(Log #211)

19- 1 - (Entire Code): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 19-1
RECOMMENDATION: The Technical Correlating Committee directs that the term "luminaire" be accepted as shown by the panel, but be followed by the existing term in parenthesis on all Proposals except those amended by Panel Action Text. This action is intended to provide consistency throughout the code. In addition, the Technical Correlating Committee directs the panel to clarify their action relative to the last line of the Panel Action. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Revise 604-6(a)(2) Exception No. 1 to (1) and (2) in both locations as follows:
Change "Fixture" to " Luminaire (fixture)".
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8
COMMENT ON AFFIRMATIVE:
MCCULLOUGH: The panel action to accept indicates agreement with the Technical Correlating Committee direction regarding the term "luminaire" and the placement of the existing term in parenthesis in all locations. The revision shown to 604-6(a)(2) should refer to 604-6(a)(2) Exception No. 1 to (1) and (2). This is to clarify the panel action as requested by the Technical Correlating Committee. The language shown is contained in the proposed draft and reflects the panel's intent of its action on Proposal 19-1.

(Log #1229)

1- 1 - (Entire Code): Reject
SUBMITTER: Dann Strube, Lanesville, IN
COMMENT ON PROPOSAL NO: 1-1
RECOMMENDATION: The proposal should have been accepted in principle as follows:
Leave the terms fixture, lighting fixture, etc. as they are and add (luminaire) after those terms.
SUBSTANTIATION: The term luminaire is not in general use in the United States; therefore, its use is not in keeping with efforts to insure that the code is user friendly.
At the August meeting of the Kentucky Chapter IAEI meeting, I ran a quick poll (show of hands) of the 150 to 200-person audience. None said they spoke French. Very few said they knew the term luminaire. None said they felt the contractors, electricians, builders or owners in their area would understand the term. None said they like the change. Almost 100% said the change was nonsense. This alone is an indication that some efforts to make the NEC look international are not productive and only make the code less friendly.
The claim that "fixture" could be confused with a toilet is nonsense. Anyone foolish enough to make that assumption should not be reading the "electrical code."
The claim that failure to change the term is a problem for the manufacturers is also nonsense. If they want to market overseas, they can mark their products and cartons any way they want.
Point 8 in the substantiation is also defective. This item cites a FPN and FPN definition in Article 410. In fact, the international definition found in this FPN does not match the definition accepted by CMP 1 at Proposal 1-165.
The United States of America is the largest user of the NEC. As such the terms in use in our own country should be the terms of first choice in the document. The code panels have dedicated untold man-hours trying to improve the code. Do not destroy their hard work in an effort to make the document appear as if it is intended for the world at large. If the NEC is to be international, it should be marketed in English and French as the IEC documents are now marketed.
PANEL ACTION: Reject.
PANEL STATEMENT: The concern of the commenter is addressed by keeping the original term in parentheses after luminaire.

RECOMMENDATION: The proposal should have been accepted in principle as follows:

Leave the terms fixture, lighting fixture, etc. as they are and add (luminaire) after those terms.

SUBSTANTIATION: The term luminaire is not in general use in the United States; therefore, its use is not in keeping with efforts to insure that the code is user friendly.

At the August meeting of the Kentucky Chapter IAEI meeting, I ran a quick poll (show of hands) of the 150 to 200-person audience. None said they spoke French. Very few said they knew the term luminaire. None said they felt the contractors, electricians, builders or owners in their area would understand the term. None said they like the change. Almost 100% said the change was nonsense. This alone is an indication that some efforts to make the NEC look international are not productive and only make the code less friendly.

The claim that "fixture" could be confused with a toilet is nonsense. Anyone foolish enough to make that assumption should not be reading the "electrical code."

The claim that failure to change the term is a problem for the manufacturers is also nonsense. If they want to market overseas, they can mark their products and cartons any way they want.

Point 8 in the substantiation is also defective. This item cites a FPN and FPN definition in Article 410. In fact, the international definition found in this FPN does not match the definition accepted by CMP 1 at Proposal 1-165.

The United States of America is the largest user of the NEC. As such the terms in use in our own country should be the terms of first choice in the document. The code panels have dedicated untold man-hours trying to improve the code. Do not destroy their hard work in an effort to make the document appear as if it is intended for the world at large. If the NEC is to be international, it should be marketed in English and French as the IEC documents are now marketed.

PANEL ACTION: Reject.

PANEL STATEMENT: The word "luminaire" is not mentioned in the materials covered by Code-Making Panel 13.

If the NEC is to be international, it should be marketed in English and French as the IEC documents are now marketed.

PANEL ACTION: Accept in Principle.

Except for Sections 520-63 and 530-51, revise the text to use the word "luminaire(s)" first followed by the current code terms "fixture(s)", "lighting fixture(s)" in parenthesis. As an example, the term fixture would appear as "luminaire (fixture)".

Retain the word "fixtures" in Sections 520-63 and 530-51 as use the current text of the 1999 NEC.

PANEL STATEMENT: The revised text complies with the submitter's intent to retain the old terms while starting with the new terms. The term luminaire is in general use throughout the United States by lighting professionals.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

COMMENT ON AFFIRMATIVE:

KLEIN: 1. The term luminaire is in general use throughout the United States by all lighting certified (NCQLP) professionals.

2. Luminaire is precisely defined by The Illuminating Engineering Society of North America as: "A complete lighting unit consisting of a lamp or lamps and ballast(s) (when applicable) together with the parts designed to distribute the light, to position and protect the lamps, and to connect the lamps to the power supply."

3. The terms "fixture" and "lighting fixture" are not precisely defined.

4. Just as lamps are no longer referred to as "light bulbs", luminaires will no longer be referred to as "fixtures" in technical documentation.

SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 1-3
RECOMMENDATION: The Technical Correlating Committee directs that this proposal be reviewed relative to the NFPA definition of the "Authority Having Jurisdiction" and determine if it is appropriate for this Article. In the Scope, change "shall be" to "are" to comply with the NEC Style Manual. The Technical Correlating Committee accepts the Scope as modified by this note. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
1.) Add "materials, " after the word "equipment". Add "a" before the word "procedure".
2.) Delete the FPN following definition of "Authority Having Jurisdiction" in Section 80.2.
3.) Change "shall be" to "are" in Section 80.1 Scope.
PANEL STATEMENT: The panel has reviewed the proposed definition in accordance with the Technical Correlating Committee directive and finds that the definition is in agreement with the NFPA definition as modified in the panel action.
The FPN was removed because it is not appropriate for a specific jurisdiction that may adopt Article 80.
The panel accepts the Technical Correlating Committee directive to change "shall be" to "are" in the scope.

1- 3 - (80): Reject
SUBMITTER: John E. Propst, Equilon Enterprises, LLC
COMMENT ON PROPOSAL NO: 1-3
RECOMMENDATION: The purpose for this comment is to reject this proposal and the action of the panel in total.
SUBSTANTIATION: The only significant justification provided by the submitter for including this new section was "to provide a standardized set of administrative rules" to "allow for more consistent adoption, use, and enforcement of the NEC". However, because of the broad application of the NEC to almost all aspects of electrical installations from single family residences up to major industrial facilities that include sophisticated computer controls, cogeneration, transmission, and distribution it is not practical to consider the application of a single set of administrative rules to all applications. While it is reasonable to consider the review of construction plans for typical residential and small commercial applications, it is highly unlikely that these rules could handle the design review of a multi-million or multi-billion dollar project designed by major engineering firms oftentimes located in other parts of the world without adding unnecessary cost burden and time delays. There are many requirements throughout the NEC that allows specific exceptions to industrial applications. This is often done with the recognition that the engineering and maintenance requirements and practices in industrial facilities goes beyond the normal practices of nonindustrial facilities. This same logic would also suggest that the rules that apply to industrial facilities must also deviate from those being applied to residential, commercial, and similar establishments.
Within the scope of the proposed article, the investigation of fires within industrial facilities is often a very rigorous process involving the expertise of many forensic experts. It is not unusual for an investigation to proceed for a period of time until the root cause can be identified. The additional involvement of personnel defined by this rule would only add unnecessary burden and delay without clearly defining the benefits. As mentioned above, the requirements for design review for major industrial installations is beyond the expected expertise of most electrical inspectors. The designation of the "authority having jurisdiction" only adds confusion to what is already a topic muddled by the differences in definitions between documents such as OSHA 1910.399, the NEC and the NEC Handbook.
Within the article, there are many examples of confusing language. For example, in 80.13(2) the article describes disconnecting power to a premises from its source of electric supply. While this may be a clearly defined point for a typical residence, it is not nearly as well defined for a facility receiving power at 230 kV with onsite generation, which is much more typical of industrial installations.
Other areas of confusing language is where there are references to existing laws (80.15 (H)(2), 80.17(A) as examples). If the desire is to achieve a standardized set of rules, then there should not be allowances for deviations set by other laws.
The requirements listed in 80.27 for inspector qualification is most likely very appropriate for personnel responsible for the inspection of typical residential and commercial installations. However, it has been our experience that most nationally recognized inspector certification programs do to address the specific requirements needed for industrial applications that might include high voltage applications, applications in classified locations, complex and integrated control, alarm, and protection schemes, and similar applications. Because of this, many industrial locations have found it necessary to provide their own custom training programs for their crafts, inspection, and engineering personnel. For these reasons, proposed Article 80 should not be included in the NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: Article 80 provides a set of model administrative rules that can be beneficial to an inspection jurisdiction in the adoption of electrical safety rules and the enforcement of those rules. The information included in Article 80 is not part of the Code unless adopted and is a resource from which to draw where needed. A jurisdiction sharing the commentor's concerns may not elect to adopt Article 80.

1- 5 - (80): Reject
SUBMITTER: John Stricklin, Mtn. Home, ID
COMMENT ON PROPOSAL NO: 1-3
RECOMMENDATION: No new Article 80. Do not accept this proposal.
SUBSTANTIATION: This article contains legal parameters that do not have anything to do with the design of electrical installations. A lot of jurisdictions have an existing law that states, they have to adopt the current addition of the National Electrical Code. This leaves no room for Article 80 in the 2002 National Electrical Code because; Article 80 could conflict with their existing laws. With Article 80 in the 2002 National Electrical Code, could make some jurisdictions look at changing their laws and with politics the way they are today, could have the inspection program eliminated.
PANEL ACTION: Reject.
PANEL STATEMENT: Article 80 is not a part of the Code unless so adopted by an appropriate jurisdiction. The authority adopting the Code will have to specifically adopt Article 80 before it becomes law. Section 80-5 states "Article 80 shall not apply unless specifically adopted by the local jurisdiction adopting the National Electrical Code." The panel does not agree that approval of Article 80 could cause inspection programs to be eliminated. A jurisdiction sharing the commentor's concerns may not elect to adopt Article 80.

1- 7 - (80): Accept in Part
SUBMITTER: Gilbert L. Thompson, MEIA Codes and Standards
COMMENT ON PROPOSAL NO: 1-3
RECOMMENDATION: We would like to go on record as supporting this proposal. The NEC Task group on administrative rules did a great service to the electrical industry by developing this proposal for consideration by localities that have not already passed legislation to accomplish its purpose. However, we think one important aspect was overlooked in its formation. Where are the qualifications or requirements for the installers who provide electrical services?
SUBSTANTIATION: In order to provide electrical services for the public, most jurisdictions require the work to be installed by a duly insured or bonded, actively certified, licensed person who is qualified for the class or type of work to be done. Also, some areas allow only the resident owner to apply for their own permit if they pass a test designed to show that they are familiar with the latest NEC code rules. We think the task force should consider this omission and come up with language and a section that would qualify the installer of the installation in a similar manner that qualified the inspector in section 80-27.
PANEL ACTION: Accept in Part.
PANEL STATEMENT: The panel accepts the commentor's expressed support of the proposal in the first two sentences only. However, the commentor has not provided specific text for the proposed additional requirements in accordance with Section 4-4.5(c) of the Regulations Covering Committee Projects.

1- 10 - (80-19(d)): Reject
SUBMITTER: Michael V. Glenn, Longview Fibre Co.
COMMENT ON PROPOSAL NO: 1-3
RECOMMENDATION: Revise 80-19(d) to read as follows:
(d) Annual Permits. In lieu of an individual permit for each installation or alteration, an annual permit shall, upon application, therefore, be issued to any person, firm or corporation regularly employing one or more employees for the installation, alteration, and maintenance of electric equipment in or on buildings or premises owned or occupied by the applicant for the permit. ~~Upon application, an electrical contractor as agent for the owner or tenant shall be issued an annual permit.~~ It shall be permissible, upon application for an annual permit, for an electrical contractor to act as agent for the owner or tenant. The applicant shall keep records of all work done and such records shall be transmitted periodically to the electrical inspector.
SUBSTANTIATION: Our industrial facility employees, approximately 90 full time electricians that do maintenance type of electrical work. The State of Washington's Electrical Inspection Department presently utilizes annual permits of which we manage our own records and work with the Inspection Department for the required inspections. We would not want nor would we use an electrical contractor to act as our agent for our electricians and inspections. There are many industrial facilities throughout the country that have their own electricians and electrical staff who would not allow a contractor to serve as their agent. The proposed change would allow any person, firm, or corporation the option of using an electrical contractor as an agent or to serve as their own agent. This change keeps the intent of an annual permit the same and provides more flexibility for a wider variety of circumstances.
PANEL ACTION: Reject.
PANEL STATEMENT: The present language specifically permits an annual permit to be issued to any "person, firm or corporation" satisfying certain conditions. While an electrical contractor is permitted to act as an agent for an owner or tenant, nothing requires that applicants for annual permits be electrical contractors.

ARTICLE 90 — INTRODUCTION

(Log #343)

1- 12 - (90-1(c)): Accept
SUBMITTER: William T. Fiske, I T S North America
COMMENT ON PROPOSAL NO: 1-5
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: Submitter's statement in substantiation, "...many rules are included in the Code that are design in nature...," is true; however the presence of some design criteria in the Code does not make it a design manual. The NEC merely sets minimum criteria, and as stated in 90-1(b), application of NEC rules does not necessarily result in good electrical system design. In addition, submitter provided no substantiation for deleting reference to, "untrained persons".
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COX: I disagree with the panel action to accept this comment. I do agree with the submitter that the presence of some design criteria in the code does not make it a design manual. The original language and the present language supports that and refers to the "Code" as the complete document. This provision has never prohibited a safety rule that includes design criteria from being adopted into the code. However, it is broadly interpreted that one can use 90.1(C) to do just that. In the 2001 NEC ROP, 90.1(C) is used by Code Making Panels over 25 times as all or part of their reason for rejecting a code proposal.
The term "untrained persons" is used only once in the NEC and is undefined in the context of the code. Without a definition of "untrained" and a description of the area of expertise or skill of training implied, this provision is unenforceable as to applying a safety rule and will be interpreted as differently as there are opinions as to what an "untrained" person is. Section 90.1(C) has no bearing on the application or enforcement of the code. The common interpretation of this rule appears to be that the code is not intended to be used by people who are untrained. Section 90.1(C) in no way prohibits anyone from using the code, whether or not they are trained. In view of the code, what does "untrained" mean? Is a trained persons required to be an electrical engineer, electrician, or electronic technician? The simple statement that the code is not intended as an instruction manual for untrained person does not have any bearing on the application or enforcement of the code. Those who are familiar with the code understand that a person cannot simply study the code to become an engineer, an electrician, or a technician. More fundamental training is necessary before a person understands electrical theory and practice. Section 90.1(C) has no role in the present NEC. The wording in 90-1(A) and (B) address the type of material that can be adopted as part of the code and it focuses on safety. This comment should be rejected. See my explanation of negative vote on Comment 1-21.

(Log #448)

1- 13 - (90-1(c)): Reject
SUBMITTER: Joseph A. Tedesco, J A Tedesco Associates, Inc
COMMENT ON PROPOSAL NO: 1-5
RECOMMENDATION: Revise the proposal to "reject" and put back the following to replace section 90-1(c). "Intention: This code is intended to be used by 'Qualified Persons'."
SUBSTANTIATION: Deleting the section makes no sense, and replacing the rule without any real concern for safety will not be appreciated by the electrical industry! Besides, the Code-Making Panel's revised definition of a qualified person makes this a necessary change.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel rejects the added new language. The existing text is clear, concise and correct. See panel action on Comment 1-12.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
COMMENT ON AFFIRMATIVE:
COX: I agree with the panel action to reject this comment but disagree with the panel statement. The submitter introduces a new concept that has not been considered by the panel or the public. To add a new restriction that would essentially limit the use of the code to people who are qualified is a drastic change from what is presently in the code. There is a significant difference between

"This code is not intended as a design specification nor an instruction manual for untrained persons" and "This code is intended to be used by qualified persons."

I disagree with the panel that the wording in 90.1(C) is clear, concise and correct. It is very clear that there are many different interpretations of this wording. That fact is evident in the comments submitted regarding Proposal 1-5 and by Code Making Panel actions shown in the 2001 NEC ROP and previous editions of the ROP and ROC. It is clear that people understand this wording to mean different things. See my explanation of negative vote on Comment 1-21.

1- 15 - (90-1(c)): Accept
SUBMITTER: Arthur J. Carlson, Pocatello, ID
COMMENT ON PROPOSAL NO: 1-5
RECOMMENDATION: (c) Intention. This code is not intended as a design specification nor an instruction manual for untrained persons.
SUBSTANTIATION: Proposal 1-5 should be rejected. To delete Section 90-1(c) would open the door to make the NEC even more non-user friendly. I am certain that in a few code cycles; the NEC would read like an engineers handbook.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel concludes that the submitter's recommendation is to reject Proposal 1-5.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COX: I disagree with the panel action to accept this comment. The purpose of the code is stated in 90-1(a) as "... the practical safeguarding of persons and property from hazards arising from the use of electricity." Proposals to change the NEC should fall within those parameters. The existing rules do not restrict the level of technical difficulty NEC provisions may contain. As electrical and electronic technology advances and become more complex, the code will have to reflect those changes. There is nothing in existing 90.1(C) that prohibits including complex engineering data or procedures in the code as long as they are for "the practical safeguarding of persons and property from hazards arising from the use of electricity." This comment should be rejected. See my explanation of negative vote on Comments 1-12 and 1-21.

(Log #609)

1- 16 - (90-1(c)): Accept
SUBMITTER: Glenn W. Zieseniss, Crown Point, IN
COMMENT ON PROPOSAL NO: 1-5
RECOMMENDATION: This proposal should be "reject".
SUBSTANTIATION: I agree with Mr. Minck's comment.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COX: I disagree with the panel action to accept this public comment. The submitter relies on information in a statement associated with a negative vote on Proposal 1-5. That negative statement includes a reference to this section as being "historic" and that it provides clarity involving those persons attempting to the use the rules of the NEC. It further states: "The clarity provided for users of the code in this section far outweigh any negative ramifications involving misdirected opposition to any specific proposal." In over 30 years of observing the code making process, the application of the design clause of 90.1(C) has been used almost exclusively to oppose the acceptance of a rule within the code, even though it involved safety. One only has to check the 2001 ROP and earlier ROPs and ROCs to verify this. The wording originally adopted for the 1937 NEC did not support its use to oppose individual proposed changes in the code and neither does the present wording. The 1937 wording was: "This code is to be regarded neither as a design specification nor an instruction manual for untrained persons." That wording cautions people that they should not think of the code as a design specification. It is interesting to note that the reference is to the code as the complete document and not to individual rules. As an emphasis on the acceptability of design as part of the NEC, the 1937 code added a title to Chapter 2 that read: "Wiring Design and Protection." Since provisions in Chapter 2 are predominately design, it can be readily pointed out that the authors of the design provision in the 1937 code did not have any intent of applying the rule to parts of the code or to proposed changes.

The wording indicating that the code is not intended as a design specification may have had some validity for the 1937 NEC and several issues following it. The 1937 code included a statement in the same paragraph as the design specification provision that read: "The requirements of this code constitute a minimum standard." With the statement that the code is a "minimum standard", it may have been considered necessary to the code developers that another statement be included to clarify that even though the code was a minimum standard, it should not be considered as a design specification to prohibit designers from using anything other than the minimum set of rules. The last sentence of the paragraph supports this position because it emphasizes that one may have to do more than the Code requires to have good service. The paragraph in question in the 1937 code reads: "The requirements of this code constitute a minimum standard. Compliance therewith and proper maintenance will result in an installation reasonably free from hazard but not necessarily efficient or convenient. This code is to be regarded neither as a design specification nor an instruction manual for untrained persons. Good service and satisfactory results will often require larger sizes of wire, more branch circuits, and better types of equipment than the minimum which is here specified." The wording regarding "minimum standard" was deleted during the 1971 code revision cycle.

The negative statement also includes: "The present wording provides all Code Making Panels with a much needed and desired reference in dealing with design proposals to the NEC." This is a significant point in this issue. Section 90.1(C) is not a basis for rejecting a proposal. This section did not prohibit the adoption of safety rules with design specifications in the 1937 code and still does not today, even with the revised wording. Regardless of how many rules in the code includes design criteria, it is still a safety code and not a design specification. In order for the NEC to be considered as a design specification, Section 90-1(A) and (B) will have to be changed to identify the NEC for that purpose or other steps taken that eliminated the present purpose of the "practical safeguarding of persons and property from the hazards arising from the use of electricity." Code proposals and public comments should be considered on their merits as to whether or not they are applicable for the NEC. Section 90.1(C) has no role in that consideration. It applies only to the code as a whole and the intent of the total document.

The negative statement references the intent of the code as an instruction manual for untrained persons, and includes the wording: "All NEC Code Making Panels depend on this second declaration in 90.1(C) to make clear that the many technical terms and technical requirements incorporated into the code's language are not directed at persons not trained in the ability to understand such language and provisions." Section 90.1(C) does not prohibit an untrained person from using the Code nor does it identify the type of training needed or the level of knowledge and experience to be achieved before one is considered as "trained". Specific sections in the Code include rules covering "qualified" persons, but

90.1(C) does not affect how those sections are applied and those rules have no bearing on the application of 90.1(C). This comment should be rejected.

(Log #898)

1- 17 - (90-1(c)): Accept
SUBMITTER: John Stricklin, Mtn. Home, ID
COMMENT ON PROPOSAL NO: 1-5
RECOMMENDATION: Leave text as 1999 NEC. Do not accept this proposal.
SUBSTANTIATION: The 1940 National Electrical Code states, as well as an 1897 electrical code edition, "It is recommended that architects when drawing plans make provisions for ample electrical etc.", an INTENT of having only persons trained in electrical knowledge, design electrical installations. Let's not leave it up to untrained persons, to draw and install electrical designs. How would you like to have a shoe clerk from the local department store design the electrical installation in your house?
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COX: I disagree with the panel action on this comment. The present wording in 90.1(C) does not prohibit an untrained person from either designing a system or using the code. While the submitter has a valid point in emphasizing that properly trained persons should design and install electrical systems, this section only addresses the intent of the code as an instruction manual for untrained persons. While several sections in the code include the term "qualified persons". Those sections generally permit a variation of a general rule where the equipment is either accessible to qualified persons or is serviced by them. It does not address the level of training and experience a designer, installer, or inspector is required to have nor does it define a "trained person". This comment should be rejected.

(Log #1007)

1- 18 - (90-1(c)): Reject
SUBMITTER: Michael P. O'Quinn, MOGO Enterprises, Inc.
COMMENT ON PROPOSAL NO: 1-5
RECOMMENDATION: Revise as follows:
"This Code is not intended as a design specification nor an instruction manual for ~~untrained~~ unqualified persons."
SUBSTANTIATION: Even though 90-1(a) declares the intent of the Code as the "practical safeguarding of persons and property ..." maintaining the statement in 90-1(c) that the Code is "...not intended as a design specification..." clarifies that the direction of the Code is towards safety and not design.
For example, past editions of the Code have dealt with the issue of harmonics by supplying FPN (fine print notes) warning the installer of possible dangers. This is because the Code is primarily concerned with safety. If the Code was a "design specification", an in-depth description of corrections would have been supplied.
The Code is also not intended to be used by persons untrained in the terminology or theory of electrical systems: the Code expects a level of expertise for understanding. Because of initial acceptance of ROP 1-178, a new definition of "qualified person", the changing of the term "untrained" to "unqualified" explains the intended audience of the Code. For example, an unqualified person has no understanding of Section 110-12, requiring "...a neat and workmanlike..." installation.
It is important to note that the Code is not designed nor intended to be a textbook.
PANEL ACTION: Reject.
PANEL STATEMENT: It is not the intent of the panel to restrict the use of this Code to qualified persons as defined in Article 100.

(Log #1548)

1- 19 - (90-1(c)): Accept
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
COMMENT ON PROPOSAL NO: 1-5
RECOMMENDATION: The panel should reject this proposal.
SUBSTANTIATION: The Code is a legislated document. As such, it is necessary to identify "what is not intended to accomplish". Typically, in the Code the permissive possibilities are not enumerated in an exhaustive list while the prohibitive possibilities are clearly identified. For a perceived misuse of existing 90.1(c) by the Panels, as suggested by the Submitter, it is not necessary to eliminate the rule that serves a purpose for the adoption and implementation of the Code. Lack of this clarification could prevent listings or approvals of products and installations that are in compliance with the Code and applicable product standards but may not be enumerated in a specific permissive list in the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COX: I disagree with the panel action to accept this comment. It is not necessary to identify what the code is not intended to accomplish nor the reference to this provision serves a purpose for the adoption and implementation of the code. There are numerous things the code is not intended to either be or to accomplish other than a design specification or an instruction manual for untrained persons. It is not clear how the deletion of 90.1(C) could prevent listings or approvals of products and installations. Section 90.1(C) has no bearing on how the code is either interpreted or applied or how products are evaluated. This comment should be rejected.

(Log #1622)

1- 20 - (90-1(c)): Accept in Part
SUBMITTER: Gilbert L. Thompson, MEIA Codes and Standards
COMMENT ON PROPOSAL NO: 1-5
RECOMMENDATION: We think this proposal should be rejected. We agreed with Mr. Dini and especially with the remarks of Mr. Minick in the negative voting. Change 90-1(c) to read like the 1937 NEC which said "the code is to be regarded neither as a design specification nor as an instruction manual for untrained persons". This wording would answer both the affirmative and negative panel votes.
SUBSTANTIATION: A change back to the old language would let proposals and installations methods be submitted for safety reasons and then be judged on their own merit since the stated intention would be clear that the code is not a design specification manual. Also, we feel that everyone "in the trade" knows that the NEC is not an instruction manual for untrained persons. However, when lawyers, judges, builders and other "outside" persons read sections of the code and suddenly become experts, it helps to refer them to this section of the code especially since proposals 1-6 and 1-7 (90-1(d) (new) have been approved if accepted.
PANEL ACTION: Accept in Part.
PANEL STATEMENT: The panel accepts the recommendation to reject the proposal. The panel concludes the present wording of the 1999 NEC is clear, concise and correct and therefore rejects the proposed wording change.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COX: I disagree with the panel action to accept this comment in part. The present wording is definitely not understood the same by users of the code. The 1937 wording recommended by the submitter is more appropriate than the present wording. The 1937 wording focuses only on how people are to regard the code whereas the present language redirects it to what the code is intended to do or be. There is a significant difference between those two versions. While the proposed change does have a different meaning, there is no assurance that the 1937 language will solve the problem stated in the substantiation for Proposal 1-5. This comment should be rejected. See my Explanation of negative vote on Comments 1-16 and 1-21.

(Log #2002)

1- 21 - (90-1(c)): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 1-5
RECOMMENDATION: The proposal should be rejected.
SUBSTANTIATION: This section says, in elegant simplicity, that the Code "is not intended as a design specification nor an instruction manual for untrained persons." This is one of the bedrock principles that provide the Code's public legitimacy. Usually we ask both proposal submitters and code making panels to cite a safety problem before changing the Code. This proposal virtually proclaims the opposite. Either the provisions in the NEC are solely founded in safety, or its provisions are something akin to a collective bargaining agreement where the industry seizes whatever economic advantage it can.

The proposal submitter asserts that: "There have been occasions where the wording in Section 90-1(c) has been used to oppose the addition of Code rules because they included requirements involving design criteria even though the objective of those rules was safety." Many rules are included in the Code that are design in nature but still fall within the "practical safeguarding of persons and property from hazards arising from the use of electricity."

This substantiation does not bear close examination. Some questions of electrical layout are indeed fair game for regulation as safety-related. As such they are utterly unaffected by this provision since the present Code wording (quoted accurately in the substantiation) already say the Code covers these topics. The real target of the proposal is those proposals questionably related to safety. Removing this subsection makes it that much easier to get non-safety issues slipped into the Code, and then to masquerade them behind the rubric of safety-related design. I don't doubt the sincerity of the proposal submitter, who certainly doesn't intend such an outcome, but that will be the result over time.

For 63 years (since the 1937 NEC) this provision has stated, without significant change, that the NEC is not intended as a design specification. As the proposal submitter noted, some of us, including this author, routinely subject code making panels to withering public criticism when they step off the reservation. We do it for good reason. It is difficult enough to produce a Code that is technically correct and coherent without going beyond the parameters of fire, electrocution, and explosion hazards caused by the use of electricity, and this rule has been a meaningful deterrent to Code Making Panels seeking to expand their role. Electricity is electricity. What compelling safety issue arises at this time, and requires this solution, that wasn't equally the case in 1937 and all the years since?

Properly enforced, the present language represents the moral basis under which the Code retains its public legitimacy. Codes and standards are under constant scrutiny, as indeed they should be, for hidden benefits that inure to the benefit of the special interests that inevitably draw them up. Nothing in our system of government enthrones the National Electrical Code Committee. The building officials or other public authorities will view any shift in the direction toward design inclusion in the NEC as proof that the electrical industry cannot be trusted with the Code. However well-intentioned, this proposal will only confirm their worst suspicions.

Key to this discussion is how to properly apply the word "design." We need to look at the term not as it could be defined in a dictionary, but as it has been used for generations of Code practice. If design were simply to mean electrical layout, then almost the entire Code would be design, since the NEC by its very nature is and must be prescriptive. Therefore, such a definition makes the term meaningless in this discussion. On the contrary, design in the Code sense means layout that serves an engineering objective relative to the utility of the installation, over and above minimum safety. That domain is clearly stated as beyond the reach of the Code in Section 90-1(b). Design in this context is the engineering that makes the completed installation "efficient, convenient, [and] adequate for good service [and] future expansion of electrical use."

Any revisions to this section should await genuine substantiation based on a real safety problem. In the meantime, both the technical merit and the moral authority of the Code are strengthened by a routine and rigorous application of the existing text. To monkey with provisions in this, the very first section in the Code, provisions that stood unchanged and unchallenged over sixty years, will inevitably further encourage the building officials in their forthcoming efforts to persuade public officials to adopt their version of a competing electrical code.

Three years ago Code-Making Panel 1 started down this route, initially accepting a similarly motivated, albeit slightly less radical, proposal. During the Public Comment period, Code-Making Panel 1 grumbled but reversed its position. That's what makes this action even more inexplicable, although there are many new members of Code-Making Panel 1 this time out. The outcome should be the same.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel does not necessarily agree with all of the submitters substantiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
EXPLANATION OF NEGATIVE:

COX: I disagree with the panel action to accept this comment. Many rules in the NEC include design criteria. Where this section is used to prohibit new products or installation provisions that could result in safe installations, it does constitute a safety issue. When the wording upon which the 90.1(C) text involving design was adopted in the 1937 NEC, Chapter 2 of that same edition was entitled: "Wiring Design and Protection". That action logically associates design with the code where the design provision is within the scope of "the practical safeguarding of persons and property". If the text in 90.1(C) is interpreted as prohibiting rules that contain design from being included in the code, that includes all types of design. The removal of the text in 90.1(C) eliminates misunderstanding as to whether or not design criteria is permitted in the code and relies on the wording in 90-1(A) and (B) to limit any design provision to that which relates to safety. The design provision in 90.1(C) had more impact on the code until the wording: "The provisions of this code constitute a minimum standard" was deleted in the 1971 NEC. While that wording was in the code, the original text involving design could have been used to protect designers from being forced to use the "minimum standard" rules when they intended to design an even safer system than the code required.

The submitter of this comment references the proper enforcement. It is not clear how an enforcing agency can enforce 90.1(C). Many jurisdictions have licensing, certification, and registration laws for people who perform electrical work within their jurisdiction. Those laws are used to ensure that qualified people perform electrical work, but 90.1(C) plays no part in that administration. Using the code to train people is generally supported by inspection jurisdictions. It would be highly unlikely that a jurisdiction that adopts the NEC as its electrical code would prohibit those who it considered as untrained from being taught from the code. In the same fashion, jurisdictions generally expect electrical installations to be designed according to the NEC even though the NEC is not to be considered as a design specification. Nothing in the wording of 90.1(C) prohibits design requirements from being included in the code. Nothing in the wording in 90.1(C) prohibits an untrained person from using the code. This comment should be rejected.

If Code Making Panel 1 concludes that 90.1(C) should remain in the code, it should clarify exactly what the provision means and how it applies. The panel should either make it clear that 90.1(C) permits the adoption of safety associated design criteria in the code or it should take the position that it does provide grounds for rejecting such proposed rules. The present wording is both misunderstood and misapplied. Proposal 1-5 should be accepted.

(Log #2222)

1- 22 - (90-1(c)): Accept
SUBMITTER: Robert H. Keis, Dover, DE
COMMENT ON PROPOSAL NO: 1-5
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: The proposer's statement that there is no need to identify what the code is not intended to accomplish is incorrect. Hundreds of times in 30 years of inspection I have been asked by electricians and engineers alike why the code doesn't tell them how to do their job. The code tells them what is required, but not how to accomplish the requirement. This also applies to why the code is not an instruction manual for untrained persons. There are many "intents" in the code, and code training is necessary to use the code properly. Even as I read this ROP I find statements such as "the panel's intent is...".

Please give some consideration to the negative votes by some of the panel members. Even Panel 2 used this section for a reference on Proposal 2-267 (Log #2892).

We need this section in the NEC.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COX: I disagree with the panel action to accept this comment. The existing language in 90.1(C) does not prohibit the NEC from containing installation information to aid the designer or electrician in his or her job as long as it falls within the purpose of the code as described in 90-1(A), "...the practical safeguarding of persons and property from hazards arising from the use of electricity." While installation information of this type is usually found in other documents and not needed in the NEC, neither 90.1(A), (B), or (C) prohibits it from being included in the code. This comment should be rejected. See my explanation of negative vote on Comment 12-21.

(Log #1642)

1- 23 - (90-1(d)): Reject
SUBMITTER: Andy Scott, National Cable Television Association
COMMENT ON PROPOSAL NO: 1-8
RECOMMENDATION: Accept Proposal 1-8.
SUBSTANTIATION: NCTA, on behalf of the cable television industry, strongly urges Panel 1 to accept this proposal. The code currently contains no statement regarding its retroactivity, leaving the interpretation of this important matter to users and enforcers of the code. This has led to confusion regarding the application of new requirements, non-uniform enforcement by authorities having jurisdiction, and local unauthorized interpretations regarding retroactivity. This proposal attempts to provide guidance to both users and enforcers of the code regarding its application situations where existing facilities, equipment, structures, or installations are being modified, but much of the existing installation remains untouched.
PANEL ACTION: Reject.
PANEL STATEMENT: No additional technical substantiation has been provided for this proposed change. The panel reaffirms its original voting statement on Proposal 1-8. See also Proposal 1-3 for further information on retroactivity.

SUBMITTER: CMP 1
COMMENT ON PROPOSAL NO: 1-10
RECOMMENDATION: Revise the wording previously accepted in Proposal 1-10 as follows:
90-2(a) Covered. This Code covers the installation of electric conductors, electric equipment, signaling and communications conductors and equipment, and fiber optic cables and raceways for the following:
1. Public and private premises including buildings, structures, mobile homes, recreational vehicles, and floating buildings.
2. Yards, lots, parking lots, carnivals, and industrial substations.
3. Installations of conductors and equipment that connect to the supply of electricity.
4. Installations used by the electric utility, such as office buildings, warehouses, garages, machine shops, and recreational buildings that are not an integral part of a generating plant, substation, or control center.
FPN: For additional information concerning such installations in an industrial or multibuilding complex, see the National Electrical Safety Code, ANSI C2-1997.
90-2(b)(5). Installations under the exclusive control of an electric utility where such installations
1. consist of ~~wiring for~~ service drops or service laterals, and associated metering; or
2. are located in legally established easements, ~~or~~ right-of-ways, or by other agreements either designated by or recognized by public service commissions, utility commissions or other regulatory agencies having jurisdiction for such installations; or
3. are on property owned or leased by the electric utility for the purpose of communications, metering, generation, control, transformation, transmission, or distribution of electric energy.
SUBSTANTIATION: The panel concludes that the amended wording adds more clarity as to the installations covered and not covered as stipulated in Section 90-2. The term "associated metering" was added to clarify that metering equipment associated with service drops and laterals is not covered by the Code. The wording added to identify access by easements, right-of-ways or by other agreements associated with the authority of public service commissions, utility commissions, or other regulatory agencies having jurisdiction is to clarify that those agencies generally have authority over those types of installations and establish the rules under which they are governed.
It is not the intent of Code-Making Panel 1 to exclude the NEC as a controlling installation document fully capable of being utilized for electrical installations in most cases. Section 90-2(b) likewise does not contain areas where portions of the NEC could not be used, but rather this section lists specific areas whereby the nature of the installation requires specialized rules or where the use of other controlling installation rules, standards, and guidelines have been specifically developed for these uses and industries. Among these industries is the electrical utility industry, which utilizes the NESC as its primary guideline in the generation, transmission, distribution, and metering of electrical energy. The utility industry's right to produce and distribute electrical energy using NESC rules or whether this industry should be prohibited or excluded from installing any type of lighting has never been an NEC issue.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
IVORY: I support the proposal and comments as suggest in Comment 1-27-902. The proposed text does not add clarity, is not easily enforceable, and certainly a step in the wrong direction. However, I support the original language from the 1998 ROP, Proposal 1-13 and Comment 1-18a which now appears as the new Proposal 1-10 in the 2001 NEC ROP. This original language is a step in the right direction, and is easily understood and enforceable. Also, the original language clarifies the issue of parking lot lighting, which is the heart of the problem.
COMMENT ON AFFIRMATIVE:
TROGLIA: I am voting affirmative on the panel recommendation on this comment as I feel the panel has adequately addressed the concerns expressed in my negative vote on Proposal 1-10. I believe the substantiation developed for this comment will be of help in understanding the appropriate application of the NEC and NESC requirements. However, I remain convinced that the NEC and NESC defined "Service Point" as proposed in Proposal 1-11 would better define the demarcation between facilities covered by the two

codes and its use would codify what is essentially present practice in most jurisdictions.

(Log #1623)

1- 26 - (90-2): Accept in Principle
SUBMITTER: Gilbert L. Thompson, MEIA Codes and Standards
COMMENT ON PROPOSAL NO: 1-10
RECOMMENDATION: This proposal should be accepted as revised and submitted by code-making panel 1.
SUBSTANTIATION: The code making panel's comments should help to clarify their intent that only wiring under the exclusive control of an electric utility for the purpose of communications, metering, generation, control, transformation, transmission, or distribution of electrical energy is not covered by the NEC. This should help answer 72 other proposals on this subject and provide the guidance necessary when deregulation of electrical energy takes place nationwide.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The revised wording provides a better understanding of the installations covered and not covered and focuses on those agencies primarily responsible for making the necessary determination of how the rules are applied on a local level.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #1887)

1- 27 - (90-2): Reject
SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers
COMMENT ON PROPOSAL NO: 1-10
RECOMMENDATION: Reject this proposal.
SUBSTANTIATION: The IBEW can not support this change. The proposed text does not add clarity, is not easily enforceable, and certainly a step in the wrong direction. However, the IBEW does support the original language from the 1998 ROP, Proposal 1-13 and Comment 1-18a which now appears as the new proposal 1-10 in the 2001 NEC ROP. This original language is a step in the right direction, and is easily understood and enforceable. Also, the original language clarifies the issue of parking lot lighting, which is the heart of the problem.

This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that the revised wording in Comment 1-26a is more appropriate and that the original wording in Proposal 1-10 could be interpreted as excluding some transmission and distribution lines from crossing private property even though they are clearly in a utility easement or right-of-way. CMP 1 reaffirms that parking lot lighting is covered by the NEC as described in Section 90-2(a).

(Log #2004)

1- 28 - (90-2): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 1-11
RECOMMENDATION: Accept the proposal in principle. Meld the substance of the proposal with the editorial structure of Proposal 1-10, as follows:

Amend 90-2 as follows:

90.2. Scope. The Code covers the installation of electric conductors, electric equipment, signalling and communications conductors and equipment, and fiber optic cables and raceways as covered in 90-2(a) subject to the exclusions in 90.2(b).

(A) Covered. This code covers the following:
(1) Buildings and Structures. Premises wiring in or on buildings and structures, both public and private, including mobile and manufactured homes, recreational vehicles, and floating buildings.
(2) Outside Wiring. Premises wiring in yards, lots, parking lots, carnivals, industrial substations, and other outside conductors and equipment.
FPN: For additional information concerning such installations in an industrial or multibuilding complex, see the National Electrical Safety Code, ANSI C2-1997.
(3) Connected to Electric Supply. Conductors and equipment that connect to the supply of electricity.
(4) Electric Utility Business and Accessory Uses. Installations used by an electric utility, such as office buildings, warehouses, garages, machine shops, and recreational buildings, which are not an integral part of a generating plant, substation, or control center.

(B) Not Covered. This Code does not cover the following:
(1) Self-Propelled Vehicles. [no change to existing text; FPN remains]
(2) Mines [no change to existing text]
(3) Railways. [no change to existing text]
(4) Communications [no change to existing text]
(5) Public Access Restricted. Installations on the supply side of the service point, and used for the purpose of communications, metering, generation, control, transformation, transmission, distribution, or utilization of electric energy provided both of the following conditions are met:
(a) Control. The installation is exclusively operated, maintained, and controlled on a continuing basis by electric utilities, or by entities recognized by the jurisdiction as having substantially equivalent organizational permanence, engineering supervision, and workforce training.
(b) Location. The installation is located in buildings or in outdoor locations owned or leased by the electric utility or equivalent entity and used exclusively for such purposes, or on or along public highways, street, roads, etc., or outdoors on private property by publicly recorded rights.

(C) Special Permission. [no change to existing text].
SUBSTANTIATION: This comment is more modest editorially than the original proposal, building on Code-Making Panel 1's work under Proposal 1-10. It includes constructive editorial changes that provide paragraph titles and also appropriate parent language in 90-2 that frames the relationship between the first two subsections following. The most important substantive change from the present NEC is contained in the revisions to Section 90-2(b)(5). Much of this substantiation unavoidably reiterates that submitted with the original proposal. It needs to be reconsidered in light of the Style Manual command that the NEC must be in a form suitable for mandatory adoption by the various jurisdictions. Every jurisdiction effectively defines, through some regulatory process, the service point. If that were not the case, there would be endless controversy and lawsuits over licensure, qualifications, insurance coverage, OSHA regulations, and a dozen other areas I haven't bothered to list. Its location may occasion controversy, but its existence is incontrovertible.

The most jurisdictional-friendly way to assure NEC adoption without amendment of Article 90, therefore, is to write it in a way that directly interfaces with the service point concept. Unfortunately, the substantive action on Proposal 1-10 guarantees that every single adopting jurisdiction will need at least one NEC amendment, unless they are willing to force the electric utilities out of existing tariffs and work practices that have continued under the NESC since its inception, albeit at variance from the NEC. There being no loss experience to support such an action, it simply will not occur. When a panel action guarantees that no known jurisdiction can adopt or enforce such a key provision without major amendment, either by direct action or in effect by ignoring its terms, that action fails Section 1.3 of the Style Manual.

As proposed in this comment, Section 90.2(B)(5) holds the key to finally end approximately seventy years of conflict and overlapping jurisdictional boundaries between the NESC and the NEC. Unless we focus on these concepts we miss the premises that underlies the NESC. If we look at NESC requirements outside this context, we inevitably see a free lunch for utilities and an unacceptable diminution of safety. Such a view is unfair, and intellectually dishonest. The NESC trades off reductions in installation requirements for increases in supervision by virtue of its intended audience.

Criticizing the lack of separate equipment grounding (per NESC) out of this context, for example, has as much consistency as criticizing a major industrial occupancy for running a medium-voltage transformer with 250% secondary protection. Now, the industrial occupancy traded off a reduction in secondary protection for enhanced supervision. Is it unsafe? If improperly supervised for the foreseeable future, yes. If properly supervised as contemplated in Table 450-3(a), no. Therefore, is it less safe than the normal 125%? Here's the real point: It's only less safe if you

ignore the operational context. That sort of tradeoff occurs all over the NEC. By now we're used to it.

Is a street light grounded to the grounded conductor unsafe? If it isn't exclusively under the control of utility (or equivalent) personnel for the foreseeable future, yes. If properly operated and controlled as contemplated in the NESC, no. There won't be any peace between the two codes until we look at their differences in this context. This proposal clearly establishes that context through this paragraph. What follows is a more detailed analysis of its provisions. The key is exempting certain highly qualified entities from NEC provisions upon a showing that they possess equivalence to traditional utility operational performance.

They would need to show equivalence in engineering supervision. This would presumably involve a track record of qualified engineering supervision of this work, by people who are accountable to state licensing authorities for their work in the electrical discipline.

They would need to show equivalence in workforce training. This would presumably involve similar training as that provided for utility line crews operating with equivalent voltages and other conditions. This would involve training significantly over and beyond the fact of electrical trade licensure in my jurisdiction. Too often we think of a license as demonstrative of qualification. This work involves a different code than the one under which trade electricians receive licensure. Under no trade licensure program I am aware of, in this country or elsewhere, do licensing authorities judge workforce qualifications under the NESC. Remember, the NESC isn't just an installation standard. It's also a maintenance and workplace safety standard.

They would need to demonstrate organizational permanence. There must be evidence that the entity assuming responsibility will, in fact, carry out its responsibilities under the premise that there be continuing control, maintenance, and supervision. The word "continuing" is without limit as to time, and therefore means the foreseeable future.

With respect to procedure, the phrasing "recognized by the jurisdiction" is different form the usual reference to an authority having jurisdiction. This is intentional. No inspector should be engaged in or asked to take responsibility for determinations of organizational permanence, for example. That should involve some formal process established under the prevailing laws and regulations, and presumably allowing for public comment.

A companion comment on Proposal 1-185 redefines service point accordingly. ("The point of connection between the premises wiring and the facilities of a serving entity recognized by the jurisdiction as having substantially equivalent organizational permanence, engineering supervision, and workforce training.") This comment also incorporates the suggestion in the affirmative comment in the voting, although with greater economy of wording ("publicly recorded rights") to assure appropriate formality (through recordings in county deed registries, etc.) in dealing with easements.

The service point redefinition (see companion comment) allows the reapplication of Article 230 to the interior of these industrial facilities (Code-Making Panel 1 already deleted the phrase "of utility conductors" from the premises wiring definition, per Proposal 1-176). The result would be a Code that tells it as it is. There are large industrial campuses using the NESC for major elements of their outdoor distribution systems. The NEC would otherwise claim these under Article 225. I am a well-bruised but still standing veteran of the battle to include manholes in the NEC, and that effort only succeeded after my panel allowed the DuPonts of the world to continue using the NESC for their outdoor distributions. I frequently represent electrical viewpoints to legislative leaders and committees. Anyone who thinks they're going to fiddle with Section 90-2 and end up forcing these major employers to revamp their campuses so as to become the sole province of conventional electrical trade licensure needs to meet some of the people I deal with in this process.

To accept this proposal would demonstrate to political authorities a level of sophistication and maturity unusual in a self-regulated industry. It is squarely rooted in safety and not market share. It removes from our table all competitive issues, because the NEC only gets mud on its face when it tries to influence them. The NEC Committee must face up to the fact that just because some area of electrical work is covered by the NEC, it does not follow that conventional electricians will wire it. The plethora of allowances for homeowner wiring should prove that point beyond any doubt.

There's no question that some utilities have abused their rate base revenue to compete with electrical contractors. However, in terms of electrical distribution, their activities constitute a natural monopoly, and natural monopolies are always subject to state regulation. That's where those battles must be fought. If a utility uses its rate base to unfairly compete with electrical contractors in the performance of premises wiring, such practices are morally reprehensible and deserve to be prohibited by regulatory authorities as contrary to sound public policy. However, what is sauce for the goose is sauce for the gander. The NEC can claim public area and roadway lighting for years to come, but the identity of those performing this work, and the standards to which they work, will be decided by the same authorities we would ask to prohibit unfair utility competition in premises wiring.

In fact, in my state we are seeing the reverse problem, namely, utility attempts to relocate service points in such a manner as to make NESC installations become premises wiring with no assurances of adequate and continuing controls. We were at the proposal stage and are still in the midst of a major regulatory initiative to restrict such activities. We want to retain utility control over this work until and unless it has been reworked to the NEC, and the language in this proposal would strengthen those attempts.

The present Section 90-2 isn't great, but it has just enough ambiguity that it does not require local amendment to accommodate historic utility practice. As such, it should not be changed without far more careful consideration of how the NEC interfaces with regulatory structures in place for generations in the United States and other countries which we hope will adopt this Code. The only point of common reference, connecting all these disparate applications throughout a global economy, is the service point concept. If Code-Making Panel 1 is unwilling to embrace it, then it should leave well enough alone.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel does not fundamentally agree with the submitter's substantiation. The term "service point" as pointed out by the submitter in the substantiation has been and continues to be a moving target. The issues involved in what can and what cannot be covered by the NEC is not a who has a right to do the work issue involving utilities, contractors, or other such entities. That issue is a local, regional, or state issue involving qualifications of an installer. This issue is really one of if the NEC is an adequate prescriptive code by which electrical installations, including street lighting and site lighting, may be safely accomplished. The panel is of the opinion that the NEC is adequate for all such purposes. The issues involved here also do not include any assumptions that following NEC requirements is safer than following NESC requirements as installations under either code that are carried out within the context of the overall rules and installations guidelines of each code are expected to produce a safe installation and this would specifically include, in this case, street or site lighting installations.

It is not the intent of Code-Making Panel 1 to exclude the NEC as a controlling installation document fully capable of being utilized for electrical installations in most cases. Section 90-2(b) likewise does not contain areas where portions of the NEC could not be used, but rather this section lists specific areas whereby the nature of the installation requires specialized rules or where the use of other controlling installation rules, standards, and guidelines have been specifically developed for these uses and industries. Among these industries is the electrical utility industry, which utilizes the NESC as its primary guideline in the generation, transmission, distribution, and metering of electrical energy. The utility industry's right to produce and distribute electrical energy using NESC rules or whether this industry should be prohibited or excluded from installing any type of lighting has never been an NEC issue. See Comment 1-26a.

COMMENT ON AFFIRMATIVE:

TROGLIA: I agree with Proposal 1-11, however, I believe the panel recommendation and substantiation on Comment 1-26a adequately addresses the issue. See my comment on vote on Comment 1-26a.

(Log #1141)

1- 29 - (90-2(a)): Accept in Principle

SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc.

COMMENT ON PROPOSAL NO: 1-81

RECOMMENDATION: This comment is intended to affirm the panel action on Proposal 1-81, and the corresponding panel action on Proposal 1-10. In addition, the panel is encouraged to make no further revisions to 90-2(a) that might detract from the intent of Technical Correlating Committee Task Group Proposal 1-81.

SUBSTANTIATION: A Technical Correlating Committee Task Group was formed to address concerns expressed in the previous code cycle that because of the independence of Chapter 8 from the

other sections of the NEC, there exists a perception that installations of communications conductors and equipment are not subject to electrical inspection by the Authority Having Jurisdiction. This misperception, addressed by the Technical Correlating Committee Task Group in Proposal 1-81 and Accepted in Principle by Panel 1, has been adequately addressed by the panel action on Proposal 1-10 and proposed rewrite of 90-2(a) to address both the Technical Correlating Committee Task Group concerns and the "parking lot lighting issue". Care should be exercised by the panel in responding to public comments that the intent of the Technical Correlating Committee Task Group as contained in Proposal 1-81 is not lost in any subsequent revisions to 90-2(a). That intent is to convey to the NEC user that although Chapter 8 is independent of the rest of the NEC, installations of communications conductors and equipment are covered by the NEC and are subject to electrical inspection (with the exception of situations identified in 90-2(b)).
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel understands the submitter to be recommending that CMP-1 reaffirm its action to add a new 90-2(a)(6). This action is in addition to that taken on Comment 1-26a.

1- 31 - (90-2(a) &(b)): Reject
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co/EEI
COMMENT ON PROPOSAL NO: 1-10
RECOMMENDATION: This proposal should be rejected and proposal 1-11 should be accepted
SUBSTANTIATION: The Panel's interpretation of the revised text of Section 90-2(b)(5) is in conflict with the scope of the National Electrical Safety Code (NESC). The NESC has always covered installations of electric utilities that are under their exclusive control and on the supply side of the service point of a premises wiring system. This includes lighting installations directly connected to their distribution systems. Utility regulatory commissions, under statutory authority, generally adopt and enforce the requirements of the NESC as they apply to utility installations within their jurisdiction. These commissions recognize street and parking lot lighting covered by the NESC as utility functions. They generally do not have regulatory authority over utility installations that are a part of a premises wiring system. These installations are generally covered by the requirements of the National Electrical Code (NEC) and are enforced by the Authority Having Jurisdiction (AHJ) referenced therein. The AHJ cannot enforce the proposed 2002 NEC as interpreted by the Panel without usurping the statutory authority of the utility regulatory commission. This conflict will have to be resolved in each and every jurisdiction adopting the 2002 NEC. This does not facilitate the NFPA stated objective of developing a code that is uniformly and readily adoptable by the jurisdiction without change. It also creates a conflict between documents both recognized as ANSI standards contrary to ANSI requirement for no conflict within its adopted standards. Acceptance of proposal 1-11 resolves the conflict between the documents by clearly establishing the defined Service Point as the point of NEC/NESC interface and facilitates the adoption of both documents without change.

The Panel's interpretation of the revised text indicates that a parking lot light on an existing utility pole that supports other distribution facilities is not covered by the NEC, however an extension from that pole to another pole and light on the lot under the exclusive control of the utility would be covered. This makes absolutely no sense and is without justification.

In addition, the Panel has presented no evidence that the existence of a recorded easement has any bearing on the safety of the installation. In our opinion, the NEC was never intended to dictate land use requirements. An easement is a mandated land use requirement. No justification has been presented for a requirement that a utility installation on private property, made solely for the supply of service to that property, needs to be covered by an easement to be considered as not covered by the NEC. An easement for utility facilities on private property assures the utility can meet its obligation to supply all of its customers served through those facilities. No such assurance is generally needed from a property owner for facilities installed on and serving only that property. Also the proposed text would require an easement for a residential electrical meter that has always been considered as not covered by the NEC.
PANEL ACTION: Reject.

1- 37 - (90-2(b)(1)): Reject
SUBMITTER: Edward T. Cousins, Conoco Inc.
COMMENT ON PROPOSAL NO:
RECOMMENDATION: Revise as follows:

90-2(b)(1) Installations in ships, watercraft other than floating buildings, railway rolling stock, aircraft, or automotive vehicles ~~(other than mobile homes and recreational vehicles).~~
SUBSTANTIATION: The problem with the phase shown in strike - through legislative format in number 3 - above is that it: (1) is redundant, unnecessary wording since mobile homes and recreational vehicles are clearly stipulated in 90-2. (1) "Installations of electric conductors and equipment within or on public and private buildings or other structures, including mobile homes, recreational vehicles, and floating buildings"; (2) The sentence 90.2(b)(1) includes a double negative when the reader attempts to read and understand the component parts of the referenced. Section/paragraph, for example: "This code does not cover installations in ships." is quite clear and unambiguous." This code does not cover aircraft" is quite clear and unambiguous." This code does not cover automotive vehicles other than mobile homes and recreational vehicles." This sentence is awkward and unclear and may be misconstrued or interpreted by the reader as being contradictory to 90-2(a)(1). Thirdly, the phrase "automotive vehicles other than mobile homes and recreational vehicles" implies that mobile homes are a subset of automotive vehicles. While some so called "mobile homes" may have drive engines and manual guidance mechanisms most "mobile homes" are towed structures more closely linked to trailers and are often referred to as "trailer homes". The result therefore considering reasons 2 and 3 above would be lack of clarity and possible misunderstanding of the subject section/paragraph 90-2(b)(1).
PANEL ACTION: Reject.
PANEL STATEMENT: It is the understanding that the submitter is referencing Proposal 1-11. See Comment 1-26a and panel statement on Comment 1-28.

1- 45 - (90-7, FPN No. 3): Reject
SUBMITTER: Dann Strube, Lanesville, IN
COMMENT ON PROPOSAL NO: 1-95
RECOMMENDATION: The proposal should have been rejected.
SUBSTANTIATION: This is a companion to my comment on Proposal 1-315.
A list of related UL standards is of no real use for several reasons.

1. The list is not a full list of all UL standards used to evaluate products.
2. Many other standards are used in code enforcement, i.e., NEMA, IEC, ANSI, etc.
3. With no cross-reference from Annex A to specific code sections, the list in Annex A is no less than wasted paper filling the code with useless pages.
4. To satisfy the intent of Annex A we must include the UL White Book, UL Catalog, ANSI catalog and who knows what else.
5. The users of the NEC should be expected to understand that Section 110-3(b) requires or at least implies that compliance with other standards and instruction is required.

PANEL ACTION: Reject.
PANEL STATEMENT: The information included in the proposed annex will be helpful to users of the Code. The submitter does not provide information on standards stated as not being included in the annex, but his concern may be addressed in Comment 1-182. While many standards are used in code enforcement, the proposed list of product safety standards is more frequently used by designers, installers, and inspectors. The panel disagrees with the submitter that the inclusion of this material is a waste of space and that the information stated in item (4) of his substantiation must also be included to meet the intent of the annex. The panel agrees that users of the NEC should understand that Section 110-3(b) is associated with conformance with product safety standards, but concludes that the informational list of product safety standards in the annex is valuable to those individuals.

(Log #2190)

1- 48 - (100): Accept in Principle in Part
SUBMITTER: Mark Goodman, BP (ARCO)
COMMENT ON PROPOSAL NO: 14-4a
RECOMMENDATION: This comment is being submitted to Panel 1 in accordance with Technical Correlating Committee direction for Panel 1 consideration of Proposal and panel action for 14-4a. As an alternate to the inclusion of the definition and fine print note for the term "Identified" in Article 500, this comment recommends that the Article 100 definition of Identified be maintained with a modification of the wording of the FPN as follows:

"FPN: The determination of the suitability of equipment for a specific purpose, environment, or application can be made by several means such as:
1. equipment listing or labeling
2. evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation, or
3. Other evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment.
(See definitions of Labeled and Listed)"

SUBSTANTIATION: The fine print note has been modified to provide additional guidance for several of the methods commonly used to determine suitability of equipment in both classified and unclassified locations. The fine print note is necessary to provide clarity and distinguish the differences between the defined terms "Approved", "Listed", and "Identified" as used throughout the code.
PANEL ACTION: Accept in Principle in Part.
The panel accepts in principle the FPN up to and including item No. 2.
The panel rejects item No. 3.
PANEL STATEMENT: The panel rejects item No. 3 since it is already covered in 90.4. See action and statement on Comment 1-177.

6-235 (Table B-310-8)
6-236 (Table B-310-9)
6-237 (Table B-310-10)
All of these proposals should be accepted.
Individual panel comments seem to fall into three major categories: (1) 'Scientific ampacity' does not appear in the NEC; (2) The present definition is entirely satisfactory; (3) All NEC ampacities are scientific
My comments:
(1) These proposals were inspired by the panel's rejection, three years ago, for this very reason. Proposal 1-101 deals with the

definition; the others deal with introducing the term into the text where appropriate.

(2) The present definition is great; very carefully crafted. It is not wrong, but it is inadequate. It applies only for those ampacities based strictly on thermal considerations, such as those in the tables listed above. Other ampacities are based on a multiplicity of factors (see section 310-15(b) FPN) beyond the scope of the existing definition. An objective observer would certainly conclude that the present definition is not entirely satisfactory.

(3) This is a very interesting observation. It can be reasonably stated that everything in the Code is scientific, but that obscures the point that a tremendous amount of judgment often modifies pure science. That is as it should be. In this case, what I have called scientific ampacities are pure science. They are calculated using only recognized scientific principles; nothing judgmental. They spring from the field of technology and computers. Other ampacities come from the field of wisdom, and cannot be calculated scientifically.

PANEL ACTION: Reject.

PANEL STATEMENT: No technical substantiation for the change has been provided. In addition, submitter(s) substantiation item (3) would be correct only if bare wires were used. As long as different electrical insulation materials and thicknesses have different heat transfer characteristics, the scientific ampacity defined by the submitter would be different for every type of conductor.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

(Log #1977)

1- 52 - (100-Bonding Jumper, Main): Reject

SUBMITTER: Charles Mello, Milwaukie, OR

COMMENT ON PROPOSAL NO: 1-107

RECOMMENDATION: Revise the definition of "Bonding Jumper, Main" as follows:

Bonding Jumper, Main. The ~~connection between~~ conductor used to connect the grounded circuit conductor and the equipment grounding conductor at the service equipment, at each building or structure where supplied from a common service, or at the source of a separately derived system.

SUBSTANTIATION: The original proposal was correct in its substantiation when it pointed out that limiting this definition and forcing the creation on another term causes confusion and makes the Code less user friendly. The first sentence of Section 250.30(a)(1) states: "A bonding jumper in compliance with Sections 250-28(a) through (d), that is sized for the derived phase conductors," is to be installed. Note that Section 250-28 is the section for sizing the Main Bonding Jumper and it is not for the service but is specifically for a separately derived system. This section then specifically defines the sizing to be based on the derived phase conductors to be used in place of the "service entrance conductors" which is done at the service. Also, note that the product standards for panelboards, switchboards and other equipment that may be supplied with a bonding jumper, to connect the grounded circuit conductor and the equipment grounding conductors and enclosure, require this item to be labeled as a "Main Bonding Jumper".

The panel statement shows some of the confusion that exists when it stated the reason to maintain this difference was to "... ensure the specific identification of the connection between grounded feeder and branch grounding conductors and the grounded service conductor at the service." Branch grounding conductors by definition are something going to a grounding electrode which is not even part of this issue. Other than a possible historical reference, there is no technical reason to not identify the conductor that connects the grounded system conductor to the equipment grounding conductors and in many cases the grounding electrode conductor as the "main bonding jumper" without regard to if that system point is at a service, at a second building or structure served by a common service, or at a separately derived system.

Using the term "bonding jumpers" (Bonding Jumper. A reliable conductor to ensure the required electrical conductivity between metal parts required to be electrically connected) as the panel suggests equates this very important system conductor to the same level as the very general terminology meaning many things in a system assembly such as the means to join loosely fitted metal parts of equipment, or the bonding of raceways because of concentric or eccentric openings.

The new proposed language was to offer an alternative definition and align with a definition change accepted by the panel in proposal 1-146 for the grounding electrode conductor. The language needs to be the same for services, separately derived systems, and where multiple buildings or structures exist. The conductor being connecting the system grounded conductor and the associated equipment grounding conductors should be consistently defined whether it is at the service or at a building supplied by a feeder or at the source of a separately derived system. The term main bonding jumper should be used consistently where system equipment grounding conductors are connected via a bond to the system grounded conductor. A similar proposal and comment to change Section 250.30(a)(1) has also been submitted.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel concludes that the use of this language would conflict with the present use of the term "main bonding jumper" in Article 250.

(Log #454)

1- 53 - (100-Circuit Integrity): Reject

SUBMITTER: Technical Correlating Committee on Signaling Systems for the Protection of Life and Property

COMMENT ON PROPOSAL NO: 1-113

RECOMMENDATION: In place of the proposed new definition, substitute the following:

Circuit Integrity. The ability of a circuit to continue to perform its function after exposure of the circuit conductors (wires or cable) to specific fire conditions for a specified period of time.

SUBSTANTIATION: This proposed definition clarifies the general meaning of circuit integrity as it is used in various paragraphs of the Code (such as 700-9(d)(1)(f) and 760-2). The specific fire conditions and specific time period of fire exposure will be determined by the use requirements and confirmed by the fire tests to which the wire or cable, alone or in combination with a wiring system, is subjected by the listing agency. Thus, different paragraphs of the Code could require distinct fire conditions and

distinct time period of fire exposure. The listing for wire or cable, alone or in combination with a wiring system, used in each such case would confirm that the wire, cable, or system meets the specific circuit integrity requirements.
PANEL ACTION: Reject.
PANEL STATEMENT: This definition is not appropriate as a general definition for the Code as it is too narrow in scope. "Circuit Integrity" as commonly understood in the industry is not just associated with performance of a conductor following exposure to fire conditions.

1- 55 - (100-Circuit Integrity): Reject
SUBMITTER: James Conrad, Rockbestors-Surprenant Cable Corp.
COMMENT ON PROPOSAL NO: 1-114
RECOMMENDATION: Accept Proposal 1-114 ROP but revise text as follows:
~~Circuit Integrity~~ (CI) Cable. A cable listed and marked with a suffix "-CI" that ensures continued operation of critical circuits during a specific time under fire conditions.
FPN No. 1: One method of testing CI cable is UL Subject 2196 bulletin dated 4, 2000
SUBSTANTIATION: I agree with the panel statement that the submitter's references listed in the substantiation are not the same. Currently "CI" cables are only specified for use in Article 760 to meet the survivability requirements for fire alarm circuits. However, we should not limit the use of "CI" cable to Article 760. The suffix "-CI" is attached only to a cable after it passes a fire and water spray test in accordance with UL Subject 2196. With the unique ability to maintain circuit integrity of an electrical cable, when attacked by fire, the "CI" listing could be attached to any UL Listed Type cable that passes the UL 2196 fire test designated for "CI" cables. For example, a Type CL3 cable that passes the "CI" test could be marked Type CL3-CI and be used to meet the survivability requirements of not only Article 760 but anywhere fire protection of a critical circuit is needed. See companion Comments on 15-114 ROP.
PANEL ACTION: Reject.
PANEL STATEMENT: This term is used in only Article 760 and does not meet the minimum requirements to include it in Article 100. The panel reaffirms its statement on Proposal 1-114.

(Log #1444)

1- 56 - (100-Circuit Integrity Cable): Accept
SUBMITTER: Kenneth E. Vannice, Leviton/NSI-Colortran/Rep. Leviton
COMMENT ON PROPOSAL NO: 1-113
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: The proposed definition would not clarify the intent of 700-9(d)(1)(f) regarding the type of cable to be used. Article 700, specifically 700-9(d)(1)(f) does not mandate the use of circuit integrity cable. It only requires a cable listed to maintain circuit integrity for a minimum of 1 hour. Cables other than those labeled as CI, which are listed for a minimum 1-hour fire rating would meet the requirements of 700-9(d)(1)(f).
This comment was developed by a Task Group consisting of the following Panel 15 members: Kenneth E. Vannice, Chair; John R. Kovacik; Michael V. Glenn; Dale A. Triffo; and Peter W. Amos.

1- 57 - (100-Circuit Integrity Cable): Reject
SUBMITTER: James Conrad, Rockbestos-Surprenant Cable Corp.
COMMENT ON PROPOSAL NO: 1-113
RECOMMENDATION: Accept Proposal 1-113 ROP but revise text as follows:
Circuit Integrity Cable. A cable that remains electrically functional during a fire exposure test and after the impact, erosion and cooling effect of a water hose stream test.
SUBSTANTIATION: The term circuit integrity is currently used in Section 700-9(d)(1)(f) and in a companion Proposal 15-94 ROP for Section 695-6(b) to describe cables that must be protected against potential damage by fire (Fire Resistive Cables).
Fire Resistive Cables are listed in the UL Building Material Directory and are defined by "The ability of the cable to remain electrically functional during a fire exposure test and after the impact, erosion and cooling effect of a water hose stream test". It is important to have the term "circuit integrity" describing these cables and not the term "fire resistive" because of the confusion associated with the words "fire resistive" and "fire resistant" which are used throughout the industry differently.
PANEL ACTION: Reject.

1- 60 - (100-Concealed): Reject
SUBMITTER: Robert H. Keis, Dover, DE
COMMENT ON PROPOSAL NO: 1-117
RECOMMENDATION: This proposal should be accepted instead of rejected.
SUBSTANTIATION: Mr. Trout's substantiation is correct. It seems strange that what can't be seen is exposed. Section 410-30(c) requires that when flexible cord is used to connect the fixture, the cord must be visible for its entire length outside the fixture. (It cannot penetrate a suspended ceiling). Section 400-8(2) does not permit flexible cord to run through holes in walls, structural ceilings, suspended ceilings, dropped ceilings, or floors. Section 400-8(5) does not permit flexible cord to be used "where concealed behind building walls, structural ceilings, suspended ceilings, dropped ceilings, or floors." But, by the definition of "exposed" in Article 100, flexible cord is permitted behind a suspended ceiling, just so it does not penetrate the ceiling getting there. How can something be concealed and exposed at the same time? If as the panel suggests, this change results in unintended consequences to other NEC articles, maybe they should be corrected also.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its statement on Proposal 1-117. There is no compelling need demonstrated to revise the present definition. Any such change in a definition should be accompanied by proposals recognizing the affects on existing rules.

(Log #1761)

1- 61 - (100-Coordination): Accept
SUBMITTER: Jim Pauley, Square D Company
COMMENT ON PROPOSAL NO: 1-122
RECOMMENDATION: The panel should reconsider and reject the proposal.
SUBSTANTIATION: The definition is not consistent with the usage of the term in the Code. 240-12 discuss Electrical System Coordination and provides some alternatives to address a possible hazard to personnel or equipment. The definition as proposed in Article 100 relates primarily to a performance issue and not a concern regarding 90-1(a) – hazards arising from the use of electricity.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #282)

1- 62 - (100-Coordination (Selective)): Reject
SUBMITTER: James T. Dollard, Jr., IBEW Local Union 98
COMMENT ON PROPOSAL NO: 1-122
RECOMMENDATION: Accept in principle revised as follows:
"Coordination (Selective). Proper localization of ~~a fault~~ an overcurrent condition to restrict outages to the equipment affected, accomplished by the choice of selective ~~fault~~ overcurrent-protective devices."
SUBSTANTIATION: This comment is the work of a Task Group assigned to address the request of CMP 1 for response from CMP 10 on the panel action to accept Proposal 1-122. The Task Group consisted of the following members of CMP 10. Chair, Jim Dollard; John Brezan; Carl Fredericks; Clive Klimblin; Charles Eldridge; George Gregory; George Ockuly and Vince Saporita.
The Task Group is in favor of moving the definition into Article 100, but feels that such a move should also be accompanied by a slight modification to the definition.
The addition of this definition to Article 100 will have a global effect on the use of this term in the National Electrical Code.
As presently written in the 1999 NEC, the definition of "Coordination" is limited to section 240-12. Proposal 10-3b which was accepted in this cycle, would have limited the definition to Article 240. The term "Coordination" in Article 240 exists only in Section 240-12. However, defining "Coordination" in Article 100 has a global impact on the NEC, therefore it is necessary to modify the present text.
The task group suggests that the word "fault" be changed to the word "overcurrent" two times in the definition. The task group believes that the need for coordination applies to all overcurrent conditions, not just to fault conditions. By definition, overcurrent covers overload, short-circuit, and ground fault. It is not enough to coordinate for just "fault" conditions but overcurrent conditions as well. This slight modification of the definition also fits with the other associated sections in the NEC.
See companion comment to Proposal 10-3b developed by this Task Group.
PANEL ACTION: Reject.
PANEL STATEMENT: 1. The selective coordination contemplated in the proposed definition goes beyond the stated purpose of the Code, into, "restricting outages" within equipment.
2. The comment at hand, No. 1-62, recommends a very sweeping change to the NEC, which would necessitate coordinating not just short-circuit protection, but also overload protection. There is no justification for such a broad change.

(Log #1549)

1- 63 - (100-Damp Location): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
COMMENT ON PROPOSAL NO: 1-124
RECOMMENDATION: Recommend that this proposal be rejected.
SUBSTANTIATION: Damp location is essentially a dry location which occasionally becomes damp. Hence the "dry and damp" rating applies to products used in these locations. It is not a dry location which is subjected to "moderate degrees of moisture". Products exposed to moisture regardless of the degree of moderation or saturation are required to bear wet rating. Thus, proposed change would eliminate requirements for wet rating in product standards. We believe that this is not the intent of Code Making Panel 1.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 1-64.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #1023)

1- 64 - (100-Damp Locations): Reject
SUBMITTER: Kenneth F. Kempel, Underwriters Laboratories Inc.
COMMENT ON PROPOSAL NO: 1-124
RECOMMENDATION: Revise the definition accepted by CMP-1 as follows:
(a) Delete the first sentence and replace with:
A space protected from the weather that is subject to condensed water vapor or fine particles of water suspended in air or temperature differentials sufficient to cause moisture in the air to condense on utilization equipment.
(b) Add a new last sentence:
Interior air conditioned spaces are generally excluded.
The revised definition would read as follows:
Damp Location. A space protected from the weather that is subject to condensed water vapor or fine particles of water

suspended in air or temperature differentials sufficient to cause moisture in the air to condense on utilization equipment. Examples of such locations include partially protected locations under canopies, marquees, roofed open porches, and like locations, and interior locations subject to moderate degrees of moisture, such as some basements, some barns, and some cold-storage warehouses. Interior air conditioned spaces are generally excluded.

SUBSTANTIATION: This comment is submitted on behalf of the Code-Making Panel 18 task group that included Michael Ber, Robert Cochran, Kenneth Kempel and Saul Rosenbaum. We agree with Mr. Minick that the wording accepted in principle by Code-Making Panel 1 could be further revised to add clarity. We believe that the revised wording included in this comment achieves this objective.

The intent of this definition is to describe the environment surrounding a piece of utilization equipment that would warrant protection against the effects of water vapor that condenses into water droplets on the equipment surfaces or where it can be absorbed into electrical insulating materials. This can happen in locations where fog comes into contact with equipment or where the temperature of the equipment surface is below the dew point of the surrounding air, causing moisture to condense on it.

These conditions don't typically occur in air conditioned interior spaces; however, some may argue that bathrooms or portions of bathrooms are interior air conditioned spaces where it can. The adjective "generally" is included to provide the latitude some authorities having jurisdiction may need to declare a bathroom a damp location.

PANEL ACTION: Reject.

PANEL STATEMENT: The language from Proposal 1-124 clearly expresses the panel's intent.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

(Log #364)

1- 65 - (100-Disconnecting Means): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

COMMENT ON PROPOSAL NO: 1-126

RECOMMENDATION: Accept proposal.

SUBSTANTIATION: The Panel Statement that requirements for disconnecting means are specified in the relevant Code sections is true only if that means a disconnecting means is required; not true if it means the type, size, rating, or other parameters are specified. The proposal references many sections that have no specifics regarding those parameters. Where disconnecting means are specified without specifics a terminal connector or wire splicing device literally complies with "device or group of devices or other means." Refer to proposal substantiation re: disconnection of a grounded conductor, line and load side conductors and two switches supplying one set of fuses.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel reaffirms its statement on Proposal 1-126. A wire connector may well constitute a disconnecting means if a Code requirement so allows. A definition should not preclude this. Requirements are not permitted in a definition.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

(Log #1194)

1- 68 - (100-Enclosure): Reject

SUBMITTER: Michael W. Smith, Guarantee Electrical Company

COMMENT ON PROPOSAL NO: 1-135

RECOMMENDATION: The word "Enclosure" could mean a variety of different areas or cabinet/boxes. Thus, we may want to divide these up by type.

Enclosure (Area) - A fence, partition or structure surrounding an electrical equipment installation for the purpose of restricting access to, or prevent personnel from accidentally contacting energized parts, or to protect the equipment from physical damage.

Enclosure (Case or Housing) - A Case or Housing of electrical apparatus or device intended to prevent accidental contact with energized parts and to protect the apparatus or device from physical damage.

Enclosure (Underground) See Cabinets and cutout boxes and junction and pull boxes.)

Article 370 - Definition

Enclosure (Underground) - A box, handhole, or manhole used for installation, splicing or access to cables or conductors. The enclosure shall be provided with a securable cover.

SUBSTANTIATION: UL has provided a new listing for "Underground Enclosure", such as Strongwell Quazite composite polymer concrete boxes. However, these boxes are primarily intended for cable installation and splicing and not for installation of equipment. Thus, the definition of "Enclosure" as it is written in the 1999 NEC could be misinterpreted to allow installation of equipment or apparatus in an underground enclosure which is not listed for such use.

PANEL ACTION: Reject.
PANEL STATEMENT: The proposed definition included in the comment does not add clarity, contains a requirement, and uses the term being defined in the definition.

1- 69 - (100-Exposed): Reject
SUBMITTER: Robert H. Keis, Dover, DE
COMMENT ON PROPOSAL NO: 1-138
RECOMMENDATION: This proposal should be accepted instead of rejected.
SUBSTANTIATION: Mr. Trout's substantiation is correct. It seems strange that what can't be seen is exposed. Section 410-30(c) requires that when flexible cord is used to connect the fixture, the cord must be visible for its entire length outside the fixture. (It cannot penetrate a suspended ceiling). Section 400-8(2) does not permit flexible cord to run through holes in walls, structural ceilings, suspended ceilings, dropped ceilings, or floors. Section 400-8(5) does not permit flexible cord to be used "where concealed behind building walls, structural ceilings, suspended ceilings, dropped ceilings, or floors." But, by the definition of "exposed" in Article 100, flexible cord is permitted behind a suspended ceiling, just so it does not penetrate the ceiling getting there. How can something be concealed and exposed at the same time? If as the panel suggests, this change results in unintended consequences to other NEC articles, maybe they should be corrected also.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its statement on Proposal 1-138. There is no compelling need demonstrated to revise the present definition. Any such change in a definition should be accompanied by proposals recognizing the affects on existing rules.

1- 71 - (100-First Floor of a Building (New)): Accept in Principle
SUBMITTER: Jason Fischer, Bad Axe, MI
COMMENT ON PROPOSAL NO: 3-65
RECOMMENDATION: Add a new definition for First floor of a building to Article 100 to read as follows: The first floor of a building shall be that floor that has fifty percent or more of the exterior wall surface area level with or above finished grade. Delete this sentence from Section 336-5(a)(1) second paragraph.
SUBSTANTIATION: This definition is needed in the following sections: 336-5(a)(1), 339-3(a)(4) and 342-3(c). The definition belongs in Article 100, not buried deep in a section of Article 336. As the original submitter requested, this is moving material from Article 336 to Article 100.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 1-174
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #1762)

1- 72 - (100-Ground Fault Circuit Interrupter): Reject
SUBMITTER: Jim Pauley, Square D Company
COMMENT ON PROPOSAL NO: 1-142
RECOMMENDATION: Revise the FPN from the Panel action on the Proposal as follows:
"FPN: Class A ground-fault circuit interrupters trip when the current to ground has a value greater than ~~in the range of 4 to~~ 6 mA. For further information, see Standard for Ground-Fault Circuit Interrupters, UL 943."
SUBSTANTIATION: The panel action is the right way to move forward with this issue and will go a long way to clearing up confusion in the field about the use of the term "ground-fault circuit interrupter" throughout the NEC. This comments recommends only a minor revision to the FPN. The proposal wording of the FPN implies that the GFCI will only operate on ground-fault currents in the 4-6mA range. In reality, the GFCI operates on any ground-fault current above 6mA.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that the accepted FPN of Proposal 1-142 is correct as presently written.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #260)

1- 73 - (100-Ground-Fault Circuit Interrupter): Reject
SUBMITTER: C. James Erickson, Newark, DE
COMMENT ON PROPOSAL NO: 1-142
RECOMMENDATION: This proposal should be rejected, and the wording left as in the 1999 National Electrical Code.
SUBSTANTIATION: The submitter's substantiation is wrong when he says the present code calls for Class A protection. The present definition allows any device that hastens the de-energization of the system, without causing nuisance trips. A de-energized system is a safe system. Experimentation on sheep has demonstrated that to cause heart fibrillation required 500 ma for 6 HZ.[1]. At that level of current, ground fault devices will open faster than in six cycles. Another reference places 50 or 60 HZ fibrillation values for a male adult at: ma = 115/t^1/2.[2]. At 6 HZ this would be 11500 ma. The same reference recommends 40 percent of this value for an adult women (4600 ma).
The submitter has not documented cases where the present definition has caused safety problems. The user must be allowed to choose protection that will allow the circuit to operate, or ground fault protection will be bypassed.
Code Making Panel 12 has limited voltage on impedance heating systems to 30 volts for personnel protection; but has allowed up to 80 volts "where ground-fault circuit-interrupter protection for personnel is provided". These systems typically have ground leakage currents measured in amperes.
Internationally, 20 and 30 ma devices have been used for many years for personnel protection. The submitter has not documented any problems arising from this usage. While there is a lot of effort being put forth by standards bodies to harmonize standards, this would be a step in the wrong direction. Can we tell Canadians, English, Germans, Etc., that their widely used devices do not protect personnel?
[1] "Electric shock hazard", Charles F. Dalziel, IEEE Spectrum, February 1972.
[2] "ELECTRIC SCHOCK", Peter N. Saveskie, Worldwide Telecommunications Series, Vol. 5 No. 10, TAI Incorporated.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's substantiation is not entirely correct. A Class A GFCI is required for personnel protection in general branch-circuit applications in the USA. The submitter of the comment did not consider the fact that a Class A GFCI in the USA provides protection against inability to let go as well as ventricular fibrillation. Let-go protection (not ventricular fibrillation protection) demands that the device trip when the current to ground from a high-impedance fault exceeds 5 mA. This is important in the USA because of all the Class 0 products (single insulation, no protective earthing conductor) that are commonplace in the USA.
Submitter's statement regarding 20 mA and 30 mA devices used in other countries is irrelevant to the definition of Ground-Fault Circuit Interrupter. Those devices are residual current-operated devices, not GFCIs.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #2005)

1- 74 - (100-Ground-Fault Circuit Interrupter): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 1-142
RECOMMENDATION: Change "for a Class A device" to "for the applicable conditions."
SUBSTANTIATION: The panel wording has the unintended result of eliminating Class B devices, which are still produced for swimming pool lighting installed prior to local adoption of the 1965 NEC. The limits in the FPN convey sufficient explanation to allow the user to distinguish between these devices and low level (usually 30 mA) devices for Section 427-22 and related applications.
PANEL ACTION: Reject.
PANEL STATEMENT: The 1999 Code does not permit Class B GFCIs. The fact that classified replacement units are still being produced is not sufficient substantiation for changing the definition.

1- 75 - (100-Grounding Electrode Conductor): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 1-146
RECOMMENDATION: Accept in principle, revise panel action:
GROUNDING ELECTRODE CONDUCTOR
The conductor used to connect the grounding electrode to the equipment grounding conductor(s), to the grounding conductor, or to both, at the service or to the building or structure disconnecting means where supplied by branch circuits or feeders, or to a separately derived system or other derived system.
SUBSTANTIATION: The grounding electrode conductor, while usually connected at the service equipment, is permitted to be connected at any accessible point from the load end of the service drop or lateral to the service equipment (disconnect) per 250-24(a)(1)(d).
A building or structure may be required to have a grounding electrode whether or not supplied by a common service (and therefore a grounding electrode conductor).
Present wording appears to permit a connection to the equipment grounding conductor and grounded conductor ("or both") at buildings served by a feeder or branch circuit which is not permitted by 250-32(b).
Section 250-30 permits a connection which is not at the source of a separately derived system.
An alternative power source generator initially installed as a back-up or peak power source, with a solid conductor connection to a circuit conductor of a normal service transformer secondary results in neither being a separately derived system, per definition. Other Code sections may require grounding of such derived systems and the conductor from the grounding electrode should also be designated a grounding electrode conductor, otherwise it is outside the definition.
PANEL ACTION: Accept in Part.
Accept deletion of "equipment" after "service" as recommended. Reject the balance of the comment.
PANEL STATEMENT: The balance of the comment is rejected as it does not provide clarity. See panel action and statement on Comment 1-76.

1- 76 - (100-Grounding Electrode Conductor): Accept in Principle
SUBMITTER: Paul Dobrowsky, Holley, NY
COMMENT ON PROPOSAL NO: 1-146
RECOMMENDATION: Revise the definition as follows:
Grounding Electrode Conductor. The conductor used to connect the grounding ~~electrode~~ electrode(s) to the equipment grounding conductor, to the grounded conductor, or to both, at the service equipment, at each building or structure where supplied from a common service, or at the source of a separately derived system.
SUBSTANTIATION: The action taken by Code-Making Panel 1 is consistent with Code-Making Panel 5's action on Proposals 5-123 and 5-124. The term "electrode(s)" is suggested to replace "electrode" because there may be more than one electrode.
This comment was developed and reviewed by a task group consisting of Paul Dobrowsky (CMP 5), David Dini (CMP 1 and CMP 5), Michael Johnston (CMP 5), Charles Mello (CMP 5), and Gregory Steinman (CMP 5).
PANEL ACTION: Accept in Principle.
Revise the definition as follows:
Grounding Electrode Conductor. The conductor used to connect the grounding ~~electrode~~ electrode(s) to the equipment grounding conductor, to the grounded conductor, or to both, at the service ~~equipment~~, at each building or structure where supplied from a common service, or at the source of a separately derived system.
PANEL STATEMENT: Revise the term "service equipment" to "service" to correlate with panel action on Comment 1-75.

1- 77 - (100-Liquid, Combustible; Liquid Flammable): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 1-160
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: The NFPA 497 definitions of these terms omit details of those in NFPA 30 which are not necessary for the purposes of that standard. Using the same philosophy, the proposed definitions provide information important to electricians, electrical contractors, and electrical engineers which is not now included in the NEC. With very few exceptions, electrical contractors and electricians do not have copies of NFPA 30 (or 497). If the panel is concerned about the incomplete definitions, which the submitter cannot envision as creating any problems, the statement "See NFPA 30, Flammable and Combustible Liquids Code, for complete information" could be added.
PANEL ACTION: Reject.
PANEL STATEMENT: Specialized requirements for electrical installations in hazardous (classified) locations are covered in Articles 500, 501, 502, 505, and 513-516. Adding definitions of flammable and combustible liquids to Article 100 will not improve usability of this Code.

(Log #1550)

1- 79 - (100-Live Parts): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
COMMENT ON PROPOSAL NO: 1-163
RECOMMENDATION: Recommend that this proposal be rejected.
SUBSTANTIATION: The present defination of live parts does not differentiate between guarded and unguarded installations. For the purpose of the application of this definition to make installations that are in compliance with the NEC, the criterion "a shock hazard exists" in this definition is a necessary condition.

Panel Action to revise the definition to satisfy the submitters concern could be misinterpreted. For example, two insulated conductors may not come in contact with each other (as in a cabled construction), because they are live parts. Panel Action could have a significant impact on the meaning of the phrase "live parts" used in over 60 places in the code.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action on Comment 1-81. Code rules specify requirements to provide protection from live parts such as isolation, insulation, and guarding. The definition should not itself describe protection methods.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #1565)

1- 80 - (100-Live Parts): Accept
SUBMITTER: Paul Dobrowsky, Holley, NY
COMMENT ON PROPOSAL NO: 1-163
RECOMMENDATION: Revise as follows:
Live Parts. Energized conductive components.
SUBSTANTIATION: Provides a simple clear definition. Conductors, buses, and terminals can all be considered components. This definition compliments the use of the term throughout the NEC allowing specific requirements to address guarding (enclosing or elevating). The issue of presenting a shock hazard depends on the relative position of a person to the parts. Elevated and enclosed live parts are a shock hazard if a person is near enough to them. When the door of an enclosure is closed the parts are not considered to be shock hazard but they are still live.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
HITTINGER: The definition as it appears in the 1999 NEC provides clear and concise wording.

MINICK: NEMA continues to support the current 1999 NEC definition of "live parts" as the current definition is consistent with the way the term is used in the NEC. A Webster's definition is not needed and does not add clarity and in fact may confuse users of the NEC and be less clear.

1- 82 - (100-Luminaire): Reject
SUBMITTER: Dann Strube, Lanesville, IN
COMMENT ON PROPOSAL NO: 1-165
RECOMMENDATION: This proposal should have been rejected.
SUBSTANTIATION: The proposal, intended to be international, does not agree with the international definition in Section 410-1 FPN.

This is a companion comment to my comments for the entire document. If rejected here, the panel should revise the definition of luminaire to match the international version. If we want to look international we should at least get the definition right.
PANEL ACTION: Reject.
PANEL STATEMENT: The definition is clear and appropriate for its use in the NEC.

1- 83 - (100-Luminaire): Reject
SUBMITTER: Gersil N. Kay, Conservation Lighting International Ltd.
COMMENT ON PROPOSAL NO: 1-1
RECOMMENDATION: The NEC and the ASHRAE/IESNA Standard 90.1-1999 should include the expression "luminaire or other lighting systems" throughout both documents. Then those creating the plans and specifications will be made aware of additional lighting tools at their disposal, even if the standard contains minimum requirements.
SUBSTANTIATION: As a second-generation commercial electrical contractor, the word luminaire has always meant a lighting fixture. In fact, that is the National Electrical Contractors' Association's understanding, too. However, the glossary of ASHRAE/IESNA Standard 90.1-1999 defines "luminaire" as a complete lighting system, which is something altogether different. Light pipe and glass fibre optics are lighting systems, not individual units with separate light sources. They are composed of a common light source, one or more light guides powered by it, and optional fittings to control the beam.

It is reported in CEE magazine that the 2002 National Electric Code is replacing the terms "fixture", "fixtures" and similar words with "luminaire" or "luminaires" throughout the code. The definition of luminaire includes the lamps, diffusers, reflectors, ballasts and similar parts of what have been commonly known as lighting fixtures, each with their own light source. This definition therefore excludes lighting systems which are much more energy efficient than traditional incandescent, fluorescent and halogen lamps.

If the goal of reducing energy consumption by 20% is to be reached, electrical contractors, architects, engineers, lighting and interior designers will have to be made aware of the more efficient lighting products that are to be used in conjunction with restrictive controls and wattage limitations.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that products described in the substantiation are not necessarily precluded by the use of the term luminaire.

The term "luminaire or other lighting system" in ASHRAE/IESNA 90.1-1999 is intended to describe natural daylighting as well as

electric lighting. The term "luminaire (lighting fixture)" is appropriate for this Code.

The additional words do not provide clarity or add to the usefulness of the NEC. The concern of the submitter does not relate to the replacement of the term "fixture" with "luminaire".

PANEL ACTION: Reject.

PANEL STATEMENT: Lighting systems can include the use of luminaires as part of the lighting system. The comment suggests a change should also be made to ASHRAE/IESNA Standard 90.1-1999. This document would have its own editorial and change process that could not be changed by the proposals or comments to the NFPA 70 document. Lighting systems and the requirements for lighting systems are presently covered in various articles of the NEC. Luminaires would just be a component of the lighting systems.

(Log #1697)

18- 2 - (100-Luminaire):

Note: It was the action of the Technical Correlating Committee that this comment be reported as "Reject" to correlate with the action on Comment 1-83.

SUBMITTER: Gersil N. Kay, Conservation Lighting International Ltd.

COMMENT ON PROPOSAL NO: 18-1

RECOMMENDATION: The NEC and the ASHRAE/IESNA Standard 90.1-1999 should include the expression "luminaire or other lighting systems" throughout both documents. Then those creating the plans and specifications will be made aware of additional lighting tools at their disposal, even if the standard contains minimum requirements.

SUBSTANTIATION: As a second-generation commercial electrical contractor, the word luminaire has always meant a lighting fixture. In fact, that is the National Electrical Contractors' Association's understanding, too. However, the glossary of ASHRAE/IESNA Standard 90.1-1999 defines "luminaire" as a complete lighting system, which is something altogether different. Light pipe and glass fibre optics are lighting systems, not individual units with separate light sources. They are composed of a common light source, one or more light guides powered by it, and optional fittings to control the beam.

It is reported in CEE magazine that the 2002 National Electric Code is replacing the terms "fixture", "fixtures" and similar words with "luminaire" or "luminaires" throughout the code. The definition of luminaire includes the lamps, diffusers, reflectors, ballasts and similar parts of what have been commonly known as lighting fixtures, each with their own light source. This definition therefore excludes lighting systems which are much more energy efficient than traditional incandescent, fluorescent and halogen lamps.

If the goal of reducing energy consumption by 20% is to be reached, electrical contractors, architects, engineers, lighting and interior designers will have to be made aware of the more efficient lighting products that are to be used in conjunction with restrictive controls and wattage limitations.

PANEL ACTION: Hold.

PANEL STATEMENT: The submitter has introduced new material in his recommendation to add "other lighting systems" which has not had previous public review. The panel has placed this comment on hold in accordance with Section 4-4.6.2.2 of the NFPA Regulations Governing Committee Projects.

19- 4 - (100-Luminaire): Reject

SUBMITTER: Gersil N. Kay, Conservation Lighting International Ltd.

COMMENT ON PROPOSAL NO: 19-1

RECOMMENDATION: The NEC and the ASHRAE/IESNA Standard 90.1-1999 should include the expression "luminaire or other lighting systems" throughout both documents. Then those creating the plans and specifications will be made aware of additional lighting tools at their disposal, even if the standard contains minimum requirements.

SUBSTANTIATION: As a second-generation commercial electrical contractor, the word luminaire has always meant a lighting fixture. In fact, that is the National Electrical Contractors' Association's understanding, too. However, the glossary of ASHRAE/IESNA Standard 90.1-1999 defines "luminaire" as a complete lighting system, which is something altogether different. Light pipe and glass fibre optics are lighting systems, not individual units with separate light sources. They are composed of a common light source, one or more light guides powered by it, and optional fittings to control the beam.

It is reported in CEE magazine that the 2002 National Electric Code is replacing the terms "fixture", "fixtures" and similar words with "luminaire" or "luminaires" throughout the code. The definition of luminaire includes the lamps, diffusers, reflectors, ballasts and similar parts of what have been commonly known as lighting fixtures, each with their own light source. This definition therefore excludes lighting systems which are much more energy efficient than traditional incandescent, fluorescent and halogen lamps.

If the goal of reducing energy consumption by 20% is to be reached, electrical contractors, architects, engineers, lighting and interior designers will have to be made aware of the more efficient lighting products that are to be used in conjunction with restrictive controls and wattage limitations.

PANEL ACTION: Reject.

PANEL STATEMENT: The accepted definition of Luminaire (by Panel 1) is proper within the context of NEC requirements. The definition does not exclude light pipe or fiber optic systems as they consist of a lamp and the parts to distribute the light, which is the language of the definition.

1- 87 - (100-Neutral (New)): Reject
SUBMITTER: David A. Kerr, Jr., Friendsville, PA
COMMENT ON PROPOSAL NO: 1-169
RECOMMENDATION: Accept in Principle.
SUBSTANTIATION: The panels are shirking their responsibility by refusing to define neutral. The term neutral does have meaning. A definition could say, "the use of the term neutral is deprecated because it is hard to define accurately and is routinely misused." You could give a list of permitted uses, then a list of incorrect uses. Such a list definition would not be elegant; it would be didactic. The code should serve as a training manual for qualified persons who use it but make mistakes because of foggy language. Don't force people to read between the lines. Don't try to write one incredibly long unbroken sentence to cover all possible electrical systems.
Please look at proposal 10-26a for 240-20(b). They use the word neutral. What does it mean?
PANEL ACTION: Reject.
PANEL STATEMENT: The comment does not contain proposed text as required by Section 4-4.5(c) of the Regulations Governing Committee Projects.
The substantiation describes definitions that are not suitable for inclusion in the NEC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
ABSTENTION: 1
EXPLANATION OF ABSTENTION:
ANTHONY: Although a supporter of the original rejection, I have since been enlightened by the comments and by debate on the topic with other friends of the National Electric Code. A world-class document such as the NEC should contain more substantive information about a fundamental technical term which appears 80-odd times, even though there may be no "silver bullet" definition that fits neatly in this Article. The difficulty in doing a clean job of it is difficult, as the following excerpt from the Canadian Electrical Code shows:
"Neutral means that conductor (when one exists) of a polyphase circuit or single-phase, 3-wire circuit which is intended to have a voltage such that the voltage differences between it and each of the other conductors are approximately equal in magnitude and are equally spaced in phase (Appendix B)".
"Appendix B: By definition, a "neutral conductor" of a circuit requires that there be at least three conductors in that circuit. However, in the trade, the term "neutral conductor" is commonly applied to that conductor of a 2-wire circuit which is connected to a conductor that is grounded at the supply end. Care should therefore be used in the use of this term when applying the Code."
While neither the original proposal nor the following comments provided the silver bullet, this vote is intended to demonstrate sympathy with the submitters and the commenters. Perhaps the objective could be met with an annex or an appendix in a future version of the NEC.

(Log #1187)

1- 88 - (100-Neutral): Reject
SUBMITTER: Joe Tedesco, NTT Inc.
COMMENT ON PROPOSAL NO: 1-169
RECOMMENDATION: Please accept the proposal.
Define neutral as follows:
"Neutral. A grounded conductor having the same voltage to each ungrounded conductor of the same 3-wire, or 4-wire circuit."
SUBSTANTIATION: The definition is reasonable and is needed. The Panel comment does not address the question! The term "Neutral" should be defined, or it should be removed from the Code! Acceptance will settle the questions!
PANEL ACTION: Reject.
PANEL STATEMENT: Neither the comment nor the proposal is appropriate for the definition of "neutral" since a neutral is not necessarily a grounded conductor.
The submitter is incorrect. For example, one definition may be "a conductor of a circuit where the vectorial sum of the nominal voltages from all other conductors within a circuit with respect to it is zero." But the panel does not believe this definition or any definition proposed adds useability to the Code.

1- 91 - (100-Panelboard): Accept
SUBMITTER: Jim Pauley, Square D Company
COMMENT ON PROPOSAL NO: 1-175
RECOMMENDATION: Revise the definition from the 1999 NEC to read as follows:
"Panelboard. A single panel or group of panel units designed for assembly in the form of a single panel; including buses, automatic overcurrent devices, and equipped with or without switches for the control of light, heat, or power circuits; designed to be placed in a cabinet or cutout box placed in or against a wall~~, or~~ partition, or other support, and accessible only from the front. "
SUBSTANTIATION: The definition as revised by the proposal is unacceptable. The previous definition provided clear guidance that panelboards could be in or on a wall. This clarity needs to be retained. The revision provided in this comment is to address the original submitter's concern by indicating that other supports besides walls are acceptable.
PANEL ACTION: Accept.

(Log #1445)

1- 93 - (100-Qualified Person): Reject
SUBMITTER: Kenneth E. Vannice, Rep. USITT
COMMENT ON PROPOSAL NO: 1-178
RECOMMENDATION: Amend the revised text as follows:
"Qualified Person. One who has skills and knowledge of the construction and operation of the equipment and who has knowledge of the applicable safety standards."
SUBSTANTIATION: The term "qualified persons" is used in various sections of the code. The term has different specific criteria in the different sections. Some sections specifically require "qualified persons" to perform electrical work of different types.
The panel's revised wording requires "training" but does not specify what this training is. Nor does it demonstrate that this training exists. It may possibly be mandating training where none exists. Or it may, inadvertently, mandate training of the wrong specific skills or knowledge. The phrase "training" is too open to interpretation and may cause confusion, possibly reducing, not increasing safety.
There are many types of specialized electrical work performed within the context of the NEC that do not have or need specific training such as would be given by a formal safety training program. These types of work instead rely on informal training such as on the job training and/or job experience. Many highly qualified electricians have received no "formal" training. The panel's revised wording, if taken to mean that formal training is mandatory, could prohibit the most qualified, and therefore safest, persons from performing the work.
Further, implicit in any requirement of training is the fact that certification of some kind would be necessary to verify that personnel have been trained. In the absence of specific certification programs, it is not practical or responsible to mandate "training".
Further, current OSHA regulations already prevail in this area, making the requirement of training by the NEC redundant.
PANEL ACTION: Reject.
PANEL STATEMENT: "Applicable safety standards" is too broad. Many users of the NEC would take that to include product safety standards. Knowledge of product safety standards is not needed for one to be a Qualified Person as defined in the Code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #1544)

1- 94 - (100-Qualified Person): Accept
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 1-178
RECOMMENDATION: Revise Article 100 - Definition of Qualified Person.
Qualified Person. One who has the skills and knowledge related to the construction and operation of the electrical equipment and installations and has received safety training on the hazards involved.

Add the word "electrical" before "equipment" and "and installations" in the revised definition to clarify its coverage.
SUBSTANTIATION: I support the revision to this definition. Qualified person, as previously defined, was not specific enough. The revision to the definition is a good one and more in tune with the proposal (1-5) to delete 90-1(c), which was accepted by Panel 1. Inserting the term "has the training" in the definition of qualified person further emphasizes that 90-1(c) can be deleted. By adding the wording proposed in the comment will eliminate question as to the term equipment used by itself, although by definition it is clear how far reaching equipment should be.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel does not necessarily agree with the submitter's substantiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
TROGLIA: I believe it may be necessary for a person to have skills and knowledge related to the construction and operation of other than specific electrical equipment, in the overall context of an installation, to be considered as "qualified". I am in agreement with the panel action on Proposal 1-178.
COMMENT ON AFFIRMATIVE:
ANTHONY: This change strengthens the NEC objective of promoting the safe use of electricity which I support. We should be alert to how the language of this change will play out in the risk management and code-training community, however.
IVORY: Definition of a qualified person was necessary for Article 100 and now we're specific that to be a qualified person, it requires related training in electrical equipment and installation, as well as safety training.

(Log #1888)

1- 95 - (100-Qualified Person): Accept in Principle
SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers
COMMENT ON PROPOSAL NO: 1-178
RECOMMENDATION: Continue to Accept this proposal in principle in part.
SUBSTANTIATION: The IBEW recognizes that this definition has been expanded to include existing federal OSHA regulations. We applaud the panel's action in recognizing the importance of safety training throughout our industry. We do not believe that there will be any financial burden to the employer, since safety training requirements have existed for over 25 years.
This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.
PANEL ACTION: Accept in Principle.

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 1-185
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: This is a companion comment to a far more extensive one directed at Proposal 1-11. It allows for jurisdictional recognition of the use of the NESC in lieu of Article 225 in major industrial campuses that effectively function as their own utilities. The panel statement that this wording would not eliminate conflicts with the NESC is belied by consistent reports from major industrial entities to the effect that they insist on utilizing the NESC for their outdoor high and medium voltage distributions. Code-Making Panel 9, with good reason, credited such reports in its final action on the manhole rules in Article 370. These facilities need a clear method of demarcation, so the NESC will not be applied in areas where the NEC alone should apply. Every indication suggests that if this comment and its companion are accepted, the NESC Correlating Committee will fall into line with reciprocal language. This action is long overdue.
PANEL ACTION: Reject.

(Log #2007)

1- 109 - (100-Structure (new)): Hold
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 1-188
RECOMMENDATION: Revise as follows:
"A combination of materials assembled at a fixed location to give support or shelter."
SUBSTANTIATION: This definition has a more descriptive quality that will not be misapplied to manufactured items placed as a unit. It conforms to the present BOCA definition, namely: "a combination of materials assembled at a fixed location to give support or shelter, such as a building, framework, retaining wall, tent, reviewing stand, platform, bin, fences over six feet high, sign, flagpole, recreational tramway, mast for radio antenna, or the like."
PANEL ACTION: Hold.
PANEL STATEMENT: The Panel concludes that this comment contains new material and desires to "hold" this comment. The panel desires that Proposal 1-188 continue to be accepted.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:

(Log #2236)

1- 110 - (100-Subpanel): Reject
SUBMITTER: Andre R. Cartal, Bldg Dept., Princeton Borough, NJ
COMMENT ON PROPOSAL NO: 1-191
RECOMMENDATION: Please reconsider the proposal.
SUBSTANTIATION: I know that the term "subpanel" is not used in the NEC but that is the only document that does not use it. The term is used, printed, spoken, described, discussed, responded to at Seminars, at great length and providing this definition makes the NEC easier to understand and more user friendly.
PANEL ACTION: Reject.
PANEL STATEMENT: The Panel agrees with the submitter that the term is commonly used within the trade, but it is not used in the Code. Including a definition of "subpanel" in Article 100 is not essential to the proper application of the NEC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:

COMMENT ON AFFIRMATIVE:
ANTHONY: The commentor makes a good point. Perhaps a proposal might be made for a Fine Print Note for the 2005 edition, as other definitions have Fine Print Notes clarifying topical considerations.

ARTICLE 110 — REQUIREMENTS FOR ELECTRICAL INSTALLATIONS

(Log #9)

1- 111 - (110-1): Accept
Note: The Technical Correlating Committee advises that article scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 1-203a
RECOMMENDATION: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. The Technical Correlating Committee directs that Code-Making Panel 1 correlate this Proposal with the information in the Technical Correlating Committee Note on Proposal 1-308. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Revise the scope statement in Section 110.1 to read as follows:
Scope. This article covers general requirements for the examination and approval, installation and use, access to and spaces about electrical conductors and equipment, and tunnel installations.
PANEL STATEMENT: The panel accepts the direction of the Technical Correlating Committee. The panel recognizes that the Technical Correlating Committee has responsibility over the scope of articles and submits the revised text for consideration and recommends approval of the proposed language. The panel understands that by action of the Technical Correlating Committee on Proposal 1-308, Part D, Tunnel Installations Over 600 Volts, Nominal, of Article 110 remains in Article 110.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #2089)

1- 112 - (110-1 (New)): Reject
SUBMITTER: Michael P. O'Quinn, MOGO Enterprises, Inc.
COMMENT ON PROPOSAL NO: 1-235
RECOMMENDATION: Revise text to read as follows:
110.1 Flash Protection Switchboards, panelboards, and motor control centers installed in other than residential occupancies shall be marked ~~in the field~~ to ~~indicate the~~ with one of the following:
(1) Incident energy in calories per square centimeter for a worker at a distance of 457 mm (18 in.).
FPN: See NFPA 70E-2000, Electrical Safety Requirements for Employee Workplaces, for calculation methods and charts related to incident energy.
(2) A sign readily visible stating the following:
THIS LOCATION IS A HAZARD RISK CATEGORY (0-4).
ALL PERSONS WITHIN 4 FEET OF THIS EQUIPMENT WHEN ENERGIZED MUST WEAR APPROPRIATE PERSONAL PROTECTIVE EQUIPMENT (PPE) ACCORDING TO THIS CATEGORY.
FPN: See NFPA 70E-2000, Electrical Safety Requirements for Employee Workplaces, Table 3-3.9.1 for Hazard Risk Category classification.
SUBSTANTIATION: 2-1.3.3 of NFPA 70E states that a Flash hazard analysis must be done before a person approaches any exposed electrical conductor or circuit part not placed in a safe work condition. 2-1.3.3.2 states how to determine the flash protection boundary (normally 4 feet when system is 600V or below), and 2-1.3.3.3 states that if work is performed within the flash protection boundary, a flash hazard analysis, documented by the employer, shall be done determining the incident energy exposure of the worker (in calories per square centimeter) based on the working distance.
But the last sentence of 2-1.3.3.3 states: "As an alternative, the PPE requirements of 3-3.9 of Part II shall be permitted to be used in lieu of the detailed flash hazard analysis approach described in 2-1.3.3.2 of Part II." This is the reason for the second option for marking.
If option (2) is used, the switchboard, panelboard, or motor control equipment, along with its voltage class and type of work to be done, will be used with Table 3-3.9.1 to determine the Hazard

Risk Category. Then 3-3.9.2 states Table 3-3.9.2 can be used to determine the protective clothing and other protective equipment needed.

It is important to note that Hazard Risk assessment and workplace safety are the responsibility of the employer, and have nothing to do with electrical installation. It is questionable whether this falls into the "practical safeguarding of persons and property" outlined in 90.1(A) of the NEC. Add to this the numerous alterations and changes that can be made to an electrical installation at the time of initial installation and after, and it becomes clear the employer, with the help of OSHA and NFPA 70E-2000, is totally responsible for this marking.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel agrees with the submitter regarding the importance of providing warning of potential arc flash hazards, but concludes the action on Comment 1-152 is more approptiate for the NEC.

(Log #1390)

1- 113 - (110-3(a)(1), FPN): Reject

SUBMITTER: Kari Barrett, American Chemistry Council

COMMENT ON PROPOSAL NO: 1-205

RECOMMENDATION: Delete FPN.

SUBSTANTIATION: The panel rejected the proposal to add another method to determine suitability and stated in its substantiation that suitability is not limited to only listing and labeling. Removing the FPN will eliminate any implied or inferred limitation.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel reaffirms its action to reject Proposal 1-205. The submitter has not provided information to support the recommendation in the comment. The Fine Print Note contains useful information to aid the approving authority.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

PRICHARD: Eliminating the fine print note would remove any implied or inferred limitation to equipment suitability and add clarity to the code.

(Log #1017)

1- 114 - (110-3(b), FPN): Reject

SUBMITTER: Nicholas Ludlam, Factory Mutual Research

COMMENT ON PROPOSAL NO: 1-205a

RECOMMENDATION: Although I agree with the panel statement, I believe that the committee should accept the new FPN as originally proposed.

FPN: Installation instructions may be provided on a certificate supplied with the apparatus.

SUBSTANTIATION: In discussing the use of certificates with members of ISA SP12, which is one committee responsible for hazardous location product standards, one concern of users and the NRTLs, is that if a certificate is issued then it may include special conditions for safe use. These special conditions may not necessarily form part of the listing. By making a reference to a certificate in the NEC, it will bring to the attention of users that they should be looking at the instruction/installation manual and the certificate. Therefore, the addition of this FPN would close a potential loophole.

PANEL ACTION: Reject.

PANEL STATEMENT: All of the instructions issued by the supplier of a listed product, that relate to that product's suitability for installation and use per the NEC are "instructions included in the listing and labeling."

The authority having jurisdiction is responsible for approving conductors and equipment and has different methods of making that determination. The Panel is not convinced that the proposed language will benefit the AHJ beyond what is already provided in 110-3.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

(Log #1188)

1- 115 - (110-3(c)): Reject

SUBMITTER: Joe Tedesco, NTT Inc.

COMMENT ON PROPOSAL NO: 1-207

RECOMMENDATION: Please accept the proposal as submitted.

SUBSTANTIATION: I agree with the negative vote to "Reject" action. Removal of unused circuits, is already covered elsewhere in the NEC where abandoned outlets are left. See Sections 354-7 and 356-7 and 358-13. The information in NFPA 1 is not difficult to understand, and should not be a problem to enforce.

PANEL ACTION: Reject.

PANEL STATEMENT: No additional technical substantiation has been provided for this proposed change. Sections 354-7, 356-7 and 358-13 all deal with a particular situation (spliced conductors in raceways) which is not the same as that described in rejected Proposal 1-207.

The panel disagrees with the explanation of the negative vote on Proposal 1-207 in that the proposed revision is a modest one.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

ABSTENTION: 1

EXPLANATION OF ABSTENTION:

ANTHONY: There seems to be some contradiction between the original proposal and the substantiation that appeared in the comment. In view of this situation, I have taken a neutral position on the voting but stand behind the justification given for my negative vote in the proposal stage. I believe that the electric power and telecommunication industry should migrate toward the practice of removing abandoned cables. At the moment, it may not be practical to establish this practice in a national standard such as the NEC. Friends of the NEC should know, however, that some local jurisdictions - the City of Chicago among them - already assert the requirement.

(Log #548)

1- 116 - (110-9): Reject

SUBMITTER: Robert B. Alexander, Fluor Daniel

COMMENT ON PROPOSAL NO: 1-211

RECOMMENDATION: Accept the proposal.

SUBSTANTIATION: The panel statement referring "complex systems design criteria" to Section 90-4 is precisely why "specific inclusion in the NEC" is necessary. My personal experience is that very few authorities having jurisdiction (AHJ) have the technical expertise necessary to determine that "equivalent objectives" have been "achieved by establishing and maintaining effective safety" in these cases.

As a Professional Engineer (PE), I am legally and ethically obligated to point out that these designs under consideration do not "technically" meet the "letter" of the NEC. Most AHJs will then take the most conservative approach. The fact that I am willing to seal the design and accept personal responsibility for it is rarely a consideration. The owners, operators, designers, manufacturers and installers of an installation all hold liability. In my primary state of licensure, I also hold personal liability in the designs I seal, as do most PEs in the US. Most AHJs cannot be held liable, personally or otherwise. (See new Section 80.29)

PANEL ACTION: Reject.

PANEL STATEMENT: No additional technical substantiation has been provided for this proposed change. Instead, the submitter's material indicates that issues of this design complexity would create enforcement problems if included in this Code. This issue best remains addressed through application of Section 90-4 since the proposal is only one of a number of possible approaches that may be judged to provide for equivalent safety.

SUBMITTER: Jim Brozek, Acton, MA

COMMENT ON PROPOSAL NO: 1-210

RECOMMENDATION: This proposal should be accepted. See action on Proposal 10-66 (Section 240-85). At the very least, an FPN as written by Panel 10 for Proposal 10-66 should be included.

SUBSTANTIATION: Single pole interrupting ratings for multi-pole circuit breakers may have tested interrupting ratings less than the marked 3-pole interrupting rating. See UL Standard 489.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel continues to support the action to reject and the panel statement on Proposal 1-210. The submitter has not provided any new substantiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #1469)

1- 118 - (110-9): Reject
SUBMITTER: Vincent J. Saporita, Cooper Bussmann
COMMENT ON PROPOSAL NO: 1-210
RECOMMENDATION: This proposal should be modified by changing "circuit breakers" to "overcurrent protective devices" in the first line and changing "circuit breaker" to "overcurrent protective device" in the third line. The modified proposal would then read: "Multi-pole overcurrent protective devices shall have a single-pole interrupting rating sufficient for the nominal circuit voltage and current that is available at the line terminals of the overcurrent protective device when utilized on corner grounded systems, resistance grounded systems, ungrounded systems and center point grounded delta systems."
SUBSTANTIATION: "Circuit breakers" needs to be changed to "overcurrent protective devices" because there are listed self-protected starters and listed manual motor controllers that are being used to meet requirements in Article 430. These devices, like circuit breakers, may have much lower interrupting capability when trying to interrupt full phase-to-phase voltage across only one pole, as can be the case in the various types of systems described in the proposal. For safety purposes, users need to realize that these multi-pole devices can violently explode when applied within their 3-pole interrupting rating, on other than solidly grounded wye systems. For further information, please refer to Proposal 10-66, which passed in Panel 10 by an 11 to 1 vote.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel continues to support the action to reject and the panel statement on Proposal 1-210. The panel does not agree with the statement that manual motor starters are overcurrent protection devices in the context of 110-9.

1- 119 - (110-9): Reject
SUBMITTER: Paul S. Hamer, San Ramon, CA
COMMENT ON PROPOSAL NO: 1-211
RECOMMENDATION: The wording of the proposal should be accepted and added to the NEC.
SUBSTANTIATION: I agree with Mr. Floyd's negative comment. This is a practice that has proven to be safe as commonly applied in industry, and should be recognized as such in the NEC. An open transition can be much riskier from a process point of view.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 1-116.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #2363)

1- 120 - (110-9): Reject
SUBMITTER: Mark Goodman, BP (ARCO)
COMMENT ON PROPOSAL NO: 1-211
RECOMMENDATION: Add the following text after the first sentence: "During the momentary paralleling of an automatically controlled power transfer, the single source condition interrupting rating shall be considered adequate provided there is no intentional time delay in the transfer and the parallel condition cannot be maintained".
SUBSTANTIATION: This comment supports the concept of the proposal, but suggests alternate language.
The condition identified in the proposal is common in double ended substation arrangements where maintaining power to the loads is critical for operation or system safety. It is also a common practice in generating stations where continuity of power flow may be required for public safety. These systems are designed for only a momentary parallel condition, typically only long enough for the closure of the paralleling breaker to initialize the opening of the designated breaker returning the system to single source configuration. During the brief parallel time (often only a few cycles), the short circuit rating of the switchgear feeder breakers may be exceeded. This added provision in 110-9 would recognize this arrangement and establish limitations under which it can be applied.
IEEE 666, Design Guide for Electric Power Service Systems for Generating Stations, section 4.6.1 specifically allows this arrangement and equipment rating.
The Explanation of Negative provided by Mr. Floyd is also supported in this comment.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 1-116.

(Log #1680)

1- 121 - (110-11): Reject
SUBMITTER: Gersil N. Kay, Conservation Lighting International Ltd.
COMMENT ON PROPOSAL NO: 1-214
RECOMMENDATION: All switchgear and other power supplying systems should be installed above grade so that water from manmade or natural disasters will not impeded operation of life safety equipment.
SUBSTANTIATION: In 1996, I sent two additions to the National Electric Code. At that time they were not included. They are more important now than ever.
PANEL ACTION: Reject.
PANEL STATEMENT: It is impractical to require that this type of equipment be installed above grade. Many buildings have portions of the structure located below grade and to prohibit this type of equipment from being located in those areas based on the possibility of a natural disaster is not justified. There has not been any technical substantiation provided.

1- 122 - (110-12): Accept
SUBMITTER: Andre R. Cartal, Bldg Dept., Princeton Borough, NJ
COMMENT ON PROPOSAL NO: 1-218
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: This proposal, if accepted, places the responsibility for a torque inspection on the Electrical Inspector, even when these connections are energized as they are in the majority of installations or they are not accessible as in meter bases.
Section 110-14 (FPN) already covers the submitter's concerns.
PANEL ACTION: Accept.
PANEL STATEMENT:
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #1136)

1- 123 - (110-12(a)): Accept
SUBMITTER: Mark R. Berner, EEI/PPL Utilities
COMMENT ON PROPOSAL NO: 1-215
RECOMMENDATION: Code-Making Panel 1 should accept the proposal in principle, revised to reword 110.12(A) as follows:
"Unused cable or raceway openings in boxes, raceways, auxiliary gutters, cabinets, cutout boxes, meter socket enclosures, equipment cases, or housings shall be effectively closed to afford

protection substantially equivalent to the wall of the equipment. Where metallic plugs or plates are used with nonmetallic enclosures, they shall be recessed at least 6 mm (1/4 in.) from the outer surface of the enclosure."

If Code-Making Panel 1 accepts this comment, and conditional on such action, Code-Making Panel 9 advises Code-Making Panel 1 of its intent to delete 370.18 and to continue to accept Proposal 9-56, which deletes the current content of 373.4.

SUBSTANTIATION: This action avoids the problem of broadening the scope of this requirement beyond the present code in potentially unintended ways, while adhering to the proposal's concept of centralizing in a general article of the code what is truly a generic requirement. This concept, broadened to include Section 370.18, is in accordance with earlier NEC changes with the same objective. In addition, it accords with the Code-Making Panel 1 action in this code making cycle on Proposal 1-233, which also centralizes a generic requirement in one general code article.

The wording suggested in this comment includes the "cable or raceway" limitation now in Section 370.18, which was accepted by Code-Making Panel 9 in the 1996 cycle to prevent this rule from being applied to a weep hole in a wet location. In addition, this wording precludes the requirement from being mistakenly applied to ventilation openings or other openings that are a legitimate part of the equipment design. This wording also incorporates the clarifying wording accepted by Code-Making PanelP 9 in its action this cycle on Proposal 9-55 related to the positioning of metal closures in nonmetallic enclosures.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #969)

1- 125 - (110-12(e) (New)): Accept
SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: 1-218
RECOMMENDATION: The Panel should reject this proposal.
SUBSTANTIATION: The tightening torque specified for a particular product is often the result of the evaluation of the product in accordance with a product standard. The product standard has recognized the need to specify a tightening torque. As a result, the manufacturer provides the tightening torque information with the product. The FPN in 110-14 acknowledges this by stating that there are many terminations and equipment marked with torque values. Mr. Minick states in his Explanation of Negative that 110-3(b) currently instructs the installer to follow the manufacturer's instructions, which in the case of these products includes the tightening torque value. The result of applying the requirement in 110-3(b) is that any termination or equipment must be installed and tightened to the torque specified by the manufacturer. Consequently, Mr. Minick is accurate in his assertion that the additional wording of the new section is redundant.

This new section will also impose the need to provide recommended torque values for terminations for electrical connections for many products that do not now require a torque specification. Products such as wiring devices, connectors and couplings for conduit systems, ground and box cover screw connections and many other products are evaluated to product standards that do not require a marked tightening torque. These product standards contain test and construction requirements that take into account the conditions that the electrical connection will be exposed to in the field. The product standards have established that a marked tightening torque is not required to ensure proper installation of these products. These products have been safely installed for many years without the need to specify a tightening torque. There is no justification for the panel to adopt a new requirement that may impose a torque marking for these products.

Another aspect of the proposal that must be taken into consideration is that the submitter has not provided substantiation that any unsafe installations have resulted from the incorrect or improper tightening torque of electrical connections. The panel should not adopt a new section that may impose additional product requirements unless there is substantiation that indicates these new requirements will alleviate a problem.

PANEL ACTION: Accept.
PANEL STATEMENT: The panel does not necessarily agree with all of the substantiation.

(Log #1450)

1- 128 - (110-14): Reject
SUBMITTER: Eric Stromberg, The Dow Chemical Company
COMMENT ON PROPOSAL NO: 1-222
RECOMMENDATION: Terminations that are in a climate controlled atmosphere, where the conditions of maintenance ensure the reliability of the HVAC system, need not be considered in determining the ampacity of the conductor.
SUBSTANTIATION: In industrial plants, it is common to have motor control centers in air-conditioned buildings. The '99 code allows motor leads to be considered as 75 degree C terminations. If, however, the termination in the MCC room is not listed as 75

degree C, the 60 degree C column still needs to be used for conductor sizing (for circuits less than 100 amps). Practically speaking, because of the amount of air conditioning in these rooms, the terminations will never get close to the 60-degree rating. Adding this sentence will fulfill the intent of the '99 code in allowing the 75 degree C column to be used for sizing conductors for motors.
PANEL ACTION: Reject.
PANEL STATEMENT: Rules for determining conductor ampacity based on ambient temperature are located in Article 310. The substantiation provided by the submitter does not justify the recommended action.

(Log #904)

1- 130 - (110-14(c)(1)d): Reject
SUBMITTER: Charles B. Schram, Wilmette, IL
COMMENT ON PROPOSAL NO: 1-230
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: While the proposed language may appear to be redundant to 110-14(c)(1)(c) it is not because the language of 110-14(c)(1) limits the application to "only one of" (a), (b), (c) or (d). Therefore, (c) and (d) cannot both be applied. The proposed revision of (d) makes (c) also applicable - for the controller end - when (d) is applied - to the motor end. Another possible way to accomplish the intent would be to revise the last clause of 110-14(c)(1) to "shall be used for only one of (a), (b) or (c), or for both (c) and (d)."
PANEL ACTION: Reject.
PANEL STATEMENT: The provisions of Section 110-14 have to be applied to each termination in the circuit. The rule for motor terminations is specific and addressed in Section 110-14(c)(1)(d). The controller termination is addressed in Section 110-14(c)(1)(c). The panel reaffirms that the proposal would only provide redundant language within the same NEC Section.

1- 131 - (110-15 (New)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 1-235
RECOMMENDATION: The Technical Correlating Committee directs the panel to change "residential" to "dwelling" to comply with current word usage. In addition, the Technical Correlating Committee directs the panel to use the proper metrication in the text. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
PANEL STATEMENT: CMP-1 has incorporated the requested change from "residential" to "dwelling" in the panel action on Comment 1-152. Further, the need for metric units has been removed from the proposed Code text.

(Log #603)

1- 133 - (110-15 (New)): Reject
SUBMITTER: John E. Propst, Equilon Enterprises, LLC
COMMENT ON PROPOSAL NO: 1-235
RECOMMENDATION: Revise as follows:
110-15 Flash Protection. For other than residential occupancies, the appropriate level of personal protective equipment shall be documented and made readily available for switchboards, panelboards, loadcenters and motor control centers ~~shall be marked in the field to indicate the incident energy in calories per square centimeter~~ for a worker at a distance of 18 in.
SUBSTANTIATION: The proposed revised text of the original proposal is attempting to correct two deficiencies. First, there are additional means of identifying the most appropriate level of PPE other than the calculated incident energy in calories per square centimeter. For example, a locations procedure for applying NFPA 70E may incorporate the PPE requirements by categories or layers. The second issue is related to the marking of PPE requirements directly on equipment. For some facilities utilizing modern methods of documentation, it may be more appropriate to document PPE requirements on one-line diagrams, equipment cross-section drawings, other computer databased systems. Having the requirements shown on the equipment, may actually hinder effective application of PPE because requirements will most likely change in time as we learn more about flash protection and the continued improvements in PPE by manufacturers. Permitting the definition of requirements on revisable documentation will permit the employer to keep accurate requirements as available PPE and system configuration changes.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 1-152. Availability of PPE is not an installation issue, and cannot be covered by the NEC. This comment addresses an issue better dealt with by the Technical Committee on Electrical Safety Requirements for Employee Workplaces.

(Log #971)

1- 134 - (110-15 (New)): Reject
SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: 1-235
RECOMMENDATION: The Panel should reject this proposal.
SUBSTANTIATION: The proposed requirement cannot be accurately enforced and could actually reduce electrical safety. Personnel safety can only be assured when equipment is deenergized before performing any work. When personnel decide to work on a piece of energized equipment, there is a great deal of knowledge and expertise required. Attempting to mandate some energy marking on the equipment will lead to a false sense of security and will increase the hazard because personnel will become complacent about all of the other necessary requirements to perform safe work. Furthermore, this type of requirement will lead personnel to "gamble" by working on pieces of equipment with smaller energy numbers assuming that smaller energy calculations is "safer".

In order to ensure that proper safety procedures are followed, personnel should receive proper training about all of the requirements in NFPA 70E. Within NFPA 70E, the energy number calculations are a very small portion of the discussion and in fact relegated to an annex of 70E due to the controversy surrounding the calculation methods.

Enforcement in the wide and varied applications of the involved products will be impossible. The NEC is an installation document to be enforced by the authorities having jurisdiction. The authority having jurisdiction will have great difficulty in verifying the accuracy of the information that is required to be marked in the field. In fact, great confusion (and potential conflicts) will arise over the variety of calculation methods and the availability of verified information in order to make a reliable calculation.

As an additional hazard, it is noted that in performing a particular task, the electrician could be facing many different energy numbers within a lineup of electrical equipment. Thus each switchboard, panelboard, or motor control center in the same equipment room could have different ratings based upon the available fault current. Should maintenance personnel only review the "lower" number on many pieces of gear, improper equipment selection will result.

The panel is also encouraged to review Mr. Minick's "Explanation of Negative Comment" in the ROP.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel agrees with the concerns on enforcement and emphasizing other safe work practices, but concludes the action on Comment 1-152 is more appropriate for the NEC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
COMMENT ON AFFIRMATIVE:
MINICK: NEMA continues to support the position that personnel safety can best be assured when equipment is de-energized before performing any work.

(Log #1005)

1- 135 - (110-15): Reject
SUBMITTER: Gil McGoldrick, Square D Company
COMMENT ON PROPOSAL NO: 1-235
RECOMMENDATION: The panel should reconsider and reject the proposal.
SUBSTANTIATION: We have much concern about the proposal and urge the panel to reconsider and reject the proposal. The proposal would require a field applied marking on switchboards, panelboards and motor-control centers to indicate the incident energy for a worker at a distance of 18 in. Presumably the objective is to attempt to have this available for workers that approach the equipment when it is energized. Unfortunately, the proposal is flawed in attempting to make this a requirement in the National Electrical Code. These flaws are outlined below.

1) NFPA 70E is a comprehensive document of electrical safety requirements. We have supported the development of those requirements and believe that industry can be better served if NFPA 70E were more widely adopted. However, in the concept of incident energy, NFPA 70E has found enough issues that the document itself does not support the calculations in other than an informative annex.

2) The incident energy number marked on a piece of equipment will mean little to the worker in the field. Unless that worker is intimately familiar with all the facets of NFPA 70E, improper assumptions about what the energy number indicates will be an issue and could lead to less safe working practices. If a worker is familiar with 70E to the extent necessary and they are attempting to select personal protective equipment (PPE), then the field selection methodology permitted in 2-1.3.3.3 of NFPA 70E referencing 3-3.9 will be used.

3) The application of the incident energy number by the contractor or initial installer is improper according to NFPA 70E. In order for this to be enforced by the authority having jurisdiction, the electrical contractor will face the burden of calculating the incident energy, and field marking the equipment. NFPA 70E is very clear in 2-1.3.3.3 that it is the responsibility of the employer to document the incident energy exposure or the worker. 70E allows the employer to choose doing either a detailed flash hazard analysis or use the simpler alternative of selecting the PPE from 3-3.9. NFPA 70E has always placed the burden of protection of the worker on the employer (and the worker him/herself). This NEC change attempts to place the burden on the installer and the authority having jurisdiction by forcing them to determine the "proper" energy marking.

4) Authorities having jurisdiction will have a most difficult time enforcing such a requirement. What is the proper calculation method? Of the many different methods being promoted, which one will the inspector allow or disallow? Who is responsible for ensuring that the marking remains accurate (changing OCP, transformer, etc.) all affect the marking? This will only introduce arguments on initial installation about which energy number is correct. Arguments that should not happen, since the employer is responsible for the documentation.

5) The marked incident energy number may not be appropriate for the particular field conditions. The marking would require a calculation at 18 in. What if the work being performed exposed the worker to live conductors closer than 18 in.? Is different gear required? Even the informative annex notes that the calculations are not valid for less than 18 in. (see B-5.1 and B-5.2 in NFPA 70E).

In summary, the efforts to make this a National Electrical Code requirement are out of place. We believe that NFPA 70E should be used by industry workers and it should be enforced by the employers. The NEC is an electrical installation document and cannot replace enforcement of all the proper working practices outlined in NFPA 70E. Attempts to require the markings by the NEC appear to be attempts to remove the responsibility from the employer. This should not be the objective of the NEC committee.

We also take this opportunity to remind the committee and the public, that the only safe approach to working on electrical equipment is to deenergize the equipment. Industry has yet to see an electrical worker electrocuted or burned from an arc flash while working on a piece of deenergized equipment.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel agrees with the concerns on enforcement and emphasizing other safe work practices, but concludes the action on Comment 1-152 is more appropriate for the NEC.

1- 136 - (110-15 (New)): Accept
SUBMITTER: Mark R. Berner, EEI/PPL Utilities
COMMENT ON PROPOSAL NO: 1-233
RECOMMENDATION: The action on Proposal 1-233 should be accepted in part as originally indicated by Code-Making Panel 1 in the ROP.

If Code-Making Panel 1 accepts this comment, and conditional on such action, Code-Making Panel 9 advises Code-Making Panel 1 of its intent to delete 384.3(E).
SUBSTANTIATION: Code-Making Panel 1's action correctly addressed the general requirements. Such requirements belong in a general code article. The specific busbar arrangements for switchboards and panelboards belong in Article 384, and the CMP 1 action allows for that. These arrangements would remain in 384.3(F). The deletion of Section 384-3(E) in this context will not be new material since the action is contingent on exactly zero net change being made in the technical requirements for equipment within the scope of Article 384.

The deletion of Section 370.18 in this context will not be new material since the action is contingent on exactly zero net change being made in the technical requirements for equipment within the scope of Article 370.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel concludes that the panel action on Proposal 1-233 should be reported as "Accept in Part" as

indicated in the Panel Action, and understands that there is an errata in the May 2001 NEC ROP for Proposal 1-233, first line, where this comment is reported as "accept in principle".

(Log #1260)

1- 138 - (110-15): Reject
SUBMITTER: Larry T. Smith, National Electrical Seminars
COMMENT ON PROPOSAL NO: 1-235
RECOMMENDATION: Delete the following text:
110.15. Flash Protection. For other than residential occupancies, switchboards, panelboards, and motor control centers shall be marked in the field to indicate the incident energy in calories per square centimeter for a worker at a distance of 18 in.
SUBSTANTIATION: Please reconsider and reject this proposal.
Acceptance of this proposal will serve no purpose. It will not contribute to safety. It is unenforceable. It will drive a wedge between the National Electrical Code and adopting authorities.
Safe work habits and proper protective equipment are personal decisions. There is nothing to ensure that if electrical equipment is marked, as required by this proposed section, that a wireman will use the proper level of protective equipment. It's a simple fact that protective equipment should be worn at all times when work is performed on energized equipment without regard to available incident energy. This is a training issue, not a Code issue. The Code simply can't be all things for all people.
The requirement is unenforceable. This is an engineering calculation. One of the equation parameters involves bolted fault short circuit current which means that electric utilities also need to be involved in the process. Any subsequent alterations made by utilities in substations, transformers, or circuitry will affect the available incident energy.
Acceptance of this proposal will throw the industry into a state of turmoil never seen before. It's a reasonable assumption that many adoption authorities, both state and municipal, will delete the requirement in their Code adoption processes.
PANEL ACTION: Reject.
PANEL STATEMENT: The Panel disagrees with the submitter's contention that this proposed change will serve no purpose and that it will not contribute to safety. It is recognized that some people will make decisions that may not conform to recognized safety practices and that proper training is important. However, that personal decision should not deter the adoption of a rule that can help people protect themselves from a recognized hazard. See panel action and statement on Comment 1-152. Also, see the revised definition of qualified person in Comment 1-94.

(Log #1543)

1- 140 - (110-15): Reject
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 1-235
RECOMMENDATION: Add the following new section:
110-15 Flash Protection. Switchboards, panelboards, and motor control centers installed in other than residential occupancies shall be marked to indicate the incident energy in calories per square centimeter for a worker at a distance of 18 in. (457 mm).
FPN: See NFPA 70E-2000, Electrical Safety Requirement for Employee Workplaces, for calculation methods and charts related to incident energy.
SUBSTANTIATION: I support the panel's decision to accept this proposal for the 2002 NEC. There are many issues relative to this proposal that warrant this. The statistics are enough to warrant the change as it will put another level of warning in place that will have an impact on injury counts. The NFPA 70E document already has the methods and means prescribed. This places emphasis on the fact that qualified persons should be familiar with the hazards involved. I do feel that this requirement will be difficult to enforce at first, as with many other new code requirements, but I disagree with the statement that it is "not enforceable" and having this requirement will improve levels of awareness and result in improved safety. This requirement not only has an affect on the workman, but also inspectors, and others that are involved examining, testing, etc. while equipment is energized. Many regions in the country have high levels of available short circuit current. It is understood that the incident energy calculation would be an adjustment, no question, but all new code requirements usually require an adjustment in some form or other. This change, together with the accepted change to the definition of qualified persons (ROP 1-178) will improve the safety for competent users of the NEC. It won't prevent unqualified persons from injuries that result from lack of understanding and training. I support this proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: Including metric values is no longer necessary based on the panel action on Comment 1-152. See panel action and statement on Comment 1-152.

1- 145 - (110-15 (New)): Reject
SUBMITTER: Kevin J. Lippert, Cutler- Hammer
COMMENT ON PROPOSAL NO: 1-235
RECOMMENDATION: The Proposal should be rejected.
SUBSTANTIATION: The inclusion of the proposed requirement could actually lead to less safe conditions. An "incident energy" value in "calories per square centimeter" would be meaningless to many people. Different numeric values would lead some to interpret a smaller number to mean that it would be "safer" for them to work on energized equipment without realizing that, amongst other things, NFPA 70E still requires the qualified person to:
(a) Have specified training to work on energized conductors or circuits parts
(b) Have a documented plan justifying the need to work that close
(c) Perform a risk analysis
(d) Have (b) and (c) approved by authorized management
(e) Use personal protective equipment appropriate for working on exposed energized conductors or circuit parts, and rated for the voltage and energy level involved.
The incident energy calculation is only a small portion of the many requirements needed when working on energized equipment. Safety can only be assured when all of the requirements in NFPA 70E are followed.
In the statement of the Affirmative, Mr. Anthony states: "Applying this proposal could also get much more complicated if investigations into comparative arc duration times of protective devices need to be investigated. Fault current distribution profiles may need to be determined in very large buildings." How can the authority having jurisdiction be expected to verify the accuracy of this information?
PANEL ACTION: Reject.
PANEL STATEMENT: The panel agrees with the concerns on enforcement and emphasizing other safe work practices, but concludes the action on Comment 1-152 is more appropriate for the NEC.

1- 146 - (110-16 Flash Protection): Accept in Principle
SUBMITTER: Ray A. Jones, Electrical Safety Consulting Services, Inc.
COMMENT ON PROPOSAL NO: 1-235
RECOMMENDATION: Panel action should have been accept in principle as it was; however, the principle should have been different. The new text should read as follows:
110.16 Flash Protection. Switchboards, panelboards, and motor control centers installed in other than residential occupancies shall be marked in the field to indicate if arc flash protective equipment is required to protect a worker when any door or cover is not fully closed.
FPN: See NFPA 70E-2000, Electrical Safety Requirements for Employee Workplaces, for assistance in determining if arc flash protection is needed to protect a worker from arc flash.
SUBSTANTIATION: Arc flash injury accounts for up to 80 percent of all injuries from a release of electrical energy. Electricians and other workers who may be exposed to arc flash injury must be warned if an arc flash hazard exists. As submitted, Proposal 1-235 was more restrictive than it should have been. Other methods exist to determine where an arc flash hazard exits or may exist. Section 110.16 should permit any calculation method that provides the necessary warning to workers.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel concludes that the action on Section 1-152 meets the intent of the submitter.

1- 149 - (110-16 (New)): Reject
SUBMITTER: Michael P. O'Quinn, MOGO Enterprises, Inc.
COMMENT ON PROPOSAL NO: 1-235
RECOMMENDATION: Revise wording as follows:
Flash Protection. Switchboards, panelboards, and motor control centers installed in other than residential occupancies shall be marked ~~in the field~~ to indicate the incident energy in calories per square centimeter for a worker at a distance of 457 mm (18 in.) based on field conditions.
FPN (unchanged).
SUBSTANTIATION: This proposal appears to require the necessary information needed by a worker to safely perform electrical service around and on switchboards, panelboards, and motor control centers, if the information is coordinated with OSHA Standards and NFPA 70E in the use of protective clothing and practices.
But OSHA has maintained that worker safety is the responsibility of the building employer, specifically a safety officer. The wording of the proposal, using the phrase "...in the field...", appears to require the installing contractor to provide the labeling.
Not only is it questionable whether the information from the contractor will be correct at or after installation, the authority having jurisdiction may not be willing to add the resources to verify. The installing contractor may also be reluctant to add this legal liability. Add to that the normal field modifications and alterations that will be done to other than residential installations after the initial installation, and the initial label will be grossly incorrect, defeating the original attempt at worker safety.
By deleting the phrase "... in the field ..." and adding the comment "...based on field conditions", this requirement reverts to the building employer, based on OSHA policy. At the very least, this modification of the proposal will require a decision between the authority having jurisdiction, building employer, and OSHA on whose responsibility it will become.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel agrees with the concerns on enforcement and emphasizing other safe work practices, but concludes the action on Comment 1-152 is more appropriate for the NEC. The energy calculation requirement has been removed from the original proposal by the action of Comment 1-152.

(Log #2008)

1- 150 - (110-16 (New)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 1-235
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: Although clearly well-intended, this proposal will convince the average Code user that the NEC has become the child of major industrial interests. The process for making these calculations involves higher-level mathematics even if certain assumptions are made, as covered in the NFPA 70E appendix. Making available fault calculations pushes the envelope of what is possible, but this sends the average user over the edge. Major industrial facilities have the engineering support to make this feasible, but only within such facilities.
The larger issue, however, is whether we need to so sanitize our work practices that injury becomes virtually impossible. As a former staff electrician at a college, I recall a campus-wide pay study at the time that was used to reclassify all staff pay grades from secretaries to plumbers a component of the calculations was the degree of personal risk involved in the job responsibilities. Without question, electricians received all 20 of the possible points for this element of our jobs, and that was instrumental in raising our pay grades relative to other staff.
Arc blasts happen and we need to be aware of them and take appropriate precautions. However, there is a point of diminishing returns for what will be an enormous investment in time and protective equipment for very little return. I remember when the 70E Committee opened this subject in prior revision to that standard, which I voted against at the NFPA Fall Meeting for just this reason. I was a part-time inspector at the time, usually making inspections after hours. I remember opening a meter socket afterwards as part of a service inspection (I always bring tools to every inspection), and saying to myself, sarcastically, "Golly. Here I am, violating 70E because I don't have a moon suit on. I guess I should get the utility to come and deenergize the building just so I can look inside this meter socket." Right.
If the major industrial interests, with their greater liability exposure and engineering support, want to so organize their work forces, more power to them, and I wish them every success. However, this is too much for everyday applications.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes that its action on Comment 1-152 will increase safety.

(Log #2255)

1- 151 - (110-16): Reject
SUBMITTER: Noel Williams, Noel Williams Consulting
COMMENT ON PROPOSAL NO: 1-235
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: The proposal creates an unenforceable rule. As noted in panel comments (both negative and affirmative) accurate values are not easily obtained or confirmed by inspection. Some variables can only be estimated and may change or may vary from time to time or under different conditions. Furthermore, only a small portion of hazards are addressed anyway. The same hazards may exist at disconnects and controllers, among others.

PANEL ACTION: Reject.
PANEL STATEMENT: The panel agrees with the concerns on enforcement, but concludes the action on Comment 1-152 is more appropriate for the NEC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #2296)

1- 152 - (110-16 (New)): Accept in Principle
SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers
COMMENT ON PROPOSAL NO: 1-235
RECOMMENDATION: Accept this proposal in principle. Revise Section 110-16 to read as follows:

110.16 Flash Protection. Switchboards, panelboards, and motor control centers, having a short-circuit current rating, in excess of 20,000 amperes shall be marked with the following label:
Warning!
Electrical Arc Flash Hazard.
Serious Injury or Death.
Use Appropriate Level of Personal Protective Equipment.

FPN No. 1: See NFPA 70E-2000, Electrical Safety Requirements for employee workplaces, for assistance in determining what level of arc flash protection is needed to protect a worker from arc flash.

FPN No. 2: See ANSI Z535-1998 Standards for guidelines for the design of safety signs and labels for application to products.

SUBSTANTIATION: Over the past 10 years there have been a dramatic increase in the awareness of the hazards associated with electrical arcs, blasts and flashes. The IBEW supports any effort to further increase this understanding. Specifically, the NEC should include a link to the safety requirements contained in NFPA 70E "Standard for Electrical Safety Requirements for Employee Workplaces, 2000 Edition". The original proposal is a first step, a major step in the right direction. But it does have some issues that need to be clarified. The largest being the complexity of the calculation required to determine incident energy levels in calories per square centimeter for a worker at a distance of 18 in.

Our experience indicates that workers need to understand the level of personal protective equipment necessary to safely work on or near switchboards, panelboards, MCCs. We have experienced several major injuries and fatalities where workers encountered significant arc blasts and flashes performing "routine" tasks.

One such accident is documented in the video "Once the Arc Begins." Both workers were subjected to an arc blast from a 120/208 meter socket while attempting to check voltage. The video captures the devastating effects of the blast. The most significant aspect of this case study was that the workers believed they were adequately protected when in fact, their PPE failed to protect them against 1st, 2nd and 3rd degree burns.

This proposal is a compromise intended as a first step towards creating the bridge between NFPA 70 and NFPA 70E. The proposed revision accomplishes several things.

A. It establishes a standard warning to be placed on all switchboards, panelboards and MCCs. The warning label has been designed in accordance with ANSI Z535-4-1998 "Product Safety Signs and Labels". Section 4.13.2 states that the word "warning" should be used to "indicate a potentially hazardous situation which, if not avoided, could result in death or serious injury." In addition, the label 1) states the hazard (Electrical Arc Flash), 2) Tells how to avoid the hazard (Use appropriate level of PPE) 3) identifies the consequence (Serious injury or death).

B. The proposal solves the problem of how the marking is to be accomplished. The manufacturer of the equipment will be required to provide the marking. The wording proposed does not require any specific calculation or determination as to the extent of the potential arc flash nor does it require the manufacturer to make a determination they are not capable of doing. Some may see this as a product standard requirement but it is an important step for worker safety and it falls within the stated purpose of the Code. In addition, the Code currently contains many provisions for marking and warning labels. These requirements are for both field and factory provided markings and labels. For example Section 690-10(c) reads as follows:

Single 120-Volt Supply. The inverter output of a stand-alone solar photovoltaic system shall be permitted to supply 120 volts to single-phase, 3-wire 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less than the rating of the neutral bus in the service equipment. This equipment shall be marked. WARNING – SINGLE 120-VOLT SUPPLY – DO NOT CONNECT MULTIWIRE BRANCH CIRCUITS!

In addition to this section, see also section, 424-92, 490-21(b)(7), 520-53(k), 530-22(a), 530-73, 620-3(a), 620-52, and 690-17.

C. The proposal includes two FPNs. The first will provide the link to NFPA 70E and in doing so provide information as to the "appropriate level of personal protective equipment." The second will reference the ANSI Z535-1998 Standards which provide information regarding the design of the warning label. This provision simply states the words that must be included. The rest of the sign design is performance oriented and the ANSI series can provide guidance for the sign.

D. The proposal removes the direct exclusion for "residential occupancies." The manufacturer will not know where the panelboard will end up. However, it does limit the labeling requirement to those built to a short-circuit rating in excess of 20,000 amperes. Most panelboards constructed for residential application will be exempt from this requirement because they are constructed with short-circuit current ratings below 20,000 amperes.

The IBEW will support any effort which helps to identify and acknowledge the increasing problem of electrical arc blasts and flashes. We hope that this proposal moves the NEC in that direction. This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.
PANEL ACTION: Accept in Principle.
Revise Section 110.16 to read as follows:
110.16 Flash Protection. Switchboards, panelboards, industrial control panels, and motor control centers in other than dwelling occupancies, that are likely to require examination, adjustment, servicing, or maintenance while energized, shall be field marked to warn qualified persons of potential electric arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

FPN No. 1: NFPA 70E-2000, Electrical Safety Requirements for Employee Workplaces, provides assistance in determining severity of potential exposure, planning safe work practices, and selecting personal protective equipment.

FPN No. 2: ANSI Z535.4-1998, Product Safety Signs and Labels, provides guidelines for the design of safety signs and labels for application to products.

PANEL STATEMENT: The panel concludes that requirements for warning of potential electrical hazards are within the purpose of the NEC, and agrees with the need to warn qualified persons of the potential of arc flash hazards in non-dwelling locations. However, the panel wants to emphasize the importance of de-energization and implementation of safe work practices outlined in NFPA 70E, in addition to recommending the use of appropriate personal protective equipment. The panel believes that the revised wording meets the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
ABSTENTION: 1
COMMENT ON AFFIRMATIVE:

FLOYD: In addition to raising user awareness of electric arc flash hazards, Code-Making Panel 1's action on 1-152 will also serve to stimulate innovation and advancements in product and system designs that reduce or mitigate the hazard. For example, in the past 5 years, the major US manufacturers of medium voltage switchgear have introduced advancements in designs listed as arc resistant. Increasing market demands to address this hazard through similar technology advancements will reduce the equipment installations needing warning labels as required by section 110-16.

IVORY: I concur with Mr. Callanan's original proposal which would add additional safety measures to this proposal, however, Panel 1 has taken a big step in recognizing the needs to require appropriate warnings of electrical hazards and to strongly suggest the need for using appropriate equipment when working in an energized system.

MINICK: NEMA continues to support the position that personnel safety can best be assured when equipment is de-energized before performing any work.

STAUFFER: NECA's affirmative vote indicates support for the concept of improving safety for electricians and contractors. However, it does not indicate support for either Proposal 1-235 or the Panel's Accept in Principle action on Public Comment 1-152. Both the proposal and comment are, in our judgment, seriously flawed and would not improve safety for

electricians/contractors in any realistic way. The reasons are as follows:

QUALIFIED PERSON. The wording proposed for new Section 110.16 talks about marking "to warn qualified persons of potential electric arc flash hazards." However, a Qualified Person is defined in Article 100 as "one familiar with the construction and operation of the equipment and the hazards involved." This makes the proposed requirement for warning language redundant.

FIELD MARKED. This would appear to require that the installer shall furnish the warning sign. But the sign wording is not specified; who decides what it should say? How effective can unstandardized warning language be in minimizing hazards? Who will bear the liability for this potentially ineffective warning language—the equipment's manufacturer, installer, or owner?

RESPONSE - COMPLIANCE. Since the wording is unspecified, what constitutes compliance or a safe and adequate response? How would an electrician or contractor decide what level of work practice or personal protective equipment (PPE) was appropriate in a particular field situation? Overly cautious lawyers, insurance companies, etc. might interpret this new Section 110.16 as requiring PPE for any "maintenance" procedure, including re-setting a tripped circuit breaker or replacing a screw-in fuse.

LOCATION NOT SPECIFIED. Where does the warning sign go—on the outside of the equipment, or inside the first door or cover? If installed outside, such signs may well be painted over or removed by users, particularly where panelboards are located in finished building areas. If installed inside the equipment, such signs will be seen only by Qualified Persons, who should already be aware of the hazards associated with electrical equipment and the proper precautions for minimizing these hazards.

INEFFECTIVENESS. Marking is the least effective way of trying to prevent hazards. If warning signs are almost universally required by a new Section 110.16, they will soon lose their impact and be almost universally ignored.

SCOPE CONFLICT. The subject of warning installers about electric arc flash hazards in order to motivate safety work practices is not within the scope of the National Electrical Code. Safety-related work practices, hazard risk category classifications, personal protective equipment, and information on electric arc flash hazards are covered in great detail by NFPA 70E-2000, Electrical Safety Requirements for Employee Workplaces. These complex subjects cannot be adequately covered, in a way that will improve safety, by two sentences and an informational Fine Print Note in the NEC.

EXPLANATION OF ABSTENTION:

ANTHONY: Even with the modifications to the original proposal, this change to the NEC may have unintended consequences for manufacturers, for building owners and for persons in the risk management community. While our support for electrician safety is unconditional, the practical details and the practical effects of this proposal needs more study.

(Log #1781)

1- 154 - (110-22): Reject
SUBMITTER: Alan Manche, Square D Co.
COMMENT ON PROPOSAL NO: 1-241
RECOMMENDATION: The panel should reconsider this proposal and accept the original proposal that adds the words "or equivalent."
SUBSTANTIATION: Product manufacturers are going to mark the product for the appropriate hazards and comply with the ANSI Z535 standards. The explicit nature of the present wording in the NEC establishes conflict between the NEC marking restrictions and the required hazard markings outlined in ANSI Z535.4

The objective of the NEC wording is to generally convey the basic message requirement to the user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would permit a hazard sign to comply with the NEC and be formatted in accordance with Z535.4.

Similar proposals were submitted to a number of code panels. Panels 3, 9, 14 &15 have accepted the addition of the words "or equivalent," and panel 13 has accepted the proposal in principal and revised the marking requirements to warn of the hazard without establishing specific wording and permitting compliance with the ANSI Z535 set of standards. The panel may want to review and consider the action taken by Code-Making Panel 13 in proposal 13-25.

Most importantly, the panel needs to take action in order to reconcile the conflict between the NEC and the ANSI Z353 standards by accepting the proposal.

PANEL ACTION: Reject.
PANEL STATEMENT: The panel rejects the term "equivalent" as there is an explicit need for a specific marking that both identifies the ampacity rating of the series combination overcurrent system and that specifically notifies an installer that rated replacement components are required. The addition of the term "or equivalent" could lead to markings that are not as clear as the present wording and it is the intent of the panel that a clear and concise informational marking such as that being currently required be placed on series combination rated overcurrent equipment.
The Code does not prohibit additional markings or similar informational signs deemed necessary by a manufacturer, designer, engineer, or installer. In addition, the panel reaffirms that the word "equivalent" is considered a vague and unenforceable word according to Section 3.2.1 of the NEC Style Manual.

1- 157 - (110-26(c)): Reject
SUBMITTER: Mike O'Meara, Arizona Public Service Co.
COMMENT ON PROPOSAL NO: 1-264
RECOMMENDATION: I disagree with the code panel action to reject this proposal. Many outdoor service equipment installations are located in areas that are partially enclosed to "hide" the service equipment. If the additional 24 in. space is not required beyond the open NEMA 3R doors of the equipment, the worker can become trapped in an area with no means of escape.
SUBSTANTIATION: By requiring the additional 24 in. of space to maintain the means of egress, an emergency exit path can be maintained at all times. This will eliminate problems in many jurisdictions that consider the "normal" condition of the equipment (with the doors closed) to meet the NEC minimum requirements.

PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient substantiation to require this change.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
COMMENT ON AFFIRMATIVE:
HITTINGER: Even though this proposal has been rejected by the code panel, I do feel the submitter has a valid point with regard to a clear means of access and egress while hinged doors or panels are in the open position. Under normal operating conditions this is not an issue, however, during an emergency a clear path is essential and could save lives.

(Log #1889)

1- 160 - (110-26(c)): Accept
SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers
COMMENT ON PROPOSAL NO: 1-260a
RECOMMENDATION: Continue to Accept this proposal.
SUBSTANTIATION: The ability to exit these areas using swing out doors and panic bars, pressure plates, or other similar devices is very important to the electrical workers of this country. We feel very strongly that, should an injury occur, swing out doors together with panic type hardware will assist in the ease of escape, prevent additional injury and facilitate rapid treatment of an injured worker. We all know that the building codes will never address the safety concerns of the electrical workers. CMP-1 is to be congratulated for recognizing the needs of electrical workers.
This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
COMMENT ON AFFIRMATIVE:
HITTINGER: This is a step in the right direction to provide electrical workers with a better means of egress should an accident occur within an equipment room. The building codes do not recognize equipment rooms as high hazard areas therefore panic hardware is not required. This change does belong in the NEC.
IVORY: Let's design our buildings with safety in mind both during construction and occupancy; panic hardware on doors and exits is a big step in the right direction.

(Log #1926)

1- 161 - (110-26(c)): Accept
SUBMITTER: James T. Dollard, Jr., Philadelphia, PA
COMMENT ON PROPOSAL NO: 1-260a
RECOMMENDATION: Continue to Accept this proposal.
SUBSTANTIATION: I agree with the Panel's statement and in particular the panel recognition of the need for panic hardware. Persons who must maintain large installations of electrical equipment are required in many cases to open or remove covers of switchboards/enclosures exposing live parts. In the event of a short circuit or ground fault the tremendous power that is released results in an Arc Flash and Arc Blast. Persons working in the area are in many cases seriously burned and blinded from the results of the Arc Flash and Arc Blast. Panic hardware and doors, which open in the direction of egress, will allow persons who may be temporarily blinded and have suffered burns to the hands to exit the area.
This change is necessary and does belong in NFPA-70 the NEC. Building Codes such as BOCA presently recognize the need for panic hardware and doors, which swing in the direction of egress for "high hazard" occupancies. Unfortunately the Building Codes do not recognize an electrical equipment room with equipment rated at 1200-amps or more as a "high hazard" occupancy.
This safety driven proposal should continue to be accepted as the stated purpose of the NEC in section 90-1 is as follows: The purpose of this Code is the practical safeguarding of persons and property from hazards arising from the use of electricity.
The Primary purpose of the NEC is to protect persons and the second to protect property. This change is necessary for the protection of all persons who will maintain large installations of electrical equipment.
PANEL ACTION: Accept.

1- 162 - (110-26(c)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 1-260a
RECOMMENDATION: Delete the sentence requiring panic hardware.
SUBSTANTIATION: Panic hardware is appropriate in areas where oil-filled equipment is common, because a fire can render a person unable to use their hands. As such, it is appropriate for transformer vaults and medium-voltage switchgear rooms, but for 600 volts and below it is excessive. Thinking back to my days as head electrician at a college, every electrical room on that campus would need its doors reconfigured, and not just in terms of providing different hardware, since many of those doors opened into the room.
PANEL ACTION: Reject.
PANEL STATEMENT: In limiting the requirement for panic hardware on exit doors to electrical rooms to those containing large equipment rated 1200 amperes or more, the intent is to avoid the situation described by the submitter. In addition, the Panel notes that the Code is not retroactive.

1- 166 - (110-26(f)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 1-271a
RECOMMENDATION: Revise as follows:
(F) Dedicated Equipment Space. All switchboards, panelboards, distribution boards, and motor control centers shall be located in dedicated spaces and protected from damage.
Exception: Control equipment that by its very nature or because of other rules of the Code must be adjacent to or within sight of its operating machinery shall be permitted in other spaces, but shall be protected from damage.
(1) Indoor. For indoor installations, the space equal to the width and depth of the equipment shall be kept clear of foreign systems unless protection is provided to avoid damage from condensation, leaks, or breaks in such foreign systems. This zone shall extend from the top of the electrical equipment to the structural ceiling. Sprinkler protection shall be permitted for the dedicated space where the piping complies with this section. A dropped, suspended, or similar ceiling that does not add strength to the building structure shall not be considered a structural ceiling.
(2) Outdoor. Outdoor electrical equipment shall be installed in suitable enclosures and shall be protected from accidental contact by unauthorized personnel, or by vehicular traffic, or by accidental spillage or leakage from piping systems. The working clearance space shall include the zone described in Section 110-26(A). No architectural appurtenance or other equipment shall be located in this zone.
SUBSTANTIATION: This, effectively, is the version Code Making Panel 9 voted at the end of the 1996 code cycle, changed somewhat to match its new location, as reflected in the panel action at the proposal stage. It's simple, and straightforward. It addresses genuine safety issues and nothing else. Absolutely nothing else.
I won't reiterate here the history covered in detail in the substantiation for Proposal 1-275. Suffice it to say that although the panel action (1-271a) will get cheers from some, it is deeply disturbing from the point of defending the NFPA process in public forums before disinterested parties on the political level. The issue is whether there is any credible safety issue in maintaining an absolute prohibition on foreign systems intruding below such equipment, or less than 6 ft above.
This argument has been going on for quite some time. I can remember a member of the NEC Committee (a design engineer) defending the dedicated space provision in the 1993 NEC. He liked it because, as an ironclad Code rule, he didn't have to fight for the space with the architects. He said this to the cheers of the NFPA Electrical Section five years ago, as part of a then successful floor attempt to derail a Code Making Panel 9 initiative similar to this comment. I wasn't cheering. I was cringing in horror, because I wasn't sure who might be taping the debate. If I were a building official bent on convincing a political authority to let building inspector organizations control the NEC, all I would have to do is play that tape and the debate would be over. That tape would prove to any disinterested government official that in the NEC process safety is a smokescreen to cover the convenience of our industry.
We don't own this space. It belongs to the property owner, who should be free to make bad design decisions as long as they don't compromise safety. They are the ones who have to live with those decisions. I came up wearing tools. No matter how obstructed the panelboard, I could always find some way out of that enclosure, however lacking in cost effectiveness, but safely and within the Code.
Furthermore, no such rule applies over 600V. Section 110-34(f) only requires leak protection, and relocation of foreign piping and ductwork requiring periodic maintenance or whose malfunction would endanger the electrical system. I note that Code Making Panel 1 avoided making any change to medium voltage requirements in this area. The result is that medium voltage systems end up, through simple continuity of requirements, with less severe requirements than those for 600V and below. Try explaining to a judge or government official that this is purely motivated by concerns about minimum safety, when you don't have to follow it at higher voltages, where even to a lay person it is obvious that the consequences of a failure are far greater.
This rule will turn around and bite us in many innocuous applications. We'll end up racking dwelling unit panels off basement walls just because the plumber got there first - even if the proverbial 4 in. drain runs below the panel and out of the required workspace, posing no conceivable leakage threat to the panel. That doesn't pose any safety threat, and it certainly doesn't take 6 ft of dedicated space to entrain a piece of Type NM cable to a panelboard. The industrial interests on Code Making Panel 1 should more carefully consider that the panel wording removes a blanket permission for their facilities (merely generalized to other locations in 1999 by Code Making Panel 9) to avoid this requirement that has been in the Code since the 1981 inception of the dedicated space rule.
The day is soon coming when we will be in front of political authorities trying to persuade them not to use an electrical code developed by building officials. I will be one of those leading our side of the debate. We must enter that debate with clean hands. The NEC must never be written as a tool to relieve us of our appropriate burden of communication, even if it does mean making the case with an architect that the space is in the best interest of his client. We must not destroy the moral authority of the Code as a document based solely on safety, and not on the convenience of its users.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its action on Proposal 1-271a. Requiring a dedicated space above the electrical equipment covered in this section provides a much safer environment for workers. The submitter's concern regarding the lack of equivalent wording covering electrical equipment rated over 600 volts is addressed in Section 110-34(F). The rule in that section prohibits pipes or ducts foreign to the equipment from being "...located in the vicinity...".

SUBMITTER: Craig M. Wellman, Newark, DE
COMMENT ON PROPOSAL NO: 1-273
RECOMMENDATION: Delete the proposed change to subparagraph (c) and revert to the existing language.
Delete the proposed exception.
SUBSTANTIATION: Where sprinkler piping is required, it is not practical to keep it out of the dedicated space. This is not a problem because it does not take up much of the space and therefore does not prevent accomplishing the purpose of having the dedicated space - the ability to run additional wiring.
If a sprinkler is fused (tripped or released) in the vicinity of indoor or water-resistant electrical equipment, water will penetrate the equipment and cause shorts, shutdowns and possibly explosions which may cause extensive damage. If this is intolerable, the owner should specify a preaction sprinkler system to minimize the possibility of a false trip. Sprinklers are considered so reliable that owners may accept the risk of sprinkler failure. In any case, it should be recognized that no shield or protection will prevent water from entering the equipment. It will be ineffective and is therefore unnecessary. If installed it is likely to be unacceptable to fire marshals.
Sprinkler lines are not subject to condensation when no water is flowing and that only happens during a fire. They are not subject to leaks because the joints do not fail and there are no valves.
PANEL ACTION: Reject.
PANEL STATEMENT: It is not the intent of the panel to prohibit sprinkler protection, water or other fire suppression materials, from coming in contact with any such protected electrical equipment. It is the intent of the panel that piping and other auxiliary fire sprinkler components not be installed within the 6 foot area directly above the equipment or the area directly above the equipment up to the structural ceiling when the distance above the equipment to the structural ceiling is less than 6 feet. Design of the type of sprinkler protection for electrical equipment is not the purpose of the NEC.

1- 168 - (110-26(g)): Reject
SUBMITTER: W. Creighton Schwan, Hayward, CA
COMMENT ON PROPOSAL NO: 1-286
RECOMMENDATION: Reconsider, and Accept, reworded as follows:
"All workspace in this section shall be free of obstructions, and flat, with no sudden changes in grade.
Exception: Areas required to be arranged to drain."
SUBSTANTIATION: This revised proposal satisfies the objections in the panel statement. An extreme example of the condition this new wording would control is a panelboard in the side wall of a stairway. There are many other examples of hazards not presently prohibited. It is obvious that a person working on electrical equipment needs a safe place to stand.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its action and statement on Proposal 1-286. To this point in time, no substantiation or specific incidents of problems have been documented to the panel. Impeded drainage is only one concern as many outdoor locations are not flat because of the general lay of the land and enforcement of such a requirement would be impractical. Many buildings have indoor floors and areas that could not be considered to be flat, but the degree of slope or unevenness would not be considered a hazard even under the most critical examination. A global requirement such has been proposed would in many cases be impractical and unworthy of enforcement.

1- 170 - (110-33): Accept
SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers
COMMENT ON PROPOSAL NO: 1-291a
RECOMMENDATION: Continue to Accept this proposal.
SUBSTANTIATION: The ability to exit these areas using swing out doors and panic bars, pressure plates, or other similar devices is very important to the electrical workers of this country. We feel very strongly that, should an injury occur, swing out doors together with panic type hardware will assist in the ease of escape, prevent additional injury and facilitate rapid treatment of an injured worker. We all know that the building codes will never address the safety concerns of the electrical workers. CMP-1 is to be congratulated for recognizing the needs of electrical workers.
This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.
PANEL ACTION: Accept.

COMMENT ON AFFIRMATIVE:
IVORY: I concur with Mr. Callanan's comment, in relation to the safety being provided by requiring swing out doors and the panic hardware. This safety measure will prevent injuries in the future. I hope that the rest of the building industry will see the value and cooperate in designing future buildings.

(Log #1927)

1- 171 - (110-33): Accept
SUBMITTER: James T. Dollard, Jr., Philadelphia, PA
COMMENT ON PROPOSAL NO: 1-291a
RECOMMENDATION: Continue to Accept this proposal.
SUBSTANTIATION: I agree with the Panel's statement and in particular the panel recognition of the need for panic hardware. Persons who must maintain installations of electrical equipment at over 600-volts nominal are required in many cases to open or remove covers of switchboards/enclosures exposing live parts. In the event of a short circuit or ground fault the tremendous power that is released results in an Arc Flash and Arc Blast. Persons working in the area are in many cases seriously burned and blinded from the results of the Arc Flash and Arc Blast. Panic hardware and doors, which open in the direction of egress, will allow persons who may be temporarily blinded and have suffered burns to the hands to exit the area.
This change is necessary and does belong in NFPA-70 the NEC. Building Codes such as BOCA presently recognize the need for panic hardware and doors, which swing in the direction of egress for "high hazard" occupancies. Unfortunately the Building Codes do not recognize an electrical equipment room with equipment rated at 1200-amps or more as a "high hazard" occupancy.
This safety driven proposal should continue to be accepted as the stated purpose of the NEC in section 90-1 is as follows: The purpose of this Code is the practical safeguarding of persons and property from hazards arising from the use of electricity.
The Primary purpose of the NEC is to protect persons and the second to protect property. This change is necessary for the protection of all persons who will maintain large installations of electrical equipment.
PANEL ACTION: Accept.

SUBMITTER: Alan Manche, Square D Co.
COMMENT ON PROPOSAL NO: 1-296
RECOMMENDATION: The panel should reconsider and accept the proposal.
SUBSTANTIATION: The panel indicated in the panel statement that the proposed material is already found in 110-32, unfortunately this is not the case. The material found in 110-32 parallels the material found in the general paragraph of 110-26. The proposed text would bring 110-34 in parallel with 110-26(a). 110-34 and 110-26(a) address the working clearance depth in contrast to 110-32 that addresses height and width of the working space.

For over 600V transformers, 110-34 is generally being interpreted in a similar manner to 110-26(a), in that working clearance depth is not required for transformers since they do not "require examination, adjustment, servicing, or maintenance while energized." However, since this sentence is not explicitly contained in 110-34, questions arise with regard to this interpretation.

The acceptance of this proposal will support the majority of the installations for industrial and commercial transformer installations and clarify the working space depth requirement.
PANEL ACTION: Reject.
PANEL STATEMENT: The present text is clear and addresses the concerns of the submitter.

1- 173 - (110-34(c)): Reject
SUBMITTER: Alan Manche, Square D Co.
COMMENT ON PROPOSAL NO: 1-302
RECOMMENDATION: The panel should reconsider i proposal and accept the original proposal that adds the words "or equivalent".
SUBSTANTIATION: Product manufacturers are going to mark the product for the appropriate hazards and comply with the ANSI Z535 standards. The explicit nature of the present wording in the NEC establishes conflict between the NEC marking restrictions and the required hazard markings outlined in ANSI Z535.4

The objective of the NEC wording is to generally convey the basic message requirement to the user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would permit a hazard sign to comply with the NEC and be formatted in accordance with Z535.4.

Similar proposals were submitted to a number of code panels. Panels 3, 9, 14 &15 have accepted the addition of the words "or equivalent," and panel 13 has accepted the proposal in principal and revised the marking requirements to warn of the hazard without establishing specific wording and permitting compliance with the ANSI Z535 set of standards. The panel may want to review and consider the action taken by Code-Making Panel 13 in proposal 13-25.

Most importantly, the panel needs to take action in order to reco
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms that the word "equivalent" is considered a vague and unenforceable word according to Section 3.2.1 of the NEC Style Manual. The term "or equivalent" will reduce consistency and lead to a reduction in safety. The panel prefers standard wording.

5- 4 - (200-6): Reject
SUBMITTER: Palmer Hickman, Royersford, PA
COMMENT ON PROPOSAL NO: 5-9
RECOMMENDATION: Revise the recommendation of the submitter and Panel Action for Proposal 5-9 as indicated:
"Delete the words "natural gray" from Section 200-6 and where similarly used in the NEC."
"FPN: The color gray may have been used in the past as a grounded conductor. Care should be taken when working on existing systems."
SUBSTANTIATION: I would urge Code-Making Panel 5 to reconsider their position on Proposal 5-9. The fact that the Panel saw the need to add a FPN alerting users of a potentially dangerous situation should be reason enough to raise concern.
I am perplexed by the 180-degree reversal of the Panel from their stance in previous Code cycles. Panel recognition of the use of gray as an ungrounded (hot) conductor is well documented in numerous Panel Statements, and Comments of Panel members. Panel 5 voted to reject Comment 5-10 from the 1998 ROC by a 12-1 vote. The Panel Statement rejecting Comment 5-10 stated that "deleting the word "natural" would permit gray to now identify a grounded conductor, where gray has been permitted to be used by the Code for many years to identify underground conductors." It would appear that Code-Making Panel 5 is rejecting its own Panel Statement without any new substantiation other than a "show of hands" as mentioned in a Comment of Affirmative on Proposal 5-9 (2001 ROP). Another apparent unsubstantiated reversal of opinion appears in the Panel Statement rejecting Proposal 5-3 (2001 ROP).
I agree a solution is needed and is long overdue. Allowing the use of gray as a grounded conductor in violation of the Code has gone on much too long. It is suggested in a Comment of Affirmative on Proposal 5-9, that the choice causing the least impact had been made by the Panel. I respectfully disagree and would offer another. I would direct your attention to the last paragraph of the Explanation of Negative offered by Mr. Rappaport for Proposal 5-13 (2001 ROP). He suggested that "the Code Panel should, once and for all, delete natural gray as identification for the grounded conductor." Mr. Rappaport provides further insight by pointing out earlier in the same comment that "SIS wire with gray insulation for switchgear wiring is a preferred method in ANSI C37 Standards for Switchgear and is used by equipment manufacturers for all control wiring within the switchgear assemblies."
What may seem to cause the least impact could well be the most dangerous. I suggest removing the term "natural gray" and adding a FPN alerting installers, maintainers, and users that the use of natural gray as a grounded conductor is no longer permitted by Code. A Panel Statement reaffirming its long standing position that natural gray has not been available for decades, and that the use of gray as a grounded conductor is not now, and has never been, permitted as a grounded conductor by the NEC.
Advocating noncompliance does not seem prudent. There are several viable alternatives recognized by the NEC to distinguish each system grounded conductor without the need for a gray conductor as a grounded conductor. Existing installations using gray conductors as grounded conductors will remain as legal or illegal as the authority having jurisdiction allowed them to be when they were installed. Removing "natural gray" as an alternative as a grounded conductor seems to be the natural progression. It protects those who have been in compliance. We, as guardians of safety, should also be diligent in our efforts to be consistent.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "natural" has already been determined to add confusion to the code relative to the identification of grounded conductors. The panel deliberated on numerous proposals to delete the term "natural gray" or just the term "natural" and found the substantiation for the latter to be acceptable. In the 1999 NEC cycle these same discussions were held without resolution and that is why there was no change from previous Codes. The panel's original action at the ROP stage was a step to eliminate the confusion caused by the word "natural" when used in the term "natural gray". Refer to the Panel statement for Proposal 5-9 in the 2001 ROP.
Conductor identification internal to various types of equipment is governed by related product standards. Manufacturers of various listed wiring methods and equipment presently use gray colored insulated conductors, intended for use as grounded conductors, in their products.

5- 5 - (200-6): Accept
SUBMITTER: Charles Mello, Milwaukie, OR
COMMENT ON PROPOSAL NO: 5-9
RECOMMENDATION: Leave the text as proposed by the panel action on this proposal.
SUBSTANTIATION: The panel has finally concluded after at least 3 code cycles of proposals to allow gray to be used as has been industry practice for over 40 years. The negative vote by Mr. Diaz leads to a misunderstanding of what different systems mean in Sections 200.6 and 200.7. Different systems do no necessarily mean different voltages, as proposal 5-26 would lead one to believe. The different systems could be two separate 208/120 volt systems, a 208/120 volt and a 240/120 volt system, or could be 120 Volt AC and 125 Volt DC.

The use of gray could be the first choice or the second to identify the grounded circuit conductor. It should be noted that at least one armored cable manufacturer has for over 15 years provided a UL listed cable assembly intended for use on multiwire branch circuits with a gray wire provided for the neutral.

The addition of the fine print note is an excellent method to forewarn individuals that there may be systems where a gray conductor was used as an ungrounded conductor. This is no different than systems installed in the 1950's with a dark green used as an ungrounded conductor that are still in service today even though green is reserved for equipment grounding conductors now.
PANEL ACTION: Accept.

(Log #2081)

5- 6 - (200-6): Reject
SUBMITTER: Henry A. Jenkins, Wake County
COMMENT ON PROPOSAL NO: 5-9
RECOMMENDATION: Replace the word "natural" with the word "light".
SUBSTANTIATION: Eliminating the word "natural" will leave the door open for even greater problems. In field practice, it is hard to determine the difference between a dark gray (charcoal for instance) conductor and a ungrounded conductor. This could be corrected by replacing the word "natural" with the word "light", therefore making the term "light gray". The word "light" is used as a descriptive word in Section 504-80(c) to distinguish between colors of blue in color coding intrinsically safe conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: The word "light" does not add clarity to the code. The term "light" is not defined; light gray to one person may be a different light gray to another. It is the intent of the panel that the color gray should be distinctive from any other color used in the circuit to prevent confusion.

5- 7 - (200-6(1)): Reject
SUBMITTER: Melvin K. Sanders, TECo., Inc.
COMMENT ON PROPOSAL NO: 5-9
RECOMMENDATION: Add the following restriction wherever the word "natural" has been deleted:

Gray shall only be permitted for new installations or where presently employed.

SUBSTANTIATION: This radical departure from past practices and legalize a past Code violation can be very dangerous if unrestricted use is made. When present Code recognized identification has been faithfully followed and gray has been used as a "live" unidentified conductor, it can easily be seen that mistakes can be made leading to incorrect wiring sequences at the least, to equipment damage as incorrect voltages are introduced, to shock, to electrocutions at the worst. Relying on a fine print note that may come to exist only in a remote appendix as the only caution is simply unwise. Those presently using it could continue to do so, those areas where Code rules have been faithfully followed can have reasonable assurance that white and gray have distinct duties and the identification schemes of Section 210-4(d) (1999 Edition) for multi-wire branch circuits can be fully utilized by all parties.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed additional text does not add clarity. Providing specific consistent requirements helps ensure safety.

The Panel action by insertion of the FPN should meet the intent of the submitter's recommendation. It should be noted the reference to Section 210-4 is incorrect as this section only deals with the identification of ungrounded conductors of different systems. See the panel statement on Proposal 5-3 of the 2001 NEC ROP.

5- 8 - (200-6(a)): Reject
SUBMITTER: Richard E. Loyd, Perryville, AR
COMMENT ON PROPOSAL NO: 5-14
RECOMMENDATION: Reconsider my proposal and accept it.
SUBSTANTIATION: I agree with the negative comment by Mr. Diaz to Proposal 5-9. I agree that gray has been used as second system color after White was used for the first system grounded color. I know of no installation where gray was used as a grounded conductor when there was only one system voltage in a building.

The panel has revised this proposal so that now gray can be used any time as a grounded conductor. This is wrong. I prefer that gray not be used at all as a grounded conductor but would prefer Mr. Diaz's compromise.

I have checked with distributors and found they will supply white wire with a colored strip as now required in 200-6(d). Therefore, gray is not needed and even the panel, by adding the fine print, note admit they are introducing and legalizing a safety hazard.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter did not provide any technical substantiation to support his opinion. The panel is aware that there are buildings in several areas of the country that have used gray for the only grounded conductor in the building. It is the intent of CMP-5 that Section 200.6A for the 2002 NEC, permit the use of either white or gray for the first (and possibly the only) system. Section 200.6D also specifies that where multiple systems exist in a common raceway or enclosure that the first system grounded conductor is identified by white, gray or three white stripes and the second system identified differently by white, gray or three white stripes or a white with color tracer.

CMP-5 does not agree that including the FPN reference indicates a safety hazard but intends to bring attention that different situations may exist.

COMMENT ON PROPOSAL NO: 5-26
RECOMMENDATION: Continue to reject this proposal.
SUBSTANTIATION: Mr. Hartwell would lead one to believe that different systems is directly correlated to different voltages where having an alternate identification of the grounded conductor involved. The negative vote by Mr. Diaz seems to perpetuate this misconception and is incorrect. Different systems can be at the same voltage level and be from different sources. The use of "natural" gray would be permitted under the present Code for all grounded conductors if there was only one system. There is no requirement that white be the first choice.

The panel should not apply any more restrictions or try defining what characteristics create a different system for the use of white, gray, the use of three white stripes or white with stripes as identifiers for the grounded conductor.
PANEL ACTION: Accept.

(Log #1989)

5- 12 - (200-6(d)): Reject
SUBMITTER: William F. Laidler, Rep. Massachusetts Electrical Code Advisory Committee
COMMENT ON PROPOSAL NO: 5-26
RECOMMENDATION: The proposal should be accepted as written.
SUBSTANTIATION: As has been noted in the panel member's comment, "The term 'natural gray' is out dated and not really applicable to modern wiring systems". It has taken 75 years to come to that thinking. If natural gray can be used to identify a grounded conductor, then other shades of gray could be permitted to be used as an ungrounded conductor (and have been).

Step one deletes the word natural. Now as written a grounded conductor can be either of three choices: (1) white (2) gray or (3) three continuous white stripes on other than green insulation. Each other system-grounding conductor shall have an outer covering of white with a readily distinguishable differently colored stripe (not green) running along the insulation. Confusing, isn't it, when you consider that the entire country accepts gray to be used for systems exceeding 150 volts to ground.

The time has come for a unique but obtainable conductor identification for a grounded conductor of a second system. Let's not wait another 75 years to take step two to permit white to be used for systems not exceeding 150 volts to ground; and gray to be used for systems exceeding 150 volts to ground.
PANEL ACTION: Reject.
PANEL STATEMENT: Listed wiring methods are presently available that contain white and gray colored insulated conductors (within a single cable assembly) which are intended to identify separate grounded conductors supplied from a single system. For all installations, CMP-5 intends that white, gray, or both be permitted to be used for grounded conductors without regard to system voltages.

5- 13 - (200-6(f)): Reject
SUBMITTER: W. Creighton Schwan, Hayward, CA
COMMENT ON PROPOSAL NO: 5-29
RECOMMENDATION: This is an important safety issue, and should be accepted.
SUBSTANTIATION: If 200-6(f) is not the appropriate location, then accept Mr. Brett's suggestion of 250-120, and it should also appear in 347-4. The panel statement that the subject is covered in 250-96 is not correct.
PANEL ACTION: Reject.
PANEL STATEMENT: It is the responsibility of the installer to verify that an appropriate equipment grounding conductor is present. Bonding can be accomplished by installing bonding jumpers, that are connected to metal enclosures at both ends of a nonmetallic raceway in accordance with Sections 250.96(A) and 250.102(E)

5- 15 - (200-7(c)(2)): Reject
SUBMITTER: Barry F. Tower, Patten, ME
COMMENT ON PROPOSAL NO: 5-42
RECOMMENDATION: The Panel should accept this proposal as submitted.
SUBSTANTIATION: The purpose of this proposal was change to back to the pre-1999 Code. It was changed in 1999 because of one person's concern about "weekend warriors" getting themselves into trouble replacing a switch. It should not have been changed without substantiation of a safety problem - (there was none!!!). Article 90-1(c) INTENTION states: "This Code is not intended as a design specification nor an instruction manual for untrained persons."

Do you really thing that "weekend warriors" will bother to reidentify the white conductor ow switch loops? They NEVER reidentify the white conductor when they wire up their own 240 V domestic water heater. Who is going to train them on recognizing reidentified conductors? Who is going to train them on recognizing common terminals of 3-way switches? Remember the white conductor may or may not go on the common terminal of

the switch. The important thing to know is which conductor goes on the common terminal. The change made to the 1999 Code DID NOT and CANNOT solve that issue - only the skills of a trained professional can accomplish the task. Even the least experienced person can replace a 3-way switch if they know enough to locate the common terminal of the old switch and the new switch. The worst thing that they can do is wire the switch in a way that it won't work properly (assuming that they know enough to turn off the circuit breaker before beginning work).
PANEL ACTION: Reject.
PANEL STATEMENT: Where insulated conductors in cable assemblies that are white, gray or have a marking of three white stripes are used as ungrounded conductors re-identification at terminations improves safety. The NEC can not ensure that only qualified individuals perform electrical work, but that, if its requirements are followed, installations will be essentially free from hazard.

It is relatively easy for qualified persons to understand what is going on in a three-way switch loop as mentioned by the submitter's comment. However there are installations where this requirement for identification would increase safety such as in ganged boxes where a few grounded conductors could exist as well as the use of the white or gray conductor of a cable assembly as an ungrounded conductor.

5- 16 - (200-7(c)(2)): Reject
SUBMITTER: William F. Laidler, Rep. Massachusetts Electrical Code Advisory Committee
COMMENT ON PROPOSAL NO: 5-48
RECOMMENDATION: This proposal should be accepted as written.
SUBSTANTIATION: Section 90 says it all, this codes is not intended as a design specification nor as an instructional manual for untrained persons. The proposal for this change in the 1999 NEC should have been rejected for inadequate substantiation. The code was changed to suit the needs of one untrained and obviously, unqualified person. This present requirement is cumbersome to a capable authority having jurisdiction and is fodder to an overzealous authority having jurisdiction.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on comment 5-15. CMP-5 does not consider that re-identifying a conductor is cumbersome but is easy to accomplish and enhances safety.

ARTICLE 210 — BRANCH CIRCUITS

(Log #1037)

2- 4 - (210-4(e) (New)): Reject
SUBMITTER: Michael L. Last, Na'alehu, HI
COMMENT ON PROPOSAL NO: 2-15
RECOMMENDATION: Consideration for accepting the recommendation in its entirety. To reject the proposal on the basis of the definition of a multiwire branch circuit, will not cause the hazardous condition to no longer exist. To consider the proposal (2-15) as attempting to eradicate a serious electrical hazard would be beneficial to the entire electrical community. The purpose of this proposal is to make it more difficult to transform a properly functioning multiwire branch circuit into a safety hazard. And without identifying what the modified branch circuit becomes.
SUBSTANTIATION: Substantiation refers to that type of wiring as defined as a Branch Circuit, Multiwire in Article 100. The integrity of a multiwire branch circuit is maintained when there is a potential difference between the ungrounded conductors. While due to a manipulation of the ungrounded conductors, no potential difference can exist, and therefore the term for this type of wiring would not be a multiwire branch circuit, however, a true compromise to electrical safety has been established. The Panel Statement that the wiring is not a multiwire branch circuit is congruent to claiming that a controller is no longer such, when it ceases to function in a predetermined manner. The initial device is still a controller, by definition, but it has stopped to function as such. What was a branch circuit, multiwire initially, due to some change, still would be considered as a multiwire branch circuit.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has provided insufficient substantiation which references how a hazardous condition would exist in a multi-wire branch circuit that would have been prevented by further identification of the conductors of the multi-wire branch circuit.

(Log #1713)

2- 6 - (210-7(g)): Accept in Principle
SUBMITTER: Charles M. Trout, Maron Electric Co. Inc.
COMMENT ON PROPOSAL NO: 2-25
RECOMMENDATION: The proposal should be accepted as written.
SUBSTANTIATION: The substantiation for the original proposal apparently dwelled too much on the requirements of Section 210-4(b). The intent of this proposal is to include all multiple receptacles mounted on the same yoke regardless of type of occupancy, dwelling unit or other, regardless of type of circuitry, be it single circuit, multi-wire circuit, or multiple circuits. When a receptacle outlet is opened, the workman should be protected by requiring all ungrounded conductors to that outlet to be disconnected simultaneously. Similar, but not complete, protection has been provided in Section 210-4(b) and this proposal would cover what that section has missed.

Example: Two receptacles on the same yoke (both tabs removed from a duplex receptacle). Two separate circuits with separate neutrals feeding the receptacle outlets. Not in a dwelling unit and not a multi-wire circuit but presenting the same hazard to a workman. Yes, of course we should all check to see that it's not energized but if everyone did as we think they should, safety rules would not be necessary, but they are. And that's why we're here.
PANEL ACTION: Accept in Principle.
Revise section 210.7 in the 2002 NEC ROP to read as follows:

210.7 Branch Circuit Receptacle Requirements.

(A) Receptacle Outlet Location. Receptacle outlets shall be located in branch circuits in accordance with Part III of Article 210.

(B) Receptacle Requirements. Specific requirements for receptacles are covered in Article 406.

(C) Multiple Branch Circuits. Where more than one branch circuit supplies more than one receptacle on the same yoke, a means to simultaneously disconnect the ungrounded conductors supplying those receptacles shall be provided at the panelboard where the branch circuits originated.

PANEL STATEMENT: The revised wording meets the intent of the submitter and provides further clarity.

SUBMITTER: Jack Wells, Pass & Seymour/Legrand
COMMENT ON PROPOSAL NO: 2-43
RECOMMENDATION: The Panel should continue to reject this proposal.
SUBSTANTIATION: This comment supports the action of the Panel to reject the proposal. Likewise, we support the Panel statement and the affirmative comment of Mr. Nissen on Proposal 2-32

Unfortunately, the survey mentioned in the Panel statement has taken longer than anticipated. The stated objective of the survey is "…to obtain statistically valid data to identify, define and quantify long term operation of GFCIs in the installed infrastructure. For suspected field failures, both the installation and the product must be analyzed and data compiled to enable clear definition (including conditions of use and environment) and mode of failure (e,g, SCR failure, test button failure) sufficient to define remedial action(s) if required.,"

The statistical model developed for this survey has been reviewed and confirmed by CPSC as appropriate. UL is fully involved in the collection, tabulation and analysis of the data as it comes in.

Because the data is incomplete, unanalyzed and lacks peer review it would be inappropriate for NEMA to release it at this time.

Even if the survey supports some remedial action, the Panel and Mr. Nissen are correct in stating that such action should involve the product safety standard, not the installation code.

SUBMITTER: Lanny McMahill, Rep. IAEI SW Section
COMMENT ON PROPOSAL NO: 2-35
RECOMMENDATION: Accept the revised text as proposed.
SUBSTANTIATION: See the information from NIOSH which I have provided to support this proposal.

The use of GFCI protection in dwelling units is a proven technology. In the interest of personnel safety, this technology should apply to all occupancies and locations. Accepting this proposal is another step toward consistency in the application of the code.

NOTE: Supporting Material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle in Part.
Add a new Item 3 to existing 210-8(b) to read as follows:
"(3) Kitchens."

The panel does not accept the submitter's recommendation to change the title of Section 210-8(a) from "Dwelling Units" to "All Occupancies".
PANEL STATEMENT: The panel has accepted in principle the concept of the submitter's comment to extend the GFCI requirement to nondwelling unit kitchens only by adding a new (3) in Section 210-8(b).

The panel did not extend GFCI requirements to all locations because the submitter's substantiation only addressed commercial kitchens sufficiently.

2- 14 - (210-8(a)): Accept in Principle in Part
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 2-35
RECOMMENDATION: Requesting that the Code Making Panel reconsider the action on this proposal. This proposal should be accepted and additional information has been provided to be included as substantiation. Normally the code gets changed or revised based on history or data. It also can be changed or revised based on additional safety that the changes affords the users and general public. The code is not very often changed in a proactive manner. Accepting this proposal does address all of these areas. It provides added safety from electrical shock and electrocution, it is in parallel with the requirements already in place for dwelling units. The hazards are the same, and sometimes even greater in occupancies other than dwelling units. Accepting this proposal would be proactive and would increase the safety for users and the public.
SUBSTANTIATION:

Subject: 25-year-old Restaurant Manager Electrocuted in North Carolina

Cause: Electrocution

Summary: On August 3, 1986, a 25-year-old male restaurant manager was cleaning the floor of the kitchen when he came in contact with a refrigerator that had a ground fault. The manager was electrocuted. The restaurant was closed and the manager's wife and 2-year-old daughter were in the dining area waiting for him to finish. The victim, who was wearing tennis shoes, put soap and water on the floor. He slipped and grabbed the handle of a commercial refrigerator. The refrigerator had a ground fault – the cord did not have a ground prong. The ground fault was apparently caused by excessive wear on the insulation of the conductors (wires) supplying power to the compressor. The conductors were exposed at a cut-out hole in the case of the refrigerator, were not protected from abrasion, and were not protected by strain relief. The victim's wife heard a noise in the kitchen. She successfully pulled the victim from the refrigerator into the dining area, though she was shocked in the process. She summoned help and began CPR, but to no avail.

Recommendations:

• All electrical equipment (such a refrigerator) should be designed and maintained to comply with all applicable requirements of the National Electrical Code. In this case, the defects in the refrigerator apparently developed over time and were not recognized as hazardous. The refrigerator was bought used and the owner had no owner's manual.

• Restaurant owners and managers should be encouraged to conduct formalized safety training for all restaurant employees.

• All electrical receptacles (outlets) in restaurant kitchens should be protected by ground fault circuit interrupters. See NIOSH Alert (85-104).

Subject: Electrocution in a Fast Food Restaurant

Cause: Electrocution

Summary: On June 30, 1984, at about 1:05 A.M., an 18-year-old male employee with 15 months experience at a fast food restaurant was electrocuted while plugging a portable electric toaster into a 110 volt/20 amp receptacle.

At the time of the incident, employees had closed the restaurant and damp-mopped the floors. About 5 to 10 minutes after mopping, the victim was in the process of plugging the toaster into a floor outlet when he received a shock. The assistant manager and other employees were elsewhere and did not see the victim. The assistant manager heard a scream and investigated. The assistant manager and the other workers found the victim with one hand on the plug, and the other hand wrapped around the receptacle box, and with his face on top of the outlet. An employee tried to take the victim's pulse but was shocked. The assistant manager went to the breaker box to open the breaker for that circuit, but could not find the specific breaker. He then called the emergency squad, returned to the box and found the right breaker. The victim had by then been in contact with the current for 3 to 8 minutes. An employee checked the victim's pulse and found very rapid radial pulse. The employee and assistant manager then unlocked the front door and placed another call to the rescue squad. The employee check the victim's pulse again and found none. An employee living nearby arrived and started CPR, which was continued by the rescue squad upon its arrival. CPR was administered for 1./5 hours. The victim was DOA at the local hospital. Two different electricians later evaluated the circuit and found no serious problems. It is surmised that while holding the plug, the victim's right hand slipped forward to make contact through the index finger to the energized prong. With his left hand holding the spring-loaded cover open, a current path through the arms, chest, and heart would be established from the prong to the ground. After the accident the employer required employees to open circuits at the breaker box before plugging and unplugging equipment. This strategy is not recommended because it relies on positive human action and places excessive wear on breakers.

Recommendations:

• Ground Fault Circuit Interrupter Breakers (GFCI's) would have interrupted the circuit before sufficient current has passed to cause physical damage to the body. They are recommended as the best solution.

• The location and design of the receptacles, the design of the plug, and the recent mopping contributed to the incident.

• CPR should be initiated when an unstable pulse is detected, rather than later when no pulse is found.

Subject: Worker Electrocuted in Mushroom Cannery in Ohio

Cause: Electrocution

Summary: On March 5, 1985, a 21-year-old male was electrocuted while attempting to unclog a drain trough located beneath a mushroom processing table. Apparently, the worker steadied himself by grasping the motor connection box while kneeling in water.

Prior to the accident, the cannery owner had been ordered by the city to reduce the amount of solid waste leaving the plant, because it was plugging drains and causing floods on public property. The employer tried to use removable filters over the drains, but employees failed to replace the filters, and so the employer bolted down a solid grate that had to cleaned by hand. At 9:30 A.M., the victim was ordered to the mushroom processing room and told to unclog a 7-inch-wide drain trough located under a processing table. A motor connection box was located under the table, 42 inches above the trough. Water had backed up behind the drain to form a pool 3 feet in diameter and 4 inches deep. The worker was in contact with the electric current for about 15 seconds. The worker was not observed, but a co-worker who reached for the victim received a shock, and a second worker was shocked by the table. Another co-worker immediately de-enrgized the equipment and the victim fell face down in the water. Medics arrived 8 minutes after the incident and attempted to revive the victim, who was DOA at a local hospital. On opening the motor connection box about 8 ounces of water poured out. The box was rusted and had many sharp edges.
(text illegible)
of the insulation was torn off and was probably the source of the electrical energy. The insulation could have been torn by pulling on the box's power cord. The motor was not suitable for wet applications.

Recommendations:

• The plant's electrical system should be inspected and brought up to the requirements of the National Electrical Code. Where appropriate, ground-fault circuit breakers should be installed.

• Workers should be required to wear appropriate protective gear.

• Insulating barriers mechanically attached to the processing machinery would be desirable.

• The mushroom processing procedure should be modified to reduce the number of mushrooms that fall on the floor.

• Management should implement a hazard identification program and request help from the Industrial Commission of Ohio in developing a comprehensive health and safety program.

Subject: Maintenance Mechanic Electrocuted While Touching Damaged Power Cord

Cause: Electrocution

Summary: On December 22, 1988, a 37-year-old male maintenance mechanic was electrocuted when he grasped a power cord with damaged insulation and contacted an exposed energized conductor. The employer is a meat-packing plant. At the end of each production shift, maintenance workers unplug two strapping machines used to package meat, and move them to the maintenance shop for the night. The plant floor is then washed. The machines are inspected and returned the next day. The machines are portable wheel-mounted units. Strapping material is fed from a fiberglass spool mounted on top. The machines have flexible power cords with twist-lock male plugs, attached to receptacles (outlets) on the end of cords hanging from the ceiling. On the day of the incident, a power cord on one machine was repeatedly rubbed by the edge of the rotating fiberglass spool. The point of contact was about 2.5 inches from the plug. Friction wore a half inch-long hole through the outer cover and through the insulation around one wire. The floor was wet. Fiberglass in non-conductive, and so the damage did not energize the machine. At about 5:00 P.M. the victim came to unplug the machine. He was wearing a damp pair of worn leather boots. As he grasped the plug, a finger of his right hand contacted the damaged section of cable and a bare 277-volt conductor. Current passed through his body to the wet floor. A foreman tried to free the victim's hand with a plastic scoop, but failed. The forman then struck the plug above the victims' hand knocking it loose from the cable. The victim lost consciousness. A company nurse began CPR, and a rescue squad was notified. The victim was pronounced dead about 1 hour and 15 minutes after the incident.

Recommendations:

• Permanent fixed wiring should be used whenever possible. When this is not practical, armored or protected cable should be used when cables can be contacted by moving parts.

• Strain relief should be provided where connections on power cords are subject to being pulled apart. See the National Electrical Code (NEC 400-10).

• Disconnect devices should be located close to equipment. See NEC 380-8. If the possibility of confusion exists, the disconnects should be clearly labeled. See NEC 110-22.

• Electrical safety training should be provided to all employees likely to be exposed to energized equipment.

• Periodic safety inspection of all electrically powered equipment should be performed to detect and correct problems. In this case, though the machines were "inspected", no one noticed that the damaged power cord had been previously abraded.

Prevention: Elements of an Electrical Safety Program (text illegible)

At least on of the following five factors was present in all 224 incidents evaluated by the FACE program: (1) established safe work procedures were either not implemented or not followed; (2) adequate or required personal protective equipment was not provided or worn; (3) lockout-tagout procedures were either not implemented or not followed; (4) compliance with existing OSHA, NEC, and NESC regulations were not implemented; and (5) worker and supervisor training in electrical safety was not adequate. These subjects are addressed in various NIOSH Alters [26-36] and related publications. [37]

Most of the 224 occupational electrocution incidents investigated as part of the FACE program could have been prevented through compliance with existing OSHA, NEC, and NESC regulations; and/or the use of adequate personal protective equipment (PPE). All workers should receive hazard awareness training so that they will be able to identify existing and potential hazards present in their workplaces and relate the potential seriousness of the injuries associated with each hazard. Once these hazards are identified, employers should develop measures that would allow for their immediate control. Based on an analysis of this data, to reduce occupation electrocutions, employers should:

• Develop and implement a comprehensive safety program and, when necessary, revise existing programs to throughly address the area of electrical safety in the workplace.

Ensure compliance with existing OSHA regulations Subpart S of 29 CFR 1910.302 through 1910.399 of the General Industry Safety and Health Standards[3] and Subpart K of 29 CFR 1926.402 through 1926.408 of the OSHA Construction Safety and Health Standards[4].

• Provide all workers with adequate training in the identification and control of the hazards associated with electrical energy in their workplace.

• Provide additional specialized electrical safety training to hose workers working with or around exposed components of electric circuits. This training should include, but not be limited to, training in basic electrical theory, proper safe work procedures, hazard awareness and identification, proper use of PPE, proper lockout/tagout procedures, first aid including CPR, and proper rescue procedures. Provisions should be made for periodic retraining as necessary.

• Develop and implement procedures to control hazardous electrical energy which include lockout and tagout procedures and ensure that workers follow these procedures.

• Provide those workers who work directly with electrical energy with testing or detection equipment that will ensure their safety during performance of their assigned tasks.

• Ensure Compliance with the National Electrical Code[5] and the National Electrical Safety Code[6].

• Conduct safety meetings at regular intervals.

• Conduct scheduled and unscheduled safety inspections at worksites.

• Actively encourage all workers to participate in workplace safety.

• In construction setting, conduct a jobsite survey before starting any work to identify any electrical hazards, implement appropriate control measures, and provide training to employees specific to all identified hazards.

• Ensure that proper personal protective equipment is available and worn by workers where required (including fall protection equipment).

• Conduct job hazard analyses of all tasks that might expose workers to the hazards associated with electrical energy and implement control measures that will adequately insulate and isolate workers from electrical energy.

• Identify potential electrical hazards and appropriate safety interventions during the planning phase of construction or maintenance projects. This planning should address the project from start to finish to ensure workers have the safest possible work environment.

The FACE data indicates that although many companies had comprehensive safety programs, in many cases they were not completely implemented. This underscores the need for increased management and worker understanding, awareness, and ability to identify the hazards associated with working on or in proximity to develop and implement a comprehensive safety program. In some cases, this may entail the development of additional worker training, and/or the evaluation and restructuring of existing safety programs. Management should also provide adequate training in electrical safety to all workers and strictly enforce adherence to established safe work procedures and policies. Additionally, adequate personal protective equipment should be available where appropriate. Information or assistance in accomplishing these measures can be provided by OSHA, electrical safety consultants, or other agencies or associations that deal with electrical safety. A strong commitment to safety by both management and workers is essential in the prevention of severe occupational injuries and death due to contact with electrical energy.

Overview of Electrical Hazards, Virgil Casini, B.S.

Electricity is a ubiquitous energy agent to which many workers in different occupations and industries are exposed daily in the performance of their duties. Many workers know that the principal danger from electricity is that of electrocution, but few really understand just how minute a quantity of electrical energy is required for electrocution. In reality, the current drawn by a tiny 7.5 watt, 120-volt lamp, passed from hand to hand or hand to foot across the chest is sufficient to cause electrocution.[1] The number of people who believe that normal household current is not lethal or that powerlines are insulated and do not pose a hazard is alarming. Electrocutions may result from contact with an object as seemingly innocuous as a broken light bulb or as lethal as an overhead powerline, and have affected workers since the first electrical fatality was recorded in France in 1879 when a stage carpenter was killed by an alternating current of 250 volts.[2]

The information in the following two sections (Definitions and Effects of Electrical Energy) is intended as a basic explanation of electricity and the effects of electrical energy. Unless otherwise indicated, information in these sections is derived from OSHA

electrical standards, [3,4] the National Electrical Code (NEC)[5], and the National Electrical Safety Code[6]. Official definitions of electrical terms can be found in these same documents.

Definitions:

Electricity is the flow of an atom's electrons through a conductor. Electrons, the outer particles of an atom contain a negative charge. If electrons collect on an object, that object is negatively charged. If the electrons flow from an object through a conductor, the flow is called electric current. Four primary terms are used in discussing electricity: voltage, resistance, current and ground.

Voltage is the fundamental force or pressure that causes electricity to flow through a conductor and is measured in volts. Resistance is anything that impedes the flow of electricity through a conductor and is measured in Ohms. Current is the flow of electrons from a source of voltage through a conductor and is measured in amperes (Amps). If the current flows back and forth (a cycle) through a conductor, it is called alternating current (AC). In each cycle the electrons flow first in one direction, then the other. In the United States, the normal rate is 60 cycles per second {or 60 Hertz (Hz)]. If current flows in one direction only (as in a car battery), it is called direct current (DC).

AC is most widely used because it is possible to step up or step down (i.e., increase or decrease) the current through a transformer. For example, when current from an overhead powerline is run through a pole-mounted transformer, it can be stepped down to normal household current.

OHM's (current = voltage/resistance) can be used to rotate these three elements mathematically. A ground is a conducting connection, whether or not unitentional, between an electric circuit on equpment and the earth or some conducting body that serves in place of the earth.

Effects of Electrical Energy

Electrical injuries consist of four main types: electrocution (fatal), electric shock, burns, and falls caused as a result of contact with electrical energy.

Electrocution results when a human is exposed to a lethal amount of electrical energy. To determine how contact with an electrical source occurs, characteristics of the electrical source before the time of the incident must be evaluated (pre-event). For death to occur, the human body must become part of an active electrical circuit having a current capable of overstimulating the nervous system or causing damage to internal organs. The extent of injuries received depends on the current's magnitude (measured in Amps), the pathway of the current through the body and the duration of current flow through the body (event) the resulting damage to the human body and the emergency medical treatment ultimately determine the outcome of the energy exchange (post-ever)[7].

Electrical injuries may occur in various ways: direct contact with electrical energy, injuries that occur when electricity arcs (an arc is a flow of electrons through a gas, such as air) to a victim at ground potential (supplying an alternative path to ground), flash burns from the heat generated by an electrical arc, and flame burns from the ignition of clothing or other combustible, nonelectrical materials. Direct contact and arcing injuries produce similar effects. Burns at the point of contact with electrical energy can be caused by arcing to the skin, heating at the point of contact by a high-resistance contact or higher voltage currents. (text illegible) voltages will normally result in burns at the sites where the electrical current enters and exits the human body. High voltage contact burns may display only small superficial injury; however, the danger of these deep burns destroying tissue subcutaneously exists.[8] Additionally, internal blood vessels may clot, nerves in the area of the contact point may be damaged, and muscle contractions may cause skeletal fractures either directly or in association with falls from elevation.[9] It is also possible to have a low-voltage electrocution without visible marks to the body of the victim.

Flash burns and flame burns are actually thermal burns. In these situations, electrical current does not flow through the victim and injuries are often confined to the skin.

Contact with electrical current could cause a muscular contraction or a startle reaction that could be hazardous if it leads to a fall from elevation (ladder, aerial bucket, etc.) or contact with dangerous equipment.[10]

The NEC describes high voltage as greater than 600 volts AC.[5] Most utilization circuits and equipment operate at voltages lower than 600 volts, including common household circuits 110/120 volts); most overhead lighting systems used in industry or office buildings and department stores; and much of the electrical machinery used in industry, such as conveyor systems, and manufacturing machinery such as weaving machines, paper rolling machines or industrial pumps.

Voltages over 600 volts can rupture human skin, greatly reducing the resistance of the human body, allowing more current to flow and causing greater damage to internal organs. The most common high voltages are transmission voltages (typically over 13,900 volts) and distribution voltages (typically under 13,900 volts). The latter are the voltages transferred from the power generation plants to homes, offices and manufacturing plants.

Standard utilization voltages produce currents passing through a human body in the milliampere (mA) range (1,000 mA= 1Amp). Estimated effects of 60 Hz AC currents which pass through the chest are shown in Table 1.

Table 1. Estimated Effects of 60 Hz AC Currents

1 mA	Barely perceptible
16 mA	maximum current an average man can grasp and "let go"
20 mA	Paralysis of respiratory muscles
100 mA	Ventricular fibrillation threshold
2 Amps	Cardiac standstill and internal organ damage
15/20 Amps	Common fuse or breaker opens circuit*

* Contact with 20 miliamps of current can be fatal. As a frame of reference, a common household circuit breaker may be rated at 15, 20 or 30 amps.

When current greater than 16 mA "let go current" passes through the forearm, it stimulated involuntary contraction of both flexor and extensor muscles. When the stronger flexors dominate, victims may be unable to release the energized object they have grasped as long as the current flows. If current exceeding 20 mA continues to pass through the chest for an extended time, death could occur from respiratory paralysis. Currents of 10 MA or more, up to 2 Amps, may cause ventricular fibrillation, probably the most common cause of death from electrical shock.[11] Ventricular fibrillation is the uneven pumping of the heart due to the uncoordinated, asynchronous contraction of the ventricular muscle fibers of the heart that leads quickly to death from lack of oxygen to the brain. Ventricular fibrillation is terminated by the use of a defibrillation, which provides a pulse shock to the chest to restore the heart rhythm. Cardiopulmonary resuscitation (CPR) is used as a temporary care measure to provide the circulation of some oxygenated blood to the brain until a defibrillator can be used.[23]

The spread with which resuscitative measures are initiated has been found to be critical. Immediate defibrillation would be ideal; however, for victims of cardiopulmonary arrest, resusciation has the greatest rate of success if CPR is initiated within 4 minutes and advanced cardiac life support is initiated within 8 minutes (National Conference on CPR and ECC, 1986).[6]

The presence of moisture from environmental conditions such as standing water, wet clothing, high humidity, or perspiration increases the possibility of a low-voltage electrocution. The level of current passing through the human body is directly related to the resistance of its path through the body. Under dry conditions, the resistance offered by the human body may be as high as 100,000 Ohms. Wet or broken skin may drop the body's resistance to 1,000 Ohms. The following illustrations of Ohm's law demonstrates how moisture affects low-voltage electrocutions. Under dry conditions, Current=Volts/Ohms = 120/100,000 = 1 mA, a barely perceptible level of current. Under wet conditions, Current=Volts/Ohms = 120/1,000 = 120 mA, sufficient current to cause ventricular fibrillation. Wet conditions are common during low-voltage (text illegible)

High voltage electrical energy quickly breaks down human skin, reducing the human body's resistance to 500 Ohms. Once the skin is punctured, the lowered resistance results in massive current flow, measured in Amps. Again, Ohm's law is used to demonstrate the action. For example, at 1,000 volts, Current = Volts/Ohms = 1000/500 = 2 Amps, which can cause cardiac standstill and serious damage to internal organs.

Conclusions:

Electrical hazards represent a serous, widespread occupational danger; practically all members of the workforce are exposed to electrical energy during the performance of their daily duties, and electrocutions occur to workers in various job categories. Many workers are unaware of the potential electrical hazards present in their work environment, which makes them more vulnerable to the danger of electrocution.

The Occupational Safety and Health Administration (OSHA) addresses electrical safety in Subpart S 29 CFR 1910.302 through 1910.399 of the General Industry Safety and Health Standards.[3] The standards contain requirements that apply to all electrical installations and utilization equipment, regardless of when they were designed or installed. Subpart K of 29 CFR 1926.402 through 1926.408 of the OSHA Construction Safety and Health Standards[4] contains installation safety requirements for electrical equipment

and installations used to provide electric power and light at the jobsite. These sections apply to both temporary and permanent installations on the jobsite.

Additionally, the National Electrical Code (NEC)[5] and the National Electrical Safety Code (NESC)[6] comprehensively address electrical safety regulations. The purpose of the NEC is the practical safeguarding of persons and property from hazards arising from the use of electricity. The NEC contains provisions considered necessary for safety and applies to the installation of electric conductors and equipment within or on public or private buildings or other structures, including mobile homes, recreational vehicles, and floating buildings; and other premises such as yards; carnival, parking, and other lots; and industrial substations.

The NEC serves as the basis for electrical building codes across the United States.

The NESC contains rules necessary for the practical safeguarding of person during the installation, operation, or maintenance of electric supply and communication lines and associated equipment. These rules contain the basic provisions that are considered necessary for the safety of employees and the public under the specified conditions. Unlike the NEC, the NESC contains work rules in addition to installation requirements.

Preventing Electrocution of Workers in Fast Food Restaurants

NIOSH Alert: December 1984

DHHS (NIOSH) Publication No. 85-104

Background:

On June 30, 1984, an 18-year-old male worker in a fast food restaurant dies by electrocution on the job. The worker, who had 15 months' work experience at this restaurant, was electrocuted while kneeling to insert the plug of a portable electric toaster into a 110/120V/20 amp outlet on a floor which had recently been (text missing)
receptacle box. Another worker who attempted to "take the pulse" of the victim received an electrical shock but was not injured.

When the assistant manager saw what was happening, he went to the breaker box to shut off the current but was unable to locate the appropriate breaker. The emergency rescue squad was called, and before they arrived, the proper circuit breaker was located and thrown. By that time, the victim had been in contact with the electricity for three to eight minutes. Attempts at cardiopulmonary resuscitation (CPR) by fellow workers and members of the emergency rescue squad were unsuccessful; the victim was pronounced dead on arrival at a nearby hospital.

The specific events that resulted in this electrocution could not be defined with absolute precision. However, investigators from NIOSH concluded that while the victim was inserting the plug of the toaster into the receptacle with his right hand and holding open the grounded metal receptacle cover with his left hand, the index finger of his right hand touched an energized prong of the plug and he received an electrical shock across the chest.

Recommendations by NIOSH

Because one-tenth (0.1) amp of electricity flowing through the human body for two seconds can cause death any active electrical circuit can pose a potentially lethal hazard.

Electrical hazards in the kitchens of commercial restaurants are particular concern because of the variety of electrical appliances in use. However, safeguards and safe work practices can eliminate most of these hazards NIOSH recommends that:

1. Ground fault circuit interrupters (GFCIs) of the breaker or receptacle type be installed in situations where electricity and wetness coexist. GFCIs will interrupt the electrical circuit before current sufficient to cause death or serous injury has passed through the body. GFCIs are inexpensive ($50.00-$85.00 for breaker type, $25.00-$45.00 for receptacle type) and a qualified electrician can install them in existing electrical circuits with relative ease;
2. Exposed receptacle boxes be made of nonconductive material so that contact with the box will not constitute "a ground";
3. Plugs and receptacles be designed to prevent energization until insertion is complete;
4. All circuit breaker or fuse boxes bear a label for each circuit breaker or fuse which clearly identifies its corresponding outlets and fixtures. Also, breaker switches should not be used for on-off switches;
5. All workers, when hired, be made aware of electrical hazards and of safe work practices by which to avoid these hazards. Workers should be informed that, in the event of an electrical injury, no contact should be made with the victim or the electrical apparatus causing the injury until the current has been shut off; and that
6. Workers in the restaurant be encouraged to train in CPR.

We are requesting that editors of appropriate trade journals, health officials, and especially food service inspectors institute and bring these recommendations to the attention of restaurant managers and owners and potential victims. Suggestions, requests for additional information on control practices, or questions related to this announcement should be directed to Mr. John Moran, Director, Division of Safety Research, National Institute for Occupational Safety and Health, 944 Chestnut Ridge Road, Morgantown, West Virginia 26505, Telephone (304) 291-4595.

We greatly appreciate your assistance. J. Donald Millar, M.D., D.T.P.H. (Lond.), Assistant Surgeon General, Director, National Institute for Occupational Safety and Health, Center for Disease Control

SUBMITTER: Volney H. Ford, Multitech Inspection Services
COMMENT ON PROPOSAL NO: 2-44
RECOMMENDATION: Proposal 2-44 should be accepted A.S.A.P. without prolonged study. The problem is very obvious and becoming more extensive by the day. The homeowner is following the self test procedure, in many cases, and it assures them that a fault device/circuit is safe.
SUBSTANTIATION: As a working, ASHI-certified home inspector, I have found hundreds of the following:
a) GFCIs that self-test "ok", but will not trip on external test.
b) GFCIs installed on ungrounded circuits, and yet self-test "ok".
c) GFCIs wired incorrectly, affecting downstream outlets, but self-tests "ok".
d) GFCIs that always remain powered, even though GFCI function has "died".
Homeowners routinely install their own GFCI outlets, or replace defective ones, and have no idea how to wire them. The device must be designed to a fail safe wire up and test format, if it is to assure safety.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 2-42. The panel notes that some of the items noted in the submitter's substantiation are not improperly operating GFCIs, but are indications of improper testing.

SUBMITTER: James N. Pearse, Leviton Manufacturing Co., Inc.
COMMENT ON PROPOSAL NO: 2-44
RECOMMENDATION: Accept the original Proposal 2-44.
SUBSTANTIATION: The original proposal reported many installed GFCIs were incapable of providing protection though they provide power. While additional studies were promised for CMP-2's review, it is unlikely that any further studies will contradict the first.

This is confirmed in a European study of the reliability of Residual Current Devices. that I have provided. This study is based on 21,147 product evaluations and reports (on page 27 of the report) an overall defect rate of 8.3 percent on commercial devices and 7.1 percent defective on residential devices. The report categorized the data in many ways and points to several environmental conditions to which the defects are attributed. Certainly, the lack of periodic testing may influence the overall percentage.

The report confirms that many external factors can cause an RCD to no longer provide protection, just as in the original survey (previously provided). Inoperable protection devices have now been shown to be global in nature. The survey I have provided affirms the original survey's premise and conclusion and minimized the need for the panel to wait on yet another study (from NEMA). How many studies are needed to show that GFCIs and similar safety devices eventually break down and no longer provide the protection one expects? By requiring outdoor GFCI's not to supply power if they cannot pass the internal test, would go a long way in increasing electrical safety.

Note: Supporting material available for review upon request at NFPA headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 2-42. The RCD study supplied with this comment does not provide data relevant to the issue at hand. The study covers electromechanical RCDs which are not used in the United States, have different applications in Europe, and have very different failure parameters than the GFCI.

2- 42 - (210-8(a)(3)): Reject
SUBMITTER: Steve Campolo, Leviton Manufacturing Co., Inc.
COMMENT ON PROPOSAL NO: 2-32
RECOMMENDATION: Accept the original Proposal 2-32.
SUBSTANTIATION: The original proposal recommended that Listed GFCI's (incorporating a certain Listed feature) be required at outdoor locations, which is the responsibility of Code-Making Panel 2. This action will resolve the problem of providing power without protection, at outdoor locations.

Mr. Nissen made an affirmative comment that encouraged advancements in technology and indicated that product requirements belong in the UL standard and not the NEC. For the most part, we agree. However, the (optional) specific product requirements have been established by UL. UL has Listed a GFCI that incorporates the above mentioned features, and has applied those requirements long ago. Since UL applied certain additional requirements upon this type of GFCI, it is expected that these additional (optional) requirements will be published in the UL Standard by the normal standards process. There seems to be reluctance to require this feature on Listed GFCIs, perhaps due to external pressures. This comment recognizes that fact and points out that the proposal recommends a UL Listed product be utilized in a specific installation location, which is well within the jurisdiction of the NEC. Without an NEC requirement for this feature, there will be little utilization of this type GFCI. This has been recognized by Code-Making Panel 2 when it was required to use a circuit breaker containing certain added features in bedroom circuits.

There is an additional benefit of requiring this UL Listed product at outdoor locations. The ongoing NEMA study has reaffirmed that many GFCIs are wired incorrectly, usually as Line/Load reversal. In fact, the UL Standard requires a label covering the Load terminals. This label is often removed and the GFCI is miswired anyway. Miswired GFCIs (with UL label) have been seen in the NEMA study. A Listed GFCI incorporating these features has the added benefit of preventing itself from being reset if wired with a Line/Load reversal. This important feature is mentioned in the third paragraph of a letter from the US CPSC.

By accepting the original proposal, the NEC will recognize these advancements in GFCI technology and help to insure that when a GFCI supplies power to outdoor receptacles, life saving personnel protection is also provided.

Note: Supporting material available for review upon request at NFPA headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel has established requirements for GFCI protection in various locations of electrical installations. The performance of that GFCI is established by UL 943 - Standard for Safety of Ground-Fault Circuit Interrupters. If changes are needed to GFCIs to address specific identified issues, requirements for these changes should be incorporated into the GFCI standard.

Although, the submitter has proposed a specific feature on a GFCI, it does not address the issue of some GFCIs not functioning in the field. Commentors have claimed that homeowners do not test their GFCIs (see for example, comment 2-44). The submitter's solution would only "lock-out" a GFCI after a test was attempted by pushing the test button. Code-Making Panel 2 would expect the GFCI industry to address the cause of the failure and design future GFCIs to be more robust. No data has been submitted to indicate that a GFCI has been appropriately tested by the user, found not to function properly, and then left in service. As such, the "lock-out" solution does not support resolution of the issue.

The panel understands that UL is actively engaged with industry to look at not only numbers of inoperative GFCIs, but also the root cause of the inoperative condition. Code-Making Panel 2 would expect UL and industry to then address those root cause issues in the product standard.

2- 43 - (210-8(a)(3)): Reject
SUBMITTER: Aaron Chase, Leviton Mfg. Co. Inc.
COMMENT ON PROPOSAL NO: 2-44
RECOMMENDATION: Accept the original Proposal 2-44.
SUBSTANTIATION: The problem that will be resolved by the above recommendation is that there will be far less GFCIs providing power without protection, in outdoor locations. In the previously provided substantiation from UL (which was Leviton data generated by home inspectors) and CPSC, frighteningly large percentages of inoperative GFCIs (no protection) were protected. These percentages were reconfirmed by additional studies of home inspection reports. The Nema study, which was promised to Code-Making Panel 2 for consideration in this cycle, has not been completed as yet. At the time of this writing that study is about 50 percent complete and indicates very similar percentages of inoperative GFCIs.

A review of the raw data indicated that out of the 1155 (actually 1209) GFCI receptacles inspected to date 9.5 percent did not provide protection. The 9.5 percent only takes into account those designated 'as no trip or trip on or no reset'. For the 83 (actually 89) GFCI breakers inspected, 12 percent also did not provide protection. All of these were no trip. These percentages are dramatically similar to the percentages from the first study. Also, the important, high lightening, areas have not been fully incorporated into the NEMA study. When they are, the percentages are sure to rise.

The panel statement on proposal number 2-32 indicates prudence in waiting for the final analysis of the study. As a NEMA company member and active participant in the study, I can inform the panel that the study will not be finished in time to be acted upon this cycle. Also, a review of the data and returned samples reconfirms lightening and voltage surges are the main (not only) culprit in GFCI inoperability. Increasing a GFCIs surge resistance will only extend the useful life without solving the problem.

If Listed GFCI's equipped with this feature as described above are required at outdoor locations, instances of unprotected power supplied by GFCIs would be far reduced.

Note: Supporting material available for review upon request at NFPA headquarters.
PANEL ACTION: Reject.

2- 44 - (210-8(a)(3)): Reject
SUBMITTER: Thomas J. D'Agostino, Islandwide Home Inspection Service, Inc.
COMMENT ON PROPOSAL NO: 2-32
RECOMMENDATION: Accept proposal 2-32.
SUBSTANTIATION: Statement of Problem:

Ground Fault circuit interrupter (GFCI) electrical outlets and circuit breakers are not reliable electrical products. For years, the electrical industry, CPSC and UL have been aware of the less than adequate reliability that exists with GFCIs now installed in our homes.

The results of the 1999 Leviton GFCI research project clearly revealed a major electrical safety problem exists in our homes. The significant percentage of non-performing GFCI devices, i.e., 19% outlets, 15.5% circuit breakers, when viewed in the context of the larger population of GFCI devices that are now installed in our homes indicates that we are now knowingly exposing our families to an increased risk of electrical shock.

Over the past years, the GFCI no doubt has saved many lives. However, industry, CPSC and UL must do better. Common sense tells us that the GFCI must work 100 percent of the time when called on to do so.

Substantiation:

Since the 1999 Leviton Research Project was completed, I've conducted approximately 700 pre-purchase home inspections and continue to see "non-performing" GFCI devices, and particularly GFCI outlets. In the past month, I inspected four devices that would not protect a homeowner if called on to do so:

1. An inoperative GFCI outlet adjacent to a kitchen sink. Use of an external UL listed GFCI outlet circuit tester ("OCT") revealed "correct wiring". When the test button on the "OCT" was depressed, the test button on the GFCI outlet was not activated. The "Test/Reset" buttons on the GFCI outlet were "manually" inoperative; and the buttons/face of the GFCI outlet showed signs of having been painted over and "cleaned" by the homeowner.
2. An inoperative GFCI outlet in a shed. Use of the GFCI "OCT" revealed "correct wiring". When the test button on the "OCT" was depressed, the test button on the GFCI outlet was not activated. The "test/reset" buttons on the GFCI outlet were "manually" inoperative.
3. An inoperative GFCI outlet in the bathroom. The use of the GFCI "OCT" revealed "incorrect wiring" - "reverse polarity". When the test button on the "OCT" was depressed, the test button on the GFCI outlet was not activated. The "test/reset" buttons were "manually" operative.
4. An inoperative GFCI outlet at "pool" side. Use of the GFCI "OCT" revealed "correct wiring". When the test button on the "OCT" was depressed, the test button on the GFCI outlet was not activated. "Test/reset" buttons on the GFCI outlet were "manually" inoperative**.

**In this case, the homeowner indicated that the pool/electrical wiring was installed in 1992 and that no change in wiring was done since that time. The homeowner also stated that he never once tested the GFCI outlet.

I have conducted approximately 7000 professional home inspections (and electrical inspections beyond "ASHI" standards to the scope/intent of NFPA 73 and electrical problems with GFCIs found in our homes seem to be increasing, not decreasing).

The proposed change to NEC, Section 210.8(a)(3), should be accepted by the NFPA Panel 2 committee. The proposed wording clearly reflects a safety requirement for an electrical installation which is the stated purpose of the NEC. I view the requirement to mean that only a GFCI device that "fails safe" shall be installed. This proposed revision will prompt each GFCI manufacturer to upgrade their GFCI circuit design to achieve this higher level of safety.

Acceptance of the proposed NEC revision by the NFPA Panel 2 committee will also result in less dependence being placed on the two "human factor" components that are equally important in the equation for achieving a safe electrical installation, i.e., items 2 and 3 below.

Reliable and Safe use of a GFCI is a function of:

1. Fail safe GFCI product design in compliance with reliability test/marking requirements of UL standards ....by the manufacturer/UL.
2. Proper use of installation instructions provided with each GFCI product ...by manufacturer/UL/homeowner.
3. 1/month test of device and maintenance of a test log .... by the homeowner.

When all GFCI devices are redesigned to meet the intent of the proposed revision of NEC Section 210.8(a)(3), and UL standards are revised to assure product compliance, the expressed concern by CPSC chairman Ann brown (in a 1994 speech) that "GFCIs should be useful only when they work" will become a reality. In the future, at any time that a GFCI installed in our home is unable to perform as intended, the GFCI must automatically become de-energized.

Note: Supporting material is available for review at NFPA Headquarters.

2- 47 - (210-8(a)(3)): Reject
SUBMITTER: William H. King, Jr., U.S. Consumer Product Safety Commission
COMMENT ON PROPOSAL NO: 2-44
RECOMMENDATION: I request reconsideration of Proposal 2-44 which requested that Section 210-8 be revised as follows:

210-8. Ground-Fault Circuit-Interrupter Protection for Personnel.

(a) Dwelling Units...

(3) Outdoor. The device(s) providing ground-fault circuit-interrupter protection for personnel shall remove the power normally available for the loads as protected receptacles, and not restore this power, if the protection device fails to operate as intended in the test mode.

SUBSTANTIATION: Proposal 2-44 should be accepted based on new information developed after the proposal received consideration during the ROP stage. Early reports from a survey that found approximately 10% not to be in working order have now been largely confirmed in the latest survey, with some areas reporting much higher failure rates. While this supports the need to upgrade the product standard with the addition of new performance requirements, it also supports immediate recognition in the 2002 edition of the NEC of a listed GFCI that already addresses safety consequences of a non-working GFCI. There exists in the marketplace this new class of GFCI that does not permit resetting the device if it does not test okay. Requiring this class of device (especially for outdoor receptacle protection where the risk of electrocution is generally the highest) would permanently take out of service a malfunctioning GFCI as soon as the test button is pushed, require replacement of the device, and thus provide effective shock protection for saving lives.

There is no justification to wait three years to reconsider such action during the next code cycle when the heightened risk of electrocution with nonoperational GFCIs is known to exist.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 2-42. The panel also notes that a revision to the product standard would not have to wait until the next code cycle, and can be implemented in a timeframe indicated by the standards developer.

2- 48 - (210-8(a)(3)): Accept
SUBMITTER: Jack Wells, Pass & Seymour/Legrand
COMMENT ON PROPOSAL NO: 2-44
RECOMMENDATION: The Panel should continue to reject this proposal.
SUBSTANTIATION: This comment supports the action of the Panel to reject the proposal. Likewise, we support the Panel statement and the affirmative comment of Mr. Nissen on Proposal 2-32.

Unfortunately, the survey mentioned in the Panel statement has taken longer than anticipated. The stated objective of the survey is "…to obtain statistically valid data to identify, define and quantify long term operation of GFCIs in the installed infrastructure. For suspected field failures, both the installation and the product must

be analyzed and data compiled to enable clear definition (including conditions of use and environment) and mode of failure (e,g, SCR failure, test button failure) sufficient to define remedial action(s) if required.,"

The statistical model developed for this survey has been reviewed and confirmed by CPSC as appropriate. UL is fully involved in the collection, tabulation and analysis of the data as it comes in.

Because the data is incomplete, unanalyzed and lacks peer review it would be inappropriate for NEMA to release it at this time.

Even if the survey supports some remedial action, the Panel and Mr. Nissen are correct in stating that such action should involve the product safety standard, not the installation code.

PANEL ACTION: Accept.

SUBMITTER: William J. Murphy, Cutler-Hammer, Inc.
COMMENT ON PROPOSAL NO: 2-32
RECOMMENDATION: Continue to reject the proposal.
SUBSTANTIATION: Cutler-Hammer supports the panel action to reject the proposal. In line with the affirmative comments of the Underwriters Laboratories Code-Making Panel 2 Representative, Mr. Nissen, Cutler-Hammer considers that any additional product requirements appropriately belong in the product safety standards and not in the NEC. If shown to be necessary, these additional product requirements might include features such as improved surge suppression or conformal coatings. Any additional product requirements would also need to take into account consumer practice relative to manufacturers' requests for the periodic testing of GFCIs. Unfortunately, many consumers do not test their GFCIs on a regular basis. Such testing needs to be encouraged. However, the provision of a lock-out feature, with the possibility of immediate loss of power at the GFCI and associated feed-through receptacles, could actually prove to be a disincentive for performing the test. A further concern is that consumers faced with a loss of power, could use extension cords to service outdoor areas that are normally associated with GFCI protected receptacles. This could prove hazardous.

COMMENT ON PROPOSAL NO: 2-43
RECOMMENDATION: Continue to reject the proposal.
SUBSTANTIATION: Cutler-Hammer supports the panel action to reject the proposal. In line with the affirmative comments of the Underwriters Laboratories Code-Making Panel 2 Representative, Mr. Nissen, Cutler-Hammer considers that any additional product requirements appropriately belong in the product safety standards and not in the NEC. If shown to be necessary, these additional product requirements might include features such as improved surge suppression or conformal coatings. Any additional product requirements would also need to take into account consumer practice relative to manufacturers' requests for the periodic testing of GFCIs. Unfortunately, many consumers do not test their GFCIs on a regular basis. Such testing needs to be encouraged. However, the provision of a lock-out feature, with the possibility of immediate loss of power at the GFCI and associated feed-through receptacles, could actually prove to be a disincentive for performing the test. A further concern is that consumers faced with a loss of power, could use extension cords to service outdoor areas that are normally associated with GFCI protected receptacles. This could prove hazardous.

2- 52 - (210-8(a)(3)): Reject
SUBMITTER: Steve Campolo, Leviton Manufacturing Co., Inc.
COMMENT ON PROPOSAL NO: 2-44
RECOMMENDATION: Accept the original Proposal 2-44.
SUBSTANTIATION: The original proposal reported many installed GFCIs were incapable of providing protection though they provide power. While additional studies were promised for Code-Making Panel 2's review, it is unlikely that any further studies will contradict the first. I have provided four recent, additional studies that were conducted by members of the American Society of Home Inspectors. As suspected, these new studies are in agreement with the original data.

The data is summarized for convenience. The raw data is made available as well.

From Inspector Jones of Colorado:
14.6 percent of Circuit Breaker GFCIs did not trip when tested.
1.0 percent of Receptacle GFCIs did not trip when tested.
From Inspector Baca, PE, of Arizona:
12.5 percent of Circuit Breaker GFCIs did not trip when tested.
8.57 percent of Receptacle GFCIs did not trip when tested.
From Inspector Johnson of Utah:
12.1 percent of Circuit Breaker GFCIs did not trip when tested.
9 percent of Receptacle GFCIs did not trip when tested.
From Inspector Hodgden of Missouri:
* 40 percent of Circuit Breaker GFCIs did not trip when tested.
14.42 percent of Receptacle GFCIs did not trip when tested.

Inspector Hodgden's comments are also included with the material I have provided.

Once again, data is provided which further supports the need for GFCIs that will not provide power when they are incapable of completing the built-in test function. No matter how robust any GFCI product is made, the continual bombardment of voltage surges will eventually damage the electronics. This change, for outdoor GFCIs will assure that when a GFCI reaches its end-of-life, unprotected power will not be supplied.

Note: Supporting material available for review upon request at NFPA headquarters.

PANEL ACTION: Reject.

COMMENT ON PROPOSAL NO: 2-32
RECOMMENDATION: This comment supports the rejection of this proposal.
SUBSTANTIATION: This writer agrees with the committee statement and the comment of Mr. Nissen on the vote.
Until the GFCI manufacturers of NEMA complete the field study of installed GFCIs, with the collection of the requisite quantities of samples, inspected and analyzed, no statistically valid conclusions can be drawn. Without such conclusions, no valid "fix" can be proposed. In any case, the product safety standard would be the place to put new operational requirements for the product, not the NEC.

SUBMITTER: William F. Laidler, Rep. Massachusetts Electrical Code Advisory Committee
COMMENT ON PROPOSAL NO: 2-48
RECOMMENDATION: This proposal should be accepted as written.
SUBSTANTIATION: It is to be noted that there was an apparent lack of correlation between proposal 2-48 [Section 210-8(a)(5) Exception No. 3] that was rejected and companion proposal 16-121 (Section 760-21 and 16-130) (Section 760-41) that were accepted.
The Code arrangement is such that chapter 2 [210-8(a)(5) Exception No. 3] applies generally, and that Chapter 7 (760-21 and 760-41) may supplement or modify Chapter 2. The NEC Technical Correlating Committee is aware of this issue and must determine the outcome.
PANEL ACTION: Accept in Principle.
Revise the wording in the proposal to read as follows:
"Exception No. 3: A receptacle supplying only a permanently installed fire alarm or burglar alarm system shall not be required to have ground-fault circuit-interrupter protection."
PANEL STATEMENT: The revised wording meets the intent of the submitter and complies with the NEC Style Manual.

2- 61 - (210-8(b)(2)): Reject
SUBMITTER: Dann Strube, Lanesville, IN
COMMENT ON PROPOSAL NO: 2-69
RECOMMENDATION: The proposal should have been accepted.
SUBSTANTIATION: The Code Making Panel 2 statement refers to the original substantiation for the rooftop requirement that was added to the code in 1993. The original proposal can be found in the 1992 TCR, page 60, proposal 2-118. Substantiation at that time was "Because of the additional hazard from standing water on roofs the additional protection afforded by a ground fault circuit interrupter should be required."
The substantiation for the many proposals for GFCI protection of outdoor receptacles at other than dwellings cite the same conditions and many are much stronger. If this proposal continues as rejected, one of those requesting GFCI protection for outdoor receptacles must be accepted. This is a companion comment to my comment on Proposal 2-64.
Note: Supporting Material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient substantiation that would justify deleting the requirement for GFCI protection of receptacles on rooftops.

2- 63 - (210-8(b)(3)): Reject
SUBMITTER: William F. Laidler, Rep. Massachusetts Electrical Code Advisory Committee
COMMENT ON PROPOSAL NO: 2-80
RECOMMENDATION: This proposal should be accepted as written.
SUBSTANTIATION: The substantiation used to introduce GFCI protection for receptacles located on rooftops to serve HACR equipment for the 1993 NEC was, because of the additional hazard of standing water on roofs, the additional protection afforded by a GFCI should be required. Generally there are drains on rooftops, hence the water hazard becomes more severe in the vicinity of HACR equipment located at ground levels.
The panel statement to see panel statement on proposal 2-33 is not really adequate and is misleading as proposal 2-33 addresses GFCI protection for all outdoor receptacles, not just those to service HACR equipment as recommended in proposal 2-80.
Apply the very same reasoning for personal protection, as was used for rooftops, to the much more severe shock hazards that may be present at ground levels.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its action and statement on Proposal 2-80. The submitter did not provide any substantiation of a standing water hazard in the vicintiy of HACR equipment located at ground levels.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
NISSEN: I am changing my vote to negative as I agree with Mr. Pauley's statements. Comment 2-63 should have been "Accept."
PAULEY: I am voting negative on the panel action. With the panel action on Comment 2-120 to add a required receptacle within 25 feet of all heating, air conditioning and refrigeration equipment, this comment should be accepted. It is clear that this required receptacle is intended for use by personnel to service the equipment. This will be done in a variety of environmental conditions including rain, snow, etc. Since the use of the receptacle is specifically known to be for personnel, GFCI protection is justified. The requirement could have been limited to this receptacle by adding a new item (4) to 210-8(b) to read: "(4) Outdoor receptacles installed to meet the requirements of 210-63.

(Log #2367)

2- 64 - (210-8(b)(3)): Reject
SUBMITTER: Monte R. Ewing, State of Wisconsin
COMMENT ON PROPOSAL NO: 2-81
RECOMMENDATION: Revise text as follows:
Commercial Repair Garages - where self-propelled motor vehicles are serviced or repaired.
SUBSTANTIATION: The original proposal was misunderstood as an application of residential rules to a commercial application. What my proposal was intended to do was move Section 511-10 into 210-8(b) as a general rule. I propose this because the original intent of 511-10 had nothing to do with hazardous location wiring. It was for electrical shock protection of the repair mechanic. The drawback is that 511 only applies where volatile flammable are used and does not apply to combustible fuel or electric fuel cell powered vehicle repair garages.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its action and statement on Proposal 2-81. There is no supporting data which would justify the GFCI requirement for commercial garages in Section 210-8(b). Commercial garages are defined only in Article 511.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #445)

2- 65 - (210-11(b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 2-85
RECOMMENDATION: Accept in principle revised:
(b) Load evenly proportioned among branch circuits~~. Where the load is computed on a volt amperes/square foot (0.093m^2) basis the~~ The wiring systems up to and including the branch-circuit panelboard(s) shall be provided to serve not less than the computed ~~calculated~~ load. This load shall be evenly proportioned insofar as practicable among ~~multiwire~~ branch circuits within the panelboard(s). Branch-circuit overcurrent devices ~~and circuits~~ shall ~~need~~ only be required to be installed ~~to serve the connected load~~ for circuits installed.
SUBSTANTIATION: My proposal substantiation was unclear re: VA per circuit loads such as small appliance circuits, laundry circuits, sign circuits to be included with the va/sq. ft. load. The

intent is to indicate they should be included in the evenly proportioned requirement. The requirements in the present text are limited to circuits covered by the second sentence. The requirement for adequate systems should not be limited to loads computed on a va/sq. ft. basis. This should apply to those computed on a va per circuit and nameplate loads. Why does the text require balanced load only for multioutlet circuits? This should apply to single outlet circuits also.

Branch-circuit overcurrent devices should only be required to be installed where circuits are installed whether there is a "connected" load or a "computed" load.

PANEL ACTION: Reject.

PANEL STATEMENT: The present code rule expresses the intent of the panel. When the load is computed on a VA per square foot basis, the wiring system must be sized to serve that computed load.

(Log #811)

2- 67 - (210-12): Reject

SUBMITTER: Bernard A. Schwartz, Schwartz Fire Specialists

COMMENT ON PROPOSAL NO: 2-104

RECOMMENDATION: After "...January 1, 2002" insert:

"or purposes of this section, the installation of an arc-fault circuit interrupter at the receptacle with all receptacles in the bedroom supplied through that protected receptacle shall be deemed compliant".

The original proposal should be accepted.

SUBSTANTIATION: 1. Available fire data indicate that although electrical fires do represent a significant part of the total fire problem, fires occurring along the straight run of wire from the load center to the receptacle represent only a minuscule percentage of that total. The receptacle device is designed to provide a much higher level of protection than the load center device for items that are connected to the receptacle and would therefore provide a higher level of protection and prevent the occurrence of a significantly larger amount of fires. The Underwriters Laboratories Inc. Standard for Safety for Arc Fault Circuit Interrupters (UL 1699) currently recognized four types of AFCI devices (Branch Feeder, Cord, Outlet Circuit and Portable). The NEC panel only recognizes the Branch Feeder ARC-Fault Circuit Interrupter.

2. The arc fault detection tests are listed in Table 50.2 of UL 1699. This table indicated that the branch feeder AFCI is to be subjected to:

U.L. section # 56.2 Carbonized path arc ignition test
56.3 Carbonized path arc interruption test
56.5 Point contact arc test, unwanted tripping tests, load
57 Unwanted tripping tests
58 Operation inhibition

3. The receptacle type AFCI is tested to all of the same tests to which the branch feeder AFCI is tested plus the Carbonized path arc clearing time test (U.L. section #56.4). It is important to note that the carbonized path arc interruption test is conducted at a current rating of 5 amperes while the point contact arc test is conducted at currents that range from 75 to 300 ampere. The sensitivity of the receptacle type device to detect electrical faults in connected devices such as a television is much greater, because the impedance of (text missing).

4. Restricting the way in which the hazard may be addressed also acts as a restraint of trade and discourages new products from entering the marketplace while making the entire NFPA process appear to be a manipulative tool of a particular group of manufacturers.

PANEL ACTION: Reject.

PANEL STATEMENT: The requirement in Section 210-12 expresses the intent of the panel, which is that the entire branch-circuit be provided with AFCI protection.

Also, see panel action and statement on Comment 2-78.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #1326)

2- 68 - (210-12): Reject

SUBMITTER: William H. King, Jr., U.S. Consumer Product Safety Commission

COMMENT ON PROPOSAL NO: 2-119

RECOMMENDATION: I request reconsideration of Proposal 2-119 which included a new subsection (c) to be added to Section 210-12. Arc-Fault Circuit-Interrupter Protection as follows:

(c) Lighting and Appliance Branch Circuits. Each existing 125-volt, single-phase, 15- and 20-ampere lighting and appliance branch circuit shall be individually protected by an arc-fault circuit interrupter when the service equipment is replaced.

SUBSTANTIATION: In the panel statement accompanying rejection of Proposal 2-119, Panel 2 indicates that it "does not intend to expand the code to require AFCIs in existing dwellings at this time." If that statement stands, it effectively closes the door for urgently needed protection for older homes, without providing a rationale for a delay. No technical substantiation for the rejection or other reason is provided as required in Section 4-3.5.1 of the NFPA Regulations Governing Committee Projects (NFPA 2000 Directory, Part V), which states that a "reject" shall include a statement, preferably technical in nature, on the reason for the TC action. Such statement shall be sufficiently detailed so as to convey the TC's rationale for its action so that rebuttal may, if desired, be submitted during the comment period.

The availability of AFCI protection today is an outgrowth of a CPSC sponsored study by Underwriters Laboratories, Inc. entitled "Technology for Detecting and Monitoring Conditions That Could Cause Electrical Wiring System Fires", September 1995. The objective of the study was to safely permit the continued occupancy of dwellings (many of which in this country are more than 40 years old with electrical wiring system elements remaining in service beyond their original design life) without manifestation of electrical symptoms that can cause fires. According to the report, arc-fault detection is the most promising new technology especially when used in combination with conventional protection devices such as circuit breakers, fuses and GFCIs. Now that AFCIs have been thoroughly evaluated and are available in the marketplace as listed devices, existing dwellings should be among the first to receive the benefits, given the greater risk of electrical fires in older homes.

As the submitter of the proposal, and in lieu of a sustained rejection, I would accept limiting the proposal to dwelling units, and including an effective date on or before the beginning of the year for the next scheduled edition of the NEC. This would permit time for sufficient production of listed AFCIs to meet anticipated demands.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel is not expanding the scope of AFCI installations at this time, pending the receipt of performance data.

SUBMITTER: Melvin K. Sanders, TECo., Inc.

COMMENT ON PROPOSAL NO: 2-102

RECOMMENDATION: Add the following as a new sentence:

Additional areas shall be permitted to be supplied by bedroom arc-fault circuit-interrupter(s) protected circuits unless prohibited elsewhere in this Code.

SUBSTANTIATION: Already the shopping list mentality is coming to the forefront. It appears that while all know what a bedroom and a closet are, some building codes may require a circuit separate from the bedroom circuit for the closet and will not permit them to be placed on the bedroom AFCI protected circuit. This would end up requiring an additional circuit and none is justified.

PANEL ACTION: Reject.

PANEL STATEMENT: This is not prohibited by the present text in the code.

COMMENT ON PROPOSAL NO: 2-106

RECOMMENDATION: Delete this code section.

SUBSTANTIATION: If AFCIs have been unreliable and costly, why is this in the code? Putting products into the code before being properly tested is questionable at best. It seems that a product with a cost ten times the actual loss to society is a tremendous waste of money. Further, how many ARC faults occur in a bedroom of a dwelling? Unless an electrical cord or the wiring in the wall is pinched or exposed to conductive material, no ARC fault should occur. In the event an ARC fault did occur, it does not appear that an AFCI would actually trip in all cases.

COMMENT ON PROPOSAL NO: 2-103

RECOMMENDATION: Proposal 2-103 should be accepted in part with the changes in text as indicated below:

(b) Dwelling Unit Bedrooms. All branch circuits that supply 125-volt, single phase, 15- and 20-ampere ~~receptacle~~ outlets installed in dwelling unit bedrooms shall be protected by an arc-fault circuit interrupter(s). ~~This requirement shall become effective January 1, 2002.~~

Dwelling Unit Living Areas. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere outlets installed in dwelling unit living areas shall be protected by an arc-fault circuit interrupter(s).

FPN: A dwelling unit living area is any space, that can be normally occupied, other than bedrooms, bathrooms, toilet compartments, kitchens, closets, halls, storage, garage or utility spaces.

SUBSTANTIATION: Cutler-Hammer's Proposal 2-103 dealt with AFCI protection for bedroom outlets (item (b) above), for dwelling unit living areas (item (c) above), for guest-rooms and for Limited Care Facility Bedrooms. With respect to item (b), the panel accepted the deletion of the word "receptacle", and has deleted the last sentence of item (b) via, for example, the panel action on Proposal 2-116. The panel did not accept the proposed changes related to dwelling unit living areas or guest rooms, and referred the Limited Care Facility issue to Panel 17 for action.

Cutler-Hammer considers that the panel's action to expand AFCI protection to all bedroom outlets represents a significant step in consumer protection. Cutler-Hammer also understands the

panel's statement "The panel continues to support the introduction of this product, based on the data received and reviewed on this subject, but believes it is prudent to limit the requirement to bedrooms to gain further experience." With our present comment, Cutler-Hammer is requesting reconsideration of section (c) of our original proposal that deals with AFCI protection for dwelling unit living areas. We consider that additional experience is available, that AFCI products are also more generally available, and that consumer awareness has increased. This substantiation therefore focuses on the experience and availability of AFCIs for enhanced branch circuit protection.

First, it must be emphasized that in this section of the code we are dealing with branch circuit protection. As such, the AFCIs must protect the branch circuit wiring from the load-center to the outlets. Logically these branch/feeder AFCIs, listed to UL 1699, must be located at the origin of the branch circuit wiring; either in or adjacent to the load-center. It must be noted however, that the protection afforded by branch feeder AFCIs extends well beyond the outlets/receptacles. In fact UL 1699 (1) requires branch/feeder performance tests with both NM-B (installed wiring) and SPT-2 (appliance cords). Thus the branch/feeder AFCIs address series and parallel arcing faults in the installed wiring. This is the origin of about 35 percent (2, 3) of residential fires associated with the electrical distribution system. In addition, the branch/feeder AFCIs detect parallel arcing faults in the appliance cords and loads beyond the outlets. They also respond to all arcs to ground. Thus, the panel, in considering expansion of AFCI protection to the dwelling unit living areas, will appreciate that, while focusing on enhanced branch circuit protection, they are also gaining considerable protection for appliance cords and loads beyond the outlets.

Second, branch/feeder AFCIs are now more generally available, with Listed product being available from four of the largest circuit breaker manufacturers. These devices are completely interchangeable with those manufacturers' conventional miniature circuit breakers (MCBs). In addition, single pole MCBs are available (4, 5) that contain both UL listed AFCI and ground-fault circuit interrupter functions. Further, the AFCI function has been incorporated into two-pole Listed circuit breakers that are also classified for mitigating the effects of arcs, and which provide protection in shared neutral circuits. Third, during the past year there has been a significant increase in operating experience. Thus Cutler-Hammer alone has more than 25,000 MCBs with AFCI protection operating in the field. The total operating time is approaching 300 million hours, and during this time there have been no reports of unwanted tripping. More importantly, there have been cases of reported fire prevention (4, 6).

Fourth, the FAA and aerospace industry (7) are actively investigating AFCI technology relative to the protection of onboard electrical wiring. During the year 2000, this has even been the subject of many newspaper articles (8). It must be noted that the aircraft AFCI will be protecting against similar types of hazards encountered in dwelling units; namely the effects of arcing faults in aging and abused wiring. In both cases, safety is enhanced by the detection and rapid interruption of hazardous arcs. In both cases there must be no unwanted tripping.

Fifth, the price of AFCIs is decreasing, and will continue to decrease with increasing volume. The present price is similar to an MCB with integrated ground fault protection. Sixth, AFCI protection has been carefully considered by Code makers in Vermont and Canada. In the state of Vermont, branch/feeder AFCIs will be mandated for all branch circuits that supply 125 V, single phase, 15 and 20 ampere receptacle outlets installed in dwelling unit bedrooms and also in dwelling unit living areas. The effective date is January 1, 2001. The application of branch/feeder AFCIs to dwelling unit bedroom circuits will also be included in the Canadian Electrical Code, Part 1.

In conclusion, we understand the prudent action that the panel took in January based on the data received and reviewed at that time. However, since the time of proposal submission in November 1999, there have been significant increases in product experience and product availability. There have also been significant increases in public awareness due to papers, publications and a book-chapter on the subject, and due to consideration of AFCI protection for aircraft onboard electrical wiring. As a consequence of these increases in experience, availability, and public awareness, we are recommending that the panel extend AFCI protection to the branch circuits of dwelling unit living areas. This will reduce the electrical fire hazards associated with the fixed wiring associated with dwelling unit living areas and, as discussed in item one, will automatically reduce the electrical fire hazards associated with the appliance wires and loads connected to those living area branch circuits.

PANEL ACTION: Accept in Part.

In the wording of the comment, the panel accepts the deletion of the word "receptacle" and the deletion of the sentence stating: "This requirement shall become effective January 1, 2002".

The panel rejects the remainder of the Comment.

PANEL STATEMENT: The panel reaffirms its prior position and statement on Proposal 2-103. The panel is awaiting experience data for review on this subject.

2- 72 - (210-12): Reject

SUBMITTER: Ronald G. Nickson, Bernard A. Schwartz, National Multi Housing Council & Schwartz Fire Specialists

COMMENT ON PROPOSAL NO: 2-106

RECOMMENDATION: The original proposal to delete section 210-12 in its entirety should be accepted.

SUBSTANTIATION: There are several reasons why the requirement for mandatory installation of an AFCI should be removed from the NEC. These reasons can be grouped into general categories:

a. FIRE DATA – The available fire data does not support the need for a device that will protect against fires started by arcing.

b. TRAINING – Fire incident reports provide questionable data because investigators are inadequately trained in separating arcing faults from high resistance faults.

c. DEVICE LIMITATIONS – The device mandated is not the best available method for detection of electrical fires in the portions of the wiring system where they predominately occur.

d. PROBLEM NOT CORRECTED – The UL report and available loss data indicate most incidents are occurring in older installations using technology not permitted by today's NEC. Installation in new residence will not address the problem.

e. COST – No cost/benefit analysis data exists.

f. RESTRICTIVE REQUIREMENT – Other types of equal or better equipment are not permitted.

g. LIMITED EXPERIENCE – Limited field data is available to demonstrate the effectiveness of the device over time.

FIRE DATA

1 – The most statistically valid, fire data collection for the United States is the National Fire Incident Reporting System (NFIRS). The system is in use in over 40 states by more than 14,000 fire departments and accumulates over 1 million fire reports annually. No other fire data system approximates these numbers.

2 – The data does show that electrical fires represent a significant portion of the overall fire problem, however fires occurring along the run of wire from the load center to the receptacle represent a minuscule percentage of the total. There is no data showing what portion of the problem will be addressed by the use of an AFCI or that the AFCI will resolve electrical problems with the fixtures attached to the building fixed wiring.

3 – By definition, an AFCI detects the presence of an arc. It will not detect the presence of overheating caused by high resistance. The NFIRS fire data collection system does not include a data code for overheating caused by high resistance. The number of electrical incidents that occur at the end of a conductor (terminal screw, binding post, etc.) is a strong indicator that most electrical incidents are in fact resistance failures and not arcing failures. This combined with the normally brief duration of an electrical arc and the inability of brief periods of arcing to ignite common combustibles[1] strongly supports the belief that arcing failures represents a very small portion of the electrical fire problem. Once a fire is initiated, the fire may cause arcing to occur, but shutting off the electricity after the fire has started will not resolve the problem.

TRAINING

1 – The NFIRS fire loss data is accumulated one incident at a time by having the responding fire department complete what is called an Incident Form. This form is filled out on every call, no matter how big or small the incident may be. The person filling out the form is normally one of the senior persons present at the incident. Since most fires are not major events and in many instances may be responded to by a single fire truck, the person filling out the form is a firefighter and not a fire investigator. In larger instances, many departments will have specially trained persons (investigators) who will respond and conduct a more intensive investigation.

2 – Fire investigators are normally well trained in determining the area of origin – the place where the fire originated. For electrical fires, they are normally not qualified to determine the specific reason why or how an electrical failure occurred. It is beyond the scope of most fire investigators to determine if a fire resulted from an arcing failure or a high resistance connection. Since the coding manual does not even include a category for resistance failures, this absence, combined with the limited understanding of electrical theory results in resistance failures being coded as an arcing failure.

Summary – Training

The majority of fire incident reports are filled out by persons lacking the electrical skills needed to understand the difference between an arcing fault and a high resistance fault. Presently available fire data is inadequate to correctly define the multiple subsets of types of electrical fires, but any survey of fire investigators will quickly reveal that the occurrence of a fire originating along a straight run of electrical conductor is extremely rare.

DEVICE LIMITATIONS

1 – The Consumer Product Safety Commission contracted with Underwriters Laboratories (UL) to evaluate presently available fire incident data and to prepare appropriate test methods which would address the failure modes identified. The 1995 UL report[2] identified 14 separate test methods which it believed would address the electrical problems identified. Subsequently, UL developed a standard to evaluate the AFCI. Many of the original test criteria included in the CPSC report were eliminated from the final standard.

2 - The UL work was experimental and as experience was gained and products improved, some changes are to be expected. The test methods proposed in the standard do not exactly duplicate the test protocols used in the original studies. It is possible to break down the original test methods into categories of hazard which the test method was designed to simulate. The fourteen original test methods simulated:

1 – A short circuit
2 – A carbonized electrical path
3 – Sustained arcing (several seconds)
4 – Resistance heating
5 – Operation inhibition
6 – Unwanted tripping tests

Short Circuit

This test concept was PARTIALLY included in the UL standard. A short circuit by cutting across two conductors is included in the test. The test which simulated a short as two stranded conductors are shorted end to end was eliminated. Stranded conductors are found on appliances connected to the branch circuit wiring and are not normally permitted in the branch circuit itself. Most electrical fires occur in devices into branch circuits, not in the branch circuit wiring.

Carbonization

This test concept was PARTIALLY included in the UL standard. The CPSC report included several tests to simulate various types of carbonization which can then lead to arcing. The UL standard incorporates versions of these tests except for the wet track fault which simulates conditions that occur in wet and damp locations.

Sustained Arcing

This test concept was NOT incorporated into the UL standard. This test produces a continuous arc for a few seconds. No explanation was given for why this test was eliminated. Many of the devices tested did not meet the test criteria when tested.

Resistance Heating

This test was NOT incorporated into the UL standard. Resistance heating is normally associated with electrical fires originating at connection points such as under terminal screws, at loose wire nut connections, wire crimps, corroded conductors, etc. This type of failure will not be detected by an AFCI.

Operation Inhibition

The concept was included in the UL standard.

Unwanted Tripping

This concept was included in the UL standard.

Summary – Devise Limitations

The present UL standard addresses only a portion of the causes of electrical fires as identified in the UL report to CPSC. Although it is possible that a AFCI may operate for items for which it is not specifically tested, it must be understood that the UL standard does not test the AFCI for such commonly encountered electrical fire causes as:

1 – A loose wire nut
2 – A loose screw on the side of a receptacle
3 – Carbonization (tracking) that occurs as a result of water
4 – Arcing resulting from make/break, end to end, stranded wire contact

In summarizing, the UL testing for CPSC, the report notes[3] "In order to fulfill the potential of AFD (sic AFCI) technology, further development is needed in order to detect and respond to a wider variety of arcing fault conditions."

Summary – Device Limitations

The presently available AFCI addresses only a small portion of the electrical hazards identified by CPSC and UL.

PROBLEM NOT CORRECTED

1 – The UL report (concerning AFCI protection) to CPSC includes an analysis[4] of the available fire data and states:

"The disproportionately high incidence of fire in the electrical systems of older homes can usually be attributed to one or more of the following factors:

Inadequately and overburdened electrical systems
Thermally re-insulated walls and ceilings burying wiring
Defeated or compromised over current protection
Misuse of extension cords and makeshift circuit extensions
Worn-out wiring devices not being replaced
Poorly done electrical repairs
Socioeconomic considerations resulting in unsafe installations"

This statement recognizes that the primary electrical problem is with older installations and none of the factors noted will be addressed by installation of an AFCI in new installations. The UL analysis later states: "Eventually these factors can lead to electrical overheating and/or arcing faults that cause fires". This statement is recognition that electrical overheating can result without the occurrence of arcing. This overheating is known as resistance heating, which is not addressed in the current UL criteria for listing of an AFCI. It is interesting to note that at no point did UL or CPSC attempt to address the number and/or the percentage of fires that are caused by arcing as compared to resistance heating. Nor does the report attempt to define the number of fires that occur in straight runs of wire or behind walls which is the primary area that the AFCI is designed to protect.

2 – Wiring and wiring installation methods used today are vastly improved over that of several years ago. Even if the simple fact that very few electrical fires originate in the straight run portion of an electrical conductor is ignored, the statistical data clearly shows that electrical problems are largely a factor in older installations. The CPSC data specifically notes that "…the frequency of wiring system fires is disproportionally high in homes more than 40 years old." AFCI technology may someday be modified to become useful for detecting problems in older installations, but installing AFCIs in new installations will do nothing to reduce the loses in older buildings. In the last 40 plus years, NEC mandated changes have included the requirement of a grounded conductor, increased ground conductor size, improved electrical insulation and other changes which will (and apparently have) affected the possibility that an electrical fire can occur.

3 – The UL study report to CPSC appears to recognize that newer installations may not require modification. The report clearly states "The purpose of the project reported here was to conduct an in-depth study of technologies to detect and monitor precursory conditions that could lead to or directly cause fires in residential wiring systems in general, and how these technologies could be applied to older residential wiring systems in particular."

Summary – Problem Not Corrected

The statistical data shows that the problems with wiring systems is apparently related to buildings 40 years and older. Mandated changes to new construction will not alleviate this problem.

COST TO THE CONSUMER

1 – In mandating the requirement for AFCI protection in residential bedrooms, the NEC panel was unaware of the actual cost of this requirement. A cost/benefit analysis was not possible because the cost of the AFCI (which did not even exist in commercial form at the time) was unknown as was the number of incidents that would be prevented by the installation of such a device. Now that the device is available, the advertised cost of such a 15 ampere, (name deleted), AFCI (Washington D. C. area) is approximately $150. The potential benefits from installing the device remain totally undefined. As indicated by the comments submitted to the NEC, there will be an increasing demand to expand the use of these devices, with a proportional increase in cost to the consumer, but a questionable increase in the protection provided.

Summary – Cost to the Consumer

Although the current requirement is limited to one or two devices, with the use limited to the bedroom areas, well meaning but ill informed persons are certain to expand their use, increasing the cost with minimal real benefit to the consumer.

RESTRICTIVE REQUIREMENT

1 – In the panel recommended rejection of Proposal 2-104, it was made clear that the receptacle type AFCI would not be permitted to be substituted to provide the required protection of bedroom circuits. The Underwriters Laboratories Inc. Standard for Safety for Arc Fault Circuit Interrupters (UL 1699) currently recognizes four types of AFCI devices (Branch Feeder, Cord, Outlet Circuit and Portable). The NEC panel only recognized the Branch Feeder Arc-Fault Circuit Interrupter.

2 – The arc fault detection tests are listed in Table 50.2 of UL 1699. This table indicates that the branch feeder AFCI is to be subjected to:

56.2 Carbonized path arc ignition test
56.3 Carbonized path arc interruption test
56.5 Point contact arc test, unwanted tripping tests, load
57 Unwanted tripping tests
58 Operation inhibition

3 – The receptacle type AFCI is tested to all of the same tests to which the branch feeder AFCI is tested plus the Carbonized path arc clearing time test. It is important to note that the carbonized path arc interruption test is conducted at a current rating of 75 amperes while the point contact arc test is conducted at currents as low as 5 ampere. The sensitivity of the receptacle type device to detect electrical faults in connected devices such as a television is much greater, because the impedance of the appliance cord will reduce the available current.

4 – The prohibition of the receptacle type AFCI detector will act as a restraint of trade. Prohibiting the use of this device to protect against the same type of hazard as the branch feeder AFCI will discourage the adoption of new technology and present the appearance that NFPA is mandating a particular requirement strictly for the benefit of a particular company or group of companies.

Summary – Restrictive Requirement

The current code requirement requires a specific device and does not recognize devices that provide an equal or higher level of protection to the consumer.

LIMITED EXPERIENCE

The AFCI utilizes a miniature computer to analyze the sine wave signal generated by electricity. This technology is new and experience is limited. The consumer is being forced to purchase this new device and become a real time test subject so the industry can gain the experience it needs to produce a safe, effective device. A limited comparison can be made with the GFCI. The GFCI uses miniaturized circuitry to detect unbalanced currents. After 20 years of experience, there are now strong indicators that these devices have some serious design flaws and for the last 20 years consumers have been provided with a false sense of protection. With such limited real world testing, the potential for this occurring with the AFCI is very high.

Summary – Limited Experience

The effectiveness of the AFCI is unknown. Also unknown is the reliability of the device over time. The consumer is being required to purchase this device and become the unwilling test subject of the manufacturer.

[2]Technology for Detecting and Monitoring Conditions That Could Cause Electrical Wiring System Fires, UL Project #NC233, 94ME78760, page vi and 1

[3]Page viii of UL Project #NC233, 94ME78760

[4]Technology for Detecting and Monitoring Conditions That Could Cause Electrical Wiring System Fires, UL Project #NC233, 94ME78760, page 1

PANEL ACTION: Reject.

PANEL STATEMENT: a. The panel reviewed both written data and data provided verbally via presentations during the 1999 NEC Code Cycle and arrived at the conclusion that there were past fires that could have been addressed and prevented by AFCI.

b. The panel has no ability to improve the "training" of fire investigators. However, the more detailed information from other sources as well as detailed investigations by the Consumer Product Safety Commission support the need for the device.

c. The code requirement is for an AFCI that provides protection for the entire branch circuit. UL 1699 has established those parameters. During the development of UL 1699, it was established that there are two basic forms of arcing, point-contact and carbonized-path arcing. The testing protocols developed address these arcing occurences.

d. New installations age and are modified in fashions that introduce the hazards addressed by AFCI. Adding the protection at installation, will help reduce the fires caused by aging and modification.

e. The cost figures stated by the submitter are inaccurate. Devices are available for significantly less than quoted. This is substantiated by comments from the observers and presenters at the ROP meeting of Code-Making Panel 2.

f. The requirement is not restrictive. The code language states that the branch circuit must be provided with AFCI protection. This would include the entire branch circuit.

g. The panel disagrees with the submitter's anecdotal analysis of the technology. The standard sets forth very explicit and significant requirements for an AFCI. The panel does not agree with the submitter's statements about GFCIs and notes that GFCIs can be attributed with saving countless numbers of lives.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

WIEHAGEN: The application of AFCI technology to new housing is one of the issues raised in this comment. The life expectancy of the AFCI breaker has not been demonstrated. The expectation that the breaker will continue to protect the home following modifications or even as the home ages is of yet unfounded. As far as is known, the breaker may suffer to its internal electronic components rendering it incapable of detecting arc faults, without any indication whatsoever. Also, refer to my explanation of negative vote on comment 2-73.

(Log #2071)

2- 73 - (210-12): Reject

SUBMITTER: Lawrence Brown, National Association of Home Builders (NAHB)

COMMENT ON PROPOSAL NO: 2-106

RECOMMENDATION: Delete Section 210-12 in its entirety.

SUBSTANTIATION: The panel's actions on AFCIs, (the original acceptance of this requirement for the 1999 NEC, and the panel's rejection of Proposal 2-106 for the 2002 NEC) is clearly insupportable by the false and misleading documentation submitted by the manufacturer's of this device. Underwriters Laboratories (UL) presentation to the panel at the last ROP meeting shows that the devices will not detect all arc-faults as was insinuated by the manufacturer's during the last ROC meeting. In fact UL stated that no determination can be made of the the number of arc-faults the device will detect and in turn disconnect the power to an outlet.

This alone clearly demonstrates that the mandatory installation of these devices is not cost-effective and will be of no cost-benefit to society. The list price of these devices on October 27, 2000 is: General Electric Model THQL 1150AFP - $170.00; Cutler-Hammer Model CH150AF - $155.00; and Square-D Model QO115AFI - $160.00. Claims by manufacturers that the "price will eventually come down", or that the "wholesale cost is lower", is not a practical basis for the total expense incurred by the end user of the product. With labor and profit margin by the sellers taken into consideration, the list price is a reliable basis for the total expense.

The ineffectiveness of this mandate on society can be determined. 1.667 million new dwelling units (single-family homes and multifamily units) were constructed in 1999. Additionally, 348,000 manufactured homes were built last year. Using NFPA and FEMA's U.S. Fire Administration's National Fire Incident Reporting System (NFIRS) data, the 1999 NEC requirements for bedroom

receptacles, and a single device with a list price of $155.00 installed in each dwelling, the misuse of available monies for fire and safety to a community is clear. If the devices were 100% reliable, consumers would spend $312,325,000 to cover losses of only $30,900,000. Well over ten (10) times the total losses. If this product would be expanded to include all circuits in a dwelling (based on 15 breakers), the public would spend over 4,684,875,000 to prevent losses of $253,600,000. This is approximately 18.5 times the actual loss. Furthermore, this is based on the devices being 100% effective. A claim that cannot be determined by the manufacturers or UL.

The panel's lack of concern as to the effectiveness and the cost to society, as shown in the panel's statement on this Proposal, should be of great concern to the end user of the NEC. Almost all laws enacted at the Federal and state levels need to be supported by a cost-benefit analysis. The mandate of this product lacks any true benefit to the end user. To find those that will benefit, all one needs to do is follow the money. Look at all of the Proposals and Comments submitted for the 1999 and the 2002 NEC. It has been the manufacturers pushing for this product requirement in the NEC. The manufacturers stand to make billions off of society by mandating through law a product that cannot be proved reliable or effective. Just follow the money.

If the manufacturers' claims that they want to help protect society from the loss-of-life and property from fire, they should team up with the nation's fire departments and provide the devices to communities free of charge as is now the practice for smoke detectors.

I urge the panel to remove the requirements for mandatory AFCI protection. Furthermore, I encourage jurisdictions that are considering the adoption of the NEC to delete Section 210-12 by ordinance.

NOTE: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel does not agree with the submitter's cost analysis estimates and notes that this is not supported by the comments made during the 2002 NEC ROP meeting by both presenters and observers.

Also, see panel action and statement on Comment 2-72.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

WIEHAGEN: 1. The need for arc fault circuit breakers has not been adequately demonstrated. The AFCI is purported to protect against fires in distribution systems, yet the number of electrical problems leading to fires that the AFCI can be expected to detect remains undefined.

2. Through the many committee discussions there has been no substantiation to show that arc fault problems with the wiring between the breaker and the first outlet is of such magnitude that it warrants a new protective device. This data has not been provided for any homes at all, and especially for new homes where the code requirement will be implemented.

3. Product testing has also indicated that series arc faults in connected wiring and equipment will not be detected by the AFCI breaker devices, making this code requirement even less likely to resolve the problem it seeks to address.

4. The cost impact of the code requirement for arc fault breakers has not been adequately evaluated. The high cost increase over current technology has not been evaluated in the context of the problem it is intended to remedy.

(Log #2128)

2- 73a - (210-12): Reject

SUBMITTER: Lawrence Brown, National Association of Home Builders (NAHB)

COMMENT ON PROPOSAL NO: 2-102

RECOMMENDATION: Reject the revised text to the Committee Action to Accept in Principle. Do not delete the term "receptacle".

SUBSTANTIATION: During an emergency situation, or nuisance tripping of the AFCI device, one would want this type of bedroom lighting to be available to rectify any problems. This is the same logic used when connecting bathroom lighting before any GFCI outlet protection. Furthermore, the submitter of the proposal did not provide any documentation showing a fire hazard exists in residential bedrooms associated with the permanently installed lighting outlet. It is more likely that accidents and the costs associated with these accidents could occur with the loss of area lighting in a bedroom under this new requirement.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter indicates that installing lighting on the same circuit as the receptacles in a bedroom presents a hazard. The panel notes that this practice is not presently prohibited in dwellings and that loss of lighting can occur because of overload, short circuits, or ground-faults. AFCI should be treated no differently.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

WIEHAGEN: The collective experience with AFCI technology is extremely limited. Because of this, the committee has consistently rejected expanding the application of AFCI technology to other circuits. The reference to bedroom receptacles should not be eliminated.

2- 74a - (210-12, Exception): Reject

SUBMITTER: David G. Foreman, The Foreman's Inc.

COMMENT ON PROPOSAL NO: 2-102

RECOMMENDATION: Add text to read as follows:

Exception: Smoke detection and/or alarm equipment shall not be supplied by any circuit protected by arc-fault circuit interrupter(s).

SUBSTANTIATION: As I pointed out at the September 2000 IAEI Northwest Section meeting, allowing smoke detectors to be installed on arc-fault protected circuits creates an additional hazard to the resident due to the possibility of deactivation of the alarm without the knowledge of the resident. Units with battery back-up (which still don't exist in a majority of residences) provide no level of safety when batteries are routinely removed and not replaced by residents. The bedroom circuit has always been the natural point of connection for residential smoke detectors, as it exists closest to the load supplied and doesn't impose any significant load upon the existing circuit. This is true in both retrofit and new construction.

PANEL ACTION: Reject.

Removed from agenda

PANEL STATEMENT: See panel statement on Comment 2-77 (Log #571).

Note: The Technical Correlating Committee accepts the action on this Comment as recommended by the Panel and notes correlation with the Code-Making Panel 3 action on Comment 3-70.

SUBMITTER: Technical Correlating Committee National Electrical Code

COMMENT ON PROPOSAL NO: 2-107

RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 3-124. This action will be considered by the Panel as a Public Comment.

SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.

PANEL ACTION: Accept.

The panel accepts the action of the Technical Correlating Committee. The panel concludes that the definition should remain in Section 210-12.

PANEL STATEMENT: Given the importance of the definition to the primary requirement in Section 210-12, the panel recommends to the Technical Correlating Committee that the definition remain in Section 210-12(a).

(Log #721)

2- 76 - (210-12(a) and (b)): Reject

SUBMITTER: W. Creighton Schwan, Hayward, CA

COMMENT ON PROPOSAL NO: 2-108

RECOMMENDATION: Reconsider, and accept this proposal.

SUBSTANTIATION: It is important that the type of arc fault interrupter which protects cords and other wiring beyond the outlet, be recognized. The Consumer Product Safety Commission states that over 50% of fires occur in the cord wiring beyond the outlet, and less than 20% occur on the permanent wiring between the overcurrent protection and the outlet. Lighting should not be included, because light may be needed when the device operates and cord wiring extends from receptacle outlets, not from lighting outlets.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel reiterates that the branch-circuits must be protected with an arc-fault circuit-interrupter. See panel action and statement on Comment 2-74 relative to the inclusion of lighting outlets.

In addition, the submitter's substantiation does not support his recommendation.

The panel notes that the UL Standard does require some tests for all types of AFCIs on cord sets and power supply cords.

COMMENT ON PROPOSAL NO: 2-114

RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 17 for action. This will considered as a public comment.

SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.

PANEL ACTION: Accept.

PANEL STATEMENT: The panel accepts the direction of the Technical Correlating Committee to consider the portion of Proposal 2-114 relating to limited care facilities. Refer to the panel action and statement on Comment 17-16.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

Note: The sequence no. 17-12 was not used.

(Log #571)

2- 77 - (210-12(b)): Reject

SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ

COMMENT ON PROPOSAL NO: 2-103

RECOMMENDATION: Revise (b) as follows:

210-12(b) Dwelling Unit Bedrooms. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere outlets, other than those provided for smoke detectors, installed in dwelling unit bedrooms shall be protected by an arc-fault circuit interrupter(s).

SUBSTANTIATION: NFPA 72 as well as model building codes require the installation of smoke detectors in dwelling unit bedrooms for new construction. These are defined as outlets and would be required to be installed on the load side of an arc-fault circuit interrupter by this section. NFPA 72 at 2-3.2.4 does not allow a smoke detector to be supplied by a GFCI unless that GFCI serves all electrical circuits within the household. The same concerns that prompted this rule should be applied to AFCIs as well with regard to smoke detectors.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel reaffirms the requirement for AFCI protection in dwelling unit bedrooms, including smoke detector outlets. There has been no data submitted substantiating why smoke detectors should be deleted from the AFCI requirement.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

WIEHAGEN: The field application of AFCI breakers is yet to be widely tested. The requirement that AFCI breakers be installed on smoke detector circuits in bedrooms is unwarranted. NFPA 72 includes this prohibition of GFCI on smoke detector circuits and does not differentiate from those units that have battery back-up. AFCI technology should be considered in the same way at this point in time.

(Log #1658)

2- 78 - (210-12(b)): Accept in Principle

SUBMITTER: Jack Wells, Pass & Seymour/Legrand

COMMENT ON PROPOSAL NO: 2-108

RECOMMENDATION: Accept in Principal proposal 2-108 revised as follows:

1. Reject the proposed addition to the definition in section 210-12(a).

2. Accept in Principal the proposed change to section 210-12(b) revised as follows:

(b) Dwelling Unit Bedrooms All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere outlets installed in dwelling unit bedrooms shall be protected by an arc-fault circuit interrupter(s). The arc-fault circuit interrupter(s) shall be of the Branch/Feeder type installed at the origin of the branch circuit, or shall be of the Outlet Branch Circuit type installed at the first outlet in the branch circuit.

SUBSTANTIATION:

The panel rejected the original proposal with the statement that "The panel rejects the expansion of AFCI's beyond the bedroom branch circuits at this time. The panel continues to support the introduction of AFCI's but intends at this time to limit the requirement to bedroom branch circuits until further data can be obtained and evaluated."

The intent of the proposal and of this comment is not to extend AFCI protection beyond the bedroom branch circuit but to clarify that there are alternative means of providing this protection. Likewise, it is not the intent of the proposal or this comment to require more than one AFCI to accomplish the required protection.

Since submittal of the original proposal, a new "type" of AFCI has been listed by Underwriters Laboratories, Inc. This new type of AFCI is called an "Outlet Branch Circuit AFCI" and the proposed UL definition follows:

> "**Outlet Branch Circuit AFCI – A device intended to be installed as the first outlet in a branch circuit. It is intended to provide protection to downstream branch circuit wiring, cord sets and power-supply cords against the unwanted effects of arcing. This device also provides protection to upstream branch circuit wiring."**

A copy of the UL Guide Card and a Fact-Finding Report prepared by UL are provided.

Understanding that the panel does not consider it appropriate to expand the AFCI protection beyond the bedroom branch circuit at this time, this comment modifies the proposal to merely communicate that there are two different types of AFCI's that have been defined and listed by UL as providing branch circuit protection.

The two types of AFCI are identified as a Branch/Feeder AFCI and an Outlet Branch Circuit AFCI. The Branch/Feeder AFCI is typically a circuit breaker device installed at the panel and the Outlet Branch Circuit AFCI is a receptacle type device.

With the advent of the Outlet Branch Circuit AFCI a choice of type of AFCI is available. Since both types are listed by UL as providing branch circuit protection, both meet the requirements of Section 210-12. This enables the homeowner or contractor to select the type of AFCI based on ease of installation, convenience of use and ancillary protection beyond that required by the NEC (such as protection on 2-wire circuits or the degree of protection of cords). The table below illustrates the types of arc scenarios for which the UL testing procedures verify the ability of the two types of AFCI to mitigate arcs.

At the time the proposal was submitted there was no clear definition of the branch circuit protection provided by the receptacle type AFCI, other than the submitters assertion that this protection is provided. The substantiation with the original proposal contained the statement: "…the nature of series arcs and the technology used in the design of the UL listed receptacle type Combination AFCI results in the ability of this type AFCI to clear series arcs both upstream and downstream…" Since that time a fact-finding study has been conducted by UL which verifies the branch circuit arc-fault protection afforded by the Outlet Branch Circuit AFCI. Because the newly defined Outlet Branch Circuit AFCI will be added to the product standard, the originally proposed change to the definition in 210-12(a) is not necessary.

For the purpose of this comment, the important element in the UL definition is that the Outlet Branch Circuit AFCI is defined as providing branch circuit protection both downstream and upstream when installed at the first outlet.

		Type of AFCI	
Arcing Event	**Type of Arc**	Branch Feeder	Outlet Branch Circuit
Panel to 1st Outlet;			
Arcing Screw Termination @ Panel	Series	NO	YES
Nail Severs LINE/NEUTRAL Conductor(3-Wire NM-B)	Series	YES*	YES
Nail Severs LINE/NEUTRAL Conductor(2-Wire NM-B)	Series	NO	YES
Staple Shorts NM-B	Parallel	YES	NO
Loose Wire Termination	Series	NO	YES
1st Outlet through downstream Branch Circuit;			
Arcing Screw Termination	Series	NO	YES
Nail Severs LINE/NEUTRAL Conductor(3-Wire NM-B)	Series	YES*	YES
Nail Severs LINE/NEUTRAL Conductor(2-Wire NM-B)	Series	NO	YES
Staple Shorts NM-B	Parallel	YES	YES
Loose Wire Termination	Series	NO	YES
Outlet to Extension/Power Supply Cord;			
Arcing Screw Termination @ Plug	Series	NO	YES
Severed Conductor(SPT-2)	Series	NO	YES
Shorted Conductors(SPT-2)	Parallel	YES	YES

*NOTE – Branch Feeder AFCI typically detects an arc that starts as a series arc but progresses to a parallel arc to the grounding conductor

The UL Fact- Finding Report also identifies other significant forms of arc-fault protection provided by the Outlet Branch Circuit AFCI, such as series arc protection of two wire branch circuits, extension cords and power supply cords as well as arcing faults that may occur at loose wire binding screws, push in connections and twist on wire connectors. Although the panel does not wish to expand AFCI protection beyond the bedroom branch circuit, these additional forms of protection are important collateral benefits that will be obtained by permitting the installation of the Outlet Branch Circuit AFCI for protection of the branch circuit. This seems to be in keeping with the panels' objective of supporting the introduction of innovative AFCI technology while not forcing the expansion of requirements beyond bedroom branch circuits.

Clearly indicating in the Code that either type of AFCI complies with the NEC will enable the installer or user to select the method of compliance. It is necessary to specifically identify the Outlet Branch Circuit AFCI in the requirement to insure that it is understood that this type of receptacle outlet AFCI is acceptable for providing upstream protection of the branch circuit conductors. Otherwise, it is likely to be confused with the similar looking GFCI receptacle that is well known as providing downstream protection only.

A copy of the UL Fact-Finding Report is provided with this comment. The UL Fact-Finding Report will also provide information for consideration of revisions to the UL1699, the Arc-Fault Circuit Interrupter Standard, as they are processed through the normal UL standards procedure. It is important to note that the UL fact-finding study was designed to provide technical data and facts concerning the capability of the Outlet Branch Circuit AFCI to provide branch circuit arc fault protection in accordance with the NEC requirement.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept in Principle.

Revise Section 210.12(B), as shown in the Proposal, to read as follows:

(B) Dwelling Unit Bedrooms. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere outlets installed in dwelling unit bedrooms shall be protected by an arc-fault circuit interrupter listed to provide protection of the entire branch circuit.

PANEL STATEMENT: The panel has revised the requirement from the ROP to make it clear that the AFCI must be "listed" to protect the entire branch circuit. The submitter's recommended wording to indicate specific types of AFCIs is not accepted and is not necessary, since the objective of the the NEC requirement is to indicate that the branch circuit be provided with AFCI protection.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #1883)

2- 79 - (210-12(b)): Accept in Principle

SUBMITTER: Howard S. Leopold, Cooper Wiring Devices

COMMENT ON PROPOSAL NO: 2-108

RECOMMENDATION: Revise to read as follows:

210-12(b) Dwelling Unit Bedrooms. All branch circuits that supply 125-volt, single phase, 15 and 20-ampere receptacle outlets installed in dwelling unit bedrooms shall be protected by an arc-fault circuit-interrupter(s) <u>of the Branch/Feeder type or a receptacle type recognized for protecting entire branch circuits.</u>

SUBSTANTIATION: 210-12(b) presently states that all branch circuits that supply 125V, single phase, 15 and 20 ampere receptacle outlets in dwelling bedrooms be protected by an arc fault circuit interrupter(s). The problem with this wording is that it does not explicitly state the type of AFCI device and is thus likely to be interpreted to mean that only the "Branch/Feeder" type must be used. This writer has heard of the introduction of a new type of receptacle AFCI which is UL listed as suitable to protect the <u>entire</u> branch circuit, even though it would be installed as the first receptacle in the branch circuit, downstream of the panelboard. Revising the wording as suggested above would avoid the exclusion of this new device (by misinterpretation) as an alternate to the Branch/Feeder type. No expansion of the required areas of protection would be made by this revision.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Comment 2-78.

2- 80 - (210-12(b)): Accept

SUBMITTER: George Gregory, Square D Company

COMMENT ON PROPOSAL NO: 2-108

RECOMMENDATION: Continue to reject Proposal 2-108.

SUBSTANTIATION: The appropriate revision is in the panel action on Proposal 2-110 as recorded in the ROP.

This proposal (2-108) would allow AFCI protection by either of two alternative devices: (1) the Branch/Feeder AFCI or (2) the Outlet Circuit AFCI. Both the performance and the location in the circuit of the two devices are different. Therefore, the two devices should not be considered equivalent or alternatives for each other.

A device located at the outlet such as the Outlet Circuit AFCI or even a device with combination performance (Outlet Branch Circuit AFCI) located at the outlet would have insurmountable limitations in protecting the fixed wiring circuit against hazardous arcing. Consider these points:

- In order to open the branch circuit and protect the branch circuit wiring, the device must open the circuit at the source of the branch, not at the outlet.
- A device located at the outlet could interrupt the current flow of a series arc on its supply side. However, such a device could not clear a line-to-ground or line-neutral fault. Series faults in fixed wiring are rare in comparison to line-to-ground or line-to-neutral faults. As a series fault progresses it becomes a line-to-ground or line-to-neutral fault. Therefore, if a series fault is not isolated from the supply, it may continue as a line-to-ground or line-to neutral fault.
- A device located at the outlet and sensing back toward the supply would sense arcing not only in the branch in which it is located, it would also sense arcing in adjacent circuits, at the service and possibly on the supply side of the service.

On the other hand, a Branch/Feeder AFCI located at the source of the branch protects against arcing fire causes in fixed wiring and provides "limited" protection to extension wiring and appliances. The limit is that the B/F AFCI is not required to provide low level, series protection in 2-wire circuits such as extension cords and appliance wiring. The 2-wire protection does not seem so limited when we consider this fact from "The U.S. Home Product Report, 1992-1996 (Appliances and Equipment) by Kimberly Rohr of NFPA. On Page 7, it clarifies that "The leading cause of cord and plug fires was short circuits and ground faults, which accounted for half or more of these fires, injuries and direct property damage. Fires caused by short circuits and ground faults also accounted for 38 percent of civilian fire deaths." The Branch/Feeder AFCIs are intended and tested for detecting these arcing short circuits and ground faults. That degree of protection extends to cords and plugs and appliances.

PANEL ACTION: Accept.

PANEL STATEMENT: See panel action and statement on Comment 2-78.

AFFIRMATIVE: 12

(Log #2117)

2- 81 - (210-12(b)): Accept

SUBMITTER: George Gregory, Square D Company

COMMENT ON PROPOSAL NO: 2-109

RECOMMENDATION: Continue to reject Proposal 2-109.

SUBSTANTIATION: The appropriate revision is in the panel action on Proposal 2-110 as recorded in the ROP.

This comment supports the addition of the AFCI at the branch to provide protection to the fixed wiring and protection to extension and appliance wiring. UL 1699, The Standard for Safety for Arc-Fault Circuit Interrupters, notes that the Branch/Feeder AFCI provides protection against the unwanted effects of arcing in branch circuits and limited protection to branch circuit extension wiring. The limited protection is that the B/F AFCI is not required to provide low level, series protection in 2-wire circuits such as extension cords and appliance wiring. This 2-wire protection does not seem so limited when we consider this fact from "The U.S. Home Product Report, 1992-1996 (Appliances and Equipment) by Kimberly Rohr of NFPA. On Page 7, it clarifies that "The leading cause of cord and plug fires was short circuits and ground faults, which accounted for half or more of these fires,

injuries in direct property damage. Fires caused by shot circuits and ground faults also accounted for 38 percent of civilian fire deaths." The Branch/Feeder AFCIs are intended and tested for detecting these arcing short circuits and ground faults. That degree of protection extends to cords and plugs and appliances.

The addition of an Outlet Circuit AFCI at the receptacle location would add the lower level, series protection for 2-wire circuits. It would enhance the protection brought by the Branch/Feeder AFCI.

Care must be taken when considering a combination AFCI. A combination AFCI located at the source of the branch would provide protection of the Branch/Feeder and Outlet Circuit AFCI all in one location. However, a combination performance AFCI (Outlet Branch Circuit AFCI) located at the outlet would have insurmountable limitations in protecting the fixed wiring circuit against hazardous arcing. Consider these points:

- In order to open the branch circuit and protect the branch circuit wiring, the device must open the circuit at the source of the branch, not at the outlet.
- A device located at the outlet could interrupt the current flow of a series arc on its supply side. However, such a device could not clear a line-to-ground or line-to-neutral fault. Series faults in fixed wiring are rare in comparison to line-to-ground or line-to-neutral faults. As a series fault progresses, it becomes a line-to-ground or line-to-neutral fault. Therefore, if a series fault is not isolated from the supply, it may continue as a line-to-ground or line-to neutral fault.
- A device located at the outlet and sensing back toward the supply would sense arcing not only in the branch in which it is located, it would also sense arcing in adjacent circuits, at the service and possibly on the supply side of the service.

PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2118)

2- 82 - (210-12(b)): Accept in Principle
SUBMITTER: George Gregory, Square D Company
COMMENT ON PROPOSAL NO: 2-110
RECOMMENDATION: Continue to accept the proposal as modified by Panel 2 according to the ROP.
SUBSTANTIATION: The addition of AFCI protection for the branch circuit will reduce the advent of fires from arcing causes. Since this protection will protect fixed wiring, it makes good sense to incorporate protection for all outlets in bedrooms and not limit protection to receptacle outlets. Also, since the Branch/Feeder AFCI that is applied at the branch provides arcing short-circuit and arcing ground-fault protection for appliance and extension wiring, a significant degree of protection is provided beyond the fixed wiring system.

As is also noted in Proposal 2-111, an additional degree of protection would be added for extension and appliance wiring by additionally requiring Outlet Circuit AFCIs (receptacle type) at the receptacle. The added protection is series arc detection at the 5-ampere level, which can be important especially in 2-wire cords. The panel should carefully consider this added protection in future revision cycles, as the devices become available.

There are several points made by Mr. Brown in Proposal 2-106 and explanation of his vote on it for this same section that deserve comment. He is probably correct that the percentage of losses from electrical arcing fires is small compared to all residential property losses including natural disasters such as floods, earthquakes, wind and hail that contractors must consider. It is even relatively small when compared to all fire causes including arson, smoking, cooking and other causes. These comparisons do not make arcing-fault related losses insignificant. The panel has the ability to act on reducing arcing-fault causes.

As Mr. Brown points out, the preponderance of fires from arcing causes are in older homes. However, as the 1987 report "Residential Electrical Distribution System Fires?" by Smith and McCoskrie of CPSC points out, the majority of these fires are related to improper installation or modification and improper use of electricity. An AFCI installed on such circuits would do much to reduce arcing related fires. We must remember that not all systems are installed or modified by trained and qualified contractors.

The Standard for Safety for Arc-Fault Circuit Interrupters, UL 1699, is a comprehensive standard. Mr. Brown notes that instead of the 14 tests that he counted in the 1994 CPSC report evaluating a variety of devices that may help reduce electrical fires in residences, he counted only four tests in UL 1699. During development of UL 1699, it was determined that two basic forms of arcing occur in residences: point-contact and carbonized-path arcing. These two forms envelop a variety of methods of applying arcs. They do not ignore any of the tests reported on in the CPSC report. UL 1699 has 10 tests for arc fault detection and another 14 for detection under conditions that would inhibit the arc from detection. There are also 33 tests for unwanted tripping (nuisance avoidance). Beyond these basic detection tests are a number of tests including abnormal operation, overvoltage, dielectric, voltage surge, environmental sequence, leakage current, humidity conditioning and others that are required for Listing.

Regarding price, Mr. Brown is correct that some of the early units were purchased for $85 or possibly even more. This price is one indication of the value of this newly available technology. However, that early price is no indication of the price that will exist in the marketplace as the product becomes more common, competition becomes stronger and manufactured volumes increase. Already there have also been units purchased for considerably less than half the price indicated by Mr. Brown. Those lower prices are probably a closer indicator of the direction that price will go.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 2-78.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2102)

2- 83 - (210-19(a)): Reject
SUBMITTER: Truman C. Surbrook, Michigan State University
COMMENT ON PROPOSAL NO: 2-126
RECOMMENDATION: Change to Accept in Part to Accept.
SUBSTANTIATION: The phrase "before the application of any adjustment or correction factors" needs to be deleted, or rewritten to make the meaning clear. Hundreds of electrical contractors and inspectors are confused by this phrase. "PLEASE" make the meaning clear. See the following example:

Assume a branch circuit is wired with copper conductors with 90°C insulation. Assume all terminations in the circuit are rated 75°C. The load on the circuit consists of 10 amperes continuous and 6 amperes noncontinuous. Assume there are 9 current carrying conductors in raceway including these circuit conductors. This raceway runs through an area where the ambient temperature is 120°F, and there are no terminations in this area or within 10 feet of the boundary of this area. Assume the overcurrent device is rated 20 amperes (1.25 x 10 A + 6 A = 18.5 A). The question here is what is the minimum permitted size of conductor?

The phrase "before the application of any adjustment or correction factors" seems to be telling me that I must find a conductor in Table 310-16 in this case 75°C column (because of terminations) that has an allowable ampacity of 18.5 amperes (1.25 x 10 A + 6 A = 18.5 A). This is an AWG #12 taking Section 240-3(d) into consideration.

Section 210-19(a) does not require the allowable ampacity to be compared to 1.25 times the continuous load "after the adjustment and correction factors" have been applied. So the adjusted and corrected allowable ampacity of the conductor must not be less than 10 amperes continuous plus 6 amperes noncontinuous for a total of 16 amperes. The insulation is 90°C rated in the area where the raceway contains 9 conductors and is exposed to 120°F ambient temperature. Applying the adjustment and correction factors to the allowable ampacity of an AWG #12 copper 90°C conductor results in an allowable ampacity of 17.2 amperes under these conditions (30 A x 0.7 x 0.82 = 17.2 A). Since the rule in Section 210-19(a) does not apply after the application of adjustment and correction factors, the allowable ampacity of 17.2 amperes is compared to 16 amperes of load. The conclusion is that an AWG #12 conductor is acceptable for this circuit.

If this analysis is correct, then reject my comment and leave the section in its present form. If my analysis is wrong, please do me the courtesy of explaining how the conductor should be sized and reword the section so the meaning is clear. By removing the phrase "before the application of any adjustment or correction factors", the allowable ampacity of the conductors must be not less than 1.25 times the continuous load plus the noncontinuous load, which in this case is 18.5 amperes and an AWG #12 conductor is too small for this circuit. An AWG #10 conductor is required (40 A x 0.7 x 0.82 = 23 A).

PANEL ACTION: Reject.
PANEL STATEMENT: The present code text reflects the intent of the requirement. The minimum conductor size that can be used based on continuous loads at 125 percent and noncontinuous loads at 100 percent is established by this section. Other calculations for the number of conductors in a raceway or ambient adjustment may be required by Section 310-15 and those adjustments can take advantage of the higher temperature values of the conductor's insulation.

2- 86 - (210-19(a), Exception): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 2-130
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: The proposal submitter does not adequately understand why the requirement exists in the first place. Conductor ampacity is defined in terms of the ability to carry load continuously. The requirement to upsize conductors was never imposed to protect conductors; instead, it had to do with providing a heat sink for conventional devices subjected to continuous loading. That NEMA sponsored revision avoided a likely UL standards revision that would have cost the industry untold millions of dollars in reengineering and testing of end use equipment, but had not basis in conductor ampacity.

Therefore the present rule is correct even though, as correctly noted in the substantiation, they could be in two different wire sizes required to serve the same 130A continuous load. The conventional device requires 2/0 (and 175A protection) and the 100% device requires No. 1 (and 150A protection) for the same load. Each wire will be protected by the installed circuit protection per 240.3, and the conventional device will be assured that the conductor has some phantom load capacity so it will perform as a heat sink under the stipulated load profile. Devices listed for 100% operation have the heat dissipation issues addressed though other engineering approaches implicitly evaluated in the listing process.
PANEL ACTION: Accept in Principle.
In the proposal, retain the use of the word "allowable" in the first sentence, and delete the last sentence.
PANEL STATEMENT: The action taken meets the intent of the submitter and retains the use of the term "allowable" in the proposal.

2- 87 - (210-19(a), Exception): Reject
SUBMITTER: Truman C. Surbrook, Michigan State University
COMMENT ON PROPOSAL NO: 2-130
RECOMMENDATION: Agree with the Panel's action to Accept in Principle, but with the deletion of the words "permitted to be" in the exception.
SUBSTANTIATION: The words "permitted to be" are not needed and they are confusing to Code users. This exception sets a minimum allowable ampacity of the circuit conductors and the words "not less than" are clear as to the meaning.

The Panel has approved a new last sentence as follows: "In no case shall the ampacity be less than the rating of the overcurrent device." I agree with the Panel's action here, and as a point of clarification, I assume the Panel means by this statement that Section 240-3(b) does not apply.
PANEL ACTION: Reject.
PANEL STATEMENT: Use of the term "shall be permitted" makes it clear that this is a permissive exception and not a mandatory requirement. The exception reads clearly with this text included.

In addition, the submitter is directed to Comment 2-86 relative to the last sentence of the exception.

2- 88 - (210-19(b) (New)): Accept in Principle
Note: See Technical Correlating Committee action on Comment 4-36.
SUBMITTER: J. Pat Roche, Celanese Acetate
COMMENT ON PROPOSAL NO: 4-40b
RECOMMENDATION: New 210-19(b) to read as follows:

(b) Branch-Circuits Over 600 Volts. Branch-circuit conductors over 600 volts shall be sized in accordance with (1) or (2):

(1) The ampacity of branch circuit conductors shall not be less than 125 percent of the designed potential load of utilization equipment that will be operated simultaneously.

(2) For supervised installations branch-circuit conductor sizing shall be permitted to be determined by qualified persons under engineering supervision. Supervised installations are defined as those portions of a facility where all of the following conditions are met:
a. Conditions of design, and installation are provided under engineering supervision.
b. Qualified persons with documented training and experience in over 600 volt systems, provide maintenance, monitoring and servicing of the system.

The ampacity of conductors shall be in accordance with Section 310-15 and Section 310-60 as applicable.
SUBSTANTIATION: Comment to address Technical Correlating Committee referral of proposal 4-40b to Code-Making Panel 2 for inclusion of the material in Articles 210 and 215 to cover over 600 volt branch-circuits, feeders, and supervised installations, in general. See companion comments on 210-19(a), 215-2(a), and new 215-2(e).
PANEL ACTION: Accept in Principle.
In the wording of the comment, include the following titles:
"(1) General.
(2) Supervised Installations."
Also, move the last sentence of the Comment to become the first sentence of (B), after the title.
PANEL STATEMENT: The panel action provides titles in accordance with the NEC Style Manual. The last sentence was moved to (B) to provide clarity.

2- 89 - (210-21(b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 2-137a
RECOMMENDATION: Accept in principle revised:
(2) Delete text and table.
SUBSTANTIATION: Cord- and plug-connected with a nameplate rating of over 12 to 15 amperes, over 16 to 20 amperes, and over 24 to 30 amperes normally have plugs rated 15, 20, and 30 amperes, respectively. A majority of cord- and plug-connected equipment may be movable or portable, or not present at time of inspection and unknown to the authority having jurisdiction, which makes this section virtually unenforceable.

Since a 15, 20, or 30 ampere plug and receptacle are rated for these values, what is the safety hazard for a duplex receptacle compared to a single receptacle on an individual branch circuit where the full rating may be used? Overload protection is provided by the branch-circuit overcurrent device. This section appears to be a design consideration rather than safety related.

This section should not permit a single lighting outlet (180 va) and a single 15 ampere receptacle supplying a 13 ampere load, on the same 20 ampere circuit which complies with 210-23(a). It doesn't permit two single receptacles with loads exceeding the values in the table where the receptacles are controlled by a selector switch which energize only one receptacle at a time.

The perceived intent to allow for additional load is better provided for in 210-23.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel disagrees with the submitter. This section does establish the basic limits intended for branch circuits.

(Log #1327)

2- 90 - (210-23): Reject
SUBMITTER: William H. King, Jr., U.S. Consumer Product Safety Commission
COMMENT ON PROPOSAL NO: 2-143
RECOMMENDATION: I support the panel action to "Accept in Principle" Proposal 2-143 with the revisions to Section 210-23 which were accepted under Proposal 2-142a. Section 210-23 in the 2002 NEC would then read as shown in Proposal 2-142a.
SUBSTANTIATION: The current wording of Section 210-23 clearly states that the rating of any one cord- and plug- connected utilization equipment shall not exceed 80 percent of the branch-circuit ampere rating for 15- and 20-ampere branch circuits, unless the load is supplied by an individual branch circuit. However, this long-standing code requirement has been abused by listing organizations over the years by certifying products exceeding the 80% rule and likely to be used on general purpose branch circuits. One rationale given is that the rule only applies to continuous loads. The NEC makes no such allowance. Noncontinuous loads can stress branch circuits, resulting in dangerous overheating at connection points: that is why current-cycling tests are conducted to qualify electrical wiring splice and termination devices.

The CPSC staff proposal to correct this safety issue during the previous code cycle was not accepted, but garnered considerable support (ref: Proposal 20-52, NFPA 70-A98 ROP). This resulted in the formation of a task group representing all interested parties to determine the proper course of action to resolve the matter. Proposal 2-143 in this code cycle reflects the outcome recommended by the task group. Compromises on all sides were necessary to result in Proposal 2-143, and the change will begin to correct the situation. Panel 2 is urged to adopt the proposal as reflected in Proposal 2-142a, and resist continuing to permit the abuses of the past, which will further stress already-stressed branch circuits. While the explanation offered by Mr. Carpenter for his negative note has merit, listing organizations did not address the problem and the issue was brought before the broader electrical community represented by the NEC Committee. The revised language sought for Section 210-23 will guide both listing organizations and appliance manufacturers. In some cases, appliances will be designed in the future to operate within the 80 percent limit. In others, appliances will be equipment with higher rated 20-ampere plugs to assure connection to the appropriate branch circuit. As a minimum, an appliance with a rating that exceeds the 80 percent limit will have information for users to consider with regard to the appropriate outlet for connecting the appliance.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 2-91.

(Log #318)

2- 91 - (210-23(a)): Accept
SUBMITTER: Alan H. Nadon, City of Elkhart, IN
COMMENT ON PROPOSAL NO: 2-143
RECOMMENDATION: Reject this proposal.
SUBSTANTIATION: The existing code which limits cord connected appliances to 80 percent of the branch circuit design has provided the cushion of safety for weak points in the branch circuit particularly joints and terminations, loading branch circuits to 100 percent at frequent intervals but, not continuously will stress the circuit, and may lead to a failure, and fire.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel notes that by accepting this proposal, they are removing the wording from Section 210-23(a)(1) in the 2002 NEC ROP, and its original intent is maintained. Sections 210-21(b) and 210-23(a)(1) limit the application of any one cord- and plug-connected utilization equipment to 80 percent of the branch-circuit rating, regardless of whether the load is continuous or noncontinuous.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
NISSEN: I agree with the panel action on Comment 2-91, as the net effect of this action is to revert back to the original wording in 210-23(a). However, I do not agree with the submitter's substantiation or the panel statement.

Section 210-23 permits an individual branch circuit to supply any load for which it is rated. For multi-outlet branch circuits, use of noncontinuous appliances rated at 100 percent of the branch circuit does not result in a hazard. All branch circuit components, such as the receptacles, branch circuit wiring, and the overcurrent devices, when used for supplying noncontinuous loads, are evaluated for service at 100 percent of their full rating.

2- 93 - (210-23(a)): Accept
SUBMITTER: Alan H. Nadon, City of Elkhart, IN
COMMENT ON PROPOSAL NO: 2-143
RECOMMENDATION: Revise as follows:
"... shall not exceed 80 percent of the branch-circuit ampere rating. ~~unless listed and marked to inform the user of the necessity for providing an individual branch circuit.~~
SUBSTANTIATION: Many cord connected appliances operate at 100 percent of their rated value without damage to themselves. However, the stressing of the total branch circuit from overcurrent device to the wire, splices, terminations and the receptacle outlet must be considered. Labeling the equipment to require a dedicated branch circuit is impractical, unenforceable, and merely shifts the blame for failure of the branch circuit wiring on the user.

PANEL ACTION: Accept.

SUBMITTER: Eric Stromberg, The Dow Chemical Company
COMMENT ON PROPOSAL NO: 2-143
RECOMMENDATION: Add new text as follows:
210-23(a)(1) Listed portable devices that exceed 80% of the branch circuit rating, and are intended for temporary connection to the branch circuit during use, shall be permitted to be connected to the receptacle type for which they are listed.
SUBSTANTIATION: Currently, the connection of cord-connected devices with a load of more than 80% of the branch circuit OCP is not permitted. The practical outworking of this is that 120V equipment rated at more than 12 amps (but less than 16) should have a 20 amp plug. There are devices that are UL listed (my circular saw, for example) that draw more than 12 amps, yet have a plug on them that allow connection to a 15 amp circuit. Connection of this device to a 15 amp circuit is in violation of 210-23(a).
PANEL ACTION: Reject.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #386)

2- 99 - (210-52, (210-60(a))): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 2-155
RECOMMENDATION: Accept in principle, revise panel action as follows: 210-60(a) GENERAL. Guest rooms in hotels, motels, and similar occupancies, <u>whether or not defined as a dwelling unit,</u> shall have receptacle outlets installed in accordance with 210-52(a) and 210-52(d). Guest rooms meeting the definition of a dwelling unit shall have receptacle outlets installed <u>in accordance with</u> ~~using~~ all the applicable rules in 210-52.
SUBSTANTIATION: Sections 210-52(a) and (d) are requirements for guest rooms that qualify as a dwelling unit. The last sentence makes a clear distinction between guest rooms which do or do not meet the definition of a dwelling unit. The last sentence is revised to conform to a many times used phrase in the Code.
PANEL ACTION: Accept in Part.
The panel rejects the revision to the first sentence.
The panel accepts the submitter's revision to the last sentence.
PANEL STATEMENT: The submitter's revision in the first sentence is redundant.
The last sentence clearly states that all applicable rules must be used if the room meets the definition of a dwelling unit.

(Log #2226)

2- 100 - (210-52): Accept
SUBMITTER: Robert H. Keis, Dover, DE
COMMENT ON PROPOSAL NO: 2-154
RECOMMENDATION: The proposal should remain rejected per the panel action.
SUBSTANTIATION: I have been hearing the argument about things dropping onto the exposed blades of a connected load for many, many years. As a rebuttal, I have seen more exposed blades when the ground prong is up. These shiny prongs could be very enticing to a child. As for the plates dropping off and contacting the prongs, just how many times has this happened? Residentially there are a whole lot more nonmetallic receptacle plates than there are metal plates. In fact, if a survey where conducted I believe you would find that 99.9 percent of the plates in a dwelling unit are nonmetallic. Furthermore, almost all cord-caps have the ground prong "down". As such, when these are plugged into a receptacle where the ground prong is "up" the weight of the cord tends to pull

the cord-cap out of the outlet which in turn exposes as much as 1/4 in. of the hot blades and also damages the cord where it is attached to the cap. Also, when the cord is removed, the ground prong is the first thing out of the outlet. When the ground prong is installed "down" the cord hangs in a natural position and stays in the receptacle outlet. I am not advocating a rule the ground is to be down. Just leave it alone and let it be a design consideration.
PANEL ACTION: Accept.

SUBMITTER: David A. Kerr, Jr., Friendsville, PA
COMMENT ON PROPOSAL NO: 2-162
RECOMMENDATION: Accept.
SUBSTANTIATION: Two foot walls are nonsense. Three or four is sensible. This would also remove the idiotic and dangerous requirement to put a receptacle behind a door. The best place is one to two feet from the open door side, not six feet, so plugs and cords are less likely to be damaged by big furniture. People think I'm crazy when I quote these code rules to them. I have better ways of wasting my time than enforcing nonsense.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel confirms its previous panel statement that the two foot dimension defines a wall space for the application of the code rules. The panel does not agree with the submitter's assertion that the placement of a receptacle in the space behind a door creates a hazard. Frequently, this is the only receptacle accessible to plug in portable devices such as vacuum cleaners.

2- 110 - (210-52(c)(5), Exception):
Note: The Technical Correlating Committee directs that Comment 2-110 be reported as "Accept in Part", and that the first sentence of the Submitter's substantiation is considered part of the Recommendation.
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 2-175
RECOMMENDATION: Revise exception to read as follows:
Exception: To comply with the conditions as specified in (a) or (b), receptacle outlets shall be permitted to be mounted not more than 12 in. (305 mm) below the countertop. Receptacles mounted below the countertop in accordance with this exception shall not be located where the receptacle countertop extends more than 6 in. (153 mm) beyond the edge of the countertop measured horizontally its support base.
SUBSTANTIATION: Comment to recommend rejecting this proposal. It is not a safe practice to locate receptacle outlets on the bottom side of countertop spaces. The receptacle outlets and inserted cord caps will be subject to potential damage. I agree with negative comments by panel members, Mr. Carpenter, Mr. Nissen and Mr. Roche to reject this proposal. This does not add safety to the code, but serves to add information in an exception to a main rule intended in some part to help limit the amount of accidents due to cords draped down in the reach of children. This would increase the risk of crock pots, coffee pots, etc. being pulled off of countertops and resulting in burns to children.
PANEL ACTION: Accept in Principle in Part.
The panel accepts the submitter's recommendation to reject Proposal 2-175, but does not accept the revisions to the paragraph as shown in the recommendation of the comment.

SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 2-179
RECOMMENDATION: Accept in Principle revised:
"(b) GUEST ROOMS. At least one wall switch-controlled lighting outlet shall be installed in bathrooms, and at least one wall switch-controlled receptacle shall be installed in guest rooms or hotels, motels, and similar occupancies.
SUBSTANTIATION: Section 210-70(a) specifically requires a wall switch-controlled lighting outlet in bathrooms of dwelling units. Many hotels and motels do not meet the definition of dwelling units and there is no requirement for a bathroom lighting outlet, though the need is just the same. Though a lighting is normally installed, a requirement is needed as much as the one for (habitable) guest rooms.
PANEL ACTION: Hold.
PANEL STATEMENT: The submitter's recommendation does not relate to the proposal and contains material that has not been subjected to public review.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1661)

2- 112 - (210-52(d)): Accept in Principle in Part
SUBMITTER: Melvin K. Sanders, TECo., Inc.
COMMENT ON PROPOSAL NO: 2-3
RECOMMENDATION: Revise as follows:
(D) Bathrooms. In dwelling units, at least one wall receptacle outlet shall be installed in bathrooms within 900 mm (3 ft) of the nearest outside edge of each basin as measured to the adjacent wall or partition. The receptacle outlet shall be located on a wall or partition that is adjacent to the basin location. A single multiple outlet located between adjacent basins shall be considered as meeting the intent of this section.
SUBSTANTIATION: This clarifies it is the wall adjacent to and next to the basin, and not the edge nearest the individual, where the measurement is to be taken.
The addition of "partition" recognizes that bathroom basins may be mounted on other than countertops, and that partitions less than room height may be involved. The additional sentence recognizes the use of a single duplex receptacle for double basin lavatories, as it provides the necessary number of receptacle outlets and two duplex receptacles are not required. Obviously more attachment points can be added but that should be a design issue.
At present, some areas allow the proposed practice and others require two duplex receptacles to be installed, sometimes placed in a two-gang box, and the subtlety of the definition of single and multiple receptacles in Article 100 is missed. Since there is this confusion, it would be a shame to miss this rewrite opportunity to clarify this issue.
PANEL ACTION: Accept in Principle in Part.
The panel does not accept the revision to the first sentence of the comment.
The panel accepts the addition of the words "or partition" by its action on Comment 2-114.
The panel does not accept the addition of the last sentence.
PANEL STATEMENT: The revision of the first sentence does not add any clarity. The measurement can be taken from any outside edge of the basin.
The last sentence is rejected because it only covers one scenario of basin and receptacle placement.
If a receptacle outlet can be placed so that it meets the requirements outlined in the first two sentences, it can qualify for more than one basin.

SUBMITTER: Mike Kietzman, Jr., Flint, MI
COMMENT ON PROPOSAL NO: 2-181
RECOMMENDATION: At the end of the second sentence of Section 210-52(d) add the word "countertop". The section will read "...adjacent to the basin countertop."
SUBSTANTIATION: Inspectors often rule that the wall behind the basin is the only adjacent wall. Frequently, a wall at the end of a counter in which the basin is installed is the more appropriate wall for mounting the receptacle outlet.
PANEL ACTION: Accept in Principle.
Revise the last sentence of Section 210.52(D) in the 2002 NEC ROP to read as follows:
"The receptacle outlet shall be located on a wall or partition that is adjacent to the basin or basin countertop."
PANEL STATEMENT: The panel has accepted the submitter's recommendation in principle and revised the wording to provide clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

(Log #1707)

2- 115 - (210-52(d)): Reject
SUBMITTER: Marc Johns, Flint, MI
COMMENT ON PROPOSAL NO: 2-180
RECOMMENDATION: Change Reject to Accept in Principle and revise the second sentence as follows: delete the end of the sentence after the word "that" and add in the new words "borders the basin counter." The sentence will then read: "The receptacle shall be located on a wall that ~~is adjacent to the basin location~~ borders the basin counter."
SUBSTANTIATION: There is still confusion about the word adjacent leading to different interpretations by inspectors and contractors in the field.
PANEL ACTION: Reject.
PANEL STATEMENT: The use of the word "adjacent" is clear and preferred over the word "border". The dictionary defines "adjacent" as "next to".

(Log #2265)

2- 116 - (210-60(a)): Reject
SUBMITTER: Lawrence Brown, National Association of Home Builders (NAHB)
COMMENT ON PROPOSAL NO: 2-155
RECOMMENDATION: Revise the proposed text revision of 210-60 as follows:
(a) General. Guest rooms in hotels, motels, and similar occupancies shall have receptacle outlets installed in accordance with ~~210.52(a) and 210.52(d). Guest rooms meeting the definition of a dwelling unit, shall have receptacle outlets installed using~~ all of the applicable rules ~~in~~ of 210-52.
To read:
(a) General. Guest rooms in hotels, motels, and similar occupancies shall have receptacle outlets installed in accordance with all of the applicable rules of 210-52.
SUBSTANTIATION: The revised text clearly indicates the panel's intent that outlet receptacles in guest rooms and guest suites in hotels meet the same criteria as those found in a residential dwelling occupancy. The main reason for striking the words "guest rooms meeting the definition of a dwelling unit, ..." is due to the fact that the residential occupancies of a dwelling unit (a one-family, two-family or multifamily dwelling) are separated in the NEC, NFPA 101 Life Safety Code, and the model building codes from the residential occupancy of a guest room or guest suite located in a hotel. This is the same as if you made requirements for a Manufactured Home, a Day Care or Residential Board and Care occupancy located in what would appear to be a single-family home. Each of these occupancies must be specifically addressed, not grouped together because of appearance. This same train-of-thought is already used throughout Chapter Two when dealing with specific requirements for these different occupancies. Upon reading the text of NFPA 101 Chapters 28 and 29, there is no use of the term "dwelling unit". The proposed revised wording of this section also achieves conformity with the NFPA 101 Life Safety Code and the NFPA 5000 Building Code.
PANEL ACTION: Reject.
PANEL STATEMENT: The use of the term "dwelling unit" is not inconsistent in the context of the NEC. Article 100 has a clear definition of "dwelling unit" for the application of rules in the NEC. Utilizing the term in this section does not make the guest room a dwelling unit, nor does it change any of the rules from the building or Life Safety Code, it simply states that a guest room that meets the definition set forth in Article 100 must have receptacles placed by all the applicable rules in Section 210-52.

2- 117 - (210-60(b)): Reject
SUBMITTER: Veronica M. Westfall, Topaz Publications
COMMENT ON PROPOSAL NO: 2-202
RECOMMENDATION: Revise as follows:
At least two receptacle outlets with tamper-resistant covers shall be readily accessible.
SUBSTANTIATION: This is good if you're a business traveler and want to plug in your laptop without having to move any furniture, but I am guessing that these receptacles were originally hidden to limit the hotel's liability for exposing some children to unprotected devices. The code requires tamper-resistant covers for pediatric areas in hospitals, why not here? Actually requiring two accessible outlets seems dangerous to me, particularly since most parents don't travel with outlet covers.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided any substantiation to support the claim that receptacles in guest rooms need to have tamper resistant covers.

2- 118 - (210-61 (New)): Reject
SUBMITTER: Jack Wells, Pass & Seymour/Legrand
COMMENT ON PROPOSAL NO: 2-205
RECOMMENDATION: Accept in principal and revise the proposal as follows:
210-61 Child care. In child care areas such as day care centers, preschools, elementary schools and similar areas where children have access to receptacles, all 15- and 20 ampere, 125-volt receptacles shall be listed tamper resistant receptacles or shall employ a listed tamper resistant cover.
SUBSTANTIATION: The proposal has been revised to include the tamper resistant covers referred to in the panel statement. The panel statement also refers to inserts. The inserts are not included in the comment because they do not afford the same level of protection as tamper resistant receptacles and covers. The tamper resistant receptacles and covers are the means of protection required by 517-18(c) for pediatric locations.
The panel also states that proper child supervision is also necessary. This is also true in pediatric care locations but 517-18(c) recognizes that even with proper supervision there is still the hazard of children inserting conductive objects into receptacles. This hazard may be even greater in the locations cited in the proposal because there are likely to be a greater number of children per adult supervisor than in a pediatric care location.

PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not supplied data to support the addition of tamper resistant receptacles in locations specified.

(Log #588)

2- 120 - (210-63): Accept in Principle
SUBMITTER: Michael L. Simmons, Simmons Electric Co.
COMMENT ON PROPOSAL NO: 2-209
RECOMMENDATION: I respectfully request the Committee to consider the following change:
"210-63. Heating, Air-Conditioning, and Refrigeration Equipment Outlet. A 125-
volt, single-phase, 15- or 20- ampere-rated receptacle outlet shall be installed at an accessible location for the servicing of heating, air-conditioning, and refrigeration ~~equipment on rooftops and in attics and crawl spaces~~. The receptacle shall be located on
the same level and within 25 feet (7.62m) of the heating, air-conditioning, and
refrigeration equipment. The receptacle outlet shall not be connected to the load side of the equipment disconnecting means.
~~Exception: Rooftop equipment on one and two-family dwellings.~~
FPN: See Section 210-8 for ground-fault circuit-interrupter requirements."
SUBSTANTIATION: Background: A very hazardous situation exists in the servicing of heating, air-conditioning, and refrigeration equipment. The current paragraph 210-63 requirements are not uniform in the safety protection provided for various applications. Paragraph 210-63 currently requires that a receptacle outlet be located within 25 feet of heating, air-conditioning, and refrigeration equipment; but the paragraph excludes coverage for all ground-level equipment and rooftop equipment in one and two family dwellings. HVAC (heating, ventilating, and air-conditioning) servicemen, who are not fully qualified electricians, service the equipment covered by paragraph 210-63. Although the existing code 210-52(e) requires an outlet on the back of the dwelling, air conditioning equipment is often located on the side of the dwelling, where the 210-52(e) outlet is not easily accessible—for example, millions of southern homes with backyard lanai areas (porch/veranda/swimming pool) have the equipment on the side of the dwelling.
Description of the Hazard: HVAC serviceman are required to use a nearby receptacle outlet for various routine and emergency reasons. These reasons include the frequent use of HVAC refrigerant recovery machines; the use of vacuum pumps; for lighting; and for power tools. Scheduled service calls are routine, but emergency service calls are also required on HVAC equipment at all hours of the day and night, including calls during wet weather or when the ground is wet after recent rain or snow. The vast majority of these calls are made for ground-level equipment at residences. Emergency calls are often made at night when lighting is required. It is normal practice for the serviceman to plug into the nearest outlet he sees during such service calls, but quite often there is not an outlet within sight. As a result, I have seen HVAC technicians plug into a non-GFI home outlet immediately inside the house, which was the nearest outlet available to the outside ground-level air-conditioner. Others will simply put jumpers inside the disconnect box to get power, putting themselves at risk to get the job done quickly. Connecting to a non-GFI outlet or using jumpers creates an immediate electrocution hazard if the ground is wet and there is a short in the equipment or extension cord. These are clearly not acceptable servicing practices, but as a master electrician with experience in many states, I have seen them occur repeatedly, due either to ignorance of the seriousness of the hazard or due to the constant pressure on the serviceman to accomplish the job efficiently and quickly. I do not know how many injuries/fatalities this causes nationwide every year. HVAC servicemen are not fully qualified electricians.
Summary: The proposed deletions to paragraph 210-63 would have the effect of applying the same requirement to all equipment, regardless of the location of the equipment. The changes would thus extend safety protection uniformly to all equipment applications, including ground-level equipment, where the largest hazard exists. A single outlet on the back of the house will often comply with both the proposed 210-63 as well as the existing 210-52(e). However, when the air conditioner is located on the side of the dwelling, or further than 25 feet away from the 210-52(e) outlet, an additional outlet would be required. I believe this additional equipment cost is nominal compared to the increase in safety and the reduced medical cost and lost-wage cost from injuries/fatalities. An added benefit to this proposed change is that the nearby outlet will provide an additional convenience outlet to the homeowner or property maintenance personnel, who increasingly use outdoor electric appliances such as lawnmowers and weedcutters.
Note: I agree with Mr. Hartwell (Proposal Log No. 4165) and others who also recommended this change. The change would also create consistency with mechanical code requirements.
PANEL ACTION: Accept in Principle.
The panel accepts the recommendation in the Comment noting that the word "equipment" in the first sentence will remain.
PANEL STATEMENT: The panel notes that for dwelling unit applications, the receptacles required by Section 210-52(e) could also meet the requirement of Section 210-63 if one were installed within 25 feet of the equipment.

SUBMITTER: Russell LeBlanc, Peterson School of Engineering
COMMENT ON PROPOSAL NO: 2-217
RECOMMENDATION: Revise as follows:
At least one switch for the required lighting outlet shall be located near at least one entrance to the habitable room or bathroom.
SUBSTANTIATION: The intent of my original proposal was to require the switch for the lighting outlet to be located near an entrance to each habitable room and bathroom. Currently the NEC only requires the switch location to be a wall. Why the wall? Which wall? The Panel's statement in the ROP says that the location of switches is a "design consideration".
Why then does the NEC require the switch location to be on the wall? A switch installed on the underneath of a cabinet, or on a countertop, or on a post would not be allowed with the current wording. The NEC requires one point of control for lighting outlets in storage and equipment spaces to be near the entrance to these spaces. Is that not a "design consideration"?
I think habitable rooms and bathrooms should have similar requirements.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reiterates its position that the location of the wall switch is a design consideration and that the thousands of variations of rooms dwelling unit layouts make a mandated location of that switch impractical. The submitter's use of the term "near" adds no more clarity than the present requirement.

2- 123 - (210-70(a)(1)): Accept
SUBMITTER: Robert H. Keis, Dover, DE
COMMENT ON PROPOSAL NO: 2-221
RECOMMENDATION: This proposal should remain rejected.
SUBSTANTIATION: Why put something in the code that is completely impossible to enforce or control. How is the inspector or anyone enforcing this code going to control what is plugged into a dwelling unit outlet. All this could do is result in arguments, lawsuits, and unnecessary government control. As for protecting against bumped shins, for falling, the code requires the switched outlet, but it doesn't require a switch at each entry into a room. What is the difference? There would still be times when entering a room that a light is not available, and this complies with code. Also, can anyone image the hazards created by some homeowners trying to disable the internal switching.
PANEL ACTION: Accept.

2- 125 - (210-83(3)): Accept
SUBMITTER: Jack Wells, Pass & Seymour/Legrand
COMMENT ON PROPOSAL NO: 2-32
RECOMMENDATION: The Panel should continue to reject this proposal.
SUBSTANTIATION: This comment supports the action of the Panel to reject the proposal. Likewise, we support the Panel statement and the affirmative comment of Mr. Nissen.
Unfortunately, the survey mentioned in the Panel statement has taken longer than anticipated. The stated objective of the survey is "…to obtain statistically valid data to identify, define and quantify long term operation of GFCIs in the installed infrastructure. For suspected field failures, both the installation and the product must be analyzed and data compiled to enable clear definition (including conditions of use and environment) and mode of failure (e,g, SCR failure, test button failure) sufficient to define remedial action(s) if required.,"
The statistical model developed for this survey has been reviewed and confirmed by CPSC as appropriate. UL is fully involved in the collection, tabulation and analysis of the data as it comes in.
Because the data is incomplete, unanalyzed and lacks peer review it would be inappropriate for NEMA to release it at this time.
Even if the survey supports some remedial action, the Panel and Mr. Nissen are correct in stating that such action should involve the product safety standard, not the installation code.
PANEL ACTION: Accept.

ARTICLE 215 — FEEDERS

(Log #2104)

2- 126 - (215-2(a)): Reject
SUBMITTER: Truman C. Surbrook, Michigan State University
COMMENT ON PROPOSAL NO: 2-243
RECOMMENDATION: Change Accept in Part to Accept.
SUBSTANTIATION: The phrase "before the application of any adjustment or correction factors" needs to be deleted, or rewritten to make the meaning clear. Hundreds of electrical contractors and inspectors are confused by this phrase. "PLEASE" make the meaning clear. Assuming that Table 310-16 applies in a particular case, the allowable ampacity is the value given in the Table if the conditions of the Table are met. If adjustment or correction factors apply, then the allowable ampacity is the result of their application to which ever column is appropriate. If the phrase that is confusing is deleted, then the rule applies to the allowable ampacity of the conductors taking adjustment and correction factors into consideration. The following example is my interpretation of this section as presently written.

Assume a three-phase, four-wire feeder is protected with a 400 ampere circuit breaker and supplies load that consists of 110 ampere continuous and 228 ampere noncontinuous. Further, the majority of the load is nonlinear so all four conductors count as current carrying conductors and an adjustment factor of 0.8 must be applied. Assume the conductors are copper with 75°C insulation and terminations.

Before applying any adjustment factors, the minimum conductor size is 500 kcmil which has an allowable ampacity of 380 amperes. This conductor is capable of carrying 1.25 times the 110 ampere continuous load and 224 ampere noncontinuous load which adds up to 362 amperes. But after the adjustment factor of 0.8 has been applied, this section is not requiring the allowable ampacity to be compared to 362 amperes. Instead it seems to be requiring the allowable ampacity to be compared to 334 amperes (110 A + 224 A = 334 A). This requires a 600 kcmil conductor with an adjusted allowable ampacity of 336 amperes (420 A x 0.8 = 336 A).

If the intent is for the adjusted allowable ampacity of the conductor to be not less than 1.25 times the continuous load plus the noncontinuous load (362 A) than a 700 kcmil conductor is required (460 x 0.8 = 368 A). But this does not seem to be what the section is stating.

Please tell me what minimum conductor size the Panel would select for this example based upon this section, and please rewrite the section to make the meaning clear.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter is incorrect in his statement of intent shown in the next to last paragraph of the substantiation. The intent of the requirement is to establish the minimum conductor size that can be used based on the continuous loads at 125% and non-continuous loads at 100%.

Other calculations for the number of conductors in a conduit and ambient adjustment may be required by Section 310-15 and those adjustments can take advantage of the higher insulation values of a conductor. Removing the words as requested by the submitter would eliminate the ability to take advantage of the higher temperature insulations for ambient adjustment and numbers of conductors in the raceway.

(Log #1702)

2- 128 - (215-2(a), Exception): Reject
SUBMITTER: Justin Kurney, Corunna, MI
COMMENT ON PROPOSAL NO: 2-240
RECOMMENDATION: Change Reject to Accept.
SUBSTANTIATION: If the conductor is adequate to carry the load, it does not matter if the overcurrent device is sized at 100 percent of the continuous load. It makes no sense to size the conductor in one case at 100 percent of the load and in another at 125 percent of the same load. There should only be one rule for sizing conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter is incorrect. The conductor is a part of the system along with other equipment such as circuit breakers, fuses, panelboards, switches, etc. The exception recognizes that there are 100% rated circuit breakers where the conductor can be sized at 100% as well. Removal of the exception would require a 125% sized conductor on a circuit breaker sized at 100%.

(Log #2014)

2- 129 - (215-2(a), Exception): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 2-244
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: The proposal submitter does not adequately understand why the requirement exists in the first place. Conductor ampacity is defined in terms of the ability to carry load continuously. The requirement to upsize conductors was never imposed to protect conductors; instead, it had to do with providing a heat sink for conventional devices subjected to continuous loading. That NEMA sponsored revision avoided a likely UL standards revision that would have cost the industry untold millions of dollars in reengineering and testing of end use equipment, but had no basis in conductor ampacity.

Therefore the present rule is correct even though, as correctly noted in the substantiation, they could be in two different wire sizes required to serve the same 130A continuous load. The conventional device requires 2/0 (and 175A protection) and the 100% device requires No. 1 (and 150A protection) for the same load. Each wire will be protected by the installed circuit protection per 240.3, and the conventional device will be assured that the conductor has some phantom load capacity so it will perform as a heat sink under the stipulated load profile. Devices listed for 100% operation have the heat dissipation issues addressed though other engineering approaches implicitly evaluated in the listing process.
PANEL ACTION: Accept in Principle.

In the 2002 NEC ROP, delete the last sentence of the Exception in Section 215-2(a).
PANEL STATEMENT: The panel has deleted the last sentence, but has retained the revision in the proposal that added "allowable" in the first sentence.

(Log #2105)

2- 130 - (215-2(a), Exception): Reject
SUBMITTER: Truman C. Surbrook, Michigan State University
COMMENT ON PROPOSAL NO: 2-244
RECOMMENDATION: Agree with the Panel's action to Accept in Principle, but with the deletion of the words "permitted to be" in the exception.
SUBSTANTIATION: The words "permitted to be" are not needed and they are confusing to Code users. This exception sets a minimum allowable ampacity of the circuit conductors and the words "not less than" are clear as to the meaning.
The Panel has approved a new last sentence as follows: "In no case shall the ampacity be less than the rating of the overcurrent device." I agree with the Panel's action here, and as a point of clarification, I assume the Panel means by this statement that Section 240-3(b) does not apply.
PANEL ACTION: Reject.
PANEL STATEMENT: The use of the term "shall be permitted" makes it clear that this is a permissive exception and not a mandatory exception. The exception reads clearly with this text included. In addition, the submitter is directed to the panel action on Comment 2-129 relative to the last sentence of the exception.

Note: See the Technical Correlating Committee action on Comment 4-36.
SUBMITTER: J. Pat Roche, Celanese Acetate
COMMENT ON PROPOSAL NO: 4-40b
RECOMMENDATION: New 215-2(e) to read as follows:
(e) Feeders Over 600 Volts. Feeder conductors over 600 volts shall be sized in accordance with (1) or (2):
(1) The ampacity of feeder conductors shall not be less than the sum of the nameplate ratings of the transformers supplied, when only transformers are supplied. The ampacity of feeders supplying a combination of transformers and utilization equipment shall not be less than the sum of the nameplate ratings of the transformers and 125 percent of the designed potential load of the utilization equipment that will be operated simultaneously.
(2) For supervised installations feeder conductor sizing shall be permitted to be determined by qualified persons under engineering supervision. Supervised installations are defined as those portions of a facility where all of the following conditions are met:
a. Conditions of design, and installation are provided under engineering supervision.
b. Qualified persons with documented training and experience in over 600 volt systems, provide maintenance, monitoring and servicing of the system.
The ampacity of conductors shall be in accordance with Section 310-15 and Section 310-60 as applicable.
SUBSTANTIATION: Comment to address Technical Correlating Committee referral of proposal 4-40b to Code-Making Panel 2 for inclusion of the material in Articles 210 and 215 to cover over 600 volt branch-circuits, feeders, and supervised installations, in general. See companion comments on 210-19(a), new 210-19(b) and 215-2(a).
PANEL ACTION: Accept in Principle.
Revise the submitter's recommendation to read as follows:
(B) Feeders Over 600 Volts. The ampacity of conductors shall be in accordance with Section 310-15 and Section 310-60 as applicable. Feeder conductors over 600 volts shall be sized in accordance with (1), (2) or (3):
(1) Feeders Supplying Transformers. The ampacity of feeder conductors shall not be less than the sum of the nameplate ratings of the transformers supplied, when only transformers are supplied.
(2) Feeders Supplying Transformers and Utilization Equipment. The ampacity of feeders supplying a combination of transformers and utilization equipment shall not be less than the sum of the nameplate ratings of the transformers and 125 percent of the designed potential load of the utilization equipment that will be operated simultaneously.
(3) Supervised Installations. For supervised installations feeder conductor sizing shall be permitted to be determined by qualified persons under engineering supervision. Supervised installations are defined as those portions of a facility where all of the following conditions are met:
a. Conditions of design, and installation are provided under engineering supervision.
b. Qualified persons with documented training and experience in over 600 volt systems, provide maintenance, monitoring and servicing of the system.
PANEL STATEMENT: The panel has accepted the submitter's concept, but has revised the section to add titles and provide a clearer approach to the arrangement of the text.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #401)

2- 132 - (215-5): Accept
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 2-248
RECOMMENDATION: Accept proposal.
SUBSTANTIATION: The term "connected load" may be commonly used in the Code but not technically accurate where applied to some loads which are "computed" such as VA/sq ft, VA per circuit such as small appliance circuits, laundry circuits, and sign circuits. A diagram for an installation where no load has been connected and there are no "computed" loads could indicate zero load and technically comply. Connected loads are also "computed" but some computed loads are not "connected".
PANEL ACTION: Accept.

(Log #407)

2- 133 - (215-8): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 2-250
RECOMMENDATION: Accept proposal.
SUBSTANTIATION: The word "secondary" basically limits the requirements to conductors supplied from a transformer and doesn't cover a feeder supplied by a generator. Present text doesn't explicitly preclude all conductors from having an orange color; it should be a distinguishing color. Present text permits tagging or other means for conductors 6 AWG and smaller. This is not permitted for the grounded or grounding conductors. Present text only requires identification where a connection is made. Many connections to a feeder may be made subsequent to time of installation and inspection when marking is less apt to be done. Grounding conductors are required to be identified where accessible.
The proposal retains the limitation to locations where the grounded conductor is present.
The requirement for marking to encircle the insulation is required for the grounded conductor of a 4-wire delta-connected circuit per 200-6(b) and will be required for the grounding conductor per Proposal 5-256.
PANEL ACTION: Reject.
PANEL STATEMENT: The identification of the high-leg of a 3 phase 4-wire system is a different issue than that for grounded conductors. The rules are not presently, nor has substantiation

been presented, that indicates similar marking rules should apply to the high-leg that apply to the grounded conductor. The submitter has not presented any field problems with the present wording.

ARTICLE 220 — BRANCH-CIRCUIT, FEEDER, SERVICE CALCULATIONS

(Log #2313)

2- 134 - (220-1): Reject
Note: See Code-Making Panel 2's action on Comment 2-88.
SUBMITTER: William M. Lewis, Eli Lilly and Co.
COMMENT ON PROPOSAL NO: 2-258
RECOMMENDATION: In response to the Panel action I offer the following alternative: Include the wording approved by panel 4 in proposal 4-40b as optional load calculations in part C. This would become:
220-37 Optional calculations for sizing outdoor conductors over 600 volts
Outdoor circuit conductors shall be sized in accordance with (A), (B) or (C):
(A) Sizing of Conductors for Outdoor Branch Circuits. The ampacity of branch circuit conductors shall not be less than 100 percent of the designed potential load of utilization equipment that will be operated simultaneously.
(B) Sizing of Conductors for Outdoor Feeders. The ampacity of outdoor feeder conductors shall be in accordance with the following:
(1) The ampacity of feeders supplying only transformers shall not be less than the sum of the nameplate ratings of the transformers supplied by the feeder.
(2) The ampacity of feeders supplying a combination of transformers and utilization equipment shall be not less than the sum of the nameplate ratings of the transformers and 125 percent of the designed potential load of the utilization equipment that will be operated simultaneously.
(C) Sizing of Conductors in Supervised Installations. For supervised installations as defined in 225-50, branch circuit and feeder conductor sizing shall be permitted to be determined by qualified persons under engineering supervision.
SUBSTANTIATION: A task group was formed at the direction of the Technical Correlating Committee to address gaps in the NEC as it pertained to over 600 volt circuits. The proposal 3-132 was to complete the process and give guidance to inspectors for the sizing of conductors for outside feeders and branch circuits over 600 volts. There was no consideration given to feeders other than outside during the deliberations of the task group.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel actions and statements on Comments 2-84 and 2-131. This action addresses the sizing of feeder conductors in all locations and not just outdoors. Article 220 is for calculating loads and not sizing conductors. Articles 210 and 215 are the appropriate locations for the material.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2306)

2- 135 - (Table 220-3(a)): Reject
SUBMITTER: James M. Daly, BICC General
COMMENT ON PROPOSAL NO: 2-266
RECOMMENDATION: This Proposal should be Accepted.
SUBSTANTIATION: Electricity used is based on data from the U.S. Department of Energy - Table 8.9 from the Annual Energy Review of DOEs Energy Information Administration Electric Utility Retail Sales for Residential Uses (Excludes Commercial, Industrial and Other Uses).
Housing units is based on data from the U.S. Census Bureau - Historical Census of Housing Tables - Units in Structure, which included detached (one-family), attached (rowhouses, townhouses, and duplexes), apartments, and mobile homes. The data in the tables included the number of housing units in the specified structures and not the number of residential buildings.
The increase in electricity used per housing unit from 1950 to 1990 (latest census data) is shown below. Residential usage of electricity was 1.1 trillion KWH in 1999, an additional increase of 19% from 1990.

Year	Residential Electricity Sales (billion KWH/year)	Housing Units (millions)	Electricity Usage (KWH per housing unit per year)
1950	72	46	1,565
1990	924	101	9,149

This data shows that, in spite of more energy efficient utilization equipment, electrical energy consumption per housing unit increased 485% in the 40-year period from 1950 to 1990. This tremendous increase in energy usage in dwelling units should certainly justify a very modest increase of 50% in the unit load per square foot in dwelling units of 3 volt-amperes has not been changed since at least 1968 (oldest NEC that I could reference).
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation does not show that the 3 VA/sq. ft. calculation is resulting in systems that are unsafe or have inadequate capacity. It only shows that usage of electricity has increased.

(Log #723)

2- 138 - (Table 220-18): Accept

Note: To clarify how to calculate the demand factor, it was the action of the Technical Correlating Committee that the following revisions be made Table 220-18 in Proposal 2-282.

The demand factors for 12-22 dryers should read: "0/0%=47 - [number of dryers minus 11]". The demand factors for 24-42 dryers should read: "0/0%=35 – (0.5 x [number of dryers minus 23])"..

SUBMITTER: W. Creighton Schwan, Hayward, CA
COMMENT ON PROPOSAL NO: 2-282
RECOMMENDATION: Reconsider, and Accept this proposal.
SUBSTANTIATION: This simple change will correct the situation where added connected load results in a lower calculated demand factor. Defending the Code containing such illogical material makes it difficult to support when facing detractors. The panel statement that the 1999 Table is easier to use is correct, but the difference is inconsequential, as are the slight differences in calculated load.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2015)

2- 139 - (Table 220-18): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 2-282
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: The proposed table is almost as easy to use as the present table, certainly at significant improvement in technical merit. The higher demand factors are adequately accounted for in the proposal substantiation. In every instance they occur on the upper cusp of an existing load bracket, where they fall below the required load when an additional dryer is connected. For example, at present 19 dryers require a load allowance of 38.0 kW; the proposal would allow 37.1 kW. This might seem to be an unsubstantiated reduction in safety until you realize that the present NEC says 20 dryers only require 35.0 kW and 21 require 36.8 kW. Therefore there should be no technical objection to allowing the 19 dryers to use 37.1 kW as the demand. The proposal keeps the calculations carefully in step with the existing table, but in a way that doesn't allow a user to reduce the calculated load by adding additional dryers. The Code Making Panel 2 action on Proposal 2-305 leaves this demand table as the only remaining such table to incorporate paradoxical load calculations, and the panel should take this opportunity to eliminate them for good. If the panel, in its judgment, chooses to ratchet the calculations slightly downward, it should still do so in the context of this proposal so the calculation problem doesn't recur.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #582)

2- 140 - (220-21 Exception No. 2 (New)): Reject
SUBMITTER: C. John Beck, Pacific Gas & Electric Co.
COMMENT ON PROPOSAL NO: 2-258
RECOMMENDATION: The proposal should be accepted.
SUBSTANTIATION: Article 225 deals with the requirements for outside branch circuits and feeders. These outside branch circuits and feeders are installed and intended for a different application than internal building wiring systems and must be considered in light of their intended installation, use and application. CMP 4 put together a task group to look at the specific requirements for calculating over 600 Volt outside feeder and branch circuit requirements. Distribution types of circuits. The requirements were developed for over 600 Volt installations based on outside installation, application, and supervision and engineering issues and applications. Other aspects, which may be more appropriate to internal building wiring systems would not necessarily be applicable. Merely incorporating these requirements into 220 would make them generally applicable to internal building systems, which was not the intent. It is appropriate that over 600 volt outside branch circuit and feeder requirements be included in Article 225 (Outside Branch Circuits and Feeders) not Article 220.
PANEL ACTION: Reject.
PANEL STATEMENT: The Technical Correlating Committee has made it clear that requirements dealing with sizing of circuits should be in the appropriate portions of Articles 210 and 215. The material proposed by Code-Making Panel 4 for outside branch circuits and feeders has been added to Articles 210 and 215 for over 600V branch circuits and feeders in general.

Code-Making Panel 2 also notes that the proposed material does not deal with load calculations, but does deal with conductor sizing. Article 220 does not establish the conductor sizing rules. As such, the exception is inappropriate.

2- 141 - (220-30): Reject
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co/EEI
COMMENT ON PROPOSAL NO: 2-289
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: Please see Bob Moore's negative vote comments on page 183 of the ROP. Additionally, the panel should reconsider the action on this proposal for many reasons including: (1) The calculated load for a heat pump can be higher than resistance heat while the actual load is always lower, (2) The calculations produce "erratic" results as shown in the proposal, (3) It is our understanding that the submitter did not intend to calculate the heat pump and strip heat system at 100 percent but simply wanted some clarification to make sure that the calculation method was understood and (4) Utility data is available from computer programs using load profiles to calculate residential demands that clearly verify that the 65 percent factor is very adequate for electric heat pump systems.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel has made it clear that the present language reflects its intent and does not agree that its statement is in error.

The panel has made it clear that the present language reflects its intent and does not agree that its statement is in error.

The submitter did not supply the information indicated in the substantiation. Furthermore, any submitted data would need to show that the submitter's claims are indeed true for heat pumps used throughout the country and not in limited climatic conditions.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
ABSTENTION: 1
EXPLANATION OF NEGATIVE:
MOORE: I do not agree with the panel action or the panel statement. It is my opinion that the 1999 NEC text was not a clarification from previous cycles and was revised without adequate substantiation.

The current code allows diversification at 65 percent of nameplate rating for central electric space heating for 4 units or less. However, current code allows no diversification (100 percent of the nameplate ratings) for a system employing heat pump compressors with supplemental heating. Heat pump compressors are more efficient than electric space heating. Thus, a combination central space heating installation employing heat pump compressors with supplemental heat in simultaneous operation would have a lower demand than a pure central resistance heat system of the same size. Rating the total load of the combination unit at 65 percent would be in line with the allowed 65 percent rating for a system composed only of electric space heating.

It is also my opinion that the submitter provided the necessary substantiation for the proposal.
EXPLANATION OF ABSTENTION:
TOMAN: This substantiation merits reconsideration by the code making panel, as the panel statement is not definitive and lacks clarity.

4- 18 - (225-31 and 225-32): Accept in Principle

Note: See the Technical Correlating Committee action on Comment 4-25.

SUBMITTER: Lanny McMahill, Rep. IAEI SW Section
COMMENT ON PROPOSAL NO: 4-22a
RECOMMENDATION: Accept this proposal, however, add "visible and not more than 50 ft away from" after "within sight."
SUBSTANTIATION: This change will clarify the intent of the revised text and provide for a maximum distance that the disconnecting means can be located away from the building or structure.
PANEL ACTION: Accept in Principle.
The panel accepts in principle this comment and revises the text in Proposal 4-22a, Section 225-31(A)(1) entitled "Outside", to read as follows: Where the branch circuit or feeder disconnecting means is outside a building or structure it shall be installed on the building or structure supplied or shall be located not more than 15m (50 ft) from the building or structure supplied.
PANEL STATEMENT: This change will clarify the requirements for the location of a building or structure disconnect. The panel utilized the term "within sight of" to stipulate a distance of 15m (50 ft). As the distance is now specified in the code, the terms "within sight of" or "visible" are not necessary.
See panel action and statement on Comment 4-25.

4- 19 - (225-31 Exception No. 5): Accept in Principle

Note: See the Technical Correlating Committee action on Comment 4-25.

SUBMITTER: Mike Theisen, St. Cloud, MN
COMMENT ON PROPOSAL NO: 4-27
RECOMMENDATION: Add text to the end of the exception to read as follows:
For outdoor emergency, legally required standby, or optional standby generator sets, the disconnecting means, when listed as suitable for use as service equipment, shall be permitted to be at the generator and no more than 25 ft from the building or structure supplied.
SUBSTANTIATION: The substantiation for the original Proposal 15-3 states "Most outdoor generator sets are located close to the building they serve, typically within 25 ft." I agree that this proposal has merit for the generator set located close to the building supplied, but I am concerned about the lack of a proximity requirement which could become a safety issue if the distance was unlimited.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel actions and statements on Comments 4-18, 4-20 (see substantiation) and 4-25. The panel accepts the concept of a specific distance. The panel does not accept the 25 foot distance limitation. The disconnecting means meeting the requirements of Section 225-31(A)(1) would be acceptable whether or not it is at or on a generator.

4- 20 - (225-31 Exception No. 5): Accept

Note: See the Technical Correlating Committee action on Comment 4-25.

SUBMITTER: Jim Pauley, Square D Company
COMMENT ON PROPOSAL NO: 4-27
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: The addition of this exception and its placement after the main rule in 225.31 would allow the building disconnect to be located at a generator regardless of the generator distance from a building. The exception removes the requirement that the disconnect would have to comply with (A) and (B) of 225.31. Furthermore, the exception is not necessary with the revisions to (A)(1) by the panel. A disconnect meeting the location requirements of (A)(1) would qualify regardless of whether or not it is at/on a generator.
PANEL ACTION: Accept.

4- 21 - (225-31 Exception No. 5 (New)): Accept

Note: See the Technical Correlating Committee action on Comment 4-25.

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 4-27
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: The proposal is no longer necessary, since the proximity rule has been modified to allow for remote disconnects if they are within sight of the building or structure served. The proposed exception has another problem, in that not all objects separated by not more than 50 ft from another object are actually in sight from the other location. The literal text of this exception would qualify a generator disconnect as a building disconnect by reason of distance alone, regardless of visibility. That is a safety issue, and unlikely to represent the panel intent.
PANEL ACTION: Accept.
PANEL STATEMENT: See also panel action and statement on Comment 4-25.

4- 22 - (225-31(a)(1)): Reject

Note: See the Technical Correlating Committee action on Comment 4-25.

SUBMITTER: Mike Theisen, St. Cloud, MN
COMMENT ON PROPOSAL NO: 4-22a
RECOMMENDATION: Revise as follows:
Where the branch circuit or feeder disconnecting means is installed outside a building or structure it shall be on ~~or within sight of~~ the building or structure supplied.
SUBSTANTIATION: There is no need for this general permission to locate the disconnecting means away from the building or structure supplied. There already exists specific permissions given in the five (5) exceptions to Section 225.31. If there is another specific situation that needs to be addressed, then simply add another exception.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comments 4-18 and 4-25. The submitter did not provide technical substantiation to limit the disconnect location to "on the building".
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #739)

4- 23 - (225-31(a)(1)): Accept in Principle in Part

Note: See the Technical Correlating Committee action on Comment 4-25.

SUBMITTER: Mike Theisen, St. Cloud, MN

COMMENT ON PROPOSAL NO: 4-22a

RECOMMENDATION: Revise as follows:

Where the branch circuit or feeder disconnecting means is installed outside a building or structure it shall ~~be~~ comply with either (a) or (b):

(a) the disconnecting means is installed on the exterior of the building or structure supplied ~~or~~

(b) the disconnecting means is installed within sight of and not more than 50 feet from the building or structure supplied and shall consist of a single switch or circuit breaker.

SUBSTANTIATION: I have two concerns regarding the outdoor location of the disconnecting means for a building or structur:

(1) "Within sight of a building" can be a very long distance. If the building were located "within sight of the disconnecting means" then the distance may be less formidable but still not very practical. A specific maximum distance must be prescribed for the sake of safety.

(2) Section 255.33 allows the disconnecting means to consist of a maximum of six switches; would this then allow a remotely located disconnecting means to contain up to six switches? Are we then not back to the possibility of six branch circuits or feeders supplying the building or structure from the remote "disconnecting means"? The remote disconnecting means must be limited to a single switch.

PANEL ACTION: Accept in Principle in Part.

The panel does not accept the requirement for a single switch or circuit breaker. The panel accepts in principle the remainder of the comment as addressed in the panel action and statement in Comments 4-18 and 4-25.

PANEL STATEMENT: The panel does not accept the requirement for a single switch or circuit breaker as no technical substantiation was provided for that requirement. See also panel action and statement in Comments 4-18 and 4-25.

4- 24 - (225-31(a)(1)): Reject

Note: See the Technical Correlating Committee action on Comment 4-25.

SUBMITTER: Jim Pauley, Square D Company

COMMENT ON PROPOSAL NO: 4-22a

RECOMMENDATION: Reword the requirement in (A)(1) to read as follows:

(1) Outside. Where the branch circuit or feeder disconnecting means is installed outside a building or structure it shall be on, or within sight of and not more than 3 m (10 ft) from, of the building or structure supplied.

SUBSTANTIATION: The revised text by the panel is not an acceptable solution. Allowing the disconnect for a building to be fifty feet from the building will result in a reduced level of safety for the building occupants. For instance, I could have two apartment buildings (one fed from the other) with a chain link fence in between. The second building would not have to have a disconnect if it were within 50' of the first. The fence would not obstruct the "within sight" requirement. Allowing the disconnect to be not more than 10 feet away would allow disconnects mounted on posts/racks and on gen sets to be used as the building disconnect, but with a much more reasonable distance specified.

PANEL ACTION: Reject.

PANEL STATEMENT: The applicability of the terms "within sight of" and "readily accessible" are addressed by the panel actions and statements to Proposal 4-22a and Comments 4-18 and 4-25. The submitter has provided no technical substantiation to limit the distance to 3 m (10 ft).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #44)

4- 25 - (225-32): Accept

Note: The Technical Correlating Committee directs that 225-31(A)(1)be revised to read as follows:

"(1) Outside. Where the branch circuit or feeder disconnecting means is outside a building or structure it shall be installed on the building or structure supplied or shall be located within sight from the building or structure supplied."

The Technical Correlating Committee directs that the issue involves safety and correlation concerns which warrant this change.

In the Panel Action text, delete the sentence "The following exceptions apply to all of NEC 225.31" and revise "Exception No. 1" to read "Exception No. 1 to (A) and (B)", revise "Exception No. 2" to read "Exception No. 2 to (A) and (B)", revise "Exception No. 3" to read "Exception No. 3 to (A) and (B)", and revise "Exception No. 4" to read "Exception No. 4 to (A) and (B)"

SUBMITTER: Technical Correlating Committee National Electrical Code

COMMENT ON PROPOSAL NO: 4-24

RECOMMENDATION: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal as it relates to Proposal 4-22a. This action will be considered by the Panel as a Public Comment.

SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.

PANEL ACTION: Accept.

The panel clarifies that Section 225.31 including all of the changes incorporated through the proposal and comment period shall read as follows and is the panel's final action on Section 225.31:

225.31 Disconnecting Means.

Means shall be provided to disconnect all ungrounded conductors that supply or pass through a building or structure in accordance with (A) and (B).

(A) Readily Accessible Location. The branch circuit or feeder disconnecting means shall be installed at a readily accessible location in accordance with (1) or (2).

(1) Outside. Where the branch circuit or feeder disconnecting means is outside a building or structure it shall be installed on the building or structure supplied or shall be located not more than 15m (50 ft) from the building or structure supplied.

(2) Inside. Where the branch circuit or feeder disconnecting means is installed inside, it shall be nearest the point of entrance of the supply conductors.

(B) Conductors Considered Outside. For the purposes of this section, the requirements of 230.6 shall be permitted to be used.

The following exceptions apply to all of NEC 225.31:

Exception No. 1: For installations under single management, where documented safe switching procedures are established and maintained for disconnection, and where the installation is monitored by qualified individuals, the disconnecting means shall be permitted to be located elsewhere on the premises.

Exception No. 2: For buildings or other structures qualifying under the provisions of Article 685, the disconnecting means shall be permitted to be located elsewhere on the premises.

Exception No. 3: For towers or poles used as lighting standards, the disconnecting means shall be permitted to be located elsewhere on the premises.

Exception No. 4: For poles or similar structures used only for support of signs installed in accordance with Article 600, the disconnecting means shall be permitted to be located elsewhere on the premises.

PANEL STATEMENT: By this action the panel clarifies its action on Proposal 4-22a and incorporates all panel actions on Comments 4-18 through 4-24. The panel action for this comment is intended as the final action on Section 225-31.

4- 28 - (225-32 Exception No. 5): Reject
SUBMITTER: Lawrence A. Bey, Onan Corp.
COMMENT ON PROPOSAL NO: 15-3
RECOMMENDATION: Delete, ~~when listed as being suitable for use as service equipment.~~
SUBSTANTIATION: It was not the intent of the submitter to require service equipment at the generator, that was added to the original proposal by the panel, without explanation as to why. On-site generator conductors are feeders, not service conductors according to the Article 100 definitions of service and feeder. The problem is that in most generator set installations the generator is not separately-derived because the service neutral and generator neutral are solidly-interconnected at the transfer switch(es). In non-separately-derived installations use of service equipment at the generator may lead to inadvertent/incorrect multiple grounding points on the solidly interconnected neutrals. Where the generator is separately-derived, it should be grounded similarly to a separately-derived transformer, and service equipment is not required for the secondary of separately-derived transformers, indoors or outdoors.
PANEL ACTION: Reject.
PANEL STATEMENT: See the panel action and submitter's substantiation on Comment 4-30.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1705)

4- 29 - (225-36): Reject
SUBMITTER: Bradley D. Kaighen, Hadley, MI
COMMENT ON PROPOSAL NO: 4-29
RECOMMENDATION: Change reject to accept.
SUBSTANTIATION: The Panel missed the point of the original proposal. If the feeder supplying the second building has overcurrent protection, this situation is no different than a subpanel in the same building. Subpanels are not required to be rated as suitable for use as service equipment. If the building is supplied from a disconnect only, such as on a farm, it should be rated as suitable for use as service equipment.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its statement on Proposal 4-29 that the term "suitable for use as Service Equipment" does not imply that overcurrent protection is mandatory or provided. Also, the panel recommends that the commenter refer to Section 250-32(B)(2) requirements.

(Log #1769)

4- 30 - (225-36): Accept
SUBMITTER: Jim Pauley, Square D Company
COMMENT ON PROPOSAL NO: 4-30
RECOMMENDATION: The panel should reconsider and reject the proposal.
SUBSTANTIATION: The revision as accepted opens up a gaping hole in electrical safety associated with disconnecting means. The requirement that the disconnect be SUSE not only provided for the proper components in the product (like neutral disconnect links, number of disconnects, arrangement of disconnects, etc.) it also required a disconnect that was of a type suitable for disconnecting under load. Electrical spacings in the disconnect are critical to these applications, the SUSE requirement ensured that the disconnect had appropriate spacings to be used as a service/feeder disconnect. Without this SUSE requirement, a device such as a manual motor controller could be used as the building disconnect. Also, a true isolation switch (one not capable of being opened under load) could be used as the disconnect as well since it is not required to be SUSE.
In addition, the revision by the panel creates a conflict with 430.95. CMP 11 determined a number of code cycles ago that due to the construction of an MCC, it should only be permitted to have a maximum of two disconnects when used in service applications. This same limitation always extended to an MCC used as a building disconnect as well because it had to be SUSE. Now that CMP 4 has removed the SUSE limitation, an MCC could have up to six disconnects as the building disconnecting means. This is in direct conflict with the intent set forth in 430.95.
The panel should return to the 1999 NEC wording for this section. Education of installers, inspectors and users has been very successful and most now understand what to look for in a disconnect at a second building. The revision as proposed would set back those education efforts considerably. **PANEL ACTION:** Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #402)

4- 31 - (225-37): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 4-35
RECOMMENDATION: Accept in Principle in Part revised.
This section shall not apply where all disconnects are grouped.
Exception No. 2: This identification shall not be required for ~~branch~~ circuits from a dwelling unit to a second building or structure or for a service supplying such building or structure.
SUBSTANTIATION: It is possible and feasible to locate all different supply disconnects at one location since limitation to six applies to each supply. Where grouped, there are no remote locations to warrant plaques. Identification is required by 110-22.
A second building may have a power service for specific use such as a 240 volt 2-wire welder in addition to a branch circuit or feeder supplied from the dwelling unit. The occupant will be fully aware of the disconnecting means.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel affirms that a plaque or directory identifying multiple supplies is useful and enhances safety even when those supplies are grouped in one location. There is no requirement for multiple plaques where the supplies are grouped at one location.

4- 32 - (225-38, Exception): Reject
SUBMITTER: Phil Simmons, Simmons Electrical Services
COMMENT ON PROPOSAL NO: 4-35a
RECOMMENDATION: Revise text as follows:
225-38. Exception: For garages and outbuildings on residential property, snap switches, other than ~~or~~ sets of 3-way or 4-way snap switches, shall be permitted as the disconnecting means.
SUBSTANTIATION: The present permission to use a set of 3-way or 4-way switches for the disconnecting means at a garage or outbuilding violates the concept of disconnection of power at the building for safety where one may be working on an electrical system. The 3-way or 4-way switch at a remote location can accidentally be operated which will energize the system being worked on and create a shock or safety hazard.
It should not be necessary to show a body count or history of electric shock incidents to recognize that this change in the code is necessary. (I wonder how many volunteers from Code Making Panel 4 we could get to work on the electrical system at a remote building downstream from a 3- or 4-way switch, especially if the other building is occupied?!)
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its statement to Proposal 4-32 that the submitter has not provided any accident data to support the elimination of a long standing code requirement.

(Log #1956)

4- 33 - (225-41): Reject
SUBMITTER: Phil Simmons, Simmons Electrical Services
COMMENT ON PROPOSAL NO: 4-38
RECOMMENDATION: Move the existing Section Section 240-13 and the exceptions to become a new Section 225-41 (or other appropriate Section).
SUBSTANTIATION: Part B of Article 225 deals with disconnecting means for buildings and structures on the premises that are supplied from a service in another building or structure. Section 240-13, which covers equipment ground fault protection requirements for building disconnecting means, should be located where the other requirements for building or structure disconnecting means are located. This should improve the structure of the Code and make the Code more "user friendly."
The origin of ground-fault protection of equipment was when it was added to Section 230-95 for service equipment. Similar rules were added to Article 215 as many utility services are at primary voltages and transformers on-site reduce the voltage and phase arrangement to 480Y/277 with overcurrent devices rated 1000 amperes or more. The same hazard exists for feeders as for services. This addition "plugged a hole" in the Code as the equipment was supplied by feeders and not services. All the rules for building disconnecting means should be located at the same place in the Code.
PANEL ACTION: Reject.
PANEL STATEMENT: This action would not be under the pervue of Code Making Panel 4. Additionally, ground fault protection for feeder is covered in Section 215-10.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2241)

4- 34 - (225-48): Reject
SUBMITTER: Robert W. Baird, IEC
COMMENT ON PROPOSAL NO: 4-39
RECOMMENDATION: The panel action should be revised to accept in principle in part as follows:
Modify the proposed section to read:
225-48 Supervised Installations.
For the purposes of Part C, the term "supervised installation" is defined as the portions of a facility where all of the following conditions are met:
1) Conditions of design, and installation are provided under engineering supervision.
2) Qualified persons provide maintenance, monitoring and servicing of the system.
SUBSTANTIATION: The additional text previously proposed by the code panel relating to training, experience and voltage level is redundant and unnecessary. By definition, Part C covers Outside Branch Circuits and Feeders over 600 volts. The definition of qualified person as adopted by Code Making Panel 1 in their action related to Proposal 1-178, states that a qualified person is one who has skills and knowledge related to the construction and operation of the equipment and has received safety training on the hazards involved. Therefore, individuals working on circuits under this section must have the skills and knowledge related to the construction and operation, and have received safety training, related to the installation and use of outside branch circuits and feeders over 600 volts.
PANEL ACTION: Reject.
PANEL STATEMENT: This comment would modify Section 225-50 to eliminate documentation of training and experience. The panel reaffirms that documented training and experience is necessary for over 600 volt supervised installations. The panel recognizes and affirms that the documentation required is subject to acceptance by the Authority Having Jurisdiction.

(Log #583)

4- 36 - (225-50, 225-51, and 225-52): Accept

Note: The Technical Correlating Committee directed that the Action on Proposal 4-40b be incorporated into Articles 210 and 215. This has been accomplished by the panel actions on Comments 2-84, 2-131 and 2-143. The Technical Correlating Committee also notes that the material is now under the purview of Code-Making Panel 2.

SUBMITTER: C. John Beck, Pacific Gas & Electric Co.
COMMENT ON PROPOSAL NO: 4-40b
RECOMMENDATION: CMP 4 disagrees with the action proposed by the Technical Correlating Committee that this proposal be relocated to CMP 2, specifically Articles 210 and 215. The content of Proposal 4-40b should remain in Article 225. A Task Group of CMP 4 members was put together to review this material and issue. Included were: John Beck; William Lewis; Tom Adams; Junior Owings; Floyd Ferris; Howard Hughes; and John Young.
SUBSTANTIATION: Article 225 deals with the requirements for outside branch circuits and feeders. These outside branch circuits and feeders are different than internal building wiring systems and must be considered in light of their intended installation, use and application. A Task Group of CMP 4 members was provided with a copy of the Technical Correlating Committee action to direct NEC Proposal 4-40b)to CMP 2 for relocation in Article 210 and 215. Based on that review and comments provided, the CMP 4 Task Group did not concur with that action. The concerns expressed by the Task Group included the fact that the material in Proposal 4-40b was developed only for outdoor applications, as covered by Article 225, and did not address indoor applications or issues. If such a relocation occurs, it is believed that there will be other negative impacts to related areas already worked on by CMP 4 such as 225-3. Further, as a general note, if 4-40b is relocated for "general application" as proposed, the concern was expressed that it would only make sense that the remainder of Article 225 be "generally" incorporated into Articles 210 and 215, with results and other ramifications for the NEC. The CMP 4 Task Group believes alternative to relocation of the material, that the correct action for CMP 2 is to place a "reference" in Articles 210 and 215 to the material contained in Proposal 4-40b.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel recognizes that the Technical Correlating Committee may wish to have this material located in Article 210 and Article 215. If that occurs the material should be retained as shown in Proposal 4-40b in its entirety. If Panel 2 does not accept the incorporation of these requirements in their entirety for above 600 volts, then this material should remain in Article 225. Therefore, by this action Panel 4 reaffirms that the material in Proposal 4-40b should be retained and the action on Proposal 4-40b be referred to the Technical Correlating Committee and Panel 2 for their information and consideration.

4- 37 - (225-50): Reject
SUBMITTER: Alan Manche, Square D Co.
COMMENT ON PROPOSAL NO: 4-43
RECOMMENDATION: The panel should reconsider this proposal and accept the original proposal that adds the words "or equivalent".
SUBSTANTIATION: Product manufacturers are going to mark the product for the appropriate hazards and comply with the ANSI Z535 standards. The explicit nature of the present wording in the NEC establishes conflict between the NEC marking restrictions and the required hazard markings outlined in ANSI Z535.4.

The objective of the NEC wording is to generally convey the basic message requirement to user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would permit a hazard sign to comply with the NEC and be formatted in accordance with Z535.4.

Similar proposals were submitted to a number of code panels. Panels 3, 9, 14, and 15 have accepted the addition of the words "or equivalent," and Panel 13 has accepted the proposal in principle and revised the marking requirements to warn of the hazard without establishing specific wording and permitting compliance with the ANSI Z535 set of standards. The panel may also want to review and consider the action taken by Code-Making Panel 13 in Proposal 13-25.

Most importantly, the panel needs to take action in order to reconcile the conflict between the NEC and the ANSI Z535 standards by accepting the proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "or equivalent" is vague and unenforcable as per Section 3.2.1 of the NEC Manual of Style. The panel refers this comment and action to the TCC as the submitter has identified other areas of the code where this term is used.

4- 38 - (225 Part C):

Note: The Technical Correlating Committee directs that the action on Comment 4-38 be recorded as "Accept in Principle" to correlate with the Technical Correlating Committee action on Comment 4-36. By this action, the Technical Correlating Committee directs that 225-50, 225-51, and 225-52 in the Report on Proposals are deleted. A new 225-50 is to be inserted that reads: "225-50 Sizing of Conductors. The sizing of conductors over 600 volts shall be in accordance with 210.19(B) for branch circuits and 215.2(E) for feeders."

SUBMITTER: J. Pat Roche, Celanese Acetate
COMMENT ON PROPOSAL NO: 4-40b
RECOMMENDATION: Reject Proposal 4-40b.
SUBSTANTIATION: Calculation of ampacity for over 600 volts should not be incorporated into Part C (III) of Article 225, sizing of branch-circuit and feeder conductors over 600 volts should be included in Section 210-215. See companion comments on Sections 210-19(a), new 210-19(b), 215-2(a), and new 215-2(e).
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 4-36.

ARTICLE 230 — SERVICES

(Log #48)

4- 40 - (230-2(a)(4)):

Note: The Technical Correlating Committee directs that the Panel Action on Comment 4-40 be reported as "Hold" consistent with Section 4-4.6.2.2 of the NFPA Regulations Governing Committee Projects. By this action, Proposal 4-46a is reported as "Reject".

SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 4-46a
RECOMMENDATION: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. There is presently no definition for "Standby Systems." This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
In Section 230-2(A)(4), change to read as follows: (4) Optional Standby Systems

Reletter existing Section 230-2(E) to become Section 230-2(F).
Add a new Section 230-2(E) to read as follows:(E) Redundant Supply. By special permission, redundant services shall be permitted in addition to the usual source of supply."
PANEL STATEMENT: The panel takes this action because Article 702 only addresses on-site generated power. Redundant supplies are often required, for example, to improve reliability.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1770)

4- 41 - (230-2(a)(4)):
Note: The Technical Correlating Committee directs that the action on Comment 4-41 be reported as "Accept". See Technical Correlating Committee action on Comment 4-40.
SUBMITTER: Jim Pauley, Square D Company
COMMENT ON PROPOSAL NO: 4-46a
RECOMMENDATION: The panel should reconsider and reject the proposal.
SUBSTANTIATION: The term "optional standby systems" from the 1999 NEC was correct. All possible standy by systems are covered by using emergency, legally required, and optional. There is no conflict with 702.2 since that section does not prohibit a service from supplying optional systems.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: By panel action on Comment 4-40, the panel has modified Proposal 4-46a to reinstate the term "optional standby systems" in Section 230-2(A)(4). In addition, the panel has developed a new item 230-2(E) entitled "Redundant Supply" to allow a separate supply which is not derived from on-site generated power. The panel has relettered current Section 230-2(E) to become 230-2(F).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

(Log #2348)

4- 42 - (230-2(d)): Reject
SUBMITTER: Neil F. LaBrake, Jr., Baldwinsville, NY
COMMENT ON PROPOSAL NO: 4-52
RECOMMENDATION: Revise text to read as follows:
(D) Different Characteristics. Additional services shall be permitted for different voltages, frequencies, or phases, or for different uses, such as for different rate schedules. Or, ~~T~~the services may be granted by special permission ~~shall be in sight from one another.~~
SUBSTANTIATION: I believe the Proposer had good intent for safety of services with different characteristics to require the service equipment located within sight of each other. However, this concept should be considered by the Panel to allow these situations optionally with special permission as in 230.2(C)(3). Special permission is defined in Article 100 meaning the written consent of the authority having jurisdiction.
It is understood that the installer must meet the requirements of the NEC for the premises wiring (re: Article 90) and the serving utility's requirements for the service connection. In situations like this which occur often, these rules will overlap and the utility has the right to ensure its rules are met due to their regulation by the State's public authority. As such, most utilities have rules regarding the supply of additional services with different characteristics. In addition, the local authority having jurisdiction over electrical installations would provide an approval certificate where code requirements have been met. These situations should not be precluded from having special permission where local conditions require it prior to installation and acceptance.
Code-Making Panel 4 should evaluate a change to 230.2(D) that would set forth management of special permission as an option to keep service connection facilities to a minimum on customer property and in the interest of safety in the event of fire or other problems on the customer's premises
PANEL ACTION: Reject.
PANEL STATEMENT: This comment does not have any relevance to Proposal 4-52. The aspect of special permission is already covered in Article 90.

SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 4-55
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 10 for consideration of Proposal 10-3a.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #381)

4- 45 - (230-7): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 4-57
RECOMMENDATION: Accept in principle revised: OTHER CONDUCTORS in RACEWAY or CABLE. ~~Conductors other than service~~ Service conductors shall not be contained ~~installed~~ in ~~the same~~ a service raceway or service cable that contains other than service conductors or service conductors (with different characteristics) (of a different class) as covered in 230-2(a).
(phrases in parentheses are alternate choices)
SUBSTANTIATION: Code users (installers) may install conductors in a raceway but do not install them in a cable. That is done by the cable manufacturer who has no control over their use. Panel statement indicates intermixing of conductors is inevitable (?) in an auxiliary gutter supplementing wiring space at service equipment. Is this intended to suggest that different classes of service (e.g., 120/240 and 480 volts) can be contained in the same service raceway terminating at such auxiliary gutter?
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided any technical substantiation to prohibit the installation of different classes of service in the same raceway.

(Log #2242)

4- 49 - (230-22): Reject
SUBMITTER: Tom Dunn, San Jose, CA
COMMENT ON PROPOSAL NO: 4-64
RECOMMENDATION: The proposed change should be accepted as stated by the submitter. The proposed wording does not change the code technically; and it certainly makes the code clearer and more "user friendly".
SUBSTANTIATION: 1) Intuitively, I interpret the terms, "covered" and "insulated" to be different. "Covered" does not imply any electrical insulating properties. "Insulated", of course, does imply electrical insulating properties.
2) As the submitter of the original proposal pointed out, the NEC's own definitions of "covered" and "insulated" (Article 100-A) makes this same distinction.
3) The panel's concern about services over 600 volts is covered by 230-202(b).
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffims that it is acceptable to use insulated or covered conductors for overhead service conductors. See panel action and statement on Proposal 4-63a.

AFFIRMATIVE: 11

(Log #403)

4- 50 - (230-28): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 4-71
RECOMMENDATION: Accept proposal.
SUBSTANTIATION: The Panel Statement reinforces the need for this requirement. It mandates a coordination with the serving utility. Where service drops are exempt from the Code ,there is no required responsibility on the installers part to assure compliance with 230-24. One just has to travel the country to see many service drops to masts which do not conform to Code clearances.
PANEL ACTION: Reject.
PANEL STATEMENT: Compliance with Section 230-24 is already required for those service drops which are covered by the NEC. Refer to Section 90-2(b)(5).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1143)

4- 51 - (230-28, Exception): Reject
SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc.
COMMENT ON PROPOSAL NO: 4-73
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: This proposal was developed in an effort to find a reasonable and safe alternative to the main rule by permitting communications and CATV attachments to a service mast that is listed for the purpose of safely supporting multiple service drops. Listing of the service mast will address both the loading and personnel safety concerns expressed by Code-Making Panel 4. These are areas that will be well investigated by the listing agency prior to issuing the listing mark. In the panel statement, Code-Making Panel 4 stated that "the panel does not believe that the listing of the product will adequately address the personnel safety issues...". This statement by Code-Making Panel 4 is contrary to both the industry and NEC accepted method to ensure the safety of wiring, cable, and equipment when used for its intended

application, that of listing by a Nationally Recognized Testing Laboratory (NRTL). The NEC, in many articles and sections, not only accepts, but relies upon listing as a means to ensure that the product is safe when used for its intended application. Further, with respect to the personnel safety issue, I would reiterate my substantiation for my original Proposal 4-73 that personnel are presently trained to work in proximity to power service, communications, and CATV conductors. Section 800-10(a)(4) permits a minimum separation of 12 inches between power service drops and communications drops at their point of attachment to the building, Section 820-10(f)(1) permits separations of as little as 4 inches where cables of two systems are attached to buildings. In response to concerns that this is solely an economic issue for the communications providers, let me point out that the provision of an additional mast for the attachment of communications service drops is the responsibility of the homeowner, not the communications utility. Code-Making Panel 4 should accept Proposal 4-73 based on the merits of the submitter's original substantiation.

Note that companion comments for Proposals 16-202, 16-281 and 16-344 have been submitted.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel has discussed over the past several code cycles the various issues regarding safety related to personnel and installation and continues to find the potential for multiple attachments by communications and other systems to be unacceptable. Therefore it is recommended the submitter undertake the development of a fact finding report or other documentation to provide the technical support and direction needed for the panel to address these safety concerns.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

YOUNG: Personnel safety is important but the Code does not impose any limitations or restrictions on the installations of different systems today. A listed mast could well be safer by identifying where and how the systems are attached.

(Log #1929)

4- 52 - (230-28, Exception): Accept

SUBMITTER: James T. Dollard, Jr., Philadelphia, PA

COMMENT ON PROPOSAL NO: 4-73

RECOMMENDATION: Continue to reject this proposal.

SUBSTANTIATION: I agree with the Panel,s statement and the Affirmative comments of Mr. Hughes and Mr. Sumrall. Safety of persons must be the primary concern. As written in the Panel statement, the co-mingling of different systems on a common mast would present a serious safety hazard to all persons who will maintain or service the installation.

PANEL ACTION: Accept.

PANEL STATEMENT: See panel action and statement on Comment 4-51.

4- 53 - (230-28, Exception (New)): Reject

SUBMITTER: Guy R. Franks, SBC

COMMENT ON PROPOSAL NO: 4-73

RECOMMENDATION: Accept the proposal.

SUBSTANTIATION: This proposal represents a reasonable approach to having a single service mast accommodate multiple drop wires. Through listing, products are evaluated to determine if they are suitable for their intended purpose. Throughout the NEC, requiring the listing of products is one of the fundamental methods used to establish the adequacy of a product for the application and provide a suitable level of safety. Through listing, installation by qualified personnel and inspection by the authority having jurisdiction, service mast installations intended to accommodate multiple drop wires can be safely installed and maintained.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and statement on Comment 4-51.

EXPLANATION OF NEGATIVE:

YOUNG: See my Explanation of Negative on Comment 4-51.

(Log #1174)

4- 54 - (230-30): Reject

SUBMITTER: Duane E. Craig, Power System Engineering, Inc.

COMMENT ON PROPOSAL NO: 4-74

RECOMMENDATION: Revise original submitter's wording to be as follows:

In cases where an outdoor structure (such as a pole on which a meter is installed) or an outdoor transfer switch (not attached to a building) is supplied by a service drop or service lateral, buried conductors from either of these points to a building or buildings having service entrance disconnects and overcurrent protection shall be sized and installed as service laterals.

An alternate location for this paragraph might more suitably be elsewhere such as in the definition section under "Service Laterals". Also some rewording may be in order.

SUBSTANTIATION: While the original submitter did not provide any technical substantiation for why the conductors should be treated as service laterals, the reason for the converse is not obvious to me either. If outdoor underground conductors from a utility transformer to a building can be sized according to 230-31(a), it seems that outdoor conductors from a meter pole or transfer switch to a building(s) should not be held to a higher standard. I can understand why more stringent ampacity requirements would apply to service-entrance conductors, feeders within buildings, or where outbuildings are fed through another building. This is because conductors attached to or within buildings pose a much greater fire risk than do those that are buried outdoors. Our concern is that many commercial and industrial installations are adding generators in the line between the utility transformer and their building service entrance. As the code now stands, it usually requires complete replacement of the conductors between the transfer switch and the building service and often major changes to the service-entrance panel. It seems that this equipment is being changed only because of a technicality and not for a practical reason.

PANEL ACTION: Reject.

PANEL STATEMENT: The requirements are different because those conductors are under the purvue of the NEC. The panel reaffirms its position that the requirements of Part IV of the draft of the 2002 NEC apply to the conductors on the load side of a terminal box, meter, or other enclosure. There is no method within the NEC to size service laterals any differently than service entrance conductors. Refer to Section 90-2(B)(5) for application of requirements of the NEC.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #589)

4- 55 - (230-40 Exception No. 1): Reject

SUBMITTER: William Barnett, City of Gresham, OR

COMMENT ON PROPOSAL NO: 4-79

RECOMMENDATION: Delete Exception No. 1.

SUBSTANTIATION: Code Making Panel No. 4's statement on Proposal 4-79 states "it is not permitted to run conductors without overcurrent protection through the interior of the building." I have provided part of an article from the September/October IAEI NEWS showing a six-plex with six meters, without mains, and six sets of service-entrance conductors connected to service panels in each dwelling unit. The 1999 NEC Handbook by NFPA shows similar installations. If Exception No. 1 is not deleted, a statement should be added indicating that persons using this exception shall install the service-entrance conductors outside the building if they do not comply with Section 230-70(a).

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel reaffirms its statement to Proposal 4-79 and the submitter has not provided any new or additional information which would change its position. Exception No. 1 permits multiple sets of service entrance

conductors to be supplied by a single service and Section 230-71(a) specifically addresses the location of the disconnecting means. The multiple sets of service entrance conductors are required to comply with the requirements of Section 230-70(a) and it is not permitted to run conductors without overcurrent protection through the interior of the building. The use of this exception has practical application for buildings with
more than one occupancy and the submitter has not provided documentation to indicate that this language has resulted in decreased safety of the installation.

4- 56 - (230-42(a)): Reject
SUBMITTER: Truman C. Surbrook, Michigan State University
COMMENT ON PROPOSAL NO: 4-85
RECOMMENDATION: Change Reject to Accept.
SUBSTANTIATION: The adjustment and correction factors are applied to the allowable ampacity of the conductor not to the calculated load. The Panel's Statement, "the ampacity of the conductors is determined by calculating the continuous and noncontinuous loads before the application of any adjustment or correction factors." makes no sense. There does not need to be a reference to adjustment or correction factors in this section. Hundreds of electrical contractors and inspectors are confused by the phrase "before the application of any adjustment or correction factors." See the example I worked out in my Comment to Proposal 2-243 to illustrate a point of confusion created by this statement. "PLEASE" rework this section so the meaning is clear. The meaning may be clear to the members of the Panel, but they are not clear to electricians, inspectors, and engineers in the field.
PANEL ACTION: Reject.
PANEL STATEMENT: See statement on Proposal 4-85. The text recommended for deletion is necessary for the proper and consistent application of the code.

(Log #1674)

4- 57 - (230-42(a)(2)): Reject
SUBMITTER: Jason Williams, Homer, MI
COMMENT ON PROPOSAL NO: 4-88
RECOMMENDATION: Change reject to accept.
SUBSTANTIATION: Paragraph (2) is inconsistent with the rule in paragraph (1). Two different wire sizes can be used for the same rating on over current protection.

Example: Assume the load for a service is 90 amp continuous and 37 amps non-continuous. According to paragraph (1) the calculated load is 150 amps. The service is permitted to be rated at 150 amps and copper conductor 75 ft. C insulation and termination. The wire size is 1/0 AWG. If overcurrent is rated for continuous and paragraph (2) is used, then the calculated load is 127 amps and 150 amp overcurrent device is required. But in this case with 75 ft. C termination, the wire is permitted to be #1 AWG.
PANEL ACTION: Reject.
PANEL STATEMENT: The reason that rule 1 is different from rule 2 is because the overcurrent device and its assembly are listed for operation at 100% of their rating and may result in different wire sizes.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #51)

4- 58 - (230-44): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 4-93a
RECOMMENDATION: The Technical Correlating Committee understands that the last paragraph of the present Section 230-43 is deleted. The panel should also consider correcting the last phrase, "in accordance with Article 318", to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Delete the phase "in accordance with Article 318". Section 230-44 should read as follows: "Cable Trays. Cable tray systems shall be permitted to support cable used as service-entrance conductors."
PANEL STATEMENT: The panel takes this action to conform with the NEC Style Manual.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2245)

4- 59 - (230-46): Reject
SUBMITTER: Gary Di Troia, FGI USA Inc
COMMENT ON PROPOSAL NO: 4-94
RECOMMENDATION: Revise text as follows:

Spliced Conductors. Service-entrance conductors shall be permitted to be spliced or tapped by crimped, clamped, or bolted connections listed for the purpose. Splices shall be made in enclosures or, if directly buried, with a listed underground splice kit. Splices or conductors shall be made in accordance with Sections 110-14, 300-5(e), 300-13 and 300-15.
SUBSTANTIATION: Proposal 4-94 (Log #405) incorrectly includes the use of the exothermic process for power applications on indoor connections. The exothermic process is uncontrolled and does not have listing for the service entrance application. Exothermic connections are most appropriate for grounding applications in outdoor environments. Due to the nature of extreme heat and toxic gases produced, the exothermic process can lead to worker safety and equipment liability issues. It would not be recommended to bring an inherently unsafe methodology into the closed confinement of service entrance applications.

Proposal 14-82, submitted by Larry Smith, can be agreed upon in principle. However, in practice, the recommendation will not solve the problems of service entrance connections nor eliminate the need for proper installation techniques to be used, and will disallow mechanical connectors of all types that are used for the service entrance. The one advantage mechanical connectors have for the installer is that they are more range taking than compression connectors. Service entrance conductor requirements are not always the same for NEC and the Utility requirements, i.e. the conductors on each side are not matched. Mechanical connectors, when installed correctly, provide a greater flexibility in this situation, which is a common occurrence. The triplex conductor is very often different form the conductor being used to connect to the distribution system.

As a company, FCI has much experience in many types of the service entrance connectors, being a designer and manufacturer of both split-bolt/clamped connectors and compression connectors for use in service entrance applied by both the contractor and utility. Split-bolt connectors are subject to installation abuse, including incorrect torque applied, non-recommended conductor combinations, or even multiple conductors in excess of two. However, testing to industry standards including UL486 has shown the split-bolt connector to be relatively forgiving of installation errors. For example, we have performed testing on our split-bolt product that shows under-torque by 25% to over-torque of 50% will still yield an acceptable connection.

Similar installation abuses can and do occur on compression connectors, from incorrect tools and dies, insufficient tool output pressure, insufficient number of crimps, lack of conductor preparation, non-recommended conductor combinations, and overstuffing the connector. Our history of compression connections used for service entrance applications (which is very common on the utility service side) shows many more failures attributed to abuses of proper installation methods than split-bolts. Again, the proposed change will not solve these issues with service entrance connection failures.

Some of the issues with installation error can be solved through proper inspection. For split-bolt connectors, FCI is one manufacturer that supplies molded covers that allow for much easier inspection of installed connections. Unfortunately, the usage of these covers is substantially lower than the connectors

themselves, suggesting that tapping is preferred, which can lead to the hiding of installation problems.

Our testing has also shown that the quality and critical design features of split-bolt type connectors vary widely, especially on dual rated (AL9CU) connectors. In some instances, UL has been notified of discrepancies between stated performance to standards and their actual performance. We encourage the Panel to follow-up with UL as to their action on sub-perfoming items as we, being a manufacturer, are not privileged to their responses in such cases. Other mechanical design and irreversible compression should be subject to the same discussion. There are more split-bolt connectors imported with various levels of quality today than irreversible connectors. This may well be one of the the root causes of the apparent high level of call back service needs.

If the problem is perceived to be critical and requiring some Code change to improve safety at the point of service entrance, a reminder of the need for listed connectors for the conductor size and type is most beneficial. Copper-to-copper, use a copper listed connector. For any combination of aluminum an AL9CU listed product must be used. The increase to 90° rated connectors for service entrance would eliminate a small amount of unstable connectors still rated to lower 75° operation from the service entrance application.

The panel should also consider another simple fact - there have been more split-bolt connectors used in the US than any other single connector for service entrance taps and splices. FCI has been supplying split-bolt connectors since the 1920's and doing so in volumes well into the millions per year. There is no other service entrance connector that comes close in quantity sold. By pure statistics, if all connectors were installed with equal level of integrity, split-bolts will have more failures, but not necessarily a higher failure rate!

If the same group of electricians were asked a more open question, "Have you ever been called to address a service entrance connection issue?," you get the same or more number of hands. Then following up with the age of the connectors found a more complete picture of the problem would emerge. Then further breakdown on wire size, evidence of over-stuffing, more than two conductors, and the nature of the application (commercial, industrial, heavy industrial, etc.) the nature of this problem would become clearer, and the need for the removal of split-bolts from the Code will not be so evident.

PANEL ACTION: Reject.

PANEL STATEMENT: This is addressed by Proposal 4-96. The panel does not specify the type of device to make a splice or tap, only the rules that apply to how the splice or tap is to be made.

SUBMITTER: Dan Leaf, Palmdale, CA

COMMENT ON PROPOSAL NO: 4-102

RECOMMENDATION: Accept proposal revised:

SERVICE CONDUCTOR with the HIGHER VOLTAGE TO GROUND. On a 4-wire delta-connected service where the midpoint of one phase winding is grounded, the service conductor having the higher phase voltage to ground shall be distinguished from the other phase conductors by a continuous outer finish that is orange in color along its entire length ~~durably and permanently marked by an outer finish that is orange in color or by other effective means, at each termination or junction point~~ except that a conductor that is larger than 6 AWG shall be permitted to be identified at the time of installation by a durable and permanent marking that is orange in color encircling the conductor at each termination and junction point except a conduit body that does not contain splices or unused hubs.

FPN: Junction point includes auxiliary gutters that supplement wiring spaces at service equipment.

SUBSTANTIATION: Present text permits service conductors smaller than No. 4 to be field-marked at terminations. This is not consistent with a continuous insulation color. Are safety considerations less for hi-leg conductors?

The Code does not limit the use of orange to hi-leg conductors as it does for white and green identification. The literal wording does not specify that orange is to be a distinguishing color, although that seems to be the intent. Intent is hard to enforce. If all the conductors were orange what section would be in violation? Field markings of grounded conductors are required to encircle the insulation per 200-6(b) and will be required for grounding conductors per Proposal 5-256.

Present text requires marking at junction points such as a conduit body; proposal would exempt them where there is no likelihood of any connection.

PANEL ACTION: Reject.

PANEL STATEMENT: This wording does not provide additional safety. It does not recognize current industry requirements, practices, or material availability. The existing wording provides the necessary requirements.

4- 61 - (230-62(c)): Reject

SUBMITTER: John M. O'Connor, North American Technologies, Inc.

COMMENT ON PROPOSAL NO: 4-104

RECOMMENDATION: Add the following new text:

(c) Meter Sockets. Meter sockets shall be effectively closed by a closure which is integral to the meter socket enclosure when a meter is not installed in the socket.

SUBSTANTIATION: The enclosure of a meter socket is UL listed only when a meter is installed in a socket. The service which is energized without a meter being installed does not meet Section 111-27 Guarding of Live Parts. In many instances meters are bypassed, often by non-code approved means, in order to provide temporary power on construction jobsites. The protection of these live parts may or may not exist, depending on the installer and when or if a meter is installed.

These hazardous situations are occurring at new homes, offices, construction sites and at temporary classrooms (which are usually located on school playgrounds) while they are waiting to have meters installed. Utility deregulation may also cause increased incidence of these situations.

The addition of an integral closure to a meter socket would protect workers, children and others from a potentially dangerous situation, one that is preventable. Listed metering assemblies with integral socket closures are already commercially available.

NOTE: This is a companion proposal to my proposal on Section 373-4(b).

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has provided no new information from Proposal 4-104. The panel reaffirms the requirements of Sections 110-27 and 230-62. The panel also disagrees that the meter socket is only listed when the meter is in place. The meter socket is listed when it leaves the factory and it is intended for installation in accordance with the NEC.

SUBMITTER: Richard E. Loyd, Perryville, AR
COMMENT ON PROPOSAL NO: 4-107a
RECOMMENDATION: Reconsider 4-107 and accept as revised.
F. Service Equipment - Disconnecting Means.
230-70. General. A means shall be provided to disconnect all conductors in a building or other structure from the service-entrance conductors. The service overcurrent device and ground fault protection where required shall be an integral part of the service disconnecting means or shall be located immediately adjacent thereto.
(A) Location. The service disconnect(s)ing means. Overcurrent device, and ground-fault protection where required shall be installed at a readily accessible location either in sight and within 50 feet outside of a building or structure, or inside nearest the point of entrance of the service conductors.
(1) Service disconnecting means shall not be installed in bathrooms.
(B) Disconnecting Device(s). The disconnecting device(s) shall simultaneously disconnect all ungrounded service conductors that it controls from the premises wiring system.
(1) Indicating. The service disconnecting means shall plainly indicate whether it is in the open or closed position.
(2) Marking. Each service disconnect shall be permanently marked to identify it as a service disconnect.
(3) Manually or Power Operable. The service disconnecting means for ungrounded service conductors shall consist of either:
(a) a manually operable switch or circuit breaker equipped with a handle or other suitable operating means or
(b) a power-operated switch or circuit breaker provided the switch or circuit breaker can be opened by hand in the event of a power supply failure.
(C) Suitable for Use. Each service disconnecting means shall be suitable for the prevailing conditions. Service equipment installed in hazardous (classified) locations shall comply with the requirements of Articles 500 through 517.
(D) Remote Control Device. A remote control device used to actuate the main disconnecting means shall be permitted as a optional control device and shall not be permitted as the disconnecting means required by 230-70 A through C.
SUBSTANTIATION: Although you accepted this proposal in principle, I don't believe Proposal 4-107a accomplished the intent of this proposal. I recommend that you reconsider 4-107 as revised. By revising 230-70 and incorporating existing 230-74, 230-76 and 230-77 into 230-70. It clarifies the existing intent, that although a shunt trip is permitted in addition to the required main that is optional and all of the requirements in 230-70 apply to the service disconnecting switch and not the remote device. I also considered Mr. Carrick's negative vote and added "within 50 feet" rather than "in sight of."
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concern with requiring the disconnecting means to be located in accordance with Section 230-70(A) when a remote control device is used as the actuator is addressed by the panel's action on Comment 4-66 (230-70(A)(3)).
This change clarifies the requirements for the location of a building or structure service disconnect.
The panel utilized the term "within sight of" to stipulate a distance of 15m (50 ft). As the distance is now specified in the code, the terms "within sight of" or "visible" are not necessary.
See panel action and statement on Comment 4-66.

4- 66 - (230-70(a)): Accept in Principle
Note: The Technical Correlating Committee directs that 230-70(A)(1)(a)(1)be revised to read as follows: "(1) The service disconnecting means shall be on the building or structure served or shall be located within sight from the building or structure served". The Technical Correlating Committee directs that the issue involves safety and correlation concerns which warrant this change. The remainder of 230-70 remains as it appears in Comment 4-66.
SUBMITTER: Lanny McMahill, Rep. IAEI SW Section
COMMENT ON PROPOSAL NO: 4-107a
RECOMMENDATION: Accept this proposal, however, add "visible and not more than 50 ft away from" after "within sight."
SUBSTANTIATION: This change will clarify the intent of the revised text and provide for a maximum distance that the disconnecting means can be located away from the building or structure.
PANEL ACTION: Accept in Principle.
The following action is the panel's final action on Section 230-70 and incorporates all changes made during the proposal and comment periods.
Revise Section 230.70 to read as follows: 230.70 General. Means shall be provided to disconnect all conductors in a building or other structure from the service-entrance conductors.
(A) Location. The service disconnecting means shall be installed in accordance with (1), (2), and (3).
(1) Readily Accessible Location. The service disconnecting means shall be installed at a readily accessible location in accordance with (a) or (b).
(a) Outside. Service disconnecting means installed outside a building or structure shall comply with (1) or (2):
(1) The service disconnecting means shall be on the building or structure served or shall be located within 15m (50 ft) from the building or structure served.
(2) Where the service disconnecting means is located more than 15m (50 ft) from the building or structure served, a feeder disconnecting means for the building or structure supplied shall be installed in accordance with Part II of Article 225.
(b) Inside. Where the service disconnecting means is installed inside, it shall be nearest the point of entrance of the service conductors.
(2) Bathrooms. Service disconnecting means shall not be installed in bathrooms.
(3) Remote Control. Where a remote control device(s) is used to actuate the service disconnecting means, the service disconnecting means shall be located in accordance with 230.70(A)(1).
(B) Marking. Each service disconnect shall be permanently marked to identify it as a service disconnect.

(C) Suitable for Use. Each service disconnecting means shall be suitable for the prevailing conditions. Service equipment installed in hazardous (classified) locations shall comply with the requirements of Articles 500 through 517.

PANEL STATEMENT: This change will clarify the requirements for the location of a building or structure service disconnect. The panel previously utilized the term "within sight of" to stipulate a distance of 15m (50 ft). As the distance is now specified in the code, the terms "within sight of" or "visible" are not necessary.

The panel action on Comment 4-66 constitutes the panels final action on section 230-70 and includes all of the changes incorporated through the proposal and comment periods.

4- 67 - (230-70(a)(1)): Accept in Principle in Part

Note: See Technical Correlating Committee action on Comment 4-66.

SUBMITTER: Jim Pauley, Square D Company

COMMENT ON PROPOSAL NO: 4-107a

RECOMMENDATION: Revise 230.70(A)(1) of the ROP to read as follows:

(1) Readily Accessible Location. The service disconnecting means shall be installed ~~at a readily accessible location~~ in accordance with (a) or (b).

(a) Outside. Where a service disconnecting means is installed outside a building or structure, ~~shall comply with (1) or (2):~~ ~~(1) The service disconnecting means~~ it shall be ~~permitted~~ installed at a readily accessible location on, or within sight of and not more than 3 m (10 ft) from, ~~of~~ the building or structure served.

~~(2) Where the service disconnecting means is not within sight of the building or structure served, a feeder disconnecting means for the building or structure supplied shall be installed in accordance with Part II of Article 225.~~

(b) Inside. Where the service disconnecting means is installed inside a building or structure, it shall be installed at a readily accessible location nearest the point of entrance of the service conductors.

SUBSTANTIATION: The revised wording suggested by this comment is to address the following:

1) The requirement that a disconnect be "within sight" (allowing it up to 50' away) is not acceptable for the building disconnecting means. 50' is too far and can introduce obstacles to effective disconnecting of power by someone at the building. This comment proposes that the disconnect be within 10' of the building or structure which would allow the disconnect to be located on posts/racks, etc. and still be easily accessed by the occupants of the building. Allowing a 50' distance in a rule that previously required it to be AT the building severely reduces the safety that was inherent in the rule.

2) This comment also removes the (2) of the section. This section is not necessary. If the service disconnecting means is not "within sight" (as defined item 1) then this would imply that the disconnect is located at another building or structure. The conductors are no longer service conductors, but they are a feeder and Article 225 applies. Keeping (2) in the Code seems to imply that there is some instance where Article 225 would not apply to a feeder that comes from a disconnect mounted remotely.

3) The readily accessible terminology has been moved from the introductory paragraph into the actual language of the rules. This is done to make sure that the rule is read completely. The wording of the proposal more directly implied that an inside disconnect MUST be "nearest" the point of entrance of the conductors. However, the readily accessible term was critical to application of the rule. Take a service busway that enters a building at a height of 10', turns down and enters a service switchboard. The disconnect is located at a readily accessible location nearest the point of entrance. Although one can attempt to get to the same point with the proposal wording, it can be more easily misinterpreted.

PANEL ACTION: Accept in Principle in Part.

The panel does not agree with the submitters requirement for 3m (10 ft) from the building or structure served.

The panel accepts in principle the remainder of the comment and refers the submitter to the panel action and statement on Comment 4-66.

PANEL STATEMENT: The submitter has provided no technical substantiation for that specific distance. See also, the panel action and statement on Comment 4-66.

4- 68 - (230-70(d), 230.91 Exception (new), 250.24 (A) Exception (new), 250.28 Exception No. 3 (new (New)): Reject

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

COMMENT ON PROPOSAL NO: 4-129

RECOMMENDATION: Place the proposal on hold for this cycle by attaching it to this comment, which must be held because it unavoidably introduces extensive new material without public review. For the next cycle, (or for a sequence of TIAs) convert this into two Code-Making Panel 4 proposals, and two for Code-Making Panel 5, as follows:

I. Add a new 230.70(D) as follows:

(D) Meter Disconnect Switches. A meter disconnect switch located on the load side of the service point shall be readily accessible. It shall be classified as a service disconnect for the premises wiring system.

(1) Overcurrent Protection Incorporated. Where a meter disconnect switch incorporates overcurrent protection it shall be listed as suitable for use as service equipment.

(2) No Overcurrent Protection. A meter disconnect switch shall be permitted to omit overcurrent protection. The feeder to the building or structure served shall be wired in accordance with Parts I through IV of Article 230. The building or structure disconnecting means shall comply with 230.91 and shall be listed as suitable for use as service equipment.

(3) Building or Structure Disconnecting Means. A feeder disconnecting means for the building or structure served shall be installed in accordance with Part II of Article 225 if the meter disconnect switch (1) omits the grounding connections required by 250.24, or (2) is not in sight of the building or structure served.

(4) Grounding. Where any meter disconnect switch omits the grounding connections required by 250.24, (1) no utilization equipment shall be supplied at the meter location, (2) the feeder supplied shall comply with 250.32, and (3) any bonding jumper required by 250.28 shall be installed at the building or structure disconnecting means. The meter disconnect switch shall be bonded in accordance with 250.92.

II. Add an Exception to 250.24(A) as follows:

Exception: The grounding electrode conductor shall be permitted to be omitted at a meter disconnect switch classified as a service disconnect in accordance with 230.70(D) provided (1) no utilization equipment is supplied at the meter location, (2) the feeder supplied complies with 250.32, and (3) any bonding jumper required by 250.28 is installed.

III. Add a third exception to 250.28 as follows:

Exception No. 3: Where the service disconnect is a meter disconnect switch as covered in 250.70(C), the main bonding jumper shall be located in the feeder disconnecting means for the building or structure served.

IV. Add an exception to 230-91 as follows:

Exception: A meter disconnect switch as covered in 230.70(D)(2) shall be permitted to have overcurrent protection located as part of the feeder disconnecting means for the building or structure served.

SUBSTANTIATION: The submitter is well aware of the rules regarding public review, but offers this comment in an attempt to allow Code-Making Panel 4 to see a larger picture. This comment is intended to be read as fully supportive of the technical objectives of the the proposal submitter. The problem is to achieve those objectives in a way that does not create confusion and controversy around a fundamental principle of code application, namely, the determination of exactly which device located where constitutes the service disconnect. As submitted the original proposal clouds that issue irretrievably.

Meter disconnects have been around for a very long time, normally consisting of a multipole circuit breaker mounted within a multifunction meter enclosure or in a self-contained metering pedestal. Theoretically a manufacturer could make any of them as convertible to either "hot sequence" (meter ahead of switch) or "cold sequence" (switch ahead of meter) in the field, to suit local utility requirements. At present, most of this market consists of hot sequence units that aren't field-convertible. If these breakers are on

the load side of the service point (the usual case), and if they provide overcurrent protection for the conductors they supply (also the usual case), then what they supply is a conventional feeder, and not a continuation of service conductors.

Although these switches can always be installed as service disconnects, this submitter understands the practical reluctance to do so in many cases. One major reason is that if they are so classified a grounding electrode would have to be provided at the metering point. If the meter is on the outside of the building that isn't a big problem, but if the meter is hundreds of feet away, it would involve an additional electrode that would meet code but accomplish very little in terms of safety, since there would be no electrical loads at the remote metering point. It would be like requiring a grounding electrode conductor to be brought to every conventional meter socket.

We also have to recognize increased, and justified, utility interest in cold sequence metering, especially on self-contained 480Y/277 volt metering systems, because of the greater safety it affords their service personnel. Pulling a meter under load at 277 volts to ground can result in a severe arc, which is why the NEC has required GFPE on 480y/277 volt services for the last thirty years. The remote switch makes sense, and clearly increases safety. Considering that the conductors run from the meter to the "service" disconnect are usually run as unprotected service conductors, requiring overload protection for these conductors has no observable safety justification. Remember also that bypass switches in meter sockets are to maintain load continuity, not load interruption, and opening a meter bypass switch under load may destroy the meter socket.

Some other utilities have expressed interest in this concept where the metering is to be at a roadside, with the service running to the building served typically using an underground wiring method. This is true even on ordinary 120/240 Volt single phase services to single family dwellings. Utility representatives point out, correctly, that here as well a remote disconnect adds an additional level of safety. Often electricians have been in the position of needing to pull a meter in order to deenergize service equipment in a flooded basement; a remote disconnect is much safer.

The problem deserves to be fixed, and soon. Unfortunately, countless NEC rules depend on a common understanding of exactly where the service is. Allowing two devices, often widely separated on the same property that each potentially qualify as service disconnecting means will be extremely troublesome. In addition the switch without overcurrent protection effectively creates per long established code definitions, a feeder without overcurrent protection, which requires correlation with Section 230-91. This section requires service overcurrent protection to be located as an integral part of the service disconnecting means, or immediately adjacent thereto. This doesn't invalidate the utility safety argument, but it does mean that the utility proposal as presented will not accommodate these issues.

It was only in the last cycle that the following similar allowance was deleted from Section 230-82: "Fuses and disconnecting means or circuit breakers suitable for use as service equipment, in meter pedestals or otherwise provided and connected in series with the ungrounded service conductors and located away form the building supplied." The reason this provision was deleted (Proposal 4-159 in the 1999 NEC cycle) was that such disconnecting means are in fact service disconnects and the normal requirements in Part B of Article 225 should generally apply because the conductors they supply are feeders. Further, the existence of this provision (which originated in the 1971 NEC, long before building disconnects moved from old Section 230-84 to Article 225) was leading to confusion and inconsistent application of the rules because of conflicts with Article 225. That action was essentially correct.

Furthermore, in this cycle, Code-Making Panel 4 is about to finally impose a long-overdue proximity rule on outdoor service disconnects. If the remote service disconnect is within a building it doesn't matter because 225.32 imposes the same requirements for a building fed from another building or structure. A self contained metering pedestal, however, is not a building or structure under the provisions of most model building codes. It is these very metering pedestals that many utilities are now requiring to contain disconnecting means. Assuming the panel action stands, if one is located within 50 ft of and on a line of sight to the building served, then its disconnect could be viewed as the service disconnect. If not, then we would have a switch in the service conductors of the premises wiring system that (1) would be a service disconnect, but (2) could not be, in and of itself, the disconnecting means for the building or structure served.

Even if located in sight, frequently the designer would prefer a local building disconnect in addition to the one at the meter, and often the electrician prefers to wire the building disconnect as if it were a service. The meter disconnect supplies no electric equipment in its vicinity, and therefore requiring all the usual grounding provisions at a service disconnect appears to add little to safety, and discouraging its placement means reducing safety for the sake of editorial purity.

On the other hand, a remote disconnect that waddles and quacks like a service disconnect will be treated accordingly by many inspectors, resulting in substantial argument and inconsistency in the application of a fundamental concept, the location of the service disconnect. This comment intends to provide the framework for an eventual resolution of the following issues:

First, the potentially incidental nature of a meter disconnect needs to be clarified in a way that acknowledges that such a disconnect might be the actual service disconnect and wired accordingly. Many high-current applications today involve a main circuit breaker located (per local utility policy) either ahead of (cold sequence) or after (hot sequence) the instrument transformer connections for metering. This equipment is usually in or on the building served, and the circuit breaker is then wired without controversy as the service disconnect. Second, when the meter disconnect is remotely located, the installer needs a mechanism to make that disconnect effectively redundant to one located on or in the building served, but in a way that accommodates existing terminology.

Any such remote service switch potentially qualifies as a service disconnect, however no safety hazard (assuming no local utilization equipment) results if there is no grounding electrode at its location, as long as there is a building disconnect grounded in accordance with 250-32. This requires a far more fundamental approach than simply adding meter disconnect switches to Section 230-82(2), which is why that wording should not go forward at this time. This comment provides a new subsection 230.70, to address the subject. It provides a correlating exception in 230.91, which allows for the omission of overload protection at the switch. It also provides correlating language in Article 250 that will be required to arrange for appropriate grounding connections in instances where an electrode is to be omitted at the remote metering location.

PANEL ACTION: Reject.

PANEL STATEMENT: The material raised by the commenter is not relevant to Proposal 4-129 or to Section 230-82 nor would any of the changes submitted by the commenter affect the text of Section 230-82.

The material is not appropriate for Section 230-70 as it does not relate to service disconnects.

(Log #52)

4- 69 - (230-71(a)): Accept

SUBMITTER: Technical Correlating Committee National Electrical Code

COMMENT ON PROPOSAL NO: 4-117

RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 4-118. This action will be considered by the Panel as a Public Comment.

SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.

PANEL ACTION: Accept.

Section 230-71 shall read as follows:

230.71 Maximum Number of Disconnects.

(A) General. The service disconnecting means for each service permitted by 230.2, or for each set of service-entrance conductors permitted by 230.40, Exception Nos. 1, 3, 4, or 5 shall consist of not more than six switches or sets of circuit breakers, or a combination of not more than six switches and sets of circuit breakers, mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be no more than six sets of disconnects per service grouped in any one location. For the purpose of this section, disconnecting means used solely for power monitoring equipment, transient voltage surge suppression, or the control circuit of the ground-fault protection system or power-operable service disconnecting means, installed as part of the listed equipment, shall not be considered a service disconnecting means.

(B) Single-Pole Units. Two or three single-pole switches or breakers, capable of individual operation, shall be permitted on

multiwire circuits, one pole for each ungrounded conductor, as one multipole disconnect, provided they are equipped with handle ties or a master handle to disconnect all conductors of the service with no more than six operations of the hand.

FPN: See 384.16(A) for service equipment in panelboards, and see 430.95 for service equipment in motor control centers.

PANEL STATEMENT: This panel action correlates prior panel actions on Proposal 4-117 and 4-118. This action constitutes the final panel action on Section 230-71.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #1785)

4- 71 - (230-71(a)): Hold

Note: It was the action of the Technical Correlating Committee that this Comment and Proposal 4-118 be reported as "Hold" to consider the requirements in 230-71(A) and 285-21(A)(1).

SUBMITTER: Alan Manche, Square D Co.

COMMENT ON PROPOSAL NO: 4-118

RECOMMENDATION: The panel should continue to accept the addition of the transient voltage surge suppressor disconnect when installed as part of a listed assembly with the following revision to 230-82(7):

230-87(7). Ground-fault protection systems or transient voltage surge suppressors, where installed as part of listed equipment, if suitable overcurrent protection and disconnecting means are provided.

SUBSTANTIATION: A correlation concern exists with the acceptance of the revision to 230-71(a) without a revision to Section 230-82(7). Disconnects for power monitoring, and the ground fault control circuits are currently not considered a service disconnecting means in 230-71(a), however, permission is then established in 230-82(6) and (7) for these disconnects to be connected ahead of the service disconnect when installed as part of the overall listed equipment. Adding "transient voltage surge suppressors" to 230-82(7) will resolve this issue.

The panel may decide the material proposed for 230-82(7) is new material and inappropriate during the comment stage. However, this is a direct result of the concept accepted in 230-71(a) and is only to correlate that action. If the panel decides this is new material and not an editorial correlation revision then this proposal should be rejected until such time the correlation issue can be resolved.

There is also a concern with the panel accepting the proposal without any comment to the submitter's substantiation. The submitter indicates the service disconnect must be rated 60A when in fact the service "disconnecting means" must be rated 60A and 230-80 states that the sum of the disconnects to meet the minimum ampacity restriction.

The submitter also indicates that misinterpretations have occurred treating the connection to the TVSS as a branch circuit. TVSS units should have the shortest connection possible to the equipment, but there is no prohibition on conductor length. This results in the conductors exiting the panelboard to connect to an externally mounted TVSS. These conductors should be treated and protected as branch circuit conductors to protect them from short circuit conditions just as any other circuit exiting the equipment. The tap rules might be applied in 240-21(b) to ensure appropriate short circuit protection of the conductors outside the panel, however, the minimum size tap conductor designated in each tap rule cannot be ignored.

PANEL ACTION: Hold.

PANEL STATEMENT: This is new material to be held for further consideration in the next code cycle.

(Log #1265)

4- 72 - (230-71(a), FPN (New)): Reject

SUBMITTER: David A. Kerr, Jr., Friendsville, PA

COMMENT ON PROPOSAL NO: 4-119

RECOMMENDATION: Perhaps this proposal should be moved to some location in Article 240 if overcurrent protection devices are their specialty. Users of the Code are requied to follow the applicable rules of Article 384, but they don't.

SUBSTANTIATION: None given.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has provided no technical substantiation for the recommendation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #406)

4- 73 - (230-72(b)): Accept in Part

SUBMITTER: Dan Leaf, Palmdale, CA

COMMENT ON PROPOSAL NO: 4-121

RECOMMENDATION: Accept in Principle revised:

(b) ~~ADDITIONAL SERVICE~~ DISCONNECTING MEANS for ADDITIONAL SERVICES. The one or more additional service ~~disconnecting means~~ disconnects for fire pumps, emergency, or ~~legally required standby or optional~~ standby systems permitted by 230-2(a) to be served by an additional service(s) shall be installed ~~sufficiently~~ remote from the one to six service ~~disconnecting means~~ disconnects for the normal service to minimize the probability of simultaneous interruption of supply.

SUBSTANTIATION: The proposal makes it clear this section relates to additional services not taps ahead of the service. Emergency systems are clearly permitted by 230-2(a)(2) to be served by an additional service, as are fire pumps, and standby systems. The present text is confusing and may be interpreted as applying to taps ahead of the normal service. The word "disconnects" is used as in (a), and "sufficiently" is deleted per Style Manual.

PANEL ACTION: Accept in Part.

PANEL STATEMENT: The panel accepts the commenters recommendation to delete the term "sufficiently" as it is not consistent with the NEC Style Manual.

The panel rejects the remainder of the recommendation as there is no intention to prohibit connections ahead of the service disconnect to feed these loads.

4- 74 - (230-72(c) Exception No. 2):

Note: It was the action of the Technical Correlating Committee that Comment 4-74 and Proposal 4-122 be reported as "Hold". The Technical Correlating Committee will direct that Code-Making Panels 4 and 10 establish a Task Group to resolve the conflicting actions on this Comment and Comment on 10-34.

SUBMITTER: William F. Laidler, Rep. Massachusetts Electrical Code Advisory Committee

COMMENT ON PROPOSAL NO: 4-122

RECOMMENDATION: Continue to accept.

SUBSTANTIATION: In the original submittal, the submitter lists only one example of an installation where the exception would allow an installation of service equipment without tenant access to the main service disconnect.

In the interest of safety, it is the ongoing opinion of the Massachusetts Electrical Code Advisory Committee, that in certain installations, tenants should in fact not have access to the main service disconnecting means. For example, mixed-use occupancies with large service ampacity located behind a mechanical room in the basement would be an area where one would not want a tenant venturing in the interest of safety as a matter of right.

By retaining this exception, Code-Making Panel 4 will allow designers and installers to create safer installations of service equipment, without seeking special permission from the authority having jurisdiction as allowed in 90-4.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel reaffirms its action to accept in principle Proposal 4-122.

4- 75 - (230-75): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 4-122a
RECOMMENDATION: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Section 230-75 shall read as follows:
230-75. Disconnection of Grounded Conductor. Where the service disconnecting means does not disconnect the grounded conductor from the premises wiring, other means shall be provided for this purpose in the service equipment. A terminal or bus to which all grounded conductors can be attached by means of pressure connectors shall be permitted for this purpose. In a multisection switchboard, disconnects for the grounded conductor shall be permitted to be in any section of the switchboard, provided any such switchboard section is marked.
PANEL STATEMENT: The panel has reconsidered its action on Proposal 4-122a and recognizes the need to retain the material. The panel action is intended to constitute the final action for Section 230-75.

4- 76 - (230-75): Accept
SUBMITTER: Jim Pauley, Square D Company
COMMENT ON PROPOSAL NO: 4-122a
RECOMMENDATION: The panel should reconsider and reject the proposal.
SUBSTANTIATION: I agree with Mr. Young's explanation of negative. The language needs to remain in the NEC to convey to the installer and inspector that the link can be in any section provided it is marked. The language was introduced to resolve a previous interpretation problem, removing it would simply reintroduce the same issue.
PANEL ACTION: Accept.
PANEL STATEMENT: See panel action and statement on Comment 4-75.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #387)

4- 77 - (230-79(c)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 4-125
RECOMMENDATION: Accept in principle revised: (c) ONE-FAMILY DWELLING. For a one-family dwelling <u>where the initial computed load is 10kVA or more, or where the initial installation consists of six or more 2-wire circuits or the equivalent,</u> the service disconnecting means shall have a rating of not less than 100 amperes 3-wire <u>single-phase or 70 amperes 4-wire three-phase.</u>
SUBSTANTIATION: Many vacation homes, cabins, etc., with a small computed load or few branch-circuits do not warrant a 100 ampere service. The substantiation for proposal 4-152 of the 1998 ROP for this requirement was simply "to reflect current building practices". I agree that it does but this is a nebulous reason for a safety code and not generally acceptable justification for Code rules. If this substantiation was used to justify a requirement for nonmetallic boxes to be used with NMSC installations I don't think it would fly.

A vacation cabin qualifying as a one-family dwelling with 700 sq. ft. of area, one general lighting circuit, two small appliance circuits, a laundry circuit, and a circuit for a 1/4 HP forced air heating unit has a net computed load of 5456 volt-amperes, or 23 amperes. To require a disconnecting means almost 500 percent greater smacks of design requirements. A 60 ampere rated disconnecting means will be suitable for a 120/240 volt load up to 14400 volt-amperes.

This proposal would not affect the majority of one-family dwellings since the norm is a minimum 100 ampere disconnecting means, commonly established by previous Code but based on criteria such as load or number of circuits.

The 100 ampere 3-wire requirement is clarified to specifically indicate single-phase. A 70-ampere 4-wire three-phase system should be indicated for clarity as they are not prohibited by the Code.

PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes the submitter intended his comment to be to Proposal 4-124 not Proposal 4-125. Regardless, he has not provided no technical substantiation and the panel reaffirms its position that current requirements of the code provide the minimum specifications for safe service installations. The current code does not prohibit a three-phase four-wire service to a dwelling provided it has the same capacity as the one hundred ampere three-wire rated disconnect.

(Log #55)

4- 78 - (230-82): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 4-126
RECOMMENDATION: The Technical Correlating Committee directs the Panel to reword "in accordance with Article 250" to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The following constitutes the final wording of Section 230-82. The revised text for Section 230-82 to read as follows:
Section 230.82 Equipment Connected to the Supply Side of Service Disconnect. Only the following equipment shall be permitted to be connected to the supply side of the service disconnecting means:
(1) Cable limiters or other current-limiting devices
(2) Meters, meter sockets, or meter disconnect switches nominally rated not in excess of 600 volts, provided all metal housings and service enclosures are grounded.
(3) Instrument transformers (current and voltage), high-impedance shunts, load management devices, and surge arresters
(4) Taps used only to supply load management devices, circuits for standby power systems, fire pump equipment, and fire and sprinkler alarms, if provided with service equipment and installed in accordance with requirements for service-entrance conductors
(5) Solar photovoltaic systems, fuel cell systems, or inter-connected electric power production sources.

(6) Control circuits for power-operable service disconnecting means, if suitable overcurrent protection and disconnecting means are provided

(7) Ground-fault protection systems where installed as part of listed equipment, if suitable overcurrent protection and disconnecting means are provided

(8) Transfer equipment installed in accordance with Sections 700-6, 701-7, and 702-6. A transfer switch installed under these provisions is not a service disconnect.

PANEL STATEMENT: By this action the panel complies with the requirements of the NEC Style Manual. This action incorporates all panel actions related to proposals and comments during this code cycle and constitutes the final wording for Section 230-82.

4- 80 - (230-82(2)): Reject
SUBMITTER: Jim Pauley, Square D Company
COMMENT ON PROPOSAL NO: 4-128
RECOMMENDATION: The panel should reconsider and reject the proposal.
SUBSTANTIATION: The change is not logical. If there is a disconnect ahead of the meter, that disconnect should be suitable for use as service equipment and the system should be wired as such. There is no prohibition in the NEC to having a meter socket downstream of the service disconnect. We even have provisions in 250.142(B) Exception No. 2 to allow the grounded conductor to ground the enclosure of a meter socket downstream of the service disconnect. This Exception was to directly handle the instances described by the submitter.

For the user of the NEC, the simpler the rule the better. Simple in this instance means that the first disconnect for the building is the service disconnect, regardless of whether or not it is upstream or downstream of the meter socket.

Also, the addition of "meter sockets" to the rule is not necessary. The rule has always allowed "meters" and the mounting device was implicit in that permissions. This is evident from the fact that the rule has required all metal housings to be grounded by Article 250. The meter itself seldom can be said to have a "metal housing".
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 4-78 and submitter's substantiation on Comment 4-82.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
POLLOCK: I am voting negative on the panel action. The term "Meter Disconnect Switch" is defined in Proposals 4-128 and 4-129, as well as in Comment 4-82, but not in the NEC. The key factor in the proposal and comment to add this term is that the "meter disconnect switch" is under the sole control of the serving utility. Therefore, in accordance with Section 90-2(b)(5), a "meter disconnect switch" is not covered by the NEC. The term "meter disconnect switch" should not be added to the NEC.

YOUNG: NEMA votes negative on the panel action. The comment should be accepted resulting in rejection of the original proposal. Although the submitter of the original proposal had a specific application in mind (as described in Comment 4-82, the term "meter disconnect switch") is not defined. Without a clear definition, there will be misapplication of many products such as non-fused switches (in service equipment applications these have overcurrent protection immediately adjacent to the switch), isolation switches (that are not suitable for load break), and meter/mains (which are typically suitable for use only as service equipment). This provision should not go into the NEC without a clear definition and with more explicit code language as to what is intended to avoid misuse of the electrical equipment.

(Log #1775)

4- 81 - (230-82(2)): Reject
SUBMITTER: Jim Pauley, Square D Company
COMMENT ON PROPOSAL NO: 4-129
RECOMMENDATION: The panel should reconsider and reject the proposal.
SUBSTANTIATION: The change is not logical. If there is a disconnect ahead of the meter, that disconnect should be suitable for use as service equipment and the system should be wired as such. There is no prohibition in the NEC to having a meter socket downstream of the service disconnect. We even have provisions in 250.142(B) Exception No. 2 to allow the grounded conductor to ground the enclosure of a meter socket downstream of the service disconnect. This Exception was to directly handle the instances described by the submitter.

For the user of the NEC, the simpler the rule the better. Simple in this instance means that the first disconnect for the building is the service disconnect, regardless of whether or not it is upstream or downstream of the meter socket.

Also, the addition of "meter sockets" to the rule is not necessary. The rule has always allowed "meters" and the mounting device was implicit in that permissions. This is evident from the fact that the rule has required all metal housings to be grounded by Article 250. The meter itself seldom can be said to have a "metal housing".

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1867)

4- 82 - (230-82(2)): Accept
SUBMITTER: Timothy M. Croushore, Allegheny Power
COMMENT ON PROPOSAL NO: 4-128 & 4-129
RECOMMENDATION: Code Making Panel 4 should continue to accept Proposal 4-129. The word "normally" used in the first sentence in the recommended text of Proposal 4-128 should have been "nominally". I agree with the affirmative comment of Mr. Zinnante.
SUBSTANTIATION: Proposals 4-128 and 4-129 reference the addition of wording to include meter sockets and meter disconnect switches to the list of equipment permitted ahead of the service disconnecting means. Utilities routinely are requiring a means to de-energize a 480Y/277 self-contained meter before performing a meter change, maintenance, or to disconnect service. When the meter disconnect is ahead of the meter, this is commonly referred to as "cold sequencing".

The main reason for this requirement is safety of utility personnel. An arc that is generated with voltages above 150 volts to ground are considered "self sustaining", meaning that the arc isn't extinguished when the fault source is removed. An arc created on a 480Y/277 volt system can easily burn down the meter socket as well as injure the individual performing the work.

Some feel that by requiring a meter disconnect switch ahead of the meter creates confusion as to if this disconnect should be considered, or classified, as a service disconnecting means. If so, then grounding requirements in Article 250 and the overcurrent protection requirements in Article 230 would technically apply. From a utility standpoint, this would not be the case. To accomplish what the meter disconnect is intended for, the following criteria is important:

• No overcurrent protection shall be incorporated in the meter disconnect
• The meter disconnect shall be under the sole control of serving utility
• Bonding of the meter disconnect enclosure shall be in compliance with Section 250.92
• The meter disconnect shall serve no feeder conductors
• No grounding electrodes shall terminate in the meter disconnect as defined by Article 250
• The meter disconnect shall not be classified as service disconnecting means under Article 230

With the above requirements being used commonly throughout the utility industry, the distinction is clear as to what this disconnect is classified as - a meter disconnect and not a service disconnecting means.

To clarify some of these points, several factors standout. First, with no overcurrent protection incorporated within the meter disconnect, access by the public ceases to be necessary. In turn, sole control of the meter disconnect by the utility negates any possibility of using the disconnect for any reasons other than a meter change or meter maintenance. Second, safety is not compromised, as the meter disconnect enclosure will be bonded, as in the meter socket, by the grounded conductor (neutral), and the building service disconnect will be grounded and bonded to the grounded conductor as well as the grounding electrode system as required under Article 250. Third, even given that the location of the meter disconnect may be remote relative to the service disconnecting means, this does not alter in any way the point of demarcation or the approved service disconnect location as governed by Article 230.

To address the issue of "combination devices", such meter socket/disconnects and meter socket/ load centers, the above guidelines still apply. As a matter of suitability, manufacturers routinely resist or do not produce units with overcurrent protection on the supply, or line side of the meter. As for units with overcurrent/disconnect integral to the load side of the meter, these would in all cases be installed in accordance with Article 230, as they would always be classified as the service disconnecting means. To classify a disconnect with overcurrent protection installed on the load side of the meter otherwise would violate many articles governing services and disconnects (Articles 225, 230, 250, etc.). Again, regardless if the application is remote to or mounted on the structure served, the same provisions apply. This removes any discretion, and confusion, on the part of inspectors, installers and the serving utility.

To summarize, allowing installation of a disconnect on the line side of the meter serves to mitigate many critical concerns. No confusion, nor enforcement chaos, will result from this application. The disconnect serves a sole purpose (meter de-energization) and will not create any hazardous situations arising from inadequate grounding or misapplication. The approved Proposals 4-128/4-129 should remain as stated - "Meters, meter sockets or meter disconnect switches, nominally rated not in excess of 600 volts, provided all metal housings and service enclosures are grounded in accordance with Article 250".

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1773)

4- 85 - (230-82(8)): Reject
SUBMITTER: Jim Pauley, Square D Company
COMMENT ON PROPOSAL NO: 4-127
RECOMMENDATION: The panel should reconsider and reject the proposal.
SUBSTANTIATION: If transfer equipment is installed on the service and as the first disconnect, it should become the service disconnecting means. There will be little value in having transfer equipment with appropriate SUSE markings if the panel retains the permission to allow it ahead of the service disconnect. By not making the transfer equipment the service disconnect (and as such not requiring it to be SUSE), there will be an influx of devices that inspectors and utilities will not be happy with. These devices will not meet all the necessary requirements for a piece of equipment located at the "head end" (i.e. high short circuit) portion of the system. Grounding and bonding will be done at the "service disconnect" downstream further impacting proper bonding at the generator.

The submitters substantiation does not support adding this new rule. In fact, the substantion is a good statement about why the transfer equipment must be the service disconnect if it is the first disconnect at/on the building and why it should be SUSE. By being the service disconnect, tt would be required to proper short circuit current ratings, proper devices suitable as a disconnects, proper electrical spacings and either integral overcurrent protection or protection mounted immediately adjacent to the transfer equipment.

Allowing the transfer equipment to escape the service equipment requirements will not improve the situation described by the submitter, it will only make it worse.
PANEL ACTION: Reject.
PANEL STATEMENT: A transfer switch may not have an open position and therefore cannot be considered the service disconnect. The panel does not intend that transfer switches become the service disconnecting means unless designed, identified and installed for that purpose.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
YOUNG: NEMA votes negative on the panel action. The comment should be accepted resulting in rejection of the original proposal. The revision by Proposal 4-127 introduces significant concern for the proper application of electrical equipment. If transfer equipment is installed as the first piece of equipment in a system, it should be the service equipment and would, as a result, be required to be suitable for use as service equipment. With the change, a piece of transfer equipment without overcurrent protection can be installed with a significant amount of unprotected service conductor between it and the service overcurrent device. This increases the potential of exposing the transfer equipment to extremely high fault currents without any overcurrent protection in place. In the 1999 NEC, this same application would require that the service overcurrent device be an integral part of the transfer equipment or located immediately adjacent thereto. In addition, the wording accepted by the panel

mixes the terms transfer equipment and transfer switch. These are two very different categories of devices. The term transfer equipment includes many product categories such as double throw switches and interlocked circuit breaker panelboards. The term transfer switch is only one type of transfer equipment.

(Log #2025)

4- 86 - (230-82(8) (New)): Accept in Part
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 4-127
RECOMMENDATION: Add the following:
A transfer switch installed under these provisions is not a service disconnect and shall not be field marked under the provisions of 230.70(B).
SUBSTANTIATION: This proposal has the potential to offer the same degree of confusion about "will the actual service disconnect please stand up" as with meter disconnects, particularly if the transfer switch used in some application carries a listing as being suitable for use as service equipment. Since it generally won't be at a remote location, however, it doesn't present the grounding issues involved with remote meter disconnects. In this case, the solution is to make sure only one disconnect gets the 230.70(B) marking through a positive Code rule.
PANEL ACTION: Accept in Part.
Revise text to Section 230-82(8) to read as follows:
(8) Transfer equipment installed in accordance with Sections 700-6, 701-7, and 702-6. A transfer switch installed under these provisions is not a service disconnect.
PANEL STATEMENT: The panel agrees with the statement that a transfer switch is not a service disconnect switch in this application.
The panel rejects the comment concerning field marking as only service disconnects are required to be marked. See panel action and statement on Comment 4-78.

4- 87 - (230-83 (New)): Reject
SUBMITTER: John M. O'Connor, North American Technologies, Inc.
COMMENT ON PROPOSAL NO: 4-135
RECOMMENDATION: Meter sockets shall be bypassed or jumpered only by a full rated Listed bypass or jumper. The bypass/jumper shall be enclosed by a Listed method which prevents access to live parts.
SUBSTANTIATION: In many instances meters are bypassed, often by non-code approved means, in order to provide temporary power on construction jobsites and power to homes and businesses until a meter is installed. If a bypass switch is used this can be done safely. However, most times it is jumpered in an unsafe manner which can be dangerous to the individual doing the work and is a shock hazard to others if not properly protected. Removal of non-Listed jumpers can also be hazardous to the meter installer when it is time for the meter to be installed. With the advent of utility deregulation there will be increased occurrences of jumpering and hazardous situations. By requiring Listed bypass/jumpers and integral covers, the industry will be safer for workers and users.
Listed metering assemblies with safe bypass means and integral covers are already commercially available.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes that the submitter was commenting on Proposal 4-134 and not Proposal 4-135. The panel reaffirms its rejection of this recommendation as the use of by-pass mechanisms is not an installation issue. This is a maintenance and service issue and the proposed language is unenforceable.

4- 88 - (230-90): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 4-135a
RECOMMENDATION: The Technical Correlating Committee directs the Panel to reword Exception No. 3 "in accordance with Article 220" to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
This is the final action on section 230-90. Section 230-90 shall read as follows:
230.90 Where Required. Each ungrounded service conductor shall have overload protection.
(A) Ungrounded Conductor. Such protection shall be provided by an overcurrent device in series with each ungrounded service conductor that has a rating or setting not higher than the allowable ampacity of the conductor. A set of fuses shall be considered all the fuses required to protect all the ungrounded conductors of a circuit. Single-pole circuit breakers, grouped in accordance wtih 230.71(B), shall be considered as one protective device.
Exception No. 1: For motor-starting currents, ratings that conform with 430.52, 430.62, and 430.63 shall be permitted.
Exception No. 2: Fuses and circuit breakers with a rating or setting that conform with 240.3(B) or (C) and 240.6 shall be permitted.
Exception No. 3: Two to six circuit breakers or sets of fuses shall be permitted as the overcurrent device to provide the overload protection. The sum of the ratings of the circuit breakers or fuses shall be permitted to exceed the ampacity of the service conductors, provided the calculated load does not exceed the ampacity of the service conductors.
Exception No. 4: Overload protection for fire pump supply conductors shall conform with 695.4(B)(1).
Exception No. 5: Overload protection for 120/240-volt, 3-wire, single-phase dwelling services shall be permitted in accordance with the requirements of 310.15(B)(6).
(B) Not in Grounded Conductor. No overcurrent device shall be inserted in a grounded service conductor except a circuit breaker that simultaneously opens all conductors of the circuit.
PANEL STATEMENT: By this action the panel complies with the NEC Style Manual. This action constitutes the final action and incorporates all actions on proposals and comments during this code cycle for Section 230-90.

4- 89 - (230-90(a)): Reject
SUBMITTER: Steven Worley, Worley Group Engineering
COMMENT ON PROPOSAL NO: 4-139
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: The panel statement requested these two articles be provided: ("Electrical Safety: Service Cables Unprotected" by Frederick F. Franklin, in the July 2000 issue of "American Society of Safety Engineers" and "Fire Hazards and Welding Action in Service-Entrance Conductors" by Richard S. Sanford in September/October 1982 issue of "IEEE Transactions on Industry Applications") which provide adequate technical substantiation that service entrance conductors need to be fully protected before they enter a residence. While the articles were written 18 years apart, they come to the same conclusion. Fires caused by inadequately protected service conductors can be dramatically reduced. The latest paper estimates a savings of 16 deaths and $45 million in property savings each year.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The comment to Proposal 4-139 carries significant impact to the code and long standing practices. No technical substantiation has been provided to support such a change. The information that has been provided is "opinion" without supporting data. We encourage the submitter to contact NFPA and other entities to see if such data can be developed.

4- 90 - (230-91(a)): Reject
SUBMITTER: Frederick F. Franklin, PACE Inc.
COMMENT ON PROPOSAL NO: 4-139
RECOMMENDATION: a. Replace "before the conductors enter the structure" with "at the utility transformer."
b. Replace "Outdoor, weatherproof fused disconnects or circuits breakers could be locked as long as the branch circuit devices, per Section 230-92, were accessible and of a smaller size than the outdoor main." with "Readily available cable fuses known variously as cable limiters or cable protectors shall be utilized for this purpose."
SUBSTANTIATION: a. I am an electrical engineer who has investigated over 2000 structure fires since 1970. Approximately one percent of all structure fires are caused by arcing in service cables. Many of these arcs occur in the service drop upstream from the power meter.
b. Circuit breakers were tried by one Indiana utility. They nuisance tripped and had to be removed. Cable fuses will not.
Note: Supporting material available for review upon request at NFPA headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: Part A of the recommendation is not under the purvue of the NEC per Section 90-2(B)(5).
Part B of the recommendation is a comment on the substantiation and is not accepted code.
See panel action and statement on Comment 4-89.

(Log #1369)

4- 91 - (230-212): Accept
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 4-150
RECOMMENDATION: Change new wording to read:
230.212 Over ~~15,000~~ 35,000 Volts. Where the voltage exceeds ~~15,000~~ 35,000 volts between conductors, which enter a building they shall terminate in a metal-enclosed switchgear compartment or a vault conforming to the requirements of 450.41 through 450.48.
SUBSTANTIATION: This change is recommended to make requirements for feeders and services between 15,000 volts and 35,000 volts equivalent. There is no basic difference between the protection methods at this voltage level, and therefore no technical justification for different rules. The rules for non-oil insulated transformers in 450-21, 450-23, 450-24, and 450-25 make the 450 Part C requirements effective for transformers over 35,000 volts.
PANEL ACTION: Accept.

ARTICLE 240 — OVERCURRENT PROTECTION

(Log #283)

10- 5 - (240-2):
Note: Based on Code-Making Panel 1's action on Comment 1-61, the Technical Correlating Committee directs that Comment 10-5 be reported as "Accept in Part". The Technical Correlating Committee further directs that the definition of "coordination" remain in 240-2.
SUBMITTER: James T. Dollard, Jr., IBEW Local Union 98
COMMENT ON PROPOSAL NO: 10-3b
RECOMMENDATION: Accept in principle Proposal 10-3b.
Revise as follows:
Continue to delete last paragraph of Section 240-12.
Delete the definition titled "Coordination" in the proposed new 240-2 Definitions.
SUBSTANTIATION: This comment is the work of a Task Group assigned to address the request of CMP 1 for response from CMP 10 on the panel action to accept Proposal 1-122. The Task Group consisted of the following members of CMP 10. Chair, Jim Dollard; John Brezan; Carl Fredericks; Clive Kimblin; Charles Eldridge; George Gregory; George Ockuly and Vince Saporita.
This Task Group is in agreement with the intent of CMP 1 to add a definition of "Coordination" to Article 100 and with the substantiation provided by the proposal submitter.
The net result of this comment and a companion comment to Proposal 1-122 is to remove the definition of "Coordination" from Article 240 and place it in Article 100.
The NEC Style Manual Section 2.2.2.1 mandates that "in general, Article 100 shall contain definitions of terms that appear in two or more other articles of the NEC".
As the substantiation for Proposal 1-122 clearly points out, this term "Coordination" is used in more than one Article of the NEC.
See companion comment to Proposal 1-122 developed by this Task Group.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
DOLLARD: I am voting Affirmative to the panel action to Accept Comment 10-5.
My comments are as follows:
As a note to the TCC, CMP-10 agreed that the definition of "Coordination (Selective)" should be relocated to Article 100. Relocating the definition required a modification, due to the global impact of moving it to Article 100. Section 2.2.2.1 of the NEC style manual requires that defined terms that appear in two or more Articles of the NEC be located in Article 100. CMP-1 has rejected a sister comment (1-62) submitted by a CMP-10 task group to modify the definition. CMP-1 voted 11 to 1 to include this definition in Article 100 in the ROP stage. CMP-1 voted to reject the modified definition in the comment stage.
The following information is offered for TCC review:
The proposed definition in comment 1-62 did not propose "restricting outages within equipment", as written in the panel statement on comment 1-62, but "restrict outages to the equipment affected", as CMP-1 had accepted in the ROP stage.
The addition of the term "overcurrent" to the definition, when moved to Article 100, does not represent a change due to the fact that all references to "coordination" outside of Article 240 also reference overcurrent protection.
The term "Coordination" exists in the 1999 NEC in five sections.
1. 230-95(c) FPN # 2. This FPN addresses "proper selective overcurrent protection coordination"
2. 240-12. 240-12. This section addresses, "Electrical System Coordination.
Where an orderly shutdown is required to minimize the hazard(s) to personnel and equipment,..." (As determined by the task group, the intent of this section will not be changed by including this definition in Article 100, as modified by comment 1-62, or leaving it as written on page 62 of the 2002 Draft).
3. 310-15(b) FPN. This FPN addresses ". Coordination with circuit and
system overcurrent protection.
4. 620-62. "Selective Coordination. Where more than one driving machine disconnecting means is supplied by a single feeder, the overcurrent protective devices in each..."
5. 685-2. Application of Other Articles. This is a cross-reference to 240-12.
In all locations other than 240-12 and the reference to 240-12 in 620-62, the term overcurrent is used to qualify the type of protection. 240-12 deals specifically with situations where "Where an orderly shutdown is required to minimize the hazard(s) to personnel and equipment...". 685-2 specifically references 240-12. The term "coordination" as used in 230-95(c) FPN # 2, 310-15(b) FPN & 620-62 does not reference 240-12, the intent in each of these sections is to provide coordination of overcurrent protective devices.
Overcurrent by definition does include overload.
As the TCC correlates the actions taken in the ROC please consider the following:
An action by the TCC to move the definition to Article 100 should be as modified by the task group.
An action by the TCC to leave the definition in Article 240 should be as written on page 62 in the 2002 Draft.

(Log #1140)

10- 6 - (240-2):

Note: The Technical Correlating Committee directs that this comment be reported as "Accept" to comply with 4.1.1 of the NEC Style Manual.

SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept.,

COMMENT ON PROPOSAL NO: 10-3b

RECOMMENDATION: Revise the panel action as follows:

Replace the words "this section" in the last sentence of the definition of "Tap Conductor" with "240.4."

SUBSTANTIATION: Now that the definition has been relocated from 240.3 into 240.2, the words "this section" are no longer appropriate. 240.2 does not describe conductor protection requirements. They are found in 240.4.

PANEL ACTION: Accept in Principle.

In the wording of the Comment, change "this section" to "this article".

PANEL STATEMENT: The panel action satisfies the intent of the submitter. Tap conductors are mentioned in several sections within this article.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #1893)

10- 7 - (240-2): Reject

SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers

COMMENT ON PROPOSAL NO: 10-3a

RECOMMENDATION: Reject this proposal.

SUBSTANTIATION: This is a safety issue. As written this proposal would allow for unlimited lengths of unprotected conductor to be run from an outside transformer to a panel as long as the conductor was considered "outside". This could completely eliminate switchgear on the secondary of the transformer. If a problem occurred with the main disconnecting means of one of the panelboards, the only available means to disconnect power would be on the medium voltage side of the transformer. As such it could encourage an electrician to work the circuit "hot". 90-4 gives the AHJ the authority to wave specific requirements to cover similar situations.

This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.

PANEL ACTION: Reject.

PANEL STATEMENT: The affirmative comment on Proposal 10-3a recognizes the Submitter's concerns. See panel action and statement on Comment 10-8. The safety issues addressed in the submitter's substantiation have been addressed in the panel action taken on Comment 10-8.

10- 8 - (240-2): Accept in Principle

SUBMITTER: James T. Dollard, Jr., Philadelphia, PA

COMMENT ON PROPOSAL NO: 10-3a

RECOMMENDATION: Delete the proposed definition and Revise the following sections as follows:

240-21(b) (5) Outside Taps of Unlimited Length. Where the conductors are located outdoors <u>or enter a building or structure from the outdoors in accordance with Condition No. 1 or Condition No. 2 of 230-6,</u> except at the point of <u>load</u> termination, and comply with all of the following conditions.

240-21(c)(4) Outside Secondary Conductors. Where the conductors are located outdoors <u>or enter a building or structure from the outdoors in accordance with Condition No. 1 or Condition No. 2 of 230-6,</u> except at the point of load termination, and comply with all of the following conditions.

240-92(c)(3) The tap conductors are installed outdoors <u>or enter a building or structure from the outdoors in accordance with Condition No. 1 or Condition No. 2 of 230-6,</u> except at the point of <u>load</u> termination.

SUBSTANTIATION: The proposed text in this comment does not represent new material. This text exists in my affirmative comment to proposal 10-3a in the ROP. I believe that this text will satisfy the intent of the Panel.

The Panels substantiation is to recognize a long-standing practice of allowing tap conductors, which originate outdoors to be treated as service entrance conductors where they enter a building or structure. Presently these conductors are not recognized as being "outside the building" when installed beneath a building or structure and covered by two inches of concrete. The existing language in the NEC clearly requires that the disconnecting means for the tap conductors in sections 240-21(b)(5), 240-21(c)(4) and 240-92(c) be installed at a readily accessible location either outside of a building or structure, or inside nearest the point of entrance of the conductors.

I believe that the Panels intent is to allow outside tap conductors in sections 240-21(b)(5), 240-21(c)(4) and 240-92(c)(3) to be considered as outside the building when entering a building or structure.

However I believe that trying to incorporate section 230-6 into Article 240 for this reason will create more problems than it will solve.

Section 230-6 as written is not a definition. As proposed this new definition contains requirements and is in conflict with section 2.2.2 of the Style Manual, which does not permit a definition to contain a requirement.

Section 230-6 is constantly subject to change outside of the jurisdiction of CMP-10. This cycle for example CMP-4 has accepted a proposal to recognize 18 inches of earth, without the concrete to be considered as outside the building.

Incorporating this proposed definition into Article 240 as written will also result in confusion, with installations and interpretations that are not the intent of the Panel on this proposal.

For example when we apply 240-21(c)(4) there is no requirement that the transformer be located outdoors, only the conductors. This definition as written in the draft would allow for service equivalent taps in many installations.

For example a one story commercial structure may have a 480-volt service which terminates in a fused disconnecting means inside of the building. A transformer is installed on the load side of this disconnecting means to provide a 120/208-volt system. The secondary of this transformer could now have any number of tap conductors provided they meet the requirements of 240-21(c)(4). This transformer is indoors but the conductors would be considered as outside the building if they are beneath the building and under two inches of concrete. This will result in any number of service equivalent taps throughout the building. This will represent a serious safety hazard to all of those persons who will service and maintain the electrical system.

The word "load" is used to clearly point out that these tap conductors receive their supply outdoors and are terminated indoors on the load end of the tap conductors only.

PANEL ACTION: Accept in Principle.

Revise the present code text to read as follows:

240-21(b)(5) Outside Taps of Unlimited Length. Where the conductors are located outdoors of a building or structure, except at the point of load termination, and comply with all of the following conditions.

a. (No Change)

b. (No Change)

c. (No Change)

d. The disconnecting means for the conductors is installed at a readily accessible location complying with one of the following:

(1) Outside of a building or structure.

(2) Inside, nearest the point of entrance of the conductors.

(3) Where installed in accordance with 230-6, nearest the point of entrance of the conductors.

240-21(c)(4) Outside Secondary Conductors. Where the conductors are located outdoors of a building or structure, except at the point of load termination, and comply with all of the following conditions.

a. (No Change)

b. (No Change)

c. (No Change)

d. The disconnecting means for the conductors is installed at a readily accessible location complying with one of the following:

(1) Outside of a building or structure.

(2) Inside, nearest the point of entrance of the conductors.

(3) Where installed in accordance with 230-6, nearest the point of entrance of the conductors.

240-92(c) Outside Feeder Taps. (No change)

1. (No change)

2. (No change)

3. The tap conductors are installed outdoors of a building or structure, except at the point of load termination.

4. (No change)
5. The disconnecting means for the conductors is installed at a readily accessible location complying with one of the following:
(1) Outside of a building or structure.
(2) Inside, nearest the point of entrance of the conductors.
(3) Where installed in accordance with 230-6, nearest the point of entrance of the conductors."

PANEL STATEMENT: The revised language meets the intent of the submitter. The panel has expanded the change to include all provisions of Section 230-6.

10- 10 - (240-2- Conductors Considered Outside the Building (new)): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 10-3a
RECOMMENDATION: The proposal should be accepted in principle in the manner suggested in the affirmative comment on vote, however, in each case (three times) the reference should be to all of Section 230.6.
SUBSTANTIATION: As the submitter of rejected 1999 Proposal 10-68, I should probably refrain from comment, since Proposal 10-3a, from the entire panel no less, accomplishes exactly what it refused to do in 1999. The affirmative comment is correct, and squarely in accordance with the Style Manual command that definitions not contain rules. The accepted term is, to all intents and purposes, styled as a rule and so intended. My only quibble with the affirmative comment is that it only includes two conditions in 230.6. This comes from 695.6(A), of which I am also the author. That section, in Chapter 6, addresses a unique need to protect fire pump conductors from an already burning building, and a transformer fire in a vault will incinerate those conductors. Article 240, like most in the NEC, aims at the reverse condition, namely to protect building from occurrences in the wiring, and both Code-Making Panel 4 and 10 have long recognized that wiring in a vault is adequately protected. For example, the waiver from the 10 times ratio for the 10-ft tap rule applies not just to within equipment, but also within vaults. Therefore, the reference to all of Section 230.6 is appropriate. It also resolves the correlation issue identified by the Technical Correlating Committee.

(Log #399)

10- 12 - (240-3): Accept in Part
Note: The Technical Correlating Committee understands that 240-4(B)(2) in Item G of the Panel Action becomes 240-5(B)(2) with the new numbering accepted in Proposal 10-3b.
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 10-4
RECOMMENDATION: Accept in Principle revised:
PROTECTION OF CONDUCTORS. Ungrounded conductors, other than flexible cords, flexible cables, and fixture wires shall be protected against overcurrent in accordance with their amapcities as specified in ~~Section~~ 310-15 unless otherwise permitted or required in (a) through (g), ~~below~~.
(a) no change
(b) DEVICES RATED 800 AMPERES OR LESS. ~~The next~~ A higher ~~standard~~ overcurrent device rating or setting (above the ampacity of the conductor being protected) shall be permitted to be used provided all the following conditions are met.
(1) No change
(2) No change
(3) The ~~next~~ higher ~~standard~~ rating or setting selected does not exceed the next higher standard rating and 800 amperes.
(c) DEVICES RATED over 800 amperes. Where the overcurrent device is rated rating or setting is over 800 amperes, the ampacity of the conductors shall be ~~equal to or greater~~ not less than the rating or setting of the overcurrent device, as defined in Section 240-6.
(d) No change
(e) TAP CONDUCTORS. Tap conductors shall be permitted to be protected against overcurrent in accordance with 210-19 (c) and (d), 240-4(b)(2) 240-21, 364-11, and 430-53(d).
(f) No change
(g) No change

SUBSTANTIATION: Article 400 is titled "Flexible Cords and Cables"; the cables of the proposal are intended to apply to those cables, not Types AC, MC, MI, NMSC, etc.
The proposal does clarify (b); it includes settings of adjustable over current devices and permits a higher rated device which may be less than the next higher standard rating, and maintains the 800 ampere limit. Experienced inspectors generally permit this. The literal text permits a conductor with an ampacity of 180 amperes to be protected at 200 amperes, but not 190 amperes, which is not a "standard" rating. What is the rationale? A similar proposal ROP 12-76 has been accepted.
Proposed (c) includes "or setting" for adjustable devices and "not less than" per Code Style Manual.
The conductors covered in 240-4(b)(2) are tap conductors and should be included in (e) for correlation between the first paragraph and 240-4(b)(2).

PANEL ACTION: Accept in Part.

In the wording of the comment, the panel takes the following actions:

A. The panel does not accept the addition of the word "Ungrounded".

B. The panel accepts the inclusion of the words "flexible cables".

C. Deletion of the word "Section" is unnecessary.

D. No action is required on deleting the word "below" because it does not presently exist in the first paragraph of 240-3.

E. The panel rejects the proposed changes to subsection (b).

F. The panel rejects the proposed changes to subsection (c).

G. In subsection (e), the panel continues to accept the words "(c) and" and editorially accepts the addition of the reference to 240-4(b)(2).

PANEL STATEMENT: A. Adding the word "Ungrounded" is technically incorrect. Section 240-3 addresses protection for all conductors in accordance with their ampacities. Also, 430-36 permits the use of an overcurrent device in the grounded conductor.

B. The panel agrees with the submitter.

C. The word "Section" will be deleted throughout the NEC by NFPA staff for the 2002 Code.

D. The word "below" does not presently exist in Section 240-3.

E. 240-3(b) addresses maximum overcurrent protection. Values below the maximum allowable overcurrent protection are already permitted.

F. The proposed changes do not improve clarity.

G. Editorial.

(Log #1387)

10- 13 - (240-3(c)): Reject

SUBMITTER: Kari Barrett, American Chemistry Council

COMMENT ON PROPOSAL NO: 10-6

RECOMMENDATION: The panel should have Accepted the proposal in Principle in accordance with the Explanation of Negative Vote given by Mr. Fredericks. The proposed text for Exception No. 1 should have been revised to:

Exception No. 1: The next higher available size of overcurrent device shall be permitted to be used, where its rating as defined in Section 240-6 is not more than 5% above the allowable conductor ampacity.

SUBSTANTIATION: Technical substantiation to accept this in principle is found in existing successful NEC practice that allows the use of the next larger overcurrent protective device for devices up to 800 amperes. For these sizes, the NEC already allows conductors to be protected at up to 18% above their allowable ampacity. The panel did not provide any reason why some form of this practice should not be permitted above 800 amperes.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel would require additional data in order to determine whether or not the termination points of the smaller conductors would create a heat problem to interfere with the proper operation of the overcurrent protective devices.

No technical justification has been supplied for the change other than the comparison to overcurrent protective devices 800 amps or less.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9

NEGATIVE: 3

EXPLANATION OF NEGATIVE:

ELDRIDGE: This Comment should have been Accept. By making this change, a 1600-ampere service could be wired with four sets of 500kcmil, Cu, 75oC wire. This was done for years without any problems and no problems have been encountered for the 800 amperes or less, as permitted now in section 240-3(b). Of course, all the other Code provisions would have to be followed. This would permit a considerable cost savings without sacrificing safety.

FREDERICKS: I'm voting against the panel action. As stated in the comment, the NEC already allows conductors below 800 amperes to be protected at the next standard device rating, effectively allowing these conductors to be protected at up to 18% above their allowable ampacity. This practice has proven successful in many thousands of NEC installations and in years of practice. This successful practice is with conductors that are smaller and heat more quickly than those above 800 amperes. Also, the overcurrent protective device is smaller and more sensitive to the wire size below 800 amperes.

It would seem that if anything, there would be more technical merit in restricting the smaller devices and conductors, but again long successful practice and experience supports the existing latitude given in 240-3.

There is no technical reason to disallow the modest 5% allowance for conductors above 800 amperes. I believe research would prove that this change would not result in any potential operation of overcurrent devices with smaller conductors than their UL 489, etc. testing than already happens below 800 amperes. Or for larger devices, than with different conductor ampacities that are already allowed under existing rules. It seems most likely to me that the only reason for the existing code text is to respect larger standard device size jumps above 800 amps, which this Comment has addressed.

As a minimum, the panel should consider a task group to further explore this issue during the next code cycle.

MUNSON: I am voting negative against the panel action. I support the comments of Mr. Eldridge and Mr. Fredericks in their negative vote against the original Proposal 10-6. This proposal should have been an accept in principle.

COMMENT ON AFFIRMATIVE:

DOLLARD: I am voting Affirmative to the panel action to Reject Comment 10-13.

My comments are as follows:

The principle suggested in this comment has merit and deserves further consideration. However as pointed out in the panel statement, data is needed to address the concerns of additional heat created by a reduction in circular mill area of conductors. Inclusion of this concept for overcurrent devices up to 1600-amps (and if possible larger) should be accompanied by additional standard sizes to be included in 240-6.

(Log #1721)

10- 14 - (240-3(c)): Reject

SUBMITTER: Don Ganiere, Ottawa, IL

COMMENT ON PROPOSAL NO: 10-6

RECOMMENDATION: Accept this proposal in principle.

SUBSTANTIATION: The panel should give more consideration to the comments of Mr. Eldridge and Mr. Fredericks. Protecting circuits over 800 amps within 5% of the conductor ampacity would be at least as safe as allowing circuits under 800 amps to be protected at 15% above the conductor ampacity.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and statement on Comment 10-13.

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

FREDERICKS: See my Explanation of Negative vote on Comment 10-13.

MUNSON: I am voting negative against the panel action. See my explanation of negative vote on Comment 10-13.

COMMENT ON AFFIRMATIVE:

DOLLARD: See my Comment on Affirmative Vote on Comment 10-13.

(Log #419)

10- 15 - (240-4): Accept in Principle in Part

SUBMITTER: Dan Leaf, Palmdale, CA

COMMENT ON PROPOSAL NO: 10-14

RECOMMENDATION: Accept in Principle revised:

PROTECTION OF FLEXIBLE CORDS, FLEXIBLE CABLES and FIXTURE WIRES. Flexible cords and cables as covered in Article 400, including tinsel cords and extension cords, and fixture wires shall be protected against overcurrent by either (a) or (b).

(a) Flexible cords and cables shall be protected by an overcurrent device in accordance with ~~its~~ their ampacity as specified in Tables 400-5(A) and (B). Fixture wires shall be protected against overcurrent in accordance with their ampacities as specified in Table 402-5.

(b) BRANCH CIRCUIT OVERCURRENT DEVICE. Flexible cords and fixture wires shall be permitted to be protected by the branch-circuit overcurrent device in accordance with (1), (2), or (3) ~~one of the methods described below.~~

(1) No change
(2) No change
(3) No change

(c) PERMANENTLY CONNECTED. Where permitted to be permanently connected as branch-circuit or feeder conductors, flexible cords and cables shall be permitted to be protected in accordance with 240-3 (a), (b), and (g) as applicable.

SUBSTANTIATION: Tables 400-5(a) and (b) cover flexible cord and cables, which should be covered in the text. Since (b)(2) covers fixture wires it should be noted in the first paragraph of (b).

Since there are no sections in Articles 364, 430, 502, 503, 553, 555, 610, 620, 668 (where permanent connections are permitted) which specifically modify 240-4(a) the provisions of 240-3(a), (b), and (g) cannot be used. The next higher standard OPD rating cannot be used, for example, where a portable power cable supplies a floating building and has an ampacity which doesn't match standard ampere ratings of fuses and breakers.

A permanently connected flexible cord with an ampacity of 15, for a 460-volt 3-phase 7 1/2 HP motor would comply with 430-32 but if the motor is protected at 300 percent the flexible cord would be in violation of 240-4(a).

PANEL ACTION: Accept in Principle in Part.

The panel takes the following actions:

A. The panel accepts the addition of the words "Flexible Cables" in the title as shown in the comment.

B. The panel accepts in principle the submitter's suggested wording and revises the first sentence of existing 240-4 to read as follows:

"Flexible cord and flexible cable including tinsel cord and extension cords, and fixture wires shall be protected against overcurrent by either (a) or (b)."

C. The panel accepts in principle the proposed change to (a) as shown in the comment to read as follows:

"Flexible cord and flexible cable shall be protected by an overcurrent device in accordance with their ampacity as specified in Tables 400-5(A) and (B)." The remainder of (a) remains unchanged.

D. The panel does not accept the changes to (b) or the addition of (c) as shown in the comment.

PANEL STATEMENT: A. Editorial.

B. The panel action meets the intent of the submitter.

C. The panel action meets the intent of the submitter.

D. No technical substantiation has been provided for the proposed change in (b). Proposed (c) is redundant and is already covered in 240-4(a) which refers to Tables 400-5 (A) and (B).

The panel disagrees with the last paragraph of the submitter's substantiation because he limited his concern to the short-circuit protection only, and did not consider overload protection of the cord or cable provided by thermal protection or other means that may be part of the motor design.

(Log #910)

10- 16 - (240-4(b)):

Note: The Technical Correlating Committee directs that Comments 10-16 and 10-17 and Proposal 10-15 be reported as "Hold". Based on the comments on the voting, it is clear that the panel does not have consensus on the intent of the revision. The Technical Correlating Committee notes that Mr. Brezan's comment on voting indicates that he changed his vote to affirmative contingent on Mr. Dollard's rewrite in his voting comment being accepted. However, the Technical Correlating Committee had no indication that the material proposed by Mr. Dollard has the consensus of the panel or represents the panel's intent. Due to the significance of the issue and the lack of a clear consensus, the Technical Correlating Committee is holding the material so that a full and complete review by the public and the panel can occur.

SUBMITTER: David A. Kerr, Jr., Friendsville, PA
COMMENT ON PROPOSAL NO: 10-15
RECOMMENDATION: Accept.

SUBSTANTIATION: The proposers, Mr. Dollard and Mr. Ockuly are right. Many fires are caused by cords and equipment that are barely protected. By 15 and 20 ampere branch circuit OCPD. Branch/feeder AFCI only provides minimal protection beyond the receptacle. The actual price at a local store is $38. British fused plugs would be a tiny fraction of the price and do a far better job. Other devices exist. Deletion of 1 and 3 might have truly massive effects in improving electrical safety. AFCI may not work and will probably get some inspector killed when people find out how expensive it is.

PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8
NEGATIVE: 4

EXPLANATION OF NEGATIVE:

FREDERICKS: See my Explanation of negative vote on Comment 10-17.

KIMBLIN: See my Explanation of Negative vote on Comment 10-17.

MUNSON: I am voting against the panel action. See my Explanation of Negative vote on Comment 10-17.

ZAPLATOSCH: The proposal to delete 240-4(b)(1) and (b)(3) would require that all appliance and portable lamp power supply cords as well as extension cord sets (1) be protected against overcurrent at their ampacity per 240-4(a), or (2) have the size of the conductors increased such that they are protected by the branch circuit protective device. This action would necessitate UL to propose revisions to all product standards involving cord- and plug-connected appliances, portable lamps, and extension cords. Most products that currently do not have supplemental overcurrent protection would need to be redesigned to incorporate additional protection.

Substantiation was provided to the panel in the form of news service clippings. Although these reported incidents identified events involving cords, sufficient detail of the cord construction, age of the cord, and failure mechanism was not provided. It cannot be concluded from the substantiation that supplemental overcurrent protection would prevent these incidents.

COMMENT ON AFFIRMATIVE:

BREZAN: See my comment on affirmative vote on Comment 10-17.

BORTHICK: I believe the intent of the panel in removing 240-4(b)(1) and (3) is to remove from the NEC what is essentially a set of product standards.

240-4(b)(1) and (3) has generally been unenforceable by inspection authorities in the field and instead compliance has been via listing and labeling by testing agencies such as UL. Special variances, albeit based on extensive testing and/or other technical substantiation, are a product standards issue and do not belong in the NEC. Deletion of these sections from the NEC should allow UL and the other testing agencies to revise their product standards thus allowing acceptance of safe products that meet current safety criteria and also to expand aceptance to those products that include emerging technologies such as arc-fault circuit interrupters.

I agree with Mr. Dollard's comments on affirmative vote. I would ask, however, does his proposal to modify 240-4 contain replications of provisions that are set forth in Articles 90, 100, and 110?

DEATON: The intent of the panel was that protection requirements for flexible appliance cords and flexible extension cords be covered by the appropriate product standards and listing requirements. The revised text that accompanied the panel action, however, has been taken to imply that 240-4 specifically requires all such cords to be protected at their ampacities, which is a totally different meaning. Mr. Dollard has proposed text for 240-4 which clears up the matter. The text is repeated here:

240-4. Protection of Flexible Cords, Flexible Cables, and Fixture Wires.

(a) Flexible Cord, Flexible Cable, and Tinsel Cord. Flexible cord, flexible cable, and tinsel cord shall be protected by an overcurrent device in accordance with its ampacity as specified in Tables 400-5(A) and (B).

Exception No. 1: Flexible cords, flexible cable, and tinsel cord approved for and used with specific listed appliances or portable lamps.

Exception No. 2: Flexible cord used in listed extension cord sets.

(b) Fixture Wires. Firxture wires shall be protected against overcurrent in accordance with their ampacity as specified in Table 400-5.

Exception: Fixture wire shall be permitted to be tapped to the branch circuit conductor of a branch circuit of Article 210 in accordance with the following:

20-ampere circuits - 18 AWG 15.2 m (50 ft) of run length.
20-ampere circuits - 16 AWG 30.5 m (100 ft) of run length.
20-ampere circuits - 14 AWG and larger.
30-ampere circuits - 14 AWG and larger.
40-ampere circuits - 12 AWG and larger.
50-ampere circuits - 12 AWG and larger.

(c) Supplementary Overcurrent Protection. Supplementary overcurrent protection as in Section 240-10 shall be permitted to be an acceptable means to provide this protection.

DOLLARD: I am voting affirmative on the panel action to accept comment 10-16.

My comments are as follows:

It was the consensus of Panel 10 to remove 240-4(b) (1) and (3) from the text of 240-4. However, after removing this material the remaining text of 240-4 infers that flexible cords for appliances and extension cords must be protected at their ampacities.

This is not the intent of the Panel. Rather it is the desire of the Panel that protection requirements for appliance cords and extension cords be covered by the appropriate product standards and associated listing requirements.

The TCC is requested to modify the text in 240-4 as follows to meet the exact intent of the Panel:

240-4. Protection of Flexible Cords, Flexible Cables, and Fixture Wires.

(a) Flexible Cord, Flexible Cable, and Tinsel Cord. Flexible cord, flexible cable, and tinsel cord shall be protected by an overcurrent device in accordance with its ampacity as specified in Tables 400-5 (A) and (B).

Exception No. 1: Flexible cord, flexible cable, and tinsel cord approved for and used with specific listed appliances or portable lamps.

Exception No. 2: Flexible cord used in listed extension cord sets.

(b) Fixture Wires. Fixture wires shall be protected against overcurrent in accordance with their ampacity as specified in Table 402-5.

Exception: Fixture wire shall be permitted to be tapped to the branch circuit conductor of a branch circuit of Article 210 in accordance with the following:

20-ampere circuits – 18 AWG 15.2 m (50 ft) of run length
20-ampere circuits – 16 AWG 30.5 m (100 ft) of run length
20-ampere circuits – 14 AWG and larger
30-ampere circuits – 14 AWG and larger
40-ampere circuits – 12 AWG and larger
50-ampere circuits – 12 AWG and larger

(c) Supplementary Overcurrent Protection. Supplementary overcurrent protection as in Section 240-10, shall be permitted to be an acceptable means for providing this protection.

JHONSON: I agree with Mr. Dollard's comment on affirmative.

OCKULY: I am voting in the affirmative; however, the resulting text in 240-4 after removing subsections 240-4(b)(1) and (3) may be misleading. I believe the intent of the panel was to require product standards, not the NEC to address the protection, suitability and proper use of appliance cords and extension cords. I support the proposed language to modify the text of 240-4 as suggested by Panel Chairman James Dollard and contained in his comment and reasons on affirmative vote. Mr. Dollard's proposed text clarifies the intent of the changes discussed by the panel members during the ROC meeting in Phoenix in December 2000.

(Log #1793)

SUBMITTER: Vincent J. Saporita, Cooper Bussmann

COMMENT ON PROPOSAL NO: 10-15

RECOMMENDATION: Panel 10 should accept this proposal.

SUBSTANTIATION: Protection of appliance and equipment power cords is a product standards issue. The NEC should not interfere with requirement that are inherently part of the product safety standard.

Twice, the panel statement refers to inadequate substantiation. Per the panel's request, substantiation in the form of two clipping services is provided. The first from 1981 is strikingly similar to the one recorded earlier this year. Both clipping services recorded reported fires that were started by various types of cords. In the three month period from April through June 1981, there were 60 fires reported to have been started by electrical cords. Almost 20 years later, from May through July of 2000, there were 63 similar fires reported. Unfortunately it appears that we have done little as an industry to prevent these types of fires. It is quite obvious that the existing practices are not working. Something needs to be done and AFCI's are a good start, but they do nothing for the millions of existing homes. By removing this long standing erroneous practice of assuming protection for small conductors from the NEC, the determination of "product safety" will rest with UL, where it belongs. the NEC has no business writing requirements for products that are not part of the fixed wiring system. Let UL write the rules on product safety.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 8
NEGATIVE: 4

EXPLANATION OF NEGATIVE:

FREDERICKS: I don't believe the panel action will result in what the majority of the panel was hoping to achieve, The panel action should be reconsidered, perhaps by a task group during the next Code cycle.

What I heard during the panel meetings was that a majority of the panel wanted to remove listed appliance and extension cords from the scope of the NEC and let the product standards organizations determine what the safety requirements for these cords should be. I tend to accept this idea in principle myself, though the ramifications of such a major change should be considered very carefully first.

There was also an expressed hope at the panel meetings that further testing and product development would result in long-term improvements to the safety performance of these cords. The goal of moving the requirements for these cords to the listing agencies was also stated as the commenter's intent.

However, this transfer of cord requirements to the product standards organizations is not what the comment, and the panel action in accepting it, has really accomplished. The proposal left the first sentence of 240-4 intact, which results in effectively requiring that all cords be protected at their NEC ampacity, including protection by a supplementary overcurrent device, such as a fuse or a thermal overload. Whether or not that text is enforceable by inspectors, it should be considered that the product standards organizations may not ignore this new NEC requirement in future listing requirements. In fact, their historical performance suggests that they would follow the NEC as a minimum. So the proposal has not removed overcurrent protection requirements for cords from the scope of the NEC. It has in fact added new and unsubstantiated requirements, which the product standards organizations would undoubtedly feel required to follow. Conscientious code users would likely also follow this NEC requirement, whether or not they were required to by inspectors. I think it is also very possible that some makers of supplemental overcurrent protection would use the new code text to actively push for the above two effects.

The substantiation provided with the comment, consisting of newspaper quotes stating the alleged causes of a limited number of fires, did not have any statistical merit or contribute any new technical information. All it established is that cords continue to be associated with certain fire losses, which is already a well known fact. However, statistics quoted by the industry show a dramatic decrease in cord-related fires, over 40% in the last five years.

This is in the face of a significant increase in residential electricity usage, and a dramatic expansion of extension cord usage that has accompanied the rapid proliferation of home electronics and continued expanded usage of other home electrical devices.

It seems clear that earlier NEC requirement changes (which have been followed by UL) and other improvements undertaken by the cord manufacturers have already had a dramatic impact in improving fire safety, even though many cords that do not meet present NEC and UL requirements are still in use.

Also, neither the original submitter nor the commenter provided any evidence that fusing present NEC-compliant cords at their ampacity will have any measurable safety benefit. Any safety benefit from fusing a damaged cord at its NEC ampacity seems doubtful, since the proposed new requirements could be met with a 13 amp fuse (or even a 13 amp thermal overload device) for a #16 cord. The substantiation provided with the earlier AFCI proposals demonstrated that branch circuit overcurrent devices as small as 15 amps cannot begin to protect against fires caused by low-level arcing faults involving these cords. Based on the data presented, it seems very doubtful that this situation will be any better with protection at 13 amps. Also, no evidence was provided that an intact cord is not already protected by the existing rules.

So to summarize, we have no evidence that the proposal improves fire safety at all for either damaged or intact cords. This could be an enormously expensive change, and it has not been supported with any technically substantiated safety benefit, so I am voting against it.

If the panel wishes to leave these cords out of the NEC, it should consider modifying the rest of 240-4 to fully effect this. If the panel instead really wishes to require that these cords be protected at

their NEC ampacity, it should first look for technical substantiation that proves a commensurate safety benefit.

If this proposal continues to pass, a TIA should be undertaken to correlate the code text vs. the majority of the panel's intent.

KIMBLIN: The substantiation provided seems to indicate that misuse of or physical damage to cords cause problems but does not substantiate an issue with the ampacity of cords. NEMA is opposed to the panel action. The panel has acted on anecdotal substantiation without consideration of the past changes that have been made to address protection of cords. During the processing of the 1984 NEC, an Ad-Hoc Committee on Control Circuit Protection was formed. This committee investigated the same type of data that was presented to Code-Making Panel 10. After much discussion, and an extensive Fact-Finding study, revisions were incorporated into the NEC. After much deliberation by the Code-Making Panel, revisions were made to 240-4 that are basically reflected in the present language.

Appliance and Portable Lamp Cords. The Ad-Hoc committee found, after investigating the field incidents, that the appliance cords rated #18 AWG and larger are appropriately protected by the 20A overcurrent device. Appliances and portable lamps are a known load on the cord so overload is not of a concern. Proper short-circuit protection of the cord is afforded by the 20A branch circuit overcurrent device. The committee acknowledged at that time that arcing faults may not be protected by the branch overcurrent device, but also acknowledged that supplemental protection at the cord ampacity would not address those arcing faults either.

Extension Cords. The Ad-Hoc committee noted that there was an issue with overloading of extension cords. This led to the change that required that extension cords be a minimum of #16 AWG and also led UL to eliminate the use of type SPT-1 cords. They noted that most of the field data involving alleged fires were using #18 AWG SPT-1 cord. Code-Making Panel 10 has not been presented any data to indicate that the field problem still exists with the minimum #16AWG and the use of type SPT-2 cord. In effect, Code-Making Panel 10 has analyzed the same data as the Ad-Hoc committee did in the early 1980's and has imposed a remedy without consideration of the earlier changes.

It was mentioned at the panel meeting that code language should be enforceable. Enforceability is not limited to the field inspector. The code does influence requirements in the product standards, particularly at the interface point between the infrastructure wiring and items such as appliances. The present language is enforced through appropriate coordination of the product standards. NEMA contends that the real issue at hand is one of consumer education. In order to raise public awareness about the dangers of misuse and abuse of extension cords, UL in 1995 upon a recommendation from NEMA, instituted requirements in the cord set and power-supply cord product standard UL 817, for warning tags for all general-use extension cords. These tags warn consumers not to use damaged cords, not to plug more than the specified number of watts into a cord, not to run a cord through doorways or ceilings, to fully insert the plug, as well as numerous other important warnings. Has the public benefited from these warning tags? Since 1995, electrical cord fires, according to CPSC statistics, were reduced from 3700 in 1995, to 2500 in 1996, to 2200 in 1997, that last year for which data were available. This represents a 41% decrease in this time span, the largest decrease of any of the causes of fire associated with electrical distribution equipment that are categorized.

With respect to Mr. Dollard's Comment on Affirmative that appeared during the recirculation of ballots, the TCC should consider that the suggested code changes in that Comment introduce new material. In particular, if this new material is necessary to complete the code change as envisaged by the majority of the panel, then the TCC should Reject or at least Hold Comments 10-16 and 10-17. Thus, Mr. Dollard, in his Comment on Affirmative, has requested that the TCC modify the overall text of 240-4 to meet the intent of the Panel. He states that the present code changes infer that flexible cords for appliances and extension cords must be protected at their ampacities and that this is counter to the panel's intent. However, the original proposal, number 10-15 by Randall Kirkman of Energy, IL, dealt solely with the deletion of items (1) and (3) from 240-4(b). The intent was indeed to require protection of small cords at their ampacity. As with Proposal 10-15, Comments 10-16 and 10-17 solely request deletion of items 240-4(b)(1) and 240-4(b)(3). Mr. Dollard's request to the TCC in his Affirmative Comment, however, is to make additional code changes, not sanctioned word for word by the panel, to bring the code language into line with the commentor's intent rather than the proposer's intent. The significant code language changes in Mr. Dollard's Affirmative Comment are considered inappropriate at this stage of the panel decision making process. These suggested code changes have not received thorough discussion at either the Proposal or Comment Code Panel Meetings.

MUNSON: I am voting negative against the panel action. The panel action to prohibit the tapping of appliance and lamp cords of 18 and 16 AWG and extension cords of 16 AWG to the premises wiring system will force a redesign of virtually every consumer cord connected product, and in addition, a number of permanently connected products as well.

Comment 10-17 presented documentation to support the original Proposal 10-15. The documentation is from news clipping services. The reports do not represent any forensic evaluation by experts, nor do they give any final outcome of the event. Yes, there were reported loss. The raw undocumented reports had language such as "damaged cords, frayed wires, thought to have started in, may have started, etc."

In looking at the documentation, it describes 60 fires for a reporting period in 1981, and 63 fires for a similar reporting period in 2000. Given the enormous increase in the use of appliance cord sets for computers, printers, scanners, power tools, etc, since 1981, it would indicate that the fires attributed to extension cords and appliance cords have actually declined.

One reason for the reduction in fires is that extension cords and cordsets have been steadily improved over the last 19 years. Today there is more use of double insulated extension cords and appliance cordsets. There has been a significant improvement in the parallel conductor (ripcord) cords used in lamps and small appliances. Extension cords come with a label warning about misuse.

Let's look at some of the implications of the panel's action. First, the obvious solution, where possible, is to attach a 14 AWG cord to all cord connected appliances and lamps and only produce 14 AWG extension cords. There will still be fires from abused, frayed or damaged cords. Unfortunately, adding a 14 AWG cord set to the appliance is not as simple as it seems. Section 240-4(b)(1) and (3) permitted an 18 and 16 gauge wire to be protected by a 20 ampere OCPD. Within the appliance, there will be 18 and 16 gauge wiring to the various components. This wiring is "tapped" to the 14 AWG appliance cordset. For example, a clothes washer may have 16 gauge wire to the motor and 18 gauge wiring to the valves and controls. These wires will have met all of the current product tests for safety; however, since the NEC no longer permits these wires to be protected by 20 ampere OCPDs the smaller wiring will be required to have additional overcurrent protection. The protection will have to be rated for branch circuit not supplemental since the permissive language that was in 240-4(b)(1) and (3) that permitted the tap, has been removed from the NEC. The obvious solution then is to wire all appliances with 14 AWG wiring. The problem not all motors, valves, printed circuits can be terminated to a 14 AWG wire.

In the substantiation to the original Proposal 10-15, the author suggested that the AFCI would be added to appliances, lamps and extension cords. While the work done to develop the AFCI was remarkable and represented a real breakthrough in being able to detect an arc signature, it is unclear if the product, in its present form, will work on all appliances, extension cords and lamps. The AFCI will have to be rated as branch circuit overcurrent protection for 18 and 16 AWG wiring not supplemental protection, since Code-Making Panel 10 no longer permits these taps.

If we accept the belief that the issue is about failures of extension cords and appliance and lamp cordsets, and not an attempt to sell some plug end product by legislation, the panel needs to set up a task group to examine cord usage and write appropriate code language that will promote safe applications. One size may not fit all.

ZAPLATOSCH: See my explanation of negative vote on Comment 10-16.

COMMENT ON AFFIRMATIVE:

BREZAN: I would like my change my vote on Comment 10-17 from negative to affirmative contingent on the comment on the affirmative received from the Panel Chair, James Dollard. In my original comment on Comment 10-17, I stated that I felt the panel was moving in the right direction, but it required additional language to prevent a serious problem for the manufacturing industry. I believe the correction to Article 240, as presented by Mr. Dollard, will remove the impression the panel wanted fuses installed in the cords. With this clarification by Mr. Dollard, I feel the panel's intent will be properly worded. This will also remove the part that is not enforceable by the inspection community.

BORTHRICK: See my comment on affirmative vote on Comment 10-16.

DOLLARD: See my Comment on Affirmative Vote on Comment 10-16.

DEATON: See my Comment on Affirmative Vote on Comment 10-16.

ELDRIDGE: By making this change, an unenforceable provision is removed from the National Electrical Code, and the premises wiring system. The requirements for protection are now placed in the hands of a third party such as UL to evaluate. Appliance cords and extension cords will have to meet whatever product standards the third party develops and has evaluated for the continuing safety of homes and businesses.

It is without question that smaller extension cords and some appliance cords are still causing fires even though the smallest (#18) has been eliminated. The reason for the elimination of the provision in (1) and (3) is to throw the safety of these cords into the hands of the product standards. The panel is very concerned with the safety in residential occupancies and the unenforceable provisions. Most of the extension cords and appliance cords are used in dwelling units and that is where most fatal fires occur. Deletion of (1) and (3) will not affect commercial and/or industrial machinery and equipment.

Since most dwelling unit fires start past the receptacle, the new AFCI devices will be a tremendous help in stemming these fires. However, older homes have very few receptacles in comparison to the new ones – sometimes just a single receptacle in a bedroom. This demands the use of extension cords just to be able to use the home. Of course the proper solution is to install a permanent receptacle where it is needed. I think we all know that is not done in most cases.

This action is causing a big stir in the extension and appliance cord industry. This is understandable since they cannot just make their cords, sized for the load and the National Electrical Code,, and just plug them into the nearest receptacle.

The prime reason given to me for not doing this at this time is the requirement given in 240-4 "Flexible cord, including tinsel cord and extension cords, and fixture wires shall be protected against overcurrent by either (a) or (b)." Since (1) and (3) are being removed, only (2) remains and doesn't apply to flexible cord and extension cord, the main rule then must be applied. The main rule would then require that (a) would be the only means of protection for flexible cords and extension cords. This would require protection in accordance with Tables 400-5(A) and would require an overcurrent device inserted in every plug to comply.

I agree the wording can be interpreted in that manner; however, it is the panel's intent that the product standards be written to indicate what is safe for a particular cord. If a product is used in a manner consistent with its listing and labeling, it is Code compliant. I also believe the insertion of overcurrent devices in cords will not reduce fires. The insertion of AFCI type devices will reduce fires, however. It also needs to be said that no single device will protect from all fires due to cords.

Modern flexible appliance and extension cords are much safer than the older cords that would dry out and the insulation break when the cord was flexed. The insulation materials are thicker, more pliable, and longer lasting. The conductor size is larger or protected by supplementary OC protection or the load.

I believe this will cost the residential consumer as one of several actions is implemented for all new extension cords and some appliance cords. I do not believe the cost will be unbearable the same as the cost for a hair dryer is not unbearable. A hair dryer has a GFCI, immersion protection, and over heat protection. I would assume a new clock radio would be required to have an AFCI and will cost a couple of dollars more after the development costs have been recovered and mass production and competition take over.

I support the proposed language to modify the text of 240-4 as suggested by Panel Chairman James Dollard and contained in his comments on affirmative vote. Mr. Dollard's proposed text clarifies the intent of the changes discussed by the panel during the ROC meetinging in Phoenix in December 2000.

JHONSON: I agree with Mr. Dollard's comment on affirmative on Comment 10-16.

OCKULY: I am voting in the affirmative; however, the resulting text in 240-4 after removing subsections 240-4(b)(1) and (3) may be misleading. I believe the intent of the panel was to require product standards, not the NEC to address the protection, suitability and proper use of appliance cords and extension cords. I support the proposed language to modify the text of 240-4 as suggested by Panel Chairman James Dollard and contained in his comment and reasons on affirmative vote. Mr. Dollard's proposed text clarifies the intent of the changes discussed by the panel members during the ROC meeting in Phoenix in December 2000.

(Log #1478)

10- 18 - (240-12): Reject

SUBMITTER: Diane Ricotta, Ft. Worth, TX

COMMENT ON PROPOSAL NO: 10-22

RECOMMENDATION: Revise the proposal to read as follows:

240-12. Electrical System Coordination. Where an orderly shutdown is required to minimize the hazard(s) to personnel and equipment, a system of coordination based on the following two conditions shall be required.

1. Coordinated short-circuit protection.
2. Coordinated overload protection or overload indication based on monitoring systems or devices.

For the purposes of this section, coordination is defined as properly localizing an overcurrent condition to restrict outages to the equipment affected, accomplished by the choice of selective overcurrent protective devices.

FPN: The monitoring system is designed to cause the condition to go to alarm, leading to corrective action or an orderly shutdown, thereby minimizing personnel hazard and equipment damage.

SUBSTANTIATION: This revised wording is only slightly different than the existing text. The word "permitted" is replaced by "required" in the first sentence, in order to agree with the first part of the sentence, "Where an orderly shutdown is required to minimize the hazard(s) to personnel and equipment." The user is given a choice in (2), between coordinated overload protection and overload indication based upon monitoring systems. The word "fault" is replaced by "overcurrent" two times in the third paragraph because coordination, when required, is necessary for all overcurrents, not just faults. The FPN was changed to conform with the style manual.

PANEL ACTION: Reject.

PANEL STATEMENT: The intent of this section is permissive, and the suggested wording changes are inconsistent with this intent.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #1892)

10- 19 - (240-12): Reject

SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers

COMMENT ON PROPOSAL NO: 10-22

RECOMMENDATION: Accept this proposal in principle.

Accept this proposal in principle by deleting the phrase "overload and" from the first sentence of the proposal. The first sentence would then read, "Where an orderly shutdown is required to minimize the hazard(s) to personnel and equipment, the overcurrent protective devices shall be selectively coordinated for all values of available short-circuit current." The rest of the proposal remains unchanged.

SUBSTANTIATION: This is a safety issue. Where an orderly shutdown is required to minimize hazards, it should be mandatory. It should not be optional, as is currently allowed by 240-12. This above suggested wording to delete the phrase "overload and" covers the objection expressed by the panel in the panel statement. This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and statement on Comment 10-18.

10- 20 - (240-13): Reject

SUBMITTER: Phil Simmons, Simmons Electrical Services

COMMENT ON PROPOSAL NO: 10-23

RECOMMENDATION: Delete this section and add these requirements to become a new Section 225-41.

SUBSTANTIATION: Part B of Article 225 deals with disconnecting means for buildings and structures on the premises that are supplied from a service in another building or structure. Section 240-13, which covers equipment ground fault protection requirements for building disconnecting means, should be located where the other requirements for building or structure

disconnecting means are located. This should improve the structure of the Code and make the Code more "user friendly."

The origin of ground-fault protection of equipment was when it was added to Section 230-95 for service equipment. Similar rules were added to Article 215 as many utility services are at primary voltages and transformers on-site reduce the voltage and phase arrangement to 480Y/277 with overcurrent devices rated 1000 amperes or more. The same hazard exists for feeders as for services. This addition "plugged a hole" in the Code as the equipment was supplied by feeders and not services. All the rules for building disconnecting means should be located at the same place in the Code.

PANEL ACTION: Reject.

PANEL STATEMENT: The general requirements for ground fault protection of non-service equipment belongs in Section 240-13. The panel agrees with Code-Making Panel 4's statement on Proposal 4-38.

SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)

COMMENT ON PROPOSAL NO: 10-26

RECOMMENDATION: The panel should accept this proposal.

SUBSTANTIATION: NEMA supports the Code Making Panel's action on this proposal dealing with a circuit breaker issue. The tripping of individual poles in multi-pole circuit breakers results in the opening of all phases. This removes both current and voltage from the load. From the standpoint of safety, it is true that the handle of multi-pole circuit breakers still needs to be moved to the "off" position rather than the "tripped" position before the downstream circuit is investigated. The common trip capability provides additional safety.

From the standpoint of handle-tied single-pole circuit breakers, the consumer perceives that tripping of one pole will again cause all poles to open. The handle-ties certainly ensure that the multiple poles are switched to the "on" position together and to the "off" position together, however, handle ties will not ensure that all poles will open when one pole trips. Unless the circuit breakers have a common trip provision, the tripping for an individual circuit breaker for line-to-line loads can result in the presence of voltage at the load despite the fact that load-current has been interrupted.

The Code Making Panel's action correctly limits the use of handle-ties to common switching "on" "off" operations. The proposal exception still permits individual single-pole circuit breakers with handle-ties to be used for the protection for each ungrounded conductor of multiwire branch circuits that serve only single-phase, line-to-neutral loads. This is consistent since, for each of these loads, current interruption in any individual circuit will be accompanied by voltage removal.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 7

NEGATIVE: 5

EXPLANATION OF NEGATIVE:

DOLLARD: I agree with the explanations of negative votes as written by Mr. Eldridge and Mr. Ockuly.

ELDRIDGE: See my explanation of negative vote on Comment 10-23.

FREDERICKS: The American Chemistry Council has reconsidered and determined that we agree with the reasons for negative voting that were given by Mr. Ockuly and Mr. Eldridge. In particular, we agree that inadequate substantiation of a practical safety problem was submitted to suport this change.

MUNSON: I am voting negative on the panel action. I support Mr. Ockuly's comment.

OCKULY: I vote negative on the panel action for the following reasons:

1. The initial Proposal 10-26 provided absolutely no evidence of a field problem existing in the application of single-pole circuit breakers with handle ties.

2. Single-pole breakers without handle ties were used for decades; i.e., 1940's through 1980's with no reported field incidents. The requirement for handle ties was added to the NEC to facilitate common disconnect requirements. The requirement for common trip circuit breakers for these applications is unnecessary, overly restrictive and levies an unwarranted cost upon the user with no proven benefit.

3. Application of single-pole circuit breakers with handle ties are recognized as a safe method of complying with NEC 240-20(b). See UL's "White Book" "General Information for Electrical Equipment-2000", page 10.

4. The documented long, safe history of applying single-pole circuit breakers (even without handle ties) speaks for itself. There is no justification to mandate common trip circuit breakers on single-phase line to line circuits.

Note: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative. The Technical Correlating Committee directs that Proposal 10-26 and Comment 10-22 are both reported as "Reject".

SUBMITTER: David A. Kerr, Jr., Friendsville, PA

COMMENT ON PROPOSAL NO: 10-26

RECOMMENDATION: Terminate this proposal with extreme prejudice and never reintroduce it. Drive a stake through its heart.

SUBSTANTIATION: It's the same nonsense every three years. There has not been a shred of technical substantiation other than the handbook. That's like watching biblical movies. It's the tail wagging the dog. Meanwhile, Proposal 10-26a, item 3 seems to permit nonexistent unlisted breakers on 3 phase.

Neutrals don't exist.

PANEL ACTION: Reject.

PANEL STATEMENT: This is at least the third code cycle dealing with this issue. Previous technical substantiations have, indeed, dealt with specific field problems. It is noted that the submitter is also critical of Item 3 of Proposal 10-26a. This is essentially present code wording, and this proposal will remove the wording from the code.

(Log #1358)

10- 23 - (240-20(b)):

Note: The Technical Correlating Committee directs that Proposal 10-26 and Comment 10-23 be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

SUBMITTER: David P. Brown, Baltimore Gas and Electric Co/EEI

COMMENT ON PROPOSAL NO: 10-26

RECOMMENDATION: Accept the proposal in part, in principal.

SUBSTANTIATION: This proposal is another attempt by the circuit breaker manufacturers to remove 240-20(b)(2) and (3). This proposal should have added the words as follows, "Circuit breakers shall simultaneously open all ungrounded conductors of the circuit by means of a common trip mechanism unless otherwise permitted in (1), (2), or (3)." Common trip is used in the UL product standard and is recognized in the industry. The remaining portion shall remain unchanged, as the substantiation has presented no documented problems with handle ties. This is the same as trying to require common trip fuses.

This proposal has been presented with no substantiation other than to delete the two subsections to "provide better protection and to follow the National Fire Protection Association Handbook". If protection was the problem, why allow fuses to be used since they cannot be common trip. Circuit breakers with approved handle ties must be used on a grounded system. Is this any different than the way fuses are used with the same system? The ONLY reason for the

handle ties is to provide for common switching, the same as in the realm of safe fusing practices.

The question of safety was raised in the panel discussions. The failure of a load to continue to operate is not sufficient to determine that a circuit is dead and is a violation of all safety rules that I know of with or without common-trip breakers or fuses. It is not reasonable to assume a circuit is dead without testing for the presence of voltage.

I understand the cost of common trip circuit breakers is not much more than single pole breakers. Cost is not the problem. I have found that the cost of common trip circuit breakers is 15 percent to 30 percent over single pole circuit breakers without handle ties. It appears that this may be an attempt by the circuit breaker manufacturers to sell a more expensive product. Deleting (2) and (3) will require all line-to-line loads to have the more expensive "common trip" circuit breakers. In dwelling units this will include all 240-volt circuits.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and statement on Comment 10-22.

Section 240-20(b) deals solely with the characteristics of circuit breakers. These devices typically open all poles simultaneously, both manually and automatically. For ungrounded systems, such circuit breakers must be common trip.

Fuses are not common trip, but they can also be used on ungrounded systems as they are recognized as fully rated single pole interrupting devices. Thus, the requirement of common trip circuit breakers on line-to-line loads on grounded systems will not impact the use of fuses for the same application.

Common trip circuit breakers provide additional safety to circuit breaker applications, since common trip is consistent with expected circuit breaker characteristics.

The submitter's proposed new wording adds no clarity.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 7

NEGATIVE: 5

EXPLANATION OF NEGATIVE:

DOLLARD: See my explanation of negative vote on Comment 10-21.

ELDRIDGE: This Comment should have been Accept. Common trip is used in the UL product standard and is recognized in the industry. The substantiation has presented no documented problems with handle ties, which have been used safely for decades, even in dwelling units. This is the same as trying to require common trip fuses, which I suppose, will be next.

FREDERICKS: See my explanation of negative vote on Comment 10-21.

MUNSON: I am voting negative on the panel action. I support Mr. Ockuly's comment.

OCKULY: I vote negative on panel action. See my explanation of negative vote on Comment 10-21.

(Log #1464)

10- 24 - (240-20(b)):

Note: The Technical Correlating Committee directs that Proposal 10-26 and Comment 10-24 be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

SUBMITTER: Joseph Schomaker, St. Louis, MO

COMMENT ON PROPOSAL NO: 10-26

RECOMMENDATION: This proposal should be rejected.

SUBSTANTIATION: Absolutely no technical substantiation has been provided to justify a significant change in this Section. Circuit breakers with approved tie handles have safely and successfully been used for years. See Mr. Ockuly's comments in the ROP.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and statement on Comment 10-23.

Substantiation was provided with Proposal 10-26 in the 2002 NEC ROP and Comment 10-21 in the 2002 NEC ROC, and relates to user expectation of circuit breaker characteristics.

Note: The Technical Correlating Committee directs that Proposal 10-26 and Comment 10-25 be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

SUBMITTER: Michael P. O'Quinn, MOGO Enterprises, Inc.

COMMENT ON PROPOSAL NO: 10-26

RECOMMENDATION: Delete the entire proposal; reinstate original wording of 240.20(b) with (1), (2) and (3).

SUBSTANTIATION: The proposal does not substantiate a safety problem with the use of handle ties on single-pole circuit breakers. The wording of the proposal's lone exception seems to allow handle ties in violation of 210.4(c), Exception No. 2.

The proposal does not substantiate why "common trip" is necessary with circuit breakers but not with fuses.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and statement on Comment 10-23.

A consequence of removing Exception No. 2 of 240-20(b) in the existing code clarifies consistency with the switching requirement in existing Section 210-4(c), Exception No. 2.

SUBMITTER: Roy T. Higa, Aiea, HI

COMMENT ON PROPOSAL NO: 10-30

RECOMMENDATION: If the panel reconsiders Proposal 10-30 and decides to accept it, whether it be in its original form or otherwise, recommend that parallel changes also be made to Section 240-21(c)(4).

SUBSTANTIATION: In the 1996 code, before Section 240-21 was broken up into two separate parts, one for feeder taps and the other for transformer secondary conductors, the rules for feeder

taps and transformer secondary conductors were combined under one section and the requirements were identical for both situations. When Section 240-21 was separated into two separate parts in the 1999 code, the requirement for feeder taps and transformer secondary conductors also stayed the same. Technically, there is no reason why it should not be the same. Therefore, if Section 240-21(b)(5) is changed, it stands to reason that similar changes should be made to Section 240-21(c)(4).
PANEL ACTION: Reject.
PANEL STATEMENT: The comment does not meet the requirements of 4-4.5(c) of the Regulations Governing Committee Projects.

10- 28 - (240-21(b)(5)): Reject
SUBMITTER: C. John Beck, Pacific Gas & Electric Co.
COMMENT ON PROPOSAL NO: 10-30
RECOMMENDATION: Proposal 10-30 should be accepted.
SUBSTANTIATION: Previously, the Technical Correlating Committee requested that Panel 4 review Panel 10's prior action on this subject and provide CMP 4's response in an effort to resolve the inconsistency between 225-33 and 240-21(b)(5). That was done. However, there continues to be a lack of coordination, which has resulted in continued confusion and conflict between the requirements and intent of the two sections and panels. CMP 4's position and intent was to treat the conductors as an extension of the distribution feeder. At issue, is the fact that what is being addressed is not internal premises wiring, but the fact that the conductors are forming part of an outdoor feeder distribution circuit and should be treated the same as service conductors.
Panel 10's continued portrayal of these conductors as taps is inconsistent with CMP 4's intended development and application for Section 225-33, much less Article 225. The proposal should be accepted.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel refers the submitter to its panel statement on Proposal 10-30 on Pages 240 and 241 of the 2002 NEC ROP.
Part H permits the use of six disconnects for qualifying supervised industrial installations.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
ELDRIDGE: Mr. Beck is correct in his assessment. Panel 10 is treating all outside wiring as if it were under the purview of Panel 10 for overcurrent protection. By the definition of a tap in Article 240 and the definition of premises wiring in Article 100, Panel 10 is correct. However, Panel 10 is not correct in its treatment of the tap rules.
The tap feeder conductors are protected at the load end at their ampacity, the same as all taps. Short circuit and ground fault protection is provided at the source of the feeder. The tap conductors would be protected better if the overcurrent protection were in multiple overcurrent devices instead of a single overcurrent device because of the diversity. Overload, short circuit or a ground fault on the load side of the smaller overcurrent device would be of a smaller magnitude than if it were on the load side of a single, larger overcurrent device.
A change in ownership would not change the safety of the installation. Many times, a portion of the electric utility's distribution system is sold to its customer. At the instant of the sale, the customer is now in violation and is considered to have an unsafe installation. Ownership of the system does not make it safe or unsafe.
The following information was sent to Stanley D. Kahn, who was chairman of CMP 10 at the time, on Feb. 23, 1996. It was the outcome of a CMP 4 Task Group established at the direction of the Correlating Committee as the result of action on the part of Panel 10, which was considered outside its scope.
The following was CMP 4's unanimous Task Group Response to CMP 10:
"1. Substantiation referencing utility practices has no bearing on dictating changes to the requirements of the number of disconnects allowed for a feeder.
2. The number of disconnects referenced in Proposal 10-60 (this was Proposal 10-60 for the 1996 cycle) would be compatible with the requirements for a feeder found in Article 225. Six Disconnects installed at a location, in a single enclosure or in separate enclosures grouped together, would constitute a safe installation."
Copies of this were sent to Harold Ware, Don Strassburg (Task Group Chair), Mark Earley, and John Troglia.
Service conductors are permitted to be protected by up to six disconnecting means and there is no justification why feeders, which supply a building or other structure, should not be allowed the same measure of protection.
This has presented a problem of lack of coordination between Article 225 and 240 that will continue since it has not been addressed this code cycle. Since there is a conflict between these two Articles, the TCC should help resolve this issue.
FREDERICKS: See my Explanation of Negative vote on Comment 10-30.
MUNSON: I am voting negative against the panel action. I agree with the public comment. In addition, this section should be transferred to Code-Making Panel 4 for administrtion to eliminate the conflict between the two panels.

(Log #1359)

10- 29 - (240-21(b)(5)): Reject
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co/EEI
COMMENT ON PROPOSAL NO: 10-30
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: The following information was sent to Stanley D. Kahn on February 23, 1996. It was the outcome of a Code-Making Panel 4 Task Group established at the direction of the Technical Correlating Committee as the result of action on the part of Panel 10 which was considered outside its scope.
The following was CodeMaking Panel 4's unanimous Task Group Response to Code-Making Panel 10:
1. Substantiation referencing utility practices has no bearing on dictating changes to the requirements of the number of disconnects allowed for a feeder.
2. The number of disconnects referenced in Proposal 10-60 (this was Proposal 10-60 for the 1996 cycle) would be compatible with the requirements for a feeder found in Article 225. Six disconnects installed at a location, in a single enclosure or in separate enclosures grouped together, would constitute a safe installation. Copies of this were sent to Harold Ware, Don Strassburg (Task Group Chair), Mark Earley, and John Troglia.
The Panel's statement regarding these conductors as taps is incorrect and the proposal should be accepted. Outside feeder taps must follow the other restrictions in 240-21(m), not just 240-21(m)(2). Service conductors are permitted to be protected by up to six disconnecting means and there is no justification why feeders, which supply a building or other structure, should not be allowed the same measure of protection.
This has presented a problem of lack of coordination between Sections 225-33 and 240-21(b)(5) that will continue if not addressed this code cycle. In addition, this issue needs to be resolved and correlated with Panel 4. Concerns have also been voiced about upgrades that would overload the tap. Any upgrade would have to be done in compliance with the NEC.
PANEL ACTION: Reject.

10- 30 - (240-21(b)(5)b): Reject
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 10-31
RECOMMENDATION: The panel should have Accepted this proposal.
SUBSTANTIATION: The panel should consider that installations with from two to six grouped disconnects are presently allowed for feeders in Article 225, and for transformer secondary protection in

Article 450. The panel statement gave no justification for its claim that a single overcurrent device is required to limit the load at the end of the tap conductors and that this same effect could not be accomplished with up to six grouped overcurrent devices. Indeed, Articles 225 and 450 recognize this method of protection, so this panel action results in a lack of correlation with these articles.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel refers the submitter to its panel statement on Proposal 10-31 on Page 241 of the ROP.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
ELDRIDGE: See my Explanation of Negative on Comment 10-28.
FREDERICKS: I'm voting against the panel action on this Comment, which should have been accepted. I don't believe the panel's earlier or present statements have given a good technical reason to maintain a miscorrelation vs. Articles 225 and 450. Supervised Industrial Installations under Part H are allowed an exception for six disconnect feeder tap installations, but only a very small percentage of installations qualify a Supervised Industrial Installations, unlike Services, which are universal.
MUNSON: I am voting against the panel action. See my explanation of negative vote on Comment 10-28.

(Log #1360)

10- 32 - (240-21(c)(4)): Reject
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co/EEI
COMMENT ON PROPOSAL NO: 10-39
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: Proposal 10-39 should have been accepted. Addressing the panel statement, the tap feeder conductors are sized to carry the load and protected at their load end, the same as all taps. Short circuit and ground fault protection is provided at the source of the feeder. The tap conductors would be protected better if the overcurrent protection were in multiple overcurrent devices instead of a single overcurrent device because of the diversity. An overload, a short circuit or a ground fault on the load side of the smaller overcurrent device would have lesser effect on the tap conductors than if it were on the load side of a single, larger overcurrent device. The panel statement does not respond to these facts in its assertion that a single overcurrent device is necessary.
A change in ownership associated with the sale of a utility installation to a customer would not change the safety of the former service conductors, now classified as tap conductors.
The following information was sent to Stanley D. Kahn, who was chairman of Code-Making Panel 10 at the time, on February 23, 1996. It was the outcome of a Code-Making Panel 4 Task Group established at the direction of the Technical Correlating Committee as the result of action on the part of Panel 10, which was considered outside its scope.
The following was Code-Making Panel 4's unanimous Task Group Response to CMP 10:
1. Substantiation referencing utility practices has no bearing on dictating changes to the requirements of the number of disconnects allowed for a feeder.
2. The number of disconnects referenced in Proposal 10-60 (this was Proposal 10-60 for the 1996 cycle) would be compatible with the requirements for a feeder found in Article 225. Six disconnects installed at a location, in a single enclosure or in separate enclosures grouped together, would constitute a safe installation. Copies of this were sent to Harold Ware, Don Strassburg, (Task Group Chair), Mark Earley, and John Troglia.
The Panel's statement regarding these conductors as taps is incorrect and the proposal should be accepted. Service conductors are permitted to be protected by up to six disconnecting means and there is no justification why feeders, which supply a building or other structure, should not be allowed the same measure of protection. This has presented a problem of lack of coordination between Sections 225-33 and 240-21(b)(5) that will continue if not addressed this code cycle. In addition, this issue needs to be resolved and correlated with Code-Making Panel 4.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel refers the submitter to its panel statement on Proposal 10-39 on Page 243 of the 2002 NEC ROP.

(Log #2058)

10- 33 - (240-24(b)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 10-41a
RECOMMENDATION: Revise text as follows:
(b) Occupancy. Each occupant shall have ready access to all overcurrent devices protecting the conductors supplying that occupancy, unless electric service and electrical maintenance are provided by the building management and these are under continuous building management supervision, but limited to the circumstances described in (1) or (2).
(1) Service and Feeder Overcurrent Devices. In multiple occupancy buildings and for guest rooms of hotels and motels that are intended for transient occupancy, each occupant shall not be required to have access to the service overcurrent devices and feeder overcurrent devices supplying more than one occupancy or room.
(2) Branch-Circuit Overcurrent Devices. For guest rooms of hotels and motels that are intended for transient occupancy, each occupant shall not be required to have access to the branch-circuit overcurrent devices supplying guest rooms.
SUBSTANTIATION: This comment responds to a desire expressed at the panel meeting for a coherent restructuring of these rules in positive language.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel appreciates the submitter's attempt to put this section into positive language; however, the language in Proposal 10-41a is easier to read and understand.
The panel reaffirms that the wording developed in proposal 10-41a is preferable.

10- 34 - (240-24(b), Exception):

Note: The Technical Correlating Committee directs that the action on this Comment and Proposal 10-42 be reported as "Hold" to correlate with the Technical Correlating Committee action on Comment 4-74.

SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 10-42
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 4-122. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the action of the Technical Correlating Committee, however, continues to reject Proposal 10-42.
PANEL STATEMENT: Adequate substantiation has not been provided to show that the change in Proposal 10-42 is necessary. Evidence of unsafe practices due to the present code language has not been presented. The panel reaffirms its position of rejecting the proposal.

Other provisions can be made, such as building a separate room in the structure or moving the overcurrent protective devices outside the building.

(Log #1995)

10- 35 - (240-24(b), Exception): Reject
SUBMITTER: William F. Laidler, Rep. Massachusetts Electrical Code Advisory Committee
COMMENT ON PROPOSAL NO: 10-42
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: The Advisory Committee wishes to provide additional substantiation to support reconsideration of the original action on this proposal, as directed by the Technical Correlating Committee.

In the original submittal, the submitter lists only one example of an installation where the exception would allow an installation of service equipment without tenant access to the main service disconnect.

In the interest of safety, it is the ongoing opinion of the Massachusetts Electrical Code Advisory Committee, that in certain installations, tenants should in fact not have access to the main service disconnecting means. For example, mixed-use occupancies with large service ampacity located behind a mechanical room in the basement would be an area where one would not want a tenant venturing in the interest of safety as a matter of right.

By retaining this exception, Code-Making Panel 10 will allow designers and installers to create safer installations of service equipment, without seeking special permission from the Authority Having Jurisdiction as allowed in 90-4.

This exception does not preclude the tenant from having a disconnecting means within their occupancy, or another location to which he/she has access.
PANEL ACTION: Reject.

AFFIRMATIVE: 12

(Log #371)

10- 36 - (240-40): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 10-47
RECOMMENDATION: Accept in principle revised: Disconnecting means for FUSES. A disconnecting means shall be provided on the supply side of all fuses in circuits of over 150 volts to ground, and cartridge fuses in circuits of any voltage where accessible to other than qualified persons, so that each ~~individual circuit containing~~ set of fuses can be individually disconnected from the source of power.
SUBSTANTIATION: The Style Manual requires terms to be specific and clear. The literal wording only applies this rule to fuses of each "individual circuit"; as defined in Article one outlet. A comma after "ground" will limit the "other than qualified persons" to cartridge fuses.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed change would require individual disconnects on each set of fuses even when installed as multiple units on a single branch circuit, for example, for fuses protecting a control transformer that is part of a motor branch circuit. The disconnect requirements for each circuit adequately meet safety needs.

The panel does not agree that the addition of a comma after the word "ground" would add clarity.

(Log #353)

10- 38 - (240-83(c)):

Note: The Technical Correlating Committee directs that Proposal 10-50 and Comment 10-38 be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

SUBMITTER: Jerome W. Seigel, West Hartford, CT
COMMENT ON PROPOSAL NO: 10-50
RECOMMENDATION: This Proposal should be rejected and no change be made to the present wording of 240-83(c). (240-86)
SUBSTANTIATION: This approach will not increase the safety of the system and could actually compromise the intended increase in safety.

This approach is actually working around the problem and not fixing the problem caused by a required increase of the service which in turn causes an increase in the available fault current to the total installation. The way to fix the problem is to either replace the equipment which has been claimed to "cause an excessive waste of dollars and resources" or to isolate the existing equipment from the new increased service and equipment. The isolation could be done through the use of a 1:1 transformer or by inserting additional impedance between the new service and the existing equipment to reduce the available fault current at the existing equipment. This a much better and safer engineering approach than that proposed.

I had the privilege to attend the January meeting of Panel 10 as a guest and was surprised that in all the time this subject has been in discussion that there had been no testing done to either prove or

disprove that this type of analytical approach would work. In addition there was no fact finding report in this area.

There just is no technical substantiation behind this proposal.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action on Comment 10-56. The IEEE Recommended Practice for Applying Low-Voltage Circuit Breakers Used in Industrial and Commercial Power Systems was approved by the IEEE Standards Board on February 10, 1997. In Chapter 4, Specific Applications, of that standard in Section 4-4, Selection Approach for Electrical Ratings, paragraph (d) states: "In cases where increases in available short-circuit current necessitates a system upgrade, a second approach shown in Figure 4- 4, may be used for retrofitting existing older systems where a recognized series rating is not available. A line-side current-limiting circuit breaker or fuses, which limits peak current and let-through energy, may be added, only if the existing load side breakers do not exhibit dynamic impedance within the first half cycle. The distribution of short-circuit energy is shifted away from the slower, load-side circuit breaker to the higher speed current-limiting device. The downstream circuit breaker is then subject to no more short-circuit energy than its ratings."

Care should be exercised when introducing inductive reactance into the system as it may, in some cases, cause the breaker X/R rating to be exceeded.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 7

NEGATIVE: 5

EXPLANATION OF NEGATIVE:

BORTHICK: My concerns about misapplication by engineers who are not specialized in this arena have caused my opposition to this series rating issue. I would have felt more at ease had these changes been placed in Section H where these applications are less rare, have a historical basis, and the engineering staffs are comprised of more experienced engineers who realize the ramifications of their actions.

My concern is for the general application of these calculations by Bubba's Engineering Services whose less experienced, albeit licensed, engineers don't realize when they are out of their depths.

I can't help but be concerned knowing the number of engineer stamped and AHJ approved plans I've seen that contain various code violations. These have included but have not been limited to:

a. undersized feeder and circuit conductors versus load and or specified voltage drop limitations

b. undersized equipment grounding conductors versus circuit conductor size

c. undersized grounding electrode conductors - I do especially like the more recent notations that appear on plans that simply state "size per the NEC" so that the electrician can properly size the conductors

d. insufficient 110-26(a) clearance requirements

e. conduits undersized for the contained conductors

f. 480 volt three-phase fountain pumps specified in violation of 680-51(b)

g. relocation of main breaker panelboards from immediately adjacent to the supply transformer to 60 feet away without an OCPD between

h. This is my absolute favorite. The engineers had on the plans to run a 480 volt three-phase four-wire feeder that was fed from a 480 volt ungrounded delta main panelboard. Even when standing below the transformer bank, these engineers couldn't recognize that the configuration was not a wye. After being convinced that it was indeed a delta , they insisted that I could somehow reconnect the secondaries into a wye and derive a neutral. Of course, the final resolution was for the electrical contractor to "just fix it" and send the change order through for approval

i. acceptance of panelboards rated for 120/208 volt 3-phase, 4-wire on a 120/240 volt 3-phase, 4-wire system. Of course, the branch breakers were rated 120/240 volt and some of these were installed on the "high leg" and were serving single-phase 240 volt loads

My observations in the field, some of which I listed above, have led to my unwavering confidence in engineers in general. Item (i) above leads to further concern on my part. During the panel discussion of comments 10-48 et al, that concerned the single-pole ratings of circuit breakers, concerns were voiced (by proponents of engineered series-ratings) that misapplication might be made by some engineers. Will the same engineers who misapply single-pole ratings also be the ones who decide when a downstream breaker is passive?

Many arguments were presented during the panel discussions. One was that ALL licensed professional engineers are competent and that their ethics would not permit them to jeopardize their licenses via misapplication. I maintain that a code of ethics is not the issue here but that a "license to kill" is the issue. Proponents of engineered series ratings also maintain that before the engineer selects the line side OCPD they will consult with the manufacturer of the load side circuit breaker and accept the information given. The most simply argument was that the installation of any sort of current limiting device would be better than no action at all. I don't think that inaction is an option.

The last sentence of the panel statement on Comment 10-55 is that "The authority having jurisdiction will rely on the engineer supervising the design and installation." It looks like they have no choice now and that the engineer will, in effect, become the AHJ.

DEATON: Although the validity of the "up-over-down" method for determining the proper engineering of series ratings for equipment combinations was demonstrated, the opportunity for abuse and misapplication is significant. Power air circuit breakers are larger, more expensive types of equipment where testing of series ratings has often been justified, and these breakers are typically repaired, not replaced, to correct deficiencies found during maintenance. Molded-case circuit breakers must be replaced when found to be defective. Molded-case circuit breakers, particularly the smaller frame sizes are relatively inexpensive devices where testing combinations is harder to justify and the incentive to use engineered combinations would be much greater. Replacement of an older, passive unit with a newer, interchangeable, nonpassive breaker is very likely to occur, even if personnel ensure that the replacement breaker has the same continuous and interrupting ratings as the unit being discarded.

KIMBLIN: See my explanation of negative vote on Comment 10-56.

MUNSON: I am voting negative against the panel action. After considering the debate around this issue, I believe that this practice should not be part of the NEC. However, this does not mean that the practice should not be allowed by the authority having jurisdiction. Authorities having jurisdiction are free to evaluate an engineered series rated system without the permission being in the NEC. The authority having jurisdiction is able to determine on a case- by-case basis if a system is a suitable candidate for a field engineered series rating upgrade. Placing this requirement in the code would suggest that all systems are suitable for upgrading, which may not be the case.

ZAPLATOSCH: A safe series combination cannot be selected solely based on the performance characteristics of the two (or more) series devices. When a manufacturer identifies a series combination for their listed equipment, the suitability of the hose equipment is also considered. For this reason, the circuit breaker-series connected information published in the Recognized Component Directory of Underwriters laboratories is not intended to be used in field applications to determine proper coordination and protection of load side circuit breakers. Testing may be necessary to determine the suitability of such series combinations. This is especially true as the determination of a suitable series combination of overcurrent devices must include an evaluation of the host equipment, not only a calculation of the performance characteristics of the two (or more) series connected devices. The full system of overcurrent devices, host equipment and connections must be reviewed, and perhaps tested, to determine the suitability of the system for use on a circuit with an available fault current greater than the marked rating of the overcurrent protective device(s). Determination of the need for tests and the method to conduct the tests must be in accordance with established safety standards.

(Log #2114)

10- 50 - (240-85): Reject
SUBMITTER: C. W. Kimblin, Cutler-Hammer
COMMENT ON PROPOSAL NO: 10-66
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: The total proposal should be rejected. The single pole interrupting capability of circuit breakers is a standards performance issue. Here it is noted, for molded case circuit breakers, that the UL 489 single pole test requirements are similar to the International IFC 60947-2 single pole test requirements. With respect to the Panel's suggested Fine Print Note, this note is in the form of a recommendation and is not in accordance with the NFPA Style Manual. Furthermore, the FPN is all encompassing and makes no distinction (1) between low voltage power circuit breakers and molded case circuit breakers. With proper system maintenance, both types of circuit breakers can be used on solidly

grounded wye systems, resistively grounded wye systems, and ungrounded delta systems. Furthermore, the Code (210-85) already addresses the special markings required for two-pole circuit breakers protecting 3-phase, corner-grounded delta circuits.

(Log #2115)

10- 51 - (240-85): Reject
SUBMITTER: George Gregory, Square D Company
COMMENT ON PROPOSAL NO: 10-66
RECOMMENDATION: Reject Proposal 10-66.
SUBSTANTIATION: This proposal along with its companion Proposal 10-55 is too broad. Article 250 requires most systems to be solidly grounded at the service entrance. For these systems, voltage across an individual pole of a circuit breaker cannot be greater than phase voltage. Molded-case circuit breakers are tested at their interrupting rating in 3-phase circuits that demonstrate the individual pole capability at phase voltage or above. In addition, all straight-rated (600, 480, 240 V) molded-case circuit breakers are tested in individual pole short circuit breaker tests at line-to-line voltage at a limited short circuit value. In other words, molded-case circuit breakers are fully tested for faults on solidly grounded WYE systems and their derivations and for single phase, 120 or 120/240 V systems. Individual poles of low-voltage power circuit breakers are fully tested for the maximum fault they could see in any system.

Industrial process facilities using three special systems came under the jurisdiction of the NEC during the 1970's. It is for these systems that the system designer must take special care in providing for both overcurrent protection and system maintenance. These systems are specially engineered for the process and are not intended or permitted for general application. The NEC is not and should not be thought of as a design manual for these cases.

Impedance-grounded WYE systems are specifically addressed in 250-36. The requirements are intended to detect and correct a first fault to ground before additional faults can occur that would apply the fault to a single pole. Without specific multiple faults, a single pole of a circuit breaker will not interrupt the fault alone.

Corner-grounded delta systems with two protected conductors are addressed by 240-85 and the "1ø-3ø" marking. Three pole circuit breakers on corner-grounded delta systems are not addressed in the NEC.

Addressing the need for information on the testing and rating of circuit breakers for these systems are the IEEE Std. 1015 Blue Book and an IEEE transactions paper titled "Single-pole short-circuit interruption of molded-case circuit breakers" in the November 1999 edition.

Calling for added ratings for all circuit breakers to address these special process industry systems is too broad. If a code revision is needed, perhaps it should be to provide requirements for the systems themselves. The addition of a fine print note with a recommendation is not in compliance with NEC style and does not establish a rule for installations.

10- 53 - (240-85, FPN): Accept in Principle
SUBMITTER: Vincent J. Saporita, Cooper Bussmann
COMMENT ON PROPOSAL NO: 10-66
RECOMMENDATION: Revise the FPN as shown below, then continue to accept the proposal.

"FPN: Proper application of circuit breakers on systems other than solidly grounded wye, particularly on corner grounded delta systems, considers the individual pole interrupting capability."

SUBSTANTIATION: The above rewording is suggested to meet the Technical Correlating Committee's requirements for the style manual. Changes are editorial.
PANEL ACTION: Accept in Principle.
Revise the wording in the comment to read as follows:

FPN: Proper application of molded case circuit breakers on 3-phase systems, other than solidly grounded wye, particularly on corner grounded delta systems, considers the circuit breakers' individual pole interrupting capability.

PANEL STATEMENT: The revised wording clarifies the intent of the submitter and meets the intent of the panel.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
KIMBLIN: NEMA considers the single pole capabilities of molded case circuit breakers, and their associated markings, to be a standards issue rather than a code issue. In particular, NEMA does not consider that the proposed Fine Print Note satisfies the Technical Correlating Committee's Comment 10-47 concerning the inclusion of a recommendation in a Fine Print Note. The wording of the FPN remains a recommendation since it suggests that if a user does not consider the single pole capability, then the installation of molded-case-circuit breakers on some three-phase systems will be improper. NEMA further asserts that three pole-listed circuit breakers, when applied within their three phase ratings, are safely applied on solidly grounded Y, resistively grounded Y and ungrounded delta systems. For corner grounded delta systems, two-pole molded case circuit breakers marked 1 phase-3 phase (240-85) may be used.
ZAPLATOSCH: See my explanation of negative vote on Comment 10-48.

SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 10-67
RECOMMENDATION: The Technical Correlating Committee directs the panel to reconsider the proposal relative to the use of pemissive language in the first sentence. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the direction of the Technical Correlating Committee.
PANEL STATEMENT: See panel action on Comment 10-56.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
BREZAN: I concur with the panel action because it adds another level of safety to the system.
I do have concerns of misapplication with the present wording. The ability to design the equipment for new installations exists and leaves the possibility for the use of mismatched equipment.
With all the listed equipment available I feel there isn't a need to use this calculation method for new work. It is my understanding that the panel developed this change with the intent for its use in new installations.
The wording should also contain language that requires a recalculation whenever additional equipment is added after the modification has been performed to prevent nonconforming equipment from being added.
My final concern is the ability to field identify the type of equipment covered by the provision for an engineered calculation of the system components.

10- 55 - (240-86):
Note: The Technical Correlating Committee directs that Proposal 10-67 and Comment 10-55 be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: 10-67
RECOMMENDATION: The proposal to select series-rated overcurrent protective devices under engineering supervision should be rejected.
SUBSTANTIATION: From a safety standpoint, NEMA has consistently opposed the determination of series ratings by engineering calculations. If such a method were safe, circuit breaker manufacturers, from an economic standpoint, would have embraced the concept years ago. Rather, series ratings are determined by thorough test programs witnessed by a third party. From an economical standpoint, these tests are onerous for manufacturers who would gladly apply calculations, if calculations existed that would reliably determine an appropriate rating. Manufacturers do not know such a method. A number of reasons are outlined in the substantiations to proposals 10-52, -53 and -54. The tests take into account the full range of potential fault current (not just the maximum current level) and also the capabilities of the devices to perform with the equipment in which they are installed. The result is a safe system that provides consumers with the economic application of circuit breakers; namely the capability of using circuit breakers whose ratings are lower than the available fault current. This is possible because they operate, under high fault conditions, in series with an upstream fully-rated circuit breaker or fuse.
The proposal raises a number of questions, and if accepted the Code-Making Panel must address these questions to provide guidance to the engineering supervision and the authority having jurisdiction:
Series ratings, determined under engineering supervision, must provide the same level of safety as series ratings determined under the present third-party witnessed test programs. Here safety includes the performance of the "passive" circuit breaker, the performance of possible circuit breakers downstream from the "passive" circuit breaker, and the capability of the overall assembly.
1. What factors will the engineering supervision take into account in determining the safety of the series-rated system?
2. What third party or other verification will the authority having jurisdiction use to verify that the combination is acceptable?
The term "circuit breaker" covers a wide range of circuit breaker types; molded case circuit breakers (UL 489), insulated case circuit breakers (UL 489), and power circuit breakers (UL 1066) . Arguments, to the panel, presented primarily for power circuit breakers, could precipitate a code change that affects the prevalent users of series-ratings; namely fuses with downstream molded-case-circuit breakers or molded-case -circuit breakers with downstream molded-case-circuit breakers. The product standards have never tested products for being passive, there are no products marked as passive, and the major circuit breaker manufacturers, including Cutler-Hammer, GE, Siemens and Square-D, are unanimous in stating that molded-case-circuit breakers are designed to be active rather than passive during the first half cycle of current.
How does the panel intend that someone will determine that a circuit breaker is passive during the first half cycle of a fault?
This proposal allows an entire installation to be installed at a fault current level where the only component that has been tested and listed to that fault level is the first fuse or circuit breaker in the circuit. There is no requirement in the proposal for the switchboards, panelboards, switches, bus duct, motor control centers, etc. to comply with 110-10.
Since none of this equipment would be in compliance with 110-3(b), on what basis does the authority having jurisdiction accept installations in which all the equipment in an installation has a marked short circuit rating less than the available fault current?
This proposal allows the markings and ratings of the equipment that are supported by the manufacturer and backed up by third party certification and surveillance to be ignored. In effect this proposal takes all testing and rating of equipment would be away from the manufacturers and test labs and allows installations to be made only under engineering supervision.
1. How does the authority having jurisdiction ensure the engineering supervision is correct?
2. How does the authority having jurisdiction ensure the equipment has been evaluated to comply with 90-7?
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 10-38.
The panel action correlates with accepted industry standards such as the IEEE Blue Book and various articles written by recognized industry experts. The panel concludes that the issues raised by the submitter in his substantiation can be safely addressed under conditions of engineering supervision. The authority having jurisdiction will rely on the engineer supervising the design and installation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

SUBMITTER: George J. Ockuly, Chesterfield, MO

COMMENT ON PROPOSAL NO: 10-67

RECOMMENDATION: Revise the first paragraph of the proposal as follows and then continue to accept the proposal. "Where a circuit breaker is used on a circuit having an available fault current higher than its marked interrupting rating by being connected on the load side of an acceptable overcurrent protective device having the higher rating, it shall meet the requirements specified in (a) or (b), and (c)."

SUBSTANTIATION: This is an editorial comment to meet the requirements of the Technical Correlating Committee, so that the proposal does not conflict with the style manual.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 7

NEGATIVE: 5

EXPLANATION OF NEGATIVE:

BORTHICK: See my explanation of negative vote on Comment 10-38.

DEATON: See my explanation of negative vote on Comment 10-38.

KIMBLIN: NEMA opposes the panel action based on safety concerns with the application of downstream circuit breakers, underrated for the available fault current, but dependent on the simultaneous operation of an upstream device, "selected under engineering supervision." As indicated in the panel's comment, the safety responsibility with such ratings rests with the engineer who designs the installation, especially since ratings marked in accordance with industry standards may be exceeded. The panel has accepted an associated FPN in Comment 10-61, "Molded-case circuit breakers are generally not considered passive during the first 1/2 cycle of a fault." NEMA circuit breaker manufacturers confirm that fact.

The panel statement does not adequately respond to questions raised in the Comment 10-56 substantiation regarding what factors to consider in determining the safety of the series rated system determined under engineering supervision and how to determine whether a circuit breaker is passive during the first 1/2 cycle. No calculation method is specified and none has been demonstrated to be fully effective.

With respect to the method of application to low-voltage power circuit breakers (LVPCBs), it is noted that such circuit breakers are not identified as being passive by either rating or marking. It is true that LVPCBs frequently have short-time withstand ratings in which the tripping mechanism is not activated instantaneously. In this mode, the objective is to permit fault isolation by which downstream devices will clear the fault. Here it is essential to consider the total system, and not only the individual circuit breaker.

LVPCBs are rated and tested under the ANSI C37 series of standards under which cascade (series) ratings are specifically not recommended and under which a very stringent series of tests are applied to fused circuit breakers.

Comments raised publicly and in panel discussion mention the desire to add protection by installing a current limiting device ahead of an existing installation for which the available fault current was increased. Although this practice may be safer than doing nothing, it would not provide the level of protection associated with a tested, recognized series rated system. The reason for not installing a full upgrade is given as economic.

MUNSON: I am voting against the panel action. See my explanation of negative vote on Comment 10-55.

ZAPLATOSCH: See my explanation of negative vote on Comment 10-38.

COMMENT ON AFFIRMATIVE:

BREZAN: See my affirmative comment on Comment 10-54.

DOLLARD: See my Comment on Affirmative Vote on Comment 10-57.

ELDRIDGE: In the March/April 1994 issue of the IAEI News, an article was written by NEMA concerning series ratings. On the Second page of the article, in the section labeled Testing vs. Up-Over-And-Down and Up-And-Over, a sentence says: "While the concept seems plausible and was valid with some breaker designs twenty or thirty years ago, it is not a viable concept today with most breaker designs."

In the May/June 1993 IEEE Transactions on Industry Applications, an article was written by Bernie DiMarco and Steven R. Hansen titled Interplay of Energies in Circuit Breaker and Fuse Combinations. In Part V of the article titled Fuse-Breaker Series Combinations and subsection "Are Analytical Methods Appropriate?, the first paragraph says:

"If the downstream device is passive, that is, it does not react to the fault current and its "withstand current" is known, then fuse let-through characteristics can be used for fuse selections. Likewise, if the downstream device is active but remains passive during fuse clearing time, then fuse let-through characteristics can be used for fuse selections. However, if the downstream device is active and capable of developing dynamic impedance concurrently with the fuse, then analytical fuse selection is in question."

Mr. Ockuly's proposal is very nearly identical to the IEEE Standard. Mr. Ockuly said the same thing in his proposal and in the Panel meeting that the above referenced articles are saying. A NRTL could test an older circuit breaker to provide data to an engineer that would allow a series rated circuit to be designed IF the circuit breaker is passive in the first half cycle of the fault.

This is an acceptable method for protecting some older circuit breakers under engineering supervision.

(Log #1894)

10- 57 - (240-86):

Note: The Technical Correlating Committee directs that Proposal 10-67 and Comment 10-57 be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers

COMMENT ON PROPOSAL NO: 10-67

RECOMMENDATION: Continue to Accept this proposal.

SUBSTANTIATION: This is a safety issue. When the utility changes out a transformer for one that can deliver more short-circuit current, the building owner is often faced with an expensive choice of completely replacing the switchboard or doing nothing and hoping that a severe fault never occurs. When the owner does "nothing", the electrician is exposed to unnecessary hazards. This proposal will provide an economical alternative for the building owner and will limit unnecessary electrician's exposure to the hazards that could arise from improperly protected equipment.

This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action on Comment 10-56.

MUNSON: I am voting against the panel action. See my explanation of negative vote on Comment 10-55.

ZAPLATOSCH: See my explanation of negative vote on Comment 10-38.

COMMENT ON AFFIRMATIVE:

BREZAN: See my affirmative comment on Comment 10-54.

DOLLARD: This is a safety issue, and this change will benefit all those persons who maintain and service electrical installations. In existing installations where the available short circuit current has increased to a value above the rating of the existing equipment a very dangerous situation awaits all of those persons who service and maintain the equipment.

Presently the owner of such an installation has only one option. Remove and scrap his/her equipment and replace it with new series rated equipment. This will represent a large financial investment to the owner of such a facility. Acceptance of this concept will provide a cost-effective option for providing the necessary level of protection. Application of this concept will be limited to use by qualified engineers. It is the engineer of an installation of "A Series Rated System Selected under Engineering Supervision" who will bear the responsibility of proper application of this concept. The addition of a FPN to this section (Comment 10-61) which reads: "Molded case circuit breakers are generally not

considered passive during the first _ cycle of a fault" will aid the engineer and the AHJ in proper application of this principle.

Safety of persons is the primary purpose of the NEC. The safety of all of those persons who service and maintain electrical equipment will benefit from permitting this cost-effective solution to achieve adequate ampere interrupting capacity for electrical installations.

ELDRIDGE: See my Comment on Affirmative on Comment 10-56.

(Log #2119)

10- 58 - (240-86):

Note: The Technical Correlating Committee directs that Proposal 10-67 and Comment 10-58 be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

SUBMITTER: George Gregory, Square D Company
COMMENT ON PROPOSAL NO: 10-67
RECOMMENDATION: Reject Proposal 10-67.
SUBSTANTIATION: The proposed addition of a calculation method for determining series ratings is not really achievable at the present time. Further, it opens the door for mistakes and misapplication. The proposal should be rejected.

1. No calculation method presently available is even close to being as safe and complete as the present 4 step testing program through UL standards:
   A. Test each individual CB at its marked interrupting rating(s).
   B. Test the series combination at the maximum series rating value.
   C. Test the combination at intermediate level(s).
   D. Test the combination in equipment in which it will be used.

The Up-Over-Down method, which is the only calculation method generally available, completely ignores steps C and D. I have provided a paper entitled: "Series Connected Circuit Breakers, Test and Know" which was presented at the May 2000 IEEE Cement Industry Conference.

2. Introducing an alternate method to the testing method will introduce confusion in the industry. Application of series ratings is already confusing enough.
   A. The calculation method as presented is not readily enforceable.
   B. No calculation method has been specified in the proposal. How will engineering supervision or authorities having jurisdiction know what method is technically safe?
   C. The Up-Over-Down method has been shown inadequate in a large class of situations. See the Hansen & DiMarco paper referenced with the substantiation to 10-67.
   D. Engineers in general do not understand the meaning of the term "passive" as used in this proposal nor how to test to determine it. Circuit breakers are all designed to open automatically and are not passive devices.

3. Application and economics.

Unfortunately, the proposed method does not provide a viable solution to the problem of an upgraded installation or increasing the numbers of series ratings.

A. An extremely small class of circuit breakers could ever be considered passive, namely the very large circuit breakers of the type used for large system main devices. Most of these are set specifically to withstand fault current for a period of time so that addition of a current limiting device would not fit into the protection scheme.

B. If adding a single current limiting device in the system is a viable correction, why not simply replace the non-current limiting device with a current limiting device instead of adding an additional device.

C. Circuit breaker manufacturers are presently carrying an enormous cost of testing including follow-up testing of products manufactured through the life of the production line. If a viable calculation method existed, we would very gladly change to the calculation method.

Because of the very small numbers of combinations this addition could apply to, its benefit would be extremely limited. However, the probability that it will be misapplied is great. The best benefit to users of the NEC is to reject the proposal.

This comment was written for Proposal 10-67. It also applies to Proposals 10-50, 10-51, and 10-58.

Note: Supporting material available for review upon request at NFPA headquarters.

SUBMITTER: John W. Young, Siemens Energy & Automation
COMMENT ON PROPOSAL NO: 10-67
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: Once again - there are no breakers designed to be passive or identified as being passive!

This proposal is not just an issue with a single main circuit breaker behind a current limiting device. This proposal is to allow an entire installation including the panelboards, switchboards, feeder and branch breakers, etc. to be installed where the available current would exceed the short circuit ratings marked on the equipment (circuit breakers, switches, switchboards, panelboards, motor control centers, etc.). Application of the products would no longer be limited by the ratings marked on the product as determined by the manufacturer of the equipment and the third party certifier in the test labs. This proposal would allow "engineering supervision" to replace the manufacturers testing and ratings and to determine how equipment can be applied - without any tests being required and without any third party certification.

How is the engineering supervision going to determine that the panelboards and switchboards can be applied beyond the marked and tested ratings? What about the future? What if equipment is added or replaced? How does someone know that they may no longer be able to add a feeder or branch breaker marked on a panelboard because the available current is beyond the rating of the panelboard and the breakers indicated to be used? Since the markings on the products (the product ratings) no longer have meaning how does anyone know what to do in the future? Simply marking a rating someone determined between the first two devices does not address all the issues.

How does the authority having jurisdiction know what to accept in one of these installations? This proposal does not address any safety issue but if accepted could create a number of safety issues. The proposal should be rejected.

PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 10-55. The panel disagrees with the submitter's substantiation as there are breakers that are passive for specific time versus current conditions. For example, power circuit breakers are allowed to be applied with intentional short-time delay.

SUBMITTER: Kevin J. Lippert, Cutler- Hammer
COMMENT ON PROPOSAL NO: 10-67
RECOMMENDATION: The proposal should be rejected.
SUBSTANTIATION: A series rating is a combination of a fully rated overcurrent protective device (fuse or circuit breaker) in series with a downstream circuit breaker that is under rated for the available fault current. At present, this system can be safely applied because the combination and application is 1) Proven by manufacturer's submittal and follow-up testing; 2) Third Party verified; 3) Stated on the end-use equipment; and 4) Confirmed by authority having jurisdiction inspection. The proposal would eliminate many of these steps and would lead to unsafe conditions.
In the original substantiation, Mr. Ockuly states: "All possible permutations of series rated combinations are not cataloged or identified by circuit breaker equipment manufacturers." As a manufacturer, we disagree with this statement. We publish series ratings that we have successfully tested under 3rd party supervision, and have proven to be safe for their application in the end-use equipment. To allow others to determine what is acceptable "under engineering supervision" through calculation would be erroneous. There is no method for users to determine whether the downstream device is "passive during the first 1/2 cycle of a fault." The proposal deals with the protection of passive load side circuit breakers, but we know that circuit breakers, in particular molded case circuit breakers, are not passive during the first 1/2 cycle. They are designed to be active. Furthermore, the total system needs to be addressed. It is insufficient to consider only the so called "passive" breaker, without consideration of any circuit breakers connected further downstream. Adoption of this proposal will surely lead to misapplication.
How can the authority having jurisdiction be expected to verify the accuracy of this information? His approval of equipment would expose him to liability for something that he cannot evaluate. It also exposes the circuit breaker manufacturers since it is the downstream circuit breakers that are under rated for the available fault current.
PANEL ACTION: Reject.

SUBMITTER: Jerome W. Seigel, West Hartford, CT
COMMENT ON PROPOSAL NO: 10-67
RECOMMENDATION: This Proposal should be rejected and no change be made to the present wording of 240-86.
SUBSTANTIATION: The approach will not increase the safety of the system and could actually compromise the intended increase in safety.
This approach is actually working around the problem and not fixing the problem caused by a required increase of the service which in turn causes an increase in the available fault current to the total installation. The way to fix the problem is to either replace the equipment which has been claimed to "cause an excessive waste of dollars and resources" or to isolate the existing equipment from the new increased service and equipment. The isolation could be done through the use of a 1:1 transformer or by inserting additional impedance between the new service and the existing equipment to reduce the available fault current at the existing equipment. This is a much better and safer engineering approach than that proposed.
I had the privilege to attend the January meeting of Panel 10 as a guest and was surprised that in all the time this subject has been in discussion that there had been no testing done to either prove or disprove that this type of analytical approach would work. In addition there was no fact finding report in this area.
There just is no Technical Substantiation behind this Proposal.

10- 67 - (240-92(d)): Reject
SUBMITTER: Jim Pauley, Square D Company
COMMENT ON PROPOSAL NO: 10-71
RECOMMENDATION: The proposal should be rejected.
SUBSTANTIATION: The added text only introduces confusion to the user of the NEC. As stated by Mr. Dollard in his explanation of negative, the material must be practical, easy to read and enforceable.

The desired type of protection can already be engineered under 240-92(B)(1)(c) and (B)(2)(d). The engineering calculations would, by these sections, have to "determine that the system overcurrent devices will protect the conductors within recognized time vs. current limits for all short-circuit and ground-fault conditions."

Introducing the text in (D) will only lead the user to believe that they can do something wildly different and of a lesser class than the engineering judgement that is spelled out in (B).
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal provides additional information and specific restrictions on the proper protection of transformer secondary conductors vs. unbalanced currents and can help prevent a misapplication. The information is not confusing to the users of Section 240-92(a), who in accordance with Section 240-91(1) are required to apply this material under conditions of engineering supervision.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1

EXPLANATION OF NEGATIVE:
KIMBLIN: The proposed wording of proposal 10-71 is not user friendly. The desired protection can already be engineered under 240-92(b)(1)(c) and 240-92(b)(2)(d).

(Log #113)

10- 68 - (240-100(a)(1)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 10-81
RECOMMENDATION: The Technical Correlating Committee directs the panel to reconsider the proposal relative to the use of permissive language in the second sentence. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the direction of the Technical Correlating Committee.
In the Proposal, (1), revise the last sentence of the first paragraph to read as follows:
"The separate overcurrent relay elements (or protective functions) shall be permitted to be part of a single electronic protective relay unit."

ARTICLE 250 — GROUNDING

(Log #1138)

5- 17 - (250): Accept
SUBMITTER: Elliot Rappaport, Electro Technology Consultants
COMMENT ON PROPOSAL NO: 5-54
RECOMMENDATION: Change item 6 from "12.7 mm (1/2 in.)" to "13 mm (1/2 in.)".
Change item 11 from "15.87 mm (5/8 in.)" to "16 mm (5/8 in.)".
Change item 12 from "12.7 mm (1/2 in.)" to "13 mm (1/2 in.)".
Change item 16 from "6.35 mm (1/4 in.)" to "6.4 mm (1/4 in.)".
Change item 17 from "1.52 mm (0.06 in.)" to "1.5 mm (0.06 in.)".
SUBSTANTIATION: The proposal uses a soft conversion for products which does not account for real world tolerances. Although there are no tolerances given for the inch-pound system when stated in fractions, once a decimal value is stated, the tolerance is typically +/-0.5 of the least significant decimal place. Thus, for "12.7 mm", the tolerance is +/-0.0.5 or 0.4 percent. If the tolerance on the "1/2 in." (for a ground rod) is 1/64 in., that would be 3.1 percent. The hard conversion to "13 mm" is in error by 2.4 percent and the number "13" now has a tolerance of 3.8 percent. The proposed change in item 11 from "15.87" to "16" represents a 0.2 percent change in rods of iron or steel.
Items 16 and 17 are plate thicknesses. The change from "6.35" to "6.4" represents a change of 0.8 percent as compared with a tolerance of 6.25 percent for a 1/64 in. tolerance on a 1/4 in. plate. The proposed change of "1.52 mm" to "1.5 mm" represents a change of 1.3 percent.
The proposed changes are intended to make the SI units compatible with the tolerances of the inch-pound system and provide values that represent realistic product ordering and manufacturing values.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16

(Log #1139)

5- 18 - (250):
Note: The Technical Correlating Committee directs that this Comment be reported as "Reject" as it is not consistent with the NFPA Manual of Style, Annex B, Section B.7.2.2 and Proposal 5-54 items 7, 14, 18, 22, 23 & 29 be reported as "Accept".
SUBMITTER: Elliot Rappaport, Electro Technology Consulltants
COMMENT ON PROPOSAL NO: 5-54
RECOMMENDATION: Change item 7 from "750 mm (30 in.)" to "0.75 m (30 in.)"
Change item 14 from "750 mm (30 in.)" to "0.75 m (30 in.)".
Change item 18 from "750 mm (30 in.)" to "0.75 m (30 in.)".
Change item 22 from "450 mm (18 in.)" to "0.45 m (18 in.)".
Change item 23 from "450 mm (18 in.)" to "0.45 m (18 in.)".
Change item 29 from "900 mm (3 ft)" to "0.90 m (3 ft)".
SUBSTANTIATION: The changes proposed by the Technical Correlating Committee utilize millimeters (mm) for all dimensions less than 1.0 meters. Although the conversion may be correct, they do not reflect the way measurements would be made in the field. Measuring instruments (tape measure) that are marked in meters and are several meters long, are marked in decimal values of meters between integral meter marks. It would, therefore, be more user friendly for dimensions less than 1.0 meter but greater than, perhaps 0.3 meters (12 inches) to be stated in decimal meters as indicated in the proposed changes.
In addition, the proposed changes reflect tolerances that are more realistic than tolerances of 0.5 mm when the distances are given in hundreds of millimeters.
PANEL ACTION: Accept.

(Log #584)

5- 20 - (250-2): Accept in Principle
SUBMITTER: C. John Beck, Pacific Gas & Electric Co.
COMMENT ON PROPOSAL NO: 5-64
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: The panel has provided no rational or reasonable technical justification in support of its actions on Proposal 5-64. Proposal 5-64 expresses the personal opinion of the submitter but does not provide technical justification for elimination of a long understood and applied fact (See references below). The application of the terminology "likely to become energized" has legitimate, reasonable and factual technical foundation. Its elimination is arbitrary and capricious and such an action will have broad reaching implications and effects of which the panel has obviously overlooked or is unaware. The resultant wording of the proposal would require all electrically conductive materials, in all cases, to be bonded even if they were isolated and not remotely likely to become energized by any means! That was never the intent.
The aspect of requiring bonding metals when likely to become energized and when intended as grounding paths or conductors

has been in the code for quite some time. For example, even in the 1981 NEC several sections state such concepts:

"Section 250-75. Bonding Other Enclosures. Metal raceways, cable trays, cable armor, cable sheath, enclosures, frames, fittings, and other metal noncurrent-carrying parts that are to serve as grounding conductors shall be effectively bonded where necessary to assure electrical continuity and the capacity to conduct safely any fault current likely to be imposed on them."

"Section 250-80(b). Other Metal Piping. Interior metal piping which may become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper shall be sized in accordance with Table 250-95 using the rating of the circuit which may energize the piping. The equipment grounding conductor for the circuit which may energize the piping shall be permitted to serve as the bonding means."

If it is unlikely for something to become energized, or to serve as a grounding conductor, the panel must provide to the user and public an explanation of the purpose or intent of requiring bonding of the system which is not likely to become energized. More so, by not providing substantiation for such a requirement, the panel is perpetuating the same type of action which was undertaken by the Technical Correlating Committee, and which was the reason behind the action on Proposal 5-229 (regarding 250-104(b)). It should also be of interest to CMP 5 that the National Fuel Gas Code Committee (NFPA 54/ANSI ASCZ223) has issued a formal interpretation with regard to the issue of gas pipe bonding (material from which the panel extracted information). The formal interpretation issued was:

"It is the intent of Z223.1/NFPA 54, Section 3.14(a), and NFPA 70, 250-104(b) to consider this bonding requirement to be satisfied where a grounded gas appliance is attached to the metal gas piping."

Panel 5, by its prior actions regarding bonding and grounding, created the potential for conditions which could have diminished the safety of certain installations. Opening up this issue to all electrically conductive materials, regardless and without a thorough understanding of the potential wide application of such a broad requirement, of the understanding the consequences of potential installation or use of that material can result in the same situation.

By its actions on Proposals 5-64, the panel has not provided the required technical guidance to resolve the necessity of bonding all electrically conductive materials, no matter in what form or application, nor provided the public the necessary direction and guidance for providing that bonding. Furthermore, by not providing guidance on the appropriate means for implementing such bonding the panel's action on these proposals will continue to allow for an unsafe practice which is contrary to other safety and code documents. For instance, it creates a condition where the gas piping system becomes a current carrying conductor and grounding conductor and interjects the gas controls for such systems into the potential path, and to the possibility of fault level currents. How do you bond flexible metal gas venting pipe, and exposure of such to currents, much less fault currents, could result in damage to the venting system leading to possible CO issues. Gas piping and gas piping system components are not tested nor listed for such application, the components are not insulated nor contain isolating unions or bushings, and the results of subjecting these systems to such currents can result in unsafe or hazardous conditions. What about simple metal door frames or other electrically conductive building materials? Such broad application of such a requirement as promulgated by Proposal 5-64 is unwarranted and arbitrary without full consideration or understanding of the breath and scope of such an application.

It is my recommendation that Panel 5 reconsider and reject this proposal and not perpetuate requirements which have no technical justification and the application of which can result is unreasonable and unsafe conditions.

PANEL ACTION: Accept in Principle.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16

(Log #585)

5- 21 - (250-2): Accept in Principle

SUBMITTER: C. John Beck, Pacific Gas & Electric Co.

COMMENT ON PROPOSAL NO: 5-65

RECOMMENDATION: This proposal should be rejected.

SUBSTANTIATION: The panel has provided no rational or reasonable technical justification in support of its actions on Proposal 5-65. Proposal 5-65 expresses the personal opinions of the individual but does not provide technical justification for elimination of a long understood fact (See references below). The application of the terminology "likely to become energized" has legitimate and factual technical foundation and its use was not intended to apply only to structural steel, but to any ferrous system likely to become energized or intended for use as grounding conductors. Such a position that the applicability was intended only to structural steel is without foundation or historical technical support. For example, even in the 1981 NEC several sections support the concepts of "likely to become energized" and used as "grounding conductors":

"Section 250-75. Bonding Other Enclosures. Metal raceways, cable trays, cable armor, cable sheath, enclosures, frames, fittings, and other metal noncurrent-carrying parts that are to serve as grounding conductors shall be effectively bonded where necessary to assure electrical continuity and the capacity to conduct safely any fault current likely to be imposed on them."

"Section 250-80(b). Other Metal Piping. Interior metal piping which may become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper shall be sized in accordance with Table 250-95 using the rating of the circuit which may energize the piping. The equipment grounding conductor for the circuit which may energize the piping shall be permitted to serve as the bonding means."

Note that the above is referring to metal systems which are "likely to become energized" and "that are to serve as grounding conductors." To assume the submitter of Proposal 5-65 was at fault by misuse of a comma is to commit to a serious change without historical support or technical justification other than the opinion of a particular person.

If there is no possibility for such to become energized, the panel must provide to the user and public an explanation of the purpose or intent of requiring bonding of the system which is not likely to become energized. More so, by not providing substantiation for such a requirement, the panel is perpetuating the same type of action which was undertaken by the Technical Correlating Committee, and which was the reason behind the action on Proposal 5-229 (regarding 250-104(b)). It should also be of interest that the ANSI ASC Z223/NFPA 54 National Fuel Gas Code Committee issued the following formal interpretation with regard to the issue of gas pipe bonding (material from which the panel originally extracted information). The formal interpretation issued was:

"It is the intent of Z223.1/NFPA 54, Section 3.14(a), and NFPA 70, 250-104(b) to consider this bonding requirement to be satisfied where a grounded gas appliance is attached to the metal gas piping system."

By its actions on Proposal 5-65 the panel has not provided the required technical necessity of bonding all systems not likely to become energized or provided the public the necessary direction and guidance for providing that bonding. Furthermore, by not providing guidance on the appropriate means for implementing such bonding the panel's action on these proposals will continue to allow for an unsafe practice which is contrary to other safety and code documents. For instance, it creates a condition where the gas piping system could become a current carrying conductor and grounding conductor, and interjects the gas controls for such systems into the potential current path and subject to the possibility of fault level currents. Recall that National Fuel Gas Code specifically prohibits the use of gas piping as a means to carry current and is not to be used for such purposes. Gas piping and gas piping system components are not tested nor listed for such application, the gas piping systems components are not normally isolated by means of isolating unions or bushings. The results of subjecting these systems to such currents can result in unsafe or hazardous conditions. Further, which such potentially broad application of such a requirement as promulgated by Proposal 5-65 even metal gas venting systems would be interpreted as required to be electrically bonded. Such an action could have serious safety implications and result in damage to certain metal systems and introduction of CO gas. Blind application of such a requirement or condition on a broad scale, without due consideration of all aspects to the system being required to be bonded, can have

serious consequences. The original wording including "likely to become energized" was carefully, thoughtfully and reasonably thought out when it was first included in the NEC.

It is recommended that Panel 5 reconsider and reject this proposal and let the existing wording remain.

PANEL ACTION: Accept in Principle.

5- 22 - (250-2): Accept in Principle
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 5-57
RECOMMENDATION: The panel should reconsider the proposal 5-57. The nature and spirit of the proposal are well intended and are continuing in the direction of further expanding on the performance aspect of Article 250. In (a)(1) change "or are optionally grounded" to "or other electrical systems specified in Section 250-21 that are grounded by choice". In (b)(2) that facilitates the operation of ground fault detection devices if utilized. The proposal adds clarity and is designed to organize this section for more logical layout. This is separation into two separate items (Grounded systems and ungrounded systems is in step with addressing the users concerns and is consistent with the reorganization patterns in other sections.)

5-57 - 250-2 Revision Proposed

250.2 General Requirements for Grounding and Bonding. The following general requirements identify what grounding and bonding of electrical systems are required to accomplish. The prescriptive methods contained in Article 250 shall be followed to comply with the performance requirements of this section.

(a) Grounded Systems.

(1) Electrical System Grounding. Electrical systems that are required to be grounded or are optionally grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher voltage lines and that will stabilize the voltage to earth during normal operation.

(2) Grounding of Electrical Equipment. Conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth so as to limit the voltage to ground on these materials.

(3) Bonding of Electrical Equipment. Conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the supply system grounded conductor in a manner that establishes an effective fault current path.

(4) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials, such as metal water piping, metal gas piping, and structural steel members, that are likely to become energized shall be connected together and to the supply system grounded conductor in a manner that establishes an effective fault current path.

(5) Creating an Effective Fault Current Path. Electrical equipment and wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low impedance circuit capable of safely carrying the maximum fault current likely to be imposed on it from any point on the wiring system where a fault may occur to the grounded conductor at the service. The earth shall not be used as the sole equipment grounding conductor or fault current path.

(b) Ungrounded Systems.

(1) Grounding of Electrical Equipment. Conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth in a manner that will limit the voltage imposed by lightning or unintentional contact with high voltage lines and limit the voltage to ground on these materials created by capacitance.

(2) Bonding of Electrical Equipment. Conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the supply system grounded equipment in a manner that facilitates the use of ground fault detection devices, where used voluntarily.

(3) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials, such as metal water piping, metal gas piping, and structural steel members, that are likely to become energized shall be connected together and to the supply system grounded equipment in a manner that facilitates the use of ground fault detection devices, where used voluntarily.

(4) Ground Fault Detection Devices. Electrical equipment, wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low impedance circuit from any point on the wiring system where a fault may occur the grounded service equipment to facilitate the use of ground fault detection devices, where used voluntarily. The earth shall not be used as the sole equipment grounding conductor or fault current path.

SUBSTANTIATION: At the annual meeting of the Southwestern Section, IAEI, on September 26, 2000, the members in attendance voted unanimously to recommend that the panel accept this proposal as revised.

Grounded and ungrounded systems need separate requirements for grounding and bonding.

On grounded systems, electrical equipment is bonded to create a return path for fault current to the source of supply which will force an overcurrent device to operate when a ground-fault occurs.

On ungrounded system, there is no return path from the point of ground-fault to the source of supply. The only "protection" against ground-fault is some type of ground-fault detection. While the use of ground-fault detection devices is voluntary, equipment must be bonded to assure that such devices will work when used voluntarily.

Bonding of equipment on ungrounded systems also assures that overcurrent devices will operate properly when there is a second fault on the system.

PANEL ACTION: Accept in Principle.

SUBMITTER: Charles Mello, Milwaukie, OR
COMMENT ON PROPOSAL NO: 5-57
RECOMMENDATION: Replace the text of 250-2 with the following. [NEW TEXT]

250.2 General Requirements for Grounding and Bonding. The following general requirements identify what grounding and bonding of electrical systems are required to accomplish. The prescriptive methods contained in Article 250 shall be followed to comply with the performance requirements of this section.

(A) Grounded Systems.

(1) Electrical System Grounding. Electrical systems that are grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher voltage lines and that will stabilize the voltage to earth during normal operation.

(2) Ground of Electrical Equipment. Non-current carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth so as to limit the voltage to ground on these materials.

(3) Bonding of Electrical Equipment. Non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the supply system grounded conductor in a manner that establishes an effective ground fault current path.

(4) Bonding of Electrically Conductive Materials and Other Equipment.
Electrically conductive materials, such as metal water piping, metal gas piping, and structural steel members, that are likely to become energized shall be connected together and to the supply system grounded conductor in a manner that establishes an effective ground fault current path.

(5) Effective Ground Fault Current Path. Electrical equipment and wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low impedance circuit capable of safely carrying the maximum ground fault current likely to be imposed on it from any point on the wiring system where a ground fault may occur to the grounded conductor at the service or source of a separately derived system.

The earth shall not be used as the sole equipment grounding conductor or ground fault current path.

(B) Ungrounded Systems.

(1) Grounding of Electrical Equipment. Non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth in a manner that will limit the voltage imposed by lightning or unintentional contact with higher voltage lines and limit the voltage to ground on these materials.

(2) Bonding of Electrical Equipment. Non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the supply system grounded equipment in a manner that creates a permanent, low impedance path for ground fault current which is capable of carrying the maximum fault current likely to be imposed on it.

(3) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials, such as metal water piping, metal gas piping, and structural steel members, that are likely to become energized shall be connected together and to the supply system grounded equipment in a manner that creates a permanent, low impedance path for ground fault current which is capable of carrying the maximum fault current likely to be imposed on it.

(4) Path for Fault Current. Electrical equipment, wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low impedance circuit from every point on the wiring system to the grounded service equipment or source of separately derived system:

(a) To facilitate the operation of ground fault detection devices where used voluntarily to detect a fault on the wiring system, and

(b) To facilitate the operation of overcurrent devices should a second fault occur on the wiring system.

The earth shall not be used as the sole equipment grounding conductor or fault current path.

FPN: See Figure 250-2 for information on the organization of Article 250.

Figure 250-2 grounding. (Figure not shown)

SUBSTANTIATION: This proposal should have been accepted in principle and the wording corrected to resolve the panel's issues. The original submitter's substantiation is correct in that the present wording is both confusing and also incorrect. The present wording actually creates the concept of a ground fault current path to an ungrounded system which is impossible. The proposed wording should resolve most of the panel's issues as stated in the panel statement. The four times rating has been removed as it does not have solid technical substantiation. The separation of these performance requirements in to subsets of "grounded systems" and "ungrounded systems" is consistent with other sections in Article 250 where this was done to ensure clarity when dealing with one system or the other.
PANEL ACTION: Accept in Principle.
Revise 1999 NEC Section 250-2 to become new NEC 2002 Section 250.4 and to read as follows:

250.4 General Requirements for Grounding and Bonding. The following general requirements identify what grounding and bonding of electrical systems are required to accomplish. The prescriptive methods contained in Article 250 shall be followed to comply with the performance requirements of this section.

(A) Grounded Systems.

(1) Electrical System Grounding. Electrical systems that are grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher voltage lines and that will stabilize the voltage to earth during normal operation.

(2) Grounding of Electrical Equipment. Non-current carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth so as to limit the voltage to ground on these materials.

(3) Bonding of Electrical Equipment. Non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the electrical supply source in a manner that establishes an effective ground fault current path.

(4) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials that are likely to become energized shall be connected together and to the electrical supply source in a manner that establishes an effective ground fault current path.

(5) Effective Ground Fault Current Path. Electrical equipment and wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low impedance circuit capable of safely carrying the maximum ground fault current likely to be imposed on it from any point on the wiring system where a ground fault may occur to the electrical supply source. The earth shall not be used as the sole equipment grounding conductor or effective ground fault current path.

(B) Ungrounded Systems.

(1) Grounding of Electrical Equipment. Noncurrent-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth in a manner that will limit the voltage imposed by lightning or unintentional contact with higher voltage lines and limit the voltage to ground on these materials.

(2) Bonding of Electrical Equipment. Noncurrent-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the supply system grounded equipment in a manner that creates a permanent, low impedance path for ground-fault current which is capable of carrying the maximum fault current likely to be imposed on it.

(3) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials that are likely to become energized shall be connected together and to the supply system grounded equipment in a manner that creates a permanent, low impedance path for ground fault current which is capable of carrying the maximum fault current likely to be imposed on it.

(4) Path for Fault Current. Electrical equipment, wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low impedance circuit from any point on the wiring system to the electrical supply source to facilitate the operation of overcurrent devices should a second fault occur on the wiring system. The

earth shall not be used as the sole equipment grounding conductor or effective fault current path.

FPN 1: A second fault that occurs through the equipment enclosures and bonding is considered a ground fault.

FPN 2: See Figure 250.4 for information on the organization of Article 250.

Figure 250.4 Grounding.

(Renumber 1999 NEC Figure 250-2 as new Figure 250.4 to be placed here)

PANEL STATEMENT: This panel action addresses the concerns of the submitter. Sections 250.2(A)(4) and 250.2(B)(3) were revised to generalize the requirement.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16

(Log #1984)

5- 27 - (250-2): Accept in Principle

SUBMITTER: Charles Mello, Milwaukie, OR

COMMENT ON PROPOSAL NO: 5-65

RECOMMENDATION: Revise the text as follows.

250.2

c) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials <u>that are likely to become energized</u>, such as metal water piping, metal gas piping, and structural steel members, ~~that are likely to become energized~~ shall be bonded as specified by this article to the supply system grounded conductor or, in the case of an ungrounded electrical system, to the electrical system grounded equipment, in a manner that establishes an effective path for fault current.

SUBSTANTIATION: The items identified are examples of those electrically conductive materials that are not part of the electrical system that may need bonding. The intent of this performance requirement is that any conductive materials that are likely to be energized need to be adequately bonded to the system so that an effective ground fault current path is established if these items were to become energized by a fault. The revised text makes it clearer that the likely to become energized applies to all cases. It is not the intent to only state that only building steel that is likely to become energized is required to be bonded whereas all other metal parts or structures are required to be bonded without regard to if they are likely to become energized or not. If taken literally all isolated sections for fire sprinkler piping, all ventilation ducting, all gas piping, and any other metal would have to be bonded to the system by some means, but only building steel where it might become energized would have to be bonded. In this general performance section, requirements that are not supported by the prescriptive parts of the Article should not be established.

PANEL ACTION: Accept in Principle.

COMMENT ON PROPOSAL NO: 5-57

RECOMMENDATION: I respectfully request that the panel reconsider its action on this proposal and accept the proposed changes which have been revised to reflect the concerns identified in the panel statement.

Amend Section 250-2 to read as follows:

250-2. General Requirements for Grounding and Bonding. The following general requirements identify what grounding and bonding of electrical systems are required to accomplish. The prescriptive methods contained in Article 250 shall be followed to comply with the performance requirements of this section.

(A) Grounded Systems.

(1) Electrical System Grounding. Electrical systems that are grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher voltage lines and that will stabilize the voltage to earth during normal operation.

(2) Grounding of Electrical Equipment. Noncurrent carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth so as to limit the voltage to ground on these materials.

(3) Bonding of Electrical Equipment. Noncurrent-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the supply system grounded conductor in a manner that establishes an effective fault current path.

(4) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials, such as metal water piping, metal gas piping, and structural steel members, that are likely to become energized shall be connected together and to the supply system grounded conductor in a manner that establishes an effective fault current path.

(5) Effective Fault Current Path. Electrical equipment and wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low impedance circuit capable of safely carrying the maximum fault current likely to be imposed on it from any point on the wiring system where a fault may occur to the grounded conductor at the service. The earth shall not be used as the sole equipment grounding conductor or fault current path.

(B) Ungrounded Systems.

(1) Grounding of Electrical Equipment. Noncurrent-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth in a manner that will limit the voltage imposed by lightning or unintentional contact with higher voltage lines and limit the voltage to ground on these materials created by capacitance.

(2) Bonding of Electrical Equipment. Noncurrent-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the supply system grounded equipment in a manner that creates a permanent, low impedance path for fault current which is capable of carrying the maximum fault current likely to be imposed on it.

(3) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials, such as metal water piping, metal gas piping, and structural steel members, that are

likely to become energized shall be connected together and to the supply system grounded equipment in a manner that creates a permanent, low impedance path for fault current which is capable of carrying the maximum fault current likely to be imposed on it.

(4) Path for Fault Current. Electrical equipment, wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low impedance circuit from every point on the wiring system to the grounded service equipment:

(a) to facilitate the operation of ground fault detection devices where used voluntarily to detect a fault on the wiring system, and

(b) to facilitate the operation of overcurrent devices should a second fault occur on the wiring system.

The earth shall not be used as the sole equipment grounding conductor or fault current path.

FPN: See Figure 250-2 for information on the organization of Article 250.

Figure 250-2 Grounding. (Figure not shown)

SUBSTANTIATION: This proposal is strictly editorial in nature. It does not propose new requirements for grounding and bonding. It has been amended to address the concerns identified in the panel statement.

The proposed reorganization of Article 250-2 is intended to address two main issues.

The first is the separation of requirements for grounded and ungrounded systems. The performance requirements for these systems are different. Combining them results in long, complicated, "two-part" sentences that are difficult to understand and easily misinterpreted. Separating them allows for shorter, clearer sentences which are much easier to understand. This proposal is consistent with the panel's actions to separate the requirements for grounded and ungrounded systems in Sections 250-24 and 250-30.

The second is the revision of 250-2(b) to separate bonding requirements, which create a return path for fault current to the source of supply, from grounding requirements which create a connection to earth. These are separate performance requirements for connections that perform totally different functions. Identifying them as such will provide for better understanding of the requirements.

The Usability Task Group proposed the rewrite of 250-2 as performance requirements in an effort to make grounding and bonding more understandable to the user of the code. It is important that these requirements be clear and easily understood. It is especially important that the wording used be consistent with the definitions of terms in Article 100. This proposed reorganization and revision of 250-2 is intended to achieve that goal.

At the September 26, 2000 meeting of the Southwestern Section, IAEI, the members in attendance voted unanimously to recommend that the panel accept this proposal as revised.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Comment 5-26.

(Log #1540)

5- 31 - (250-2-Fault Curent Path, Effective Fault Current Path, Ground Fault): Accept in Principle

SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors

COMMENT ON PROPOSAL NO: 5-56

RECOMMENDATION: This request is that Code Making Panel 5 reconsider the action taken on this proposal. Revise Section 250-2. Definitions, to define technical terms used in Article 250. Adding definitions to define some of the critical performance based terms used in Article 250 can add to the increased understanding of the purposes of grounding and bonding and promote a more user friendly Article 250. The style manual indicates that terms be defined. The proposed new section would read as follows:

Proposal 5-56, 250-2 Revision

Fault Current Path. An electrically conductive path from the point of a ground fault on a wiring system to the grounded conductor at the service. The path may consist of any combination of equipment grounding conductors, metallic raceways, metallic cable sheaths, electrical equipment, and any other electrically conductive material such as metal water and gas piping, steel framing members, stucco mesh, metal ducting, reinforcing steel, phone or TV cables, and the earth itself.

Effective Fault Current Path. An electrically conductive path from the point of a ground fault on a wiring system to the grounded conductor at the service designed and intended to carry current under fault conditions. An effective fault current path is created by effectively bonding together all of the electrically conductive materials that are likely to be energized by the wiring system.

Effective bonding is accomplished through the use of equipment grounding conductors, bonding jumpers or bonding conductors approved metallic raceways, connectors and couplings, approved metallic sheathed cable and cable fittings, and other approved devices. A ground fault path is effective when it is an intentionally constructed, permanent, low impedance circuit that will safely carry the maximum fault likely to be imposed on it.

Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the earth or some electrically conductive material which is connected to earth.

SUBSTANTIATION: At the annual meeting of the Southwestern Section, IAEI, on September 26, 2000, the members in attendance voted unanimously to recommend that the panel accept this proposal as revised.

The NEC Style Manual requires definitions of technical terms which are not clearly defined in other codes and standards or standards and reference publications.

The definitions proposed are technical terms used in Article 250 which are not presently defined.

These definitions fo the new terms are clear and accurate. They will be important aids to users of the NEC attempting to (remainder missing)

These definitions of the new terms are clear, complete and accurate. They will be important aids to users of the NEC attempting to (remainder of text not provided with proposal).

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Comment 5-33.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16

(Log #2298)

5- 32 - (250-2-Fault Current Path, Effective Fault Current Parth & Ground Fault (New)): Accept in Principle

SUBMITTER: Thomas E. Trainor, City of San Diego, CA

COMMENT ON PROPOSAL NO: 5-56

RECOMMENDATION: I respectfully request that the panel reconsider its action on this proposal and accept the recommended new definitions which have been amended to reflect the concerns identified in the panel statement.

Add a new Section, 250-2. Definitions, to define technical terms used in Article 250. Present Section 250-2 to be renumbered to 250-3. The proposed new section would read as follows:

250.2. Definitions.

Fault Current Path. An electrically conductive path from the point of a ground fault on a wiring system to the grounded conductor at the service. The path may consist of any combination of equipment grounding conductors, metallic raceways, metallic cable sheaths, electrical equipment, and any other electrically conductive material such as metal water and gas piping, steel framing members, stucco mesh, metal ducting, reinforcing steel, phone or TV cables, and the earth itself.

Effective Fault Current Path. An electrically conductive path from the point of a ground fault on a wiring system to the grounded conductor at the service designed and intended to carry current under fault conditions. An effective fault current path is created by effectively bonding together all of the electrically conductive materials that are likely to be energized by the wiring system. Effective bonding is accomplished through the use of equipment grounding conductors, bonding jumpers or bonding conductors approved metallic raceways, connectors and couplings, approved metallic sheathed cable and cable fittings, and other approved devices. A ground fault path is effective when it is an intentionally constructed, permanent, low impedance circuit that will safely carry the maximum fault current likely to be imposed on it.

Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the earth or some electrically conductive material which is connected to earth.

SUBSTANTIATION: The term Fault Current Path is a new technical term used in the 1999 NEC. The term Effective Fault Current Path is a new technical term proposed for the 2002 NEC. The term Ground Fault is a technical term not defined in Article 100 and requires a definition to describe why a fault current path is required.

Definitions of technical terms are supported by both the NEC Style Manual and the Scope of Article 100. Definitions are not required where the term is clearly defined in a related code or standard or can be found in standard reference material. This is not the case with these terms. They are unique to Section 250. Definitions are needed to assist the user in properly applying the requirements of Article 250.

The thrust of the Usability Task Group recommendation to rewrite the present Section 250-2, was to use performance requirements to clearly describe what grounding and bonding are intended to accomplish. Providing definitions of the technical terms used in this Section will certainly make them easier to understand and apply. The action of Code-Making Panel 1 to delete Section 90-1(c) recognizes that the NEC is used by less than fully trained persons. That just adds to the importance of providing the user with clear, well-defined requirements. The proposed definitions are an important part of that effort.

At the September 26, 2000 meeting of the Southwestern Section, IAEI, the members in attendance voted unanimously to recommend that the panel accept this proposal as revised.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Comment 5-33.

5- 33 - (250-2-Ground Fault Current Path, Effective Ground Fault Current Path, and Ground Fault): Accept in Principle

Note: The Technical Correlating Committee directs that the second Fine Print Note be deleted because it contains requirements which are not in accordance with the NEC Style Manual.

SUBMITTER: Charles Mello, Milwaukie, OR

COMMENT ON PROPOSAL NO: 5-56

RECOMMENDATION: Add the following definitions to Section 250.2. [NEW TEXT]

250.2. Definitions.

Ground Fault Current Path. An electrically conductive path from the point of a ground fault on a wiring system through normally non-current carrying conductors, equipment or the earth to the electrical supply source.

FPN: Examples of ground fault current paths could consist of any combination of equipment grounding conductors, metallic raceways, metallic cable sheaths, electrical equipment, and any other electrically conductive material such as metal water and gas piping, steel framing members, stucco mesh, metal ducting, reinforcing steel, phone or TV cables and the earth itself.

Effective Ground Fault Current Path. An intentionally constructed, permanent, low impedance electrically conductive path from the point of a ground fault on a wiring system to the power system supply source for the service or a separately derived system designed and intended to carry current under fault conditions.

FPN: An effective fault current path is created by effectively bonding together all of the electrically conductive materials that are likely to be energized by the wiring system. Effective bonding is accomplished through the use of equipment grounding conductors, bonding jumpers or bonding conductors, approved metallic raceways, connectors and couplings, approved metallic sheathed cable and cable fittings, and other approved devices. A ground fault path is effective when it will safely carry the maximum fault current likely to be imposed on it.

Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the normally noncurrent carrying conductors, metallic enclosures, metallic raceways, metallic equipment, or earth.

SUBSTANTIATION: The proposal should have been accepted in principle and modified to resolve the few objections the panel had. The technical substantiation provided by the submitter demonstrated the need for these definitions for both existing terms that were undefined or for new terms proposed to clarify the present text.

The term Fault Current Path is a new technical term used in the 1999 NEC. To further clarify its use, the word "Ground" has been added. The term Effective Ground Fault Current Path is a new technical term proposed for the 2002 NEC. The term Ground Fault is a technical term not defined in Article 100 and requires a definition to describe what a ground fault is to explain why a ground fault current path is required.

Definitions of technical terms are supported by both the NEC Style Manual and the Scope of Article 100. Definitions are not required where the term is clearly defined in a related code or standard or can be found in standard reference material. This is not the case with these terms. They are unique to Section 250. Definitions are needed to assist the user in properly applying the requirements of Article 250 and understand the differences between grounding and bonding.

The substantiation of the Usability Task Group recommendations to reorganize and to create Section 250-2 for the 1999 NEC, was to use performance based requirements to clearly describe what grounding and bonding are intended to accomplish. The technical terms used need to be properly defined to make them easier to understand and apply. The basis for many changes accepted over the last two Code cycles have been for clarity and to make the document more user friendly. Specifically in Article 250, the terminology has been stated as confusing and unclear meaning that definitions of the key words or phrases used is clearly needed.

PANEL ACTION: Accept in Principle.

Revise the text to read as follows:

250-2 Definitions.

Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the normally non-current carrying conductors, metallic enclosures, metallic raceways, metallic equipment, or earth.

Ground-Fault Current Path. An electrically conductive path from the point of a ground fault on a wiring system through normally non-current carrying conductors, equipment or the earth to the electrical supply source.

FPN: Examples of ground-fault current paths could consist of any combination of equipment grounding conductors, metallic raceways, metallic cable sheaths, electrical equipment, and any other electrically conductive material such as metal water and gas piping, steel framing members, stucco mesh, metal ducting, reinforcing steel, shields of communications cables, and the earth itself.

Effective Ground-Fault Current Path. An intentionally constructed, permanent, low impedance electrically conductive path designed and intended to carry current under ground fault conditions from the point of a ground fault on a wiring system to the electrical supply source.

FPN: An effective ground-fault current path is created by effectively bonding together all of the electrically conductive materials that are likely to be energized by the wiring system. Effective bonding is accomplished through the use of equipment grounding conductors, bonding jumpers or bonding conductors, approved metallic raceways, connectors and couplings, approved metallic sheathed cable and cable fittings, and other approved devices. A ground-fault path is effective when it will safely carry the maximum ground fault current likely to be imposed on it.

PANEL STATEMENT: The definitions of these terms are warranted for a more complete foundation in the performance section of Article 250. Defining the words or terms appearing in Section 250-2 will help the users more readily understand the prescriptive requirements that follow Part A of Article 250. Definitions of technical terms when used in the NEC are supported by the NEC Style Manual. These definitions are in step with the Usability Task Group recommendation to that 250-2 include performance requirements to clearly describe what grounding and bonding is intended to accomplish. The word "grounded" was added in three locations to ensure clarity that this section is dealing with ground faults as opposed to short circuits.

SUBMITTER: Donald Martin, Sr., DLR Group Architects & Engineers, Inc.

COMMENT ON PROPOSAL NO: 5-64

RECOMMENDATION: Revise as follows:

Electrically conductive materials, such as metal water piping, metal gas piping, <u>metal fences,</u> and structural steel members....

Note: Lightning protection/building grounding system considerations...
SUBSTANTIATION: A situation where a metal fence (chain link) is installed to and or on a building structure.
*Case and point: Prison facility which has a security metal fence installed up and over the roof of the structure, attached to the structure.
PANEL ACTION: Reject.
PANEL STATEMENT: It is not the intent of the panel to itemize all possible electrically conductive materials likely to become energized. If the chain link fence is likely to become energized, it will require bonding as set forth in the panel action of Comment 5-26.

5- 38 - (250-2(c)): Accept in Principle
SUBMITTER: Robert Molde, Xeel Energy
COMMENT ON PROPOSAL NO: 5-65
RECOMMENDATION: Please accept the proposal as modified. Delete the following text from section 250-2(c) including commas: ",such as metal water piping, metal gas piping, and structural steel members,".
The revised text for Section 250-2(c) will read as follows:
"Electrically conductive materials that are likely to become energized shall be bonded as specified by this article to supply grounded conductor or, in the case of an ungrounded electrical system, to the electrical system grounded equipment, in a manner that establishes an effective path for fault current".
SUBSTANTIATION: We believe the submitter is incorrect in stating that the structural steel is the only item the statement, "that are likely to become energized", applies to. Deleting the comma after "and structural steel members" does not improve the intent of the section. Different individuals may still interpret the section differently with or without the comma. Metal water piping, metal gas piping, and structural steel members are all conductive materials so it is not necessary that they be listed here. The general statement "all conductive materials" is sufficient.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 5-26.

5- 39 - (250-2(c)): Accept in Principle
SUBMITTER: Wayne A. Lilly, Bridgewater, VA
COMMENT ON PROPOSAL NO: 5-65
RECOMMENDATION: Revise Section 250-2(c) to read as follows:
(c) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials that <u>are likely to become energized</u> such as metal water piping, metal gas piping, and structural steel members, ~~that are likely to become energized~~ shall be bonded as specified by this article to the supply system grounded conductor or, in the case of an ungrounded electrical system, to the electrical system grounded equipment, in a manner that establishes an effective path for fault current.
SUBSTANTIATION: I agree with the comments made by Mr. Mello and Mr. White. The wording in the Draft will require each isolated piece of water piping and gas piping to be bonded regardless of whether it may become energized or not. This means a structure with plastic water lines connected to metallic stub ups at each plumbing fixture will have to have those metallic stub ups bonded.
The location of the phrase "likely to become energized" is critical to the understanding of the requirements of this section. By locating that phrase ahead of the items to be bonded it applies to each of the items. With this proposed wording there is no doubt that metal water piping, metal gas piping, and structural steel members are required to be bonded but only when they "are likely to become energized".
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 5-26.

5- 42 - (250-8): Reject
SUBMITTER: Don Ganiere, Ottawa, IL
COMMENT ON PROPOSAL NO: 5-71
RECOMMENDATION: The proposal should be accepted in principle. Add new text: "Machine screws and bolts shall be permitted to secure listed pressure connectors and solid conductors".
SUBSTANTIATION: Machine screws and bolts are used to secure pressure connectors and solid connectors. A machine screw is not a listed means and use of machine screws would be a violation. New wording should be added: "Machine screws and bolts shall be permitted to secure listed pressure connectors and solid conductors".
PANEL ACTION: Reject.
PANEL STATEMENT: The use of a machine screw to secure a listed pressure connector must be installed in accordance with the manufacturers. instruction. Section 110-14(a) does not permit the connection of a solid conductor with an ordinary machine screw.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
DOBROWSKY: The comment should be accepted in principle and the proposed additional text revised as follows: "Machine screws identified for the purpose shall be permitted to secure 10 AWG or smaller conductors."
This concept is permitted as described in Section 110.14(A). Forming a loop in a 14 AWG through 10 AWG solid conductor and securing it with a screw in compliance with Section 110.14(A) should be acceptable in Section 250.8.
HAMMEL: The comment should be accepted in principle and the proposed additional text revised as follows:
"Machine screws identified for the purpose shall be permitted to secure 10AWG or smaller conductors."
This concept is permitted as described in Section 110.14(A). Forming a loop in a 14AWG through 10AWG solid conductor and securing it with a screw in compliance with Section 110.14(A) should be acceptable in Section 250.8.

(Log #1522)

5- 43 - (250-20(b)(1)): Reject
SUBMITTER: George O. Stiles, Stiles Electric Service
COMMENT ON PROPOSAL NO: 5-73
RECOMMENDATION: Revise text as follows:
250.20 Alternating -Current Circuits and Systems to Be Grounded. Alternating-current circuits and systems shall be grounded as provided for in (A), (B), (C), or (D). Other circuits and systems shall be permitted to be grounded. If such systems are grounded, they shall comply with the applicable provision of this article. (ROP 5-72)
FPN: An example of a system permitted to be grounded is a corner-grounded delta transformer connection. See 250-26(d) for conductor to be grounded.
(B) Alternating-Current Systems of 50 Volts to 1000 Volts. Alternating-current systems of 50 volts to 1000 volts that supply premises wiring and premises wiring systems shall be grounded ~~under any of the following conditions:~~
~~(1) Where the system can be grounded so that the maximum voltage to ground on the ungrounded conductors does not exceed 150 volts~~
~~(2) Where the system is 3-phase, 4-wire, wye connected in which the neutral is used as a circuit conductor~~
~~(3) Where the system is 3-phase, 4-wire, delta connected in which the midpoint of one phase winding is used as a circuit conductor.~~
(This makes this a positive statement. This option would comply with the panel's stated desire to require all 50 to 1000 volt systems to be grounded.)
OR
(B) Alternating-Current Systems of 50 Volts to 1000 Volts. Alternating-current systems of 50 volts to 1000 volts that supply premises wiring and premises wiring systems shall be grounded under any of the following conditions:
(1) Where the system can be grounded so that the maximum voltage to ground on the ungrounded conductors does not exceed ~~150 volts~~.
(2) Where the system is 3-phase, 4-wire, wye connected in which the neutral is used as a circuit conductor.
(3) Where the system is 3-phase, 4-wire, delta connected in which the midpoint of one phase winding is used as a circuit conductor.
(The panel may conclude that constrictions should be placed on allowed voltage and change the 150 volt rating to some other more appropriate value. They could justify their actions positively as exemplified by 250-21 and 250-22 type of language.
SUBSTANTIATION: The unanimous vote of the seventeen members of this Code making Panel indicates that they had s single minded desire to limit their consideration to proposals that further the evolution of the system grounding question. They did not recognize that this proposal deals with the problem of contradictive statements in the text of the code. Failure to address this proposal will cause the voracity of the individual Code Panel members to be impunged and the usefulness of the code will be diminished.
A great problem with understanding and enforcing the code is dealing with avances - statements that are very similar - (example, 120-200 and 120-240) and contradictive statements especially when they are in the same section. There have been contradictions in Article 250 for many code cycles (text illegible) but they are much more apparent when published (text illegible) the 2002 Code. The manner in which a previous panel resolved a similar problem is revealed by referring to proposal 6-60 in the 1998 ROC. Examples of contradictions, (text illegible). How are electricians and inspectors supposed to react?
PANEL ACTION: Reject.
PANEL STATEMENT: The commentor has not provided any substantiation as to why systems that are permitted to be ungrounded and have performed successfully should now be required to be grounded.

5- 46 - (250-20(d), FPN No. 1): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 5-77
RECOMMENDATION: Accept in Principle revised:
FPN No. 1: An alternating-current power source such as an on-site generator is not a separately derived system if ~~the neutral~~ a circuit conductor is solidly connected to a ~~service-supplied system neutral~~ supply conductor originating in another system.
SUBSTANTIATION: If the FPN is not intended to be inclusive it should contain the phrase "for example". It can be misleading. Many Code users may not check the definition of what is a separately derived system.
The proposal is inclusive and covers 2-wire or 3-phase 3-wire generators and those interconnected to a non-service transformer secondary. The definition of separately derived system does not indicate a limitation to service-supplied system interconnection or only neutrals.
PANEL ACTION: Reject.
PANEL STATEMENT: See CMP-1 Task Group substantiation contained in Comment 5-44. CMP-1 and CMP-5 both concur that the FPN is providing explanatory material and the use of "such as" in the FPN is indicating an example of what is not a separately derived system and is directly related to the code text it immediately follows. The FPN is not intended to be a fully comparable or differing definition to the NEC definition of "Separately Derived System". CMP-1 Task Group recommended that the original action of CMP-5 to reject the proposed change to this FPN was proper.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16

(Log #418)

5- 47 - (250-21): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 5-78
RECOMMENDATION: Accept in Principle revised:
The following systems of 50 volts to 1000 volts, nominal, shall be permitted to be grounded. ~~but shall not be required to be grounded.~~
(1) No change
(2) No change
(3) No change
(4) No change
FPN No change
(5) ~~High-impedence grounded neutral systems as specified in 250-36~~ Three phase three-wire systems over 150 volts, nominal, between conductors.
SUBSTANTIATION: Section 250-20 already states other circuits and systems (such as covered in this section) shall be permitted to be grounded. If the systems of (3) are grounded by choice the conditions of (A)(b)(c)(d) still apply are not justified. Removal of the phrase "shall be permitted to be grounded" will clarify that those restrictions only apply where the system in ungrounded, and where grounded by choice other code rules will suffice. Some separately derived systems which don't meet all the conditions may be required to be grounded.
High-impedence grounded systems are grounded systems. How can they be covered by the phrase "shall not be required to be grounded"?
The proposal for (5) covers the common 3-phase 3-wire delta systems of 240 and 480 volts.
PANEL ACTION: Reject.
PANEL STATEMENT: The present text makes it very clear that these systems shall be permitted to be grounded but are not required to be grounded. This Comment misquotes the existing code language. The high impedance grounded system needs to remain as this provides the alternative to a system that might fall under section 250.20(B)(1) or 250.20(B)(3) and was in fact the old exception 5 for section 250-5(b) in the 1996 Code. These exceptions were made positive text and grouped in as section 250-21 for the 1999 Code. Adding 3 phase, three wire systems over 150 volts, nominal, between conductors, serves no purpose as a new item (5) of this section as these systems are already covered in the requirements of Section 250-20(b)(1).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16

(Log #1223)

5- 48 - (250-21): Accept in Principle
SUBMITTER: Dann Strube, Lanesville, IN
COMMENT ON PROPOSAL NO: 5-78
RECOMMENDATION: Reconsider the proposal and accept.
SUBSTANTIATION: I have been told by installers and some inspectors that ungrounded systems such as 3-phase 3-wire delta systems cannot be operated as ungrounded systems. It was their position that Section 250-21 did not list 3-wire delta systems; therefore, these systems must be grounded. When they were shown the Fine Print Note to Section 250-20 that addresses delta systems, their position was "A Fine Print Note cannot be enforced."
It was quite clear that these individuals did not like ungrounded systems and were willing to stretch the words to prohibit their use. The proposed wording is intended to make it clear that systems not covered by Section 250-20 and the systems in Section 250-21 may be operated as ungrounded systems.
PANEL ACTION: Accept in Principle.
Add to a new Section 250.21(5) of the NEC 2002 draft to read as follows:
(5) Other systems that are not required to be grounded in accordance with the requirements of Section 250.20(B).
PANEL STATEMENT: The revised text meets the intent of the submitter.

5- 53 - (250-30(a)(2)): Reject
SUBMITTER: Dann Strube, Lanesville, IN
COMMENT ON PROPOSAL NO: 5-100
RECOMMENDATION: The proposal should have been accepted.
SUBSTANTIATION: Section 250-24(a)(4) requires two grounding electrode connections where a service transformer is located outside the building. The grounding connection at the transformer is adequate to stabilize the system voltage and provides lightning protection at that point. The second connection at the building provides additional protection if lightning is introduced into the system between the transformer and the building.
The same conditions exist if a derived system transformer is located outdoors. The current code seems to prohibit multiple electrode connections for a separately derived system.
The proposed change would provide the same grounding requirement for services and derived systems.
PANEL ACTION: Reject.
PANEL STATEMENT: Where the transformer of a separately derived system is provided outside the building, grounding shall be in accordance with Section 250.32.

5- 54 - (250-30(a)(2)): Accept in Principle
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 5-101
RECOMMENDATION: Revise the 2nd paragraph (from the draft) as follows: It shall be permissible to connect the grounding electrode conductor of a separately derived system to a continuous grounding electrode conductor that is connected to the building grounding electrode system and extended through the building or structure. All connections shall be made at an accessible location by an irreversible compression connector listed for the purpose, listed connections to copper busbars not less than 6 mm x 50 mm (1/4 in. x 2 in.), or by the exothermic welding process. This continuous grounding electrode conductor shall ~~not~~ be sized in accordance with 250.66 based on the total area of the derived phased conductors smaller than 3/0 AWG copper or 250 Kcmil aluminum. This continuous grounding electrode conductor and the grounding electrode conductor(s) of each separately derived system shall comply with 250.64(A) through (E).
SUBSTANTIATION: The term structures should be added for consistency with 250-50 and to allow this method in other types of construction. Requiring a 3/0 AWG conductor for all separately derived systems is excessive. The NEC should not have requirements for what could occur in the future.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 5-55.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16

(Log #1527)

5- 55 - (250-30(a)(2)): Accept in Principle
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 5-101
RECOMMENDATION: Revise as follows:
Where the grounding electrode specified in 250-30(a)(3)(1) is not available it shall be permissible to connect the grounding electrode conductor of a separately derived system to a continuous grounding electrode conductor that is connected to the building grounding electrode system and extended through the building. All connections shall be made at an accessible location by an irreversible compression connector listed for the purpose, listed connections to copper busbars not less than mm x 50 mm (1/4 in. X 2 in.), or by the exothermic welding process. This continuous grounding electrode conductor shall not be smaller than 3/0 AWG copper or 250 kcmil aluminum. This continuous grounding electrode conductor and the grounding electrode conductor(s) of each separately derived system shall comply with 250-64(a) through (e). If the electrode in 250-30(a)(3)(1) is available and the continuous grounding electrode conductor is also installed, as indicated above, then the electrodes shall be bonded together as near as practicable to the separately derived system.
SUBSTANTIATION: The original proposal addresses a valid concern and problem in the field that resulted from the new requirements added to separately derived systems using the effectively grounded metal water pipe as the electrode, and having to make this connection within 5 feet of the entry to the building structure. The proposed change that has been accepted should also be adjusted to address a possible problem of having a difference of potential when effectively grounded building steel is available and in the same area as the separately derived system. By adding these two new sentences as requirements, the possible difference of potential should be eliminated. The proposal as originally accepted would have allowed the continuous conductor to be used even if effectively grounded building steel was available and in the same area as the separately derived system. The

adjusted wording is to clarify that effectively grounded building steel is available, and in the same area as the separately derived system, then it should be used as the electrode for the system. If the alternative method given in 250-30(a)(2), as accepted, is used and effectively grounded building steel is near the separately derived system, then the two should be bonded together.
PANEL ACTION: Accept in Principle.
Revise the text of Section 250.30(A)(2) of the 2002 NEC draft and add revised Section 250.30(A)(3) to read as follows. Renumber existing Section 250.30(A)(3) to become Section 250.30(A)(4).
(2) Grounding Electrode Conductor. The grounding electrode conductor shall be installed in accordance with (a) or (b). Where taps are connected to a common grounding electrode conductor, the installation shall comply with Section 250.30(A)(3).
(a) Single Separately Derived System. A grounding electrode conductor for a single separately derived system shall be sized in accordance with Section 250.66 for the derived phase conductors and shall be used to connect the grounded conductor of the derived system to the grounding electrode as specified in Section 250.30(A)(4). Except as permitted by Sections 250.24(A)(3) or (A)(4), this connection shall be made at the same point on the separately derived system where the bonding jumper is installed.
Exception: A grounding electrode conductor shall not be required for a system that supplies a Class 1, Class 2, or Class 3 circuit and is derived from a transformer rated not more than 1000 volt-amperes, provided the system grounded conductor is bonded to the transformer frame or enclosure by a jumper sized in accordance with Section 250.30(A)(1), Exception No. 2, and the transformer frame or enclosure is grounded by one of the means specified in Section 250.134.
(b) Multiple Separately Derived Systems. Where more than one separately derived system is connected to a common grounding electrode conductor as provided in Section 250.30(A)(3), the common grounding electrode conductor shall be sized in accordance with Section 250.66 based on the total area of the largest derived phase conductor from each separately derived system.
(3) Grounding Electrode Conductor Taps. It shall be permissible to connect taps from a separately derived system to a common grounding electrode conductor. Each tap conductor shall connect the grounded conductor of the separately derived system to the common grounding electrode conductor.
(a) Tap Conductor Size. Each tap conductor shall be sized in accordance with Section 250.66 for the derived phase conductors of the separately derived system it serves.
(b) Connections. All connections shall be made at an accessible location by an irreversible compression connector listed for the purpose, listed connections to copper busbars not less than 6 mm x 50 mm (1/4 in. x 2 in.), or by the exothermic welding process. The tap conductors shall be connected to the common grounding electrode conductor as specified in Section 250.30(A)(2)(b) in such a manner that the common grounding electrode conductor remains without a splice or joint.
(c) Installation. The common grounding electrode conductor and the taps to each separately derived system shall comply with Section 250.64(A), (B), (C) and (E).
(d) Bonding. Where exposed structural steel that is interconnected to form the building frame or interior metal piping exists in the area served by the separately derived system, it shall be bonded to the grounding electrode conductor in accordance with Section 250.104.
PANEL STATEMENT: The concept of grounding electrode conductor tap conductors was found in Section 250.64(d) but that section does not cover separately derived systems. The original proposal was revised to be consistent in concept and language for permitting grounding conductor taps for separately derived systems. The words "or structure" were added to correlate action from Comment 5-54. The panel concludes the new section on bonding of structural steel meet the intent of the submitter.

COMMENT ON AFFIRMATIVE:
BOKSINER: While I affirm the Panel Action, I would like to point out that the accepted language can be interpreted to restrict the application of "listed connection to copper busbars not less than 6 mm X 50 mm" to cases of multiple separately derived systems. In many applications, a common grounding electrode conductor and a tap may be provided for a single system in order to allow subsequent systems to tap to the same common conductor. While, the initial conductor may be considered a grounding electrode conductor in accordance with new (2)(a), it would not be able to include "listed connection to copper busbars not less than 6 mm X 50 mm" since this is only permitted for installations of multiple systems. Thus, the accepted language might preclude an important application of this useful new rule.

5- 58 - (250-30(a)(3)): Accept in Principle
SUBMITTER: Robert H. Keis, Dover, DE
COMMENT ON PROPOSAL NO: 5-101
RECOMMENDATION: This proposal should be modified as stated in Mr. Dobrowsky's comment.
SUBSTANTIATION: I see no justification for the 3/0 minimum size of the GEC for this use and restriction of the connection method. Nor is there any reason to limit the use to "high-rise" buildings or "large manufacturing facilities". There are many times in small to medium size manufacturing buildings and other buildings (large and small, including malls) with step down transformers installed where running a GEC to a water pipe within 5 ft. of its entry into the building is bad enough but to have to run a 3/0 copper wire when a No. 1/0 or even a No. 2 conductor would be sufficient does not make any sense. Some of these conductors could be several hundred feet long. We are permitted to install a single equipment grounding conductor for multiple circuits in Section 250-122(c). Why can't a GEC that extends from a transformer to a water pipe or even building steel be utilized that same way. Also, if a No. 2 (just for example) is all that is required, then this wire can be run to the water pipe with no problem and no other restriction. But if I want to use it for say two transformers, I must install a 3/0. As for the restriction of how this conductor is connected to the "3/0", again this makes no sense when compared to other code requirements. Example: When grounding services, Section 250-64(d) allows conductors to be "tapped" to the grounding electrode conductor. There is no restriction on how this tap can be made, except for section 110-14 which requires proper connections, Section 250-8 lists proper connections for "Grounding and Bonding Jumpers", and Section 250-70 lists acceptable methods of connecting to electrodes, and these sections permit "listed pressure connectors" among the connection methods. Is the grounding of a separately derived system on the load side of the main service more important than

the grounding of the service equipment that has no protection ahead of it. This don't make any sense.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 5-55.

5- 59 - (250-30(a)(3)b, Exception): Reject
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 5-103
RECOMMENDATION: This proposal should be accepted in principle and revised as follows:
Exception: In industrial ~~and commercial~~ buildings, as defined by the applicable building code, where conditions of maintenance and supervision ensure that only qualified persons will service the installation and the entire length of the interior metal water pipe that is being used for the grounding electrode is exposed, the connection shall be permitted at any point on the water pipe system.
SUBSTANTIATION: I agree with the panel statement that there are many instances where the conditions of maintenance and supervision do ensure that only qualified persons service the installation, however, in many commercial buildings conditions of maintenance and supervision do not exist to the extent and degree they do in the industrial buildings. Therefore, I feel by limiting this alternative to more controlled conditions which usually exist in most qualified industrial occupancies, reduces the possibility of deficiencies and safety hazards related to the submitter's concerns.
PANEL ACTION: Reject.
PANEL STATEMENT: The type of building is only part of the requirement, conditions of maintenance and supervision are also necessary to apply this exception, regardless of the occupancy type. Some other facilities such as universities, colleges, communication firms, utilities, etc. use this exception under the stated conditions.
The introduction of building codes interjects a problem where local jurisdiction adoptions of the National Electrical Code have included definitions of commercial and industrial facilities in their statutes.

COMMENT ON PROPOSAL NO: 5-105
RECOMMENDATION: Insert the following to replace the deleted text:
(4) Grounded Conductor. If a grounded conductor is installed and where the bonding jumper is not located at the separately derived system the following shall apply:
(a) Routing and Sizing. This conductor shall be routed with the phase conductors and shall not be smaller than the required grounding electrode conductor specified in Table 250.66, but shall not be required to be larger than the largest ungrounded ~~service entrance~~ phase conductor. In addition, for ~~service entrance~~ phase conductors larger than 1100 kcmil copper or 1750 kcmil aluminum, the grounded conductor shall not be smaller than 12 1/2 percent of the area of the largest ~~service entrance~~ phase conductor. The grounded ~~service entrance~~ conductor of a three-phase, three-wire delta ~~service~~ system shall not be ~~the same size as~~ smaller than the ungrounded conductors.
(b) Parallel Conductors. Where the ~~service entrance~~ phase conductors are installed in parallel, the size of the grounded conductor shall be based on the total circular mil area of the parallel conductors as indicated in this section. Where installed in two or more raceways, the size of the grounded conductor in each raceway shall be based on the size of the ungrounded ~~service entrance~~ conductor in the raceway but not smaller than 1/0 AWG.
FPN: See 310.4 for grounded conductors connected in parallel.
(c) High Impedance. The grounded conductor on a high-impedance grounded neutral system shall be grounded in accordance with 250.36.
SUBSTANTIATION: Specific sizing requirements are necessary for grounded conductors if they are installed. If the bonding

jumper is installed at the source then other fault current return paths will be provided by the EGC.

Note: Another comment was submitted without referencing a proposal number and without all of the changes in the last sentence of (a).

PANEL ACTION: Accept in Principle.

Add a new 250.30(A)(4) to the 2002 NEC draft to read as follows:

(4) Grounded Conductor. Where a grounded conductor is installed and where the bonding jumper is not located at the source of the separately derived system, the following shall apply:

(a) Routing and Sizing. This conductor shall be routed with the derived phase conductors and shall not be smaller than the required grounding electrode conductor specified in Table 250.66, but shall not be required to be larger than the largest ungrounded ~~service entrance~~ derived phase conductor. In addition, for ~~service entrance~~ phase conductors larger than 1100 kcmil copper or 1750 kcmil aluminum, the grounded conductor shall not be smaller than 12 1/2 percent of the area of the largest derived ~~service entrance~~ phase conductor. The grounded ~~service entrance~~ conductor of a three-phase, three-wire delta ~~service~~ system shall have an ampacity not less than ~~be the same size as~~ the ungrounded conductors.

(b) Parallel Conductors. Where the ~~service entrance~~ derived phase conductors are installed in parallel, the size of the grounded conductor shall be based on the total circular mil area of the parallel conductors as indicated in this section. Where installed in two or more raceways, the size of the grounded conductor in each raceway shall be based on the size of the ungrounded ~~service entrance~~ conductors in the raceway but not smaller than 1/0 AWG.

FPN: See 310.4 for grounded conductors connected in parallel.

(c) High Impedance. The grounded conductor on a high-impedance grounded neutral system shall be grounded in accordance with 250.36.

PANEL STATEMENT: The last sentence of Section 250.30(A)(4)(a) was changed to correlate with the action on Comment 5-49 (Log #417). The word "derived" was added to be consistent with the terminology for conductors coming from separately derived systems.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16

COMMENT ON AFFIRMATIVE:

MELLO: The panel action for this comment presents a conflict with the final panel actions from Comment 5-55.

The action in Comment 5-55 revised the text to 250.30(A)(2) for the grounding electrode conductor in the draft and added a new section numbered 250.30(A)(3) for the grounding electrode conductor taps. The panel action also renumbered the existing 250.30(A)(3) dealing with the grounding electrode in the draft to 250.30(A)(4).

The panel action on Comment 5-65 creates a new section for the interconnecting bond jumper sizing and numbers it as 250.30(A)(5).

The panel action on Comment 5-62 creates a new section numbered 250.30(A)(4) dealing with sizing of the grounded circuit conductor where it may have to act to carry ground fault current. This section as numbered conflicts with the previous action and the panel action should be revised to number this as 250.30(A)(6) since it deals with the case where the conductor in 250.30(A)(5) is not present.

(Log #2247)

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16

(Log #1530)

5- 65 - (250-30(a)(5)): Accept in Principle

SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors

COMMENT ON PROPOSAL NO: 5-106

RECOMMENDATION: Add new text to read as follows:

(5) Equipment Bonding Jumper Size. The bonding jumper run with the derived phase conductors from the source of a separately derived system to the first disconnecting means shall be sized in accordance with Section 250.28(a) through (d) based on the size of the derived phase conductors.

SUBSTANTIATION: The bonding or grounding conductor that is installed between the source of a separately derived system such as a transformer and the first disconnecting means is not specifically defined by a name and there are not clear requirements for the size. Some individuals consider this strictly as an equipment grounding conductor sized per Section 250-122. Others consider it like a bonding jumper sized per Table 250-66. This conductor may have to carry a ground fault current for some time until the short circuit and ground fault protection on the primary of the source is able to operate. By defining what this conductor is and providing requirements for sizing, this issue in the code is clarified. By using the same sizing criteria as for the main bonding jumper for the derived system, the conductor sizing is adequate to perform its intended function. I agree with the submitter that a problem exists in the field. This change would clarify any confusion. I disagree with the Panel's statement that the wording does not add clarity to this section.

By accepting this proposal, it would be clear how to accomplish the sizing of this conductor and add a proper term for this conductor. The new subsection number (5) text will clarify the size of the equipment bonding jumper on secondary side of separately derived systems.

PANEL ACTION: Accept in Principle.

Add new text to read as follows:

(5) Equipment Bonding Jumper Size. Where a bonding jumper is run with the derived phase conductors from the source of a separately derived system to the first disconnecting means, it shall

be sized in accordance with Section 250.28(a) through (d) based on the size of the derived phase conductors.

5- 68 - (250-32(a), Exception): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
COMMENT ON PROPOSAL NO: 5-113
RECOMMENDATION: The proposal should be accepted.
SUBSTANTIATION: The Advisory Committee assumes that Proposal 5-123 will end up accepted in form that effectively sets a No. 8 conductor as the smallest GEC allowable at any given installation (see companion comment). The advisory Committee reiterates its original substantiation, to which Code-Making Panel 5 offered no technical rebuttal, and calls Code-Making Panel 5's attention to the fact that the problems discussed in the original substantiation will be exacerbated under the likely final form of the 2002 NEC. If a feeder arrives at a second building, it will terminate in an enclosure inherently capable of accommodating a reasonable termination of a GEC. If only a branch circuit arrives at the same building, and something requires grounding (the usual case), the outcome will be installers attempting to terminate No. 6 GECs on receptacle grounding terminals or in twist-on wire connectors (No. 8 being unused because it would require raceway). The panel should revisit the sequence of events that resulted in the exception assuming its present form, and then reconsider the merits of this proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: It continues to be the panel's intent the exception only apply to buildings or structures supplied by one branch circuit that includes an equipment grounding conductor for grounding noncurrent carrying metal parts of all equipment at the building or structure.

(Log #1679)

5- 71 - (250-32(e)): Reject
SUBMITTER: Scott Heyboer, Nashville, MI
COMMENT ON PROPOSAL NO: 5-119 & 5-118a
RECOMMENDATION: Change reject to accept. For proposal 5-118a, change accept to reject.
SUBSTANTIATION: Section 547-4(f) is dealing with equipment grounding conductors after the disconnecting means. Section 250-32(e) is dealing with equipment grounding conductors supplying the building. It is important that equipment grounding conductors be copper, and covered or insulated, to prevent corrosion. Also, the proposal uses the word agricultural to include all buildings on farms, not just those with livestock.
PANEL ACTION: Reject.
PANEL STATEMENT: See proposal 19-18a of the 2001 NEC ROP. The requirements have been moved to Section 547.9(C) of the 2002 NEC draft.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16

(Log #1997)

5- 72 - (250-32(e)): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
COMMENT ON PROPOSAL NO: 5-123
RECOMMENDATION: The proposal as the panel accepted it in principle should be further modified as follows: "The size of the grounding electrode conductor to the grounding electrode(s) shall not be less than given in 250.66 based on ~~and shall not be required to be larger than~~ the largest ungrounded supply conductor. The installation shall comply with Part III of this article."
SUBSTANTIATION: The Advisory Committee agrees with the proposal substantiation, but panel action seems to be at cross

purposes to that substantiation. The substantiation indicated that GEC sizing should be based on the same considerations in second buildings as apply to primary buildings. Those considerations involve mechanical permanence and voltage limitation during high voltage events such as lightning surges. The actual wording, however, reduces the GEC to the size of the supply conductors, which might not exceed No. 14. That puts the section close to where it was in the 1999 cycle.

The Advisory Committee assumes that something close to this comment will be accepted, because the panel statement took no issue with the proposal substantiation. Therefore the Committee sees the ROP text as to some degree inadvertent. The Committee offers this comment because if the size does go up, that will have a practical bearing on the eventual Code-Making Panel 5 disposition of Proposal 5-113, on which we are submitting a companion comment.

PANEL ACTION: Accept.

Editorially change the word "less" to "smaller" to read as follows: The size of the grounding electrode conductor to the grounding electrode(s) shall not be smaller ~~less~~ than given in 250.66 based on ~~and shall not be required to be larger than~~ the largest ungrounded supply conductor. The installation shall comply with Part III of this article.

PANEL STATEMENT: These changes are made to comply with the NEC Style manual.

SUBMITTER: Technical Correlating Committee National Electrical Code

COMMENT ON PROPOSAL NO: 5-131

RECOMMENDATION: The Technical Correlating Committee directs the Code-Making Panel to reconsider the use of the words "grounded conductor" in 250-34(c) relative to two-wire generators.

This action will be considered by the Panel as a Public Comment.

SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.

PANEL ACTION: Accept.

PANEL STATEMENT: The panel has reconsidered the use of the words "grounded conductor." The panel concludes that the words "grounded conductor" are correct because the frame of the generator serves in place of earth.

(Log #383)

5- 75 - (250-34(c)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

COMMENT ON PROPOSAL NO: 5-131

RECOMMENDATION: Accept in principle revised: (c) GROUNDED CONDUCTOR BONDING. An alternating current ~~A~~ system conductor that is required to be grounded by Section ~~250-26~~ 250-20 shall be bonded to the generator frame by a bonding jumper in accordance with 250-30(a)(1) where the generator is a component of a separately derived system.

FPN No.1: For grounding of separately derived ac systems supplied by portable or vehicle-mounted generators supplying fixed wiring systems see ~~Section 250-20(d)~~ 250-30.

FPN No.2: For grounding of separately derived systems supplied from portable or vehicle-mounted direct-current generators see 250-162 and 250-169.

SUBSTANTIATION: The reference to 250-26 is incorrect in that no conductor is required to be grounded by that section; it only designates the conductor to be grounded, if grounding is provided, while 250-20 designates the system or circuit that shall be grounded. A reference to bonding jumper requirements would be helpful to Code users.

Vehicle-mounted generators should be included in FPN No.1 since portable (not defined) and vehicle-mounted generators could be identical in kW, voltage, etc. The demarcation between the two is not clear; a generator transported by a vehicle and unloaded by a crane can be deemed portable.

Proposed FPN No. 2 would clarify that this section does not apply to dc generators.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel statement on Comment 5-74.

5- 76 - (250-36(g) (New)): Accept in Principle

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

COMMENT ON PROPOSAL NO: 5-134

RECOMMENDATION: Revise as follows:

(1) Where the equipment bonding jumper location does not preclude its function as a component of a potential fault current path, it shall be sized per 250.66 based on the size of the service entrance conductors for a service or the derived phase conductors for a separately derived system.

(2) Where the equipment bonding jumper location precludes its function as a component of a potential fault current path, it shall be sized not less than the size required in 250.36(B) for the neutral conductor.

(3) In making the determinations required in (1) and (2), the potential fault current path shall be assumed to be over the equipment grounding system common to equipment supplied by any potential combination of differing ungrounded phase conductors.

SUBSTANTIATION: The proposal is technically well-motivated, but the wording is confusing because 250.36(F) allows a grounding electrode connection "from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or the first system disconnecting means." Any allowable such connection will fall, in the electrical sense, on the grounded side of the impedance. It would be a code violation [250.36(C) prohibits grounding connections on the line side of the impedance, and this is reflected in 250.24(A)(2) Exception], and the system wouldn't work properly if it were otherwise. Therefore, an inspector would be within his rights to always ask for a full-sized bonding jumper per the literal wording of (1), negating the intent of the proposal.

This comment addresses the safety issue directly. A safety issue only arises if, under a condition of two simultaneous ground faults on different phases, when the equipment grounding system becomes part of a phase-to-phase short circuit, the bonding jumper is a link in that path. Most applications of these systems should qualify for (2), as the original proposal apparently intended.

PANEL ACTION: Accept in Principle.

Revise 250.36(G) to read as follows:

(G) Equipment Bonding Jumper Size. The equipment bonding jumper shall be sized in accordance with (1) or (2).

(1) Where the grounding electrode conductor connection is made at the grounding impedance, the equipment bonding jumper shall be sized in accordance with 250.66 based on the size of the service entrance conductors for a service or the derived phase conductors for a separately derived system.
(2) Where the grounding electrode conductor is connected at the first system disconnecting means or overcurrent device, the equipment bonding jumper shall be sized the same as the neutral conductor in 250.36(B).
PANEL STATEMENT: The panel concludes the revised text meets the intent of the submitter and adds clarity to the section.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 16

(Log #293)

5- 77 - (250-50): Reject
SUBMITTER: Victoria Valentine, National Fire Sprinkler Association
COMMENT ON PROPOSAL NO: 5-143
RECOMMENDATION: Accept Proposal 5-143.
SUBSTANTIATION: The Panel's statement for rejection is not responsive to the proposal substantiation. A direct conflict exists between NFPA 24 and NFPA 70, which the panel has failed to recognize or resolve. For reasons outlined in the proposal, including the use of plastic underground, the use of fire protection piping as a portion of the grounding electrode system is ill advised.
The article by Mr. Caloggero referenced by the panel in Proposals 5-153 and 5-165 helps to prove our point. In the third to the last paragraph he states, "A 6-inch sprinkler main would be a good electrode, but Section 8-3.5 of NFPA 24 prohibits using it as such. Sprinkler systems with a dielectric isolator in the main sprinkler supply wouldn't satisfy the requirements for a grounding electrode, either ...". Since almost all sprinkler systems use dielectric isolators (in the form of flexible couplings) Mr. Caloggero is confirming that sprinkler systems would be poor choices for inclusion in the grounding electrode system.
We recognize that correct interpretation of the NEC in many circumstances would solve the problem, but too many people in the field are not interpreting the NEC correctly. Without an explicit prohibition, sprinkler systems are being relied upon for the grounding electrode system and they simply cannot perform that function adequately or safely.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal addresses interior metal water piping which is required to be bonded by Section 250-104(a). This interior piping is not currently permitted to be used as an electrode beyond the first 5 feet of the entry of the water piping system to the building. If the metal water piping system supplying the building for the sprinkler system qualifies as an electrode in accordance with Section 250-50(a), then it is required to be part of the grounding electrode system. Not including this electrode as part of the grounding electrode system introduces the possibilities of differences of potential between the grounding electrode system and an available grounding electrode that is not bonded to and made part of the grounding electrode system. See Panel statement to proposal 5-143 in 2001 ROP.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16

5- 78 - (250-50): Accept in Principle
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
COMMENT ON PROPOSAL NO: 5-134a
RECOMMENDATION: Revise recommendation as follows:
If available on the premises at each building or structure served, each item in 250-52(a)(1) through (a)~~(6)~~(3) shall be bonded together to form the grounding electrode system. Where none of these electrodes ~~is~~ are available, one or more of the electrodes specified in 250-52(a)(4) through (a)(7) shall be used.
SUBSTANTIATION: The section as proposed requires everything listed in 250-52(a), except item (7), to be used as the grounding electrode system if they are available on premises. The second sentence then states that if none of them are available (items 1-6) you then use some of the electrodes that weren't available in the first place, or item (7), as the grounding electrode system. This overlapping of list items needs to be corrected. Additionally, English weren't my strong point but the singular "is" should be changed to "are" since we are talking about the plural "electrodes" in items 1-3. Also, the panel's action on Proposal 5-162a adds the title "Electrodes Permitted for Grounding" to 250-52. Since the language here in 250-50 says "each item in 250-52(a) shall..." is there the possibility of confusion with the term "permitted" in 250-52?
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 5-80.

5- 79 - (250-50): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 5-135
RECOMMENDATION: Accept in part as follows:
Except for connections to concrete-encased, driven, or buried electrodes, the points of attachment of the bonding jumper shall be accessible.
SUBSTANTIATION: Since the bonding jumper is required to comply with other requirements for a grounding electrode conductor (250-64(a)(b)(e)) the points of attachment should be accessible, as is required in 250-24(a)(1)(d); 250-68(a); and 250-104(a). The points of bonding in (a)(2) do not preclude a connection to a GEC concealed in a wall or to a grounded service raceway installed in or under a building concrete slab.
PANEL ACTION: Reject.
PANEL STATEMENT: The method of connection of the bonding jumper that ties the electrodes of the grounding electrode system together is covered in Section 250.68(A) relative to accessibility.

(Log #1538)

5- 81 - (250-50): Reject
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 5-141
RECOMMENDATION: Revise the first sentence as follows:
If installed or present on the premises at each building or structure served, each item (a) through (d), and any made electrodes in accordance with Section 250-52(c) and (d) shall be bonded together to form the grounding system.
SUBSTANTIATION: My original vote on this proposal was a negative vote, but after considerable thought, the proposal has

merit and should be reconsidered by the panel. The whole concept of using the metal water pipe, effectively grounded structural steel and the concrete encased electrode based on one or more of these being installed as part of the construction of the building or structure. The word "available" is not enforceable and per the NEC Style Manual for 2000 is to be avoided. This situation is an excellent example of why the word "available" is not enforceable. The concept and use of the concrete encased electrode has been a proven excellent electrode in any region. The nature of this electrode and the fact that it can be installed as part of most construction of buildings or structures should warrant its use in all buildings. The years of service on some of the first sites as this electrode was developed in Arizona lasted without failure for years and some are even in use today. After serving in the code enforcement part of the industry for over 10 years in the Phoenix, Arizona jurisdiction, the value and reliability of the concrete encased electrode is exceptional. This would be an excellent area in the code to address the word "available" and its use in this section to resolve the controversy that it creates in the field. Requiring buildings with concrete footings to include a concrete encased electrode as part of the grounding electrode system will enhance safety. The concrete encased electrode is able to be included as part of the grounding electrode system of any building or structure with concrete and rebar footings. This proposal is well intended and worth a closer look.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel recognizes the effectiveness of the concrete encased electrode and that it should be used when present and accessible. However, the panel concludes that, although it may be present, it may not be accessible to the installer because of construction coordination and scheduling issues. The footings may be in place prior to the electrical construction commencing.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13
NEGATIVE: 2
ABSTENTION: 1

EXPLANATION OF NEGATIVE:

BOKSINER: If this comment were accepted, the requirements of the NEC would force building and electrical contractors to address the coordination and scheduling issues.

SKUGGEVIG: With the introduction of plastic piping and the loss of metal water piping systems as a reliable, low-impedance grounding electrode, other types of electrodes are needed to serve as part of the grounding electrode system. Concrete-encased electrodes are among the best types to serve this important role. Concrete-encased electrodes should be required to be used along with other electrodes that are likely to have low impedance to earth and that are installed on the premises to improve the likelihood of getting a reliable, low-impedance grounding electrode system.

COMMENT ON AFFIRMATIVE:

BRETT: I agree with the panel's action and statement. The electrician has little control over the availability issue for a number of reasons however, through the joint efforts of interested parties a proposal can be submitted, to the International Building Codes (IBC), to make "available" the concrete encased electrode. I agree with Mr. Johnston that "...including a concrete encased electrode as part of the grounding electrode system will enhance safety." While difficult to address within the NEC, I believe the IBC is the correct forum to affect this change.

EXPLANATION OF ABSTENTION:

JOHNSTON: The spirit and intent of the original proposal and the comment appear to be worth of additional consideration. The word "available" is not enforceable and per the NEC Style Manual for 2000 is recommended that it be avoided. The word available relative to the coordination of installation concrete encased electrode is a matter of a point in time when the building is being constructed. The issue of the word "available" being replaced with the term "if installed and present" is a concept that needs further review. The comment to the negative regarding the IEEE papers written by H.G. Ufer confirming the validity, reliability, and effectiveness of concrete encased electrodes has both value and merit. History and data have proven the worthiness of the concrete encased electrode. Numerous States and municipalities amend the NEC by requiring a concrete encased electrode to be included as part of the grounding electrode system. A current grounding electrode study is under way to monitor grounding electrode connection resistance values to ground are being monitored season to season. The panel affirms that data gathered from the on going testing program of grounding electrodes might have an impact on the mandate of its use in every structure of new construction. The panel is sensitive to the impact to current industry practices relative to requiring a concrete encased electrode on all new installations. The word "available" and the word "existing" work against each other where buildings are constructed without installing a concrete encased electrode in the building footing. An example is where the building construction is started and all footings and foundations are completed before the electrical construction is started or the electrical contractor is onsite to install a concrete encased electrode. If the footings are poured, then they are existing and no longer available. The panel concludes that this appears to be a trade coordination problem, although a trade coordination issue in the field should not serve as a basis for allowing it to be installed only when there is "availability" or "access" to a foundation of a building or structure that is not poured. If the word "existing" were defined in the code it might serve to eliminate a gray area between when trying to meet the intent of the word "available". Proposed definitions for the word "existing" have been rejected in previous code cycles. Clearly the intent is to not require that existing building structural footings be disturbed to install a concrete encased electrode. It should also be noted that in most cases, effectively grounded building steel is effectively grounded through the concrete encased rebar. IAEI agrees that the concept of "If installed and present" relative to the concrete encased electrode and its use and requirements in future editions of the NEC should be further studied. IAEI is interested in the gathering of reliable data on the subject.

5- 83 - (250-50): Accept in Principle

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

COMMENT ON PROPOSAL NO: 5-134a

RECOMMENDATION: Revise the second sentence to read as follows:

"Where none of these electrodes is available, an electrode specified in (A)(7) shall be used, or one or more electrodes specified in (A)(4) through (A)(6) shall be provided and used, or both. 5-134a 250-50, panel reorganization of the section. {lists traditional made electrodes here, so they get drawn into the grid. OK, like before. However the text says if none are available, then one (including (a)(4) - ground ring) must be used. Must say (a)(7) (other underground structure) to be used, or one or more (a)(4) through (a)(6) electrodes to be provided and used, or both.}

SUBSTANTIATION: The panel action did a good job of reorganizing the presentation of the section, however, it inadvertently failed to properly incorporate a distinction that separates other underground structures from other made electrodes. In the 1999 NEC, an (A)(7) electrode is optional, but fully qualified if available and elected to be used. It is not something that is provided merely for grounding purposes, unlike ground rings, plates, and rods. In this sense it is akin to a metal water lateral. Remember also, that the second sentence assumes that (A)(4-6) electrodes must be provided because by the literal text they are assumed to not have been available during the original evaluation. That is not true of (A)(7) electrodes.

This comment requires (A)(4-6) electrodes to be provided and used, or (A)(7) electrodes can be used if available and so elected,

or you could do both (this construction being the Style Manual version of and/or.) This appears to better reflect panel intent.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 5-80. The panel concludes this meets the intent of the submitter.

5- 87 - (250-50, Exception (New 250.53 (c))): Accept in Principle
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 5-149
RECOMMENDATION: The following should be added:
Exception: Where a supplementary electrode(s) is connected to the equipment grounding conductor in accordance with 250-54 a bonding jumper sized according to 250-66 shall not be required.
SUBSTANTIATION: Section 250.53(C) provides sizing requirements for bonding jumpers and needs an exception to remove confusion between this section and 250.54. Presently 250.53(C) requires a 250.66 jumper and 250.54 allows an equipment grounding conductor presumably sized according to 250.122.
PANEL ACTION: Accept in Principle.
Revise 250.54 to read as follows:
250.54 Supplementary Grounding Electrodes. Supplementary grounding electrodes shall be permitted to be connected to the equipment grounding conductors specified in 250.118 and shall not be required to comply with the electrode bonding requirements of 250.50 or 250.53(C), or the resistance requirements of 250.56, but the earth shall not be used as the sole equipment grounding conductor.
PANEL STATEMENT: The panel concludes that this meets the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BRENDER: Present Code language in 250-54 adequately addresses the subject.

(Log #2073)

5- 88 - (250-50, Exception): Accept
SUBMITTER: Phil Simmons, Simmons Electrical Services
COMMENT ON PROPOSAL NO: 5-162a
RECOMMENDATION: Revise text as follows:
Exception: In industrial and commercial buildings or structures where conditions of maintenance and supervision ensure that only qualified persons will service the installation, interior metal water piping located more than 1.52 m (5 ft) from the point of entrance to the building shall be permitted as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system provided that the entire length, other than short sections passing perpendicular through walls, floors or ceilings, of the interior metal water pipe that is being used for the conductor is exposed.
SUBSTANTIATION: These changes are necessary to make the Exception a complete sentence to comply with the NEC Style Manual. In addition, the complete sentence is necessary as the paragraph above the exceptions contains more than one requirement.
Finally, the words, "or structures" are included in accordance with Mr. Dobrowsky's comment on affirmative vote.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel understands this text replaces 250.52(A)(1), Exception of the 2002 ROP draft.

(Log #520)

5- 89 - (250-50 Exception No. 1 (New)): Reject
SUBMITTER: David A. Kerr, Jr., Friendsville, PA
COMMENT ON PROPOSAL NO: 5-148
RECOMMENDATION: Accept.
SUBSTANTIATION: This proposal has a ton of technical substantiation. Clearly, Fred Hartwell has access to a ground rod tester, which I don't. The Code-Making Panel's concern about the inductive reactance of 4 AWG bare copper is the craziest thing I have ever heard. Bare copper buried 4 ft. deep in a trench is a good ground all by itself. A steel well casing is the single best form of lightning protection. Lightning travels for miles in the country. People have been using plastic water pipe for half a century. I believe it is possible for lightning to melt the 12 AWG commonly used as an equipment grounding conductor to the well casing.
PANEL ACTION: Reject.

PANEL STATEMENT: See panel action on Comment 5-90.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
BRENDER: A well casing has been shown to be an effective electrode in most cases where it supplements the electrodes required elsewhere in Article 250. The proposal as submitted lists several limitations as to the Exception's applicability in the grounding electrode system under specific limitations of new buildings or structures directly supplied by a well, and thus is not an onerous requirement, and could enhance safety at minimal cost.
The original proposal has merit, and the vote to reject the comment should be reconsidered.
SKUGGEVIG: See my Explanation of Negative vote on Comment 5-90.

(Log #2029)

5- 90 - (250-50 Exception No. 1): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 5-148
RECOMMENDATION: The proposal should be accepted in principle. Accept the concept of the proposal as written but reorganize it to correlate with the panel action on the parent section, and then add two sentences to the end as follows:
"Where located on the premises and within 60 m (200 ft) of a new building or structure directly supplied by a well, and where none of the electrodes specified in 250.52(A)(1) through (A)(4) or (A)(7) are available, metallic well casings in direct contact with the earth for not less than 10 3.0 m (10 ft) shall be included in the grounding electrode system. Where the length of the grounding electrode conductor between the building or structure served and the metallic well casing exceeds 6.0 m (20 ft), the grounding electrode conductor shall be additionally bonded to another electrode specified in 250.52(A)(5) or (A)(6). The installation shall be arranged so that the distance between the building or structure and the nearest grounding electrode does not exceed 6.0m (20 ft)."
SUBSTANTIATION: The Advisory Committee wishes to commend Code-Making Panel 5 for its thoughtful and careful review of this proposal. The Committee agrees that as written the proposal failed to adequately address di/dt issues that come into play in the case of a lightning event. The proposal did address, however, the issue of utility crosses, as the panel noted. This comment responds to those concerns by effectively assuring that a made electrode would be placed near the building. In high-resistance soil areas, the additional made electrode would be admittedly marginal in terms of medium voltage utility crosses, but in terms of a lightning strike at millions of volts to ground, the self-inductance of a long conductor becomes more of a limiting factor than the resistance of a poor electrode. This comment bridges the two technical issues. The Committee continues to believe that well casings should be mandatory in instances when one or even two made electrodes become the only alternative. The 20 ft dimension correlates with the Code-Making Panel 16 action on Proposal 16-212, which addresses a similar issue.
With respect to the panel statement that this is not an exception, the Committee respectfully disagrees. The Committee is aware that well casings are permissible electrodes [falling in the rewrite under 250.52(A)(7)], however, they are never mandatory under present Code. This proposal is a mandatory exception, obliging the use of a well casing in a particular circumstance (namely, the only alternative being made electrodes without supplementation). As such, it is an exception to the language of 250.50.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement to proposal 5-148. Submitter did not substantiate the need for a reversal by the panel on the original rejection of the proposal. Section 250.52(A)(7) permits the well casing to be used as a grounding electrode already. Requiring the well casing under 60 meters will require additional substantiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
BOKSINER: It seems the submitter has addressed the concerns expressed in the Panel Statement during the ROP. Therefore, even if the 60 m distance is somewhat arbitrary, the concept of the proposal, as revised, has merit and deserves to be included into the NEC.
BRENDER: See my Explanation of Negative vote in Comment 5-89.
SKUGGEVIG: With the introduction of plastic piping and the loss of metal water piping systems as a reliable, low-impedance grounding electrode, other types of electrodes are needed to serve as part of the grounding electrode system. In many installations, there is a good chance that the well casing will already be connected to the system by means of a smaller, more fragile equipment grounding conductor between the service equipment and the well pump motor frame. However, by including the well casing in the grounding electrode system, the well casing would be connected directly to the service equipment enclosure through a larger conductor that can better withstand the damaging effects of lightning surges.

(Log #295)

5- 91 - (250-50(a)): Reject
SUBMITTER: Victoria Valentine, National Fire Sprinkler Association
COMMENT ON PROPOSAL NO: 5-153
RECOMMENDATION: Accept Proposal 5-153.
SUBSTANTIATION: The Panel's statement for rejection is not responsive to the proposal substantiation. A direct conflict exists between NFPA 24 and NFPA 70, which the panel has failed to recognize or resolve. For reasons outlined in the proposal, including the use of plastic underground, the use of fire protection piping as a portion of the grounding electrode system is ill advised.
The article by Mr. Caloggero referenced by the panel helps to prove our point. In the third to the last paragraph he states, "A 6-inch sprinkler main would be a good electrode, but Section 8-3.5 of NFPA 24 prohibits using it as such. Sprinkler systems with a dielectric isolator in the main sprinkler supply wouldn't satisfy the requirements for a grounding electrode, either ...". Since almost all sprinkler systems use dielectric isolators (in the form of flexible couplings) Mr. Caloggero is confirming that sprinkler systems would be poor choices for inclusion in the grounding electrode system.
We recognize that correct interpretation of the NEC in many circumstances would solve the problem, but too many people in the field are not interpreting the NEC correctly. Without an explicit prohibition, sprinkler systems are being relied upon for the grounding electrode system and they simply cannot perform that function adequately or safely.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 5-77.

(Log #389)

5- 92 - (250-50(c)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 5-160
RECOMMENDATION: Accept in Principle revised as follows:
"CONCRETE-encased electrode. An electrode encased by ~~at least~~ not less than 50.8 mm (2 in.) of concrete, located within and near the bottom of a concrete foundation or footing, not less than 6.1 m (20 ft) in length that is in direct contact with the earth..."
(remainder unchanged)
SUBSTANTIATION: The proposal is intended to require a lineal 20 ft distance. Five 4 ft lengths assembled together side-by-side within in. of each other is tantamount to permitting the additional electrodes of 250-56 to be installed side-by-side. The present text doesn't prohibit 20 ft of tightly coiled wire as the electrode. I believe the intent and earlier testing of these electrodes was based on a run lengthwise in the concrete.
"Not less than" is a standard Code Manual term.
PANEL ACTION: Reject.
PANEL STATEMENT: This proposal introduces unsubstantiated technical changes. The intent of the submitter is not clear.

5- 93 - (250-51 (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 5-162
RECOMMENDATION: Accept in principle revised:

250-51 Grounding Alternate or Standby Power Systems other Than Separately Derived Systems. Where a premises wiring system is supplied by an alternate or standby power source such as a battery, a solar photovoltaic system, a generator, a transformer or converter winding, and has a direct circuit conductor connection to a circuit conductor originating in another system, grounding shall be in accordance with (a), (b), and (c).

(a) Alternating-current Systems. Where the alternate or standby power source connection is to a conductor that has a direct electrical connection to a service-supplied system the service grounding system shall be used for grounding the alternate or standby system. Where the alternate or standby system power source connection is to a conductor of a system that does not have a direct electrical connection to a service-supplied system, such as the secondary of an isolating type transformer, a bonding jumper in accordance with 250-28 based on the largest derived phase conductor of the systems shall be used to connect the equipment grounding conductors of the systems to the grounded conductor of the system with the largest derived phase conductor. This connection shall be made at any point from the system source to the first disconnecting means or overcurrent device(s), or it shall be made at the source of a system that has no disconnecting means or overcurrent devices. A grounding electrode conductor sized in accordance with Table 250-66 based on the largest derived phase conductor of the systems shall be used to connect the conductor to be grounded to the grounding electrode(s). This connection shall be made at the same point on the system where the bonding jumper is installed. Neutral conductors which must carry ground-fault current shall not be smaller than the size of the bonding jumper.

(b) Direct-Current Systems. Where the alternate or standby power source connection is to a conductor supplied by a service, the grounding system (off-premises source) shall be used for grounding the alternate or standby power system. Where the alternate or standby power connection is to a conductor supplied by a source located on the premises, a bonding jumper shall be used to connect the equipment grounding conductors of the systems to the largest conductor to be grounded of the systems. This connection shall be made at any point from the system source to the first disconnecting means or overcurrent device(s), or it shall be made at the source of a system that has no disconnecting means or overcurrent devices. A grounding electrode conductor shall be used to connect the grounded conductor to a grounding electrode(s). This connection shall be made at the same point where the bonding jumper is installed. The size of the bonding jumper and the grounding electrode conductor shall be in accordance with 250-166 and 250-168. Neutral conductors which must carry ground-fault current shall not be smaller than the largest ungrounded conductor of the systems.

(c) Grounding Methods. In all other respects, grounding methods shall comply with applicable requirements prescribed in other parts of this code.

SUBSTANTIATION: The panel statement was these systems are already covered in the code and referred to Article 100 definition of Separately Derived Systems. This proposal has nothing to do with separately derived systems since it covers power sources with a direct conductor interconnection (usually a neutral). Where, for example, a generator source has a neutral conductor connection to a transformer secondary neutral conductor neither system is covered by the definition of separately derived system and there does not appear to be grounding and bonding rules specifically for grounding such interconnected systems. Section 250-24 does not apply since they are not services. Section 250-30 does not apply since they are not separately derived systems as defined in Article 100. Section 250-20 may require grounding of such systems and 250-26 specifies the conductor to be grounded, which can be interpreted to require separate bonding and grounding of each such interconnected system. Separate individual grounding and bonding of interconnecting systems may cause problems and seems to violate 250-24(a)(5) since any service-supplied transformer secondary interconnected to a generator source is not covered by 250-30.

A generator with a direct neutral connection to an in-plant transformer secondary may be used to augment a service-supplied transformer for peak load periods, or used as the power source during service outages to supply the total load or a portion of the load such as critical loads. The transformer kVA and generator kVA may differ, with a difference in size of the source supply conductors. Is each system to be bonded and grounded in accordance with sizing of the source conductors per 250-28 or 250-30 if they are not services or separately derived systems? Or is only one source system to be directly bonded and grounded, using the system with the largest phase conductor to determine bonding jumper and grounding electrode conductor size?

The proposal assumes that single-point grounding and bonding is preferable and offers specifics for sizing and point of connection of grounding and bonding conductors, determined by the system with the largest phase conductor, and specifies that the service grounding system is to be used where a derived system is interconnected to a service-derived conductor.

A requirement for neutral which must carry ground-fault current is proposed since a reduced-in-size neutral run to a remote disconnecting means or overcurrent device enclosure and bonded at that location will carry ground-fault current. There is such a requirement in 445-5 for generators but none for transformer neutrals.

PANEL ACTION: Reject.
PANEL STATEMENT: Where two systems exist on a premises that may become interconnected, the first system is to be selected for grounding and the other system may be treated as a separately derived system depending on connection and usage.

The proposed text is confusing and does not add any clarity.

5- 95 - (250-53): Accept
SUBMITTER: Dann Strube, Lanesville, IN
COMMENT ON PROPOSAL NO: 5-171a
RECOMMENDATION: Reconsider the wording in Section 250-53(b) and revise as follows:

Where more than one <u>of the electrodes of the type specified in Section 250-52(a)(5) or (6) are used</u>...

SUBSTANTIATION: The proposed wording would require the six-foot distance between any of the electrode types. If a ground ring is installed at a 2 1/2 foot depth, the water pipe would need to be 8 1/2 feet deep. The situation would be even worse with a concrete-encased electrode. In previous codes, the six-foot rule was only for rods, pipes and plates. No substantiation was given to change to a more restrictive rule.
PANEL ACTION: Accept.

(Log #1957)

5- 96 - (250-53): Accept in Principle
SUBMITTER: Phil Simmons, Simmons Electrical Services
COMMENT ON PROPOSAL NO: 5-171a
RECOMMENDATION: Make the following changes:
Move Section 250.53(D) to become part of Section 250.64. Make appropriate changes to the titles of Section 250.64. In so doing, delete Section 250.53(D)(3) as it says the same thing as Section 250.64(C).
In Section 250.53(E) change "When" to "Where."
Delete Section 250-53(F).
Renumber 250.53(E) to (D), (G) to (E), and (H) to (F).
Change the text of Section 250.53(H) [renumbered to (F)] to read as follows:
The electrode shall be installed such that at least 2.44 m (8 ft) of length is in contact with the soil. It shall be driven to a depth of not less than 2.44 m (8 ft) except that, where rock bottom is encountered, the electrode shall be driven at an oblique angle not to exceed 45 degrees from the vertical or, where rock bottom is encountered, the electrode shall be permitted to be buried in a trench that is at least 2 1/2 ft (762 mm) deep. The upper end of the electrode shall be flush with or below ground level unless the aboveground end and the grounding electrode conductor attachment are protected against physical damage as specified in Section 250.10."
SUBSTANTIATION: For moving Section 250.53(D) to become part of Section 250.64; doing so will improve the organization of these sections. At the present time, rules on the connection, sizing and splicing of the grounding electrode conductor are located in the middle of the section that deals with installation of the grounding electrode system. Other rules on installing the grounding electrode conductor(s) are found in Section 250.64. After moving the text of 250.53(D) to Section 250.64, Section 250.53(D)(3) can be deleted as it says the same thing as Section 250.64(C). In addition, Section 250.64(C) has an Exception which does not appear in 250.53(D)(3).
Section 250.64 will then read or be organized as follows:
"250.64. Grounding Electrode Conductor Installation.
Grounding electrode conductors shall be installed as specified in (A) through (G) ~~(E)~~.
(A) Aluminum or Copper-Clad Aluminum Conductors (Present text remains)
(B) Securing and Protecting~~Grounding Electrode Conductors~~. (See Comment on Proposal 5-177 for this change.) [Present text from 250.64(B)].
(C) Continuous. [Present text from 250.64(C)].
(D) Grounding Electrode Conductor Taps. [Present text from 250.64(d)].
(E) Enclosures for Grounding Electrode Conductors [Present text from 250.64(E)].
(F) To Electrode(s). ~~Connection.~~ [Present text from 250.53(d)(1)]. The present title of Connection should be improved upon. Section 250.70 covers the connection methods to grounding electrodes so that the title of this section should be changed to more accurately relate to the requirements of the section.
(G) Sizing. [Present text from 250.53(D)(2)].
For the change to Section 250.53(E); this is an editorial change to comply with the NEC Style Manual.
For deleting Section 250-53(F); this is identical language to that found in 250.66(A). The size rules for other grounding electrode conductors is not repeated in Section 250.53 so it appears unnecessary to have the size for the grounding electrode conductor for a rod, pipe or plate repeated here.
For the proposed change to the text of Section 250.53(H); this clarifies that only where an 8 ft rod cannot be driven to full length on an oblique angle it is permitted to bury the rod in a trench. This helps ensure compliance with 250.53(A) which requires "Where practicable, rod, pipe, and plate electrodes shall be embedded below permanent moisture level." This revised language does not introduce a new concept in this article as similar language has been in the Code for many editions.
For deleting Section 250.53(F); this section is not needed as identical language is contained in Section 250.66(A). In addition, Section 250.53(C) covers the size of the bonding jumper and makes proper reference to 250.66 for the proper size.
PANEL ACTION: Accept in Principle.
Make the following changes:
Move Section 250.53(D) to become part of Section 250.64. Make appropriate changes to the titles of Section 250.64. In so doing, delete Section 250.53(D)(3) as it says the same thing as Section 250.64(C).
In Section 250.53(E) change "When" to "Where."
Renumber 250.53(E) to (D), (F) to (E), (G) to (F), (H) to (G), and (I) to (H).
Change the text of Section 250.53(H) [renumbered to (G)] to read as follows:
The electrode shall be installed such that at least 2.44 m (8 ft) of length is in contact with the soil. It shall be driven to a depth of not less than 2.44 m (8 ft) except that, where rock bottom is encountered, the electrode shall be driven at an oblique angle not to exceed 45 degrees from the vertical or, where rock bottom is encountered at an angle up to 45 degrees, the electrode shall be permitted to be buried in a trench that is at least 2 1/2 ft (762 mm) deep. The upper end of the electrode shall be flush with or below ground level unless the aboveground end and the grounding electrode conductor attachment are protected against physical damage as specified in Section 250.10."
PANEL STATEMENT: The "45 degrees" was added to ensure that a horizontally buried rod will not be a second choice but rather a third choice. Section 250.53(F) is not being deleted because of DC systems. See panel Comment 5-100a (Log #CC503) which incorporates the action on Section 250.64 as accepted in this comment.

(Log #1262)

5- 100 - (250-56): Reject
SUBMITTER: David A. Kerr, Jr., Friendsville, PA
COMMENT ON PROPOSAL NO: 5-173
RECOMMENDATION: Reject.
SUBSTANTIATION: This circular proposal is impossible to read. It seems to require water plus two. That proposal was rejected in 5-1-56, which at least has the merit of being comprehensibly written. Water plus one rod is fine. How many angels can dance on the head of a ground rod? What we need is clear language requiring real electrodes such as rebar building steel and well casings. Rebar in the footer is better than low cost; it's free. In the course of five years I've come across zero concrete-encased electrodes. Two ground rods are twice as good as one, VIZ nearly worthless.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that no substantiation is provided that accepted Proposal 5-173 does not clarify the requirements. The requirement to augment a supplemental made electrode that does not have a resistance of less than 25 ohms has not changed from the 1999 NEC. The submitter has not provided substantiation or reasons to reverse the panel action in the 1999 NEC. The panel concurs with the submitter's rational that the supplemental electrode(s) should be able to act as the sole electrode in the event that the water pipe electrode is disrupted at a later date. See the substantiation of Proposal 5-173.

Note: The Technical Correlating Committee understands that 250.53(D) as it appears in Comment 5-100a is not to be included as the last section in the revision of 250-64. See Panel Action on Comment 5-96.
SUBMITTER: CMP 5
COMMENT ON PROPOSAL NO: 5-260, 177, 178, 179, 171a
RECOMMENDATION: Revise as follows:

250.64 Grounding Electrode Conductor Installation.
Grounding electrode conductors shall be installed as specified in (A) through (F) ~~(E)~~.

(A) Aluminum or Copper-Clad Aluminum Conductors. ~~Insulated or~~ Bare aluminum or copper-clad aluminum grounding conductors shall not be used where in direct contact with masonry or the earth or where subject to corrosive conditions. Where used outside, aluminum or copper-clad aluminum grounding conductors shall not be terminated ~~installed~~ within 450 mm (18 in.) of the earth. **C 5-101**

(B) Securing and Protection from Physical Damage. ~~Protecting Grounding Electrode Conductor.~~ A grounding electrode conductor or its enclosure shall be securely fastened to the surface on which it is carried. A 4 AWG copper or aluminum, or larger conductor shall be protected if exposed to severe physical damage. A 6 AWG grounding conductor that is free from exposure to physical damage shall be permitted to be run along the surface of the building construction without metal covering or protection where it is securely fastened to the construction; otherwise, it shall be in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, electrical metallic tubing, or cable armor. Grounding conductors smaller than 6 AWG shall be in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, electrical metallic tubing, or cable armor. **C 5-103**

(C) Continuous. The grounding electrode conductor shall be installed in one continuous length without a splice or joint, unless spliced only by irreversible compression-type connectors listed for the purpose or by the exothermic welding process.

Exception: Sections of busbars shall be permitted to be connected together to form a grounding electrode conductor. ~~Busbars shall be permitted to have splices.~~ **C 5-105**

~~**250.53(D)(3) Splicing.** The grounding electrode conductor shall be unspliced or spliced by means of irreversible compression-type connectors listed for the purpose or by the exothermic welding process.~~

(D) Grounding Electrode Conductor Taps. Where a service consists of more than a single enclosure as permitted in 230.40, Exception No. 2, it shall be permitted to connect taps to the grounding electrode conductor. Each such tap conductor shall extend to the inside of each such enclosure. The grounding electrode conductor shall be sized in accordance with 250.66, but the tap conductors shall be permitted to be sized in accordance with the grounding electrode conductors specified in 250.66 for the largest conductor serving the respective enclosures. The tap conductors shall be connected to the grounding electrode conductor in such a manner that the grounding electrode conductor remains without a splice.

(E) Enclosures for Grounding Electrode Conductors. Metal enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode, and shall be securely fastened to the ground clamp or fitting. Metal enclosures that are not physically continuous from cabinet or equipment to the grounding electrode shall be made electrically continuous by bonding each end to the grounding electrode conductor. Where a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article. **C 5-104**

(F) To Electrode(s). ~~250-53(D)(1) Connection.~~ A grounding electrode conductor shall be permitted to be run to any convenient grounding electrode available in the grounding electrode system or to one or more grounding electrode(s) individually. ~~**(G) Sizing. 250-53(D) (2) Sizing.**~~ The grounding electrode conductor ~~It~~ shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it.
C 5-96

250-53(D) Grounding Electrode Conductor.

(1) Connection. A grounding electrode conductor shall be permitted to be run to any convenient grounding electrode available in the grounding electrode system or to one or more grounding electrode(s) individually.

(2) Sizing. It shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it.

(3) Splicing. The grounding electrode conductor shall be unspliced or spliced by means of irreversible compression-type connectors listed for the purpose or by the exothermic welding process.

SUBSTANTIATION: This action is intended to combine CMP 5 actions on Comments 5-96, 101, 102, 103, 104, and 105.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
BOKSINER: See my Explanation of Negative vote on Comment 5-105.
RAPPAPORT: This panel proposal combines actions on several comments, not all of which are acceptable. Comments 5-101 and 5-102 propose permitting all insulated aluminum or copper-clad aluminum grounding conductors to be installed in direct contact with masonry or the earth or where subject to corrosive conditions. There are no limitations on the type of insulation or whether listing is necessary. The substantiation for this change was that one type of cable is listed for this purpose. However not all insulated aluminum or copper-clad aluminum conductors are listed for this purpose and the proposed text is too broad. The concept of permitting these aluminum conductors to be used in corrosive

conditions is new material that was not included in the original Proposal 5-260 and, therefore has no had public review. Small pinholes in insulation can result in conductor deterioration and disintegration. If a power conductor fails, this can result in circuit failure but if a grounding conductor fails, there is no indication and safety is compromised. This change is too broad and potentially dangerous to be made without public comment and review by technical organizations.

COMMENT ON AFFIRMATIVE:

DOBROWSKY: The text as provided on page 2 of Log #CC503, beginning with 250.53(D) should be struck through. Comparable text is already in proposed 250.64(C) and (F).

MELLO: The text or the proposed language as presented on the ballot included at the end the text that was derived from the 2002 Draft 250.53(D). The panel action in Comment 5-96 was to relocate the text from 250.53(D) in the Draft and incorporate into 250.64. This was done in 250.64(C) and in 250.64(F) as presented on the ballot and need not be repeated again.

This comment suggests accepting the balloted text up to and including the proposed section 250.64(F) and the remainder beginning with "250.53(D)..." be deleted.

(Log #1125)

5- 101 - (250-64(a)): Accept in Principle

SUBMITTER: Paul Dobrowsky, Holley, NY

COMMENT ON PROPOSAL NO: 5-260

RECOMMENDATION: Revise as follows:

(a) Aluminum or Copper-Clad Aluminum Conductors. ~~Insulated or bare~~ Bare aluminum or copper-clad aluminum grounding conductors shall not be used where in direct contact with masonry or the earth or where subject to corrosive conditions. Where used outside, aluminum or copper-clad aluminum grounding conductors shall not be ~~installed~~ terminated within 18 in. (457 mm) of the earth.

SUBSTANTIATION: Aluminum conductors that are listed as suitable for direct burial in the earth (such as USE) are readily available and have been successfully and safely used. The issue is the termination points.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel Comment 5-100a which incorporates the action on this comment.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

BRENDER: There has been no statistical or other evidence presented to substantiate this change in the Code. Discussions with cable manufacturers has indicated that they do not have data related to absolute or relative failure rates of aluminum USE cable compared to other conductors. Therefore, the words used in the substantiation "have been successfully and safely used" are without merit and are unjustified.

Elimination of the words "Insulated or" from the first sentence of this section represents a substantial change from present Code language for which no statistical or technical substantiation has been provided. The presence of the words "shall not be used where in direct contact with..." are currently present in the Code for the reason that aluminum and copper-clad aluminum are not very corrosion resistant when used under the listed circumstances. Especially when used as a grounding electrode conductor, a safety-related end use, the most corrosion-resistant conductors should be stipulated.

RAPPAPORT: This comment is new material and has not had public review. The comment is related to Proposal 5-260 that is for Section 250-120(b) but the comment proposes changing 250-64(a). The comment proposes permitting all insulated aluminum or copper-clad aluminum grounding conductors to be installed in direct contact with masonry or the earth or where subject to corrosive conditions. There are no limitations on the type of insulation or whether listing is necessary. The substantiation for this change was that one type of cable is listed for this purpose. However not all insulated aluminum or copper-clad aluminum conductors are listed for this purpose and the proposed text is too broad. The concept of permitting these aluminum conductors to be used in corrosive conditions is new material that was not included in the original Proposal 5-260 and, therefore has not had public review. Small pinholes in insulation can result in conductor deterioration and disintegration. If a power conductor fails, this can result in circuit failure but if a grounding conductor fails, there is no indication and safety is compromised. This change is too broad and potentially dangerous to be made without public comment and review by technical organizations.

SUBMITTER: Ravindra H. Ganatra, Alcan Cable

COMMENT ON PROPOSAL NO: 5-260

RECOMMENDATION: To correlate with Panel Action on Proposal 5-260 (to revise 250-120(b)) and a comment with affirmative vote on Proposal 5-260, 250-64(a) (or 250.64(A) for 2002 NEC) should be revised to read:

(a) Aluminum or Copper-Clad Aluminum Conductors. Insulated or bare<u>Bare</u> aluminum or copper-clad aluminum grounding conductors shall not be used where in direct contact with masonry or the earth or where subject to corrosive conditions. Where used outside, aluminum or copper-clad aluminum grounding conductors shall not be installed<u>terminated</u> within 18 in. (457 mm)<u>457 mm (18 in.)</u> of the earth.

SUBSTANTIATION: Panel Action and TCC Comment in ROP on Proposal 5-260 to revise 250-120(b) are satisfactory. Thank you.

This comment recommends a similar correction (based on the comment provided with affirmative vote by Mr. Dobrowsky) for 250-64. Insulated aluminum conductors identified in Table 310-13, such as Type USE (or USE-2), are recognized and used for direct burial application. Example: A mobile home feeder cable consist of four USE conductors, to comply with 550-24, and one of them is identified by green color for grounding purpose. Bare and insulated aluminum conductors, such as Type XHHW, THWN, etc., are part of a cable assembly, such as MC and TC, which are marked suitable for direct burial. In all cases these conductors do not terminate within 18 in. of the earth.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel Comment 5-100a (Log #CC503).

5- 103 - (250-64(b)): Accept in Principle

SUBMITTER: Phil Simmons, Simmons Electrical Services

COMMENT ON PROPOSAL NO: 5-177

RECOMMENDATION: Change the title of this Section to <u>"Securing and Protecting"</u> from ~~Grounding Electrode Conductor.~~

SUBSTANTIATION: The proposed subsection title is more descriptive of the requirements in the subsection.

PANEL ACTION: Accept in Principle.

Revise the title as follows: (B) Securing and Protection from Physical Damage.

PANEL STATEMENT: The panel concludes the title revision clarifies what is meant by "protection" of the grounding electrode conductor. The panel concludes that the change in the title to this subsection is more appropriate to the requirements covered in the section. The term grounding electrode conductor is too open ended; being specific to "Securing and Protecting" is in step with what is covered in the rule. See panel Comment 5-100a (Log #CC503) which incorporates the action on this comment.

5- 104 - (250-64(e)): Accept in Principle

SUBMITTER: Phil Simmons, Simmons Electrical Services

COMMENT ON PROPOSAL NO: 5-179

RECOMMENDATION: Make the following changes to the existing text of the Code.

(E) Enclosures for Grounding Electrode Conductors. Metal enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode, and shall be securely fastened to the

ground clamp or fitting. Metal enclosures that are not physically continuous from cabinet or equipment to the grounding electrode shall be made electrically continuous by bonding each end of the grounding electrode conductor. Where a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article.
SUBSTANTIATION: Since changes were made to the name of the conductor used to connect the grounding electrode(s) at additional buildings or structures in Proposal 5-123, the above changes need to be made to this section for correlation.
PANEL ACTION: Accept in Principle.
Editorially correct the second sentence to change the "of" to "to" and read as follows:
Metal enclosures that are not physically continuous from cabinet or equipment to the grounding electrode shall be made electrically continuous by bonding each end of to the grounding electrode conductor.
PANEL STATEMENT: See panel Comment 5-100a (Log #CC503) which incorporates the action on this comment.

(Log #2256)

5- 105 - (250-64(e)): Accept in Principle
SUBMITTER: Noel Williams, Noel Williams Consulting
COMMENT ON PROPOSAL NO: 5-178
RECOMMENDATION: The proposal should have been accepted.
SUBSTANTIATION: Apparently the panel did not understand the intent of the proposal. Contrary to the panel statement, the title of the section is "Grounding Electrode Conductor Installation." The current language is often interpreted to mean that a busbar may be used to splice two sections of another type of grounding electrode conductor. The proposal should simply clarify that it's a busbar used as a grounding electrode conductor that can be spliced.
PANEL ACTION: Accept in Principle.
Revise existing exception from Section 250.64(C) to read as follows:
Sections of busbars shall be permitted to be connected together to form a grounding electrode conductor.
PANEL STATEMENT: Editorially revised proposed language to add clarity. See panel Comment 5-100a (Log #CC503) which incorporates the action on this comment.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BOKSINER: The revised wording, if read literally, is more restrictive than previous code language. The revised wording seems to imply that if busbars are used, then the entire grounding electrode conductor must consist only of sections of busbars. However, presently, there is no prohibition of connecting a busbar or spliced busbar sections to another type of conductor as long as the connection uses an irreversible compression-type connector listed for the purpose or exothermic welding process.

(Log #2030)

5- 106 - (250-66(d)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 5-190
RECOMMENDATION: The proposal should be accepted.
SUBSTANTIATION: Although metal well casings are much better than made electrodes, they are unlikely to approach the low impedance of an entire building frame or a cast iron traditional water supply network. The No. 4 size in the proposal is a legitimate trade-off that makes the companion proposal (5-148) workable. There are several precedents in Article 250 for this sort of treatment. The largest conductor that need be run to a made electrode is No. 6, the largest to a ufer ground No. 4, and the largest to a ground ring No. 2 (unless the ring itself is thicker). Remember also, that the minimum size would follow normal rules at the time of the original installation. Regardless, the impedance presented by a well casing is unlikely to be lower than a ufer ground, making this provision at least the equal of 250.66(B).
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement of Proposal 5-106 in the 2001 ROP. The submitter provided no additional technical substantiation to warrant accepting the proposed action.

5- 107 - (250-68 Exception No. 2 (New)): Reject
SUBMITTER: Donald R. Cook, Shelby County Building Inspections
COMMENT ON PROPOSAL NO: 5-140 and 5-145
RECOMMENDATION: Renumber existing 250-68 exception and make it Exception No. 1.
Add new Exception No. 2 to read:
"Exception No. 2: A concealed connection to the interior metal water pipe within 5 ft from the point of entrance to the building.
SUBSTANTIATION: Since the connection of the conductor to the first 5 ft is critical to the integrity of the electrode, and the accessibility is not (if it were connected outside and underground the current exception would allow it to not be accessible) the new exception would solve the problem. If the connection were concealed it would lessen the likelihood of it being disconnected also.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its intention to have the connection to the interior metal water pipe accessible and the connection made within the first five feet.

(Log #374)

5- 108 - (250-70): Accept in Principle
Note: The Technical Correlating Committee directs that the word "approved" be deleted from the first sentence of the Panel Action text. The Technical Correlating Committee understands that the list in 250-70 (1-4) remains unchanged from the 1999 Code.
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 5-192
RECOMMENDATION: Accept proposal.
SUBSTANTIATION: Since bonding jumpers are also connected to electrodes they should be noted as covered by the requirements. The technical substantiation to delete item No. 2 is that all connection devices as indicated in the first sentence are required to be listed. The definition of "approved" is not the same as "listed". The UL "white book" does not indicate pipe fittings, plugs, etc. as grounding or bonding equipment. There seems to be a conflict within this section.
PANEL ACTION: Accept in Principle.
250.70 Methods of Grounding and Bonding Conductor Connection to Electrodes. The grounding or bonding conductor shall be connected to the grounding electrode by exothermic welding, listed lugs, listed pressure connectors, listed clamps, or other listed approved means. Connections depending on solder shall not be used. Ground clamps shall be listed for the materials of the grounding electrode and the grounding electrode conductor and, where used on pipe, rod, or other buried electrodes, shall also be listed for direct soil burial or concrete encasement. Not more than one conductor shall be connected to the grounding electrode by a single clamp or fitting unless the clamp or fitting is listed for multiple conductors. One of the following methods shall be used:
(continue with all of the remaining existing text)
PANEL STATEMENT: This action satisfies the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16

(Log #1546)

5- 109 - (250-86 Exception No. 3): Accept in Principle
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 5-196
RECOMMENDATION: This proposal should be accepted in principle and revised as follows:
Exception No. 3: A metal elbow that is installed in an ~~underground~~ run of rigid nonmetallic conduit and is isolated from

possible contact by a minimum burial cover of 18 in. (457 mm) or 2 in. (50.8 mm) of concrete cover to any part of the elbow shall not be required to be grounded.

SUBSTANTIATION: This change would not limit the exception to underground installations only. Rigid metallic elbows are commonly installed in runs of nonmetallic raceways to prevent undue stress on both the conductors and the raceway. This change would bring the code in line with actual practices currently happening in the field where metal elbows are installed for this reason. The previous exception limited the relief in the exception to only underground installations. The revision would offer equal and effective safety anticipated by the code for this particular condition. This revision should meet the intent of the submitter.

This section should be looked at for revision to eliminate the exceptions and turn the requirements in the exceptions to rules and follow the NEC Style Manual.

PANEL ACTION: Accept in Principle.

Revise proposed text to read as follows:

Exception No. 3: A metal elbow shall not be required to be grounded where it is installed in a nonmetallic raceway and is isolated from possible contact by a minimum cover of 450 mm (18 in.) to any part of the elbow or is encased in not less than 50 mm (2 in.) of concrete.

PANEL STATEMENT: The revised text meets the intent of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

RAPPAPORT: This is new material, not included in the original proposal and has not had public review. The existing exception requires that the elbow be isolated by 18 in. of cover. The proposed change would permit the 2 in. of concrete to be exposed. Concrete is not an insulator especially when it is wet. An extreme example of the use of concrete as a conductor is in its application as a concrete encased grounding electrode (250-50(c)). Consider an application where nonmetallic conduit with metal elbows is placed in a poured floor that is part of a shower room. The 2 in. cover may exist but a fault of an energized conductor to the elbow will certainly result in fault current through the concrete. Perhaps the example is not what was intended but it certainly could happen with the change as accepted by the panel.

(Log #1963)

5- 110 - (250-92(b)): Accept in Principle

SUBMITTER: Phil Simmons, Simmons Electrical Services

COMMENT ON PROPOSAL NO: 5-200

RECOMMENDATION: Revise text as follows:

(b) Bonding to Other Systems. An accessible means external to enclosures for connecting intersystem bonding and grounding conductors shall be provided at the service equipment and at the disconnecting means for an additional building or structure by at least one of the following means:

1. Exposed nonflexible grounded metallic ~~service~~ raceways.
2. Exposed grounding electrode conductor.
3. Approved means for the external connection of a copper or other corrosion-resistant bonding or grounding conductor to the grounded ~~service~~ raceway or equipment.

~~For the purposes of providing an accessible means for intersystem bonding, the disconnecting means at a separate building or structure as permitted in Section 250-32 and the disconnecting means at a mobile home as permitted in Section 550-23(a) shall be considered the service equipment.~~

FPN No. 1: A 6 AWG copper conductor with one end bonded to the grounded nonflexible metallic ~~service~~ raceway or equipment and with 150 mm (6 in.) or more of the other end made accessible on the outside wall is an example of the approved means covered in (B)(3).

FPN No. 2: See 800.40, 810.21, and 820.40 for bonding and grounding requirements for communications circuits, radio and television equipment, and CATV circuits.

SUBSTANTIATION: Changes to this section are intended to incorporate the concept included in Comment 5-149 for the 1999 NEC which was accepted in principle by Code Making Panel 5. The comment was rejected by the Technical Correlating Committee with the comment that "Items (1), (2) and (3) may not be available at separate buildings and mobile homes." It should be noted however, all three provisions for intersystem bonding are not required at every service or building or structure disconnecting means. One of the three provisions must be made.

Further, changes are proposed to this section since the Panel, in its Statement on Proposal 5-118, indicates it is the Panel's intention to keep all the intersystem bonding requirements in Section 250.92(B).

This provision for intersystem bonding ensures that other electrical systems, where installed, can be safely bonded to the electrical distribution system grounding electrode system and other electrical equipment regardless of whether the other systems are at the building or structure having the service equipment or at a remote building or structure.

In addition, changes to this section are intended to remove the confusing reference to disconnecting means for remote buildings or mobile homes being referred to as service equipment. In fact, these remote buildings are most likely supplied by a feeder or branch circuit and not be a service.

PANEL ACTION: Accept in Principle.

Relocate the existing Section 250.94 to become Section 250.92(B).

Insert the following text (taken from existing Section 250.92(B)) as a new Section 250.94 to read as follows:

250.94 Bonding for Other Systems. An accessible means external to enclosures for connecting intersystem bonding and grounding conductors shall be provided at the service equipment and at the disconnecting means for an additional buildings or structures by at least one of the following means:

(1) Exposed nonflexible metallic raceways

(2) Exposed grounding electrode conductor

(3) Approved means for the external connection of a copper or other corrosion-resistant bonding or grounding conductor to the grounded raceway or equipment

FPN No. 1: A 6 AWG copper conductor with one end bonded to the grounded nonflexible metallic raceway or equipment and with 150 mm (6 in.) or more of the other end made accessible on the outside wall is an example of the approved means covered in (B)(3).

FPN No. 2: See 800.40, 810.21, and 820.40 for bonding and grounding requirements for communications circuits, radio and television equipment, and CATV circuits.

PANEL STATEMENT: The panel concludes the revised text meets the intent of the submitter. The sections were interchanged to add clarity.

(Log #1960)

5- 111 - (250-97 (d)): Accept

SUBMITTER: Phil Simmons, Simmons Electrical Services

COMMENT ON PROPOSAL NO: 5-207

RECOMMENDATION: Revise the existing text of the Code to read as follows:

"d. Listed fittings that are identified for the purpose."

SUBSTANTIATION: There are lots of conduit fittings such as insulating bushings that are not suitable for the purpose of bonding over 250 volts to ground connections. The present requirement to use "listed fittings" does not ensure that proper fittings will be used.

The reference to Section 300-15(a) which specifies "Fittings and connectors shall be used only with the specific wiring methods for which they are designed and listed" would allow any fitting to be used so long as it is suitable for the wiring method employed. It does not ensure that the proper fitting is used for the bonding required here. An example is a insulating bushing that is designed and listed to be installed on rigid metal conduit.

Including the requirement that "identified" fittings be used incorporates the definition of "identified" in Article 100 which reads, "Recognizable as suitable for the specific purpose, function, use, environment, application, etc., where described in a particular Code requirement." It seems the use of this term ensures the proper fitting(s) will be used.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

SKUGGEVIG: To say in the Code "listed fittings that are identified for the purpose" may imply that each fitting is marked to indicate the details related to its proper use. This is not practical

in an all-inclusive and comprehensive way. Instead, all the information needed for a designer, installer, or Authority to identify a listed fitting as suitable for a particular application is contained in the product information published in UL's General Information Directory (white book). The white book is readily available, and in addition, the guide information is available free through the Internet at www.ul.com. "Identified" as defined in the NEC, presently includes the information provided as part of a Listing, such as the UL guide information.

STEINMAN: The substantiation does not include any field experiences where users have misunderstood this requirement. The addition of the requirement "that are identified for the purpose" is not necessary. It will cause confusion as some authorities having jurisdiction may expect fittings to be marked suitable for grounding. This is unnecessary, as UL 514B requires fittings to be suitable for grounding.

(Log #685)

5- 112 - (250-100): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 5-208
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: The panel states that special occupancies are covered in Chapter 5 and requirements for such occupancies need not be covered in Article 250. However, the heading of the section to which it is proposed to add this text is "Bonding in Hazardous (Classified) Locations," which states some, but not all of the bonding requirements for classified locations. To avoid errors by the Code user, this section should either provide complete information, or it should only refer the user to the applicable Code sections (which seems unnecessarily repetitive, since the requirements are the same for all classified locations).
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that the general requirements for bonding in hazardous (classified) locations as specified in Section 250-100 should remain as a general requirement and that it should be expanded upon in Chapter 5 as it presently is. The panel also concludes that repeating the requirement in Section 250-100 is unnecessary. Section 250-100 also serves to require that the bonding should be by any of the methods specified for services, which is not mentioned in Sections 501-16(a), 502-16(a), or 503-16(a).

5- 115 - (250-102(e)): Accept in Principle
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 5-212
RECOMMENDATION: Add a new sentence after the current second sentence.

An equipment bonding jumper longer than six feet shall be permitted at utility pole and other pole locations for the purpose of bonding or grounding isolated sections of metal raceways or elbows installed in ~~a run~~ exposed risers of ~~rigid~~ metal conduit or raceways.
SUBSTANTIATION: My original vote was a negative, but I agree with nature, spirit, and intent of the proposal. It should have been accepted in principle and adjusted as adjusted above. The original proposal limited the permission for the bonding jumper longer than six feet to utility pole locations only. It should include those pole-types of installations other than utility poles. The code already requires metal enclosures for service conductors and other conductors to be grounded. Although the metal raceways and conduits that enclose service conductors are required to be bonded in Part E of Article 250, there is room for the allowance for the bonding jumpers in these situations to exceed the six feet length as currently limited by Section 250-102(e). The scope of what the code covers is outlined in Section 90-2. In many cases the metal conduits or raceways at utility poles would not be covered under the scope of the NEC and the authority having jurisdiction would have difficulty enforcing the requirement. However, the problem is real, regardless of who has jurisdiction. The problem is with not only 600 volt and less installations, but also exists with medimum and high voltage pole risers also. The acceptance of the proposal is a step in the right direction and I support the panel's decision to accept and recommend adjusting as indicated above.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 5-117.

(Log #994)

5- 117 - (250-102(e), Exception and FPN): Accept in Principle
SUBMITTER: Joseph A. Ross, Ross Electrical Assessments
COMMENT ON PROPOSAL NO: 5-212
RECOMMENDATION: Add an Exception and a FPN as follows:
Exception: Where installed on the outside, an equipment bonding jumper shall be permitted to be longer than 1.83 (6 ft) at pole locations to bond isolated sections of metal raceways or elbows installed in a run of rigid nonmetallic conduit.
FPN: See 250.80.
SUBSTANTIATION: There are times when an Exception and an explanatory FPN are needed to clearly define the text of a Code requirement. This may be the place. In many cases, in an underground installation of rigid nonmetallic conduit, metal raceways and elbows are used at pole locations for physical protection. The present requirement of "no longer than 6 ft" mandates that the metal raceway is to be run to the top of the pole so as to be within 6 ft of the bonding connection. Most will balk at a bonded metal raceway in such a close proximity to pole-top high-voltage conductors. Hence, it will be more safe to bring a bonding conductor, rather than a metal raceway, to the pole-top vicinity.
PANEL ACTION: Accept in Principle.
Revise the proposed text for Section 250.102(E) of the 2002 NEC draft by
1.) deleting the third sentence, and
2.) add an exception to read as follows:
Exception: An equipment bonding jumper longer than six feet shall be permitted at outside pole locations for the purpose of bonding or grounding isolated sections of metal raceways or elbows installed in exposed risers of metal conduit or other metal raceway.
PANEL STATEMENT: The concept from the original proposal has merit for those parts of the system governed under the NEC. Depending on the establishment of the "service point" this may include a utility pole where the raceways belongs to the premises wiring and does fall under the NEC. The panel concludes the revised text meets the intent of the submitter. The FPN proposed did not add clarity.

5- 119 - (250-104): Accept in Principle
SUBMITTER: Robert H. Keis, Dover, DE
COMMENT ON PROPOSAL NO: 5-212
RECOMMENDATION: This proposal should remain accepted.
SUBSTANTIATION: Regardless of what some of the panel members feel, this proposal is needed. The comment that these installations are owned by the utility is not always true. Many times, especially on commercial installations, the customers service raceway is installed "up" the pole on standoffs. This raceway is the owner's responsibility even when it goes up the utility pole. As the submitter states, there are times when metal raceways and fittings are installed in this service raceway and it is very difficult to properly bond these metal sections and keep within code rules of 6 feet. Any type of bonding will be better than not bonding at all because of the 6 ft restriction. As for Mr. Mello's comment that "there is no method to ensure this proposed bonding wire will ever be connected...". This seems like a poor excuse for not at least trying to make a safe installation. Most utilities know the purpose of this wire, and they will connect it if it is there.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 5-117.

5- 120 - (250-104(a)): Reject
SUBMITTER: Jamie McNamara, Hastings, MN
COMMENT ON PROPOSAL NO: 5-215
RECOMMENDATION: The panel should reconsider this proposal and accept it.
SUBSTANTIATION: The current wording in 250.104(a) Metal Water Piping, The interior metal water piping system shall be bonded as required in (1), (2), (3), or (4) of this section. Requires that 1, 2, 3, or 4 be done if any one of the four is done, that is all that is required. It may be advisable to change (as required) to (if available).
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that the proposed changes are not necessary and that the present code text is clear. Insufficient substantiation provided by the submitter. The present wording in Section 250-104(a) is the same as with other code sections written in similar fashion and is intended that where any of conditions 1, 2, 3, or 4 exist then the requirements are applicable in accordance with that section. The change would require bonding of something that may not exist as stated in the original rejected Proposal 5-215.

5- 121 - (250-104(a)(1)): Reject
SUBMITTER: David A. Kerr, Jr., Friendsville, PA
COMMENT ON PROPOSAL NO: 5-219
RECOMMENDATION: Reject.
SUBSTANTIATION: The present code has worked fine for decades. There has been no substantiation that mysterious other piping systems are causing a problem. There is no technical reason to require wire sized to Table 66. Wire that size costs real money.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that the proposal addresses a concern of the literal meaning of the rule with the use of the word "interior". The intent is that all metal water piping systems whether interior or on the exterior are required to be bonded for effective safety. The wording in the 1999 NEC was limited literally to interior water piping systems only and if taken and enforced literally could lead a concern of unbonded metal water piping systems on the exterior and attached to the building or structure. Insufficient substantiation has been provided for the panel to reverse its decision or to change the reference for the size of the bonding conductor from Section 250.66.

5- 122 - (250-104(a)(1)): Reject
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 5-219
RECOMMENDATION: Insert the word "potable" before "water piping...").
Delete the word "interior" and insert the word "potable" before "water piping...) in 250.104(A) also for consistency.
SUBSTANTIATION: There are many piping systems in industry that may contain aqueous solutions that could be interpreted as being water piping. Examples are sprinkler, de-ionized water, waste, cooling, steam, heating, etc. Some process piping has corrosion protection that would be compromised by bonding.
We suggest that a task group be formed to investigate shock incidents form ungrounded piping.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel contends that replacing the word "interior" with the word "potable" is not substantiated and would not enhance safety. The present language covers all water piping systems and is not limited to one. Replacing the word interior with the word potable is reducing the minimum requirements of this section.

5- 126 - (250-104(a)(4), Exception (New)): Accept in Principle in Part
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 5-223
RECOMMENDATION: Revise the proposed exception as follows:
Exception: A separate bonding jumper shall not be required where the effectively grounded metal frame of a building or structure, used as the grounding electrode for separate systems, is bonded to the metal potable water piping in the area served by the separately derived system.
SUBSTANTIATION: Where the grounded metal frame of a building or structure is used as the grounding electrode for a separately derived system installing a second conductor (bonding jumper) to the water piping "in the area" is not necessary. No substantiation was given for making this change in the 1999 NEC. See Mr. Dobrowsky's negative ballot comment in the May 2001 ROP for further information.
PANEL ACTION: Accept in Principle in Part.
Revise the proposed to add an exception to Section 250-104(A)(4) to read as follows:
Exception: A separate water piping bonding jumper shall not be required where the effectively grounded metal frame of a building or structure is used as the grounding electrode for a separately derived system and is bonded to the metallic water piping in the area served by the separately derived system.
PANEL STATEMENT: The panel concludes the revised text meets the intent of the submitter. The panel did not accept the term "potable". See panel action and statement on Comment 5-123.

5- 127 - (250-104(b)): Accept in Principle
SUBMITTER: David A. Kerr, Jr., Friendsville, PA
COMMENT ON PROPOSAL NO: 5-225
RECOMMENDATION: Accept.
SUBSTANTIATION: I think it is a mistake to delete all reference to fuel gas piping of the numerous proposals, this one sounds best to me. Fuel gas piping is far more dangerous than other kinds of piping.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 5-132.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16

(Log #923)

5- 128 - (250-104(b)): Accept in Principle in Part
SUBMITTER: Joseph A. Ross, Ross Electrical Assessments
COMMENT ON PROPOSAL NO: 5-236
RECOMMENDATION: Delete the superscript letter "x" and revise (b) as follows:

(b) Metal Fuel Gas Piping. Each above ground portion of a fuel gas piping system upstream from the equipment shutoff valve shall be electrically continuous and bonded to the grounded electrode system. The bonding conductor shall be sized in accordance with Table 250.66 and installed in accordance with 250.64.a, .b and .e.

SUBSTANTIATION: Section 250-104(b) continues to be one of the most controversial sections of the 1999 NEC and it needn't be. Simple references for proper sizing and installations were needed. As revised, it is no longer considered an extract. It does not need to be. As revised, it does not conflict with paragraph 3.14(a) of the National Fuel Gas Code, NFPA 54. The addition of the word "fuel" further harmonizes the text with NFPA 54 and separates fuel gas requirements from other gas piping systems, e.g., medical gas piping systems that only would require to be sized in accordance with Table 250-122 as covered in Section 250-104(c).

The reference for Table 250-66 sizing of the bonding conductor is the most practical and obvious choice. Consider, e.g., that a building contains a mass of metal water piping, a mass of exposed and likely to be energized structural steel, and a mass of fuel gas piping. If the service were rated at 200 amperes, does it make sense to bond a 4 AWG CU conductor to the metal water pipe and to the structural steel, but [as proposed, group fuel gas piping into 250-104(c)] with a 15-ampere circuit in the vicinity, run a 14 AWG in a raceway to bond the fuel gas piping? Wouldn't it be more practical to size the bonding conductor for the three systems with one size and one rule, i.e., one conductor, one size and run it to the first system and keep it running to the other two systems. Reject the deletion of 250-104(b)! Making (b) go away will not stop the controversies and it will create mass confusion.
PANEL ACTION: Accept in Principle in Part.
PANEL STATEMENT: See panel action and statement on Comment 5-132. The panel did not accept the use of Section 250.66. The panel disagrees with the substantiation.

5- 130 - (250-104(b)): Accept in Principle
SUBMITTER: Don Ganiere, Ottawa, IL
COMMENT ON PROPOSAL NO: 5-229
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: Both Code-Making Panel 5 and Fuel Gas Code agree that interior gas piping must be bonded. Deletion of this section of the code will result in gas piping systems that are not bonded. Many installers, like the submitter of Proposal 5-229, believe that bonding the gas pipe increases the hazard. Few in the field will agree with the panel statement that 250-104(c) covers the gas pipe bonding requirement. If the bonding of the gas piping is required for a safe installation, 250-104(b) must remain in the code. However, it should be modified to specify the required size of the bonding conductor.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 5-132.

(Log #771)

5- 131 - (250-104(c) and c): Accept in Principle
SUBMITTER: Richard E. Loyd, Perryville, AR
COMMENT ON PROPOSAL NO: 5-231
RECOMMENDATION: Revise 250-104(c) as follows:

(c) Other Metal Piping. Interior metal piping <u>such as interior gas piping</u> that may become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper shall be sized in accordance with Table 250-122 using the rating of the circuit that may energize the piping.

The equipment grounding conductor for the circuit that may energize the piping shall be permitted to serve as the bonding means. <u>The points of attachment of the bonding jumpers shall be accessible.</u>

FPN: Bonding all piping and metal air ducts within the premises will provide additional safety.

SUBSTANTIATION: I agree with the panel action, however, I feel the panel should have placed a reference in 250-104(c) in addition to the reference in 250-2 to make it clear that it is still the intent of the panel to require gas piping to be bonded for safety. This proposed change will make the code more user friendly. The deletion of 250-104(b) may give the user the impression that bonding gas piping is no longer required. By adding the requirement that the terminations of the bonding jumpers be accessible makes this section consistent with 250-104(a).
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 5-132.

5- 132 - (250-104(c)): Accept in Principle
SUBMITTER: Phil Simmons, Simmons Electrical Services
COMMENT ON PROPOSAL NO: 5-238
RECOMMENDATION: Revise text as follows:

(c) Other Metal Piping. <u>Where installed in or attached to a building or structure,</u> metal piping system(s) ~~installed in or attached to a building or structure~~ that may become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with Table 250-122 using the rating of the circuit that may energize the piping system(s). The equipment grounding conductor for the circuit that may energize the piping system(s). The equipment grounding conductor for the circuit that may energize the piping shall be permitted to serve as the bonding means.

FPN: Bonding all piping and metal air ducts within the premises will provide additional safety.

SUBSTANTIATION: Editorial improvement. The intention of this section is not to require bonding of the building or structure but of the metal piping that might become energized.
PANEL ACTION: Accept in Principle.
Revise Section 250.104(B) of the 2002 NEC ROP draft to read as follows:
(B) Other Metal Piping. Where installed in or attached to a building or structure, metal piping system(s), including gas piping, that may become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with 250.122 using the rating of the circuit that may energize the piping system(s). The equipment grounding conductor for the circuit that may energize the piping shall be permitted to serve as the bonding means. The points of attachment of the bonding jumper(s) shall be accessible.
FPN: Bonding all piping and metal air ducts within the premises will provide additional safety.

PANEL STATEMENT: The panel concludes that the revised wording meets the submitters intent. Additionally, the concepts of Comment 5-131 are included in this revision.

(Log #2390)

5- 133 - (250-104(d)): Reject
SUBMITTER: Arthur Burbaum, City of San Diego
COMMENT ON PROPOSAL NO: 5-239
RECOMMENDATION: Revise text to read:
(d) Structural ~~Steel~~ Metal. Exposed interior structural ~~steel~~ metal that is interconnected to form a ~~steel~~ building frame, and any ancillary part located within 30 in. (0.732 m), thereof ~~and~~ that is not intentionally grounded and may become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to one or more grounding electrodes used. The bonding jumper shall be sized in accordance with Table 250-66 and installed in accordance with Sections 250-64(a), (b) and (e). The points of attachment of the bonding jumpers shall be accessible.
SUBSTANTIATION: I agree with Mr. Bender's comment that the wording is best stated as now revised and will try to answer the other questions asked by the panel. Essentially the installation would have complied with the present wording of the 1993 to present NEC without this added wording. While I can not discuss all aspects of the case at this time, suffice to state as you view picture #1 you can note the difference of voltage going to ground via the concrete by the level of the metal flow. The bench as you will note is a separate structure from the shelter. It is always difficult to figure a safe distance, therefore the 30 in. spacing from a parallel structure was selected using half the distance of an average spread of a person between two points and then determining a maximum reach. The change of wording to bond the various metal parts together now places all the reachable parts at the same (equal) potential and a flow of current is then limited to the amounts of resistive values between the parts and/or a person. The rule of electrical flow is an equation with the higher resistance causing the lesser flow. Body resistance is generally higher than the bonded parts. The bonding of these parts together results in generally a lesser resistance, generally not enough to be fatal to the average person in contact with them. Incidents involving metal patio covers and other metallic structures would also benefit. While there would still be the slight hazard of a possible electrical shock, it would generally not be fatal. I have provided pictures that demonstrate the condition that caused the fatality. This type of structure is in common use throughout the country. This similar condition of separated metallic parts has been known to cause problems in animal shelters. We cannot totally prevent accidents, but we must learn from them. To reply to Mr. Johnson's comment, in most states contractors install structures and electrical installations to a standard. In the Electrical field the standard used is the NEC. In short, if this installation had been bonded together it is doubtful the severe consequences would have occurred.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel recognizes the concerns of the submitter. The panel concludes that to properly mitigate the hazards cited by the submitter during the presentation as well as in the written proposal, each installation has to be evaluated by a qualified person to determine safety measures necessary for protection. The general solution proposed in this comment may not be adequate in all cases.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BRENDER: The original proposal and subsequent comment seek to address a safety hazard that resulted in a fatality. While the proposed solution may not be adequate in all cases, it represents a significant improvement that should prove adequate in most similar cases, at bare minimum cost.
The Panel Statement that "to properly mitigate the hazards cited...each installation has to be evaluated by a qualified person to determine safety measures..." could apply to the entire Code. The requirement for bonding ancillary structures with 30 in. of a structure will enhance safety and provide language necessary for electrical inspectors to enforce this requirement.

(Log #999)

5- 134 - (250-104(e) (New)): Reject
SUBMITTER: David A. Kerr, Jr., Friendsville, PA
COMMENT ON PROPOSAL NO: 5-241
RECOMMENDATION: Accept.
SUBSTANTIATION: This proposal contains abundant documentation that metal studs are dangerous. The combination of metal studs, NM cable and plastic boxes is a time bomb. Bonding should be required by a bonding wire or the simple use of metal boxes, why do you worry about other metal piping systems and ignore this clear and present danger.
PANEL ACTION: Reject.
PANEL STATEMENT: No additional substantiation was provided. CMP-5 reaffirms the original panel statement of Proposal 5-241.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BRENDER: The original proposal and subsequent comment identify a present hazard that could be easily and inexpensively rectified through the use of a bonding jumper or a metallic junction box. This comment should be accepted.

(Log #2223)

5- 135 - (250-106): Accept in Principle
SUBMITTER: Robert H. Keis, Dover, DE
COMMENT ON PROPOSAL NO: 5-106
RECOMMENDATION: This proposal should be accepted instead of rejected.
SUBSTANTIATION: Regardless of how some panel members feel about this proposal not adding clarity or causing confusion. This proposal is needed for clarification. I have been an inspector for over 30 years and I have problems figuring this out. This proposal clears up what size jumper is required. As for the panel statement that "the term may be misunderstood to require an additional conductor", if the conductor is needed, this new wording will clarify the size requirements. If the bonding jumper is not needed, then the installer has no problem.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 5-65.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 16

(Log #1177)

5- 136 - (250-114): Reject
SUBMITTER: Frank Martucci, Fort Lee, NJ
COMMENT ON PROPOSAL NO: 5-247
RECOMMENDATION: Please accept this proposal. Exposed noncurrent-carrying metal parts of cord and plug-connected equipment likely to become energized shall be "redundantly" grounded.
(a) Two grounding conductors shall be installed in cord and cord sets with the branch circuit conductors supplying the unfixed equipment.
(b) Component Grounding poles. Cord connectors and attachment plugs shall be provided with two separate wiring sites at the existing grounding pole. Cord female connectors, and male attachment plugs shall be designed so that only the grounding pole can be wired with two conductors.
SUBSTANTIATION: For the past thirteen years I have submitted proposals for the 1990, 1993, 1996, 1999, and the forthcoming 2002 National Electrical Code that will prevent thousands of electricians and fiery deaths each and every year. Yet, despite my serious admonitions and allegations, code panels continue to reject my proposals sight unseen, without any demonstrations or testing whatsoever.
It boggles my mind that members of code making panels, most with no cord expertise whatsoever, can display such an indifference to human life. What if my system works? Don't they have any fear

of being liable for thousands of deaths these past 13 years? Don't they have any fear of being liable for the loss of hundreds of thousands of homes each and every year?

I, for one, would demand extensive tests before I rejected a system that may indeed save thousands of lives each and every year.

My reaction to a single electrocution bordered on the fanatical. I immediately replaced undersized 3 conductor cords with 4 conductor cords to provide two #14, (15 amapacity) grounding conductors for all medical devices.

In addition, costly, and time consuming, outlet modifications were made to provide the redundancy every other federal agency, or responsible engineer, resorts to whenever lives are at stake. The design also provided a wiring safeguard that prevented miswired cords from causing electrocutions and current flow through raceways.

The same redundancy, and safeguard, I propose that will prevent thousands of electrocutions and fiery deaths each and every year.

The same redundancy and wiring safeguard code panel members have unanimously rejected, time and again, the past 13 years. They not only reject the concept of redundancy, but they adamantly defend the use of conductors sized up to 50 percent less than required by our original National Electrical Code.

The original code, written under the influence of insurance companies, distinctly states the equipment grounding conductor shall be no smaller than #14 (15 ampacity) when used on a typical 15 ampere branch circuit.

However, when the NFPA took over the code making process in 1911, they established exceptions to the code whereby a #18 (7 ampacity) conductor is permitted to protect our people from line drop, shock , and electrocution.

This is a clear violation of our electrical code and detrimental to the electrical safety of every, man, woman, and child in our nation.

And it boggles my mind that, during the past 13 years, not a single panel member ever endorsed the use of redundancy. How can code panel members dedicated to electrical and fire safety fight so vehemently to keep our people protected with a grounding conductor sized less than required by our original electric code?

If code panels see fit to jeopardize the lives of our people with undersized, rarely tested, equipment grounding conductors then at least provide two of them.

And this is what my proposal accomplishes. And to boot, a bonus wiring safeguard that will make our grounding system electrocution-proof and fire-proof.

It's bad enough that code panels saw fit to reduce our protective equipment grounding conductor over 50 percent in our cord and plug connected equipment.

But worse than that is complete elimination of grounding conductors in our electrical distribution system.

Article 250-95 in the original code document, written under the influence of insurance companies, states "the equipment grounding conductor shall be copper, copper clad, or aluminum."

However, when the National Fire Protection Association took over the code making process in 1911, members of the electrical industrial complex established exceptions to the code, permitting inappropriate outlet mounting screws, metal outlet boxes, outlet connectors, and metal raceways, to be used as the grounding conductor.

This may be adequate for the short time it takes to clear ground faults, but what are the consequences if excessive current from a hotplate, heater, or air conditioner should flow through corrosive, steel screws, 100 feet of metal raceways, and up to 16 raceway outlet box connectors for lengthy periods of time?

During heater and hotplate current tests, I was horrified to find the temperatures of outlet mounting screws exceeding the 250 degree limit of my electronic thermometer. In addition, the metal raceway temperature measured 150 degrees.

The temperatures were taken in open air and should be considerably higher inside sealed walls and ceilings, where the outlet mounting screws, and raceways, are located.

At times the outlet mounting screws were glowing at the threads of the outlet box and tissue paper smoldered or ignited when placed on them.

The consequences are quite obvious. Should excessive current ever flow for lengthy periods of time through this ill-conceived grounding system, "unseen" fires could develop and rage inside the walls and ceilings; fires that flashover into rooms and incinerate occupants and contents within seconds.

And excessive current can be made to flow through inappropriate screws and metal raceways if an appliance cord, or extension cord, is inadvertently wired with reversed green and white conductors; a wiring error especially possible when repairing the cords flooding our nation without any color coding whatsoever. The white, black, and green conductors are similarly colored black, gray, yellow, or brown.

There is no doubt in my mind that the sudden inferno that killed three students at (name deleted) was caused by our ill-conceived grounding system. What else could explain the sudden flashover that incinerated two students at the very same time the smoke alarms sounded and an extreme amount of smoke and heat poured down the corridors.

But panels don't believe in scenarios or theories and the carnage will continue unless they accept my proposal that prevents fires inside walls.

Panels reject my proposals because they think it will necessitate drastic changes in cord components. This is simply not true. And if they would only ask for a demonstration I can prove it to them.

They reject my proposal because they think GFCIs and assured grounded programs are more effective than a wiring safeguard or a second, redundant ground. This, despite the fact that over a hundred workers were electrocuted on construction sites in 1992 where GFCIs and assured grounding programs are extensively used.

And the reason for rejection is flawed because GFCIs and assured grounding programs are only mandated for construction sites. What about other workplaces, homes, and hospitals?

I urge the panels to adopt the use of redundancy every responsible engineer resorts to when lives are at stake. If our lives must be protected with an undersized, rarely tested, equipment grounding conductor, than at least provide two of them.

And please mandate the slight no cost change to cord components as described in this proposal to provide a wiring safeguard that prevents electrocutions and fiery deaths.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel has again reviewed the submitter's substantiation and reaffirms its position and previous statements on this subject.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16

(Log #975)

5- 138 - (250-118): Accept

SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)

COMMENT ON PROPOSAL NO: 5-251

RECOMMENDATION: The Panel should continue to Reject this proposal.

SUBSTANTIATION: The submitter states "installation practices today cannot assure that all connections are made properly." Using that same logic, one could say that if a grounding conductor were installed in the raceway, it, too, could be improperly connected. When metal raceways are installed in accordance with the requirements of the National Electrical Code, they provide a low-impedance path to ground and, as the Panel states: "have safely been used as an equipment grounding conductor for many years."

The submitter is addressing a workmanship issue that cannot be solved by writing another code requirement. The NEC does not prohibit the use of a supplementary grounding conductor if the building owner/designer decides to require one. This should remain a design decision.

Steel Conduit manufacturers are in the process of finishing an Installation Guide that will provide information on the proper installation of steel conduit. This will be published before the new Code is. The NEMA Fittings Section (5-FB) has already completed an installation guide on fittings, the primary element of connections, which is available from NEMA. Both publications are written to encourage good workmanship, proper installation, and maintenance.

In his negative comment, Mr. Rappaport mentions a Factory Mutual report. This report was prepared as substantiation for several proposals for the 1990 NEC.

NEMA submitted a comment to reject the proposal. The Panel voted unanimously to accept the NEMA comment. In NEMA's substantiation the following points were made:
- The FM loss reports contained a statement that "the exact ignition scenarios for these fires are open to discussion and speculation."
- The installations cited in the loss reports had an average age of 40 years and did not reflect current products, code requirements, etc.
- Several Code violations were described including improper grounding, no overcurrent protection, etc.
- Inadequate maintenance was cited.

Another negative comment submitted during that code cycle stated that the submitter had had an independent consulting engineering firm TEC, Inc. review the FM report. Their conclusion was that "the FM technical report does not relate a completely fair analysis of all aspects of electrical equipment grounding and "true life" installation practices."

PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 2
EXPLANATION OF NEGATIVE:

BRENDER: Continuity of the grounding path under real field conditions cannot be assured without the use of a continuous copper equipment grounding conductor. Numerous recognized outside sources have stated that they insist on such a conductor, irrespective of the conduit material.

Indeed, Mr. Renscok, in Comment 5-139, points out that the State of Oklahoma and many cities in Arizona and elsewhere require the use of a separate equipment grounding conductor in all raceways.

This comment should be rejected and the original proposal accepted.

RAPPAPORT: See my explanation of negative vote on Comment 5-139.

(Log #1193)

5- 139 - (250-118): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
COMMENT ON PROPOSAL NO: 5-251
RECOMMENDATION: This proposal should have been accepted.
SUBSTANTIATION: I agree with Mr. Brender, Mr. Rappaport, and Mr. Toomer on their statements to the panel's action.

See also Proposal 8-3 on page 315 of the ROP which shows that the state of Oklahoma requires an equipment grounding conductor in all raceways. Many cities around the country are also requiring this conductor including many in Arizona.

The Georgia Tech professor will not comment to existing installations because maintenance and work installation vary as due soil conditions.

PANEL ACTION: Reject.
PANEL STATEMENT: When metal raceways are installed in accordance with the requirements of the National Electrical Code, they provide a low-impedance path to ground and have safely been used as an equipment grounding conductor for many years. Workmanship issues cannot be solved by writing another code requirement. The NEC does not prohibit the use of an additional equipment grounding conductor. This should remain a design decision.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 2
EXPLANATION OF NEGATIVE:

BRENDER: See my Explanation of Negative vote on Comment 5-138.

RAPPAPORT: The panel consistently refuses to listen to comments from the field concerning the inadequacy of metal raceways as equipment grounding conductors, especially electrical metallic tubing. Even when installed correctly, there are many applications where conduits move and, as a result, the couplings and connectors are loosened. Many of the workmanship issues could be solved by requiring the additional equipment grounding conductor in the metal raceways. There has been adequate substantiation from inspectors and contractors in the field to warrant accepting the original proposal.

(Log #63)

5- 140 - (250-118(1)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 5-253a
RECOMMENDATION: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in Mr. Rappaport's Explanation of Negative. This action will be considered by the panel as a public comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel accepts the direction of the Technical Correlating Committee to reconsider the negative comment expressed in the voting. See panel action on Comment 5-141.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
NEGATIVE: 1
EXPLANATION OF NEGATIVE:

BRENDER: I will reiterate that aluminum is not a particularly corrosion-resistant conductor, witness the numerous restrictions on its use in contact with the earth, in agricultural premises and other locations. It is inappropriate to specifically denote aluminum in this section and diminishing the discretion of the Authority Having Jurisdiction in exercising judgment as to the appropriate application.

(Log #1712)

5- 141 - (250-118(1)): Accept
SUBMITTER: Charles M. Trout, Maron Electric Co. Inc.
COMMENT ON PROPOSAL NO: 5-253(a)
RECOMMENDATION: This proposal should be accepted as written.
SUBSTANTIATION: I'm not sure of the meaning of the action taken by the Technical Correlating Committee and the reference to Mr. Rappaport's explanation of negative as indicated in the ROP. Rather than assume an error in printing, I am sending this comment in favor of the panel's action. Mr. Brender's negative comment referring to an un-named previous panel member's assertions that the omission of aluminum from Section 250-118(1) was intentional is to say the least "anecdotal" in light of the fact that Sections 250- 64, 250-120, and Table 250-122 permit the use of aluminum and copper-clad aluminum. It appears to me that it would have been reprehensible for the panel to knowingly incorporate conflicting requirements in the same Article.
PANEL ACTION: Accept.

(Log #1924)

5- 144 - (250-118(11)): Accept in Principle
SUBMITTER: James T. Dollard, Jr., Philadelphia, PA
COMMENT ON PROPOSAL NO: 5-254
RECOMMENDATION: Continue to Accept this proposal.
SUBSTANTIATION: I agree with the Panel action to accept this proposal. The present text of 250-118(11) is misleading, not user friendly and not in line with the product standards. I would like to address the negative comments as written in the ROP.

All three negative comments state that the product standards already address this issue. Included with this comment are copies of from the "UL White Book General Information for Electrical Equipment 2000" pages 62, 63 and 64. This includes the listing information for: "METAL CLAD CABLE (PJAZ)" "METAL CLAD CABLE CLASSIFIED IN ACCORDANCE WITH IEC PUBLICATIONS (PJHY)" and "METAL CLAD CABLE, CLASSSIFIED IN ACCORDANCE WITH UL 1569,WITH METRIC CONDUCTOR SIZES (PJPJ)". Also included is page 37 and 38 of the "UL Wire and Cable marking Guide 2000". This includes the listing information for "METAL CLAD CABLE FOR HAZARDOUS LOCATIONS (PJPP)". UL provides these documents to users and inspectors to facilitate the application, installation and inspection of electrical equipment. However not all users of this code own or even know what a UL White Book is or how to apply it.

The product standards do not recognize the armor of the interlocking type jacketed type MC cable as an equipment-grounding conductor. The product standards do not recognize the combination of the interlocking jacket of type MC cable with the REQUIRED internal equipment-grounding conductor as an equipment-grounding conductor. The only combination that is recognized is the jacket of the smooth or corrugated type MC cable and an internal equipment grounding conductor which in most cases is not required. See (PJAZ), (PJHY) which refers you to PJAZ, and (PJPJ). The Product Standards are clear, yet the present text of 250-118(11) is not. This proposed change will clearly point out to the user that the interlocking jacket of type MC cable may never be used as an equipment grounding conductor in accordance with the product standards.

Mr. Steinman states that "The present wording accurately reflects the grounding characteristics of the sheath of MC cable." This is not true. The present wording is directed at only the smooth or corrugated type MC cable.

Mr. Stienman also states that "The implication of the proposed wording would imply that the sheath of the smooth tube or corrugated tube must always be suitable as an equipment grounding conductor. This is not always the case." Mr. Steinman is correct that the corrugated tube of one type of MC cable not permitted to serve as an equipment-grounding conductor. See (PJPP) "METAL CLAD CABLE FOR HAZARDOUS LOCATIONS (PJPP)". Mr. Steinman is not correct however in his statement that "The implication of the proposed wording would imply that the sheath of the smooth tube or corrugated tube must always be suitable as an equipment grounding conductor." The proposed text is to section 250-118(11) in Chapter # 2. This requirement is a general requirement as it exists in Chapter # 2. The only type MC cable in which the corrugated tube is not permitted as equipment grounding is specifically designed and listed only for use in hazardous locations. These are special locations and exist in Chapter # 5. The first paragraph of Section 90-3 Code Arrangement reads as follows:
This Code is divided into the introduction and nine chapters. Chapters 1, 2, 3, and 4 apply generally; Chapters 5, 6, and 7 apply to special occupancies, special equipment, or other special conditions. These latter chapters supplement or modify the general rules. Chapters 1 through 4 apply except as amended by Chapters 5, 6, and 7 for the particular conditions. While the user of this code may not own or have access to product standards section 90-3 clearly states that Chapters 1 through 4 apply generally and the special Chapters 5, 6 and 7 may supplement or modify the first four chapters.

The proposed text would apply generally. Chapter # 5 presently addresses the use of type MC cable in hazardous locations. In exceptions # 2 to section 501-4 this cable is presently addressed as follows:

Exception No. 2: In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type MC cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated aluminum sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application shall be permitted.

FPN: See Sections 334-3 and 334-4 for restrictions on use of Type MC cable.

Presently the user of this code is referenced to Article 250 to determine the use of the jacket of all types of type MC cable as outlined in section 334-23 Grounding as follows:
Type MC cable shall provide an adequate path for equipment grounding as required by Article 250.

The present text of 250-118(11) is misleading as it states as follows The metallic sheath or the combined metallic sheath and grounding conductors of Type MC cable. This present language clearly misleads the user of this code to believe that the metallic sheath of all types of type MC cable can stand alone as an equipment-grounding conductor.

This code makes several references to the smooth or corrugated sheath of type MC cable. Section 300-22 allows "Type MC cable employing a smooth or corrugated impervious metal sheath without an overall nonmetallic covering" to be used in "Ducts or Plenums Used for Environmental Air." If we were to apply the logic of the negative comments then we should remove this text from 300-22(b) and let the user reference product standards. The NEC specifies different types of MC cable where it permits that

product to be installed in a particular application. The NEC must move to be more user friendly and clearly point out to the user that under no circumstances is the jacket of the interlocking type MC cable permitted to serve as an equipment grounding conductor.

The interlocking type MC cable is used in almost all-commercial installations. This cable assembly must be clearly addressed in section 250-118, as is type MI cable. Section 250-118(10) recognizes "The copper sheath of mineral-insulated, metal-sheathed cable" as an equipment-grounding conductor. This is good code. Included with this comment, is the product standard listing for type MI cable in the "UL White Book General Information for Electrical Equipment 2000" page 65 under the heading "MINERAL INSULATED METAL SHEATHED CABLE (PPKV). The present text of 250-118(10) is clearly in line with the product standards as the text specifically recognizes only the copper jacket of type MI cable as an equipment-grounding conductor.

Also included with this comment are labels removed from coils of the interlocking type MC cable. Notice that each label specifically includes "with green ground" or "with green insulated ground. The interlocking type MC cable is REQUIRED to have an equipment-grounding conductor installed. Notice also the lack of the mention of a combination of the REQUIRED equipment grounding conductor and the interlocking jacket. The installer reading these labels and the present text of 250-118(11) would be led to believe that the interlocking type MC cable may be used for example to supply receptacles in a patient care area. This would be a violation of the NEC. In order to enforce such a violation the inspector must cite a violation of section 110-3(b), and provide product listing information to prove that the interlocking jacket of type MC cable is not in any manner permitted to serve as an equipment grounding conductor. Only then is it clear that the use of the interlocking jacket type MC cable does not meet the requirements of section 517-13 exception No. 1. However the present text of section 250-118(11) and the product labeling clearly mislead the user of this code to believe that the installation is in compliance with the NEC.

This proposed text makes for a more user-friendly code, it is easy to read, enforceable and practical.

Note: Supporting material available for review upon request at NFPA headquarters.

5- 145 - (250-118(11)): Accept in Principle
SUBMITTER: George W. Flach, Nat'l Armored Cable Mfrs' Assn. (NACMA)
COMMENT ON PROPOSAL NO: 5-254
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: The submitter's own substantiation cites that the UL white book provides the necessary information to properly install MC Cable. The White Book information in conjunction with the Product Standard requirements concerning product marking and instruction are integral to the proper installation of all products covered by the NEC. The present language permits cable manufacturers to submit product to listing laboratories for approval of the interlocked construction as an equipment ground. The proposed change will prohibit manufacturers from such product development.

The substantiation cites misuse of the cable and a lack of knowledge and experience in working with MC cable as a reason to remove the current Code language. Revising this section as proposed will not resolve the poor installations described. Continuous sheath MC that is approved as an equipment ground with the combination sheath and grounding conductor will be installed incorrectly as well according to the substantiation if the equipment ground is not properly terminated.

If there were wide spread misuse, it would be more evident than from the information provide in the substantiation. If any action were deemed needed, the product Standard through some form of product marking would more effectively address it.

PANEL ACTION: Accept in Principle.

8- 3 - (250-118(2) and (3)): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
COMMENT ON PROPOSAL NO: 8-7
RECOMMENDATION: This proposal should have been accepted.
SUBSTANTIATION: I disagree with the panel's statement for rejection. All products do not have to be listed for use. See NEC Section 90-4 and 90-7.

The panel statement is in error because all factory cut threads are not protected against corrosion. Field thread are not protected when cut and threaded by the installing person.

PANEL ACTION: Reject.
PANEL STATEMENT: The word evaluated, not listed, was used in the panel statement for Proposal 8-7. However, Sections 345-1 and 346-1 require the use of listed IMC and RMC respectively, which require protection against corrosion for factory cut threads. For general applications Section 300-6(a) does not require corrosion protection for threads at joints. For other applications, such as installations in corrosive areas, Sections 345-3(b) and 346-3(b) require protection judged suitable for the condition. The exception in Sections 300-6(a) permits threads at joints "to be coated with an identified electrically conductive compound." This exception gives the installer the permission to apply an identified

electrically conductive compound to the threads. This is the permission sought in the proposal.
Leaving joints or terminations loose is a workmanship issue.

5- 148 - (250-118(4)): Accept
SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: 5-255
RECOMMENDATION: The Panel should continue to Reject this proposal.
SUBSTANTIATION: The submitter states that EMT does not provide adequate grounding due to separation, corrosion, loose fittings, thermal expansion, etc., and maintains that there are inadequate code requirements to cover these situations. On the contrary, 348-4 covers corrosion protection; 348-5 states EMT shall not be used where subject to severe physical damage; 348-10 requires couplings and connectors to be made up tight; 300-7(b) covers requirements for expansion fittings; 110-3(b) requires a product be installed in a neat and workmanlike manner. When the current code requirements are followed, EMT has been proven to be an effective equipment-grounding conductor.

Steel conduit manufacturers are in the process of finishing an Installation Guide that will provide information on the proper installation of steel conduit. This will likely be published before the new Code is. The NEMA Fittings Section (5-FB) has already completed an installation guide on fittings, which is available from NEMA. Both publications are written to encourage good workmanship and proper installation.

The submitter cites his concerns about EMT on rooftops. If the installation is one where the EMT would be subjected to severe physical damage, 348-5 says that it shall not be used. There are new pipe support systems on the market that reduce rooftop wear and tear and provide protective cushioning between mounting hardware and the roof.

The submitter states: "it has been proven everyday that the raceway system has a high impedance path". A 1994 research report on grounding by the Georgia Institute of Technology shows that EMT actually has the lowest impedance path of all metal conduits.

There is nothing in the Code that prohibits the use of a supplemental grounding conductor. This should remain a design decision.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
BRENDER: See my Explanation of Negative vote on Comment 5-138.

RAPPAPORT: This comment and the proposal to which it is related refers only to electrical metallic tubing as a metal raceway that should not be permitted to be used as an equipment grounding conductor. Even when installed correctly, there are many applications where electrical metallic tubing moves and, as a result, the couplings and connectors are loosened. The workmanship issues with installing electrical metallic tubing are different than with installing rigid or intermediate metal conduit and can be solved by accepting the original proposal.

5- 153 - (250-120(d) (New)): Accept
SUBMITTER: Richard E. Loyd, Perryville, AR
COMMENT ON PROPOSAL NO: 5-262
RECOMMENDATION: I support the panel action to reject this proposal; it is overly restrictive and unenforceable.
SUBSTANTIATION: The NEC can never regulate other crafts nor can it regulate the owner's maintenance policies. It is the building owner's responsibility to ensure a safe environment for employees and workers in their facilities. If they permit their facility to be damaged and left in that condition then we cannot write code that will prevent that. There will always be electrical equipment located on the building roof that is easily damaged i.e., disconnecting switches, receptacles, etc. It is the designer's responsibility to regulate the wiring methods used and the owner's responsibility to maintain those installations after they are installed.

Many industrial facilities and larger office buildings properly install raceways on rooftops. They build walkways and racks to hold these raceways. Many of these racks hold large and small sizes of EMT properly installed. It would be wrong and overly restrictive to outlaw these good installations that have been practiced for years.

The submitter states that permits are not required for re-roofing. Most raceway installations where the conduit or tubing is simply laid on wood blocks across the top of the roof are after the final inspection has been signed off and would not be caught by the inspector. Therefore, they would not be regulated either.
PANEL ACTION: Accept.

EXPLANATION OF NEGATIVE:
BRENDER: See my Explanation of Negative vote on Comment 5-138.

RAPPAPORT: In addition to the substantiation that has been presented for the need to require an equipment grounding conductor in metallic raceways, a large amount of that substantiation is related to electrical metallic tubing used on roof tops. The access of personnel on flat and gently sloping roofs (the subject of this comment) and the resultant movement of the raceways due to the natural environment (wind, sun, snow, and ice) warrants assurances that the equipment ground will remain intact in spite of adverse conditions.

SUBMITTER: Jamie McNamara, Hastings, MN
COMMENT ON PROPOSAL NO: 5-273
RECOMMENDATION: The panel should reconsider this proposal and accept it. This proposal would clarify sizing of equipment grounding conductor.
SUBSTANTIATION: The Panel's statement indicates this is already covered in other sections of Article 250. It is not clear how to size grounding conductor on the secondary side of devices that change the voltage and current values before they terminate on an overcurrent devices. The example of ungrounded 1/0 transformer secondary conductor protected at 60 amps on the primary and terminating in a 150-amp overcurrent device on the secondary. With a #10 on the primary as well as the secondary to the 150 amp overcurrent device, is a code violation unfortunately it is not obvious and clear. Code panel member Mr. Mello's explanation on the original proposal explains the controversy and confusion in the current code text.
PANEL ACTION: Accept in Principle.

(Log #2031)

5- 157 - (250-146(a)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 5-282
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: The panel action was correct three years ago, and should stand. The proposal submitter asserts that the contact surface is only the underside of the screw in an old-work application. That is untrue. The device support ear on an old-work metal box has the same approximate surface area in contact with the yoke as the comparable area on a surface-mounted handy box. The submitter then accuses the panel of being unrealistic in terms of the prevalence of inspections. If inspections are not performed all manner of violations can take place. Every receptacle that is moved forward due to new wall coverings by untrained persons, and therefore inadequately bonded, is also even more likely to be an outlet in violation of 370.20. Does the proposal submitter seriously expect my panel (Code-Making Panel 9) to prohibit flush box applications unless each flush box is installed with movable extensions ("Add-a-Depth" rings or equivalent) as part of the original installation? I have not seen such a proposal, nor do I ever expect to.

The simple fact is that the NEC should never be written to presume the absence of inspection, any more than it can be written to presume the absence of products standards. Product standards cannot be written such that they lose the presumption of both the NEC and inspections. Inspections cannot take place outside of a context that assures the existence of both product standards and the NEC. That's how the system works. Any attempt by a portion of the NEC Committee to assume otherwise amounts to shoveling sand against the tide. The untrained persons moving the receptacle cited in the substantiation likely removed the receptacle rather than fit it through the plywood; what guarantees are there that when they put it back that they even polarized it correctly?
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes the metal-to-metal contact should be limited to surface mounted boxes only. Boxes mounted semi-flush or flush will always present the possibility of metal-to-metal contact between the box and device mounting strap being compromised. In "old-work" installations it is not uncommon for the mounting ears for devices to be broken away from the device to allow the device to seat firmly against the 6-32 tapped hole in the box, and not the retaining ears of the "cut-in" style box. This allows the faceplates to seat firmly against the wall or surface in which the box is installed. The panel reaffirms its position in accepting the proposal adds clarity in this section and that enhanced safety is achieved.

5- 159 - (250-148): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 5-286
RECOMMENDATION: Revise as follows:
"Where circuit conductors are spliced within a box, or terminated on equipment within or supported by a box, any separate equipment grounding conductors associated with those circuit conductors shall be spliced or joined within the box or to the box with devices suitable for the use."
SUBSTANTIATION: The proposal concept is good, but the term "junction" in the context of the word "box" is incorrect. The terminology doesn't agree with industry definitions. A junction or pull box (and they are synonymous) is defined in UL 50 in terms of size only, and not whether or not a splice occurs within it. No one reading this will know when the requirement should be applied. This comment avoids the terminology problem entirely by inverting the sentence to focus on the real safety issue. If the associated circuit conductors either join or terminate, the odds of a failure are much greater. As the submitter noted, other Code rules (and I would also note 370.4 at this point) require a grounding connection to metal boxes generally.
PANEL ACTION: Accept.

(Log #2211)

5- 160 - (250-148): Reject
SUBMITTER: Robert H. Keis, Dover, DE
COMMENT ON PROPOSAL NO: 5-286
RECOMMENDATION: This proposal should be rejected instead of accepted.
SUBSTANTIATION: The fundamental "purpose of the code is the practical safeguarding of persons and property from hazards arising from the use of electricity." These are the words in the very first article and section of this great code. Now we are going to ignore this requirement by eliminating the bonding of some boxes because we can't bond all metal fittings. Maybe we should ask Panel 14 to eliminate seal-offs because we cannot totally stop the passage of gases from one area to the other. Article 501 requires that we "minimize" the passage of gas. Why can't we take the same approach in Article 250 and require that the electrical system be made as "safe as reasonably possible."

The submitter's reference to Sections 250-80, 250-86 and Part F do not completely solve the problem. Section 250-80 and 86 require a metal enclosure to be "grounded". Part F says the same thing. None on these require a metal box that is used as a pull box to be connected to the equipment ground wire if one is pulled. The argument of the contractor is that the box is grounded by the raceway, and he don't need the ground wire. The equipment ground wire is usually installed as additional safety for the grounding system. How about the equipment ground wire pulled with a circuit that has several metal boxes between flexible metal raceways with a total length of over 6 feet. The conductors are many times pulled without joint or splice through these boxes. (Maybe the submitter thinks that conductors are always spliced in the boxes they pass through.) The submitter feels that since the conductors are not always spliced, the ground wire would not be required to be connected to these boxes. Now we would have many feet of flexible raceway used as an equipment ground in violation of several code sections. How about broken and loose fittings into boxes or along conduit runs. If the ground wire is there, and properly attached to the boxes, we probably will prevent a fire or electrocution. If the ground wire is not connected to the boxes, then we have hazards that could have been eliminated by good code.

A lot of boxes are installed as "pull-boxes" in long runs of conduit. The conductors are not cut or spliced in these boxes, thus, the rule in the revised Section 250-148 would not require that the equipment grounding conductor be bonded to these boxes. Many times in 30 years I have seen the required bonding of metal boxes provide sufficient fault current return past damaged or loose fittings. The submitter's claim that we do not require conduit fittings to be bonded is correct. We can't solve all the problems of electricity, but we can do our best to make sure the system is as safe as we can reasonably make it. Reject this proposal if for no other reason than safety.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its position in accepting the original proposal as submitted and concludes that the bonding requirements for metal pull boxes exists in the code when metal pull boxes are used with nonmetallic raceways. The bonding of the pull box by a wiring method that is suitable as an equipment grounding conductor specified in Section 250-118 is a suitable means of bonding required for the pull box. See Comment 5-159.

5- 161 - (250-148): Reject
SUBMITTER: Monte R. Ewing, State of Wisconsin
COMMENT ON PROPOSAL NO: 5-286
RECOMMENDATION: Revise text as follows:
Where more than one equipment grounding conductor enters a wireway, outlet box, device box, junction box, conduit body, cabinet, auxiliary gutter, or explosionproof apparatus used for termination, splicing, or tapping of circuit conductors, all such... (remainder unchanged).
SUBSTANTIATION: The original submitter did not name all of the enclosures which contain splices, taps, or termination of conductors. I have added enclosures which share the same hazard as those previously accepted in the 5-286 proposal which are common field installed items. It appears that it is the panel's intent to require these multiple equipment grounding conductors to be bonded to the enclosure anytime splices, taps, or terminations are made within a metal enclosure.
PANEL ACTION: Reject.
PANEL STATEMENT: A list of all enclosures that need grounding is not practical and are covered by other sections already.

(Log #378)

5- 162 - (250-168): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 5-292
RECOMMENDATION: Accept in principle revised: DIRECT-CURRENT BONDING JUMPER. For dc systems that are grounded, an unspliced bonding jumper shall be used to connect the equipment grounding conductor(s) to the grounded conductor of the system. The point of connection shall be the same as the grounding electrode conductor, as specified in 250-164.
(a) MATERIAL. The bonding jumper shall be of copper or other corrosion-resistant material and shall be a wire, bus, screw, or similar conductor.
(b) CONSTRUCTION. Where the bonding jumper is a screw only, the screw shall be identified with a green finish that shall be visible with the screw installed.
(c) ATTACHMENT. The bonding jumper shall be attached in the manner specified by the applicable provisions of 250-8.
(d) SIZE. The size of the bonding jumper shall not be smaller than the system grounding electrode conductor specified in ~~Section~~ 250-166.
SUBSTANTIATION: Specifics are lacking for the bonding jumper; for example this section doesn't have one and no location is indicated. Section 250-28 appears limited to ac systems since a main bonding jumper applies to a connection at the service, by

definition, and 250-164 prohibits a connection at the service. Section 250-28(d) also differs from this section.

The requirements for ac system bonding jumpers are equally important for dc systems.

PANEL ACTION: Reject.

PANEL STATEMENT: Sufficient substantiation has not been provided to include all of the additional requirements. Other sections of Article 250 not specifically intended for AC systems apply to DC systems.

5- 165 - (250-184(a) Exception No. 1): Reject

SUBMITTER: Donald W. Zipse, Zipse Electrical Engineering, Inc.

COMMENT ON PROPOSAL NO: 5-295

RECOMMENDATION: Revise as follows:

Exception No. 1: Bare conductors shall be permitted to be used outdoors. ~~for the service entrances where the equipment is station type equipment located outdoors. The equipment grounding conductor of direct-buried portions of feeders may be bare conductor.~~

SUBSTANTIATION: The panel is correct in its panel comment #3. There is no reason that bare neutral conductors cannot be used outside as long as they are insulated from earth by insulators of some form, except at one location where the neutral is connected to earth or if you prefer, ground in order to earth the electrical system forming a grounded neutral system.

The equipment grounding conductor proposal belongs in Section 250-184(c).

PANEL ACTION: Reject.

PANEL STATEMENT: There is no technical substantiation of why conductors, other than neutrals, may be used without insulation and why bare copper conductors should not be permitted as neutrals of service entrances and direct buried portions of feeders. See also panel action on Comment 5-180.

5- 167 - (250-184(b)): Accept in Principle

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

COMMENT ON PROPOSAL NO: 5-298

RECOMMENDATION: Revise as follows:

(B) Multiple Grounding. Grounding connections shall be made to the neutral of a solidly grounded neutral system at the following locations, and shall be permitted to be made at additional locations.

1. At each transformer supplying a set of feeder conductors serving a building or other structure; 2. At the supply point of underground portions of feeders where the neutral is uninsulated; and 3. To overhead portions installed outdoors, in accordance with the spacing requirements in 250.184(D).

SUBSTANTIATION: As written the term "neutral" is the subject of the clause "and shall include the following", but none of the following are portions of a neutral. This comment rewrites the second clause by inverting the sentence, allowing the mandatory information to come first. This places the focus on mandatory ground-to-neutral connections, which appears to be the intent of the phrase "and shall include" in the proposal. The three list items following have been rewritten to correlate with the parent language, and with additional material reflecting current NEC organization.

First, since this article does not govern wiring on the supply side of the service point, particularly where the medium voltage feeder with the solidly grounded neutral is premises wiring or it would never be covered here, the comment removes the term "services." Any wiring supplied by such a feeder must be a feeder, and not a service.

Second, since the focus must be on mandatory connections, the section must say where those connections are to be made. The intent appears to be at the point of connection as a minimum, with additional regrounding permitted but not required. Similarly, outdoor overhead wiring needs minimum connections specified in some way; in this case a simple reference to the new subsection (D).

Finally, this comment corrects the improper use of "exposed" in the second item, which is inconsistent with Article 100.

PANEL ACTION: Accept in Principle.

Replace the 2002 NEC ROP Proposal 5-298 with the following text:

(b) Multiple Grounding. The neutral of a solidly grounded neutral system shall be permitted to be grounded at more than one point. Grounding shall be permitted at one or more of the following locations:

(1) Transformers supplying conductors to a building or other structure;

(2) Underground circuits where the neutral is exposed;

(3) Overhead circuits installed outdoors.

PANEL STATEMENT: The first sentence was split into two and editorially revised for clarity. Reference to service in (1) was deleted. The change in (2) was rejected because there may be more portions of underground feeders, other than the supply point and exposed sections of uninsulated neutrals that are intended to be grounded. The change to (3) was rejected as not adding to clarity since the reference is in the same section.

5- 168 - (250-184(b)(3)): Reject
SUBMITTER: Donald W. Zipse, Zipse Electrical Engineering, Inc.
COMMENT ON PROPOSAL NO: 5-295
RECOMMENDATION: Keep the text the same.

Panel's comment #6, "There is no substantiation for requiring the neutral conductor to be insulated."

The definition of: "in-su-lat-ed, in-sul-lat-ing, in-su-lates. 1. To cause to be in a detached or isolated position. 2. To prevent the passage of heat, electricity, or sound into or out of, especially by surrounding with a nonconducting material."
SUBSTANTIATION: NEC requires low voltage systems to have the phase conductor insulated with material on the conductor to prevent passage of current to other conducting surfaces. Likewise, the neutral conductor is required to have insulation on the conductor. Panel 5 has required ranges and dryers to have the neutral conductor covered with insulation.

Using the same logic, why would not the neutral conductor of high voltage be insulated with a covering, unless 250-184(a) Exception No. 1 applies, which is outdoors. Even then, the neutral is on insulators insulating the neutral conductor from contacting a conducting material. On the other hand, panel 5 should cover the omission of the neutral being on insulators when outside.

The object of this section is to prevent stray current from flowing uncontrolled over the earth, metallic pipes, etc. causing shocks to persons and even the possibility of electrocution.
PANEL ACTION: Reject.
PANEL STATEMENT: No additional technical substantiation has been provided to require neutral conductor insulation in all cases. The panel does not agree that the use of similar logic is a technical substantiation for electrical systems that have very different distribution systems. See panel action on Comment 5-180.

5- 169 - (250-184(c)(2)): Reject
SUBMITTER: Donald W. Zipse, Zipse Electrical Engineering, Inc.
COMMENT ON PROPOSAL NO: 5-295
RECOMMENDATION: The panel's comment #5 states that a "neutral/blocker" cannot be supplied unless a separate system exists.

This is untrue. Per one manufacturer, such a neutral/blocking device can be supplied by setting the adjustment to carry the system's available fault current.

See comment on Panel's Comment #4.
SUBSTANTIATION: Section 250-184 does not prohibit such a service from a utility that has the misfortune to install a less than total safe electrical system. I call your attention to Section 90-2. Scope. This section specifically excludes utilities. However, Section 250-184 applies to industrial and commercial systems that elect to have electrical system 1 kV and over. It is the industrial and commercial installations that my proposal applies.

If I have misinterpreted your comment, please explain.

One manufacturer has confirmed the feasibility of using a "Neutral Blocker" to generate the separate ground conductor. The neutral would be carried straight through connecting both the utility and the industrial neutral systems. However, the neutral would not be connected to earth beyond the service point, metering point, which serves as the interface between the utility and the industrial site.

At the above service point, the fifth wire would be generated and serve as the grounding conductor just as we have in our under 1kV systems (homes). Should a fault occur and this said fault encompass the ground conductor within the industrial facility, the "modified neutral blocker" would function and connect the fault carrying current (equipment) grounding conductor to the utility's multiple grounded neutral, thus allowing the utility's protective device to open and protect the conductors inside the industrial facility.

This would prevent stray current from flowing within the industrial facility and causing the potential of electrical shock and possibility of electrocution.
PANEL ACTION: Reject.
PANEL STATEMENT: The comment does not comply with 4-4.5 of the NFPA Regulations Governing Committee Projects. There is no recommendation. See panel action on Comment 5-180.

5- 170 - (250-184(c)(2)): Reject
SUBMITTER: Donald W. Zipse, Zipse Electrical Engineering, Inc.
COMMENT ON PROPOSAL NO: 5-295
RECOMMENDATION: The panel comment #4 states: "This requirement (neutral grounded in one location only) cannot be met for a service supplied directly from a utility high voltage system."
SUBSTANTIATION: Section 250-184 does not prohibit such a service from a utility that has the misfortune to install a less than total safe electrical system. I call your attention to Section 90-2. Scope. This section specifically excludes utilities. However, Section 250-184 applies to industrial and commercial systems that elect to have electrical system 1 kV and over. It is the industrial and commercial installations that my proposal applies.

If I have misinterpreted your comment, please explain.

One manufacturer has confirmed the feasibility of using a "Neutral Blocker" to generate the separate ground conductor. The neutral would be carried straight through connecting both the utility and the industrial neutral systems. However, the neutral would not be connected to earth beyond the service point, metering point, which serves as the interface between the utility and the industrial site.

At the above service point the fifth wire would be generated and serve as the grounding conductor just as we have in our under 1 kV systems (homes). Should a fault occur and this said fault encompass the ground conductor within the industrial facility, the "modified neutral blocker" would function and connect the fault carrying current (equipment) grounding conductor to the utility's multiple grounded neutral, thus allowing the utility's protective device to open and protect the conductors inside the industrial facility.

This electrical system would function just the same way the present low voltage service entrance systems functions. In the case of the low voltage service entrance system the utility service drop consists of insulted phase conductors and a combination neutral/ground/messenger conductor.

With three (3) phase conductors, the neutral is combined with the ground conductor and uses the messenger for the conducting path. This is a 4 wire service. Inside the service entrance panel there can be a separate terminal strip for the white colored neutral conductors and another terminal block for the bare or green color equipment grounding conductors. The two terminal blocks are connected together.

What we now have inside the house is a 5 wire system originating from a 4 wire utility system service. Three phase conductors, an insulated white color neutral and the equipment ground conductor.

Where in the house the junction of the neutral terminal block with the equipment grounding terminal block are joined together and on one side is the utility 4 service and on the house side is the 5 wire service. With the 1 kV and over systems the neutral blocker serves the same function and the connection between the terminal blocks.

This would prevent stray current from flowing within the industrial facility and causing the potential of electrical shock and possibility of electrocution.
PANEL ACTION: Reject.

SUBMITTER: Donald W. Zipse, Zipse Electrical Engineering, Inc.
COMMENT ON PROPOSAL NO: 5-302
RECOMMENDATION: The paragraph is too long and covers several different subjects and should be broken down as follows:
(d) Multi-grounded Neutral Conductor:
(1) The multi-grounded neutral conductor shall be of sufficient ampacity for the load imposed on the conductor but not less than 20 percent of the ampacity of the phase conductors.
(2) The multi-grounded neutral conductor shall be grounded at each transformer and at other additional locations by connection to a made or existing electrode.
(3) At least one grounding electrode shall be installed and connected to the multi-grounded neutral ~~circuit~~ conductor every 400 m.
(4) The maximum distance between any two adjacent electrodes shall not be more than 400 meters.
(5) In a multi-grounded shielded cable system, the shielding shall be grounded at each cable joint, which is exposed to personnel contact.
SUBSTANTIATION: The paragraph is too long and covers several different subjects that should be broken out separately.
It is a multi-grounded neutral so, so state. Let's not hide the fact. After all, Panel 5 may in the future have rules on Single Grounded Neutral.
Note the words "multi-grounded" were included in the section on shields.
One cannot clearly refer to the rules on transformers easily since "transformer's rules" are contained within the paragraph. by having a separate number for "transformers" a person can clearly cite that section without any ambiguity.
Consideration should be given to including lightning arrestors in Section 250-184.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel Comment 5-173a (Log #CC504) that incorporates the action on this comment.

5- 174 - (250-184(e)(2)): Reject
SUBMITTER: Donald W. Zipse, Zipse Electrical Engineering, Inc.
COMMENT ON PROPOSAL NO: 5-295
RECOMMENDATION: 250-184(e)(1) as submitted. The numbering should be "1" not "2" and renumber the following paragraphs.
250-184(e)(2) as found on page 332 of the ROP.
(1) 250-184(e) ~~(2)~~(1) The equipment grounding conductor may be bare and shall have sufficient ampacity for the ~~load~~ fault current imposed on the conductor, but not less than 20 percent of the ampacity of the phase conductors.
SUBSTANTIATION: The panel was correct in finding the wrong work was used. The panel could elect to use Table 250-122 for the equipment grounding conductor size in place of the 20 percent.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no technical substantiation for permitting the equipment grounding conductor to have an ampacity of only 20% of the phase conductors. Table 250-122 provides for equipment grounding ampacities that are sometimes above and sometimes below 20% of the phase overcurrent device rating. Taken by itself, this comment does not fit into the existing 1999 NEC text because the use of equipment grounding conductors is not specified nor required.

SUBMITTER: Donald W. Zipse, Zipse Electrical Engineering, Inc.
COMMENT ON PROPOSAL NO: 5-295
RECOMMENDATION: 250-184(e)(1) as submitted. The numbering should be "1" not "2" and renumber the following paragraphs.
250-184(e)(2) as found on page 332 of the ROP.
(1) 250-184(e)~~(2)~~(1) The equipment grounding conductor may be bare and shall have sufficient ampacity for the ~~load~~ fault current

imposed on the conductor, but not less than 20 percent of the ampacity of the phase conductors.
SUBSTANTIATION: The panel was correct in finding the wrong work was used.
The panel accepted 5-302, 250-184(d) new, which contains the same 20%. Using logic which is sometimes missing, since the multiple grounded neutral carries the fault current and is limited to minimum of 20% of the phase conductor size, it would seem appropriate to limit the minimum size of the equipment ground conductor to the same 20%, based on accepting the NESC logic, whatever that may have been.
Remember the equipment grounding conductor will be grounded every 400 m, thus allowing only the fault current to flow over the earth for the time that it takes the protective device to operate.
Equipment ground conductors should not carry continuously flowing phase return current.
The panel could elect to use Table 250-122 for the equipment grounding conductor size.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no technical substantiation for permitting the equipment grounding conductor to have an ampacity of only 20% of the phase conductors. Table 250-122 provides for equipment grounding ampacities are sometimes above and sometimes below 20% of the phase overcurrent device rating. Taken by itself, this comment does not fit into the existing 1999 NEC text because the use of equipment grounding conductors is not specified nor required.

COMMENT ON PROPOSAL NO: 5-295
RECOMMENDATION: 250-184(e)(2) as submitted. The numbering should be "2" not "3" and renumber the following paragraphs.
250-184(e)(3) as found on page 332 of the ROP.
As submitted:
250-184(e)
(2) The equipment grounding conductor shall be connected to each transformer and to the transformer's grounding electrode and at other additional locations by connection to existing grounding electrodes.
As accepted by the panel-
See 5-302, page 334: The Panel accepted, "The neutral conductor shall be grounded at each transformer and at other additional locations by connection to a made or existing electrode."
As suggested:
"The ~~neutral~~ equipment ground conductor shall be grounded at each transformer and connected to each transformer and lightning arrestor and at other additional locations by connection to a made or existing electrode."
SUBSTANTIATION: Substantiation is based on the same as the panel accepted. It is necessary to make sure each transformer is connected to the equipment grounding conductor. In addition, the lightning arrestor was missing from the previous entry. The NESC includes the lightning arrestor and that the lightning arrestor has a separate earthing, grounding electrode.
PANEL ACTION: Reject.
PANEL STATEMENT: There is, presently, no defined requirement for an equipment grounding conductor. The text, accepted by the panel, was for a new requirement that the neutral, not an equipment grounding conductor, be grounded at each transformer.

5- 177 - (250-184(e)(4)): Reject
SUBMITTER: Donald W. Zipse, Zipse Electrical Engineering, Inc.
COMMENT ON PROPOSAL NO: 5-295
RECOMMENDATION: Keep the text the same.
SUBSTANTIATION: Panel Comment #10
Would the panel be so kind as to tell me why the panel accepted the identical "400 m" when they accepted 5-302 and made the comment rejecting my "400 m"?
PANEL ACTION: Reject.
PANEL STATEMENT: The text accepted by the panel was for a new requirement for a neutral, not an equipment grounding conductor. This accepted requirement is consistent with existing utility practices that have been in place for many years. There is no technical substantiation that the requirements for an equipment grounding conductor should be the same as for a multiple grounded neutral.

SUBMITTER: Donald W. Zipse, Zipse Electrical Engineering, Inc.
COMMENT ON PROPOSAL NO: 5-295
RECOMMENDATION: Panel comment #11
250-184(e)
~~(6)~~(5) In a multiple grounded shielded cable system there shall be, ~~if required~~ when the electrical load device has a neutral load, a separate insulated neutral conductor. The equipment grounding shield shall be grounded at each cable joint which is exposed to personnel contact.
SUBSTANTIATION: The panel comment asked to define "when required". Naturally, a neutral conductor would be required whenever a neutral load exists.
The panel should not be specifying when a shielded cable would be required as this is a design criteria and the NEC is not supposed to be a design manual. If one wants a safe electrical system with reduced circulating neutral currents over the earth, metallic piping, etc., then one would not use a bare neutral conductor in a cable. The object is to reduce and eliminate stray electrical currents that have the potential for shocking persons and possible electrocuting of persons in showers and swimming pools and other places.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action on Comment 5-180.

5- 180 - (250-184(e)(6)): Reject
SUBMITTER: Donald W. Zipse, Zipse Electrical Engineering, Inc.
COMMENT ON PROPOSAL NO: 5-295
RECOMMENDATION: Revise 250-184 to read as follows:
250-184. Solidly Grounded Neutral Systems
(a) Neutral Conductor Insulation Rating. The minimum insulation level for neutral conductors of solidly grounded systems shall be 600 volts.

Exception No. 1: Bare conductors shall be permitted to be used outdoors ~~for the service entrances where the equipment is station type equipment located outdoors. The equipment grounding conductor of direct buried portions of feeders may be bare conductor.~~

FPN: See Section 225-4 for conductor covering where within 10 ft (3.05 m) of any building or other structure.

(b) Grounding. The neutral conductor of a solidly grounded neutral system above 1 kV and over (high voltage) shall be grounded at one location only, preferably at the source transformer or generator.

(1) The neutral conductor shall be insulated and isolated from earth except at one location.

(2) A separate bare equipment grounding conductor shall be installed and run with the phase conductors and the insulated neutral conductor and shall be extended into the customer's property along with the insulated phase and insulated neutral conductor(s).

(c) Utility Source. The interface between the utility source and the customer's property shall have:

(1) A neutral isolator/blocker device installed between the utility's multiple neutral grounded conductor and the customer's isolated and insulated neutral conductor. Such neutral blocking device shall be listed by Underwriters Laboratories as per 250-2(d).

(2) A separate bare equipment grounding conductor shall be installed and run with the phase conductors and extending into the customer's property.

(d) Neutral Conductor. The neutral conductor shall be an insulated conductor. The neutral conductor shall have sufficient ampacity for the load imposed on the conductor, but not less than unbalanced ampacity of the phase conductors. The neutral conductor shall be designed to carry unbalanced phase current continuously.

(e) Equipment Grounding Conductor.

(1) The equipment grounding conductor may be bare and shall have sufficient amapcity for the ~~load~~ fault current imposed on the conductor, but not less than 20 percent of the ampacity of the phase conductors.

(2) The equipment grounding conductor shall be ~~connected~~ grounded ~~to~~ at each transformer and connected to each transformer and lightning arrestor and to the transformers' grounding electrode and at other additional locations by connection to existing ground electrodes.

(3) The equipment grounding conductor shall have a least one grounding electrode installed and connected to the equipment grounding conductor every 400 m and the maximum distance between any two adjacent electrodes shall not be more than 400 meters.

(4) The equipment grounding conductor shall be available for fault current duty only and the equipment grounding conductor shall not carry or conduct continuous current.

(5) In a multiple grounded shielded cable system there shall be~~,~~ ~~if required~~ when the electrical load device has a neutral load, a separate insulated neutral conductor. The equipment grounding shield shall be grounded at each cable joint which is exposed to personnel contact.

SUBSTANTIATION: The revised Section now has been revised and meets all of the comments made by the Panel.

A few important points to digest are:

1. Low voltage wiring practices uses the separate equipment grounding conductor principle. The proposed high voltage rules eliminate the equipment grounding conductor concept.

2. It cannot be denied the combined multiple grounded neutral, which takes the place of the equipment ground conductor concept, results in continuous stray current (voltage) flow over the earth resulting in shocking and possibility of electrocuting persons.

3. The costs savings of present high voltage wiring practice of eliminating the equipment grounding conductor and combining it with the neutral and then multiple grounding the neutral to compensate for the lack of equipment grounding conductor is a dangerous practice for the NEC Panel 5 to adopt.

The choice for the Panel is between the concepts started in the late 1940s, early 1950s when the equipment ground wire was introduced and reverting back to the old days of two wire receptacles concept. Adoption of this version of 250-184 maintains the concept of the equipment ground conductor concept.

If you reject this proposal and comment, the Panel will no longer uphold the equipment ground concept. The Panel will be reverting back to the two wire concept using only the phase conductor(s) and the neutral conductor for wiring equipment.

The equipment ground conductor brought SAFETY to the electrical wiring practices. Panel 5 will be abandoning the SAFETY CONCEPT of the equipment grounding conductor if it adopts the NESC 250-184 proposal.

The next code cycle, following your principle of no equipment grounding conductor necessary for high voltage, will bring forth cost saving ideas of using the neutral as both the equipment grounding conductor and the neutral for low voltage systems, which is the same as is used by the NESC, which is less than safe.

Persons receiving shocks in showers and swimming pools are an indication the improved electrical wiring practices are dearly needed to prevent such electrical shocks. Persons may have been electrocuted from the stray currents that will be and presently are generated by the wiring practices that Panel 5 has approved so far.

PANEL ACTION: Reject.

PANEL STATEMENT: The single grounded neutral system may have advantages in certain applications and should be an optional choice rather than a mandated requirement. The panel does not agree that there is a listing requirement in Section 250.2(D) or with the requirement for a single testing laboratory.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

RAPPAPORT: The comment and the original proposal provide rules for a premises wiring system of 1 KV and over that meets the safety requirements of premises wiring systems that are less than 1 KV. The proposal is an attempt to keep all electrical current contained in conductors rather than permitting some of the current to travel through the earth. That this procedure is permitted for utilities as contained in the National Electrical Safety Code should not be a factor in the National Electrical Code. Where a utility provides a high voltage service to a facility and is complying with the National Electrical Safety Code, the facility should have the ability to provide a premises wiring system that prevents neutral current from flowing on their premises piping systems and in the grounds of their facility.

The original proposal is flawed in that it required a single point grounded neutral system rather than permitting it. The choice of whether to use a single or a multiple grounded neutral system should be an engineering decision and should not be dictated by the code. The panel action should be to accept in principle and change the requirement of single point neutral grounding from a requirement to a permission.

(Log #379)

5- 181 - (250-186): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

COMMENT ON PROPOSAL NO: 5-309

RECOMMENDATION: Accept in principle revised: Delete ~~(3) Line to neutral loads are not served.~~

(b) IDENTIFIED AND INSULATED. Where the neutral conductor of an impedance grounded system is used it shall be identified in accordance with 200-6, ~~as well as~~ and fully insulated as the phase conductors.

SUBSTANTIATION: While this proposal incorporates some requirements of 250-36, the part proposed to be deleted is not in the text of 250-186, and (b) indicates a neutral may be used. For what purpose if no load is permitted? It should be noted that both 250-36 and Part K cover a 1 kV system.

"Identified" per se; is not specific; other conductors required to be identified have the specific means indicated, such as green or orange color. Section 200-6 does not appear limited to 600 volt or less systems.

PANEL ACTION: Reject.

PANEL STATEMENT: Deletion of Section 250-186(3) is not practical when the impedance grounded neutral system is used. Line to neutral loads can not be served by such a system.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

SKUGGEVIG: I agree with the comment. This comment should be accepted. Line-to-neutral loads should be continued to be acceptable as long as the neutral conductor is fully insulated as required by (b) and as long as it is clear that the ground detectors required by (2) are required to include a response to ground faults on the neutral conductor as well as the phase conductors. In addition, it appears that a conflict exists in the new text between the new item (3) which prohibits line-to-neutral loads and (b) which requires identification and insulation where the neutral "is used".

(Log #CC501)

5- 181a - (250-186(B)): Accept
SUBMITTER: CMP 5
COMMENT ON PROPOSAL NO: 309
RECOMMENDATION: Revise 250.186(B) text to read as follows: The neutral conductor of an impedance grounded neutral system shall be identified, as well as fully insulated with the same insulation as the phase conductors.
SUBSTANTIATION: In an impedance grounded system the neutral can not be utilized to supply line to neutral loads.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
COMMENT ON AFFIRMATIVE:
SKUGGEVIG: I agree with the Panel Action to accept this proposal, but I do not agree with the submitter's substantiation. The substantiation seems inconsistent with the recommendation because there would be no need for a fully insulated and identified neutral conductor if it were not usable and permitted to serve a line-to-neutral load. Provided that the neutral conductor is fully insulated (required) and the ground detectors (also required) will respond to ground faults on the neutral conductor as well as the phase conductors, line-to-neutral loads should be permitted.

ARTICLE 285 — TRANSIENT VOLTAGE SURGE SUPPRESSORS: TVSS

(Log #1121)

5- 182 - (285): Accept in Principle in Part
SUBMITTER: George Mayle, Advanced Protection Technologies
COMMENT ON PROPOSAL NO: 5-316
RECOMMENDATION: Support the panel action to accept new Article 285, but recommend the panel reconsider accepting the wording provided by the original submitter.
SUBSTANTIATION: The panel has made two significant changes to the submitter's proposal and both are highlighted in panel member statements. The panel should support Mr. Dobrowsky's affirmative comment requesting the inclusion of the proposed 285-3(3). The new article 285 parallels the requirements in 280 and the 285-3(3) requirement the panel struck is found in Section 280-4(a).

The panel action to revise the short circuit current rating requirements for a TVSS is not clear. The short circuit current rating must be required to be marked on TVSS products. This will ensure a safe installation, specifically when the TVSS is installed in or near a panelboard or switchboard where the available fault current can cause damage when the TVSS reaches end-of-life. Mr. Diaz does not understand that when a TVSS reaches end-of-life generally fails shorted and the available fault current is introduced along that shorted path. The internal components and any external overcurrent device are then required to open this short circuit condition. Product evaluation is necessary to ensure proper overcurrent protection of the TVSS exists either internally and or externally and the short circuit current marking is required to make sure the TVSS is applied in a safe location in the electrical system.

The UL standard does not currently address this testing and marking issue as indicated in Mr. Diaz's comment, however, TVSS manufacturers such as our company (APT) and users are recognizing a need for such an evaluation to ensure proper electrical safety. The short circuit current marking concern is currently being reviewed by UL. A bulletin was issued by UL in June 2000 requesting comments on a new requirement to add short circuit current ratings which would indicate UL is also beginning to recognize this safety concern.
PANEL ACTION: Accept in Principle in Part.
Revise the introductory phrase of Section 285.21 to read as follows: 285.21 Connection. Where a TVSS is installed, it shall be connected as follows:
PANEL STATEMENT: The panel accepts the previous language from the proposal for the introductory phrase of Section 285.21 only because it adds clarity. The panel does not accept any other changes from this comment because there was no substantiation to make such a wide sweeping change. The panel prefers this language because it is clear. See panel action on Comment 5-183.

5- 183 - (285): Accept
Note: The Technical Correlating Committee advises that article scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the Panel Action with respect to 285-1.
SUBMITTER: Alan Manche, Square D Co.
COMMENT ON PROPOSAL NO: 5-316
RECOMMENDATION: The panel should continue to accept new Article 285 with the following revisions to the panel action:

1) 285.1 Scope. This article covers general requirements, installation requirements, and connection requirements for transient voltage surge suppressors (TVSS) permanently installed on premises wiring systems.

2) 285.3 (3) Where the rating of the TVSS is less than the maximum continuous phase-to-ground power frequency voltage available at the point of application.

3) 285.6 Short Circuit Current Rating. The TVSS ~~transient voltage surge suppressors~~ shall be marked with a short circuit current rating and shall not be installed at a point on the system where the available fault current is in excess of ~~the marked~~ that rating. This marking requirement shall not apply to receptacles.

4) 285.25 Grounding. ~~Except as indicated in this Article, TVSS transient voltage surge suppressor grounding connections shall be made as specified in Article 250, unless otherwise noted in this article.~~ Grounding conductors shall not be run in metal enclosures unless bonded to both ends of such enclosure.
SUBSTANTIATION: The present wording of the scope would include cord-and-plug connected TVSS units or TVSS units integral to appliances. It was never the intent of this article to apply to cord connected equipment such as power taps, therefore adding the word "permanently" will clarify the scope.

The panel should include the proposed text in 285-3(c) for consistency since it is nearly identical to the wording found in 280-4(a).

The wording in the panel action is not as clear as the proposed wording, therefore the text should return to the original proposed wording. An additional sentence exempting receptacles from having a marked short circuit rating should also be added since receptacles are evaluated to UL 498 which does not require short circuit current rating markings on receptacles. The discussion of this article has indicated that short circuit current markings are not necessary for receptacle type TVSS units due to their location in the electrical system, however, those TVSS units installed either internally or externally near a panel, switch, switchboard, ...are susceptible to the high fault currents that can create a hazardous condition if the tvss has not been appropriately evaluated and marked.

The comment by Mr. Diaz only addresses short circuit current conditions during normal operation of single and two-port TVSS products. His comment does not address the shorted condition of a TVSS when the current travels along the shorted path of an MOV when it fails as explained in the original proposal. The TVSS must be tested to demonstrate it has internal protection or that a breaker will protect it. You cannot assume the TVSS assembly is protected by the breaker or fuses that protect wire leads to the TVSS. The energy that passes through the branch breaker or fuses during this shorted condition can cause the TVSS to fail in an unsafe manner if it has not been appropriately designed or internally protected. Only a short circuit current evaluation and marking can assist with a safe electrical installation.

The cross-reference in paragraph 285-25 to Article 250 is not specific and not relevant and should be deleted in order to conform with Paragraph 3.6.2 of the NEC Style Manual. The proposed paragraph was copied directly from Article 280 but it is in violation of the NEC style manual.
PANEL ACTION: Accept.
Editorially in Section 285.2 Definitions, move the FPN to follow the item (3).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16

(Log #2135)

5- 184 - (285): Accept in Principle
SUBMITTER: Patrick Howard, Lucent Technologies
COMMENT ON PROPOSAL NO: 5-316
RECOMMENDATION: The new Article 285 should continue to be accepted with specific support for the requirement to mark TVSS products with a short circuit current rating.
SUBSTANTIATION: Our company has experienced some unacceptable product failure modes with TVSS product. To minimize this damage, we evaluated both the construction and failure modes of TVSSs to both IEEE and UL test standards.

In testing hundreds of samples from different manufacturers, we find a strong correlation between undesirable failure modes and inadequate fault current ratings. Most TVSS devices we tested (either one- or two-port) rated for branch circuit use (5000 Amp fault) had undesirable failure modes when tested to 200 Amp service panel limits. Of those designs with only a 5000 Amp rating, most failed badly at their surge rating. Of those with a 10,000 Amp rating, almost none failed badly at their surge rating.

We find that use of the UL fault current ratings is a vital step in correctly applying surge protectors. Without mandatory ratings and markings, an inferior TVSS will most often be used where it has insufficient surge and follow current capability.

Harm to persons and damage to buildings can result from using TVSSs rated less than the UL requirement. A user will not know the fault current rating unless it is required to be marked.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 5-183.

(Log #278)

5- 185 - (285-21): Reject
SUBMITTER: Roy T. Higa, Aiea, HI
COMMENT ON PROPOSAL NO: 5-316
RECOMMENDATION: Recommend that proposed sections 285-21(A)(1), 285-21(A)(2) and 285-21(A)(3) be reworded as follows:

285-21(A)(1): Service Supplied Building or Structure. A TVSS can be connected anywhere in the premises wiring system except the line side of the service disconnect overcurrent device required in section 230-91. Overcurrent protection for the TVSS shall be provided in accordance with the manufacturers' instructions.

285-21(A)(2): Feeder Supplied Building or Structure. A TVSS can be connected anywhere in the building wiring system except the line side of first overcurrent device at the building or structure. Overcurrent protection for the TVSS shall be provided in accordance with the manufacturers' instructions.

285-21(A)(3): Separately Derived System. A TVSS can be connected anywhere in the separately derived system except the line side of first overcurrent device in the separately derived system. Overcurrent protection for the TVSS shall be provided in accordance with the manufacturers' instructions.
SUBSTANTIATION: The original proposed section 285-21(A)(1) states that "The TVSS shall be connected on the load side of a service disconnect overcurrent device...". In my opinion, this can be interpreted to mean either (1) a TVSS must be connected to the load side terminals of the service overcurrent device or (2) a TVSS can be connected anywhere in the premises wiring system as long as it is on the load side of the service disconnect overcurrent device. First of all, the code needs to be written so that the intent is clear. Secondly, it is my opinion that the second, broader interpretaton is more appropriate since UL 1449 not only applies to permanently connected TVSS [which would be used with a service equipment or feeder overcurrent device] but also to cord connected TVSS and receptacle type TVSS which are normally connected to a branch circuit rather than at the service equipment or feeder overcurrent device. A similar argument holds for sections 285-21(A)(2) and 285-21(A)(3).
PANEL ACTION: Reject.
PANEL STATEMENT: The panel prefers the present wording. The submitter has not supplied sufficient substantiation for the proposed changes.

ARTICLE 300 — WIRING METHODS

(Log #1102)

TCC- 1 - (300): Reject
Note: The Technical Correlating Committee reaffirms its previous action that Chapter 3 should be reorganized. This action results in a change that, once implemented, will provide advantages for the user of the Code. These advantages include:
1) Opens space for additional articles to minimize renumbering in the future.
2) Articles are grouped by common wiring methods. 300-310 is general 312-314 is boxes and enclosures, 320-340 covers cables, 342-356 covers conduits, 358-362 covers tubing, 366-390 covers other methods and 392-398 covers open wiring. Within those common groups, the articles are basically alphabetized by name of the article. This allows the user to more easily find the wiring method they are using at the time.
3) In addition, a need to split a number of articles to accommodate the parallel numbering implemented by Code-Making Panel 7 and Code-Making Panel 8 resulted in the need for a number of new article numbers. The renumbering accommodates grouping of these articles.
For these reasons, the Technical Correlating Committee moves that the actions on Comments TCC-1, TCC-2, and TCC-3, be reported as "Reject".
SUBMITTER: Francis C. Pologruto, MacDonald Electric Co./Rep. IBEW
COMMENT ON PROPOSAL NO: Note to Chapter 3 Renumbering
RECOMMENDATION: Reject renumbering/relocations of Chapter 3 articles.
SUBSTANTIATION: The present article numbers, have been in the code for many years. This proposed change will add confusion to the 2002 NEC. A new future article could be assigned an unused number. It is not practicable to renumber the existing articles to even numbers, then assign new articles with odd numbers if this change causes confusion.
PANEL ACTION: Reject.

(Log #1488)

TCC- 2 - (Chapter 3): Reject
Note: See Technical Correlating Committee Note on TCC-1.
SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: Note to Chapter 3 Renumbering
RECOMMENDATION: NEMA suggests that the proposed renumbering of Chapter 3 be revised as shown on the following page:
SUBSTANTIATION: NEMA proposes that the Cable Articles be arranged by the outer coverings and uses; as opposed to the alphabetic order. Concealed Knob and Tubing and Open Wiring on Insulators were moved to the end of the different cables articles. This seems more appropriate than listing them after all the raceways.

NEMA arranged the raceways by uses permitted and physical characteristics. Liquidtight conduits were organized together and located before the flexible raceways since these products have common uses. Surface Raceways are listed before the Wireways to keep these common raceways together and Strut-Type Channel Raceways are located after the Wireways for the same reason.

NEMA supports moving Switches, Receptacles and Switchboards to Chapter 4. In addition, NEMA supports relocating Temporary Wiring to Chapter 5.

present numbers. Most printed or educational materials, slides or projections have been made and used with these old numbers. The usability task force may have thought it would help to have a new numbering system, but we feel it would cause havoc in our existing industry. Field reports, notice of correction letters, educational programs and other materials will have to be reprinted, reprogrammed and generally reorganized at the expense of local educational and inspection authorities. It does not seem fair to make such a drastic change to the most used general wiring methods. Why should odd numbers be reserved for future code cycles?

TCC- 4 - (Chapter 3): Reject

Note: The Technical Correlating Committee moves that the action on Comment TCC-4 be reported as "Reject". See Technical Correlating Committee Note on Comments TCC-1, TCC-2, and TCC-3. In addition, Articles 380 and 384 are equipment Articles and belong in Chapter 4, Equipment For General Use. The Technical Correlating Committee recommendation to locate existing Article 305 as new Article 527 is still valid as it is more frequently associated with installations such as carnivals, theatres, etc., where wiring is used on a temporary basis. It is more appropriately associated with Chapter 5 which covers special occupancies rather than in Chapter 7 which covers special conditions.

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: Note to Chapter 3 Renumbering
RECOMMENDATION: Revise as shown on the following page:
SUBSTANTIATION: The pending Chapter 3 reorganization unquestionably has benefits in terms of allowing the common internal numbering of articles by splitting off articles now subdivided into parallel parts, such as Article 351. However, it does so in a radical way, which disorients the present user base for the Code at the very time when NFPA's stewardship of the code is under concerted attack. It also contains a number of technical problems in the way it was executed, as follows:
- Under no circumstances should Articles 380 and 384 move out of Chapter 3. Very little of Article 380, for example, covers a pure device (snap switches). These articles cover enclosures that complete a wiring system, just as surely as enclosures covered in Articles 373 and 370. These four articles must stay together. They were together in 1935 when the current arrangement took effect, and nothing has changed since to force us to revisit the present plan. Code-Making Panel 9 voted at the ROP meetings to oppose this relocation. The Technical Correlating Committee should listen to the Technical Committee with jurisdiction of these articles.
- The article groupings, based in part on the alphabet for the benefit of the poorly trained, make far less sense than the present Code. This initiative groups Type AC cable with Type FCC cable (the flat cable used to run branch circuits under carpet squares), and separates it from its sister method, Type MC cable. Type FCC now lands next to Type FC cable. The only similarity here is in the letters of the alphabet; Type FC cables runs inside of strut. That's the reason, a very good reason the present Code puts this wiring method nearer strut-type raceways. The proposal ungroups some of the flexible wiring methods, and makes the major technical mistake of placing auxiliary gutters with raceways, which they are not. In 1985, the Technical Correlating Committee rejected a similar relocation for that very reason.

1999 NEC	2002 NEC	Title

373	383	Cabinets, Cutout Boxes, and Meter Socket Enclosures
374	384	Auxiliary Gutters
380	390	Switches
384	394	Switchboards and Panelboards
410L	415	Receptacles, Cord Connectors, and Attachment Plugs (Caps)

- The Technical Correlating Committee action sends Article 305 out of Chapter 3. That's a good idea, but Article 527 is in the wrong chapter. Chapter 5 covers special occupancies, and you can have temporary wiring in any occupancy. Temporary wiring is a special condition, and it should be found in Chapter 7.

- The Technical Correlating Committee action misses the opportunity to move the Type MV cable article, which is less a wiring method than a home for conductors that will run within wiring methods covered in other articles, next to the ampacity tables that apply to it.

This counterproposal is intended as a constructive alternative to the Technical Correlating Committee initiative, one which meets all of its major objectives. It also uses the higher end of Chapter 3 more effectively, but yet conservatively, still retaining the relative arrangement and the units digits of Articles 370-384. It does not, however, pay heed to bureaucratic objectives of only using even Chapter numbers, or remaining in alphabetical order, nor should it. The total number of wiring method articles has remained static over the last twenty years (adding 331, 352C, and 362B; dropping 337, 344, 366), proving no great need for forty or fifty vacant article numbers.

Although this is a comment on material that has no formal proposal number, the NFPA Standards Administration staff has assured the submitter that a comment addressed in this way is in order, that it will be processed by the NEC Committee accordingly, and that it is actionable in this form should a motion be made on it as a part of floor action at the NFPA Annual Meeting.

PANEL ACTION: Reject.

3- 7 - (300-1(c), FPN): Reject
SUBMITTER: David A. Kerr, Jr., Friendsville, PA
COMMENT ON PROPOSAL NO: 3-6
RECOMMENDATION: Revise the FPN to read:

FPN: Metric designators are approximate inside diameter of schedule 40 pipe. Trade sizes are for identification purposes only and are not actual dimensions. Actual dimensions vary with different products.

SUBSTANTIATION: The table, as printed, will only confuse and anger users, the FPN should provide useful information, not more gibberish. Neither Americans nor foreigners will be able to make sense of the table without a didactic FPN.
PANEL ACTION: Reject.
PANEL STATEMENT: The FPN is not confusing. The metric designators are dimensionless. There is no substantiation provided as to why the Table will "confuse and anger" users.

The metric designators are not specific to just Schedule 40 conduit, as would seem to be the case in this comment. These designators are the same in most raceway articles in the 1999 NEC and have simply been relocated to Section 300-1(c) for simplification purposes, rather than having an FPN in each raceway article. Stating that actual dimensions may vary depending upon

the product is redundant since the accepted text already states that fact.

3- 8 - (300-3): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 3-8
RECOMMENDATION: The Technical Correlating Committee directs that the panel review this Proposal relative to the action on Proposal 3-11. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
PANEL STATEMENT: Panel accepts the Technical Correlating Committee directive to review the PA on Proposal 3-8 and refers the Technical Correlating Committee to Comment 3-9.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #21)

3- 9 - (300-3(b)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 3-11
RECOMMENDATION: The Technical Correlating Committee directs that the panel review this Proposal relative to the action on Proposal 3-8. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The Panel Action in Proposal 3-11 should have contained the text as amended by Proposals 3-8 and 3-11 and should be as follows:

300-3(B) Conductors of the Same Circuit. All conductors of the same circuit and, where used, the grounded conductor, all equipment grounding conductors, and bonding conductors shall be contained within the same raceway, auxiliary gutter, cable tray, trench, cable, or cord, unless otherwise permitted in accordance with (1) through (4).

~~Where permitted in (1) through (4), conductors in wiring methods with a nonmetallic sheath or other nonmagnetic sheath shall comply with the provisions of 300.20(B).~~

(1) Unchanged.

(2) Grounding and Bonding Conductors. Equipment grounding conductors shall be permitted to be installed outside a raceway or cable assembly where in accordance with the provisions of 250.130(C) for certain existing installations, or in accordance with 250.134(B), Exception No. 2, for dc circuits. Equipment bonding conductors shall be permitted to be installed on the outside of raceways in accordance with 250.102(E).

PANEL STATEMENT: The phrase ",and bonding conductors" was added to the first paragraph in (b) in accordance with Proposal 3-8. The second paragraph added in Proposal 3-11 was an error based upon a strike-out that occurred during the transfer of text at the panel meeting as recognized by Comment 3-11. This paragraph is deleted.

The title to (2) was revised to include "and Bonding Conductors" in accordance to Proposal 3-11.

3- 11 - (300-3(b)): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 3-11
RECOMMENDATION: Delete the second paragraph of (b).
SUBSTANTIATION: This paragraph makes an unnecessary change in this section that is inconsistent with the panel statement. The panel member generating the word processing text at the meeting confirms to this submitter that this paragraph was supposed to have been lined out, and the line-out didn't get picked up in the ROP. The proposal submitters accused the panel of making unsubstantiated changes during the comment period for the 1999 NEC based on this submitter's comments at that time. However, the panel was correct. The 1999 action made no technical changes in the requirements. The proposal submitters seem to have overlooked 1996 NEC Section 300-3(b) Exception No. 3, which specifically recognized installations made that conformed to Section 300.20(b). The wording in 300.3 (b)(3) clearly incorporates the required reference to 300.20(b). Finally, the notion in the proposal substantiation of equipment grounding conductors running in a different cable assembly doesn't bear close examination. Nothing in Article 300 supersedes the requirements in 250.134.
PANEL ACTION: Accept.
Refer to action on Comment 3-9.

3- 12 - (300-3(b)): Reject
SUBMITTER: Wayne A. Lilly, Bridgewater, VA
COMMENT ON PROPOSAL NO: 3-11
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: The Panel Statement did not address the issue raised in the proposal substantiation regarding (b)(3). This section was revised at the comment stage during the 1999 Code cycle. The revision included a new concept that should not have been accepted because it did not have the benefit of public review. The new concept is given in item three. It is now possible to obtain conductors from separate nonmetallic or nonmagnetic sheathed cables or raceways to form a circuit. Please review the comments given in the proposal substantiation again. The proposed language for 300-3(b) is simplified, direct, and easily understandable. It also does not introduce any new material.

Thank you for your consideration.
PANEL ACTION: Reject.
PANEL STATEMENT: While there may be some validity to the submitter's substantiation, there is no technical reason why wiring methods employing a nonferrous outer jacket or sheath should not be permitted to be installed as separate cables where the cables are run in close proximity to each other.

Since the nonferrous outer jacket or sheath is nonmagnetic, these cables would permit cancellation of magnetic lines of flux from one cable to another. Care must be used where installing these cables to insure the cables are not separated by any ferrous metal

products and obviously where entering a ferrous metal enclosure, they must comply with Section 300-20. Aluminum MC cable and nonmetallic sheathed cable are two cables types that could utilize this method of installation.

This action correlates with the action by CMP-7 on Proposals 7-126 and 7-126a allowing single conductor such as nonferrous MC cable with the same requirements as existed for MI cables where single conductor MC cable is used.

3- 14 - (300-3(c)(1)): Reject
SUBMITTER: Daniel P. Kurelowech, San Diego, CA
COMMENT ON PROPOSAL NO: 3-14
RECOMMENDATION: Revise text to read as follows:

Conductors of circuits rated 600 volts, nominal, or less, as circuits and DC circuits shall not be permitted to occupy the same equipment wiring enclosure, cable, or raceway. ~~All conductors shall~~ (All the rest of text deleted).

Exception: All conductors relate to the function of the piece of equipment. All conductors shall have an insulation rating equal to the maximum circuit volt.

SUBSTANTIATION: The problem comes from "end user" trying to work with what was installed by others. Junction boxes not labeled, or painted over. Neutrals not identified. Neutrals crossed between systems. Multiple systems in a receptacle junction box with only receptacle circuit identified. Contractors do not provide accurate "as-builts".
PANEL ACTION: Reject.
PANEL STATEMENT: There is no technical substantiation in the comment to warrant the recommendation that only conductors related to the function of a particular piece of electrical equipment be permitted to occupy the same enclosure, cable, or raceway. The comment substantiation appears to relate to improper wiring with apparent Code violations. The suggested changes would not alleviate that condition in an existing installation.

(Log #1737)

3- 15 - (300-4(a), Exception (New)): Reject
SUBMITTER: Francis W. Peri, Communications Design Corporation
COMMENT ON PROPOSAL NO: 3-19
RECOMMENDATION: Add:

Exception: A plate of 1/32 in. (0.8 mm) thickness with a minimum hardness of 45 on the N scale in the Standard Hardness Conversion Tables for Metals (ASTM E140-97) shall be permitted. The plate shall be marked "1/32-45N".

SUBSTANTIATION: Association of Cabling Professionals (ACP) would like to eliminate the common complaint of the drywall bulging in places where the telecommunications cable had been run in wall studs and covered by protective nail plate.

The 1/32 in. nail plate proposed is made from a harder material than the 1/16 in. plate identified in the code today. It provides equivalent protection, and will not show the bulge in the drywall. We support a marking of nail plates to allow an inspector to readily identify that an appropriate nail plate is being used. ACP also recommends removal of the reference to bushings, as the proposal only has to do with nail plates.
PANEL ACTION: Reject.
PANEL STATEMENT: Inadequate technical substantiation was provided in the comment on the equivalency of the protection. The Panel reaffirms its position that twisted and imperfect studs, electrical boxes with raised nail brackets designed to be installed on the edge of a stud, plumbing pipes, and many other construction related items can cause bulges in drywall but a properly installed steel nail plate that is 1/16th inch in thickness would not create an unnecessary bulge in the drywall.

If the intent of the comment is to deal with nail plates for communications cables, Section 300- 4 would not apply to Chapter 8 installations, unless specifically referenced in Chapter 8. There are no requirements for nail plates for communications cables in Article 800, for example, so any nail plate can be used by the communications industry. See Section 90-3.

SUBMITTER: David Costa, DC Electric
COMMENT ON PROPOSAL NO: 3-29
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: The panel rejected this proposal with the statement that the submitter had not provided technical substantiation for his proposal. Mr. Casparro in his explanation of negative on this proposal has identified the technical substantiation; The Fact-Finding Report provided with Proposal 3-31. The Fact-Finding Report provides information to indicate that rigid nonmetallic conduit is susceptible to damage from nails and screws. Mr. Casparro cites from the report that the conduit was penetrated 60 and 72 percent of the times that it was tested. These percentages are mush too high and it is evident that additional protection from nails and screws is needed.

PANEL ACTION: Reject.
PANEL STATEMENT: The fact finding report referenced is to show equivalent physical characteristics between armored cable and the wiring methods currently allowed per Section 300-4(d). Rigid Nonmetallic Conduit (RNMC) has been acceptable for this application since the publication of the 1984 NEC without a reported incident. This comment requires RNMC to be protected while exempting rigid steel, IMC, and EMT without data to support this segregation.

3- 22 - (300-4(d)): Reject
SUBMITTER: George A. Straniero, AFC Cable Systems
COMMENT ON PROPOSAL NO: 3-31
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: The Fact-Finding Report submitted with the proposal shows that steel armored cables resist penetration by nails and screws equal to or better than wiring methods currently excepted from the requirements of 300-4(d). The panel acted to reject Proposal 3-29 that would have added the steel plate requirement for rigid nonmetallic conduit. The Fact-Finding Report submitted with the proposal shows that rigid nonmetallic conduit is susceptible to damage from nails and screws. It is apparent then that the panel believes that some degree of damage is acceptable. Accordingly, since steel armored cables resist penetration by nails and screws equal to or better than rigid nonmetallic conduit, Exception No. 1 to 300-4(d) should apply to steel armored cables.

The panel statement that it may be difficult for the Authority Having Jurisdiction to determine whether the cable sheath is steel or aluminum should not be cause for rejection of the proposal. The Authority Having Jurisdiction will determine if the sheath is steel or aluminum the same way that they will determine if the steel

plate required by 300-4(d) is actually steel or aluminum. A simple means would be a commonly available pocket sized pen magnet.
PANEL ACTION: Reject.
PANEL STATEMENT: No additional technical substantiation has been submitted to support the proposed action.

3- 23 - (300-4(d), Exception (New)): Reject
SUBMITTER: Francis W. Peri, Communications Design Corporation
COMMENT ON PROPOSAL NO: 3-28
RECOMMENDATION: Add:
Exception: A plate of 1/32 in. (0.8 mm) thickness with a minimum hardness of 45 on the N scale in the Standard Hardness Conversion Tables for Metals (ASTM E140-97) shall be permitted. The plate shall be marked "1/32-45N".
SUBSTANTIATION: Association of Cabling Professionals (ACP) would like to eliminate the common complaint of the drywall bulging in places where the telecommunications cable had been run in wall studs and covered by protective nail plate.
The 1/32 in. nail plate proposed is made from a harder material than the 1/16 in. plate identified in the code today. It provides equivalent protection, and will not show the bulge in the drywall. We support a marking of nail plates to allow an inspector to readily identify that an appropriate nail plate is being used. ACP also recommends removal of the reference to bushings, as the proposal only has to do with nail plates.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to panel statement on Comment 3-15.

3- 25 - (300-4(d) Exception No. 4 (New)): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
COMMENT ON PROPOSAL NO: 3-31
RECOMMENDATION: Should panel decide to add an Exception No. 4, it should read as follows:
"Interlocked ~~steel~~ armored MC and AC cables ~~not exceeding four conductors no larger than 10 AWG~~."
SUBSTANTIATION: We agree with the Panel Action to reject this proposal. Interlocked steel armored MC and AC cables, regardless of the armoring material, are required to meet the same applicable prescriptive and performance requirements specified in their product standards. Type MC and AC are manufactured and listed in accordance with UL 1569 and UL 4, respectively. The performance, if compared, for puncture resistance should be between an MC (or AC) cable with a given armoring material (of thickness "x") against same product with the same armoring material (of thickness "y") and a protective steel plate that is at least 1/16 in. thick. Thus, if the first product performs equal to or better than the second product with protective steel plate that is at least 1/16 in. thick, then such exception could be evaluated for possible inclusion. Since the aforementioned product standards mandate performance and they do not mandate a thickness for the armor, the products suitable for such exception should be listed and distinctly identified. Further, there is no need for size restriction when performance is compared in this manner.
We believe that a fact finding report supporting such performance comparison is submitted to the Panel, then the Panel may consider an exception that is worded as follows:
"Interlocked armored MC and AC cables listed and marked suitable for "puncture resistant"."
PANEL ACTION: Reject.
PANEL STATEMENT: No additional technical substantiation has been submitted to support the proposed action.

3- 28 - (300-5(a)(1) (New)): Reject
Note: The Technical Correlating Committee notes that the various raceway articles under the jurisdiction of Code-Making Panel 8 require that raceways be listed.
SUBMITTER: David H. Kendall, Carlon
COMMENT ON PROPOSAL NO: 3-41
RECOMMENDATION: Add text to read as follows:
(1) When raceways are used with Direct Burial Cables or Conductors the raceway shall be listed.
SUBSTANTIATION: This comment supports the Panel statement. The Panel stated that sleeves should be listed conduit. This proposed text clarifies to the user that any raceways used with cables or conductors listed for direct burial are required to be listed. Currently, contractors and designers are using non-listed raceways and installing direct burial cable and conductors into it.
The original proposal allowed the raceway to be a non-listed raceway when used with cables or conductors approved for direct burial applications.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation does not support adding a requirement for listing of raceways for underground application.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
FORSBERG: This comment should have been accepted. In part, the panel statement on Proposal 3-41 reads: "A sleeve used in this application should consist of a listed conduit. Non- listed products could contain internal defects that could damage the conductors and have not been tested for the suitability of the application. Also, the panel is concerned about the potential of adding future circuits to this installation." As a result of this statement Comment 3-28 proposed text that would satisfy the panel's concern, i.e, the requirement that a raceway used with direct burial cable or conductors be listed. The panel statement for the rejection of comment 3-28 now indicates the comment substantiation "does not support a requirement for listing of raceways for underground application.
Thus, the panel has created confusion over the treatment of raceways used for direct burial cables:
1. Proposal 3-41, which specifically permitted the use of non listed raceways was rejected because the panel wanted "sleeves to be listed."
2. Comment 3-28, which requires such raceways to be listed, was rejected because the substantiation did not support the listing requirement.
Comment 3-28 should be accepted. This comment did address the concerns expressed in the panel statement on Proposal 3-41.
GRUBER: The panel should have accepted this proposal.
Substantiation: There is nothing to prevent a cable not listed for direct burial being pulled in at a later date. Or having the listed cable for direct burial removed and replaced with a cable that is not listed for direct burial. If a listed raceway is used, one would not have to worry about whether the cable is listed for direct burial or not.
A non-listed raceway is not inspected for defects on the inside of the raceway such as a high weld pad. The potential for damage to the insulation exists because the raceway is not required to be a listed product.

(Log #729)

3- 29 - (300-5(b)(1)): Accept in Principle in Part
SUBMITTER: Richard E. Loyd, Perryville, AR
COMMENT ON PROPOSAL NO: 3-25a
RECOMMENDATION: Reconsider and accept this proposal.
SUBSTANTIATION: Mr. Nickson's substantiation is accurate. The reference to UL 635, which could be revised if needed to address NM cable grommets. Should this proposal be accepted, I would hope that the new listing would require a grommet with a nonremoval feature, so that when it was installed it could not be removed without destroying it. This would resolve the problem.
Accepting this comment will correct a well-documented field problem. The 1999 NEC was revised because of reoccuring problems and Canada has considered outlawing NM cable in metal studs because of the problem. The existing grommets fall out easily. This usually occurs when other crafts are installing their systems or when the sheet rockers align the studs just prior to screwing the gypsum rock to them. This leaves the NM cable exposed to the sharp edges of the metal studs. Once the gypsum is installed the electrician cannot get to the grommet to reinsert it. The requirement for a listed grommet would ensure that removal would be very difficult and help to resolve this acute safety problem.
PANEL ACTION: Accept in Principle in Part.
Revise 300.4 (b) (1) to read:
(1) Nonmetallic-Sheathed Cable. In both exposed and concealed locations where nonmetallic-sheathed cables pass through either factory or field punched, cut, or drilled slots or holes in metal members, the cable shall be protected by listed bushings or listed grommets covering all metal edges that are securely fastened in the opening prior to installation of the cable.
PANEL STATEMENT: The requirement for listed grommets and bushings is added to correlate with the addition of a requirement in Section 336-17, second paragraph for NM cable installed in metal studs to have listed fittings for protection of the cable. The removal of the word "grommet" is rejected since the dictionary also defines it as a bridle ring or a rope ring. In this case, it functions similar to a rope ring to keep the type NM cable from abrading on sharp edges.

3- 30 - (300-5(d)): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 3-47
RECOMMENDATION: Accept in Principle, revise last sentence:
Insulated conductors used in enclosures or raceways in underground installations shall be listed for use in wet locations.
SUBSTANTIATION: The literal wording imposes the rule on bare conductors also.
PANEL ACTION: Accept in Principle.
Refer to action on Comment 3-31
PANEL STATEMENT: The revised text accomplishes the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
ANDREWS: This comment should be rejected thus reversing the panel action. Proposal 3-47, which was accepted, added the words "Conductors or cables used in enclosures or raceways in underground installations shall be listed for wet locations". The proposer's stated intention was "to protect the conductors and cables from corrosion...". The commentor has added new material by inserting the word "insulated" in front of the word "conductors". His argument was that the proposal imposed the rule on bare conductors also. He did not give any substantiation as to why the rule should not apply to bare conductors. Perhaps it was because bare conductors are not "listed". The panel "accepted this comment in principle" and incorporated it in the panel action

on Comment 3-31. The adopted wording implies that no consideration needs be given to bare conductors. However, when in a wet environment, bare conductors should be suitable for any possible corrosive action in that environment. NEC Section 230-30 gives some criteria for bare service-lateral conductors in underground installations. If the panel decides to agree with this negative vote, some action would have to be taken to modify the revised words of Section 300-5(d)(5) in the panel action on Comment 3-31. We suggest the following words: "Cables and ~~insulated~~ conductors installed in enclosures or raceways in underground installations shall be ~~listed~~ suitable for wet locations."

(Log #2017)

3- 31 - (300-5(d)): Accept in Principle

Note: The Technical Correlating Committee understands that the panel did not intend to change the clearances from those accepted in Proposal 3-5. Therefore, "8 ft (2.44 m)" should be shown as "2.5 m (8 ft)", "18 in. (457 mm)" should be shown as "450 mm (18 in.)", and "12 in. (305 mm)" should be shown as "300 mm (12 in.)".

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

COMMENT ON PROPOSAL NO: 3-48

RECOMMENDATION: Revise as follows:

(D) Protection from Damage. Direct-buried conductors and cables ~~emerging from the ground~~shall be protected from damage from exposure to soil and moisture, and from impact upon emergence from grade, in accordance with (1) through (5).

(1) Emergence from Grade. Direct-Buried conductors and cables emerging from the ground shall be enclosed in ~~by~~ enclosures or raceways extending from the minimum cover distance required by Section 300-5(a) below grade to a point at least 8 ft (2.44 m) above finished grade. In no case shall the protection be required to exceed 18 in. (457 mm) below finished grade. Conductors entering a building shall be protected to the point of entrance. Where the enclosure or raceway is subject to physical damage, the conductors shall be installed in rigid metal conduit, intermediate metal conduit, Schedule 80 rigid nonmetallic conduit, or equivalent.

(2) Service Conductors. Undergroundservice ~~lateral conductors~~ that are not encased in concrete and that are buried 18 in. (457 mm) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 12 in. (305 mm) above the underground installation.

~~Conductors entering a building shall be protected to the point of entrance. Where the enclosure or raceway is subject to physical damage, the conductors shall be installed in rigid metal conduit, intermediate metal conduit, Schedule 80 rigid nonmetallic conduit, or equivalent.~~

(3) Listing. Conductors or cables used in enclosures or raceways in underground installations shall be listed for wet locations.

SUBSTANTIATION: This comment makes a more logical division of the material covered, which has different functions. One rule, the original on dating back many cycles, covers the protection of conductors as they emerge from grade. Subsequently the warning ribbon and the listing requirement were/are being added, and need a separate heading.

This comment also reiterates the proposed language in Proposal 3-48. Code Making Panel 3 rejected it, suggesting that Article 100 solved the problem. Article 100 does not solve the problem. There are many example of underground service entrance conductors that are not service lateral. For examples, if a service lateral (or, for that matter, aboveground service entrance conductors connected to a service drop) extends to an outdoor meter socket, and then the conductors running from the load side of the meter socket to the service disconnect are routed underground to another location, those conductors are underground service entrance conductors. They do not constitute a service lateral, but they do present the same hazard. This comment economizes on wording by simply using the phrase "underground service conductors."

PANEL ACTION: Accept in Principle.

Revise 300-5 (d) to read:

(d) Protection from Damage. Direct-buried conductors and cables shall be protected from damage in accordance with (1) through (5)

(1) Emerging from Grade. Direct-buried conductors and enclosures emerging from grade shall be protected by enclosures or raceways extending from the minimum cover distance required by Section 300-5(a) below grade to a point at least 8 ft (2.44 m) above finished grade. In no case shall the protection be required to exceed 18 in. (457 mm) below finished grade.

(2) Conductors Entering Buildings. Conductors entering a building shall be protected to the point of entrance.

(3) Service Conductors. Underground service conductors that are not encased in concrete and that are buried 18 in. (457 mm) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 12 in. (305 mm) above the underground installation.

(4) Enclosure or Raceway Damage. Where the enclosure or raceway is subject to physical damage, the conductors shall be installed in rigid metal conduit, intermediate metal conduit, Schedule 80 rigid nonmetallic conduit, or equivalent.

(5) Listing. Cables and insulated conductors used installed in enclosures or raceways in underground installations shall be listed for use in wet locations.

PANEL STATEMENT: The first paragraph is revised to delete the phrase "from damage from exposure to soil and moisture" since this is new material introduced at the comment stage without public review.

Two additional subsections are inserted to provide clarity and a further delineation of information.

The (5) text is changed to comply with the revision initiated by Comment 3-30.

COMMENT ON AFFIRMATIVE:

ANDREWS: Although we agree with the panel action to "Accept this comment in principle", we do not agree with the revised wording accepted for Section 300-5(d)(5), which came from Comment 3-30. See our Explanation of Negative on Comment 3-30.

(Log #2018)

3- 32 - (300-5(i)): Accept in Principle

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

COMMENT ON PROPOSAL NO: 3-49

RECOMMENDATION: Add the words "or cables" after "in parallel in raceways" and change (in Exception No. 2) "nonmetallic raceways or nonmetallic sheathed cables" to "nonmetallic raceways, or cables with nonmetallic or nonmagnetic sheaths, arranged."

SUBSTANTIATION: The first change makes the two halves of the sentence agree with each other. The second change avoids possible confusion with Romex. It uses the more technically correct language in Section 300-3(B)(3), which also recognizes such methods as copper MI cable. It also makes the close proximity rule clearly apply to both raceway and cable installations, by means of revised sentence punctuation.

PANEL ACTION: Accept in Principle.

The base section should remain as changed by Proposal 3-49. The words "or cables" should be added in the first exception. The second exception should have the text as indicated in the recommendation without the final word "arranged" to read as follows:

(i) Conductors of the Same Circuit. All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors shall be installed in the same raceway or cable or shall be installed in close proximity in the same trench.

Exception No. 1: Conductors in parallel in raceways or cables shall be permitted, but each raceway or cable shall contain all conductors of the same circuit including grounding conductors.

Exception No. 2: Isolated phase, polarity, grounded conductor and equipment grounding and bonding conductor installations shall be permitted in nonmetallic raceways or cables with a nonmetallic covering or nonmagnetic sheath in close proximity where conductors are paralleled as permitted in Section 310-4, and where the conditions of Section 300-20(b) are met

PANEL STATEMENT: The comment was not clear as to the location of the first change so the panel action clarified the changes in the entire subsection, including the exceptions. This change also clarifies the issue of permitting single conductor MC cables as now covered in Sections 334-14 and 334-22.

300-6. Protection Against Corrosion and Degradation. ~~Metal r~~ Raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, fittings, supports, and support hardware shall be of materials suitable for the environment in which they are to be installed.
(a) General. Ferrous raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, metal elbows, couplings, fittings, supports, and support hardware shall be suitably protected against corrosion inside and outside ~~(except threads at joints)~~ by ~~a coating of~~ an approved corrosion-resistant coating ~~material such as zinc, cadmium, or enamel. Where protected from corrosion solely by enamel, they shall not be used outdoors or in wet locations as described in (c). Where boxes or cabinets have an approved system or organic coatings and are marked "Raintight," Rainproof," or "Outdoor Type," they shall be permitted outdoors.~~
~~Exception:~~ The threads at joints shall be permitted to be coated with an identified electrically conductive compound.
(1) Protected from Corrosion Solely by Enamel. Where protected from corrosion solely by enamel they shall not be used outdoors or in wet locations as described in (c). Where boxes or cabinets have an approved system of organic coatings and are marked "Raintight," "Rainproof," or "outdoor Type," they shall be permitted outdoors.
~~(b)~~ (2) In Concrete or in Direct Contact with the Earth.
(a) Ferrous or nonferrous, other than aluminum, metal raceways, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, fittings, supports, and support hardware shall be permitted to be installed in concrete or in direct contact with the earth, or in areas subject to severe corrosive influences where made of material judged suitable for the condition, or where provided with corrosion protection approved for the condition.
(b) Aluminum, raceways, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, fittings, supports, and support hardware shall be protected by an approved corrosion resistant material or coating where embedded or encased in concrete or where in direct contact with soil.
(c) Nonmetallic raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing cabinets, metal elbows, couplings, fittings, supports, and support hardware shall be suitable for the environment in which they are installed and shall comply with (1) and (2) below.
(1) Exposed to Sunlight. Where exposed to sunlight or other forms of ultraviolet rays they shall utilize materials or coatings approved for the installation and shall be listed sunlight resistant.
(2) Exposed to Chemical Degradation. Where subject to chemical solvent vapors, or airborne, splash or immersion exposure they shall utilize materials or coatings suitable for the installation.
(c) Indoor Wet Locations. In indoor wet locations, and in locations where walls are frequently washed or where there are surfaces of absorbent materials, such as damp paper or wood, the entire wiring system, where installed exposed, including all boxes, fittings, conduits, and cable used therewith, shall be mounted so that there is at least a 1/4-in. (6.35 mm) airspace between it and the wall or supporting surface.
Exception: Nonmetallic raceways, boxes, and fittings shall be permitted to be installed without the airspace on a concrete, masonry, tile, or similar surface.
FPN: In general, areas where salts, acids and alkali chemicals are manufactured, processed, handled and or stored ~~may~~ present such corrosive conditions, particularly when wet or damp. Severe corrosive conditions ~~may~~ also tend to be present in portions of

~~meatpacking plants, tanneries, glue houses, and some stables;~~ water and wastewater treatment plants, pulp and paper plants, petrochemical operations, primary metals production facilities, direct burial applications in corrosive soils, food processing areas subject to frequent washdowns, installations immediately adjacent to a seashore and swimming pool areas; and areas where chemical deicers are used; and storage cellars or rooms for hides, casings, fertilizer, salt, and bulk chemicals.

SUBSTANTIATION: I have over 40 years in the electrical industry with the last 18 years as a circuit rider attending and speaking at industry related meetings. As a consultant, former inspector, author and instructor regarding electrical installations, I constantly receive questions about the requirements for corrosion and degradation. The proper selection of a wiring method at the time of installation is one of the most important aspects of a design to ensure a good installation that will last the life of the electrical system. Too often the installer selects a product, which fails due to improper product selection for the environmental elements present. The panel was incorrect in their statement for rejection in stating that corrosion is covered in the individual nonmetallic articles this is not true 347-2(b) references the user to 300-6 for guidance. Articles 351, 352, and 362 Part B do not address the issue. Articles 370, 373 and 374 do not address the issue. Therefore, the information in 300-6 is needed as stated by the proposal.

Proposal 3-52 was intended as an editorial rewrite with additional references and information. There are numerous metallic and nonmetallic materials being used today to manufacture electrical products i.e., steel with various protective coatings, aluminum, brass, stainless steel, PVC, polyethylene and fiberglass just to name a few. All of the specific uses cannot be covered therefore, general information and guidance is needed and this information belongs in the "General Requirements Article 300."

It was the intent of the submitter to reorganize the existing text, separate the aluminum products from other nonferrous products and incorporate into 300-6 the proposed wording developed by the nonmetallic representative and the chemical representative on CMP 8 for the new Article 344, which was rejected in the 1999 NEC cycle for other reasons. The 1999 NEC only covers metallic wiring methods with some reference to nonmetallic wiring methods. Common corrosion and degradation issues that need to be addressed by the user and designer should first appear in the general wiring method requirements, Article 300. I believe this proposal does that.

The rewrite proposed in 3-52 did not add confusion or place any additional restrictions on the nonmetallic products. This proposal did not state that mold and fungus caused degradation. It is agreed that exposure to sunlight, is addressed in some individual nonmetallic cable tray and wiring method articles however, not all. The attempt here is to make the NEC a more complete and user-friendly document.

PANEL ACTION: Reject.

PANEL STATEMENT: "Degradation" is an undefined term in the NEC and has only been used in a Fine Print Note in Section 310-10 dealing with the temperature rating of a conductor.

Section 300-6 is written to instruct the users about how and when to protect metal raceways against corrosion. This proposal adds requirements to nonmetallic products, including raceways, cable trays, auxiliary gutters, cable armor, enclosures, outlet boxes, cable sheathing, cabinets, elbows, couplings, fittings, supports and support hardware without substantiation.

Section 300-6 (a) required metal raceways to be protected by an approved corrosion-resistant coating. The proposal only requires it to be suitable where as the nonmetallic products needs to be approved (Section 300-6(b)(1)). These listing requirements belong in the individual raceway Article where they are currently addressed. Nonmetallic raceway articles do reference Section 300-6 but also have additional requirements per the raceway article. Exposure to sunlight, corrosion and temperature are addressed in each of the individual raceway articles and product standards.

The revisions to the Fine Print Note is unnecessary. Removing and adding a new list of corrosive applications is only confusing.

The comment has continued to add confusion without the substantiation to change it.

(Log #972)

3- 38 - (300-6(a)): Accept in Principle

SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)

COMMENT ON PROPOSAL NO: 3-54

RECOMMENDATION: The Panel should Accept this proposal in Principal. The text should be revised as follows:

Retain the words "(except threads at joints:" in the first sentence.

Add the following text after the first sentence: "Where corrosion protection is necessary for field threads, an approved electrically conductive compound shall be used."

Retain the last two sentences and delete the exception.

SUBSTANTIATION: The Panel is correct that the factory-applied corrosion protection on the threads is sufficient and that the submitter has not provided technical substantiation to justify the requirement for an additional coating for all threads. (The comment by Mr. Beile and Dr. Gruber that the word "often" should be deleted from the Panel Statement is also correct). However, field threads need protection suitable for the environment in which the conduit is installed. The proposed text makes it clear that an electrically conductive coating must be used where corrosion protection of field threads is necessary. The word "approved" is used in lieu of "identified" because there are many products, such as zinc rich spray paint, that will provide the intended field thread protection. A requirement to be "identified" could preclude their use.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The submitter's concern has been addressed by the panel action on Comment 3-39.

(Log #1711)

3- 39 - (300-6(a)): Accept in Principle

SUBMITTER: Charles M. Trout, Maron Electric Co. Inc.

COMMENT ON PROPOSAL NO: 3-54

RECOMMENDATION: This proposal should be accepted with new wording as follows. Delete the exception and add a new second sentence to read: "Threads at joints shall be coated with an identified electrically conductive, corrosion-resistant compound."

SUBSTANTIATION: The concerns addressed in this proposal are that when field threads are cut the corrosion-resistant material applied at the factory is disrupted and should be replaced. Additionally, factory applied corrosion resistant material applied to the threads is disrupted by the threads in a coupling being applied. If the integrity of the corrosion-resistant material is compromised, corrosion resulting in a high resistance connection will result. A high resistance connection will result in additional impedance in the ground-fault return path. As presently written this section excepts threads at joints because some of the corrosion-resistant materials suggested in the text are not electrically conductive. To support this, the existing exception permits threads to be coated with an identified electrically conductive compound. Identified electrically conductive, corrosion-resistant compounds are readily available from manufacturers. Application of electrically conductive, corrosion resistant compounds should be mandatory.

Note: supporting material available for review at NFPA Headquarters.

PANEL ACTION: Accept in Principle.

Revise the text to read:

Where corrosion protection is necessary and the conduit is threaded in the field, the threads shall be coated with an approved electrically conductive, corrosion-resistant compound."

PANEL STATEMENT: The revised text meets the intent of the submitter and clarifies the requirement. The panel has changed "identified" to "approved" to indicate that the compound is not required to be listed.

SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 3-61
RECOMMENDATION: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the Technical Correlation Committee direction for further consideration of negative comments expressed in the voting for Proposal 3-61 and accepts in principle the following text noted in two of the negative comments:
Where portions of a cable, raceway or sleeve are known to be subjected to different temperatures and where condensation is known to be a problem, as in cold storage areas of buildings or where passing from the interior to the exterior of a building, the raceway or sleeve shall be filled with an approved material to prevent the circulation of warm air to a colder section of the raceway or sleeve. An explosionproof seal shall not be required for this purpose.
PANEL STATEMENT: The panel has modified the text to address the concerns expressed in the negative votes as requested by the Technical Correlating Committee.

3- 41 - (300-7(b)): Reject
SUBMITTER: Richard E. Loyd, Perryville, AR
COMMENT ON PROPOSAL NO: 3-63
RECOMMENDATION: Reject this proposal.
SUBSTANTIATION: Reject this proposal as it is overly restrictive. The proponent cites the exact reason the term "joint" needs to remain. At architectural expansion joints the amount of expansion is sometimes too great for standard electrical expansion fittings and these fittings are not appropriate since the building can move apart during a drop in temperature of several inches. 6 to 12 inches would not be uncommon. EMT and Rigid expansion fittings would not accommodate this amount in one fitting. Also seismic considerations may not be covered by this section since it appears to only apply for thermal considerations.
PANEL ACTION: Reject.
PANEL STATEMENT: The term used for expansion devices, connectors, couplings and similar raceway fittings is a "fitting." This section is not referring to an architectural expansion joint but is actually referring to a raceway fitting. This fitting may be required for the raceway even where the raceway may not be installed over an architectural expansion joint, such as noted in the Fine Print Note for raceways exposed to wide variations in temperatures with the resulting expansion and contraction of the raceway.

(Log #430)

3- 42 - (300-11(a) and (b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 3-67
RECOMMENDATION: Accept in principle revised:
(a) Secured in place. Raceways, cable assemblies, auxiliary gutters, cable trays, cablebus assemblies, boxes, cabinets, and other electric equipment shall be securely fastened in place, except as otherwise permitted or required elsewhere in this Code.
(remainder unchanged)
(b) Raceways and cables used as a means of support. Raceways or cables shall only be used as a means of support for other raceways, cables, conductors, or nonelectric equipment under the following conditions:
(1) Where the raceway or means of support is identified for the purpose.
(2) Where the raceway or cable contains power supply conductors for electrically controlled equipment and is used to support Class 2 circuit conductors or cables that are solely for the purpose of connection to the equipment control circuits.
~~(3) Where the raceway is used to support boxes or conduit bodies in accordance with Section 370-23 or to support fixtures in accordance with Section 410-16(f).~~
SUBSTANTIATION: Previously missing underlining is provided. Additional items are proposed in (a) and a proviso to correlate with permission or requirements of other Code sections relating to flexibility or movement, or nonfastening such as 333-7(b). (Style Manual 3.3.5) This section does not mention cables used as support. Power cables should be as suitable for support of Class 2 conductors as flexible raceways.
The word "conductors" is added in (b) to exclude single conductors such as grounding electrode conductors, to correlate with (b)(2) use of the word.
The present (b)(3) has no relation to the rule of (b) since boxes, conduit bodies, and fixtures are not raceways, cables, or nonelectric equipment. In any case nonelectric equipment is covered by (b)(1).
The original proposal relating to a raceway mast and external bonding jumpers is deleted as those uses are covered by (b)(1).
PANEL ACTION: Reject.
PANEL STATEMENT: The change recommended for (a) was not accepted since there is no reason to start a list of items that should be securely fastened in place, especially since the items being recommended already have their own articles and support requirements.
Power cables do not necessarily provide the same support for Class 2 or 3 cables as other flexible raceways, such as liquidtight flexible metal and nonmetallic raceways. The initial acceptance of text to allow Class 2 or Class 3 cables to be supported by raceways was an attempt to provide some relief to installers of having to provide separate support for these low voltage cables. The submitter has not provided any technical support or data to allow this to be expanded for cables to support other cables.
There also was no technical data submitted on allowing raceways to support grounding electrode conductors, some of which could be sized at 3/0 or larger, depending upon the size of the service conductors and the design provided by the electrical designer. For example this change would permit a 1/2 inch raceway to support a 3/0 grounding electrode conductor. Item (3) has been retained to correlate this section with Sections 370-23 and 410-16.

KREINER: In the 11th line of the Panel Statement, delete the apple and replace with "1/2".

(Log #2137)

3- 43 - (300-11(a)(2), Exception): Reject
SUBMITTER: Joseph A. Ross, Ross Electrical Assessments
COMMENT ON PROPOSAL NO: 3-68
RECOMMENDATION: Accept Proposal 3-68 in Part as follows:
Delete the Exception to Section 300-11(a)(2).
SUBSTANTIATION: It's time for this Exception to be deleted. There is no "ceiling system manufacturer" that is willing to assign their name to any instructions for the support of branch-circuit wiring and associated equipment. This is just a little overdue house cleaning. Let's make this Code the best it can be.
PANEL ACTION: Reject.
PANEL STATEMENT: There was no technical substantiation submitted in either the proposal or this comment to support the deletion of the exception. A survey of all the ceiling system manufacturers indicating which ceiling assemblies, if any, permit the ceiling assembly to support branch circuit wiring would provide a true indication that this exception should be deleted. This has not been provided. Acceptance of this proposal and comment would preclude the submission of documentation by a ceiling manufacturer in the future.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #628)

3- 44 - (300-11(b)(2)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 3-73
RECOMMENDATION: Accept in principle. Revise (b)(2) of proposal:
Where the raceway contains power supply conductors for electrically controlled equipment and is used to support Class circuit ~~conductors or~~ cables of a type listed in Table 725-61 that are soley for the purpose of connection to the equipment control circuits. ~~or~~ Delete (b)(3).
Revise panel action: (c) Cables Not Used as a Means of Support. Cable wiring methods shall not be used as a means of support for other cables, raceways, or nonelectrical equipment, except that cables covered in Chapter 3 used for power supply conductors for electrically controlled equipment shall be permitted to support Class 2 cables of a type listed in Table 725-61 that are solely for the purpose of connection to the equipment control circuits.
SUBSTANTIATION: Class 2 circuit conductors are not prohibited from being installed in accordance with wiring methods of Chapter 3. The Class 2 type cables of Table 725-61 are an alternative to wiring requirements of Chapters 1 through 4 but are not mandatory requirements per the fine print note for 725-1. Article 725 indicates Class 2 conductors in raceways, or installed as Class 1 conductors as may be required. Sections 330-3, 334-3 permit Type MI and MC cables for control and signal circuits and other articles of Chapters 1 through 4 do not prohibit applications to Class 2 circuits. Present wording appears to literally not disallow Class 2 circuits in raceways or cables as covered in Chapter 3 from being supported by another raceway. The intent seems to envision Class 2 type cables.
Section (b)(3) has no relationship to the second paragraph of (b) since boxes, conduit bodies, and fixtures are not raceways, cables or nonelectric equipment.
In the panel action use of the word "nonelectrical" may infer that electrical equipment is not prohibited from being supported and perhaps modifies other code rules which require other support.
Cable wiring methods of Chapter 3 appear to be suitable for support of Class 2 type cables. If a 3/8 or 1/2 in., flexible raceway is permitted to support Class 2 cables but a Type MC or MI cable with three No. 4 conductors is not, it seems somewhat unreasonable.
PANEL ACTION: Reject.
PANEL STATEMENT: Class 2 conductors enclosed in a raceway wiring method from Chapter 3 can support individual Class 2 conductors or Class 2 cables. The existing text in the 1999 and previous Codes provides adequate clarity for permission to support Class 2 conductors or cables from raceways and the proposed new text does not provide that same clarity. The new text may cause confusion about the intent.

(Log #328)

3- 45 - (300-14): Reject
SUBMITTER: Daniel P. Kurelowech, San Diego, CA
COMMENT ON PROPOSAL NO: 3-78
RECOMMENDATION: Add to exceptions:
Where conductors end at a device, conductors shall measure 6 in. from front edge of junction box.
SUBSTANTIATION: As an end user, I am required to work live at times. 3 in. from front of a deep box makes it hard and unsafe. (3 in. based on the NEC 1999 handbook page 224)
PANEL ACTION: Reject.
PANEL STATEMENT: Requiring 6 inches of free conductor from the front edge of a box, in addition to the conductor length inside the box, will add a substantial amount of box fill to the installation without any technical substantiation to warrant the change. Circuits are provided with a disconnecting means in the system so that the circuit may be disconnected to allow maintenance and work to be done. Adding extra conductor length would not make live work any less dangerous. The current text of the code does not preclude longer conductor lengths where a safety concern exists.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1346)

3- 46 - (300-14): Reject
SUBMITTER: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
COMMENT ON PROPOSAL NO: 3-78
RECOMMENDATION: In the present text, after "cable sheath" insert "to its first point of termination or splice."
SUBSTANTIATION: Mr. Slater is right that shallow boxes don't demand 6 in. of free conductor to permit 3 in. to emerge, and the code-making panel is right that shallow boxes often are extended. Even deep boxes, though may be retrofitted with extension boxes that can make it impossible to get at wiring. However, if conductors can be rendered accessible by pigtailing before, or at the time, the extension box is added, the problem has a great work-around. However, the wording I propose reflects a more restrictive interpretation of 300-14, indicating that you have to pull, or re-pull 8 in. or 10 in. or whatever length of conductor is required to peek out from extension boxes, especially multiple extension boxes. Interpretations differ, since the required 3 in. is for terminations and splices, but the NEC has no restriction against "splicing a splice", equivalent to the rule against tapping a tap. If doing so is incorrect, and the 6 in. and 3 in. free conductors must be unbroken, reject this comment.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing text in the 1999 NEC provides the necessary information that the submitter of the comment requested. The existing text states that the length of the conductor must be at least 6 inches from the point in the box where it emerges from the raceway or cable sheath. This 6-inch length would be from the sheath to where it terminates at the junction, switch, or outlet point. It would not permit the conductor to be cut off 2 inches from the sheath and then spliced internally with an additional 4 inches of conductor.

(Log #1215)

3- 49 - (300-15(i)): Hold
SUBMITTER: Don W. Jhonson, ESP of South Florida, Inc.
COMMENT ON PROPOSAL NO: 3-81
RECOMMENDATION: Add new text as indicated:
300-15(i) Enclosures. A box or conduit body shall not be required where a splice, switch, terminal or pull point is in a cabinet or cutout box, in an enclosure for a switch or overcurrent device as permitted in Section 373-8, in a motor controller as permitted in Section 430-10(a), or in a motor control center. A box or conduit body shall not be required where a splice, tap or pull point is in an approved underground handhole and conductors are listed for wet location where the wiring method is conduit, tubing, or direct burial cables.
SUBSTANTIATION: The problem is the widespread industry practice of using underground handholes for the distribution of underground branch wiring in conduit systems, which is presently not permitted by 300-15. The handholes are often used in conjunction with underground PVC conduit as well as other approved wiring methods for the installation of landscape lighting, light poles, and other applications where an above ground box would pose a physical hazard such as parks and recreational areas. Listed wet location boxes are not designed for immersions during prolonged flooding conditions as experience in many parts of the country and have not been the equipment of choice due to the accumulation of water and potential fault conditions caused when standard splice connections are used within the box. The handhole would require a listed direct burial splice and allows for natural drainage through the open bottom where subject to heavy rain flooding. I have substantiated the practice of using these handholes as described through personal contact with other industry members and have found many felt the intent of the code permitted a conduit to be stubbed up within the handhole, a bushing/fitting installed, conduit sealed to prevent foreign entry, continuity maintained with bonding jumpers, conductors suitable for wet locations, splice/taps made with direct burial listed methods, covers secured and handhole grounded if metallic.
PANEL ACTION: Hold.
PANEL STATEMENT: While the submitter is correct in his substantiation about the widespread use of handholes, this comment must be held in accordance with Section 4-4.6.2.2 of the NFPA Regulations Governing Committee Projects since it has not had public review in the ROP stage of the process. We recommend that the Technical Correlating Committee establish a task group between CMP 3 and CMP 9 to develop a definition for handhole and associated requirements.

(Log #26)

3- 50 - (300-22(b)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 3-95
RECOMMENDATION: The Technical Correlating Committee directs that the panel clarify the Panel Action on this Proposal considering the comments on voting and the Panel Action on 3-98. This acton will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the Technical Correlating Committee direction to clarify the panel action on this proposal. The proposal is accepted in principle and the phrase "without an overall nonmetallic covering" inserted after "rigid metal conduit" with the change to read as follows:
"(b) Ducts or Plenums Used for Environmental Air. Only wiring methods consisting of Type MI cable, Type MC cable employing a smooth or corrugated impervious metal sheath without an overall nonmetallic covering, electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, or rigid metal conduit without an overall nonmetallic covering shall be installed in ducts or plenums specifically fabricated to transport environmental air."
The remainder of the existing text in this subsection in the 1999 Code to remain unchanged.
PANEL STATEMENT: By inserting the phrase "without an overall nonmetallic covering" after "Type MC cable employing a smooth or corrugated impervious metal sheath" and after "rigid metal conduit" the concerns of the submitter of the proposal should be satisfied. Rigid metal conduit with an overall nonmetallic covering should not be installed in a fabricated duct or plenum, unless the nonmetallic covering is tested and listed for use in this area.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #789)

3- 51 - (300-22(b)): Reject
SUBMITTER: David H. Kendall, Carlon
COMMENT ON PROPOSAL NO: 3-95
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: This proposal is similar to Proposal 3-98 where the panel rejected the proposed text because the substantiation covered only coated rigid nonmetallic conduit. There was no substantiation to include other products, such as cables with nonmetallic insulation, to be limited in this application. There are products currently listed to be used in these applications with nonmetallic coatings. In addition, this sort of text limits the development of future products that may be evaluated as acceptable for the plenum.
PANEL ACTION: Reject.
PANEL STATEMENT: The text as revised in Comment 3-50 specifically applies to corrugated or smooth MC cable and rigid metal conduit and does not put undue restrictions on other wiring methods or any future wiring methods. See panel action and statement on Comment 3-50.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1817)

3- 52 - (300-22(b)): Accept in Principle
SUBMITTER: Tim Andrassy, Steel Tube Inst.
COMMENT ON PROPOSAL NO: 3-95
RECOMMENDATION: This proposal should continue to be accepted.
SUBSTANTIATION: Section 300-22(B) has never included a permission for nonmetallic wiring methods. Note that the current text states "only wiring methods consisting of Type MI cable, Type MC cable employing a smooth or corrugated impervious metal sheath without an overall nonmetallic covering" . . . "Flexible metal conduit and liquid tight flexible metal conduit shall be permitted."
The raceways currently permitted (electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal

conduit, flexible metal conduit) have not been listed before with a nonmetallic cover; therefore, the words "without an overall nonmetallic covering" were not necessary. However, recent changes have been made to UL Safety Standard 6 (Rigid Metal Conduit), UL 797 (Electrical Metallic Tubing), and UL 1292 (Intermediate Metal Conduit) which now allow the listing of those products with a PVC coating as an alternative to galvanizing. If this change is not made, this type of conduit could be used in ducts or plenums, which was not the original intent.

The 1999 UL electrical Construction Equipment Directory states that: "Conduit with nonmetallic coatings has not been evaluated for use in ducts, plenums, or other environmental air spaces in accordance with Section 300-22 of the National Electrical Code."

Concerning Mr. Forsberg's negative comment: These Articles (725, 770, 800) are covered by Panel 16. According to 90-3, Chapter 7 can amend Chapters 1-4 and Chapter 8 is independent of the other chapters. If Panel 16 wants to allow the nonmetallic wiring methods covered in those articles in ducts and plenums, they can allow permission in those articles. However, it is not Panel 16's jurisdiction to change Chapter 3 requirements.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The submitter's intent is covered by the panel's action on Comment 3-50.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #1818)

3- 53 - (300-22(c)): Accept in Principle

SUBMITTER: Tim Andrassy, Steel Tube Inst.

COMMENT ON PROPOSAL NO: 3-98

RECOMMENDATION: This proposal should be accepted with the following change in text:

Other type cables and conductors shall be installed <u>in the following raceways, which are not permitted to have an overall nonmetallic covering:</u> electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.

SUBSTANTIATION: The intent of the current code text is that nonmetallic wiring methods are not permitted in these spaces, unless they are "factory-assembled multiconductor control or power cable that is specifically listed for the use". The current code uses the phrases: "Type MC cable without an overall nonmetallic covering", "listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath", "surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers." The raceways currently permitted (electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit, flexible metal conduit) have not been listed before with a nonmetallic cover; therefore the words "without an overall nonmetallic covering" were not necessary. However, recent changes have been made to UL Safety Standard 6 (Rigid Metal Conduit), UL 797 (Electrical Metallic Tubing), and UL 1292 (Intermediate Metal Conduit) which now allow the listing of those products with a PVC coating as an alternative to galvanizing. If this change is not made, this type of conduit could be used in "other spaces used for environmental air", which was not the original intent. The text submitted with the original proposal may have been confusing. The altered text submitted with this comment should clarify the intent. The addition of this text does not prevent the use of any of the wiring methods currently permitted in this section.

The 1999 UL Electrical Construction Equipment Directory (Green Book) states that, "Conduit with nonmetallic coatings has not been evaluated for use in ducts, plenums, or other environmental air spaces in accordance with Section 300-22 of the National Electrical Code."

PANEL ACTION: Accept in Principle.

The proposal is accepted in principle and the phrase "without an overall nonmetallic covering" inserted after "rigid metal conduit" with the change to read as follows:

(1) Wiring Methods. The wiring methods for such other space shall be limited to totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables and conductors shall be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.

PANEL STATEMENT: By inserting the phrase "without an overall nonmetallic covering" after "rigid metal conduit" the concerns of the submitter of the proposal should be satisfied. Rigid metal conduit with an overall nonmetallic covering should not be installed in an other space used for environmental air, unless the nonmetallic covering is tested and listed for use in this area.

AFFIRMATIVE: 11

(Log #1873)

3- 54 - (300-22(e)): Reject

SUBMITTER: C.W. Beile, Allied Tube & Conduit

COMMENT ON PROPOSAL NO: 3-100

RECOMMENDATION: Change the proposal to read:

(e) Abandoned, unusable and obsolete cables shall be removed.

SUBSTANTIATION: Never in the history of Code-Making Panel 3 has the other space used for environmental air been considered a storage area for unused equipment. The code panel's rationalizations are weak.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal submitter's own substantiation states there is no indication that the additional cables in plenums caused an added fire hazard and that the fire record of cables in plenums is excellent. Requiring abandoned cables to be removed that are not intended for future use would be almost impossible to enforce. Many cables are installed for future use and cables are often swapped at patch panels to provide a very effective method of moving a computer or a piece of telecommunications equipment without having to pull a new cable.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 8

NEGATIVE: 3

EXPLANATION OF NEGATIVE:

BEILE: Although CMP-16 has partially addressed the problem, the total subject seems to evade a direct solution. Many weak arguments rationalize why obsolete unused equipment cannot be removed. Until responsibility is fixed upon those who are adding new equipment to take out the items they are replacing, nothing will be done and unused items will continue to pile up in other space used for environmental air. New equipment is fast replacing old technology.

Many manufacturers as well as inspectors and installers are concerned that additional weight and combustibles will ultimately cause them liability if accidents occur.

There is no valid reason not to act.

GRUBER: The panel should have accepted this proposal in principal. See my Explanation of Negative on Comment 3-55.

WEBER: My negative vote on this panel action is in concurrence with the negative vote and justification on Comment 3-55. See my explanation of negative vote on Comment 3-55.

(Log #1913)

3- 55 - (300-22(e)): Reject

SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers

COMMENT ON PROPOSAL NO: 3-100

RECOMMENDATION: Accept this proposal in principle as follows:

<u>(e) Abandoned wiring methods, cable assemblies and cables. Wiring methods, cable assemblies and cables not intended for future use shall be removed from plenums and other air handling spaces. Wiring methods, cable assemblies and cables intended for future use shall be durably and legibly marked where accessible.</u>

SUBSTANTIATION: The submitter has identified an existing and future problem that the NEC must address. The buildup of discontinued wiring methods, cable assemblies and cables represent serious hazards for persons and property. Renovation after renovation of transient commercial occupancies demand that

the NEC clearly require that an accumulation of wiring methods, cable assemblies and cables not in use shall not be permitted.

This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and statement on Comment 3-54.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 8

NEGATIVE: 3

EXPLANATION OF NEGATIVE:

CASPARRO: This comment should be accepted. The allowance of abandoned cables, and cable assemblies to be accumulated in plenums and other air handling spaces is unbelievable. The technology of the telecommunications industry is dictating that new cables be pulled all the time for upgrading, not only for computer wiring, but also power wiring for isolated circuits. I disagree with the panel statement on Comment 3-54, that many cables are installed for future use. Most cables are obsolete after a few years.

How many cables, and how much weight are we going to allow in these plenums and air handling spaces before we have support problems?

GRUBER: The panel should have accepted this proposal.

Substantiation: because something would be difficult to enforce is not a reason to reject a proposal. This item has significant merit for several reasons.

1. There is an ever increasing burden of unused, abandoned and obsolete cables left in plenums and air handling spaces. Not only is there a concern for a potential increase in the fire hazards, but also the safety factor based upon the weight load.

2. The Society of Plastic Industries could not come to agreement on this proposal which indicates that some of the members believe there is merit to this proposal.

3. Simply because we have had no deaths to support the proposal is not a reason to dismiss the efficacy of it.

WEBER: This comment should be accepted. The panel needs to review and develop guidance on the type and amount of discontinued wiring methods, cable assemblies and cables that remain in other spaces used for environmental air purposes. As we examine the panel action on Proposal 3-99 (300-22(c)(1) Exception): which was accepted by the panel thus removing the exception that allowed liquidtight flexible conduit in single lengths not exceeding 6 feet to be installed in that space. The proposal correctly indicated that a conflict exists with the basic intent of the section. These spaces need special care and concern as to what is allowed in the space or to remain in that area that can have a serious hazard in a fire scenario. The proposed wording in essence addresses the need to remove abandoned, unusable and obsolete cables and allows those wiring methods intended for future use to remain and are then required to be durably and legibly marked where accessible.

(Log #334)

3- 56 - (300-37): Reject

SUBMITTER: Gregory P. Bierals, Electrical Design Inst.

COMMENT ON PROPOSAL NO: 3-103

RECOMMENDATION: Revise text to read as follows:

Aboveground conductors shall be installed in rigid metal conduit, intermediate metal conduit, EMT, in rigid nonmetallic conduit, in flexible metal conduit and liquidtight flexible metallic conduit at motor connections in lengths up to 6 ft.

SUBSTANTIATION: Section 430-123 and Section 430-145(b) recognize the use of the flexible raceways for motor connections at voltages over 600 volts. This proposal should be accepted.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel affirms the reason for rejecting the original proposal. The permission to use this wiring method for over 600 volt applications is very limited. To insert it within Section 300-37 would seem to be an invitation to misread and misapply it. If the user is installing a motor with a voltage in excess of 600 volts, then Part K of Article 430 should be read and the requirements specifically adhered to, especially Section 430-123. The submitter also deleted other wiring methods within this section without proper substantiation for the deletion. See panel action on Comment 3-58.

(Log #1662)

3- 57 - (300-37): Hold

Note: The Technical Correlating Committee directs that Proposal 3-102 and Comment 3-57 be reported as "Hold", and forwarded to Code-Making Panel 8 for action during the next code cycle.

SUBMITTER: Melvin K. Sanders, TECo., Inc.

COMMENT ON PROPOSAL NO: 3-102

RECOMMENDATION: This proposal should be rejected for the reasons cited by Mr. Andrews.

SUBSTANTIATION: In addition to the rejection comments of Mr. Andrews, I have reviewed similar articles in the 1999 Edition and the 2002 Draft and they specifically include minimum wall thickness where higher voltages are concerned. None is included for auxiliary gutters.

In earlier editions, information on permitted wiring methods was covered by now deleted Article 710 and the referral in 300-2(a) (1999 Edition) to other articles allowed specific review by them. Now that this is in Article 300, this cross-check has been eliminated and until the panel having jurisdiction of particular wiring methods makes an evaluation, adding it to the shopping list here without such validation makes no sense. This should have been referred to Code-Making Panel 6, and if they agree sufficient safeguards are in place they can include it at that time and present wording of 300-2(a) would be adequate.

The present wording of 300-2(a) does not prohibit wiring methods - it merely guides the reader to the appropriate article of concern. I see this as a backdoor attempt to accept wiring methods that rightfully are the responsibility of the individual panels where the expertise to make such decisions resides.

PANEL ACTION: Hold.

PANEL STATEMENT: The proposal and comment should be held for further study and sent to CMP-8 as a proposal for the 2005 Code cycle since they have jurisdiction over the specific use of auxiliary gutters. The Technical Correlating Committee could then send it to CMP-3 for insertion of the term "auxiliary gutter" into Section 300-37.

The panel statement for the proposal did not make any reference to permission for use above 600 volts since it was permitted for 600 volts or less. In fact, Article 374 does not make any reference to voltage at all. With the utility company deregulation, many systems that were utility-owned high voltage systems are now being sold to the end user or installed as owner provided high voltage substations. There is no particular reason why auxiliary gutters for over 600 volts could not be submitted for listing and UL 870 modified to provide for over 600 volt testing.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #2334)

3- 58 - (300-37): Accept

SUBMITTER: Wayne A. Lilly, Bridgewater, VA

COMMENT ON PROPOSAL NO: 3-103

RECOMMENDATION: This comment is made at the direction of the Technical Correlating Committee. That direction being that Code-Making Panel 8 "comment on application of the subject wiring methods over 600 volts."

This proposal should continue to be rejected.

SUBSTANTIATION: A Task Group that consisted of Wayne A. Lilly and Kenneth E. Jannot developed this comment.

The language of this proposal would delete from the current text several wiring methods, such as cablebus and busway, as being suitable for above ground applications of over 600 volts. The proposal offered no substantiation to support the removal of these wiring methods. These wiring methods have a positive history of use in over 600-volt applications.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #1218)

3- 59 - (300-50): Hold

SUBMITTER: Dann Strube, Lanesville, IN

COMMENT ON PROPOSAL NO: 3-109

RECOMMENDATION: The panel needs to reconsider several parts of the proposed table. Differences between this table and the 300-5 table need to be addressed.

SUBSTANTIATION: Column (7) depth on Table 300-50 is zero inches while at less than 600 volts a depth of 4 in. is required.

Depth for 15 KV should not be less than that required for 480 volt systems under the same conditions.

Section 300-50 Exception No. 2 allows reduction of depth with concrete cover. Section 300-5 has no such provision. Safe at 15 KV is safe at 480 V.

Please note that I did not recommend a specific way to revise the items. It is not important to me which way code-making panel 3 fixes this problem, only that the rules agree.

The third issue to consider is airport runway depth. The exception allowing cable to be at 18 in. while other methods did not change is documented in the TCR for the 1974 NEC (published 1975) as proposal 7 for Panel 8. The exception, seen as 300-50 Exception No. 6, 1999 NEC, appeared in 300-5 for less than 600 V as well as Article 710 for higher voltages. The table now found in 300-5 was introduced in 1990. The exception in question went away and the 18 in. rule appeared. There was no substantiation for the change in depth requirements at that time.

I am not really opposed to the 18 in. depth at the runway but I do urge the panel to consider the need for greater depth for raceways. First the FAA Memphis office told me that their Advisory Circular 150/5370-108 specifies 18 in. for all methods in these locations. I was also told that this is advisory only and they do not demand 18 in. in some cases.

I have a background in air traffic control and can say from experience that an aircraft off the runway does alot of damage. Runway lights, taxiway lights, distance marker signs and lights, etc. are damaged. Considering the amount of above ground damage that can occur, I question the need to provide extra protection for an underground conduit.

PANEL ACTION: Hold.

PANEL STATEMENT: The panel recommends that the proposal and comment be held for further study in order that all issues regarding conduits and other raceways are addressed.

3- 61 - (Table 300-50): Hold

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

COMMENT ON PROPOSAL NO: 3-109

RECOMMENDATION: Replace the accepted table with the suggested version, with four notes, as shown below:

SUBSTANTIATION: The attached table eliminates all exceptions without making unsubstantiated changes in the technical requirements. The panel action raised conduits under slabs to the surface of the slabs, eliminated cables from the runway allowance, failed to account for the 2-in. concrete-in-the-trench exception, and didn't incorporate the warning ribbon requirement. The panel action also made column headers that are far too complicated to be usable as such. This comment solves that problem with a note, only enumerates columns with substantive requirements, similar to Table 300-5, and it also incorporates the Technical Correlating Committee objection to the cover definition being in the title.

PANEL ACTION: Hold.

PANEL STATEMENT: See panel action and statement on Comment 3-59.

Table 300.50 Minimum Cover[1] Requirements

	General Conditions (not otherwise specified)						Special Conditions (use if applicable)					
	(1) Direct- Buried Cables[2]		(2) Rigid Nonmetallic Conduit[2,3]		(3) Rigid Metal Conduit and Intermediate Metal Conduit		(4) Raceways under buildings or exterior concrete slabs, 100 mm (4 in.) minimum thickness[4]		(5) Cables in airport runways or adjacent areas where trespass is prohibited		(6) Areas subject to vehicular traffic, such as thoroughfares and commercial parking areas	
Circuit Voltage	**mm**	**in.**	**mm**	**in.**	**mm**	**in.**	**mm**	**in.**	**mm**	**in.**	**mm**	**in.**
Over 600 V through 22 kV	750	30	450	18	150	6	100	4	450	18	600	24
Over 22 kV through 40 kV	900	36	600	24	150	6	100	4	450	18	600	24
Over 40 kV	1000	42	750	30	150	6	100	4	450	18	600	24

[1]Cover is defined as the shortest distance in millimeters (inches) measured between a point on the top surface of any direct-buried conductor, cable, conduit, or other raceway and the top surface of finished grade, concrete, or similar cover.

[2]Depth reduction of 50 mm (2 in.) permitted for each 50 mm (2 in.) of concrete or equivalent protection placed in the trench over the underground installation.

[3]Listed by a qualified testing agency as suitable for direct burial without encasement. All other nonmetallic systems shall require 50 mm (2 in.) of concrete or equivalent above conduit in addition to the table depth.

[4]The slab shall extend a minimum of 150 mm (6 in.) beyond the underground installation, and a warning ribbon or other effective means suitable for the conditions shall be placed above the underground installation.

INSERT LANDSCAPE TABLE 300-50 (Log #1663) HERE **See Table on the following page**

Table 300-50 Minimum Cover[1] Requirements ~~(Cover is defined as the shortest distance in millimeters (inches) measured between a point on the top surface of any direct buried cable or conduit, and the top surface of finished grade, concrete, or similar cover.~~

					Rigid Metal and Intermediate Metal Conduit							
Circuit Voltage	Column 1 Direct Buried Cables		Column 2 Rigid Nonmetallic Conduit Approved for Direct Burial and not Under a Building[2]		Column 3 All Locations not Otherwise Specified		Column 4 Under a Building or Minimum 4-in. Thick Concrete Exterior Slab with No Vehicular Traffic and the Slab Extending Not Less than 150 mm (6-in.) Beyond the Underground Installation (Including Rigid Nonmetallic Conduit Approved for Direct Burial)		Column 5 Under Streets, Highways, Roads, Alleys, Driveways, and Parking Lots (Including Rigid Nonmetallic Conduit Approved for Direct Burial)		Column 6 In or Under Airport Runways, Including Adjacent Areas Where Trespassing is Prohibited (Including Direct Buried Cables and Nonmetallic Conduit With or Without Approval for Direct Burial)	
	mm	in.	mm	in.	mm	in.	mm	in.	mm	in.	mm	in
Over 600 V through 22 kV	750	30	450	18	150	6	100	4	600	24	450	18
Over 22 kV through 40 kV	900	36	600	24	150	6	100	4	600	24	450	18
Over 40kV	1000	42	750	30	150	6	100	4	600	24	450	18

1. **NOTE –** Cover is defined as the shortest distance in millimeters (inches) measured between a point on the top surface of any direct-buried cable or conduit, and the top surface of finished grade, concrete, or similar cover.

2. **NOTE –** Listed by a qualified testing agency as suitable for direct burial without encasement. All other nonmetallic systems shall require 50 mm (2 in.) of concrete or equivalent above conduit in addition to above depth.

(The definition of "Cover" was deleted from the table title and added as Note No. 1 at the direction of the Correlating Committee. The asterisk information in the 1999 Edition for this Table then became Note No. 2.)

~~Exception No. 1: Areas subject to vehicular traffic, such as thoroughfares or commercial parking areas, shall have a minimum cover of 24 in. (610 mm).~~

(The provisions of Exception No. 1 are now covered by Column 6.)

Exception No. ~~2~~ 1: The minimum cover requirements for other than rigid metal conduit and intermediate metal conduit shall be permitted to be reduced 150 mm (6 in.) ~~(152 mm)~~ for each 50 mm (2 in.) ~~(50.8 mm)~~ of concrete or equivalent protection placed in the trench over the underground installation.

(Re-number Exception No. 2 to become Exception No. 1 and metric values added with inches placed in brackets to conform to the Manual of Style.)

Exception No. ~~3~~: ~~The minimum cover requirements shall not apply to conduits or other raceways that are located under a building or exterior concrete slab not less than 4 in. (102 mm) in thickness and extending not less than 6 in. (152 mm) beyond the underground installation.A~~ *Installations meeting the conditions of Column 4 shall have a warning ribbon or other effective means suitable for the conditions ~~shall be~~ placed above the underground installation.*

(The 1st sentence of Exception No. 4 is covered by Column 4, and text was added to the 2nd sentence in order to make a complete sentence and indicate what situation governs the placement of warning ribbon. Note: this is not an exception to burial depths but instead covers the placement of warning ribbon and should be added as new 300-50 (F).)

Exception No. ~~4~~ 2: Lesser depths shall be permitted where cables and conductors rise for terminations or splices or where access is otherwise required.

(Re-number Exception No. 4 as Exception No. 2.)

~~Exception No. 5: In airport runways, including adjacent defined areas where trespass is prohibited, cable shall be permitted to be buried not less than 18 in. (457 mm) deep and without raceways, concrete enclosement, or equivalent.~~

(The provisions of Exception No. 1 are now covered by Column 6.)

Exception No. ~~6~~3: Raceways installed in solid rock shall be permitted to be buried at lesser depth where covered by 50 mm (2 in.) ~~(50.8 mm)~~ of concrete~~.~~ ~~which~~ and the concrete shall be permitted to extend to the rock surface.

(Exception No. 6 changed to Exception No. 3, with metric value with inches placed in brackets to conform to the Manual of Style. "Which" changed to "and the concrete" for grammar.)

(In addition, I combined proposed columns (6) and (7) into a single column 5 since the only difference was whether the raceway was under a building or under a concrete slab.)

ARTICLE 305 — TEMPORARY WIRING

(Log #770)

3- 64 - (305): Reject
SUBMITTER: Richard E. Loyd, Perryville, AR
COMMENT ON PROPOSAL NO: 3-141
RECOMMENDATION: Reconsider the location of this article was moved to and leave it in chapter three or retitle Chapter 5 or move to Chapter 7.
SUBSTANTIATION: Chapter 5 is titled "Special Occupancies," "Temporary Wiring" is not an occupancy. It is either a lesser "Chapter 3 General Wiring Method" or "Chapter 7 Special Conditions". To relocate Article 305 to Chapter 5 does not make the code more user friendly. A new student of the code would never look for it in Chapter 5. I would suggest reconsideration or retitle Chapter 5 to "Special Occupancies and Systems". If this is done the move would be acceptable.
PANEL ACTION: Reject.
PANEL STATEMENT: 1. This comment is outside the scope of CMP 3 since the organization and location of articles is under the pervue of the Technical Correlating Committee.
2. CMP 3 refers this comment to the Technical Correlating Committee for action.
3. CMP 3 requests that it retain pervue over the article on temporary wiring.
4. CMP 3 requests that the article on temporary wiring be located in Chapter 7 because it relates to special conditions and occupancies.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
FORSBERG: I agree that this comment must be rejected, but I disagree with item No. 4 of the panel statement. The panel should recommend to the Technical Correlating Committee that Article 305 should remain in Chapter 3 because the temporary wiring rules are related to, but different than, rules for permanent installations. Chapter 7 deals with "Special Conditions" that, in my view, do not cover temporary wiring. The NEC will be a more user friendly document if Article 305 is retained in Chapter 3.
KREINER: Concerning Item No. 4 of the Panel Statement, it would seem better to leave Article 305 where it is presently located since it is more of an exception to Article 300 than it is a special occupancy as indicated in the title of Chapter 5.

(Log #879)

3- 65 - (305): Reject
SUBMITTER: George W. Flach, New Orleans, LA
COMMENT ON PROPOSAL NO: 3-141
RECOMMENDATION: Leave temporary wiring in Chapter 3 under Article 305.
SUBSTANTIATION: Although Article 305 covers more than temporary wiring, it does relax the requirements for wiring methods. Chapter 5 has the title Special Occupancies. Temporary wiring is not restricted to special occupancies, and therefore should not be placed in Chapter 5.
PANEL ACTION: Reject.
PANEL STATEMENT: 1. This comment is outside the scope of CMP 3 since the organization and location of articles is under the pervue of the Technical Correlating Committee.
2. CMP 3 refers this comment to the Technical Correlating Committee for action.
3. CMP 3 requests that it retain pervue over the article on temporary wiring.

3- 69 - (305-2(c)): Accept in Principle
SUBMITTER: Alan Manche, Square D Co.
COMMENT ON PROPOSAL NO: 3-119
RECOMMENDATION: The panel should reconsider and reject this proposal.
SUBSTANTIATION: The proposals accepted by Panel 15 to expand the scope of Article 702 to include portable generator sets makes the addition of this new paragraph 305-2(c) unnecessary. The first paragraph of the proposed section addressing portable generators and inadvertent interconnection is covered by a revised 702-1 and the present 702-6. The submitter states in his substantiation that 410-56(g) covers the second sentence of the part (c) proposal that addresses the prevention of a backfeed potential on the inlet plug, therefore it is not necessary to repeat the requirement in 305. Capacity and ratings of the generator are also already addressed in 702-5. Therefore, this proposal is only repeating the safety requirements already found in the NEC and should be rejected with the advent of the scope change in Article 702.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The Technical Correlating Committee has sent both Proposals 3-119 and 120 to CMP-15 for their action and Comments 3-67 and 3-68 have been accepted by CMP-3 to indicate our acceptance of the Technical Correlating Committee direction.

(Log #CC301)

3- 72a - (305-4(j)): Accept
SUBMITTER: CMP 3
COMMENT ON PROPOSAL NO: 3-132
RECOMMENDATION: Add new sentence to Section 305-4(j) (1999 NEC) to read:
Vegetation shall not be used for support of overhead spans of branch circuits or feeders.
SUBSTANTIATION: The panel had added this new language on the support of conductors from vegetation at the direction of the Technical Correlating Committee's comment on Proposal 3-132.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
PACE: There is no technical substantiation to change existing wording and there is no evidence submitted to indicate that this has been a problem. Existing language requires protection from physical damage regardless of the support method. Cable for temporary use can be installed on vegetation such that it is not subject to physical damage.

(Log #1664)

3- 73 - (305-4(j)): Reject
SUBMITTER: Melvin K. Sanders, TECo., Inc.
COMMENT ON PROPOSAL NO: 3-132
RECOMMENDATION: Change the title of 305-4(j) and add new 305-4(k) (1999 Edition) [527.4 (J) and add new 527.4(K) (2002 Draft)] as follows:
527.4(J) Means of Support. Cable assemblies and flexible cords and cables shall be supported in place at intervals that ensure that they will be protected from physical damage. Support shall be in the form of staples, cable ties, straps, or similar type fittings installed so as not to cause damage.
527.4 (K) Method of Support. Chapter Three and Chapter Four wiring methods utilized as service entrance, feeder or branch circuits shall be supported from the structure.
SUBSTANTIATION: Changing the title of 527.4(J) to Means of Support will clarify it covers how cable assemblies and flexible cords and cables are to be supported and what can be utilized. Adding proposed 527.4(K) clarifies that the method of support is by the structure as stated in the proposed definition (ROP 188) for Article 100.
New 527.4(K) addresses service entrances, feeders and branch circuits as detailed in 527.1 but not those installations as limited by 90.2(B). Use of vegetation, living or dead is not permitted because of concern about strength of the support, unpredictable whipping action of vegetation, the uncontrollable variety of vegetation requiring best guesses as to the which may or could be used, the flexing that stretches and relaxes conductors between supporting points over the life of the project, and the temporary rigging necessary in order to adapt supports intended for structural use to vegetation is just a minimal listing of the problems of concern. It is recognized by the panel members that poles are the direct result of a particular type of dead vegetation, but they are also altered, treated, strength rated, designed and intended to provide a particular structure duty. It is also recognized by the panel members that trees are merely poles that have not yet died.
PANEL ACTION: Reject.
PANEL STATEMENT: The suggested change in title does not totally reflect the information given in this subsection. The existing first sentence deals more with flexible cords and cables that must be supported at intervals so damage does not occur. The second sentence deals with the means for support of cables and cords. The more generic title allows both support of the cables and the means of support to be covered in the same subsection.
The second part of the recommendation introduces new material that has not had public review.
This comment does not have anything to do with the text of the original proposal. The panel reaffirms its position to not allow live vegetation to provide support for temporary electrical wiring. Stringing power cords or cable assemblies from tree to tree may subject the cords or cables to insulation damage or outside jacket damage due to wind or other natural causes. Poles can be installed at the temporary worksite to provide support for cords and cable assemblies for feeder and branch circuits. The text in Section 225-26 prohibits live vegetation from being used to support overhead spans of wiring systems for outside branch circuits and feeders and this prohibition should also apply for temporary wiring. Code Panel 3 asks the Technical Correlating Committee to please have the exception to Section 225-26 deleted.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2320)

3- 74 - (305-4(j)): Reject
SUBMITTER: William M. Lewis, Eli Lilly and Co.
COMMENT ON PROPOSAL NO: 3-132
RECOMMENDATION: The proposal should be accepted as long as the 225-26 exception remains as worded.
SUBSTANTIATION: The panel statement only tells half of the story.
Point 1: While it is true that there are no current provisions in 305 which prohibit the attachment to temporary or permanent structures. Neither is there a provision which prohibits the attachment to vegetation.
Point 2: While it is true that there may be cases where attaching to vegetation may be more harmful to the cable; it is also true that there may be cases where not using convenient vegetation could be more harmful to the cable. These are the reasons why a commonly accepted practice should remain acceptable, but for temporary wiring only. The only reason for proposing the new wording was for correlation only.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its intent not to allow live vegetation to provide support for temporary branch circuits and feeders. Stringing power cords or cable assemblies from tree to tree may subject the cords or cables to insulation damage or outside jacket damage due to wind or other natural causes. Structures can be installed at the temporary work site to provide support for cords and cable assemblies for feeder and branch circuits. The text in Section 225-26 prohibits live vegetation from being used to support overhead spans of wiring systems for outside branch circuits and feeders and this prohibition should also apply for temporary wiring.

Code-Making Panel 3 recommends to the Technical Correlating Committee that the exception to Section 225-26 in the 1999 NEC be deleted. This change would prohibit overhead spans of branch circuits and feeders from being supported on live vegetation for all temporary installations. This change would not prohibit the use of decorative lighting strings from being supported by live vegetation.

(Log #1179)

3- 75 - (305-6): Reject
SUBMITTER: Frank Martucci, Fort Lee, NJ
COMMENT ON PROPOSAL NO: 3-135
RECOMMENDATION: Please accept this proposal.
After existing material add:
(c) Electrocution-proof cord and plug grounding system.
Receptacles of all voltages shall be protected in accordance to (1) and (2)
(1) Cords and cordsets shall be redundantly grounded with two insulated conductors. The grounding conductors shall be installed in cords and cordsets with the branch circuit conductors supplying the unfixed equipment. Attachment plugs and connector bodies shall be of the hospital grade type.
(2) Grounding Poles. Cord connectors, attachment plugs, and the internal connections of multiple outlet boxes shall be provided with two separate wiring sites at the grounding pole. The cord connectors, attachment plugs, and the multiple outlet boxes, shall be designed so that only the grounding pole can be wired with two conductors.
SUBSTANTIATION: For the past thirteen years I have submitted proposals for the 1990, 1993, 1996, 1999, and the forthcoming 2002 National Electrical code that will prevent thousands of electricians and fiery deaths each and every year. Yet, despite my serious admonitions and allegations, code panels continue to reject my proposals sight unseen, without any demonstrations or testing whatsoever.
It boggles my mind that members of code making panels, most with no cord expertise whatsoever, can display such an indifference to human life. What if my system works? Don't they have any fear of being liable for thousands of deaths these past 13 years? Don't they have any fear of being liable for the loss of hundreds of thousands of homes each and every year?
I, for one, would demand extensive tests before I rejected a system that may indeed save thousands of lives each and every year.
My reaction to a single electrocution bordered on the fanatical. I immediately replaced undersized 3 conductor cords with 4 conductor cords to provide two #14, (15 amapacity) grounding conductors for all medical devices.
In addition, costly, and time consuming, outlet modifications were made to provide the redundancy every other federal agency, or responsible engineer, resorts to whenever lives are at stake.
The same redundancy I proposed that, together with a slight component modification, will prevent thousands of electrocutions and fiery deaths each and every year.
The same redundancy code panel members have unanimously rejected, time and again, the past 13 years. They not only reject the concept of redundancy, but they adamantly defend the use of conductors sized up to 50% less than required by our original National Electrical Code.
The original code, written under the influence of insurance companies, distinctly states the equipment grounding conductor shall be no smaller than #14 (15 ampacity) when used on a typical 15 ampere branch circuit.
However, when the NFPA took over the code making process in 1911, they established exceptions to the code whereby a #18 (7 ampacity) conductor is permitted to protect our people form line drop, shock , and electrocution.
This is a clear violation of our electrical code and detrimental to the electrical safety of every, man, woman, and child in our nation.
And it boggles my mind that, during the past 13 years, not a single panel member ever endorsed the use of redundancy. How can code panel members dedicated to electrical and fire safety fight so vehemently to keep our people protected with a grounding conductor sized less than required by our original electric code?
If code panels see fit to jeopardize the lives of our people with undersized, rarely tested, equipment grounding conductors then at least provide two of them.
And this is what my proposal accomplishes. And to boot, a bonus wiring safeguard that will make our grounding system electrocution-proof and fire-proof.
And it is obvious that only a demonstration will convince the panels that two wire grounding redundancy together with a no-cost modification of existing cord components will indeed make the grounding system electrocution-proof and also fire-proof.
But until such a demonstration ever takes place, let me try again to convince the panel, in as plain English as possible, how little they know about our ill-conceived grounding system.
If the panels took the time to wire a plug each of the six ways it can be wired, they will discover that four of six ways will cause shock, electrocution or fiery death.
When plugged into a properly wired outlet, current will flow through inappropriate steel outlet mounting screws, outlet boxes, and raceways. Massive current from a heater or hotplate will cause overheating and possible undetectable fires inside the walls of dwellings.
And when plugged into an outlet, or extension cord, wired with reversed polarity, the exposed metal parts of appliances will become immediately charged with a full 120 volt potential.
A person holding a drill, for example, will become shocked, or electrocuted, because he, or she, is a poor conductor of electricity and lacks the impedance required to trip circuit breakers or blow fuses.
The wiring safeguard automatically provides the necessary impedance regardless of any wiring error and even though the wall outlet, or female connector of an extension cord, is wired with reversed polarity.
You see, by simply adding a second, redundant, grounding conductor there now exists three grounded conductors, two green and one white. If existing cord components are modified so that only the ground pole can be wired with two conductors, there is absolutely no possible way to wire a plug so as to cause a shock, electrocution or undetectable fires inside walls.
And the system is indeed a self-monitoring system unlike the existing system whereby four of six ways to wire existing cord components will electrocute or cause fiery deaths.
No costly assured grounding programs are required to assure proper wiring. Should miswiring cause a device to become energized, the second grounding conductor will automatically provide the necessary impedance required to activate branch circuit ground fault interrupters, converting them into GFCIs.
It is morally wrong for code panels to evaluate and reject proposals without any thorough demonstrations to prove the submitter's proposal is flawed.
How much easier it is to make live demonstrations. I could first demonstrate how I can make existing cord components electrocution-proof and fire-proof by simply drilling a hole or removing, or adding a tiny piece of metal.
And also make thorough demonstrations, with mock up outlets, exactly how the second ground conductor will prevent electrocutions, and fires inside walls, due to miswired cords.
I urge the panels to seek a demonstration before they reject my proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has provided demonstrations of his systems to both the Standards Council and to the NFPA general assembly with the same results. The submitter should provide technical data that is verified as to the cause and origin of the electrocutions that he is claiming to be caused by improper cord installations.
The panel finds the technical substantiation in both the proposal and in the comment to support such a major change to be inadequate. Redundant (two conductor) grounding does not make a cord and plug system "electrocution-proof". The submitter provides no evidence that the cause of the mentioned electrocutions are related to wiring or grounding problems involving cord and plug sets or connected equipment. Other causes such as personnel error or other kinds of equipment could have been the cause.
Redundancy of grounding conductors is not the only effective way to achieve enhanced protection against electric shock. Use of GFCIs, double insulation, and assured equipment grounding programs are other ways. GFCI protection provides protection even if the equipment grounding conductor is inadvertently lost in the branch circuit or at the equipment. Redundancy of grounding conductors will not make GFCI's trip faster, or at a lesser current value.
The construction requirements of flexible cords are not within the jurisdiction of CMP-3. Article 400 is under the jurisdiction of CMP-6.

Section 3-3.3.3(f) of the NFPA Regulations Governing Committee projects does not allow physical demonstrations, experiments, or simulations at meetings of technical committees.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #606)

3- 76 - (305-6(a)): Reject
SUBMITTER: John E. Propst, Equilon Enterprises, LLC
COMMENT ON PROPOSAL NO: 3-138a
RECOMMENDATION: This comment is submitted to reject the action of the panel and reject the original proposal.
SUBSTANTIATION: The issues identified in Mr. Andrew's and Mr. Pace's comments provide adequate substantiation to reject this proposal. When properly applied, assured grounding is a safe option that is being effectively applied in industry today. To eliminate this option without substantiation would place an unnecessary burden on industries that already have significant investments in their programs.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal to delete the exception warrants acceptance based on the fact that there is no need for all receptacle outlets in industrial establishments to be exempted from GFCI protection. The panel disagrees with the statement of the submitter that requiring the use of ground-fault circuit- interrupter for personnel places an unnecessary burden on industry. See panel action and statement on Comment 3-80.

5- 186 - (305-6(a) Exception No. 1): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 3-138
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for action. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel agrees with the action of CMP-3 to delete Exception No. 1 of 305-6(a).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
COMMENT ON AFFIRMATIVE:
SKUGGEVIG: My affirmative vote to delete the exception is intended to not discourage the use of ground-fault circuit-interrupters to reduce the risk of electric shock. However, deleting this exception would only cause 2-wire generators with no connection between the circuit output and the generator frame to be required to have GFCIs. This type of generator without the connection between one conductor and the frame is not suited for GFCI protection since GFCIs are differential current devices and need to have a complete path for differential current when a fault occurs. This is the reason for this exception in the first place. In my opinion, Proposal 3-138 is beyond an editorial change, and is based on a wrong premise. I do not agree with the substantiation given for Comment 3-138 that states that "250.34 does not permit a 2-wire single-phase portable or vehicle-mounted generator to have all circuit conductors insulated from the frame if system grounding is required, which is the case where supplying the receptacles of (a)". 250.34 does not require a connection between the 2-wire output circuit and the generator frame. For a 2-wire, 120-volt system with no other windings in proximity (such as with a transformer instead of a generator), 250.20 does not require grounding of the system because it is not possible for the isolated 120-volt winding to produce as much as 150 V, under normal or fault conditions. 250.26 states that either conductor may be selected to be the grounded conductor IF the system were either required to be grounded or voluntarily grounded. 250.34 permits the frame of the generator to serve as the grounding electrode with no connection to earth, but in this case, a system conductor does not have to be connected to the frame or to earth. For this change to be effective and be able to help reduce the risk of electric shock, a statement needs to be added to 305.6 to explicitly require GFCI-protected generators to have a connection between either conductor of a 2-wire system and the generator frame.

(Log #543)

3- 78 - (305-6(a) Exception No. 2): Reject
SUBMITTER: Robert B. Alexander, Fluor Daniel
COMMENT ON PROPOSAL NO: 3-139
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: Only if the panel asserts that the assured equipment grounding conductor program (AEGCP) is unsafe or ineffective does it warrant rejecting this proposal. In fact, the panel has asserted just the opposite in the panel statement for Proposal 3-135.

The panel statement fails to offer any documentation available for public review that would indicate that a GFCI program would have prevented death or injury where an effective AEGCP was in place. There is only a vague reference to OSHA citations. However, a simple review of the data readily available at the OSHA website (http://www.osha.gov/oshstats/std1.html) indicates the following:

1. Section 1926 404 was cited 1386 times from Oct. 1998 to Sept .1999.
2. Small construction projects (1-99 workers) accounted for 1357 (98 percent) of those citations.
3. For large construction projects (100-249 total workers) it was cited only 20 times.
4. For even larger construction projects (250 + total workers) it was cited only 9 times.

There is no comparable section in 29CFR1910, so it's not surprising that construction accumulated the bulk of the citations. Even assuming that all the citations issued were for substandard personnel ground-fault protection in temporary wiring, which is highly unlikely, it is obvious that large, well managed construction projects are as well equipped to guard worker safety, as general industrial users.

Worker Deaths by Electrocution: A Summary of Surveillance Findings and Investigative Case Reports, is available at http://www.cdc.gov/niosh/elecmono.html. It is a summary of worker electrocutions from 1982-1994. The recorded case studies indicate fewer than 5 worker deaths caused by electrocution would have been attributed to substandard personnel ground fault protection in temporary wiring for 15, 20 and 30A, 120 V systems in those twelve years.

The fact that the panel believes GFCI is superior is irrelevant, a "line" can only be properly drawn between "safe" and "unsafe" not between "safe" and "safer."

All other substantiations offered in Proposal 3-139 are still valid
PANEL ACTION: Reject.
PANEL STATEMENT: The panel disagrees with the statement of the submitter that it may only reject the proposal if the panel asserts that the assured equipment grounding conductor program (AEGCP) is unsafe or ineffective. This proposal is an attempt to expand the use of the AEGCP beyond the scope of the present exception. The submitter references the panel statement for Proposal 3-135. The panel lists the AEGCP third in a list of ways to

achieve enhanced protection against electric shock in response to a proposal on redundant grounding. The submitter should not infer that it is the intent of the panel to confer equal weight to the AEGCP to that of ground-fault circuit-interrupter for personnel (GFCI) protection in providing protection to personnel. The panel further states in that panel statement that GFCI protection provides protection even if the equipment grounding conductor is lost in the branch circuit or at the equipment. The AEGCP does not afford this protection. The panel again reaffirms its position that GFCI protection affords a higher level of protection, as stated in the panel statement for this proposal.

The submitter has provided no technical substantiation that would compel the panel to alter its position as stated in the panel statement for this proposal. To the contrary, the substantiation provided by the submitter bolsters the position of the panel. An examination of the "simple review of the data" mentioned by the submitter indicates there were 1,386 OSHA citations of 29CFR 1926.404 for the twelve-month period provided.
Furthermore, the panel does not see the need to discriminate against the size of the project as broken down by the submitter when applying the provisions of this exception.

The submitter is correct to state there is no comparable section in 29CFR 1910 regarding GFCI and the AEGCP. That regulation applies to general industry, not to construction. If a receptacle(s) is installed or exists as part of the permanent wiring of the building or structure and is used for temporary electric power, ground-fault circuit-interrupter for personnel shall be provided as stated in Section 305-6(a) of the NEC. The submitter has not provided substantiation supporting his conclusion that general industry users are well equipped to guard worker safety.

The panel also concludes that the information provided by the submitter in "Worker Deaths by Electrocution: A Summary of Surveillance Findings and Investigative Reports" indicating that fewer than 5 worker deaths caused by electrocution have been attributed to "substandard" GFCI protection in temporary wiring for 15, 20, and 30A, 125V systems in those twelve years, is further evidence that GFCI is safe and effective. A review of the web address noted in the comment substantiation did not produce this evidence, however.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #547)

3- 79 - (305-6(a) Exception No. 2): Reject
SUBMITTER: Robert B. Alexander, Fluor Daniel
COMMENT ON PROPOSAL NO: 3-138a
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: This proposal lacks sufficient substantiation. Only if the panel asserts that assured equipment grounding conductor program (AEGCP) is unsafe or ineffective does it warrant deleting the exception. In fact, the panel asserted just the opposite in the panel statement for Proposal 3-135.

The proposal substantiation fails to offer any documentation available for public review that would indicate that a GFCI prgram would have prevented death or injury where an effective AEGCP was in place.

The fact that the panel believes GFCI is superior is irrelevant, the "line" can only be properly drawn between "safe" and "unsafe" not between "safe" and "safer."
PANEL ACTION: Reject.
PANEL STATEMENT: The panel rejects the recommendation of the submitter. The panel disagrees with the statement of the submitter that it may only delete the exception if the panel asserts that the assured equipment grounding conductor program (AEGP) is unsafe or ineffective.

The submitter references the panel statement for Proposal 3-135. The panel lists the AEGCP third in a list of ways to achieve enhanced protection against electric shock in response to a proposal on redundant grounding. The submitter should not infer that it is the intent of the panel to confer equal weight to the AEGCP to that of GFCI protection in providing protection to personnel. The panel further states in that panel statement that ground fault circuit-interrupter for personnel (GFCI) protection provides protection even if the equipment grounding conductor is lost in the branch circuit or at the equipment. The AEGCP does not afford this protection. The panel again reaffirms its position that GFCI protection affords a higher level of protection, as stated in the panel statement for this proposal.

In Comment 3-80, the panel changed the last phrase "or having a design that is not compatible with GFCI protection" to make it clear that permission is given to operate equipment on a circuit that is not GFCI protected where the inherent design of the equipment does not allow it to operate properly on a GFCI protected circuit. This equipment is required to comply with Section 305-6(b)(2).
See panel action and statement on Comment 3-80.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
CASPARRO: I feel the panel has remained consistent and steadfast in refusing to expand the use of the AEGCP beyond a narrowing scope of permitted use. Code-Making Panle 3 has yet again in the panel statement for this comment and for Proposal 3-139, as well as over the past several code cycles, reaffirmed its position that GFCI protection affords a higher level of protection and clearly has no desire to expand the use of the AEGCP. The attempt to expand the use of the AEGCP beyond the restrictive industrial establishment exception would have been a major step backward for worker safety.

(Log #1131)

3- 80 - (305-6(a) Exception No. 2): Accept in Principle
SUBMITTER: Paul Dobrowsky, Holley, NY
COMMENT ON PROPOSAL NO: 3-139
RECOMMENDATION: Revise the exception as follows:

Exception No. 2: In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified personnel are involved, an assured equipment grounding conductor program as specified in Section ~~305-6(b)(2)~~ 527.6(B)(2) shall be permitted ~~to be utilized~~ for ~~all~~ only those receptacle outlets used to supply equipment that would create a greater hazard if power was interrupted or will not operate with GFCI protection.

SUBSTANTIATION: Some equipment such as magnetic based portable drills and vacuum based coring machines, that depend on being energized to maintain position, would be a greater hazard if power was interrupted due to a "nuisance" trip. Small 120 volt MIG welders are also commonly used which may not be operable with GFCI protection. These types of equipment are commonly used on industrial construction sites.

The exception may need to be renumbered as (1) depending on the final action on the existing (1999 NEC) Exception No. 1.
PANEL ACTION: Accept in Principle.
Revise the exception as follows:
Exception No. 2: In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified personnel are involved, an assured equipment grounding conductor program as specified in Section 305-6(b)(2) shall be permitted for only those receptacle outlets used to supply equipment that would create a greater hazard if power was interrupted or having a design that is not compatible with GFCI protection.
PANEL STATEMENT: The panel changed the last phrase "or having a design that is not compatible with GFCI protection" to make it clear that permission is given to operate equipment on a circuit that is not GFCI protected where the inherent design of the equipment does not allow it to operate properly on a GFCI protected circuit. This equipment is required to comply with Section 305-6(b)(2).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
CASPARRO: Continued acceptance of this exception is cause for concern. The fact that the panel recognized there was no need for all receptacle outlets to be included in this exception was a step in the right direction, however.

Substantiation was submitted referencing OSHA 29CFR1926.404 as a basis for retaining the AEGCP concept. The regulations pertaining to the AEGCP in the NEC and OSHA standards have significant differences. As an example, 1926.404(b)(1)(iii)(B) states the employer shall designate a "competent person" as defined in 1926.32(f) to implement the AEGCP. The NEC states in 305-6(b)(2) that one or more "designated persons" are to enforce the AEGCP. OSHA defines a "designated person" in 1926.32(d). Additionally, 1926.404(b)(1)(iii)(C) requires any equipment connected by cord and plug to be visually inspected before each

day's use for external defects and for possible internal damage. The NEC has no such requirement. OSHA requiring GFCI certainly has precedent. 29CFR1926.405(a)(2)(ii)(G) tells us 120-volt portable electric lighting used in wet and/or other conductive locations may be used if protected by GFCI, or be operated at 12 volts or less.

There should be no question that the AEGCP is an inferior people protector compared to GFCI. Ventricular fibrillation of adults can begin at around 50-ma. GFCI for personnel is designed to operate at 4 to 6-ma. Assurance an equipment-grounding conductor is in place does not provide anywhere near the same level of personnel protection afforded by GFCI protection for personnel. Perhaps we should question if the OSHA required tests to be performed under the AEGCP at intervals not to exceed 3 months and in some cases up to 6 months are often enough to assure the equipment-grounding conductor is not compromised in the often-hostile construction environment. Panel 3 is on record as recognizing that GFCI is designed to operate even if the equipment-grounding conductor is lost. It should be a matter of great concern to those who feel they have satisfied the restriction of this exception, that they are potentially exposing themselves to a greater shock hazard by using the AEGCP.

Some comments make reference to equipment that may not work with GFCI or could create a greater hazard. Technical substantiation of a greater hazard or of a GFCI incompatible design was not submitted. Therefore, the panel should not have altered the position it developed at the proposal stage to enhance personnel safety. Even if that substantiation was provided, I feel there would still be a need to prove there is no other means feasible for the task to be performed before personnel safety is compromised.

The panel action now includes language concerning a "greater hazard" and "a design that is not compatible". It would seem there are few "greater hazards" than electrocution of personnel. Who is qualified to make the determination as to what is a "greater hazard"? Is it the "qualified personnel as stated in this exception?" The same question needs to be asked of equipment design "not compatible with GFCI protection". Perhaps equipment having a design not compatible with GFCI protection for personnel is not equipment that should be used under construction conditions. We must bear in mind the NEC "contains provisions that are necessary for safety" but "not necessarily" "efficient, or convenient" as stated in 90-1(b). Could not the "exercise of ingenuity" as noted in 500-3 FPN eliminate these incompatible receptacle outlets? It seems likely these same "hazards" would exist if equipment lost power due to overcurrent operation, as those that would exist if the equipment with GFCI protection for personnel operated as intended to protect human life.

In summary, I feel the panel action taken at the comment stage represents an unfortunate compromise. The panel was faced with a difficult task. It had to decide between the decisive panel action it took at the proposal stage eliminating the exception for industrial establishments in an effort to enhance worker safety and the concern expressed by industry for relief. No technical substantiation was provided to support the request for relief, or that there is no alternative. Neither convenience nor economics should take precedence over safety. Increased safety should not be considered an "unnecessary burden" to industry. Elimination of this exception would cause the natural evolution of procedure. It would require users to adopt the "exercise of ingenuity" and for new safer methods to be employed. Recognizing we must develop code that is usable, let us also strive to make it a code we can live with literally as well as figuratively.

On an editorial note, I believe "GFCI protection" as used in the last sentence of this panel action should read "GFCI protection for personnel", to be consistent with language used in 305-6 and elsewhere in the NEC.

3- 83 - (305-6(a) Exception No. 3): Reject
SUBMITTER: Frank Martucci, Fort Lee, NJ
COMMENT ON PROPOSAL NO: 3-140
RECOMMENDATION: Please accept this proposal.
After existing material add:
Exception No. 3: In all industrial establishments, a self monitoring, redundantly grounded, electrocution-proof, shall be permitted for all outlets.
SUBSTANTIATION: For the past thirteen years I have submitted proposals for the 1990, 1993, 1996, 1999, and the forthcoming 2002 National Electrical code that will prevent thousands of electricians and fiery deaths each and every year. Yet, despite my serious admonitions and allegations, code panels continue to reject my proposals sight unseen, without any demonstrations or testing whatsoever.

It boggles my mind that members of code making panels, most with no cord expertise whatsoever, can display such an indifference to human life. What if my system works? Don't they have any fear of being liable for thousands of deaths these past 13 years? Don't they have any fear of being liable for the loss of hundreds of thousands of homes each and every year?

I, for one, would demand extensive tests before I rejected a system that may indeed save thousands of lives each and every year.

My reaction to a single electrocution bordered on the fanatical. I immediately replaced undersized 3 conductor cords with 4 conductor cords to provide two #14, (15 amapacity) grounding conductors for all medical devices.

In addition, costly, and time consuming, outlet modifications were made to provide the redundancy every other federal agency, or responsible engineer, resorts to whenever lives are at stake.

The same redundancy I proposed that, together with a slight component modification, will prevent thousands of electrocutions and fiery deaths each and every year.

The same redundancy code panel members have unanimously rejected, time and again, the past 13 years. They not only reject the concept of redundancy, but they adamantly defend the use of conductors sized up to 50% less than required by our original National Electrical Code.

The original code, written under the influence of insurance companies, distinctly states the equipment grounding conductor shall be no smaller than #14 (15 ampacity) when used on a typical 15 ampere branch circuit.

However, when the NFPA took over the code making process in 1911, they established exceptions to the code whereby a #18 (7 ampacity) conductor is permitted to protect our people form line drop, shock , and electrocution.

This is a clear violation of our electrical code and detrimental to the electrical safety of every, man, woman, and child in our nation.

And it boggles my mind that, during the past 13 years, not a single panel member ever endorsed the use of redundancy. How can code panel members dedicated to electrical and fire safety fight so

vehemently to keep our people protected with a grounding conductor sized less than required by our original electric code?

If code panels see fit to jeopardize the lives of our people with undersized, rarely tested, equipment grounding conductors then at least provide two of them.

And this is what my proposal accomplishes. And to boot, a bonus wiring safeguard that will make our grounding system electrocution-proof and fire-proof.

And it is obvious that only a demonstration will convince the panels that two wire grounding redundancy together with a no-cost modification of existing cord components will indeed make the grounding system electrocution-proof and also fire-proof.

But until such a demonstration ever takes place, let me try again to convince the panel, in as plain English as possible, how little they know about our ill-conceived grounding system.

If the panels took the time to wire a plug each of the six ways it can be wired, they will discover that four of six ways will cause shock, electrocution or fiery death.

When plugged into a properly wired outlet, current will flow through inappropriate steel outlet mounting screws, outlet boxes, and raceways. Massive current from a heater or hotplate will cause overheating and possible undetectable fires inside the walls of dwellings.

And when plugged into an outlet, or extension cord, wired with reversed polarity, the exposed metal parts of appliances will become immediately charged with a full 120 volt potential.

A person holding a drill, for example, will become shocked, or electrocuted, because he, or she, is a poor conductor of electricity and lacks the impedance required to trip circuit breakers or blow fuses.

The wiring safeguard automatically provides the necessary impedance regardless of any wiring error and even though the wall outlet, or female connector of an extension cord, is wired with reversed polarity.

You see, by simply adding a second, redundant, grounding conductor there now exists three grounded conductors, two green and one white. If existing cord components are modified so that only the ground pole can be wired with two conductors, there is absolutely no possible way to wire a plug so as to cause a shock, electrocution or undetectable fires inside walls.

And the system is indeed a self-monitoring system unlike the existing system whereby four of six ways to wire existing cord components will electrocute or cause fiery deaths.

No costly assured grounding programs are required to assure proper wiring. Should miswiring cause a device to become energized, the second grounding conductor will automatically provide the necessary impedance required to activate branch circuit ground fault interrupters, converting them into GFCIs.

It is morally wrong for code panels to evaluate and reject proposals without any thorough demonstrations to prove the submitter's proposal is flawed.

How much easier it is to make live demonstrations. I could first demonstrate how I can make existing cord components electrocution-proof and fire-proof by simply drilling a hole or removing, or adding a tiny piece of metal.

And also make thorough demonstrations, with mock up outlets, exactly how the second ground conductor will prevent electrocutions, and fires inside walls, due to miswired cords.

I urge the panels to seek a demonstration before they reject my proposal.

PANEL ACTION: Reject.

ARTICLE 310 — CONDUCTORS FOR GENERAL WIRING

(Log #1630)

6- 4 - (Table 310-1): Accept
SUBMITTER: James M. Daly, BICC General
COMMENT ON PROPOSAL NO: 6-6
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: Relocating Table B-310-1 to Table 310-21 introduces a conflict in the Code as noted in the Technical Correlating Committee Comment since two tables now specify different amapcities for the same three conductor cable. The following table comparing the ampacities in Tables 310-21 and 310-16 for a three conductor cable with 90°C conductors. In all but one instance, Table 310-21 has slightly lower ampacities than Table 310-16. For the small difference in values, it does not support adding another ampacity table into Chapter 3.

Allowable Ampacities of Insulated Conductors Rated 0 through 2000 Volts, 90°C Not More than Three Current-Carrying Conductors in a Cable

Conductor (AWG/kcmil)	Table 310-21 30°C	Table 310-16 30°C
18		14
16		18
14*	21	25
12*	27	30
10*	36	40
8	48	55
6	65	75
4	89	95
3	102	110
2	119	130
1	137	150
1/0	163	170
2/0	186	195
3/0	214	225
4/0	253	260
250	276	290
300	317	320
350	345	350
400	371	380
500	427	430
600	468	475
700	514	520
750	529	535
800	543	555
900	570	585
1000	617	615
1250		665
1500		705
1750		735
2000		750

Table 310-16 already defines the ampacity of not more than three current-carrying conductors in a cable and includes sizes up to 2000 kcmil.

Table 310-21 limits the number of conductors to "two or three insulated conductors." If the equipment grounding conductor is insulated, then only two insulated current-carrying conductors would be permitted in the cable without derating. Table 310-21 also does not include conductors larger than 1000 kcmil.
PANEL ACTION: Accept.
PANEL STATEMENT: See panel action and submitter's substantiation on Comment 6-36.

(Log #409)

6- 6 - (310-4 Exception No. 4): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 6-8
RECOMMENDATION: Accept in Part as follows:
Exception No. 4: Under engineering supervision, grounded neutral conductors ~~in sizes No. 2 and larger~~ shall be permitted to be run in parallel ~~for~~ with and existing ~~installation~~ 2 AWG or 1 AWG neutral conductor of a three-phase 4-wire wye-connected circuit where overheating of the existing neutral occurs due to high content of triplen currents.
Delete FPN.
SUBSTANTIATION: The present wording is broader and more permissive than what was apparently intended. The exception should apply to No. 2 and No. 1 conductors as "and larger" includes size 1/0 and larger conductors which may be paralleled by right of 310-4 without engineering supervision. Present wording permits paralleling of No. 2 and No. 1 grounded neutral of any existing installation, whether the circuit is single-phase or direct-current. It is my impression this exception was intended to relieve neutral circuit conductors in the 100 to 125 ampacity range where overloading had occured due to high harmonic currents. The FPN may explain the intended purpose but there is no mandatory requirement that limits the exception to this purpose.
PANEL ACTION: Reject.
PANEL STATEMENT: Present text of Section 310.4 Exception No. 4 is adequate. Since the Code limits the size of conductors to 1/0 AWG and larger for parallel runs, this exception was added to permit paralleling of conductors smaller than 1/0 AWG. This exception is applicable for existing installations where such change is essential and is performed under engineering supervision and the size of the neutral conductor is not smaller than 2 AWG.

(Log #1868)

6- 8 - (310-8(d)): Reject
SUBMITTER: Timothy M. Croushore, Allegheny Power
COMMENT ON PROPOSAL NO: 6-17, 6-19 & 6-21
RECOMMENDATION: Code Making Panel 6 should accept Proposal 6-21.
SUBSTANTIATION: I agree with the substantiation of Mr. Cook, Mr. Cox and Mr. Schwan. I also agree with the explanation of negative statement of Mr. Burns. Conductors exposed at the weatherhead in the past have not been listed as sunlight resistant. Requiring the conductors be listed for sunlight resistance is a solution for a non-existent problem. Allegheny Power serves approximately 1.5 million customers in Pennsylvania, Virginia, West Virginia, Maryland and Ohio. Many of these customers have overhead electrical service. If this was truly a problem, we would see short circuits at the weatherhead and would be failing pole top transformers at a significant rate. Non-sunlight resistant wire at the weatherhead has not been a problem in the field.
PANEL ACTION: Reject.
PANEL STATEMENT: Sunlight deterioration is not a function of exposed cable length. The panel action ensures that the products exposed to sunlight meet the requirement for sunlight resistance.

(Log #726)

6- 10 - (310-8(d), Exception (New)): Reject
SUBMITTER: W. Creighton Schwan, Hayward, CA
COMMENT ON PROPOSAL NO: 6-22
RECOMMENDATION: Reconsider, and Accept this proposal.
SUBSTANTIATION: The millions of service drip loops installed over many decades with no failures attributed to the lack of sunlight resistance of the conductor insulation is evidence that this proposed exception is necessary.
A careful reading of the supporting comment strongly supports the need for this exception.
The fact that drip loops are well separated from each other, leave the service head in separate openings, are limited in length, and are in open air more than offsets the need for sunlight resistant insulation.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Comment 6-8. Supporting comment referenced in the substantiation supports the need for requirement for sunlight resistance in the Code to ensure that the products exposed to sunlight meet the requirement for sunlight resistance. It does not support the need for an exception as inferred by the submitter.

6- 13 - (310-13 Table 310-61): Accept in Principle

Note: The Technical Correlating Committee notes that Article 600 is under the purview of Code-Making Panel 18. The Technical Correlating Committee accepts the panel action of Code-Making Panel 6 to revise 600-32. This material will be under the jurisdiction of Code-Making Panel 18 after completion of the 2002 code cycle.

SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)

COMMENT ON PROPOSAL NO: 6-40

RECOMMENDATION: The Panel should accept the original proposal in Principal in Part. Create a new table as shown and place in Article 600.

(table shown below)

SUBSTANTIATION: GTO cable is being used by electricians today as evidenced by no less than three articles in the Jan/Feb 2000 IAEI News. GTO cables are listed in the 1998 CEC Table D1 and are also described in the UL Greenbook in section ZTQX.

PANEL ACTION: Accept in Principle.

Revise 600-32(b) as follows:

(b) Insulation and Size. Conductors shall be insulated, listed as Gas Tube Sign and Ignition Cable, Type GTO, for the purpose, rated for 5, 10 or 15 kV, in sizes the voltage, not smaller than No. 18 AWG, and have a minimum temperature rating of 105ºC (221ºF).

PANEL STATEMENT: This material is not suitable for general wiring. The panel agrees with the submitter that this material is more appropriate in Article 600. CMP-6 provided these revisions to meet the intent of the submitter and requests that the TCC review this action and forward this material to CMP-18.

UL Directory states that: "Gas tube sign and ignition cable is Listed as single conductor Type GTO-5 (5,000 volts), GTO-10 (10,000), or GTO-15 (15,000 volts), in sizes Nos. 18-10 AWG copper, and Nos. 12-10 AWG aluminum and copper-clad aluminum. This material is intended for use with gas tube signs, oil burners, and inside lighting."

Conductor Application and Insulation

Trade Name	Type Letter	AWG	Maximum Operating Temperature	Application Provision	Insulation	Outer Covering
Gas Tube And Ignition Cable	GTO[1]	18-10	105ºC[2]	Dry or wet Locations Rated 5, 10, or 15kV	Thermoplastic Or Thermoset	Jacket[3]

[1]Type GTO cable shall be restricted to a maximum ampacity of 300 milliamperes where installed for the secondary circuit conductors as required by Section 600-23(d).

[2]Higher temperature ratings are available when insulations with requisite properties are used.

[3]Some insulations do not require and outer jacket.

(Log #1541)

6- 15 - (310-13, Table 310-61): Reject
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 6-40
RECOMMENDATION: The panel should reconsider the intent and merit of this proposal. Although the location and code section may not appear to be appropriate for the proposed revision, the submitter does raise an excellent, and important point that leads to other issues that should be addressed in the NEC.
Original proposal: Add an additional type of conductor to this Table 310-61. Remainder of this section to remain as now shown in this table.
SUBSTANTIATION: Original Substantiation: Article 600 refers to a GTO Type of cable that has no reference in Article 310 and no one really knows what this conductor is.
Substantiation: This type conductor which is a high voltage application cable is and has been used by the sign industry for many years. This conductor is and has been listed by NRTLs for many years under UL Standard 814. The code has never defined Type GTO cable in Article 310 leaving confusion within the inspection community.
Comment: GTO cable is referred to by Article 600 as both a cable such as in Section 600-32(e) and (j) and as a conductor in other sections such as Section 600-32(a) through (h). This is an inconsistency that should be addressed by either Panel 6 or Panel 18 or both. This GTO cable is used as a conductor in Article 600 and is required to be installed in a wiring method as specified in Chapter 3 just as other conductors and cables covered by Chapter 3 of the code. The panels should consider inclusion of this type of conductor in Table 310-13 and the inclusion of all its properties and permitted uses as indicated for the other types of conductors listed in Table 310-13. I agree with the panel's comment about not including the GTO conductor or cable in Table 310-61, but I don't agree totally with the rejection of the proposal completely. There are serious issues with GTO conductors and cables that should be addressed, both in Standard 814 and the NEC. For example, the Code requires that conductors and cables installed in wet locations be of a type marked with a "W" or be listed for use in wet locations [(310-8(c)]. GTO conductors or cables are not even listed as suitable for wet locations, yet they are continuously and regularly used in wet locations outdoors in neon and cold-cathode high voltage secondary circuits. There are many fires that are linked to secondary circuits of neon signs or neon outline lighting systems. Perhaps this issue should be addressed and looked at from the standpoint that maybe GTO conductors or cables that carry high voltage are contributing to this problem. This may not be able to be addressed by Panel 6 in this cycle, but should be referred to Panel 18 or held for further study and appropriate action taken to investigate the standard for these conductors and cables and how the code requires them to be used. That use should be within the limitations of the standard and the code. Recommend supporting the intent of the proposal to include type GTO cable in Article 310 or other appropriate code article. Type GTO cable is mentioned as a conductor type in Article 600; however, there is no reference to this cable type in Articles 310, 400, 402 or 600. This oversight should be corrected.
PANEL ACTION: Reject.

6- 16 - (310-15(a)): Reject
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 6-49
RECOMMENDATION: The Panel should Accept this proposal as submitted.
SUBSTANTIATION: This is an attempt to make the NEC more "user friendly". Providing cross-reference tables will add to the usability of the NEC. The cross reference tables do not add to the usability of the individual tables but do add to the usability of the numerous tables contained in the Article. The number of Ampacity tables included in the mandatory portion of the NEC has increased and so has the probability of error. The goal of the Code-Making Panels should be to reduce the probability of error in using the NEC. Assisting users in selecting the correct table helps assure a correct installation.
PANEL ACTION: Reject.
PANEL STATEMENT: No new technical substantiation to support the recommendation has been provided. The titles of the ampacity tables are self-explanatory.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 1
NOT RETURNED: 1 Ferrell
EXPLANATION OF NEGATIVE:
PETTIGREW: The panel should accept this comment. The cross-reference table(s) would assist the code user in locating the correct ampacity table for their application. They would provide a convenient reference in one place for all listed applications, steering the code user directly to the correct ampacity table and reducing the probability of selecting the incorrect table in error. Aiding code users in selecting the correct table helps to assure a safe and correct installation. Providing the cross-reference table(s) will also add to the usability of the NEC. The number of ampacity tables included in the mandatory portion of the NEC has increased, resulting in a greater probability of error by the user in the field. Adding the cross-reference table(s) will reduce the margin of error in using the NEC.

6- 18 - (310-15(a)): Reject
SUBMITTER: Robert H. Keis, Dover, DE
COMMENT ON PROPOSAL NO: 6-51
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: This proposal should be accepted provided the test data has been submitted and is true. Having wired many, many houses I cannot think of any situation where bundled cables would be subjected to any thing near the rating of the cables when in dwelling use. The loads simply are not there. If the tests were to run using 12.5 amp per cable as stated, this would be greatly exaggerated load for dwellings. There is simply no way that these loads would ever be applied in a dwelling. There is too much diversity.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel can only act on data submitted with the recommendation. No data was submitted with either the proposal or the comment.

6- 24 - (310-15(b)(2)a Exception No. 5 (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 6-71
RECOMMENDATION: Accept proposal, or Accept in Principle revised as follows:

Exception No. 5: Where multiple sets of conductors of the same circuit are installed in the same portion of a raceway covered by Articles 354, 356, or 358, and each set of conductors is terminated at only one outlet, the total number of such conductors shall be permitted to be counted as that number of current-carrying conductors that comprise one set of conductors, for de-rating purposes.

SUBSTANTIATION: The intent of the proposal and the comment is to mitigate the draconian reduction in allowable ampacity which results where a succession of outlets in a run of raceways covered by Articles 354, 356, or 358 are individually fed from a header or trench duct or junction box by an individual set of conductors terminating at only one outlet but connected to the same circuitry.

For example, consider an underfloor raceway with twelve receptacle outlets at intervals along the raceway, each outlet individually fed by a set (two) of conductors and all sets connected to the same 20-ampere circuit. The total number of conductors is twenty-four which requires an allowable ampacity reduction to 45 percent of the conductor ampacity. If 75 degree C. copper conductors are used, a minimum No. 8 supply conductors to the receptacles is required, even if the computed load for each receptacle is a minimum 180 volt-amperes (1.5 amperes). The application of this section to such installations results in:

(1) An unrealistic reduction in the allowable current for such conductors; (2) the oversize conductors diminish the available 40% fill area of the raceway; (3) an unrealistic reduction of allowable ampacity of all other conductors in the same portion of the raceway; (4) inefficient use of resources (conductors); (5) economic incentives to install such outlets in a "daisy chain" configuration, loop-wired and fed by a single set of conductors.

Where such outlets are loop-wired in a "daisy chain" configuration and the first supplied outlet is removed, there is a greater likelihood the conductors will be reinsulated and not removed, rather than resupply the next downstream outlet with a new set of conductors. This violation of Code is difficult to prevent or detect since generally no inspection is required for removal of wiring.

The total voltage drop and heat generated in multiple sets of conductors as indicated in the example would be less than that occurring where a single set of conductors supplies multiple outlets.

PANEL ACTION: Reject.

PANEL STATEMENT: There is no assurance in the recommendation or in the substantiation that either one or more receptacles will be limited to 1.5 amperes or only one receptacle will operate at any given time. Code requirements are to ensure safe installation and not necessarily for less or more expensive installations. Typically, a fact-finding report is provided to amend such requirements. Further, the Code does not prohibit the proposed recommendation, whereby separate conductors feed each outlet when other applicable requirements are met.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ferrell

(Log #428)

6- 25 - (310-15(b)(3)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

COMMENT ON PROPOSAL NO: 6-76

RECOMMENDATION: Accept in principle revised:

"(3) Where bare or <u>covered</u> circuit conductors are used in close proximity with insulated conductors ~~their allowable ampacity shall be limited to those permitted for the adjacent insulators~~ <u>they shall be considered to have insulation equal to the lowest insulation temperature rating of the adjacent insulated conductors for the purpose of determining their allowable ampacity.</u>

<u>Exception: Uninsulated conductors of Type SE cable shall be considered to have the same ampacity of the insulated conductors."</u>

SUBSTANTIATION: Present text appears to allow bare conductors to have an ampacity equal to but not to exceed the allowable ampacity of the insulated conductors regardless of the size or material of the bare conductors. Code tables do not indicate ampacities of bare conductors in raceways or cables. The proposal specifies "lowest" insulation temperature rating since circuit conductors may have different insulation ratings. If a bare grounded neutral conductor is twice the size of the ungrounded insulated phase conductors to compensate for high harmonic currents, the present text limits the ampacity to that of the phase conductors.

PANEL ACTION: Reject.

PANEL STATEMENT: No new technical substantiation to change the requirement was provided. Further, Section 310-15(b)(3) correlates with Section 310-15(b)(4). Typically, an insulated grounded conductor would be used for applications that require a larger size grounded conductor to compensate for high harmonic currents.

(Log #280)

6- 26 - (310-15(b)(4)(a)): Reject

SUBMITTER: James A. Popma, Engineering Design Assoc., Inc. (F.D.A. Inc.

COMMENT ON PROPOSAL NO: 6-77

RECOMMENDATION: Revise as follows:

(a) A <u>common</u> neutral conductor that carries only the unbalanced current from other conductors of the same <u>multi-wire</u> circuit shall not be required to be counted when applying the provisions of section 310-15(b)(2)(a).

SUBSTANTIATION: I know of contractors who are using this paragraph as an exception for not counting the neutrals of 120V, 2-wire circuits (when derating because of multiple conductors in the same raceway).

Example: Multiple lighting circuits in the same raceway, because dimming is required each circuit needs a separate neutral. The contractor is only counting the phase conductors as current carrying conductors when using Table 310-15(b)(2)(a). I think the above change would help clarify their misunderstanding.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed wording does not add any clarification to the existing requirement. The example given in the substantiation does not comply with the Code.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

(Log #427)

6- 27 - (310-15(b)(6)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

COMMENT ON PROPOSAL NO: 6-81

RECOMMENDATION: Accept in principle revised:

"For application of this section the main power feeder(s) shall be the feeder(s) between the ~~main disconnect~~ <u>service disconnecting means</u> and the lighting and appliance branch-circuit panelboard(s), and the feeder conductors shall not be required to ~~be larger~~ <u>have and ampere rating greater</u> than the service-entrance conductors."

SUBSTANTIATION: "Main disconnect" (singular) infers there is only one service switch or breaker. Service disconnecting means may consist of up to six devices. The table indicates an aluminum main power feeder size 4/0 is rated for 200 amperes. If the service-entrance conductor is copper, it may be rated for 200 amperes and be 2/0. The feeder would be larger. Ampere rating should be specified in lieu of "larger" which relates to size of the conductor.

PANEL ACTION: Reject.

PANEL STATEMENT: Present wording does not lead to the interpretation included in the substantiation provided by the submitter. "Larger than" means that a comparison of equals is made. If service-entrance is 4/0 AWG than the feeder is not required to be larger than 4/0 AWG (of same conductor material). Alternatively, if service-entrance is 2/0 AWG copper than the feeder is not required to be larger than 2/0 AWG copper (or the electrical equivalent 4/0 AWG aluminum).

(Log #1555)

6- 29 - (310-15(b)(7)): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
COMMENT ON PROPOSAL NO: 6-89
RECOMMENDATION: Continue to accept Proposal as Accept in Principle in Part and revise 310.15(B)(7) shown in ROP Draft as shown below:
"(7) Mineral-Insulated, Metal-Sheathed Cable. The temperature limitations on which the ampacities of mineral-insulated, metal-sheathed cable are based shall be determined by the insulating materials used in the end seal fitting. The conductor temperature at the termination shall not exceed the listed temperature rating of the end seal fitting and the installation shall comply with temperature ratings of termination and equipment. When mineral insulated cable is bundled in accordance with ~~330.16~~330.10(11), ampacities from applicable ampacity tables ~~can be used in accordance with 110.14 provided the temperature limit of the cable's end seal fitting is not exceeded~~ are permitted to be used, provided the temperature limit of the cable's end seal fitting is not exceeded and the installation is in compliance with temperature ratings of termination and equipment."
SUBSTANTIATION: See my comment submitted with affirmative vote on this proposal.
To correlate with actions taken by CMP 7 to develop 330.40(B) and 330.80. Proposed revision of 330.80 (shown in ROP Draft) submitted to CMP 7 on Proposal 7-88 is as follows:
330.80 Ampacity.
(A) General. The ampacity of Type MI cable shall be determined in accordance with 310.15. The conductor temperature at the end seal fitting shall not exceed the ~~listed~~ temperature rating of the listed end seal fitting and the installation shall comply with temperature ratings of termination and equipment.
(B) Type MI Cable Installed in Cable Tray. The ampacities for Type MI cable installed in cable tray shall be determined in accordance with 318.11 and the installation shall comply with temperature ratings of termination and equipment.
(C) Single Type MI Conductors Grouped Together. Where single Type MI conductors are grouped together in a triangular or square configuration, as required by ~~330.16~~330.10(11), and installed on a messenger or as open runs with a maintained free air space of not less than 2.15 times one conductor diameter (2.15 x O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall not exceed the allowable ampacities of Table 310.17 and the installation shall comply with temperature ratings of termination and equipment.
~~The conductor temperature at the end seal fitting shall not exceed the listed temperature rating of the end seal fitting.~~
Via this comment, CMP 6 is requested to revise 310.15(B)(7) to clarify the use of ampacity values for MI Cable while supporting enforcement of other applicable requirements (i.e. temperature limitation) for installation.
Notes for this comment:
(1) Acceptance of this comment will facilitate acceptance of a separate comment, on Proposal 7-88 to revise 330.80 (as shown above), by CMP 7.
(2) Acceptance of this comment supports correlation between actions taken on Proposals 6-88, 89, 90, 91, 92, 93, 94, 106, and 113; and 7-82, 83, 86 and 88.
(3) Request that this comment be forwarded to CMP 1 and CMP 7 for their information.
Alternatively, since CMP 6 has the responsibility for ampacity, CMP 6 may consider revising 310.15(B)(7) as follows:
310.15(B)(7). Ampacity and Temperature Limitations. Ampacity values allowed in Table 310.16 are used to determine temperature ratings of termination and equipment as identified in 110.14(C). Unless permitted specifically in the Code, use of all other values of ampacity greater than those allowed in Table 310-16 and determined in accordance with 310.15(B) or 310.15(C) shall be identified and the installation shall comply with temperature ratings of termination and equipment.
Since this is new text and other correlated changes may be necessary, CMP 6 is requested to send this suggestion (with or without making a judgement at the present time) to the Usability Task Group.
PANEL ACTION: Reject.
Delete 310-15(b)(7).

GANATRA: See my Comment on Affirmative on Comment 6-30.

(Log #1776)

6- 30 - (310-15(b)(7)): Reject
SUBMITTER: Jim Pauley, Square D Company
COMMENT ON PROPOSAL NO: 6-91
RECOMMENDATION: Revise the wording from the ROP as follows:
The conductor temperature at the end seal termination shall not exceed the listed temperature rating of the end seal fitting. When mineral insulated cable is bundled in accordance with 330-16, ampacities from applicable ampacity tables ~~can~~ shall be permitted to be used. At the termination to equipment, the ampacity of the MI cable shall be based on requirements specified in 110-14(C). ~~in accordance with 110-14 provided the temperature limit of the cable's end seal fitting is not exceeded.~~
SUBSTANTIATION: The wording as accepted by the panel can easily be misinterpreted to allow MI cable to have increased ampacities at equipment terminations. The confusions comes from the use of the word "termination" in the first sentence. To address that issue, the words "end seal" have been added to make it clear that it is the termination to the end seal that is being discussed and not the termination to the equipment.
The third sentence of the proposal language introduces further confusion. MI cable cannot be used to meet 110-14 at equipment terminations if the ampacities are based on other those found in 310-16. The language from the panel implies that you can use Tables 310-17 and 310-18 for the ampacity and still be in compliance with 110-14. This is not true. CMP 1 accepted proposal 1-227 to clearly address the issue about which table can be used when selecting ampacity of conductors at the termination. The language included with this comment is to make it clear that when you get to the equipment termination, the rules set forth in

110-14(C) must be followed. This will limit selection to the proper table for the equipment termination.
Leaving the section as worded in the ROP introduces what can be interpreted as a direct conflict with 110-14(C).
PANEL ACTION: Reject.
Delete 310-15(b)(7).
PANEL STATEMENT: Code-Making Panel 6 has reviewed panel action on Proposal 7-88 and agrees with the action taken by Code-Making Panel 7. Panel action by CMP-7 negates the need for 310-15(b)(7). The rejection by CMP-6 of this comment and panel action on Proposal 6-90 will result in deletion of Section 310-15(b)(7).
The action is consistent with the action taken on Proposal 6-90.

COMMENT ON AFFIRMATIVE:
GANATRA: Panel Action refers to Comment 7-88. Reference should be to Proposal 7-88. Although we agree with the intent of the panel action that 310-15(B)(7) can be deleted from its present location. However, Panel 7's action on Proposal 7-88 should include reference to 110-14 to provide a complete assurance that temperature of MI Cable will not exceed its rating of 90 degrees C. Panel 6 should insist on such clarification.
Panel 6 should review the following comment with negative vote on Comment 7-15 (on Proposal 7-88).

(Log #926)

6- 31 - (310-15(c)): Reject
SUBMITTER: John E. Conley, Stratford, CT
COMMENT ON PROPOSAL NO: 6-92
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: These comments apply, individually, and collectively, to the following proposed actions published in the ROP for the 2002 NEC.
1-101 (100-Ampacity)
6-92 (310-15(c))
6-120 (310-60(d))
6-126 (Table 310-67)
6-127 (Table 310-68)
6-128 (Table 310-69)
6-129 (Table 310-70)
6-130 (Table 310-71)
6-131 (Table 310-72)
6-132 (Table 310-73)
6-133 (Table 310-74)
6-134 (Table 310-75)
6-135 (Table 310-76)
6-136 (Table 310-77)
6-137 (Table 310-78)
6-138 (Table 310-79)
6-139 (Table 310-80)
6-140 (Table 310-81)
6-141 (Table 310-82)
6-142 (Table 310-83)
6-143 (Table 310-84)
6-144 (Table 310-85)
6-145 (Table 310-86)
6-223 (B-310-15(b)(1))
6-226 (Table B-310-1)
6-228 (B-310-15(b)(2))
6-231 (Table B-310-3)
6-232 (Table B-310-5)
6-233 (Table B-310-6)
6-234 (Table B-310-7)
6-235 (Table B-310-8)
6-236 (Table B-310-9)
6-237 (Table B-310-10)
All of these proposals should be accepted.
Individual panel comments seem to fall into three major categories: (1) 'Scientific ampacity' does not appear in the NEC; (2) The present definition is entirely satisfactory; (3) All NEC ampacities are scientific
My comments:
(1) These proposals were inspired by the panel's rejection, three years ago, for this very reason. Proposal 1-101 deals with the definition; the others deal with introducing the term into the text where appropriate.
(2) The present definition is great; very carefully crafted. It is not wrong, but it is inadequate. It applies only for those ampacities based strictly on thermal considerations, such as those in the tables listed above. Other ampacities are based on a multiplicity of factors (see section 310-15(b) FPN) beyond the scope of the existing definition. An objective observer would certainly conclude that the present definition is not entirely satisfactory.
(3) This is a very interesting observation. It can be reasonably stated that everything in the Code is scientific, but that obscures the point that a tremendous amount of judgment often modifies pure science. That is as it should be. In this case, what I have called scientific ampacities are pure science. They are calculated using only recognized scientific principles; nothing judgmental. They spring from the field of technology and computers. Other ampacities come from the field of wisdom, and cannot be calculated scientifically.
PANEL ACTION: Reject.
PANEL STATEMENT: Replacing the word "conductor" with "scientific" would make the text inconsistent with the rest of the section that addresses the ampacity of conductors.
See panel statement on Comment 6-43.

(Log #2108)

6- 32 - (310-15(c)): Reject
SUBMITTER: Truman C. Surbrook, Michigan State University
COMMENT ON PROPOSAL NO: 6-94
RECOMMENDATION: Change Reject to Accept.
SUBSTANTIATION: If this section makes reference to the calculations of conductor ampacity in Appendix B, then it should also permit the tables in the Appendix to be used. The section uses the phrase "shall be permitted," therefore, this is not a requirement.
PANEL ACTION: Reject.
PANEL STATEMENT: No new technical substantiation provided. The recommendation would use non-mandatory text from the appendix as mandatory requirements. Tables provided in Appendix B provide examples of the formula provided in Section 310-15(c) under specific conditions. Formula provided in Section 310-15(c) is used under engineering supervision for given applications.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ferrell

(Log #69)

6- 33 - (Table 310-20): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 6-113
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 7-88. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
PANEL STATEMENT: There is no correlation issue between the panel action on Proposal 7-88 as modified by Comment 7-13 and the panel action on Proposal 6-113.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ferrell

(Log #1709)

6- 34 - (Table 310-20): Accept in Principle
SUBMITTER: Jeff Palovich, Flint, MI
COMMENT ON PROPOSAL NO: 6-112
RECOMMENDATION: Change "accept in principle" to accept.

SUBSTANTIATION: The original proposal clearly includes duplex, triplex, and quadruplex. The panel's action appears to be ruling out quadruplex by referring to only three current carrying conductors. A three phase four wire feeder has four current carrying conductors.
PANEL ACTION: Accept in Principle.
Revise the title of Table 310-20 to read:
Table 310-20. Ampacities of not more than Three Single- Insulated Conductors, Rated 0 Through 2000 Volts, Supported on a Messenger, Based on Ambient Air Temperature of 40oC (104oF).
PANEL STATEMENT: Title was revised to provide ampacities for duplex, triplex and quadraplex. Where the messenger is a current-carrying conductor and acting as a neutral, the insulated conductors need not be derated per 310-15(b)(4)(a).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10

(Log #2036)

6- 35 - (Table 310-20): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 6-113
RECOMMENDATION: In addition to the panel action accepting the proposal, and in order to correlate with the result of Code-Making Panel 7 action on Proposal 7-88, add an asterisk note to the MI designation as follows:
"Multiconductor cable; for single conductor cable, see 330.80." Then add "MI**" to the 90°C copper column of Table 310.17 with the following note: "**Single conductors as allowed in 330.80. For multiconductor cable see Table 310.16 or Table 310.20 where run on a messenger."
SUBSTANTIATION: This provides the necessary correlation to address the Technical Correlating Committee note.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 6-33.

(Log #1554)

6- 36 - (Table 310-21): Accept
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
COMMENT ON PROPOSAL NO: 6-6
RECOMMENDATION: Reject this proposal.
Note: Panel action was to renumber existing Table 310-21 to 310-23 and relocate Table B-310-1 as Table 310.21. Also, Panel Action on Proposal 6-115 was to relocate Table B-310-3 as Table 310.22. A separate comment has been submitted to reject that Panel Action also. If both comments are accepted then Tables B-310-1 and B-310-3 will remain in Appendix B and will be numbered as B.310.1 and B.310.3, respectively. Existing Table 310-21 will remain as is and will be numbered as Table 310.21.
SUBSTANTIATION: Table B-310-1 should be used where ampacity is calculated under engineering supervision as stated in Appendix B. Where cables are installed in raceways and ampacities are not determined under engineering supervision, Table 310-16 provides allowable ampacities.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

(Log #70)

6- 37 - (Table 310-22): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 6-115
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with Table 310-16. This proposal will be refered to Code Making Panel 7 for information. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
PANEL STATEMENT: See panel action on Comment 6-38.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ferrell

(Log #1556)

6- 38 - (Table 310-22): Accept
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
COMMENT ON PROPOSAL NO: 6-115
RECOMMENDATION: Reject this proposal.
Note: Panel action was to renumber existing Table 310-21 to 310-23 and relocate Table B-310-3 as Table 310.22. Also, Panel Action on Proposal 6-6 was to relocate Table B-310-1 as Table 310.21. A separate comment has been submitted to reject that Panel Action also. If both comments are accepted then Tables B-310-1 and B-310-3 will remain in Appendix B and will be numbered as B.310.1 and B.310.3, respectively. Existing Table 310-21 will remain as is and will be numbered as Table 310.21.
SUBSTANTIATION: Table B-310-3 should be used where ampacity is calculated under engineering supervision as stated in Appendix B. Use of this table will create a conflict with Table 310-16 as the values provided in Table 310-16 are used (without engineering supervision) for conductors in multiconductor cables in ambient air at 30 degree C. If needed, adjustment can be made for ambient temperature of 40 degree C.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10

(Log #1629)

6- 39 - (Table 310-22): Accept
SUBMITTER: James M. Daly, BICC General
COMMENT ON PROPOSAL NO: 6-115
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: Addition of Table 310-22 introduces a conflict in the Code as noted in the Technical Correlating Committee Comment since two tables now specify different ampacities for the same three conductor cable in air. See the table comparing the ampacities for a three conductor cable with 90°C conductors in air when Table 310-22 is corrected to 30°C. Table 310-22 permits significantly higher ampacities than those allowed by Table 310-16.

Allowable Ampacities of Insulated Conductors Rated 0 through 2000 Volts, 90°C Not More than Three Current-Carrying Conductors in a Cable

Conductors	Table 310-22		Table 310-16
(AWG/kcmil)	40°C	30°C	
18	11*	12	14
16	16*	18	18
14*	25*	28	25
12*	32*	35	30
10*	43*	47	40
8	59	65	55
6	79	87	75
4	104	114	95
3	121	133	110
2	138	152	130
1	161	177	150
1/0	186	205	170
2/0	215	237	195
3/0	249	274	225
4/0	287	316	260
250	320	352	290
300	357	393	320
350	394	433	350

400	425	468	380
500	487	536	430
600	538	592	475
700	589	648	520
750	615	677	535
800	633	696	555
900	670	737	585
1000	707	778	665
1250			665
1500			705
1750			735
2000			750

Table 310-6 already defines the ampacity of not more than three current-carrying conductors in a cable and includes sizes up to 2000 kcmil.

Table 310-22 limits the number of conductors to "not more than three insulated conductors." If the equipment grounding conductor is insulated, then only two insulated current-carrying conductors would be permitted in the cable without derating. Table 310-22 also does not include conductors larger than 1000 kcmil.

Table 310-22 is based on an ambient temperature of 40°C while Tables 310-16 and 310-17 are based on 30°C. If another Table is to be added into 310, the parameters should be consistent with the existing Tables.

Table 310-22 is not as conservative as Tables 310-16 and 310-17. If Table 310-22 is added, then Tables 310-16 and 310-17 should be completely revised to be consistent with Table 310-22.

PANEL ACTION: Accept.

6- 40 - (Table 310-22): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 6-115
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: For the specified cable types in Table B-310-3 (including UF, MC, etc.) this action results in two conflicting ampacities for similar conductors, which will create chaos. For example compare the ampacity of No. 6 Type MC cable. In Table 310.16 at 75°C, its ampacity is 65A. The new table makes the same cable 77A, figured at the same temperature limitation (after correcting or the ambient temperature differences between the tables, which will be its own source of endless discussion.) Will the real MC cable ampacity please take a bow? The difference for this common wire size is a full standard overcurrent device.

When this table was created in the 80s, it was in the context of removing these types from Table 310-16, which internally correlated but raised hob with established trade practice. Now it may also conflict with international harmonization efforts. This table should stay put. If it does move, note that it contains MI cable, which will need its own asterisk note comparable to the one suggested for Proposal 6-113.

PANEL ACTION: Accept.
PANEL STATEMENT: See panel action and submitter's substantiation on Comment 6-38.

(Log #1375)

6- 41 - (310-60(c)): Reject
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 6-118
RECOMMENDATION: The Panel should Accept this proposal as submitted.
SUBSTANTIATION: This is an attempt to make the NEC more "user friendly". Providing cross-reference tables will add to the usability of the NEC. The cross reference tables do not add to the usability of the individual tables but do add to the usability of the numerous tables contained in this Article. The number of Ampacity tables included in the mandatory portion of the NEC has increased and so has the probability of error. The goal of the Code-Making Panels should be to reduce the probability of error in using the NEC. Assisting users in selecting the correct table helps assure a correct installation.
PANEL ACTION: Reject.
PANEL STATEMENT: No new technical substantiation to support the recommendation has been provided. The titles of the ampacity tables are self-explanatory.

6-141 (Table 310-82)
6-142 (Table 310-83)
6-143 (Table 310-84)
6-144 (Table 310-85)
6-145 (Table 310-86)
6-223 (B-310-15(b)(1))
6-226 (Table B-310-1)
6-228 (B-310-15(b)(2))
6-231 (Table B-310-3)
6-232 (Table B-310-5)
6-233 (Table B-310-6)
6-234 (Table B-310-7)
6-235 (Table B-310-8)
6-236 (Table B-310-9)
6-237 (Table B-310-10)

All of these proposals should be accepted.

Individual panel comments seem to fall into three major categories: (1) 'Scientific ampacity' does not appear in the NEC; (2) The present definition is entirely satisfactory; (3) All NEC ampacities are scientific

My comments:

(1) These proposals were inspired by the panel's rejection, three years ago, for this very reason. Proposal 1-101 deals with the definition; the others deal with introducing the term into the text where appropriate.

(2) The present definition is great; very carefully crafted. It is not wrong, but it is inadequate. It applies only for those ampacities based strictly on thermal considerations, such as those in the tables listed above. Other ampacities are based on a multiplicity of factors (see section 310-15(b) FPN) beyond the scope of the existing definition. An objective observer would certainly conclude that the present definition is not entirely satisfactory.

(3) This is a very interesting observation. It can be reasonably stated that everything in the Code is scientific, but that obscures the point that a tremendous amount of judgment often modifies pure science. That is as it should be. In this case, what I have called scientific ampacities are pure science. They are calculated using only recognized scientific principles; nothing judgmental. They spring from the field of technology and computers. Other ampacities come from the field of wisdom, and cannot be calculated scientifically.
PANEL ACTION: Reject.
PANEL STATEMENT: By replacing the word "conductor" with "scientific" would make the text inconsistent with the rest of the section that addresses the ampacity of conductors.

6-235 (Table B-310-8)
6-236 (Table B-310-9)
6-237 (Table B-310-10)
All of these proposals should be accepted.
Individual panel comments seem to fall into three major categories: (1) 'Scientific ampacity' does not appear in the NEC; (2) The present definition is entirely satisfactory; (3) All NEC ampacities are scientific
My comments:
(1) These proposals were inspired by the panel's rejection, three years ago, for this very reason. Proposal 1-101 deals with the definition; the others deal with introducing the term into the text where appropriate.
(2) The present definition is great; very carefully crafted. It is not wrong, but it is inadequate. It applies only for those ampacities based strictly on thermal considerations, such as those in the tables listed above. Other ampacities are based on a multiplicity of factors (see section 310-15(b) FPN) beyond the scope of the existing definition. An objective observer would certainly conclude that the present definition is not entirely satisfactory.
(3) This is a very interesting observation. It can be reasonably stated that everything in the Code is scientific, but that obscures the point that a tremendous amount of judgment often modifies pure science. That is as it should be. In this case, what I have called scientific ampacities are pure science. They are calculated using only recognized scientific principles; nothing judgmental. They spring from the field of technology and computers. Other ampacities come from the field of wisdom, and cannot be calculated scientifically.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel stands by its statement on the referenced proposal. The submitter has not provided any new technical substantiation to change these requirements.
The use of the present definition of ampacity in Article 100 and compliance with the present requirements of Section 310-15 results in safe installations. For a given installation, requirements in Section 310-15 provide sufficient details to the user to use either the ampacity values provided in the tables or calculate ampacity values under engineering supervision in accordance with Section 310-15(c). Where calculated in accordance with Section 310-15(c), the values in the Medium Voltage Tables and the Tables in Annex B take into account the most common values for the variables that affect the computation of ampacity. In addition, the application of Section 310-15(c) permits the user to compute more specific (i.e. scientific, as suggested by the submitter) value of ampacity for a given installation with a specific set of variables.
It is understood that the ampacity values in the Medium Voltage Tables and those contained in Annex B are "scientific" because they were calculated using the engineering formula in Section 310-15(c) for the specific installation. It is not necessary to repeat the word "scientific" in each of the tables. The use of the words "conductor ampacity" is well understood by the users of the Code and the addition of the word "scientific" would not add clarity.

6-235 (Table B-310-8)
6-236 (Table B-310-9)
6-237 (Table B-310-10)
All of these proposals should be accepted.
Individual panel comments seem to fall into three major categories: (1) 'Scientific ampacity' does not appear in the NEC; (2) The present definition is entirely satisfactory; (3) All NEC ampacities are scientific
My comments:

(1) These proposals were inspired by the panel's rejection, three years ago, for this very reason. Proposal 1-101 deals with the definition; the others deal with introducing the term into the text where appropriate.
(2) The present definition is great; very carefully crafted. It is not wrong, but it is inadequate. It applies only for those ampacities based strictly on thermal considerations, such as those in the tables listed above. Other ampacities are based on a multiplicity of factors (see section 310-15(b) FPN) beyond the scope of the existing definition. An objective observer would certainly conclude that the present definition is not entirely satisfactory.
(3) This is a very interesting observation. It can be reasonably stated that everything in the Code is scientific, but that obscures the point that a tremendous amount of judgment often modifies pure science. That is as it should be. In this case, what I have called scientific ampacities are pure science. They are calculated using only recognized scientific principles; nothing judgmental. They spring from the field of technology and computers. Other ampacities come from the field of wisdom, and cannot be calculated scientifically.

It can be reasonably stated that everything in the Code is scientific, but that obscures the point that a tremendous amount of judgment often modifies pure science. That is as it should be. In this case, what I have called scientific ampacities are pure science. They are calculated using only recognized scientific principles; nothing judgmental. They spring from the field of technology and computers. Other ampacities come from the field of wisdom, and cannot be calculated scientifically.

PANEL ACTION: Reject.

6-235 (Table B-310-8)
6-236 (Table B-310-9)
6-237 (Table B-310-10)

All of these proposals should be accepted.

Individual panel comments seem to fall into three major categories: (1) 'Scientific ampacity' does not appear in the NEC; (2) The present definition is entirely satisfactory; (3) All NEC ampacities are scientific

My comments:

(1) These proposals were inspired by the panel's rejection, three years ago, for this very reason. Proposal 1-101 deals with the definition; the others deal with introducing the term into the text where appropriate.

(2) The present definition is great; very carefully crafted. It is not wrong, but it is inadequate. It applies only for those ampacities based strictly on thermal considerations, such as those in the tables listed above. Other ampacities are based on a multiplicity of factors (see section 310-15(b) FPN) beyond the scope of the existing definition. An objective observer would certainly conclude that the present definition is not entirely satisfactory.

(3) This is a very interesting observation. It can be reasonably stated that everything in the Code is scientific, but that obscures the point that a tremendous amount of judgment often modifies pure science. That is as it should be. In this case, what I have called scientific ampacities are pure science. They are calculated using only recognized scientific principles; nothing judgmental. They spring from the field of technology and computers. Other ampacities come from the field of wisdom, and cannot be calculated scientifically.

6-237 (Table B-310-10)

All of these proposals should be accepted.

Individual panel comments seem to fall into three major categories: (1) 'Scientific ampacity' does not appear in the NEC; (2) The present definition is entirely satisfactory; (3) All NEC ampacities are scientific

My comments:

(1) These proposals were inspired by the panel's rejection, three years ago, for this very reason. Proposal 1-101 deals with the definition; the others deal with introducing the term into the text where appropriate.

(2) The present definition is great; very carefully crafted. It is not wrong, but it is inadequate. It applies only for those ampacities based strictly on thermal considerations, such as those in the tables listed above. Other ampacities are based on a multiplicity of factors (see section 310-15(b) FPN) beyond the scope of the existing definition. An objective observer would certainly conclude that the present definition is not entirely satisfactory.

(3) This is a very interesting observation. It can be reasonably stated that everything in the Code is scientific, but that obscures the point that a tremendous amount of judgment often modifies pure science. That is as it should be. In this case, what I have called scientific ampacities are pure science. They are calculated using only recognized scientific principles; nothing judgmental. They spring from the field of technology and computers. Other ampacities come from the field of wisdom, and cannot be calculated scientifically.

PANEL ACTION: Reject.

ARTICLE 318 — CABLE TRAYS

(Log #441)

8- 5 - (318-3): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 8-14
RECOMMENDATION: Accept in principle, revise panel action:

Add after (b)(1)(a): Exception: Type MI cables without a nonmetallic jacket shall not be required to be listed and marked for use in cable trays.

SUBSTANTIATION: Type MI cable without a nonmetallic jacket is not indicated in the UL "white book" as a cable that is so marked.
PANEL ACTION: Reject.
PANEL STATEMENT: No data was submitted to substantiate the use of Type MI cable in cable tray where the Type MI cable is not listed and marked for cable tray use.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #352)

8- 6 - (318-3(a)): Reject
SUBMITTER: James M. Daly, BICC General
COMMENT ON PROPOSAL NO: 8-17
RECOMMENDATION: This Proposal should be Accepted in Principle in Part.

The wording should be revised to read as follows:

"Single conductors or multiconductor cables that comply with the requirements for both Type MV and Type MC, and are ~~identified~~ listed and marked as Type MV or MC ~~and~~ for use in cable tray shall also be permitted to be installed in cable tray."

SUBSTANTIATION: There are two types of MV cable for both single conductor and multiconductor constructions:

(1) Nonmetallic jacketed and identified as Type MV.

(2) Armored with interlocking tape armor or a continuous corrugated metallic sheath with an optional nonmetallic jacket under and/or over the armor. This cable carries the dual rating of Type MV or MC, provided the cable complies with the requirements of both product standards.

The Panel is correct that, in Article 318, Type MV single conductors are not permitted in cable tray in any occupancy and Type MV multiconductor cables are specifically restricted by 318-3(b)(2) to use only in industrial establishments. These restrictions, which are also specified in Section 326-3, apply to the nonmetallic jacketed constructions. I agree that nonmetallic jacketed (no armor) Type MV Medium Voltage single conductors should not be permitted in cable tray in any occupancy and nonmetallic jacketed (no armor) Type MV Medium Voltage multiconductor cables should be restricted to cable trays in industrial establishments and the proposal will not change this restriction.

If the single conductor or the multiconductor cable is armored (enclosed within an interlocking metal tape armor or a continuous corrugated metallic sheath), complies with the requirements for both Type MV and MC cables, and is labeled as "Type MV or MC", then the uses permitted can be in compliance with either Type MC (Section 334-3) or Type MV (Section 326-3) or both.

Section 334-3(8) permits MC cable to be installed as open runs with no restrictions regarding occupancy. MC cable, regardless of voltage, is permitted to be installed as open runs in any occupancy except where specifically not permitted, e.g., some hazardous locations.

Section 334-3(6) permits MC cable to be installed in cable tray "Unless specifically prohibited elsewhere in this Code and where not subject to physical damage." Section 318-3(a) permits Type MC cable "to be installed in cable tray systems under the conditions described in their respective articles and sections". There is no voltage restriction on the MC cable.

Therefore, since medium voltage Type MC cable, both single conductors and multiconductor cables, is currently permitted to be installed as open wiring in non-ndustrial occupancies, safety could be further enhanced by permitting the same identical cable construction to be installed in a cable tray to provide additional mechanical protection. Since Section 318-3(a) already permits Type MC cable (no voltage restriction) to be installed in cable tray in any occupancy, the proposed text would not authorize any additional use but would merely provide additional clarity in the Code.

PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not agree with the submitter's substantiation. Section 318-3(a) permits Type MC cable. Any of the wiring methods permitted by Section 318-3(a) may have additional markings. For example, Type MC cable may also be marked as Type MV cable. However, only those methods given in Section 318-3(a) are permitted. Section 318-3(a) permits a cable marked as Type MC and Type MV but permits the cable to be utilized as only a Type MC cable.
The proposed additional language would cause confusion and could lead to cables with only a Type MV marking being used.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #774)

8- 7 - (318-3(b)): Reject
SUBMITTER: Richard E. Loyd, Perryville, AR
COMMENT ON PROPOSAL NO: 8-21
RECOMMENDATION: Reconsider and reject this proposal.
SUBSTANTIATION: Consideration should be given to the negative comment on the voting.
PANEL ACTION: Reject.
PANEL STATEMENT: The use of conductors and cables as permitted in Section 318-3(b)(1)&(2) in solid bottom cable tray is an acceptable practice in supervised industrial applications.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
LILLY: The proposal seeks to add solid bottom cable tray to those permitted cable tray types in "industrial establishments". There are no provisions in Section 318-10 covering the installation of single conductor cables rated 2000 volts or less in solid bottom cable tray. If the proposal is accepted, solid bottom cable tray would be permitted, but there would be no cable installation guidelines in Section 318-10. Additional proposals are necessary to address conductor installation requirements for single conductors in solid bottom cable tray.
Section 318-11 details the requirements for determining the ampacity of single conductor cables or single conductors cabled together nominally rated 2000 volts or less in cable tray. Only two of the terms contained in 318-11 could be used to determine the conductor ampacity for solid bottom cable tray. Item (b)(3) utilizes Tables 310-17 and 310-19. The conductor ampacity in both of these tables is based on free air. Item number (b)(4) utilizes conductors "supported on a messenger" which also uses the free air concept to determine conductor ampacity. Conductors lying on a solid bottom cable tray are not in free air. The resultant lack of free air could result in conductor insulation breakdown due to "hot spots" or long term exposure to temperatures slightly elevated above the insulation temperature rating. This situation could be made more severe as there are no provisions restricting the use of solid bottom cable trays with unventilated covers. Research is needed to demonstrate what effect, if any, the introduction of a solid bottom might have on the insulation integrity of conductors installed in cable tray.
LOYD: I agree with Mr. Lilly's comments expressed in his negative vote, and the comment on the negative vote on Proposal 8-21. There has been no substantiation for making this change in the Code.

(Log #1032)

8- 8 - (318-3(b), FPN (New)): Accept
SUBMITTER: Michael R. Borden, Cable Tray Institute
COMMENT ON PROPOSAL NO: 8-21
RECOMMENDATION: The Cable Tray Institute supports the acceptance of this proposal.
SUBSTANTIATION: Cables are installed within solid metal enclosures, i.e., conduit and wireway. There is no reason to exclude solid bottom tray from containing these cables as long as they are being installed by qualified individuals in industrial establishments and the fill requirements are consistent with the conservative numbers used for conduit and wireway.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
LILLY: The proposal seeks to add solid bottom cable tray to those permitted cable tray types in "industrial establishments". (Log #394)

8- 14 - (318-6(j)): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 8-33
RECOMMENDATION: Accept in Principle revised:
RACEWAYS, CABLES ~~and OUTLET~~ BOXES and CONDUIT BODIES SUPPORTED from cable trays. In industrial facilities where conditions of maintenance and supervision ensure only qualified persons will service the installation and where cable trays are designed and installed to support the load, raceways, cables, ~~and outlet~~ boxes, and conduit bodies shall be permitted to be supported by cable trays. ~~For raceways,~~ Intermediate metal conduit, rigid metal conduit, and electrical metallic tubing terminating at, and secured to the tray with a listed cable tray clamp or adapter ~~shall be used and no nearby supports, such as a support within 3 ft (914 mm) shall be required~~ shall be permitted to be fastened in accordance with 345-12(a), 346-12(a), or 348-13 Exception No. 1.
For raceways or cables running parallel to, but under or ~~beside~~ on the side of a tray, supports shall be in accordance with the requirements of the appropriate raceway or cable article.
For ~~outlet~~ boxes and conduit bodies located under or beside on the side of a tray, support shall be in accordance with the requirements of ~~Article~~ 370-23.
SUBSTANTIATION: "Secured to" emphasizes the clamp or adapter is to be fastened to the tray. The relaxation of support "within 3 ft" applies to raceways of the flexible type or RNMC even though it appears related to requirements for IMC, RMC, RNMC, and EMT, since other raceways have different requirements where terminated. The 3 ft requirement is modified to 5 ft in Articles 345, 346, and 348 but not 347, nor for flexible types. The proposed references to 345-12(a), 346-12(a) and 348-13 Ex. No. 1 contain conditions (no support within 3 ft, unbroken EMT) which are not covered by present wording.
"Nearby support" is vague; how far is nearby? The 5 ft modification for IMC, RMC, and EMT is their respective articles is apparently predicated on the assumption of a termination that is secure such as a threaded connection or locknuts and bushings.
The Panel stated the raceway support is intended in accordance with the respective article, however the present wording doesn't provide consistency as indicated in the Style Manual Section 3.3.5.
PANEL ACTION: Accept in Principle in Part.
Revise Section 318-6(j) to read:
(j) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems. In industrial facilities where conditions of maintenance and supervision ensure that only qualified persons will service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 370-1. For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.
For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.
For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 370-23.
PANEL STATEMENT: The deletion of the word "outlet" and the addition of "conduit bodies" was accomplished by the panel action on Proposal 8-34.
The inclusion of the words "and installed" is accepted in the first sentence.
The words "to securely fasten the raceway to the cable tray system" in the second sentence of the first paragraph clarifies that the wording is meant to apply to all raceways.
The addition of a third sentence in the first paragraph alerts the user to the fact that regardless of the attachment of the raceway to the cable tray the securing and supporting requirements of the appropriate raceway article still apply.
The words "attached to the bottom or side" in the second and third paragraph clarifies that these are raceways, etc. that are mounted to the cable tray system.
The word "fastening" was added in the second and third paragraphs because there are both fastening and supporting requirements for raceways and boxes.
The reference to Section 370-23 is included in the last paragraph as it was added by the action taken on Proposal 8-34.
"Systems" was added to correlate with the definition of cable tray in Section 318-1.
The panel did not accept the text to add specific types of raceways.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #773)

8- 15 - (318-6(j)): Reject
SUBMITTER: Richard E. Loyd, Perryville, AR
COMMENT ON PROPOSAL NO: 8-34
RECOMMENDATION: Reconsider and reject this proposal.
SUBSTANTIATION: Consideration should be given to the negative comment on the voting. In my experience, cable tray installations are a combination of lightweight steel or more often aluminum channel (cable tray) supported by trapeze hangers or channel iron structural supports. The cable tray has very little structural strength. I have seen outlet boxes screwed to the side of the tray for various purposes but usually anything larger is

supported to the structural supports holding the cable tray. This proposal, if it is accepted, it will permit attaching to the cable tray itself any size junction box.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 8-14.

(Log #1030)

8- 16 - (318-6(j), FPN (New)): Accept
SUBMITTER: Michael R. Borden, Cable Tray Institute
COMMENT ON PROPOSAL NO: 8-37
RECOMMENDATION: The Cable Tray Institute supports the accept in principle action on this proposal and the relocation to Section 318-1.
SUBSTANTIATION: This standard is an industry resource for the installations of cable systems.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #1736)

8- 17 - (318-9(f)): Accept in Principle in Part
SUBMITTER: Rich Buschart, Cable Tray Institute
COMMENT ON PROPOSAL NO: 8-41, 8-42, 8-43, 8-44
RECOMMENDATION: The Cable Tray Institute supports the acceptance of this proposal. Add new text to read as follows:
(f) Solid Channel Cable Trays. Where solid channel cable trays contain multiconductor cables of any type, the following shall apply.
(1) Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in column 1 of Table 318-9(f).
(2) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 318-9(f).
SUBSTANTIATION: Solid channel cable trays have been available for over 10 years but have not been recognized in previous NEC publications. On the other hand, solid bottom cable tray has been recognized by the NEC for over 20 years to contain multiconductor cables. The percent fill value shown in Columns 1 and 2 of Table 318-9(f) are based on the area fill values for installing one cable in conduit raceway or two cables in conduit raceway, respectively. This equates to a 53 percent fill for one cable and a 31 percent fill for more than one cable. Given the more stringent requirements for cables that are rated for cable tray use, along with the proven track record of both ventilated channel cable tray and solid bottom cable tray for more than 20 years, this proposal gives industry professionals another valuable alternative for installations that they feel require continuous support of their cables while still providing an open system for ease of installation and retrofit.
PANEL ACTION: Accept in Principle in Part.
The panel rejects the part of the comment to accept Proposal 8-41.
The panel accepts in principle that part of the comment that accepts Proposals 8-42, 8-43, and 8-44.
Revise the proposed wording of 318-9 (f)(1) of the comment to read as follows:
"(1) Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of Table 318-9(f)."
Accept the table without the width: "200mm, 8 inch".
PANEL STATEMENT: The panel has accepted the 50mm, 2 inch size based on the submitter equating the fill requirement to Chapter 9, Table 1. The panel did not accept the inclusion of 200mm, 8 inch using the same approach to calculating the fill as there was no data provided for the 8 inch size.
The words "of the cable" were added to Section 318-9(f)(1) of the comment to make it clear that the cross-sectional area referred to is that of the cable not that of the cable tray.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #1735)

8- 18 - (318-10(b)): Accept in Principle in Part
SUBMITTER: Rich Buschart, Cable Tray Institute
COMMENT ON PROPOSAL NO: 8-46
RECOMMENDATION: Revise as follows:
(b) Ventilated Channel Cable Trays. Where 2 in. (51 mm), 3-in. (76 mm), 4 in. (102 mm), 6-in. (152 mm), or 8 in. (204 mm) wide ventilated channel cable trays contains single conductor cables, the sum of the diameters of tall single conductors shall not exceed the inside width of the channel.
The Cable Tray Institute supports the acceptance of this proposal.
SUBSTANTIATION: Two in. and 8 in. Channel Cable Tray are two widely available sizes that have been overlooked in previous NEC proposals. Due to continued inquires by the industry, adding the 2 in. and 8 in. sizes would increase the available options for installing amounts of cables while building on the proven installation practices of 3, 4, and 6 in. channel cable tray that have been used successfully for over 13 years.
PANEL ACTION: Accept in Principle in Part.
The panel accepts the inclusion of 50mm (2 inch) ventilated channel cable tray and rejects the inclusion of 200mm (8 inch) ventilated channel cable tray.
PANEL STATEMENT: The panel has accepted the 50mm, 2 inch size based on the submitter equating the fill requirement to Chapter 9, Table 1. The panel did not accept the inclusion of 200mm, 8 inch using the same approach to calculating the fill as there was no data provided for the 8 inch size. The panel has used hard metric conversions and reversed the dimension order to comply with the Style Manual.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
POHOLSKI: Reject panel action to accept this comment in principle in part and accept the proposal as submitted. Chapter 9, Table 1 is used for Conduit and Tubing and not Ventilated tray. The proposal should be accepted as submitted in Log #1735.

Table 318-9(f). Allowable Cable Fill Area for Multiconductor Cables in Solid Channel Cable Trays for Cables Rated 2000 Volts or Less

		Maximum Allowable Fill Area For Multiconductor Cables

ARTICLE 320 — OPEN WIRING ON INSULATORS

(Log #1439)

7- 4 - (320-3): Reject
SUBMITTER: Barry Bauman, Alliante Energy/Rep. American Society of Agricultural Engineers
COMMENT ON PROPOSAL NO: 7-12
RECOMMENDATION: 7-12 should be accepted as proposed.
SUBSTANTIATION: The clip on luminaries used in NEC 320 agricultural installations do not conform to NEC 547.8. Consequently, these installations do not conform to the NEC. Due to their loss experience, insurance companies will either not insure buildings wired with Open Wiring On Insulators or they will impose a much higher rate.
A similar comment is to be submitted for Proposal 19-14.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter could be referencing Section 547-7 in place of Section 547-8. Since Chapters 5, 6 and 7 can modify the requirements provided in Chapters 1 through 4, 547-7 specifies the specific requirements for lighting fixtures suitable for use in agriculture buildings. There is no conflict between 320-3 and 547-7.

(Log #413)

7- 7 - (326-10): Reject
Note: The Technical Correlating Committee notes that the issue raised in the panel statement will be sent to the NEC Technical Correlating Committee Usability Task Group for action in the 2005 cycle.
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 7-52
RECOMMENDATION: Accept in Principle, revise Panel Action:
USES PERMITTED. Type MV cables shall be permitted for use on power systems rated up to 35,000 volts, nominal, in wet or dry locations, in raceways, in cable trays as specified in 318-3(b)(1), or directly buried in accordance with 300-50, ~~and~~ in messenger supported wiring, in cablebus assemblies, and as open wiring in accordance with 300-37.
SUBSTANTIATION: The first part of the sentence ending at "locations" should be sufficient to cover the following wiring methods. However, if they are to be specifically indicated they should be inclusive to avoid any confusion that the conductors cannot be used in cablebus, or as open wiring in transformer volt or switchgear rooms or as open aerial conductors as covered in Article 225. The panel stated in Proposal 7-57 that uses not specifically excluded permits all other use. Under that concept, "uses not permitted" negates the need for a litany of permitted uses.
PANEL ACTION: Reject.
PANEL STATEMENT: Code Making Panel 7 recognizes that not having an all inclusive list for "uses permitted" is an issue for this and other articles in the Code. The panel requests that the Technical Correlating Committee ask the Usability Task Group to review this issue, correlate with Section 110-8, and make recommendations for future editions of the Code.

Note: The Technical Correlating Committee notes that the Recommendation relative to 334.17 should not be included with the action on Article 330, but is covered by Comment 7-22a.
SUBMITTER: CMP 7
COMMENT ON PROPOSAL NO: 7-69a
RECOMMENDATION: Add new 330-17 to read:
330-17. Through or Parallel to Framing Members. Type MI cable shall be protected in accordance with 300-4 where installed through or parallel to framing members.
Revise 334-17 to read:
334-17. Through or Parallel to Framing Members. Type MC cable shall be protected in accordance with 300-4 where installed through or parallel to framing members.
SUBSTANTIATION: In response to a public comment relative to this subject, the panel has added this section to be consistent with corresponding sections in Articles 333, 334 and 336.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
COMMENT ON AFFIRMATIVE:
STRANIERO: The comment recommendation includes code sections from two different articles. The comment should cover only Section 330-17. Section 334-17 is covered by Comment 7-22a.

(Log #1631)

7- 12 - (330-20):
Note: It was the action of the Technical Correlating Committee that Comment 7-12 be reported as "Hold" since it introduces new material that has not had public review.
SUBMITTER: James M. Daly, BICC General
COMMENT ON PROPOSAL NO: 7-87
RECOMMENDATION: The proposal should be accepted in principle.
The section should be revised as follows:
Type MI cable conductors shall be of solid copper, nickel or nickel-coated ~~clad~~ copper with a resistance corresponding to standard AWG and kcmil sizes.
SUBSTANTIATION: The addition of the word "nickel" and the change of "clad" to "coated" will make the text consistent with the text used in Table 310-13 (PFAH and TFE), Tables 310-18 and 310-19, and Table 402-3 (PAF and PTF).
Many petroleum and chemical companies require both power and control cables that can withstand extreme fire conditions (1093°C (2000°F)) for a short period of time (20 to 30 minutes) to permit a safe shutdown of the process to protect personnel and to minimize damage to the facility. Since copper and nickel-coated copper conductors melt at 1082°C (1938°F), the only alternative is the use of solid nickel conductors which have a melting point of 1455°C (2651°F).
PANEL ACTION: Accept.
PANEL STATEMENT: The text was revised to be consistent with the sections referenced in the substantiation and is deemed to be editorial in nature.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
GUIDA: This comment should be held. There was no public review of the addition of nickel to Article 330. The adding of nickel to the 90°C columns of Tables 310-16; 310-17 and 310-20 should be part of this proposal.
TEMBLADOR: We believe that the recommendation is proposing new material. The Technical Correlating Committee should review the action. Further, no fact finding report was provided that suggests that the existing fittings listed for MI cable would work satisfactorily with nickel conductors. Although Table 310-18 provides ampacity for nickel-clad and nickel conductors, it does not mean that solid nickel conductors, when used in MI cable, would behave the same in all aspects. Tables 310-17 and 310-20 do not recognize both, nickel-clad and nickel. These tables are likely choices for MI cable and without a fact-finding report, safety of the installation would be compromised.

(Log #1559)

7- 13 - (330-80 (New)): Accept in Principle
Note: The Technical Correlating Committee understands that the Panel Action to delete the last phrase in 330.80(C) results in deleting the words "and the…equipment."
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
COMMENT ON PROPOSAL NO: 7-88
RECOMMENDATION: Accept Proposal as Accept in Principle and revise 330.80 as follows:

330.80 Ampacity.
(A) General. The ampacity of Type MI cable shall be determined in accordance with 310.15. The conductor temperature at the end seal fitting shall not exceed the ~~listed~~ temperature rating of the listed end seal fitting and the installation shall comply with temperature ratings of termination and equipment.
(B) Type MI Cable Installed in Cable Tray. The ampacities for Type MI cable installed in cable tray shall be determined in accordance with 318.11 and the installation shall comply with temperature ratings of termination and equipment.
(C) Single Type MI Conductors Grouped Together. Where single Type MI conductors are grouped together in a triangular or square configuration, as required by ~~330.16~~330.10(11), and installed on a messenger or as open runs with a maintained free air space of not less than 2.15 times one conductor diameter (2.15 x O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall not exceed the allowable ampacities of Table 310.17 and the installation shall comply with temperature ratings of termination and equipment.
~~The conductor temperature at the end seal fitting shall not exceed the listed temperature rating of the end seal fitting.~~
SUBSTANTIATION: Proposal suggests that construction of MI Cable provide a unique performance capability in regards to its permitted ampacity in various installations and configurations. However, the temperature ratings of other components (end seal fittings, through-penetration products, terminations, equipment, etc.) in the circuit are factors that limit the use of ampacity values at temperatures ratings higher than the temperature ratings of these components. Thus, compliance with 110.14(C) shall not be compromised. Further, since 90 degree C limitation referenced in 310.15(B)(7) for end seal fitting has been deleted, a clarification is needed regarding the applicable temperature limitations. Proposed wording does not compromise any innovation for end seal fittings.
Thus, two concepts need to be recognized to facilitate the use of performance capability of MI Cable. First, for the purpose of derating calculations in known installation methods for MI Cable, the higher values of ampacity (in accordance with 318.11 or Table 310.17) are permitted. However, this permission is based on the facts that the temperature rating of other components in the circuits is suitable for the purpose and the resulting derated ampacity value for MI Cable does not exceed the ampacity value used to establish temperature ratings of terminations and equipment as established in accordance with 110.14 (C).
Second, it is possible to configure the installation of MI Cable in such a manner that temperature rating of other components and compliance with 110.14 (C) are not compromised. Since these configurations could be very specific, they should be listed to ensure proper investigation and compliance. Further, it is essential that specific configurations of installation methods, other than those that are already recognized in this section and where ampacity is determined in accordance with 310.15, are evaluated for compliance with 110.14 (C) and then recognized in this Section for their permitted use. Code-Making Panel 7 needs to review such fact finding data prior to permitting applications at ampacities other than those permitted in this section.
Additional changes are editorial to facilitate rewriting of this section. The last sentence has been relocated in the first section titled, "(A) General." as it is applicable to all different types of installations of MI Cable. Reference to 330.16 has been corrected to 330.10(11) to correlate with the rewrite of the Article.
Notes:
(1) Acceptance of this comment will facilitate acceptance of a separate comment, on Proposal 6-89 to revise 310.15(B)(7), by Code-Making Panel 6.
Revised wording of 310.15(B)(7) submitted to Code-Making Panel 6 is shown below:
"(7) Mineral-Insulated, Metal-Sheathed Cable. The temperature limitations on which the ampacities of mineral-insulated, metal-sheathed cable are based shall be determined by the insulating materials used in the end seal fitting. The conductor temperature at the termination shall not exceed the listed temperature rating of the end seal fitting and the installation shall comply with temperature ratings of termination and equipment. When mineral insulated cable is bundled in accordance with ~~330.16~~330.10(11), ampacities from applicable ampacity tables ~~can be used in accordance with 110.14 provided the temperature limit of the cable's end seal fitting is not exceeded~~ are permitted to be used, provided the temperature limit of the cable's end seal fitting is not exceeded and the installation is in compliance with temperature ratings of termination and equipment."
(1) Acceptance of this comment supports correlation between actions taken on Proposals 6-88, 89, 90, 91, 92, 93, 94, 106, and 113; and 7-82, 83, 86 and 88.
(2) Request that this comment be forwarded to Code-Making Panel 1 and Code-Making Panel 6 for their information.
PANEL ACTION: Accept in Principle.
Revise text to read:
330.80 Ampacity. The ampacity of Type MI cable shall be determined in accordance with 310.15. The conductor temperature at the end seal fitting shall not exceed the temperature rating of the listed end seal fitting and the installation shall not exceed the temperature ratings of terminations or equipment.
Change "(B)" to "(A)", add the title and delete the underlined phrase.
Change "(C)" to "(B)", add the title, change 330-10(11) to 330-31 to agree with the panel action on Comment 7-10, and delete the last phrase.

PANEL STATEMENT: The panel action meets the intent of the submitter's comment.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #2040)
7- 14 - (330-80): Accept in Principle in Part
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 7-88
RECOMMENDATION: Accept the Panel action in Principle.
Revise as follows:
330.70. Single Conductors. Where single conductor cables are used, all phase conductors and, where used, the neutral conductor shall be grouped together in a triangular or square configuration to minimize induced voltage on the sheath.
330.80. Ampacity. The ampacity of multiconductor Type MI cable shall be determined in accordance with 310.15. The ampacity of Type MI cable installed in cable tray shall be determined in accordance with 318.11. The ampacity of single-conductor Type MI cable shall be determined by (A) or (B).
(A) Maintained Spacing. Where the circuit groupings of Type MI cable required by 330.70 are installed on a messenger or as open runs with a maintained free air space of not less than 2.15 times one conductor diameter (2.15 x O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall be permitted to be determined by Table 310.17. The installation shall comply with (1), (2), and (3).
(1) Heat Dissipation. At each point of cable termination at an enclosure, the bundles shall be spread so each cable has a maintained spacing from adjacent cables of not less than one cable diameter for a distance of not less than 450 mm (18 in.) and not more than 900 mm (30 in.).
(2) Adjacent Ampacities. The ampacity determined under this procedure shall not be used to establish temperature ratings of conductors at terminations. The provisions of 310.15(A)(2) Exception shall not apply.
(3) End Seal. The conductor temperature at the end seal fitting shall not exceed the listed temperature rating of the end seal fitting.
(B) Spacing Not Maintained. Where the spacing in (A) is not maintained, the ampacity shall be determined using a method that does not rely on the ampacities of single conductors run in free air.
SUBSTANTIATION: The NEC has to recognize that the cables are operating above 90°C under these conditions, admittedly harmless to the MI cable, but which need to correlate with Sec. 110-14(c), and Sec. 310-15(b)(2) and its exception. Some MI cable folks have already told me that they are relying on that exception to get them into an enclosure with terminations based on free-air temperatures over the run. That only works if the cable actually operates under free air conditions. For example, suppose the cable ran unbundled (not allowed; this is only for discussion). Then, for a 75°C allowable termination, I would agree that you could use the 75°C column of Table 310-17. However, you can't run the cable unbundled. Furthermore, product standards almost universally rely on Table 310-16 to provide enough headroom in conductor sizing to allow for the conductor to function as a heat sink from the device. Therefore:
1) The cable must be unbundled for some distance, which the Code needs to specify upon due input from third parties, sufficient to allow the elevated temperature within the bundle to fall to the

point where the end seals aren't affected. I have heard 1 ft as a number OK for 90° C end seals and somewhat greater for lower rated seals. Probably 2 ft is a good number, one that makes intuitive sense to users based on the nipple rule; this comment uses a range with that number in the middle.

2) Sec. 310-15(b) Exception relies on a length of higher ampacity (= cooler wires) to act as a heat sink for lower ampacity (= hotter wires) areas along the run. In this unique case if someone applies this exception to the conductors in the panelboard they would inadvertently be doing the reverse, that is, attempting to use hotter conductors as a heat sink for cooler conductors. Therefore this rule has to clearly stipulate how the allowable ampacity tables intersect with termination requirements.

This comment also suggests that Code-Making Panel 7 establish another standard number for the cable articles, namely, Section 70 (could be changed, of course) as the uniform repository of special requirements for single-conductor applications. That section would be used in this article, as well as Articles 334 and 339.

PANEL ACTION: Accept in Principle in Part.

PANEL STATEMENT: The panel action on Comment 7-13 addresses the submitter's concern regarding the proper use of the ampacity for MI Cables. Since there is no data provided to support specific recommendations for installations by the submitter, the panel does not accept that portion of the recommendation.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

(Log #2149)

7- 15 - (330-80 (New)): Reject

SUBMITTER: Robert Konnik, Rockbestos-Suprenant Cable Corp.

COMMENT ON PROPOSAL NO: 7-88

RECOMMENDATION: Change Table 310-17 to 310-20.

SUBSTANTIATION: The use of Table 310-17 will result in conductor temperatures exceeding 90°C. An example is for the 8 AWG, the calculated ampacity is 72 amperes, and it is proposed to allow 80 amperes. In Table 310-17, for a 75°C conductor temperature, ampacity is 70 amperes (much closer to the 72 amperes). By extrapolation, it would appear that conductor temperature would be over 100°C if 80 amperes is allowed.

Additionally, the IEEE 835 Table cited is for no direct sunlight. MI cable may be installed outdoors, or indoors in sunlight. Under this circumstance, the use of the ampacities in Table 310-17 will result in conductor temperatures above 90°C. Using the same example of an 8 AWG, the allowable ampacity in IEEE 835 is 58 amperes with full sun (corrected to 30°C ambient). Compared to 60 amps for Table 310-17 with a 60°C conductor temperature (Delta of 30°C).

Note, excessive conductor temperature will be a concern for splices, terminations, possibly for adjacent cables rated at 90°C, etc. Additionally, the IEEE Tables cited can be used under engineering supervision in the proper installation, and are applicable to all cable types which conform to the assumptions.

It is suggested that Table 310-20 be used which is consistent with the proposal for Type MC (334-13, Proposals 7-125 and 6-113). Note though that compared to IEEE 835, most of the values fall somewhere between the full sun columns with 0 ft/sec and 2 ft/sec air movement.

PANEL ACTION: Reject.

PANEL STATEMENT: The substantiation provided with Proposal 7-88 supports the use of Table 310-17. Table 310-17 has been used for the ampacity of Type MI cables grouped together for many years. The panel has addressed the temperature rating of the terminations in Comment 7-13.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

GUIDA: This comment should be accepted. There is evidence that these cables will exceed 90°C when installed in a bunched configuration. Although this will not harm the cable that is rated for 250°C, it is a bad precedent to deliberately let cables exceed their rating and may be a hazard if they come in contact with some building materials.

TEMBLADOR: We are voting negative so that members of Code-Making Panel 7 will have one more opportunity to review the panel's action on this comment.

Recommendation: The Panel Action on Comment 7-88 should be revised, as recommended by Comment 7-15 and as intended by Comments 6-29 and 6-30, so that 330.80 reads as follows: (strikeout and underlined text highlight the changes to the panel action arrived at during the ROC Meeting):

330-80 Ampacity. The ampacity of Type MI cable shall be determined in accordance with 310.15. The conductor temperature at the end seal fitting shall not exceed the temperature rating of the listed end seal fitting <u>in accordance with 110.14(C)</u> and the installation shall not exceed the temperature ratings of terminations or equipment.

(A) Type MI Cable Installed in Cable Tray. The ampacity of Type MI cable installed in cable tray shall be determined in accordance with 318.11.

(B) Single Type MI Conductors Grouped Together. Where single type MI conductors are grouped together in a triangular or square configuration, as required by 330-31, and installed on a messenger or as open runs with a maintained free air space of not less than 2.15 times one conductor diameter (2.15 X O.D.) of the largest conductor contained within the configuration and adjacent conductor configuration or cables, the ampacity of the conductors shall not exceed the allowable ampacity of Table 310.17 <u>310.20</u>.

Substantiation: (1) For "in accordance with 110.14(C)" Although implied and very clear from the substantiation provided with Comments 7-88, 6-29 and 6-30, it is important that this text is part of this section so that there is no confusion about the requirement and the intent. Also, we believe that this action will then be in total and complete agreement with the willingness of Code-Making Panel 6 to delete 310-15(B)(7). Since all Nationally Recognized Testing Laboratories apply 110-14 to evaluate and list fittings, terminations, etc., it should be identified clearly.

(Note: If this change is accepted, then a similar change is essential in 334.80 also. We have submitted a comment with our affirmative vote on Panel Action on Comment 7-25.)

(2) For "Table 310.17" to "Table 310.20" Initially, Code-Making Panel 7 agreed to make this change on Proposal 7-88 during the ROC Meeting abased on the discussion and presentation on Comment 7-15. However, the item was reconsidered and the Comment 7-15 was rejected and the above change was eliminated from the revised 330.80.

A comparison between Tables 310-17 and 310-20, when adjusted for 30° C ambient, suggests that there is an increase of 25% in ampacity values of MI cable when Table 310-17 is used over Table 310-20 for the intended application of grouping of single conductors. While focusing the attention on the capability of MI cable, it appears that Panel 7 has overlooked a need of fact finding that confirms that other requirements in the code are not compromised. Since specific installation requirements are a part of such installation, it is essential that this data is provided to support the recommendation to use 310-17.

In addition to the fittings and terminations for MI cable, the investigation should also include fire stop and floor and wall penetration products. The actual temperature of cable within the portion of the run where these products are located would be significantly higher than 90°C when they are grouped as proposed and the ampacity values per Table 310-17 are permitted. Thus, the temperature ratings and other performance requirements of these products that may come in contact with the grouped single conductors of MI cable could be compromised. A comparison between Table 310-16 and 310-17, shown in the following table, suggests that the temperature rating of these components could be severely compromised.

Size AWG or kcmil	Ampacity at 75° C per Table 310-16 at 30° C (Used for compliance with 110-14)	Ampacity at 90° C per Table 310-20 at 40° C	Ampacity at 90°C per Table 310-20 adjusted to 30° C (Using 1.13 factor for temperature adjustment provided in Table 310-20	Ampacity at 90°C per Table 310-17 at 30° C	Percent Increase in Ampacity by using Table 310-17 (instead of Table 310-20) at 30° C	Percent Increase in Ampacity by using Table 310-17 at 90° C (instead of Table 310-16 at 75° C) at 30° C
8	50	57	64	70	23%	40%
6	65	76	86	95	25%	46%
4	85	101	114	125	24%	47%
3	100	118	133	145	23%	45%
2	115	135	153	170	26%	48%
1	130	158	179	195	23%	50%
1/0	150	183	207	230	26%	53%
2/0	175	212	240	265	25%	51%
3/0	200	245	277	310	27%	55%
4/0	230	287	324	360	25%	57%
250	255	320	362	405	27%	59%
300	285	359	406	445	24%	56%
350	310	397	449	505	27%	63%
400	335	430	486	545	27%	63%
500	380	496	560	620	25%	63%
600	420	553	625	690	25%	64%
700	460	610	689	755	24%	64%
750	475	638	721	785	23%	65%
800	490	660	746	815	23%	66%
900	520	704	796	870	24%	67%
1000	545	748	845	935	25%	72%

Since the Code is applicable for every manufacturer and installer of MI cable, proper installation requirements are essential to ensure compliance with the Code and to permit maximum capability of MI cable.

It should be noted that for 334.80, the panel Action on Comment 7-25 rejected the recommendation to use Table 310-17 instead of Table 310-20 for a similar application of grouping of MC cable.

In addition to the discussion on Comment 7-15 at the ROC meeting, we hope that this information is sufficient to help Panel 7 change its decsion to make this change from Table 310-17 to 310-20. Procedurally, to do so requires a negative vote on the panel Action at the ROC Meeting on Comment 7-15. Should it be successful, then the Techncial Correlating Committee will review this action for further decision(s).

Lastly, again in the interest of consensus, we are willing to support the present action on Comment 7-15 if there is sufficient information available to alleviate our concerns.

ARTICLE 331 — ELECTRICAL NONMETALLIC TUBING: TYPE ENT

(Log #1824)

8- 19 - (331-3 and 331-4): Accept

SUBMITTER: Marshall A. Klein, Marshall A. Klein & Assoc., Inc.

COMMENT ON PROPOSAL NO: 8-64

RECOMMENDATION: We support the Panel's rejection based on the supporting documentation in the original proposal.

SUBSTANTIATION: Article 331 was a new article in the 1984 NEC. In the 1984 NEC Section 331-3 was the same as Section 336-3. In the 1987 NEC Section 331-3 was revised to eliminate the three story limit on the use of ENT.

The use of ENT was recognized by the NEC, and permitted to be used in buildings above 3 stories, as a result of the U.S. Supreme Court case, from 1981-1988, Allied Tube & Conduit v. Indian Head, Inc. (which decided that the actions of Allied Tube & Conduit during the 1980 NFPA Annual Meeting were not protected from antitrust liability), NEC-TCR-86-A Code Proposal 8-49, and NEC TCD-86 Comments 8-32 and 8-33.

NEC-TCR-86-A Code Proposal 8-49 used as substantiation the report entitled "The Use of ENMT, Fire Hazard Analysis", by Benjamin/Clarke Associates, Inc., dated 9/85, to accept the use of ENT above three stories when concealed behind a 15 minute finish rated thermal barrier.

In 1998, Sullivan Code Group prepared a report entitled, "Type NM Cable Fire Hazard Analysis", based on the same type of analysis that was used by the Benjamin/Clarke Hazard Analysis for ENMT. The results of the Sullivan Report (which is based on cone calorimeter testing by Dr. Fred Mower, Fire Protection Engineering Department, University of MD, and a third party peer review by Dr. Fred Clarke, Benjamin/Clarke Associates) concludes that the fire hazard (or lack thereof) of NM Cable is equivalent to ENMT.

As submitter of the original proposal, I support the Panel's rejection of my proposal based on the documentation submitted that clearly shows that ENT, as well as N/M Cable "...provide no new substantiation to identify this use as a hazard." It was clear from the Panel's Statement that ENT is a safe wiring system. Since the report submitted with this proposal compared ENT with NM Cable based on this Panel's original approval of ENT in 1985, it is clear that this Panel, by default, would agree that the installation of NM Cable behind a 15 minute barrier would be expected to perform the same. The inconsistent treatment between two PVC wiring methods under the NEC Code, by virtue of Panel 7's continued resistance to remove the 3 story restriction on the use of NM Cable, when presented the same documentation (See Code Proposal 7-145-(336-5)), as well as NFPA Fire Data showing no major fire problem in the US with fixed wiring in Apartment Buildings, will require the NEC Technical Correlating Committee and/or the NFPA Standards Council to resolve. We are only attempting to gain consistency in the NEC, and between Panel Committees, on electrical wiring methods.

Note: Supporting Material is available for review at NFPA Headquarters.

PANEL ACTION: Accept.

PANEL STATEMENT: The panel disagrees with the submitter's substantiation. The panel has not evaluated the suitability of installing Type NM cable behind a 15 minute finish rated assembly, nor has the panel made a comparison evaluation of ENT to Type NM cable. CMP-7 has the jurisdiction over the technical issues associated with Type NM cable and CMP-8 offers no opinion on the cable data provided by the submitter.

AFFIRMATIVE: 14

(Log #1605)

8- 20 - (331-3(2)): Accept in Principle
SUBMITTER: James K. Lathrop, Koffel Assoc., Inc.
COMMENT ON PROPOSAL NO: 8-65
RECOMMENDATION: Accept proposal as originally submitted.
SUBSTANTIATION: The Panel has not provided a valid technical reason for rejecting the proposal. The Panel Statement does not address legitimate issues presented in the Proposal Substantiation. In addition to the substantiation provided with the proposal, this comment is supported by the following.

This proposal simply allows an automatic sprinkler system to substitute for the 15-minute finish rating. There are many walls and ceilings even in a "fire rated" building that are not required to have a fire resistance rating. For example, in a Type II (222) building, if the ceiling is not part of the rating of the floor or roof assembly any ceiling tile, including no ceiling tile, is permitted. Similarly, if a wall is not a bearing wall, and is not required elsewhere to be rated, no fire resistance is required. To require materials that have a finish rating in a sprinklered building, just because of the existence of ENT is not justified. This is based on: analysis of the hazard, the fire record, and the litigation record.

In a sprinklered building, ENT that happens not to be protected behind a 15-minute finish rating is better protected than in a non-sprinklered building installed behind a 15-minute finish rating. NFPA fire data is clear that sprinkler protection is very successful, especially in the type of multi-story building being addressed in this provision. In order to have ENT or RNMC burn, a sustained fire exposure is needed. This is less likely in a sprinklered building than behind a 15-minute finish rating in a non-sprinklered building.

NFPA's fire records do not show any increase in fire incidents involving fixed electrical wiring since ENT has been permitted; in fact there is an overall decrease. There is no fire data that justifies the rejection of this proposal.

ENT has been used for decades without the 15-minute finish rating. In today's very litigious society if there were any injuries or deaths or serious fires in which ENT played a role, the manufacturer would be quickly aware of it. Carlon is not aware of such cases. There is no justification for the 15-minute finish rating, therefore there should be no problem substituting a sprinkler system for the barrier.
PANEL ACTION: Accept in Principle.

(Log #1807)

8- 21 - (331-3(2)): Reject
SUBMITTER: Tim Andrassy, Steel Tube Inst.
COMMENT ON PROPOSAL NO: 8-65
RECOMMENDATION: This proposal should continue to be rejected.
SUBSTANTIATION: To date, the building codes have restricted use of ENT in Types I and II construction. Even though the NEC requires a thermal barrier, ENT is only permitted in accordance with a National Evaluation Report (NER-290). This report only covers use in noncombustible, fire-resistive nonbearing walls and floor-ceiling assemblies. The limitations are based on testing provided by the company submitting Proposal 8-65.

The report requires that only specific outlet boxes (per NER-140) be used with the ENT. It covers only trade sizes 1/2 and 3/4, although ENT is produces through trade size 2 in. Gypsum wallboard is required to be 5/8 Type X. For a two-hour rated wall only three runs in any 6 foot length of wall is permitted, and there can be no more than two tubes in any one stud cavity. In one-hour rated walls only two tubes are permitted in any one stud cavity. In addition, the tubing must be wrapped in a specific 1-1/2 inch thick fiberglass insulation. (A proposal previously submitted to the CMP shows that this wrap substantially increases the temperature of the conductors and additional derating is required.) Nonmetallics are addressed as a whole in a floor-ceiling assembly and are permitted up to a three-hour rating. The distance from the top of the ceiling membrane to the bottom of the floor or roof deck above shall not be less than 16 3/8 inches. The total volume of rigid nonmetallic conduit, electrical nonmetallic tubing and liquidtight conduit shall not exceed 380 cubic inches per 100 square feet of ceiling area. This value also takes into account the amount of fittings and junction boxes necessary for installation. A table is provided to show the maximum linear feet/100 square feet of ceiling area. ALL types must be added together and the total must fall below the limit. None of these requirements appears in the NEC.

The current building code cycle has just ended. There appears to be a lack of correlation between two committees of the ICC Building Code this cycle. The General Occupancy Committee passed proposal G-113-00 which ordinarily addresses combustibles in nonconcealed spaces of Type I and Type II buildings. The Fire Safety Committee rejected the same type of proposal in FS-46-00 dealing with concealed spaces in these same buildings. Both proposals would permit the use of electrical wiring methods with combustible insulation, tubing, raceways and related components when installed in accordance with the ICC Electrical Code (this references the NEC.) The reason given by the Fire Safety Committee for not permitting these products in concealed spaces was that it was inappropriate because electrical wiring has a built-in source of ignition. However, a reference to the General Occupancy section makes it unclear if the Fire Safety decision can be enforced. We will try to clear this up next cycle, but in the meantime we must rely on the NEC for protection in these buildings.

Even before we get to Type I and II buildings, there is a problem. Some buildings will often be one-hour rated buildings. This one-hour rating is permitted to be reduced to 1/2 hour for tenant separation and guest rooms when the building has sprinklers. In some instances even the corridor and incidental common areas are not required to be separated. Even a full NFPA 13 does not require sprinklers where the exposed portions of the concealed space are constructed entirely of fire-retardant treated wood as defined by NFPA 703. Also, there is no data to indicate if nonmetallic wiring in these spaces will overwhelm the sprinklers such as has occurred in plastic storage situations. As Dr. Jack Snell has noted so frequently in the past, redundancy is necessary in fire safety. That redundancy is fast disappearing. This is especially troubling as buildings age and maintenance may not be sufficient.

With regard to the "fire history" of ENT, we quote Dr. Wesley Clayton, formerly a TAC member (6-23-89), "I am interested in the statement that you have had 'no claims.' I grew up in DuPont and have learned statements of that nature are questionable. Can you document this for the whole industry?" In addition, it has been our experience that every time we started to track down the specifics of nonmetallic fires the case has been settled and the court records sealed. It is extremely difficult to secure the data.

The NFPA Research Foundation is in the process of trying to determine the answers to concerns regarding incapacitation and lasting injury from the products of combustion. These answers are not available, but would follow-up on concerns expressed by the last TAC relative to endpoints other than death. This same concern in currently under review internationally. It is untimely to reduce the protection for ENT.

The codes, both the NEC and the building codes, provide a way to use nonmetallic wiring methods in a specific building or area if equivalency of specific details to permitted wiring methods can be provided. Permitting broad use is not in the interest of public safety and the mission of the Code.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 8-22.

EXPLANATION OF NEGATIVE:
DOLLINS: This comment should be accepted. It brings up many concerns that are not addressed either by Proposal 8-65 or the comments submitted in support of Proposal 8-65.
LOYD: See my Explanation of Negative on Comment 8-22.

(Log #1822)

8- 22 - (331-3(2)): Accept

Note: The panel's mandatory reference to another standard is in violation of Section 4.2 of the NEC Style Manual. To resolve the issue, the Technical Correlating Committee directs that 331.10(2) be revised to read as follows:

"(2) In any building exceeding three floors above grade, ENT shall be concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies. The 15-minute finish rated thermal barrier shall be permitted to be used for combustible walls, floors, and ceilings.

Exception: Where an approved fire sprinkler system(s) is installed on all floors as a complete system, ENT shall be permitted to be used within walls, floors, and ceilings, exposed or concealed, in buildings exceeding three floors above grade.
FPN 1: For further information on fire sprinkler system(s), see NFPA 13 – Standard for the Installation of Sprinkler Systems.
FPN 2: [remains as published in ROP 8-65].”

SUBMITTER: Joseph B. Zicherman, Fire Cause Analysis/Rep. Carlon, Lamson & Sessions
COMMENT ON PROPOSAL NO: 8-65
RECOMMENDATION: Revise text to read as follows:
(2) In any building exceeding three floors above grade, electrical nonmetallic tubing shall be concealed within walls, floors and ceilings where the walls, floors and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies. The 15-minute finish rated thermal barrier shall be permitted to be used for combustible walls, floors and ceilings.
Exception: When a fire sprinkler system(s) is installed in accordance with NFPA 13, Installation of Sprinkler Systems on all floors, ENT is permitted to be used within walls, floors and ceilings exposed or concealed in buildings exceeding three floors above grade.
FPN: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.
SUBSTANTIATION: Problem: Code Panel 8 rejected the original proposal pending: (a) input from the NFPA Toxicity Advisory Committee (which met to consider this item in October 2000) and (b) because "There was no substantiation provided to demonstrate the safety record of the product as stated by the submitter." This ROP comment is provided to give Code Panel 8 the desired substantiation to the panel beyond the comments on the subject provided in the original proposal.
Substantiation: ENT was allowed to be used in buildings up to three stories in height without requiring its installation behind a material with a minimum 15-minute finish rating from 1984 to 1987. Subsequent to that ENT has been used extensively with [minimum] 15-minute finish rated materials without verifiable reports of fire incidents or fire incidence data developing in the available databases.
In terms of fire incidents - the occurrences from which fire incidence data is developed - a search of the available literature shows that no systematic references can be found to ENT being a first item ignited or ENT leading to spread of fires. Sources researched include the fire incident reporting databases such as the National Fire Incident Reporting System, NFIRS compiled initially by individual jurisdictions and the NFPA as well as those on the forensic side such as Nexus, Westaw and Lexus.
Reviews of other sources of information such as the monthly anecdotal listings in the NFPA Fire Journal are also consistent with this lack of fire incidence related to ENT use. Evaluation of the peer reviewed Journal of the International Association of Arson Investigators (the IAAI) does not contain a single reference to ENT being involved in either the cause or spread of unwanted fires. In contrast to the lack of data on ENT involvement in fires, this same IAAI Journal includes references to electrical causation of fires in every issue published under many types of scenarios and for many types of wiring and installation methods. Given this lack of fire incidence information related to the use of millions of feet of ENT installed in all sorts of occupancies since 1984, it is not surprising that the original proposal could not provide extensive substantiation of fire occurrences involving ENT as none have been reported.
Additional substantiation that the installation method proposed would not diminish levels of fire safety achieved can be found in at least four additional sources. These include:
1. Review of the results of "Operation San Francisco: Smoke/Sprinkler Test" which documented full-scale fire tests with functioning NFPA 13 compliant sprinkler systems in 1984. That testing included ENT products in fire exposed rooms and compartments. A copy of the study referenced is provided for the panel's consideration.
2. Review of a technical report conducted relating to electrical and fire safety hazards posed in using PVC RNMC, a chemically identified precursor to ENT by Factory Mutual published in 1984 which demonstrated that faulting electrical of conductors installed in PVC based raceways does not lead to increased fire hazard. A copy of the study referenced is provided for the panel's consideration.
3. Review of comments in Chapters 3 and 5 included in "Fire Safety of PVC Raceways and the Model Building Codes" describing the response of ENT to fire conditions. A copy of the study is provided for the panel's consideration.
4. Study of a detailed analysis of both ENT and RMC materials exposed to electrical fault and fire conditions in a fire incident documented recently in San Jose, California which illustrates the resistance of ENT to ignition and fire spread in the field. These results showed in fact that the ENT raceway was significantly less effected than the RMC. The performance of the latter specifically led to fire growth and spread. See report including photos which I have provided.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept.
PANEL STATEMENT: Based on Comment 8-24 from the Toxicity Technical Advisory Committee and the substantiation for Comment 8-22, the reference to NFPA 13 is necessary as part of the requirements of this section. The panel agrees that the use of a Fine Print Note reference to NFPA 13 is not appropriate because a FPN is not enforceable. The panel understands that the reference to NFPA 13 in the text of the requirement does not comply with Section 4.2 of the NEC Style Manual, but in lieu of extracting the applicable sections of NFPA 13 into the NEC, the action is justified and the panel requests that the Technical Correlating Committee permit this action to stand.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
DOLLINS: See my explanation of negative vote on Comment 8-21.
LOYD: The TTAC substantiation does not support their recommendation nor the technical committee's action. Two major items cause me to find this insufficient for approving removal of the thermal barrier. The TAC decision was determined primarily on toxicity alone, using death as the endpoint.
1. Current international work is examining the role of toxic combustion gases in incapacitation of fire victims to the extent their escape is inhibited. (Work at ISO and the NFPA Research Foundation.) The jury is not in on this matter and we should not load our concealed building spaces with combustible materials until we have the answers to the questions being raised. It is important to remember that HCL, an extremely irritant gas from PVC, has a strong effect on the eyes, nose, and respiratory system and could be very incapacitating. In addition, however, PVC produces prolific carbon monoxide, the primary killer in fires. The TAC has not convinced me that they fully evaluated a fire originating in concealed spaces, especially in suspended ceilings. This is where I see use of ENT increasing the most because currently ceiling tiles with a finish rating are limited. If no finish rating is required, it is possible the NET will be installed behind non-fire rated tiles. This would be even more apt to occur in hi-rise buildings where this grid ceiling is used purely for esthetics and service concealment and the floor above it is the fire barrier. The TAC has focused more on the contribution of ENT in the event a fire originates in a room, and thus is incomplete. Looking at overall risk assessment of ENT permitted without the currently required thermal barrier I find there is a foreseeable hazard involved and do not believe it is justified. The courts are looking seriously at codes and standards that ignore these foreseeable hazards.
2. The trend of trading of important safety issues and depending strictly on sprinklers for fire protection is of concern. Everyone is aware that when some of the more serious fires have occurred the sprinkler system (failed) did not perform properly or the sprinkler system was down for repairs. There is no question sprinklers are very valuable for controlling fire spread until the fire department arrives but there is still a lot of smoke. Also, the building codes have already permitted numerous trade-offs, such as reducing the fire rating required for some assemblies to as little as 1/2 hour. Protection of corridors has been reduced or eliminated. Permitting this unrestricted use of a nonmetallic wiring method throughout buildings where combustibles have long been regulated opens the door for even more combustibles and further reduction in safety. Redundant fire protection is fast disappearing and I do not believe the NEC should be part of this deterioration.
The committee agrees that any building above three stories using ENT without the thermal barrier must be protected with a fire sprinkler system installed in accordance with NFPA 13. This was

intended to assure that the building was protected with a minimum level of safety, and verifies that the ENT could be a safety hazard. I believe this is sufficient reason to provide the extra safety measure of a thermal barrier.

NFPA has repeatedly marketed the NEC as in international document. This requirement may not be know or used in some countries where the NEC is adopted and used. I would urge the committee to vote "negative" on the written ballot on comments 8-20, 8-21, 8-22, 8-25, 8-26 and 8-27 to accept the concept at this time.

COMMENT ON AFFIRMATIVE:

DAUBERGER: NEMA recognizes that the mandatory reference to NFPA 13 is in violation of NFPA NEC Style Manual, and makes the following recommendations:

Revise 331-10(2) of the 2002 NEC Draft to read:

(2) In any building exceeding three floors above grade, ENT shall be concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies. The 15-minute finish rated thermal barrier shall be permitted to be used for combustible walls, floors, and ceilings.

Exception: When an approved fire sprinkler system(s) is installed on all floors as a complete system, ENT shall be permitted to be used within walls, floors, and ceilings, exposed or concealed, in buildings exceeding three floors above grade.

FPN 1: For further information on fire sprinkler system(s), see standard NFPA 13, Installation of Sprinkler Systems.

FPN 2: A finish rating is established for assemblies containing combustible (wood) supports...

KENDALL: I agree with George Dauberger and the NEMA affirmative statement on Comment 8-22. An approved sprinkler system installed completely on all floors is an acceptable practice and is in compliance with local codes.

(Log #2377)

8- 24 - (331-3(2), Exception (New)): Accept

SUBMITTER: Toxicity Technical Advisory Committee

COMMENT ON PROPOSAL NO: 8-65

RECOMMENDATION: The TTAC finds that this change would not significantly increase toxic hazard to occupants.

SUBSTANTIATION: Summary of Proposal: The use of ENT would be expanded to permit the concealed and exposed installation in buildings over three stories in height without a 15-minute finish rated barrier when the building is sprinklered in accordance with NFPA 13.

Toxicity Issues: The expanded use of exposed ENT in buildings over three stories and sprinklered throughout is not likely to decrease appreciably the time to the incapacitation of the occupants or slow their rates of egress. A properly installed sprinkler system should control the fire, reducing the overall smoke and thus the exposure of occupants to toxic gases, and more than compensating for any modest change in toxicity properties.

The toxic potency of the ENT smoke is not a primary issue. In a serious fire, far more fuel than the ENT would be involved. The lethal toxic potency of smoke from well-ventilated flaming of unplasticized PVC (such as in current ENT) is about 25 g/m^3 (NFPA 269)[1] which is comparable to values for most common fuels in buildings.[2] A similar value is estimated for post-flashover toxic potency.[3] A lethal toxic potency value for the smoke from thermally degraded unplasticized PVC is about 20 g/m^3, which is comparable to the values for flaming combustion.[4] The incapacitating exposures from smoke are generally taken as about one-third of the lethal exposures.[5] The toxic potency of ENT is already mandated in NEC Section 331-1 to be no greater than that of unplasticized PVC.

There is the potential for the ENT-generated fraction of the smoke to have a different toxicological impact on occupants, e.g., irritation by HC1 in addition to asphyxia caused by CO. This would affect the rate at which occupants are able to progress effectively from the hazardous zones in a building. The ENT fraction of the total fuel in a serious fire is likely to be small and the yields of irritant from the other (ordinary) fuels varies and is not regulated. Thus, it is not possible to estimate whether there is a significant and different toxic impact of the increased presence of ENT. However, since the control of the burning rate by the sprinkers should more than offset modest (if any) increases in the irritancy of the smoke from the ENT. The TTAC did not expect that the expanded use of ENT would result in a meaningful change in smoke density and thus, e.g., in the ability to view exit signs or doors.

It is possible that the exposure of occupants to fire smoke would be more lengthy and involve more people in tall buildings than in those of three or fewer floors. The TTAC noted that a building code provides many requirements that would mitigate any increase in hazard due to expnaded use of ENT. However, there are international and domestic locales where the NEC is used without building or fire code enforcement. Even in absence of a building or fire code, serious fires are likely to be dominated by fuels other than ENT, and thus the contribution to toxic hazard by ENT is likely to be modest at best.

The NEC panel statement for this proposal indicates that the TTAC would review the use of automatic sprinklers as a substitute for a 15-minute finish rating. A full benefit analysis is outside the role of the TTAC. However, should the water reach the burning fuels, the control of the fire would more than offset any increase in toxic hazard due to additional exposed ENT.

General comments on the offered sprinkler protection: The proposal should be clarified to use sprinkler terminology found in current building and fire codes. For example "Exception: In buildings protected throughout with a fire sprinkler system installed in accordance with NFPA 13, Installation of Sprinkler Systems, ENT is permitted to be used...". Consideration should be given to sprinkler systems installed according to NFPA 13R for four story residential buildings. The accumulation of C/D electrical products in non-combustible concealed spaces may become large enough to require sprinkler protection in those spaces.

General Statements: This comment was developed by the NFPA Toxicity Technical Adviosry Committee. Members of this committee are as follows: Richard G. Gann, Ph.D., Chair; Craig Beyler, Ph.D; Edward V. Clougherty, Ph.D; Christopher Laux, AIA, CBO; James P. Lyon, Ph.D; and Richard Pehrson, Ph.D.

The 12 proposals for the 2002 NEC that were forwarded to the Toxicitiy Technical Advisory Committee (TTAC) on May 26, 2000 for comment all involve potential changes in the mass and location of combustible or degradable (C/D) materials within a building. Such changes might affect the fire's rate of heat release, the single most important variable affecting hazard to people since it is the driving force leading to the spread of fire and products of combustion. Having been advised that the NEC task groups contain the necessary expertise to address fire growth and overall fire hazard, the TTAC is only submitting comments on the impacts of the proposed changes on smoke toxicity and toxic hazard.

In the following comments, references to "occupants" are meant to include firefighters operating in accordance with NFPA 1500.

The composition of the C/D products, and thus the smoke generated in a fire, may evolve over time. Thus, the TTAC comments apply to general changes in the mass and location of C/D products and are not limited to the current formulation of such products.

Section 331-1 of the NEC requires that the toxicity characteristics of NMT be no worse than those of unplasticized PVC, but does not name those characteristics nor cite a test method for measuring them. NFPA 269 was developed for such purposes. It can be used to provide (a) data on the lethal toxic potency of smoke and (b) gas yields of key toxicants for use in fire hazard modeling. Section 331-1 should be modified to note both the method to be used and that these are the data to be provided. A prescriptive (e.g., LC_{50}) comparison with unplasticized PVC should be replaced by a comparison of Toxic hazard of the proposed product and unplasticized PVC.

EXPLANATION OF NEGATIVE:
SIMPSON: I would agree with the panel action if there is a way to word enforcement of NFPA - 13 sprinkling guidelines as proposed, however, during panel discussion there is concern of such enforcement. Therefore, without such enforcement my vote would be to reject 8-24.

(Log #1606)

8- 25 - (331-3(5)): Accept in Principle
SUBMITTER: James K. Lathrop, Koffel Assoc., Inc.
COMMENT ON PROPOSAL NO: 8-66
RECOMMENDATION: Accept proposal as originally submitted.
SUBSTANTIATION: The Panel has not provided a valid technical reason for rejecting the proposal. The Panel Statement does not address legitimate issues presented in the Proposal Substantiation. In addition to the substantiation provided with the proposal, this comment is supported by the following.

This proposal simply allows an automatic sprinkler system to substitute for the 15-minute finish rating. There are many walls and ceilings even in a "fire rated" building that are not required to have a fire resistance rating. For example, in a Type II (222) building, if the ceiling is not part of the rating of the floor or roof assembly any ceiling tile, including no ceiling tile, is permitted. Similarly, if a wall is not a bearing wall, and is not required elsewhere to be rated, no fire resistance is required. To require materials that have a finish rating in a sprinklered building, just because of the existence of ENT is not justified. This is based on: analysis of the hazard, the fire record, and the litigation record.

In a sprinklered building, ENT that happens not to be protected behind a 15-minute finish rating is better protected than in a non-sprinklered building installed behind a 15-minute finish rating. NFPA fire data is clear that sprinkler protection is very successful, especially in the type of multi-story building being addressed in this provision. In order to have ENT or RNMC burn, a sustained fire exposure is needed. This is less likely in a sprinklered building than behind a 15-minute finish rating in a non-sprinklered building.

NFPA's fire records do not show any increase in fire incidents involving fixed electrical wiring since ENT has been permitted; in fact there is an overall decrease. There is no fire data that justifies the rejection of this proposal.

ENT has been used for decades without the 15-minute finish rating. In today's very litigious society if there were any injuries or deaths or serious fires in which ENT played a role, the manufacturer would be quickly aware of it. Carlon is not aware of such cases. There is no justification for the 15-minute finish rating, therefore there should be no problem substituting a sprinkler system for the barrier.

PANEL ACTION: Accept in Principle.

(Log #1821)

8- 26 - (331-3(5)): Accept

Note: The panel's mandatory reference to another standard is in violation of Section 4.2 of the NEC Style Manual. To resolve the issue, the Technical Correlating Committee directs that 331-3(5) be revised to read as follows:

"(5) Above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies, except as permitted in Section 331-10(1)(a).

Exception: Where an approved fire sprinkler system(s) is installed on all floors as a complete system, ENT shall be permitted to be used above suspended ceilings without a 15-minute finish rated thermal barrier material.

FPN: For further information on fire sprinkler system(s), see NFPA 13 – Standard for the Installation of Sprinkler Systems."

SUBMITTER: Joseph B. Zicherman, Fire Cause Analysis/Rep. Carlon, Lamson & Sessions
COMMENT ON PROPOSAL NO: 8-66
RECOMMENDATION: Revise text to read as follows:

(5) Above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies, except as permitted in Section 331-3(1)(a).

Exception: When a fire sprinkler system(s) is installed in accordance with NFPA 13, Installation of Sprinkler Systems, on all floors, ENT is permitted to be used above suspended ceilings without 15-minute finish rated thermal barrier material.

SUBSTANTIATION: Problem: Code Panel 8 rejected the original proposal pending: (a) input from the NFPA Toxicity Advisory Committee (which met to consider this item in October 2000) and (b) because "There was no substantiation provided to demonstrate the safety record of the product as stated by the submitter." This ROP comment is provided to give Code Panel 8 the desired substantiation to the panel beyond the comments on the subject provided in the original proposal.

Substantiation for comment: ENT was allowed to be used in buildings up to three stories in height without requiring its installation behind a material with a minimum 15-minute finish rating from 1984 to 1987. Subsequent to that ENT has been used extensively with [minimum] finish rated materials without verifiable reports of fire incidents or fire incidence data developing in the available databases.

In terms of fire incidents - the occurrences from which fire incidence data is developed - a search of the available literature shows that no systematic references can be found to ENT being a first item ignited or ENT leading to spread of fires. Sources researched include the fire incident reporting databases such as the National Fire Incident Reporting System, NFIRS compiled initially by individual jurisdictions and the NFPA as well as those on the forensic side such as Nexus, Westlaw and Lexus.

Reviews of other sources of information such as the monthly anecdotal listings in the NFPA Fire Journal are also consistent with this lack of fire incidence related to ENT use. Evaluation of the peer reviewed Journal of the International Association of Arson Investigators (the IAAI) does not contain a single reference to ENT being involved in either the cause or spread of unwanted fires. In contrast to the lack of data on ENT involvement in fires, this same IAAI Journal includes references to electrical causation of fires in every issue published under many types of scenarios and for many types of wiring and installation methods. Given this lack of fire incidence information related to the use of millions of feet of ENT installed in all sorts of occupancies since 1984, it is not surprising that the original proposal could not provide extensive substantiation of fire occurrences involving ENT as none have been reported.

Additional substantiation that the installation method proposed would not diminish levels of fire safety achieved can be found in at least four additional sources. These include:

1. Review of the results of "Operation San Francisco: Smoke/Sprinkler Test" which documented full-scale fire tests with functioning NFPA 13 compliant sprinkler systems in 1984. That testing included ENT products in fire exposed rooms and compartments. A copy of the study referenced is provided for the panel's consideration.

2. Review of a technical report conducted relating to electrical and fire safety hazards posed in using PVC RNMC, a chemically identified precursor to ENT by Factory Mutual published in 1984 which demonstrated that faulting electrical of conductors installed in PVC based raceways does not lead to increased fire hazard. A copy of the study referenced is provided for the panel's consideration.

3. Review of comments in Chapters 3 and 5 included in "Fire Safety of PVC Raceways and the Model Building Codes" describing the response of ENT to fire conditions. A copy of the study referenced is provided for the panel's consideration.

4. Study of a detailed analysis of both ENT and RMC materials exposed to electrical fault and fire conditions in a fire incident documented recently in San Jose, California which illustrates the resistance of ENT to ignition and fire spread in the field. These results showed in fact that the ENT raceway was significantly less effected than the RMC. The performance of the latter specifically led to fire growth and spread. I have provided a copy of the report including photos.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept.

PANEL STATEMENT: Based on Comments 8-24 and 8-29 from the Toxicity Technical Advisory Committee and the substantiation for Comment 8-26, the reference to NFPA 13 is necessary as part of the requirements of this section. The panel agrees that the use of a Fine Print Note reference to NFPA 13 is not appropriate because a FPN is not enforceable. The panel understands that the reference to NFPA 13 in the text of the requirement does not comply with Section 4.2 of the NEC Style Manual, but in lieu of extracting the applicable sections of NFPA 13 into the NEC, the action is justified and the panel requests that the Technical Correlating Committee permit this action to stand.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

LOYD: The TTAC substantiation does not support their recommendation nor the technical committee's action. Two major items cause me to find this insufficient for approving removal of the thermal barrier. The TAC decision was determined primarily on toxicity alone, using death as the endpoint.

1. Current international work is examining the role of toxic combustion gases in incapacitation of fire victims to the extent their escape is inhibited. (Work at ISO and the NFPA Research Foundation.) The jury is not in on this matter and we should not load our concealed building spaces with combustible materials until we have the answers to the questions being raised. It is important to remember that HCL, an extremely irritant gas from PVC, has a strong effect on the eyes, nose, and respiratory system and could be very incapacitating. In addition, however, PVC produces prolific carbon monoxide, the primary killer in fires. The TAC has not convinced me that they fully evaluated a fire originating in concealed spaces, especially in suspended ceilings. This is where I see use of ENT increasing the most because currently ceiling tiles with a finish rating are limited. If no finish rating is required, it is possible the NET will be installed behind non-fire rated tiles. This would be even more apt to occur in hi-rise buildings where this grid ceiling is used purely for esthetics and service concealment and the floor above it is the fire barrier. The TAC has focused more on the contribution of ENT in the event a fire originates in a room, and thus is incomplete. Looking at overall risk assessment of ENT permitted without the currently required thermal barrier I find there is a foreseeable hazard involved and do not believe it is justified. The courts are looking seriously at codes and standards that ignore these foreseeable hazards.

2. The trend of trading of important safety issues and depending strictly on sprinklers for fire protection is of concern. Everyone is aware that when some of the more serious fires have occurred the sprinkler system (failed) did not perform properly or the sprinkler system was down for repairs. There is no question sprinklers are very valuable for controlling fire spread until the fire department arrives but there is still a lot of smoke. Also, the building codes have already permitted numerous trade-offs, such as reducing the fire rating required for some assemblies to as little as 1/2 hour. Protection of corridors has been reduced or eliminated. Permitting this unrestricted use of a nonmetallic wiring method throughout buildings where combustibles have long been regulated opens the door for even more combustibles and further reduction in safety. Redundant fire protection is fast disappearing and I do not believe the NEC should be part of this deterioration.

The committee agrees that any building above three stories using ENT without the thermal barrier must be protected with a fire sprinkler system installed in accordance with NFPA 13. This was intended to assure that the building was protected with a minimum level of safety, and verifies that the ENT could be a safety hazard. I believe this is sufficient reason to provide the extra safety measure of a thermal barrier.

NFPA has repeatedly marketed the NEC as in international document. This requirement may not be know or used in some countries where the NEC is adopted and used. I would urge the committee to vote "negative" on the written ballot on comments 8-20, 8-21, 8-22, 8-25, 8-26 and 8-27 to accept the concept at this time.

COMMENT ON AFFIRMATIVE:

DAUBERGER: NEMA recognizes that the mandatory reference to NFPA 13 is in violation of the NFPA NEC Style Manual, and makes the following recommendations:

Revise 331-10(5) of the 2002 NEC Draft to read:

(5) Above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies, except as permitted in Section 331-10(1)(a).

Exception: When an approved fire sprinkler system(s) is installed on all floors as a complete system, ENT shall be permitted to be used above suspended ceilings without a 15-minute finish rated thermal barrier material.

FPN: For further information on fire sprinkler system(s), see standard NFPA 13, Installation of Sprinkler Systems.

KENDALL: I agree with George Dauberger and the NEMA affirmative statement on Comment 8-26. An approved sprinkler system installed completely on all floors is an acceptable practice and is in compliance with local codes.

SUBMITTER: James M. Daly, BICC General
COMMENT ON PROPOSAL NO: 8-57
RECOMMENDATION: The proposal should continue to be accepted in principle with the following revisions.
331-12 Revise as follows:
ENT shall not be used ~~in the following:~~
Add the following exception to 331-12(4):
Exception: Insulated conductors or multiconductor cables rated at a higher temperature than the ENT listed temperature rating shall be permitted to be installed in ENT provided they are not operated at a temperature higher than the ENT listed temperature rating.
SUBSTANTIATION: Deletion of the phrase "in the following" makes the list read better as complete sentences.
The exception will resolve a conflict within the code.
There are numerous wire and cable products in the code that are rated higher than the ENT temperature rating.
The exception will permit higher rated conductors or cables to be installed in ENT provided they are not operated at a temperature higher than the ENT temperature rating.
The temperature rating of the ENT will not be exceeded, equivalent safety will be provided, and other products will not be prohibited from being used in ENT.
PANEL ACTION: Hold.
PANEL STATEMENT: In accordance with Section 4-4.6.2.2(a) of the NFPA Regulations Governing Committee Projects this comment is held as the proposed exception introduces new material that has not had public review.

8- 32 - (331-30, Exception): Hold
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 8-57
RECOMMENDATION: Accept in principle revised as follow:
Delete present exception and substitute:
Exception No. 1: The intervals for fastening and support from luminaires and equipment in or on suspended ceilings shall be permitted to be increased where: (1) structural members (including support wires or rods and ceiling grid members) where permitted to be used, do not readily permit support intervals required by this section; (2) the nearest readily available support member is used; (3) the fastening and support intervals do not exceed 1.8 m (6 ft); and (4) the ENT is above the suspended ceiling.
Exception No. 2: Fastening shall not be required where an unbroken length of ENT is fished between access points in finished buildings or structures.
SUBSTANTIATION: I believe the original concept of allowing unsupported lengths was to apply to the space above suspended ceilings. Present wording permits a carte blanche use for all installations and negates the general rule. Where structural support above a suspended ceiling is less than 6 ft above the ceiling or where support wires or ceiling grids not prohibited from support are available at less than 6 ft there is no reason such members can't be used. Similar exceptions for other wiring methods include connection to equipment and permit fishing.
PANEL ACTION: Hold.
PANEL STATEMENT: In accordance with Section 4-4.6.2.2(a) of the NFPA Regulations Governing Committee Projects this comment is held as the proposed exception introduces new material that has not had public review. There were no technical changes to the support requirements in Proposal 8-57.

(Log #958)

8- 33 - (331-30(a), Exception): Hold
SUBMITTER: Joseph A. Ross, Ross Electrical Assessments
COMMENT ON PROPOSAL NO: 8-57
RECOMMENDATION: Revise the Exception as follows:
Exception: Lengths not exceeding 6-feet (1.83m) from an outlet for connection within an accessible ceiling to lighting fixtures or equipment.
SUBSTANTIATION: This revised exception is not to be considered new material. Note: The proper text presently appears in Sections 333-7(b)(3), 334-10(b), and 336-18 Exception No. 2. This Comment corrects an omission. It is to be noted that ENT is intended to be permitted as a "whip." The text of the present Exception stops short of referencing Section 410-67(c), but uses the text from Section 410-67(c) and ENT is not permitted for that use (to contain hi-temp conductors). See companion Comments for Sections 350-30 and 3XX-30(a) Exception.
The omission must be corrected as 6-foot lengths (whips) are presently manufactured and listed and in common use today. Some inspectors have rejected their use.
The term "whip" is not defined in the NEC, but everyone knows what a "whip" is and takes for granted that flexible raceways and cables are permitted for this use. However, many misinterpret that Section 410-67(c) addresses "whips" and believe the method is covered. It is not.
Section 410-67(c) was introduced into the NEC to permit a transition from the hi-temp fixture wires of a recessed incandescent fixture to lo-temp branch-circuit wires. That is, a recessed incandescent fixture was provided with a 6 foot "tail" of flexible metal raceway or metal-sheathed cable containing hi-temp fixture wire for connection, within a field installed junction box, to lo-temp branch-circuit wiring. The 6 foot "tail" assured that the heat of the fixture would not be transmitted to the branch-circuit wiring.
This method provided for the fixture to be installed in a plastered or sheetrock (nonaccessible) ceiling cavity and the junction box being "placed" rather than rigidly supported and fastened. The unsupported "tail" and branch-circuit wiring assures that the box is accessible and may be retrieved (for any reason) through the fixture trim opening by removing the fixture.
A "whip" application is quite different, i.e., a "whip" is permitted to be unsupported, not more than 6 feet in length, and run from an accessible and rigidly supported and fastened outlet box for connection within an accessible ceiling to lighting fixtures or equipment.
PANEL ACTION: Hold.
PANEL STATEMENT: In accordance with Section 4-4.6.2.2(a) of the NFPA Regulations Governing Committee Projects this comment is held as the proposed exception introduces new material that has not had public review. There were no technical changes to the support requirements in Proposal 8-57.

ARTICLE 333 — ARMORED CABLE

(Log #1825)

7- 16 - (333-3 and 333-4): Accept
SUBMITTER: Marshall A. Klein, Marshall A. Klein & Assoc., Inc.
COMMENT ON PROPOSAL NO: 7-96
RECOMMENDATION: We support the Panel's rejection based on the supporting documentation in the original proposal. The

submitted report, NBSIR 78-1415, "Fire Endurance Tests of Residential Walls Containing Branch Circuit Wiring-Preliminary Findings," substantiates that there is no significant difference in the performance of different cable types. The two cable types used in this study were Type NM and Type AC.
SUBSTANTIATION: As submitter of the original proposal, I support the Panel's rejection of my proposal based on the documentation submitted that clearly shows that AC, as well as NM Cable "...has not documented any problems resulting from the current permitted uses for Type AC Cable that would support the proposed restrictions on those uses." It was clear from the Panel's Statement that AC Cable is a safe wiring system. Since the NBS Report submitted with this proposal compared AC Cable with NM Cable, it is clear that Panel 7, by default should agree that the installation of NM Cable in a one hour fire rated wall assembly would be expected to perform the same. There is an inconsistent treatment between these two wiring methods under the NEC Code, as well as vs. the unrestricted use of ENT above three stories. Panel 8's continued resistance to restrict the use of ENT to 3 story buildings (See Code Proposal 8-64-(331-3 and 331-4)), when Panel 7 has continued to restrict the use of NM Cable above three stories based on the same documentation and NFPA Fire Data showing no major fire problem in the US with fixed wring in Apartment Buildings (See Code Proposal 7-145-(336-5)), will require the NEC Technical Correlating Committee and/or the NFPA Standards Council to resolve. We are only attempting to gain consistency in the NEC, and between Panel Committees, on electrical wiring methods.

In further support, the NEC NM Task Group at its August 27-30, 2000 meeting, confirmed with ULs representative on the Task Group, Mr. Tom Guida, that wiring installed within a fire-rated wall or ceiling does not have any impact on the integrity of the fire rating of the wall or ceiling (Enclosure 4 of the August 2000 Meeting Minutes, Question #11 and Answer). As also noted in the minutes of this Task Group, under Item 00-8-4c, "Review of UL Information", Chairman Traniner had a phone conversation with Mr. Walke of UL that confirmed Mr. Guida's answer on this issue.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel concurs with submitter's recommendation that is in agreement with the panel's action to reject Proposal 7-96. The panel does not agree with the inference made by the submitter, in the substantiation provided with this comment, that Type AC Cable should be treated the same as Type NM Cable because in some specific test no difference was observed in the performance of the two wiring methods.

ARTICLE 334 — METAL-CLAD CABLE

(Log #2099)

7- 17 - (334-3(12)c): Reject
SUBMITTER: George W. Flach, Nat'l Armored Cable Mfrs' Assn. (NACMA)
COMMENT ON PROPOSAL NO: 7-114
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: The technical substantiation requested by the panel is that the interlocked armor of Type MC is not impervious to water and while the conductors within the cable are rated for wet locations, water that enters the cable core through the armor will migrate to terminations creating a hazardous condition. Major manufacturers of MC cable do not offer unjacketed MC for wet locations. The Code should reflect this higher level of safety.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided additional technical substantiation to convince the panel to change its position on Proposal 7-114.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #79)

7- 18 - (334-10(a)(2), (e)): Accept in Principle
Note: The Technical Correlating Committee understands that the Panel Action on Comment 7-22b is the final action on this section and the issue of support at terminations will now be covered in 334.30(C).
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 7-121
RECOMMENDATION: The Technical Correlating Committee understands that the action deletes 334-30(a)(2) in Proposal 7-107a. In addition, the Technical Correlating Committee directs the Panel to address the Style Manual issues as they relate to the rewrite of 334-30. This action will be considered by the Panel as a Public Comment.

SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept in Principle.
Section 334-30(a)(2) should become 334.30(A)(2) and read as follows:
At Terminations. Cables containing four or fewer conductors, sized not larger than 10 AWG shall be secured within 300 mm (12 in.) of every box, cabinet, fitting, or other cable termination.
PANEL STATEMENT: The panel recognizes that their action on Proposal 7-121 deletes 334-30(a)(2) in Proposal 7-107a. The panel has reconsidered this action and reverses its action. The 1999 NEC contained identical support requirements in Sections 334-30(a) and 334-30(a)(2). The panel only intended to delete one of these requirements.

7- 21 - (334-14 (New)):
Note: The Technical Correlating Committee directs that this Comment be reported as "Accept in Principle" and is superceded by the wording in Comment 7-19a.
SUBMITTER: James M. Daly, BICC General
COMMENT ON PROPOSAL NO: 7-126
RECOMMENDATION: This proposal should continue to be accepted.
The text should be included as 334-31 in the rewrite of Article 334 accepted under Proposal 7-107a. The new section would read as follows:
334-31 Grouping of Single Conductors. Where single-conductor cables are used, all phase conductors and, where used, the neutral conductor shall be grouped together to minimize induced voltage on the sheath.
SUBSTANTIATION: Location of the text as indicated above will address the Technical Correlating Committee Comment relative to the location and title of the proposed language and will also be consistent with the direction provided by the Technical Correlating Committee Comment on Proposal 7-69a.
Location of the text in a new Section 334-31 will provide consistency with a Comment to locate similar text in 330-31; see my Comment on Proposal 7-69a.
The numbering of this section will also coordinate with the section renumbering of Chapter 3 and XXX-31 should be added to the renumbering list and reserved for this specific requirement.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
STEWART: As written, the new section 334-31 limits the use of single conductor Type MC cable to bundled configuration. This is excessively restrictive as there are many installations of single conductor MC cable with spaced conductors.
This should be revised to allow both spaced and bundled installations.
The suggested revision should be as given below:
"334-31 - Grouping of single conductor:
Where single conductor cables are used, they may be bundled or spaced.
Where all phase conductors and, where used, the neutral conductor are grouped together, the induced voltage in the sheath will be minimized.
Where phase conductors and, where used, the neutral conductor are spaced, the armor should be grounded at one point only to avoid circulating current in the armor."
The above revision would allow for installation of both spaced and bundled conductors and the user can choose which method best fits their needs.

(Log #2151)

7- 22 - (334-14 (New)): Reject
SUBMITTER: Robert Konnik, Rockbestos-Suprenant Cable Corp.
COMMENT ON PROPOSAL NO: 7-126
RECOMMENDATION: Reject new text 334-14.
SUBSTANTIATION: Cables in Table 310-13 (RHW, XHHW, THHN, etc.) are used as single conductors that are not required to be grouped. The same is true for shielded and nonshielded medium voltage cable. One application is shown in detail 9 of Appendix B of the NEC, and in detail 9 of 310-60. The NEC should not limit a single conductor MC cable to be bundled, when it may be properly designed and installed in a maintained space configuration. This configuration may be used to increase ampacity to allow the use of Table 310-17 ampacity when properly designed.
PANEL ACTION: Reject.

PANEL STATEMENT: The panel does not concur with the substantiation provided in this comment that single conductors do not have to be grouped. See panel action on Comment 7-19a.

(Log #385)

7- 23 - (334-30(b)): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 7-107(a)
RECOMMENDATION: Accept in principle revised: 334-30(b) UNSUPPORTED CABLES. (1) WHERE FISHED. Type MC cable shall not be required to be supported and secured where the cable is fished between access points where concealed in finished buildings or structures. ~~and supporting is impractical, or where used in lengths not more than 1.8m (6 ft.) from an outlet for connections within an accessible ceiling to lighting fixtures or equipment.~~ (2) ACCESSIBLE CEILINGS. The support interval from terminations at luminaires or equipment in or on suspended ceilings shall be permitted to be increased where all the following conditions are met: (a) structural members (including support wires or rods and ceiling grid members, where permitted to be used) do not permit the support interval required by (a)(2); (b) the nearest readily available support member is used; (c) the support interval does not exceed 1.8m (6 ft); and (d) the cable is above the suspended ceiling.
SUBSTANTIATION: The phrase "and supporting is impracticable" is superfluous. Present requirement "from an outlet" infers the length must originate from a box or conduit body and cannot be a longer continuous length from a panelboard.
The broad exemption of support within 12 in. is not warranted where structural support above a suspended ceiling is less than 6 ft or where support wires or rods and ceiling grid members are available at less than 6 ft. The 6 ft maximum should apply only where no closer support is available. Since this section only affects (a)(2) that section is noted.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Comment 7-22b.

7- 25 - (334-80): Accept in Principle
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
COMMENT ON PROPOSAL NO: 7-125
RECOMMENDATION: Revise text as follows:
334.80. Ampacity.
(A) General. The ampacity of Type MC cable shall be determined in accordance with 310.15 or 310.60 for 14 AWG and larger conductors and in accordance with Table 402.5 for 18-16 AWG conductors. The installation shall comply with temperature ratings of termination and equipment.
(B) Type MC Cable Installed in Cable Tray. The ampacities for Type MC cable installed in cable tray shall be determined in accordance with 318.11 and 318.13 and the installation shall comply with temperature ratings of termination and equipment.
(C) Single Type MI Conductors Grouped Together. Where single Type MC conductors are grouped together in a triangular or square configuration, as required by 334.14, and installed on a messenger or as open runs with a maintained free air space of not less than 2.15 times one conductor diameter (2.15 x O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall not exceed the allowable ampacities of:
(1) Table ~~310.20~~310.17 for conductors rated 0 through 2000 volts
(2) Tables 310.67 and 310.68 for conductors rated over 2000 volts
The installation shall comply with temperature ratings of termination and equipment.
SUBSTANTIATION: Recommended changes regarding compliance with temperature ratings of termination and equipment are similar to those recommended in a separate comment on Proposal 7-88 for 330.80. Please see that comment.
In Item (C) above, the Table reference should be 310.17 instead of 310.20.
PANEL ACTION: Accept in Principle.
Revise text to read:
334.80 Ampacity. The ampacity of Type MC cable shall be determined in accordance with 310.15 or 310.60 for 14 AWG and larger conductors and in accordance with Table 402.5 for 18-16 AWG conductors. The installation shall not exceed the temperature ratings of terminations and equipment.
(A) Type MC Cable Installed in Cable Tray. The ampacities for Type MC cable installed in cable tray shall be determined in accordance with 318.11 and 318.13.
(B) Single Type MC Conductors Grouped Together. Where single Type MC conductors are grouped together in a triangular or square configuration and installed on a messenger or as open runs with a maintained free air space of not less than 2.15 times one

conductor diameter (2.15 x O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall not exceed the allowable ampacities of:
(1) Table 310.20 for conductors rated 0 through 2000 volts
(2) Tables 310.67 and 310.68 for conductors rated over 2000 volts.
PANEL STATEMENT: The submitter's text has been incorporated into revisions made to be consistent in style with the text in Section 330-80. See panel action on Comment 7-15 relating to the change from Table 310-17 to Table 310-20.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
STEWART: This proposal would allow Type AC cable to be used as a general wiring method on cranes and hoists. Type AC cable is not suitable for the flexing conditions normally associated with this application due to armor separation. AC cable should be limited to fixed installations only.
The flexibility test for Type AC cable is a single bend of one turn around a fixed cylinder. This is not sufficient to qualify this construction for a flexing application.
COMMENT ON AFFIRMATIVE:
TEMBLADOR: Add "in accordance with 110-14(C)" as shown below. See our Explanation of Negative vote on Comment 7-15 for details.
334.80 Ampacity. The ampacity of Type MC cable shall be determined in accordance with 310.15 or 310.60 for 14 AWG and larger conductors and in accordance with Table 402.5 for 18-16 AWG conductors. The installation shall not exceed the temperature ratings of terminations and equipment in accordance with 110-14(c).
No change in the remaining text per Panel Action.

ARTICLE 336 — Nonmetallic-Sheathed Cable

(Log #81)

7- 26 - (336): Reject
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 7-128a
RECOMMENDATION: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
Further, the Technical Correlating Committee directs that the definition in 336-12(a)(1) be moved to 336-2 Definitions to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Reject.

7- 27 - (336): Accept
SUBMITTER: James M. Daly, BICC General
COMMENT ON PROPOSAL NO: 7-130
RECOMMENDATION: Continue to reject this proposal.
SUBSTANTIATION: This proposal should continue to be rejected as supported by the panel statement. Refer to my comment on Proposal 7-145.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
NUTT: It has not been technically substantiated that there is a need for the three-floor restriction on the use of Type NM cable. Properly installed type NM wiring systems are safe to operate and safe to use regardless of the building's height or number of floors. There are two states (Massachusetts and Michigan) that take exception to the restricted use of NM, NMC, and NMS and have positive experience in using these cables in those areas. These cables have thus far stood the test of time and we should be cautious about restricting the use of these cables.
Additional statistical NFPA data has been supplied to the Code Making Panel that shows an excellent track record for NM type cable systems. Also, the Toxicity Advisory Committee comments on NM type cables did not indicate that toxicity was not a reason to restrict the use of NM cable.
PROPST: While I do not necessarily support the concept presented by this proposal, I also do not support the reasoning used by Code-Making Panel 7 in rejecting the variety of different proposals related to the application of NM cable to multifamily dwellings. My reasoning for disagreeing with the direction of the panel is further discussed under Comment 7-52.

(Log #1814)

7- 28 - (336): Accept
SUBMITTER: Tim Andrassy, Steel Tube Inst.
COMMENT ON PROPOSAL NO: 7-130
RECOMMENDATION: This proposal should continue to be rejected.
SUBSTANTIATION: Since this proposal was submitted we have realized that the NEC should be a stand alone document. Building codes are not in the same code change cycle and their requirements differ in various jurisdictions, both domestic and foreign. Any requirements for mitigation of, or protection from, the fire hazards of N/M cable should be self-contained in the NEC. Additionally, further fire characteristic information has been developed in a cohesive fashion. Information is available that N/M cable can be a source of ignition even in a code compliant installation, due to undetected damage at the time of installation. Many trade-offs are occurring in exchange for sprinklers, including the fact that some assemblies that are tenant separations and guest room separations may now only be 1/2 hour. The NFPA Task Group on the three story rule has examined documentation in support of expanded use of N/M Cable in detail and does not recommend expansion at this time. SEE ALSO FULL COMMENTS MADE TO PROPOSAL 7-145
PANEL ACTION: Accept.

7- 31 - (336-4 and 336-5): Accept
SUBMITTER: James M. Daly, BICC General
COMMENT ON PROPOSAL NO: 7-137
RECOMMENDATION: Continue to reject this proposal.
SUBSTANTIATION: This proposal should continue to be rejected as supported by the panel statement. Refer to my comment on Proposal 7-145. Item 3, regarding electromagnetic interference in the panel statement is beyond the scope of the NEC. In the panel statement, the panel noted that the task Group on NM Cable disagreed on the extent to which nonmetallic sheathed cable becomes an ignition source under these conditions. Evaluation of Type NM cable under overload conditions should be provided in any Fact Finding Report. It should be noted that the Task Group Report included as an attachment to Proposal 7-137 did not receive consensus support from the Task Group.

SUBMITTER: Tim Andrassy, Steel Tube Inst.
COMMENT ON PROPOSAL NO: 7-135
RECOMMENDATION: Continue to reject this proposal.
SUBSTANTIATION: Particular attention is called to 336-4 (2). This proposal permits use in multifamily dwellings in Types III, IV and V construction. Even if it were to be accepted, it should read Multifamily Dwelling Units. As defined in the NEC, multifamily dwellings could be any building that contains three or more dwelling units, regardless of what other occupancies are in the building. This proposal was originally developed by the 3-story Task Group, but was not accepted by them. Further review by the Task Group found this not to be acceptable expanded use for the product as currently produced. Even with a thermal barrier, ENT has been limited in its use by the building codes. There is information available that even ENT in 1-hour rated assemblies can reduce the rating unless it is wrapped in specific environmental insulation. Some of the assembly ratings in the proposed construction could now be 1/2 hour rated. Testing similar to that performed on ENT is needed to assure the assembly rating will not be compromised. The NIBS report submitted by the proponents does not provide the necessary information and primarily evaluated openings in assemblies. In addition, the impact of the insulation on the ampacity of the N/M Cable should be evaluated as the wrap dramatically increases the temperature of the ENT. SEE ADDITIONAL INFORMATION IN COMMENT TO 7-145.

7- 40 - (336-4 and 336-5): Accept
SUBMITTER: Phil Simmons, Simmons Electrical Services
COMMENT ON PROPOSAL NO: 7-135
RECOMMENDATION: Continue to reject the proposal.
SUBSTANTIATION: While it is true that all wiring methods can be improperly installed and abused, they are not equally susceptible to such treatment. That is because not all wiring methods are equally constructed to withstand improper installation or abuse. The hazards presented by improper installation and abuse also are not equal. Type NM cable by its very nature invites abuse and non-code compliance by the ease with which it can be spliced, tapped, nicked, and overloaded. Recent fire reports indicate that a single staple that is driven too tightly (used to secure type NM cable) can be the source of fire ignition.
Type NM cable products are not as safe from physical damage as armored cable projects are. Type NM cables, having a nonmetallic overall outer jacket, are much more susceptible to damage from nails and screws during building construction and during later remodeling projects. Type NM cable products cannot compete with armored cable products when it comes to protection from physical damage. I have personally been called out to job sites to try to locate and repair damage done to type NM cables by other building trades. Homeowners and other building occupants have damaged Type NM cables by installing photographs or other objects on the wall.
Type NM cable does not fit well with the types of construction used for high-rise buildings. It is much more likely to be damaged by sharp edges of framing materials during construction as well as during remodeling. More stringent construction requirements are imposed on high-rise construction due to concern for smoke propagation and exiting requirements. Type NM cables should not be permitted in these structures.

(Log #2297)

7- 43 - (336-4 and 336-5): Hold
SUBMITTER: C. David Mercier, Southwire Co.
COMMENT ON PROPOSAL NO: 7-139
RECOMMENDATION: Revise text to read as follows:
336.4(2) Multifamily dwellings and other structures, except as prohibited in Section 336-5 In multifamily dwellings exceeding three floors above grade, Type NM cable shall be concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies. The 15-minute finish rated thermal barrier shall be permitted to be used for combustible walls, floors, and ceilings. Type NM shall be identified as meeting the following requirements when used in multifamily dwellings exceeding three floors above grade:
a. Use in cable trays.
b. Limited smoke.
c. Crush and impact of Type MC cable.
FPN: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.
336-5(a)(1) In any ~~multifamily dwelling or other structure~~ structure, other than dwellings, exceeding three floors above grade.
SUBSTANTIATION: Additional performance requirements for Type NM cables used in multifamily dwellings above three floors above grade address concerns over removing building height restrictions. The additional requirements for NM cables address the concerns relating to flame spread, smoke and mechanical damage. These restrictions provide increased flame resistance by requiring the cable to pass the vertical-flame test that limits the flame spread in vertical cable runs, the limited smoke test which limits the amount of smoke produced in a fire, and the crush and impact test for Type MC cables to increase the cables resistance to mechanical damage. Presently, NM cable can be marked for cable tray use and limited smoke if it meets the requirements of the UL Standard. The crush and impact test for type MC cable is presently used with Type TC cable for open wiring applications.
The proposed NM construction is equivalent to currently accepted wiring methods used in buildings without height restrictions. This comment uses the same language used to recognize the use of Electrical Nonmetallic Tubing above three floors with the additional restriction of limiting installations to multifamily dwellings. Type MC cables with a nonmetallic jacket can be used in dwellings without meeting the requirements of the vertical-flame test and limited smoke test. The proposed NM cable's flame and smoke tests exceed the requirements for Type MC. The proposed NM cable's crush and impact test is the same as Type MC. The expanded use of NM should be accepted based on increased performance requirements that meet accepted wiring methods above three floors while limiting installations to concealed areas behind a 15-minute finish rated thermal barrier in multifamily dwellings.
PANEL ACTION: Hold.
PANEL STATEMENT: The material submitted is considered to be new. There were no proposals that provided for different construction requirements for Type NM cable where it is installed in buildings that exceed three floors above grade. A fact finding report is necessary and this comment should be considered in the development of that report.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
NICKSON: Comment should be rejected. ROP 7-139 should be Accepted in Principle. See NMHC Explanation of Negative vote on Comment 7-52.
COMMENT ON AFFIRMATIVE:
TEMBLADOR: We support the Panel Action on this comment to "Hold for Further Study" provided, a thorough fact-finding report that evaluates a nonmetallic sheathed product's construction, performance, and identifies relevant installation criteria for intended applications is submitted to Panel 7. We believe that the contents of the presentation, made at the ROC meeting by the submitter, do not constitute a fact-finding report. Without a fact-finding report, the recommendation made by this comment should be rejected.

(Log #2373)

7- 44 - (336-4, 336-5): Reject
SUBMITTER: Joseph A. Hertel, Safety and Buildings Div., State of Wisconsin
COMMENT ON PROPOSAL NO: 7-139, 7-137
RECOMMENDATION: Revise as follows:
336-4 Uses Permitted. Type NM, Type NMC and Type NMS cables shall be permitted to be used in the following:
(1) One- and two-family dwellings
(2) In any building exceeding three floors above grade, nonmetallic-sheathed cables shall be concealed within walls, floors, and ceilings where the walls, floors and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies. The 15-minute finish rated thermal barrier shall be permitted to be used for combustible walls, floors and ceilings.
336-5(1) Delete this section of uses not permitted.
SUBSTANTIATION: While there may be a lack of substantiation to justify this proposed change in the use of NM cable, there is no substantiation to not support this change. The greatest deterrent to this change seems to be a metal image that at one time was the scourge of the plumbing industry. The panel has stated that there is a lack of substantiation, while the Technical Correlating Committee directs the proposal to the NFPA Toxicity Advisory Committee and the NM Cable Task Group. Rejecting proposals due to a lack of substantiation is relatively easy and in doing so the panel has failed to provide an answer as to what problems may be encountered with the expanded use of NM cable.
The panel addresses potential hazards raised by the Task Group, with the expanded use of NM cable but does not provide any substantiation of the hazards. I can agree with portions of the panel Statement in Proposal 7-137 in that as an electrical inspector or installer, I am not intimately familiar with the types of construction in building codes and do not wish to be. I would like to address the numbered responses to this proposal.
(1) The compatibility of NM cable with modern building code requirements and construction methods and materials other than wood frame construction. Steel studs and as you say "modern building methods" are used in one- and two-family dwellings as well as commercial buildings of three floors or less. I am not aware of problems with NM in these installations. NM cable can be and is used in shopping malls and many buildings of less than three floors with the exception of Places of Assembly as covered in Article 518. The use of NM cable and steel studs is a common application.
(2) The NFPA Research Foundation's study of Incapacitation and the possible contribution of PVC to this issue. It appears to be a toxicity concern yet we are discussing commercial buildings while the NFPA indicates most fire deaths are in dwellings. The amount of PVC in NM cable seems significant when compared to the plastic content of carpeting, furnishings and plumbing piping.
(3) The potential contribution of Electromagnetic Interference which is of particular concern in commercial and industrial installations. I assume from your statement the ENT, nonmetallic raceways or other wiring methods magically prevent electromagnetic interference while NM does not have the

capability, perhaps this should be discussed with the manufacturers. This is a design issue and commercial and industrial installations are free to use any appropriate method. Most industrial buildings do not exceed three floors and the use of NM cables is limited more by the installation requirements than the potential for EMI. National studies on the effects of magnetic fields do not appear to substantiate a health risk, but the owner is free to specify any acceptable wiring method.

"Of ongoing concern is the behavior of Nonmetallic-sheathed cable under fault or overload conditions." While concerns with fault or overload are addressed for all conductors in Article 240, I must assume from the statement that metal cables and raceway methods do not have this potential problem.

Again, since this wiring method appears to have so many inherent dangers, perhaps the panel should reconsider its allowed usage in one- and two-family dwellings given their higher statistics for fire related injuries and death.

I would recommend that the panel support Proposal 7-139 as a logical extension to the use of nonmetallic wiring methods.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not provided any new substantiation. See the panel action and statement on Comment 7-48.

(Log #2379)

7- 45 - (336-4 and 336-5): Accept

SUBMITTER: Toxicity Technical Advisory Committee

COMMENT ON PROPOSAL NO: 7-135 & 7-137

RECOMMENDATION: The TTAC finds that this is an issue of fire hazard analysis and less one of toxic hazard.

SUBSTANTIATION: Summary of Proposal: In these two identical proposals the use of NM cable would be expanded to permit installation (a) behind a 15-minute finish rated barrier on all floors of multifamily dwellings and (b) with no protection in nonresidential construction.

Toxicity Issues: The TTAC comments on proposal 8-65 on fuel contribution apply here as well. The toxic potency associated with the smoke from NM cable varies with the polymeric composition of the insulation and the jacket. The smoke from flaming combustion of a cable with fire-retarded ethylene vinyl acetate insulation and a chlorosulfonated polyethylene jacket had a lethal toxic potency of about 30 g/m^3 (NIST Cup Furnace).[6] Cup Furnace data for a plasticized PVC wall covering indicate a slightly lower lethality than for an unplasticized conduit product.[2] Thus, the toxic potencies of smoke from well-ventilated burning of cable materials do not appear to differ greatly from the potency of normal contents of buildings. The irritancy of the smoke from those combustibles in uncontrolled, making it difficult to analyze the contribution of smoke from NM cable. However, the combustible mass of NM cable in a structure is a small fraction of the combustibles present in buildings. As such, NM cable is not likely to add significantly to the toxic hazard posed by the normal, unregulated combustibles present in buildings that conform to modern building codes. In a case where the NM cable is the initial and dominant fuel, a fire hazard analysis is needed. The irritancy of the smoke will impact an occupant's ability to escape, but this effect would need to be compared to the smoke effects from any other fire for which the safety features of the building have been designed.

The contribution to fire hazard of building contents in general, and NM cable in particular, is not a direct function of the building height or the floor on which the combustibles are located. As the mitigating features of buildings through active and passive means are increased with height, it follows that both the hazards of ordinary building contents and NM cable would be mitigated in a similar manner. Thus, there is no basis for differentiating the toxic hazard of NM cable on the basis of building height.

Committee members did, however, identify fire scenarios where the irritation properties of smoke may exceed that experienced without NM cable. When protected with a 15 minute thermal barrier, the toxicity of NM cable is not expected to be materially different from that already permitted by code for ENT.

General Statements: This comment was developed by the NFPA Toxicity Technical Adviosry Committee. Members of this committee are as follows: Richard G. Gann, Ph.D., Chair; Craig Beyler, Ph.D; Edward V. Clougherty, Ph.D; Christopher Laux, AIA, CBO; James P. Lyon, Ph.D; and Richard Pehrson, Ph.D.

The 12 proposals for the 2002 NEC that were forwarded to the Toxicitiy Technical Advisory Committee (TTAC) on May 26, 2000 for comment all involve potential changes in the mass and location of combustible or degradable (C/D) materials within a building. Such changes might affect the fire's rate of heat release, the single most important variable affecting hazard to people since it is the driving force leading to the spread of fire and products of combustion. Having been advised that the NEC task groups contain the necessary expertise to address fire growth and overall fire hazard, the TTAC is only submitting comments on the impacts of the proposed changes on smoke toxicity and toxic hazard.

In the following comments, references to "occupants" are meant to include firefighters operating in accordance with NFPA 1500.

The composition of the C/D products, and thus the smoke generated in a fire, may evolve over time. Thus, the TTAC comments apply to general changes in the mass and location of C/D products and are not limited to the current formulation of such products.

Section 331-1 of the NEC requires that the toxicity characteristics of NMT be no worse than those of unplasticized PVC, but does not name those characteristics nor cite a test method for measuring them. NFPA 269 was developed for such purposes. It can be used to provide (a) data on the lethal toxic potency of smoke and (b) gas yields of key toxicants for use in fire hazard modeling. Section 331-1 should be modified to note both the method to be used and that these are the data to be provided. A prescriptive (e.g., LC_{50}) comparison with unplasticized PVC should be replaced by a comparison of Toxic hazard of the proposed product and unplasticized PVC.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

SCHUMACHER: The Toxicity Committee's recommendation that NM Cable is a fire hazard, and not a toxicity hazard does not lessen the fact that a person who dies of toxic smoke poisoning, or fire is any less dead. The fact of the matter is that NM Cable, used improperly can cause fires, and even though the Toxicity Committee has determined that toxic products of smoke are not a major problem to occupants, the fire that causes them can have significant effects on persons and property.

(Log #2380)

7- 46 - (336-4 and 336-5): Accept

SUBMITTER: Toxicity Technical Advisory Committee

COMMENT ON PROPOSAL NO: 7-138

RECOMMENDATION: The TTAC finds that this change would not significantly increase toxic hazard to occupants.

SUBSTANTIATION: Summary of Proposal: The use of NM cable would be expanded to permit the concealed and exposed installation with no fire barrier or other protection in buildings over three stories in height.

Toxicity Issues: The expanded use of exposed NM cable in code-compliant buildings over three stories is not likely to decrease appreciably the time to the incapacitation of the occupants or slow

their rates of egress any more or less than it would in code-compliant buildings of fewer stories.

The toxic potency of the smoke from the NM cable is not a primary issue. As noted in the TTAC comments on Proposals 7-135 and 7-137, the toxic potencies of smoke from well-ventilated burning of cable materials do not appear to differ greatly from the potency of normal contents of buildings. Similar to the TTAC comments on ENT in 86-5, it is not possible to estimate whether there is a significant and different toxic impact of the increased presence of NM cable, given the presence of a large, unregulated mass of other combustibles. The TTAC did not expect that the expanded use of NM cable would result in a meaningful change in smoke density and thus, e.g., in the ability to view exit signs or doors.

There is the potential for unprotected C/D cable to become involved in a fire earlier than cable installed behind a fire barrier. As addressed in the comments on Proposals 7-135 and 7-137, these are issues of general fire hazard, not toxic hazard in particular.

General Statements: Please also see general statements of the substantiation submitted with Comment 7-45 (Log #2379).

7- 47 - (336-4 and 336-5): Accept

SUBMITTER: Toxicity Technical Advisory Committee

COMMENT ON PROPOSAL NO: 7-139

RECOMMENDATION: The TTAC finds that this is an issue of fire hazard analysis and less one of toxic hazard.

SUBSTANTIATION: Summary of Proposal: The use of NM cable would be expanded to buildings taller than three stories if installed behind a 15-minute finish rated barrier.

Toxicity Issues: As noted in the TTAC Comments on Proposals 7-135 and 7-137, the amount of NM cable in relation to the other unregulated combustibles present, particularly contents, was small and the characteristics of the smoke produced by burning NM cable did not differ substantially from the smoke produced by a fire serious enough to involve the cable.

General Statements: Please also see general statements of the substantiation submitted with Comment 7-45 (Log #2379).

(Log #639)

7- 48 - (336-5): Accept

SUBMITTER: James M. Daly, BICC General

COMMENT ON PROPOSAL NO: 7-145

RECOMMENDATION: This proposal should continue to be rejected.

SUBSTANTIATION: 1. While the fire loss data from the U.S. Fire Administration's National Fire Incident Reporting System (NFIRS) is factual, it is not definitive regarding Type NM Cable. Different conclusions can be drawn from the data, e.g., will the incidence rate increase if the expanded use of Type NM cable is authorized? There is no evidence regarding how much Type NM cable has actually been used in buildings either under or over three floors. Not all of the states report and there is no data supplied as to how many cities within a state report.

The State of Michigan has deleted the three-floor limitation since 1978. However, the state code only became mandatory for the entire state in late 1999. In Massachusetts, which also permits Type NM cable above three floors, the cable is not permitted to leave the floor or the dwelling in which its originates. The code proposal does not include such a restriction. Also, there is no data on the extent of the use of Type NM Cable over three floors in Massachusetts.

2. The National Bureau of Standards Report on fire Endurance Tests of Residential Walls Containing Branch Circuit Wiring stipulates that the differences in the fire performance between not more than two Type NM and Type AC branch circuit cables is not appreciable within a gypsum board and wood stud constructed, one-hour fire-rated wall.

However, the report specifically states that "(T)these conclusion apply only to a single cable or at most two single cables penetrating a stud space under the conditions of the test. They may not apply to bundles of cables or to many cables passing through a stud space." Cable bundling or multiple cable runs in close proximity are common practices and the wording of the proposed exception does not limit the cable installation in a manner consistent with the report findings.

In addition, the report limits the scope of the performance tests to gypsum board and wood stud constructed one-hour fire-rated walls. The report further stipulates that "no conclusion can be made on the integrity of other types of wall construction." Ceiling voids are not addressed in the report. These findings are not reflected in the proposed wording of the exception because there are no provisions to limit installation in other types of wall construction or in ceiling voids.

3. NFPA 921: Fire and Explosion Investigations is relevant to Proposal 7-145 because it provides information on Type NM cable as a source of ignition and was submitted in response to one of the concerns expressed by the Task Group on Type NM Cable established by the NEC Technical Correlating Committee. NFPA 921 does not in and of itself support the conclusion that Type NM cable cannot be a source of ignition. The experience of some installers on the Task Group also does not support such a conclusion.

4. The Type NM Cable Fire Hazard Analysis, prepared by the Sullivan Code Group, contains two sets of conclusions.

The first set of conclusions stated that "The results of this analysis were as follows:

1. In a nonsprinklered area, for all fire scenarios evaluated, untenable conditions within the room of fire origin will be reached due to the products of combustion well before any toxic products are generated from the thermal decomposition of Type NM Cable.
2. In an area protected by residential sprinklers, for all fire scenarios evaluated, the calculated sprinkler activation time is well before the time that the Type NM cable is exposed to temperatures which would cause thermal decomposition of the cable.
3. Tests conducted using a Cone Calorimeter in accordance with NFPA 271 provided evidence that the minimum exposure necessary to cause decomposition of Type NM cable was equivalent to ENMT."

It should be noted that the fire scenarios utilized to reach conclusions 1 and 2 above were limited to a fire originating in a room and the effect this fire would be expected to have on the Type NM cable or ENMT inside a wall or in a ceiling cavity (void space). Type NM cable and ENMT exposed in the room of fire origin, or fires originating in the wall or ceiling void space were not evaluated.

The Cone Calorimeter test data in conclusion 3, above did not provide evidence that the minimum exposure necessary to cause decomposition of Type NM cable was equivalent to ENMT. However, for the particular fire scenario tested, the Report does support the contention that neither ENT nor Type NM cable will decompose within the temperature limitations of the test (194°F/90°C). A subsequent letter from Mr. Paul Sullivan dated August 22, 2000, clarified that the minimum measured surface temperature required to cause decomposition of Type NM and ENMT (ENT) is 347°F.

The second set of conclusions stated "Therefore, for the conditions evaluated in this report, it is our professional opinion that:

1. Type NM cable will not decrease the level of life safety within a building of any height when located in ceiling and wall spaces separated from the interior of the building by a 15 minute finish rating (i.e., 1/2 in. thick gypsum wall board), and on this basis should not arbitrarily be limited to 3 stories in height.
2. In terms of building fire safety, these results indicate that Type NM Cable, like ENMT (which is not limited to 3 stories by the National Electrical Code), will not contribute to the hazard of a fire when the cable is separated from the interior of the building by a 15 minute finish rating (NFPA 70, Section 331-3(2)).
3. We believe that this fire hazard analysis report provides reasonable and adequate documentation for approval of this appeal under the City of Rockville Building and Buildings Regulations Section 5-12(a)(3), "Grounds for appeals" which states: "An appeal may be taken when it is claimed that an equally good or better form of construction can be used.""

The Report does not adequately support the broad statements made in conclusions 1. and 2. above. These conclusions in the Report must be limited to the specific fire scenario where the fire originates in the room under specific test conditions and may not be applicable to all fire conditions for which Type NM Cable may be subjected in any expanded use. For example, fires originating in ceiling void spaces and inside walls are not addressed by this Report.

The material in conclusion 3 above is not relevant to an NEC proposal.

4. It is noted that, at the request of the NFPA Standards Council (Council Agenda Item 98-60, April 28, 2000 decision), the NEC Technical Correlating Committee has referred the concerns about toxicity of the products of combustion of NM cable, if expanded use of Type NM Cable is permitted, to the Toxicity Technical Advisory Committee. Comments provided by the Toxicity Technical Advisory Committee should also be considered in addition to this comment.

5. A review of the UL test methods for various wiring methods indicted that there are differences in testing Type NM cable and other wiring methods currently permitted above three stories. A Fact Finding Report should be submitted that provides test data from a qualified testing laboratory showing that the performance characteristics of Type NM cable, a modified Type NM cable, or another product are equal to, or better than, those of one or more of the currently permitted wiring methods. Specifically, the report should discern what are appropriate or acceptable differences in terms of the mechanical, electrical, flame propagation, and smoke generation properties between the wiring methods and what, if any, significance that makes for the intended expanded use of Type NM cable.

6. It should be noted that the Task Group Report included as an attachment to Proposal 7-137 did not receive consensus support from the Task Group.

7- 50 - (336-5): Reject
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co/EEI
COMMENT ON PROPOSAL NO: 7-147
RECOMMENDATION: This Proposal should be accepted.
SUBSTANTIATION: EEI believes that the technical substantiation submitted by the National Multi Family Council in support of Proposal 7-145 clearly indicates that there are no valid safety reasons for continuing to maintain the existing three-floor limit on the use of Type NM cable in commercial and all non-single family residential construction. Our Proposal 7-147 to remove the restriction should be accepted.

EEI continues to maintain that the three-floor restriction on the use of Type NM Cable is not now, and never has been technically substantiated. We recognize that this is not a black and white issue, and that there are many factors that must be considered. We are also aware of the considerable amount of effort and work performed trying to resolve this issue by the "NM Cable Task Group to the NEC", appointed at the direction of the Standards Council (Tom Trainor as chairman). But even with all their work (and it was considerable), the Task Group was not able to reach a unanimous consensus on their conclusions and recommendations. We understand that they spent a lot of time trying to create valid technical substantiation that would justify the initial restriction in the 1974 Code, and the continued restriction in the 2002 Code. In our opinion, that would have been the preferred solution. Had they been able to reach unanimous agreement on the technical justification for instituting and retaining the restriction, the controversial issue would have been resolved and there would be no more problems. Maybe they were not successful because valid technical substantiation for the three-floor limitation of Type NM cable simply does not exist. If it did exist, then in our opinion, the Task Group would not have found it that difficult to technically justify a Code requirement that has been in place for 25+ years.

Failing to reach unanimous agreement, the Task Group put the ball in the opposition's court by requiring the opposition to prove that the restriction was not presently justified and should be removed or modified. As active participants in the Code making process, the EEI EL&P TF members know that it is the responsibility of the submitter of a Proposal or Public Comment to provide technical substantiation for making the requested Code change. We totally agree with that concept. And we agree that the proponents of removing the three-floor restriction on the use of Type NM cable should provide technical substantiation for making the change. But we also know that for the last 25+ years, no opponent has ever been able to provide technical substantiation that Code-Making Panel 7 considered adequate for removing the restriction. It's difficult to develop suitable technical substantiation to remove a Code requirement that has no technical substantiation for being there in the first place. What was broken and must be fixed? Why can Type NM be used safely in up to three floors, but not four or more? If we knew those answers, then we would know how to fix the problem. In our opinion, the only reason this limit made it into the 1974 NEC was because certain members of Code-Making Panel 7 wanted it to be there, and they had the voting strength to make it happen. The way it appears to us, that is still the case today.

The electric utilities have energized millions of electrical wiring systems using Type NM cable. This includes services to residential, commercial, industrial, and institutional facilities and installations above and below three floors. If there was or is a major safety concern with Type NM installations, we would know about it. Regardless of the cause, as the electric energy supplier, we generally get involved with most property damage or personal injury claims attributed to the use or misuse of electricity. For that reason, we have a vested interest in the electrical safety of all of our customers' wiring systems. And that is one of the reasons that we have Utility representation on all 20 Code-Making Panel. While we don't have detailed records, our experience does not indicate that Type NM installations are any better or any worse than any of the other approved wiring systems. If it could be technically documented that Type NM cable is unsafe when used in installations above three floors, then that may give us some reason to be concerned about all Type NM installations, regardless of building height.

In its July 7, 1998 decision, the Standards Council directed the NM Cable Task Group to the NEC "to do an in-depth review of the Proposals at issue (processed in the 1999 edition of the NEC) with consideration as to whether any one or a combination of these Proposals could be approved and the basis for such approval". We are not sure if this directive was met. In item one of their final report addressing Proposal 7-145 for the 2002 NEC, the Task Group states, "In Massachusetts, which also permits Type NM above three floors, the cable is not permitted to leave the floor or the dwelling in which it originates. The Code Proposal does not include such a restriction". Does that imply that if the Proposal did include the restriction, that it may be more acceptable? If so, then why wasn't it combined with Proposal 7-77 for the 1999 NEC, which did include that restriction? Isn't that what the Standards Council asked them to do? For the record, Code-Making Panel 7 rejected Proposal 7-77 without addressing that or any of the recommendations contained in the proposal.

The Standards Council decision went on to say, "Further, if the Task Group believed that acceptance of any revision to the three floor limit could not be achieved based on the existing

substantiation, they should provide clear direction relative to what substantiation would be required before favorable consideration could be given to Proposals to eliminate or modify the three floor limit". When Code-Making Panel 7 was not able to successfully resolve the issue during the 2002 ROP meeting, the Standard's Council once again directed the Task Group "to provide clear explanation and direction along the lines set forth by the Council when the Task Group was formed".

In their final Task Group report, which the Technical Correlating Committee directed be submitted to Code-Making Panel 7 for information only, the Task Group did appear to address all of the issues as directed by the Standards Council's decisions of July 17, 1998 and April 28, 2000. But although they appeared to address the issues, in our opinion, they did not always provide the results requested by the Standards Council's directives. Specifically, in addition to the example discussed in the previous paragraph, the Task Group report does not provide clear direction relative to what substantiation would be required before favorable consideration could be given to Proposals to eliminate or modify the three floor limit. The key word here is "favorable". The Task Group Report does recommend the need for a detailed "Fact Finding Report" comparing the performance of Type NM cable to any of the presently permitted wiring systems under the same specified tests procedures. But the report does not indicate that if the Type NM performs as well as or better than the comparison wiring system, Type NM would then receive favorable consideration by either the Task Group or Code-Making Panel 7. When we we discussed this with some of the Task Group members, we were told that the Task Group would not make any assurances that positive results of a Fact-Finding Report would guarantee favorable consideration by anyone. In our opinion, that does not comply with the Standards Council's directive to provide clear direction resulting in "favorable" consideration by Code-Making Panel 7. Code-Making Panel 7 has a 25-year track record of considering change proposals to remove the three-floor limit, without ever making any substantial changes.

Based on Code-Making Panel 7's documented track record on this issue, the EEI EL&P TF members don't get any "warm and fuzzies" that a favorable Fact Finding Report developed by a NRTL will result in the removal of, or any acceptable modifications to the three floor limit. In our opinion, Code-Making Panel 7's past and present actions clearly indicate that for whatever their reasons, some of their members absolutely don't want to remove the restriction. And in our opinion, unless there is an attitude change by some of the Code-Making Panel 7 members or the organizations that they represent, then right or wrong, the three-floor limit on the use of Type NM cable will continue to be maintained.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not provided any new substatiation. See panel action and statement on Comment 7-48.

7- 51 - (336-5): Accept

SUBMITTER: Tim Andrassy, Steel Tube Inst.

COMMENT ON PROPOSAL NO: 7-145

RECOMMENDATION: This proposal should continue to be rejected and retain the permitted uses of the 1999 NEC.

SUBSTANTIATION: The language in the exception permits the use of N/M Cable in "Multifamily dwellings" exceeding three floors above grade. Although the substantiation indicates this would only be R2 occupancies (residential)the literal definition of "multifamily dwelling" in the NEC would permit more than that. A multifamily DWELLING is defined as any building or structure containing three or more multifamily DWELLING UNITS. This can literally be interpreted to mean any building containing three dwelling units, no matter what other occupancies may be in the building.

It is untrue that the 3-story limitation has never been substantiated. The proposal that initiated the 3-story rule was submitted by NEMA in response to complaints from inspectors, contractors, and fire officials that numerous hazards were occurring due to the use of N/M Cable. The proposal originally would have prohibited use in any building with a 3/4 hour fire rating. When it was discovered that HUD had some fire ratings on one-and-two family dwellings the 3-story rule was implemented in order not to be too restrictive. This decision was based on egress and rescue concerns in the event of fire. Those concerns have not changed today.

The fire loss data used as substantiation for this proposal is not sufficient to show that N/M cable is not a problem. It has been confirmed with NFPA that current statistics (which do not name the wiring method involved) are not suitable for determining product differences. In addition, although Michigan and Massachusetts have not had a 3-story limitation, there is nothing to indicate how many installations actually use N/M cable above 3 stories. Also, Massachusetts has additional requirements that are not contained in this proposal.

The paper I have provided by Frederick Franklin, P.E., forensic electrical engineer, provides evidence that fires in N/M cable have occurred inside walls that have not been opened since the original installation. It also details how fires can occur in N/M cable due to carbon arc paths that develop over time. This is true even in an installation that was code-complying when installed. N/M is a recognized built-in source of ignition. Other proposals for this Code, both in Article 336 and in proposals for arc-fault interrupters also document N/M Cable fires.

We are not yet aware of what guidance the Toxicity Advisory Committee will provide. However, we do know they did not address smoke density and the effect smoke has on incapacitation and inhibiting escape. The Task Group also did not address smoke as they passed that to the Toxicity Advisory Committee. IT IS THEREFORE IMPORTANT THAT THIS CODE PANEL LOOK AT THE OVERALL FIRE HAZARD THEY FEEL N/M CABLE WOULD PRESENT. It appeared that the TAC considered toxicity only from the viewpoint of the added contribution it would make to a fire in a room. A CONCEALED SPACE FIRE - ESPECIALLY OVERHEAD - IS AN ENTIRELY DIFFERENT MATTER. We must not continue to take the attitude that if other things are burning, additional combustibles do not matter. If that is the case, the fire safety of our buildings overall will go down. The stated mission of the NEC, in 90-1(a), is: "The purpose of this Code is the practical safeguarding of persons and property from hazards arising from the use of electricity." The NFPA Board of Directors has made it clear many years ago that fires from electricity are hazards arising from its use, and that they are to be considered by the Code Panels.

In a letter to Mr. Casey Grant of NFPA, Mr. Jeffrey Shapiro, on page 6 states that his clients question whether the toxicity of insulation is within the purview of the NEC, or that Code Making Panel 7 has any right to discuss toxicity. In response to this we submit letter of November 8, 1991 from Mr. Arthur Cote of NFPA to one of our members. In the second paragraph Mr. Cote explicitly states: "first let me say that the scope of the National Electrical Code Committee certainly does include fire hazards." He further notes: "Since it is well recognized that smoke toxicity hazard analysis always should be conducted within the larger context of fire hazard it is admittedly difficult, if not impossible, to separate toxicity hazard analyses from hazard analysis." He further clarifies that the recommendations of the TAC are strictly advisory, and that the TAC is not a Code Making Panel. And finally, Mr. Cote makes the explicit statement: "There is no restriction against NEC Panel Members discussing toxicity or any other fire related matters regarding Proposals or Comments submitted to them on the National Electrical Code." We bring this to your attention because the chairman of the Toxicity Committee made it very clear that the only issue they would be addressing was toxic hazard, not overall fire hazard.

To that end (overall fire hazard) we submit the attached paper provided to the Toxicity Advisory Committee which was not considered. A few pertinent facts are detailed here for the edification of readers that do not have the full paper. (1) A single N/M Cable 18 inches long is tested with a 5-inch flame from a Bunsen burner for 1 min 15 sec at 1700 BTU. In addition it is permitted to flame for 60 seconds after the flame is removed. (2) In comparison, ten A/C or ten M/C Cables, eight feet long, are tested for 20 minutes. The test flame is a burner over 13 inches wide producing a heat of 70,000 BTU. (3)N/M Cable is a plasticized product, and ENT is not permitted to be plasticized. ENT can only flame for 15 seconds at the completion of the flame test. (4)In the attached modified E-84 test,24 foot lengths of N/M Cable were tested. Flame spread the full 24 feet in approximately 31/2 minutes, ENT took 13 minutes to reach the same endpoint. The base against which other products are measured on flame spread is red oak and it reached the 24 feet in about 6 minutes.

(5)In the same test, red oak reached a peak optical density of 0.06 in just over seven minutes. In comparison both ENT and N/M Cable went off the limit of the recording equipment; ENT in just over 5 minutes and N/M cable (2.0) in less than a minute. (6)In assessing the added hazard, remember that wood is controlled and it performed better than either of the two wiring methods did.

Note the section on concerns about coordination with the building codes. A couple of special points to note are that a 13R sprinkler system in particular states "Sprinklers shall not be required in attics, penthouse equipment rooms, crawl spaces, floor/ceiling spaces, elevator shafts, and storage." Also, Section 5-5 of NFPA 13d Exception 3 states: "Sprinklers are not required in attics, crawl spaces and other concealed spaces that are not intended for living purposes or storage." Even a full NFPA 13 does not require sprinklers where the exposed portions of the concealed space are constructed entirely of fire-retardant treated wood as defined by NFPA 703.

The NEC should be a stand-alone document due to the fact that building codes change in a different cycle and without correlation with the NEC. Also, the NEC is used in other countries where the building codes differ from the US. One cannot count on the building code requirements for protection. As an example, the Multi-family Housing Council, proponent of unlimited use of N/M Cable, has submitted a sprinkler trade-off proposal to the International Building Code that at this point has been accepted. Buildings of Type IIA, IIIA and VA currently are required to be of one-hour fire-resistive construction. This proposal (G107-00) would trade-off that requirement for the 13 R sprinkler system noted above with all the exceptions. Rick Thornberry, P.E. notes in a comment recommending disapproval of the proposal, "In those cases a concealed fire could grow to significant proportions before breaking out and activating the sprinklers in the occupied areas which by then may be too late to avoid significant fire damage to the building structure." There are other areas noted where fire-resistance of the assembly is lowered from 1 hour to 1/2 hour. The Sullivan report submitted to support use of the 15-minute finish rating for N/M Cable did not address fires originating in concealed spaces.

The effects of dense smoke, particularly when it is irritating such as with HCL from PVC, has not yet been clarified. Logic tells us, however, that when one is perhaps in a state of panic, can't see, finding it hard to breath, and has eyes that are tearing and shutting, that smoke cannot be ignored. The higher one goes in a building, the more difficult it is to escape.

N/M Cable is not equal to the wiring methods currently permitted over 3 stories and its overall fire hazard will decrease the safety of the occupants.

Note: Supporting Material is available for review at NFPA Headquarters.

PROPST: See my explanation of negative vote on Comment 7-27.
COMMENT ON AFFIRMATIVE:
SCHUMACHER: This comment should be accepted. The Pace report data saying that 1/3 of short circuit arcing fires in structures occur in NM branch circuit cables, which is 7 percent of all structure fires. What would this percentage be if unlimited use of NM cable were allowed?

(Log #1823)

7- 52 - (336-5): Reject
SUBMITTER: Marshall A. Klein, Marshall A. Klein & Assoc., Inc.
COMMENT ON PROPOSAL NO: 7-145
RECOMMENDATION: Revise as follows:
335-6. Uses Not Permitted.
(a) Types NM, NMC, and NMS. Types NM, NMC, and NMS cables shall not be used in the following:
(1) In any multifamily dweling or other structure exceeding three floors above grade.
Exception: Type NM, NMC, and NMS cables shall be permitted in a multifamily dwelling building, in multifamily dwelling portions of a multiple occupancy building, and in common areas associated with a multifamily dwelling portion of a multiple occupancy building, exceeding three floors above grade where installed in accordance with all the following conditions:
(FPN): Multifamily Dwelling Building is defined under NEC Article 100 under "Dwelling."
1. The building shall be protected by a sprinkler system installed in accordance with the building code.
(FPN): Sprinkler systems are regulated by NFPA 13, Standard for Automatic Sprinkler Systems and NFPA 13R, Standard for Residential Occupancies up to and Including Four Stories in Height.
2. The cables shall be concealed within walls, floors and ceilings where the walls, floors and ceilings provide a thermal barrier that has a finish rating of not less than 15-minutes as identified in listings of fire rated assemblies.
3. Where installed in a concealed space above a suspended grid ceiling, the cables shall not be exposed to the concealed space.
4. In other than a multi-floor dwelling unit, the cable shall not leave the floor from which the cable originated.
5. The cables shall be protected from mechanical damage where pulled through trusses or metallic studs.
(FPN): See 300-4 for protection against mechanical damage.
6. The cable penetrations shall be protected in accordance with Section 300-21.
7. The cable shall be listed.
SUBSTANTIATION: BACKGROUND
Proposal 7-145 and the general concept of restricting NM cable based on building height have recently been through two comprehensive reviews, one by Panel 7 and one by the NM Cable Task Group appointed by the NEC Technical Correlating Committee. As a result of these reviews, all interested parties have been given an opportunity to air their views regarding removal of NM cable height restriction, and objections that were voiced in both forums have been documented. Panel 7's objections were spelled out in detain in the Panel's reasons for rejecting Proposal 7-145, as originally submitted, and the NM Cable Task Group's issues were spelled out in detail in the Task Group's report.

It is the intent of this comment to address all of these objections so that there will no longer be any basis of argument for retaining the three-story limit on the use of NM cable in residential uses. Code text proposed in this comment and the comment's supporting statement respond to every objection raised by Panel 7 in the Panel's reason for rejecting Proposal 7-145, and every substantive issue identified by the NM Cable Task Group.

So that there is no misunderstanding, our intent is to show that NM cable is no more hazardous that other wiring methods currently allowed by the NEC that are not restricted with respect to the height of buildings in which they are used. It is not our intent to claim that NM cable is equivalent to each and every other wiring method permitted by the NEC to be used above the third story. Such a demonstration is not necessary to make our case. NM cable need only demonstrate parity with a single wiring method that is not restricted with respect to height to substantiate removing the 3-story limit on NM cable.

There is no debate that the flamespread and ignitibility characteristics of wire in steel conduit or AC cable may exceed those of NM cable; however, there is no reason that NM cable must demonstrate equivalent performance to these other wiring methods. Because the NEC permits the use of wire in electrical nonmetallic tubing (ENT)without regard to building height, it would be clearly unfair to restrict the use of NM cable with respect to building height once it has been demonstrated that the safety-related performance of NM cable is satisfactorily equivalent to ENT.

RESPONSE TO NM CABLE TASK GROUP ISSUES:

Code text proposed by this comment modifies the original proposal to address issues identified by the NM Task Group. A description of the reason for each modification follows:

1. Multiple occupancy building are now addressed in the exception. In multi-story, multiple occupancy buildings there may be floors or portions of floors with retail, offices, industrial, parking garages and residential uses. Only the floors, or portions of floors classified as multifamily dwelling occupancies, would be permitted to use this exception. This would include the common elements (corridors) and incidental uses (laundry room, lounge room, etc.) that serve a multifamily dwelling occupancy.

2. Condition 1 was added to enhance the fire protection/life safety of the building in which this exception is to be used. Given the lack of a demonstrated loss history associated with NM cable, the requirement to sprinkler buildings in order to get a relaxation of the three-story height limit could easily be argued as excessive.

However, the sprinkler condition is offered to ensure the success of this proposal, recognizing that the fire-safety record of sprinklered multi-family buildings is excellent and that many, if not most, such building are wired with Type NM cable.

3. Condition 2 was added to provide the 15-minute protection currently required for ENT when ENT is installed in buildings more than three-stories in height. This provides parity for the two wiring methods with respect to protection from an external fire exposure and negates the issue of cable protections. Since ENT, a plastic product, is acceptable above three stories when protected by a material with a 15-minute finish rating, it would be unfair to limit the use of NM cable with respect to building height based on cable protection when the cable is protected in an equivalent manner to that required for ENT.

4. Condition 3 was added to address the NM Cable Task Group's concern of using NM cable above suspended ceiling tiles that, over time, may be taken out and not properly replaced. The type of ceiling system of concern to the task group is referred to in the UL Fire Resistance Directory as a suspended "grid system," so that is the proposed terminology. NM cable installed above a monolithic ceiling membrane, such as drywall or plaster, would be acceptable.

5. Condition 4 was added to clarify that NM cable may not be used as a riser cable from floor to floor. NM cable will be limited to primarily horizontal runs on the residential floors. In multi-story dwelling units, NM cable will be permitted throughout the interior of a dwelling unit. This requirement basically incorporates the technical content of the Commonwealth of Massachusetts' Proposals 7-150 and 7-151 into Proposal 7-145 to address concerns of some NM Cable Task Group members about using Type NM cable as a floor to floor riser.

6. Condition 5 addresses a concern of the NM Cable Task Group regarding the susceptibility of NM cable to damage during installation. The added condition alerts the installer to follow NEC Section 300-4 for protection of NM cable against mechanical and physical damage. It should be noted that susceptibility to damage is not a valid reason to restrict the use of NM cable based on building height since susceptibility to damage is not a height sensitive issue.

7. Condition 6 addresses a concern expressed by the NM Cable Task Group that a fire involving NM Cable might be more likely to spread from floor to floor in concealed spaces than a fire involving another wiring method. This concern is already accommodated in large part of Condition 4, which prohibits use of NM cable as a riser in buildings exceeding three stories in height. Nevertheless, Condition 6 has been added to alert the user to the applicability of Section 300-21, which requires that openings around floor to floor penetrations be fire-stopped to prevent the spread of fire or products of combustion.

8. Condition 7 addresses a concern of some of the members of the NM Cable Task Group that all manufacturers of NM cable should list their product. It should be noted that the listing requirement would only apply to NM cable installed in multi-family dwelling buildings under this exception.

In summary, the revisions that have been made to Proposal 7-145 address all substantive concerns that were discussed at the NM Cable Task Group Meetings regarding the use of NM cable in multi-family buildings above three stories, with the exception of smoke toxicity, which has been determined by the Standards Council's special Toxicity Advisory Committee to be an invalid basis for restricting the use of NM cable.

RESPONSE TO PANEL 7 ISSUES"

The following comments provide and item-by-item rebuttal to reasons provided by Panel 7 to substantiate their rejection of Proposal 7-145. (NOTE: In the following text, Panels 7's statements from their reason for rejecting Proposal 7-145 are in quotes, and our responses are noted in the "Comment" under each quoted Panel 7 statement).

Panel 7: "There is concern that the requirements of the use of Type NM cable will now be dependent upon the use of building codes for proper interpretation types of construction."

Comment: This is not a valid basis for rejection for the proposal since it has nothing to do with technical merit. Nevertheless, the proposal does not rely on types of construction. It references only the installation of NM Cable in multi-family dwelling buildings, which are already defined in the NEC.

Panel 7: "The substantiation provided with this proposal does not provide a comparison with the wiring methods that are currently used in the applications for which the expanded use of Type NM cable is being proposed."

Comment: It is unnecessary to compare Type NM cable with every wiring method recognized by the NEC for use in buildings above three stories. NM cable need only judged to be equivalent to any single method recognized for use above three stories to justify acceptance. Substantiation for this proposal exceeds that level of justification by providing comparisons to both the AC and ENT wiring methods, both of which are permitted in buildings above three stories.

Furthermore, this revised proposal, in addition to requiring the 15-minute protection as required for ENT, includes other requirements addressing concerns of Panel 7 and the NM Cable Task Group.

It is unclear what additional information is deemed necessary by Panel 7 to favorably consider this proposal when the panel asks for a "comparison" with other wiring methods. Detailed fire testing and fire modeling documentation submitted with Proposal 7-145 compares NM cable with AC and ENT and clearly shows that the fire performance of NM cable is substantially equivalent to AC and ENT with respect to overall building fire safety. In addition, NFPA fire statistics submitted in support of the original proposal clearly show the fixed electrical wiring, no matter what wiring method is used, is not a significant fire problem.

Panel 7: "The Task Group report, which is the substantiation for the proposal, noted that there are potential hazards involving the use of Type NM cable that have not been adequately reviews. These include: 1. The compatibility of NM cable with modern building code requirements and construction methods and materials other than wood frame construction."

Comment: The three-story limit on NM cable has no relevance to the materials used in building construction. Although some relate the three-story limit to a mandate limiting the use of NM cable to buildings of wood frame construction, that relationship is arbitrary.

There is nothing in any of the building codes prohibiting a building that is three stories or less in height from using concrete or steel framing materials. In fact, many buildings that are three stories or less in height are build using concrete and/or steel. Those that claim that there is a problem regarding compatibility between NM cable and concrete or steel construction should be able to present some evidence to that effect. Since the use of NM cable in concrete and steel construction is commonplace. However, no evidence of any kind has been presented to substantiate these claims.

Furthermore, if the intent of the NEC were to limit the use of NM cable to buildings constructed with wood framing, the NEC is too restrictive to accomplish that intent anyway because current building codes permit wood-framed buildings to exceed three stories in height.

Finally, it is important to point out that plastic products, such as light-transmitting plastic wall panels, plastic roof panels, plastic skylights, foam plastic insulation, and plastic plumbing piping, just to name a few, are permitted to be used in all types of construction under the building codes. The presence of NM cable as a source of fuel for a fire in such buildings is inconsequential compared to all of the other combustible materials found in a building, including contents, that are constructed of plastics or otherwise.

Panel 7: "2. The NFPA Research Foundation's study of incapacitation and the possible contribution of PVC to this issue."

Comment: Based on the Standards Council Decision: D00-18, Agenda Item SC 98-60, dated April 28, 2000, the Standard Council directed that the advice of the Council's special Toxicity Advisory Committee be sought for guidance on how to handle toxicity concerns. The Toxicity Advisory Committee met on October 20, 2000, and determined that toxicity concern is not a valid basis for restricting the use of NM cable based on building height. The Toxicity Advisory Committee's comment is included in this ROC.

Panel 7: "3. The potential contribution to electromagnetic interference which is of particular concern in commercial and industrial applications."

Comment: This issue is not regulated by the NEC, for NM cable or any other wiring method. It is outside the scope of the NEC as defined under Section 90-1. In fact, even at the meetings of the NM Cable Task Group, it was agreed that this was not a problem since the electromagnetic currents between the wires in NM Cable will cancel each other out.

Panel 7: "The task group report also states "Of ongoing concern is the behavior of Nonmetallic-Sheathed Cable under fault or overload conditions. The task group disagrees on the extent to which nonmetallic sheathed cable becomes an ignition source under these conditions. Any expanded use of Nonmetallic-sheathed Cable would need to address this issue effectively."

Comment: The NM Cable Task Group and Panel 7 have been provided with sections and reference articles from NFPA 921 (14-11.4, 14-11.5, A-14-11.4 and Bruce Ettling's articles noted in NFPA 921, page 149.) These credible sources provide technical evidence that NM cable is no more likely to serve as a source of ignition than any other recognized wiring method. Fire data submitted in

support of this proposal also substantiates our position that electrical distribution wiring is not a common ignition source.

Panel 7: "Attachment 2 - In attachment 2 there are two parts, the first part is a letter with corresponding data covering various types of conduits (Scheduled 40, Schedule 80, and Electrical Nonmetallic Tubing). This is not relevant to the use of Type NM cable. The second item provides toxicity results of PVC without interpreting the data relative to the safety or dangers of the test results."

Based on the Standards Council Decision : D00-18, Agenda Item: SC 98-60, dated April 28, 2000, the Standards Council directed that the advice of the Council's special Toxicity Advisory Committee be sought for guidance on how to handle toxicity concerns. The Toxicity Advisory Committee met on October 20, 2000, and determined that toxicity concern is not a valid basis for restricting the use of NM cable based on building height. The Toxicity Advisory Committee's comment is included in this ROC. Because of the Toxicity Advisory Committee's expert opinion on this issue, it is now inappropriate for Panel 7 to continue to use the toxicity argument as a basis for restricting NM cable, given that the panel generally lacks credentialed expertise in the field of toxicity.

Panel 7: "Attachment 3 - A primary stated purpose of the tests was to determine the effect on the fire endurance of a one-hour fire-rated wall due to the installation of NM or AC cable. The fire-rating was reduced in both instances. Various "suppositions" are offered as to the reasons. The report notes in paragraph 4 of the introduction that the UL test is "a type of ease of ignition test." "It cannot be used for evaluating the effect of electrical wires on the fire resistance of a fire barrier."

Comment: Based on Panel 7's comments on this attachment, the Panel did not read the Report. The Panel's comment indicates that they understood the report's conclusions to have been based on "ease of ignition" tests that the Panel deemed irrelevant to the issue of fire resistance. Based on this incorrect assumption, the Panel then discredited the report's conclusions. In fact, the report specifically stated that existing ease of ignition tests were inadequate for drawing conclusions regarding the effect of wiring on the performance of fire-resistive assemblies, and on that basis, justified the use of the ASTM E119 test for analysis.

For the record, the statement in the report that the Panel expressed concern about stated:

"The test for electric wiring used by Underwriters' Laboratories [3,4] is a type of ease of ignition test. It cannot be used for evaluating the effect of the electrical wires on the fire resistance of a fire barrier. To the best of our knowledge, no controlled laboratory tests have been conducted to measure the relative effect of different kinds of electric cables on the fire endurance of residential wall construction; these reported tests represent an initial step in developing such information."

Footnote [3,4] were listed on page 11 of the Report as "References":

"[3] Standard for Rubber-Insulated Wires and Cables, UL 44, Underwriters' Laboratories, Northbrook, Illinois (1975) and Amendments dated June 8, 1976. Also listed as ANSI C33. 6-1974

[4] Standard for Thermo-Plastic Insulated Wires, UL 83, Underwriters' Laboratories, Northbrook, Illinois (1971). Also listed as ANSI C33. 80-1971."

Again, this paragraph established the basis for using the E119 test procedures for this study because the other UL tests noted in the footnote as UL 44 & UL 83 "…cannot be used for evaluating the effect of the electrical wires on the fire resistance of a fire barrier."

Since the Panel apparently missed the point of the report, we'll reiterate. Attachment 3, NBSIR 78-1415, "Fire Endurance Tests or Residential Walls Containing Branch Circuit Wiring – Preliminary Findings", Final Report, February 1978, was done by the National Bureau of Standards for U.S. Department of Housing & Urban Development. In this 1978 study using the ASTM E119 fire test, Type NM (nonmetallic sheathed) cable was tested along with Type AC (armored) cable. The Study's conclusions were:

- Page 1, "Abstract," Paragraph 2: "The tests showed no significant difference in the performance of the different cable types."
- Page 8, "Discussion of Results", paragraph 2: "The differences in the NM wired and the AC-wired assemblies were slight as measured by the times at which the air temperature in the studs spaces rose abruptly."
- Page 9, "Wall No. 2," Paragraph 2: "The differences between the AC an NM assemblies are probably not significant."
- Page 10, "Both Walls," Paragraph 4: "The differences in the fire performance between type NM and type AC branch circuit cables, within a particular one-hour fire rated wall assembly, as shown by these tests is slight."
- Page 10, "Summary," Paragraph 1: "The test showed little effect of the cable types on the fire performance of the walls. The reduced fire resistance appears to be more related to the cut-outs for the electric boxes than to the presence of electric cables."

The fire test conclusions dealing with the flow of hot gases along he paths of cables and conduit have since been addressed by the new products listed under E814 and the fire stopping requirements added in the 1980s by NEC Article 300-21 and by model building codes (1999 BOCA Code Section 714, "Penetrations," 1997 UBC Code Sections 709.6, 710.2, & 714, all entitled "Through-Penetrations," 1999 SBC Code Sections 705.5 and 705.6, all entitled "Through-Penetrations," 2000 IBC Code Section 711 , "Penetrations").

The fire test conclusions dealing with electrical outlet boxes have since been resolved by the new UL outlet box fire resistance classifications CEYY "Outlet Boxes and Fittings Classified for Fire Resistance" and CLIV "Wall Opening Protective materials." These new classifications came out in the 1980s and 1990s to address the issue of maintaining the fire rating of the walls that contain electrical boxes.

In summary, Attachment 3 demonstrated through ASTM E119 fire tests (the recognized method for testing assemblies for fire resistance) that neither NM or AC cable creates s fire spread problem from dwelling unit to dwelling unit or floor to floor. Therefore, because AC cable is not restricted with respect to building height and because NM cable demonstrated comparable properties with respect to the impact of wiring on the fire resistance of rated assemblies, there is no basis for maintaining a height restriction for NM cable based on concerns about the potential impact of wiring on fire-resistive assemblies.

Finally, as noted in the 8/27/00-8/3/00 minutes of the NM Cable Task Group, Item 00-8-4c and Enclosure 4 (Questions and Answer 11), UL stated its position on wiring installed in fire rated assemblies. UL's position was that NM wiring in fire rated assemblies does not have any adverse affects on the fire rating.

Panel 7: "Attachment 4-This documentation is addressing two subjects. The first is the likelihood of a staple igniting the insulation on the conductor or the wood to which it was stapled."

Comment: It should be noted that Panel 7 did NOT comment on, or dispute, the documentation that was submitted under Attachment 4. This documentation from the highly respected NFPA 921, "Guide for Fire and Explosion Investigation," clearly debunks the myth that overdriven or misdriven staples securing NM cable will commonly cause a fire. See NFPA 921 Section 14-11.4, 14-11.5 and A-14-11.4 and Appendix B on Referenced Publications.

Panel 7: "Table A from Statistical Report on Fire Losses Attributed to Electrical Wiring in Apartments and other Structures" prepared by Jeffrey M. Shapiro P.E., International Code Consultants was submitted. This table indicates that there were an average of 1,759 fixed wiring structure fires in high rise and low rise apartments and in buildings other than homes reported by US fire departments that caused an average of nine civilian deaths from 1993-1997. This data only supports what was contained in the task group's report concerning the other potential hazards involved in the expanded use of Type NM cable."

Comment: Panel 7's interpretation of the submitted fire data is difficult to comprehend. Our intent in submitting the statistical report was to demonstrate that fire losses associated with electrical wiring in concealed spaces accounts for a very, very small percentage of fires in multi-family residential occupancies.

It is true that neither the National Fire Incident Reporting System (NFIRS) nor the NFPA fire data currently available has the necessary information to discriminate between fire involving NM cable from other wiring methods. However, it can be reasonably concluded that if the overall losses associated with electrical distribution wiring fires in concealed spaces (inclusive of ALL WIRING METHODS), are only one-half of one percent (a number substantiated by subsequent data analysis), then any subset of this number associated with NM cable would never represent a large enough loss history to demonstrate a unique restriction for this product.

From the perspective argued by Panel 7, that the annual average of 1,759 fires involving ALL TYPES of electrical wiring, both concealed and exposed, is an unacceptable level of loss, the panel would have to conclude that all existing wiring methods are inadequate to provide an acceptable level of safety because the data is all-inclusive. Does this mean that all electrical wiring methods should be restricted to buildings that are three stories or less in height? Note that the same NFPA fire data shows that stoves caused an annual average of 30, 647 (29.6% of all fires) fires that result in an average of 48 (7% of all fire deaths) fire deaths per year. Would Panel 7 rationalize that we now prohibit installation of stoves above the third floor of apartment buildings?

There is NOTHING in the submitted data that supports Panel 7's conclusion that there are hazards associated with expanded use of NM cable, with respect to elevation or otherwise. The ONLY valid conclusion that can be drawn from the data that we presented with respect to this issue is that electrical wiring, and particularly wiring in concealed spaces, accounts for a very small percentage of fires in multi-family residential occupancies. Given that losses associated with NM cable are only a subset of a vary small number, no unique restriction on NM cable can be justified based on fire loss history.

One other point worth noting is that the Panel was also provided with statewide fire loss data from Michigan and Massachusetts for comparison purposes because these two states both amend the NEC to delete the three-story limit on NM cable, and they have both done so since the restriction was first added to the NEC in 1974. Both of these states took the position that the three-story limit on NM cable was never properly justified to substantiate inclusion in the NEC in the first place, and neither enacted the restriction. As a result, fire loss data associated with electrical distribution wiring from these states would be expected to be higher than national averages if NM cable was truly more hazardous than other wiring methods.

In fact, the opposite was found to be true. Fire loss data presented to the Panel in Tables C and D of the report showed that fire losses associated with electrical distribution wiring were actually lower, in percentage terms, that national averages. It is not our intent to convince the Panel that NM cable would thereby be judged to be a safer wiring method than others recognized by the NEC, but it is our intent to demonstrate that two states that most certainly have a more liberal stance with respect to the use of NM cable versus the rest of the country have fire loss histories that are certainly no out of line with national averages.

Panel 7: "The second part of Attachment 4 basically discusses different types of fire stops which does not provide substantiation for the proposal."

Comment: The second part of Attachment 4 provided information regarding UL listings for fire rated outlet boxes and fire-stopping systems that were designed in response to the fire test conclusions of the NBS report provided in Attachment 3. Our intent in providing information regarding these UL listings was to demonstrate that the safety recommendations presented in the NBS Report (none of which pertain to NM cable) have been addressed.

Panel 7: "Attachment 5 -The test submitted does not provide conclusive data as there are not firm test conditions. The cone calorimeter is not an accepted method for fire testing electrical wire and cable. Wire and cable is tested for flame propagation and, in some cases, for smoke release using actual flame tests on wire and cable products. The cone calorimeter measures heat release, not flame propagation."

Comment: Attachment 5, "Type NM Cable Fire Hazards Analysis," was prepared by Paul D. Sullivan, P.E., based on fire testing performed by Dr. Fred Mowrer (Fire Protection Engineering Department, University of Maryland). The report was third party reviewed by Dr. Fred Clarke (Benjamin/Clarke Associates, Inc.). The report was submitted for the purpose of demonstrating that the fire performance of NM cable and ENT are satisfactorily equivalent to substantiate equal treatment by the NEC with respect to use in buildings exceeding three stories in height.

This documentation provides the same level of analysis as that which was previously used to justify the removal of the three-story height restriction on ENT. Cone calorimeter testing in the Sullivan study concluded that the decomposition temperatures of ENT and NM cable are essentially equivalent (375 degrees Fahrenheit).

Sullivan's study also showed the importance of providing a 15-minute thermal barrier to maintain the temperature of the wall cavity well below the decomposition temperature of the wiring. The 15-minute barrier assures that a fire in the room of origin will yield untenable conditions in the room of origin long before the temperature in surrounding wall cavities would cause decomposition of wiring. The Sullivan report supports the use of NM cable on a par with ENT in that the NM cable will react the same as ENT when located in a wall cavity exposed to an external fire condition. In summary, there is no increased hazard associated with the use of NM cable as compared to ENT.

It is important to point out that prior to the 1986 NEC Code, NM Cable and ENT were both subject to the same three-story height restriction. NEC-TCT-86-A, Code Proposal 8-49-(331-3 and 331-4), submitted by Charles Forsberg, Carlon, eliminated the three-story limitation on ENT based on a research project that analyzed potential toxicity hazards from electrical nonmetallic tubing installations in walls, floors or ceiling where the room is involved in a fire situation. The research report, entitled "The Use of ENMT– Fire Hazard Analysis," was submitted by Benjamin/Clarke Associates, Inc. in support of Carlon's proposal. The NFPA Toxicity Advisory Committee reviewed this report and submitted Code Comment 8-32A-(331-3 and 331-4), recommending an action of accept in principle, requiring a thermal barrier when placing ENT in walls, floors or ceilings in buildings over three stories in height. In the end, Panel 8 ACCEPTED Carlon's proposal with a modification that was based on the Toxicity Advisory Committee's recommendation that a thermal barrier be provided. The Panel added a requirement that the barrier carry a finish rating of not less that 15 minutes.

In response to Panel 7's concern that the cone calorimeter test was not a proper test for the intended purpose, the intended purpose was NOT to address flame propagation or smoke release associated with NM cable or ENT. The intent was to determine the temperature at which these two products will begin to decompose. The cone calorimeter test is, in fact, a proper test for this purpose.

With respect to flame propagation, it is difficult to understand why the Panel has pushed this as an issue since both ENT and NM cable will pass the UL "All-Wire Test Procedure", given that they do not substantially support or spread the flame and that they will both self extinguish when the source of heat is removed.

Considering that the appropriate test method was used, that the analysis was essentially equivalent to that performed to justify removal of the three-story limit on ENT in the NEC and that the report was prepared and reviewed by subject matter experts, the report's conclusions are perfectly valid. These conclusions were:

i. "Type NM cable will not decrease the level of life safety within a building of any height when located in ceiling and wall spaces separated from the interior of the building by a 15 minute finish rating (i.e. 1/2" thick gypsum wallboard), and on this basis should not arbitrarily be limited to 3 stories in height."

ii. "In terms of building firesafety, these results indicate that Type NM Cable, like ENMT (which is not limited to 3 stories by the National Electrical Code), will not contribute to the hazard of a fire when the cable is separated from the interior of the building by a 15 minute finish rating [NFPA 70 Section 331-3(2)].

Panel 7: "Present restrictions for the use of Type NM Cable attests to the fact that it is a safe product provided it is used in accordance with the NEC."

Comment: This statement by Panel 7, in itself, should be regarded as adequate substantiation for approval of this comment. If panel 7 currently regards NM cable as a safe product when used in accordance with the NEC, than there is absolutely no basis for maintaining the three-story restriction in the NEC without evidence that NM cable somehow becomes less safe when used above the third floor level in a building. To date, no one on the Panel or otherwise has presented any evidence that the safety of NM cable is sensitive to elevation in a building. The product and all of the criteria needed for safe installation are identical on the first, third, tenth and any other floor level in a building. If one were to take a proper installation of NM cable on the third floor of a building and relocate that identical floor to the tenth level or higher, would the installation be any less safe?

Nevertheless, the conditions set forth in the code text proposed by this comment have been offered to ensure that every substantive concern expressed by Panel 7 and the NM Cable Task Group has been addressed so that there will not be a valid basis for rejection of this comment.

Panel 7: "Evidence is required by a committee of NFPA responsible for a particular standard or any portion thereof to make a change in the existing requirements."

Comment: Based on ANSI procedures, evidence by way of all the original attachments and the NFPA Fire Data has been provided for this code proposal. In fact, this proposal has more supporting documentation than any other issue considered by Panel 7 during this code cycle. While Panel 7 certainly has the right to disagree with what has been presented, it is incomprehensible how the Panel could suggest that "evidence" was not provided, as this statement suggests.

Panel 7's disagreements with the supporting documentation were provided in the Panel's ROP statement, and in accordance with NFPA/ANSI procedures, we have responded in this comment to ALL of the issues (point by point) identified by the Panel in their statement.

Panel 7: "It is not the responsibility of the responsible technical committee to substantiate the existing requirements. Submitter is required to provide necessary and sufficient technical substantiation for a proposed change."

Comment: When the validity of an existing provision in an NFPA code or standard is challenged by a substantial volume of technical evidence, it is incumbent on the technical committee responsible for the code or standard to exercise due diligence and reassess the validity of the existing provision. Such an assessment would absolutely have to include an analysis of the basis/substantiation

that served as the original justification for the provision. To date, neither Panel 7 nor the NM Cable Task Group has been able to provide a valid technical reason for maintaining the three-story restriction on NM cable. Every documented argument against removal of the restriction has been based on a concern that is not sensitive to the elevation of NM cable in a building.

To justify maintaining the three-story limit, it is incumbent on Panel 7 to identify at least one valid technical or statistical reason justifying the existing provision against which a proposed change to the provision can be measured.

In this particular instance, the National Multi Housing Council has provided what was believed to be sufficient technical substantiation to justify acceptance of the proposal The committee responded with a detailed critique of this substantiation, which did not substantiate the existing provision but instead provided what we accepted as a complete list of the committee's concerns given that the committee was obligated to make its ROP statement complete by prior actions of the Standards Council (see rulings associated with Standards Council Agenda Item: 98-60(b/c/d), dated July 17, 1998 and Standards Council Decision: D00-18, Agenda Item: SC98-60, dated April 28,2000 in which the Standards Council directed that Panel 7 "…should provide detailed substantiation for any position it takes."

Panel 7: "The Panel does not have any knowledge as to the substantiation used by the Commonwealth of Massachusetts and the State of Michigan in amending the three floor restriction since it first appeared in the NEC."

Comment: These jurisdictions have not developed specific substantiation for amending the NEC to remove the three-story limit on NM cable because neither believes that the restriction was adequately substantiated when it was added to the NEC in 1974. Lacking a valid reason for making their electrical codes more restrictive with respect to the allowable use of NM cable in 1974, no substantiation was deemed necessary to delete a provision that was never justified in the first place. Furthermore, it is now evident in our opinion that the three-story limit on NM cable was adopted in violation of NFPA/ANSI rules due to a procedural violation (no public review prior to consideration at the Annual Meeting) in processing of the provision.

Nevertheless, the reasons for Massachusetts and Michigan amending the NEC are irrelevant to the issue at hand. These jurisdictions certainly permit more widespread use of NM cable than jurisdictions who follow the NEC as published, and their fire loss histories are in line with, if not better than, national averages for fires involving electrical distribution systems in multi-family occupancies.

Panel 7: "Fire loss data does not differentiate the specific wiring methods used for Fixed Wiring."

Comment: See response above to the Panel's other comment regarding fire data.

Panel 7: "Fire spread of individual products is not compared using test methods applicable to wire and cable products."

Comment: All conductors and cables must be flame retardant if they are used inside a building. To assess flame resistance for wiring system, tests involve burning samples of the product and measuring the flame spread and duration.

Most building wire products are required to pass a flame test, depending on the conductor or cable type. The fire (flame) spread tests for wiring systems should be well know to NEC panel members, but are presented here for review:

1. For NM Cable, under UL 719, cable is required to pass the "All Wires Flame Test".
2. For ENT, under UL 1653, tubing is required to pass the "All Wires Flame Test".
3. For Rigid PVC Conduit, under UL 651, conduit is required to pass the "Cable Flame Test".
4. For MC with a jacket, under UL 1569, cable is required to pass the "All Wires Flame Test".
5. For AC (UL 4), MC without a jacket and Rigid Metallic Conduit, there are no requirements for flame spread testes.

In the All-Wires Flame Test, the flame test cabinet is placed in a draft-free environment. An 18-inch product sample is clamped in a vertical position in the center of the cabinet above a layer of cotton. A gas burner adjusted to provide a temperature of 1,500°F is pointed at the product. A strip of gummed kraft paper is wrapped around the sample 10 inches above the point where the gas flame contacts the cable as a flame indicator flag. The burner is moved into place and the flame is ignited. It is allowed to burn for 15 seconds, then turned off for 15 seconds. This is repeated until the flame has been applied a total of five times.

To pass the All-Wires Flame Test, the sample must not continue to burn for more than 60 seconds (For ENT, the maximum time for burning is 10 seconds). The flame must not travel up the sample to a point where more than 25% of the paper flag is consumed. The cotton must not be ignited by flaming particles. This test shows if the product is flame retardant. The product passes the test if it does not support or spread the flame, and if it self-extinguishes when the source of heat is removed.

The Cable Flame Test is the multi-conductor cable version of the All-Wires test, which is for single conductors only. In this test, the flame is turned on for 60 seconds and turned off for 30 seconds three times. The criteria for acceptance are identical to those in the All-Wires test.

As can be see by the flame tests noted above, NM Cable is treated in a similar fashion in its flame (fire spread) testing criteria to other comparable wiring methods permitted by the NEC Code without a three-story height restriction.

Panel 7: "Fire Hazard Analysis comparison of Type NM Cable versus wiring in ENT does not compare all other differences in the two wiring methods."

Comment: The fire hazard analysis comparison of NM Cable vs. ENT did compare all the differences in the two wiring methods that are relevant to the issue of the three-story limitation. Comparing the requirements of NEC Article 331 (ENT) to Article 336 (NM) shows that the only relevant difference between the two wiring methods is the three-story limitation that was present for both NM cable and ENT before 1987, that has since been applicable only to NM cable.

NEC-TCT-86-A, Code Proposal 8-49 (331-3 & 331-4), submitted by Charles Forsberg, Carlon, eliminated the three-story limit for ENT. The fire hazard analysis comparison of NM cable vs. ENT that was submitted to Panel 7 used the same parameters that were used in the ENT research project, which justified removal of the height limit on ENT. The analysis compares "apples to apples" and shows that NM cable is equal to or better than ENT with respect to toxicity, which was the major issue inhibiting expanded use of ENT in 1986.

Accordingly, there is no logical reason for maintaining the height restriction on NM cable but not ENT. If the NM cable height restriction is still considered valid, then it is incumbent on the NEC Correlating Committee and the Standards Council, to justify why a height restriction isn't placed on ENT.

As indicated previously, panel 7 is obligated to consider that the Standards Council's Toxicity Advisory Committee met on October 20, 2000 and determined that toxicity, as it relates to the use of NM cable above three stories, is a non-issue (See the Toxicity Advisory Committee's Comment in this ROC). Thereby, the Sullivan NM Cable Fire Hazard Analysis meets all the parameters required of the ENT research project done by Carlon to justify removal of the three-story limit on ENT. Given that NM cable has now been shown to meet the same criteria as those used to justify elimination of the three-story limit on ENT, the height restriction on NM cable can no longer be justified.

Conclusion

These rebuttal comments, along with the revised text, the supporting statements above and the original substantiation submitted for Code Proposal 7-145 provide a more than adequate technical basis for acceptance of the proposed code text, as required by NFPA/ANSI procedures. It is important to emphasize that the focus of this proposal is very specific. It deals only with the removal of a height limit on the use of NM cable in multifamily dwelling buildings.

Nowhere in any of the Panel's comments or the NM Cable Task Group's comments has there been any valid substantiation offered to justify a three-story limit on the use of NM cable. The three-story limit is entirely arbitrary, and lacking a valid technical reason that supports a specific height limit, such as data showing that the product creates an unsafe condition if used at a particular elevation, we can find no basis under the NFPA rules for rejection of this comment.

PANEL ACTION: Reject.

PANEL STATEMENT: Review of material provided with this comment, presentations made at the ROC panel meeting, review of material distributed at the ROC panel meeting, and panel action on Comment 7-48 along with the substantiation provided with that comment support the following:

· The panel's action on this comment.
· The present requirements in the Code relative to the permitted uses of Type NM cable.
· The need for a comprehensive fact-finding report as stipulated in Item 5 of the substantiation for Comment 7-48.

Items submitted to the panel for review at the ROC meeting include:

1. Statistical Report-Structure Fires in Apartments by Area of Fire Origin, prepared by: Fire Analysis and Research Division, NFPA,

November 2000. This document affirms that the current requirements in the NEC are adequate.
2. Document entitled-Test Report: Investigation of the potential for fire propagation along Type NMC cable within a steel stud wall cavity. The document states that the test was conducted at the Potomac Laboratory of the Department of Fire Protection Engineering at the University of Maryland. The panel noted that the two typed pages were not on letterhead stationary and did not contain any signature or date. This document does not satisfy the concern relating to a fire originating in a concealed space as stipulated in Item 3 nor the comparison requested in Item 5 in the substantiation for Comment 7-48.

Note: Supporting material available at NFPA Headquarters.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 3
EXPLANATION OF NEGATIVE:

NICKSON: Comment 7-52 should be approved. In rejecting Comment 7-52 without a detailed substantiation and introducing a new requirement for a "fact finding report," Panel 7 failed to comply with the NFPA Standards Council directive set forth in decision D#98-22 and reaffirmed in decision D#00-18, directing Panel 7 to "provide clear direction relative to what substantiation would be required before favorable consideration could be given to proposals to eliminate or modify the three floor limit."

The requirement for a fact finding report by a third-party testing laboratory is simply a delay tactic intended to sidestep the Council's directive. Furthermore, in requiring a fact finding report that supports the comment prior to further consideration, the Panel has established an insurmountable hurdle because the proponent has been advised the testing laboratories will not make any specific recommendations with regard to modifying the three story limit. The laboratories advise that they will only provide technical data that must be interpreted by others. Nevertheless, the type of information that would be addressed in a fact finding report has already been supplied to the Panel in the supporting documentation submitted with Proposal 7-145 and Comment 7-52.

By mandating that a fact finding report be submitted and not responding to technical modifications offered in Comment 7-52, Panel 7 has violated Section 4-4.6.3 of the Regulations Governing Committee Projects, which requires that TCs must provide a statement substantiating their action that is "preferably technical in nature, on the reason for the TC action." The regulations further state: "Such statement shall be sufficiently detailed so as to convey the TC's rationale for its action so that rebuttal may, if desired, be offered when the Committee presents its Technical Committee Report to the Association for consideration."

By establishing a prerequisite for a fact finding report prior to further consideration of proposals modifying the three-story limit on NM cable, Panel 7 has also exceeded its authority in the code development process by independently imposing a supplemental regulation governing submittal contents. NFPA procedures clearly delineate minimum requirements for submittal contents in Section 4-3.3 of the Regulations Governing Committee Projects, and technical committees are not authorized to change this threshold.

After 25 years of debate, there is one simple fact that sums up the entire issue. There is absolutely no documented evidence that correlates the safety of NM cable with the elevation of its installation in a building. NONE. If such information existed, surely it would have surfaced by now.

In contrast, the proponent has submitted technical analyses demonstrating satisfactory equivalence of NM cable to other wiring methods already permitted above three-storeies. Furthermore, Comment 7-52 clearly responded to all issues documented by Panel 7 in opposing the original proposal, Proposal 7-145.

In addition, the fire data prepared by the NFPA Fire Research Division clearly indicates that fixed wiring in concealed spaces in apartment occupancies is not a statistically significant source of fire ignition, accounting for less than 0.5-percent of all apartment fires. Supplemental data submitted during the comment stage further refined the initial statistical report based on sprinklered buildings, and indicated that nationally, there have been an annual average of only 28 fires in sprinklered apartments attributed to fixed electrical wiring in concealed spaces. These fires caused an average of zero deaths, three injuries, and $500,000 in damage per year, and the figures represent all wiring methods, not just NM cable.

NUTT: See my explanation of negavite vote on Comment 7-27.

PROPST: I do not support the panel's belief that a rigorous fact finding report related to the application of NM cable is mandatory for the acceptance of NM cable use in multifamily dwellings. We should not be focusing only on whether or not NM wiring methods are as good as, better, or worse than other wiring methods, but rather on whether or not the wiring method will meet or exceed acceptable safety risks when used in multifamily dwellings. The panel seems to be in agreement that the use of NM cable meets acceptable safety risks when used in residential applications. It was pointed out in the panel discussion that the probability of failure is not a function of height. However, the consequences of failure can be height and occupancy related. In order to maintain the same level of risk in multifamily dwellings that we already have accepted for single family residential units, we then need to only demonstrate that the increase in consequences when using NM cable for applications above 3 floors and multifamily dwellings is equally offset by providing additional safeguards to reduce either the consequences or the probability of failure. During the panel discussion, I believe that Mr. Klein's comments and data clearly showed that several of the seven proposed requirements alone, could provide these additional safeguards. When the risk reduction of all seven are considered together, I believe the risk of using NM cable in multifamily dwellings was shown to be far less than the currently accepted risk for using NM cable in single family residences.

COMMENT ON AFFIRMATIVE:

SCHUMACHER: This comment should be rejected. The work of the task group on NM cable shows that this cable has not been tested to the extent of the cables that are approved for over three floor construction. Although safe in wood frame construction, this cable cannot withstand the rigors placed on it during the construction of buildings that are built of other materials.

PROPST: See my explanation of negative vote on Comment 7-27.

(Log #1964)

7- 54 - (336-5): Accept
SUBMITTER: Phil Simmons, Simmons Electrical Services
COMMENT ON PROPOSAL NO: 7-145
RECOMMENDATION: Continue to reject the proposal.
SUBSTANTIATION: The proposed exception is faulty as it would permit Type NM, NMC and NMS cables in any building of any type and height so long as it has a multifamily dwelling exceeding three floors above grade. The submitter did not provide adequate substantiation for such a proposal.

The submitter states that "there is no unique fire hazard associated with NM wiring when compared to other code recognized wiring methods." This is not a correct statement. Type NM cable is unique when compared to other code recognized wiring methods. Type NM cable readily ignites and propagates flame. Metallic wiring methods such as Type AC and MC cables do not. The fire performance difference between Type NM and armored cable products is dramatic with the armored cable products being significantly better.

Type NM cable must only meet the UL Vertical Flame test. It is the least severe flame test for any cable that is listed by UL. The test involves a single 18 inch length of NM cable that is subjected to a 5-inch flame from a 3/8-inch diameter Bunsen type burner (about the size of your little finger). The heat from the flame is 1,700 BTU/hr. The flame applied to the cable is 15 seconds on

and 15 seconds off five times for a total exposure to the fame of 1 minute 15 seconds. The cable is permitted to flame for 60 seconds after the test flame is removed.

CMX communications cable is a power-limited communications cable that is closest to NM cable (a power cable) in fire characteristics. Even CMX cable must meet the UL Vertical Wire flame test. CMX must also either (1) be installed in raceway, (2) be installed in nonconcealed spaces and be no longer than 10 ft. long, (3) be less than 0.25 in. in diameter where installed in one or two family dwellings, or (4) be less than 0.25 in. and installed only in nonconcealed spaces of multifamily dwellings.

MC and AC armored cables meet ULs Vertical Tray Flame Propagation and Smoke Release test. The test involves up to 10 cables, eight feet long, installed vertically. The cables are subject to a 13 - 7/16-inch wide burner flame with a heat of 70,000 BTU/hr. The flame is applied to the cable for 20 minutes. In addition to the flame test, Types MC and AC armored cables meet the smoke release requirements of 0.95m2 total smoke release and 0.25m2/s peak smoke release so that the cables are permitted to be marked as "Limited Smoke."

	NM	MC and AC
No. of cables	1	10
Length of cable	18 incles	8 feet
Burner Size	3/8 inch diameter	13-7/16 inch
Heat rate of flame	1,700 BTU/hr.	70,000 BTU/hr.
Time of flame exposure	1 minute 15 seconds	20 minutes
Limtied Smoke rating	None	“LS” rated
Tensile strength	1500 psi	38-40,000 psi

Type NM and armored cable products each contain the same type of insulted conductors. This, however, is where the similarity ends. If the wiring methods were equal, there would be no need for an outer covering over the insulated conductors. The outer covering is what distinguishes the cables, and their appropriate use.

Type NM cable is constructed with a combination outer covering of 0.020-inch of flexible PVC and 0/.010 inch of paper. As an illustration, a 0.020-inch thickness of flexible PVC is the thickness of 6 pages from the Report on Proposals. The physical property of the flexible PVC is 1500 psi tensile strength. The physical properties of the paper are not specified.

Armored cables are constructed with outer coverings of steel and aluminum ranging from 0.012 inch to 0.025 inch in thickness with the physical property of 38,000 psi tensile strength for aluminum and 40,000 psi tensile strength for steel.

7- 55 - (336-5): Accept
SUBMITTER: Frank Ricketti, Deerfield Beach, FL
COMMENT ON PROPOSAL NO: 7-145
RECOMMENDATION: Continue to reject the proposal.
SUBSTANTIATION: The proposal would replace conduit and metal jacketed cables in buildings above three floors with NM cable which is a fragile wiring method by comparison. It is evident that the incidents and severity of fires in buildings will increase and not decrease as a result of this proposal based on the physical and fire performance differences between the wiring methods. The substantiation for the proposal seems to indicate that the submitter believes that a certain amount of fires is acceptable. The goal should be safer buildings not an acceptable level of fire safety.

7- 56 - (336-5): Accept
SUBMITTER: James C. Dollins, AFC Cable Systems
COMMENT ON PROPOSAL NO: 7-145
RECOMMENDATION: Continue to reject the proposal.
SUBSTANTIATION: The manufacturers of type NM cable are the best judges of how and where NM cable should be used. By a unanimous vote the Building Wire Technical Committee of NEMA developed a position that the current uses of NM should not be expanded. The position was based on the lack of technical justification for expanding the scope of permitted uses beyond those currently permitted by the NEC. The NEMA Building Wire Section includes all major manufacturers of NM.

It should also be pointed out that during the 25 plus years that the three-story rule has been in the NEC, not once has a manufacturer of NM submitted a proposal to the NEC to remove or modify the current requirement. The manufacturers of NM know the product best in terms of how the cable is designed, constructed, and tested. The product does have its limitations and manufacturers are acting in a safe and responsible manner in not supporting the expanded use.

The vocal and open lack of support by the manufacturers to expand the use of NM should serve as a strong recommendation to those who would use the product in an application for which it is not suitably designed.

COMMENT ON PROPOSAL NO: 7-147
RECOMMENDATION: Continue to reject this proposal.
SUBSTANTIATION: This proposal would permit N/M Cable in practically every application except hazardous locations, some places of assembly, and patient care areas, without justification. The fact that Michigan and Massachusetts do not have a 3 story rule does not prove that NM cable is actually used in all of these buildings. Acceptance of this proposal will lower the bar on combustibles in buildings over 3 stories. SEE COMMENT AND DATA PROVIDED FOR proposal 7-145. The International Residential Building Code stops at three stories. Doesn't that say a lot about extra protection necessary above that level? If N/M cable, with its known fire hazards of ignition, flammability, and prolific smoke, can be run throughout buildings, what is next? Even if one assumes that the use of N/M cable will not be extensive or that local jurisdictions will continue to make amendments if the NEC expands the use of N/M cable, the precedent will be used to add more and more combustibles to the buildings in which we live and work. We see that each cycle in the NEC and the building codes. Redundant panels must concern themselves with addressing and maintaining building safety that could be compromised by the electrical system. Other groups are responsible for different fire safety concerns. A hazard in noncombustible buildings that has not been addressed is corrosion of the structural elements in the event of an N/M fire in a concealed space. This may not be a dangerous fire for people, but could mean that the building framework would not even be examined and cleaned. Corrosive products of combustion have not received the attention they deserve, and should be of particular concern in high-rise buildings such as would be permitted by this proposal. Refusal to expand the permitted use of N/M cable by ever-changing Code Panel 7, the NFPA floor vote, and the building codes says a lot about personal knowledge and experience. The International Electrical Code (ICC Codes) did vote for 4 stories this Fall, but we would caution that the attic spaces and other concealed spaces of 4 story buildings will not require sprinklers. Again, the primary concern is fires in concealed spaces, and we are not sure that point was clear.

7- 66 - (336-5(a)(1)): Accept
SUBMITTER: Patricia Horton, Elaine Thompson, Allied Tube & Conduit
COMMENT ON PROPOSAL NO: 7-149
RECOMMENDATION: Continue to reject this proposal.
SUBSTANTIATION: It is not true that the 3-story rule is unsubstantiated. In the 1987 TCD (now called ROC) the NFPA Legal Counsel prepared a recap of the 3-story rule for the Technical Correlating Committee due to accusations of this nature. This was called Appendix A of that TCD. Since that time additional data supporting this rule has continued to be supplied for the Code-Making Panel. The proponent states: "Acceptance of this proposal will restore credibility to our NFPA consensus process." We believe just the opposite will happen. This rule has been evaluated thoroughly for over 25 years with the same results. This cycle even more data has been supplied to NFPA. In addition to the Code panel, a special 3-story Task Group has spent ten days reviewing materials submitted by both proponents and opponents of expanded use of NM Cable. This has served to reinforce that expansion of the current product would reduce the safety provided by the current Article 336. If anything, this review has served to show that perhaps additional installation requirements should be implemented. With no information to support expanded use, acceptance of this proposal would serve to discredit the work of Code-Making Panel 7 and the NFPA membership voting at the annual meeting for 25 years. This proposal would permit use of N/M Cable in buildings of any height and almost any occupancy. This is certainly not justified.
Note: Supporting material available for review upon request at NFPA headquarters.

(Log #1998)

7- 80 - (336-5(a)(1), Exception): Reject
SUBMITTER: William F. Laidler, Rep. Massachusetts Electrical Code Advisory Committee
COMMENT ON PROPOSAL NO: 7-151
RECOMMENDATION: The proposal should be accepted.
SUBSTANTIATION: As stated in our original proposal, Massachusetts approaches thirty years of experience allowing this type of use and if there had been any concerns of safety it surely would have surfaced by now. The cable is widely used in buildings above three stories in urban areas of the state. In fact, when the NFPA Standards Council met at the Sonesta Hotel in Cambridge to take final action on the 1999 NEC in July of 1998, they were meeting in a high rise building wired with Type NM cable. It is simply not true that the Massachusetts experience is limited, as has been asserted, by design choices that make the use of the product rare, however allowable, in such buildings. The Committee is continuing to gather statistics about the use of this product in such occupancies, and hopes to have more complete information by the December meetings.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided any new substantiation. See panel action on Comment 7-48.

(Log #1874)

7- 82 - (336-6(f)): Accept in Principle
Note: The Technical Correlating Committee understands that the panel action on Comment 7-82a is the final action on the issue by placing the appropriate text in 336.17. There will not be a separate 336.6(F) in the 2002 NEC.
SUBMITTER: David G. Foreman, The Foreman's Inc.
COMMENT ON PROPOSAL NO: 7-158
RECOMMENDATION: Revise text to read as follows:
(f) Grommets in Metal Studs. Grommets shall be used in metal studs as required in 300-4(b)(1) shall remain in place during the wall finishing process and shall be listed for the purpose of cable protection.
Deleted text: , shall cover the complete opening,
SUBSTANTIATION: Although well-intentioned, the proposal that grommets cover the complete opening mandates that all penetrations through metal studs be either drilled or punched. Two-piece, snap-together grommets which are designed to protect cables running through pre-punched factory openings in studs (and which by design will not come out of these holes) are perfectly suited for use with metal studs from all manufacturers. All "shall cover the complete opening" does is to increase the cost of every job where metal studs are employed.
PANEL ACTION: Accept in Principle.
Revise recommended text to read:
Grommets in Metal Studs. Grommets shall be used in metal studs as required in 300-4(b)(1), shall remain in place and shall be listed for the purpose of cable protection.
PANEL STATEMENT: The panel understands this panel action requires that the listing process for grommets will address the evaluation of specific designs for their capability to provide required protection to the cables passing through the openings in the metal studs. The panel action also eliminates the wording "during the wall finishing process", as the listing process should address the capability of the gromments to remain in place.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #CC704)

7- 82a - (336-17): Accept
Note: The Technical Correlating Committee directs that the second sentence of the Recommendation be revised to read as follows: "Grommets used as required in 300.4(B)(1) shall remain in place and be listed for the purpose of cable protection." This action complies with 3.3.4 of the NEC Style Manual.
SUBMITTER: CMP 7
COMMENT ON PROPOSAL NO: 7-128a
RECOMMENDATION: Revise 336-17 to read:
336-17. Through or Parallel to Framing Members. Types NM, NMC, or NMS cable shall be protected in accordance with 300-4 where installed through or parallel to framing members. Grommets shall be used in metal studs as required in 300-4(b)(1), shall remain in place and shall be listed for the purpose of cable protection.
SUBSTANTIATION: The panel has revised this section to be consistent with corresponding sections in Articles 330, 333 and 334. The language on the use of grommets reflects the panel action on Comment 7-82.
PANEL ACTION: Accept.

7- 83 - (336-18): Reject
SUBMITTER: William F. Laidler, Rep. Massachusetts Electrical Code Advisory Committee
COMMENT ON PROPOSAL NO: 7-164
RECOMMENDATION: The proposal should be accepted.
SUBSTANTIATION: For no significant cost, extra protection is afforded by the insulated staple. If an uninsulated staple is struck too hard it will damage the cable, especially if the staple has sharp edges.
PANEL ACTION: Reject.
PANEL STATEMENT: Present code requirements do not prohibit the use of insulated staples. The recommendation to prohibit the use of uninsulated staples lacks technical substantiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #2216)

7- 84 - (336-18): Accept
SUBMITTER: Robert H. Keis, Dover, DE
COMMENT ON PROPOSAL NO: 7-164
RECOMMENDATION: This proposal should remain "rejected."
SUBSTANTIATION: Mr. Hartwell made the comment that it is difficult to control the force on a hammer. This is true, but good workmanship would require knowing how to use a hammer. Just because the staple is insulated will not prevent damage to the insulation itself. If it is over driven, the damage will most likely be to the insulation between conductors, not to the staple. I have seen a lot more fires caused by arcing between conductors through damaged insulation, than I have from arcing to the staple. The insulated staples that I have seen are made for two-conductor flat cable and will will not properly seat against 3-conductor. Or must electricians now carry two kinds of staples. I am curious how the State of Massachusetts can tell that insulated staples have prevented fires. How do you derive statistics on fires that don't happen? Maybe electricians just finally learned how to use a hammer.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #376)

7- 85 - (336-18 Exception No. 3): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 7-169
RECOMMENDATION: Accept in principle revised: Delete present wording and substitute the following: Exception No. 3: The support interval from terminations at luminaires or equipment in or on suspended ceilings shall be permitted to be increased where all the following conditions are met: (1) structural members (including support wires or rods and ceiling grid members where permitted to be used) do not permit the support interval required by this section; (2) the nearest readily available support member is used; (3) the support interval does not exceed 1.4 m (4 1/2 ft); and (4) the cable is above the suspended ceiling.
SUBSTANTIATION: The broad exemption of support within 12 in. is not warranted where structural support above a suspended ceiling is less than 4 1/2 ft. above or where support wires, rods, or ceiling grids not prohibited for support are available at intervals less than 4 1/2 ft. The 4 1/2 ft. maximum should apply only where no closer support is available. The proposal would address some concern of Mr. Trainor in that runs between fixtures would require fastening at some interval less than 4 1/2 ft. where the building structure or ceiling assembly would permit.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Comment 7-87a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #1830)

7- 86 - (336-26): Reject
SUBMITTER: Patricia Horton, Elaine Thompson, Allied Tube & Conduit
COMMENT ON PROPOSAL NO: 7-179
RECOMMENDATION: Accept this proposal.
SUBSTANTIATION: The need for a 60°C ampacity derating factor with a 90°C actual insulation on NM Cable was well documented when the 90° requirement went into the 1984 Code. The permission to start derating from 90° is erasing that safety factor. In addition, the Panel should review Proposal 7-190. The summary of the study that led to 90°C insulation for the Panel, is (NBSIR 78-1477). Temperatures reached as high as 298°F on paralleled nonmetallic-sheathed cables carrying, 135 percent of rated current, 27a; for one hour, and located between two layers of R-11 glass fiber insulation simulating a ceiling joist space.
Note: Supporting material available for review upon request at NFPA headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no new technical substantiation provided to change the requirements specified for the ampacity of Type NM Cable.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
SCHUMACHER: This comment should be accepted. The outer jacket of Type NM cable is not rated for 90 degrees C, even though the conductors are, when this cable is installed in thermal insulation, or bundles of cables, can cause excessive heat that the outer jacket is not rated for.
STRANIERO: New technical substantiation should not be necessary to correct previous panel actions to permit derating based on 90°C which is contrary to the recommendation of the original study referenced by this comment. The original study referenced by the comment was the basis for requiring a 90°C insulation rating and 60°C ampacity for NM where located in thermal insulation.

(Log #2000)

7- 87 - (336-26): Reject
SUBMITTER: William F. Laidler, Rep. Massachusetts Electrical Code Advisory Committee
COMMENT ON PROPOSAL NO: 7-180
RECOMMENDATION: The proposal should be accepted
SUBSTANTIATION: Effectively 7-177 meets the intent of the proposal, however, the wording (clarity) is inconsistent with 330-20. Also 7-177 does not require that the cable insulation be rated 90° and does not reference 310-15.
PANEL ACTION: Reject.
PANEL STATEMENT: Proposal 7-177 was part of the rewrite effort for Article 336. The panel is not clear about submitter's inference that the panel action on Proposal 7-177 effectively meets the intent of Proposal 7-180. The panel believes that the submitter's reference to Section 330-20 is actually to Section 333-20. The insulation for a conductor used in Type NM Cable is required to be rated 90° C as shown in 336-112.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #CC708)

7- 87a - (336-30): Accept
SUBMITTER: CMP 7
COMMENT ON PROPOSAL NO: 7-128a
RECOMMENDATION: Revise 336-30 to read:
336-30. Securing and Supporting. Nonmetallic-sheathed cable shall be secured by staples, cable ties, straps, hangers, or similar fittings designed and installed so as not to damage the cable at intervals not exceeding 1.4 m (4 1/2 ft) and within 300 mm (12 in.) of every cabinet, box, or fitting. Flat cables shall not be stapled on edge.
(A) Horizontal Runs Through Holes and Notches. In other than vertical runs, cables installed in accordance with 300-4 shall be considered supported and secured where such support does not exceed 1.4 m (4 1/2 ft) intervals and the nonmetallic-sheathed cable is securely fastened in place by an approved means within 300 mm (12 in.) of each box, cabinet, conduit body, or other nonmetallic-sheathed cable termination.
FPN: See 370-17(c) for support where nonmetallic boxes are used.
(B) Unsupported Cables. Nonmetallic-sheathed cable shall be permitted to be unsupported where the cable is
(1) Fished between access points, where concealed in finished buildings or finished panels for prefabricated buildings and supporting is impracticable; or
(2) Not more than 1.4 m (4 1/2 ft) from the last point of support for connections within an accessible ceiling to luminaire(s) [lighting fixture(s)] or equipment.
(C) Wiring Device without a Separate Outlet Box. A wiring device identified for the use, without a separate outlet box, incorporating an integral cable clamp shall be permitted where the cable is secured in place at intervals not exceeding 1.4 m (4 1/2 ft.) and within 300 mm (12 in.) from the wiring device wall opening, and there shall be at least a 300mm (12 in.) loop of unbroken cable or 150 mm (6 in.) of a cable end available on the interior side of the finished wall to permit replacement.
SUBSTANTIATION: The panel has revised this section to be consistent with corresponding sections in Articles 330, 333 and 334.
PANEL ACTION: Accept.

7- 89 - (336-30):
Note: It was the action of the Technical Correlating Committee that this comment be reported as "Accept in Principle" to correlate with the panel action on Comment 7-92.
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 7-183
RECOMMENDATION: The American Chemistry Council recommends that proposal 7-183 should have been accepted as proposed.
SUBSTANTIATION: As noted in the negative explanation of Mr. Propst and Mr. Trainor, the risks associated with the use of nonlisted type NM cable is potentially significant whereas the burden for implementation is essentially zero.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its position in the panel statement on Proposal 7-183.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
GUIDA: This comment should be accepted. The definition of "Listed" in the NEC states that the listing organization is required to be acceptable to the authority having jurisdiction, and that equipment meets identified standards or has been tested and found suitable for a specified purpose. Many other cables and most raceways in the NEC are required to be listed.
The panel statement indicates that company reputation or a supplier's declaration are acceptable alternatives to listing. It should be noted that Code Making Panel 1 has rejected similar proposals due to the potential for inconsistent interpretations by

authorities having jurisdiction. Listing is based on compliance with recognized product safety standards.

As additional information, the Standard for Nonmetallic-Sheathed Cables, UL 719, requires a thorough construction and performance evaluation for all nonmetallic-sheathed cables. Among others, testing includes flammability, dielectric voltage-withstand, unwinding at low temperatures, pulling through joists, conductor pullout, crushing, and abrasion. Nonlisted cables may not have been evaluated for compliance with these requirements, and may not function correctly with listed termination fittings.

PROPST: This proposal should have been accepted in principle with a panel statement that referenced the panel's action on Comment 7-92, which accepted the same concept with editorial changes to relocate it to the appropriate section of the NEC.

SCHUMACHER: This comment should be accepted. Type NM Cable is used by not only trained electricians, but by "home handymen" as well. Listing of this product will raise the standard to where all users will be using a product that has been recognized as safe.

(Log #1813)

7- 90 - (336-30(b)): Reject
SUBMITTER: Tim Andrassy, Steel Tube Inst.
COMMENT ON PROPOSAL NO: 7-191
RECOMMENDATION: If the use of N/M cable is expanded above 3 stories, this proposal should be accepted.
SUBSTANTIATION: Expanded use of N/M Cable requires improvement in its fire characteristics. This is not the ultimate, but would be better than no improvement. "Accept in Principal" with more stringent requirements to make N/M performance equal to that of A/C and M/C cable would be more appropriate.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action on Comment 7-48.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #1832)

7- 91 - (336-30(b)): Reject
SUBMITTER: Patricia Horton, Elaine Thompson, Allied Tube & Conduit
COMMENT ON PROPOSAL NO: 7-190
RECOMMENDATION: Accept this proposal.
SUBSTANTIATION: The proponent has been submitted real life data on problems with NM Cable. He has also offered a solution that has already proven effective in his own jurisdiction. The panel has rejected Proposal 7-179 that would require ampacity derating for NM cable to apply as though the insulation rating is 60°C. This need was well documented when the 90° insulation was required (see Comment on 7-179). Rejection of this proposal will compound the overheating hazard.
PANEL ACTION: Reject.
PANEL STATEMENT: No additional technical substantiation has been provided to support increasing the minimum conductor size for this particular wiring method.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
STRANIERO: Overheating of conductors is an actual problem as reported by the original proposal. The broad brush approach of increasing the conductor size will provide an increased safety factor to account for the long term aging effects of conductors operating in ambient temperatures above 30°C and at ampacity levels resulting in insulated conductor operating temperatures above that for which it is rated.

(Log #1831)

7- 92 - (336-32 (New)): Accept
SUBMITTER: Patricia Horton, Elaine Thompson, Allied Tube & Conduit
COMMENT ON PROPOSAL NO: 7-194
RECOMMENDATION: Accept this proposal.
SUBSTANTIATION: Requiring listing for nonmetallic sheathed cable does not mean that all cables under the jurisdiction of Code-Making Panel 7 would necessarily need to be listed. This particular cable is the subject of much controversy and it is especially important that we are addressing standardized product as we go forward. As noted by Mr. Guida and Mr. Trainor, most NM cable in the U.S. is listed. This will aid in assuring NM cable is constructed as necessary for the permitted uses where the NEC is used in international jurisdictions. It will also provide a basis for imported NM cable to meet expectations relative to the electrical and fire characteristics. Any NM produced in the U.S. that is not listed should be. This is basic standardization and provides a means for any construction characteristics that may need to be changed in the future.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel notes that this section should be numbered 336-6.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
TEMBLADOR: We continue to support the Panel Action and Panel Statement at the ROP Meeting on Proposal 7-194.
COMMENT ON AFFIRMATIVE:
GUIDA: This comment should be accepted. The definition of "listed" in the NEC states that the listing organization is required to be acceptable to the authority having jurisdiction, and that equipment meets identified standards or has been tested and found suitable for a specified purpose. Many other cables and most raceways in the NEC are required to be listed.

As additional information, the Standard for Nonmetallic-Sheathed Cables, UL 719 requires a thorough construction and performance evaluation for all nonmetallic-sheathed cables. Among others, testing includes flammability, dielectric voltage-withstand, unwinding at low temperatures, pulling through joists, conductor pullout, crushing, and abrasion. Nonlisted cables may not have been evaluated for compliance with these requirements, and may not function correctly with listed termination fittings.

PROPST: In order to help assure that NM cable, which is widely used by the general public for residential use, meets acceptable minimum product safety standards, I support the requirement that type NM cable should be listed. Since essentially all types NM cable is already listed, this requirement should have no financial impact on the manufacturers or users while at the same time enhancing safety.

SCHUMACHER: See my explanation of negative vote on Comment 7-89.

(Log #2042)

7- 93 - (336-80): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 7-180
RECOMMENDATION: Accept the proposal, and relocate to 336.80.
SUBSTANTIATION: The panel statement says there has been no problem applying 60°C ampacities to this cable where located in thermal insulation, but utilizing 90°C conductors for derating. How then, should we characterize the NEMA research of 15 years ago, showing literal incineration of embedded 90°C SE cables at rated ampacity, and overheating when drawing current 10A below the 60°C table ampacity? The term "final ampacity" in the panel statement is meaningless. Ampacity is the current carrying ability of a wire under conditions of use. It is determined by thermodynamics, not politics. If the use impedes free circulation of air, then the ampacity is reduced to whatever it is. The proposal is correct. If there are no thermal impediments to air circulation, then allow the 90°C number for derating purposes. If installed in thermal insulation, start with the 60°C number, just as in the case of armored cable.
PANEL ACTION: Reject.
PANEL STATEMENT: There has been no additional technical substantiation provided to support changing the ampacity requirements of Type NM cable.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
STRANIERO: The comment should be accepted. The submitter provided technical substantiation for supporting the comment which was the original study that showed thermal degradation of the conductor insulating materials when operating at 60°C ampacity where the cable is located in thermal insulation. Permitting derating based on 90°C ampacity will result in insulated conductor operating temperatures in excess of the insulated conductor temperature rating for cables installed in thermal insulation.

(Log #396)

7- 94 - (337-7(b)(3)): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 7-101
RECOMMENDATION: Accept in Principle revised as follows:
Delete proposal wording and substitute: (3) Used in suspended ceilings for connections to lunimaires or equipment in or on the ceiling and (a) structural members (including support wires or rods and ceiling grid members where permitted to be used) do not readily permit support intervals from terminations as required in (a); (b) the nearest readily available support member is used; (c) the support interval shall not exceed 1.8 m (6 ft); (d) The cable is above the suspended ceiling.
SUBSTANTIATION: The broad exemption of support is not warranted where structural support above a suspended ceiling or support wires or rods and ceiling grid members are available at less than 6 ft intervals. The 6 ft maximum should only apply where no closer support is available. The proposal addresses some concern expressed by Mr. Trainor in that runs between fixtures would require fastening if the structural ceiling, suitable ceiling assembly provides support at less than 6 ft. It also specifies intervals "from terminations" which would not permit a 50 ft run to a fixture to be supported at 6 ft intervals. Present wording can be interpreted to apply to support for the entire run.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Comment 7-16c. The panel notes that this comment is on Section 333-7(b)(3), not Section 337-7(b)(3).

ARTICLE 338 — SERVICE-ENTRANCE CABLE

(Log #629)

7- 95 - (338-2, 338-100 (New)): Accept
SUBMITTER: James M. Daly, BICC General
COMMENT ON PROPOSAL NO: 7-195a
RECOMMENDATION: The proposal should be accepted in part in principle.
Change the title of Section 338-2 from "Definition" to "Definitions."
Delete the last three paragraphs from 338-2 which read:
"Cabled, single-conductor, Type USE constructions recognized for underground use may have a bare copper conductor cabled with the assembly. Type USE single, parallel, or cabled conductor assemblies recognized for underground use may have a bare copper concentric conductor applied. These constructions do not require an outer overall covering.
FPN: See 230-41, Exception, item (b) for directly buried, uninsulated service-entrance conductors.
(c) One Uninsulated Conductor. If Type SE or USE cable consists of two or more conductors, one shall be permitted to be uninsulated."
Relocate the deleted text by adding the following section to read as follows:
338-100. Construction. Cabled, single-conductor, Type USE constructions recognized for underground use ~~may~~ shall be permitted to have a bare copper conductor cabled with the assembly. Type USE single, parallel, or cabled conductor assemblies recognized for underground use ~~may~~ shall be permitted to have a bare copper concentric conductor applied. These constructions ~~do~~ shall not require an outer overall covering.
FPN: See 230-41, Exception, item (b) for directly buried, uninsulated service-entrance conductors.
~~(c) One Uninsulated Conductor. If Type SE or USE cable consists of two or more conductors, one shall be permitted to be uninsulated.~~ Type SE or USE cable containing two or more conductors shall be permitted to have one conductor uninsulated."
SUBSTANTIATION: There is no more than one definition in the section and the proposed revision complies with the National Electrical Code Style Manual, Section 2.2.2.
The relocated text contained requirements or recommendations that are not permitted in definitions in accordance with the National Electrical Code Style Manual, Section 2.2.2.
The revised text uses positive code language in compliance with the National Electrical Code Style Manual, Section 3.1.1.
PANEL ACTION: Accept.

7- 96 - (338-3(a), (b) and Exception (New)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 7-202
RECOMMENDATION: The Technical Correlating Committee directs the Panel to correlate the action on this Proposal with the action on Proposals 7-203 and 7-209.
The Technical Correlating Committee understands that the recommended text replaces the text in 338-10(b)(1) and (2) in Proposal 7-195a.
This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Revise 338-10 to read:
338-10. Uses Permitted
(a) Service-Entrance Conductors. Service-entrance cable used as service-entrance conductors shall be installed as required by Article 230.
Type USE used for service laterals shall be permitted to emerge from the ground outside at terminations in meter bases or other enclosures where protected in accordance with Section 300-5(d).
(b). Branch Circuits or Feeders
(1) Grounded Conductor Insulated. Type SE service-entrance cables shall be permitted in wiring systems where all of the circuit conductors of the cable are of the rubber-covered or thermoplastic type.
(2) Grounded Conductor Not Insulated. Type SE service-entrance cable shall be permitted for use where the insulated conductors are used for circuit wiring and the uninsulated conductor is used only for equipment grounding purposes.
Exception: Uninsulated conductors shall be permitted as a grounded conductor in accordance with 250-140.
(3) Temperature Limitations. Type SE service-entrance cable used to supply appliances shall not be subject to conductor temperatures in excess of the temperature specified for the type of insulation involved.
(4) Installation Methods for Branch Circuits and Feeders.
(a) Interior Installations. In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Parts I and II of Article 336, excluding 336-80.
FPN: See Section 310-10 for temperature limitation of conductors.
(b) Exterior Installations. In addition to the provisions of this article, service-entrance cable used for feeders or branch circuits, where installed as exterior wiring, shall be installed as required by Article 225. The cable shall be supported in accordance with Section 336-30, unless used as messenger-supported wiring as allowed by Article 321.
Type USE cable shall be installed outside in accordance with the provisions of Article 339. Type USE shall be permitted to be terminated in enclosures at an indoor location where Type USE cable emerges from the ground. The length of the cable extending indoors to the first termination box shall not exceed 1.8m (6 ft.). Where Type USE cable emerges from the ground at terminations, it shall be protected in accordance with Section 300-5(d).
Multiconductor service-entrance cable shall be permitted to be installed as messenger-supported wiring in accordance with Articles 225 and 321.
PANEL STATEMENT: This revised text correlates the actions taken on Proposals 7-195a, 7-202, 7-203 and 7-209. This action incorporates the intent expressed in these proposals. The panel has amended the text of Section 338-10(B) relating to the cable emerging from the ground as an editorial correction.

(Log #1057)

7- 98 - (338-4(a)): Reject
SUBMITTER: Lanny McMahill, Rep. IAEI SW Section
COMMENT ON PROPOSAL NO: 7-205
RECOMMENDATION: Delete the words "excluding Section 336-26."
SUBSTANTIATION: The ampacity requirements for Type SE cable should be the same as for Types NM, NMC and NMS cables. The cable types are similar in construction and application. This will provide another step towards consistency. Agree with comments by Mr. Straniero.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel action on Proposal 7-205 was to correct an inadvertent correlation oversight. No techncial substantiation has been provided to equate the ampacity requirements of Types NM and SE cables.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
STRANIERO: The basis for the ampacity limitations placed on Type NM cable are applicable to any wiring method that is installed and used as Type NM cable. The panel statement in rejecting this comment does not address the technical substantiation provided. Stating that an oversight is being corrected, does not address the technical issues raised by the comment. Type SE cables that are installed and used in the same manner as Type NM cable will be subjected to the same thermal degradation and so should be treated the same.

STRANIERO: The comment is correct and should be accepted. See my explanation of negative vote on Comment 7-98.

(Log #1561)

7- 100 - (338-10(b)(1) and (2)): Accept in Principle
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
COMMENT ON PROPOSAL NO: 7-202 & 7-203
RECOMMENDATION: Accept Panel Action on both Proposals.
ROP Draft shows the revised text for 338-3 (a) and (b) from 1999 NEC as 338.10 (B) (1) and (2) as a result of the Panel Action on these two proposals.
SUBSTANTIATION: Type SE cables are manufactured as Style U and Style R in accordance with UL 851. Although their predominant application is for service entrance applications, they are also suitable for feeders and branch circuits. Therefore, it is essential to clarify the Panel Actions on these two proposals by review following constructions and their applications for feeders and branch circuits:
For 338.10(B)(1): These deals with those constructions of Type SE products in which an insulated grounded conductor is either designated or provided and the construction is suitable for following permitted feeder or branch circuit applications:
SEU:
(2 insulated + 1 concentric bare): Single phase circuits. Bare conductor is used as an equipment grounding conductor. (Note: One of the insulated conductors is used as the grounded conductor and the concentric bare conductor is used as an EGC. All three conductors are of the same size (example: 2-2-2 SEU).)
SER:
(2 insulated + 1 bare): Single phase circuits. Bare conductor is used as an equipment grounding conductor. (See note above, example 2-2-2 SER).
(3 insulated): Single phase circuits. In this case, the equipment grounding conductor is insulated. (See note above, example 2-2-2 SER).
(3 insulated + 1 bare): For feeder and branch circuits. Bare conductor is used as an equipment grounding conductor. (Example 2-2-2-4, 4/0-4/0-4/0-2/0).
(4 insulated): For feeder and branch circuits. In this case, the equipment grounding conductor is insulated. (Example 2-2-2-4, 4/0-4/0-4/0-2/0, etc.)
(4 insulated + 1 bare): For three phase applications. Bare conductor is used as an equipment grounding conductor. (Example 2-2-2-2-4, 4/0-4/0-4/0/4/0-2/0, etc.)
For 338.10(B)(2): These deals with those constructions of Type SE products in which the typically designated grounded conductor is uninsulated and the construction is suitable for following permitted feeder or branch circuit applications:
SEU:
(2 insulated + 1 concentric bare): Single phase circuits. Bare conductor is used as an equipment grounding conductor. (Note: One of the insulated conductors is used as the grounded conductor and the concentric bare conductor is used as an EGC. All three conductors are of the same size (example: 8-8-8 SEU, 6-6-6 SEU, etc.).)
The exception (as shown in ROP Draft) permits the use of such SEU construction for existing ranges and clothes dryer where the uninsulated conductor is used as a grounded conductor in accordance with 250-140.
SER:
(2 insulated + 1 bare): Single phase circuits. Bare conductor is used as an equipment grounding conductor. (See note above, example 8-8-8 SER, 6-6-6 SER, etc.).
The exception (as shown in ROP Draft) permits the use of such SER construction for existing ranges and clothes dryer where the uninsulated conductor is used as a grounded conductor in accordance with 250-140.
Lastly, since the conductors used in Type SE Cable are suitable for wet locations, the Panel Action on these proposals also clarifies the installation of Type SE Cables underground in raceways where all circuit conductors are insulated and the bare conductor (if present) is used only for equipment grounding purposes.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 7-96.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #1562)

7- 101 - (338-10(b)(4)b): Accept
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
COMMENT ON PROPOSAL NO: 7-209
RECOMMENDATION: Reject this proposal.
Note: Acceptance of this comment should result in no change in the text for 338-4(b) as it appears in 1999 NEC, except for renubering where required. The final rewrite of Article 338 should reflect this accordingly and 338.10(B)(4)(b) should read:
(b) Exterior Installations. In addition to the provisions of this article, service-entrance cable used for feeders or branch circuits, where installed as exterior wiring, shall be installed as required by Article 225. The cable shall be supported in accordance with 336-18336.30, unless used as messenger-supported wiring as allowed by Article 321.
Type USE cable shall be installed outside in accordance with the provisions of Article 339. Where Type USE cable emerges above ground at terminations, it shall be protected in accordance with 300-5(d).
Multiconductor service-entrance cable shall be permitted to be installed as messenger-supported wiring in accordance with Articles 225 and 321.
SUBSTANTIATION: I believe that CMP 7 needs to review the Panel Action for follwing reasons to reject this proposal:
(1) Product referenced in the substantiation for Mobile Homes carries multiple ratings (i.e. "USE-2 or RHH or RHW-2"), which make it suitable for termination inside. Markings "Types RHH" and "RHW-2" make it suitable for installation inside. In case of Mobile Home, the product is an assembly of four conductors to satisfy the requirement of 550.33(A) (or 199 NEC 550-24(a)). In case of aluminum conductors, Type RHH or RHW-2 markings also require a compliance with 310-14.
(2) Product marked Type USE (or Type USE-2) only is not permitted for termination inside and the submitter's incomplete reasoning should not make it suitable for termination inside.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel concurs with the substatiation that the Type USE is not appropriate for interior wiring as recommended in Proposal 7-209.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
COMMENT ON AFFIRMATIVE:
TEMBLADOR: We support the panel action to accept Comment 7-101 to reject Proposal 7-209. In addition to the substantiation provided with the comment, it should be noted that since Type USE (or USE-2) are intended for outdoor applications, the insulation on Type USE (or USE-2) products is not required to be flame-retardant. For Mobile Home Feeder Cable application, the required cable assemblies consisting of four conductors (two phase conductors, a grounded conductor, and an equipment grounding conductor) is available to satisfy the requirements of 550-33(A) or (550-24(a) per the 1999 NEC). Conductors are identified as USE-2 or RHH or RHW-2 to meet the requirements on both sides, outdoor and indoor, of the service point or the meter as the case may be. Further, recommendation, if permitted, would entail field modification of the standard three-conducotr assembly of USE (or USE-2) conductors to provide for the fourth conductor required for equipment grounding purpose when used as Mobile Home Feeder Cable.

ARTICLE 339 — UNDERGROUND FEEDER AND BRANCH-CIRCUIT CABLE: TYPE UF

(Log #2043)

7- 102 - (339): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 7-210a
RECOMMENDATION: Delete the last sentence in 339.10(1) and 10(3); delete all of 339.10(7).
Create a new 339.70 as follows:
Reactivate deleted 339.3 as follows:
339.3 Other Articles.
(A) Underground. Underground cable installations shall comply with the requirements in 300.5.
(B) Nonheating Leads. Single conductor Type UF cables used as nonheating leads for heating cables shall comply with the provisions of 424.43(B) and (C).
339.70. Single Conductors. Type UF configured as single conductor cables shall be installed with all conductors of the feeder or branch circuit run together in the same trench or raceway.
SUBSTANTIATION: This is a companion comment to others on Articles 334 and 330, all suggesting a common section numbering placement for single conductor topics. It also creates a more appropriate location for other article references, making new 339.10 less congested and more readable.
PANEL ACTION: Reject.
PANEL STATEMENT: The present location of text in the last sentence of Section 339.10(1) and Section 339.10(3); and text in 339.10(7) is more appropriate and is consistent with other cable articles.

7- 103 - (339-3(a)(1)): Accept
Note: Based on the Panel Action on Comment 7-105, the Technical Correlating Committee notes that 339-10(2) as referenced in the Panel Action on this Comment has been deleted.
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 7-222
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 7-210a. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
In Proposal 7-210a change the reference in Section 339-10(2) from 339-4 to 240-3(1999 NEC).
PANEL STATEMENT: The intent of Proposal 7-222 has been incorporated into Section 339-10 per Proposal 7-210a. The panel inadvertently omitted a reference to Proposal 7-222 in its statement on Proposal 7-210a. The panel notes that the reference in Section 339-10(2) to 339-4 should be changed to 240-3(1999 NEC).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #901)

7- 104 - (339-3(b)): Reject
SUBMITTER: Art Cummins, City of Decatur
COMMENT ON PROPOSAL NO: 7-225
RECOMMENDATION: Add sentence number 10 to read:
In complete raceway system.
SUBSTANTIATION: Many homeowners and unqualified people install cable inside raceways, usually 1 conduit length at a time, damaging the cable plus making it impossible to install new conductors at a later time. Type UF cable should not be allowed to be installed in raceways in place of Type TW, THHhN, etc. cables.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel is unclear on the intent of the comment.
Installation in a raceway is a permitted use for Type UF Cable. Improper installation of a raceway can be equally damaging to other recognized conductor types identified in the substantiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #395)

7- 105 - (339-10, 339-12): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 7-210a
RECOMMENDATION: Accept in Principle revised:
"339-10 ~~(2) As feeder or branch circuit cable where provided with overcurrent protection of the rated ampacity as required in 339.4. (3)~~ (2) AS SINGLE CONDUCTOR CABLES. Where ~~so~~ installed as single conductor cables, all conductors of the feeder or branch-circuit, including the ~~neutral~~ grounded conductor and equipment grounding conductor, if any, shall be installed in

accordance with 300-3. ~~run together in the same trench or raceway. (4)~~ (3) For ~~interior~~ wiring in wet, dry, or corrosive locations under the recognized wiring methods of this Code."

"339-12 USED NOT PERMITTED. Multiconductor Type UF cable shall not be used..." (remainder unchanged)

SUBSTANTIATION: There is no longer a 339-4 and overcurrent protection is not rated in ampacity. In present (3) "grounded" is more inclusive than "neutral". A reference to 300-3 is more comprehensive in providing for parallel runs, isolated phases, etc. In present (4) limiting locations to interiors conflicts with (1) and 321-3. Limitation to use as feeders or branch circuits denies permission for single conductors in raceways for service entrance, service lateral, and control and signal conductors.

The proposed word "multiconductor" for 339-12 is intended to allow for single-conductor Type UF in raceways or other wiring methods suitable for the use and locations indicated in that section. Table 310-13 includes Type UF as conductors for general wiring.

PANEL ACTION: Accept in Part.

The panel accepts the changes to Section 339-10. The panel rejects the proposed change to Section 339-12.

PANEL STATEMENT: The panel understands that the accepted portions of the comment only impacts items 2, 3 and 4 in Section 339-10. The remainder of this section remains unchanged. Staff is directed to renumber accordingly. The panel does not accept the change to add "multiconductor" in Section 339-12. Section 339-12 does not prohibit the use of single conductor Type UF cable for general wiring purposes in a raceway.

ARTICLE 340 — POWER AND CONTROL TRAY CABLE: TYPE TC

(Log #630)

7- 106 - (340-2): Reject

SUBMITTER: James M. Daly, BICC General

COMMENT ON PROPOSAL NO: 7-231a

RECOMMENDATION: The proposal should be accepted in principle.

In Section 340-2, delete "for installation in cable trays, in raceways, or where supported by a messenger wire."

SUBSTANTIATION: The deleted text is not appropriate for a definition; it is more appropriate in Uses Permitted and is already addressed in 340-10(2). The deleted text contains requirements or recommendations that are not permitted in definitions in accordance with the National Electrical Code Style Manual, Section 2.2.2.

PANEL ACTION: Reject.

PANEL STATEMENT: Type TC Cable is required to be supported by cable trays or raceways or messengers. Elimination of these specific identifiers from the definition of Type TC Cable, as suggested in this comment, will permit Type TC Cable to be installed without any support or protection. Text in Section 340-10(2) addresses permitted uses and not installation requirements for Type TC Cable in all installations.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

(Log #281)

7- 109 - (340-3, Exception): Reject

SUBMITTER: Frank H. Rocchio, The Okonite Co., Inc.

COMMENT ON PROPOSAL NO: 7-242

RECOMMENDATION: Revise as follows:

Exception: Type TC cable, meeting the requirements of a Type MC core, can be converted to Type MC cable with the addition of a metallic sheath and an overall jacket marked in accordance with Article 334.

SUBSTANTIATION: There is a distinct application for Type TC cable per Article 340 and Type MC cable per Article 334 and this distinction should be continued. On the other hand, there are times when a Type TC core meeting the requirements of a Type MC core is required to be armored. The addition of a metallic sheath over a completed Type TC cable is consistent with the proposed exception. To further clarify when a Type TC core can be used, the wording "meeting the requirements of a Type MC core," has been added to the exception to allay any of the panel's questions on the armoring of a Type TC cable. This exception is definitely needed as provided in the initial substantiation and does not effect the safety of the cable in any manner. If anything, the panel's initial rejection and the addition to the proposed exception make this an even safer cable.

PANEL ACTION: Reject.

PANEL STATEMENT: The concern raised by the submitter is a product certification issue and not one that should be covered in the NEC. It is the panel's understanding that standards development organizations are in the process of addressing this issue.

(Log #654)

7- 110 - (340-3, Exception (New)): Reject

SUBMITTER: Robert B. Alexander, Fluor Daniel

COMMENT ON PROPOSAL NO: 7-242

RECOMMENDATION: Accept Proposal 7-242 "in principle" and revise as follows:

Exception: Type TC cable shall be permitted to serve as the core of Type MC cable.

SUBSTANTIATION: Current Panel Statement to Proposal 7-242:

"All type TC cables may not be appropriate for use as MC cables. There are inherent construciton differences such as equipment grounding conductor provisions and type of conductor insulation that preclude a dual designation."

While the Panel Statement may be literally true, a simple "side-by-side" comparison of the root definitions (as currently proposed in the 2002 "draft" by Code-Making Panel 7) would indicate that very few type TC cables actually would be unsuitable as cores for type MC cables. The grounding requirements of "new" Section 334.108 would not exclude the Type TC cable core and the insulation requirements described in "new" 334.112 are compatible with those of "new" 340.104. A review of UL product standards 1277 and 1569 do not indicate substantial exclusions either.

334.2 Definition.

Metal Clad Cable, Type MC. A factory assembly of one or more insulated circuit conductors with or without optical fiber members enclosed in an armor of interlocking metal tape, or a smooth or corrugated metallic.

340.2 Definition.

Power and Control Tray Cable, Type TC. A factory assembly of two or more insulated conductors, with or without associated bare or covered grounding conductors, under a nonmetallic jacket, for installation in cable trays, in race-ways, or where supported by a message wire. (ROP 7-236)

These definitions along with the construction standards in the "draft" for both Articles Part III would suggest that Type MC is a very general construction with respect to its core.

III Construction Specifications (Metal Clad)

334.104 Conductors. The conductors shall be of copper, aluminum, or copper-clad aluminum, solid or stranded. The minimum conductor size shall be 18 AWG copper and 12 AWG aluminum or copper-clad aluminum. (ROP 7-108)

334.108 Equipment Grounding. Type MC cable shall provide an adequate path for equipment grounding as required by Article 250.

334.112 Insulation. The insulated conductors shall comply with (A) or (B).

(A) 600 Volts. Insulated conductors in sizes 18 and 16 AGW shall be of a type listed in Table 402.3, with a maximum operating temperature not less than 90C (194F), and as permitted by 725.27. Conductors larger than 16 AWG shall be of a type listed in Table 310.13 or of a type identified for use in Type MC cable.

(B) Over 600 Volts. Insulated conductors shall be of a type listed in Tables 310.61 through 310.64.

334.116 Sheath. The metallic covering shall be one of the following types: smooth metallic sheath, corrugated metallic sheath, interlocking metal tape armor. The metallic sheath shall be continuous and close fitting. A nonmagnetic sheath or armor shall be used on single conductor Type MC. Supplemental protection of an outer covering of corrosion-resistant material shall be permitted and shall be required where such protection is needed. The sheath shall not be used as a current-carrying conductor. (ROP 7-126a)

FPN: See 300.6 for protection against corrosion.

III Construction Specifications (Tray Cable)

340-100. Construction. A metallic sheath shall not be permitted either under or over the nonmetallic sheath.

340-104. Conductors. The insulated conductors of Type TC tray cable shall be in sixzes 18 AWG through 1000 kcmil copper and sizes 12 AWG through 1000 kcmil aluminum or copper-clad aluminum. Insulated conductors of sizes 14 AWG and larger copper and sizes 12 AWG and larger aluminum or copper-clad aluminum shall be one of the types listed in Table 310-13 or 310-62 that is suitabe for branch circuit and feeder circuits or one that is identified for such use.

(a) Fire Alarm Systems. Where used for fire alarm systems, conductors shall also be in accordance with 760-27.

(b) Thermocouple Circuits. Conductors in Type TC cables used for thermocouple circuits in accordance with Article 725 shall also be permitted to be any of the materials used for thermocouple extension wire.

(c) Class 1 Circuit Conductors. Insulated conductors of sizes 18 AWG and 16 AWG copper shall also be in accordance with 725.27.

340-116. Sheath. The outer sheath shall be a flame-retardant, nonmetallic material.

340-120. Marking. There shall be no voltage marking on a Type TC cable employing thermocouple extension wire.

[It is noted that Panel Actions/Statements on Proposals 7-239 and 7-241 do not appear to be reflected in the "Draft" of new sections 340-116 and 340-100.]

Except for the direct statement in Section 340-100, which itself appears unnecessary - at least for safety purposes, there would seem to be no contradictory Type TC construction that would preclude them serving as a type MC core.

The real issue appears to be one of "labeling," not cable construction. While the addition of an improper label certainly could cause a safety problem, it is difficult to ascribe a safety problem by omitting one. Neither this comment or the original proposal suggests dual listing but, even if a cable were dual labeled it would have to meet the most stringent applicable installation requirement.

Finally, any type MC cable that included a Type TC cable core would still be required to meet the product standards of UL 1569.

PANEL ACTION: Reject.

7- 112 - (340-4(6)): Accept in Principle

SUBMITTER: Joe Cox, Bluff City, TN

COMMENT ON PROPOSAL NO: 7-245

RECOMMENDATION: The panel should accept the proposal as modified in Mr. Propost's negative comment to include the wording "supported and protected against physical damage using mechanical protection, such as struts, angles, or channel."

SUBSTANTIATION: With the additional requirements for protection and support of the cable, there is no reason to keep the 50 ft limit. If the panel accepts that installation up to 50 ft are safe, then installations exceeding 50 ft should also be safe.

Since reliability of power is of utmost concern in industrial establishments, I would not expect that this allowance would be abused.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Comment 7-115.

(Log #1386)

7- 115 - (340-4(6)): Accept in Principle
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 7-245
RECOMMENDATION: The American Chemistry Council supports the following revised text for 340-4(6) as proposed in Mr. Propst's explanation of negative comment:

340-4(6). In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is ~~not subject to physical damage~~ supported and protected against physical damage using mechanical protection, such as struts, angles, or channel, Type TC tray cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted as open wiring ~~in lengths not to exceed a total of 50 ft (15.24 m)~~ between a cable tray and the utilization equipment or device.

The cable shall be supported and secured at intervals not exceeding 6 ft (1.83m).

Equipment grounding for the utilization equipment shall be provided by an equipment grounding conductor within the cable. FPN: See Section 310-10 for temperature limitation of conductors.

SUBSTANTIATION: As noted in Mr. Propst's explanation of negative comment, this is an application of a hybrid type cable only in industrial applications. While the panel's general concerns about abuse of the exception may be warranted if it were permitted for general use, the "industrial" exceptions have a proven track record of not being abused while at the same time meeting the special needs of industry. The existing support requirements will assure adequate support of this type cable. As noted in Mr. Propst's comments, installation economics will automatically result in the maximum use of tray and the minimum use of this exception. Also, as noted in Mr. Stewart's comments, this option will also improve reliability and safety by reducing the need for alternate wiring methods for the same application.
PANEL ACTION: Accept in Principle.
Revise 340-4(6) to read:

340-4(6). In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is continuously supported and protected against physical damage using mechanical protection, such as struts, angles, or channel, Type TC tray cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted between a cable tray and the utilization equipment or device.

The cable shall be secured at intervals not exceeding 1.8m (6 ft).

Equipment grounding for the utilization equipment shall be provided by an equipment grounding conductor within the cable. FPN: See Section 310-10 for temperature limitation of conductors.

PANEL STATEMENT: The panel has clarified that Type TC cable is not permitted to be installed as "open wiring" and that it shall be continuously supported on struts, angles or channels. In addition the panel has added the provision that physical protection for the cable is required where installed on struts, angles or channels.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
COMMENT ON AFFIRMATIVE:
GUIDA: The wording shown in the panel action was revised to meet the intent of the submitter and does so effectively. However, when making this revision the panel did not consider the revision to the last paragraph of 340-4(6) in Proposal 7-244 that was accepted in principle. The final wording of 340-4(6) should therefore be the first two paragraphs shown under this panel action and the third paragraph as shown under the panel action for Proposal 7-244.
TEMBLADOR: We support the panel action and the panel statement on this comment. It clearly differentiates, as it should, installation requirement for Type TC from "open wiring" methods such as raceways and Type MC cable.

(Log #2305)

7- 116 - (340-4(6)): Reject
SUBMITTER: Frank H. Rocchio, The Okonite Co., Inc.
COMMENT ON PROPOSAL NO: 7-245
RECOMMENDATION: I agree with the panel action in Proposal 7-245 (340-4(6)) to maintain the distinction and permitted use of Type TC (Tray Cable) and Type MC (Metal Clad) cable currently as defined in Articles 340 and 334, respectively.
SUBSTANTIATION: Subjecting Type TC - Tray cable to the mechanical crush and impact test protocol required for Type MC - Metal Clad cable and concluding that the two cable types are functionally equal and can be used in all areas of an industrial establishment is misleading.

The mechanical crush and impact test protocol for Type MC - Metal Clad cable in UL Standard 1569 is applied to the Type TC - Tray Cable optional application for the "Open Wiring" listing and restricted to a 50 foot length per Article 340-4(6). The UL qualification test requires that a 3/C 14 AWG with grounding conductor withstand an impact of 15 foot-pounds (a 2 inch wide weight of 10 pounds hitting the cable form a height of 1.5 feet) and a 3/C 2 AWG with grounding conductor withstand a 50 foot-pound (a 2 in. wide weight of 50 pounds hitting the cable from a height of 1 foot) impact application. Each sample must pass 8 out of 10 impacts performed at 1 foot intervals along an 11 foot length of cable.

The Type MC - Metal Clad cable construction easily passes this requirement. The cable's armor or metal sheath protects the cable core as intended and designed.

Type TC - Tray Cable "Open Wiring" presents a safety issue. When the cable assembly is penetrated by a mechanical device, the cable will fail electrically directly to the intruding device or to a companion insulated conductor or the grounding conductor (insulated or bare). The systems protection devices may not operate correctly in this scenario.

The Type MC - Metal Clad cable construction offers the metallic sheath as a path to ground in addition to the grounding conductor. This design feature offers a low resistance path to ground permitting the fault protection equipment to safely operate. Type MC cable may also not be penetrated by the same intruding device that could enter a Type TC cable.

In summary, since there can be two failures out of ten samples tested, the Type TC - Tray cable "Open Wiring" construction is not inherently safe. Type MC - Metal Clad cables, when crushed or impacted, fail to the metallic sheath or the grounding conductor or to each other, all of which are low resistance paths to ground and the intruding device is protected.

The - Uses Permitted - definitions in Articles 334, 334-3 for Type MC - Metal Clad cable and Articles 340, 340-4 for Type TC - Tray Cable correctly define and recognize these separate cable types for industrial applications. Type MC - Metal Clad cable is the proper

application to safeguard equipment and personnel in open wiring, exposed installations. Type TC - Tray Cable cannot be installed where it will be exposed to physical damage.

The panels vote to maintain the distinction between Type TC - Tray Cable and Type MC - Metal clad cable in proposal 7-245 is consistent with the panel action on proposal 7-242.

PANEL ACTION: Reject.

PANEL STATEMENT: The cable will be required to be continuously supported in accordance with the panel action on Comment 7-115. See panel action and statement on Comment 115.

7- 117 - (340-4(6)): Accept in Principle

SUBMITTER: William M. Lewis, Eli Lilly and Co.

COMMENT ON PROPOSAL NO: 7-245

RECOMMENDATION: I recommend that the proposal should be accept in principle, with the wording as proposed in Mr. Propst's comment.

SUBSTANTIATION: All of the concerns of the panel were met by the proposal in the comment. The 50 ft length limitation is not really a safety nor technical issue and it can create a hardship for industrial installations where a greater than 50 foot length makes sense. Reliability and safety are foremost in the day to day operation of an industrial facility and any installation which might be unsafe would not be installed. Limitations on length with no technical justification are not necessary.

PANEL ACTION: Accept in Principle.

SUBMITTER: James M. Daly, Upper Saddle River, NJ

COMMENT ON PROPOSAL NO: 7-252a

RECOMMENDATION: The proposal should be accepted in principle with the following revisions:

(1) ~~Cables with an outside diameter of 1.000 inches or less 4~~ Four times the overall diameter for cables 25 mm (1 in.) or less in diameter.

(2) ~~Cables with diameter of 1.001 to 2.000 inch 5~~ Five times the overall diameter for cables larger than 25 mm (1 in.) but not more than 50 mm (2 in) in diameter.

(3) ~~Cables with diameters of 2.001 inch and larger 6~~ Six times the overall diameter for cables larger than 50 mm (2 in.) in diameter.

The remainder of the proposed text is unchanged.

SUBSTANTIATION: The proposed revised text complies with the NFPA No. 1M Manual of Style, Section 4, with respect to the placement of units and values of measurement and addresses the Technical Correlating Committee comment shown in the ROP.

The text is consistent with the text used in Section 334-11.

The original proposed values imply a degree of precision not required for safety.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

(Log #655)

7- 121 - (340-10(6)): Reject

SUBMITTER: Robert B. Alexander, Fluor Daniel

COMMENT ON PROPOSAL NO: 7-245

RECOMMENDATION: Accept the original proposal "in principle" and revise "new" section 340-10(6) as follows:

340.10 Uses Permitted...

(6) In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage, Type TC tray cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted as open wiring. ~~in length not to exceed a total of 15m (50 ft) between a cable tray and the utilization equipment or device.~~

The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft). An equipment-grounding conductor within the cable shall provide equipment grounding for the utilization equipment.

In cables containing conductors 6 AWG or smaller, the equipment grounding conductor shall be provided within the cable or, at the time of installation, one or more insulated conductors shall be permanently identified as an equipment-grounding conductor in accordance with 250.119(B). (ROP 7-244)

SUBSTANTIATION: "Points" from and rebuttals to the current panel statement:

1. By definition Type TC cable is intended to be supported by a cable tray, in raceways or where supported by a messenger wire. As a "statement" this is accurate; however, if these were absolute restrictions then "new" Section 340-10(6) should not be permitted at all.

2. The panel has concerns relative to the use of the cable in unlimited lengths as open wiring including increased exposure to physical damage.

From "new" section 340-10(6), as proposed, the installation already has the following substantial restrictions:

The Cable:

- is installed..."in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation,"
- "is not subject to physical damage,"
- "complies with the crush and impact requirements of Type MC cable, " and

• "is identified for such use"

3. Section 340-5(2) does not permit the installation of Type TC cable as open cable on brackets or cleats. This was corrected by Proposal 7-248. See "new" Section 340.12(2).

A review of UL Standard 1277, Sections 20A and 20B indicates that Tray Cable suitable for identification as "open wiring" are tested to identical standards for those of Metal Clad cables in UL Standard 1569, Sections 24 and 25. The commentator is aware that Metal Clad cables may exceed the requirement to "pass" the tests, while Tray Cables identified as "open wiring" just "get by;" however, if the criteria for acceptance are valid then this is irrelevant. It the criteria are not valid, then the product standard should be corrected, but his comment should still be accepted.

Finally, the fundamental substantiation of the original Proposal 7-245 is still valid; i.e., there has been no offer to public review in any ROP, ROC, TCR or TCD - past or present - that ever substantiated the 50 ft. limit in the first place.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not provided technical substantiation to remove the restriction on installing Type TC cable only from the cable tray to "the utilization equipment or device." See panel action and statement on Comment 7-115.
