(c) ~~Nonmetallic Surface Extensions.~~ Residential or Offices. For nonmetallic surface extensions mounted directly on the surface of walls or ceilings, the building is occupied for residential or office purposes and does not exceed the height limitations specified in 336-5(a)(1).

SUBSTANTIATION: The deleted text is not appropriate for a definition; it is more appropriate for Uses Permitted and is partially addressed in 342-10(c). The revised text proposed above incorporates the additional clarification. The deleted text contains requirements or recommendations that are not permitted in Definitions in accordance with the National Electrical Code Style Manual, Section 2.2.2.

The revised section heading more accurately reflects the additional requirement in (c) on the use of nonmetallic surface extensions.

PANEL ACTION: Accept.

ARTICLE 343 — NONMETALLIC UNDERGROUND CONDUIT WITH CONDUCTORS: TYPE NUCC

(Log #91)

8- 34 - (343-1): Accept

Note: The Technical Correlating Committee notes that the panel action indicates text from Proposal 8-77 is the appropriate text for 343.100(B).

SUBMITTER: Technical Correlating Committee National Electrical Code

COMMENT ON PROPOSAL NO: 8-77

RECOMMENDATION: The Technical Correlating Committee directs the panel to clarify the action on this Proposal. The Technical Correlating Committee assumes that the Panel Action on Proposal 8-74 appropriately handles the issue through the introduction of 343-6. This action will be considered by the Panel as a Public Comment.

SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.

PANEL ACTION: Accept.

PANEL STATEMENT: The Technical Correlating Committee pointed out the need to correlate between Proposal 8-74 covering the complete assembly, and Proposal 8-77 covering the components. To meet the intent of Proposal 8-77, proposed Section 343-100(b) was revised as follows:

"The nonmetallic underground conduit shall be listed and composed of a material that is resistant to moisture and corrosive agents."

The NEC draft has correctly correlated these proposals.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

(Log #777)

8- 36 - (345-12(b)(3)): Accept in Part

SUBMITTER: Richard E. Loyd, Perryville, AR

COMMENT ON PROPOSAL NO: 8-222

RECOMMENDATION: Reconsider action, this proposal should have been accepted. Consider the voting comments and incorporate "stationary equipment."

SUBSTANTIATION: The panel acted without substantiation to delete industrial machinery and not accepting stationary equipment which would still permit industrial equipment to be connected using this section. I feel the panel has responsibility to provide substantiation to change the code. They require of the public to

provide substantiation and state a need for changing the code. The panel should not be permitted to substantially change a code requirement without doing the same thing.
PANEL ACTION: Accept in Part.
The panel rejects the deletion of "industrial machinery" and the addition of "stationary equipment."
The panel accepts the addition of "fixed equipment."
Revise Section 345-12(b)(3) to read:
(3). Exposed vertical risers from industrial machinery or fixed equipment shall be permitted to be supported at intervals not exceeding 6.0 m (20 ft.), if the conduit is made up with threaded couplings, is firmly supported at the top and bottom of the riser, and no other means of intermediate support is readily available.
PANEL STATEMENT: Staff is advised that Section 345-12(b)(3) in the 1999 NEC is Section 345-30(b)(3) in the reorganized Article 345 as found in Proposal 8-204.
Proposal 8-222 sought to delete the words "industrial machinery" and insert the words "fixed or stationary equipment ". The language "industrial machinery" implies a heavy piece of equipment that is not likely to be moved without intentional effort. As a result, the IMC vertical riser was not likely to be subjected to horizontal stresses that could result in damage to couplings, fittings, termination points, and points where it was supported and secured. The vertical riser was expected to remain vertical.
The use of the term "stationary" in the language of the proposal does not convey the need that the equipment must be fixed in place or otherwise not likely to move, as was implied with the language "industrial machinery". A stationary store fixture, such as a display case, is easily moved depending on its weight. That same display case is not easily moved if it is "fixed".
The language "industrial machinery or fixed equipment, " will still allow the same use of IMC vertical risers for heavy industrial machinery that has been permitted. At the same time it will permit an expanded application of the concept to other equipment that is fixed in place while limiting the potential for damage to the IMC, points where it is secured or supported, and its couplings and fittings.

8- 37 - (345-12(b)(3)): Reject
SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: 8-221
RECOMMENDATION: The panel should accept the proposal as originally submitted.
SUBSTANTIATION: NEMA proposed this change in language for IMC in order to correlate with the language in 346-12(b)(3) for rigid metal conduit. IMC is equivalent to rigid conduit, with physical characteristics equal to or greater than RMC. The Panel changed the proposed language without any substantiation that a problem exists with "stationary equipment for fixtures", the same language that the Panel accepted for rigid metal conduit in the 1999 code cycle. We agree with the negative comment of Mr. Cox that when the language was originally put in the code, the submitter's intent was to be able to wire heavy equipment that would not move during operation, without fastening it to the floor. We also agree with the negative comment of Mr. Griffith who states that no substantiation has been provided to deny the application to stationary equipment. There is confusion over the definitions of the terms "fixed" and "stationary" and in the manner in which these words are used in the Code.
Also see comments on 8-222 and 8-249.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 8-36.

(Log #2045)

8- 45 - (346-24): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 8-245
RECOMMENDATION: Reconsider and insist on more comprehensive technical substantiation for this proposal.
SUBSTANTIATION: None of the stated dimension numbers in the table are changing, only the nomenclature. In the case of the one-shot bends (allowed to have a reduced radius) presently covered in the exception, these were always measured to the centerline, and won't change. However, the present exception only applies to a "bending machine". As such it presumably doesn't apply to a hand bender, which now, at least theoretically, uses the larger radii in the basic rule. The column in the new table with the smaller radii, however, doesn't mention machines but instead covers "One Shot and Full Shoe Benders" which would include full-shoe hand benders for the first time. Hickeys would still use the larger radii, however, since those radii are now to be measured to the centerline, all those bends end up tighter by one half the raceway diameter. None of these technical changes was addressed on their merits, and whether they will force a redesign of present bending products. Some technical discussion of these issues would help those of us who must explain why things happen.
PANEL ACTION: Reject.
PANEL STATEMENT: In part, the substantiation for this proposal states "Manufacturers of bending equipment measure to the centerline. This revised text and table clarifies the measurement in accordance with current field practice." One shot and full shoe type benders as well as factory made bends have been made with the required minimum radius measured to the centerline for a number of years. Field personnel making bends with these types of benders have been making bends with the measurement to the centerline. The resultant elbows have not resulted in a diminished level of performance or in installation difficulties. This long history of successful use provides a measure by which the acceptance of the centerline measurement is appropriate.

(Log #2046)

8- 49 - (347-9): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 8-265
RECOMMENDATION: Accept the proposal as written, except add the phrase "over a straight run" following the 1/8-in. specification [...will exceed 3 mm (1/8 in.) over a straight run at securely mounted items ..."
SUBSTANTIATION: As noted by the comment in the voting, the original proposal was correct. The addition of the reference to straight runs addresses the panel statement. If all of the present 1/4-in. allowable movement occurs at one point, particularly if propelled in one direction over a straight run, most equipment connected to the conduit will fail in some way.
PANEL ACTION: Reject.
PANEL STATEMENT: There have been several proposals over the years to reduce the entry level for application of an expansion fitting from 1/4 inch to 1/8 inch. Insufficient technical substantiation has been provided to warrant a change from 1/4-inch to 1/8-inch as the entry level for installation of expansion fittings.

8- 51 - (Table 347-9(a) Note): Accept
SUBMITTER: Wayne A. Lilly, Bridgewater, VA
COMMENT ON PROPOSAL NO: 8-267
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: The substantiation for this proposal is for outdoor installations only. The wording of the proposed note would make it applicable to all installations "in direct sunlight". This means indoor installation in direct sunlight would be required to have 30°F added to the estimated temperature change even though no substantiation was provided. For indoor installations that do not have heat or air conditioning, consideration of an increase in the temperature change due to direct sunlight exposure might be justified based on length of exposure. However, if the indoor installation is in a controlled environment, where heating and air-conditioning are provided, an increase is not warranted. The heating and air conditioning regulate the temperature of the raceway and expansion and contraction are not a factor.
The substantiation did not provide information on how much direct sunlight exposure is needed before adding 30°F to the total temperature change is required. Is a fifteen-minute exposure required? Perhaps a two-hour exposure is needed. There are many installations where the direct sunlight exposure is limited by items such as adjacent buildings. The proposed wording of the note would require the addition of 30°F for those installations with even a single minute of direct sunlight exposure.
I agree that consideration should be given to the impact direct sunlight might have on the overall temperature change of PVC RNC. However, the proposed wording would require an addition of 30°F to installations where it is not necessary to do so. This proposal should be rejected until language is proposed that will provide consideration for expansion and contraction while not requiring such consideration to be given to installations where it is not required.
PANEL ACTION: Accept.

8- 53 - (347-12(e), Exception (New)): Hold
SUBMITTER: James M. Daly, BICC General
COMMENT ON PROPOSAL NO: 8-255
RECOMMENDATION: The proposal should continue to be accepted in principle and the following exception should be added to 347-12(e):
Exception: Insulated conductors or multiconductor cables rated at a higher temperature than the RNC listed temperature rating shall be permitted to be installed in RNC provided they are not operated at a temperature higher than the RNC listed temperature rating.

SUBSTANTIATION: This exception will resolve a conflict within the code.

Most wire and cable manufacturers no longer mark Type MV conductors for 90°C since the conductors meet the 105°C requirements and are marked for the higher temperature rating. Without the exception, the code currently prohibits the installation of 105°C Type MV insulated conductors and cables in RNC since they are rated higher than the RNC. The exception will permit the higher rated conductors or cables to be installed in RNC provided they are not operated at a temperature higher than the RNC temperature rating.

The temperature rating of the RNC will not be exceeded, equivalent safety will be provided, and the product will not be prohibited from being used in RNC.

Except for electric utilities in major cities, users do not operative MV conductors or cables above 90°C anyhow so the restrictions of limiting the conductor operating temperature to the temperature rating of the RNC will not require any change from current practice.

Also, there are other conductors and cables in the NEC that are rated higher than 90°C such as PLTC which is rated 105°C and yet, because of the power limited requirements, can never reach the rated temperature. The rated temperature is based upon the rating of the insulation and the jacketing material used in the construction, not the operational temperature. There is no reason to exclude these conductors and cables from being installed in RNC provided the RNC temperature rating is not exceeded.

PANEL ACTION: Hold.

PANEL STATEMENT: In accordance with Section 4-4.6.2.2(a) of the NFPA Regulations Governing Committee Projects this comment is held as the proposed exception introduces new material that has not had public review.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 3

EXPLANATION OF NEGATIVE:

COX: Many of the problems addressed by the proposal are workmanship issues. Improvements in the connection between coupling and conduit were reported and new installation guides have been published. It was also stated that the conductivity of the connection between coupling and conduit for EMT is better than rigid.

However, the discussions also brought out that there is no life cycle testing done that would address the effects of temperature and time on the integrity of the coupling/conduit connection.

I believe properly made up coupling to conduit connections can come loose over time and the relief sought should be given.

GRIFFITH: It is believed the inherent design characteristics and general durability of an EMT raceway system remain such that there is an appreciable likelihood it will lose its ground continuity due to the unpredictable conditions of exposure over the entire installation life of the system. Further, it is unrealistic to expect a raceway system to be periodically maintained by tightening or replacing raceway couplings. For these reasons, the panel should have accepted the concept of the original proposal requiring a separate equipment grounding conductor, which would better ensure the long-term safety of such systems.

POHOLSKI: Reject panel action to accept this comment. The use of conduit or metallic raceway that encloses the conductors provides an excellent fault return path. When a high current fault occurs, a shower of sparks can occur from the fittings and couplings. These sparks can set fires in nearby combustible materials and this can happen even when the raceway has been installed properly with all joints pulled up to normal tightness or a little more. As installations age with time the fittings and coupling of a raceway can corrode and even loosen from expansion and contraction and accidental contact, also service amperes are getting larger and require larger transformers that have larger fault current available. For these reasons the installation of an internal

equipment-grounding conductor, in parallel with the raceway conductors, can the current carried by the raceway be reduced. And also the all joints in conduit and raceways must be connected wrenchtight, using proper tools, for the raceway to function effectively as an equipment-grounding conductor. The grounding conductor with proper bonding in the system will reduce the difference in impedance.

(Log #778)

8- 58 - (348-4(a)): Accept
SUBMITTER: Richard E. Loyd, Perryville, AR
COMMENT ON PROPOSAL NO: 8-282
RECOMMENDATION: I support the panel action, continue to reject this proposal.
SUBSTANTIATION: Consideration should be given to the panel comments on the voting. The submitter has not provided any new substantiation from his proposal to the 1996 or 1999 NEC. Although workmanship cannot be regulated by this code, many changes have been made. This industry has made extensive improvements. The fittings industry continue to improve their fittings. Installation recommended practices have been developed and published to be used by national apprenticeship programs and for engineers and contractors to use as specification requirements. The articles governing raceways have been restructured to make support requirements easier to find in the code, which should emphasize the requirements.
PANEL ACTION: Accept.

(Log #840)

8- 59 - (348-4(a) (New)): Accept
SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: 8-283
RECOMMENDATION: The panel should continue to reject this proposal.
SUBSTANTIATION: The submitter states that EMT does not provide adequate grounding due to separation, corrosion, loose fittings, thermal expansion, etc., and maintains that there are inadequate code requirements to cover these situations. On the contrary, 348-4 covers corrosion protection; 348-5 states EMT shall not be used where subject to severe physical damage; 348-10 requires couplings and connectors to be made up tight; 300-7(b) covers requirements for expansion fittings; 110-3(b) requires a product be installed in accordance with its listing; 110-12 requires electrical equipment be installed in a neat and workmanlike manner. When the current code requirements are followed, EMT has been proven to be an effective equipment grounding conductor.

Steel conduit manufacturers are in the process of finishing an Installation Guide that will provide information on the proper installation of steel conduit. This will likely be published before the new Code is. The NEMA Fittings Section (5-FB) has already completed an installation guide on fittings, which is available from NEMA. Both publications are written to encourage good workmanship and proper installation.

The submitter cites his concerns about EMT on rooftops. If the installation is one where the EMT would be subjected to severe physical damage, 348-5 says that it shall not be used. There are new pipe support systems on the market that reduce rooftop wear and tear and provide protective cushioning between mounting hardware and the roof.

The submitter states: "It has been proven everyday that the raceway system has a high impedance path." A 1994 research report on grounding by the Georgia Institute of Technology show sthe EMT actually has the lowest impedance path of all metal conduits.

There is nothing in the Code that prohibits the use of a supplemental grounding conductor. This should remain a design decision.
PANEL ACTION: Accept.

(Log #841)

8- 60 - (348-4(a) (New)): Accept
SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: 8-282
RECOMMENDATION: The panel should reject this proposal.
SUBSTANTIATION: The submitter states that EMT does not provide adequate grounding due to separation, corrosion, loose fittings, thermal expansion, etc., and maintains that there are inadequate code requirements to cover these situations. On the contrary, 348-4 covers corrosion protection; 348-5 states EMT shall not be used where subject to severe physical damage; 348-10 requires couplings and connectors to be made up tight; 300-7(b) covers requirements for expansion fittings; 110-3(b) requires a product be installed in accordance with its listing; 110-12 requires electrical equipment be installed in a neat and workmanlike manner. When the current code requirements are followed, EMT has been proven to be an effective equipment grounding conductor.

We agree with M . Berman's negative that this issue has been considered by code-making panels 5 and 8 for several code cycle and that the substantiation has consisted primarily of reports of incidents where the EMT was improperly installed or subject to severe physical abuse, which is not permitted by 348-5(1). No new substantiation has been submitted this code cycle.

The submitter mentions a Factory Mutual report to substantiate this proposal. This report was prepared as substantiation for several proposals for the 1990 NEC. NEMA submitted a comment to reject the proposal. The Panel voted unanimously to accept the NEMA comments. In NEMA's substantiation the following points were made:

The FM loss reports contained a statement that "the exact ignition scenarios for these fires is open to discussion and speculation."

The installations cited in t =he loss reports had an average age of 40 years and did not reflect current products, code requirements, etc.

Several Code violations were described including improper grounding, no overcurrent protection, etc.

Inadequate maintenance was cited.

The submitter cites his concerns about EMT on rooftops. IF the installation is one where the EMT would be subjected to severe physical damage, 348-5 says that it shall not be used. There are new pipe support systems on the market that reduce rooftop wear and tear and provide protective cushioning between mounting hardware and the roof.

Steel conduit manufacturers are in the process of finishing an Installation Guide that will provide information on the proper installation of steel conduit. This will be published before the next Code is published. The NEMA Fittings Section (5-FB) has completed an installation guide on fittings, the primary element in connections, which is available from NEMA. Both publications are written to encourage good workmanship and proper installation.

(Log #1137)

8- 63 - (348-4(a), Exception): Reject
SUBMITTER: Elliot Rappaport, Electro Technology Consulltants
COMMENT ON PROPOSAL NO: 8-282
RECOMMENDATION: Revise wording of proposal, as indicated below, and relocate as an exception to new 348-60 as accepted in Proposal 8-305.
Exception: A separate equipment grounding conductor, sized as required in Section 250-122, shall be installed in all electrical metallic tubing trade sized 1 in. and smaller.
SUBSTANTIATION: This proposal, and similar ones in at least the previous three code cycles, of which I am aware of, provide substantiation that there is a problem in the field. It appears that the panel members who have voted negative on this proposal would require a detailed listing of a multitude of new deaths and electrocutions in order to accept this proposal. This motivation for rejection appears to be that we live in a perfect world, the code is perfect, UL testing is totally adequate for all conditions, and that electricians follow all of the manufacturers' recommended installation procedures. If all of that were true, we would not have the examples of electrocutions as reported over the past nine years, of which I am personally aware of as a member of Code-Making Panel 5. During the comment phase of the 1999 NEC, it appeared that Code-Making Panel 5 might accept a similar proposal, the Technical Correlating Committee ruled that this issue was the responsibility of Code-Making Panel 8. (See Comment 5-186, A98 ROC).
Most of the previous documentation appears to be related to small branch circuits including roof top circuits. "Large" EMT tubing is generally not subject to the daily contact that small branch circuits are. It is the intent of the revised text to provide additional requirements for the smaller ampacity circuits that are the most susceptible to accidental contact that destroys the equipment ground continuity. Even when installed properly, an inspector or an electrician will seldom know what kind of abuse the electrical installation is likely to be subjected to.
No detailed substantiation for why 1 in. is selected as the upper limit for requiring a supplementary equipment grounding conductor. The choice was arbitrary and is based upon my experience in designing and examining electrical installations after construction. I leave it to Code-Making Panel 8 to modify the indicated upper limit, as it sees fit, but to maintain the concept that certain installations require a supplementary equipment grounding conductor in order to ensure an adequate ground return path.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient technical substantiation to require a separate equipment grounding conductor in 1 inch and smaller raceways.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 4
EXPLANATION OF NEGATIVE:
GRIFFITH: Although I agree with the panel that the submitter of Comment 8-63 has not substantiated his proposed wording, it does for certain designs of EMT raceway systems offer a solution to a loss of ground continuity possibility believed to exist over the life of an installation. See also my explanation of negative vote on Comment 8-57.
POHOLSKI: Reject panel action to reject this comment and accept the proposal as submitted. See Comment 8-57 (348-4(a)).
ROWE: I believe there has been provided sufficient substantiation to amend the NEC to require the installation of a separate equipment grounding conductor for electrical circuits installed in electrical metallic tubing, trade size 1 inch and smaller.
My personal observations and experience while conducting premises electrical inspections has convinced me that a significant hazard exists by relying on the mechanical integrity of the (EMT) raceway installation to provide an adequate, low impedance grounding path for fault current. While I agree that some failures of the grounding integrity is attributable to poor workmanship during installation of the raceway system and some failures are attributable to a lack of proper maintenance, none the less people are being killed and injured as a result of fault current present on this type of raceway installation.
Aside from the premises installations that I have officially inspected, I have informally noted, at each of the hotel/motels I have stayed since this grounding conductor issue was proposed to the panel several cycles ago. Almost without exception, there have been installations of EMT raceway that did not afford a continuous grounding path and were not NEC compliant. Some due to improper use of the product, some due to workmanship or lack of proper maintenance and perhaps some where attributable to noncompliant or substandard materials.
Each of the installations I refer to was typically size 1/2 or 3/4 inch trade size. However, I believe that the requirement for a separate grounding conductor should apply to 1 in. trade size and smaller due to the design of the fitting associated with size 1/2 through 1 in. and the greater incident of failure that I personally have knowledge of falls within that size range.
It makes no difference to an electrocution victim why the fault current was present, or why an adequate low impedance path to earth was not available. Whether deficient because of workmanship, defective material or other reason the net result is the same, unnecessary death or injury.
SIMPSON: The panel action was to reject this proposal, however I still maintain that there is sufficient substantiation that a separate equipment grounding conductor in 1 inch and smaller EMT raceways would increase safety to the public, equipment, and property. GRIFFITH: See my explanation of negative vote for Comment 8-57.

(Log #760)

8- 64 - (348-5(6) (New)): Accept
SUBMITTER: Richard E. Loyd, Perryville, AR
COMMENT ON PROPOSAL NO: 8-286
RECOMMENDATION: I support the panel action to reject this proposal it is unsubstantiated and overly restrictive.

SUBSTANTIATION: The submitter has not provided any substantiation. EMT is used successfully outdoors all over the US and where there are extreme corrosion conditions the code and the listing requirements (300-6 and 110-3(b)) covers this very adequately.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
GRIFFITH: It is believed that the original proposal, 8-286 expresses valid concerns about the long-term suitability of EMT on outdoor rooftops, where the raceway is exposed to the elements over its instalaltion life.
POHOLSKI: Reject the panel action to accept this comment and accept the proposal as submitted. See Log #260 on Proposal 8-286 as substantiation for this rejection.

(Log #2287)

8- 65 - (348-5(6) (New)): Reject
SUBMITTER: Christopher R. Pharo, Marlton, NJ
COMMENT ON PROPOSAL NO: 8-286
RECOMMENDATION: I would urge acceptance of this proposal.
SUBSTANTIATION: If EMT is continued to be used on rooftops as an acceptable wiring method, then a grounding electrode conductor should be installed.
EMT installed on rooftops is subject to the weather and physical damage.
The weather has an obvious detrimental effect on the raceway due to its thinwall steel design. The fittings used, when compared to its rigid steel equivalent, also has a shorter life expectancy.
Rooftops are rugged places. Service contractors are constantly stepping on conduits to get across the roof. These same conduits are also used to help pull yourself up or lower yourself into a better position.
It is because of the two scenarios, that I believe a good installation may become faulty, thus creating a safety hazard.
While I do not support the need for an EGC in EMT in other parts of the Code (Proposal 8-282), I do feel it is necessary in this particular application.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient technical substantiation to require a separate equipment grounding conductor for rooftop installations.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
POHOLSKI: Reject the Panel Action to reject this comment and accept the proposal as submitted. See Log #260 on Proposal 8-286 as substantiation for this rejection. See Comment 8-57 (348-4(a)).
SIMPSON: The panel action was to reject this proposal. I disagree and believe that there is plenty of proof that EMT does not hold up when used on rooftops and such use needs to be further restricted.

(Log #530)

8- 66 - (348-13): Accept
SUBMITTER: Craig M. Wellman, Newark, DE
COMMENT ON PROPOSAL NO: 8-277
RECOMMENDATION: Revise last sentence of proposal for this section as follows:
"... fastened within ~~3 ft (914 mm)~~ 900 mm (3 ft) of termination...".
SUBSTANTIATION: The proposal missed this metrication conversion. This comment was developed by the NEC Technical Correlating Committee Metrication Task Group which included: James Daly; Bruce Barrow; Michael Callanan; Richard Berman; Ed Lawry; Neil LaBrake, Jr.; Jim Pauley; Jack A. Gruber; George Dauberger; Ravi Ganatra; and Craig Wellman.
PANEL ACTION: Accept.
PANEL STATEMENT: The change is editorial in nature.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #2330)

8- 67 - (348-13): Accept in Principle
SUBMITTER: Wayne A. Lilly, Bridgewater, VA
COMMENT ON PROPOSAL NO: 8-293
RECOMMENDATION: Revise the proposed language in this Section so it will be as follows:
"(A) Securely Fastened. EMT shall be installed as a complete system as provided in Article 300. ~~It~~ Each tubing run between any combination of outlet boxes, junction boxes, device boxes, cabinets, conduit bodies, or other tubing termination shall be securely fastened in place at least every 3 m (10 ft). In addition, EMT shall be securely fastened within 914 mm (3 ft) of each outlet box, junction box, device box, cabinet, conduit body, or other tubing termination."
SUBSTANTIATION: The substantiation for Proposal 8-162 of the 1998 ROP was "Many interpretations have been made pertaining to this situation where installers wish to "take credit" for supports on opposite sides of an outlet box, junction box, device box, etc. The new wording would clarify the intent that supports are needed for each conduit terminating in such boxes, not just on one side of the box."
The language accepted in this proposal, Proposal 8-293, allows this section to be interpreted as it was prior to the 1999 NEC. This will cause the code to regress by creating the same problem that was solved by Proposal 8-162 of the 1999 NEC. The proposed language of this comment maintains the corrective work done in the 1999 NEC while still addressing the concerns of the person making the proposal for the 2002 NEC.
PANEL ACTION: Accept in Principle.
Revise 348.30(A) in the 2002 NEC Draft and Proposal 8-276 to read:
(A) Securely Fastened. EMT shall be securely fastened in place at least every 3 m (10 ft). In addition, each EMT run between termination points shall be securely fastened within 900 mm (3 ft) of each outlet box, junction box, device box, cabinet, conduit body, or other tubing termination.
PANEL STATEMENT: Editorial changes were made to correlate the comment with the action taken on Proposal 8-276.
The comment language was reorganized to apply to the termination points rather than the 3 m (10 ft) requirement. These changes were made to address the submitter's concerns that the requirement for securing within 900mm (3 ft) of termination points be made clear.

ARTICLE 349 — FLEXIBLE METALLIC TUBING: TYPE FMT

(Log #2047)

8- 71 - (349-60): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 8-306
RECOMMENDATION: Revise as follows:
Flexible metallic tubing shall be permitted as a grounding means as covered in Section 250-118(8).
SUBSTANTIATION: The wording in the proposal essentially takes a fine print note and makes it normal sized text, which leaves it improperly worded for a rule. This comment improves the syntax.
PANEL ACTION: Accept in Principle.
Revise 349.60 of the 2002 NEC Draft as follows:
349.60 Grounding. FMT shall be permitted as an equipment grounding conductor where installed in accordance with 250.118(8).
PANEL STATEMENT: The panel action on the submitter's proposed language has enhanced clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
POHOLSKI: Reject panel action to accept in principle this comment. Flexible metallic tubing is installed because it is flexible. When it is installed at a motor it moves from vibration, when it is installed at fixture or box it acts as an expansion joint and moves over time. Bonding jumps should be installed on all flexible metallic tubing for these reasons. Also see Comment 8-57 (348-4(a)).

ARTICLE 350 — FLEXIBLE METAL CONDUIT: TYPE FMC

(Log #98)

8- 72 - (350-16): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 8-325
RECOMMENDATION: The Technical Correlating Committee understands that the panel action replaces the last sentence of 350-26 in Proposal 8-315. It was the action of the Technical Correlating Committee that this Proposal be reconsidered and that the panel utilize the common numbering system for the text in 350-26. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
PANEL STATEMENT: The location of the section is correct per the 2002 NEC Draft.

(Log #959)

8- 74 - (350-30 Exception No. 4 (New)): Hold
SUBMITTER: Joseph A. Ross, Ross Electrical Assessments
COMMENT ON PROPOSAL NO: 8-315
RECOMMENDATION: Add new text as follows:
Exception No. 4: Lengths not exceeding 6-feet (1.83m) from an outlet for connection within an accessible ceiling to lighting fixtures or equipment.

SUBSTANTIATION: This revised exception is not to be considered new material. Note: The proper text presently appears in Sections 333-7(b)(3), 334-10(b), and 336-18 Exception No. 2. This Comment corrects an omission. See companion Comments for Sections 331-30(a) Exception and 3XX-30(a) Exception.

The omission must be corrected as 6 foot lengths (whips) are presently manufactured and listed and in common use today. Some inspectors have rejected their use.

The term "whip" is not defined in the NEC, but everyone knows what a "whip" is and takes for granted that flexible raceways and cables are permitted for this use. However, many misinterpret that Section 410-67(c) addresses "whips" and believe the method is covered. It is not.

Section 410-67(c) was introduced into the NEC to permit a transition from the hi-temp fixture wires of a recessed incandescent fixture to lo-temp branch-circuit wires. That is, a recessed incandescent fixture was provided with a 6 foot "tail" of flexible metal raceway or metal-sheathed cable containing hi-temp fixture wire for connection, within a field installed junction box, to lo-temp branch-circuit wiring. The 6 foot "tail" assured that the heat of the fixture would not be transmitted to the branch-circuit wiring.

This method provided for the fixture to be installed in a plastered or sheetrock (nonaccessible) ceiling cavity and the junction box being "placed" rather than rigidly supported and fastened. The unsupported "tail" and branch-circuit wiring assures that the box is accessible and may be retrieved (for any reason) through the fixture trim opening by removing the fixture.

A "whip" application is quite different, i.e., a "whip" is permitted to be unsupported, not more than 6-feet in length, and run from an accessible and rigidly supported and fastened outlet box for connection within an accessible ceiling to lighting fixtures or equipment.

PANEL ACTION: Hold.

PANEL STATEMENT: In accordance with Section 4-4.6.2.2(a) of the NFPA Regulations Governing Committee Projects this comment is held as the proposed exception introduces new material that has not had public review. There were no technical changes to the support requirements in Proposal 8-315.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

(Log #377)

8- 75 - (350-30(a) Exception No. 4): Hold

SUBMITTER: Dan Leaf, Palmdale, CA

COMMENT ON PROPOSAL NO: 8-315

RECOMMENDATION: Accept in principle add the following: Exception No. 4: The support interval from terminations at luminaires or equipment in or on suspended ceilings shall be permitted to be increased where all the following conditions are met: (1) structural members (including support wires or rods and ceiling grid members, where permitted to be used) do not permit the support interval required by this section; (2) the nearest readily available support member is used; (3) the support interval does not exceed 1.4m (4 1/2 ft); and (4) the FMC is above the suspended ceiling.

SUBSTANTIATION: Similar relaxation of support requirements are provided for other wiring methods e.g., Type AC, MC, NMSC cables, RMC, IMC, EMT, which should be applicable to FMC. The proposal relaxes the 12 in. requirement only where no suitable support is available but requires fastening to suitable support that is available at less than 4 1/2 ft intervals, such as a structural ceiling or suspended ceiling assembly.

PANEL ACTION: Hold.

PANEL STATEMENT: In accordance with Section 4-4.6.2.2(a) of the NFPA Regulations Governing Committee Projects this comment is held as the proposed exception introduces new material that has not had public review. There were no technical changes to the support requirements in Proposal 8-315.

ARTICLE 351 — LIQUIDTIGHT FLEXIBLE METAL CONDUIT: TYPE LFMC

(Log #384)

8- 76 - (351-8 Exception No. 4): Hold

SUBMITTER: Dan Leaf, Palmdale, CA

COMMENT ON PROPOSAL NO: 8-329

RECOMMENDATION: Accept in principle, add the following: Exception No.4: The support interval from terminations at luminaires or equipment in or on suspended ceilings shall be permitted to be increased where all the following conditions are met: (1) structural members (including support wires or rods and ceiling grid members, where permitted to be used) do not permit the support interval required by this section; (2) the nearest readily available support member is used; (3) the support interval does not exceed 1.4 m (4 1/2 ft.); and (4) the LTFMC is above the suspended ceiling.

SUBSTANTIATION: Similar relaxation of support requirements are provided for other wiring methods e.g., Type AC, MC, NMSC cables, RMC, IMC, EMT. The proposal relaxes the 12 in. requirement only where no suitable support is available but requires fastening to suitable support that is available at less than 4 1/2 ft. intervals, such as a structural ceiling or suspended ceiling assembly.

If this proposal is accepted the panel may wish to provide something similar for LTFNMC.

PANEL ACTION: Hold.

PANEL STATEMENT: In accordance with Section 4-4.6.2.2(a) of the NFPA Regulations Governing Committee Projects this comment is held as the proposed exception introduces new material that has not had public review. There were no technical changes to the support requirements in Proposal 8-329.

SUBMITTER: Technical Correlating Committee National Electrical Code

COMMENT ON PROPOSAL NO: 8-339

RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 8-327. This action will be considered by the Panel as a Public Comment.

SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.

PANEL ACTION: Accept.

In the 2002 NEC Draft revise 3XX.26 as follows:

3XX.26 Bends-Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, e.g., conduit bodies and boxes.

Delete remainder of text in this section.

Amend the text in Proposals 8-339 and 8-327 to read:

3XX.24 Bends - How Made. Bends in conduit shall be made so that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment. The radius of the curve to the centerline of any bend shall not be less than shown in Table 346.24 using the column "Other Bends".

PANEL STATEMENT: The panel action clarifies the location and content of 3XX.24 and 3XX.26.

8- 79 - (3XX-30(a), Exception No. 3): Hold
SUBMITTER: Joseph A. Ross, Ross Electrical Assessments
COMMENT ON PROPOSAL NO: 8-327
RECOMMENDATION: Revise Exception No. 3 as follows:
Exception No. 3: Lengths not exceeding 6 ft (1.83m) from an outlet for connection within an accessible ceiling to lighting fixtures or equipment.
SUBSTANTIATION: This revised exception is not to be considered new material. Note: The proper text presently appears in Sections 333-7(b)(3), 334-10(b), and 336-18 Exception No. 2. This Comment corrects an omission. The Exception is revised as it is very unlikely that LFMC would be permitted to contain hi-temp conductors as addressed by Section 410-67(c). See companion Comments for Sections 331-30(a) Exception, 350-30 Exception and 3XX(51)-30(a) Exception No. 4.

The omission must be corrected as 6 foot lengths (whips) are presently manufactured and listed and in common use today. Some inspectors have rejected their use.

The term "whip" is not defined in the NEC, but everyone knows what a "whip" is and takes for granted that flexible raceways and cables are permitted for this use. However, many misinterpret that Section 410-67(c) addresses "whips" and believe the method is covered. It is not.

Section 410-67(c) was introduced into the NEC to permit a transition from the hi-temp fixture wires of a recessed incandescent fixture to lo-temp branch-circuit wires. That is, a recessed incandescent fixture was provided with a 6 foot "tail" of flexible metal raceway or metal-sheathed cable containing hi-temp fixture wire for connection, within a field installed junction box, to lo-temp branch-circuit wiring. The 6 foot "tail" assured that the heat of the fixture would not be transmitted to the branch-circuit wiring.

This method provided for the fixture to be installed in a plastered or sheetrock (nonaccessible) ceiling cavity and the junction box being "placed" rather than rigidly supported and fastened. The unsupported "tail" and branch-circuit wiring assures that the box is accessible and may be retrieved (for any reason) through the fixture trim opening by removing the fixture.

A "whip" application is quite different, i.e., a "whip" is permitted to be unsupported, not more than 6 feet in length, and run from an accessible and rigidly supported and fastened outlet box for connection within an accessible ceiling to lighting fixtures or equipment.
PANEL ACTION: Hold.
PANEL STATEMENT: In accordance with Section 4-4.6.2.2(a) of the NFPA Regulations Governing Committee Projects this comment is held as the proposed exception introduces new material that has not had public review. There were no technical changes to the support requirements in Proposal 8-327.

ARTICLE 362 — METAL WIREWAYS AND NONMETALLIC WIREWAYS

(Log #762)

8- 91 - (362-15(1)(2)): Accept in Principle
SUBMITTER: Richard E. Loyd, Perryville, AR
COMMENT ON PROPOSAL NO: 8-416
RECOMMENDATION: Reconsider and revise as per Mr. Berman's comment on his negative vote.
SUBSTANTIATION: I believe the panel statement is incorrect and misleads the public. PVC is an excellent material for many corrosive environments but not all!! I believe both Mr. Berman's and my comments on the voting should be considered and proposed wording revise.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle.
In the 2002 NEC Draft:
The revision to 3BB.10(1) remains accepted as submitted in Proposal 8-416.
Revise Section 3BB.10(2) to read as follows:
"(2). Where subject to corrosive environments where identified for the use."
PANEL STATEMENT: The revised wording removes the incorrect conclusion that nonmetallic wireways are suitable for all corrosive environments.
The panel understands the submitter to be concerned with panel statement in Proposal 8-416. The panel has only provided permission to use nonmetallic wireway in corrosive environments, however, consideration must be given to the corrosive environmental effects on the wireway nonmetallic material.

ARTICLE 364 — BUSWAYS

(Log #727)

8- 93 - (364-8(b)(2), Exception): Reject
SUBMITTER: W. Creighton Schwan, Hayward, CA
COMMENT ON PROPOSAL NO: 8-429
RECOMMENDATION: Reconsider, and Accept this proposal.
SUBSTANTIATION: The exception in the 1999 NEC is an invitation for installers to violate Section 400-8(1) which prohibits the use of flexible cords and cables as a substitute for the fixed wiring of a structure. Special permission is a reasonable requirement for exceeding the 6 ft horixontal limit for cord or cable extensions from busways.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its position as stated in its statement on Proposal 8-429. Section 364-8(b) pertains to portable equipment or stationary equipment to facilitate their interchange. The section requires compliance with Sections 400-7 and 400-8. As pointed out by the submitter, Section 400-8(1) prohibits the use of flexible cords and cables "As a substitute for the fixed wiring of a structure." An installation utilizing flexible cords and cables in a manner not in compliance with Section 364-8(b) is a violation of the Code.
A requirement for special permission is not needed as Section 364-8(b) currently provides the language necessary to prohibit the use of flexible cords and cables as a substitute for fixed wiring.

ARTICLE 370 — OUTLET DEVICE, PULL AND JUNCTION BOXES, CONDUIT BODIES AND FITTINGS

(Log #2048)

9- 3 - (370-3 Exception No. 1): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 9-10
RECOMMENDATION: Accept the proposal in principle. Amend existing Exception No. 1 as follows:
"Exception No. 1: Where internal bonding means are provided between all entries, or for wiring not requiring grounding continuity by other provisions of this Code, nonmetallic boxes shall be permitted to be used with metal raceways or metal-armored cables."
SUBSTANTIATION: The submitter makes a valid point, although his proposal is incorrectly worded, and needlessly introduces a third exception. This section doesn't line up properly with allowances in Section 250.112(I).
PANEL ACTION: Reject.
PANEL STATEMENT: Section 250-21 refers to ungrounded systems. Section 250-30(4)(b) states that the equipment of an ungrounded system must be grounded as prescribed in other parts of the Code. Code-Making Panel 9 is concerned that a discontinuous raceway may be assumed to be continuous by future installers. As a result, Code-Making Panel 9 believes this requirement is essential to maintain consistency.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
CROUSHORE: I agree with the panel action on the comment. However, I don't believe the first sentence of the panel statement addresses the situation described by the submitter. Section 370-3 deals with the issue of raceway bonding and not system or circuit grounding. Even though the circuit may not be grounded, the raceways should be bonded together to form a continuous metallic path through any nonmetallic boxes. The provisions in Section 250-112(i) require equipment cases that are used on grounded systems for power-limited remote-control, signaling, and fire alarm circuits to be grounded. Therefore, equipment cases on ungrounded systems for power-limited remote-control, signaling, and fire alarm circuits need not be grounded. However, this reference, as described by the submitter, does not vitiate the need to have continuity of the metallic raceway or metallic cable system supplying this equipment. Therefore, this comment should be rejected.

(Log #434)

9- 4 - (370-15(a)): Hold
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 9-12
RECOMMENDATION: Accept in principle, revise Panel Action:
Add after first sentence: A surface mounted box installed outdoors in a location protected from the weather, or in other damp locations and containing a switch(es) or receptacle(s) shall be listed for wet locations.
SUBSTANTIATION: This section does not require a box in damp locations to be listed for wet locations, which is reasonable, and the proposal only requires this where the box contains switches or receptacles, in accordance with 380-4 and 410-57(a). The requirements of those sections is justified due to contact by persons. A requirement in this section would provide correlation and be user friendly.
PANEL ACTION: Hold.
PANEL STATEMENT: This comment addresses a subject that has not had public review.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #801)

9- 5 - (370-15(a)): Accept in Part
Note: The Technical Correlating Committee understands that by this action Proposal 9-12 is rejected and 370-15(A) remains unchanged from the 1999 NEC.
SUBMITTER: David H. Kendall, Carlon
COMMENT ON PROPOSAL NO: 9-12
RECOMMENDATION: Revise the current proposed text:
Junction boxes installed below finished grade in accordance with Section 270-29, Exception shall have an enclosure Type 6P rating.
to read as follows:
See 370-29 for Boxes and Conduit Bodies used in direct burial and concrete applications.
SUBSTANTIATION: This comment has a companion comment to add a new Exception to 370-29.
It is appropriate that 370-15 references 370-29 since Wet Locations include direct burial and concrete encasement applications. But the proposed Panel text now requires that all junction boxes maintain an enclosure rating for those applications described in the exception in 370-29. This was not the intent of the submitter. There is nothing wrong with using currently listed junction boxes in the applications described in the 370-29.
PANEL ACTION: Accept in Part.
1. The panel accepts the removal of the first sentence as recommended in the Comment.
2. The panel does not accept the second sentence as recommended in the Comment.
PANEL STATEMENT: After reconsideration, and also in light of the substantiation provided for this Comment and Comment 9-6, the panel now agrees that the action on Proposal 9-12 was too restrictive. The application for which the new language would apply has been rejected. See the panel action and statement on Comment 9-19. The effect of this action is to overturn the panel's previous acceptance of Proposal 9-12.

AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
CROUSHORE: I agree with the action of "accept in part" on Comment 9-5. However, the panel action on this comment is confusing because it refers to a first and second sentence of the commenter. After reviewing the work of the panel, this statement doesn't seem to make sense.
Here is the explanation of the panel intent on the accept in part: During the comment stage, the members of Panel 9 agreed with the comment submitter to delete the sentence that was proposed by Panel 9 in the ROP panel action on Proposal 9-12. The panel did not accept the replacement phrase as indicated by the comment submitter. Therefore, the code text should not change and should remain the same as the language of the 1999 NEC. This intent is indicated in the last sentence of the panel statement on Comment 9-5.

(Log #1217)

9- 6 - (370-15(a)): Accept in Principle

Note: The Technical Correlating Committee understands that by this action Proposal 9-12 is rejected and 370-15(A) remains unchanged from the 1999 NEC.

SUBMITTER: Dann Strube, Lanesville, IN

COMMENT ON PROPOSAL NO: 9-12

RECOMMENDATION: Revise proposed wording as follows: Section 370-29, exception shall ~~have an enclosure Type 6P rating~~ be suitable for the use.

SUBSTANTIATION: The proposed wording is far too restrictive. Other enclosures covered by this section are not required to meet specific NEMA/UL design requirements.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Comment 9-5.

9- 7 - (370-15(a)): Reject

Note: The Technical Correlating Committee understands that by this action Proposal 9-12 is rejected and 370-15(A) remains unchanged from the 1999 NEC.

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

COMMENT ON PROPOSAL NO: 9-12

RECOMMENDATION: Revise the last sentence to read:

"Boxes installed below finished grade, as covered in Section 370-29, Exception, shall have an enclosure Type 6P rating."

SUBSTANTIATION: The panel action inadvertently begged the question of how a direct-buried box needs to be rated if it doesn't comply with 370.29 Exception. In addition, it omitted other smaller boxes more routinely buried, such as device and outlet boxes.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and statement on Comment 9-5.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #2050)

9- 8 - (370-16(b)(1)): Reject

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

COMMENT ON PROPOSAL NO: 9-16

RECOMMENDATION: The proposal should have been accepted in principle. Revise as follows:

"(1) Conductor Fill. Each conductor that originates outside the box and terminates or is spliced within the box shall be counted once, and each conductor that passes <u>directly</u> through the box without splice or termination shall be counted once. <u>A looped, unbroken conductor not less than twice the minimum length required for free conductors in Section 300.14 shall be counted twice.</u> The conductor fill, in cubic inches, shall be computed using Table 370.16(B). A conductor, no part of which leaves the box, shall not be counted."

SUBSTANTIATION: This revision properly distinguishes between a small loop left to assist wire pulling and dressing, and a large loop left to allow cutting in the middle and then adding a splice or a device. For such cases, the original proposal substantiation was correct.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel reaffirms their original action and statement on Proposal 9-16.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 8

NEGATIVE: 3

EXPLANATION OF NEGATIVE:

HARTWELL: This comment should have been accepted, and it will be resubmitted as a proposal for the 2005 NEC. A looped conductor in a box that is double the 300.14 length clearly impacts box fill, and should be counted for what it really is, a multiple conductor instance. If it were cut in the middle with the cut ends terminated on a device, it would be counted twice with zero marginal increase in occluded volume, not even the volume of a twist-on wire connector. The panel statement provides no technical basis for concluding that such an installation practice has less of an impact before the putative wire is cut and terminated.

HIDAKA: The comment should have been accepted. A looped conductor whose length is twice that required in Section 300.14 should be counted twice in order to properly determine the correct size of the box.

MONTUORI: The comment submitter provides adequate substantiation based on typical installation practice. This comment should have been accepted to properly size boxes for present and future use.

(Log #1116)

9- 9 - (370-22, FPN (New)): Reject

SUBMITTER: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

COMMENT ON PROPOSAL NO: 9-22

RECOMMENDATION: Insert fine print note following Section 370-22, as follows:

Note that extension boxes, especially multiple extension boxes, can make it difficult to comply with 300-14, which requires that conductors entering the back or side of an ordinary box must be long enough, without splicing, to extend at least 76 mm (3 in.) out the front.

SUBSTANTIATION: Mr. Kaunzner is quite right that extension boxes can make it impossible to get at wiring. He has not provided substantiation for a new rule, but a heads-up is only reasonable, and a fine print note is the normal means for providing one. If conductors can be rendered accessible by pigtailing before, or at the time, the extension box is added, the problem has a great workaround. However, the wording I propose reflects the more restrictive interpretation of 300-14. If it is incorrect, the fine print note should not be adopted as proposed in this comment.

PANEL ACTION: Reject.

PANEL STATEMENT: The length of conductors is adequately covered in 300.14.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #1457)

9- 11 - (370-23(g)): Reject

SUBMITTER: Paul E. Guidry, Fluor Daniel, Inc.

COMMENT ON PROPOSAL NO: 9-34

RECOMMENDATION: This proposal should be accepted or the exception to Section 370-23(e) and Exception No. 1 to 370-23(f) should be clarified.

SUBSTANTIATION: The proposal was to allow oversized conduit bodies to be used for splices. For instance 3/4" in. conduit could be run for lighting circuits and 1-1/2 in. "T" fittings could be used to splice at the fixtures even though no 1-1/2 in. conduit is used.

The panel statement to this proposal was "The Code already allows what is proposed. See panel action and statement on Proposal 9-31."

There is much confusion based on the present wording of 370-23(e) Exception and 370-23(f) Exception No. 1. It is my impression based on the panel statement that oversized conduit bodies are allowed for all conduit runs even those where all conduits entering the conduit bodies are smaller trade sizes than that of the conduit body. This isn't what the exceptions say at this time. The exceptions start out saying that conduit shall be permitted to support a conduit body of any size but then it puts a stipulation by saying the conduit body can't be larger than the largest trade size of the conduit (or EMT on 370-23(e)). I assume that this stipulation is to be applied only to conduit bodies with one conduit entry based on the panel statement, which doesn't make sense either. What would be wrong with a 1 in. rigid conduit supporting an 1-1/2 in. conduit body with one conduit opening? The exceptions need to be clarified to allow oversized conduit bodies.

PANEL ACTION: Reject.

PANEL STATEMENT: The rule and permissive exception following it are clear. If you comply with the rule, a permissive exception is of purely academic interest, in this article and throughout the NEC. A 1 1/2 in. conduit body with 1 1/2 by 1/2 in. reducing bushings can be supported by rigid metal or intermediate metal conduit, provided its capacity doesn't exceed 100 cu. in. However, if the wiring method is of any other type, or if the conduit body exceeds 100 cu. in., you fail the rule and need to look at the exception. The exception allows other wiring methods to support their conduit bodies, or any wiring method to support an "E" fitting, but only where no larger than the largest trade size of the entering raceway. Taken as a whole, the rule and exception are intended to severely restrict the allowable wiring methods that can be used to exempt an enclosure from independent support, while not imposing an independent support rule on a conduit body used only to change the direction of a raceway. Where conduit bodies are used in lieu of boxes, they must meet the capacity and support rules for boxes.

9- 12 - (370-27, Exception): Accept in Principle

SUBMITTER: Thomas D. Knecht, Allied Moulded Products, Inc.

COMMENT ON PROPOSAL NO: 9-39

RECOMMENDATION: Reject proposal, revise text as follows:

Exception: A wall mounted fixture weighing not more than 6 lb. (2.72 KG) shall be permitted to be supported on other boxes and boxes with plaster rings, provided the fixture or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws.

SUBSTANTIATION: Proposal will allow unsafe installations.

Presently, those who enforce the Electrical Code can look at the installation in a ceiling and determine if a box has been tested for the application by its size and shape. Allowing flush device boxes to support fixtures in a ceiling will force the inspectors to look for fixture support marking. Not all flush device boxes will be tested and approved for the application. There will be fixtures weighing more than 15 pounds attached to flush device boxes not tested.

Substantiation of comment - fixtures are furnished with #8-32 screws to match the screw threads provided in outlet boxes. #6-32 screws would not be readily available for attaching fixtures to flush device boxes.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See action on Comment 9-14 which meets the intent of the submitter.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #843)

9- 14 - (370-27(a), Exception): Accept

Note: The Technical Correlating Committee directs that since the substantiation did not address the need for a "soft" conversion, the metric conversion in this section be "hard" as follows: "3kg (6 lbs.)".

SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)

COMMENT ON PROPOSAL NO: 9-39

RECOMMENDATION: The panel should reject the proposal and based on the action on 9-38, the Exception should read as follows (proposed revised wording is underlined)

Exception: A wall mounted fixture weighing not more than 2.72kg (6 lbs) ~~6.80kg (15 lbs)~~ shall be permitted to be supported on other boxes or plaster rings that are secured to other boxes, provided the fixture or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws.

SUBSTANTIATION: The substantiation for this Proposal was based on a statement in UL's 1998 edition of the Electrical Construction Equipment Book (Green Book). The statement reads as follows: "Nonmetallic device boxes or nonmetallic device boxes intended to be installed in an existing structure have been investigated for the support of fixtures, smoke detectors, carbon monoxide detectors weighing not more than 15 lbs." This substantiation is flawed to the extent that the test methods were not defined and the results of these tests were not supplied for review by the Code-Making Panel.

When a fixture is installed on a device box in the ceiling, several safety issues must be addressed; issues such as the thermal effects of a ceiling mounted fixture on the box and the possibility of future homeowners overloading a box with a larger fixture. We question whether these safety issues were adequately addressed in the testing.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

WEDEL: The limitation of "16 inches in. Dimension" of proposal 9-39 should have been included in the revised exception. Without the 16 in. limit, the center of gravity of the fixture could be an unspecified distance from the wall which would overstress the two No. 6 screws or the box material in which the screws are threaded. The wording should be revised to read as follows:

"Exception: A wall mounted fixture weighing not more than 2.72kg (6 lbs.) and not extending more than 16 in. (406 mm) from the wall shall be permitted to be supported on other boxes or plaster rings that are secured to other boxes, provided the fixture or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws."

(Log #843a)

18- 4 - (370-27(a), Exception): Accept

SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)

COMMENT ON PROPOSAL NO: 9-39

RECOMMENDATION: The panel should reject the proposal and based on the action on 9-38, the Exception should read as follows (proposed revised wording is underlined)

Exception: A wall mounted fixture weighing not more than 2.72kg (6 lbs) ~~6.80kg (15 lbs)~~ shall be permitted to be supported on other boxes or plaster rings that are secured to other boxes, provided the fixture or its supporting yoke is secured to the box with no fewer than two No. 6 larger screws.

SUBSTANTIATION: The substantiation for this Proposal was based on a statement in UL's 1998 edition of the Electrical Construction Equipment Book (Green Book). The statement reads as follows: "Nonmetallic device boxes or nonmetallic device boxes intended to be installed in an existing structure have been investigated for the support of fixtures, smoke detectors, carbon monoxide detectors weighing not more than 15 lbs." This substantiation is flawed to the extent that the test methods were not

defined and the results of these tests were not supplied for review by the Code-Making Panel.

When a fixture is installed on a device box in the ceiling, several safety issues must be addressed; issues such as the thermal effects of a ceiling mounted fixture on the box and the possibility of future homeowners overloading a box with a larger fixture. 9- 15 - (370-27(a), Exception): Accept in Principle
SUBMITTER: David H. Kendall, Carlon
COMMENT ON PROPOSAL NO: 9-39
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: The submitter failed to supply the technical and physical substantiation that would support the use of a wall box as a fixture support in the ceiling. Those special old work boxes mentioned in the proposal are listed for 15 pounds and are intended to be used in the walls and have been evaluated as such. Section 370-17(c) Exception, currently allows single gang outlet boxes to be used in the ceiling for receptacles and smoke detectors.

The current language was added because it was a common use for the outlet box to support wall fixtures such as coach lights. UL determined that the boxes currently on the market were safe for these applications. UL did not determine that the same boxes were safe for supporting 15 pound light fixtures in a ceiling.

The submitter needs to supply the technical substantiation showing that these boxes are safe in this application prior to the code being changed.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See action on Comment 9-14 which meets the intent of the submitter.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2051)

9- 16 - (370-27(c)): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 9-40
RECOMMENDATION: The proposal should have been accepted in principle and in part. The panel action rejecting the universal placement of fan boxes was correct, but the editorial improvement still has merit. Revise as follows:

"Boxes used at suspended ceiling (paddle) fan outlets shall be listed for the purpose where used as the sole support of the fan. The installation shall comply with Section 422.18."

SUBSTANTIATION: This arrangement eliminates an exception through the appropriate use of positive language.
PANEL ACTION: Accept in Principle.
Revise the wording in the Comment to read as follows:

"Where a box is used as the sole support of a ceiling-suspended (paddle) fan, the box shall be listed for the application and for the weight of the fan to be supported. The installation shall comply with 422.18."

PANEL STATEMENT: Code-Making Panel 9 wants to assure that boxes used for fan support are suitable for the weight to be supported. 422.18(B) Exception recognizes a second classification of fan box which is eligible for listing for the support of fans up to 70 lbs. Installers need to be aware that unless so evaluated, boxes listed for fan support cannot support fans weighing more than 35 lbs.

9- 19 - (370-29 Exception No. 2 (New)): Reject
SUBMITTER: David H. Kendall, Carlon
COMMENT ON PROPOSAL NO: 9-12
RECOMMENDATION: Add text to read as follows:

Exception 1: Listed boxes shall be permitted where covered by gravel, light aggregate, or noncohesive granulated soil if their location is effectively identified and accessible for excavation.

Exception 2: Listed junction boxes that maintain a Type 6P Rating shall be permitted for direct burial or concrete applications where servicing is not required.

SUBSTANTIATION: This comment has a companion comment to revise the text in 370-15(a).

Junction Boxes are not used strictly for servicing after the installation. Junction boxes are used underground (and aboveground) to change direction of the conduit system and/or for multiple conduit runs. System may have one conduit entering a junction box and several conduits leaving the box. This is common in parking lot applications. The 6P rating is a requirement for those junction boxes permanently installed.
PANEL ACTION: Reject.
PANEL STATEMENT: This comment would sanction a practice that Code-Making Panel 9 specifically rejected in its action on Proposal 9-47. Code-Making Panel 9 reaffirms its action on that proposal.

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 9-57
RECOMMENDATION: Assuming Proposal 9-56 is eventually accepted, this section number will become vacant. Otherwise, renumber the article accordingly, but add the following requirement:
"373-4. Meter Socket Enclosures. Meter socket enclosures shall be completed by the installation of a meter, or by a closure assembly identified for use with the meter socket enclosure employed."
SUBSTANTIATION: In all my years in the trade, and in all the seminars I have given across the country, I have never found an electrician who would think to apply this section to a vacant meter socket. The universal trade practice is to cover the jaws with part of the carton and hope it holds up in the rain until the utility gets there to set a meter. Many utilities, including my own, allow for hot-work cut and reconnects. If an old A-base meter is being replaced, that means the socket will be energized in this condition for some period of time.

This section has to do with omitted knock-out sections, and the coordinate responsibility to provide knock-out seals of equivalent heft to that of the enclosure. Furthermore, in the 1996 cycle Code-Making Panel 9 amended the correlating section in Article 370 (370.18) to explicitly call out cable and conduit knockouts, precisely because it was being misapplied. If the Code-Making Panel 9 comment to Code-Making Panel 1 stands, that general section will incorporate the restriction to conduit and cable knockouts. This language avoids the problem in the original proposal, which would prohibit meter socket closure assemblies added to ring-type meter sockets.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 7
NEGATIVE: 4
EXPLANATION OF NEGATIVE:
CROUSHORE: I believe that this comment should be rejected. As currently worded, this new code text will require the electrician or electrical contractor to provide a meter socket closure plate or an electric meter for all installed meter sockets regardless if the socket is energized or not. I agree that the meter hole in the meter socket should not be left open if the socket is energized. However, in most locations, this is not a problem because the serving utility either installs a meter or installs a cover plate when the service is connected and energized. If accepted, this new section will require the meter or cover plate even if the service is not energized. This new section is not practical and forces the electrician to purchase and carry additional equipment for an unsubstantiated problem. If the meter socket is not energized, there is no hazard. Therefore,

requiring a meter socket closure plate for a de-energized meter socket is unnecessary.

KAEMMERLEN: I believe this comment should be rejected. The panel has not received specific substantiation of injuries received from an energized meter socket, which is temporarily protected until the utility installs a meter.

From a practical point of view, an installer in the field would have difficulty locating an "identified closure assembly" for older meter sockets. The utility usually is very prompt in installing a meter.

In addition, approval of this comment would require covering of all nonenergized meter sockets where no safety issue exists.

MONTUORI: I believe that this comment should be rejected. As currently worded, this new code text will require the electrician or contractor to provide a meter socket closure plate or an electric meter for all installed meter sockets regardless if the socket is energized or not. I agree that the meter hole in the meter socket should not be left open if the socket is energized. However, in most locations, this is not a problem because the serving utility either installs a meter or installs a cover plate when the service is connected and energized. If accepted, this new section will require the meter or cover plate even if the service is not energized. This new section is not practical and forces the electrician to purchase and carry additional equipment for an unsubstantiated problem. If the meter socket is not energized, there is no hazard. Therefore requiring a meter socket closure plate for a de-energized meter socket is unnecessary.

WELNAK: I believe that this comment should be rejected. As currently worded, this new code text will require the electrician or contractor to provide a meter socket closure plate or an electric meter for all installed meter sockets regardless if the socket is energized or not. I agree that the meter hole in the meter socket should not be left open if the socket is energized. However, in most locations, this is not a problem because the serving utility either installs a meter or installs a cover plate when the service is connected and energized. If accepted, this new section will require the meter or cover plate even if the service is not energized. This new section is not practical and forces the electrician to purchase and carry additional equipment for an unsubstantiated problem. If the meter socket is not energized, there is no hazard. Therefore, requiring a meter socket closure plate for a de-energized meter socket is unnecessary.

COMMENT ON AFFIRMATIVE:

HARTWELL: The requirement to complete the meter socket enclosure with a plate or meter applies when the NEC applies to the meter base, namely, when it is connected to a supply of electricity. As such it is analogous to the acceptability of dry location wiring methods in temporarily wet locations when a building is under construction. No one expects such wiring to be made weatherproof during construction, although some protection from deterioration must be in place. Similarly, no inspector worthy of the name will ask for a closure plate on a socket that the utility will set a meter in when they energize the wiring. The rule does, however, provide the inspector with an enforceable basis for rejecting closures made of cardboard when the socket is hot with no meter in place, nothing more.

9- 23 - (373-4(b) (New)):

Note: Based on the Technical Correlating Committee action on Comment 9-22, the Technical Correlating Committee directs that Comment 9-23 be reported as "Reject".

SUBMITTER: John M. O'Connor, North American Technologies, Inc.

COMMENT ON PROPOSAL NO: 9-58

RECOMMENDATION: 373-4. Unused Openings. Unused openings in enclosures within the scope of this article shall be effectively closed to afford protection substantially equivalent to that of the enclosures within the scope of this article.

(a) Nonmetallic. Where metal plugs or plates are used with nonmetallic cabinets or cutout boxes, they shall be recessed at least 1/4 in. (6.35 mm) from the outer surface.

(b) Meter Socket Enclosures. Meter sockets shall be effectively closed by a closure which is integral to the meter socket when a meter is not installed in the socket.

SUBSTANTIATION: The enclosure of a meter socket is UL listed only when a meter is installed in a socket. The service which is energized without a meter being installed does not meet Section 111-27 Guarding of Live Parts. In many instances meters are bypassed, often by non-code approved means, in order to provide temporary power on construction jobsites. The protection of these live parts may or may not exist, depending on the installer and when or if a meter is installed.

These hazardous situations are occurring at new homes, offices, construction sites and at temporary classrooms (which are usually located on school playgrounds) while they are waiting to have meters installed. Utility deregulation may also cause increased incidence of these situations.

The addition of an integral closure to a meter socket would protect workers, children and others from a potentially dangerous situation, one that is preventable. Listed metering assemblies with integral socket closures are already commercially available.

NOTE: This is a companion proposal to my proposal on Section 230-62.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See action on Comment 9-22 which meets the submitter's concern regarding meter socket closure.

ARTICLE 380 — SWITCHES

(Log #107)

9- 28 - (380-2(a)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 9-70
RECOMMENDATION: The Technical Correlating Committee notes that the action on this Proposal received less than the two-thirds affirmative vote. It was the action of the Technical Correlating Committee that this action be reconsidered based on the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Code-Making Panel 9 accepts the direction of the Technical Correlating Committee to reconsider their action based on the comments expressed in the voting.
PANEL STATEMENT: See panel action on Comment 9-30.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
CROUSHORE: I agree with the reject of Comment 9-28. However, I disagree with the action on Comment 9-30. See my Explanation of Negative on Comment 9-30.
LEMAY: The Technical Correlating Committee is correct in the request for Code-Making Panel 9 to revisit the issue of providing an insulated grounded circuit conductor on single pole and 3-way switch loops in residential and commercial installations when wiring with cable systems.

(Log #732)

9- 29 - (380-2(a)): Reject
SUBMITTER: Thomas J. LeMay, LeMay Electric, Inc.
COMMENT ON PROPOSAL NO: 9-70
RECOMMENDATION: Accept Proposal 9-70 as revised:
An insulated grounded circuit conductor shall be routed from the controlled outlet to the first control point when employing switch loop wiring methods using cable systems.
SUBSTANTIATION: Article 90-1(b) specifically states that hazards can occur by not providing for increased uses in electricity. There are many installations in place where the electrician used a bare equipment ground to facilitate operation of a control requiring a grounded circuit conductor or additional control wires such as a paddle fan with a light kit.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action on Comment 9-30.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
LEMAY: I vote negative with the following comment. This proposal should be accepted as it provides for the reduction of a hazard introduced when a homeowner, business owner, maintenance person or electrician installs a control device requiring a grounded circuit conductor or an additional control conductor at a switch point that has been wired using a switch loop wiring method with cable.
Section 90-1(b) specifically states that hazards can occur by not providing for increased uses in electricity.
Installing control devices requiring either an insulated grounded circuit conductor or additional control conductor(s) with none present temps the device installer to resort to use of the equipment grounding conductor as a means to an end. This is a hazard I have seen many times while in the field.
COMMENT ON AFFIRMATIVE:
CROUSHORE: I agree with the reject of Comment 9-29. However, I disagree with the action on Comment 9-30. See my explanation of negative on Comment 9-30.

(Log #842)

9- 30 - (380-2(a)):
Note: The Technical Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: 9-70
RECOMMENDATION: The panel should accept this proposal.
SUBSTANTIATION: The panel action does not address the safety concerns regarding the absence of grounded circuit conductors in single pole and three-way switch loops. Products such as programmable controllers, timers, home automation switches and occupancy sensors are currently in widespread use and are often installed after the initial switch installation.
In many instances the installation of the products mentioned are dependent upon the presence of a grounded circuit conductor. IF the grounded circuit conductor is not available, improper installations of these products will occur, creating safety hazards. Examples of improper installations are incorrect retrofitting of a grounded circuit conductor or the use of the grounding circuit conductor in place of the grounded circuit conductors.

The safe installation of the products mentioned would be significantly enhanced by the requirement of a grounded circuit conductor in all single pole and three-way switch loops.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 3
NEGATIVE: 8
EXPLANATION OF NEGATIVE:
CROUSHORE: Comment 9-30 should have been rejected. The submitter did not provide adequate technical substantiation to make a change in the code. Specifically, this change is not necessary because of a number of reasons. Here is a list of these reasons that need to be addressed by any proposal or comment before this change should take place.
1. There is nothing in the code to prohibit installing a grounded conductor at the locations indicated by the submitter. However, providing wiring for a possible future application is not the intent of the NEC. Should the installed device installed require a grounded conductor, a grounded conductor should be installed to meet the current code. However, a grounded conductor should not have to be present for a future unplanned addition of an automation-type device.
2. The submitter did not address how an unused grounded conductor should be terminated in a box where the grounded conductor is not needed for the switch loop. The submitter also did not address any box fill requirements for this new conductor and termination.
3. The submitter does not acknowledge devices on the market that accomplish the switching task without needing a grounded conductor. Currently, there are devices manufactured that can safely accomplish the desired switching automation as mentioned by the submitter without the use of a grounded conductor.
4. The installation of the grounded conductor as proposed will add cost to the wiring installation without any documented improvement in safety. Persons connecting an equipment-grounding conductor to the retrofit device that requires a grounded conductor are violating the current code. Poor wiring practice and willful violation of the manufacturer's instructions as well as the NEC are not reasons to change the current requirements.

DEMING: After the panel meeting on Public Comments, I voted affirmated to accept Comment 9-30. Now, after reading the Panel Members' comments circulated with their negative votes, I find their logic to sound to be ignored.

HARTWELL: The wording accepted under this comment is substantially better than that rejected three years ago, but numerous issues remain. First, nothing in the panel wording requires the grounded circuit conductor of the same circuit as the one supplying the ungrounded conductor(s). Second, the wording extends beyond the scope of its subsection, in that it covers single pole snap switches in a set of provisions that only address three-way and four-way snap switches.

This is, frankly, a fan-box proposal for switches. The present code rules are adequate if they are followed. The problem appears to be one of widespread noncompliance. Three years ago I asked for much more detailed substantiation in two areas. First, we needed objective reports covering the actual prevalence of noncompliance arranged by occupancy. We also needed much more detail about the actual product standards; what devices are allowed to do, and what warning information must be included in the installation directions. That substantiation has not been provided.

It may be possible to adequately address the substantiation in this and the related comments through revisions to the product standards. Specifically, for the benefit of unqualified personnel, the installation directions should carry a bold-print explanation of how to distinguish between an equipment grounding conductor and a grounded circuit conductor, and warning never to connect to the former. Following the fan box example, we should also put a label on the outside of the package saying: "Product requires grounded (white) conductor; switch box may need to be rewired. Consult a qualified electrician if in doubt."

I am not yet persuaded that we should impose the significant costs involved in implementing this change to accommodate untrained persons who will undoubtedly create many other infractions of the NEC in the process of installing such controls. This practice involves wiring complexities that exceed, by an order of magnitude, those involved in changing a faceplate. At some point we have to draw a line and remember that electrical safety depends on electrical inspection and coordinated actions within product standards just as much as the NEC. Untrained persons can and will endanger themselves and others, but that is an argument for licensure or other means of establishing accountability for poor work, not for amending the code.

KAMMERLEN: I believe this comment should be rejected. Providing a spare grounded conductor would possibly serve as a convenience in the future, but potentially create a serious safety hazard should an installer choose to use the spare grounded conductor along with the grounding conductor to provide an additional circuit.

This section, as currently written in the code, provides "practically safeguarding" and "adequacy" as described in the code.

90-1(A) Practical Safeguarding. The purpose of this code is the practical safeguarding of persons and property from hazards arising from the use of electricity.

90-1(B) Adequacy. This code contains provisions that are considered necessary for safety. Compliance therewith and proper maintenance will result in an installation that is essentially free from hazard but not necessarily efficient, convenient, or adequate for good service or future expansion of electrical use.

MONTUORI: The comment should have been rejected. This type of device should only be installed where the grounded conductors are available. Providing a grounded conductor to all switch locations does not provide additional safety, when this type of device is used.

SENGUPTA: The recommended requirement of a grounded circuit conductor in every switch box is a good engineering practice, but is more of a convenience issue for installing a new product that requires a grounded circuit; however, the total safety issue, as described in the substantiation, is compromised.

Some of these new products require more room than is available in most existing switch boxes. The probability of creating a hazardous installation is increased, as a result of forcing a new switch that is larger than a standard switch into an existing standard size box. The available space for wiring of a new switch may not be adequate; and in some cases the heat dissipation problem during operation of an electronic switch, due to shortage of space, may also cause a safety hazard.

Availability of an insulated grounded circuit conductor in a box may give the installer a false impression that it is totally safe to replace an old switch with a new generation switch.

It is imperative that the whole safety issue be looked at.

WEDEL: There is nothing in the existing code preventing this practice. Requiring a grounded conductor at all single pole and 3-way switch loops will disallow an established method that has performed without problem. The commentor has not provided any statistical justification of a problem. To accept this proposal will penalize most installations for the benefit of only a few.

WELNAK: The acceptance of this proposal assumes that future use of the spare white wire will be for a grounded circuit conductor. There is also a danger that a person would illegally use it for an ungrounded conductor and use the equipment ground for a grounded conductor. I also question the availability of 4-wire cable in all areas, which would be necessary in some installations.

The purpose of the NEC states in 90-1(a): "The purpose of this code is the practical safeguarding of persons and property from hazards arising from the use of electricity."

Also in the NEC, 90-1(c) states in part: "This code is not intended as a design specification...".
COMMENT ON AFFIRMATIVE:
LEMAY: See my explanation of negative vote on Comment 9-29.

(Log #315)

9- 31 - (380-2(a), Exception (New)): Reject
SUBMITTER: Russell LeBlanc, Peterson School of Engineering
COMMENT ON PROPOSAL NO: 9-70
RECOMMENDATION: Add an exception to read as follows:
Exception: Switch loops shall not require a grounded conductor, unless required for the operation of the switch.
SUBSTANTIATION: The proposal to always require the grounded conductor be brought to switch loops is very far reaching and unnecessary. It also makes the assumption that installers are going to wire things improperly. My proposed wording addresses the concern of the original proposal and makes this a safety concern instead of a design consideration.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action on Comment 9-30.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

COMMENT ON AFFIRMATIVE:
CROUSHORE: I agree with the reject of Comment 9-31. However, I disagree with the action on Comment 9-30. See my explanation of negative on Comment 9-30.
LEMAY: See my explanation of negative vote on comment 9-29.

(Log #453)

9- 32 - (380-6(c)): Accept in Principle
SUBMITTER: Douglas P. Ball, Mac Products Inc.
COMMENT ON PROPOSAL NO: 9-75
RECOMMENDATION: Revise to read as follows:
Single-throw knife switches and bolted pressure contact switches shall be connected so that the blades are de-energized when the switch is open or be constructed such that the blades are fully barriered to prevent anything from coming in contact with the blades and shall be connected so that the terminals feeding the load and the fuse terminals are de-energized when the switch is open.
SUBSTANTIATION: A knife switch, or more specifically a bolted pressure contact switch with fully barriered contacts, is no less protected than molded case or butt contact switches. The proposed change in section 380-6(c) would eliminate bottom feed bolted pressure contact switches causing switch and fuse type switchboards to double in size and increase in cost.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 9-41 which meets the submitter's intent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #618)

9- 33 - (380-6(c)): Accept in Principle
SUBMITTER: James A. Erickson, Boltswitch, Inc.
COMMENT ON PROPOSAL NO: 9-75
RECOMMENDATION: Revise as follows:
Single throw knife switches, bolted pressure contact switches, and switches with butt contacts shall be connected in accordance with the manufacturer's specifications, typically identified by the markings "line" and "load". If there are no specifications, then these products shall be connected so that the blades are de-energized when the switch is in the open position. Single throw knife switches, bolted pressure contact switches, molded case switches, switches with butt contacts, and circuit breakers used as switches shall be connected so that the terminals supplying the load are de-energized when the switch is in the open position.
SUBSTANTIATION: Bottom-feed bolted pressure contact switches typically have energized blades when the switch is in the open position. This is by design, as switch manufacturers may feel it is more practical than having switch blades pivot at the top and open against gravity. Switch manufacturers provide barriers around the switch blades that remain energized to prevent accidental contact and labels to warn that the switch blades may be energized when the switch is open. These safety features are generally required by design standards and third party listing agencies. Bottom-feed bolted pressure contact switches with energized blades (when open) have been in existence for over 25 years, and tens of thousands are installed. Adoption of Proposal 9-75 as originally submitted would make many bottom-feed bolted pressure contact switch designs obsolete, and many existing installations would no longer comply with the code.
Transfer switches also typically have switch blades that remain energized when the blades are in the open position. The blades are energized by reverse feed through the load side bus ties.
The reason for Section 380-6(c) in the code should be to ensure that switches are connected in accordance with how the products are designed, tested, and labeled, and to prevent the connection of these products backwards. It should not be the intent of this article to dictate how products are designed. A switch, after all, will have energized parts at one end and de-energized parts at the other end. This is the definition of a switch. It should be allowable by design to have any part of a switch energized when in the off position, as long as the energized part is reasonably protected from inadvertent contact.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 9-41 which meets the submitter's intent.

9- 34 - (380-6(c) Connection of Switches): Reject
SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: 9-75
RECOMMENDATION: The panel should reject this proposal.
SUBSTANTIATION: The inclusion of the proposed wording would effectively eliminate bottom-fed bolted pressure contact switches. The design of these switches provides for a tamper-proof barrier that encloses the blades, in accordance with UL 977.
PANEL ACTION: Reject.
PANEL STATEMENT: The comment would overturn positive aspects of the proposal that can be retained without compromising existing product listings. See the panel action and statement on Comment 9-41.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #872)

9- 35 - (380-6(c)): Reject
SUBMITTER: Ronnie Ridgeway, Siemens Energy & Automation
COMMENT ON PROPOSAL NO: 9-75
RECOMMENDATION: Proposal should be rejected. Return to the existing wording as follows:
(c) Connection of Switches. Single-throw knife switches, ~~bolted pressure contact switches,~~ and switches with butt contacts shall be connected so that the blades are de-energized when the switch is in the open position. Single-throw knife switches, bolted pressure contact switches, molded-case switches, switches with butt contacts, and circuit breakers used as switches shall be connected so that the terminals supplying the load are de-energized when the switch is in the open position.
SUBSTANTIATION: If bolted pressure contact switches are included in the wording, bottom feed switches would no longer be allowed. These bottom feed switches have barriers with block contact with blades when accessing fuses or load lugs. These switches have been used safely for many years and are designed to meet the requirements of UL 977.
PANEL ACTION: Reject.
PANEL STATEMENT: The comment would overturn positive aspects of the proposal that can be retained without compromising existing product listings. See the panel action and statement on Comment 9-41.

(Log #914)

9- 37 - (380-6(c)): Reject
SUBMITTER: Bob G. Newton, Pringle Electric Mfg. Co.
COMMENT ON PROPOSAL NO: 9-75
RECOMMENDATION: Reject this proposal to add "bolted pressure contact switches."
SUBSTANTIATION: This proposal would eliminate the use of bottom feed bolted pressure contact switch design. This would cover disconnects and tie-switches. This design type cover about 30% of the installations. Bottom feed designs have the blades energized in the open position, but they are covered. The bottom feed design has been used for the past 40 years as standard in the industry and they are UL listed. There have been no reported problems with this design.

Neither top or bottom feed bolted pressure contact switches have a butt contact design. It is believed that the intent of the proposal was not to eliminate the bottom feed design, top feed switches are already de-energized in open the position.
PANEL ACTION: Reject.
PANEL STATEMENT: The comment would overturn positive aspects of the proposal that can be retained without compromising existing product listings. See the panel action and statement on Comment 9-41.

(Log #2374)

9- 41 - (380-6(c)): Accept in Principle
SUBMITTER: G. Erich Heberlein, Jr., Rockwell Automation/Allen-Bradley Co.
COMMENT ON PROPOSAL NO: 9-75
RECOMMENDATION: Revise the wording of the proposal to read as follows:

"Single-throw knife switches and switches with butt contacts shall be connected so that their blades are de-energized when the switch is in the open position. Bolted pressure contact switches and molded case switches shall be listed and connected in accordance with their "line" and "load" markings. Single-throw knife switches, bolted pressure contact switches, molded case switches, switches with butt contacts and circuit breakers used as switches shall be connected so that the terminals supplying the load are de-energized when the switch is in the open position."
SUBSTANTIATION: With the proposal, the change would effect many bottom entry designs and could lead to technical problems. On bottom entry applications in MCCs, switchboards, etc., listed devices such as bolted pressure contact switches, molded case switches, switches with butt contacts and circuit breakers are bottom fed. Thus, the entry cabling is connected directly to the device without any "loop-a-round" cabling connections. This straight in connection to the device is important as the short circuit forces due the "loop-a-round" connection are now eliminated to the cabling and cable connections. In addition, most of these applications are large capacities with multiple cable connection per each phase and the field short circuit cable bracing is simplified with the straight in connection. Finally, these listed devices are marked for their connection, e.g, "line" and "load."
PANEL ACTION: Accept in Principle.
Revise the second sentence of the wording in the Comment to read as follows: "Bolted pressure contact switches shall have barriers that prevent inadvertent contact with energized blades." The panel accepts the balance of the comment as submitted.
PANEL STATEMENT: Code-Making Panel 9 wants to be sure that energized blades do not present a safety issue. The panel acknowledges that it never intended to interfere with existing listed bolted pressure contact switch designs.

(Log #1531)

9- 42 - (380-14(e)): Accept

Note: The Technical Correlating Committee understands that the term "luminaires" will be inserted before "(lighting fixtures)" in the revised wording.

SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors

COMMENT ON PROPOSAL NO: 9-88

RECOMMENDATION: Change accepted in principle and adjusted by the panel as follows:

(e) Dimmer Switches. General use dimmer switches shall only be used to control permanently installed incandescent lighting fixtures unless listed for the control of other loads, and installed accordingly.

SUBSTANTIATION: Recommendation that the Technical Correlating Committee consider a similar section to be included in the new Article 406 where the requirement for receptacles have been relocated to. This new article should include the limitations on what devices may be used or are not permitted to be used to control receptacles unless listed otherwise.

PANEL ACTION: Accept.

PANEL STATEMENT: Code-Making Panel 9 notes that the recommendation does not differ from the panel action on Proposal 9-88. The panel also notes that Article 406 is out of its jurisdiction.

EXPLANATION OF NEGATIVE:

CROUSHORE: See my explanation of negative on Comment 9-43.

(Log #1870)

9- 43 - (380-14(e) (New)): Reject

SUBMITTER: Timothy M. Croushore, Allegheny Power

COMMENT ON PROPOSAL NO: 9-88

RECOMMENDATION: Code Making Panel 9 should reject Proposal 9-88.

SUBSTANTIATION: The panel should gave rejected this proposal. The submitter did not provide any technical substantiation of a problem existing in the field, nor did the submitter identify any problem. The panel is writing new code to attempt to fix a non-existent problem. This new restriction will eliminate the receptacle-controlled table lamp on a dimmer switch. There is no safety problem with applying dimmers to table lamps.

PANEL ACTION: Reject.

PANEL STATEMENT: The listing restriction is largely unknown in the field. The receptacle supplying a table light with an incandescent lamp today may have an incompatible appliance plugged into the other half of the same duplex receptacle, and the homeowner would be completely unaware of the safety issue.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

CROUSHORE: This comment should have been accepted. The restriction as mentioned in the panel statement is not an actual restriction. The text of the UL White Book gives an indication of the intended product use. Also, this indication is only applicable to Dimmers, General Use Switch. This intention does not apply to Commercial Dimmers or Theater Dimmers that can be used for fluorescent lighting and portable lighting. Reference page 20 of the Underwriters laboratories, Inc., General Information for Electrical Equipment (White Book). The submitter of the original proposal did not provide any technical substantiation of a problem existing in the field. A dimmer switch controlled receptacle can safely supply energy to an incandescent table or a floor lamp.

(Log #1923)

9- 44 - (380-15): Accept

SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers

COMMENT ON PROPOSAL NO: 9-88a

RECOMMENDATION: Continue to Accept this proposal.

SUBSTANTIATION: The acceptance of this proposal is extremely important to the safety of any person working on these devices or equipment served by occupancy devices. Presently, devices exist where voltage is still present even when placed in the off position. This change clearly requires that, where an OFF position is included on a switching device, it truly will require that all of the ungrounded conductors must be disconnected. CMP-9 is to be congratulated for recognizing the safety needs of electrical workers.

This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.

PANEL ACTION: Accept.

(Log #2054)

9- 45 - (384-11): Reject

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

COMMENT ON PROPOSAL NO: 9-99

RECOMMENDATION: The proposal should have been accepted in principle, revised to use comparable wording as presently exists in Section 384.13 for panelboards, as follows:

"Switchboards shall have a rating not less than the minimum feeder capacity required for the load computed in accordance with Part II or III of Article 220."

SUBSTANTIATION: The submitter correctly points to a gap in code coverage. The panel should remember that motor control centers are essentially a form of switchboard, and 430.94 requires not just a board rating but actual overcurrent protection based on the common power bus.

PANEL ACTION: Reject.

PANEL STATEMENT: The present code adequately covers the requirements for switchboards.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

HARTWELL: This comment should have been accepted, and it will be resubmitted as a proposal for the 2005 NEC. This article needs enforceable language comparable to panelboard and motor control center requirements.

(Log #1962)

9- 46 - (384-20, Exception): Reject

SUBMITTER: Phil Simmons, Simmons Electrical Services

COMMENT ON PROPOSAL NO: 9-112

RECOMMENDATION: Revise the existing text of the Code text as follows:

384.20 Grounding of Panelboards. Panelboard cabinets and panelboard frames, if of metal, shall be in physical contact with each other and shall be grounded. Where the panelboard is used with nonmetallic raceway or cable or where separate grounding

conductors are provided, a terminal bar for the grounding conductors shall be secured inside the cabinet. The terminal bar shall be bonded to the cabinet and panelboard frame, if of metal, otherwise it shall be connected to the grounding conductor that is run with the conductors feeding the panelboard.

Exception: Where an isolated equipment grounding conductor is provided as permitted by Section 250-146(d), the insulated equipment grounding conductor that is run with the circuit conductors shall be permitted to pass through the panelboard without being connected to the panelboard's equipment grounding terminal bar unless

(1) The grounded conductor of a separately derived system is bonded to the panelboard enclosure,

(2) The panelboard is used as the building or structure disconnecting means, or

(3) The panelboard is the service equipment.

Equipment grounding conductors shall not be connected to a terminal bar provided for grounded conductors (may be a neutral) unless the bar is identified for the purpose and is located where interconnection between equipment grounding conductors and grounded circuit conductors is permitted or required by Article 250.

SUBSTANTIATION: Including the additional information on where an insulated equipment grounding conductor is not permitted to pass through a panelboard without being bonded to the enclosure is important to the clarity of this section. The opening phrase of the exception does not require compliance with Section 250.46(D) but simply indicates "where an isolated equipment grounding conductor is provided...".

Adding this additional wording will make this section and exception much more "User Friendly."

PANEL ACTION: Reject.

PANEL STATEMENT: The panel reaffirms its action and statement on Proposal 9-112. The submitter has provided no new information.

(Log #251)

6- 63 - (Table 400-4): Accept in Principle

SUBMITTER: Siegfried A. Schauffele, American Insulated Wire Corp.

COMMENT ON PROPOSAL NO: 6-148

RECOMMENDATION: Add text as follows:

For Type G-GC change the description under heading "No. of Conductors" to:

3-6 plus grounding conductors and 1 ground-check conductor.

Editorial: Change heading for size to:

AWG or kcmil

This needs to be done in the 4th and 7th columns.

SUBSTANTIATION: This reflects the action taken by the panel on Proposal 6-148.

PANEL ACTION: Accept in Principle.

For clarification in Table 400-4:

1. Delete the word "Size" and change "(AWG)" to "AWG or kcmil" in the title of column 4 in the Preprint and column 3 in the 1999 Code.

2. Change "AWG" to "AWG or kcmil" in the title of column 7 in the preprint and column 6 in the 1999 Code.

3. Editorially remove "kcmil" in the body of Table 400-4.

PANEL STATEMENT: Editorial for clarification.

[1]The ampacities under subheading D shall be permitted for single-conductor Types SC, SCE, SCT, PPE, and W cable only where the individual conductors are not installed in raceways and are not in physical contact with each other except in lengths not to exceed 24 in. (610 mm) where passing through the wall of an enclosure.

[2]The ampacities under subheading E apply to two-conductor cables and other multiconductor cables connected to utilization equipment so that only two conductors are current carrying.

[3]The ampacities under subheading F apply to three-conductor cables and other multiconductor cables connected to utilization equipment so that only three conductors are current carrying.

(Log #1376)

6- 67 - (Table 400-4): Accept
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 6-151
RECOMMENDATION: The Panel should Accept this proposal as submitted.
SUBSTANTIATION: This issue needs to be revisited in light of the fact that Panel 14 has Accepted in Principle proposal 14-8 (an identically worded proposal), and has also Accepted proposal 14-2 (revised Article 500) in which the term "unclassified location" has been defined. The term "nonhazardous" implies locations which are not required to be evaluated, whereas "unclassified" means that the area has been evaluated as to Class, Division, and Zone and determined that none of those classifications apply. "Unclassified" most clearly states that the area is safe for general-purpose equipment without implying that other, nonelectrical, hazards do not exist.
PANEL ACTION: Accept.
PANEL STATEMENT: See panel action and submitter's substantiation on Comment 6-68.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

AFFIRMATIVE: 10
NOT RETURNED: 1 Ferrell

(Log #2174)

6- 68 - (Table 400-4): Accept
SUBMITTER: Donald R. Cook, Shelby County Building Inspections
COMMENT ON PROPOSAL NO: 6-151
RECOMMENDATION: Code-Making Panel 14 recommends the Code-Making Panel 6 accept Proposal 6-151.
SUBSTANTIATION: Although Code-Making Panel 14 included definitions to both terms "nonhazardous" and "unclassified" in the proposed Section 500-2 in the ROP, a recent poll of Code-Making Panel 14 members indicates that most members prefer only one term and that term "unclassified". The panel was not balloted and positions could change with discussion at the ROC meeting.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ferrell

(Log #2184)

6- 69 - (Table 400-4): Accept
SUBMITTER: Mark Goodman, BP (ARCO)
COMMENT ON PROPOSAL NO: 6-151
RECOMMENDATION: Replace "nonhazardous" with "unclassified" in two places within the table.
SUBSTANTIATION: This comment is in support of the original proposal, substantiation and Explanation of Negatives by Mr. McClung and Mr. Pettigrew.
This proposal should have been "Accept". The Panel Action correctly identified this as a code wide issue requesting guidance from the Technical Correlating Committee. This proposal is a companion proposal to several others intended to remove the term "nonhazardous" and replace it with the more technically correct "unclassified". This change should be supported throughout the code to provide consistency and to avoid confusion and misapplication.
PANEL ACTION: Accept.
PANEL STATEMENT: See panel action and submitter's substantiation on Comment 6-68.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ferrell

(Log #1377)

6- 71 - (400-7(a)(6)): Accept in Principle
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 6-176
RECOMMENDATION: The panel should Accept the proposal as submitted.
SUBSTANTIATION: The current wording in the NEC is a contradiction in terms. The word stationary does not mean it is subject to being changed. The word stationary means "fixed, unchanging". The wording in NEC implies that stationary equipment will be frequently changed out. This is the root of the confusion in the field. The current wording also implies that all stationary equipment can utilize this wiring method. This is in direct conflict with the intent described in the panel statement. The equipment described in the proposal substantiation is not considered in the field as stationary equipment but is considered as portable or mobile equipment. Because of this field understanding, it is sometimes not allowed to utilize this wiring method. The proposed wording would clarify the panel intent.
PANEL ACTION: Accept in Principle.
Revise 400-7(a)(6) to read as follows:
(6) Connection of utilization equipment to facilitate frequent interchange.
PANEL STATEMENT: The revised text eliminates the contradiction between "stationary" and "frequent interchange".

(Log #2038)

6- 72 - (400-8(4)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 6-183
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: The present rule removed an allowance that has been done for generations, without adequate substantiation. Any electrician with field experience will attest to the numbers of cord drops that emerge from many overhead sources, busways being relatively unusual among them. As a member of Code-Making Panel 9, I can assure Code-Making Panel 6 that the cords supporting boxes per 370.23(H)(1) originate somewhere, and only some of the time from busway. A requirement so routinely subject to local amendment or simply ignored without adverse consequence tends to discredit public confidence in the process.
PANEL ACTION: Reject.
PANEL STATEMENT: No new technical substantion was provided by the submitter to support the recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ferrell

(Log #1124)

6- 73 - (400-8(5)): Accept in Principle
SUBMITTER: Paul Dobrowsky, Holley, NY
COMMENT ON PROPOSAL NO: 6-186
RECOMMENDATION: Accept the proposal as submitted.
SUBSTANTIATION: The definition of concealed (in Article 100) indicates that flexible cords above ceilings, having removable panels, are <u>not</u> concealed because the "structure or finish" does <u>not</u> render them inaccessible.

100-Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.

The definition of exposed (in Article 100) does not help because where panels are "designed to allow access" a flexible cord above the panel would still be considered exposed. I realize that flexible cords are not a wiring method but this definition is commonly used to describe the space above a suspended ceiling.

100-Exposed. On or attached to the surface or <u>behind panels designed to allow access.</u>

Many well respected NEC authorities such as the submitter of Proposal 6-185 agree that the language is confusing. Changing the word "concealed" to "located" will clearly state the requirement and remove confusion.
PANEL ACTION: Accept in Principle.
Revise 400-8(5) to read:
(5) Where concealed by walls, floors or ceilings; or located above suspended or dropped ceilings.
PANEL STATEMENT: This addresses the submitter's recommendation. Editorially revised for clarification.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

NOT RETURNED: 1 Ferrell

(Log #2234)

6- 74 - (400-8(5)): Accept in Principle
SUBMITTER: Andre R. Cartal, Bldg Dept., Princeton Borough, NJ
COMMENT ON PROPOSAL NO: 6-185
RECOMMENDATION: Please reconsider the proposal.
SUBSTANTIATION: The present code wording is not in conflict, but is subject to various interpretations. If it read "flexible cords and cables shall not be used WHERE CONCEALED" period, then the Article 100 definition is enforced, but the code does not say that, the words are "Flexible cords and cables shall NOT be used (5) where concealed behind building walls, etc. Now "concealed" looses its Article 100 definition because its use in this sentence has to be based Webster's Dictionary and this is confirmed by the present code wording. You can't read it any other way. Acceptance of the proposal will eliminate any confusion.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 6-73.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10

(Log #2039)

6- 75 - (400-8(6)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 6-187
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: The proposed exception allows for a limited use of flexible cord in a manner consistent with other NEC precedents. It avoids wiring method transition splices and additional enclosures, which cause far more problems than a short length of flexible cord would ever cause. Remember that in instances where flexibility is required, cord may be used on a permanent basis. This proposal is a practical and modest method of addressing a field problem.
PANEL ACTION: Reject.
PANEL STATEMENT: No new technical substantiation was provided to change the present requirement in the Code that prohibits the use of flexible cord for permanent wiring.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

ARTICLE 402 — FIXTURE WIRES

(Log #74)

8- 97 - (Table 402-3): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 6-202
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 8 for correlation in its respective articles and annexes.
This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Per the CMP-6 action on Appendix C, delete Type AF from the following:
1. Table C1, Fixture Wires, 3 places.
2. Table C2, Fixture Wires, 4 places.
3. Table C3, Fixture Wires, 4 places.
4. Table C4, Fixture Wires, 3 places.
5. Table C5, Fixture Wires, 4 places.
6. Table C6, Fixture Wires, 4 places.
7. Table C7, Fixture Wires, 4 places.
8. Table C8, Fixture Wires, 4 places.
9. Table C9, Fixture Wires, 4 places.
10. Table C10, Fixture Wires, 4 places.
11. Table C11, Fixture Wires, 4 places.
12. Table 350-12 (350.22 2002 NEC Draft), 1 place
In addition, Type AX should be deleted from Table C1 and C4, Fixture Wires. It is the Panel's understanding that AX is a typographical error.

PANEL STATEMENT: The panel understands that Type AF wire is being deleted in its entirety and have reviewed and made the appropriate changes to the tables and sections under the jurisdiction of CMP-8.

ARTICLE 410 — LIGHTING FIXTURES, LAMPHOLDERS, LAMPS, AND RECEPTACLES

(Log #1806)

18- 7 - (410): Accept in Principle
SUBMITTER: Jim Evanisko, National Cathode Corp.
COMMENT ON PROPOSAL NO: 18-58
RECOMMENDATION: Revise as follows:

Q. Special Provisions for Electric-Discharge Lighting Systems of More than 1000 Volts

410-80. General.

(a) ~~Open-Circuit Voltage Exceeding 1000 Volts~~ Listing. ~~Equipment for use with~~ Electric-discharge lighting systems ~~and designed for~~ with an open-circuit voltage exceeding 1000 volts shall be ~~of a type intended for such service~~ listed and installed in conformance with that listing.

(b) Dwelling Occupancies. Equipment that has an open-circuit voltage exceeding 1000 volts shall not be installed in or on dwelling occupancies.

(c) Live Parts. The terminal of an electric-discharge lamp shall be considered as a live part ~~where any lamp terminal is connected to a circuit of over 300 volts.~~

(d) Additional Requirements. In addition to complying with the general requirements for lighting fixtures, such equipment shall comply with Part Q of this article.

FPN: For signs and outline lighting, see Article 600.

410-81. Control.

(a) Disconnection. Fixtures or lamp installation shall be controlled either singly or in groups by an externally operable switch or circuit breaker that opens all ungrounded primary conductors.

(b) Within Sight or Locked Type. The switch or circuit breaker shall be located within sight from the fixtures or lamps, or it shall be permitted elsewhere if it is provided with a means for locking in the open position.

410-82. Lamp Terminals and Lampholders. Parts that must be removed for lamp replacement shall be hinged or held captive. Lamps or lampholders will be designed so that there shall be no exposed live parts when lamps are being inserted or are being removed.

410-83. Transformers ~~Ratings Transformers and ballasts shall have a secondary open-circuit voltage of not over 15,000 volts with an allowance on test of 1000 volts additional. The secondary current rating shall not be more than 120 milliamperes if the open-circuit voltage is over 7500 volts, and not more than 240 milliamperes if the open-circuit voltage is 7500 volts or less.~~

~~410-84. Transformer Type. Transformers shall be enclosed and listed.~~

~~410-84. Transformers and Secondary~~

~~410-85. Transformers and Secondary Connections. the high voltage windings of transformers shall not be connected in series or parallel.~~

(a) Type. Transformers shall be enclosed, identified for the use and listed.

(b) Voltage. Secondary-circuit voltage shall not exceed 15,000 volts, nominal, under any load condition. The voltage to ground of any output terminals of the secondary circuit shall not exceed 7500 volts, under any load conditions.

(c) Rating. Transformers shall have a secondary short-circuit current rating of not more than 150 mA if the open-circuit voltage is over 7500 volts, and not more than 300 mA, if the open-circuit voltage rating is 7500 volts or less.

(d) Secondary Connections. Secondary circuit outputs shall not be connected in parallel or in series.

410-~~86~~4. Transformer Locations.

(a) Accessible. Transformers shall be accessible after installation.

(b) Secondary Conductors. Transformers shall be installed as near to the lamps as practicable to keep the secondary conductors as short as possible.

(c) Adjacent to Combustible Materials. Transformers shall be located so that adjacent combustible materials will not be subjected to temperatures in excess of 90°C (194°F).

410-~~87~~5. Transformer Loading. The lamps connected to any transformer shall be of such length and characteristics so as not to cause a condition of continuous overvoltage on the transformer.

410-~~88~~6. Wiring Method — Secondary Conductors. Conductors shall be installed in accordance with Section 600-32.

410-~~89~~7. Lamp Supports. Lamps shall be adequately supported as required in Section 600-41.

410-~~90~~88. Exposure to Damage. Lamps shall not be located where normally exposed to physical damage.

410-~~91~~89. Marking. Each fixture or each secondary circuit of tubing having an open-circuit voltage of over 1000 volts shall have a clearly legible marking in letters not less than 1/4 in. (6.35 mm) high reading: "Caution ...volts." The voltage indicated shall be the rated open-circuit voltage.

410-~~92~~90. Switches. Snap switches shall comply with Section 380-14.

SUBSTANTIATION: Cold Cathode Lighting systems over 1000 volts can be listed. To the best of our knowledge all manufacturers of such systems are listed by UL. It is appropriate that the NEC require listing, rather than relying upon the knowledge of an authority having jurisdiction to inspect each installation in accordance with the applicable standards.

The phrase "where any lamp terminal is connected to a circuit of over 300 volts" is deleted as this phrase has no application to Part Q which covers installations of over 1000 volts.

The transformers sections have been restructured to provide

consistency with the format and terminology used in 600-23 because transformers for Cold Cathode lighting systems and Neon Signs are very similar. They are both manufactured under a single ANSI standard, UL 2161.

The current rating changes are presented to more readily accomplish manufacturing and rating of Cold Cathode transformers and to introduce consistency with Article 600. Article 410 has historically been interpreted to be referencing operating current ratings. Article 600 has always referenced short-circuit current ratings. A transformer manufacturer cannot accurately control operating current. They design cold cathode transformers to operate at approximately 80 percent of the short-circuit current, however operating current is also controlled by the actual load of tubing as well as the wiring of each circuit at the installation location. The NEC should specify maximum short-circuit current ratings in 410, as is done in 600, to provide controllable limits for the ANSI standard which regulates the manufacturing of transformers.

PANEL ACTION: Accept in Principle.

Revise text to read as follows:

"Q. Special Provisions for Electric-Discharge Lighting Systems of More than 1000 Volts

410-80. General.

(a) Listing. Electric-discharge lighting systems with an open-circuit voltage exceeding 1000 volts shall be listed and installed in conformance with that listing.

SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: 18-19
RECOMMENDATION: The Panel should reject the proposal and retain the original verbiage of Section 410-14(a) and (b) as it appears in the 1999 NEC.
SUBSTANTIATION: The Panel Action to remove "Electric Discharge" from the heading and the body of the text would disallow the use of many incandescent fixtures such as: chandeliers, swag lamps, and alike, that are too heavy to be supported by the outlet box alone, or by design require independent mounting means. Many of these fixtures have been in use for decades without a problem. Neither the Panel nor the submitter have shown any substantiation that shows that incandescent fixtures have been a problem when used in this manner.
PANEL ACTION: Accept.

18- 9 - (410-14(a) (b)): Accept
SUBMITTER: Tony Paone, Progress Lighting
COMMENT ON PROPOSAL NO: 18-19
RECOMMENDATION: Recommend leaving the "electric discharge" wording in.
SUBSTANTIATION: The intent of the proposal is to require a suitable method of connecting a surface mounted fixture, supported independent of a junction box, to the junction box. This interpretation makes sense, as it would eliminate fixture wires or extension cords as a means of connecting the fixture. However, the problem with the change is that it would also affect chain hung chandeliers and similar fixtures. If an installer wanted to swag a chandelier, so that it is supported independently from the unction box, the change would require that the fixture cord be routed through raceway. According to the negative vote explanations, this was the reason that the phrase "electric discharge" was included in the first place.
PANEL ACTION: Accept.

18- 11 - (410-14(a), (b)): Accept
SUBMITTER: Don Miletich, Cooper Lighting Div.
COMMENT ON PROPOSAL NO: 18-19
RECOMMENDATION: Retain the original verbiage of Sections 410-14(a) and (b) as it appears in the 1999 edition of NEC.
SUBSTANTIATION: The panel action to remove "electric discharge" from the heading and the body of the text will prohibit the use of the cord connected incandescent luminaires, such as chandeliers, swag lamps and alike. These luminaires are either too heavy to be supported directly from the outlet box or by design are intended to be mounted away from the outlet box. These types of luminaires are common and have been in use for decades without a problem. Changing the requirement will represent unnecessary hardship on both manufacturers and the user communities for no apparent reason. Neither the panel nor the submitter has shown any substantiation that shows that incandescent luminaires have been a problem when used in this manner.
PANEL ACTION: Accept.

18- 14 - (410-18(b)): Hold
SUBMITTER: Eric Stromberg, The Dow Chemical Company
COMMENT ON PROPOSAL NO: 18-28
RECOMMENDATION: 410-18(b)(1) Where this circuit is supplied by a GFCI, fixtures with exposed metal parts shall be allowed.
SUBSTANTIATION: Currently, the code (410-18(b)) only allows nonmetallic (no exposed conductive parts) lighting fixtures to be used when supplied by an ungrounded two-wire circuit. 210-7(d)(3)(e), however, allows the use of a grounded receptacle on an ungrounded two-wire circuit when the receptacle is fed by a GFCI and is labeled accordingly. It is the opinion of the author that the spirit of Article 210 should be applied to article 410-18 and thereby allow the use of metallic light fixtures on a two-wire system when the circuit is protected by a GFCI.
PANEL ACTION: Hold.
PANEL STATEMENT: This is new material and is being held in accordance with Section 4-6.2.2 of the Regulations Governing Committee Projects. The panel will hold Comment 18-14.

18- 16 - (410-31): Accept in Principle
SUBMITTER: James Hospodarsky, Lithonia Lighting
COMMENT ON PROPOSAL NO: 18-30
RECOMMENDATION: Revise the proposed paragraph 410-32 as follows:
410-32 Wiring Supplying Fixtures Connected Together. Fixtures designed for end-to-end connection to form a continuous assembly, or fixtures connected together by recognized wiring methods shall be permitted to contain the conductors of 2-wire <u>branch</u> circuits, or one multiwire branch circuit supplying the connected fixtures <u>and need not be listed as raceway.</u> One additional 2-wire branch circuit separately supplying one or more of the connected fixtures shall also be permitted.
SUBSTANTIATION: 410-31, Exception 2 has clearly stated fixtures carrying branch circuits supplying the fixtures need not be listed as raceway and has been an accepted installation method for many years. The proposal to break 410-31 into three distinct sections loses this clarity. As proposed, the new 410-31 may be taken as a stand-alone requirement and applied to continuous row fixtures carrying branch circuits supplying the fixtures in the row. Adding the revised wording to the proposed 410-32 will reestablish the intent of Exception 2 to 410-31.
PANEL ACTION: Accept in Principle.
Revise the proposed paragraph 410-32 as follows:
410.32 Wiring Supplying Luminaires (Fixtures) Connected Together. Luminaires (Fixtures) designed for end-to-end connection to form a continuous assembly, or fixtures connected together by recognized wiring methods shall be permitted to contain the conductors of a 2-wire branch circuit, or one multiwire branch circuit supplying the connected luminaires (fixtures) and need not be listed as a raceway. One additional 2-wire branch circuit separately supplying one or more of the connected luminaires (fixtures) shall also be permitted.

18- 17 - (410-31, 410.33): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 18-30
RECOMMENDATION: Change the word "identified" to "marked" in both sections.
SUBSTANTIATION: This use of the term identified varies from its proper application as covered in the Article 100 definition. Identified means generally recognizable as suitable, not marked, and as such any listed product is also identified if applied within the listing, however, not all identified products are necessarily listed. Misuse of the term identified is becoming a major issue, especially in Code-Making Panel 14. The intent in this case seems to be that the fixture be listed, and that the raceway acceptability and temperature suitabilities be obvious through a factory-applied marking. The proper terminology for this is listed and marked.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2075)

18- 19 - (410-33): Reject
SUBMITTER: Phil Simmons, Simmons Electrical Services
COMMENT ON PROPOSAL NO: 18-31
RECOMMENDATION: The proposal should have been accepted in principle with the following ways permitted to prevent excessive and dangerous temperatures from being created in junction boxes where connections are made to lighting fixtures:
(1) The design of the screw shell shall be such that it cannot accept a lamp of a higher wattage than the luminaire (fixture) is designed, listed and marked for.
(2) Thermal protection shall be provided that will interrupt the supply to the lampholder(s) where the temperature for which the branch circuit supply conductors are rated is exceeded.
(3) Design and listing of the luminaire (fixture) so the maximum temperature of branch circuit supply connections is not exceeded with the maximum wattage lamp that can be installed in the luminaire (fixture).
SUBSTANTIATION: There is a serious safety problem with many lighting fixtures that are being installed as indicated in the substantiation. No practical means has been provided to prevent dangerous overlamping of these fixtures. Sorry, homeowners simply do not read and follow the lamping instructions. While a product cannot be made so it is impossible to install it in an unsafe manner, products can certainly be made so it is more likely than not to have a product that is safe.
Many, many electricians see the kind of problem expressed in the substantiation for the Proposal on almost a daily basis. Unfortunately, there is not a repository for incident data from which reliable statistics can be produced. IAEI announced their intention at the Northwestern Section meeting in Anchorage this year to develop such a database. We hope not too many lives will be lost and property destroyed while we are waiting for the data to be assembled.
Perhaps a task force of industry leaders should be assembled to address this serious problem. Maybe an interim solution, such as revising product safety standards, can be accomplished without waiting more than three years for the next NEC revision cycle.
PANEL ACTION: Reject.
PANEL STATEMENT: No data has been provided to identify overlamping to be a cause of fires. Wiring degradation may be due to multiple causes. The anecdotal example given in Proposal 18-31 did not provide indication of the age of the wiring or the luminiare involved. Both the NEC and product standards have addressed the effect of luminaire overlamping. Minimum allowable thermal rating of branch circuit wiring has increased twice, from 60°C to 75°C and then in 1985 to 90°C. Luminaire product standards have also been revised to better address outlet box heating. Product listing temperature measurement methods have been refined and qualification tests conducted on insulated test ceilings; resulting in that addition of thermal insulation pads to the majority of outlet box mounted luminaires. Product standards also impose minimum thresholds for luminaire wattage ratings to reduce the likelihood that end users will overlamp. Proposal 18-31 requests a drastic product change that may cause existing luminaries to become incompatible with replacement lamps. The proposal would not correct wire degradation in older installations.
This comment does not add any additional information to enable the panel to determine whether the problem of overheating is associated with old fixtures and old wiring or with new luminaires and wiring meeting the current code and standards. To impose a change of this magnitude without this information would be inappropriate. If the problem is with old luminaires and old wiring this proposed change would have minimal effect.
The panel encourages the data base being developed by IAEI and referred to in the submitters substantiation include the age of the luminaire, the age of the wiring, and wattage of the lamp.

(Log #2272)

18- 20 - (410-33 (New)): Reject
SUBMITTER: Curtis Chapel, Resistance Electric
COMMENT ON PROPOSAL NO: 18-31
RECOMMENDATION: Same as original proposal #18-31.
SUBSTANTIATION: Electrical Manufacturers have neglected to protect the public by failing, so far, to design Surface Mounted Lighting Fixtures and associated equipment to prevent dangerous overlamping. Instead, it has tried to shift its responsibility to the untrained public to notice a small warning, which many of them don't see, don't notice, don't heed, and/or don't remember the next time someone/anyone changes a light bulb to a larger size because they need more light and assume, because it will fit, it is safe and intended for such use. I believe this constitutes deadly (criminal?) negligence on the manufacturers' part, as it has and will continue to result in too many fires and deaths each and every year this situation continues unchanged, with the continuing real possibility that the numbers of those fires will increase as more fixtures enter "the market", more residences are built with them, and the longer time existing installations will have to continue to deteriorate.
In order to attempt to save innocent lives continuing to be undeniably lost year after year due to current lack of prevention on the NEC's part at this point in time, I will respond to the (Panel Statement) sentence by sentence:
(The data provided is not specific enough to identify overlamping as a cause.)
In conversations I have had with fire investigators of the Fire Marshal's offices in my city and state, they have made it abundantly clear that there is no way for them to determine specifically that overlamping was a cause. Upon investigation after a fire, the temperature extremes exploded the bulb, and completely obliterated any markings on it or its fixture; besides which there is no known way to document, after the fact, how many bulbs of whatever higher wattage were installed for what length of time previous (months, years, decades) contributing to the final failure and resulting fire - and - in too many cases - deaths. This is why I submitted my own personal observation of a situation just prior to a fire, that proves undeniably that overlamping causes overheating causes insulation failure leading to an irrefutable proportion of at least one of the 23,200 fires and 180 civilian deaths that occurred in 1996 alone. That one death should have been enough to warrant this committee to act, let alone the substantial proportion of 5,200 fires probably caused by "light fixtures". (See original substantiation and supporting material.)
(This proposal is a product requirement that is difficult if not impossible for an Authority Having Jurisdiction to enforce).

Electrical Inspectors and other Authorities Having Jurisdiction (fire officials +) inspect for Listed and Labeled equipment all the time. If they can't see the marking, who's to say an untrained homeowner or occupant will, and then follow it, which is in fact part of the problem. It is not impossible to enforce, harder to determine requirements already in code are being enforced every day.

(Also, as written, it is a prescriptive requirement that provides only one way to accomplish its purpose.)

This in not prescriptive in that it does not prescribe only one way to accomplish its purpose to prevent overlamping. I, and I am not a light fixture designer by profession, can think of more than one way to accomplish the purpose. Some examples: 1) vary the length of the screwshell according to maximum wattage; 2) vary the length or depth of the small contacting tip or tab; 3) vary the length of the insulating screwshell cover to contact, or not, with the bulge in the glass portion of the bulb, as the degree of bulge and its location changes as wattage increases; 4) install a non-heat conducting barrier to limit the overall length of the bulb because currently the length of the bulb increase; and 5) etc., etc., etc. Where there is a will, created by a Mandate, there will be found a way (and so far, apparently, with no Mandate, no will or way has been found).

(Section 90-2 clearly states that the NEC covers the installation of electric conductors and equipment.)

In only this instance do I agree with the panel: It is undeniably within the purpose 90-1(a) "... practical safeguarding of persons and property from the hazards arising from the use of electricity." And Scope 90-2(a)(2) "Installations of conductors and equipment that connect to the supply of electricity." This panel failed in that it did not "Accept in Principle" this proposal, and then come up with a solution itself, as it and other panels have in so many other cases where no loss of life or property was documented as it has been in this case. See the "supporting material" available for review at NFPA headquarters.

(Since lamps of varying wattages have a common base and envelope, there is no physical means for the lampholder to reject the lamp based on wattage.)

This is relatively true, especially in the case of 60, 75, and 100 watt "A" or "Medium Base" type light bulbs as currently manufactured are concerned, and this is not the only place although I have found it is majorly where most of the problem is found. But maybe the panel has stumbled onto a hereto unaddressed discrepancy: light bulbs and lamps are a part even though replaceable, of electrical equipment: they do "... connect to the supply of electricity" 90-2(a)(2)! Maybe (just maybe: I am not attempting to "prescribe" "only one way here") lamps should be listed and labeled, with specific dimensions to accomplish this (and other i.e. heat dissipation?) purposes. But again, this is only one of many possible solutions, should a Mandate be secured.

When I joined NFPA almost 20 years ago I was told that a proposal documenting life and/or fire loss would definitely have to be resolved by NFPA action because of our purpose and scope. Why didn't this happen in this case? I know you are very very very very busy which is why I have submitted only one proposal, this one, in all the time I have been a member, and only after irrefutable documentation of a major major problem that no one refutes is a problem that its still killing innocent and unsuspecting people yet still today.

I have noticed that Panel 18 is comprised of four (4) "Manufacturer", and two (2) "Research/Testing" Laboratories, who arguably derive their living under the shadow of the Manufacturers, which pay for their services. Was/Is this a conflict of personal/professional self-interest on this panel in this case? The "User" member in this case appears to be an engineer, who in his daily duties probably would not know of or see this situation routinely if in fact at all. The same might also be true for the "Utility" member, whose employer is an Institute? So far this is a majority of the panel. Only the "IM" "E" and "L" members might routinely have seen this situation. If they are personally/professionally aware - were they too intimidated by the rest of the committee? or - too lazy to write a dissenting opinion against the majority, with whom they must work? And last but not least please notice the striking absence of an "Insurance" representative: whose employer must pay for these fires, a "Consumer" the ultimate purchaser who may be "consumed" in the fire that follows, or a Special Expert whom I suggest in this case could be a fire inspector/Marshal. Who will uphold the Scope and Purpose of the NFPA? If not Panel 18 - Who? If not now - When? There are people (figuratively and literally) dying to know that today.

Note: Supporting Material available for review at NFPA Headquarters.

18- 21 - (410-56(b)): Reject

SUBMITTER: Joel A. Rencsok, Scottsdale, AZ

COMMENT ON PROPOSAL NO: 18-36

RECOMMENDATION: This proposal should have been "accept in principle" and the panel should have added a second sentence to read as follows:

"Receptacles rated more than 20 amperes and designed for direct connection of aluminum conductors shall be marked AL/CU."

SUBSTANTIATION: There presently is no requirement to mark receptacles rated greater than 20 amperes and this allows aluminum conductors to connect to any type of receptacle greater than 20 amperes.

This addition will also make the code more user friendly.

PANEL ACTION: Reject.

PANEL STATEMENT: Section 110-14(a) requires terminals used to connect aluminum to be so identified. The product standards have for many years defined the appropriate marking. Typically the marking is "AL/CU". This is applicable for receptacles of higher current ratings, for circuit breakers and other device terminals. A number of years ago, UL revised the performance requirements for 15- and 20-ampere receptacle terminals suitable for connecting copper or aluminum conductors. Prior to this the "AL/CU" marking was used for these devices as well. The "R" in "CO/ALR" stands for "revised". To emphasize this change, the current wording was added in Section 410-56(b). Adding additional marking requirements is not necessary.

18- 22 - (410-56(e)): Reject

SUBMITTER: Michael Shotey, TayMac

COMMENT ON PROPOSAL NO: 18-38

RECOMMENDATION: None provided.

SUBSTANTIATION: The Panel Statement indicates that there are "significant questions" about the investigation by the listing agency relating to engagement of the attachment plug blades in the receptacle contacts. This was, in fact, investigated (by testing), and this can and should be attested to by the listing agency.

The third and fourth sentences of the second paragraph of the Panel Statement do not address the proposal.

With respect to the first four sentences of the third paragraph of the Panel Statement, it is the purpose of the proposal to permit the Faceplates listed for the purpose. It is inappropriate for the Panel to argue that the proposed exception should not be accepted because it, in effect, would permit a violation of what is now in the Code.

Examination of Faceplates, that obviously inhibit to some limited degree the extent of insertion of attachment plug blades into the receptacle contacts, does not substitute for actual testing to determine whether or not this constitutes a hazard.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel statement on Comment 18-23.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

WELLS: After abstaining at the ROC meeting I have considered carefully the presentation of the proponents and the concerns expressed by Panel 18 members. My conclusion is that while the proposed wording leaves something to be desired, it is appropriate to recognize the products and trust that the certification organization will exercise sufficient controls until better wording of the proposed exception can be acted on during the next cycle.

Concerns expressed by various panel members with whom I concur are:

1. A detailed study has not been conducted to determine the "worst case" dimension from the receptacle contacts to the attachment plug blades. It is clear that some combination of

receptacle, attachment plug, and coverplate will prevent safe engagement of the attachment plug..
2. The cover plates can be used to cover damaged receptacles.
3. It is insufficient for the plates to be packaged with instructions directing the installer to use them only with certain manufacturer's receptacles.

Comments by the proponent with which I concur are:
1. The covers can be safely installed with specific receptacles and will not interfere with proper plug engagement.
2. Failure to recognize such covers will limit the convenience of providing protection for children from accidental insertion of foreign objects into receptacle contacts.

My conclusion is that such plates should be permitted by the Code and absent a comprehensive analysis to determine "worst case" (including old receptacles installed in the existing infrastructure) that the standard and certification organization should:
1. Evaluate the product with specific receptacles and attachment plugs with minimum blade length.
2. Require the plates and receptacle to be packaged and sold as kit or assembly.
3. Require instructions to direct the installer to replace both the plate and receptacle.

(Log #2295)

18- 23 - (410-56(e), Exception): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
COMMENT ON PROPOSAL NO: 18-38
RECOMMENDATION: This proposal should have been accepted.
SUBSTANTIATION: The requirement for listed products negates the panel statement that there is a problem with the blade of the attachment plug engagement with the receptacle. The pullout test would have shown this problem. The panel statement that this product was not listed for installations to comply with the NEC does not make sense. There would be no violation to Section 410-56(e) if the proposal is accepted.
PANEL ACTION: Reject.
PANEL STATEMENT: While faceplates with insulating material that cover the receptacle face have been tested by certification organizations, significant questions remain regarding the use of such faceplates. It is understood that such devices are listed for use with specific manufacturer's receptacles. However, removal of the existing faceplate may not reveal the identity of the installed receptacle. The consumer may be reluctant to further remove the receptacle to attempt to identify it as one being suitable for use with the replacement faceplate and thus use the faceplate anyway resulting in an untested combination.

(Log #891)

18- 24 - (410-57(b)(2)): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
COMMENT ON PROPOSAL NO: 18-44
RECOMMENDATION: This proposal should have been accepted.
SUBSTANTIATION: See also Proposal 18-45 substantiation. There is no need to allow weatherproof covers to be installed where an attendant needs to standby to unplug the utilization equipment today. Many companies are now manufacturing weatherproof receptacle covers to meet the intent of the code. You can not verify which receptacle is being installed for use only where attended. As technology changes so must the NEC keep abreast of changes.
PANEL ACTION: Reject.
PANEL STATEMENT: Proposal 18-44 would have required "in use" covers in wet locations. In accepting Proposal 18-43 the panel accepted a more limited application of such covers. As noted in the panel statement in Proposal 18-43 there are some applications where an "in use" cover is not desired. The substantiation with this comment does not dispute any of the limitations the panel adopted on Proposal 18-43.

(Log #890)

18- 25 - (410-57(f) (New)): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
COMMENT ON PROPOSAL NO: 18-51
RECOMMENDATION: This proposal should have been accepted.
SUBSTANTIATION: I disagree with the panel's statement.
If the panel statement is true then the panel needs to delete 410-57(f) as this reasoning is redundant to Section 410-57(a) and (b). Receptacle covers are not designed to be installed without some means of providing a weather tight or weatherproof means be inserted between the faceplate and the enclosure or box. The panel statement enforces deletion of Section 410-57(f).
PANEL ACTION: Reject.
PANEL STATEMENT: The panel in its statement on Proposal 18-51 indicated that the requirements in Section 410-57 (A) and (B) apply equally to surface and flush mounted receptacle installations. Further, Section 410-57(E) deals with flush mounting. The substantiation for this comment provides no rationale why the reasons in the original panel statement are not correct.

18- 26 - (410-58): Reject
SUBMITTER: Frank Martucci, Fort Lee, NJ
COMMENT ON PROPOSAL NO: 18-52
RECOMMENDATION: Please accept this proposal.
After existing material add:
(c) Warning tags. Replacement cord connectors, and attachment plugs, shall be permanently tagged with warnings that improper use of this product can cause fiery death, shock, or electrocution.
SUBSTANTIATION: For the past thirteen years I have submitted proposals for the 1990, 1993, 1996, 1999, and the forthcoming 2002 National Electrical code that will prevent thousands of electricians and fiery deaths each and every year. Yet, despite my serious admonitions and allegations, code panels continue to reject my proposals sight unseen, without any demonstrations or testing whatsoever.
It boggles my mind that members of code making panels, most with no cord expertise whatsoever, can display such an indifference to human life. What if my system works? Don't they have any fear of being liable for thousands of deaths these past 13 years? Don't they have any fear of being liable for the loss of hundreds of thousands of homes each and every year?
I, for one, would demand extensive tests before I rejected a system that may indeed save thousands of lives each and every year.
However, I will continue to send in my proposals because I know I am right and lives are being needlessly lost because of our ill-conceived grounding system.
Article 250-95 in the original code document, written under the influence of insurance companies, states "the equipment grounding conductor shall be copper, copper clad, or aluminum."
However, when the National Fire Protection Association took over the code making process in 1911, members of the electrical industrial complex established exceptions to the code, permitting inappropriate outlet mounting screws, metal raceways, outlet boxes, and raceway connectors to be used as the grounding conductor.
This may be adequate for the short time it takes to clear ground faults, but what are the consequences if excessive current from a hotplate, heater, or air conditioner should flow through inappropriate, corrosive steel screws, 100 feet of metal raceways, and up to 16 raceway outlet box connectors for lengthy periods of time?
During heater and hotplate current tests, I was horrified to find the temperatures of outlet mounting screws exceeded the 250 degree limit of my electronic thermometer. In addition, the metal raceway temperature measured 150 degrees.
The temperatures were taken in open air and should be considerably higher inside sealed walls and ceilings, where the outlet mounting screws, and raceways, are located.

At times the outlet mounting screws were glowing at the threads of the outlet box and tissue paper smoldered or ignited when placed on them.

The consequences are quite obvious. Should excessive current ever flow for lengthy periods of time through this ill-conceived grounding system, "unseen" fires could develop and rage inside the walls and ceilings; fires that flashover into rooms and incinerate occupants and contents within seconds.

And excessive current can be made to flow through inappropriate screws and metal raceways if an appliance cord, or extension cord, is inadvertently wired with reversed green and white conductors; a wiring error especially possible when repairing the cords flooding our nation without any color coding whatsoever. The white, black, and green conductors are similarly colored black, gray, yellow, or brown.

There is no doubt in my mind that the sudden inferno that killed three students at (name deleted) was caused by our ill-conceived grounding system. What else could explain the sudden flashover that incinerated two students at the very same time the smoke alarms sounded and an extreme amount of smoke and heat poured down the corridors.

Prosecutors, inspectors, and grand juries have failed to find the cause because they are not electrical experts.

Here is a scenario of what really caused the tragedy at (name deleted).

Since a party was going on prior to the inferno, coffee, tea, or hot food had to be served and one, or more, hotplates were being used in one, or more rooms.

A hotplate cord, or an extension cord, inadvertently wired with reversed green and white conductors was being used. Or, a repaired extension cord without color coding was being used. Since the green, white, and black conductors in these cords are the same color, the student had to hit and miss wire a replacement plug until it worked.

In either case, the hotplate operated perfectly but its' current flowed through inappropriate outlet mounting screws and a hundred feet, or more, of flexible metal raceway that lace the walls and ceilings, of the lounge.

An outlet mounting screw, excessive raceway heat, or poorly made raceway connector, caused an "unseen" fire to start, rage and superheat, the interior of the walls, and possibly the ceiling, until it caused a 2000 degree flashover that incinerated everything and everyone in the lounge within seconds.

But code panels don't believe in scenarios and the carnage will continue.

And since cord components, as deadly as a gun, are being sold without background checks, instructions, or wiring safeguards, at least have the decency to warn people that four of six ways to wire this product can cause shock, electrocution, or fiery death. And also warnings to not install the product on cords without color coding unless highly qualified.

Not that highly qualified people could make a difference because highly qualified people caused the electrocution of a patient on March 15, 1956.

The patient died because the plug on the surgical device was wired with reversed green and white conductors by a well supervised, and qualified, (name deleted) factory worker.

And the patient dies because a well supervised, and qualified, (name deleted) electrician installed an outlet with reversed white and black conductors.

If experienced and well supervised workers can make mistakes that kill, what about the people with no experience whatsoever.

The code panel openly admits that most electrical equipment if improperly installed will cause electrocution or fires, yet refuses to install warning tags to warn the unsuspecting public about the danger. They state that "Code requirement are written to clearly define how to install electrical equipment."

What does that mean to the guy who knows nothing about Code requirement? He only wants to repair his extension cord and without background checks to see if he understands the "code requirements" or instructions, or warnings of dire consequences, he will hit and miss wire an extension cord without color coding until it works.

And the insidious nature of the system is that a reversal of the grounded conductors will cause an appliance to operate properly. However, the current will be flowing through inappropriate screws and raceways causing raging undetectable fires inside the walls.

Since code panels adamantly refuse to correct the design defects in cord components at least have the decency to install tags with warnings that four of six ways to wire this product can cause an electrocution or fiery death.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter provided no additional technical data to support his recommendation. See panel statements on Proposal 18-52 and Proposal 18-53.

18- 27 - (410-58(a)): Reject

SUBMITTER: Frank Martucci, Fort Lee, NJ

COMMENT ON PROPOSAL NO: 18-53

RECOMMENDATION: Please accept this proposal.

Add after first sentence:

"Each grounding pole for cord connectors, and attachment plugs, shall have two wiring sites. The cord connectors, and attachment plugs, shall be designed so that only the grounding poles can be wired with two conductors."

SUBSTANTIATION: For the past thirteen years I have submitted proposals for the 1990, 1993, 1996, 1999, and the forthcoming 2002 National Electrical code that will prevent thousands of electricians and fiery deaths each and every year. Yet, despite my serious admonitions and allegations, code panels continue to rejectt my proposals sight unseen, without any demonstrations or testing whatsoever.

It boggles my mind that code making panels would reject proposals involving human lives without thoroughly exploring the possibility that may indeed save lives.

However, I will continue to send in my proposals because I know I am right and lives are being needlessly lost because of our ill-conceived grounding system.

Article 250-95 in the original code document, written under the influence of insurance companies, states "the equipment grounding conductor shall be copper, copper clad, or aluminum."

However, when the National Fire Protection Association took over the code making process in 1911, members of the electrical industrial complex established exceptions to the code, permitting inappropriate outlet mounting screws, metal raceways, outlet boxes, outlet connectors, and raceways connectors, to be used as the grounding conductor.

This may be adequate for the short time it takes to clear ground faults, but what are the consequences if excessive current from a hotplate, heater, or air conditioner should flow through inappropriate, corrosive steel screws, 100 feet of metal raceways, and up to 16 raceway outlet box connectors for lengthy periods of time?

During heater and hotplate current tests, I was horrified to find the temperatures of outlet mounting screws exceeded the 250 degree limit of my electronic thermometer. In addition, the metal raceway temperature measured 150 degrees.

The temperatures were taken in open air and should be considerably higher inside sealed walls and ceilings, where the outlet mounting screws, and raceways, are located.

At times the outlet mounting screws were glowing at the threads of the outlet box and tissue paper smoldered or ignited when placed on them.

The consequences are quite obvious. Should excessive current ever flow for lengthy periods of time through this ill-conceived grounding system, "unseen" fires could develop and rage inside the walls and ceilings; fires that flashover into rooms and incinerate occupants and contents within seconds.

And excessive current can be made to flow through inappropriate screws and metal raceways if an appliance cord, or extension cord, is inadvertently wired with reversed green and white conductors; a wiring error especially possible when repairing the cords flooding our nation without any color coding whatsoever. The white, black, and green conductors are similarly colored black, gray, yellow, or brown.

There is no doubt in my mind that the sudden inferno that killed three students at (name deleted) was caused by our ill-conceived grounding system. What else could explain the sudden flashover that incinerated two students at the very same time the smoke alarms sounded and an extreme amount of smoke and heat poured down the corridors.

But panels don't believe in scenarios or theories and the carnage will continue unless they accept my proposal that prevents fires inside walls.

Panels reject my proposals because they think it will necessitate drastic changes in cord components. This is simply not true. And if they would only ask for a demonstration I can prove it to them.

They reject my proposal because they think GFCIs and assured grounded programs are more effective than a wiring safeguard or a second, redundant ground. This, despite the fact that over a hundred workers were electrocuted on construction sites in 1992 where GFCIs and assured grounding programs are extensively used.

They just don't see the merits of the redundancy employed to every other federal agency whenever lives are at stake.

I urge the panels to adopt the use of redundancy every responsible engineer resorts to when lives are at stake. If our lives must be protected with an undersized, rarely tested, equipment grounding conductor, than at least provide two of them.

And please mandate the slight no cost change to cord components as described in this proposal to provide a wiring safeguard that prevents electrocutions and fiery deaths due to miswiring of components; especially when wiring components to the molded cords flooding our nation without any color coding whatsoever.

To answer specific reasons for rejection:

A credible source of the allegations made by Ralph Nader can be found in the 1987 issue of the Federal Registar where the FDA investigated allegations that doctors electrocuted 5000 patients in 1970.

And that was at a time when there were no more than a few hundred electrical devices used on patients. Now that the use of electrical devices has exploded 10 fold or more we can assume the deaths are proportionately higher since no changes have been made in our cord and plug grounding system.

You no longer hear of electrocutions in hospitals since the advent of defibrillators and cardiac arrest teams. Patients are simply zapped back to life when electrocutions occur; an extremely painful procedure according to patients fortunate to survive.

The panel accuses me of having a lack of understanding of proven electrical safety precepts. The same panel that condones the use of corrosive steel screws, metal raceways, metal outlet boxes and their raceway connectors to act as a conductor of electricity inside the walls of practically every dwelling in our nation. Is this the safety precept the panel was referring to?

The same panel that rejects the use of redundancy as a concept whenever lives are at stake. Is reducing the life protecting conductor up to 60% the safey precept the panel is referring to?

And the panel accuses me of being disingenuous?

On March 15, 1956 a patient was electrocuted when an attendant moved a Bovie surgical device from one outlet to another during an operation.

The patient died because the plug on the surgical device was wired with reversed green and white conductors by a well supervised experienced (name deleted) factory worker.

And the patient died because a well supervised experienced (name delete) electrician installed an outlet with reversed white and black conductors.

If experienced and well supervised workers can make mistakes that kill, am I being disingenuous trying to have our nation adopt a wiring safeguard that will prevent electrocutions and fiery deaths due to miswiring?

I strongly urge the panel to finally accept a proposal that will correct the design defects in cord design responsible for thousands of electrocutions and fiery deaths each and every year.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter provided no additional technical data to support his recommendation. See panel statements on Proposal 18-52 and Proposal 18-53.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #393)

18- 28 - (410-67(c)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

COMMENT ON PROPOSAL NO: 18-4

RECOMMENDATION: Accept in Principle revised as follows:

Delete present text for 410-67(c) and substitute:

(c) TAP CONDUCTORS for luminaries that require supply conductors with an insulation temperature rating higher than the branch-circuit conductors, tap conductors of a type suitable for the temperature encountered shall be permitted to run from the luminaire terminal connections to an outlet box or other connection point to the branch-circuit conductors not less than 305 mm (1 ft) from the luminaire. Where the tap conductors are of a type other than fixture wires and have an ampacity less than the branch-circuit conductors they shall be in accordance with 210-19(d). Where the tap conductors are fixture wires they shall be in accordance with 240-4(b) and enclosed in a suitable raceway or cable.

SUBSTANTIATION: A similar version of this section has been in the Code for many years from a time when the majority of branch-circuit conductors were rated 60°C or 75°C and some fixtures required 75°C or higher rated supply conductors. Tap conductors were commonly a fixture wire such as Type AF.

Taps (splices) can be made with conductors that are still considered branch-circuit conductors and this section should not apply to those as the are covered by (b). All taps are not defined by 240-3(e). This section literally applies to the conductors of (b) if they are taps and invokes the mandatory last sentence re: distance and wiring methods.

It is more fitting to apply those conditions to other than branch-circuit type tap conductors and delete the 6 ft requirement for suitable raceways or cables with fixture wire taps, to correlate with 240-4(b)(2). A tap conductor longer than 6 ft would allow for better heat dissipation.

Connection to only an outlet box is too restrictive; for example, if a tap is made to knob-and-tube wiring or open wiring on insulators a fitting is suitable and may be required by 300-16(a).

PANEL ACTION: Reject.

PANEL STATEMENT: This comment offers no comment on the changes in Proposal 18-54 but rather introduces a number of new changes to Section 410-67(C). The submitter provided no technical substantiation to eliminate the minimum and maximum dimensions.

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

COMMENT ON PROPOSAL NO: 18-55

RECOMMENDATION: Change the subsection title to "Field-Wired Tap Conductors."

SUBSTANTIATION: This rule is widely understood to apply to the connection between a branch-circuit outlet box and the splice box on a prewired fixture housing, which is not the case. This rule only applies to the more unusual condition where the cold lead from the fixture terminal connection point to the outlet is field wired. Changing the title should clarify that this rule has no applicability to the conventional prewired recessed fixture.

PANEL ACTION: Reject.

PANEL STATEMENT: Section 410.67(C) addresses conventional pre-wired recessed luminaires and field wired tap conductors.

SUBMITTER: Jim Evanisko, National Cathode Corp.

COMMENT ON PROPOSAL NO: 18-58, 18-59, 18-60, 18-61, 18-62, 18-63

RECOMMENDATION: Revise as follows:

Q. Special Provisions for Electric-Discharge Lighting Systems of More than 1000 Volts

410-80. General.

(a) ~~Open Circuit Voltage Exceeding 1000 Volts~~ Listing. ~~Equipment for use with~~ Electric-discharge lighting systems ~~and designed for~~ with an open-circuit voltage exceeding 1000 volts shall be ~~of a type intended for such service~~ listed and installed in conformance with that listing.

(b) Dwelling Occupancies. Equipment that has an open-circuit voltage exceeding 1000 volts shall not be installed in or on dwelling occupancies.

(c) Live Parts. The terminal of an electric-discharge lamp shall be considered as a live part ~~where any lamp terminal is connected to a circuit of over 300 volts.~~

(d) Additional Requirements. In addition to complying with the general requirements for lighting fixtures, such equipment shall comply with Part Q of this article.

FPN: For signs and outline lighting, see Article 600.

410-81. Control.

(a) Disconnection. Fixtures or lamp installations shall be controlled either singly or in groups by an externally operable

switch or circuit breaker that opens all ungrounded primary conductors.

(b) Within Sight or Locked Type. The switch or circuit breaker shall be located within sight from the fixtures or lamps, or it shall be permitted elsewhere if it is provided with a means for locking in the open position.

410-82. Lamp Terminals and Lampholders. Parts that must be removed for lamp replacement shall be hinged or held captive. Lamps or lampholders will be designed so that there shall be no exposed live parts when lamps are being inserted or are being removed.

410-83. Transformers ~~Ratings. Transformers and ballasts shall have a secondary open-circuit voltage of not over 15,000 volts with an allowance on test of 1000 volts additional. The secondary current rating shall not be more than 120 milliamperes if the open-circuit voltage is over 7500 volts, and not more than 240 milliamperes if the open-circuit voltage is 7500 volts or less.~~

~~410-84. Transformer Type. Transformers shall be enclosed and listed.~~

~~410-85. Transformers and Secondary Connections. The high voltage windings of transformers shall not be connected in series or parallel.~~

(a) Type. Transformers shall be enclosed, identified for the use and listed.

(b) Voltage. Secondary-circuit voltage shall not exceed 15,000 volts, nominal, under any load condition. The voltage to ground of any output terminals of the secondary circuit shall not exceed 7500 volts, under any load conditions.

(c) Rating. Transformers shall have a secondary short-circuit current rating of not more than 150 mA if the open-circuit voltage is over 7500 volts, and not more than 300 mA, if the open-circuit voltage rating is 7500 volts or less.

(d) Secondary Connections. Secondary circuit outputs shall not be connected in parallel or in series.

410-8~~6~~4. Transformer Locations.

(a) Accessible. Transformers shall be accessible after installation.

(b) Secondary Conductors. Transformers shall be installed as near to the lamps as practicable to keep the secondary conductors as short as possible.

(c) Adjacent to Combustible Materials. Transformers shall be located so that adjacent combustible materials will not be subjected to temperatures in excess of 90°C (194°F).

410-8~~7~~5. Transformer Loading. The lamps connected to any transformer shall be of such length and characteristics so as not to cause a condition of continuous overvoltage on the transformer.

410-8~~8~~6. Wiring Method -- Secondary Conductors. Conductors shall be installed in accordance with Section 600-32.

410-8~~9~~7. Lamp Supports. Lamps shall be adequately supported as required in Section 600-41.

410-~~90~~8. Exposure to Damage. Lamp shall not be located where normally exposed to physical damage.

410-~~89~~~~1~~89. Marking. Each fixture or each secondary circuit of tubing having an open-circuit voltage of over 1000 volts shall have a clearly legible marking in letters not less than 1/4 in. (6.35 mm) high reading: "Caution ... volts" The voltage indicated shall be the rated open-circuit voltage.

410-~~92~~90. Switches. Snap switches shall comply with Section 380-14.

SUBSTANTIATION: Cold Cathode Lighting systems over 1000 volts can be listed. To the best of our knowledge all manufacturers of such systems are listed by UL. It is appropriate that the NEC require listing, rather than relying upon the knowledge of an Authority Having Jurisdiction to inspect each installation in accordance with the applicable standards.

The phrase "where any lamp terminal is connected to a circuit of over 300 volts" is deleted as this phrase has no application to Part Q which covers installations of over 1000 volts.

The transformers sections have been restructured to provide consistency with the format and terminology used in 600-23 because transformers for Cold Cathode lighting systems and Neon Signs are very similar. They are both manufactured under a single ANSI standard, UL 2161.

The current rating changes are presented to more readily accomplish manufacturing and rating of Cold Cathode transformers and to introduce consistency with Article 600. Article 410 has historically been interpreted to be referencing operating current ratings. Article 600 has always referenced short-circuit current ratings. A transformer manufacturer cannot accurately control operating current. They design cold cathode transformers to operate at approximately 80 % of the short-circuit current, however operating current is also controlled by the actual load of tubing as well as the wiring of each circuit at the installation location. The NEC should specify maximum short-circuit current ratings in 410, as is done in 600, to provide controllable limits for the ANSI Standard which regulations the manufacturing of transformers.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to panel action and statement for Comment 18-7.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1547)

18- 32 - (410-84(a)and B(1) and (2) and Exception): Reject
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 18-64
RECOMMENDATION: Revise Section 410-84 as follows:

410-84 Transformer Type(s). Transformers shall be of the enclosed type or shall be installed in suitable enclosures.

(a) Type. Transformers shall be identified for the use and shall be listed.

(b) Secondary-Circuit Ground-Fault Protection. Transformers and electronic power supplies other than the following shall have secondary-circuit ground-fault protection:

1. Transformers with isolated secondaries and with a maximum open circuit voltage of 7500 volts or less.

2. Transformers with integral porcelain or glass secondary housing for the neon tubing and requiring no field wiring of the secondary circuit.

Exception: Listed assemblies that require no field installed high voltage secondary circuit conductors.

SUBSTANTIATION: The panel should reconsider the action taken on the original proposal. In the panel statement to the original proposal, Panel 18 indicated that the substantiation did not clearly state what the hazard is with electric discharge lighting systems. I agree, the original substantiation of the original proposal was not specific to the types of installations the proposed changes were addressing. I'll try to clarify what systems specifically the proposal is intended to address. Many cold-cathode electric discharge systems are listed systems, that's a given. However, there are cold-cathode electric discharge systems that are not listed systems, but field assembled components installed in identical fashion to field installed skeleton neon tubing installations. Example: 15,000 volt transformer installed in an enclosure, supplied by a 120 volt primary branch circuit. There are secondary GTO cables (15kv) installed in a wiring method in accordance with Section 600-32 as required by Section 410-88. The tubing is required to be supported by the same type of tubing supports required for neon tubing and there is a reference from 410-89 to Section 600-41 for lamp support. I totally agree that listed cold-cathode lighting systems falling under the requirements of Part Q in Article 410 should not be required to employ secondary circuit ground-fault protection transformers. However, the field installed cold-cathode systems which are usually installed by the same contractor that would install a field-installed neon tubing installation should require the same type of secondary circuit ground-fault protection. The same problems exist with the field-

installed cold-cathode high voltage secondary circuit that are present in the field-installed neon tubing secondary circuit. Same transformer and voltage output levels, often times higher, same field installed GTO (15 kv) secondary circuit conductor (without length limitation), same capacitance, same corona, and same ozone. The type of protection afforded for neon secondary circuits should not be more restrictive than field installed cold-cathode high voltage secondary circuits. The problems are the same. The panel may wish to consider accepting the comment in principle and adjusting the wording to fit the needs.

Another approach looking to the future would be to incorporate the field-installed high voltage cold-cathode systems in Article 600 and leave the lower voltage cold-cathode and other listed electric discharge lighting systems to be covered by Article 410, Part Q. This adjustment would make sense from a user friendly aspect also because there are a few references to Article 600 from Part Q of Article 410. Those references are there because the characteristics of the high voltage secondary circuit and the wiring of it, need to be treated the same. The same SCGFP protection should be provided. There is work to be done in this section to address this issue.

PANEL ACTION: Reject.

PANEL STATEMENT: With the panel action on Comment 18-7 all cold cathode systems are required to be listed, including field installed components. See panel action and statement on Comment 18-7.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #391)

18- 33 - (410-104): Hold

SUBMITTER: Dan Leaf, Palmdale, CA

COMMENT ON PROPOSAL NO: 18-4

RECOMMENDATION: Accept in Principle revise last sentence of 410-104:

Unless identified for supports at greater intervals, (1) a single section ~~4 ft (1.22 m) or shorter in length~~ shall have not less than two supports and, (2) a support shall be provided for each 1.22 m (4 ft) of length or major fraction thereof. ~~Where installed in a continuous row, each individual section of not more than 4 ft (1.22 m) in length shall have an additional support.~~

SUBSTANTIATION: Present wording is confusing. It only addresses individual sections of track 4 ft or less in length with no specifics for longer lengths. Manufacturers instructions re: mounting holes and clips indicating greater support intervals are covered by the first paragraph of the section.

PANEL ACTION: Hold.

PANEL STATEMENT: The panel considered no proposals pertaining to Section 410-104 at the 2002 NEC ROP meeting. This comment introduces new material. The panel will hold Comment 18-33.

(Log #1489)

18- 34 - (410PartQ): Accept in Principle

SUBMITTER: Jim Evanisko, National Cathode Corp.

COMMENT ON PROPOSAL NO: 18-58

RECOMMENDATION: Revise 410 Part Q as follows:

Q. Special Provisions for Electric-Discharge Lighting Systems of More than 1000 Volts.

410-80. General

(a) ~~Open-Circuit Voltage Exceeding 1000 Volts~~ Listing ~~Equipment for use with~~ Electric-discharge lighting systems ~~and designed for~~ with an open-circuit voltage exceeding 1000 volts shall be ~~of a type intended for such service~~ listed and installed in conformance with that listing.

(b) Dwelling Occupancies. Equipment that has an open-circuit voltage exceeding 1000 volts shall not be installed in or on dwelling occupancies.

(c) Live Parts. The terminal of an electric-discharge lamp shall be considered as a live part ~~where any lamp terminal is connected to a circuit of over 300 volts~~.

(d) Additional Requirements. In addition to complying with the general requirements for lighting fixtures, such equipment shall comply with Part Q of this article.

FPN: For signs and outline lighting, See Article 600.

410-81. Control

(a) Disconnection. Fixtures or lamp installations shall be controlled either singly or in groups by an externally operable switch or circuit breaker that opens all ungrounded primary conductors.

(b) Within Sight or Locked Type. The switch or circuit breaker shall be located within sight from the fixtures or lamps, or it shall be permitted elsewhere if it is provided with a means for locking in the open position.

410-82. Lamp Terminals and Lampholders

Parts that must be removed for lamp replacement shall be hinged or held captive. Lamps or lampholders will be designed so that there shall be no exposed live parts when lamps are being inserted or are being removed.

410-83. Transformers ~~Ratings~~

~~Transformers and ballasts shall have a secondary open-circuit voltage of not over 15,000 volts with an allowance on test of 1000 volts additional. The secondary current rating shall not be more than 120 miliamperes if the open circuit voltage is over 7500 volts, and not more than 240 miliamperes if the open circuit voltage is 7500 volts or less.~~

~~410-84. Transformer Type.~~

~~Transformers shall be enclosed and listed.~~

~~410.85 Transformer and Secondary Connections~~

~~The high voltage windings of transformers shall not be connected in series or parallel.~~

(a) Type. Transformers shall be enclosed, identified for the use and listed.

(b) Voltage. Secondary-circuit voltage shall not exceed 15,000 volts, nominal, under any load condition. The voltage to ground of any output terminals of the secondary circuit shall not exceed 7500 volts, under any load condition.

(c) Rating. Transformers shall have a secondary short-circuit current rating of not more than 150 mA if the open-circuit voltage is over 7500 volts, and not more than 300 mA, if the open-circuit voltage rating is 7500 volts or less.

(d) Secondary Connections. Secondary circuit outputs shall not be connected in parallel or in series.

410-8~~6~~4. Transformer Locations

(a) Accessible. Transformers shall be accessible after installation.

(b) Secondary Conductors. Transformers shall be installed as near to the lamps as practicable to keep the secondary conductors as short as possible.

(c) Adjacent to Combustible Materials. Transformers shall be located so that adjacent combustible materials will not be subjected to temperatures in excess of 90°C (194°F).

410-8~~7~~5. Transformer Loading

The lamps connected to any transformer shall be of such length and characteristics so as not to cause a condition of continuous overvoltage on the transformer.

410-8~~8~~6. Wiring Method - Secondary Conductors

Conductors shall be installed in accordance with Section 600-32.

410-8~~9~~7. Lamp Supports

Lamps shall be adequately supported as required in Section 600-41.

410-~~90~~88. Exposure to Damage

Lamps shall not be located where normally exposed to physical damage.

410-~~91~~89. Marking

Each fixture or each secondary circuit of tubing having an open-circuit voltage of over 1000 volts shall have a clearly legible marking in letters not less than 1/4 in. (6.35 mm) high reading:

"Caution ...volts." The voltage indicated shall be the rated open-circuit voltage.

410-~~92~~90. Switches

Snap switches shall comply with Section 380-14.

SUBSTANTIATION: In accordance with the Panel Statement in 18-58 the proposed changes to Part Q are submitted.

Cold Cathode Lighting systems over 1000 volts can be listed. To the best of our knowledge, all manufacturers of such systems are listed by UL. It is appropriate that the NEC require listing, rather than relying upon the knowledge of an authority having jurisdiction to inspect each installation in accordance with the applicable standards.

The phrase "where any lamp terminal is connected to a circuit of over 300 volts" is deleted as this phrase has no application to Part Q which covers installations of over 1000 volts.

The transformers sections have been restructured to provide consistency with the format and terminology used in 600-23 because transformers for Cold Cathode lighting systems and Neon Signs are very similar. They are both manufactured under a single ANSI standard, UL 2161.

The current rating changes are presented to more readily accomplish manufacturing and rating of Cold Cathode transformers and to introduce consistency with Article 600. Article 410 has historically been interpreted to be referencing operating current ratings. Article 600 has always referenced short-circuit current ratings. A transformer manufacturer cannot accurately control operating current. They design cold cathode transformers to operate at approximately 80% of the short-circuit current, however operating current is also controlled by the actual load of tubing as well as the wiring of each circuit at the installation location. The NEC should specify maximum short-circuit current ratings in 410, as is done in 600, to provide controllable limits for the ANSI standard which regulates the manufacturing of transformers.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to panel action and statement for Comment 18-7.

(Log #2243)

18- 41 - (420-6(b) (New)): Hold
SUBMITTER: Tom Dunn, San Jose, CA
COMMENT ON PROPOSAL NO: 18-70
RECOMMENDATION: Delete the second sentence of this paragraph.
SUBSTANTIATION: The first sentence clearly states that plugs are not to be installed on the "hot", or "down-stream", end of a cord. The second sentence implies that the wires supplying power to a receptacle cannot have a plug at the other end.
This would eliminate a lot of extension cords.
Another example of what would not be permitted, is the case of carnival rides, where receptacles at the outside end of carousel sweeps are powered by plugs at the inside end which plug into receptacles at the center of the ride.
PANEL ACTION: Hold.
PANEL STATEMENT: Proposal 18-70 was the editorial relocation of the receptacle portion of Article 410. It did not contain any substantive change. This comment introduces a substantive change to Section 410.56(G) of the 1999 NEC for which there was no proposal at the 2002 NEC ROP stage. Therefore, this comment introduces new material and this comment is on hold.

(Log #590)

20- 5 - (422-11(f)): Accept
Note: The Technical Correlating Committee notes that the panel action on this Comment and on Comment 20-4 have conflicting panel actions and panel statements. Both panel actions state that the panel accepts Proposal 20-6, however, Proposal 20-6 was "Accept in Principle In Part". The panel statements indicated that the wording was modified and as such the Technical Correlating Committee understands that the panel is retaining their modified action on Proposal 20-6. Based on the record, the Technical Correlating Committee understands that the action on this comment is more appropriately "Accept in Principle". The Technical Correlating Committee directs that 422.11(F)(3) read as follows:
"(3) Water Heaters and Steam Boilers. Water heaters and steam boilers employing resistance-type immersion electric heating elements contained in an ASME-rated and stamped vessel, or listed instantaneous water heaters, shall be permitted to be subdivided into circuits not exceeding 120 amperes and protected at not more than 150 amperes."
SUBMITTER: Thomas L. Harman, Univ. of Houston Clear Lake
COMMENT ON PROPOSAL NO: 20-6
RECOMMENDATION: I agree with the Technical Correlating Committee's recommendation. Please incorporate Proposal 20-6 into Article 422-11 and add the new text to the requirement to subdivide the load of resistance-type electric heating elements.
SUBSTANTIATION: Proposal 20-6 was accepted by the panel but the new exception was not added to the revised wording of Article 422. This would add the words "or listed instantaneous water heaters" to Exception No. 3 of 422-11(g) in the revised article as written in Proposal 20-7.
PANEL ACTION: Accept.
The panel accepts Proposal 20-6.
PANEL STATEMENT: See panel statement on Comment 20-4.

(Log #1928)

20- 7 - (422-31(b)): Reject
SUBMITTER: James T. Dollard, Jr., Philadelphia, PA
COMMENT ON PROPOSAL NO: 20-10
RECOMMENDATION: Accept this proposal in Principle as follows:
422-31. Disconnection of Permanently Connected Appliances
(a) Rated at Not Over 300 Volt-Amperes or 1/8 Horsepower. For permanently connected appliances rated at not over 300 volt-amperes or 1/8 hp, the branch-circuit overcurrent device shall be permitted to serve as the disconnecting means.
(b) Appliances Rated Over 300 Volt-Amperes or 1/8 Horsepower. For permanently connected appliances rated over 300 volt-amperes or 1/8 hp, the branch-circuit switch or circuit breaker shall be permitted to serve as the disconnecting means where the switch or circuit breaker is within sight from the appliance or is capable of being locked in the open position. <u>The provision for locking or adding a lock to the disconnecting means shall be permanently installed on or at the switch or circuit breaker used as the disconnecting means.</u>
FPN No. 1: For motor-driven appliances of more than 1/8 hp, see Section 422-35.
FPN No. 2: For appliances employing unit switches, see Section 422-33.
SUBSTANTIATION: This safety driven proposal should be accepted in principle. The intent of the submitter is similar to the intent of proposal 11-70 in this cycle to section 430-102(b) Exception. Proposal 11-70 was Accepted in Principle and the Panel action is reflected word for word in the proposed recommendation above to section 422-31(b).
The present text of 422-31(b), which reads as follows "…where the switch or circuit breaker is within sight from the appliance or is capable of being locked in the open position." Clearly requires that the switch or circuit breaker be CAPABLE of being locked in the open position.
The problem with the present wording of this section is that the disconnect in many appliance installations is a circuit breaker in a panelboard or a snap switch, neither of which have permanent provisions for being locked in the open position. This clearly does not meet the requirements of 422-31(b). The present text of 422-31(b) which reads as follows "…where the switch or circuit breaker is within sight from the appliance or is capable of being locked in the open position." clearly requires that the switch or circuit breaker be CAPABLE of being locked in the open position. The intent of this section is that with lock in hand an installer/maintainer can apply the lock and work safely. This text in the NEC does not include "through the use of a device which will permit a lock to be utilized".
However the onset of circuit breaker locking devices have given the impression that any circuit breaker is capable of being locked in the open position.
OSHA does not permit circuit breaker lockout devices.
OSHA requires that they be approved (listed by a Nationally Recognized Testing Laboratory). None are listed. Even if these devices were listed for the purpose then the NEC would expect that

installers/maintainers would each carry dozens of different accessory devices to safely lockout power sources. This is not practical.
Permanent provisions for making a circuit breaker and/or snap switch capable of being locked in the open position are readily available from manufacturers today.
Proposal 20-10 and this comment will not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.
The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have an accessory device that just happens to fit a snap switch or circuit breaker in a given installation.
Where permanently connected appliances rated over 300 volt-amperes or 1/8 hp, are installed we know that regular maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter did not provide sufficient technical substantiation for the original proposal to require individual requirements for locking.

ARTICLE 424 — FIXED ELECTRIC SPACE-HEATING EQUIPMENT

(Log #682)

20- 8 - (424-19(a)(2)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 20-21
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: The present language of this section clearly requires compliance with only ONE of items (a) through (d) (if one item is complied with, the others become irrelevant according to this language). Therefore, as provided by (b), a disconnecting means is not required within sight of heating equipment having a motor rated over 1/8 hp if a lockable disconnecting means is installed out of sight of the equipment. The substantiation for this change in the 1990 Code alleged that the change was editorial. If you intended to change the meaning of this section at that time, leave it as is. If not, accept this proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its position that the existing text is clearer.

11- 5 - (430-2): Accept
SUBMITTER: Jerry Spencer, Potlatch Corporation
COMMENT ON PROPOSAL NO: 11-6
RECOMMENDATION: Retain 1999 NEC wording as is.
SUBSTANTIATION: Historically, there have been two sensors used as described in the proposal. RTD technology is dependable, but prohibitively expensive. "Klixon" type sensors have proven very unreliable over time. For this reason, all motor manufacturer's offer motors with independent cooling for this use. It makes more sense to use these engineered motors for the few applications needing them than to saddle all motors with extra costs, wiring, and potential problems.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
COMMENT ON AFFIRMATIVE:
BUNCH: I vote affirmative, but do not agree with the substantiation that "Klixon type sensors have proven very unreliable over time". Millions of these products have been used by all compressor manufacturers for decades, very successfully.
HAMER: I agree with the comment substantiation on the unreliability of internal thermal switches. When ordered with a new motor, resistance temperature detectors are relatively economic and are a more effective way to protect a motor driven by an ASD.

(Log #115)

11- 6 - (430-6(a)(1)): Hold
Note: The Technical Correlating Committee directs that the Comment and the Proposal be reported as "Hold", and further notes that the panel statement is incorrect and the Comment does not introduce new material.

(Log #422)

11- 10 - (430-22): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 11-20
RECOMMENDATION: Accept in principle, revise panel action:
(a) General. Branch-circuit conductors that supply a single <u>continuous duty rated</u> motor ~~used in a continuous duty application~~ shall have an ampacity...
(remainder unchanged)
SUBSTANTIATION: Continuous duty is not the same as continuous load, but apparently refers to the motor nameplate rating per 430-7(a)(6). Refer to the May/June 2000 issue of IAEI News article page 90 in which continuous duty was interpreted as a load of 3 hours or more. If a continuous duty rated motor is used in an application where the load continues for less than 3 hours, does this section apply? This comment is intended to clarify that continuous duty is determined by the motor nameplate, not the length of time of the load.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel intends Section 430-22(a) to apply to continuous duty application, as in the 1999 NEC. Section 430-22(b) in the 1999 NEC was renumbered as 430-22(e) by the panel action on Proposal 11-20, and it applies to motors used in other than continuous duty applications. See the note following Table 430-22(b) in the 1999 NEC.

11- 11 - (430-22(b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 11-23
RECOMMENDATION: Accept proposal.
SUBSTANTIATION: "Conductors" literally includes service and feeder conductors for compliance with Table 430-22(b) while (a) limits the requirements to branch-circuit conductors and 430-24 only applies a multiplier to the highest rated motor (branch circuit, feeder, service). If feeder or service conductors supply only a motor for duty cycle service they see the same heating effect as the branch-circuit conductors and may be the same size and ampacity, whereas feeder or service conductors supplying additional load normally have some diversity factor, as addressed in 430-26.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's concerns are addressed by the current language. Section 430-22(b) currently applies to all conductors including service and feeder conductors that supply only a motor for duty cycle service.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #375)

11- 13 - (430-28): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 11-26
RECOMMENDATION: Accept in principle revised: Delete "and Part E".
SUBSTANTIATION: Since tap conductors may be a feeder the requirement for a branch-circuit overcurrent device is misleading. The panel statement that a device suitable for branch-circuit overcurrent protection may be used on feeders is correct, but it then becomes a feeder overcurrent device. Since the phrase "branch-circuit overcurrent device" describes a specific use it is not synonymous with "feeder overcurrent device", as those phrases are used in the Code. The Style Manual 3.3.4 requires words and terms to be clear and specific.
PANEL ACTION: Reject.
PANEL STATEMENT: The commenter's use of the term overcurrent device in the original proposal is an incorrect application for this section. All branch circuit OCPDs are fully rated for overload and short circuit performance. Not all overcurrent devices are fully rated, e.g. supplementary protective devices. Tap conductors must be protected by a fully rated device.

11- 14 - (430-31, 430-125 (a)): Accept
SUBMITTER: Jerry Spencer, Potlatch Corporation
COMMENT ON PROPOSAL NO: 11-2, 11-28
RECOMMENDATION: Retain 1999 NEC wording as is.
SUBSTANTIATION: The proposal would require adding expensive equipment to already crowded motor control buckets. The present system of overloads has proven itself capable of taking loaded motors off-line in cases of phase loss, since the load rises dramatically on the two remaining phases. A motor so lightly loaded as not to trip would be capable of running cool enough to not pose a hazard. In the case cited, tying furnace firing to airflow would be a better choice.
PANEL ACTION: Accept.
PANEL STATEMENT: The submitter's reference to 11-2 should be to 11-12.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #1471)

11- 18 - (430-53(c)): Accept
SUBMITTER: Vincent J. Saporita, Cooper Bussmann
COMMENT ON PROPOSAL NO: 11-45
RECOMMENDATION: Reject this proposal.
SUBSTANTIATION: This is a safety issue. The proposal and substantiation incorrectly assume that all group motor installations are for heating/air conditioning/refrigeration (HACR) applications. 430-53(c) also applies to (1) other listed factory assemblies and to (2) field assembled equipment. As written, this proposal would remove the requirements for the circuit breaker's "group motor listing" for these two other applications described above. No substantiation has been provided to show that these other "systems" will be safe and free from hazards without the currently required testing and listing.

While the code permits circuit breakers to be used interchangeably if listed for group installation, manufacturers have chosen not to submit their products for listing under this special application. Most likely because circuit breakers of the same rating from different manufacturers have significantly different energy let-through characteristics. This can result in damage to the controller and associated overload relays. Note the FPN reference to 110-10 at the end of 430-53(c).
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 5

EXPLANATION OF NEGATIVE:

RASMUSSEN: The comment should be rejected and the original proposal should be accepted. No fuse or circuit breaker is tested or identified by UL for group installation by itself. Either type of protective device becomes part of the listed installation when evaluated and identified for the intended application. Listing of Industrial Control Equipment such as Combination Motor Controllers for group installation does not now and has never required "special rated" (i.e.,HACR) circuit breakers. Depending on the rated fault current level, Industrial Control Equipment is either tested with any properly rated circuit breaker (for "standard or low fault" ratings) or with specific rating, type designation, and manufacturer circuit breakers (for "high fault" ratings.) Product safety standards are well aware of the differences between fuses and circuit breakers and, for "high fault" situations, between individual manufacturer and type circuit breakers. Removal of the words "group installation" will have no impact on safety or on product standards. As noted in the substantiation for the proposal, the requirements for circuit breakers marked HACR are identical to the requirements for all circuit breakers. However, since there is no difference between a circuit breaker with an HACR marked rating and a circuit breaker without this marking, UL intends to consider revising the Listing Information for Circuit Breakers to state that all circuit breakers are suitable for group motor installation when used in listed equipment as specified in the listing of the equipment.

SAUNDERS: There appears to be no difference in a HACR breaker and UL 489 test standards per UL Code-Making Panel 11 representative.

SCHRAM: Since UL has determined that special tests on circuit breakers marked "HACR" are no longer necessary, and this marking is permitted by UL on any listed circuit breaker at the manufacturer's request, this circuit breaker marking has become obsolete. Also, the UL representative on the panel has indicated that UL does not list any circuit breaker or fuse independently for group installation. Further, as I understand it, where circuit breakers are part of UL listed equipment, including combination motor controllers listed for group installation and multi-motor equipment, any special restrictions as to the rating, type, or make of supply circuit protective device are marked on the equipment. Therefore, I believe that the revision recommended in Proposal 11-45 and supported by Comments 11-20 and 11-21 should be accepted.

THOMAS: For listing purposes, the Type HACR circuit breaker is subjected to exactly the same tests as all standard breakers. According to the UL rep on the panel, the HACR label is available "for the asking". As such, it has no impact on safety in any way and should be eliminated. For group motor installations with nonhermetic motors, motor controller listings include specific breakers, which are tested with the controller. It is and will continue to be a code violation to use a controller with a breaker not included in its listing. Other than as part of the controller listing, circuit breakers are not currently listed for group installations. Changing the text of 430-53(c) as recommended in Proposal 11-45 will not degrade safety but will be one small step in eliminating unnecessary words and requirements from the code..

WRIGHT: See my explanation of negative vote on Comment 11-20.

COMMENT ON AFFIRMATIVE:

HAMER: This comment (to reject the proposal) should be accepted. A "group installation listing" is necessary to be sure that an inappropriate circuit breaker is not interchanged for an originally supplied circuit breaker. An inappropriately substituted circuit breaker may permit too much let-through energy during a short circuit downstream of the controller and overload. The "group installation listing" standard should address the case where the Group Installation may be connected to a high-short-circuit-capacity source. As listing standards exist today, "standard fault short circuit test" (i.e., low level) listing is the default, and special efforts must be made to make sure a group motor installation is properly applied for the more frequent industrial situation of a high-short-circuit-capacity source. The group installation listing standards need to adequately address this potential safety hazard, and the language of 430-53(c)(3) in the 1999 NEC should not be changed.

(Log #120)

11- 19 - (430-53(c)(3)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 11-45
RECOMMENDATION: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #849)

11- 20 - (430-53(c)(3)): Reject
SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: 11-45
RECOMMENDATION: The panel should continue to accept the proposal.
SUBSTANTIATION: This comment is intended to address the perceived issues raised by the negative comments in the voting.

Addressing the comments from Mr. Bunch:

There is not an inconsistent application issue with this change. As noted in the proposal substantiation UL 489 requires that a breaker intended for use in HARC applications comply with the construction requirements for "all types". As such, the application after this change will be more consistent than in the past. Any listed circuit breaker could be used in an HARC application (provided the equipment marking did not prohibit the use of circuit breakers).

Addressing the comments from Mr. Garvey:

Fuses are evaluated to the UL 248 series of standards. There are no special tests required by the fuse standards for fuses to be used in group motor applications. Circuit breakers are evaluated to UL 489. There are no special tests required by the circuit breaker standard for circuit breakers to be used in group motor applications. However, because of this particular code section, UL 489 does require a special marking (HARC). If this code section did not require "listed for the purpose", the need for a special marking could be removed from the standards and both fuses and breakers would then be treated equally. Mr. Garvey's comment references UL category NJOT for motor controllers. This reference actually supports the objective of the proposal. The motor controller used in group applications will specify if a fuse, a circuit breaker or both can be used for the protection. The key is that this is part of the evaluation of the motor controller and not of the circuit breaker.

Addressing the comments from Mr. Naughton:

See responses to Bunch and Garvey. There are no special requirements for HARC breakers. Removal of the wording as suggested by the proposal only removes the need to a special marking on a standard circuit breaker. There is no hazard as stated in the comment because a breaker that is presently marked HARC can be used in any applications suitable for a circuit breaker. With the code change accepted, the ability to use the breaker in both group motor and non-group motor applications does not change.

Addressing the comments from Mr. Saporita:

Mr. Saporita is correct in that there are group motor installations other than HARC. However, HARC is the only marking that even exists to meet the words "listed for the purpose". There is no safety issue. NEC 430-53(c)(1) and (2) still require that the motor overload device and the motor controller be listed for group installation and specify a maximum rating of fuse or breaker. The point is that the controllers and overload relay have always been (and still will be) required to indicate what overcurrent protection is acceptable for the group installation. However, requiring a special marking (HARC) to be placed on a breaker is redundant to the already required evaluation of the controller. Particularly since a HARC breaker is a standards circuit breaker.

Addressing the comments form Mr. Saunders:

The change driven by the proposal does not make the breaker automatically acceptable in all group motor applications. That acceptability has been and will continue to be dictated by the evaluation of the controller and overload relay as required in 430-53(c)(1) and (2). Again, there is no special marking on a circuit breaker to meet the words "listed for the purpose" other than HACR.
PANEL ACTION: Reject.
PANEL STATEMENT: No technical documentation has been presented to justify such a major change.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 5
EXPLANATION OF NEGATIVE:

RASMUSSEN: The comment should be accepted. See my Explanation of Negative Vote on Comment 11-18.

SAUNDERS: See my explanation of negative vote on Comment 11-18.

SCHRAM: See my explanation of negative vote on Comment 11-18.

THOMAS: See my explanation of negative vote on Comment 11-18.

WRIGHT: The panel should maintain the position of accept on Proposal 11-45, as was done during the ROP stage. Comment Numbers 11-18, 11-22 and 11-23 should be rejected. Comment numbers 11-20 and 11-21 should be accepted.

The panel statement that "no technical documentation has been presented to justify such a major change" is simply not true. During the last code cycle, and again this code cycle, in the original Proposal 11-45, in the NEMA comment, and at the panel meeting, substantial documentation was presented to support the proposal. NEMA has stated, and UL has verified, that there are no differences in the testing or construction requirements in UL standards for circuit breakers listed for group motor applications and for circuit breakers not listed for group motor applications. No one questions the fact that, years ago, there were differences in the standard, but those differences are gone, and therefore the need for identification as a circuit breaker "listed for motor group applications" in the NEC is also gone. At this point, all listed circuit breakers are suitable for group motor applications when part of equipment listed for group motor applications. There is no need to force yet another unnecessary marking on the product, nor is there a need to force inspectors to search for an additional marking on the circuit breakers.

During the panel discussions, there seemed to be some confusion as to how controllers are tested and listed for group applications. There are two conditions of listing which determine the extent of testing and type of marking required on the controller. Under conditions of "standard" short-circuit current ratings (5kA, 10kA, etc., depending upon the horsepower rating of the controller), listing is obtained through testing with any listed thermal-magnetic circuit breaker, with a rating as specified by the controller manufacturer, from any circuit breaker manufacturer. The marking on the controller states the maximum rating of the circuit breaker to be used in the installation. No reference to the circuit breaker manufacturer is required. Whether or not a circuit breaker is marked for "group motor applications, or HACR", is immaterial. The testing and listing procedure is the same when fuses are specified.

Under condition of "high capacity" short-circuit current ratings (any rating above the "standard" rating), the controller must be tested with each specific circuit breaker (rating, manufacturer and type) for which the controller manufacturer desires listing. The controller then must be provided with marking which specifies the circuit breakers with which it was tested. Again, the presence of or lack of an "HACR" marking makes no difference. The test procedure is similar when fuses are specified, except that "umbrella" test limiters (which represent the most severe let-through conditions for any fuse of the specified type, such as RK5) may be used for the tests. In that case, only the fuse type and size must be marked on the controller.

Another concern expressed at the panel meetings relates to the current interchangeability of "HACR marked" circuit breakers in heating/air conditioning/refrigeration applications. The UL standard for those products currently permits substitution of any "HACR-marked" circuit breaker for another, freely, without the need for retesting. The fear is that, if the requirement for "group rating" is removed from the NEC, manufacturers of that equipment will be forced to retest their equipment with "non-HACR" circuit breakers.

The interchangeability in that type of equipment is based on the limited short-circuit current rating ("standard" short-circuit current ratings) which are assigned to those products. While UL might conduct a review of products, since there is no difference in construction or testing of the "non HACR" circuit breakers, the

interchangeability could no doubt be extended to the "non-HACR" circuit breakers with no additional testing or evaluation.

As pointed out in the original proposal and other comments, the current situation is a "catch 22" situation for UL. They cannot remove the identification requirement from their standard until it is removed from the code. The panel advocates leaving the marking in the code because it is still in the UL standard. The change must occur in the code first, in order for UL to proceed with a standard change.

COMMENT ON AFFIRMATIVE:

BUNCH: I vote affirmative with the panel action. It is not clear at this time if this change were made, that all equipment with HACR and fuse interchangeability now might be required to be retested and requalified.

HAMER: See my Affirmative Comment on Comment 11-18.

(Log #1778)

11- 21 - (430-53(c)(3)): Reject

SUBMITTER: Jim Pauley, Square D Company

COMMENT ON PROPOSAL NO: 11-45

RECOMMENDATION: The panel should continue to accept the proposal.

SUBSTANTIATION: The proposal does not introduce unsafe practices nor is it inconsistent with the product standards. Controllers and overload relays used in group motor applications must still be listed and marked for group application. This listing will handle the issue of what overcurrent device is acceptable. There is no need for special circuit breakers or a special marking such as HACR. All breakers have to pass the same set of test criteria and this in conjunction with the appropriate evaluation of the end equipment or controller/overload relay components covers all areas of concern.

This is (at least) the third code cycle for this proposal. All of the issues raised in previous cycles as well as those noted in the explanation of negatives have been addressed.

PANEL ACTION: Reject.

(Log #850)

11- 24 - (430-53(d)): Accept

SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)

COMMENT ON PROPOSAL NO: 11-46

RECOMMENDATION: The Panel should continue to Accept the proposal in Principal but the last sentence of the Panel Action should be revised as follows:

The conductors from the branch-circuit short-circuit and ground-fault protective device <u>to the controller</u> shall (1) be suitably protected from physical damage and enclosed by either an enclosed controller or by a raceway, and shall be not more than 3 m (10 ft) long, or (2) ~~shall have an ampacity in accordance with 430-22~~ shall have an ampacity ~~in accordance with 430-22 and shall have an ampacity~~ not less than that of the branch circuit conductors.

SUBSTANTIATION: The original proposal limited the length of the conductors between the branch-circuit protective device and the controller. The Panel action removed the specification of which conductors need to be restricted to a 3 m (10 ft) length and provided with protection. As revised, it could be incorrectly interpreted to mean that the protection and limitation could apply to the conductors between the branch-circuit protective device and the motor. It is understood that the conductors between the controller and the motor are protected by the controller.

The intent of the affirmative comment submitted by Mr. R. Rasmussen on item (2) in the last sentence of the Panel's action is correct, but should be clarified. Reference to sizing in accordance with 430-22 is unnecessary since the branch-circuit conductor will always be at least as large as the conductor to the motor.

PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
SAPORITA: I vote negative on the Panel Action for the following two reasons:
1. A product standard does not exist for these products. Introduction of code requirements for products that do not have a bona fide product standard identifying their application use and limitations creates unnecessary Code rules, not unlike the situation that exists for Design E motor applications. As such it would be inappropriate for the Panel to approve this comment or original Proposal 11-46.
2. The creepage and clearance spacings are a real safety concern. For example, at 480 volts, the spacings through air between opposite polarity are 25.4 mm for branch circuit overcurrent protective devices (UL 489) but only 9.5 mm for these types of devices (UL 508). Spacings over surface are 50.8 mm for branch circuit devices but only 12.7 mm for control devices. This raises a concern for personnel safety.
COMMENT ON AFFIRMATIVE:
RASMUSSEN: I agree with the panel action to accept this comment. See my Affirmative Comment on Comment 11-25.

(Log #1467)

11- 25 - (430-53(d)): Reject
SUBMITTER: George J. Ockuly, Chesterfield, MO
COMMENT ON PROPOSAL NO: 11-46
RECOMMENDATION: Reject this proposal. There is no industry standard for this product.
SUBSTANTIATION: The panel's concerns from the previous Code cycle have not been addressed with a bonafide, published product standard. Until an industry standard is published, it is premature to permit such a significant variation to established, proven code requirements.
PANEL ACTION: Reject.
PANEL STATEMENT: The standard exists in concept as outlined in the substantiation for Proposal 11-46.

(Log #368)

11- 29 - (430-74(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 11-53
RECOMMENDATION: Accept proposal.
SUBSTANTIATION: The panel statement for rejection was that the proposal would permit a three-phase corner-grounded delta-connected grounded leg to remain energized. If a motor control circuit is supplied by such a source it doesn't appear to be significantly different than one supplied by a single-phase or three-

phase 4-wire wye source. The general rule of 380-2(b) states switches or breakers shall not disconnect the grounded conductor. Panel statement infers that present literal wording requires disconnecting means for grounded conductors (all sources of power) which was the reason for the proposal. Lack of consistency creates confusion (Style Manual 3.3.5).
PANEL ACTION: Reject.
PANEL STATEMENT: On a three phase corner grounded delta there is normally current in the grounded leg and the grounding point may be remote from the equipment served.

11- 30 - (430-83(a)(3)): Hold
SUBMITTER: R. L. Nailen, Hales Corners, WI
COMMENT ON PROPOSAL NO: 11-57a
RECOMMENDATION: As accepted, this proposal specifically includes "Design E" motors. All references to such motors should be stricken form the Code. As of Feb. 2000, NEMA has rescinded its Design E motor standard. Furthermore, no such motors were ever offered on the market by either U.S. or foreign manufacturers, as can readily be verified through NEMA. This and any other Code references to "Design E" characteristics are therefore unnecessary and inappropriate.
SUBSTANTIATION: The problem in continuing to cite a nonexistent standard in the Code is that it inevitably casts doubt on the product knowledge of the Code-making panel and on the currency of the Code itself. When a product has never existed except on paper, and will not exist in the future, it need not and should not be cited in a Code of practice.
PANEL ACTION: Hold.
PANEL STATEMENT: Deleting reference to Design E motors from the Code is a subject that has not had public review. There are several references to Design E motors in Article 430 that cannot be properly handled within the time frame for processing the report, such as 430-52. The hold would apply to the comment only.

(Log #851)

11- 31 - (430-91): Reject
SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: 11-58a
RECOMMENDATION: The panel should accept the proposal.
SUBSTANTIATION: First is the issue of other sections in the code not referring to enclosure types. This is not correct. Section 110-11 refers to equipment identified only..." type 1" ...plus there was a proposal accepted in Section 370-15(a) [Log#9-12] that includes a reference to an "enclosure type 6P rating." Other sections of the code are definitely referring to enclosure types and adding the Table to Chapter 9 will make it accessible to any section in the code needing to refer to the table.
Second is the authority to relocate the table to Chapter 9. The panel does in fact have the authority to put the table in Chapter 9. There is not one panel that has control of all of Chapter 9 but different sections of the Chapter are assigned to certain panels. Panel 11 could in fact put the information in Chapter 9 plus retain control of the table by requesting its maintenance be assigned to them.
PANEL ACTION: Reject.
PANEL STATEMENT: The current table location is acceptable and the proposed move would not increase ease of use.

Note: The Technical Correlating Committee understands that the panel intended to reference Parts A, B, and H of Article 240. See Mr. Hamer's Comment on Affirmative Vote.
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 11-61
RECOMMENDATION: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual relative referencing an entire article. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Change "Article 240" to "Parts A, B, and I of Article 240"
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
COMMENT ON AFFIRMATIVE:
HAMER: While I agree that Parts A and B of Article 240 should be referenced in the context of "motor control centers," the content of Part H of Article 430 seems applicable to MCCs rated 600 volts and below (see Table 430-97). Part I of Article 240 (over 600 volts) should not be included in the reference unless Table 430-97 is expanded to include 5 kV and 7.2 kV motor starters.

(Log #2060)

11- 34 - (Table 430-97): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 11-63
RECOMMENDATION: Use the soft conversions generated by Code-Making Panel 9 for the identical values in Table 384.36 under Proposal 9-116. The dimensions are minimum safety requirements, reflected in the applicable product standards. Furthermore, motor control centers and switchboards are functionally equivalent, differing primarily in application only. Using different numbers for the same purposes will generate chaos in the manufacturing process.
SUBSTANTIATION: None given.
PANEL ACTION: Accept.
Change mm dimensions as follows:
1st column: 19.1, 31.8, 50.8
2nd column: 12.7, 19.1, 25.4
3rd column: 12.7, 12.7, 25.4
PANEL STATEMENT: The change is only for consistency with Table 384.36 as accepted by Code-Making Panel 9.

11- 44 - (430-102): Reject
SUBMITTER: William M. Lewis, Eli Lilly and Co.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: The proposal should be rejected.
SUBSTANTIATION: The recommendation does not address a valid safety of design issue, but an enforcement issue. Proper lock out tag out procedures will assure total safety from electrical shock or flash for all workers under the existing rules. Local disconnect switches are one of the weakest points in an industrial electrical system. Not only do they introduce an opportunity for nonqualified people to access live electricity but also they are the most common failure point in a typical motor circuit next to the motor itself. They are often subject to dirt, water, corrosion, and abuse and their installation where not required for lock out by nonqualified people presents a fire hazard. Also there are many places where "practicability" could be an area of disagreement. A laundry list of examples will never cover every eventuality. For instance, cleans rooms was not mentioned. This is an area where I usually do not install local disconnects, even if the rest of the building has them because of the difficulty of keeping the area sanitized. The suggestion that this will be minimal cost to the user is entirely inaccurate. Perhaps for a common pump in a clean pump room, it is minimal, however when you install 5000 of them in sizes up to 600 hp, the costs can become astronomical; all because of inadequate training of electricians or indifference to work safety requirements.
PANEL ACTION: Reject.
PANEL STATEMENT: The Panel Action on comment 11-56 has added a new provision to the exception, that specifically permits the use of the exception in industrial installations where conditions of maintenance and supervision ensure that only qualified persons will service the equipment. This change will resolve most of the concersn of those objecting to Proposals 11-68 and 11-69, and the original Panel Actions on them.

This submitter, together with many others, apparently assumes that Section 430-102(b) applies only to industrial installations, where OSHA regulations apply, and where there is worker training and qualification, and control and supervision of work practices. This is not an accurate assessment of the application of 430-102(b), which applies to any motor installation under Section 430-102, including residential and commercial installations. Such unlimited permissable use of remote lockable disconnecting means in lieu of disconnecting means in sight from the motor and driven machinery location is of major concern.

The submitter of Comment 11-153 has provided the panel with further field accident data in support of the panel action on the proposal. Also, as noted in the substantiation for Comment 11-153, and in dictionaries, the meanings of "practical" and "practicable" are not synonymous, although this could be an area of disagreement. The FPN stated in the panel action was worded so that it could not be construed as a laundry list.

It should be noted that the exception stated in the panel action on the proposal included the situation where a disconnecting means in sight from the motor and the driven machinery location would introduce additional or increased hazards to persons or property, as could be the case in clean rooms.

11- 46 - (430-102(a)): Reject
SUBMITTER: John E. Propst, Equilon Enterprises, LLC
COMMENT ON PROPOSAL NO: 11-67
RECOMMENDATION: The purpose for this comment is to reject the action of the panel and to reject the original proposal.
SUBSTANTIATION: As noted in Mr. Cox's explanation of negative vote, the proposal and panel has not provided any substantiation of any problem. Within industrial applications, there is a long and successful track record of assuring safety through the use of approved lockout tagout programs, even for disconnect devices located out of sight. There are many scenarios in which the location of disconnect devices within sight of the controller, in the context and requirements of this proposal, could result in a less safe installation. A more appropriate solution for the concern would be to have the employer and employees comply with the requirements of NFPA 70E-2000.
PANEL ACTION: Reject.
PANEL STATEMENT: Exception No. 2 is intended only to permit a single disconnecting means for more than one controller under specified conditions. It was never intended to permit this disconnecting means to be out of sight of the controller locations. A problem does not need to have occured in the field as a condition for the revision of the Code.

(Log #238)

11- 49 - (430-102(b)): Reject
SUBMITTER: Mark A. O'Brien, Fort James Corporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reconsider panel action and reject the proposal.
SUBSTANTIATION: The originator of this proposal did not supply any substantiation of any incidents or accidents caused by using the disconnecting means required in accordance with 430-120(a) for electrical safety lockout. The originator's statement that workers might attempt to work the equipment "hot" rather than walk an excessive distance is vague, a generality, and a violation of law. The originator's scenario substantiation stating that a worker who gets "hung up" in a piece of machinery could use a disconnect as a means of getting out of trouble clearly shows a lack of understanding of safety procedures, NFPA 70E requirements, and the Federal Law regarding lockouts. OSHA Regulations (Standards - 20 CFR) "The control of hazardous energy (lockout/tagout) - 1910.147 established the minimum requirement for safety lockout and tagout of all energy sources including electrical. Both OSHA and NFPA 70E presently provide for the correct and safe procedures to lock or tag electrical equipment.

Using a disconnect means required in 430-120(a) is a proven safe method of lockout. This is substantiated by many safe years with no accidents. Only when the law or company policy is violated has there been a problem. Fort James has put into effect all the practices required to be safe when locking out in accordance with all existing laws. Also, Fort James will discipline anyone not following these rules up to and including dismissal.

The submitter's statement that this change would be "at a very minor incremental cost to the owner" is not correct. At Fort James in Old Town, we have approximately 4000 motors. We purchase the latest standard of motor control centers with lockable devices for the purpose of lockout and tagout. Installing disconnects in the field for every motor will take up valuable field space that might interfere with operations but must be in sight of the motor. We have many motors that are clustered together which would make it difficult to find a location so close to the motors that a disconnect means to be within reach if one was to get "hung up". This proposed requirement has a very significant impact not only on cost, but also in real estate required. I realize that cost is no substitute for safety. However, in this particular case, the additional cost is not warranted when there is an already proven means of lockout.

There are many good reasons to use the disconnect required in 430-102(a) as the lockout device rather than a disconnect within sight of the motor. The starter disconnect is a proven safe lockout means. The starter also allows for determining if the starter is stopped prior to opening the disconnect. The disconnect at the starter is where everyone would go to check the status of equipment. The starter control circuit condition can be observed at the starter. It would be unsafe to open a disconnect at the motor without knowing the state of the starter.

I strongly request the panel reconsider its action and reject this proposal to remove exemption 430-102(b) based on inadequate substantiation supporting this requirement. The need for a field disconnect within sight of a motor should be left to the need of the user and not dictated by code.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Comment 11-44.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #239)

11- 50 - (430-102(b)): Reject
SUBMITTER: John T. Penberthy , Potlatch
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: I recommend reconsideration of the panel action and rejection of the proposal.
SUBSTANTIATION: The originator's substantiation of this proposal was incomplete and incorrect. He did not give examples of any accidents or injuries caused by following the current disconnect procedures outlined in 430-120(a) for electrical safety lockout. As well, his suggestion that an employee would routinely choose to circumvent the current requirements and work on equipment which is "hot" rather than walk a short distance, implies our employees blatantly disobey the law. It is a requirement of NFPA 70E and the Federal Law Regarding lockouts that these shortcuts not take place. OSHA Regulations (Standards - 20CFR) "The control of hazardous energy (lockout/tagout) - 1910.147 established the minimum requirement for safety lockout and tagout of all energy sources including electrical. Our company complies with these regulations on all lockout/tagout procedures. To imply we do otherwise is unsubstantiated and untrue.

The submitter of this proposal also stated that to convert to this new regulation would be "at a very minor incremental cost to the owner". It is obvious this statement has not been researched. At our site we currently have over 7,000 motors in service. Converting to a system, which requires disconnects for every motor in service would be very costly. As well, it is unnecessary. By following the requirements in 430-120(a) we are confident of safe operations and maintenance of our motors. It has only been when these methods have been violated that we have experienced problems.

Finally, it would be a mistake to eliminate the use of the disconnect required in 430-102(a). The option of using a disconnect, which is in sight of the motor instead of the controller disconnect gives rise to a whole new set of issues. The controller disconnect is where a worker can determine if the controller is open, prior to opening the disconnect. It would be unwise and a potential safety hazard to open or close a disconnect switch at the motor without knowing the state of the controller first.

In my opinion the only way to safely install local disconnects at every motor would be to install disconnects with control interlocks. These control interlocks would need to open before the disconnect opened and hopefully allow sufficient time for the controller to open. This type of installation would be at an even higher cost.

It is for these reasons that I strongly request the panel reconsider its action and reject this proposal to remove exemption 430-102(b). The reasons given for making the proposal are unsubstantiated. Determination of when a field disconnect is necessary should be left to each site affected, and not dictated by code.

PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Comment 11-44.

(Log #240)

11- 51 - (430-102(b)): Reject
SUBMITTER: Michael V. Glenn, Longview Fibre Co.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reconsider panel action and reject the proposal.
SUBSTANTIATION: The originator of this proposal did not supply any substantiation of any accidents caused by using the disconnecting means required in accordance with 430-120(a) for electrical safety lockout. The originator's statement that workers might attempt to work the equipment "hot" rather than walk an excessive distance is vague, a generality, and a violation of law. The originator's scenario substantiation stating that a worker who gets "hung up" in a piece of machinery could use a disconnect as a means of getting out of trouble is clearly a violation of all existing laws, safety procedures, NFPA 70E requirements, and the Federal Law Regarding lockouts. OSHA Regulations (Standards - 20CFR) "The control of hazardous energy (lockout/tagout) - 1910.147" establishes the minimum requirement for safety lockout and tagout of all energy sources including electrical. Both OSHA and NFPA 70E provide for the correct and safe procedures to lock or tag electrical equipment.

Using the disconnecting means required in 430-120(a) is a proven safe method of lock out. This is substantiated by many safe years with no accidents. Only when the law is violated has there been a problem. The submitter's statement that this change would be "at a very minor incremental cost to the owner" is incorrect. At our industrial facility we have approximately 8,000 AC and DC motors. We purchase the latest type of motor control centers with lockable devices just for the purpose of lockout and tagout. Installing disconnects in the field for every motor will increase building space and size requirements to provide the necessary space that does not interfere with operations but yet is in sight of the motor. For industrial type processes and equipment that must be coordinated and interlocked, it will require not only an interlocking scheme at the controller but at the disconnect as well. This will substantially increase the installed cost and the complexity of the equipment. This proposed requirement has a very significant impact not only on cost, but also in real estate required. I realize that cost is no substitute for safety. However, in this particular case the additional cost is not warranted when there is a proven safe means of lockout.

There are many more good reasons to use the disconnect required in 430-102(a) as the lockout device rather than a disconnect within sight of the motor. The controller disconnect is a proven safe lockout means. The controller disconnect allows for determining if the controller is open prior to opening or closing the circuit to the motor. It would be unwise to open or close a disconnect at the motor without knowing the state of the controller because the controller may be in the closed position and the motor could inadvertently start if the disconnect is closed. There are many automatic processes and equipment that for safety reasons cannot and should not have an individual motor de-energized without shutting down the process or the equipment as a whole. Using a disconnect at the motor in lieu of the controller disconnect bypasses all safety interlocking schemes.

I strongly request the panel reconsider its action and reject this proposal based on inadequate substantiation supporting this requirement, a significant financial impact on the user, and the increased industrial safety risks just mentioned. The need for a field disconnect within sight of the motor is an engineering design consideration and safety issue that should be left to the requirement of the user and not dictated by code.

Considering that industrial facilities have their own maintenance forces, purchase equipment that presently meet the requirement of the exemption in Article 430-102(b), have processes and environments that cannot tolerate a disconnect at the motor, and are more equipped to handle safety and lockout procedures, the following compromise may serve the purpose of both industry and the submitter: Change Article 430-102(b) Exemption to read as follows: "Exception: In an industrial facility or plant, a disconnecting means,...". The addition of the words "In an industrial facility or plant," limits the use of this procedure to those larger facilities that are manned, organized, and have better lockout and tagout control.

PANEL ACTION: Reject.

11- 52 - (430-102(b)): Reject
SUBMITTER: James A. Rooks, J & R Consulting Inc.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reconsider panel action and reject the proposal.
SUBSTANTIATION: The originator of the proposal did not supply substantiation of any accidents caused by proper use of the disconnect means now required in accordance with NEC 430-120(a) for electrical safety lockout. The originator's statement that workers might attempt to work equipment "hot" rather than walk an excessive distance is generally a serious disregard for safety issues. Usual operating procedures will require the disconnect at the source be opened and "locked out" before any work is done on the involved circuit or its motor. There is no acknowledgment that the disconnect is rated to interrupt motor load current. Opening a disconnect at the motor may allow false control scheme information to a process, causing possible serious process and/or safety issues elsewhere. The source disconnect still must be "locked out", still requiring the worker to walk the distance to that source four times. Any attempt to bypass the existing rules is a serious breach of safety rules and shows a disregard for human life.

Considering that safety and equipment ratings can be overcome, and the change is allowed, I suggest that as a minimum an exception be allowed for industry establishments which have and enforce an approved effectively safety "lock out" program.

PANEL ACTION: Reject.

(Log #244)

11- 54 - (430-102(b)): Reject
SUBMITTER: Walter Bruehl, Boise Cascade Corporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: The Boise Cascade Corporation strenuously objects to the proposed change to NEC Article 430-102(b) that would eliminate the following exception:

"A disconnecting means, in addition to the controller disconnecting means as required in accordance with Section 430-102(a), shall not be required for the motor where the disconnection means at the controller is individually capable of being locked in the open position."

SUBSTANTIATION: This provision is fundamental to our lockout/tagout policy and procedure. Many of our systems have multiple sources of energy that must be verified at zero energy and locked out before the equipment can be safely worked on. In addition to a single motor there are often other motors, compressed air, steam, various fluids and other sources of energy that must be secured, locked out and verified as having zero energy and no chemicals or other hazards to the worker prior to working on the equipment. We require the lockout of the entire "system" to be complete prior to work beginning. Employee violation of this policy can result in disciplinary action including loss of employment at Boise Cascade.

The proposed change to require a local disconnect switch at the motor may result in a greater hazard to the worker by tempting the worker to short cut the lockout process that assures that all hazards are put in a safe condition prior to work. They may simply throw the local switch and forget about the other hazards associated with the equipment. Further when the local switch is closed the machinery may restart in an undesired condition and result in additional damage or confusion.

The controls for most of our machinery would need to be modified in a manner to protect the machine and workers from an individual inadvertently opening a local disconnect switch prior to safely shutting down the machine and safely securing it.

Some of our motor driven equipment is in hazardous, corrosive, or wet environments. Our policy has long been to keep the number of electrical components in these environments to a minimum due to the difficulty maintaining the integrity of the enclosure and its internal components under these conditions. A field mounted disconnect switch in a hazardous environment would need to be rated for the environment to avoid introducing an explosive hazard.

Further, Boise Cascade Corporation has in excess of 30,000 motor drives some as large as 14,000 hp. The cost and space required for all the additional local disconnects would be very prohibitive.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Comment 11-44.

(Log #245)

11- 55 - (430-102(b)): Reject
SUBMITTER: Ray Crane, Weyerhaeuser Company Columbus Modified Fiber Facitlity
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Deleted text.
~~Add a second sentence to read:~~
~~"The disconnecting means required in accordance with 430-102(a) may also serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location."~~
~~Remove the exception in 430-102(b).~~
SUBSTANTIATION: Asbstract: The exception in 430-102(b) has allowed large industrial facilities to centralize their motor control and isolation equipment providing for a safe and proper environment for operating and maintaining electrical power equipment. These industrial facilities have maintenance and engineering systems in place such that only qualified personnel (as defined and required by 20 CFR) are allowed to disconnect, test, and lockout the equipment safely. Industry clearly identifies all lock out devices in the motor control centers and the motor and/or equipment. Standard Operating Procedures that meet or exceed the OSHA Electrical Safe Working Practices and the NFPA Standard for Electrical Safety Requirements for Employee Workplaces have been established and utilized for years. The submitter of the ROP has failed to justify this change because the examples provided entail direct violations of the law as well as deviations from any standard of safe work practices. There is no evidence of ANY accidents or safety incidents resulting from properly using the device required by 430-102(a) and properly following established and requisite lockout/tagout procedures required by 20 CFR and NFPA 70E. Our company has consistently used these practices for safely locking out and tagging of equipment prior to working on the equipment and our safety record clearly shows the procedure to be very effective.

Section 430-102 and the exceptions, has served industry well through the years and has done so in a safe manner. If the recommended changes were to be made, I believe it would increase the risk to employees. A few examples are as follows; increased chances of opening a disconnect under load, opening a disconnect to a dc motor with a fault and a large inertia that keeps the motor (generator) rotating, and opening a disconnect to a motor being driven by a variable frequency drive causing major damage to the drive.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel action on the proposal modified the existing exception, but did not delete it. See panel statement on Comment 11-44 and panel action and statement on Comment 11-56.

SUBMITTER: Ray Crane, Weyerhaeuser Company Columbus Modified Fiber Facitlity
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Add a second sentence to read:

"The disconnecting means required in accordance with 430-102(a) may also serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location."

~~Remove the exception in 430-102(b).~~ "Exception: In industrial occupancies, where conditions of maintenance and supervision ensure that only qualified persons service the installation, a ~~A~~ disconnecting means, in addition to the controller disconnecting means as required in accordance with Section 430-102(a), shall not be required for the motor where the disconnecting means for the controller is individually capable of being locked in the open position.

"FPN: For information on lockout/tagout procedures, see Standard for Electrical Safety Requirements for Employee Workplaces, NFPA 70E-1995."

SUBSTANTIATION: Abstract: The exception in 430-102(b) has allowed large industrial facilities to centralize their motor control and isolation equipment providing for a safe and proper environment for electrical power equipment. These industrial facilities have engineering and maintenance systems in place such that only qualified personnel (as defined and required by 20 CFR) are allowed to disconnect, test, and lockout the equipment safely. The submitter of the ROP has failed to justify this change because the examples provided entail direct violations of the law as well as deviations from any standard of safe work practices. There is no evidence of ANY accidents or safety incidents resulting from properly using the device required by 430-102(a) and properly following established and requisite lockout/tagout procedures required by 20 CFR and NFPA 70E.
PANEL ACTION: Accept in Principle.
Revise to read as follows:

"(b) Motor. A disconnecting means shall be located in sight from the motor location and the driven machinery location. The disconnecting means required in accordance with 430-102(a) shall be permitted to serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location.

Exception: The disconnecting means shall not be required to be in sight from the motor and the driven machinery location under either condition (1) or (2) below, provided the disconnecting means required in accordance with 430-102(a) is individually capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be permanently installed on or at the switch or circuit breaker used as the disconnecting means.

(1) Where such a location of the disconnecting means is impracticable or introduces additional or increased hazards to persons or property.

(2) In industrial installations, with written safety procedures, where conditions of maintenance and supervision ensure that only qualified persons will service the equipment.

FPN No. 1: Some examples of increased or additional hazards

include, but are not limited to: motors rated in excess of 100 Hp, multi-motor equipment, submersible motors, motors associated with variable frequency drives and motors located in hazardous (classified) locations.
Existing FPN to become FPN No. 2.
PANEL STATEMENT: The panel action meets the submitter's intent.

The panel reaffirms its position that where practicable and where the installation does not add increased or additional hazards, the motor disconnecting means shall be located within sight from the motor and driven machinery. The Panel however recognizes that frequently industrial establishments have a greater degree of control over the workplace. Data on the effectiveness of Lockout/Tagout programs for example, shows a correlation between the type of the facility and the effective implementation of the program. See for example the substantiation submitted with Comment 11-163. The addition of provision (2) of the exception should ensure that only those facilities that are most likely to have an effective Lockout/Tagout program can utilize the exception. Note that the provision for impracticable or additional or increased hazard remains unchanged from the original Panel action on Proposal 11-68.

This revision of the original panel action on the proposal adds condition (2) to the exception, editorially modifies the exception for clarity, and clarifies the use of the FPNs. The intent of condition (2) was recommended or suggested in Comments 11-56, 11-68, 11-117, 11-119, 11-125, 11-149, 11-163, 11-164, 11-168, 11-210 and 11-211, and also in comments expressed in voting on the panel action on the proposal.

11- 57 - (430-102(b)): Reject
SUBMITTER: Thomas A. Phelps, Bowater Incorporated
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reconsider panel action and reject the proposal.
SUBSTANTIATION: The originator of this proposal did not take into account the additional safety risk presented when relying on a disconnect switch located in view of the motor. A disconnect switch is not designed to start and stop a motor. If used for this purpose, it will eventually fail and cause equipment damage and possible personal injury. A motor starter is provided to start and stop the motor. Placing the disconnect switch at or near the motor will encourage its use as the starting and stopping device. Our practice is to locate the disconnect device at the starter in an environmental protected control center remote from the motor. Our lockout policy requires that we stop the motor, verify that the starter has opened, and proceed to open and lockout the disconnect switch. Making sure that the starter has done its job prior to opening the disconnect switch is a very important step in our safety procedure. Locating the disconnect switch near the motor would not eliminate the need to witness the motor starter in the open state before opening the disconnect switch.

The originator of this proposal suggests that people will violate the law and fail to lockout because the disconnect switch is installed in an inconvenient remote location. The people that might ignore this safety requirement are the same people who would likely use the proposed local disconnect switch without first shutting down and verifying that the motor is electrically disconnected by the starter. As mentioned above, the disconnect switch is not designed to dissipate the energy flowing to a motor. With age, and repeated use the switch will physically fail when used as the stopping derive. The resultant explosion will likely occur when someone's hand is on the handle of the disconnect device.

The originator suggests that the proposal will result in minor incremental cost to the owner. This is not true. It will be extremely expensive and in some cases not practical. We have some 10,000 motors in this industrial facility. Thirty three of these are 5,000 and 6,000 hp each. Because of the physical size of these disconnect devices, locating them in view of the motors is not practical. Cost is no substitute for safety. However, additional cost in this case will not improve safety. A proven safe means of lockout already exists.

The originator's statement "when the distance is excessive, workers attempt to work the equipment hot, rather than walk the distance four times" is vague, a generality, and the acceptance of a violation of law. The originator's suggestion that the disconnect device being located in view of the motor will be of assistance when a worker gets "hung up" clearly shows a lack of understanding of safety and an acceptance of unsafe work practices.

I strongly request the panel reconsider is action and reject this proposal to remove exemption 430-102(b) based on the increased safety risk that it would impose.

(Log #256)

11- 59 - (430-102(b)): Reject
SUBMITTER: Walter Bruehl, Boise Cascade Corporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reconsider panel action and reject the proposal. Leave this section as it appears in the 1999 code.
SUBSTANTIATION: NEC Section 430-102(b) Exception is fundamental to our lockout/tagout policy and procedure. All of our lockouts for process motors are done at the motor controller. Only a few simple stand-alone machines have local disconnects. Many of our systems have multiple sources of energy that must be verified at zero energy and locked out before the equipment can be safely worked on. In addition to a single motor there are often other motors, compressed air, steam, various fluids and other sources of energy that must be secured, locked out and verified as having zero energy and no chemicals or other hazards to the worker prior to working on the equipment. We require the lockout of the entire "system" to be complete prior to work beginning. Employee violation of this policy can result in disciplinary action including loss of employment.

The proposed change to require a local disconnect switch at the motor may result in a greater hazard to the worker by tempting the worker to short cut the lockout process that assures that all hazards are put in a safe condition prior to work. They may simply throw the local switch and forget about the other hazards associated with the equipment. Further, when the local switch is closed the machinery may restart in an undesired condition and result in additional damage or confusion.

The controls for most of our machinery would need to be modified in a manner to protect the machine and workers from an individual inadvertently opening a local disconnect switch prior to safely shutting down the machine or process and safely securing it.

Some motor driven equipment is in hazardous, corrosive or wet environments. It is desirable to keep the number of electrical components in these environments to a minimum due to the difficulty maintaining the integrity of the enclosure and its internal components under these conditions. A field mounted disconnect switch in a hazardous environment would need to be rated for the environment to avoid introducing an explosive hazard.

The author of the proposal to eliminate this exception may not be aware of the additional hazards introduced in the process industries by requiring local disconnects. These additional

disconnect switches are unnecessary and undesirable from a safety standpoint in the process industries.
PANEL ACTION: Reject.
PANEL STATEMENT: Leaving the exception unchanged would not include the panel action on Proposal 11-70. See panel statement on Comment 11-44.

(Log #259)

11- 60 - (430-102(b)): Reject
SUBMITTER: William F. Robertson, AGRA Simons Engineering, Inc.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reconsider panel action. Reject the proposal.
SUBSTANTIATION: The referenced proposal describes a problem that would not exist if maintenance workers follow OSHA safety procedures, as described in CFR 29, 1910.149. The referenced safety procedures are not optional. They are enforced by federal and state governmental agencies. Every business employing maintenance personnel requires strict compliance with these regulations. I challenge the proposal submitter to provide the name of any business that tolerates the actions of maintenance personnel described in his proposal.

Panel member Cox points to Section 90-1(b), which eloquently states:

"This Code contains provisions that are considered necessary for safety. Compliance therewith and proper maintenance will result in an installation that is essentially free from hazard but not necessarily efficient, convenient, or adequate for good service or future expansion of electrical use."

Existing Code requirements for disconnects are safe and adequate. Both of the submitter's "Serious problems" would not exist if OSHA lockout and tag-out procedures are followed...even though they may be inconvenient.

Further, the submitter provides no documentation to support his claim that a serious problem exists. He provides no statistics or data describing the number of injuries directly attributed to inadequate disconnects. Why did the panel vote to accept this proposal without supporting data? Certainly, inconvenience is not supporting data for a statement that existing Code requirements for disconnects are inadequate.

Further, the submitter's claim that locally-mounted disconnects can be installed "At very minor incremental cost to the owner" is false and misleading. Consider the following estimated installed costs, based on nationally recognized estimating data (e.g., Means), for locally-mounted, nonfused disconnect switches, including control wiring for an auxiliary contact on the switch installed in the motor control circuit.

Description	0.5-10 hp	50 hp	100 hp	150 hp
Nonfused switch, NEMA 4 encl.	$896	$985	$2732	$5447
Switch Labor	100	168	248	356
Switch terminations	72	120	240	240
Control cable material (220 ft)	180	180	180	180
Control cable labor	352	352	352	352
Conduit material (30 ft)	70	70	70	70
Conduit labor	300	300	300	300
Control terminations	40	40	40	40
Cable tray (ignored)				
Totals	$2010	$2215	$4162	$6985

The above installations are typical of equipment installed in the pulp and paper industry. Auxiliary contacts on switches are wired to PLC input cards, the cost of which were not included in the above example.

Larger 460 volt, paper machine motors (e.g., 600 - 1200 hp) would also require local disconnect switches. The installed cost of a 2000 A, 600 volt class bolted pressure switch in a NEMA 3R enclosure is about $20,000. The size of these switches may require an additional 8 - 10 feet in a paper machine drive isle. Consider a 400 ft long paper machine, an 80 ft tall building and a $3/ft^3$ building cost. The increased cost of the building alone is about $960,000.

This proposal would also apply to medium voltage motors. The installed cost for a 600 A, 5 kV class switch suitable for a 250 hp, 4000 volt motor will be about $17,000. These switches typically have a 3 ft x 5 ft footprint and require 4 ft - 0 in. working space in front.

Imagine the installed cost of this proposal for a larger paper mill with 6000 motors. These are not "minor incremental costs", they are staggering!

Application of a nonfused disconnect switch is more difficult and misunderstood than one might imagine. A nonfused disconnect switch's short-circuit withstand current rating is based on the upstream overcurrent device. If the upstream overcurrent device is a fuse, the switch's short-circuit withstand rating is the same as the fuse's interrupting current rating. If the upstream overcurrent device is a circuit breaker, the switch's short-circuit withstand current rating is 10 kA, unless the switch has been tested with that specific circuit breaker type. In reality, nonfused switches are rarely tested with upstream circuit breakers. There are simply too many combinations of switches and circuit breakers to make this economically attractive.

In most industrial plants in this country, the upstream overcurrent device will be a circuit breaker in a motor starter. The maximum available fault current on a motor control center bus fed from a 2000 kVA, 5.75 percent impedance transformer, connected to a primary system with a short-circuit capability of about 1000 MVA, is typically in the range of 50,000 amperes. The available fault current at a nonfused disconnect switch fed from a starter in such an MCC will depend on the impedance of the motor feeder. For motors rated 10 hp and less, a 12 AWG motor feeder would have to be about 24 ft long to reduce the fault duty on a locally-mounted nonfused switch to less than 10 kA rms asymmetrical. However, about 425 ft would be required for a 2/0 AWG feeder to a 100 hp motor. When the available fault current exceeds 10 kA, the disconnect device must be a fused switch, a molded case switch or a circuit breaker. Fused switches are often avoided because of associated single-phasing problems. The costs of molded case switches and circuit breakers are significantly higher than nonfused switches.

In summary, the panel should reconsider and reject the original proposal. The proposal is a solution to a problem that would not exist, if OSHA tag-out and lockout procedures are followed. The costs to implement the proposal are staggering for large industrial plants, and the benefits are minuscule. Existing Code requirements for motor disconnects are both safe and adequate. Changing the Code to make maintenance convenient is not the work of this panel.
PANEL ACTION: Reject.

(Log #261)

11- 61 - (430-102(b)): Reject
SUBMITTER: Ray Crane, Weyerhaeuser Company Columbus Modified Fiber Facitlity
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reject this proposal.
SUBSTANTIATION: Abstract: The exception in 430-102(b) has allowed large industrial facilities to centralize their motor control and isolation equipment providing for a safe and proper environment for electrical power equipment away from wet, caustic, explosive, and other hazardous locations. These industrial facilities have engineering and maintenance systems in place such that only qualified personnel (as defined and required by 29 CFR Part 1910) are allowed to disconnect, test, and lockout the equipment safely. The submitter of the Proposal has failed to justify this change because the samples provided entail direct violations of the law as well as deviations from any standard of safe work practices. There is no evidence of ANY accidents or safety incidents resulting from properly using the device required by 430-102(a) and properly following established and requisite lockout/tagout procedures required by 29 CFR Part 1910 and NFPA 70E.

Substantiation: The submitter of this Proposal has not supplied any substantiation for this change. I am not aware of any accidents caused by properly using the disconnecting means required in accordance with 430-120(a) for electrical safety lockout as required by 29 CFR Part 1910. I am aware, however, of several incidents caused by unqualified operators using field mounted disconnects for a lockout. These incidents include, opening disconnects under fault conditions such as DC motors with large inertia loads, standing in water while operating the disconnect, failing to test the

circuit to ensure that it is de-energized, explosions caused by equipment failure due to deterioration in adverse environments, explosions caused by using a nonload break disconnect to interrupt a running motor.

Implementing the change called for by this Proposal will, in my professional opinion, lead to further abuses of the lockout/tagout standards required by 29 CFR Part 1910 and NFPA 70E. With the disconnect located at the machine, unqualified persons will be tempted to operate the disconnect "just for a second" rather than properly lockout the equipment.

The originator's statement that workers might attempt to work the equipment "hot" rather than walk an excessive distance is vague, a generality, violation of Federal, State and Local law and our Companies Standard Operating Procedures. The originator's substantiation, stating that a worker who gets "hung up" in a piece of machinery could use a disconnect as a means of getting out of trouble clearly shows a lack of understanding of all safety procedures, NFPA 70E requirements, and the Federal Law Regarding lockouts. OSHA Regulations (Standard - 29 CFR Part 1910) "The control of hazardous energy (lockout/tagout) - 1910.147 established the minimum requirement for safety lockout and tagout of all energy sources including electrical. Both OSHA and NFPA 70E presently provide for the correct and safe procedures to lock or tag electrical equipment. The originator is not taking into consideration the Industry Standards now in effect and the Education and Development of our team members in safely locking out and tagging out equipment before working on the equipment. Industry today has dramatically improved the expectations and accountability of Safe Working Practices and has developed Safe Working Behaviors for all team members that are required to work on or operate equipment requiring removing power.

Using the disconnecting means required in 430-120(a) is a proven safe method of lock out. This is substantiated by many safe years of following these standards with no accidents. Only when the law is violated has there been a problem. The submitter's statement that this change would be "at a very minor incremental cost to the owner" is incorrect. At our industrial facility we have approximately 400 AC and DC motors from fractional to 800 HP. We purchase the latest type of motor control centers with lockable devices just for the purpose of lockout and tagout. Also we go the extra mile in protecting our team members by installing current limiting fuses in series with the circuit breakers or disconnecting means, just in case a fault occurs in the starter compartment. These current limiters interrupt the short circuit in less than a half cycle.

Installing disconnects in the field for every motor will increase building space and size requirements to provide the necessary space that does not interfere with operations but yet in sight of the motor. This proposed requirement has a very significant impact not only on cost, but also in real estate required. I realize that cost is no substitute for safety. However, in this particular case the additional cost is not warranted when there is a proven safe means of lockout and the recommendation will only increase the risk as stated above.

There are many good reasons to use the disconnect required in 430-102(a) as the lockout device rather than a disconnect within site of the motor. The controller disconnect is a proven safe lockout means. The controller disconnect allows for determining if the controller is open prior to opening the disconnect. The disconnect at the controller is where most everyone would go to check the status of the equipment. Proper identification at both the starter and the motor assists the person in disconnecting the proper equipment. Having a common location for disconnecting motors from the power source allows the controllers to be in an air conditioned, clean atmosphere reducing the risk of electrical faults from extreme atmospheres typical to industry. The controller control circuit condition can be observed at the controller. It would be unwise to open or close a disconnect at the motor without knowing if the controller has been opened by the control circuit.

I strongly request the panel reconsider its action and reject this proposal to remove exemption 430-102(b) based on inadequate substantiation supporting this requirement. The need for a field disconnect within sight of the motor should be left to the need of the user and not dictated by code.

PANEL ACTION: Reject.

11- 62 - (430-102(b)): Reject
SUBMITTER: David Kay, Weyerhaeuser Corp.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reconsider panel action and reject the proposal.
SUBSTANTIATION: I strongly disagree with the statements of the originator of this proposal. He did not submit any documentation to support his contention that the current method of locking out is unsafe. I have never heard of anyone being injured by following a lockout procedure; quite the contrary, the injuries happen when people fail to follow the lockout procedure. In my 15 years in paper mills it has not been my experience that people will take whatever time is required to lock out properly. If a worker refuses to properly lock out, it won't matter whether he has to walk 150 ft or 15 ft. In addition, the cost of local disconnects would be prohibitive. It's not uncommon for a medium-sized mill to have 5000 installed motors; larger mills may have 7000 or more. At a conservative cost of $500 per installed disconnect, the cost to a medium-sized mill would be $2.5 million. This does not include any costs associated with building considerations. In some situations, it would be difficult to install a line-of-sight disconnect without significant structural modifications.

Summary: I strongly request that the panel reconsider its action and reject this proposal. It tries to address a problem that doesn't exist. Everyone is in favor of safety. Because of this safety focus, we have developed a very effective lockout policy that incorporates the safest available equipment and the accompanying documentation. Every lockout-related issue is fully and thoroughly investigated. We already have a program that works very well. There is little to be gained by spending huge sums of money to install additional equipment that provides little, if any, additional protection.

PANEL ACTION: Reject.

11- 63 - (430-102(b)): Reject
SUBMITTER: Terry Howle, Westvaco
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: I recommend that this proposal not be included in the 2002 NEC.
SUBSTANTIATION: 430-102(b) provides an exception for the disconnecting means to be located at a place other than within sight of the motor location and driven machinery location provided the disconnecting means is capable of being locked in the open position.

The design of the Westvaco Wickliffe, KY mill has the motor starter which is also the disconnecting means located in climate controlled rooms (Electrical Control Rooms). All motors are identified at the motor location (usually at the local start/stop station) and also on the starter door in the electrical control room. Our policy for lockout calls for a motor to be locked out at the starter. Verification is also included-the worker must try to start the motor from the local start/stop station and verify that it does not start. This has served the mill well for many years.

The additional costs of installing a local disconnect for the power leads to the motors is not warranted. These additional connection points (one for the wires coming into the local disconnect, and one for the outgoing wires) add to the potential for loose connections which usually cause failure. In addition, some motors are installed in areas that are hot and humid, thus adding to the potential for failure of the disconnect.

I recommend the panel reconsider and reject the proposal to remove exception 430-102(b) from the 2002 NEC because 430-102(b) provides a safe lockout method for motors.

PANEL ACTION: Reject.

11- 64 - (430-102(b)): Reject
SUBMITTER: Adrian E. Totty, Fort James Corporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: I would encourage the panel to reject this proposal as unnecessary.
SUBSTANTIATION: The current OSHA regulations (1910.147) requiring that all energy sources be locked out is more than sufficient.

To assume a worker would not lock out a motor because they had to walk a short distance is a misconception and is without substantiation.

In the Muskogee Mill, failure to lock out results in dismissal. There have been no accidents due to not locking out a motor in over 20 years of operation and we have over 5000 motors.

The implementation of this proposal would result in a great expense on industry without any added benefits. I urge you to reconsider your action on the proposal.
PANEL ACTION: Reject.

11- 65 - (430-102(b)): Reject
SUBMITTER: Jim Lepin, Fort James
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reconsider panel action and reject the proposal.
SUBSTANTIATION: The originator of this proposal did not supply any substantiation of any incidents or accidents caused by using the disconnecting means required in accordance with 430-120(a) for electrical safety lockout. The originator's statement that workers might attempt to work the equipment "hot" rather than walk an excessive distance is vague, a generality, and a violation of law. The originator's scenario substantiation stating that a worker who gets "hung up" in a piece of machinery could use a disconnect as a means of getting out of trouble clearly shows a lack of understanding of safety procedures. NFPA 70E requirements, and the Federal Law regarding lockouts. OSHA Regulations (Standards - 20 CFR) "The control of hazardous energy (lockout/tagout) - 1910.147 established the minimum requirement for safety lockout and tag-out of all energy sources including electrical. Both OSHA and NFPA 70E presently provide for the correct and safe procedures to lock or tag electrical equipment.

Using a disconnect means required in 430-120(a) is a proven safe method of lockout. This is substantiated by many safe years with no accidents. Only when the law or company policies are violated has there been a problem. Fort James has put into effect all the practices required to be safe when locking out in accordance with all existing laws. Also, Fort James will discipline anyone not following these rules up to and including dismissal.

The submitter's statement that this change would be "at a very minor incremental cost to the owner" is not correct. At the Fort James pulp and paper mill in Oregon, we have approximately 4000 motors. We purchase the latest standard of motor control centers with lockable devices for the purpose of lockout and tag-out. Installing disconnects in the field for every motor will take up valuable field space that might interfere with operations but must be in sight of the motor. We have many motors that are clustered together which would make it difficult to find a location close to the motors as a disconnect means to be within reach if one was to get "hung up." This proposed requirement would have a very significant impact not only on cost, but also in real estate required. I realize that cost is no substitute for safety. However, in this particular case, the additional cost is not warranted when there is an already proven means of lockout in place.

There are many good reasons to use the disconnect required in 430-102(a) as the lockout device rather than a disconnect within sight of the motor. The starter disconnect is a proven safe lockout means. The starter also allows for determining if the starter is stopped prior to opening the disconnect. The disconnect at the starter is where everyone would go to check the status of equipment. The starter control circuit condition can be observed at the starter. It would be unsafe to open a disconnect at the motor without knowing the state of the starter.

I strongly request the panel reconsider its action and reject this proposal to remove exemption 430-102(b) based on inadequate substantiation supporting this requirement.
PANEL ACTION: Reject.

11- 66 - (430-102(b)): Reject
SUBMITTER: Daniel J. Cassidy, Great Northern Paper, Inc.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: I recommend that this proposal be reconsidered and rejected.
SUBSTANTIATION: The submitter of this proposal does not cite any instances where this exception has caused damage or injury. The reasoning presented in the substantiation could be used to argue for a disconnecting means within sight of any electrical equipment. If the problem to be addressed is the "walking distance" to the disconnect, then it would seem that a disconnect installed nearby but not necessarily within sight of the motor should also be permitted (i.e., a controller disconnect located in an electrical room close to the motor location). The suggested location being in sight of the "...driven machinery location" would be difficult to satisfy for industrial machinery, where often the entire machine is not within sight of the motor itself (i.e., a motor in the basement driving a machine on the floor above, a long conveyor with a motor at one end, etc.). The proposal does not distinguish between motors of below 600V and those above 600V, thereby requiring disconnecting means within sight of very large motors operating at higher voltages. The statement that "workers attempt to work the equipment 'hot', rather than walk the distance..." is simply a blatant disregard of established modern safety practices.

Good engineering practice dictates that the motor controller should start and stop the motor, and the disconnecting means should be used primarily as an isolating device. Installing a locally mounted disconnect switch exposes personnel to some risk if the switch is operated under load, the risk being greater for larger motors at higher voltages. At our facility, whatever locally mounted disconnects have been deemed necessary, we have interlocked the control circuit of the controller with an auxiliary contact of the locally mounted switch, which will cause the controller to open if the locally mounted switch is opened. This also ensures that the switch is not energized when it is closed, since the controller is prevented from operating until the switch is closed. Our preference, however, is to use the controller disconnecting means for lockout wherever possible.

As to the submitter's claim that the proposal would result in a "... minor incremental cost..." this may be true for a facility with a few small motors, but for an industrial facility with hundreds of thousands of motors, many above 500 HP and some of several thousand HP, the impact on cost and space requirements would be fairly significant! I certainly do not suggest that cost should override safety concerns, but for a proposal with a cost impact of this magnitude, I believe the substantiation should be more specific and that the practical implications should be given consideration. The current code accommodates practical considerations while providing for safe lock out, however, it requires accurate identification of the disconnecting means for each motor, and secure locking provisions at the controller disconnecting means.

(Log #323)

11- 68 - (430-102(b)): Accept in Principle
SUBMITTER: Larry Menche, Willamette Industries Inc.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reconsider panel action and reject the proposal to remove exemption 430-102(b) or include an exception for supervised locations.
SUBSTANTIATION: OSHA regulations (Standards - 20 CFR) "The Control of Hazardous Energy" (lockout/tagout) 1910.147 established the minimum requirements for safety lockout and tagout of all energy sources including electrical. Both OSHA and NFPA 70E presently provide for the correct and safe procedures to lock or tag electrical equipment. Using the disconnecting means required in 430-120(a) is a proven safe method of lockout.
There are many good reasons to use the disconnect required in 403-102(a) as the lockout device rather than a disconnect within sight of the motor.
• The controller disconnect is a proven safe lockout.
• There will be more of a tendency for someone not to lockout properly because they can see the disconnecting means.
• The disconnect at the controller is the logical place most people would go to check equipment status.
• The controller circuit condition can be observed at the controller.
• The controller control circuit condition can be observed at the controller.
• It could be hazardous to open a disconnect on a running piece of equipment where controls and associated interlocks are not also opened.
• It could be hazardous closing a disconnect to a piece of equipment when the contactor is already closed, thus starting the motor etc. with the disconnect.
The need for a field disconnect within sight of the motor should be left to the need of the user and not dictated by code.
PANEL ACTION: Accept in Principle.

COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reconsider Panel Action and retain the wording of Section 430-102(b) and its Exception as it is in the 1999 NFPA 70.
SUBSTANTIATION: The wording of the 1999 NEC Section 430-102(b) and the wording of the Exception are sufficient to provide for the safe isolation of the motors covered under this section.

Further comments:

Our workforce, as with other large industrial facilities, consists of highly skilled and thoroughly trained professionals. Our facility has a well-developed policy for the control of hazardous energy (lockout/tagout) as required under 20 CFR 1910.147 and referenced in the existing FPN under Section 430-102(b). Our employees, as well as outside contractors performing work in the facility, are regularly trained on this procedure. This procedure has resulted in the reduction of both workplace injuries and damage to equipment. Both OSHA and NFPA 70E presently provide for safe procedures to lock or tag electrical equipment. The requirements under 430-102(a) provide a proven and safe disconnecting method.

There are many benefits to using the controller disconnect under 430-102(a) as the disconnecting and lockout device rather than a field disconnect located at the motor. Programmable Logic Controllers (PLCs) are used in many industrial facilities for controlling motors. Opening the motor controller disconnect device (a fused disconnect, MCP or breaker) removes all power from within the controller supplying all devices related to that controller. If a field disconnect at the motor were to be used, a set of auxiliary contacts must be included to open the controller to prevent closing the local disconnect into a start command. Furthermore, the electrical status of the motor circuit can be fully determined only at the motor controller and not at a field disconnect near the motor. Additionally, the disconnecting device used to isolate the controller is rated to handle both motor and fault currents. A typical nonfused disconnecting device that would be used at the motor is not usually rated to handle fault current.

Another concern relating to the use of a field disconnect is that process areas of industrial facilities may be wet, corrosive, and/or dusty. These types of conditions negatively impact the integrity, reliability, and ultimate safety of field (at the motor) installation of disconnect switches even when the best available NEMA 3R, 4 and 4X enclosures are used. Adequate space, NEC Section 110-26 "Spaces About Electrical Equipment," for the proper installation of these additional devices could also be a great problem. The space problem, of course, increases as the motor horsepower increases.

We have nearly 8,000 in-service motors (AC and DC) at our facility. These motors vary in size from fractional horsepower to 2500 hp. We use state-of-the-art grouped motor control centers (MCCs) for 460 volt applications and grouped medium voltage controllers for 2300 Volt motors. This equipment is located within Electrical Control Rooms (ECRs) many of which are air-conditioned and supplied with highly filtered pressurizing air. All motor control equipment is purchased with the means of physically locking its source-disconnecting device. The space required to safely install an additional disconnect at or within sight of each motor is simply not available within our facility. A local, at the motor, disconnect is another point of potential failure. In fact, due to the conditions mentioned above at the motor location, the potential for failure is high. A local disconnect also provides the greatest potential within the electrical system for exposure by unqualified personnel. Since safety, not convenience, is the primary concern for any electrical installation, we feel Article 430, Sections 102(a) and (b) provides a proven safe and reliable means to isolate a motor.

Additionally, we support the negative responses of Mr. Cox and Mr. Saunders as reported under Panel Action, NEC Proposal 11-61, as they relate to Log #2926 and Log #4074. Therefore, the Luke Electrical Committee requests that the panel reconsiders its proposed change and keep the Exception under 430-102(b) as is, except for the possible inclusion of an additional FPN(s) for clarity. The decision to use or not use a field disconnect device within sight of the motor should be dependent upon the user's application and the principles of good engineering practice and should not be dictated by the National Electrical Code.
PANEL ACTION: Reject.
PANEL STATEMENT: Leaving the exception unchanged would not include the panel action on Proposal 11-70. See panel statement on Comment 11-44.

(Log #351)

11- 79 - (430-102(b)): Reject
SUBMITTER: J. B. Gonzalez, R.M. Montgomery, WESTVACO Corporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reconsider Panel Action and reject the proposal.
SUBSTANTIATION: The originator of this proposal seems to have not given consideration to typical industrial installations. If acted upon without due consideration of all facts, the panel could possibly make an erroneous judgment.

Industrial facilities can present wet, corrosive, and/or dusty environments that can be very detrimental to the integrity and reliability of field (at the motor site) mounted disconnect devices. Equipment installed in NEMA 3R, 4, or 4X enclosures has been subjected to failure when exposed to such environments over a period of time. From experience, installations of load-break disconnect switches in NEMA 4X stainless steel enclosures at motor sites have resulted in some failures due to excessive corrosion within a period of about five years.

Although 600V class load-break disconnects are readily available for smaller motors, they are very difficult to find for 200 HP and larger motors. Furthermore, medium voltage motors would require the installation of motor controllers at the motor site. Such controllers are available in neither NEMA 4 nor NEMA 4X enclosures and require real estate not available in the great majority of applications. Field space limitations can result in violations of NEC Section 110-26: Spaces About Electrical Equipment, especially when these larger disconnect devices would be required.

Our facility has a long-standing practice of purchasing state-of-the-art, grouped motor control centers and medium voltage motor controllers with lockable devices for 460V and 2300/4160V applications, respectively. They are located in electrical control rooms (ECRs) that are pressurized with filtered air to minimize outside air intrusion and environmentally conditioned to control temperature and humidity. This installation provides an optimum environment for the safe and reliable operation of these devices.

Like most industrial facilities, our workforce consists of highly skilled, thoroughly trained professionals whose personal safety, as well as the safety of their coworkers, is paramount. OSHA and NFPA 70E lockout and tag procedures are strictly observed for isolation of equipment at the respective motor controller. Workers are required to go to the ECR to properly isolate the source of power. Workers are also provided with the means to verify, at the motor site, that the motor has been properly isolated from its power source.

The proponent of 11-68-(430-102(b)) Log #4074 has failed to provide specific facts to properly substantiate his position. Furthermore, our experience indicates that a clearly written and established lockout and tag procedure in accordance to OSHA and NFPA 70E will insure worker safety. Procedures such as ours are safe and straightforward, whereas locating the disconnect device near the motor in a hostile environment may result in equipment faults and unsafe and unreliable operation.

Therefore, we strongly request that the panel reconsider its action and reject this proposal to remove exemption 430-102(b) based on inadequate substantiation supporting this requirement. The need for a field disconnect within sight of the motor should be left to the specific need of the user and not dictated by code.
PANEL ACTION: Reject.

11- 80 - (430-102(b)): Reject
SUBMITTER: Anthony L. Sherrill, Batesville, AR
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: The panel should have rejected the proposal.
SUBSTANTIATION: • The code panel realized that this proposal was not practical in many applications. The wording in the panel's revised exception makes this proposal unenforceable. Each application could be argued as impracticable or as adding additional hazards. Every location where the local disconnect is added could present additional hazards because it could expose unqualified personnel to live circuits. Also, if more expensive "Load Break Disconnects" are not installed, additional hazards are introduced by the possibility of unqualified personnel operating the disconnects under load. If this were truly a safety issue, there should not be thousands of applications where the requirement is impracticable.

• OSHA Lockout/Tagout procedures, when properly followed, have proven adequate for many years in the chemical industry. The example in the substantiation is a severe violation of this standard. As qualified electricians, we are expected to follow OSHA safety standards. The additional local disconnect will not necessarily protect those who choose not to follow established safety standards.

• This substantiation is based on a single job. It seems to me that the application the submitter refers to should not fall under the exception to Section 430-102(b) since the circuit breaker is not "capable of being locked in the open position." Also, the OSHA Lockout/Tagout procedures should eliminate the question of who has the authority to lock or unlock the disconnect.

• I am only familiar with working in the chemical industry where OSHA regulations are strictly enforced. If this proposal was accepted because of areas where these regulations are not strictly enforced, there should at least be an exception for areas where the conditions of maintenance and supervision ensure that only qualified personnel utilizing the OSHA Lockout/Tagout procedures perform maintenance on the equipment.
PANEL ACTION: Reject.

11- 81 - (430-102(b)): Reject
SUBMITTER: John Leibee, PPG Industries
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Leave existing text in NEC 1999 430-102(b) as it stands.
SUBSTANTIATION: The justification for Proposal 11-68 states that workers would attempt to work the equipment "hot" as opposed to walking to lockout a disconnect is a people problem and not a Code issue.
This proposal also will allow the same worker to open a disconnect "within sight" and not apply a lock and still be in compliance with NFPA 70E Chapter 5, paragraph 5-1.3.1. This poses a more serious threat because the disconnect can be closed while the workers' back is turned or while he is at a break or lunch. This just happened in our area and resulted in a fatality.
PANEL ACTION: Reject.
PANEL STATEMENT: Leaving the exception unchanged would not include the panel action on Proposal 11-70. See panel statement on Comment 11-44.

11- 83 - (430-102(b)): Reject
SUBMITTER: James D. Erwin, Celanese Ltd
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: I am formally rejecting the panel acceptance in principle of:
Proposal No. 11-68 (430-102(b)): Accept in Principle NEC-P11 (Log #4074)
SUBSTANTIATION: The panel does not provide sufficient technical support to accept this proposal. The submitter states as his substantiation, "When the distance is excessive, workers attempt to work the equipment "hot," rather than walk the distance four times." The violation of existing codes and safety policies do not necessitate their change or removal. Petrochemical facilities incorporate very stringent lockout/tagout procedures based upon OSHA and NEC requirements and allowances. If safety policies based upon the current NEC are in place and strictly enforced, you will not have the situation of a worker getting "hung up". The submitter also refers to the addition of local disconnecting means as a "very minor incremental cost to the owner". This is far from the truth when explosion-proof disconnects are required in electrically classified facilities, especially when their use cannot be substantiated.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Comment 11-44.

SUBMITTER: James D. Erwin, Celanese Ltd
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: I am formally rejecting the panel acceptance in principle of:
Proposal No. 11-69 (430-102(b)): Accept in Principle NEC-P11 (Log #2926)
SUBSTANTIATION: The panel does not provide sufficient technical support to accept this proposal. In petrochemical facilities, lockout/tagout procedures are written and strictly enforced at all levels, including the provisions for locking out the primary disconnecting means. The submitter states that, "There is a very good possibility that a disconnect switch can be unlocked and energized when a maintenance personnel is asked to turn on a specific exhaust fan because of odors they want to exhaust out of a room. This is in direct violation of existing OSHA and NEC policies and is not sufficient reason to change existing NEC allowances. Besides, if this occurs at a location, no minimum number of disconnecting means, local or otherwise, would suffice if someone is bent upon restoring power. Additionally, if the local disconnecting means is not the load-break type, additional safety hazards could be introduced. Once again, you are depending upon written safety procedures to ensure that the equipment is operated properly. Contrary to what the submitter states, the only sure way that electrical personnel are "in control of the switch", is to follow established lockout/tagout procedures which include verification that the equipment is deenergized before working on it. This can be safely accomplished using existing NEC allowances without the need of installing local disconnecting means.
PANEL ACTION: Reject.

(Log #646)

11- 86 - (430-102(b)): Reject
SUBMITTER: Raymond Pearigen, International Paper
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reject the proposal and retain the current 430-102(b) Exception.
SUBSTANTIATION: The International Paper mill in Georgetown, SC is a fully integrated pulp and paper facility employing 800 plus people, and makes uncoated paper and pulp for market.
The Georgetown Mill is concerned about the proposed change to Article 430 from the NEC Panel 11 committee which will eliminate an exception which allows disconnects to be located out of sight provided disconnects can be locked in the open position for the following reasons.

The environment in a paper mill, as well as may other process industries is less than perfect. The introduction of disconnects at the motor will make motor installations more failure prone and will make void past work which has put disconnects and motor controllers into dedicated electric rooms, thereby making them more reliable.

There is a legitimate safety concern of utilizing local disconnects to make or break the motor load after the effects of age and environment have taken their toll. Failure of the disconnect to open or close properly can create a hazardous condition to employee safety and potential damage to equipment. Once again, the present practice of locating controllers and disconnects in dedicated electric rooms minimizes the role that the operating floor environment can play in equipment failure.

The addition of disconnects in the field will require additional interlocks to prove closed the disconnect on pieces of equipment requiring sequencing on startup and shutdown. However, the addition of such interlocks can interject more problems when troubleshooting in the field.

Furthermore, the lock out of motors is already a requirement of OSHA 1910.147. In facilities such as the Georgetown Mill, where proper maintenance and training exists, and strict adherence to a "lock out, tag out" policy is required, there is no need for a disconnect in sight of a motor.

Finally, while it is realized that cost is not the only criteria for accepting or rejecting a new change to the NEC, it must be noted that this proposal will add additional cost to every new motor installation, and increased maintenance cost over the life of the equipment which the motor serves. These costs will be incurred in the harsh industrial environment that characterizes process industries.

PANEL ACTION: Reject.

(Log #649)

11- 89 - (430-102(b)): Reject

SUBMITTER: Dennis M. Dauzuk, International Paper

COMMENT ON PROPOSAL NO: 11-68

RECOMMENDATION: Reject the proposal and retain the current 430-102(b) Exception.

SUBSTANTIATION: The International Paper mill in Georgetown, SC is a pulp and paper facility employing 800 people, and manufactures uncoated paper and pulp.

The Georgetown Mill is concerned about the proposed change to Article 430 from the NEC Panel 11 committee which will eliminate the current which allows disconnects to be located out of sight of the equipment, provided it can be locked in the open position.

There is a safety concern when utilizing local, within sight of the

motor. Failure of the disconnect to properly open or close would create a hazardous condition to employee safety and potential damage to equipment. The current industrial design of constructing dedicated electrical equipment rooms minimizes the role that the operating floor environment contributes to increased employee risks with the failure of electrical equipment.

The lock out of motors, and other energy sources, is already a requirement of OSHA 1910.147. In facilities such as the Georgetown Mill, where proper maintenance and training exists, with strict adherence to a "lock out, tag out" policy is required, there is no need for a disconnect in sight of a motor.

The addition of disconnects in the field will add complexity to the electrical interlock systems without adding any benefits. The addition of the added interlocks will interject more problems when troubleshooting.

Finally, while it is realized that cost is not the only criteria for accepting or rejecting a new change to the NEC, it must be noted that this proposal will add additional cost to every new motor installation, and increased maintenance cost over the life of the equipment which the motor serves. These costs will further limit the success of domestic industries that compete in global markets.

PANEL ACTION: Reject.

11- 92 - (430-102(b)): Reject
SUBMITTER: S. L. Ralston, Madison, IN
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: As noted in the negative vote comments, no evidence was presented that indicated an unsafe condition. OSHA 1910.147 and NFPA 70E requirements for lockout-tagout have proven to be safe in countless installations for years of service. A disconnect is not designed for or intended as stop or start device. If a disconnect is installed on the load side of the controller ,it will likely be used to stop and start the motor. Local stop, start push buttons or special emergency stop control circuits operate the controller to safely stop and start the motor.

The NEC has never required a disconnecting device in sight of the motor in industrial locations where trained operation and maintenance personnel are used. This requirement has not always been required for all applications. The 1971 NEC, Section 430-86(a), allowed the controller disconnect to serve as the motor disconnect where the controller disconnect was lockable. In the 1993 NEC, Section 430-86 was deleted and disconnecting location requirements were moved to Section 430-102 with a 430-102(b) exception to allow a lockable controller disconnect to serve as the motor disconnect. Between 1974 and 1993 the exception for allowing a lockable controller disconnect to be the motor disconnect applied for industrial locations. The 1993, 1996, and 1999 NECs made this exception applicable to all locations with only editorial revisions in those three Codes. This is safe and the 1999 NEC wording should be kept. If an in-sight disconnect is required and a motor is inadvertently started by closing this disconnect, an unsafe condition will be created.

PANEL ACTION: Reject.

11- 100 - (430-102(b)): Reject
SUBMITTER: Alan J. Greene, International Paper Co.
COMMENT ON PROPOSAL NO: 11-68, 11-69, 11-70
RECOMMENDATION: Leave 430-102(b) as is currently worded in the 1996 NEC. As stated, the code provides adequate protection and a means for locking out individual pieces of equipment. The paragraph calls for a local disconnecting means unless there is an individual, lockable, disconnecting means at the controller location.
SUBSTANTIATION: The existing exception in the 1996 NEC is adequate safety protection provided: (1) The disconnecting means at the controller is a permanently installed, lockable mechanism, and (2) a controlled lockout system or procedure is in place. The addition of a field disconnect invites many additional problems, both in safety and in reliability. Complex interlocking between the controller and field disconnect would be required, and relied on, in order to make the opening and closing of the field disconnect safe. Also, the additional hardware added to the motor circuit provides another source of potential reliability problems, especially as the equipment ages. In closing, I would seriously doubt that adding a new restrictive NEC Code would mean much to a company or individual who is currently not enforcing or following the intent of OSHA 1910.147. Is the NEC moving from ensuring adequate protection and installation practices are utilized to providing convenience?

SUBMITTER: Jim Bruce, International Paper Co.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Disregard this proposal in its entirety. Make no changes to the section.
SUBSTANTIATION: 1. The environment at many motors is less than ideal. A local disconnect adds another potential source of failure to a motor circuit. It has taken years to move motor controls from the local area to electrical control rooms to improve the reliability of the equipment and the safety to personnel disconnecting motors or working on the motor controls. This item would move the industry in reverse.
2. Many motors are locked out for work on equipment that is not "visible" from the work area. Examples are conveyors, paper machines, fans, boilers, etc. Would this new ruling require multiple disconnects?
3. Disconnects could possibly pose a hazard if opened or closed while under load as the units age, particularly in less than environmentally friendly atmospheres. Even the installation of an auxiliary interlock, while reducing the hazard, would not eliminate the situation should the interlock fail.
4. Lockout of the motor disconnect is already required by OSHA 1910.147. In locations where proper maintenance and supervision exists, there is no need for a local disconnect when the regulations are followed.
5. Many systems have "interlocks" from a starter auxiliary contact. This would require adding an interlock at the disconnect to prove the disconnect was also closed.
PANEL ACTION: Reject.

SUBMITTER: Robert B. Alexander, Fluor Daniel
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: • This proposal lacks sufficient substantiation. There is no offer for public review in either the proposal or the panel statement that establishes how many deaths or injuries, if any, would be prevented by requiring local disconnects where current installation requirements are met and safe work practices are followed.

• The examples given in this proposal are, at best, anecdotal. In fact, in the lone substantive anecdote the current system worked properly.

• It is not necessarily the intent of code to make workers "comfortable"; in fact, when working on dangerous systems workers should be decidedly uncomfortable, so that they will take great care to ensure their safety with strict adherence to safe work practices.

• Panel action on Proposal 11-70 properly addressed the legitimate concerns of this proposal.

11- 110 - (430-102(b)): Reject
SUBMITTER: William D. Glover, New Martinsville, WV
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: The substantiation offered for this proposal seems to be only an expression of safety concerns. There is no evidence presented in this proposal nor is there any generally recognized evidence that these concerns represent a safety problem that should be corrected by changing the existing wording of 430-102(b).

The safety concern, stated in the substantiation, of working the equipment "hot" rather than walk the distance four times would not be corrected by this proposed code change. Employers lockout/tagout procedures will continue to require lockout/tagout of these motors by the same well established procedure of applying the lock at the controller location. These locations typically contain the required lockout devices, safety equipment, restricted access, Nomex clothing, fire extinguishers and other safety features that are not available at scattered field locations.

The safety concern, stated in the substantiation, of a worker being "hung up" should be discounted as it is already properly handled by the local start/stop or E-stop circuits. A disconnect switch installed for this purpose would place the operator of the switch in danger since it is not rated for this service.

The proposed changes will not achieve their stated objectives. Lockout/tagout confusion will result and additional safety hazards will be created. The existing wording of 430-102(b) has a proven safety record over a long period of time.

SUBMITTER: J. Pat Roche, Celanese Acetate
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: The substantiation provided is inadequate for such a significant change. It is based on personnel violating recognized safety procedures required to be followed by OSHA. The requirements established by the NEC can never be effective in preventing willful violations of requirements such as these. The reference to excessive distances is undefined and too imprecise for any meaningful substantiation. Ten feet might be excessive to someone who is going to violate safe work practices.

The present exception requires a disconnecting means at the controller, which is capable of being locked in the open position. When the equipment specified by the existing code language is used and required safe work practices are followed no one is going to be "hung up". The proposal substantiation did not contain even one specific instance, just a possibility of what might happen if someone violated recognized safety procedures. This is not adequate substantiation.

The generalizations of the substantiation continued with the reference to "very minor incremental cost". The cost for future thousands of unnecessary disconnects, some of which would have to be explosion-proof, is not "very minor".
PANEL ACTION: Reject.

11- 114 - (430-102(b)): Reject
SUBMITTER: J. Pat Roche, Celanese Acetate
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: The substantiation provided is inadequate for such a significant change. I asked "how do you lock out a circuit breaker that is not capable of being locked out". You can't; and if the electrician had such a situation, the installation did not meet existing code. The existing exception requires the disconnecting means for the controller is individually capable of being locked in the open position. This is the essential safety requirement - lock and tag. That is the only sure way personnel are in control.

Even if that disconnect is in sight of the motor, and it is not locked out - that is an unsafe situation. Who knows what happens when the person working turns his back or steps away for a moment. Dependence on being within sight of the disconnecting means and possibly not locking the disconnecting means is a more unsafe situation.

The incident related in the substantiation apparently involved several safety procedure violations. The lock being cut off implies it was not tagged properly. It was apparently not the electrician's own safety lock, or it would not have had to be cut off after he was notified. Why didn't the worker have his own lock and tag on the disconnecting means. Note too procedures did work as he was still notified before the equipment was energized.

The addition of many unnecessary, costly disconnecting means is no remedy for not following required safe work practices.
PANEL ACTION: Reject.

(Log #895)

11- 115 - (430-102(b)): Reject
SUBMITTER: Kurt D. Brillhart, Hemlock Semiconductor Corporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Revise 430-102(b): The motor controller disconnect means shall be capable of being locked in the open position. If a disconnecting means is not located in sight from motor location and the driven machinery location, then motor operating controls for the motor controller shall be in sight from the motor location.

Revise exception in 430-102(b): If the motor controller disconnect means is not capable of being locked in the open position then a lockable disconnecting means shall be located in site from the motor location and driven machinery location.

Revise FPN: A lockable disconnecting means in sight of the motor location and the driven machinery location provides a convenient method for working on motors and driven machinery. For information on lockout/tagout procedures see Standard for Electrical Safety Requirements for Employee Workplaces, NFPA 70E-1995.
SUBSTANTIATION: The current wording of 430-102(b), its exception and proposed change 11-68 are out of compliance with OSHA requirements, standard equipment, and safe work practices. The principle of the "in sight disconnect" is to provide a disconnect means close to the work area to provide a worker a convenient method to isolate the energy source and protect the worker. However, since the installation of OSHA Regulation 1910.147: "The control of hazardous energy (lockout/tagout)" and 1910.333: "Selection and use of work practices", this is no longer considered a safe method to protect workers. The principle of these standards is that equipment must be de-energized and locked out to work on that equipment. As 1910.333(b)(2) states: "Lockout and Tagging." While any employee is exposed to contact with parts of fixed electric equipment or circuits which have been deenergized, the circuits energizing the parts shall be locked out or tagged or both in accordance with the requirements of this paragraph.

A second point is that most of today's installations involve a combination disconnect means and motor controller. All of this equipment is built and designed with the latest advancements in lockout methods. This is largely due to OSHA regulation 1910.147(c)(2)(iii) that states: After January 2, 1990, whenever replacement or major repair, renovation or modification of a machine or equipment is performed, and whenever new machines or equipment are installed, energy isolating devices for such machine or equipment shall be designed to accept a lockout device.

All lookouts must properly test the effectiveness of the lockout. In other words the worker must be in full view of motor and the driven machinery and attempt start the equipment to prove that the proper energy source has been deenergized. This stipulation is covered under 1910.147(c)(4)(ii)(D) which states: Procedures shall clearly ... outline... specific requirements for testing a machine or equipment to determine and verify the effectiveness of lockout devices, tagout devices, and other energy control measures.

Lockout procedures and standards is true worker safety. No safe guard can protect workers if they take safety shortcuts and remove safety barriers. Furthermore, opening a disconnect means that is located in site from motor location that is not lockable or is not locked out prior to performing work on electrical circuits is prohibited under OSHA standards. Thus, "lockability" of the disconnecting means is far more important than disconnect location. Thus, a lockable disconnect means should be the general rule. If the disconnect means is not located in site from motor then the operating controls must be within site to test the effectiveness of the lockout. This also provides the proper method for shutting off the circuit if a worker gets "hung up" in the equipment. Finally, an in sight disconnect means is purely a convenience, and it should not be a general requirement since it does not provide any additional safety to the worker.
PANEL ACTION: Reject.
PANEL STATEMENT: Motor operating controls for the motor controller are not suitable as disconnecting means under Part J. The recommended text would require that a snap switch used as both the motor controller and disconnecting means, and located within sight of the motor, be lockable.

(Log #896)

11- 116 - (430-102(b)): Reject
SUBMITTER: Kurt D. Brillhart, Hemlock Semiconductor Corporation
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: The panel should reject the proposal.
SUBSTANTIATION: There is no evidence to support the injuries and deaths that have occurred because of ineffectiveness of OSHA standard 1910.147 or NFPA 70E-1995 standard and that a disconnect switch within site of the motor will reduce injuries. In fact, the number of injuries has decreased since the inception of these standards/regulations.

Ironically, a disconnect in sight of the motor and driven machinery location can provide a false sense of security and lead to possible safety risks by making it too easy to flip the switch off and skip the lockout. "In Sight" is roughly defined as visible within 50 feet. A worker cannot keep their eyes on the position of the disconnect switch all the time, especially when it is 50 feet away or takes a lunch break. It is very easy to get preoccupied with one's task and miss someone flipping on the disconnect switch.

The person servicing the equipment is responsible for their own safety and ensuring that the equipment is adequately locked out. Lockout is for the safety of the personnel servicing the equipment. This is specifically addressed in 1910.147(b) "Definitions" which states: "Authorized employee. A person who locks out or tags out machines or equipment in order to perform servicing or maintenance on that machine or equipment. An affected employee becomes an authorized employee when the employee's duties include performing servicing or maintenance covered under this section."

Improper removal of a lock can happen with a disconnect switch located within sight of the motor. This can happen when the worker goes on break or is preoccupied. The only true safe guard against this type of incidence is following proper safety practices and lockout/tagout procedures. So while a nearby disconnect may make personnel "feel" comfortable, there is no substitute for a lock on a disconnect means with only a key in your pocket. The existing NEC requirements in 430-102(b) and its exception have been time proven to be adequate to protect workers and should not be changed.

PANEL ACTION: Reject.

11- 117 - (430-102(b)): Accept in Principle
SUBMITTER: John Paschal, Bechtel
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Leave the existing code wording unchanged, at least in industrial establishments where only skilled professional persons work on electrical systems, and where lock-out, tag-out procedures are commonly followed.
SUBSTANTIATION: There is no reason to add the expense of local motor disconnects, many of which are outdoor and/or explosionproof, where combination motor controllers can be padlocked in the OFF position and tagged out. The skilled professional workmen in these industrial areas are trained in safety, and would no more remove someone else's padlock to energize a circuit than they would cut off their own arm. More than in almost any other discipline, the electrical discipline requires disciplined personnel, and it is impossible to make something foolproof to undisciplined persons. The extra local switch is like putting an expensive band-aid over cancer. What needs to be done is to eliminate the caner, the unskilled, and undisciplined person who would remove someone else's padlock and then energize a circuit.
PANEL ACTION: Accept in Principle.

11- 118 - (430-102(b)): Reject
SUBMITTER: Stephen Whitfield, Solvay Polymers, Inc.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: We very strongly disagree with Mr. Michael I. Callanan's recommendation to remove the exception in 430-102(b).
SUBSTANTIATION: We agree with all of the arguments presented by messieurs Cox, Hammer, Sanders, and Thomas in the Explanation of Negative. One point mentioned by Mr. Cox should be stressed: "Disconnects are not designed to be used as controllers." Since the purpose of this recommendation seems to be to provide a lockout point near the motor the possibility that the disconnect could be opened under load presents a real danger. Mr. Thomas summed it up quite well in his statement, "The existing text is adequate to provide a safe installation." We have a Lockout/Tagout procedure that meets the requirements of OSHA and NFPA 70E and even prior to those regulations have enjoyed decades without an injury due to improperly locking out a motor.
We further take issue with Mr. Callanan's substantiation for requesting the change. His statement that "workers attempt to work the equipment 'hot' rather than walk the distance..." to lock it out borders on ludicrous. Any electrician in our plant with that attitude of laziness and disrespect for safety rules would be terminated immediately. In addition, we disagree with his statement that disconnects could be added "at very minor incremental cost to the owner." We have hundreds of motors in our plant. The cost to add a disconnect in each motor circuit would be anything but "minor."
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Comment 11-44.

11- 119 - (430-102(b)): Accept in Principle
SUBMITTER: John Sigmund, PPG Industries
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Exception to read as follows:
Exception: A disconnecting means, in addition to the controller disconnecting means as required in accordance with section 430-102(a), shall not be required for the motor where the disconnecting means for the controller is individually capable of being locked in the open position, provided that conditions of maintenance and supervision assure that lockout procedures are followed.
SUBSTANTIATION: The justification for proposal 11-68 states that workers may work equipment hot rather than follow lockout procedures. In a plant that has supervision and maintenance training that requires the strict adherence to lockout procedures, this would not be tolerated. Following safety procedures is a condition of employment, and violation risks termination. Following lockout procedures would also negate the second justification of a worker getting "hung up" in equipment. Lockout procedures would not allow guards to be removed from equipment before the lockout had taken place.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 11-56.

11- 121 - (430-102(b)): Reject
SUBMITTER: Walter Finn, Dow Corning Corporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: I am recommending deletion of the proposed change that would require a disconnect located at individual motors.
SUBSTANTIATION: As a former IBEW electrician with honorary withdrawal status, I hope that the motivation behind this proposed change is a well intended safety recommendation, even though I believe it misses the mark. Safety of personnel is appropriately accomplished with the current required lockout procedure. There are no statistics that support the recommendation. A very small percentage (I would guess less than 2 percent) of situations would require an electrician to walk 5 minutes to accomplish lockout. It would be more sensible to require disconnects on motors that are greater than 500 ft from an NEC/OSHA approved disconnecting means, although having a local stop is in my estimation is a better overall solution.
The addition of disconnects will not only add cost and decrease reliability, but will create new safety risks. I recall that the proposal says these would not be required where hazard is increased by installation of a disconnect or where "impracticable". This would be very difficult to assess, and would result in numerous problems and disparities between installations. Motors are often in areas that are outdoors, dusty or dirty, even though the areas are not defined by NEC as "hazardous" or "classified". Disconnects, even when rated for these applications, corrode and fall into poor conditions in these areas.
I believe the requirement to have local disconnects at HVAC units is a useful and safety improving requirement, although these disconnects, even though rated for the area, often freeze up and/or corrode to the point they are not workable. The proposed requirement will encompass situations that do not have the same criteria that HVAC units typically have (more complicated power and control than a single motor). When we design systems that have similar remote applications where the benefit outweighs the disadvantages, we design local disconnects in the system. If the approach had been to try to assess the situations where the benefit would outweigh the downside, and require local lockable disconnects in these "exception locations", it would be more likely to provide a benefit to the safety of workers. However, it would be a difficult task, as individual situations have many differences.

PANEL ACTION: Reject.
PANEL STATEMENT: The panel action did not remove the exception and would not require a disconnecting means at every motor. See panel statement on Comment 11-44 and panel action and statement on Comment 11-56.

11- 122 - (430-102(b)): Reject
SUBMITTER: Craig M. Wellman, Newark, DE
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: The panel should revise its action so it only accepts the following:
"The provisions for locking or addition of a lock shall be permanently installed on or at the switch or circuit breaker used as a disconnecting means."
SUBSTANTIATION: Substantiation for the NEC addition above was well stated by the original proposer. The substantiation offered for other parts of his proposal are not persuasive.
It is currently a legal requirement that equipment be deenergized and a lock and tag procedure followed. The statement that some people prefer to work equipment hot rather than walk the distance is the same as saying some people prefer to not wear seat belts because they are uncomfortable. Well, wearing seat belts is a legal requirement in most jurisdictions and enforcement processes are increasingly effective. Enforcement processes are also available for following lockout procedures.
The other issue is the worker who gets "hung up" in moving equipment. A local disconnect switch is not an adequate solution for this hazard. A disconnect switch would still not be close enough or easy enough for an operator in trouble to throw. Where that hazard exists, an emergency stop button or a pull cord or a two-hand release is already required before the equipment can be used.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Comment 11-44.

11- 122a - (430-102(b)): Reject
SUBMITTER: Jerry Spencer, Potlatch Corporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Leave text in 1999 NEC as is.
SUBSTANTIATION: All of the substantiation offered ignores OSHA lockout/tagout. If a personal lock and tag on a disconnect will not deter a person from closing the disconnect, with discharge a near certainty for violators, after OSHA penalties, nothing will deter them, short of standing with both arms wrapped around the handle. A worker who doesn't lock out a distant disconnect will not lock out a near disconnect, but feel safer.
PANEL ACTION: Reject.
PANEL STATEMENT: The reference is incorrect. Leaving the exception unchanged would not include the panel action on proposal 11-70, which the submitter has ignored. See panel statement on comment 11-44.

11- 123 - (430-102(b)): Reject
SUBMITTER: Rusty Harp, Cognis Corporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: The panel should reject this proposal.
SUBSTANTIATION: As noted under FPN, this proposal has been clarified under NFPA 70E-1995 regulations including Lockout/Tagout procedures under OSHA 1910.147. Enforcement of these procedures is the responsibility of the person doing the work. Additional line of site disconnects will not improve personal safety for those individuals who do not practice nor follow safety guidelines or procedures. The current text under Section 430-102(b) is adequate for personal and equipment safety.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Comment 11-44.

11- 124 - (430-102(b)): Reject
SUBMITTER: Rusty Harp, Cognis Corporation
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: The panel should reject this proposal.
SUBSTANTIATION: Removing the exception 430-102(b) implies that the motor/equipment intended for service is safe to work on since the worker has opened the line of site disconnecting means. However, this doesn't mean that the supply power to the controller has been opened and therefore hazardous conditions(s) may exist to the unknowingly worker. Exception 430-102(b) provides a means of safety for the worker by disconnecting power from the controller. Enforcing NFPA 70E-1995 Lockout/ Tagout and the contents of the existing 430-102(b) is adequate for personnel and equipment safety.
PANEL ACTION: Reject.

11- 125 - (430-102(b)): Accept in Principle
SUBMITTER: Brian L. Bashore, International Paper Lock Haven Mill
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Add a second sentence to read:
"The disconnecting means required in accordance with 430-102(a) may also serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location."
Remove the exception in 430-102(b).
I disagree with the proposed recommendation from Michael I. Callanan.
(b) Motor. A disconnecting means shall be located in sight from the motor location and driven machinery location. The disconnecting means required in accordance with 430-102(a) shall be permitted to serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location.
Exception: The disconnecting means shall not be required to be in sight of the motor if such a location of the disconnecting means is impracticable or introduces additional or increased hazards to persons or property <u>or in locations where proper maintenance and supervision exists</u> and the disconnecting means is individually capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be permanently installed on or at the switch or circuit breaker used as the disconnecting means.
FPN*: Some examples of increased or additional hazards include, but are not limited to; motors rated in excess of 100 hp, multi-motor equipment, submersible motors, motors associated with variable frequency drives and motors located in hazardous (classified) locations."
*FPN: Fine Print Notes are informational only and are not enforceable as requirements of the Code. This means that this rule could be applied to any new or upgraded installation at the discretion of the authority having jurisdiction.
The exception needs to stay and add to the exception "property or in locations where proper maintenance and supervision exists."
SUBSTANTIATION: Reasons for my comments are 11 years of Electrical Maintenance experience in an industrial facility.
The Lock Haven Mill has equipment and starter labeling and zero energy state procedures that make this proposed change unnecessary in an industrial facility.
The environment at many motors is less than ideal. A local disconnect would add another potential source of failure to a motor circuit. The Lock Haven Mill has been moving motor controls from the local area to electrical control rooms to improve the reliability of the equipment and the safety to personnel disconnecting motors or working on the motor controls. This item would move the industry in reverse.

Many motors are locked out for work on equipment that is not "visible" from the work area. Examples are DC motors, medium voltage motors, etc. This new ruling requiring disconnects in sight of the motor would create a serious safety hazard for qualified and unqualified personnel at the Lock Haven Mill and other facilities.

Disconnects could possibly pose a hazard if opened or closed while under load as the units age, particularly in less than environmentally friendly atmospheres. Even the installation of auxiliary interlock, while reducing the hazard, would not eliminate the situation should the interlock fail.

These disconnects would be added to the mill infrared routes. This would create a safety hazard for these employees that open and scan this equipment under load in less than environmentally friendly atmospheres.

Lockout of the motor disconnect is already required by OSHA 1910.147. In locations where proper maintenance and supervision exists, there is no need for a local disconnect when the regulations are followed.

Many systems have "interlocks" from a starter auxiliary contact. This would require adding an interlock at the disconnect to prove the disconnect was also closed. This would increase the potential for problems and expose the Mill's maintenance personnel to more hazards when troubleshooting.

11- 127 - (430-102(b)): Reject
SUBMITTER: Barry Peterson, Bayer Corporation
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: The panel should have rejected the proposal.
SUBSTANTIATION: As stated in the negative vote comments, there is no evidence presented that an unsafe condition exists. OSHA 1910.147 and NFPA 70E requirements on lockout/tagout have proven to be safe in countless installations and years of service.

In hazardous areas, a disconnecting means is just one more place to possibly cause an unnecessary safety problem. Example - Someone opening the switch under load and possibly causing an explosion or not tightening the bolts on the disconnect after opening it. This voids the area classification rating of the disconnect.

A possible exception should be that "Where OSHA 1910.147 and NFPA 70E requirements are met, the existing exception for 430-102(b) is acceptable."
PANEL ACTION: Reject.

SUBMITTER: Tim Fisher, Sr., Cognis Corporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: The Panel should reject this proposal.
SUBSTANTIATION: Proposal 11-68 should be rejected by the panel due to several reasons:

1. The manner in which the exception is worded makes enforcement almost impossible because there is too much room for interpretation of "impracticable" by the authority having jurisdiction.
2. OSHA lockout/tagout and NFPA 70E already require that the machinery have a mechanism for the mechanic to lockout all sources of energy to the equipment. The problem of accidental energization is taken care of as long as these rules are followed and enforced.
3. The addition of another electrical device in a circuit for remote machinery is simply adding significant cost and an additional source of failure to that circuit.

SUBMITTER: R. Ken Gibbs, Anheuser-Busch Companies Inc
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Proposal should be rejected. The present wording is well understood within the industry and assures safe installations when proper maintenance procedures are in place.
SUBSTANTIATION: Contrary to the "Substantiation", it is our experience that proper trouble-shooting of motor circuits begins at the controller location. As such, lock-out/tag-out devices are applied at the controller disconnecting means prior to progressing the trouble-shooting process to the motor if necessary. A separate, local motor disconnect provides no additional safety value but would add additional installation costs, require on/off status feedback to the automatic control circuit, encourage potential unintended operating abuses, and introduce another point of failure to the motor circuitry. Strategically placed local emergency stop stations should provide a failsafe means to bring operating equipment to a zero energy state vs. installation of individual motor disconnects that may in many cases be inaccessible in a personnel emergency. Responsible owners assure plant safety through the preparation and enforcement of operating and maintenance procedures including detailed training programs.

SUBMITTER: Kenneth P. White, Olin Corp.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reject Proposal 11-68, leave existing wording.
SUBSTANTIATION: As a user who had local disconnects in a chemical plant as a plant policy and has since removed them, I am very much against local disconnects. Unless the disconnect is fully rated, you have the risk of an operator opening the disconnect to stop the motor, thus exposing the individual to a possible arc flash. You also have to interlock the contactor to prevent operators from closing the disconnect to start the motor. These interlocks often fail and electricians often jump them out to keep equipment running. Disconnects, often subject to exposure from chemicals, are subject to failure, again exposing personnel to arc flash. The existing lockout procedures that are in agreement with OSHA and 70E have worked very well for several years keeping people safe when working on motors.
PANEL ACTION: Reject.
PANEL STATEMENT: Leaving the exception unchanged would not include the panel action on Proposal 11-70. See panel statement on Comment 11-44.

11- 132 - (430-102(b)): Reject
SUBMITTER: Dann Strube, Lanesville, IN
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: This proposal should have been rejected.
SUBSTANTIATION: The current rule is adequate for safety. The statement that workers will not use lock-out tag-out is defective. If the worker is too lazy to go 100 feet, they are also too lazy to go 50 feet. Proper training and worker compliance with safe work practice will provide safety. Throwing money at the problem will not.

Contrary to the proposer's statement the cost of this change is not small. The cost of this change is monumental. Since the FPN is not a requirement, we may find inspectors requiring the additional disconnect for very large motors or motors in hazardous locations. Even without that problem the cost to the industry is unacceptable.

All of the negative votes on this proposal were 100% correct.
PANEL ACTION: Reject.

(Log #1344)

11- 134 - (430-102(b)): Reject
SUBMITTER: Larry T. Smith, National Electrical Seminars
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reject Proposal 11-68 in its entirety.
SUBSTANTIATION: There are four reasons to reconsider and reject this proposal.
1. The proposer hasn't offered any tangible evidence to substantiate a change of this magnitude.
2. Existing Lockout/Tagout requirements coupled with mandated employee training, and the existing provisions of Sections 430-102(b) are an effective combination.
3. There is nothing to prevent the installation of disconnecting means within sight of the motor as an extra measure of safety.
4. The term additional or increased hazards is totally subjective.

First. Where are the statistics to support this revision? Show us the money! How many accidents and fatalities can be attributed to 430-102(b) as presently written? If the numbers are there, we as an industry should embrace the proposed change. If the numbers existed, I believe that Mr. Cox, Mr. Hamer, Mr. Saunders and Mr. Thomas, representing their respective industries, would be leading the charge instead of casting negative votes and opinions.

Second. Is Lockout/Tagout an employee training mandated by OSHA ineffective? Acceptance of the proposal would seem to indicate so.

Third. Even though Section 430-102(b) doesn't require a disconnecting means within sight of the motor when the controller is capable of being locked in the open position, the option of providing one within sight is always there. And many times it is provided. It is policy for many industrial plants, grain companies and railroads to provide a disconnecting means within sight of the motor. It's been an optional extra measure of safety and, at times, convenience.

Fourth. The term additional or increased hazards is totally subjective. Any engineer, inspector, contractor, building owner and even installer who chooses to omit the disconnecting means because it will introduce additional or increased hazards might well be assuming some liability in the event of an accident involving the motor installation.

In conclusion, I urge the members of the panel to carefully weigh their decision. Let the proposer come forth with the statistics to support the change - then we can all support it.
PANEL ACTION: Reject.

11- 137 - (430-102(b)): Reject
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: The panel should have rejected the proposal.
SUBSTANTIATION: As stated in the negative vote comments, there is no evidence presented that an unsafe condition exists. The substantiation provided indicates a lack of training by the employer and a lack of discipline by the employees. OSHA 1910.147 and NFPA 70E requirements on lock out-tag out have proven to be safe in countless installations and years of service. A disconnecting means is not designed for or intended as an emergency stop means. The local stop pushbutton or specially designed emergency stop control circuits serve that function.
The panel rewrite is vague and unenforceable. "Impracticable" is a word that will generate disagreements between the designer/owner and the inspector on many installations. Since the FPN is not a mandatory part of the code, inspectors could disregard it and require disconnects in sight from the motor locations where the panel has already agreed that they may introduce additional or increased hazards.
It should also be pointed out that if the panel permits some installations without a disconnecting means in sight from the motor location and the panel accepts those as safe installations, then all installations should be safe without a disconnecting means as proposed.
PANEL ACTION: Reject.

(Log #1432)

11- 139 - (430-102(b)): Reject
SUBMITTER: Tom Kwarciany, Carl Lippens, Gunter Wise, Andrew Weber, & Patty Skufca, Mead Paper
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: On behalf of Mead Corporation, my employer, we urgently request that the panel reject this proposal and prevent it from becoming law.
SUBSTANTIATION: The subject defined proposal is a recommendation to make mandatory the use of a local disconnecting means for all electrical motors. The purpose of this rebuttal is to ask the NFPA to vote against this proposal and prevent it from becoming law.
The substantiation used by the submitter of the proposal is based on assumptions and inaccuracies. The safety concerns brought up are opinion and are by no means justification for such an involved change. The first safety argument suggests that employees may be tempted to work on "hot" equipment if the distance to the disconnecting means is excessive. We at Mead Paper have policies and training in place to prevent any such activity. Such behavior would be dealt with in a swift and severe manner up to and including dismissal. In addition, a local disconnect would encourage the act of switching a motor under load whether or not a load-braking type disconnect is installed, a very dangerous act in and of itself. Further, we question strongly the assumption that a trained craftsperson would rather work on a kive 480, 2300, or 4160 volt system to save the effort of walking an "excessive" distance or even climbing a few flights of stairs. The second safety argument suggests a local disconnect would help in the event that a worker got "hung up". The problem is that if you are "hung up", it would be difficult to throw a disconnect switch. When the proper lockout/tagout procedure is followed, the opportunity for a "hang-up" doesn't exist. Furthermore, in locations where "hang-up" hazards exist for operating machinery, emergency stop buttons are in place at several strategic points around the equipment, whereas a single local disconnect would do little in protection around large moving machinery (i.e., Paper Machines). Finally, the statement that the proposal would reduce accidental injuries and death cites no evidence or statistics and is purely opinion.

The second and less important argument against this proposal is purely economical. The last part of the proposal reads "...at very minor incremental cost to the owner". We argue the following: the proposed changes would provide a questionable reduction in accidental injuries and deaths, at a large capital and operating cost to the facility. These costs would manifest in the form of all of the following:

1. New equipment cost of the local disconnects.
2. Labor and material cost of a new wire run and installation of the new equipment.
3. Lost production time during changeover.
4. Labor costs for the revision of drawings, lockout procedures, training and engineering.
5. Higher maintenance costs would also be realized as mechanical wire connections double and more equipment is maintained.

At this facility, there are approximately 6000 electrical motors in service. An estimated 30% of these are in hazardous locations, which would require a NEMA 4X enclosed disconnect. Large motors would require extraordinary measures to comply with this proposal. Consider the act of installing a local disconnect on a 2300 volt, 2000 horsepower synchronous motor. Our facility is not mapped to allow sufficient clearance for the placement of such a device within sight of the motor. The statement "...at very minor incremental cost to the owner" is, in a word, wrong.

The bottom line: This proposal is not justifiable through safety. There has been no research; there is no hard accurate data, only opinion. On the contrary, this change will introduce some safety risks that are known such as switching motors off under load, and general confusion in procedure. Compliance with this proposal would not involve a "minor incremental cost: It would result in a huge capital expenditure, which would redirect money from essential projects and redirect manpower valuable to maintenance.

PANEL ACTION: Reject.

11- 140 - (430-102(b)): Reject
SUBMITTER: Gordon Beatty, Patrick Malie, Keith Glaser, Mead
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reconsider Panel Action and reject the proposal.
SUBSTANTIATION: - The first safety issue stated in the proposal substantiation is: "When the distance is excessive, workers attempt to work equipment 'hot', rather than walk the distance four times."

This is a vague, subjective, and unsubstantiated statement. There is no definition of "excessive" distance. What research or records were used to determine this? The statement generalizes that all workers will do this at some unspecified "excessive distance".

A "worker" that will not lock out a motor because the controller is "too far" away is in violation of all our safety policies and the law. This action is grounds for immediate dismissal, as it is in complete violation of our lockout/tagout procedures. We have very formal lockout/tagout procedures. These procedures have proven to be a safe way to work on equipment. Mandating retrofitting local disconnects for all motors is subscribing to an unsubstantiated unsafe "worker", not an unsafe situation.

There are instances where a local disconnect would be practical and these should be looked at on a case-by-case basis, not by broad-brushing the NEC.

- The second safety issue stated in the proposal substantiation is: "The other issue concerns the worker who gets 'hung up' and the disconnecting means is not within sight".

The NEC Article 100 defines a motor circuit switch as: "A switch rated in horsepower capable of interrupting the maximum operating overload current of a motor of the same horsepower rating as the switch at the rated voltage".

Exceptions soften this requirement, such as 430-109(e) for instance. It allows a general purpose switch to be used on an AC motor rated larger than 100 HP. The switch must be labeled "Do Not Open Under Load". This not only seems to defeat the intent of the proposed code change, but may provide a new means for injury. A switch not rated for load break on a motor could flash over, arc, and even explode if operated under load.

The proposed code change is also being substantiated on the grounds that if someone is "hung up" the disconnect could be used. If a "worker" doesn't follow the present law, and well defined lockout/tagout procedures by walking the required distance, what will prevent them from throwing the disconnect under load, in violation of the sign that says "Do Not Open Under Load".

The issue of a person getting "hung up" is quite concerning. A hardwired emergency stop pushbutton is the required way of stopping a machine in an emergency or "hung up" situation. It is normal to have several of these "E-stops" distributed around the machine for easy access. Most machinery in a manufacturing environment requires more than one motor. To quickly rescue a worker that is "hung up", the E-stop should be pressed to stop all motors on the equipment simultaneously. To attempt to select the correct motor disconnect switch from the many associated with a machine only delays the rescue attempt.

- Stated in the proposal's substantiation is "This proposal will reduce accidental injuries and death...". Based on the above NEC exceptions this proposal has the potential of actually having injuries occur, instead of using already established, proven, safe methods.

- Stated in the proposal's substantiation is: "...at very minor incremental cost to the owner". Let's take an example of a 100 hp AC motor. A 480V rated motor switch, 200 AMP (for HP rating), in a NEMA 4 enclosure, is over $4400 list (Square-D). It is 27 in. H x 18 in. W x 10 in. D. A similar switch for a 200 hp AC motor, 400 amp rating, lists at over $9000 and is 46 in. H x 26 in. W x 10 in. D.

Considering that we have thousands of motors, the cost is far from minor or incremental. Additionally, the space requirements for installation, clearances, and equipment maintenance access around these size switches can be prohibitive in existing facilities. New processes would require increasing building size and floor space, also not a minor cost.

Cost is not an argument for avoiding safety implementations. However, mandating a code change does not improve established safety procedures has a potential for injuries to occur, and also creates significant costs is not prudent, sensible or warranted.

Since the proposal's substantiation is that a hypothetical "worker" won't go lock out a motor because it's "too far", indicates where the issue is. The issue is an unsafe person who won't follow established safety procedures. Putting in more equipment at the owner's expense so that an unsafe person can continue to not have a proper "safety mind set" will not guarantee that the disconnects will be properly used either.

We strongly request that the panel reconsider its action and reject this proposal to remove exemption 430-102(b) based on inadequate substantiation of the proposal, and a potential negative impact to another section of the code [430-109(e)]. The need for a field disconnect within sight of a motor should be left to the owner and not dictated by code.

PANEL ACTION: Reject.

11- 141 - (430-102(b)): Reject
SUBMITTER: Tommy S. Joseph, International Paper Co.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Disregard proposal NEC-P11 Log 4074 in its entirety. Make no changes to the section.
SUBSTANTIATION: 1. The environment at many motors is less than ideal. A local disconnect adds another potential source of failure to a motor circuit. It has taken years to move motor controls from the local area to electrical control rooms to improve the reliability of the equipment and the safety to personnel disconnecting motors or working on the motor controls. This item would move the industry in reverse.

2. Many motors are locked out for work on equipment that is not "visible" from the work area. Examples are conveyors, paper machines, fans, boilers, etc. Would this new ruling require multiple disconnects?

3. Disconnects could possibly pose a hazard if opened or closed while under load as the units age, particularly in less than environmentally friendly atmospheres. Even the installation of an auxiliary interlock, while reducing the hazard, would not eliminate the situation should the interlock fail.

4. Lockout of the motor disconnect is already required by OSHA 1910.147. In locations where proper maintenance and supervision exists ,there is no need for a local disconnect when the regulations are followed.

5. Many systems have "interlocks" from a starter auxiliary contact. This would require adding an interlock at the disconnect to prove the disconnect was also closed.

PANEL ACTION: Reject.
PANEL STATEMENT: Leaving the exception unchanged would not include the panel action on Proposal 11-70. See panel statement on Comment 11-44.

11- 142 - (430-102(b)): Reject
SUBMITTER: Paul E. Guidry, Fluor Daniel, Inc.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Delete entire text shown in ROP Panel Action. Leave Section 430-102(b) as is. I believe the panel should have rejected proposal 11-68-(430-102(b)) instead of Accepting it in Principle.
SUBSTANTIATION: The submitter provided no substantiation to back up his statement that there are "...two serious safety issues" with the present rules in the Code. At the panel meeting the submitter stated that the IBEW will continue to make this proposal until the general rule is changed to include a local disconnecting means at all motors. No evidence or statistics were presented to prove that a problem exists. The panel shouldn't be making Code changes just to appease certain groups. If a worker gets "hung up" as the submitter states is happening, then he obviously ignored safe work practices outlined in OSHA and NFPA 70E.

The submitter also made the statement in his substantiation that "When the distance is excessive (to the disconnecting means) workers attempt to work the equipment "hot" rather than walk the distance four times." This implies that now the Code should have requirements to accommodate a worker who is too lazy to do their job correctly. The intent of the Code isn't to provide convenience. Section 90-1(b) states that "This Code contains provisions that are considered necessary for safety. Compliance therewith and proper maintenance will result in an installation that is essentially free from hazard but not necessarily efficient, convenient, or adequate for good service or future expansion of electrical use." Adding a disconnecting means at every motor doesn't improve safety, it merely provides a convenience for workers.

The direction that the panel took is troublesome not only because they're trying to please certain interests but also because the word "practicable" is used in the text. This is in violation of the Style Manual. What is practicable in one person's mind may not be practicable to others. This language is vague and probably unenforceable.

Also, the FPN that was added to explain what isn't practicable should have been part of the text of the Code in order to be enforceable.
PANEL ACTION: Reject.
PANEL STATEMENT: Leaving the exception unchanged would not include the panel action on Proposal 11-70. See panel statement on Comment 11-44.

11- 143 - (430-102(b)): Reject
SUBMITTER: Bill Green, Jacobs Engineering
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reconsider Panel Action and reject the proposal.
SUBSTANTIATION: The originator of this proposal did not supply any substantiation of any accidents caused by using the disconnecting means required in accordance with 430-120(a) for electrical safety lockout. The originator's statement that workers might attempt to work the equipment "hot" rather than walk an excessive distance is vague, a generality, and a violation of law. The originator's scenario substantiation stating that a worker who gets "hung up" in a piece of machinery could use a disconnect as a means of getting out of trouble clearly shows a lack of understanding of all safety procedures, NFPA 70E requirements, and the Federal Law regarding lockouts. OSHA Regulations (Standards - 20 CFR) "The control of hazardous energy (lockout/tagout). - 1910.147 established the minimum requirement for safety lockout and tagout of all energy sources including electrical. Both OSHA and NFPA 70E presently provide for the correct and safe procedures to lock or tag electrical equipment.

Using the disconnecting means required in 430-120(a) is a proven safe method of lock out. This is substantiated by many safe years with no accidents. Only when the law is violated has there been a problem. The submitter's statement that this change would be "at a very minor incremental cost to the owner" is incorrect. At our industrial facility we have approximately 20,000 AC and DC motors. We purchase the latest type of motor control centers with lockable devices just for the purpose of lockout and tagout. Installing disconnects in the field for every motor will increase building space and size requirements to provide the necessary space that does not interfere with operations but yet in sight of the motor. This proposed requirement has a very significant impact not only on cost, but also in real estate required. In addition, it will decrease electrical safety, where disconnect switches will be installed in wet locations.

There are many good reasons to use the disconnect required in 430-102(a) as the lockout device rather than a disconnect within site of the motor. The disconnect at the controller is where most everyone would go to check the status of the equipment. The controller control circuit condition can be observed at the controller. It would be unwise to open or close a disconnect at the motor without knowing the state of the controller.

I strongly request the panel reconsider its action and reject this proposal to remove exemption 430-102(b) based on inadequate substantiation supporting this requirement. The need for a field disconnect within sight of the motor should be left to the need of the user and not dictated by code.
PANEL ACTION: Reject.

(Log #1515)

11- 145 - (430-102(b)): Reject
SUBMITTER: Marybeth Sodini, Olin Corporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Do not delete the exception in 430-102(b) and do not add a sentence reading: "The disconnecting means required in accordance with 430.102(a) may also serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location."
SUBSTANTIATION: Remote motor controllers should be allowed as a lockout location as currently stated in 430.102(b). Motor control center equipment, which remotely de-energizes the motor and control circuit, can be safely maintained when lockout procedures are enforced. If lockout procedures are not enforced, having a local disconnect available may not necessarily increase safety.

In addition, locating additional remote switching devices in the field can create problems including:

1. Often there are two separate power connections associated with driven equipment, power for the equipment, and power for a remote operator controller such as a hand switch. If a remote

switch is used to disconnect power to the equipment the controller could still be powered unless a second remote disconnect or interlock is provided. A failed interlock could create an unexpected hazard, while a second disconnect would complicate the lockout. Using a single disconnect that locks the control and equipment power, eliminates these problems.

2. Locating disconnect switches and/or controllers in the field increases the possibility of failure due to exposure to moisture (outdoors) and in certain industries, hazardous substances. Failed interlocks could pose a safety hazard to the electrician, while a failed controller might pose an additional hazard to the community if critical equipment fails at the wrong time.

PANEL ACTION: Reject.

11- 148 - (430-102(b)): Reject
SUBMITTER: Carl J. Fredericks, S. Houston, TX
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: This proposal should have been rejected.
SUBSTANTIATION: The proposed code change would put an extreme cost burden on many thousands of owners and users with no substantiated safety benefit. This change could result in costs of up to a thousand dollars or more per motor installation, even in the restricted range currently envisioned by the panel. We should consider that some large industrial sites have 10,000 or more operating motor installations - all without a safety problem.

Existing code requirements, used with lockout/tagout procedures as required in NFPA 70E (including test/try functions and proper labeling and documentation), allow for a safe installation, though not necessarily one that is convenient to maintain. Where the maintenance cost savings of a local disconnect really justifies the cost and other associated problems, the owner is already free to install these.

The panel should not fail to consider that extra required devices add safety problems of their own. Ultimately even a local switch will need to be maintained and create the same issue this proposal seeks to address.

I would suggest that safety concerns in this category be directed to specific facilities, work groups or individuals that do not comply with NFPA 70E. One such violation would be attempting to work an installation hot to avoid walking back to a remote disconnect. Imposing a cost of this magnitude on the entire industry is not the way to address unacceptable work practices such as described in the proposal.

PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Comment 11-44.

(Log #1526)

11- 149 - (430-102(b)): Accept in Principle
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Add new text as follows:

(b) Motor. A disconnecting means shall be located in sight from the motor location and the driven machinery location. The disconnecting means required in accordance with 430-102(a) shall be permitted to serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location.

Exception: The disconnecting means shall not be required to be in sight of the motor if such a location of the disconnecting means is impracticable or introduces additional or increased hazards to persons or property and the disconnecting means individually capable of being locked in the open position. The provision for adding a lock to the disconnecting means shall be permanently installed on or at the switch or circuit breaker used as the disconnecting means.

FPN: Some examples of increased or additional hazards include, but are not limited to; motors rated in excess of 100 hp, multi-motor equipment, submersible motors, motors associated with variable frequency drives and motors located in hazardous (classified) locations.

SUBSTANTIATION: I support the panel's action to accept in principle and support the proposal as adjusted by the panel. The revision and new text will provide a requirement that will enhance safety for the workman, inspectors, and others. This is a direct safety issue, with injury stats and deaths that overwhelmingly support the need for the new requirement. I do agree with some of the points made in the explanation of negative that the use of the word "impracticable" should be avoided to be in step with the style manual. Not sure if itemizing all the situations in list form is a practical approach either, as the list would surely be not inclusive. Perhaps insertion of the phrase "acceptable to the authority having jurisdiction" (which is consistent with other code sections) would be a step in the right direction. See wording below:

Exception: Where acceptable to the authority having jurisdiction, the disconnecting means shall not be required to be in sight of the motor if such a location of the disconnecting means ~~is impracticable or~~ introduces additional or increased hazards to persons or property and the disconnecting means individually capable of being locked in the open position. The provision for adding a lock to the disconnecting means shall be permanently installed on or at the switch or circuit breaker used as the disconnecting means.

It is one thing to know of the statistics of death and injury associated with these types of motor installations to help support a proposal, but having known individuals who suffered injury and been exposed to situations personally, that were uncomfortable relative to motor disconnecting means locations, justifies the need to support this proposal. I support the panel's action on this proposal and agree that it would enhance safety.

PANEL ACTION: Accept in Principle.

11- 150 - (430-102(b)): Reject
SUBMITTER: Walter L. Selle, The Dow Chemical Company
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: The proposal should have been rejected.
SUBSTANTIATION: The existing code requirements along with the lockout/tagout procedures in NFPA 70E and OSHA allows for safe operation of electrical installations. When employees take shortcuts by not walking back and locking out a disconnect switch, people get hurt or killed. NFPA-70E, chapter 5 and OSHA section 1910-333 clearly states that circuits to be worked on must be lockout and/or tagout with few exceptions. The substantiation "When the distance is excessive, workers attempt to work the equipment hot rather than walk the distance four times" is not acceptable. The employer cannot accept this practice and fellow employee's should not accept it either.

The panel indicates "where practicable the motor disconnecting means shall be located within site from the motor, etc." This indicates to me that remote disconnecting means are acceptable and allowable if safe work procedures are in place and followed. If these practices exist, then they are acceptable for all loads and machinery devices. It will end up being very judgmental and many variations could exist between various local inspectors, thus creating more confusion. The situation could become more dangerous for maintenance personnel and contractors that work in many different localities.

Employers need to train and set expectations for employees to follow. Written safe work procedures must be documented and followed. Employees must also be accountable for their actions and understand that shortcuts to established safe work practices and procedures are prohibited.

I would suggest the code panel to communicate the use of safe work practices and procedures as stated in NFPA 70E and OSHA. If these items are followed, the number of injuries and deaths would be greatly reduced. By requiring a local disconnect in some applications does not correct the root cause of the problem.
PANEL ACTION: Reject.

11- 151 - (430-102(b)): Reject
SUBMITTER: Gordon Beatty, Patrick Malie, Keith Glaser, Mead Corp
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Do not remove the exception in 430-102(b).
SUBSTANTIATION: The proposal does not improve safety and the original substantiation of the proposal (Log #4074) is ill founded.

- The first safety issue stated in the proposal substantiation is: "When the distance is excessive, workers attempt to work equipment "hot", rather than walk the distance four times."

This is a vague, subjective and unsubstantiated statement. There is no definition of "excessive" distance. What research or records were used to determine this? The statement generalizes that all workers will do this at some unspecified "excessive distance".

A "worker" that will not lock out a motor because the controller is "too far" away is in violation of all our safety policies and the law. This action is grounds for immediate dismissal, as it is in complete violation of our lockout/tagout procedures. We have very formal lockout/tagout procedures. These procedures have proven to be a safe way to work on equipment. Mandating retrofitting local disconnects for all motors is subscribing to an unsubstantiated unsafe "worker", not an unsafe situation.

There are instances where a local disconnect would be practical and these should be looked at on a case by case basis, not by broad brushing the NEC.

- The second safety issue stated in the proposal substantiation is: "The other issue concerns the worker who gets "hung up" and the disconnecting means is not within sight.

The NEC Article 100 defines a motor circuit switch as: "A switch rated in horsepower capable of interrupting the maximum operating overload current of a motor of the same horsepower rating as the switch at the rated voltage."

Exceptions soften this requirement, such as 430-109(e) for instance. It allows a general purpose switch to be used on an AC motor rated larger than 100 HP. The switch must be labeled "Do Not Open Under Load". This not only seems to defeat the intent of the proposed code change, but may provide a new means for injury. A switch not rated for load break on a motor could flash over, arc, and even explode if operated under load.

The proposed code change is also being substantiated on the grounds that if someone is "hung up" the disconnect could be used. If a "worker" doesn't follow the present law, and well defined lockout/tagout procedures by walking the required distance, what will prevent them from throwing the disconnect under load, in violation of the sign that says "Do Not Open Under Load".

The issue of a person getting "hung up" is quite concerning. A hardwired emergency stop pushbutton is the required way of stopping a machine in an emergency or "hung up" situation. It is normal to have several of these "E-stops" distributed around the machine for easy access. Most machinery in a manufacturing environment requires more than one motor. To quickly rescue a worker that is "hung up", the E-stop should be pressed to stop all motors on the equipment simultaneously. To attempt to select the correct motor disconnect switch from the many associated with a machine only delays the rescue attempt.

- Stated in the proposal's substantiation is: "This proposal will reduce accidental injuries and death...". Based on the above NEC exceptions this proposal has the potential of actually having injuries occur, instead of using already established, proven, safe methods.

- Stated in the proposal's substantiation is "...at very minor incremental cost to the owner." Let's take an example of a 100 hp AC motor. A 480V rated motor switch, 200 AMP (for HP rating), in a NEMA 4 enclosure, is over $4400 list (Square-D). It is 27 in. H x 18 in. W x 10 in. D. A similiar switch for a 200 hp AC motor, 400 amp rating, lists at ove $9000 and is 46 in. H x 26 in. W x 10" D.

Considering that we have thousands of motors, the cost is far from minor or incremental. Additionally, the space requirements for installation, clearances, and equipment maintenance access around these size switches can be prohibitive in existing facilities. New processes would require increasing building size and floor space, also not a minor cost.

Cost is not an argument for avoiding safety implementations. However, mandating a code change that does not improve established safety procedures, has a potential for injuries to occur, and also creates significant costs is not prudent, sensible, or warranted.

Since the proposal's substantiation is that a hypothetical "worker" won't go lock out a motor because it's "too far", indicates where the issue is. The issue is an unsafe person who won't follow established safety procedures. Putting in more equipment at the owner's expense so that an unsafe person can continue to not have a proper "safety mind set" will not guarantee that the disconnects will be properly used either.

We strongly request that the panel reconsider its action and reject this proposal to remove exemption 430-102(b) based on inadequate substantiation of the proposal, and a potential negative impact to another article of the code [430-109(e)]. The need for a field disconnect within sight of a motor should be left to the owner and not dictated by code.

(Log #1840)

11- 153 - (430-102(b)): Accept in Principle
SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Continue to accept in principle Proposal 11-68.
SUBSTANTIATION: The proposal is intended to tighten the use of the exception by requiring that one of two conditions (Infeasibility/Greater Hazard) be met before it can be employed while at the same time providing sufficient latitude to designers and installers of electrical systems without the need for developing a "laundry list" of every application where the disconnecting means can be located remote from the motor.

Several concerns were raised in the negative voting on this proposal that warrant a response.

1. The term "practicable" is "unenforceable and vague". Table 3.2.1 in the NEC Style Manual lists possible unenforceable and vague terms. Note that the words "practicable" or "impracticable" do not appear in the list. One negative comment suggests that the term "practicable is synonymous with practical". That simply is not true. Annex B, Standard Terms, in the NEC Style Manual lists practicable as meaning "feasible" and practical as "useful". That is the exact context in which the terms are used in this proposal. In addition, note that terms practicable and impracticable are already in use in the Code. See for example Sections 230-54(c) Exception, and 250-52. In addition, several Code-Making Panels have accepted the use of the term in the 2002 cycle. See for example Proposal 16-192 on Section 800-5. Both uses are in the context of feasibility. Impracticable could be considered vague but it is certainly not unenforceable. The term is intentionally vague in order to provide the necessary latitude to properly apply a requirement, without placing undue restrictions on the application. In the context of this proposal, the term impracticable is intended to provide latitude to the designer and installer of the electrical system, while at the same time placing the burden on them to demonstrate that the disconnecting means cannot be located at the motor.

2. This code does not require a lockout/tagout program nor should the members of Code-Making Panel 11 assume that all maintenance/service personnel apply the lockout/tagout provisions of applicable OSHA standards. Several members expressed concerns that the existing lockout/tag provisions of OSHA are adequate for personnel safety. The fact of the matter is that every year far too many workers lose their lives from lockout/tagout related accidents. OSHA justified the original LOTO Standard as follows:

"Approximately 39 million workers are protected by this rule. (The 3 million workers who actually service equipment - i.e., craft workers, machine operators, and laborers - face the greatest risk.) OSHA estimates that compliance with the standard prevents about 122 fatalities, 28,400 lost workday injuries, and 31,900 non-lost workday injuries each year.

OSHA estimates that adherence to the requirements of this standard can eliminate nearly 2 percent of all workplace deaths in establishments affected by this rule and can have a significant impact on worker safety and health in the U.S."

Current statistics seem to support the contention that the need for effective LOTO procedures has not diminished over the past 10 years. I have provided OSHA Abstracts.

Clearly, a LOTO program cannot, in and of itself, remove the hazard. Revising this section will help to ensure that any LOTO program can be more effectively and thus more safely implemented.

3. One panel member suggested that requiring a motor disconnect at each motor location is merely a matter of "convenience". This is not about convenience. This is nothing more than a safety issue. When a disconnecting means is located within sight of the motor location, the result is a safer workplace, 95 percent of the time. In those cases where it could create a greater hazard, the exception will provide the necessary latitude to locate the disconnecting means at an alternate location.

4. The negative comment of Mr. Cox states that "It could also be argued that the addition of a local disconnect increases the hazards to persons or property for ever installation" is certainly without merit. This proposal is directed towards an increase in safety for persons. This change will not in any case decrease the level of safety presently required in the NEC.

In the end, this proposal is, as it should be, about safety, about "the practical safeguarding of persons and property from hazards arising from the use of electricity." Many will attempt to argue that this proposal will place an undue "burden" on owners or plants and facilities. In other words, that it will cost too much. The purpose of this proposal is to correct a practice that has gone array. The general rule, placing of the disconnecting means, a sound and clear rule, has been replaced by the exception which virtually eliminates the need for any disconnect to be located at the motor. I am certain that the extent to which this proposal will be opposed, will be in direct proportion to the extent to which it is used. Panel 11 took a bold step by reaffirming and clarifying that in every case except those where it is infeasible or would create a greater hazard, the motor disconnecting means shall be located within sight of the motor.

This comment represents the official position of the International Brotherhood of Electrical Workers Codes and Standards Committee.

11- 154 - (430-102(b)): Reject
SUBMITTER: Timothy M. Croushore, Allegheny Power
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Code Making Panel 11 should reject Proposal 11-68.
SUBSTANTIATION: The panel should have rejected this proposal. I agree with the negative comments of Mr. Cox, Mr. Hamer, Mr. Saunders and Mr. Thomas. The current Code requirements are adequate to provide a safe installation. The current OSHA lockout/tagout requirements are adequate for worker safety. Failure to follow the proper lockout/ tagout safety procedure is not a reason to change the NEC. There is nothing in the Code to prohibit installing a disconnecting means at the motor and accomplishing what the submitter is requesting. However, a mandatory requirement of making the motor disconnecting means be within sight from the motor location and the driven machinery is unnecessary. The term "Practicable" as applied in the exception is not easily understood and is not enforceable.
PANEL ACTION: Reject.

11- 155 - (430-102(b)): Reject
SUBMITTER: Michael J. Marno, Haviland Enterprises, Inc.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: We strongly urge the NFPA to vote AGAINST the proposal to change the National Electrical Code and require local disconnects on every motor in the workplace. The substantiation used by the submitter of the proposal is based on assumptions and inaccuracies. The safety concerns brought up are opinion and are by no means justification for such an involved change. The first safety argument suggest that employees may be tempted to work on "hot" equipment if the distance to the disconnecting means is excessive. We at Haviland Enterprises Inc. have policies and training in place to prevent any such activity. Such behavior would be dealt with in a swift and severe manner up to an including dismissal. In addition, a local disconnect would encourage the act of switching a motor under load whether or not a load-breaking type disconnect is installed - a very dangerous act in itself. Further, we question the assumption that a trained craftsperson would rather work on live voltage systems to save the effort of walking an "excessive" distance. The second safety argument suggests a local disconnect would help in the event that a worker was "hung up". The fallacy is that if you are hung up, it will be difficult to throw a disconnect switch! When proper lockout/tagout procedures are followed, the opportunity for hang-up doesn't exist. Finally, the statement that the proposal would reduce accidental injuries and death cites NO EVIDENCE or STATISTICS and is purely opinion.

The second and less important argument against this proposal is purely economical. The last part of the proposal reads "...at very

minor incremental cost to the owner." We question this as costs manifest themselves in the form of all of the following: cost of the local disconnects, labor and materials for new wire runs and installation, lost production time during changeover, labor costs for drawing revisions, procedures, training and engineering. Higher maintenance costs would also be realized. In some cases, and depending on motor size, space for a local disconnect could be a big issue - again resulting in increased cost. The statement "...at very minor incremental cost to the owner" is, in a word, wrong!
SUBSTANTIATION: The bottom line: This proposal is not justifiable through safety. There has been no research; there is no hard, accurate data - only opinion! This change will introduce some safety risks that are known and general confusion in procedure. Compliance would involve much more than "minor incremental cost." It would redirect money from more valuable projects and manpower from valuable maintenance. We urge you to REJECT the proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel action did not remove the exception and would not require a disconnecting means at every motor. See panel statement on Comment 11-44 and panel action and statement on Comment 11-56.

11- 158 - (430-102(b)): Accept in Principle
SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Continue to accept in principle.
SUBSTANTIATION: Typical maintenance procedures do not widely include a working lockout/tagout program. In addition situations such as large distances or different levels are inconvenient for maintenance/service personnel, leading to unsafe work practices. The addition of a disconnect within sight of the motor will not result in a large cost to the owner. However the addition of this disconnect will result in a tremendous increase in safety for all persons involved in the maintenance/repair of the equipment.
he negative comment of Mr. Cox states that "It could also be argued that the addition of a local disconnect increases the hazards to persons or property for every installation" is certainly without merit. This proposal is directed towards an increase in safety for persons. This change will not in any case decrease the level of safety presently required in the NEC. Negative comments, which were directed towards the application of a lockout/tagout program, are not sufficient reason to reject this proposal. This code does not require a lockout/tagout program nor should the members of CMP-11 assume that all maintenance/service personnel apply the lockout/tagout provisions of applicable OSHA standards.
This is a safety driven proposal, which is directly in tune with the purpose of the NEC which "is the practical safeguarding of persons and property from hazards arising from the use of electricity."
This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.

11- 159 - (430-102(b)): Accept in Principle
SUBMITTER: James T. Dollard, Jr., Philadelphia, PA
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Continue to accept in principle.
SUBSTANTIATION: This safety driven proposal will at last recognize that a disconnecting means within sight of a motor is absolutely necessary for the safety of all those who maintain and service the motors. Panel 11 is to congratulated for recognizing that the purpose of the NEC is the practical safeguarding of PERSONS and property. Safety of persons is priority number one and property is number two. This proposal and others like it in this cycle and past cycles are from electricians who have been there, maintaining and servicing motors. The proposers have seen first hand the danger presented when an installation standard such as NFPA-70 permits the disconnect to be located out of sight of the motor. We are the persons that section 90-1(a) is addressing where electrical maintenance is to be performed.
Panel 11 will be inundated with proposals from a group that has formed a letter writing campaign to reverse the action on this proposal. This is unfortunate. A single proposal representing an individual group or industry segment would have been the proper method to express their interests. Letter writing campaigns only make more work for the panel.
I would like to ask the members of Panel 11 to pay close attention to the identity of those proposers who would reverse the Panel action on this proposal. Those interested in reversing your safety driven action on this proposal will not be in the field maintaining and servicing motors. We will. Those interested in reversing your safety driven action on this proposal are interested only in what they perceive as an additional cost involved in the installation. This perceived additional cost is far more important to this group than the safety of persons who will maintain the installation. This proposal will not represent a significant increase in the cost of the installation but will result in a dramatic increase in the safety of persons.
This comment is written to represent the segment of the industry whose safety and lives will one day depend on the location of this disconnecting means for motors.
The members of Panel 11 will be called upon to make a choice with all segments of the electrical industry watching when the chairman calls for a vote on proposal 11-69. The choice will be the safety of persons or the pockets of CEO's.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel noted the comments in the substantiation. Most large industrial users have effective safety procedures and this is reflected in panel action on Comment 11-56.

(Log #1973)

11- 160 - (430-102(b)): Reject
SUBMITTER: Anthony Paul Gabba, The Dow Chemical Company
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: This proposal should have been rejected.
SUBSTANTIATION: a) The existing Lockout/Tagout requirements in NFPA 70E are quite sufficient when followed. We do not need additional components in a circuit because a worker does not want to "walk the distance four times."

b) Additional mechanical/electrical devices will introduce more unreliability to the circuit and the user will also need to maintain the disconnect device during a maintenance outage on the motor. This would seem to imply the worker would be required to revert to the existing primary disconnect device anyway.

c) The wording as presented in the Committee Action Text is vague and in fact, quite contradictory. With statistical analysis, one could easily argue that insertion of additional series components (another disconnecting device) connected in any circuit negatively impacts reliability. Job/process hazards are easily linked statistically to unreliability. Therefore, we have "increased the hazards to persons and or property" and the Exception clause allows Owners to bypass this requirement.

d) I disagree with both of the submitters' substantiation comments: 1) "this proposal will reduce accidental injuries and death" and, 2) "This proposal will be at a very minor incremental cost to the owner." Item 1 has been refuted in my comments a, b and c above. The item 2 statement clearly demonstrates the submitter does not understand the widespread implications (cost and concern for reliability) this requirement has on owners. Retroactive implementation cost for small petrochemical complexes to large integrated sites will range between $1,000,000 to $30,000,000 by our estimate. This could hardly be described as a "minor incremental cost."

e) Operations training is also an issue and potential misuse by those unfamiliar with proper use of such devices would create additional hazards. Consider the implications of operating a no-load device under load.
PANEL ACTION: Reject.

11- 161 - (430-102(b)): Reject
SUBMITTER: Robert A. Leigh, Leigh Engineering, Inc.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Request the Panel to reconsider its action and reject this proposal to remove Exemption 430-102(b). The need for a field disconnect within sight of the motor should be left to the need of the user and not dictated by code.
SUBSTANTIATION: The problem of putting the disconnecting means in sight of each motor makes it too easy for workers not to take the time to properly shut down equipment before lockout/tagout of the disconnect. The disconnects installed in wet process areas, particularly paper and chemical mills, are more likely to be contaminated and fail during power interruption. It is even more dangerous with disconnecting means above 600 volts. The originator's substantiation was because the worker had violated legal procedures already established by OSHA 1910.147 and NFPA 70E-1995.
PANEL ACTION: Reject.

11- 162 - (430-102(b)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: The substantiation is not persuasive. Locating a disconnect because an employee is deemed unlikely to walk as far as the electrical room is a design question. The employer can choose whether to enforce worksite discipline, or install local disconnects. The answer may vary even within a given plant, but the NEC as written is safe. The second half of the substantiation is simply incorrect. Motor disconnects really shouldn't be counted on to stop motors in emergency situations. If a worker gets "hung up" a disconnect even 5 ft away won't help, but a properly designed control circuit using dead man switches and E-stop chains very well might.

I can appreciate that the panel is fatigued by the endless resubmittal of similar proposals, but they should continue to be rejected. The final panel action on the proposal showed just how unrealistic (impracticable) it is to try and write a rule that works in actual factory settings. If that rule stands, I think I could design an entire seminar on how to apply it. That's good for me, but very bad Code.
PANEL ACTION: Reject.

(Log #2076)

11- 163 - (430-102(b)): Accept in Principle
SUBMITTER: Todd Anderson, Dow Corning Coporation
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: Regarding Article 430-102(b): The panel needs to revise the proposed (new) Exception as shown in Proposal 11-68 to state:

The disconnecting means shall not be required to be in sight of the motor if such a location of the disconnecting means is impracticable or introduces additional or increased hazards to persons or property or on industrial premises where maintenance and supervision indicate that qualified persons will service the equipment and the disconnecting means is individually capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be permanently installed on or at the switch or circuit breaker used as the disconnecting means.
SUBSTANTIATION: Problem:

The substantiation for 11-69 is not relevant when electrical work is performed in an environmental (usually Industrial and Larger firms) where Electrical Lockout/Tagout procedures are in place and enforced.

Substantiation:

Based on the OSHA report (which covers both electrical and mechanical lockouts), it documents that 90 percent of large firms (250 or more employees) were in full compliance of the OSHA lockout/tagout standard.

On the other hand, medium to small firms (250 employees or less) were less likely to apply the OSHA standard to lockout/tagout equipment.

I agree that the changes made are valid for smaller companies and commercial/residential applications where Supervision and defined electrical lockout/tagout procedures are often nonexistent.

I DO NOT AGREE that the recommendation in 11-69 applies to Large/Industrial Firms. The data shows that Large/Industrial Firms (250 or more employees) maintain and enforce defined Electrical Lockout/Tagout Procedures. These large firms also provide annual training to maintenance personal and outside contractors who are expected to apply the procedures on their sites.

Industrial electricians have a proven track record of abiding by and following the OSHA electrical lockout/tagout standard and need to be exempt from Section 430-102(b).

Note: Supporting material available for review upon request at NFPA headquarters.
PANEL ACTION: Accept in Principle.

(Log #2077)

11- 164 - (430-102(b)): Accept in Principle
SUBMITTER: Todd Anderson, Dow Corning Coporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Regarding Article 430-102(b): The panel needs to revise the proposed (new) Exception to state:

The disconnecting means shall not be required to be in sight of the motor if such a location of the disconnecting means is impracticable or introduces additional or increased hazards to

persons or property or on industrial premises where maintenance and supervision indicate that qualified persons will service the equipment and the disconnecting means is individually capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be permanently installed on or at the switch or circuit breaker used as the disconnecting means.

SUBSTANTIATION: Problem:

The substantiation for 11-68:

The concern for electriciaans opting to work on electiracl equiment "hot" are not relevant when electrical work is performed in an environment (ususually Industrial and Larger firms) where electrical lockout/tagout procedures are in place and enforced.

The concern regarding an electricain getting "hung up" is not relevant. The local stop or emergency stop control will adequately deenergize power to the equipment.

Additonal Substantiation:

Based on the OSHA report (which covers both electrical and mechanical lockouts), it documents that 90 percent of large firms (250 or more employees) were in full compliance of the OSHA lockout/tagout standard.

On the other hand, medium to small firms (250 employees or less) were less likely to apply the OSHA standard to lockout/tagout equipment.

I agree that the changes made are valid for smaller companies and commercial/residential applications where Supervision and defined electrical lockout/ tagout procedures are often nonexistent.

I DO NOT AGREE that the recommendation in 11-68 applies to Large/Industrial Firms. The data shows that Large/Industrial Firms (250 or more employees) maintain and enforce defined Electrical Lockout/Tagout Procedures. These large firms also provide annual training to maintenance personal and outside contractors who are expected to apply the procedures on their sites.

Industrial electricians have a proven track record of abiding by and following the OSHA electrical lockout/tagout standard and need to be exempt from Section 430-102(b).

SUBMITTER: Ray Klink, ESCO Company Ltd, Partnership

COMMENT ON PROPOSAL NO: 11-68

RECOMMENDATION: We strongly urge you to not adopt this revision to the existing standard.

SUBSTANTIATION: We are a small chemical facility. We currently have most of the systems in place which would meet the revised standard. However, the revised standard would still cause us considerable expense and difficulty. There are currently laws in place to ensure that workers disconnect electrical devices and lock them out before working on them. We enforce these laws very vigorously. Anyone who would presently put their life and their job at risk will not change their habits just because the disconnect device is closer. The problem is not that the disconnects are too far away, the problem is the relationship between the employer and employee. They must reach an understanding that existing procedures must be followed every time!

The term "impracticable" in the exception is totally unenforceable and is sure to be interpreted differently by different people. One backyard electrical regulatory expert can cause severe employee relations problems with their insistence that companies are not following regulations or don't care about the safety of their employees.

Many of the existing systems which are currently being handled safely and efficiently would have to be revised. We look at some of the more obscure systems such as unit heater motors and air duct damper motors which would have to be changed. Where would you put a disconnect for an air duct damper motor in an office environment?

PANEL ACTION: Reject.

11- 166 - (430-102(b)): Reject

SUBMITTER: Marcus C. Weikle, Westvaco Corporation, Packaging Resources Group

COMMENT ON PROPOSAL NO: 11-68

RECOMMENDATION: Request the panel to reconsider its action and reject the proposal to remove Exemption 430-102(b).

SUBSTANTIATION: This proposal will increase the possibility of personnel interrupting energized circuits which can be more dangerous than the established procedure by OSHA Regulation 1910.147 covering lockout and tagout procedures. Before any work can be performed around a motor or the driven load, lockout and tagout of the motor controller disconnect is an absolute must. Also, in addition to 480 volt motors up to 200 horsepower, very large horsepower motors are present in industrial facilities operating at 2300, 4160, 7200 and 13800 volts. Disconnect switches for these motors would be very large and impractical to mount at the motor site. These switches would be even more life threatening to operate without knowing the state of the motor controller. Again, lockout/ tagout of the motor controller disconnect is the only completely safe way to work on the motor or the driven equipment.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel action on the proposal modified the existing exception, but did not delete it. See panel statement on Comment 11-44 and panel action and statement on Comment 11-56.

(Log #2130)

11- 167 - (430-102(b)): Reject

SUBMITTER: Brian J. Nenninger, The Dow Chemical Company

COMMENT ON PROPOSAL NO: 11-68

RECOMMENDATION: This proposal should be rejected.

SUBSTANTIATION: This proposal is a very expensive approach especially when considering many industrial users have a majority of their motor applications in Division 2 areas. In fact one could argue, the installation of an explosion proof disconnect at the motor is inherently less safe than the one having no local disconnect at all. As explosion proof disconnects are often not properly left with all bolts installed and tightened, Division 2 gasses could easily migrate into the switch causing a significant hazard the next time the switch is operated. Very often the milled surfaces of explosion proof enclosures are scratched rendering them unsafe for the application. Our industry has worked for many years to relocate disconnecting means out of the Division 2 areas and into an unclassified electrical room where they are not subject to the hazards associated with Division 2 gases.

The committee should also consider the additional disconnect will also reduce the overall reliability of the plant electrical system due to the addition of another component to fail. This will ultimately add to the installation cost incurred by lost production through plant outages. Often in the Chemical Industry a plant trip can additionally result in a potential environmental impact. Once again as an industry, we have worked to increase the reliability and safety of our operating plants by reducing the component count and system failure points.

It would also behoove the Panel to keep in mind, Lockout/Tagout programs have allowed the industry to safely use disconnecting means remote from the motor for many years and with thousands of motors.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel statement on Comment 11-44.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

(Log #2141)

11- 168 - (430-102(b)): Reject
SUBMITTER: Donald R. Bonem, II, Dow Corning Corporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: It is time to incorporate this exception that has decades of precedence, into this paragraph into positive requirements.

I suggest the following:

(b) Motor: Disconnects for motors shall be provided by either of the following means.

(1) The disconnecting means provided in Section 430.102(a) is capable of being locked in the open position.

(2) A disconnecting means located in sight from the motor location and the driven machinery location.

SUBSTANTIATION: The change in wording of the exception will invalidate time proven safe installations without substantiation. The 1997 fatalities due to occupation contact with electrical current was 297 people for all industries. The Total Deaths Due to injuries from 1994 to 1996 has decreased each year for the following categories: (1) Electric current; (2) Industrial wiring, appliances, and electrical machinery; and (3) Other and unspecified electric current. (National Safety Council, 1999 Injury Facts Report). The number of these incidences due to locks being cut off has to be small if nonexistent.

The draft statement also allows a very subjective decision making process for the Authority Having Jurisdiction. The Authority Having Jurisdiction is concerned with compliance, how can one confirm compliance with the code with statements such as "unless not practical"? Practical to whom? The electrician, operator, or owner? Adding an additional disconnect in the field adds: (1) Significant real estate due to working area about electrical equipment requirements, another two sets of terminations that can fail, as well as a host of other requirements. Also, the Authority Having Jurisdiction will usually default to the decision which will leave them with the least legal risk. The Authority Having Jurisdiction for smaller jurisdictions, (say urban/rural areas less than 50,000 people) usually only has expertise in the application of the NEC and will not be familiar with other safety issues. This division of judgment makes it difficult for the Authority Having Jurisdiction to evaluate the total impact of the safety of a given installation based on electrical components only. The text as written, is not enforceable and is vague requiring judgment which will ultimately demand that disconnects be located near motors even in locations where the increased risk. It is not practical to disagree with the Authority Having Jurisdiction. To convince the Authority Having Jurisdiction their interpretation is not correct let alone "practical" is usually not worth the time and effort on a job by job basis. Therefore, either make it a clear requirement or disregard the change. Examples of increased risk are: (1) Installations in hazardous locations increase risk of ignition. (2) Access to 480V equipment by unqualified personnel due to location near equipment where they work. People do dump things, give them access to 480V equipment and someone will open them up and get hurt. I prefer to locate disconnects in manageable areas. If the electrician is "uncomfortable" with a locked disconnect, then go one step further, pull the fuses, disconnect the motor leads, or connect them together at the motor.
PANEL ACTION: Reject.
PANEL STATEMENT: The exception is an exception because it has not been and is not now intended to be standard practice to use lockable disconnecting means for a controller that is out of sight of the motor in lieu of a disconnecting means within sight of the motor any time the installer chooses to do so. See panel statement on Comment 11-44.

11- 169 - (430-102(b)): Reject
SUBMITTER: Mark Goodman, BP (ARCO)
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reject the proposal and maintain the text (including the exception) of the 1999 NEC as is. API supports the negative explanations of Panel 11 members Mr. Cox, Mr. Hamer, and Mr. Saunders.
SUBSTANTIATION: There are a number of reasons why the proposed changes should not be adopted. They include:

Adequate substantiation for these changes have not been given.

Adding a motor disconnect near the motor does not isolate voltage to the local control station (stop/start) at the motor or the space heaters (if applied) within the motor. The present FPN in the 1999 NEC, and using the motor controller disconnect to isolate the motor, will disconnect the auxiliary devices.

The proposal introduces an additional risk of opening a "disconnect" that is not rated to interrupt load for motors over 100 hp (see 430-109(G)), therefore one situation described in the proposal substantiation (a worker being "hung up" and being saved by opening a disconnect) is potentially unsafe, since opening a disconnect under load may result in an explosion.

"Impracticable" is not enforceable, and the explanations given in the proposed FPN are not mandatory and will create confusion for the Authority Having Jurisdiction and the user.

The risks introduced by the installation of a disconnect outdoors can be high, due to condensation buildup within the disconnect's enclosure, added exposed live terminals within the enclosure, and corrosion of the disconnect component from non-use. This can result in a fault within the enclosure.

Reliability will be reduced by the increased number of terminations on the motor feeder necessitated by the disconnect.
PANEL ACTION: Reject.

11- 170 - (430-102(b)): Reject
SUBMITTER: Mark Goodman, BP (ARCO)
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: Reject the proposal and maintain the text (including the exception) of the 1999 NEC as is. API supports the negative explanations of Panel 11 members Mr. Cox, Mr. Hamer, and Mr. Saunders.
SUBSTANTIATION: There are a number of reasons why the proposed changes should not be adopted. They include:

Adequate substantiation for these changes have not been given.

Adding a motor disconnect near the motor does not isolate voltage to the local control station (stop/start) at the motor or the space heaters (if applied) within the motor. The present Exception and FPN in the 1999 NEC, and using the motor controller disconnect to isolate the motor, will disconnect the auxiliary devices.

The proposal introduces an additional risk of opening a "disconnect" that is not rated to interrupt load for motors over 100 hp (see 430-109(G)), therefore one situation described in the proposal substantiation (a worker being "hung up" and being saved by opening a disconnect) is potentially unsafe, since opening a disconnect under load may result in an explosion.

"Impracticable" is not enforceable, and the explanations given in the proposed FPN are not mandatory and will create confusion for the Authority Having Jurisdiction and the user.

The risks introduced by the installation of a disconnect outdoors can be high, due to condensation buildup within the disconnect's enclosure, added exposed live terminals within the enclosure, and corrosion of the disconnect component from non-use. This can result in a fault within the enclosure.

Reliability will be reduced by the increased number of terminations on the motor feeder necessitated by the disconnect.

Additionally, the substantiation of Proposal 11-69 suggests that it is unclear who has the authority to lock and unlock the disconnect identified in the Exception. The FPN however directs to the lockout/tagout requirements of NFPA 70E which clearly identify the methodology to ensure the safety of those working on the equipment.
PANEL ACTION: Reject.
PANEL STATEMENT: Leaving the exception unchanged would not include the panel action on Proposal 11-70. See panel statement on Comment 11-44.

11- 171 - (430-102(b)): Reject
SUBMITTER: John J. Ankoviak, Dow Corning Corporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: The panel should reject the proposal.
SUBSTANTIATION: The rejection is based on the scope of the NEC.

Section 90-1(a) Purpose states "Practical Safeguarding. The purpose of this code is the practical safeguarding of persons and property from hazards arising from the use of electricity." One definition of practical is from "The American Heritage Dictionary - Second College Edition" and states "Level-headed, efficient unspeculative." Section 90-1(b) states "Adequacy. This Code contains provisions that are necessary for safety...". The first point is speculative which the dictionary states is: "...risky." Therefore, unspeculative is one who is not risky. With NFPA 70E-2000 and OSHA 1910.147 we have regulations of how a worker is to safely work when servicing or maintaining machines and equipment through the control of hazardous energy. When a worker chooses not to follow these mandatory requirements they have made an individual choice that is risky and not practical, not to say that the installation is risky. The second point is necessary for safety. The above mandatory regulations provide the necessary level of safety that has been proven time and again, for trained persons working on electrical equipment. The proposal to add a requirement for the installation of local disconnects is not necessary for safety. Instead it will add additional cost for the petrochemical industry to do business in the USA. Other codes do not require this additional device and thus the cost of doing business outside the USA would be more favorable. The FPN, though not enforceable, adds confusion to what an electrician would normally expect for typical installations in the petrochemical industry. Since the only installations this would be required are ones in a standard area, at 480V or less, non-VFD motors and less than 100HP motors. This does not seem practical.
PANEL ACTION: Reject.

11- 172 - (430-102(b)): Reject
SUBMITTER: John J. Ankoviak, Dow Corning Corporation
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: The panel should reject the proposal.
SUBSTANTIATION: As stated in my comments on 11-68, with NFPA 70E-2000 and OSHA 1910.147 we have regulations of how a worker is to safely work when servicing or maintaining machines and equipment through the control of hazardous energy. It also states the responsibility of the employer in 1910.147 (a)(3)(i) "...to establish a program and utilize procedures for affixing appropriate lockout devices or tagout devices to energy isolating devices, and to otherwise disable machines or equipment to prevent unexpected energization, start-up or release of stored energy in order to prevent injury to employees." It is not the responsibility of the NEC to add additional levels of protection anytime an employee or employer does not follow mandatory safety requirements. OSHA has a standard for devices that can and cannot be locked out. This lock and tag is someone's life and those that take it upon themselves to not respect that life should be disciplined. It should not be the NEC's responsibility to continue adding additional requirements to those of us who meet the standard. If the employee or employer does not follow OSHA and NFPA 70E, why would they follow the NEC and this change? The present installations are safe as stated int he NEC-1999 430-102(b) and in conjunction with OSHA and NFPA 70E provide a safe environment for a worker to perform their tasks.

In addition, the acceptance of 11-69 would only add another financial burden for those of us in the petrochemical industry that follows our national standards. Section 90-1(b) states "Adequacy. This Code contains provisions that are necessary for safety...". This additional cost of business in the USA is not necessary for safety.
PANEL ACTION: Reject.

11- 173 - (430-102(b)): Reject
SUBMITTER: Joyce Evans Blom, The Dow Chemical Company
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: The panel should reject the proposal.
SUBSTANTIATION: The proposed code change would be unduly burdensome to thousands of owners and users. The efficacy of this additional lock-out point is questionable for an industrial facility. Stringent lockout/tagout procedures are already required by OSHA; these procedures already include verification of de-energized condition and that a qualified person must try to operate the equipment with controls to verify that the equipment cannot be restarted, among many other requirements.

Per motor installation, the cost of this change is estimated in excess of $1,000. The Panel should consider that small industrial sites have up to 3,000 motor installations. Large industrial sites have 30,000 or more motor installations. Additionally, these sites will need to increase their maintenance costs for upkeep of these disconnects. These existing motor installations are operating without a safety problem in regard to lockout/tagout.

Existing industrial practice is that the owner, at their discretion, may add a local disconnect in specific motor applications. The owner may find that for specific maintenance and operations procedures, the extra provision for safety justifies the additional installation and maintenance costs associated with the additional disconnect.

The panel should consider the economic burden of this magnitude on small, medium and large industry. When existing regulations are in place and effective, additional equipment does not improve unacceptable work practices such as described in the proposal.
PANEL ACTION: Reject.

SUBMITTER: Noel Williams, Noel Williams Consulting
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: The proposal should be rejected.
SUBSTANTIATION: The substantiation for this proposal is entirely inadequate. The argument in the proposal and some similar proposals amounts to a plea for a rule to protect electricians from their own laziness or stupidity. The current rule permits the exclusion of a local disconnect only where the remote disconnect (at the controller) is lockable. A lockable disconnect is entirely adequate for safety if the locking feature is used. This is a major change with only hypothetical substantiation. The Code cannot be idiot-proof.
PANEL ACTION: Reject.

11- 176 - (430-102(b)): Reject
SUBMITTER: Mark Capra, International Paper
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: I do not support the proposed changes of 11-68-(430-102(b)) and ask that you reject the Proposal.
SUBSTANTIATION: 1. Lockout procedures following OSHA requirements presently provide a completely safe method of lockout at the motor disconnect switches built into the motor starters. I don't know of anyone that would "attempt to work the equipment "hot," rather than walk the distance four times" to the disconnecting means.

2. Local disconnects will be exposed to the controlled atmospheres found in the Motor Control Centers where the disconnect switches built into the motor starters are located. I think there would be reduced reliability in the wide scale use of local disconnect switches.

3. The cost to install local disconnecting means would be substantial, as proposed to "at a very minor incremental cost" stated in the Proposal. The added financial burden on American industry will not result in increased safety, and will just make it more difficult to compete in the Global economy.
PANEL ACTION: Reject.

11- 177 - (430-102(b)): Reject
SUBMITTER: Marlin Holder, Inland Paperboard & Packaging-Rome Linerboard Mill
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Do not remove exception in 430-102(b).
SUBSTANTIATION: The lockout/tagout procedure established by OSHA 1910-147 and NFPA 70E is the only completely safe system to prevent injuries. This is the law and must not be violated. No substitution should be made. Even if a disconnect is within sight of the motor, it is often impossible to tell whether the motor is running if the noise level is high and the rotating coupling and shaft are properly guarded. In many locations at our plant, the disconnect would have to be located outside where the person opening it would have to be standing in water when they opened the switch. In many situations, simply pulling and locking the electrical energy source will not make the motor safe to work on. In the case of pumps, valves and other energy sources must also be locked out to ensure safety. A thorough and complete lockout must be followed for each situation. Pulling a local disconnect instead of following the complete procedure would give a false sense of security. The lockout/tagout procedure must be enforced and not add another possible hazard. How many injuries have occurred when lockout/tagout procedures have been followed? Let's enforce the laws we have rather than add additional laws that are only needed if we assume the original laws will be broken.

I might also note that our plant location has more than 4000 motors. Over 200 of these are 4160 volt motors. Twenty seven motors are one thousand horsepower and above. The "minor incremental cost" of compliance at our location alone would be over $7,000,000.00. There are many plants that are well over twice as large as ours. The financial effect on commercial or very light industrial facilities might be minor, but the effect on a large industrial facility would be devastating.
PANEL ACTION: Reject.

11- 178 - (430-102(b)): Reject
SUBMITTER: Stephen Pauli, Bayer Corporation
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: The panel should reject this proposal. Leave 430-102(b) alone as currently written in 1999 NEC.
SUBSTANTIATION: Heavy industrial chemical plants have safely used thousands of motors installed in Class 1 Division 2 areas outdoors without disconnect switches in the past. Requirements to add disconnect switches in these wet and hazardous locations adds severe risk to the area by providing more locations for water entry to motors and live terminals, and by providing a location to generate a spark in an area that avoids electrical arcing contacts at all costs. The mandatory location of additional safety switches in all motor locations will add substantial costs to the initial installation in chemical and petrochemical industries.

Existing motor control center disconnects and safe working procedures in our facility are designed around a series of OSHA mandated lockout/tagout regulations and NFPA 70E. Shortcuts to safety for convenience are not allowed in any Bayer Corporation facility.

The wording of this proposal is far too vague to be enforceable. A word like "impracticable" will be impossible to interpret and enforce.

This proposal will also affect the cost of final manufactured product, and affecting our position in a highly competitive and global industry. This proposal could negatively affect US global competitiveness.

The negative comments expressed by Mr. Cox in Proposal 11-68 more aptly state the reasons why Bayer Corporation would not support this proposal.

SUBMITTER: G. Erich Heberlein, Jr., Rockwell Automation/Allen-Bradley Co.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reconsider the Code Panel action and reject the proposal. Therefore, the Exception 430-102(b) in the 1999 NEC should be retained in the future.
SUBSTANTIATION: The grounds for removing the exception are flawed as it infers workers are disregarding lock-out and tag-out procedures and indicates a lack of safety procedures, i.e., the justification behind the proposal is in conflict with Federal law requiring lock-out tag-out operations. There is a need on many industrial applications requiring that the disconnect means should not be located near or "in sight" of the motor. For example: In extreme temperature, toxic or hazardous locations, locating the disconnecting means near the motor can increase the risk of additional hazards. In continuous process operations, additional disconnects will cause reduced reliability, additional infrared scan requirements, and other maintenance concerns. In addition, very large motors and complex machinery with multi-motors do not lend themselves to having disconnects near the motor locations.
PANEL ACTION: Reject.

SUBMITTER: Mike McNeil, Rockland, ME
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: The panel should reject this proposal.
SUBSTANTIATION: - The substantiation of the proposal is itself a violation of NFPA 70E and OSHA lockout/tagout. This proposal requires additional equipment to protect from willful violations of accepted safety practices is illogical and reinforces unsafe work practices.
- There is no technical substantiation.
- In every case, there will be an added or increased hazard introduced by the unnecessary disconnect. There will be identification issues with multi motor applications, probable confusion over which disconnect to lockout (motor control center or the one in sight), and the introduction of another piece of equipment in the circuit to become a point of failure, maintenance issue, and another source of shock, flash burn, thermal burn, and arc blast.
- The statement "very minor incremental cost" to the owner used by the submitter is neither realistic nor accurate. The cost to owners in large commercial and industrial facilities will be huge.
PANEL ACTION: Reject.

11- 185 - (430-102(b)): Reject
SUBMITTER: J. Richard Viel, Pharmacia, Inc.
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: The following argument is in objection to the proposed modifications to Article 430-120(b) in the 2002 NEC. The argument is a modification of the one being submitted by the Mead Paper Company but reflects the concerns of our Electrical Standards Committee for Pharmacia Corp.
SUBSTANTIATION: The substantiation used by the submitter of the proposal is based primarily on assumptions. The safety concerns brought up are opinion and are by no means justification for such an involved change.
The first safety argument suggests that employees may be tempted to work on "hot" equipment if the distance to the disconnecting means is excessive. We at Pharmacia Corp have policies and training procedures in place to prevent any such activity. They are SOPs and Lock Out Tag Out procedures which are required by OSHA as well as by our own safety committee. Such behavior would be dealt with immediately as a performance issue. Further, we question strongly the assumption that a trained craftsperson would rather work on a live 480 or 4160 volt system to save the effort of walking an "excessive" distance or even climbing a few flights of stairs.
The second safety argument suggests a local disconnect would help in the event that a worker was "hung up". The problem is that if you are "hung-up", it will be difficult to get to or even turn off a disconnect switch. When the proper lockout/tagout procedure is followed, the opportunity for a "hang-up" does not exist. Furthermore, in locations where "hang-up" hazards exist for operating machinery, emergency stop buttons are in place at several strategic points around the equipment, whereas a single local disconnect would do little in protection around large moving machinery (i.e., Large Chillers, Air Compressors, Process

Equipment, etc.). Finally, the statement that the proposal would reduce accidental injuries and death cites no evidence or statistics and is purely opinion.

The last part of the proposal reads: "... at very minor incremental cost to the owner". We argue the following: The proposed changes would provide a questionable reduction (no substantiated data to indicate there would be a reduction) in accidental injuries and deaths, at a large capital and operating cost to the facility. These costs would be manifest in the form of all of the following: New equipment cost of the local disconnects, labor and material cost of a new wire run and installation of the new equipment and lost production time during changeover. Labor costs for the revision of drawings, additional lockout procedures, training and engineering and higher maintenance costs would also be realized as mechanical wire connections double and more equipment is maintained. At this facility, there are thousands of electrical motors in service. A high percentage of these are in hazardous locations, which would require an additional NEMA 4X enclosed disconnect. Medium voltage motors would require extraordinary measures to comply with this proposal. Consider the act of installing a local disconnect on a 4160 volt, 2000 horsepower motor. The statement: "... at very minor incremental cost to the owner" is, in a word, wrong.

The bottom line: This proposal is not justifiable through safety. There has been no research; there is no hard accurate data, only opinion. On the contrary, this change will introduce some safety risks that are known such as the potential of switching motors off under load, and the potential for a general confusion in procedure. Compliance with this proposal would not involve a "minor incremental cost". It would result in a significant capital expenditure.

PANEL ACTION: Reject.

PANEL STATEMENT: Leaving the exception unchanged would not include the panel action on Proposal 11-70. See panel statement on Comment 11-44.

11- 186 - (430-102(b)): Accept in Principle

SUBMITTER: Clifford J. Normand, International Paper

COMMENT ON PROPOSAL NO: 11-68

RECOMMENDATION: Let the wording of 430.102(B) remain the same as in the 1999 Code. As an alternate install the following exception:

Under conditions of maintenance and supervision where formal Zero Energy State procedures exist the disconnecting means, in addition to the controller disconnecting means as required in accordance with Section 430.102(A), shall not be required for the motor where the disconnecting means for the controller is individually capable of being locked in the open position.

SUBSTANTIATION: Our company complies with the requirements of OSHA 1910.147 for lockout. Our formal policy provides for employee safety; therefore, the installation of an additional disconnect is not required. All employees and contractors are trained and required to follow the procedures of the lockout policy as a condition of employment.

We have spent years installing motor controls in environmentally protected control centers for both safety and reliability. In many cases the motor controls have been replaced where they existed in less than environmentally desirable areas. The installation of local disconnects would force us to move backward in terms of safety and reliability.

We also have many large pieces of equipment such as paper machines and conveyors where the maintenance areas are distant and not within sight of the motor and therefore the disconnect is not within sight of the work area. Situations where local disconnects deemed necessary for safety or convenience are reviewed on a case-by-case basis.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Comment 11-56.

(Log #2370)

11- 187 - (430-102(b)): Reject

SUBMITTER: John Hayden, International Paper

COMMENT ON PROPOSAL NO: 11-68

RECOMMENDATION: International Paper has a proactive health and safety management process, however, the company does not support the promulgation of the proposed NFPA National Electrical Code change ROP 11-68-(430-102(b)), published in the NFPA 70 Report on Proposals, and strongly urges the panel to reject the proposal based on our substantiating comments.

SUBSTANTIATION: I. Evidence Does Not Support the Substantiation of the Submitter's Recommendation.

A. The submitter Indicates in his substantiation that, "When the distance is excessive, workers attempt to work the equipment "hot" rather than walk the distance 4 times". The submitter offers no data to substantiate this statement, and presumes that qualified employees are going to commit an act that is a clear and blatant violation of company policy, as well as, OSHA standard 29 CFR 1910.147. In addition, the submitter makes a general statement that when a distance becomes excessive (he does not define excessive) employees are going to "shortcut" established safety policies. In fact, there is no evidence within our company, or within industry, that employees are working on "hot" equipment to save the effort of walking to a disconnecting means. International Paper has an established formal lockout/tagout policy, in addition to starter labeling requirements, that goes beyond the requirements of the OSHA standard 29 CFR 1910.147. This policy provides for effective employee safety by requiring the lockout of the motor disconnects.

International Paper has established a system for health and safety accountability within the company. This procedure defines employee accountabilities and procedures for administering disciplinary actions aimed at addressing employee conduct issues. At International Paper, achieving our vision of injury free, requires that every employee remains committed to health and safety standards and takes responsibility for working safely every day. We tell our employees that there is no job so important that adequate time cannot be taken to do it safely. Working safely is a condition of employment. International Paper will not tolerate, nor ignore any act or behavior that places an employee or others at risk of injury, e.g. working on energized equipment because it's too far to lockout the disconnect.

B. The submitter makes a second statement in his substantiation about the worker getting "hung up" and the disconnecting means not within sight. This is the very reason why OSHA promulgated 29 CFR 1910.147 (The Control of Hazardous Energy). This standard presently provides for the correct and safe procedures to lock and tag electrical equipment to prevent the unexpected activation of equipment. OSHA and NFPA 70E already effectively protect employees from being "hung up" in equipment. In addition, local start/stops and emergency stops are located strategically on the equipment for easy access. Utilization of emergency stops is the most effective method to quickly cut power to effect rescue of a worker.

C. To Justify the premise of this proposed change, one must assume that the employer and employee are in violation with federal and state standards. These standards are in place to protect the employee from work place hazards. If situations exist where compliance is questionable, the employee has protections under OSHA regulations and a clear means to resolve the matter.

II. Other Issues as a Result of This Proposal

A. The environment at many motors is less than ideal. A local disconnect adds another potential source of failure to a motor circuit. It has taken years to move motor controls from the local area to electrical control rooms to improve the reliability of the equipment and the safety to personnel disconnecting motors or working on the motor controls. This item would move the industry in reverse.

B. Disconnects could possibly pose a hazard if opened or closed while under load as the units age, particularly in less than environmentally friendly atmospheres. Even the installation of an auxiliary interlock, while reducing the hazard, would not eliminate the situation should the interlock fail.

C. Many systems have interlocks from a starter auxiliary contact. This would require adding an interlock at the disconnect to prove the disconnect was also closed.

D. In many instances, motors on equipment are positioned such that a single disconnect would not be visible from all points where maintenance work is performed. In the case of large equipment that extends over a large area, e.g., conveyors, paper machines, and boilers, the requirement to have a disconnect within sight would conceivably add several local disconnects, thereby increasing the potential for system failure and risk to employees.

III. The Proposal Greatly Underestimates Costs Associated with the Installation of Local Disconnects.

The statement made in the substantiation, "at very minor incremental cost to the owner" has no basis in fact. The cost of the proposal is precipitously underestimated by orders of magnitude for International Paper's manufacturing locations. The cost of installing a single local disconnect is not a very minor incremental cost as stated in the substantiation of the proposal. The list price of a 60 amp NEMA 4X disconnect for a 50 hp motor is $1600 (Square D) plus installation. List for a 100 hp disconnect is $4410. Several hundred would be required in a large paper manufacturing facility. This is in addition to the disconnect and controller installed in an environmentally controlled environment. Additionally, space requirements for installation and clearance would be prohibitive in existing facilities. Mandating a code change that does not improve employee safety, or equipment reliability, and adds a financial burden to the worksite, is not warranted or prudent for the employee or employer.

IV. Conclusions

International Paper realizes that there are certain situations where a local disconnect would be practical. These situation are analyzed on a case-by-case situation. In summary, mandating a code change that all motors have disconnects in sight of the motor is not a means to improve emplyee safety. In fact, this proposal actually has the potential to increase employee risk to injury for the aforementioned reasons. Once again, International Paper does not support the promulgation of the proposed NFPA National Electrical Code change 11-68-(430-102(b)), published in the NFPA 70 Report On Proposals. An overly burdensome sweeping approach, will not only fail to improve the health and welfare of the workforce, but also it will surely adversely impact workforce opportunities. To International Paper, the proposal will not improve employee safety and has excessive cost for no benefit.

PANEL ACTION: Reject.

11- 188 - (430-102(b)): Reject
SUBMITTER: Robert Pratt, The Dow Chemical Company
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: This proposal (11-68) should have been rejected. Modification to more clearly define the types of locations (those using "Lockout/Tagout") could be considered, but not removal of the exception.
SUBSTANTIATION: In many (22) years of exposure to numerous "industrial facilities" at various companies, I have never encountered a "qualified electrician" that was concerned about the walk necessary to clear a piece of equipment. I believe that argument is inappropriate to this discussion.

If the person could get "hung-up" it would be because either the equipment was energized from a remote location or the person initiated the work on an already energized source. Both of these possibilities are thoroughly eliminated by compliance with clearing procedures of a "Lockout/Tagout" program. The idea of de-energizing a circuit, via local disconnect, after getting "hung up", is too late in the concept of a safe installation. The addition of local disconnects is unnecessary in facilities operating with "Lockout/Tagout".

Requiring the addition of a local disconnect adds more opportunities for equipment failure.

Requiring the addition of a local disconnect offers more opportunities for someone to inappropriately (by numerous definitions) interrupt equipment in operation.

PANEL ACTION: Reject.
PANEL STATEMENT: The panel action on the proposal modified the existing exception, but did not delete it. See panel statement on Comment 11-44 and panel action and statement on Comment 11-56.

11- 189 - (430-102(b)): Reject
SUBMITTER: Terry L. Stoyek, International Paper
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Recommend rejecting the proposed change.
SUBSTANTIATION: A worker inclined to violate lockout procedures is just as likely to open the motor disconnect and not lockout because the lock was left in the shop and he/she feels in control of the disconnect, thereby introducing another hazard. The addition of the motor disconnect adds an additional point of failure, exposure, and accessibility to unqualified people. In outdoor, washdown, and pump areas this additional exposure and water greatly increase hazards. This disconnect will increase the hazards of unexpected startup due to the potential of the starter being energized before the motor disconnect is closed. In conveying systems normally served by a single disconnect on a starter panel, any motor in excess of 50 feet from the panel would require a motor disconnect. Due to the necessary coordination of conveyors for safe material handling the disconnecting of a single motor rather than the system potentially increase hazards associated with material handling. Normal stop and emergency stop buttons are the appropriate method of stopping equipment. Following proper lockout procedures is the solution.
PANEL ACTION: Reject.

11- 190 - (430-102(b)): Reject
SUBMITTER: David R. White, Westvaco Corporation Packaging Resources Group
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Request the panel to reconsider its action and reject this proposal to remove Exemption 430-102(b).
SUBSTANTIATION: This proposal will increase the possibility of personnel interrupting energized circuits which can be more dangerous than the established procedure by OSHA Regulations 1910.147 covering lockout and tagout procedures. Before any work can be performed around a motor or the driven load, lockout and tagout of the motor controller disconnect is an absolute must. Also, in addition to 480 volt motors up to 200 horsepower, very large horsepower motors are present in industrial facilities operating at 2300, 4160, 7200 and 13800 volts. Disconnect switches for these motors would be very large and impractical to mount at the motor site. These switches would be even more life threatening to operate without knowing the state of the motor controller. Again, lockout/tagout of the motor controller disconnect is the only completely safe way to work on the motor or the driven equipment.
PANEL ACTION: Reject.

11- 191 - (430-102(b)): Reject
SUBMITTER: Ron B. Watson, Chattanooga, TN
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Leave the exception in 430-102(b) as it is that presently states:

"Exception: A disconnecting means, in addition to the controller disconnecting means as required in accordance with Section 430-102(a), shall not be required for the motor where the disconnecting means for the controller is individually capable of being locked in the open position."

SUBSTANTIATION: Removing this exception to 430-102(b) will result in unnecessary economic costs to industry users where the NEC is applied. The reasons stated for the change are not valid based on the past record within the industry. The project assumption that worker might choose to not spend the time or effort to walk to the disconnecting means to open the circuit and violate acceptable lock-out procedures, and work the circuit energized, indicates that the worker is willfully violating the requirements of OSHA 1910 subpart S, OSHA 1910-147, and NFPA 70E. This also implies that the supervision of such worker will completely ignore the requirements for lock-out as well. The Industry as a whole, design organizations, and users, have been applying the NEC Section 430-102(b) exception and have not experienced any injuries, incidents, or intentional violations of the lock-out requirement, derived from its application. The

requirements of the NEC is the "practical safeguarding of persons and property from hazards arising from the use of electricity". It is not intended to replace disciplinary action for willful violators of lock-out or replace the intelligence and common sense thinking entrained in people. The introduction of another disconnecting means in the motor circuit will add one more chance for lock-out failure and confusion.
PANEL ACTION: Reject.
PANEL STATEMENT: Leaving the exception unchanged would not include the panel action on Proposal 11-70. See panel statement on Comment 11-44.

11- 193 - (430-102(b)): Reject
SUBMITTER: Edward R. Nicholas, Earth Tech
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: I strongly urge the NFPA to reject this proposal and to let motor installations continue to be installed following the present code.
SUBSTANTIATION: As a member of the NFPA, I would like to voice my concur over a proposal by Code Making Panel 11 for NFPA 70 (National Electrical Code) seeking to make it mandatory to place a disconnect at every motor in the work place. There are several reasons why such a requirement does not enhance work place safety and another that the cost to be borne by the owners and manufacturers will be exorbitant.
The present codes and procedures more than adequately protect the workman in the work place if the codes and procedures are followed. The suggested changes to the NEC sound more like a convenience for the workman than a way to increase safety. If the Lock Out/Tag Out procedure is followed, the motor to be worked on will be disconnected from the power source, locked out, and tagged such that the power will not be restored until the workman completes his work and removes his lock and tag. In the instance quoted, where the workman may become "hung up", the procedures were obviously not followed and the workman was working on a live circuit or motor without following the safety guidelines prescribed by OSHA, and most likely, the safety procedures of the company or owner where the work is being performed.
Even assuming that there was a disconnect available at the motor, that disconnect could have been located as much as 50 feet away. Again, obviously too far for the workman to reach himself. An adequately designed E-stop system would be of more use than a disconnect out of reach of the workman, assuming that the workman had the presence of mind to react in the situation or was even able to operate the disconnect in the situation. The resultant conclusion must be that the workman was not following proper procedures, therefore exposing himself to severe consequences. Aain, assuming that a disconnect is available, and the workman ignored that safeguard and worked on a live circuit, what would the Code-Making Panel suggest next? Safeguards are in place and they work if the workman follows them. Laziness is no excuse for forcing unnecessary expense on owners.
The other compelling reason is financial. If owners are forced to add a disconnect at every motor location, the cost would be astronomical for facilities having thousands of motors. The cost to add or supply a new disconnect would include the cost of the disconnect, the labor to install it, the rerouting of the existing conduit and wire (if applicable) or additional conduit and wire in the case of a new installation. If the motor location is in a hazardous area, the cost of the disconnect could run into the thousands of dollar. One of the advantages of the present code is that a starter capable of being locked out can be located in a nonhazardous area such as a motor control center room and the wiring installed in the hazardous area without incurring the additional cost of installing an explosion-proof disconnect along with the explosion-proof motor. The disconnect cost could exceed thousands of dollars for a large sized motor and much more than that for a motor run on 4160 volts, and if the environment is NEMA 7 or 9, the cost is extremely prohibitive.
In conclusion, this proposal in no way increases the safety of the worker if he does not follow proper procedures. In addition, it might encourage known hazards such as switching off a motor under load if the disconnect is not horsepower rated. It also will incur considerable expense to the owner, especially in the case of many motors or in the case of hazardous environments.
PANEL ACTION: Reject.

(Log #2397)

11- 194 - (430-102(b)): Reject
SUBMITTER: James L. Graff, Chem-Trend Incorporated
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: We are asking the NFPA to vote against the proposed revision to the National Electrical Code which if passed would require a disconnect on every motor in the workplace environment.
SUBSTANTIATION: The substantiation used by the submitter of the proposal is based on assumptions and inaccuracies. The safety concerns brought up are opinion and are by no means justification for such an involved change. The first safety argument suggests that employees may be tempted to work on "hot" equipment if the distance to the disconnecting means is excessive. We at Chem-Trend have policies and training in place to prevent any such activity. Such behavior would be dealt with in a swift and severe manner up to and including dismissal. In addition, a local disconnect would encourage the act of switching a motor under load whether or not a load-breaking type of disconnect is installed, a very dangerous act in and of itself. Further, I question strongly the assumption that a trained craftsperson would rather work on a live 480, 2300 or 4160 volt system to save the effort of walking an "excessive" distance or even climbing a few flights of stairs. The second safety argument suggests a local disconnect would help in the event that a worker was "hung up". The problem is that if you are "hung-up," it will be difficult to throw a disconnect switch. When the proper lockout/tagout procedure is followed, the opportunity for a "hang-up" does not exist. Furthermore, in locations where "hang-up" hazards exist for operation machinery, emergency stop buttons are in place at several strategic points

around the equipment, whereas a single locale disconnect would do little in protection around large moving machinery. Finally, the statement that the proposal would reduce accidental injuries and death cites no evidence or statistics and is purely opinion.

The second and less important argument against this proposal is purely economical. The last part of the proposal reads: "...at very minor incremental cost to the owner." I argue the following: The proposed changes would provide a questionable reduction in accidental injuries and deaths, at a large capital and operating cost to the facility. These costs would manifest in the form of all of the following: New equipment cost of the local disconnects. Labor and material cost of a new wire run and installation of the new equipment. Lost production time during changeover. Labor costs for the revision of drawings, lockout procedures, training and engineering. Higher maintenance costs would also be realized as mechanical wire connections double and more equipment is maintained. At our McPherson Park facility, the electrical motors are in hazardous locations, given the number of electrical motors present, the cost to comply with the proposal would be significant. The statement: "...at very minor incremental cost to the owner" is, in a word, wrong.

This proposal is not justifiable through safety. There has been no research; there is no hard accurate data, only opinion. On the contrary, this change will introduce some safety risks that are known such as switching motors off under load, and general confusion in procedure. Compliance with this proposal would not involve a "minor incremental cost." It would result in a huge capital expenditure, which would redirect money from valuable projects and redirect manpower from valuable maintenance.

PANEL ACTION: Reject.

PANEL STATEMENT: Leaving the exception unchanged would not include the panel action on Proposal 11-70. See panel statement on Comment 11-44.

11- 195 - (430-102(b)): Accept

SUBMITTER: Jerry Spencer, Potlatch Corporation

COMMENT ON PROPOSAL NO: 11-68

RECOMMENDATION: Reconsider Panel Action on Proposal 11-68 (430-102(b)) Log #4074.

SUBSTANTIATION: I want to recommend reconsideration of Panel Action and rejection of Proposal 11-68 (430-102(b)) Log #4074 proposal. I see nothing int he originator's substantiation to indicate a need for this change. I have not heard of any examples whatsoever of injuries or accidents preventable by the proposal that did not involve violation of the existing electrical lockout procedures outlined in 430-102(a). Both the NFPA 70E and OSHA Regulations prohibit the sort of shortcut he is talking about, and I know for a fact that the company for which I work, as well as those workers I talk to regularly believe in and enforce/comply with requirements for lockout/tagout of all energy sources.

I also disagree strongly with the submitter's assessment of the "minor incremental" cost of implementing such a proposal. We have literally thousands of electrical motors at our site, and our site is only one of 5 just in this state. The sort of disconnect that would be required will run from several hundred to several thousand dollars each, depending upon the load, plus enclosure.

The other problem which arises with disconnects within sight of motors, is that the disconnect is far from the motor controller. Mistakenly opening a disconnect on a running motor could start a serious arc fault. The only way to avoid the danger of such faults is to introduce "break-before-break" contacts to open the motor contactor before the disconnect blades clear. Such auxiliary switches run several hundred dollars each, and introduce a new possibility for control problems. I strongly recommend that the panel reject this proposal, and leave the decision of whether or not to install field disconnects to the individual sites affected, who can best evaluate the relative cost/risk/benefits of each installation.

PANEL ACTION: Accept.

PANEL STATEMENT: The panel has reconsidered the panel action on the proposal and continues to accept the proposal in principle, but with further changes. See panel action and statement on Comment 11-56, and panel statement on Comment 11-44.

11- 196 - (430-102(b)): Reject

SUBMITTER: Tim Wing

COMMENT ON PROPOSAL NO:

RECOMMENDATION: I strongly oppose the proposed code revision that will require a disconnect on every motor. This proposal will be very expensive and there is no evidence it will increase safety. I believe it will reduce safety.

SUBSTANTIATION: The substantiation used by the submitter of the proposal is based on assumptions and inaccuracies. The safety concerns brought up are opinion and are by no means justification for such an involved change. The first safety argument suggests that employees may be tempted to work on "hot" equipment if the distance to the disconnecting means is excessive. Rather, a local disconnect would encourage the act of switching a motor under load whether or not a load-breaking type disconnect is installed, a very dangerous act in and of itself. Further, I question strongly the assumption that a trained craftsperson would rather work on a live 480, 2300 or 4160 volt system to save the effort of walking an "excessive" distance or even climbing a few flights of stairs. The second safety argument suggests a local disconnect would help in the event that a worker was "hung up". The problem is that if you are "hung up", it will be difficult to throw a disconnect switch. When the proper lockout/tagout procedure is followed, the opportuity for a "hang up" does not exist. Furthermore, in locations where "hang-up" hazards exist for operation machinery, emergency stop buttons are in place at several strategic points around the equipment, whereas a single locale disconnect would do little in protection around large moving machinery. Finally, the statement that the proposal would reduce accidental injuries and death cites no evidence or statistics and is purely opinion.

The second and less important argument against this proposal is purely economical. The last part of the proposal reads: "...at very minor incremental cost to the owner." I argue the following: The proposed changes would provide a questionable reduction in accidental injuries and deaths, at a large capital and operating cost to the facility. These costs would manifest in the form of all of the following: New equipment cost of the local disconnects. Labor and material cost of a new wire run and installation of the new equipment. Lost production time during changeover. Labor costs for the revision of drawings, lockout procedures, training and engineering. Higher maintenance costs would also be realized as mechanical wire connections double and more equipment is maintained. Large motors would require extraordinary measures to comply with this proposal. The statement "...at very minor incremental cost to the owner" is, in a word, wrong.

The bottom line: This proposal is not justifiable through safety. There has been no research; there is no hard accurate data, only opinion. On the contrary, this change will introduce some safety risks that are known such as switching motors off under load, and general confusion in procedure. Compliance with this proposal would not involve a "minor incremental cost." It would result in a huge capital expenditure, which would redirect money from valuable projects and redirect manpower from valuable maintenance.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel action did not remove the exception and would not require a disconnecting means at every motor. See panel statement on Comment 11-44 and panel action and statement on Comment 11-56.

(Log #241)

11- 197 - (430-102(b), Exception): Reject

SUBMITTER: Michael V. Glenn, Longview Fibre Co.

COMMENT ON PROPOSAL NO: 11-69

RECOMMENDATION: Reconsider panel action and reject the proposal.

SUBSTANTIATION: The originator of this proposal did not supply any substantiation of any accidents caused by using the disconnecting means required in accordance with 430-120(a) for electrical safety lockout. The originator's statement "how do you lockout a circuit breaker that is not capable of being locked out?" is an example of a controller disconnecting means that does not meet the requirements of the exemption. The exemption requires "the disconnecting means for the controller is individually capable of being locked in the open position." The submitter questioned who has authority to lock and unlock a disconnect. This type of requirement is adequately covered by existing laws, safety procedures, NFPA 70E requirements, and the Federal Law

Regarding lockouts. OSHA Regulations (Standards - 20 CFR) "The control of hazardous energy (lockout/tagout) - 1910.147" establishes the minimum requirement for safety lockout and tagout of all energy sources including electrical. Both OSHA and NFPA 70E provide for the correct and safe procedures to lock or tag electrical equipment. The procedures for removing a lock are covered by these codes. In the submitter's substantiation, it sounds like these procedures were followed when the electrician was notified and warned of the intended removal of his lock.

Using the disconnecting means required in 430-120(a) is a proven safe method of lock out. This is substantiated by many safe years with no accidents. Only when the law is violated has there been a problem. The submitter's statement that this change would be "at a very minor incremental cost to the owner" is incorrect. At our industrial facility we have approximately 8,000 AC and DC motors. We purchase the latest type of motor control centers with lockable devices just for the purpose of lockout and tagout. Installing disconnects in the field for every motor will increase building space and size requirements to provide the necessary space that does not interfere with operations but yet is in sight of the motor. For industrial type processes and equipment that must be coordinated and interlocked, it will require not only an interlocking scheme at the controller but at the disconnect as well. This will substantially increase the installed cost and the complexity of the equipment. This proposed requirement has a very significant impact not only on cost, but also in real estate required. I realize that cost is no substitute for safety. However, in this particular case the additional cost is not warranted when there is a proven safe means of lockout.

There are many more good reasons to use the disconnect required in 430-102(a) as the lockout device rather than a disconnect within sight of the motor. The controller disconnect is a proven safe lockout means. The controller disconnect allows for determining if the controller is open prior to opening or closing the circuit to the motor. It would be unwise to open or close a disconnect at the motor without knowing the state of the controller because the controller may be in the closed position and the motor could inadvertently start if the disconnect is closed. There are many automatic processes and equipment that for safety reasons that cannot and should not have an individual motor de-energized without shutting down the process or the equipment as a whole. Using a disconnect at the motor in lieu of the controller disconnect bypasses all safety interlocking schemes.

I strongly request the panel reconsider its action and reject this proposal based on inadequate substantiation supporting this requirement, a significant financial impact on the user, and the increased industrial safety risks just mentioned. The need for a field disconnect within sight of the motor is an engineering design consideration and safety issue that should be left to the requirement of the user and not dictated by code.

Considering that industrial facilities have their own maintenance force, purchase equipment that presently meet the requirement of the exemption in Article 430-102(b), have processes and environments that cannot tolerate a disconnect at the motor, and are more equipped to handle safety and lockout procedures, the following compromise may serve the purpose of both industry and the submitter: Change Article 430-102(b) Exemption to read as follows: "Exception: In an industrial facility or plant, a disconnecting means...". The addition of the words "In an industrial facility or plant," limits the use of this procedure to those larger facilities that are manned, organized and have better lockout and tagout control.

PANEL ACTION: Reject.

(Log #250)

11- 198 - (430-102(b), Exception): Reject
SUBMITTER: Louis Ward, Smurfit-Stone Container Corporation
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: Reconsider panel action and reject the proposal.
SUBSTANTIATION: The person submitting this proposal obviously has not received mandatory training pertaining to the 1910 OSHA Guide Sections 147 and 331-333, which cover among other things, proper lockout procedures. The answers to his questions are contained within these sections. He also did not cite any instances, where injuries were incurred by someone utilizing the lockout means required by Section 430-120(a), only an uncomfortable feeling (which may well be lack of required training).

Placing a local disconnect in sight of each motor, to be used for lockout, poses special safety concerns in an industrial facility. The lockout procedures at our plant require that after a switch is pulled off, a qualified electrician must prove with electrical measuring devices that the power has indeed been interrupted. (We have had incidences in the past where a switch handle has been pulled to the off position and the switch did not open electrically). How will the person pulling a field-mounted switch know the status of the motor contactor? (Pulling a switch underload is not a good idea and should only be done in an emergency). Placing a lockout switch in the field, would encourage unqualified personnel to attempt their own lockout or to simply forego lockout entirely, since they would be in sight of the switch feeding a motor and "feel" in control. An additional safety consideration pertains to automated processes. Most automated processes are interlocked to insure that all equipment starts or stops in a certain sequence due to process and safety requirements. Placing a means of circumventing these interlocks (i.e., the local lockout switch) in the field could potentially result in a hazardous condition due to process upset. Finally, placing switches in the field for lockout of large 2300 Volts or 4160 Volts motors, simply isn't safe or in some cases possible, due to existing space limitations.

Existing OSHA and NFPA 70E regulations have provided proven safe procedures and means for insuring the zero-energy status of electrical equipment and its lockout. If anyone has been injured due to improper lockout, it is because these procedures "laws" have been ignored or violated. I strongly urge the panel to reject this proposal based on the concerns itemized above.

PANEL ACTION: Reject.

11- 199 - (430-102(b), Exception): Reject
SUBMITTER: Walter Bruehl, Boise Cascade Corporation
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: Reconsider panel action and reject the proposal. Leave this section as it appears in the 1999 code.
SUBSTANTIATION: NEC Section 430-102(b) Exception is fundamental to our lockout/tagout policy and procedure. All of our lockouts for process motors are done at the motor controller. Only a few simple stand-alone machines have local disconnects. Many of our systems have multiple sources of energy that must be verified at zero energy and locked out before the equipment can be safely worked on. In addition to a single motor there are often other motors, compressed air, steam, various fluids and other sources of energy that must be secured, locked out and verified as having zero energy and no chemicals or other hazards to the worker prior to working on the equipment. We require the lockout of the entire "system" to be complete prior to work beginning. Employee violation of this policy can result in disciplinary action including loss of employment.

The proposed change to require a local disconnect switch at the motor may result in a greater hazard to the worker by tempting the worker to short cut the lockout process that assures that all hazards are put in a safe condition prior to work. They may simply throw the local switch and forget about the other hazards associated with the equipment. Further, when the local switch is closed the machinery may restart in an undesired condition and result in additional damage or confusion.

The controls for most of our machinery would need to be modified in a manner to protect the machine and workers from an individual inadvertently opening a local disconnect switch prior to safely shutting down the machine or process and safely securing it.

Some motor driven equipment is in hazardous, corrosive or wet environments. It is desirable to keep the number of electrical components in these environments to a minimum due to the difficulty maintaining the integrity of the enclosure and its internal components under these conditions. A field mounted disconnect switch in a hazardous environment would need to be rated for the environment to avoid introducing an explosive hazard.

The author of the proposal to eliminate this exception may not be aware of the additional hazards introduced in the process industries by requiring local disconnects. These additional disconnect switches are unnecessary and undesirable from a safety standpoint in the process industries.

PANEL ACTION: Reject.

PANEL STATEMENT: Leaving the exception unchanged would not include the panel action on Proposal 11-70. See panel statement on Comment 11-44.

11- 200 - (430-102(b), Exception): Reject
SUBMITTER: Robert Huddleston, Jr., Gray, TN
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: Do not delete the exception in 430-102(b).
SUBSTANTIATION: Lock and tag procedures and policies adequately assure the safety of a motor lockout without the requirement of a local disconnect. While it may be less convenient to have to walk to an electric room to de-energize, lock and tag - it is no reduction in safety period. There is no substantiation that this costly change would increase safety.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel action on the proposal modified the existing exception, but did not delete it. See panel statement on Comment 11-44 and panel action and statement on Comment 11-56.

11- 202 - (430-102(b), Exception): Reject
SUBMITTER: Anthony L. Sherrill, Batesville, AR
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: The panel should have rejected the proposal.
SUBSTANTIATION: • The code panel realized that this proposal was not practical in many applications. The wording in the panel's revised exception makes this proposal unenforceable. Each application could be argued as impracticable or as adding additional hazards. Every location where the local disconnect is added could present additional hazards because it could expose unqualified personnel to live circuits. Also, if more expensive "Load Break Disconnects" are not installed, additional hazards are introduced by the possibility of unqualified personnel operating the disconnects under load. If this were truly a safety issue, there should not be thousands of applications where the requirement is impracticable.

• Based on the substantiation, this proposal was written mainly for convenience. The submitter describes "working the equipment Hot" when the distance is "excessive". This is an obvious violation of OSHA standards. As already stated in the "Explanation of Negatives", the NEC is written to provide an installation free from hazards, not for convenience. This proposal is too costly to implement for convenience.

• OSHA Lockout/Tagout procdures, when properly followed, have proven adequate for many years in the chemical industry. The example in the substantiation is a severe violation of this standard. As qualified electricians, we are expected to follow OSHA safety standards. The additional local disconnect will not necessarily protect those who choose not to follow established safety standards.

• I am only familiar with working in the chemical industry where OSHA regulations are strictly enforced. If this proposal was accepted because of areas where these regulations are not strictly enforced, there should at least be an exception for areas where the conditions of maintenance and supervision esure that only qualified personnel utiziling the OSHA Lockout/Tagout procedures perform maintenance on the equipment.
PANEL ACTION: Reject.

SUBMITTER: John Leibee, PPG Industries
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: Leave existing text in NEC 1999 "430-102(b) Exception" as it stands.
SUBSTANTIATION: The substantiation for Proposal 11-69 is first based on circuit breakers that can't be locked out and secondly on personnel violating Lock and Tag procedure. A lot of time and imagination has been spent developing ways of locking out "unlockable" circuit breakers. These devices are available and should be part of the planning of a job. Violations of Lock and Tag Procedure can take place no matter where the disconnect is located. As a matter of fact if the disconnect is "within sight" the worker does not even have to lock it out. This poses a more serious threat because the disconnect can be closed while the workers' back is turned or while he is at break or lunch. This just happened in our area and resulted in a fatality.
PANEL ACTION: Reject.
PANEL STATEMENT: Leaving the exception unchanged would not include the panel action on Proposal 11-70. See panel statement on Comment 11-44.

SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
COMMENT ON PROPOSAL NO: 11-70
RECOMMENDATION: Revise panel action as follows:
The provision for locking or adding a lock to the disconnecting means shall ~~be permanently~~ remain installed on or at the switch or circuit breaker used as the disconnecting means when the equipment is returned to service.
SUBSTANTIATION: It is unclear if the panel action would allow any type of field installed lock-out accessory by its use of the word "permanent". It would appear that the submitter by his statement that permanent provisions are readily available from manufacturers, in his substantiation, was referring to the type of handle clip that is installed on the breaker and held in place by the panel cover. Is this the type of provision that the panel was thinking of, or does this change require the use of some sort of prefabricated assembly that is a part of the enclosure cover or deadfront? It would seem that the intent was to disallow the truly portable type that the worker carries with him or her, attaches to the breaker handle while working on the equipment and then completely removes when done. This is borne out by the last sentence in the substantiation which says that only a lock is needed to work safely. The suggested language may help to clarify this issue.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed text would apply only after some service operation. It is intended that the provision for locking be permanently installed at the time the disconnecting means is installed.

SUBMITTER: Robert L. Hughes, Chattanooga, TN
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Leave the current exception in 430-102(b) that states:
Exception: A disconnecting means, in addition to the controller disconnecting means as required in accordance with Section 430-102(a), shall not be required for the motor where the disconnecting means for the controller is individually capable of being locked in the open position.
SUBSTANTIATION: Removing this exception to 430-102(b) will result in astronomical and unnecessary costs to industrial users where the NEC is applied. The substantiation the proposer uses is not valid. The notion that a worker might choose to not spend the time or effort to walk to the disconnecting means to open the circuit and choose to work the circuit "hot" means that worker is really dumb and the worker is also violating the requirements of OSHA 1910 subpart S, OSHA 1910-147, and NFPA 70E. Industrial users have been applying the NEC 430-102(b) exception and have not experienced any problems derived from its application. The purpose of the NEC is for the "practical safeguarding of persons and property from hazards arising from the use of electricity". It is not intended to replace intelligence and common sense in people. The introduction of another disconnecting means in the motor circuit will add one more device that can fail, can be wired incorrectly, can fault to ground, and can be operated by unqualified persons.
PANEL ACTION: Reject.

11- 209 - (430-102(b), Exception): Reject
SUBMITTER: William D. Glover, New Martinsville, WV
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: The substantiation offered for this proposal, concerning a circuit breaker that cannot be locked, is based on an incorrect premise. The existing wording of the exception in 430-102(b) does not eliminate the requirement for a disconnect in sight of the motor in situations where the disconnecting means for the controller cannot be locked in the open position. Therefore, the existing wording adequately covers this situation.
The existing wording of 430-102(b) provides requirements for motor circuit installations to have a disconnecting means that is capable of being locked in the open position. The requirement for lockout/tagout procedures and the application of these procedures is not the domain of the NEC. NFPA-70E and OSHA clearly deal with these issues. Employers and employees must be familiar with and adhere to the requirements of these standards for the safe maintenance of motor circuits.
PANEL ACTION: Reject.

SUBMITTER: Tim Fisher, Sr., Cognis Corporation
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: The Panel should reject this proposal.
SUBSTANTIATION: This proposal should be rejected by the panel. Federal Regulations are currently in place (OSHA 1910.147 and NFPA 70E) that require a disconnecting mechanism(s) be installed that allows a mechanic to lockout/tagout all sources of energy to a piece of equipment before working on that equipment. Requiring an additional means of disconnecting the power to a motor is not only cost prohibitive but it also introduces another possible failure point to that circuit. If the concern is for the safety of the mechanic on the job, which it certainly should be, it is more important to train these workers on the contents of the aforementioned regulations and ensure enforcement thereof, then it is to add disconnects.
PANEL ACTION: Reject.

SUBMITTER: Robert B. Alexander, Fluor Daniel
COMMENT ON PROPOSAL NO: 11-68
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: A reading of Part IX of the draft indicates that a disconnecting means "in sight" of the motor is not necessarily required to be lockable. In fact, under the proposed conditions neither disconnecting means is required to be lockable. Therefore, the proposed change is inherently less safe than the current requirements since having a disconnect "in sight" does not mean the worker will always be paying attention to its status or that the disconnecting means could not be inadvertently closed.
The commentor is aware that most devices suitable for motor disconnecting means are lockable, however, it would not be a requirement under the current proposal. Adding a requirement that the "in sight" disconnect be lockable at this stage of the code making process is "new material."
PANEL ACTION: Reject.

11- 216 - (430-102(b), Exception): Accept in Principle
SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers
COMMENT ON PROPOSAL NO: 11-69
RECOMMENDATION: Continue to accept in principle.
SUBSTANTIATION: The panel action on proposal 11-68 did satisfy the intent of the submitter by requiring a disconnect within sight of the motor.
Typical maintenance procedures do not widely include a working lockout/tagout program. In addition situations such as large distances or different levels are inconvenient for maintenance/service personnel, leading to unsafe work practices. The addition of a disconnect within sight of the motor will not result in a large cost to the owner. However the addition of this disconnect will result in a tremendous increase in safety for all persons involved in the maintenance/repair of the equipment. The negative comment of Mr. Cox states that "It could also be argued that the addition of a local disconnect increases the hazards to persons or property for every installation" is certainly without merit. This proposal is directed towards an increase in safety for persons. This change will not in any case decrease the level of

safety presently required in the NEC. Negative comments, which were directed towards the application of a lockout/tagout program, are not sufficient reason to reject this proposal. This code does not require a lockout/tagout program nor should the members of CMP-11 assume that all maintenance/service personnel apply the lockout/tagout provisions of applicable OSHA standards. This is a safety driven proposal, which is directly in tune with the purpose of the NEC which "is the practical safeguarding of persons and property from hazards arising from the use of electricity."

This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.

11- 220 - (430-109(A)(6)): Reject
SUBMITTER: Gordon T. Davis, Moeller Electric Corp.
COMMENT ON PROPOSAL NO: 11-75
RECOMMENDATION: Motor Disconnects are suitable for use on the lineside of fuses, based on the same objective criteria used to evaluate other types of disconnecting means. Restriction of the use of motor disconnects to the loadside of fuses reduces the safety of some assemblies, as most motor disconnects have recessed terminals, making them finger safe. It is our understanding that Code Panel 11 has concerns regarding the use of motor disconnects in service entrance installations. In order to address those concerns and to reach a consensus we propose the following wording to 430-109(A)(6):

"Motor disconnects may only be used on the lineside of fuses in listed assemblies, that are not marked for use as service equipment."

SUBSTANTIATION: Code Panel 11 statement to Proposal 11-75 indicates a need for clarification of the substantiation showing the suitableness of motor disconnects installed on the lineside of branch circuit overcurrent protective devices. As everyone is aware the NEC is an ANSI consensus standard. It has been the consensus for some time that the following is used to determine the suitableness of a device in an installation, 1. Sound engineering theory, 2. Scientific evidence, and 3. Statistical data. It has also been the consensus that comments negative to sound engineering theory, scientific evidence, and statistical data would have to be explained.

Motor disconnects have been proven suitable for use on the lineside of fuses by sound engineering theory, by scientific test programs, and by statistical data. Code Panel 11 restriction of motor disconnects from the lineside of fuses has gone unexplained in light of empirical evidence.

1. The basis for the dielectric values of motor disconnects used on the lineside of fuses is Insulation Coordination. This engineering theory is accepted in the USA (UL 840 and NEMA ICSI Annex A) as well as throughout the world (IEC 664). Code Panel 11 restriction of such motor disconnects (i.e., having UL 508 spacings and using Insulation Coordination to determine dielectric values) to the load side of fuses has the effect of compelling constructional requirements to product standards.

Code Panel 11 is choosing one design of a product (measured clearances) over another (insulation coordination dielectric values). It is my understanding that the NEC is an installation standard and such a compulsion of design is beyond the scope of the standard. Code Panel 11 has provided no refutation of the sound engineering theory of insulation coordination when it restricted motor disconnects to the load side of fuses.

2. The scientific evidence of the suitableness of motor disconnects used on the line side of fuses consists of test programs developed by Nationally Recognized Testing Laboratories, most notably UL. These test programs have shown that motor disconnects are suitable for use on the line side of fuses, using the same tests that Code Panel 11 had found suitable for other disconnects providing the same function. Code Panel 11 has not shown that the tests performed were inadequate for motor disconnects, especially when the Panel finds the same tests adequate for other disconnects.

3. Motor disconnects (UL 508 manual controllers which are tested to UL 98) have a significant history of use in the USA, over a decade of continuous use. There is no statistical evidence to show that when used within their ratings they fail at a greater rate than other disconnecting means, nor are there any reports of failures leading to a hazard. Indeed, the evidence would rather indicate that these motor disconnects are no less safe than other disconnecting means and may even provide a greater degree of safety due to inherent protective design features with respect to electric shock hazards. We would point out that Code Panel 11 did not make reference to any statistics that would have supported their action to restrict motor disconnects to the load side of branch circuit overcurrent protective devices.

All of the engineering, empirical, and objective evidence would indicate that motor disconnects are suitable to be used on the lineside of branch circuit overcurrent protective devices. There should be an obligation to reveal any evidence to the contrary. As stated previously, there are many motor disconnects used on the lineside of fuses in the USA and throughout the world. If Code Panel 11 or any individual on Code Panel 11 has any knowledge that motor disconnects are not suitable for this purpose then that evidence should be revealed so that users of motor disconnects may take appropriate remedial action.

It has been alleged that large spacings in field wiring terminals are required for maintenance purposes. To our knowledge, this also has not been substantiated by any scientific or statistical data.

Indeed, such assertions run counter to a growing demand in the field for these products and the successful application of numerous UL 508 motor disconnect devices already in service.

As best as we can understand Code Panel 11 feels uncomfortable about the use of motor disconnects in service entrance applications. It was for that reason that we indicated in our proposal that motor disconnects (UL 508 manual controllers tested to UL 98) are constructionally limited to 100 amps and less by the size of their field terminals. Almost all of these devices are used in industrial control panels where they can provide a degree of protection against unintentional contact with live parts; most motor disconnects are fingersafe or back of hand safe.

As a means of further addressing the concerns of Code Panel 11 and reaching a consensus we propose the additional wording:

"Motor Disconnects may only be used on the lineside of fuses in listed assemblies that are not marked for use as service equipment."

PANEL ACTION: Reject.

PANEL STATEMENT: Manual motor controllers were allowed into Section 430-109 (a)(6) in the 1999 Code cycle even though they have lesser creepage and clearances than UL 98 switches or UL 489 circuit breakers because the line side branch circuit overcurrent device is there to protect it if arcing were to occur. This proposal would allow these devices to be installed without overcurrent protection.

The tests referred to do not address line side spacings.

15- 10 - (430-113 Exception No. .3 (New)):

Note: It was the action of the Technical Correlating Committee that Proposal 11-79 be reported as "Reject" because Code-Making Panel 15 has appropriately handled the exemption of fire pumps from 430-113 in Proposal 15-85.

SUBMITTER: Technical Correlating Committee National Electrical Code

COMMENT ON PROPOSAL NO: 11-79

RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 15 for action in Article 695. This exemption to a Chapter 4 requirement should be located in the Chapter 6 article. This action will be considered by the Panel as a Public Comment.

SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.

PANEL ACTION: Accept.

PANEL STATEMENT: The panel addressed the concern in the action on Proposal 15-85.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

(Log #291)

11- 221 - (430-120(b)): Reject

SUBMITTER: Douglas J. Lauer, Boise Cascade Corporation

COMMENT ON PROPOSAL NO: 11-68

RECOMMENDATION: Reconsider panel action and reject proposal. Leave wording as in 1999 NEC.

SUBSTANTIATION: The originator lists "two serious safety issues." The first is that "when the distance is excessive, workers attempt to work the equipment "hot", rather than walk the distance four times." This substantiation is invalid since OSHA and NFPA 70E violations (particularly lockout/tagout) have occurred. NFPA 70E referenced by OSHA states lockout/tagout is required without mention of distance. The second "concerns the worker who gets "hung-up" and the disconnecting means is not within sight." Workers will not become "hung-up" if lockout/tagout rules and procedures are followed. Being within sight does not mean readily accessible, and will not provide for a safe and reliable method of disconnecting in a "hung-up" situation.

The originator does not substantiate any accidents. Most accidents relating to disconnecting means are a result of failure to follow lockout/tagout procedures. A lock on a disconnecting means and following designated safety procedures is the only way to be certain that the machinery is isolated from energy sources, regardless where the lock is. Also workers will not be looking at the disconnecting means the entire time they are performing the work at hand and therefore in sight is irrelevant.

Within sight does not mean a short travel distance, the disconnecting means can be on the opposite side of a conveyor, in sight, and visually ten feet away, but it may be 200 feet of travel distance to get to a safe crossover point and access the disconnecting means.

The originator also states that "This proposal will reduce accidental injuries and death, at very minor incremental cost to the owner." I work for a company that has one of the lowest incident rates in the wood products industry. We commonly install disconnects and safety procedures for equipment that requires frequent lockout/tagout. We never discount safety! When we install disconnects we use a common sense approach and look at the workers access to the disconnecting means in preparing to do the work safety. Often this common sense approach will locate the disconnecting means not within sight of the motor but more often along the route to access the work and/or at a disconnect station where many motors can be locked out to secure a work area. This proposal does not increase the level of safety, nor does it guarantee a convenient disconnecting means; at best it decreases the amount of time to lockout/tagout. As for "minor incremental cost", the cost of a disconnect is relatively cheap, but the installation and additional building area required commonly are significant.

Opening or closing a disconnecting means is not a safe operation without knowing the status of the controller. Therefore locking out at the controller is typically the safest since the status of the controller is easily determined.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel statement on Comment 11-2.

(Log #734)

11- 222 - (430-120(b)): Reject

SUBMITTER: Robert B. Alexander, Fluor Daniel

COMMENT ON PROPOSAL NO: 11-68

RECOMMENDATION: Reject the proposal.

SUBSTANTIATION: • This proposal lacks sufficient substantiation. There is no offer for public review in either the proposal or the panel statement that establishes how many deaths or injuries, if any, would be prevented by requiring local disconnects where current installation requirements are met and safe work practices are followed.

• The assertion that current requirements are unsafe is based on the willful disregard of safe working practices.

• It is not the intent of the disconnecting means to protect a worker from being "hung up". Should it be necessary, that is the function of a local operator of the motor controller, such as an emergency push button or conveyor trip wire.

• The FPN is meaningless. A designer cannot appeal to the fine print note with certainty that it would be accepted by an authority having jurisdiction. Proper enforcement would require that the authority having jurisdiction demand that it be demonstrated that a local disconnect either could not be installed or that it would increase danger. Some jurisdictions view this from an economic perspective, which is improper if it is truly a safety issue, some do not. In any case, it is likely to be inconsistently enforced which makes it bad code.

• Splices and terminations are typically the "weak link" in electrical installations. For any installation this requirement would increase the number of terminations by two and for typical three-phase industrial systems by six; therefore this proposal is dictating a less reliable system.

• New Section 80-9(B) states: "Existing electrical installations that do not comply with the provisions of this code shall be permitted to be continued in use unless the authority having jurisdiction determines that the lack of conformity with this code presents an imminent danger to occupants." If the lack of a local disconnect did not constitute imminent danger in these cases, then there was no need for it in the first place.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel statement on Comment 11-44.

11- 226 - (430-145(b)): Reject

SUBMITTER: William M. Lewis, Eli Lilly and Co.

COMMENT ON PROPOSAL NO: 11-84

RECOMMENDATION: Reject the proposal.

SUBSTANTIATION: I am uncertain as to the origin of this requirement, however I doubt that the original intent was as stated in the substantiation. I suspect that the original intent was to only allow remote location of the connection box only if the leads were AWG 10 or smaller. (Although off hand I do not understand the technical justification for this cut off point). The effect is to limit the size of motor which could have the connection box remote. To require each strand be smaller than AWG 10 strikes me as a silly requirement for a nonexistent problem.

PANEL ACTION: Reject.

PANEL STATEMENT: The substantiation for the proposal correctly states the intent, which is to provide a vibration tolerant installation. Limiting each strand to No. 10 or smaller does not limit the size of the motor that can have a remote connection box.

(Log #447)

11- 227 - (430-152): Hold

Note: The Technical Correlating Committee understands that the "Hold" applies to Comments 11-30 and 11-227, and not to Proposal 11-89.

SUBMITTER: R. L. Nailen, Hales Corners, WI

COMMENT ON PROPOSAL NO: 11-89

RECOMMENDATION: As accepted, this proposal includes specific reference to "Design E" motors. All such references should be deleted from the Code. As of Feb. 2000, NEMA has rescinded its Design E motor standard. Furthermore, no such motors were ever offered on the market by either U.S. or foreign manufacturers, as can readily be verified through NEMA. This and any other Code references to "Design E" characteristics are therefore unnecessary and inappropriate.

SUBSTANTIATION: The problem in continuing to cite a nonexistent standard in the Code is that it inevitably casts doubt on the product knowledge of the Code-Making Panel and on the currency of the Code itself. When a product has never existed except on paper, and will not exist in the future, it need not and should not be cited in a Code of practice.

PANEL ACTION: Hold.

PANEL STATEMENT: See panel statement on 11-30.

PANEL ACTION: Reject.

PANEL STATEMENT: There is no recommendation, as required by 4-4.5(c) of the Regulations Governing Committtee Projects.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

(Log #279)

11- 229 - (430-192(b)): Reject

SUBMITTER: Ronald H. Simpson, GE Company

COMMENT ON PROPOSAL NO: 11-68

RECOMMENDATION: We strongly recommend the panel reconsider its action and reject this proposal to remove exemption 430-120(b) based on inadequate substantiation supporting this requirement. The need for a disconnect in sight of the motor should be left to the need of the user and not directed by code.

SUBSTANTIATION: This is to inform you of the position of the PPIC with respect to the proposed removal of exception 430-102(b) from the NEC. The PPIC is opposed to the removal of this exception for industrial plants.

The originator of this proposal did not supply any substantiation of any accidents caused by using the disconnecting means required in accordance with 430-120(a) for electrical safety lockout. The originator's statement that workers might attempt to work the equipment "hot" rather than walk an excessive distance is vague, a generality, and a violation of the law. The originator's substantiation stating that a worker who gets "hung up" in a piece of machinery could use a disconnect as a means of getting out of trouble clearly shows a lack of understanding of all safety procedures, NFPA 70E requirements, and the Federal Law Regarding lockouts. OSHA Regulations (Standard - 20 CFR) "The Control of Hazardous Energy (Lockout/Tag out) - 1910.147" established the minimum requirement for safety lockout and tag out of all energy sources including electrical. Both OSHA and NFPA 70E presently provide for the correct and safe procedures to lock or tag electrical equipment.

Using the disconnect means required in 430-120(a) is a proven safe method of lock out. This is substantiated by many safe years with no accidents. Only when the law is violated has there been a problem. The submitter's statement that this change would be "at a very minor cost to the owner" is incorrect. The substantial cost is not warranted when there is a proven safe means of lockout.
PANEL ACTION: Reject.
PANEL STATEMENT: The reference is incorrect. See panel statement on Comment 11-44.

ARTICLE 440 — AIR-CONDITIONING AND REFRIGERATING EQUIPMENT

(Log #1328)

11- 230 - (440-2 and 440-65): Accept
SUBMITTER: William H. King, Jr., U.S. Consumer Product Safety Commission
COMMENT ON PROPOSAL NO: 11-104
RECOMMENDATION: I support the panel action to "Accept in Principle in Part" with the additions to Section 440-2, and by adding the new Section 440-65. I further support broadening the protection devices permitted to include arc-fault circuit-interrupter protection.
SUBSTANTIATION: Panel 11 is urged to adopt the proposal as amended by the panel and reported in the ROP, and as noted above. While the explanation offered by several panel members for their negative votes has merit, i.e., the matter is a product standard issue, and product standard developers and listing organizations have not responded to this safety issue with upgraded requirements. Therefore, it is appropriate to bring the matter before the broader electrical safety community represented by the NEC Committee.

Each year CPSC identifies fires that specifically mention the power cord attached to an air conditioner as the cause. In a check of incidents reported to the CPSC for 1999, six reports clearly state that the power cord on the air conditioner started the fire. Other reports for room air conditioners mention short circuit conditions associated with the appliance, but lack more specificity. Still other reports cite an extension cord used with a room air conditioner as the cause. While there may be multiple reasons for fires with room air conditioners, the power cord is a specific part in need of improvement.

Window-mount room air conditioners are frequently used as seasonal products, often removed from window locations and stored elsewhere when not in use. Cords used on these products (typically SP-3 type construction) are not designed to withstand mechanical stress conditions encountered as part of the removal and storage process.

Of the cost-effective technologies available today, listed arc-fault circuit interrupters and leakage current detection interrupters provide a remedy for numerous causes associated with the power cord as well as some internal appliance faults that increase the risk of fire with cord-connected air conditioners.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 4
EXPLANATION OF NEGATIVE:
BUNCH: I vote negative. The substantiation for this is not well founded. Several incidents have been referenced without any forensic support that the problem was a direct result of what this proposal is addressing. This should be examined by the manufacturers and testing agencies to first verify if these reports are accurate and if so, the product should be regulated through product standards and not the NEC. This is inappropriate and in many cases will not be enforceable by the authority having jurisdiction.

CLOSSON: While the use of cord sets with leakage current detection have merit; the requirement for the construction and performance of products belongs in the end product safety standards, not in the NEC.

COX: While I agree that the LCDI is a means to enhance safety for portable cords for air conditioners, I believe this is an issue for the product standards and should not be mandated by the NEC. If portable cords are the source of some fires as indicated by the data, then it should be the responsibility and desire of the listing agency to change the standard to eliminate the hazard. The listing agency may allow other suitable methods for alleviating the safety hazard.

SAPORITA: I vote negative on the panel action. While protection of air conditioing power cords against arcing fault and overload conditions has great merit, the proposed solution to remedy the problem is a product standards issue and should be addressed therein. The proposed requirements for LCDI and AFCI protection of specific power cords do not belong in the NEC.

Also, the inclusion of AFCI protection is new material introduced during the comment stage that has not had adequate public review. Therefore, this material should not be introduced into the 2002 NEC.
COMMENT ON AFFIRMATIVE:
HAMER: See my Affirmative Comment on Comment 11-242.

(Log #848)

11- 231 - (440-2-Leakage Current Detection and Interruption (LCDI) Protection and 440-65 Leakage Current Detection and Interruption (LCDI) and Arc Fault Circuit Interrupter (AFCI)): Accept

Note: The Technical Correlating Committee understands that the final action on this material is contained in Comment 11-242.
SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: 11-104
RECOMMENDATION: Add a new definition to 440-2 as follows:

Leakage Current Detection and Interruption (LCDI) Protection. A device provided in a power supply cord or cord set that senses leakage current flowing between or from the cord conductors and interrupts the circuit at a predetermined level of leakage current.

Add a new 440-65 as follows:

Leakage Current Detection and Interruption (LCDI) and Arc Fault Circuit Interrupter (AFCI). Single-phase-cord- and plug-connected room air conditioners shall be provided with factory-installed LCDI or AFCI protection. The LCDI/AFCI protection shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm (12 in). of the attachment plug.
SUBSTANTIATION: NEMA supports the Panel's action of Accept in Principle in Part with the addition of including an option for AFCI protected cord set.

A unnecessary and serious safety hazard continues to exist. An article in the March/April 2000 NFPA journal documented a room air conditione cord fire in a nursing home. Both the January/February and March/April electrical accidents section of the IAEI News also had articles on air conditioner cord fires.

Room air conditioners are used in existing homes, institutions and elderly housing which do not have requirements for AFCI protection. There are many precedents for incorporation of product and cord safety requirements in the Code. This includes:

Section 422-41 Immersion protection for cord and plug connected appliances

Section 422-45 Stands for cord-and plug-connected appliances

Section 422-46 Flatirons equipped with an identified temperature limiting means

Section 422-49 Factory installed GFCIs for High Pressure Spray Washers

Section 680-40 GFCI protection for cord-and plug-connected spas and hot tubs.

This requirement is functional in nature. It is based on the UL/CSA standards. A serious and preventable safety hazard that results in fires, injuries and deaths every year continues to exist. There are many precedents for this requirement. Economical, proven, and listed products are available that will provide the necessary safety protection.
PANEL ACTION: Accept.

(Log #1734)

11- 236 - (440-65 (New)): Accept
SUBMITTER: Rocco J. Gabriele, State of Maryland Dept of State Police
COMMENT ON PROPOSAL NO: 11-104
RECOMMENDATION: This is to respectfully request your reconsideration of Proposal 11-104 (Log #3327), regarding "Leakage Current Detection and Interruption (LSDI) Protection" as submitted by Mr. Edward A. Schiff of Technology Research corporation, Clearwater, FL.
SUBSTANTIATION: We believe this proposal address a significant fire safety and electrical shock hazard associated with the power cord for portable room air conditioners, as documented by the U.S. Consumer Product Safety Commission.
Although there may be some debate as to whether such a device should be installed on the appliance or on the wiring serving an outlet that the appliance may be plugged into, it appears that the proposal to require it on the appliance has more merit since it would address the customer's need who has an existing home or office and, therefore, will not likely have their electrical system upgraded to install a LSDI at the outlet. As noted in the proposal, there are other sections of the NEC that requires such protection for other electrical products. We believe such a requirement in the NEC would encourage testing laboratories to incorporate such protection in their product standards.
Accordingly, extending requirements for LSDI protection to the power cords of air conditioners appears to be an appropriate means to safeguard these appliances from fire and electrical shock. We encourage the panel to accept the above proposal for reconsideration under the comment period.

(Log #2393)

11- 240 - (440-65): Reject
SUBMITTER: Steven R. Moses, Wood Industries, Inc.
COMMENT ON PROPOSAL NO: 11-104
RECOMMENDATION: Reject (delete) proposed wording as present in Proposal 11-104 (Log #3327) for Article 440 paragraph 45.
SUBSTANTIATION: The proposal should address specifically the power supply cord and not a cord set. The proposal is vague as to the application of the technology.
While in support of Arc Fault Circuit Interruption, the technology is not proven. There has not been enough usage of these devices to support standardization on a proprietary design. The trip levels may or may not be correct for the application causing the user frustration, which leads to circumvention of the safety device.
The proposal should not limit the protective device to the plug of the power supply cord or within 12 inches of the male fitting. Other devices exist that can offer more protection specifically in the outlet and branch circuit leading up to the plug of the air conditioner. These devices should not be precluded since they can offer protection not offered by the LCDI.
This proposal was circumvented from the normal review process at NEMA. Interested NEMA sections were not allowed the opportunity to review this proposal. Thus, the NEMA position does not necessarily reflect the industry position. The manufacturers of the flexible cord and power supply cords were made aware of this only days prior to the cut off date for comments. The flexible cord being supplied on these LCDI devices is unique and manufacturing capabilities must be considered prior to forcing an industry to use such a device.
PANEL ACTION: Reject.
PANEL STATEMENT: Protective devices in the branch circuit are the responsibility of other panels. The use of the devices noted by the commenter is not precluded by the panel action on the proposal. See panel action on Comment 11-242.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 4
EXPLANATION OF NEGATIVE:
BUNCH: I vote negative, see my explanation of negative vote on Comment 11-230. This substantiation against the proposal raises several technical issues which will have to ultimately be addressed through product standards.
CLOSSON: I agree, the use of the phrase "Cord Sets" is not appropriate, as a cord set is not always permanently connected to the end product. Separable cord sets are commonly used today on many products and would not meet the intent of the proposal.
I agree that the proposal does not specify directly or indirectly the performance characteristics of such a device employed to comply

with this proposed code requirement.
COX: See my Explanation of Negative on Comment 11-230.
SAPORITA: See my Explanation of Negative vote on Comments 11-230 and 11-231.

(Log #2400)

11- 241 - (440-65 and 440-2): Accept
SUBMITTER: George Miller
COMMENT ON PROPOSAL NO: 11-104
RECOMMENDATION: Reject the Technical Correlating Committee action on Proposal 11-104 (Log No. 3327).
SUBSTANTIATION: I have been somewhat surprised to read, in the May 2001 ROP, that the Technical Correlating Committee voted to reject (log #3327) Proposal 11-104, to add a new 440-65 requirement and a new definition to 440-2 of NFPA 70, the National Electrical Code.
This proposal, if adopted, will lead to a reduction in fire losses, both property and life. A number of articles in the NEC currently require products to take cord safety into consideration (See Sections 422-41, 422-45, 422-46, 422-49 and 680-40). This is appropriate in the NEC. To refer to the additional cost of $2 or $3 to an appliance such as a room air conditioner as a "major change" is ludicrous.
I encourage the Standards Council to favorably reconsider the Proposal.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 4
EXPLANATION OF NEGATIVE:
BUNCH: I vote negative, see my explanation of negative vote on Comment 11-230.
CLOSSON: While the use of cord connected room air conditioners provided with factory installed LCDI or AFCI protection has merit, there was insufficient evidence provided to demonstrate the need for or effectiveness of such a device.
COX: See my Explanation of Negative on Comment 11-230.
SAPORITA: See my Explanation of Negative vote on Comments 11-230 and 11-231.

(Log #1953)

11- 242 - (440-65-Leakage Current Detection and Interruption (LCDI) Protection): Accept
SUBMITTER: Edward A. Schiff, Technology Research Corp.
COMMENT ON PROPOSAL NO: 11-104
RECOMMENDATION: Add a new definition to 440-2 as follows: "Leakage Current Detection and Interruption (LCDI) Protection. A device provided in a power supply cord or cord set that senses leakage current flowing between or from the cord conductors and interrupts the circuit at a predetermined level of leakage current."
Add a new 440-65 as follows: "Leakage Current Detection and Interruption (LCDI) and Arc Fault Circuit Interrupter (AFCI). Single-phase cord- and plug-connected room air conditioners shall be provided with factory-installed LCDI or AFCI protection. The LCDI or AFCI protection shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm (12 in) of the attachment plug."
SUBSTANTIATION: The submitter wishes to express his appreciation to the Chairman and Members of Panel 11 for their inputs, time, consideration, and support of this proposal. The submitter supports the Panel's action of Accept in Principle in Part with the addition of including an option for an AFCI protected cord set. This comment addresses the issues raised by some of the Panel members.
Clear evidence of cord fires
An unnecessary and serious safety hazard continues to exist. The original proposal cited 60 room air conditioner cord fires between 1997 and 1999, which resulted in 14 deaths. The list was only a sampling of incidents, not by any means a complete log. The following table lists over 25 additional cord fires, which resulted in 7 more needless fatalities. These room air conditioner cord fires occurred in nursing homes, apartments, mobile homes, and single family dwellings.
Installation of like devices on the branch circuits
Room air conditioners are used in existing homes, apartments, institutions, schools, hotels, and elderly housing which do not have requirements for AFCI protection on the branch circuit. AFCI circuit breakers only sense parallel faults in cord sets; not series faults (broken conductors). This protection will only be provided on a limited number of branch circuits in dwellings constructed after the 2002 Code is adopted.
Immersion protection on hair dryers, GFCI protection on pressure washers, snow melting equipment and hot tubs is required by the code, even though these circuits are now required to have GFCI protection. This requirement is to protect people using these products in older dwellings. Therefore LDCI or AFCI cord protection needs to be part of the product, since it is not provided on the branch circuits of existing dwellings.
Is this a Code issue or a product standard issue?
The National Electrical Code was created to address electrical safety. This proposal is will reduce electrical fires and prevent needless deaths.
The NEC has been and continues to be the catalyst for improving electrical safety. The Panels provides the complete representation of the electrical community including engineers, inspectors, contractors, electricians, users, standards development organization, testing labs, trade associations, the insurance industry, and manufactures. This complete representation creates the proper forum for safety issues.
There are many precedents for incorporation of product and cord safety requirements in the Code. This includes:
Article 422-41 Immersion protection for cord and plug connected appliances
Article 422-45 Stands for cord- and plug-connected appliances
Article 422-46 Flatirons equipped with an identified temperature limiting means
Article 422-49 Factory installed GFCI's for High Pressure Spray Washers
Article 680-40 GFCI protection for cord- and plug-connected spas and Hot Tubs
In all these cases, the NEC requirement led to the change in product standard. Had the NEC not adopted these requirements, the product standards would not have changed. The Authority Having Jurisdiction will only need to check to see that the product is Listed by a Nationally Recognized Testing Laboratory (NRTL) like any other installed appliance.
Flexible cords have always been the domain of the code (i.e. table 400-4). They are part of the branch circuit wiring, particularly in this case where the room air conditioner is often permanently mounted (hotels, schools, nursing homes, etc.). This is a continuous duty unattended application that the Code can and should anticipate.
Ability to Prevent Cord Fires
Arcing within a conductor (series fault) or arcing between conductors (parallel or ground fault) causes combustion of the cord or surrounding material. The precursor to an arc is leakage current from or between conductors.
The UL testing of the LDCI protected cord set includes a point contact (guillotine) test and rotational flex testing. These tests result in insulation degradation and damaged conductors. The testing must be completed without creating combustion to be approved. The technology has been used over 50,000 appliance and extension cords without a report cord fire occurring.
The AFCI testing includes point contact, carbonized path, and operation inhibition testing per UL 1699. This will detect both series and parallel arc faults in the cord set.
Cord damage caused by frayed or broken conductors, insulation degradation from overload and overheating, or normal aging will result in leakage current from one or both live conductors. This condition will eventually lead to an arc before combustion of the cord or surrounding materials can occur. Both technologies will prevent virtually all cord fires.
Proposal is too restrictive
This comment allows for the use of an AFCI protected cord sets, since this technology can prevent most cord fires. As previously described, AFCI branch circuit protection will only be provided on new dwellings; not existing structures.
In conclusion, a serious and preventable safety hazard that results in fires, injuries and deaths every year continues to exist. AFCI branch circuit protection will only be on new dwellings, where room air conditioners are used in existing dwellings with no protection. This is a Code issue and there are many precedents for this requirement. Economical, proven, and listed products are available that will provide this necessary safety protection.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 4
EXPLANATION OF NEGATIVE:
BUNCH: I vote negative, see my explanation of negative vote on Comment 11-230. I also oppose adding definitions within sections of the code rather than in Article 100.

CLOSSON: While the use of cord connected room air conditioners provided with factory installed LCDI or AFCI protection has merit, the requirement for the construction and perforamnce of products belongs in the end product safety standards, not in the NEC.

COX: See my Explanation of Negative on Comment 11-230.

SAPORITA: See my Explanation of Negative vote on Comments 11-230 and 11-231.

COMMENT ON AFFIRMATIVE:

HAMER: While we still believe this requirement should be in the product standards, it is disappointing that the product standards-making organizations have not yet addressed the problem. The panel comments and negative ballot explanations during the 1999 Code cycle should have initiated changes in product standards.

ARTICLE 445 — GENERATORS

(Log #174)

15- 11 - (445-9): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 15-5
RECOMMENDATION: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Revise 445-9 (New 445.17) to read as follows:
445-9 Generator Terminal Housings. Generator terminal housings shall comply with 430-12. Where a horsepower rating is required to determine the required minimum size of the generator terminal housing, the full-load current of the generator shall be compared with comparable motors in Tables 430-147 through 430-150. The higher horsepower rating of Tables 430-147 through 430-150 shall be used whenever the generator selection is between two ratings.
PANEL STATEMENT: The panel action will clarify that selecting the higher horsepower rating from table 430-147 through 43-150 will ensure the generator terminal housing is adequately sized. The panel added "of the generator terminal housing" in the first sentence and added the last sentence.

19- 6 - (447-9(a)(6)): Accept in Part
Note: The Technical Correlating Committee understands that the wording accepted in Comment 19-19a for 547-8(a)(6) shall be used.
SUBMITTER: Ronald P. O'Riley, Innovative Education, Inc.
COMMENT ON PROPOSAL NO: 19-18a
RECOMMENDATION: ...through a grounding conductor
Revise to read:
...through a grounding electrode conductor and shall comply with 250.32(E).
SUBSTANTIATION: As per the new definition for a grounding electrode conductor in Article 100, this conductor at a separate building is now the grounding electrode conductor and not just grounding conductor. 250.32(E) covers the installation of the grounding electrode conductor at the second building.
PANEL ACTION: Accept in Part.
Revise 547-9 (a) (6) to read:
(6) Grounding. The grounded conductor of the system shall be grounded at the distribution means and be connected to a grounding electrode through a grounding <u>electrode</u> conductor.
Reference to 25032(E) is deleted.
PANEL STATEMENT: The concept is accepted and reference to 250-32 (e) is deleted, as it has been deleted by CMP 5.
The Panel does not agree that the conductor mentioned in 547-9 (a) (6) is at a separate building. It is at the distribution point.

(Log #2121)

13- 3 - (450-23(a)(1)c):
Note: The Technical Correlating Committee directs that this comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
SUBMITTER: C. Patrick McShane, Cooper Power Systems
COMMENT ON PROPOSAL NO: 13-10
RECOMMENDATION: This is a request that Code-Making Panel 13 reconsider its action on the original proposal from "reject" to "accept".
SUBSTANTIATION: The substantiation provided by the Panel to reject the proposal does not explain what, if any, damage to property or hazard to individuals by the release of a less-flammable liquid can occur if containment is not provided.
The original reason for adding the containment requirement in Section 450-23 was based on limiting the potential hazard of burning fluid to limit the flame propagation and the propagation of flame from an ignition source back to the transformer. However, history and testing have shown the pool fire scenario to be a non-issue, and key listing NRTL proponent of this scenario has since eliminated its listing requirements based on pool fire heat release rate. In fact, the NRTL no longer even tests nor publishes the HHR of less-flammable dielectric liquids it lists. Facts and documents documenting that lack of fire hazard and the field history were incorporated in the original proposal substantiation.
The protection schemes used by FM and UL are one of the success stories for the elimination of fire risk using HFP dielectric liquids. Elimination of the containment requirement will result in greater use of the UL and FM protection methods, which will in turn result in a reduction in the overall risk of fires from transformers.
The main reason for the flawless "pool fire" safety record for the approximate 250,000 less-flammable transformers is due to the inability of even sustained arcing to ignite less-flammable fluids. Data and test reports were referenced in the original proposal. Another reason for the total lack of reports of ruptured tanks when using less flammable fluids is that the two dielectric fluid listing NRTLs' requirements focus on rupture prevention. The occurrence of significant volumes of spilled fluid in indoor applications has never been reported to our company. Only one occurrence (20 percent fluid loss) was reported out of nearly a quarter million less-flammable distribution and power transformers that are in service worldwide. This incident involved an outdoor installation adjacent to a building, resulting without fire or property damage, or personal injury.
In summary, by reversing the committee rejection of Proposal log 3744 would reflect the Code-Making Panel 13's acknowledgment of:
• The flawless safety record of a quarter century of listed less-flammable dielectric fluids.
• The now total rejection of the pool fire scenario of such fluids by the two leading fluid listing NRTLs.
• The importance of staying true to the Code mission, the <u>practical</u> safeguarding of persons and property.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 6
NEGATIVE: 4
NOT RETURNED: 1 Davis
EXPLANATION OF NEGATIVE:
BAKER: I vote to reject this change. Containment offers protection from many different dangers. Some are from electrical dangers and others from physical dangers such as slips and falls,

mechanical failure or release of dangerous liquids. These are sometimes classed as a hazardous chemical of substance. Containment provides an orderly method of clean up.

BRUNNER: The acceptance of this comment would eliminate the need for liquid containment on transformers with less than flammable fluids.

The panel should maintain the reject position of the ROP meeting.

Containment of liquids has many benefits besides flammability:

1) Fall and slip hazards from oil spills.

2) Cross contamination of water mixing with coolant and entering the waste water system.

3) A substance that is classified as nonhazardous today may not be that in the future. So containment of all liquids would be prudent.

CARROLL: The panel should maintain the position of reject that was supported at the ROP meeting for the following reasons:

1. The provisions provided for the installation of less flammable liquid transformers in indoor applications are reasonable and necessary. Additional personnel and property hazard may rise from spilled liquids such as converting a dry location to a wet location, contamination of other equipment, slippage hazards, etc.

2. There are no required markings on transformers identifying the type of liquid utilized, therefore the user/inspector has no method to determine specific installation requirements.

3. Many building codes require confinement of ANY liquid. An example is the requirement to provide a confinement area under a water heater. Transformer fluid should also be contained.

4. Transformers are not always installed in equipment rooms or vaults and may even be installed in a ceiling area or mezzanines. Additionally, transformers may also be installed in accessible areas of public buildings such as hospitals or schools. In any of the above installations, a liquid containment area is needed for the practical safeguarding of persons and property.

CRIST: I vote to reject this change. I agree with the explanations of negatives votes submitted by Mr. Baker, Mr. Brunner, and Mr. Carroll. In addition, acceptance of this proposal would permit a liquid filled tansformer with no containment in the ceiling of a hospital or directly over a fire pump. The submitter commented that this would "level the playing field" because his company did not make a dry-type transformer. Leveling playing fields is not a function of the NEC.

(Log #2371)

15- 12 - (480): Accept in Principle

SUBMITTER: Max R. Schulman, Schulman Assoc., Ltd.

COMMENT ON PROPOSAL NO: 15-10

RECOMMENDATION: This comment does not modify my previous support for the above noted proposal (et al.), but is intended to present optionally alternate wording to that I previously submitted on 23 September with respect to spillage neutralization. Note: Like wording and substantiation may be submitted by others, as the need has been recognized by many and commonly discussed.

In lieu of the new sentence originally proposed, add a new Paragraph (e) to read:

"Neutralization of spilled electrolyte and the supplemental removal and disposal of same, shall be in accordance with applicable federal regulatory criteria (i.e., EPA and DOT) as existing or as otherwise amended by the cognizant local Authority Having Jurisdiction."

SUBSTANTIATION: No other NFPA Standard or Code addresses the matter of neutralization of spilled electrolyte, and understandably the Panel may be reluctant to develop criteria for an area already pre-empted by federal mandates. The proposed new paragraph adequately covers the need for neutralization (et al.) by reference, and brings the entire matter of containment into continuity with the intent of Article 64 of the Uniform Fire Code.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to the panel action and statement on Comment 15-15.

ARTICLE 480 — STORAGE BATTERIES

(Log #421)

15- 13 - (480-3 Exception No. 1and 2 (new)): Accept in Principle in Part

SUBMITTER: Dan Leaf, Palmdale, CA

COMMENT ON PROPOSAL NO: 15-7

RECOMMENDATION: Accept proposal.

SUBSTANTIATION: Though batteries and cables may be a manufacturer-supplied part of prime movers they may not always be supplied, or may be part of unlisted equipment and subject to Code rules. The proposal is to simply legitimize installations made and provided by the installer. Sections 240-1, 240-3, 240-20, and 720-8 are rather inclusive and 300-1(b) and 300-3 appear to literally apply.

PANEL ACTION: Accept in Principle in Part.

Revise 480-3 to read as follows:

"480-3. Wiring and Equipment Supplied from Batteries.

Wiring and equipment supplied from storage batteries shall be subject to the requirements of this Code applying to wiring and equipment operating at the same voltage, unless otherwise permitted by 480.4."

Add new 480.4 to read as follows:

"480.4 Overcurrent Protection for Prime Movers. Overcurrent protection shall not be required for conductors from a battery rated less than 50 volts if the battery provides power for starting, ignition, or control of prime movers. Section 300-3 shall not apply to these conductors."

Retain and renumber subsequent sections accordingly.

The panel rejects the part addressing interconnected batteries.

PANEL STATEMENT: The panel rejects the part addressing interconnected batteries because this section does not apply to interconnection of batteries. The panel agrees with the submitter that there might be a few cases where the batteries and cables are not always supplied with a manufactured unit and in these cases new Section 480.4 would apply. The panel eliminated the reference to distances, because "as short as practicable" is not enforceable.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

NOT RETURNED: 1 Kakalec

(Log #175)

15- 14 - (480-8(d) (New)): Accept

Note: The Technical Correlating Committee understands that the section referenced by this panel action will be renumbered 480-9(d) due to the panel action on Comment 15-13.

SUBMITTER: Technical Correlating Committee National Electrical Code

COMMENT ON PROPOSAL NO: 15-10

RECOMMENDATION: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual relative to the word "such" in the last sentence of the Panel Action. This action will be considered by the Panel as a Public Comment.

SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.

PANEL ACTION: Accept.

Revise the panel action text of Proposal 15-10 to amend the second paragraph as follows:

Steel encased NiCad batteries shall have a containment system ~~such that there is no contact~~ that does not allow contact between the spilled electrolyte and the steel casing of adjacent cells.

PANEL STATEMENT: The panel revised the text to incorporate text to comply with the Manual of Style.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

NOT RETURNED: 1 Kakalec

(Log #579)

15- 15 - (480-8(d) (New)): Accept in Principle

Note: The Technical Correlating Committee directs that the reference to the "EPA regulations for electrolyte disposal and" be deleted because the reference is not to a specific portion of the EPA Regulations. The Technical Correlating Committee also directs that "UFC" be changed to "Uniform Fire Code."

SUBMITTER: Max R. Schulman, Schulman Assoc., Ltd.
COMMENT ON PROPOSAL NO: 15-10
RECOMMENDATION: This transmittal is intended to reflect support for the submittal shown (Gordon S. Johnson) and the noted action of the panel. Additionally, it is intended to address the "Comment on Affirmative," directed to disposal and neutralization - an obvious problem. With respect to "disposal" the context of existing EPA regulations should be adequate; however, with respect to neutralization it is recommended that the following wording (excerpted from the UFC - Article 64, Section 6404) be added as the last sentences to proposed new paragraph (d) after the word "directions." To wit:

An approved method to neutralize spilled electrolyte shall be provided. The method shall be capable of neutralizing a spill from the largest lead-acid battery to pH between 7.0 and 9.0.

SUBSTANTIATION: The problem (disposal and neutralization) has been identified and addressed in the UFC and brought to the panel's attention through Mr. Johnson's "Comment on Affirmative" referenced above. Substantiation for the proposed new wording is supported by Article 64, Section 6404 of the UFC, a copy of the recent NFPA issued incident summary and the USDA (Forestry) mandate of December 1, 1999. Copies of the latter two documents have been provided.

As an "editorial footnote" to the action (et al.) on 15-10 as shown in the ROP (page 771), the word "Universal" shown on the last line should be "Uniform."

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept in Principle.

Add the following FPN to new Section 480-9(d):

FPN: See EPA regulations for electrolyte disposal and UFC - Article 64, Section 6404 for spilled electrolyte handling requirements.

PANEL STATEMENT: The panel feels that this information is better served as a FPN and that referring the user to the appropriate disposal and neutralization requirements meets the intention of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NOT RETURNED: 1 Kakalec
COMMENT ON AFFIRMATIVE:
VANNICE: The Section 480-9(d) referenced here is a result of the renumbering of Section 480-8, Battery Location, caused by the action on Comment 15-13. It is not a part of Section 480-9, Vents, found in the 1999 Code.

(Log #592)

15- 16 - (480-8(d) (New)): Reject
SUBMITTER: Max R. Schulman, Schulman Assoc., Ltd.
COMMENT ON PROPOSAL NO: 15-10
RECOMMENDATION: It is recommended that the word "free" preceding electrolyte be deleted.
SUBSTANTIATION: The purpose of containment and neutralization of electrolyte has been clearly qualified and directed to "spillage" as stated in Article 64, Section 6404 of the UFC. The concern addressed by that wording was electrolyte out of a battery as opposed to that normally within. Any lead acid battery can leak or evidence spillage conditions if improperly handled, serviced, or through abnormal circumstances resulting in damage to the exterior walls of cell(s) - this includes sealed type and those utilizing metal housings.

It should be noted, that any spillage which creates a path to ground presents a common hazard - irrespective of the volume of the spillage.

If the panel formally defines "free" electrolyte to include that which may be potentially present in any spillage situation, my recommendation can be considered withdrawn.

PANEL ACTION: Reject.
PANEL STATEMENT: The term "free" electrolyte is an industrial term for a liquid electrolyte that is capable of spilling.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NOT RETURNED: 1 Kakalec
COMMENT ON AFFIRMATIVE:
JOHNSON: The word "free" was added to the UFC wording to make it clear that the requirement does not apply to VRLA batteries. Leakage from VLRA batteries is negligible. See original proposal 15-10.
KRAMER: The term >free electrolyte< and quotes need to enclose both words "free electrolyte".

(Log #808)

15- 17 - (480-8(d) (New)): Reject
SUBMITTER: Kenneth A. Cotton, Enviroguard
COMMENT ON PROPOSAL NO: 15-10
RECOMMENDATION: In the proposed new paragraph the word "free" preceding "electrolyte" should be deleted to maintain continuity with Article 64 UFC.
SUBSTANTIATION: The insertion of "free" appears to circumvent. This clearly defines intent of Article 64.01 Paragraph 6401.99.1 of the Uniform Fire Codes.
Note: Supporting material available for review upon request at NFPA headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to the panel action and statement on Comment 15-16.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NOT RETURNED: 1 Kakalec

(Log #1383)

15- 18 - (480-8(d) (New)): Accept in Principle

Note: The Technical Correlating Committee understands that the section referenced by this Panel Action will be numbered 480-9(d) due to the Panel Action on Comment 15-13.

SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 15-10
RECOMMENDATION: Reword proposal as follows:

(d) Electrolyte containment. Where the total free electrolyte in a single battery installation exceeds 190 liters (to gal), each rack of batteries, or group of racks, shall be provided with a liquid-tight~~,100 mm (4 in.)~~ spill containment barrier sized to contain the volume of free electrolyte in the single largest cell. The barrier shall be at least 100 mm (4 in.) high and shall~~which~~ extend~~s~~ at least 25 mm (1 in.) beyond the battery rack in all directions. Steel encased NiCad batteries shall have a containment system such that there is no contact between the spilled electrolyte and the steel casing of adjacent cells.

SUBSTANTIATION: The recommended revision will establish a minimum requirement for electrolyte spill containment volume, that is, the volume of the largest single cell in the battery. Such a requirement is necessary in order to verify the suitability of the actual dimensions of the spill containment. It should also be noted for information purposes that NFPA 70E Standard for Electrical Safety Requirements for Employee Workplaces - 2000 Edition, Part IV Sec. 3-4 details other alternatives for electrolyte spill containment, such as floor grading and sumps.

PANEL ACTION: Accept in Principle.

Revise the first paragraph of the panel action on Proposal 15-10 to read as follows:

"(d) Electrolyte containment. Where the total free electrolyte in a single battery installation exceeds 190 liters (50 gal), each rack of batteries, or group of racks, shall be provided with a liquid-tight spill containment barrier sized to contain the volume of free electrolyte in the single largest cell."

{The second paragraph remains unaffected by this action.}

PANEL STATEMENT: The proposed design dimensions may not be applicable to all installations.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
NEGATIVE: 1
NOT RETURNED: 1 Kakalec
EXPLANATION OF NEGATIVE:
JOHNSON: The comment should have been rejected. The original wording was taken from section 64 of the UFC. Those dimensions have been established to be practical. The dimensions should not be left entirely to the discretion of the user.

(Log #2270)

15- 19 - (480-8(d)): Reject
SUBMITTER: Sanjay L. Deshpande, GNB Industrial Power, A Division of Exide Technologies
COMMENT ON PROPOSAL NO: 15-10
RECOMMENDATION: We recommend that the proposed text shown below be rejected.
"Where the total free electrolyte in a single battery installation exceeds 50 gallons, each rack of batteries, or group of racks, shall be provided with a liquid-tight, 100 mm spill containment barrier which extends at least 25 mm beyond the battery rack in all directions."
SUBSTANTIATION: Spill containment is covered by other specifications such as UFC 64, IFC and NFPA 76. Users of batteries are confused by multiple codes addressing the same issue but not uniformly. The proposed text in NEC will add to this. In addition, the proposed language does not adequately address the difference between flooded and sealed (VRLA) cells and their considerably different potential for spilling electrolyte.
Battery manufacturers and users under the aegis of IEEE and BCI are working together to draft acceptable uniform language that will be recommended to code bodies like UFC, IFC and NFPA for adoption in their respective sections for spill containment and safety. The said language:
- will include proper definition of flooded (vented) and sealed (VRLA) batteries,
- assess the potential or absence of electrolyte spills and other hazards for each type, and
- prescribe appropriate methods to prevent each hazard or minimize/contain its effects.

If necessary, separate sections will be recommended to address the substantially different issues that pertain to the two battery types. IFC will receive the first proposal on November 1.
At this time, we recommend that the NEC reject the new language regarding spill containment.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to panel action and statement on Comment 15-18.

(Log #2276)

15- 20 - (480-8(d)): Accept in Principle
SUBMITTER: Gary L. Briese, Int'l Assoc. of Fire Chiefs
COMMENT ON PROPOSAL NO: 15-10
RECOMMENDATION: Add new text as follows:
"Neutralization of spilled electrolyte and the supplemental removal and disposal of same shall be in accordance with applicable federal regulatory criteria as existing or as otherwise amended by the local Authority Having Jurisdiction."
SUBSTANTIATION: In consideration of recent major unintentional incidents (i.e., LA City 911 Center outage and US State Department Offices, Washington D.C., evacuation) resulting from standby battery networks that were not configured with containment and neutralization, and the potential of like incidents including those possibly associated with domestic terrorism, the ICHIEFS hereby expresses its support for the incorporation of such requirements in the NEC as stated in the referenced proposal. However, the proposal did not include provisions for neutralization. Accordingly, the additional wording as shown in #4 is recommended for inclusion as a new paragraph (e).
No other NFPA Standard or Code addresses the matter of neutralization of spilled electrolyte, and understandably the Panel may be reluctant to develop criteria for an area already pre-empted by federal mandates. The proposed new paragraph adequately covers the need for neutralization by reference and brings the entire matter of containment into continuity with the intent of Article 64 of the Uniform Fire Code.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to the panel action and statement on Comment 15-15.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NOT RETURNED: 1 Kakalec

(Log #809)

15- 21 - (480-8(d), Exception): Reject
SUBMITTER: Kenneth A. Cotton, Enviroguard
COMMENT ON PROPOSAL NO: 15-10
RECOMMENDATION: Add an exception to the proposed paragraph to read:
"When the containment barrier is not part of the structure in which it is located, but a separately installed assembly, said barrier shall not extend more than 75 mm beyond the battery rack in all directions."
SUBSTANTIATION: The present wording allows for a potentially dangerous hazard (access impairment) to those normally servicing the batteries involved, as greater distances could require unsupported leaning (over the barrier edges) as well as requiring foot traffic on the neutralized low medium employed.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to panel action and statement on Comment 15-18.

ARTICLE 490 — EQUIPMENT, OVER 600 VOLTS, NOMINAL

(Log #139)

13- 4 - (490-1): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 13-18a
RECOMMENDATION: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. The Technical Correlating Committee directs the panel to add a Title for the standard identified in the Fine Print Note. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the action of the Technical Correlating Committee and provides the title to the standard in the Fine Print Note to read as follows:
"FPN No. 2: For further information on hazard signs and labels see ANSI Z535-4, Product Signs and Safety Labels."
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Davis

(Log #1614)

13- 5 - (Table 490-24): Reject
SUBMITTER: Robert Molde, Xeel Energy
COMMENT ON PROPOSAL NO: 13-26
RECOMMENDATION: We do not agree with the number rounding-method used to convert from inches to millimeters in this proposed table. It is inconsistent with other parts of the Code. Please confer with the other panels to develop a consistent method for converting from inches to metric.
SUBSTANTIATION: When inches are converted to millimeters, in this table, the next value is increased to the next tens number in mm. For example, under the column heading Phase to Ground/Indoors, 4.0 in. is converted to 110 mm, 5 in. is converted to 130 mm, 6 in. to 160 mm, etc. The new metric clearances are increased slightly and not consistently. Panel 8 in Proposal 8-232, Table 346-10 converts 4 in. to 100 mm, 5 in. to 125 mm, 6 in. to 150 mm. In Proposal 8-38, Table 318-9(e). Panel 6 in Proposal 6-216, Chapter 9, Table 5A uses a consistent factor of 25.4 for converting conductor diameters in inches to mm.
There does not appear to be justification for using different and arbitrary conversion methods between separate parts of the code. However insignificant this may seem, it does stray from the goal of consistency.
PANEL ACTION: Reject.
PANEL STATEMENT: These distances are minimum electrical clearances. Rounding down the conversion to millimeters was not the intent of the panel and would cause substantive changes

without technical justification. The panel rounded up to nominal dimensions for field fabrication.

See panel action on Comment 13-6.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Davis

(Log #1791)

13- 6 - (Table 490-24): Accept

SUBMITTER: Neil F. LaBrake, Jr., Baldwinsville, NY

COMMENT ON PROPOSAL NO: 13-26

RECOMMENDATION: This proposal should be accept in principle in part.

SUBSTANTIATION: CMP 13's action taken on this proposal implies a rounding of the SI equivalent values to the next highest integer by the nearest fifth multiple significance. Using a Microsoft Excel97 spreadsheet analysis and the "ceiling" math & trig function with significance of 5, the inch-pound units are multiplied by 25.4 mm/in. and the results are as shown in the proposed corrections in the comment above.

This analysis and the Panel's statement are mathematical results only and are without source document reference for the electrical B.I.L. minimum clearances with the exception of one document. The AIEE Paper 54-80, June 1954 Transactions, p. 636 is the only source I have found through the Standard Handbook for Electrical Engineers, Eleventh Edition, p. 17-20, Table 17-4 attached. This source only lists outdoor clearances in inch-pound units. Thus, the values above in the stated comment meet the Panel's implication that the metric conversions must be rounded higher to assure minimum clearances are maintained and the level of safety is as assured as the inch-pound units.

Also, the Panel's action and this comment do meet the intent of the Technical Correlating Committee's metrication proposal according to the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurements. Refer to a second comment by this submitter on this Proposal for correlation effect of other source documents.

Note: Supporting material is available for review at NFPA Headquarters.

(Log #1792)

13- 7 - (Table 490-24): Reject
SUBMITTER: Neil F. LaBrake, Jr., Baldwinsville, NY
COMMENT ON PROPOSAL NO: 13-26
RECOMMENDATION: The proposal should be accept in principle in part.

SUBSTANTIATION: The following source documents are referenced and attached to correlate the indoor and outdoor clearances to the Panel's reason for maintaining the same metric values as used in the 1999 NEC Table 490-24:
A. 1998 Canadian Electrical Code, Part I, Table 30 for indoor clearances.
B. Table 17-4 of Standard Handbook for Electrical Engineers, 11th edition referencing AIEE Paper 54-80, June 1954 Transactions, p. 636 for outdoor clearances.
Source A was used for only evaluating the indoor clearances since Source B only covered outdoor clearances. Source A only lists metric values and Source B inch-pound units. Source A combines indoor and outdoor clearances for equivalent phase-to-ground requirements of system voltages up to 34.5kV and appear to be quite conservative from the present NEC values. Source B correlates with the present NEC values with the exception that 62 inches is required for 650kV BIL outdoor phase-to-phase clearance.

	—	650	—	—	~~1600~~1575	~~63~~62	—	—	~~1280~~1270	50
161	—	650	—	—	~~1600~~1575	~~63~~62	—	—	~~1280~~1270	50
	—	750	—	—	1830	72	—	—	~~1480~~1475	58
230	—	750	—	—	1830	72	—	—	~~1480~~1475	58
	—	900	—	—	~~2270~~2265	89	—	—	~~1810~~1805	71
	—	1050	—	—	2670	105	—	—	2110	83

* The values given are the minimum clearance for rigid parts and bare conductors under favorable service conditions. They shall be increased for conductor movement or under unfavorable service conditions or wherever space limitations permit. The selection of the associated impulse withstand voltage for a particular system voltage is determined by the characteristics of the surge protective equipment.

** The outdoor values apply to conditions at 1010 m (3300 ft.) above sea level.

Since, CMP 13's action taken on this proposal implies a rounding of the SI equivalent values to the next highest integer by the nearest fifth multiple significance. Using a Microsoft Excel97 spreadsheet analysis and the "ceiling" math & trig function with significance of 5 (uppermost 5 mm), the Source B inch-pound units are multiplied by 25.4 mm/in. to determine the SI values for the outdoor clearances. Also, the Source A SI units for indoor clearances are divided by 25.4 mm/in. and the "ceiling" math & trig function applied with significance of 0.5 (uppermost 0.5 in.) to determine the inch-pound units. Source A did not have values for the 2.4-4.16kV and the 13.8kV system voltages, so these values were interpolated from the other values in the source table. These results are as shown in the proposed change of the comment above. Thus, these values meet the Panel's implication that the metric conversions must be rounded higher to assure minimum clearances are maintained and the level of safety is as assured as the inch-pound units.

The added double asterisk (**) note is included according to Source B to note the outdoor clearance values are based on 3300 ft. above sea level. The SI equivalent of 3300 ft. was determined by rounding up to nearest 5th multiple (5 m) of 3300 ft. multiplied by 0.3048 m/ft. resulting in 1010 m. Source A did not qualify its values in this manner.

This analysis and the Panel's statement are mathematical results of correlating with the source documents referenced above for the electrical B.I.L. minimum clearances. These results do meet the intent of the Technical Correlating Committee's metrication proposal according to the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurements.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

(Log #1363)

13- 8 - (490-46 (New)): Reject

SUBMITTER: David P. Brown, Baltimore Gas and Electric Co/EEI

COMMENT ON PROPOSAL NO: 13-28

RECOMMENDATION: Accept the original proposal in principle to add a new subsection to Section C of Article 490 and rewrite as follows:

490.46(new). Metal Enclosed and Metalclad Service Equipment.

(a) General. Metal enclosed and metalclad switchgear installed as high-voltage service equipment shall have the following features in (b) and (c) below to ensure separation between service and feeder or branch circuit equipment. The high-voltage components that may be installed within this equipment are: service conductors and terminations, surge arresters, metering transformers, insulators, bus, main disconnecting device, and main overcurrent protective device, including any associated current and voltage transformers for protective relaying.

FPN: Local serving utilities may have additional requirements for high-voltage service equipment. See ANSI/IEEE C2-1997 Sections 18 and 38 for further information.

(b) Service Conductor Termination Compartment. The compartment in which the high-voltage service conductors terminate shall include the following:

(1) A hinged door with provision for padlocking.

(2) This compartment shall be identified as the service cable termination compartment.

FPN: for further information on hazard signs and labels see ANSI Z535.

(3) Live front construction shall have an inner metal barrier marked with the highest voltage present. Each phase bus shall have a bare bus bar extension for voltage testing and application of safety grounds.

(4) A ground bus extension for connection of service cable termination shields and a safety ground attachment.

(c) Service Overcurrent Protective Device. Access for maintenance of the service fuses, circuit breaker or circuit interrupter shall not expose personnel to live parts connected to the service conductors. Barriers, rack-out mechanisms and interlocks with disconnect or isolating switches are recognized safeguards to provide this isolation.

SUBSTANTIATION: This proposal should have been accepted in principal. The suggested rewording of the original proposal eliminates product requirements and provides a performance-based requirement for service equipment over 600 Volts. This will establish a minimum requirement for high-voltage service equipment. The proposal establishes the difference between high voltage equipment installed as service entrance and high voltage equipment installed for feeders and branch circuit protection.

PANEL ACTION: Reject.

PANEL STATEMENT: The requirements are still product specifications and are not universally accepted by all utilities across the country.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9

NEGATIVE: 1

NOT RETURNED: 1 Davis

EXPLANATION OF NEGATIVE:

FOGARTY: The original proposal (13-28) attempted to provide the minimum requirements for high-voltage service equipment but was not accepted by the Panel at the January, 2000 ROP meeting. In response to this action, Comment 13-8 was submitted by the Edison Electric Institute (EEI) representative wherein the original proposal wording was further generalized to eliminate the objection of "product requirements." This comment should have at least been Accepted in Principle because it addresses a void in the NEC, and is essentially a performance-based requirement for service equipment over 600 volts. The EEI represents the input of approximately 40 utilities and is a significant cross-section summary of their individual service equipment requirements.

(Log #1396)

14- 7 - (500): Accept in Principle
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 14-3
RECOMMENDATION: Use the rewrite from Mr. Wechsler's ballot as stated in the balloting comments for 14-2a, as a starting textual basis for all actions on public comments to Article 500 proposals.
SUBSTANTIATION: As stated under the balloting comments of the Panel 14 committee, due to the errors that the Committee felt existed with the presented rewrite texts, that are corrected by the rewrite addressed by the Wechsler submitted ballot, this "Wechsler" rewrite should be the starting textual basis for Panel actions.
PANEL ACTION: Accept in Principle.
Use the text submitted with Comment 14-11 (Log #2228) as the working text for all amendments to Article 500.
PANEL STATEMENT: The panel action on Comment 14-11 will reflect the complete text of Article 500.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #1490)

14- 8 - (500): Accept
SUBMITTER: David N. Bishop, David N. Bishop, Consultant
COMMENT ON PROPOSAL NO: 14-2a
RECOMMENDATION: Delete: Nonhazardous Locations. Locations which are not required to have been evaluated by the process defined in 500-~~3~~5 (a) or 505-~~3~~5(a).
SUBSTANTIATION: Inclusion of this definition will cause a most serious safety problem. Craftsmen in the industry have used the term "nonhazardous location" to be synonymous with "unclassified location" for decades. Deletion of the term will have no deletrious effects on the otherwise excellent panel proposal. At least 99% of those in the trade would be totally mislead by the new proposed definition.
PANEL ACTION: Accept.
See Comment 14-11.
PANEL STATEMENT: The submitter's concerns have been addressed by the panel action in Comment 14-26, as reflected in Comment 14-11.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #2188)

14- 9 - (500): Accept
SUBMITTER: Mark Goodman, BP (ARCO)
COMMENT ON PROPOSAL NO: 14-2a
RECOMMENDATION: Delete the term and definition of "Nonhazardous" from the revised Article 500, Section 500-2 Definitions.
SUBSTANTIATION: This comment recommends the removal of the term, Nonhazardous, its definition, and use for the following reasons.
1. This term was added as part of the Panel Chairman assigned Task group responsible for reorganizing the information in Article 500. This term and definition are new material and beyond the scope of the Panel Chair's direction.
2. The added term and definition was not part of any proposal made to the panel and has no substantiation for its inclusion.
3. Several proposals (14-8, 14-40, and 14-315) specifically requested that the term "nonhazardous" currently used in the Article be deleted and substituted with there term "unclassified".
4. This term adds an additional area classification location that does not currently exist in related standards and practices (API 500, 505, and NFPA 497 for example) or in most company documentation systems.
5. The term is misleading. The implication of "nonhazardous" is that there are no hazards. There are hazards other than electrical area classification such as caustics, acids, radiation, etc. Using the term "unclassified" is becoming widely accepted and recognized as specific to electrical area classification. "Nonhazardous' is much too broad.
6. The term is not needed. An area is either "Classified", requiring specifically identified or approved equipment suitable for the location or "Unclassified", not requiring equipment so identified or approved. The term will only add confusion and potential misapplication.
7. By its definition, "Nonhazardous Locations. Locations which are not required to have been evaluated". Whoever makes the determination that the location is not required to be evaluated has just evaluated the location. It is also not at all clear how or who would make that determination.
For the above reasons, the term "Nonhazardous", its definition and use should be removed from Article 500 (and 505).
PANEL ACTION: Accept.
PANEL STATEMENT: This has been addressed by the action on Comment 14-26.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #2191)

14- 10 - (500): Accept in Principle
Note: The Technical Correlating Committee directs that the Panel Action be revised to delete the second sentence of the FPN. In accordance with the NEC Style Manual, FPNs are not permitted to contain recommendations.
SUBMITTER: Mark Goodman, BP (ARCO)
COMMENT ON PROPOSAL NO: 14-6
RECOMMENDATION: In the proposed new definition section, 500-2 for "Electrical and Electronic Equipment", delete the words "as well as any portable or transportable device having a battery or other electrical power source". Table the issue until further study provides greater guidance.
SUBSTANTIATION: There are several reasons why this text should not be included in the NEC at this time.
1. The NEC is an installation based document and excludes equipment that is not "installed". The specific question of whether portable equipment is within the scope of the NEC was posed to the NFPA Standards Council. In their written reply, the Standards Council stated that portable equipment is not within the scope of the NEC. Although the Technical Correlating Committee did not comment on this proposal during their review of proposals, the Standards Council direction should result in the removal of these devices as beyond the scope of the NEC.
2. The statement as written is too broad and includes everything

from wristwatches and hearing aids to test equipment.

3. An ad-hoc group (including a member of the Technical Correlating Committee) has been formed to provide testing and some basic guidelines with respect to battery powered devices. The testing of many of these is expected to yield results that the equipment has insufficient energy to cause ignition.

For the reasons stated above, it is recommended that portable and transportable equipment not be included in Article 500 of the Code at this time.

PANEL ACTION: Accept in Principle.

Delete the words indicated by the submitter and add a Fine Print Note to the definition to read as follows:

"FPN: Portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, could potentially become an ignition source in hazardous (classified) locations. Equipment suitable for the location or safety procedures to ensure safe operation of this equipment should be employed."

PANEL STATEMENT: The panel agrees with the submitter, but believes that additional guidance is needed.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

COMMENT ON AFFIRMATIVE:

OMEARA: The last sentence of the added fine print note contains language not permitted by the style manual ("Equipment...should be employed"). I recommend changing this sentence to make it advisory in nature as follows: "Using equipment suitable for the hazardous location or using safety procedures to ensure the safe operation of equipment in hazardous (classified) locations are two ways to ensure personnel safety."

(Log #2228)

14- 11 - (500): Accept in Principle

Note: The Technical Correlating Committee directs that the first sentence of the definition of "Nonincendive Component" in 500-2 read as follows: "A component having contacts for making or breaking an incendive circuit where the contacting mechanism is constructed so that…" to comply with 2.2.2 of the NEC Style Manual.

The Technical Correlating Committee directs that a title be added to Table 500-8(c) (2)to read: "Class II Temperatures" in accordance with 2.3.1 of the NEC Style Manual.

SUBMITTER: James D. Cospolich, Waldemar S. Nelson & Co., Inc.

COMMENT ON PROPOSAL NO: 14-2a

RECOMMENDATION: Please see the following revised text which represents what I believe to be the correct wording that Code Making Panel 14 voted on and accepted during the January 2000 ROP meeting. The shaded wording represents what I consider to be revisions and corrections. Some of this shaded wording is very important for the technical accuracy and intent of the article. Entire 500 with recommended changes would appear as follows Entire 500 with recommended changes would appear as follows [14-3, or CP140?, note ~~[500-4]~~ indicates current NEC text section and is shown only for reference and should not be part of the final text]:

ARTICLE 500 – Hazardous (Classified) Locations, Classes I, II, and III, Divisions 1 and 2

500-1. Scope — Articles 500 through 504 [no change]

Articles 500 through 504 cover the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Divisions 1 and 2; Class II, Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, combustible dust, or ignitible fibers or flyings.

FPN: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors, or flammable liquids, refer to Article 505.

[new] 500-2 Definitions. For purposes of Articles 500 through 504 and Articles 506 through 516, the following definitions apply.

Identified (as applied to equipment). Recognizable as suitable for the specific purpose, function, use, environment, application, etc., where prescribed in a particular Code requirement.

FPN: Suitability of equipment for a specific purpose, environment, or application may be determined by:

1. equipment listing or labeling;
2. evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation; or
3. other evidence acceptable to the authority having jurisdiction such as a manufacturer's self certification or an owner's engineering judgement.

(See definitions of *Labeled* and *Listed*)

[CP140?-500 rewrite, Panel action Cook actions, correlation w/500]]

Unclassified Locations. Locations that have been evaluated by the classification process defined in Section 500-5(a) or Section 505-5 (a) and determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof. [14-8,14-58]

Nonhazardous Locations. Locations which are not required to have been evaluated by the process defined in 500-5 (a) or 505-5(a). [14-8]

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with an electrical installation, as well as any portable or transportable device having a battery or other electrical power source. [14-6]

Dust-ignitionproof. Equipment enclosed in a manner that will exclude dusts and will not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure. [14-15,14-203]

FPN: For further information on dust-ignitionproof enclosures, see Type 9 enclosure in Enclosures for Electrical Equipment, ANSI/NEMA 250-1991, and Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations, ANSI/UL 1203-1994.

Dusttight. Enclosures constructed so that dust will not enter under specified test conditions. [14-18]

FPN: See Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA S12.12-1994, and Electrical Equipment for Use in Class I and II, Division 2 and Class III Hazardous (Classified) Locations, UL 1604-1994.

Explosionproof Apparatus. Apparatus enclosed in a case that is capable of withstanding an explosion of a specified gas or vapor that may occur within it and of preventing the ignition of a specified gas or vapor surrounding the enclosure by sparks, flashes, or explosion of the gas or vapor within, and that operates at such an external temperature that a surrounding flammable atmosphere will not be ignited thereby.

FPN: For further information, see Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations, ANSI/UL 1203-1994. [14-13]

Purged and Pressurized. The process of supplying an enclosure with a protective gas, at a sufficient flow and positive pressure to reduce the concentration of any flammable gas or vapor initially present to an acceptable level. [14-20]

FPN: For further information, see Purged and Pressurized Enclosures for Electrical Equipment, ANSI/NFPA 496-1998.

Nonincendive Circuit. A circuit, other than field wiring, in which any arc or thermal effect produced under intended operating conditions of the equipment, is not capable, under specified test conditions, of igniting the flammable gas–, vapor–, or dust–air mixture. [14-31]

FPN: For further information see Nonincendive Electrical Equipment for Use in Class I and II, Division 2 and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA-S12.12-1994.

Nonincendive Field Wiring. Wiring that enters or leaves an equipment enclosure and, under normal operating conditions of the equipment, is not capable, due to arcing or thermal effects, of igniting the flammable gas–, vapor–, or dust–air mixture. Normal operation includes opening, shorting, or grounding the field wiring. [14-30]

Nonincendive Equipment. Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing ignition of a specified flammable gas–, vapor–, or dust–air mixture due to arcing or thermal means.

FPN: For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA-S12.12-1994.

Nonincendive Component. A component having contacts for making or breaking an incendive circuit and the contacting mechanism shall be constructed so that the component is incapable of igniting the specified flammable gas– or vapor–air mixture. The housing of a nonincendive component is not intended to exclude the flammable atmosphere or contain an explosion.

FPN: For further information, see Electrical Equipment for Use in Class I and II, Division 2, and Class III Hazardous (Classified) Locations, UL 1604-1994.

Associated Nonincendive Field Wiring Apparatus - Apparatus in which the circuits are not necessarily nonincendive themselves, but that affect the energy in nonincedive field wiring circuits and are relied upon to maintain nonincendive energy levels. Associated nonincendive field wiring apparatus may be either of the following:

1. Electrical apparatus that has an alternative type of protectionfor use in the appropriate hazardous (classified) location, or

2. Electrical apparatus not so protected that shall not be used in ahazardous (classified) location.

FPN: Associated nonincendive field wiring apparatus has designated associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and may also have connections for other electrical apparatus.
[14-30]

Nonincendive field wiring apparatus - Apparatus intended to be connected to nonincendive field wiring.

[14-31]

Oil Immersion. Electrical equipment immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

FPN: For further information, see Industrial Control Equipment for Use in Hazardous (Classified) Locations, ANSI/UL 698-1995.

Hermetically Sealed. Equipment sealed against the entrance of an external atmosphere where the seal is made by fusion, e.g., soldering, brazing, welding, or the fusion of glass to metal.

FPN: For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations, ANSI/ISA S12.12-1994.

500-3. Other Articles ~~[500-2]~~

Except as modified in Articles 500 through 504, all other applicable rules contained in this Code shall apply to electrical equipment and wiring installed in hazardous (classified) locations.

500-4 General ~~[500-3]~~

(a) Documentation. ~~[500-3(b)]~~All areas designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

(b) Reference Standards.~~[500-3(c)]~~

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with the standards of the National Fire Protection Association (NFPA), the American Petroleum Institute (API), and The Instrumentation, Systems, and Automation Society (ISA) that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

FPN No. 2: For further information on the classification of locations, see Flammable and Combustible Liquids Code, NFPA 30-1996; Standard for Drycleaning Plants, NFPA 32-1996; Standard for Spray Application Using Flammable or Combustible Materials, NFPA 33-1995; Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids, NFPA 34-1995; Standard for the Manufacture of Organic Coatings, NFPA 35-1995; Standard for Solvent Extraction Plants, NFPA 36-1997; Standard on Fire Protection for Laboratories Using Chemicals, NFPA 45-1996; Standard for Gaseous Hydrogen Systems at Consumer Sites, NFPA 50A-1994; Standard for Liquefied Hydrogen Systems at Consumer Sites, NFPA 50B-1994; Liquefied Petroleum Gas Code, NFPA 58-1998; Standard for the Storage and Handling of Liquefied Petroleum Gases at Utility Gas Plants, NFPA 59-1998; Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997; Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997; Standard for Fire Protection in Wastewater Treatment and Collection Facilities, NFPA 820-1995; Recommended Practice for Classification of Locations of Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2, ANSI/API RP500-1997; Area Classification In Hazardous (Classified) Dust Locations, ANSI/ISA-S12.10-1988.

FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see Recommended Practice on Static Electricity, NFPA 77-1993; Standard for the Installation of Lightning Protection Systems, NFPA 780-1997; and Protection Against Ignitions Arising Out of Static Lightning and Stray Currents, API RP 2003-1991.

FPN No. 4: For further information on ventilation, see Flammable and Combustible Liquids Code, NFPA 30-1996; and Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2, API RP 500-1997, Section 4.6.

FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class I, Division 1 and Division 2 Locations, ANSI/API RP 14F-1999.

500-5. Classifications of Locations ~~[500-3(a)]~~

(a) Classifications of Locations. ~~[500-3(a)]~~Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases, or combustible dusts or fibers that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified.
Each room, section, or area shall be considered individually in determining its classification.

FPN: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in a reduced level of classification or in an unclassified location and, thus, to reduce the amount of special equipment required. [14-40]

Rooms and areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation, may be classified as "unclassified" locations. [14-37]

FPN: For further information regarding classification and ventilation of areas involving ammonia, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989 (14-37)

(b) Class I Locations ~~[500-7]~~

Class I locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures. Class I locations shall include those specified in

(1) and (2).

(1) Class I, Division 1. ~~[500-7(a)]~~A Class I, Division 1 location is a location
(a) ~~[500-7(a)(1)]~~In which ignitible concentrations of flammable gases or vapors can exist under normal operating conditions, or
(b) ~~[500-7(a)(2)]~~In which ignitible concentrations of such gases or vapors may exist frequently because of repair or maintenance operations or because of leakage, or
(c) ~~[500-7(a)(3)]~~In which breakdown or faulty operation of equipment or processes might release ignitible concentrations of flammable gases or vapors, and might also cause simultaneous failure of electrical equipment in such a way as to directly cause the electrical equipment to become a source of ignition.

FPN No. 1: This classification usually includes the following locations:

a. Where volatile flammable liquids or liquefied flammable gases are transferred from one container to another
b. Interiors of spray booths and areas in the vicinity of spraying and painting operations where volatile flammable solvents are used
c. Locations containing open tanks or vats of volatile flammable liquids
d. Drying rooms or compartments for the evaporation of flammable solvents
e. Locations containing fat and oil extraction equipment using volatile flammable solvents
f. Portions of cleaning and dyeing plants where flammable liquids are used
g. Gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape
h. Inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids
i. The interiors of refrigerators and freezers in which volatile flammable materials are stored in open, lightly stoppered, or easily ruptured containers
j. All other locations where ignitible concentrations of flammable vapors or gases are likely to occur in the course of normal operations.

FPN No. 2: In some Division 1 locations, ignitible concentrations of flammable gases or vapors may be present continuously or for long periods of time. Examples include the following:

a. The inside of inadequately vented enclosures containing instruments normally venting flammable gases or vapors to the interior of the enclosure
b. The inside of vented tanks containing volatile flammable liquids
c. The area between the inner and outer roof sections of a floating roof tank containing volatile flammable fluids
d. Inadequately ventilated areas within spraying or coating operations using volatile flammable fluids
e. The interior of an exhaust duct that is used to vent ignitible concentrations of gases or vapors.

Experience has demonstrated the prudence of avoiding the installation of instrumentation or other electric equipment in these particular areas altogether or where it cannot be avoided because it is essential to the process and other locations are not feasible [see Section 500-5(a), FPN], using electric equipment or instrumentation approved for the specific application or consisting of intrinsically safe systems as described in Article 504.

(2) Class I, Division 2. ~~[500-7(b)]~~A Class I, Division 2 location is a location
(a) ~~[500-7(b)(1)]~~In which volatile flammable liquids or flammable gases are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems, or in case of abnormal operation of equipment, or
(b) ~~[500-7(b)(2)]~~In which ignitible concentrations of gases or vapors are normally prevented by positive mechanical ventilation, and which might become hazardous through failure or abnormal operation of the ventilating equipment, or
(c) ~~[500-7(b)(3)]~~That is adjacent to a Class I, Division 1 location, and to which ignitible concentrations of gases or vapors might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.

FPN No. 1: This classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used but that, in the judgment of the authority having jurisdiction, would become hazardous only in case of an accident or of some unusual operating condition. The quantity of flammable material that might escape in case of accident, the adequacy of ventilating equipment, the total area involved, and the record of the industry or business with respect to explosions or fires are all factors that merit consideration in determining the classification and extent of each location.

FPN No. 2: Piping without valves, checks, meters, and similar devices would not ordinarily introduce a hazardous condition even though used for flammable liquids or gases. Depending on factors such as the quantity and size of the containers and ventilation, locations used for the storage of flammable liquids or liquefied or compressed gases in sealed containers may either be considered hazardous (classified) or unclassified or nonhazardous locations. See Flammable and Combustible Liquids Code, NFPA 30-1996, and Liquefied Petroleum Gas Code, NFPA 58-1998. [14-40]

(c) Class II Locations ~~[500-8]~~
Class II locations are those that are hazardous because of the presence of combustible dust. Class II locations shall include those specified in (1) and (2).
(1) ~~[500-8(a)]~~**Class II, Division 1**. A Class II, Division 1 location is a location
(a) ~~[500-8(a)(1)]~~In which combustible dust is in the air under normal operating conditions in quantities sufficient to produce explosive or ignitible mixtures, or
(b) ~~[500-8(a)(2)]~~Where mechanical failure or abnormal operation of machinery or equipment might cause such explosive or ignitible mixtures to be produced, and might also provide a source of ignition through simultaneous failure of electric equipment, operation of protection devices, or from other causes, or
(c) ~~[500-8(a)(3)]~~In which combustible dusts of an electrically conductive nature may be present in hazardous quantities.

FPN: Combustible dusts that are electrically nonconductive include dusts produced in the handling and processing of grain and grain products, pulverized sugar and cocoa, dried egg and milk powders, pulverized spices, starch and pastes, potato and wood-flour, oil meal from beans and seed, dried hay, and other organic materials that may produce combustible dusts when processed or handled. Only Group E dusts are considered to be electrically conductive for classification purposes. Dusts containing magnesium or aluminum are particularly hazardous, and the use of extreme precaution will be necessary to avoid ignition and explosion.

(2) Class II, Division 2. ~~[500-8(b)]~~A Class II, Division 2 location is a location
(a) ~~[500-8(b)(1)]~~Where combustible dust is not normally in the air in quantities sufficient to produce explosive or ignitible mixtures, and dust accumulations are normally insufficient to interfere with the normal operation of electrical equipment or other apparatus, but combustible dust may be in suspension in the air as a result of infrequent malfunctioning of handling or processing equipment and

(b) ~~[500-8(b)(2)]~~Where combustible dust accumulations on, in, or in the vicinity of the electrical equipment may be sufficient to interfere with the safe dissipation of heat from electrical equipment or may be ignitible by abnormal operation or failure of electrical equipment.

FPN No. 1: The quantity of combustible dust that may be present and the adequacy of dust removal systems are factors that merit consideration in determining the classification and may result in an unclassified or nonhazardous area. [14-40]

FPN No. 2: Where products such as seed are handled in a manner that produces low quantities of dust, the amount of dust deposited may not warrant classification.

(d) Class III Locations ~~[500-9]~~
Class III locations are those that are hazardous because of the presence of easily ignitible fibers or flyings, but in which such fibers or flyings are not likely to be in suspension in the air in quantities sufficient to produce ignitible mixtures. Class III locations shall include those specified in (a) and (b).
(1) Class III, Division 1. ~~[500-9(a)]~~A Class III, Division 1 location is a location in which easily ignitible fibers or materials producing combustible flyings are handled, manufactured, or used.

FPN No. 1: Such locations usually include some parts of rayon, cotton, and other textile mills; combustible fiber manufacturing and processing plants; cotton gins and cotton-seed mills; flax-processing plants; clothing manufacturing plants; woodworking plants; and establishments and industries involving similar hazardous processes or conditions.

FPN No. 2: Easily ignitible fibers and flyings include rayon, cotton (including cotton linters and cotton waste), sisal or henequen, istle, jute, hemp, tow, cocoa fiber, oakum, baled waste kapok, Spanish moss, excelsior, and other materials of similar nature.

(2) Class III, Division 2. ~~[500-9(b)]~~A Class III, Division 2 location is a location in which easily ignitible fibers are stored or handled other than in the process of manufacture.

500-6 Material Groups
~~[500-5(a) second paragraph]~~For purposes of testing, approval, and area classification, various air mixtures (not oxygen-enriched) shall be grouped in accordance with Sections 500-6(a) and 500-6(b).

Exception: Equipment identified for a specific gas, vapor, or dust.[14-33]

FPN: This grouping is based on the characteristics of the materials. Facilities are available for testing and identifying equipment for use in the various atmospheric groups.

(a) Class I Group Classifications. ~~[500-5(a)]~~Class I groups shall be as follows.
[x]**(1)** ~~[500-5(a)(1)]~~**Group A**. Acetylene.
[x]**(2)** ~~[500-5(a)(2)]~~**Group B**. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.45 mm or a minimum igniting current ratio (MIC ratio) less than or equal to 0.40.

FPN: A typical Class I, Group B material is hydrogen.

Exception No. 1: Group D equipment shall be permitted to be used for atmospheres containing butadiene provided all conduit and cable runs into explosionproof equipment are provided with explosionproof seals installed within 18 in. (457 mm) of the enclosure.
Exception No. 2: Group C equipment shall be permitted to be used for atmospheres containing allyl glycidyl ether, n-butyl glycidyl ether, ethylene oxide, propylene oxide, and acrolein provided all conduit and cable runs into explosionproof equipment are provided with explosionproof seals installed within 18 in. (457 mm) of the enclosure.

[x]**(3)** ~~[500-5(a)(3)]~~**Group C**. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.45 mm and less than or equal to 0.75 mm, or a minimum igniting current ratio (MIC ratio) greater than 0.40 and less than or equal to 0.80.
FPN: A typical Class I, Group C material is ethylene.

[x]**(4)** ~~[500-5(a)(4)]~~**Group D.** Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.75 mm or a minimum igniting current ratio (MIC ratio) greater than 0.80.
FPN No. 1: A typical Class I, Group D material is propane.
FPN No. 2: For classification of areas involving ammonia atmospheres, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989.
~~*Exception: For atmospheres containing ammonia, the authority having jurisdiction for enforcement of this Code shall be permitted to reclassify the location to a reduced level of classification or to an unclassified location. (14-37)*~~

~~FPN No. 1: For additional information on the properties and group classification of Class I materials, see Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997, and Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, NFPA 325-1994.~~
The following FPN's apply to section (a):
FPN No. 1: The explosion characteristics of air mixtures of gases or vapors vary with the specific material involved. For Class I locations, Groups A, B, C, and D, the classification involves determinations of maximum explosion pressure and maximum safe clearance between parts of a clamped joint in an enclosure. It is necessary, therefore, that equipment be identified [14-38] not only for class but also for the specific group of the gas or vapor that will be present.
FPN No. 2: Certain chemical atmospheres may have characteristics that require safeguards beyond those required for any of the above groups. Carbon disulfide is one of these chemicals because of its low ignition temperature [100ºC (212ºF)] and the small joint clearance permitted to arrest its flame.

[14-37]
(b) Class II Group Classifications. ~~[500-5(b)]~~Class II groups shall be as follows.

[x]**(1)** ~~[500-5(b)(1)]~~**Group E.** Atmospheres containing combustible metal dusts, including aluminum, magnesium, and their commercial alloys, or other combustible dusts whose particle size, abrasiveness, and conductivity present similar hazards in the use of electrical equipment.

FPN: Certain metal dusts may have characteristics that require safeguards beyond those required for atmospheres containing the dusts of aluminum, magnesium, and their commercial alloys. For example, zirconium, thorium, and uranium dusts have extremely low ignition temperatures [as low as 20ºC (68ºF)] and minimum ignition energies lower than any material classified in any of the Class I or Class II Groups.

[x]**(2)** ~~[500-5(b)(2)]~~**Group F**. Atmospheres containing combustible carbonaceous dusts that have more than 8 percent total entrapped volatiles (see Standard Test Method for Volatile Material in the Analysis Sample for Coal and Coke, ASTM D3175-89, for coal and coke dusts) or that have been sensitized by other materials so that they present an explosion hazard. Coal, carbon black, charcoal, and coke dusts are examples of carbonaceous dusts.

[x]**(3)** ~~[500-5(b)(3)]~~**Group G.** Atmospheres containing combustible dusts not included in Group E or F, including flour, grain, wood, plastic, and chemicals.
FPN No. 1: For additional information on group classification of Class II materials, see Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997.

FPN No. 2: The explosion characteristics of air mixtures of dust vary with the materials involved. For Class II locations, Groups E, F, and G, the classification involves the tightness of the joints of assembly and shaft openings to prevent the entrance of dust in the dust-ignitionproof enclosure, the blanketing effect of layers of dust on the equipment that may cause overheating, and the ignition temperature of the dust. It is necessary, therefore, that equipment be identified [14-42]not only for the class, but also for the specific group of dust that will be present.

FPN No. 3: Certain dusts may require additional precautions due to chemical phenomena that can result in the generation of ignitible gases. See National Electrical Safety Code, ANSI C2-1997, Section 127A, Coal Handling Areas.
[x Editorial note to indicate that all these definitions are extracted from NFPA 497 and 499. NFPA Staff needs to correlate these texts. Published 497 as or last "official" printing was in error. Contact EECA Panel if needed.

500 -7 Protection Techniques ~~[500-4]~~
The following shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.

(a) ~~[500-4(a)]~~**Explosionproof Apparatus**. This protection technique shall be permitted for equipment in Class I, Division 1 or 2 locations.

(b) ~~[500-4(b)]~~**Dust Ignitionproof**. This protection technique shall be permitted for equipment in Class II, Division 1 or 2 locations.

(c) ~~[500-4(c)]~~**Dusttight.** This protection technique shall be permitted for equipment in Class II, Division 2 or Class III locations.

(d) ~~[500-4(d)]~~**Purged and Pressurized.** This protection technique shall be permitted for equipment in any hazardous (classified) location for which it is identified. [Cook proposal, CP140? Panel action- correlate with Article 505]

(e) ~~[500-4(e)]~~**Intrinsic** ~~**Safe Systems**~~ **Safety**. This protection technique shall be permitted for equipment in Class I, Division 1 or 2, or Class II, Division 1 or 2, or Class III, Division 1 or 2 locations. The provisions of Articles 501 through 503 and 510 through 516 shall not be considered applicable to such installations, except as required by Article 504, and installation of intrinsically safe apparatus and wiring shall be in accordance with the requirements of Article 504. [Editorial change for new text alignment format CP-140?]

(f) Nonincendive Circuit. ~~[500-4(f)-(1)]~~This protection technique shall be permitted for equipment in Class I, Division 2, Class II, Division 2, Class III, Division 2 locations. [14-30 – note "Nonincendive" was replaced by the techniques of nonincendive circuit, nonincendive equipment, and nonincendive component. See also the new definition section 500-2, CP140?]

(g) Nonincendive Equipment. ~~[500-4(f)(2)]~~This protection technique shall be permitted for equipment in Class I, Division 2, Class II, Division 2, Class III, and Division 2 locations.

(h) Nonincendive Component. ~~[500-4(f)(2)(a)]~~This protection technique shall be permitted for equipment in Class I, Division 2, Class II, Division 2, Class III, Division 2 locations.

(i) Oil Immersion. ~~[500-4(g)]~~This protection technique shall be permitted for current-interrupting contacts in Class I, Division 2 locations as described in Section 501-6(b)(1)(b).

(j) Hermetically Sealed. ~~[500-4(h)]~~This protection technique shall be permitted for equipment in Class I and II, Division 2, and Class III, Division 1 and 2 locations.

(k) Other Protection Techniques. ~~[500-4(i)]~~Other protection techniques used in equipment identified for use in hazardous (classified) locations. [Cook correlation 14-42, 14-45, CP140?]

500 -8 Equipment

~~[500-5]~~Articles 500 through 504 require equipment construction and installation that will ensure safe performance under conditions of proper use and maintenance.

FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to installation and maintenance.

FPN No. 2: Low ambient conditions require special consideration. Explosionproof or dust-ignitionproof equipment may not be suitable for use at temperatures lower than -25ºC (-13ºF) unless they are identified for low-temperature service. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified Class I, Division 1 at normal ambient temperature.

(a) Approval for Class and Properties. ~~[500-5(c)]~~

(1) ~~[500-5 (c) paragraph 2]~~Equipment shall be identified [14-42, with correlation CP-140? For Article 505] not only for the class of location but also for the explosive, combustible, or ignitible properties of the specific gas, vapor, dust, fiber, or flyings that will be present. In addition, Class I equipment shall not have any exposed surface that operates at a temperature in excess of the ignition temperature of the specific gas or vapor. Class II equipment shall not have an external temperature higher than that specified in Section 500-8(2). Class III equipment shall not exceed the maximum surface temperatures specified in Section 503-1.

(2) ~~[500-5 (c) paragraph 3]~~Equipment that has been identified [14-45 with correlation CP-140? For Article 505] for a Division 1 location shall be permitted in a Division 2 location of the same class and group.

(3) ~~[500-5 (c) paragraph 4]~~Where specifically permitted in Articles 501 through 503, general-purpose equipment or equipment in general-purpose enclosures shall be permitted to be installed in Division 2 locations if the equipment does not constitute a source of ignition under normal operating conditions.

(4) ~~[500-5 (c) paragraph 1]~~Equipment, regardless of the classification of the location in which it is installed, that depends on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the equipment, shall be identified [14-44]for a Class I, Division 2 location, unless the *equipment is installed in a Class I, Division 1 location. In this case, the equipment shall be identified for the Class I, Division 1 location*.

FPN: See Section 501-5(f)(3) for additional requirements.

(5) ~~[500-5 (c) paragraph 5]~~Unless otherwise specified, normal operating conditions for motors shall be assumed to be rated full-load steady conditions.

(6) ~~[500-5 (c) paragraph 6]~~Where flammable gases or combustible dusts are or may be present at the same time, the simultaneous presence of both shall be considered when determining the safe operating temperature of the electrical equipment.

FPN: The characteristics of various atmospheric mixtures of gases, vapors, and dusts depend on the specific material involved.

(b) Marking. ~~[500-5 (d)]~~Equipment shall be marked to show the class, group, and operating temperature or temperature class referenced to a 40ºC ambient. [14-50,14-51,14-52]

Exception No. 1: Equipment of the non-heat-producing type, such as junction boxes, conduit, and fittings, and equipment of the heat-producing type having a maximum temperature **(QUESTION TO CMP-14 COMMITTEE: IS THIS THE MAXIMUM TEMPERATURE OF AN INTERNAL COMPONENT WITHIN AN ENCLOSURE OR IS THIS THE ENCLOSURE SURFACE TEMPERATURE?)** *not more than 100ºC (212ºF) shall not be required to have a marked operating temperature or temperature class.*

Exception No. 2: Fixed lighting fixtures marked for use in Class I, Division 2 or Class II, Division 2 locations only shall not be required to be marked to indicate the group.

Exception No. 3: Fixed general-purpose equipment in Class I locations, other than fixed lighting fixtures, that is acceptable for use in Class I, Division 2 locations shall not be required to be marked with the class, group, division, or operating temperature.

Exception No. 4: Fixed dusttight equipment other than fixed lighting fixtures that are acceptable for use in Class II, Division 2 and Class III locations shall not be required to be marked with the class, group, division, or operating temperature.

Exception No. 5: Electric equipment suitable for ambient temperatures exceeding 40ºC (104ºF) shall be marked with both the maximum ambient temperature and the operating temperature or temperature class at that ambient temperature.

FPN: Equipment not marked to indicate a division, or marked "Division 1" or "Div. 1," is suitable for both Division 1 and 2 locations. Equipment marked "Division 2" or "Div. 2" is suitable for Division 2 locations only.

The temperature class , if provided, shall be indicated using the temperature class (T Codes) shown in Table 500-8(b).

The temperature class (T Code)marked on equipment nameplates shall be in accordance with Table 500-8(b).

Equipment for Class I and Class II shall be marked with the maximum safe operating temperature, as determined by simultaneous exposure to the combinations of Class I and Class II conditions. [14-49,14-53]

FPN: Since there is no consistent relationship between explosion properties and ignition temperature, the two are independent requirements.

Table 500-8(b)~~[500-5(d)].~~Classification of Maximum Surface Temperature ~~Identification Numbers~~

Maximum Temperature		~~Identification~~Temperature ~~Number~~Class (T Code)
ºC	ºF	
450	842	T1
300	572	T2

165	329	T3B
160	320	T3C
135	275	T4
120	248	T4A
100	212	T5
85	185	T6

(c) Temperature
(1) Class I Temperature. ~~[500-5 (c)]~~The temperature marking specified in (b) ~~(d)~~ shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

FPN: For information regarding ignition temperatures of gases and vapors, see Recommended Practice for the Classification of flammable gases, etc. and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997.

(2) Class II Temperature. The temperature marking specified in (b) ~~(d)~~ shall be less than the ignition temperature of the specific dust to be encountered. For organic dusts that may dehydrate or carbonize, the temperature marking shall not exceed the lower of either the ignition temperature or 165ºC (329ºF).

FPN: See Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997, for minimum ignition temperatures of specific dusts.

The ignition temperature for which equipment was approved prior to this requirement shall be assumed to be as shown in Table 500-5(c) (2) ~~500-5(f).~~

(d) Threading ~~[500-3 (d) See CP140? Title change correlation with Article 505 CP140?]~~
All threaded conduit ~~or fittings~~ referred to herein shall be threaded with an National (American) Standard Pipe Taper (NPT) [14-11] standard conduit cutting die that provides a taper of 1 in 16 (3/4-in. taper per foot). Such conduit shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof or flameproof integrity of the conduit system where applicable.
Equipment provided with threaded entries for field wiring connections shall be installed in accordance with (1) or (2).

(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.

FPN: Threading specifications for NPT threads are located in Pipe Threads, General Purpose (Inch), ANSI/ASME B1.20.1-1983.

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in Metric Screw Threads, ISO 965/1-1980, and Metric Screw Threads, ISO 965/3-1980.

(e) Fiber Optic Cable Assembly. ~~[500-3 (e)]~~
Where a fiber optic cable assembly contains conductors that are capable of carrying current, the fiber optic cable assembly shall be installed in accordance with the requirements of Articles 500, 501, 502, or 503, as applicable.

500-9. Specific Occupancies ~~[500-6]~~
Articles 510 through 517 cover garages, aircraft hangars, gasoline dispensing and service stations, bulk storage plants, spray application, dipping and coating processes, and health care facilities.

SUBSTANTIATION: During the January 2000 ROP meeting, Code Making Panel 14 was challenged with a very difficult task due to the large number of proposals that required action, the technical content of the requested revisions, and the Technical Correlating Committee formatting changes. As a result, it was very difficult for the NEC staff assigned to Code Making Panel 14 to keep up with the actions taking place. This comment's intent is to clarify what took place and make necessary revisions.
PANEL ACTION: Accept in Principle.
Revise Article 500 to read as follows:

ARTICLE 500
[Comment 14-11]

Hazardous (Classified) Locations, Classes I, II, and III, Divisions 1 and 2

500-1 Scope — Articles 500 through 504. Articles 500 through 504 cover the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Divisions 1 and 2; Class II, Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, combustible dust, or ignitible fibers or flyings.

FPN: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors, or flammable liquids, refer to Article 505.

500-2 Definitions. For purposes of Articles 500 through 504 and Articles 506 through 516, the following definitions apply.

Associated Nonincendive Field Wiring Apparatus. Apparatus in which the circuits are not necessarily nonincendive themselves, but that affect the energy in nonincendive field wiring circuits and are relied upon to maintain nonincendive energy levels. Associated nonincendive field wiring apparatus may be either of the following:

1. Electrical apparatus that has an alternative type of protection for use in the appropriate hazardous (classified) location, or
2. Electrical apparatus not so protected that shall not be used in a hazardous (classified) location.

FPN: Associated nonincendive field wiring apparatus has designated associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and may also have connections for other electrical apparatus.

Combustible Gas Detection System. A protection technique utilizing stationary gas detectors in industrial establishments which under specific conditions permits the use of equipment suitable for Class I, Division 2 locations to be used in a Class I, Division 1 location or the use of equipment suitable for unclassified locations to be used in a Class I, Division 2 locations.

Control Drawing. A drawing or other document provided by the manufacturer of the intrinsically safe or associated apparatus, or of the nonincendive field wiring apparatus or associated nonincendive field wiring apparatus, that details the allowed interconnections between the intrinsically safe and associated apparatus, or between the nonincendive field wiring apparatus or associated nonincendive field wiring apparatus.

Table 500-5(c) (2) ~~500-5(f)~~.

			Equipment (Such as Motors or Power Transformers) that May Be Overloaded			
Class II Group	Equipment that Is Not Subject to Overloading		Normal Operation		Abnormal Operation	
	ºC	ºF	ºC	ºF	ºC	ºF
E	200	392	200	392	200	392
F	200	392	150	302	200	392
G	165	329	120	248	165	329

Dust-ignitionproof. Equipment enclosed in a manner that will exclude dusts and will not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.

FPN: For further information on dust-ignitionproof enclosures, see Type 9 enclosure in Enclosures for Electrical Equipment, ANSI/NEMA 250-1991, and Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations, ANSI/UL 1203-1994.

Dusttight. Enclosures constructed so that dust will not enter under specified test conditions.

FPN: See Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA — 12.12.01-2000, and Electrical Equipment for Use in Class I and II, Division 2 and Class III Hazardous (Classified) Locations, UL 1604-1994.

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with an electrical installation.

FPN: Portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, could potentially become an ignition source in hazardous (classified) locations. Equipment suitable for the location or safety procedures to ensure safe operation of this equipment should be employed.

Explosionproof Apparatus. Apparatus enclosed in a case that is capable of withstanding an explosion of a specified gas or vapor that may occur within it and of preventing the ignition of a specified gas or vapor surrounding the enclosure by sparks, flashes, or explosion of the gas or vapor within, and that operates at such an external temperature that a surrounding flammable atmosphere will not be ignited thereby.

FPN: For further information, see Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations, ANSI/UL 1203-1994.

Hermetically Sealed. Equipment sealed against the entrance of an external atmosphere where the seal is made by fusion, e.g., soldering, brazing, welding, or the fusion of glass to metal.

FPN: For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations, ANSI/ISA — 12.12.01-2000.

Nonincendive Circuit. A circuit, other than field wiring, in which any arc or thermal effect produced under intended operating conditions of the equipment, is not capable, under specified test conditions, of igniting the flammable gas–, vapor–, or dust–air mixture.

FPN: Conditions are described in Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA — 12.12.01-2000.

Nonincendive Component. A component having contacts for making or breaking an incendive circuit and the contacting mechanism shall be constructed so that the component is incapable of igniting the specified flammable gas– or vapor–air mixture. The housing of a nonincendive component is not intended to exclude the flammable atmosphere or contain an explosion.

FPN: For further information, see Electrical Equipment for Use in Class I and II, Division 2, and Class III Hazardous (Classified) Locations, UL 1604-1994.

Nonincendive Equipment. Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing ignition of a specified flammable gas–, vapor–, or dust–air mixture due to arcing or thermal means.

FPN: For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA — 12.12.01-2000.

Nonincendive Field Wiring. Wiring that enters or leaves an equipment enclosure and, under normal operating conditions of the equipment, is not capable, due to arcing or thermal effects, of igniting the flammable gas–, vapor–, or dust–air mixture. Normal operation includes opening, shorting, or grounding the field wiring.

Nonincendive Field Wiring Apparatus. Apparatus intended to be connected to nonincendive field wiring.

FPN: For further information see Nonincendive Electrical Equipment for Use in Class I and II, Division 2 and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA — 12.12.01-2000.

Oil Immersion. Electrical equipment immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

FPN: For further information, see Industrial Control Equipment for Use in Hazardous (Classified) Locations, ANSI/UL 698-1995.

Purged and Pressurized. The process of supplying an enclosure with a protective gas, at a sufficient flow and positive pressure to reduce the concentration of any flammable gas or vapor initially present to an acceptable level.

FPN: For further information, see Purged and Pressurized Enclosures for Electrical Equipment, ANSI/NFPA 496-1998.

Unclassified Locations. Locations determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof.

~~**Identified (as applied to equipment).** Recognizable as suitable for the specific purpose, function, use, environment, application, etc., where prescribed in a particular Code requirement.~~

~~FPN: Suitability of equipment for a specific purpose, environment, or application may be determined by:~~

~~1.~~equipment listing or labeling;

~~2. evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation; or~~

~~3. other evidence acceptable to the authority having jurisdiction such as a manufacturer's self~~ evaluation ~~certification or an owner's engineering judgement.~~

~~(See definitions of *Labeled* and *Listed*)~~

500~~-23~~ Other Articles. Except as modified in Articles 500 through 504, all other applicable rules contained in this Code shall apply to electrical equipment and wiring installed in hazardous (classified) locations.

500~~-3 4~~ General

(a) Documentation. All areas designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

(b) Reference Standards. Important information relating to topics covered in Chapter 5 may be found in other publications.

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with the standards of the National Fire Protection Association (NFPA), the American Petroleum Institute (API), and ~~the~~ ~~Instrument Society of America~~ ISA — Instrumentation, Systems, and Automation Society (ISA) that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

FPN No. 2: For further information on the classification of locations, see Flammable and Combustible Liquids Code, NFPA 30-2000~~1996~~; Standard for Drycleaning Plants, NFPA 32-1996; Standard for Spray Application Using Flammable or Combustible Materials, NFPA 33-2000~~1995~~; Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids, NFPA 34-2000~~1995~~; Standard for the

Manufacture of Organic Coatings, NFPA 35-1999~~1995~~; Standard for Solvent Extraction Plants, NFPA 36-2001~~1997~~; Standard on Fire Protection for Laboratories Using Chemicals, NFPA 45-1996; Standard for Gaseous Hydrogen Systems at Consumer Sites, NFPA 50A-1994; Standard for Liquefied Hydrogen Systems at Consumer Sites, NFPA 50B-1994; Liquefied Petroleum Gas Code, NFPA 58-1998; Standard for the Storage and Handling of Liquefied Petroleum Gases at Utility Gas Plants, NFPA 59-1998; Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997; Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997; Standard for Fire Protection in Wastewater Treatment and Collection Facilities, NFPA 820-1995; Recommended Practice for Classification of Locations of Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2, ANSI/API RP500-1997; Area Classification In Hazardous (Classified) Dust Locations, ~~ANSI/~~ISA — ~~S~~12.10-1988.

FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see Recommended Practice on Static Electricity, NFPA 77-2000~~1993~~; Standard for the Installation of Lightning Protection Systems, NFPA 780-1997; and Protection Against Ignitions Arising Out of Static Lightning and Stray Currents, API RP 2003-1998.

FPN No. 4: For further information on ventilation, see Flammable and Combustible Liquids Code, NFPA 30-2000~~1996~~; and Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2, API RP 500-1997~~, Section 4.6~~.

FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class I, Division 1 and Division 2 Locations, ANSI/API RP 14F-1999.

500-45 Classifications of Locations

(a) Classifications of Locations. Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases, or combustible dusts or fibers that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified. Each room, section, or area shall be considered individually in determining its classification.

FPN: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in a reduced level of classification or in an unclassified location ~~less hazardous or in nonhazardous locations~~ and, thus, to reduce the amount of special equipment required.

Rooms and areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation, may be classified as "unclassified" locations.

FPN: For further information regarding classification and ventilation of areas involving ammonia, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989.

(b) Class I Locations

Class I locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures. Class I locations shall include those specified in (1) and (2).

(1) Class I, Division 1. A Class I, Division 1 location is a location

(a) In which ignitible concentrations of flammable gases or vapors can exist under normal operating conditions, or
(b) In which ignitible concentrations of such gases or vapors may exist frequently because of repair or maintenance operations or because of leakage, or
(c) In which breakdown or faulty operation of equipment or processes might release ignitible concentrations of flammable gases or vapors, and might also cause simultaneous failure of electrical equipment in such a way as to directly cause the electrical equipment to become a source of ignition.

FPN No. 1: This classification usually includes the following locations:
a. Where volatile flammable liquids or liquefied flammable gases are transferred from one container to another;
b. Interiors of spray booths and areas in the vicinity of spraying and painting operations where volatile flammable solvents are used;
c. Locations containing open tanks or vats of volatile flammable liquids;
d. Drying rooms or compartments for the evaporation of flammable solvents;
e. Locations containing fat and oil extraction equipment using volatile flammable solvents;
f. Portions of cleaning and dyeing plants where flammable liquids are used;
g. Gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape;
h. Inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids;
i. The interiors of refrigerators and freezers in which volatile flammable materials are stored in open, lightly stoppered, or easily ruptured containers;
j. All other locations where ignitible concentrations of flammable vapors or gases are likely to occur in the course of normal operations.

FPN No. 2: In some Division 1 locations, ignitible concentrations of flammable gases or vapors may be present continuously or for long periods of time. Examples include the following:
a. The inside of inadequately vented enclosures containing instruments normally venting flammable gases or vapors to the interior of the enclosure;
b. The inside of vented tanks containing volatile flammable liquids;
c. The area between the inner and outer roof sections of a floating roof tank containing volatile flammable fluids;
d. Inadequately ventilated areas within spraying or coating operations using volatile flammable fluids;
e. The interior of an exhaust duct that is used to vent ignitible concentrations of gases or vapors.

Experience has demonstrated the prudence of avoiding the installation of instrumentation or other electric equipment in these particular areas altogether or where it cannot be avoided because it is essential to the process and other locations are not feasible [see Section 500-45(a), FPN], using electric equipment or instrumentation approved for the specific application or consisting of intrinsically safe systems as described in Article 504.

(2) Class I, Division 2. A Class I, Division 2 location is a location

(a) In which volatile flammable liquids or flammable gases are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems, or in case of abnormal operation of equipment, or
(b) In which ignitible concentrations of gases or vapors are normally prevented by positive mechanical ventilation, and which might become hazardous through failure or abnormal operation of the ventilating equipment, or
(c) That is adjacent to a Class I, Division 1 location, and to which ignitible concentrations of gases or vapors might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.

FPN No. 1: This classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used but that, in the judgment of the authority having jurisdiction, would become hazardous only in case of an accident or of some unusual operating condition. The quantity of flammable material that might escape in case of accident, the adequacy of ventilating equipment, the total area involved, and the record of the industry or business with respect to explosions or fires are all factors that merit consideration in determining the classification and extent of each location.

FPN No. 2: Piping without valves, checks, meters, and similar devices would not ordinarily introduce a hazardous condition even though used for flammable liquids or gases. Depending on factors such as the quantity and size of the containers and ventilation, locations used for the storage of flammable liquids or liquefied or compressed gases in sealed containers may either be considered hazardous (classified) or unclassified ~~or nonhazardous~~ locations. See Flammable and Combustible Liquids Code, NFPA 30-2000~~1996~~, and Liquefied Petroleum Gas Code, NFPA 58-1998.

(c) Class II Locations. Class II locations are those that are hazardous because of the presence of combustible dust. Class II locations shall include those specified in (a) and (b).

(1) Class II, Division 1. A Class II, Division 1 location is a location

(a) In which combustible dust is in the air under normal operating conditions in quantities sufficient to produce explosive or ignitible mixtures, or
(b) Where mechanical failure or abnormal operation of machinery or equipment might cause such explosive or ignitible mixtures to be produced, and might also provide a source of ignition through simultaneous failure of electric equipment, operation of protection devices, or from other causes, or
(c) In which combustible dusts of an electrically conductive nature may be present in hazardous quantities.

FPN: Combustible dusts that are electrically nonconductive include dusts produced in the handling and processing of grain and grain products, pulverized sugar and cocoa, dried egg and milk powders, pulverized spices, starch and pastes, potato and wood-flour, oil meal from beans and seed, dried hay, and other organic materials that may produce combustible dusts when processed or handled. Only Group E dusts are considered to be electrically conductive for classification purposes. Dusts containing magnesium or aluminum are particularly hazardous, and the use of extreme precaution will be necessary to avoid ignition and explosion.

(2) Class II, Division 2. A Class II, Division 2 location is a location

(a) Where combustible dust is not normally in the air in quantities sufficient to produce explosive or ignitible mixtures, and dust accumulations are normally insufficient to interfere with the normal operation of electrical equipment or other apparatus, but combustible dust may be in suspension in the air as a result of infrequent malfunctioning of handling or processing equipment and
(b) Where combustible dust accumulations on, in, or in the vicinity of the electrical equipment may be sufficient to interfere with the safe dissipation of heat from electrical equipment or may be ignitible by abnormal operation or failure of electrical equipment.

FPN No. 1: The quantity of combustible dust that may be present and the adequacy of dust removal systems are factors that merit consideration in determining the classification and may result in an unclassified ~~or nonhazardous~~ area.

FPN No. 2: Where products such as seed are handled in a manner that produces low quantities of dust, the amount of dust deposited may not warrant classification.

(d) Class III Locations. Class III locations are those that are hazardous because of the presence of easily ignitible fibers or flyings, but in which such fibers or flyings are not likely to be in suspension in the air in quantities sufficient to produce ignitible mixtures. Class III locations shall include those specified in (a) and (b).

(1) Class III, Division 1. A Class III, Division 1 location is a location in which easily ignitible fibers or materials producing combustible flyings are handled, manufactured, or used.

FPN No. 1: Such locations usually include some parts of rayon, cotton, and other textile mills; combustible fiber manufacturing and processing plants; cotton gins and cotton-seed mills; flax-processing plants; clothing manufacturing plants; woodworking plants; and establishments and industries involving similar hazardous processes or conditions.

FPN No. 2: Easily ignitible fibers and flyings include rayon, cotton (including cotton linters and cotton waste), sisal or henequen, istle, jute, hemp, tow, cocoa fiber, oakum, baled waste kapok, Spanish moss, excelsior, and other materials of similar nature.

(2) Class III, Division 2. A Class III, Division 2 location is a location in which easily ignitible fibers are stored or handled other than in the process of manufacture.

500~~-5~~-6 Material Groups. For purposes of testing, approval, and area classification, various air mixtures (not oxygen-enriched) shall be grouped in accordance with Sections 500-~~5~~6(a) and 500-~~5~~6(b).

Exception: Equipment identified ~~approved~~ for a specific gas, vapor, or dust.

FPN: This grouping is based on the characteristics of the materials. Facilities are available for testing and identifying equipment for use in the various atmospheric groups.

(a) Class I Group Classifications. Class I groups shall be as follows.

FPN No. 1: FPNs 2 and 3 apply to section **(a)**.

FPN No. 2: The explosion characteristics of air mixtures of gases or vapors vary with the specific material involved. For Class I locations, Groups A, B, C, and D, the classification involves determinations of maximum explosion pressure and maximum safe clearance between parts of a clamped joint in an enclosure. It is necessary, therefore, that equipment be identified not only for class but also for the specific group of the gas or vapor that will be present.

FPN No. 3: Certain chemical atmospheres may have characteristics that require safeguards beyond those required for any of the above groups. Carbon disulfide is one of these chemicals because of its low ignition temperature [100ºC (212ºF)] and the small joint clearance permitted to arrest its flame.

x**(1) Group A.** Acetylene.
x**(2) Group B.** Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.45 mm or a minimum igniting current ratio (MIC ratio) less than or equal to 0.40.

FPN: A typical Class I, Group B material is hydrogen.

Exception No. 1: Group D equipment shall be permitted to be used for atmospheres containing butadiene provided all conduit ~~and cable~~ runs into explosionproof equipment are provided with explosionproof seals installed within 450 mm (18 in.)~~. (457 mm)~~ of the enclosure.

Exception No. 2: Group C equipment shall be permitted to be used for atmospheres containing allyl glycidyl ether, n-butyl glycidyl ether, ethylene oxide, propylene oxide, and acrolein provided all conduit ~~and cable~~ runs into explosionproof equipment are provided with explosionproof seals installed within 450 mm (18 in.)~~. (457 mm)~~ of the enclosure.

x**(3) Group C.** Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.45 mm and less than or equal to 0.75 mm, or a

minimum igniting current ratio (MIC ratio) greater than 0.40 and less than or equal to 0.80.

FPN: A typical Class I, Group C material is ethylene.

(4) Group D. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.75 mm or a minimum igniting current ratio (MIC ratio) greater than 0.80.

FPN No. 1: A typical Class I, Group D material is propane.

FPN No. 2: For classification of areas involving ammonia atmospheres, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989.

(b) Class II Group Classifications. Class II groups shall be as follows.

(1) Group E. Atmospheres containing combustible metal dusts, including aluminum, magnesium, and their commercial alloys, or other combustible dusts whose particle size, abrasiveness, and conductivity present similar hazards in the use of electrical equipment.

FPN: Certain metal dusts may have characteristics that require safeguards beyond those required for atmospheres containing the dusts of aluminum, magnesium, and their commercial alloys. For example, zirconium, thorium, and uranium dusts have extremely low ignition temperatures [as low as 20°C (68°F)] and minimum ignition energies lower than any material classified in any of the Class I or Class II Groups.

(2) Group F. Atmospheres containing combustible carbonaceous dusts that have more than 8 percent total entrapped volatiles (see Standard Test Method for Volatile Material in the Analysis Sample for Coal and Coke, ASTM D3175-89, for coal and coke dusts) or that have been sensitized by other materials so that they present an explosion hazard. Coal, carbon black, charcoal, and coke dusts are examples of carbonaceous dusts.

(3) Group G. Atmospheres containing combustible dusts not included in Group E or F, including flour, grain, wood, plastic, and chemicals.

FPN No. 1: For additional information on group classification of Class II materials, see Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997.

FPN No. 2: The explosion characteristics of air mixtures of dust vary with the materials involved. For Class II locations, Groups E, F, and G, the classification involves the tightness of the joints of assembly and shaft openings to prevent the entrance of dust in the dust-ignitionproof enclosure, the blanketing effect of layers of dust on the equipment that may cause overheating, and the ignition temperature of the dust. It is necessary, therefore, that equipment be identified ~~approved~~ not only for the class, but also for the specific group of dust that will be present.

FPN No. 3: Certain dusts may require additional precautions due to chemical phenomena that can result in the generation of ignitible gases. See National Electrical Safety Code, ANSI C2-1997, Section 127A, Coal Handling Areas.

500-~~6~~7 Protection Techniques. The following shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.

(a) Explosionproof Apparatus. This protection technique shall be permitted for equipment in Class I, Division 1 or 2 locations.

(b) Dust Ignitionproof. This protection technique shall be permitted for equipment in Class II, Division 1 or 2 locations.

(c) Dusttight. This protection technique shall be permitted for equipment in Class II, Division 2 or Class III, Division 1 or 2 locations.

(d) Purged and Pressurized. This protection technique shall be permitted for equipment in any hazardous (classified) location for which it is identified~~approved~~.

(e) Intrinsic Safety. This protection technique shall be permitted for equipment in Class I, Division 1 or 2;~~, or~~ Class II, Division 1 or 2;~~,~~ or Class III, Division 1 or 2 locations. The provisions of Articles 501 through 503 and 510 through 516 shall not be considered applicable to such installations, except as required by Article 504, and installation of intrinsically safe apparatus and wiring shall be in accordance with the requirements of Article 504.

(f) Nonincendive Circuit. This protection technique shall be permitted for equipment in Class I, Division 2;~~,~~ Class II, Division 2;~~,~~ or Class III, Division 1 or 2 locations.

(g) Nonincendive Equipment. This protection technique shall be permitted for equipment in Class I, Division 2;~~,~~ Class II, Division 2;~~,~~ or Class III, ~~and~~ Division 1 or 2 locations.

(h) Nonincendive Component. This protection technique shall be permitted for equipment in Class I, Division 2;~~,~~ Class II, Division 2;~~,~~ or Class III, Division 1 or 2 locations.

(i) Oil Immersion. This protection technique shall be permitted for current-interrupting contacts in Class I, Division 2 locations as described in Section 501-6(b)(1)(b)~~501-6~~7(b)(1)(b).

(j) Hermetically Sealed. This protection technique shall be permitted for equipment in Class I, Division 2; ~~and~~ Class II, Division 2;~~,~~ or ~~and~~Class III, Division 1 or ~~and~~2 locations.

(k) Combustible Gas Detection System. A combustible gas detection system incorporating combustible gas detectors used in industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, is a protection technique permitted under the following conditions:

(1) In a Class I, Division 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Division 2 locations shall be permitted.

(2) In a building located in, or with an opening into, a Class I, Division 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted.

(3) In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases or vapors, electrical equipment suitable for Class I, Division 2 locations shall be permitted.

Gas detection equipment shall be listed for detection of the specific gas or vapor to be encountered.

FPN: For further information, see ANSI/ISA — 12.13.01, Performance Requirements, Combustible Gas Detectors.

Use of this technique for each of the applications above includes adherence to established industrial practices and requirements.

FPN No. 1: For further information, see ANSI/API RP 500, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 or Division 2.

FPN No. 2: For further information, see ISA — RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments.

(l) Other Protection Techniques. Other protection techniques used in equipment identified ~~listed~~ for use in hazardous (classified) locations.

500-~~7~~8 Equipment. Articles 500 through 504 require equipment construction and installation that will ensure safe performance under conditions of proper use and maintenance.

FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to installation and maintenance.

FPN No. 2: Low ambient conditions require special consideration. Explosionproof or dust-ignitionproof equipment may not be suitable for use at temperatures lower than -25ºC (-13ºF) unless they are identified for low-temperature service. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified Class I, Division 1 at normal ambient temperature.

(a) Approval for Class and Properties.

(1) Equipment shall be identified ~~approved~~ not only for the class of location but also for the explosive, combustible, or ignitible properties of the specific gas, vapor, dust, fiber, or flyings that will be present. In addition, Class I equipment shall not have any exposed surface that operates at a temperature in excess of the ignition temperature of the specific gas or vapor. Class II equipment shall not have an external temperature higher than that specified in Section 500-~~7~~8(2). Class III equipment shall not exceed the maximum surface temperatures specified in Section 503-1.

FPN: Luminaires (lighting fixtures) and other heat-producing apparatus, switches, circuit breakers, and plugs and receptacles are potential sources of ignition and are investigated for suitability in classified locations. Such types of equipment, as well as cable terminations for entry into explosionproof enclosures, are available as listed for Class I, Division 2 locations. Fixed wiring, however, may utilize wiring methods that are not evaluated with respect to classified locations. Wiring products such as cable, raceways, boxes, and fittings, therefore, are not marked as being suitable for Class I, Division 2 locations. Also see Exception No. 3 to 500-8(b).

Suitability of identified equipment shall be determined by:

1. Equipment listing or labeling, or
2. Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation, or
3. Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment.

(2) Equipment that has been identified ~~approved~~ for a Division 1 location shall be permitted in a Division 2 location of the same class and group.

(3) Where specifically permitted in Articles 501 through 503, general-purpose equipment or equipment in general-purpose enclosures shall be permitted to be installed in Division 2 locations if the equipment does not constitute a source of ignition under normal operating conditions.

(4) Equipment, regardless of the classification of the location in which it is installed, that depends on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the equipment, shall be identified ~~approved~~ for a Class I, Division 2 location. ~~, unless the .~~
~~Exception:~~ E~~E~~equipment ~~is~~ installed in a Class I, Division 1 location~~.~~ ~~In this case, the equipment~~ shall be ~~suitable~~ identified for the Class I, Division 1 location.

FPN: See Section 501-5(f)(3) for additional requirements.

(5) Unless otherwise specified, normal operating conditions for motors shall be assumed to be rated full-load steady conditions.

(6) Where flammable gases or combustible dusts are or may be present at the same time, the simultaneous presence of both shall be considered when determining the safe operating temperature of the electrical equipment.

FPN: The characteristics of various atmospheric mixtures of gases, vapors, and dusts depend on the specific material involved.

(b) Marking. Equipment shall be marked to show the class, group, and operating temperature or temperature class ~~range~~ referenced to a 40ºC ambient.

Exception No. 1: Equipment of the non-heat-producing type, such as junction boxes, conduit, and fittings, and equipment of the heat-producing type having a maximum temperature ~~**(QUESTION TO CMP-14 COMMITTEE: IS THIS THE MAXIMUM TEMPERATURE OF AN INTERNAL COMPONENT WITHIN AN ENCLOSURE OR IS THIS THE ENCLOSURE SURFACE TEMPERATURE?)**~~ *not more than 100ºC (212ºF) shall not be required to have a marked operating temperature or temperature class~~*range*~~.*

Exception No. 2: Fixed luminaires (lighting fixtures) marked for use in Class I, Division 2 or Class II, Division 2 locations only shall not be required to be marked to indicate the group.

Exception No. 3: Fixed general-purpose equipment in Class I locations, other than fixed luminaires (lighting fixtures), that is acceptable for use in Class I, Division 2 locations shall not be required to be marked with the class, group, division, or operating temperature.

Exception No. 4: Fixed dusttight equipment other than fixed luminaires (lighting fixtures) that are acceptable for use in Class II, Division 2 and Class III locations shall not be required to be marked with the class, group, division, or operating temperature.

Exception No. 5: Electric equipment suitable for ambient temperatures exceeding 40ºC (104ºF) shall be marked with both the maximum ambient temperature and the operating temperature or temperature class ~~range~~ at that ambient temperature.

FPN: Equipment not marked to indicate a division, or marked "Division 1" or "Div. 1," is suitable for both Division 1 and 2 locations. Equipment marked "Division 2" or "Div. 2" is suitable for Division 2 locations only.

The temperature- class ~~range~~, if provided, shall be indicated using the temperature class (T Codes) ~~in identification numbers, as~~ shown in Table 500-~~7~~8(b). The temperature class (T Code) ~~Identification numbers~~ marked on equipment nameplates shall be in accordance with Table 500-~~8~~7(b). Equipment ~~that is approved~~ for Class I and Class II shall be marked with the maximum safe operating temperature, as determined by simultaneous exposure to the combinations of Class I and Class II conditions.

FPN: Since there is no consistent relationship between explosion properties and ignition temperature, the two are independent requirements.

Table 500-8(b) Classification of Maximum Surface Temperature

Maximum Temperature ºC	ºF	~~Identification Number~~ Temperature Class (T Code)
450	842	T1
300	572	T2
280	536	T2A
260	500	T2B
230	446	T2C
215	419	T2D
200	392	T3
180	356	T3A
165	329	T3B
160	320	T3C
135	275	T4
120	248	T4A
100	212	T5
85	185	T6

(c) Temperature

(1) Class I Temperature. The temperature marking specified in (b) shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

FPN: For information regarding ignition temperatures of gases and vapors, see Recommended Practice for the Classification of flammable gases, etc. and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997.

(2) Class II Temperature. ~~[500-5 (f)]~~The temperature marking specified in (b) shall be less than the ignition temperature of the specific dust to be encountered. For organic dusts that may dehydrate or carbonize, the temperature marking shall not exceed the lower of either the ignition temperature or 165ºC (329ºF).

FPN: See Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997, for minimum ignition temperatures of specific dusts.

The ignition temperature for which equipment was approved prior to this requirement shall be assumed to be as shown in Table 500-~~85~~(c)(2).

Table 500-~~85~~(c) (2)

Class II Group	Equipment that Is Not Subject to Overloading		Equipment (Such as Motors or Power Transformers) that May Be Overloaded			
			Normal Operation		Abnormal Operation	
	ºC	ºF	ºC	ºF	ºC	ºF
E	200	392	200	392	200	392
F	200	392	150	302	200	392
G	165	329	120	248	165	329

(d) Threading. All threaded conduit ~~or fittings~~ referred to herein shall be threaded with an National (American) Standard Pipe Taper (NPT) standard conduit cutting die that provides a taper of 1 in 16 (3/4-in. taper per foot). Such conduit shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof or flameproof integrity of the conduit system where applicable. Equipment provided with threaded entries for field wiring connections shall be installed in accordance with (1) or (2).

~~(1)~~**(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings.** For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.

FPN: Thread form~~ing~~ specifications for NPT threads are located in Pipe Threads, General Purpose (Inch), ANSI/ASME B1.20.1-1983.

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in Metric Screw Threads, ISO 965/1-1980, and Metric Screw Threads, ISO 965/3-1980.

(e) Fiber Optic Cable Assembly. Where a fiber optic cable assembly contains conductors that are capable of carrying current, the fiber optic cable assembly shall be installed in accordance with the requirements of Articles 500, 501, 502, or 503, as applicable.

500-9. Specific Occupancies. Articles 510 through 517 cover garages, aircraft hangars, gasoline dispensing and service stations, bulk storage plants, spray application, dipping and coating processes, and health care facilities.

PANEL STATEMENT: The action on this Comment, which is a rewrite of Article 500, incorporates all applicable panel actions on Comments 14-1 through 14-42, and 14-105, with the exception of Comment 14-3.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
COMMENT ON AFFIRMATIVE:
BRIESCH: Editorial Correction. In Section 500-8(d) in the parentheses at the end of the first sentence add "3/4" so that it reads "(3/4 in. taper per foot)." This was accepted by the panel action on comment 14-29 and was inadvertently deleted.
COOK: I agree with the reorganization of Article 500 and most of the actions taken by the panel. I do not support action on comment 14-51 and expressed the negative on that comment. I also believe that the following are typing errors:
1) page 8, Section 500-7(i), reference should be 501-6(b)(1)(b),
2) page 12, Section 500-8(d), should read; .....taper of 1 in 16 (3/4-in. taper per foot).

In Section 500-2, the definition of "Nonincendive Component", strike the words "shall be" that are between mechanism and constructed so that the definition does not contain a requirement. (to comply with style manual)
In Section 500-5(d), last sentence, change "specified in (a) and (b)" to "specified in (1) and (2)". (editorial).
In Section 500-8(a)(1), third sentence, change "specified in Section 500-8(2)" to "specified in Section 500-8(c)(2)". (editorial).
GOODMAN: Panel members Mr. Briesch, Mr. Cook, Mr. Jagunich, and Mr. O'Meara have identified typographical, syntax, cross-reference, structure, and other minor errors in the section. I support the correction of these items as "editorial" by the Panel Chair and NFPA staff, provided no changes are made to the content of the effected sections.
JAGUNICH: The definition of "Nonincendive Component" is so worded as to contain a requirement. Strike the words, "shall be", so that the definition reads as a definition.
OMEARA: See my explanation of vote on Comment 14-10. Also, recommend making editorial changes (corrections) to this rewrite of Article 500 as follows:
500-5(d): In the last sentence change, "...specified in (a) and (b)" to "...specified in (1) and (2)."
500-7(i) Change, "... as described in Section 501-6(b)(1)(2)" to "... as described in Section 501-6(b)(1)(b)."
500-8(a)(1): In the third sentence change, "... that specified in Section 500-8(2)" to "... that specified in Section 500-8(c)(2)."
Table 500-8(b). Delete lined thru "identification Number" in column heading.
500-8(d). Add "3/4" in the first sentence so that it reads, "... provides a taper of 1 in. 16 (3/4 in. taper per foot)."
SABAN: 1) I have stated that purged and pressurized equipment, control enclosures are not being maintained in the field, and that since type of pressurization I have made statements at every panel meeting that this technique is not more safe since it got into the code only to save money.
a. Maybe add wording... for further information see NFPA 70B
2) Pressurized and purged shall be identified "The draft looked good."

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #141a)

1- 177 - (500-2 and 505-2): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 14-4a
RECOMMENDATION: The Technical Correlating Committee directs that this Proposal be reconsidered and directs the Code-Making Panel to use the definition currently in Article 100.
The Technical Correlating Committee further directs that this Proposal be referred to Code-Making Panel 1 for action relative to the elimination of the existing Fine Print Note in the definition of "Identified" because the Fine Print Note contains permissive language and is not permitted by the NEC Style Manual. This action will be considered by Code-Making Panels 1 and 14 as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Revise the Fine Print Note as follows:
FPN: Some examples of ways to determine suitability of equipment for a specific purpose, environment, or application include investigations by a qualified testing laboratory (listing and labeling), an inspection agency, or other organizations concerned with product evaluation.
PANEL STATEMENT: The panel accepts the direction to reconsider the deletion of the FPN proposal.
This revision removes the permissive language while still providing much needed explanatory information. FPNs are informative in nature, and nothing in the definition of "Identified" precludes an AHJ from approving a product on the basis of other evidence acceptable to that AHJ. See definition of "Approved."
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
PRICHARD: Elimination of the fine print note would remove an incomplete list of examples of ways to determine suitability of equipment. The incomplete list implies a limitation to only those ways in the list.

14- 13 - (500-2, 505-2): Accept
SUBMITTER: William T. Fiske, Intertek Testing Services
COMMENT ON PROPOSAL NO: 14-4a
RECOMMENDATION: Proposal should be rejected.
SUBSTANTIATION: As noted by the technical correlating committee, placing permissive language in a fine print note is not allowed by the Style Manual. In addition to the Technical Correlating Committee's comment, we note that the Style Manual does not allow definitions to contain requirements, yet that is the effect of the fine print note as written.
PANEL ACTION: Accept.
PANEL STATEMENT: The Panel agrees with the comment.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #481)

14- 14 - (500-2): Accept in Principle
SUBMITTER: William T. Fiske, Intertek Testing Services
COMMENT ON PROPOSAL NO: 14-6
RECOMMENDATION: Panel should reject the proposal.
SUBSTANTIATION: Proposed definition is over broad and unenforceable. Proper use of battery-operated equipment would be better addressed by work practices than by adding material to the NEC that is outside its scope.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The commenter's request was to remove battery-powered equipment from the definition. This was accomplished by the action on Comment 14-10.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #613)

14- 15 - (500-2 and 502-2): Reject
SUBMITTER: Glenn W. Zieseniss, Crown Point, IN
COMMENT ON PROPOSAL NO: 14-4a
RECOMMENDATION: This proposal should remain "accept."
SUBSTANTIATION: This is a step to help an Authority Having Jurisdiction who do not have ways to evaluate cables etc. for hazardous locations.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel was directed by the Technical Correlating Committee to delete a definition that conflicted with one in Article 100. The commenter is directed to Comment 14-19 and is further advised that other Code provisions require that cables used in hazardous (classified) locations be listed.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #873a)

14- 16 - (500-2and 505-2 Identified): Reject
SUBMITTER: Robert B. Alexander, Fluor Daniel
COMMENT ON PROPOSAL NO: 14-4a
RECOMMENDATION: Relocate the proposed definition to Article 100.
SUBSTANTIATION: The original proposal only recommends a revised fine print note rather than a change to the fundamental definition. While it may not say so or be the actual intent, the current fine print note in Article 100 strongly implies that listing and labeling are the exclusive methods of identifying acceptable equipment. This proposed fine print note indicates other appropriate methods that are of value throughout the NEC and not just within the scope of Code-Making Panel 14.
Since the Technical Correlating Committee has forwarded the original proposal to CMP 1, I believe there is sufficient public review to warrant the recommended relocation.
PANEL ACTION: Reject.
PANEL STATEMENT: See action on Comment 14-19.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #874)

14- 17 - (500-2 and 505-2 Nonhazardous Locations): Reject
SUBMITTER: Robert B. Alexander, Fluor Daniel
COMMENT ON PROPOSAL NO: 14-2a
RECOMMENDATION: Revise new definition of "Nonhazardous Locations" as follows:

~~Nonhazardous~~ Nonclassified Locations. Locations that, by inspection, are not required to ~~have been~~ be evaluated by the process defined in 500.5(A) or 505.5(A).

Revise the following uses of "nonhazardous" to "nonclassified:"
500.8(A)(6) FPN No. 2
501.4(B)(3)
504.60 [two places]

SUBSTANTIATION: As the submitter of Proposal 14-23 noted: "The term nonhazardous infers that the area has "no" hazards...".

Even with the term defined, it is not consistent with how it is used in the rest of the NEC including those uses in the scope of CMP 14. "Unclassified" now implies rigorous evaluation. This definition recognizes that some locations may be quickly evaluated (in this case "not classified") by inspection without implying that other hazards are not potentially present.

The term "nonhazardous" is used in places outside the scope of CMP 14; however in those cases the term indeed implies "free from hazard" rather than "nonclassified" or "unclassified".

In the three cases cited, the location may have been determined "by inspection".
PANEL ACTION: Reject.
PANEL STATEMENT: The issue raised by this comment has been addressed by the action on Comment 14-26.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #1003)

14- 18 - (500-2): Accept in Principle
SUBMITTER: Craig M. Wellman, Newark, DE
COMMENT ON PROPOSAL NO: 14-6
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: The proposal raises several issues that require extensive study. Are electronic watches and hearing aids which are unlisted not acceptable? If they are not, what does the panel expect users to do? If they are, what is the basis and how about key fobs, cell phones, insulin pumps, etc.

An ad hoc committee is investigating the hazards posed by consumer electronic devices for which the manufacturers have no incentive to seek approval but which are or may be used in classified areas. These are devices which may be worn on the body or carried into a classified area. Where listed products can meet the need, no study is needed, but where they are not available, users have a problem. A report and proposal should be available by the next code cycle but cannot be provided at this time.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The commenter's request was to remove battery-powered equipment from the definition. This was accomplished by the action on Comment 14-10.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #1134)

14- 19 - (500-2 and 505-2): Accept in Principle
SUBMITTER: A.W. Ballard, Crouse-Hinds
COMMENT ON PROPOSAL NO: 14-4a
RECOMMENDATION: Delete definition. Revise and relocate fine print note as bold text under 500-8(a)(1) as follows:

"suitability of identified equipment shall be determined by:
1.
2.
3."

SUBSTANTIATION: Does not repeat the definition of "identified". Makes the means of identification mandatory.
PANEL ACTION: Accept in Principle.
Delete the definition of "Identified" and add the following sentence to 500-8(a)(1):

"Suitability of identified equipment shall be determined by:
1. equipment listing or labeling, or
2. evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation, or
3. evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment."

PANEL STATEMENT: The panel action specifically indicates the means by which suitability in hazardous locations is determined and deletes the definition, as was directed by the Technical Correlating Committee.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
COMMENT ON AFFIRMATIVE:
KUCZKA: It is NEMA's understanding that the "evidence" in item #3 is based on compliance with applicable National Standards.
SABAN: (a), (b), and (b) below all pertain to the word "Identified":
(a) Pressurized and purged not working correctly in field...
(b) Owner's judgement.... [send owner to 90-4]
(c) Draft looks okay.

(Log #1337)

14- 20 - (500-2): Reject
SUBMITTER: John J. Kowal, Webster, NY
COMMENT ON PROPOSAL NO: 14-2a
RECOMMENDATION: Delete following text:

500-2 Definitions
FPN 3: - Other evidence acceptable to the authority having jurisdiction such as a manufacturer's self evaluation or an owner's engineering judgment.

SUBSTANTIATION: Self evaluation or owner's engineering "judgment" is a loosely defined criteria for safety issues. Article 100 definitions for labeled and listed is more definitive along with the FPN as it appears in 1999 version NFPA 70.
PANEL ACTION: Reject.
PANEL STATEMENT: See Comment 14-19. This information is needed and does not adversely affect safety.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
COMMENT ON AFFIRMATIVE:
COOK: Panel statement should read "see Comment 14-19" not "see Comment 14-10."
OMEARA: Panel statement should read: "See Comment 14-19. This information is needed...".
SABAN: See my affirmative comment on Comment 14-19.

(Log #2189)

14- 21 - (500-2 and 505-2): Reject
SUBMITTER: Mark Goodman, BP (ARCO)
COMMENT ON PROPOSAL NO: 14-4a
RECOMMENDATION: This comment supports the inclusion of the definition and fine print note for the term "Identified" in Article 500. (A parallel comment is also being submitted to Panel 1 in accordance with Technical Correlating Committee direction for Panel 1 consideration.) Modification of the wording of the FPN to remove the permissive language in accordance with the style manual is also recommended as follows:

"FPN: The determination of the suitability of equipment for a specific purpose, environment, or application can be made by several means such as:
1. equipment listing or labeling
2. evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation, or
3. Other evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment.
(See definitions of Labeled and Listed)"

SUBSTANTIATION: The definition for the term "identified" included in the Article 500 and 505 rewrite is identical to the current definition in Article 100. The fine print note has been modified to provide additional guidance for several of the methods commonly used to determine suitability of equipment in classified locations.
PANEL ACTION: Reject.
PANEL STATEMENT: The action and statement to Comment 14-19 explain the reasons for rejecting this comment.

(Log #875)

14- 23 - (500-2-Unclassified and 505-2): Reject
SUBMITTER: Robert B. Alexander, Fluor Daniel
COMMENT ON PROPOSAL NO: 14-2a
RECOMMENDATION: Revise the definition of "unclassified" as follows:
Unclassified Locations. Locations <u>adjacent or proximate to classified locations</u> that have been evaluated by the classification process defined in 500.5(A) or 505.5(A) and determined to be neither Class I, ~~Division 1; Class I, Division 2; Class I Zone 0; Class I, Zone 1; Class I, Zone 2;~~ Class II, ~~Division 1; Class II, Division 2;~~ or Class III <u>locations,</u> ~~Division 1; Class III, Division 2;~~ or any combination thereof.
Revise the following uses of "nonhazardous" to "unclassified."
500.5(A)(2)(3) FPN No. 2
500.5(B)(2) FPN No. 1
SUBSTANTIATION: "Division" or "Zone" implies that an area has been "classified."
The new definition implies that unclassified locations have been evaluated under rigorous techniques as opposed to being evaluated "by inspection." Only areas near classified locations need such evaluation.
The two references cited imply that a rigorous evaluation has been made.
PANEL ACTION: Reject.
PANEL STATEMENT: The issue raised by this comment has been addressed by the action on Comment 14-26.

(Log #684)

14- 27 - (500-3(b)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 14-9
RECOMMENDATION: This proposal should be accepted, at least in principle.
SUBSTANTIATION: This proposal does not attempt to establish area classification criteria, as stated in the panel comment. Does the present text iterate what must be "documented"? Does it mean establishment of the extent and classification of potentially hazardous areas (where hazardous materials are present, it is also important to document the limits of classified areas to avoid unnecessary costs)? Does it mean that there must be a set of plans and specifications for the installation? The present language is unenforceably vague, and the proposed change or similar language should be adopted.

PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation for neither the original proposal nor for the comment are sufficient to support such a sweeping change in documentation of area classification.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
COMMENT ON AFFIRMATIVE:
SABAN: Is owner's judgement as stated?

(Log #913)

14- 28 - (500-3(b)): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
COMMENT ON PROPOSAL NO: 14-9
RECOMMENDATION: As a replacement for this proposal, add the following after "properly documented.":
"This documentation shall define the extent of the classified location and the class, division, NEC group and "T" number or autoignition temperature of the classified location."
SUBSTANTIATION: This comment adds the basic requirements for a complete definition of the classification.
An IEEE paper, PCIC-93-01, which presented a survey of area classification industry practice, indicated that only 25% of the survey respondents included "T" numbers or autoignition temperature in their area classification documentation. This addition would define a complete description of classification.
PANEL ACTION: Reject.

COMMENT ON AFFIRMATIVE:
SABAN: Is owner's judgement as stated?

(Log #142)

14- 29 - (500-3(d) and 500-5(a)(2)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 14-10
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the Technical Correlating Committee direction to reconsider Proposal 14-10.
Revise the first sentence of 500-8(d) in the action to Comment 14-11 to read: "All threaded conduit or fittings referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) standard conduit cutting die that provides a taper of 1 in 16 (3/4-in. taper per foot)."
PANEL STATEMENT: As correctly identified in the original Proposal 14-11, the term "NPT" required identification as well as the commonly-used term "3/4 in. taper per foot". These have been included in addition to the TCC requirement for the 1 in 16 taper.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
COMMENT ON AFFIRMATIVE:
COOK: I agree with panel action, however I believe the last part of panel action should read: ... taper of 1 in 16 (3/4-in. taper per foot).
OMEARA: In last sentence of panel action, change "1" to "3/4" such that the sentence would now read: "... that provides a taper of 1 in. 16 (3/4 in. taper per foot)."

(Log #670)

14- 30 - (500-3(d) and 500-5 (a) (2)): Reject
SUBMITTER: Jack A. Gruber, Wheatland Tube Co.
COMMENT ON PROPOSAL NO: 14-10
RECOMMENDATION: The metric designators should remain as presented by the NEC Metric Conversion Task Group.
SUBSTANTIATION: The metric designators submitted for the conduit are the same ones currently listed in the 1999 NEC (346-6(b), FPN, and do not represent a change or new material. These metric designators are also currently listed in the UL Standards (6, 797, 1242) and also in the ANSI documents (C80.1, C80.3 and C80.6). These are designators and should not be an exact conversion because they are dimensionless designators. The UL and ANSI documents selected these designators because they were taken from the International Electrotechnical Commission IEC 981 which is an International Standard for Extra-Heavy Duty Rigid Steel Conduits for Electrical Installations. The metric designators should remain as presented by the NEC Metric Conversion Task Group.
The finished length of the conduit is correct at 3.05 m. It is currently produced to this length by all U.S. conduit manufacturers. The NEC Metric Conversion Task Group retained the 3.05 m due to current industry practice and the finished conduit length should remain as presented by the NEC Metric Conversion Task Group.
The Metric Screw Threads in ISO 365 are true metric threads. However, all threaded domestic conduit is threaded to the ANSI/ASME B1.20.1 Standard for Pipe Threads, General Purpose (inch) and these inch-pound units have been soft converted to metric values in IEC 981 and have also been incorporated into the UL documents (UL 6, UL 797 and UL 1242, as well as the ANSI C80 documents (C80.1, C80.3 and C80.6). The IEC 981 International Standard for Extra-Heavy Duty Rigid Steel Conduits for Electrical Installations should also be referenced in the FPN as the standard to which all domestic conduit is threaded. The NEC Metric Conversion Task Group discussed this issue and the US Conduit threads are produced in conformance to the ANSI/ASME B 1.20.1 and the IEC 981 Standards.
PANEL ACTION: Reject.
PANEL STATEMENT: The referenced sections in Proposal 14-10 and in this comment do not contain metric designators.

(Log #1019)

14- 39 - (500-4(f)(4), FPN): Accept in Principle
SUBMITTER: Nicholas Ludlam, Factory Mutual Research
COMMENT ON PROPOSAL NO: 14-31
RECOMMENDATION: I accept the panel proposal, but the references to ISA S12.12.01:1994 is incorrect.
FPN: Conditions are described in ~~ISA S12.12:1994~~ ISA 12.12.01:2000 Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations.
SUBSTANTIATION: ISA 12.12.01:2000 is in the process of being published. ISA has dropped the "S" from the front of all of their standards, and have reformatted the numbers.
PANEL ACTION: Accept in Principle.
Insert the correct designation and most recent revision date for this document at the time of the NFPA Annual Meeting.
PANEL STATEMENT: The panel agrees with the submitter, but can only reference the 2000 edition if this edition is published at the time of adoption of the NEC.

(Log #1936)

14- 40 - (500-5(a)(c), FPN): Reject
SUBMITTER: David Wechsler, Union Carbide Corp.
COMMENT ON PROPOSAL NO: 14-6
RECOMMENDATION: Following this paragraph add a new FPN as follows:
(a) Approval for Class and Properties ~~[500-5(c)]~~
"Equipment shall be ...exceed the maximum surface temperatures specified in Section 503-1."
FPN: Examples of ways of identifying battery powered portable or transportable device(s) as being suitable for a specific purpose, environment, or application may be determined by:
1. equipment listing or labeling;
2. evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation; or
3. other evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment.
SUBSTANTIATION: The new FPN provides needed additional clarification regarding evaluation of portable battery powered devices to enable their use within an electrically classified location. It should be noted that some portable battery powered devices such as watches, hearing aids, implanted- sub-dermal devices (such as pacemakers), etc. are considered to have a historic percent of being considered as nonincendive equipment with no documented evidence of causing a fire or explosion.
PANEL ACTION: Reject.
PANEL STATEMENT: The actions taken on Comments 14-10 and 14-19 address this issue.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #2193)

14- 41 - (500-5(a)(4)): Accept in Principle
SUBMITTER: Mark Goodman, BP (ARCO)
COMMENT ON PROPOSAL NO: 14-40
RECOMMENDATION: Replace "Nonhazardous" with "Unclassified".
SUBSTANTIATION: This comment is in support of the original proposal and substantiation.
This proposal should have been "Accept" and not "Accept in Principle". The Panel Action is contrary to the submitter's intent and justification. The correct term is "unclassified" and should be used consistently throughout the code sections to avoid confusion and misapplication.
PANEL ACTION: Accept in Principle.
The text in question has been deleted. The term, therefore, does not exist.
PANEL STATEMENT: The panel agrees with this comment, but the text no longer exists.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #867)

14- 42 - (500-8(d)(2), FPN): Accept in Principle
SUBMITTER: Steven Blais, EGS Electrical Group
COMMENT ON PROPOSAL NO: 14-2a
RECOMMENDATION: Revise Section 500-8(d)(2) FPN to read:
"NPT Thread Construction Specifications are located in...".
SUBSTANTIATION: Fine print note implies any thread to the ANSI/ASME B1.20 1-1983 Standard are suitable. This is not entirely true. The ANSI Standard only governs the "construction" of the threads not what the L_1 Tolerance should be. Manufacturers are aware of the proper tolerance to obtain required fit. Where field threading is encountered, it should be done in accordance to manufacturers' instructions.
PANEL ACTION: Accept in Principle.
Change the Fine Print Note to 500-8(d)(1) (see Comment 14-11) to read: "Thread form specifications for NPT threads are located in Pipe Threads, General Purpose (Inch), ANSI/ASME B1.20.1-1983."
PANEL STATEMENT: The panel action satisfies the intent of the submitter. The paragraph reference is the new number according to the Article 500 rewrite.

ARTICLE 501 — CLASS I LOCATIONS

(Log #143)

14- 43 - (501): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 14-59
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the Technical Correlating Committee direction to reconsider Proposal 14-59. The original Proposal 14-59 is accepted in principle with the following changes (all section numbers are 1999 NEC):
-In Section 501-5(a)(1), change "2 in." to "(b) the entry is metric designator 53 (trade size 2) or larger"
-In Section 501-5(a)(4), change "10 ft (3.05m)" to "3.05m (10 ft.)"
-In Section 501-5(b)(2), change "10 ft. (3.05m)" to "3.05m (10 ft.)"
PANEL STATEMENT: The revised text provides more consistent use of metric units from Article 500 through 516 and consistency with CMP-8 action on conduit. CMP-14 recognizes that some changes involve extracted material, however changes were made based on Standards Council direction provided at their October 6, 2000 meeting.

(Log #144)

14- 44 - (501): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 14-59a
RECOMMENDATION: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. Further, it was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel, with further consideration given to the comments expressed in the voting, specifically with respect to comments that the accepted Proposal does not accurately reflect what was agreed upon by the Panel. It is the understanding of the Technical Correlating Committee that this proposal is modified by Proposals 14-61, 14-62, 14-64, 14-66, 14-67, 14-68, 14-69, 14-70, 14-71, 14-72, 14-75, 14-77, 14-92, 14-93, 14-94, 14-95, 14-96, 14-98, 14-100, 14-101, 14-102, 14-103, 14-106, 14-107, 14-108, 14-109, 14-110, 14-111, 14-116, 14-117, 14-118, 14-119, 14-130, 14-131, 14-132, 14-133, 14-134, 14-135, 14-140, 14-141, 14-142, 14-143, 14-144, 14-145, 14-146, 14-147, 14-149, 14-150, 14-151, 14-152, 14-153, 14-154, 14-155, 14-156, 14-157, 14-158, 14-162, 14-164, 14-165, 14-166, 14-168, 14-169, 14-170, 14-171, 14-172, 14-174, 14-175, 14-178, 14-179, 14-184, 14-185, 14-186, 14-187, 14-194, 14-195, 14-196, and 14-197. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
PANEL STATEMENT: See action on Comment 14-48.

AFFIRMATIVE: 14

(Log #1393)

14- 46 - (501): Accept in Principle
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 14-59a
RECOMMENDATION: Use the rewrite from Mr. Wechsler's ballot as stated in the balloting comments for this proposal, as starting textual basis for all actions on public comments to Article 501 proposals.
SUBSTANTIATION: As stated under the balloting comments of the Panel 14 committee, due to the errors that the Committee felt existed with the presented rewrite texts, that are corrected by the rewrite addressed by the Wechsler submitted ballot, this "Wechsler" rewrite should be the starting textual basis for Panel actions.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See action on Comment 14-48.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #1947)

14- 47 - (501): Reject
SUBMITTER: David Wechsler, Union Carbide Corp.
COMMENT ON PROPOSAL NO: 14-59a
RECOMMENDATION: Replace "identified" with the prior NEC wording.
SUBSTANTIATION: The proposed definition for "identified" contains an important FPN that is fundamental to the entire reason for having this definition. This definition also differs from the Article 100 definition. It was the action of the Technical Correlating Committee that the Article 100 definition be used and that the FPN be eliminated since it contains permissive language that is not permitted by the NEC Style Manual. With the elimination of this definition, the text must be reverted to that of the current code.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel has concluded that the correct terms are now being used.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

(Log #2230)

14- 48 - (501): Accept in Principle
Note: The Technical Correlating Committee directs that 501-5(a)(1)(1) and (b) be shown in list format.
The Technical Correlating Committee directs that 501-5(a)(1) Exception be revised to read as follows: "Exception to 501-5(a)(1)(a) Seals shall not be required for conduit entering…".
Move "d. In nonincendive circuits" up following "c."
Move the paragraph shown under the Exception that begins with "Factory-sealed enclosures…" out of the Exception and make it regular text under 501-5(a)(1) as it existed in the 1999 NEC
The Technical Correlating Committee directs that in Section 501-5(d)(1) of the Panel Action, third sentence, the word "aluminum" be changed to "metallic" to provide correlation with the revision made in Section 501-4(a)(1)(c) in accordance with Proposal 14-78.
The Technical Correlating Committee directs that the 501-5(e)(4), FPN be deleted because it contains permissive language.
The Technical Correlating Committee directsthat the last paragraph of 501-8(a) be revised to read as follows: "Totally enclosed motors of the types specified in 501-8(a)(2) or (3) shall have no external surface…" to provide clarity
SUBMITTER: James D. Cospolich, Waldemar S. Nelson & Co., Inc.
COMMENT ON PROPOSAL NO: 14-59a
RECOMMENDATION: Please see the following revised text which represents what I believe to be the correct wording that Code Making Panel 14 voted on and accepted during the January 2000 ROP meeting. The shaded wording represents what I consider to be revisions and corrections. Some of this shaded wording is very important for the technical accuracy and intent of the article.

ARTICLE 501 -- Class I Locations

501-1. General. The general rules of this Code shall apply to the electric wiring and equipment in locations classified as Class I in Section 500-~~75~~.

Equipment listed and marked in accordance with Section 505-10 for use in Class I, Zone 0, 1, or 2 locations shall be permitted in Class I, Division 2 locations for the same gas and with a suitable temperature ~~rating~~classification.
Exception: As modified by this article.

501-2. Transformers and Capacitors

(a) Class I, Division 1. In Class I, Division 1 locations, transformers and capacitors shall comply with the following.

(1) Containing Liquid that Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed only in ~~approved~~ [14-61,14-62]vaults that comply with Sections 450-41 through 450-48, and, in addition,

a. There shall be no door or other communicating opening between the vault and the Division 1 location, and
b. Ample ventilation shall be provided for the continuous removal of flammable gases or vapors, and
c. Vent openings or ducts shall lead to a safe location outside of buildings, and
d. Vent ducts and openings shall be of sufficient area to relieve explosion pressures within the vault, and all portions of vent ducts within the buildings shall be of reinforced concrete construction.

(2) Not Containing Liquid that Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with (a)(1) or be approved for Class I locations.

(b) Class I, Division 2. In Class I, Division 2 locations, transformers and capacitors shall comply with Sections 450-21 through 450-27.

501-3. Meters, Instruments, and Relays

(a) Class I, Division 1. In Class I, Division 1 locations, meters, instruments, and relays, including kilowatt-hour meters, instrument transformers, resistors, rectifiers, and thermionic tubes, shall be provided with enclosures approved for Class I, Division 1 locations. Enclosures ~~approved~~ [14-66] for Class I, Division 1 locations include explosionproof enclosures and purged and pressurized enclosures.

FPN: See Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

(b) Class I, Division 2. In Class I, Division 2 locations, meters, instruments, and relays shall comply with the following.

(1) Contacts. Switches, circuit breakers, and make-and-break contacts of pushbuttons, relays, alarm bells, and horns shall have enclosures approved [14-67,14-68] for Class I, Division 1 locations in accordance with Section 501-3(a).

Exception: General-purpose enclosures shall be permitted, if current-interrupting contacts are
a. Immersed in oil, or
b. Enclosed within a chamber that is hermetically sealed against the entrance of gases or vapors, or
c. In nonincendive circuits, or
d. Part of a listed nonincendive component.

(2) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment that are used in or in connection with meters, instruments, and relays shall comply with Section 501-3(a).
Exception: General-purpose–type enclosures shall be permitted if such equipment is without make-and-break or sliding contacts [other than as provided in (b)(1)] and if the maximum operating temperature of any exposed surface will not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved or has been tested and found incapable of igniting the gas or vapor. This exception shall not apply to thermionic tubes.

(3) Without Make-or-Break Contacts. Transformer windings, impedance coils, solenoids, and other windings that do not incorporate sliding or make-or-break contacts shall be provided with enclosures. General-purpose–type enclosures shall be permitted.

(4) General-Purpose Assemblies. Where an assembly is made up of components for which general-purpose enclosures are acceptable as provided in (b)(1), (b)(2), and (b)(3), a single general-purpose enclosure shall be acceptable for the assembly. Where such an assembly includes any of the equipment described in (b)(2), the maximum obtainable surface temperature of any component of the assembly shall be clearly and permanently indicated on the outside of the enclosure. Alternatively, ~~approved~~ [14-69,14-70] equipment shall be permitted to be marked to indicate the temperature ~~range~~class~~-~~ for which it is suitable, using the temperature class (T Code)~~identification numbers~~ of Table 500-8 (b)~~5(d)~~.

(5) Fuses. Where general-purpose enclosures are permitted in (b)(1), (b)(2), (b)(3), and (b)(4), fuses for overcurrent protection of instrument circuits not subject to overloading in normal use shall be permitted to be mounted in general-purpose enclosures if each such fuse is preceded by a switch complying with (b)(1).

(6) Connections. To facilitate replacements, process control instruments shall be permitted to be connected through flexible cord, attachment plug, and receptacle, provided the following:

1. A switch complying with (b)(1) is provided so that the attachment plug is not depended on to interrupt current; and
2. The current does not exceed 3 amperes at 120 volts, nominal; and
3. The power-supply cord does not exceed 3 ft (914 mm), is of a type listed ~~approved~~[14-71,14-72]~~-~~for extra-hard usage or for hard usage if protected by location, and is supplied through an attachment plug and receptacle of the locking and grounding type; and
4. Only necessary receptacles are provided; and
5. The receptacle carries a label warning against unplugging under load.

501-4. Wiring Methods. Wiring methods shall comply with (a) or (b). [14-73, 14-75,14-76,14-79]

(a) Class I, Division 1.
(1) In Class I, Division 1 locations, the following wiring methods shall be permitted:

a) Threaded rigid metal conduit or threaded steel intermediate metal conduit. Threaded joints shall be made up with at least five threads fully engaged.

Exception No. 1: Rigid nonmetallic conduit complying with Article 347 shall be permitted where encased in a concrete envelope a minimum of 2 in. (50.8 mm) thick and provided with not less than 24 in. (610 mm) of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of Section 511-4, Exception; 514-8, Exception No. 2; and Section 515-5(a). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 24 in. (610 mm) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.

b) Type MI cable with termination fittings approved for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings. [14-77]

c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation Type MC-HL cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated metallic (14-78) sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application.
FPN: See Sections 334-3 and 334-4 for restrictions on use of Type MC cable.

d) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type ITC-HL cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application.

(2) Where necessary to employ flexible connections, as at motor terminals, flexible fittings listed for Class I, Division 1 locations or flexible cord in accordance with the provisions of Section 501-11 shall be permitted.

(3) All boxes, fittings, and joints shall be ~~approved~~ listed for Class I, Division 1.

(b) Class I, Division 2.
(1) In Class I, Division 2 locations, the following wiring methods shall be permitted: [14-83,14-86,14-87]

a) All wiring methods permitted in Article 501-4(a).
b) Threaded rigid metal conduit, threaded steel intermediate metal conduit,
~~b~~c) Enclosed gasketed busways, enclosed gasketed wireways,
~~c~~d) Type PLTC cable in accordance with the provisions of Article 725, or in cable tray systems. PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.
~~d~~e) Type ITC cable in cable trays, in raceways, supported by messenger wire, afforded mechanical protection and run as open wiring, or directly buried where the cable is listed for this use;
~~e~~f) Type MI, MC, MV, or TC cable with -[14-79/14-80] termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings.

(2) Where provision must be made for limited flexibility, flexible metal fittings, flexible metal conduit with listed fittings, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord listed for extra-hard usage and provided with listed bushed fittings shall be used. An additional conductor for grounding shall be included in the flexible cord. [14-87, 14-80]
FPN: See Section 501-16(b) for grounding requirements where flexible conduit is used.

(3) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for nonhazardous [14-81,14-88,1401] locations, including Chapter 7 and 8 wiring methods. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). (14-83)

(4) Boxes, fittings, and joints shall not be required to be explosionproof except as required by Sections 501-3(b)(1), 501-6(b)(1), and 501-14(b)(1).

501-5. Sealing and Drainage
Seals in conduit and cable systems shall comply with (a) through (f)~~.~~ ~~Sealing compound shall be of a type approved for the conditions and use~~ (14-89,14-91). Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.

FPN No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal, and through conductors passing through the seal. See Section 501-5(e)(2). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See Section 501-5(c)(2).
FPN No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than No. 2. Special conductor constructions, e.g., compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.

(a) Conduit Seals, Class I, Division 1. In Class I, Division 1 locations, conduit seals shall be located as follows.
1. In each conduit entry into an explosionproof enclosure where either (a) the enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors, that may produce arcs, sparks, or high temperatures that are considered to be an ignition source in normal operation, or (b) the entry is 2-in. size or larger and the enclosure contains terminals, splices, or taps. For the purposes of this section high temperatures shall be considered to be any temperatures exceeding 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved.

Exception to (a)(1)(a): Conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors are
a. Enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or
b. Immersed in oil in accordance with Section 501-6(b)(1)(b), or
c. Enclosed within a factory-sealed explosionproof chamber located within the enclosure, identified ~~approved~~ [14-92, 14-93] for the location, and marked "factory sealed" or equivalent, unless the enclosure entry is 2 in. size or larger. Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal.
Conduit seals shall be installed within 18 in. (457 mm) from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and Cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.
d. In nonincendive circuits. [14-94]

2. In each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 18 in. (457 mm) from the pressurized enclosure.

FPN No. 1: Installing the seal as close as possible to the enclosure will reduce problems with purging the dead airspace in the pressurized conduit.
FPN No. 2: For further information, see Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

3. Where two or more explosionproof enclosures for which conduit seals are required under (a)(1) are connected by nipples or by runs of conduit not more than 36 in. (914 mm) long, a single conduit seal in each such nipple connection or run of conduit shall be considered sufficient if located not more than 18 in. (457 mm) from either enclosure.

4. In each conduit run leaving a Class I, Division 1 location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Division 1 portion of the conduit from being communicated to the conduit beyond the seal. Except for listed ~~approved~~ [14-95,14-96] explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 1 location.
Exception: Metal conduit containing no unions, couplings, boxes, or fittings that passes completely through a Class I, Division 1 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not require a conduit seal if the termination points of the unbroken conduit are in unclassified locations.

(b) Conduit Seals, Class I, Division 2. In Class I, Division 2 locations, conduit seals shall be located as follows.
1. For connections to enclosures that are required to be explosionproof, a conduit seal shall be provided in accordance with (a)(1)(a) and (a)(3). All portions of the conduit run or nipple between the seal and such enclosure shall comply with Section 501-4(a).
2. In each conduit run passing from a Class I, Division 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Division 2 portion of the conduit from being communicated to the conduit beyond the seal. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Division 2 location, and a threaded connection shall be used at the sealing fitting. Except for listed ~~approved~~[14-100,14-101] explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 2 location.

Exception No. 1: Metal conduit containing no unions, couplings, boxes or fittings that passes completely through a Class I, Division 2 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.

Exception No. 2: Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or open wiring shall not be required to be sealed where passing from the Class I, Division 2 location into the unclassified location. The unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The conduits shall not terminate at an enclosure containing an ignition source in normal operation.
Exception No. 3: Conduit systems passing from an enclosure or room that is unclassified as a result of pressurization into a Class I, Division 2 location shall not require a seal at the boundary.

FPN: For further information, refer to Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Class I, Division 2 location into an unclassified location if the following conditions are met:
a. No part of the conduit system segment passes through a Class I, Division I location where the conduit contains unions, couplings, boxes, or fittings within 12 in. (305 mm) of the Class I, Division 1 location; and
b. The conduit system segment is located entirely in outdoor locations; and
c. The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system; and
d. The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location; and
e. The conduit system segment is sealed at its entry to each enclosure or fitting housing terminals, splices, or taps in Class I, Division 2 locations.

(c) Class I, Divisions 1 and 2. Where required, seals in Class I, Division 1 and 2 locations shall comply with the following.
(1) Fittings. Enclosures for connections or equipment shall be provided with an approved integral means for sealing, or sealing fittings approved for Class I locations shall be used. ~~Sealing fittings shall be accessible.~~Sealing fittings shall be listed for use with one or more specific compounds and shall be accessible. (14-102,14-103,14-104, 14-105)
(2) Compound. The compound shall provide a ~~Sealing compound shall be approved and shall provide a~~ seal against passage of gas or vapors through the seal fitting, shall not be affected by the surrounding atmosphere or liquids, and shall not have a melting point of less than 93ºC (200ºF). (14-104, 14-105)
(3) Thickness of Compounds. In a completed seal, the minimum thickness of the sealing compound shall not be less than the trade size of the sealing fitting and, in no case, less than 5/8 in. (16 mm).
Exception: Listed cable sealing fittings shall not be required to have a minimum thickness equal to the trade size of the fitting.
(4) Splices and Taps. Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.
(5) Assemblies. In an assembly where equipment that may produce arcs, sparks, or high temperatures is located in a compartment separate from the compartment containing splices or taps, and an integral seal is provided where conductors pass from one compartment to the other, the entire assembly shall be identified ~~approved~~ for Class I locations. Seals in conduit connections to the compartment containing splices or taps shall be provided in Class I, Division 1 locations where required by (a)(1)(b).[14-106, 14-107]
(6) Conductor Fill. The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless it is specifically identified ~~approved~~ [14-108,14-109]-for a higher percentage of fill.

(d) Cable Seals, Class I, Division 1. In Class I, Division 1 locations, cable seals shall be located as follows.
1. Cable shall be sealed at all terminations. The sealing fitting shall comply with (c). Multiconductor Type MC-HL cables with a

gas/vaportight continuous corrugated aluminum sheath and an overall jacket of suitable polymeric material shall be sealed with an listed ~~approved~~ [14-110,14-111]-fitting after removing the jacket and any other covering so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors.
Exception: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

2. Cables in conduit with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Division 1 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor and the outer jacket.
Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered as a single conductor by sealing the cable in the conduit within 18 in. (457 mm) of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods. For shielded cables and twisted pair cables, it shall not be required to remove the shielding material or separate the twisted pair.

3. Each multiconductor cable in conduit shall be considered as a single conductor if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with (a).

(e) Cable Seals, Class I, Division 2. In Class I, Division 2 locations, cable seals shall be located as follows.
1. Cables entering enclosures that are required to be explosionproof ~~approved for Class I locations~~ [14-116,14-118]shall be sealed at the point of entrance. The sealing fitting shall comply with (b)(1). Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in an listed ~~approved~~ [14-117,14-119]-fitting in the Division 2 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors. Multiconductor cables in conduit shall be sealed as described in (d).
Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Class I, Division 2 location shall not require a seal at the boundary.
Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

2. Cables with a gas/vaportight continuous sheath and that will not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in (e)(1). The minimum length of such cable run shall not be less than that length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings [0.007 ft3/hour (198 cm3/hour) of air at a pressure of 6 in. of water (1493 pascals)].
FPN No. 1: See Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations, ANSI/UL 886-1994.
FPN No. 2: The cable core does not include the interstices of the conductor strands.

3. Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall not be required to be sealed except as required in (e)(1), unless the cable is attached to process equipment or devices that may cause a pressure in excess of 6 in. of water (1493 pascals) to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified area.
Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, Division 2 location without seals.

4. Cables that do not have gas/vaportight continuous sheath shall be sealed at the boundary of the Division 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.
FPN: The sheath mentioned in (d) and (e) may be either metal or a nonmetallic material.

(f) Drainage.
(1) Control Equipment. Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.

(2) Motors and Generators. Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize entrance of liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.

(3) Canned Pumps, Process or Service Connections, etc. For canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the electrical raceway or cable system capable of transmitting fluids, an additional approved seal, barrier, or other means shall be provided to prevent the flammable or combustible fluid from entering the raceway or cable system capable of transmitting fluids beyond the additional devices or means, if the primary seal fails. The additional approved seal or barrier and the interconnecting enclosure shall meet the temperature and pressure conditions to which they will be subjected upon failure of the primary seal, unless other approved means are provided to accomplish the purpose above. Drains, vents, or other devices shall be provided so that primary seal leakage will be obvious.
FPN: See also the fine print notes to Section 501-5.

501-6. Switches, Circuit Breakers, Motor Controllers, and Fuses
(a) Class I, Division 1. In Class I, Division 1 locations, switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices, shall be provided with enclosures, and the enclosure in each case, together with the enclosed apparatus, shall be identified ~~approved~~ [14-130, 14-131] -as a complete assembly for use in Class I locations.

(b) Class I, Division 2. Switches, circuit breakers, motor controllers, and fuses in Class I, Division 2 locations shall comply with the following:

(1) Type Required. Circuit breakers, motor controllers, and switches intended to interrupt current in the normal performance of the function for which they are installed shall be provided with enclosures identified ~~approved~~[14-132,14-133]- for Class I, Division 1 locations in accordance with Section 501-3(a), unless general-purpose enclosures are provided and
a. The interruption of current occurs within a chamber hermetically sealed against the entrance of gases and vapors, or
b. The current make-and-break contacts are oil-immersed and of the general-purpose type having a 2 -in. (50.8-mm) minimum immersion for power contacts and a 1 -in. (25.4-mm) minimum immersion for control contacts, or
c. The interruption of current occurs within a factory-sealed explosionproof chamber ~~approved for the location~~[14-134, 14-135], or
d. The device is a solid state, switching control without contacts, where the surface temperature does not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved.

(2) Isolating Switches. Fused or unfused disconnect and isolating switches for transformers or capacitor banks that are not intended to interrupt current in the normal performance of the function for which they are installed shall be permitted to be installed in general-purpose enclosures.

(3) Fuses. For the protection of motors, appliances, and lamps, other than as provided in (b)(4), standard plug or cartridge fuses shall be permitted, provided they are placed within enclosures identified ~~approved~~ (14-136,14-137) for the location; or fuses shall be permitted if they are within general-purpose enclosures, and if they are of a type in which the operating element is immersed in oil or other approved liquid, or the operating element is enclosed within a chamber hermetically sealed against the entrance of gases and vapors, or the fuse is a nonindicating, filled, current-limiting type.

(4) Fuses Internal to Lighting Fixtures. Approved cartridge fuses shall be permitted as supplementary protection within lighting fixtures.

501-7. Control Transformers and Resistors
Transformers, impedance coils, and resistors used as, or in conjunction with, control equipment for motors, generators, and appliances shall comply with (a) and (b).
(a) Class I, Division 1. In Class I, Division 1 locations, transformers, impedance coils, and resistors, together with any switching mechanism associated with them, shall be provided with enclosures identified ~~approved~~ [14-140,14-141]- for Class I, Division 1 locations in accordance with Section 501-3(a).

(b) Class I, Division 2. In Class I, Division 2 locations, control transformers and resistors shall comply with the following.
(1) Switching Mechanisms. Switching mechanisms used in conjunction with transformers, impedance coils, and resistors shall comply with Section 501-6(b).
(2) Coils and Windings. Enclosures for windings of transformers, solenoids, or impedance coils shall be permitted to be of the general-purpose type.
(3) Resistors. Resistors shall be provided with enclosures; and the assembly shall be identified ~~approved~~ [14-142, 14-143]- for Class I locations, unless resistance is nonvariable and maximum operating temperature, in degrees Celsius, will not exceed 80 percent of the ignition temperature of the gas or vapor involved, or has been tested and found incapable of igniting the gas or vapor.

501-8. Motors and Generators
(a) Class I, Division 1. In Class I, Division 1 locations, motors, generators, and other rotating electric machinery shall be as follows:
1. Identified ~~Approved~~[14-146,14-147]- for Class I, Division 1 locations; or
2. Of the totally enclosed type supplied with positive-pressure ventilation from a source of clean air with discharge to a safe area, so arranged to prevent energizing of the machine until ventilation has been established and the enclosure has been purged with at least 10 volumes of air, and also arranged to automatically de-energize the equipment when the air supply fails; or
3. Of the totally enclosed inert gas-filled type supplied with a suitable reliable source of inert gas for pressuring the enclosure, with devices provided to ensure a positive pressure in the enclosure and arranged to automatically de-energize the equipment when the gas supply fails; or
4. Of a type designed to be submerged in a liquid that is flammable only when vaporized and mixed with air, or in a gas or vapor at a pressure greater than atmospheric and that is flammable only when mixed with air; and the machine is arranged so to prevent energizing it until it has been purged with the liquid or gas to exclude air, and also arranged to automatically de-energize the equipment when the supply of liquid or gas or vapor fails or the pressure is reduced to atmospheric.
Totally enclosed motors of Types (2) or (3) shall have no external surface with an operating temperature in degrees Celsius in excess of 80 percent of the ignition temperature of the gas or vapor involved. Appropriate devices shall be provided to detect and automatically de-energize the motor or provide an adequate alarm if there is any increase in temperature of the motor beyond designed limits.
Auxiliary equipment shall be of a type identified ~~approved~~ [14-144,14-145]- for the location in which it is installed.
FPN: See ASTM Test Procedure, D 2155-69.

(b) Class I, Division 2. In Class I, Division 2 locations, motors, generators, and other rotating electric machinery in which are employed sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices, either while starting or while running, shall be identified ~~approved~~ [14-149, 14-151]- for Class I, Division 1 locations, unless such sliding contacts, switching mechanisms, and resistance devices are provided with enclosures approved for Class I, Division 2 locations in accordance with Section 501-3(b). The exposed surface of space heaters used to prevent condensation of moisture during shutdown periods shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved when operated at rated voltage, and the maximum surface temperature [based on a 40ºC (104ºF) ambient] shall be permanently marked on a visible nameplate mounted on the motor. Otherwise, space heaters shall be identified ~~approved~~ [14-152] for Class I, Division 2 locations.
In Class I, Division 2 locations, the installation of open or nonexplosionproof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Division 2 location, shall be permitted.
FPN No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.
FPN No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitible gases or vapors is suspected, clean-air purging may be needed immediately prior to and during start-up periods.

501-9. Lighting Fixtures
Lighting fixtures shall comply with (a) or (b).
(a) Class I, Division 1. In Class I, Division 1 locations, lighting fixtures shall comply with the following.
(1) Approved Fixtures. Each fixture shall be identified ~~approved~~ as a complete assembly for the Class I, Division 1 location and shall be clearly marked to indicate the maximum wattage of lamps for which it is identified ~~approved~~. Fixtures intended for portable use shall be specifically identified ~~approved~~ as a complete assembly for that use. [14-153,14-154]
(2) Physical Damage. Each fixture shall be protected against physical damage by a suitable guard or by location.
(3) Pendant Fixtures. Pendant fixtures shall be suspended by and supplied through threaded rigid metal conduit stems or threaded steel intermediate conduit stems, and threaded joints shall be provided with set-screws or other effective means to prevent loosening. For stems longer than 12 in. (305 mm), permanent and effective bracing against lateral displacement shall be provided at a level not more than 12 in. (305 mm) above the lower end of the stem, or flexibility in the form of a fitting or flexible connector identified ~~approved~~[14-155,14-156]- for the Class I, Division 1 location shall be provided not more than 12 in. (305 mm) from the point of attachment to the supporting box or fitting.
(4) Supports. Boxes, box assemblies, or fittings used for the support of lighting fixtures shall be identified ~~approved~~ [14-157, 14-158]- for Class I locations.

(b) Class I, Division 2. In Class I, Division 2 locations, lighting fixtures shall comply with the following~~:~~.
(1) Portable Lighting Equipment. Portable lighting equipment shall comply with (a)(1).
Exception: Where portable lighting equipment are mounted on movable stands and are connected by flexible cords, as covered in Section 501-11, they shall be permitted, where mounted in any position, if they conform to Section 501-9(b)(2).
(2) Fixed Lighting. Lighting fixtures for fixed lighting shall be protected from physical damage by suitable guards or by location. Where there is danger that falling sparks or hot metal from lamps or fixtures might ignite localized concentrations of flammable vapors or gases, suitable enclosures or other effective protective means shall be provided. Where lamps are of a size or type that may, under normal operating conditions, reach surface temperatures exceeding 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved, fixtures shall comply with (a)(1) or shall be of a type that has been tested in order to determine the marked operating temperature or temperature class~~range~~ (T Code).
(3) Pendant Fixtures. Pendant fixtures shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, or by other approved means. For rigid stems longer than 12 in. (305 mm), permanent and effective bracing against lateral displacement shall be provided at a level not more than 12 in. (305 mm) above the lower end of the stem, or flexibility in the form of an identified ~~approved~~ [14-162, 14-164]- fitting or flexible connector shall be provided not more than 12 in. (305 mm) from the point of attachment to the supporting box or fitting.
(4) Switches. Switches that are a part of an assembled fixture or of an individual lampholder shall comply with Section 501-6(b)(1).
(5) Starting Equipment. Starting and control equipment for electric-discharge lamps shall comply with Section 501-7(b).
Exception: A thermal protector potted into a thermally protected fluorescent lamp ballast if the lighting fixture is identified ~~approved~~ [14-165, 14-166]- for locations of this class and division.

501-10. Utilization Equipment
(a) Class I, Division 1. In Class I, Division 1 locations, all utilization equipment shall be approved for Class I, Division 1 locations.

(b) Class I, Division 2. In Class I, Division 2 locations, all utilization equipment shall comply with the following.
(1) Heaters. Electrically heated utilization equipment shall conform with either item (a) or (b).
a. The heater shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved on any surface that is exposed to the gas or vapor when continuously energized at the maximum rated ambient

temperature. If a temperature controller is not provided, these conditions shall apply when the heater is operated at 120 percent of rated voltage.

Exception No. 1: For motor-mounted anticondensation space heaters, see Section 501-8(b).

Exception No. 2: A current-limiting device is applied to the circuit serving the heater that will limit the current in the heater to a value less than that required to raise the heater surface temperature to 80 percent of the ignition temperature.

b. The heater shall be identified ~~approved~~ [14-169, 14-170] for Class I, Division 1 locations.
Exception: Electrical resistance heat tracing identified ~~approved~~ [14-171, 14-172] for Class I, Division 2 locations.

(2) Motors. Motors of motor-driven utilization equipment shall comply with Section 501-8(b).

(3) Switches, Circuit Breakers, and Fuses. Switches, circuit breakers, and fuses shall comply with Section 501-6(b).

501-11. Flexible Cords, Class I, Divisions 1 and 2
A flexible cord shall be permitted for connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit. Flexible cord shall also be permitted for that portion of the circuit where the fixed wiring methods of Section 501-4(a) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment, in an industrial establishment where conditions of maintenance and engineering supervision ensure that only qualified persons will install and service the installation, and the flexible cord is protected by location or by a suitable guard from damage. The length of the flexible cord shall be continuous. Where flexible cords are used, the cords shall be as follows:
1. Of a type listed ~~approved~~ [14-174,14-175] for extra-hard usage;
2. Contain, in addition to the conductors of the circuit, a grounding conductor complying with Section 400-23;
3. Connected to terminals or to supply conductors in an approved manner;
4. Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections; and
5. Be provided with suitable seals where the flexible cord enters boxes, fittings, or enclosures of the explosionproof type.
Exception: As provided in Sections 501-3(b)(6) and 501-4(b).
Electric submersible pumps with means for removal without entering the wet-pit shall be considered portable utilization equipment. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be permitted.
Electric mixers intended for travel into and out of open-type mixing tanks or vats shall be considered portable utilization equipment.
FPN: See Section 501-13 for flexible cords exposed to liquids having a deleterious effect on the conductor insulation.

501-12. Receptacles and Attachment Plugs, Class I, Divisions 1 and 2
Receptacles and attachment plugs shall be of the type providing for connection to the grounding conductor of a flexible cord and shall be identified ~~approved~~ [14-178,14-179] for the location.
Exception: As provided in Section 501-3(b)(6).

501-13. Conductor Insulation, Class I, Divisions 1 and 2
Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type approved for use under such conditions; or the insulation shall be protected by a sheath of lead or by other approved means.

501-14. Signaling, Alarm, Remote-Control, and Communications Systems
(a) Class I, Division 1. In Class I, Division 1 locations, all apparatus and equipment of signaling, alarm, remote-control, and communications systems, regardless of voltage, shall be identified ~~approved~~ [14-184,14-185] for Class I, Division 1 locations, and all wiring shall comply with Sections 501-4(a) and 501-5(a) and (c).

(b) Class I, Division 2. In Class I, Division 2 locations, signaling, alarm, remote-control, and communications systems shall comply with the following.
(1) Contacts. Switches, circuit breakers, and make-and-break contacts of pushbuttons, relays, alarm bells, and horns shall have enclosures identified ~~approved~~ [14-186,14-187] for Class I, Division 1 locations in accordance with Section 501-3(a).
Exception: General-purpose enclosures shall be permitted if current-interrupting contacts are one of the following:
a. Immersed in oil, or
b. Enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or
c. In nonincendive circuits, or
d. Part of a listed nonincendive component
(2) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with Section 501-3(b)(2).
(3) Protectors. Enclosures shall be provided for lightning protective devices and for fuses. Such enclosures shall be permitted to be of the general-purpose type.
(4) Wiring and Sealing. All wiring shall comply with Sections 501-4(b) and 501-5(b) and (c).

501-15. Live Parts, Class I, Divisions 1 and 2
There shall be no exposed live parts.

501-16. Grounding, Class I, Divisions 1 and 2
Wiring and equipment in Class I, Division 1 and 2 locations shall be grounded as specified in Article 250 and with the following additional requirements.
(a) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.
Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in Sections 250-32(a), (b), and (c), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.
FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.

(b) Types of Equipment Grounding Conductors. Where flexible metal conduit or liquidtight flexible metal conduit is used as permitted in Section 501-4(b) and is to be relied on to complete a sole equipment grounding path, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with Section 250-102.
Exception: In Class I, Division 2 locations, the bonding jumper shall be permitted to be deleted where all the following conditions are met.
a. Listed liquidtight flexible metal conduit 6 ft (1.83 m) or less in length, with fittings listed for grounding, is used.
b. Overcurrent protection in the circuit is limited to 10 amperes or less.
c. The load is not a power utilization load.

501-17. Surge Protection
(a) Class I, Division 1. Surge arresters, including their installation and connection, shall comply with Article 280. The surge arresters and capacitors shall be installed in enclosures identified ~~approved~~ [14-194, 14-195] for Class I, Division 1 locations. Surge-protective capacitors shall be of a type designed for specific duty.

(b) Class I, Division 2. Surge arresters shall be nonarcing, such as metal-oxide varistor (MOV), sealed type, and surge-protective capacitors shall be of a type designed for specific duty. Installation and connection shall comply with Article 280.
Enclosures shall be permitted to be of the general-purpose type.
Surge protection of types other than described above shall be installed in enclosures identified ~~approved~~ [14-196,14-197] for Class I, Division 1 locations.

501-18. Multiwire Branch Circuits
In a Class I, Division 1 location, a multiwire branch circuit shall not be permitted.
Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.
SUBSTANTIATION: During the January 2000 ROP meeting, Code Making Panel 14 was challenged with a very difficult task due to the large number of proposals that required action, the technical content of the requested revisions, and the Technical Correlating Committee formatting changes. As a result, it was very difficult for the NEC staff assigned to Code Making Panel 14 to keep up with the actions taking place. This comment's intent is to clarify what took place and make necessary revisions.

PANEL ACTION: Accept in Principle.
Revise Article 501 to read as follows:

ARTICLE 501 -- Class I Locations
[Comment 14-48]

501-1 General. The general rules of this Code shall apply to the electric wiring and equipment in locations classified as Class I in Section 500-~~7~~5. Equipment listed and marked in accordance with Section 505-9(c)(2) for use in Class I, Zone 0, 1, or 2 locations shall be permitted in Class I, Division 2 locations for the same gas and with a suitable temperature ~~rating~~class~~ification~~.

Exception: As modified by this article.

501-2 Transformers and Capacitors

(a) Class I, Division 1. In Class I, Division 1 locations, transformers and capacitors shall comply with the following.

(1) Containing Liquid that Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed only in ~~approved~~vaults that comply with Sections 450-41 through 450-48, and, in addition,

(a) There shall be no door or other communicating opening between the vault and the Division 1 location, and
(b) Ample ventilation shall be provided for the continuous removal of flammable gases or vapors, and
(c) Vent openings or ducts shall lead to a safe location outside of buildings, and
(d) Vent ducts and openings shall be of sufficient area to relieve explosion pressures within the vault, and all portions of vent ducts within the buildings shall be of reinforced concrete construction.

(2) Not Containing Liquid that Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with (a)(1) or be approved for Class I locations.

(b) Class I, Division 2. In Class I, Division 2 locations, transformers and capacitors shall comply with Sections 450-21 through 450-27.

501-3 Meters, Instruments, and Relays

(a) Class I, Division 1. In Class I, Division 1 locations, meters, instruments, and relays, including kilowatt-hour meters, instrument transformers, resistors, rectifiers, and thermionic tubes, shall be provided with enclosures identified ~~approved~~ for Class I, Division 1 locations. Enclosures ~~approved~~for Class I, Division 1 locations include explosionproof enclosures and purged and pressurized enclosures.

FPN: See Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

(b) Class I, Division 2. In Class I, Division 2 locations, meters, instruments, and relays shall comply with the following.

(1) Contacts. Switches, circuit breakers, and make-and-break contacts of pushbuttons, relays, alarm bells, and horns shall have enclosures identified ~~approved~~for Class I, Division 1 locations in accordance with Section 501-3(a).

Exception: General-purpose enclosures shall be permitted, if current-interrupting contacts are
a. Immersed in oil, or
b. Enclosed within a chamber that is hermetically sealed against the entrance of gases or vapors, or
c. In nonincendive circuits, or
d. Part of a listed nonincendive component.

(2) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment that are used in or in connection with meters, instruments, and relays shall comply with Section 501-3(a).

Exception: General-purpose–type enclosures shall be permitted if such equipment is without make-and-break or sliding contacts [other than as provided in (b)(1)] and if the maximum operating temperature of any exposed surface will not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved or has been tested and found incapable of igniting the gas or vapor. This exception shall not apply to thermionic tubes.

(3) Without Make-or-Break Contacts. Transformer windings, impedance coils, solenoids, and other windings that do not incorporate sliding or make-or-break contacts shall be provided with enclosures. General-purpose–type enclosures shall be permitted.

(4) General-Purpose Assemblies. Where an assembly is made up of components for which general-purpose enclosures are acceptable as provided in (b)(1), (b)(2), and (b)(3), a single general-purpose enclosure shall be acceptable for the assembly. Where such an assembly includes any of the equipment described in (b)(2), the maximum obtainable surface temperature of any component of the assembly shall be clearly and permanently indicated on the outside of the enclosure. Alternatively, ~~approved~~equipment shall be permitted to be marked to indicate the temperature ~~range~~class~~-~~ for which it is suitable, using the temperature class (T Code)~~identification numbers~~ of Table 500-8 (b)~~5(d)~~.

(5) Fuses. Where general-purpose enclosures are permitted in (b)(1), (b)(2), (b)(3), and (b)(4), fuses for overcurrent protection of instrument circuits not subject to overloading in normal use shall be permitted to be mounted in general-purpose enclosures if each such fuse is preceded by a switch complying with (b)(1).

(6) Connections. To facilitate replacements, process control instruments shall be permitted to be connected through flexible cord, attachment plug, and receptacle, provided the following:

1. A switch complying with (b)(1) is provided so that the attachment plug is not depended on to interrupt current; and
2. The current does not exceed 3 amperes at 120 volts, nominal; and
3. The power-supply cord does not exceed 900 mm (3 ft)~~(914 mm)~~, is of a type listed ~~approved~~ for extra-hard usage or for hard usage if protected by location, and is supplied through an attachment plug and receptacle of the locking and grounding type; and
4. Only necessary receptacles are provided; and
5. The receptacle carries a label warning against unplugging under load.

501-4. Wiring Methods. Wiring methods shall comply with (a) or (b).

~~(a)~~(b) Class I, Division 1.

(1) In Class I, Division 1 locations, the following wiring methods shall be permitted:

(a) Threaded rigid metal conduit or threaded steel intermediate metal conduit. Threaded joints shall be made up with at least five threads fully engaged.

Exception No. 1: Rigid nonmetallic conduit complying with Article 347 shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) ~~(50.8 mm)~~thick and provided with not less than 600 mm (24 in.) ~~(610 mm)~~ of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of Section 511-4, Exception; 514-8, Exception No. 2; and Section 515-5(a). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) ~~(610 mm)~~of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.

(b) Type MI cable with termination fittings listed ~~approved~~ for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.
(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type MC-HL cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application.

FPN: See Sections 334-3 and 334-4 for restrictions on use of Type MC cable.

(d) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type ITC-HL cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application.

(2) Where necessary to employ flexible connections, as at motor terminals, flexible fittings listed for Class I, Division 1 locations or flexible cord in accordance with the provisions of Section 501-11 shall be permitted.

(3) All boxes, fittings, and joints shall be approved ~~approved listed~~ for Class I, Division 1.

(b) Class I, Division 2.

(1) In Class I, Division 2 locations, the following wiring methods shall be permitted:

(a) All wiring methods permitted in ~~Article~~ 501-4(a).
(b) Threaded rigid metal conduit, threaded steel intermediate metal conduit,
(~~b~~c) Enclosed gasketed busways, enclosed gasketed wireways,
(~~c~~d) Type PLTC cable in accordance with the provisions of Article 725, or in cable tray systems. PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.
(~~d~~e) Type ITC cable in cable trays, in raceways, supported by messenger wire, afforded mechanical protection and run as open wiring, or directly buried where the cable is listed for this use;
(~~e~~f) Type MI, MC, MV, or TC cable with ~~-~~termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings.

(2) Where provision must be made for limited flexibility, flexible metal fittings, flexible metal conduit with listed fittings, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord listed for extra-hard usage and provided with listed bushed fittings shall be used. An additional conductor for grounding shall be included in the flexible cord.

FPN: See Section 501-16(b) for grounding requirements where flexible conduit is used.

(3) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified ~~nonhazardous~~locations.~~, including Chapter 7 and 8 wiring methods.~~ Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

FPN: Simple apparatus is defined in Section 504-2.

Separate nonincendive field wiring circuits shall be:

(a) in separate cables, or
(b) in multiconductor cables where the conductors of each circuit are within a grounded metal shield, or
(c) in multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in).

(4) Boxes, fittings, and joints shall not be required to be explosionproof except as required by Sections 501-3(b)(1), 501-6(b)(1), and 501-14(b)(1).

501-5. Sealing and Drainage. Seals in conduit and cable systems shall comply with (a) through (f)~~. Sealing compound shall be of a type approved for the conditions and use~~ . Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.

FPN No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal, and through conductors passing through the seal. See Section 501-5(e)(2). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See Section 501-5(c)(2).

FPN No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than No. 2. Special conductor constructions, e.g., compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.

(a) Conduit Seals, Class I, Division 1. In Class I, Division 1 locations, conduit seals shall be located as follows.

(1) In each conduit entry into an explosionproof enclosure where either (a) the enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors, that may produce arcs, sparks, or high temperatures that are considered to be an ignition source in normal operation, or ~~(b)~~(b) the entry is metric designator 53 (trade size 2) or larger ~~the entry is 2 in. size or larger~~ and the enclosure contains terminals, splices, or taps. For the purposes of this section high temperatures shall be considered to be any temperatures exceeding 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved.

Exception to (a)(1)(a): Conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors are
a. Enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or
b. Immersed in oil in accordance with Section 501-6(b)(1)(b), or
c. Enclosed within a factory-sealed explosionproof chamber located within the enclosure, identified ~~approved~~ for the location, and marked "factory sealed" or equivalent, unless the enclosure entry is metric designator 53 (trade size 2) ~~, unless the enclosure entry is 2 in. size~~ or larger.

Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal. Conduit seals shall be installed within 450 mm (18 in.) ~~(457 mm)~~from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and Cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.

d. In nonincendive circuits.

(2) In each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 450 mm (18 in.) ~~(457 mm)~~ from the pressurized enclosure.

FPN No. 1: Installing the seal as close as possible to the enclosure will reduce problems with purging the dead airspace in the pressurized conduit.

FPN No. 2: For further information, see Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

(3) Where two or more explosionproof enclosures for which conduit seals are required under (a)(1) are connected by nipples or by runs of conduit not more than 900 mm (36 in.) ~~(914 mm)~~ long, a single conduit seal in each such nipple connection or run of conduit shall be considered sufficient if located not more than 450 mm (18 in.) ~~(457 mm)~~from either enclosure.

(4) In each conduit run leaving a Class I, Division 1 location. The sealing fitting shall be permitted on either side of the boundary of such location within 3.05m (10 ft.) ~~10 ft (3.05 m)~~of the boundary, and

shall be designed and installed so to minimize the amount of gas or vapor within the Division 1 portion of the conduit from being communicated to the conduit beyond the seal. Except for listed ~~approved~~explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 1 location.

Exception No. 1: Metal conduit containing no unions, couplings, boxes, or fittings that passes completely through a Class I, Division 1 location with no fittings less than 300 mm (12 in.) ~~(305 mm)~~ beyond each boundary shall not require a conduit seal if the termination points of the unbroken conduit are in unclassified locations.

Exception No. 2: For underground conduit installed in accordance with Section 300-5 where the boundary is beneath the ground, the sealing fitting shall be permitted to be installed after the conduit leaves the ground, but there shall be no union, coupling, box, or fitting, other than listed explosionproof reducers at the sealing fitting, in the conduit between the sealing fitting and the point at which the conduit leaves the ground.

(b) Conduit Seals, Class I, Division 2. In Class I, Division 2 locations, conduit seals shall be located as follows.

(1) For connections to enclosures that are required to be explosionproof, a conduit seal shall be provided in accordance with (a)(1)(a) and (a)(3). All portions of the conduit run or nipple between the seal and such enclosure shall comply with Section 501-4(a).

(2) In each conduit run passing from a Class I, Division 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 3.05m (10 ft.)~~10 ft (3.05 m)~~ of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Division 2 portion of the conduit from being communicated to the conduit beyond the seal. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Division 2 location, and a threaded connection shall be used at the sealing fitting. Except for listed ~~approved~~explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 2 location.

Exception No. 1: Metal conduit containing no unions, couplings, boxes or fittings that passes completely through a Class I, Division 2 location with no fittings less than 300 mm (12 in.) ~~(305 mm)~~ beyond each boundary shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.

Exception No. 2: Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or open wiring shall not be required to be sealed where passing from the Class I, Division 2 location into the unclassified location. The unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The conduits shall not terminate at an enclosure containing an ignition source in normal operation.

Exception No. 3: Conduit systems passing from an enclosure or room that is unclassified as a result of pressurization into a Class I, Division 2 location shall not require a seal at the boundary.

FPN: For further information, refer to Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Class I, Division 2 location into an unclassified location if the following conditions are met:
a. No part of the conduit system segment passes through a Class I, Division I location where the conduit contains unions, couplings, boxes, or fittings within 300 mm (12 in.) ~~(305 mm)~~ of the Class I, Division 1 location; and
b. The conduit system segment is located entirely in outdoor locations; and
c. The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system; and
d. The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location; and
e. The conduit system segment is sealed at its entry to each enclosure or fitting housing terminals, splices, or taps in Class I, Division 2 locations.

(c) Class I, Divisions 1 and 2. Where required, seals in Class I, Division 1 and 2 locations shall comply with the following.

(1) Fittings. Enclosures for connections or equipment shall be provided with an ~~approved~~integral means for sealing, or sealing fittings listed ~~approved~~for the ~~Class I~~location~~s~~ shall be used. ~~Sealing fittings shall be accessible.~~Sealing fittings shall be listed for use with one or more specific compounds and shall be accessible.

(2) Compound. The compound shall provide a ~~Sealing compound shall be approved and shall provide a~~ seal against passage of gas or vapors through the seal fitting, shall not be affected by the surrounding atmosphere or liquids, and shall not have a melting point of less than 93ºC (200ºF).

(3) Thickness of Compounds. In a completed seal, the minimum thickness of the sealing compound shall not be less than the trade size of the sealing fitting and, in no case, less than 16 mm (5/8 in.)~~(16 mm)~~.

Exception: Listed cable sealing fittings shall not be required to have a minimum thickness equal to the trade size of the fitting.

(4) Splices and Taps. Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.

(5) Assemblies. In an assembly where equipment that may produce arcs, sparks, or high temperatures is located in a compartment separate from the compartment containing splices or taps, and an integral seal is provided where conductors pass from one compartment to the other, the entire assembly shall be identified ~~approved~~ for the ~~Class I~~location~~s~~. Seals in conduit connections to the compartment containing splices or taps shall be provided in Class I, Division 1 locations where required by (a)(1)(b).

(6) Conductor Fill. The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless it is specifically identified ~~approved~~ for a higher percentage of fill.

(d) Cable Seals, Class I, Division 1. In Class I, Division 1 locations, cable seals shall be located as follows.

(1) Cable shall be sealed at all terminations. The sealing fitting shall comply with (c). Multiconductor Type MC-HL cables with a gas/vaportight continuous corrugated aluminum sheath and an overall jacket of suitable polymeric material shall be sealed with a~~n~~ listed ~~approved~~ fitting after removing the jacket and any other covering so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors.

Exception: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

(2) Cables in conduit with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Division 1 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor and the outer jacket.

Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered as a single conductor by sealing the cable in the conduit within 450 mm (18 in.) ~~(457 mm)~~ of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods. For shielded cables and twisted pair cables, it shall not be required to remove the shielding material or

separate the twisted pair.

(3) Each multiconductor cable in conduit shall be considered as a single conductor if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with (a).

(e) Cable Seals, Class I, Division 2. In Class I, Division 2 locations, cable seals shall be located as follows.

(1) Cables entering enclosures that are required to be explosionproof ~~approved for Class I locations~~ shall be sealed at the point of entrance. The sealing fitting shall comply with (b)(1). Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in a~~n~~ listed ~~approved~~ fitting in the Division 2 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors. Multiconductor cables in conduit shall be sealed as described in (d).

Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Class I, Division 2 location shall not require a seal at the boundary.

Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

(2) Cables with a gas/vaportight continuous sheath and that will not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in (e)(1). The minimum length of such cable run shall not be less than that length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings [200 cm3/hour (~~1~~0.007 ft3/hour) ~~(198 cm3/hour)~~of air at a pressure of 1500 pascals (6 in. of water)~~(1493 pascals)~~].

FPN No. 1: See Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations, ANSI/UL 886-1994.

FPN No. 2: The cable core does not include the interstices of the conductor strands.

(3) Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall not be required to be sealed except as required in (e)(1), unless the cable is attached to process equipment or devices that may cause a pressure in excess of 1500 pascals (6 in. of water) ~~(1493 pascals)~~to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified location ~~area~~.

Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, Division 2 location without seals.

(4) Cables that do not have gas/vaportight continuous sheath shall be sealed at the boundary of the Division 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.

FPN: The sheath mentioned in (d) and (e) may be either metal or a nonmetallic material.

(f) Drainage.

(1) Control Equipment. Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.

(2) Motors and Generators. Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize entrance of liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.

(3) Canned Pumps, Process or Service Connections, etc. For canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the electrical raceway or cable system capable of transmitting fluids, an additional approved seal, barrier, or other means shall be provided to prevent the flammable or combustible fluid from entering the raceway or cable system capable of transmitting fluids beyond the additional devices or means, if the primary seal fails. The additional approved seal or barrier and the interconnecting enclosure shall meet the temperature and pressure conditions to which they will be subjected upon failure of the primary seal, unless other approved means are provided to accomplish the purpose above. Drains, vents, or other devices shall be provided so that primary seal leakage will be obvious.

FPN: See also the fine print notes to Section 501-5.

501-6. Switches, Circuit Breakers, Motor Controllers, and Fuses

(a) Class I, Division 1. In Class I, Division 1 locations, switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices, shall be provided with enclosures, and the enclosure in each case, together with the enclosed apparatus, shall be identified ~~-~~as a complete assembly for use in Class I locations.

(b) Class I, Division 2. Switches, circuit breakers, motor controllers, and fuses in Class I, Division 2 locations shall comply with the following:

(1) Type Required. Circuit breakers, motor controllers, and switches intended to interrupt current in the normal performance of the function for which they are installed shall be provided with enclosures identified ~~approved~~for Class I, Division 1 locations in accordance with Section 501-3(a), unless general-purpose enclosures are provided and

(a) The interruption of current occurs within a chamber hermetically sealed against the entrance of gases and vapors, or
(b) The current make-and-break contacts are oil-immersed and of the general-purpose type having a 50 mm (2 ~~-~~in.) ~~(50.8 mm)~~ minimum immersion for power contacts and a 25 mm (1 ~~-~~in.) ~~(25.4 mm)~~ minimum immersion for control contacts, or
(c) The interruption of current occurs within a factory-sealed explosionproof chamber ~~approved for the location~~, or
(d) The device is a solid state, switching control without contacts, where the surface temperature does not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved.

(2) Isolating Switches. Fused or unfused disconnect and isolating switches for transformers or capacitor banks that are not intended to interrupt current in the normal performance of the function for which they are installed shall be permitted to be installed in general-purpose enclosures.

(3) Fuses. For the protection of motors, appliances, and lamps, other than as provided in (b)(4), standard plug or cartridge fuses shall be permitted, provided they are placed within enclosures identified ~~approved~~ for the location; or fuses shall be permitted if they are within general-purpose enclosures, and if they are of a type in which the operating element is immersed in oil or other approved liquid, or the operating element is enclosed within a chamber hermetically sealed against the entrance of gases and vapors, or the fuse is a nonindicating, filled, current-limiting type.

(4) Fuses Internal to Luminaires (Lighting Fixtures). ~~Approved~~ Listed ~~c~~cartridge fuses shall be permitted as supplementary protection within luminaires (lighting fixtures).

501-7. Control Transformers and Resistors. Transformers, impedance coils, and resistors used as, or in conjunction with, control equipment for motors, generators, and appliances shall comply with (a) and (b).

(a) Class I, Division 1. In Class I, Division 1 locations, transformers, impedance coils, and resistors, together with any switching mechanism associated with them, shall be provided with enclosures identified ~~approved~~for Class I, Division 1 locations in accordance with Section 501-3(a).

(b) Class I, Division 2. In Class I, Division 2 locations, control transformers and resistors shall comply with the following.

(1) Switching Mechanisms. Switching mechanisms used in conjunction with transformers, impedance coils, and resistors shall comply with Section 501-6(b).

(2) Coils and Windings. Enclosures for windings of transformers, solenoids, or impedance coils shall be permitted to be of the general-purpose type.

(3) Resistors. Resistors shall be provided with enclosures; and the assembly shall be identified ~~approved~~for Class I locations, unless resistance is nonvariable and maximum operating temperature, in degrees Celsius, will not exceed 80 percent of the ignition temperature of the gas or vapor involved, or has been tested and found incapable of igniting the gas or vapor.

501-8. Motors and Generators

(a) Class I, Division 1. In Class I, Division 1 locations, motors, generators, and other rotating electric machinery shall be as follows:

(1) Identified ~~Approved~~for Class I, Division 1 locations; or
(2) Of the totally enclosed type supplied with positive-pressure ventilation from a source of clean air with discharge to a safe area, so arranged to prevent energizing of the machine until ventilation has been established and the enclosure has been purged with at least 10 volumes of air, and also arranged to automatically de-energize the equipment when the air supply fails; or
(3) Of the totally enclosed inert gas-filled type supplied with a suitable reliable source of inert gas for pressuring the enclosure, with devices provided to ensure a positive pressure in the enclosure and arranged to automatically de-energize the equipment when the gas supply fails; or
(4) Of a type designed to be submerged in a liquid that is flammable only when vaporized and mixed with air, or in a gas or vapor at a pressure greater than atmospheric and that is flammable only when mixed with air; and the machine is arranged so to prevent energizing it until it has been purged with the liquid or gas to exclude air, and also arranged to automatically de-energize the equipment when the supply of liquid or gas or vapor fails or the pressure is reduced to atmospheric.

Totally enclosed motors of Types (2) or (3) shall have no external surface with an operating temperature in degrees Celsius in excess of 80 percent of the ignition temperature of the gas or vapor involved. Appropriate devices shall be provided to detect and automatically de-energize the motor or provide an adequate alarm if there is any increase in temperature of the motor beyond designed limits. Auxiliary equipment shall be of a type identified ~~approved~~ for the location in which it is installed.

FPN: See ASTM Test Procedure, D 2155-69.

(b) Class I, Division 2. In Class I, Division 2 locations, motors, generators, and other rotating electric machinery in which are employed sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices, either while starting or while running, shall be identified ~~approved~~ for Class I, Division 1 locations, unless such sliding contacts, switching mechanisms, and resistance devices are provided with enclosures identified~~approved~~ for Class I, Division 2 locations in accordance with Section 501-3(b). The exposed surface of space heaters used to prevent condensation of moisture during shutdown periods shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved when operated at rated voltage, and the maximum surface temperature [based on a 40ºC (104ºF) ambient] shall be permanently marked on a visible nameplate mounted on the motor. Otherwise, space heaters shall be identified ~~approved~~ for Class I, Division 2 locations. In Class I, Division 2 locations, the installation of open or nonexplosionproof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Division 2 location, shall be permitted.

FPN No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.

FPN No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitible gases or vapors is suspected, clean-air purging may be needed immediately prior to and during start-up periods.

501-9. Luminaires (Lighting Fixtures). Luminaires ~~L~~(lighting fixtures) shall comply with (a) or (b).

(a) Class I, Division 1. In Class I, Division 1 locations, luminaires (lighting fixtures) shall comply with the following.

(1) ~~Approved~~ Luminaires (Lighting Fixtures). Each luminaire (lighting fixture) shall be identified ~~approved~~ as a complete assembly for the Class I, Division 1 location and shall be clearly marked to indicate the maximum wattage of lamps for which it is identified~~approved~~. Luminaires (lighting fixtures) intended for portable use shall be specifically listed ~~identified approved~~ as a complete assembly for that use.

(2) Physical Damage. Each luminaire (lighting fixture) shall be protected against physical damage by a suitable guard or by location.

(3) Pendant Luminaires (Lighting Fixtures). Pendant luminaires (lighting fixtures) shall be suspended by and supplied through threaded rigid metal conduit stems or threaded steel intermediate conduit stems, and threaded joints shall be provided with set-screws or other effective means to prevent loosening. For stems longer than 300 mm (12 in.) ~~(305 mm)~~, permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) ~~(305 mm)~~above the lower end of the stem, or flexibility in the form of a fitting or flexible connector identified ~~approved~~for the Class I, Division 1 location shall be provided not more than 300 mm (12 in.) ~~(305 mm)~~from the point of attachment to the supporting box or fitting.

(4) Supports. Boxes, box assemblies, or fittings used for the support of luminaires (lighting fixtures) shall be identified~~-~~ for Class I locations.

(b) Class I, Division 2. In Class I, Division 2 locations, luminaires (lighting fixtures) shall comply with the following:

(1) Portable Lighting Equipment. Portable lighting equipment shall comply with (a)(1).

Exception: Where portable lighting equipment are mounted on movable stands and are connected by flexible cords, as covered in Section 501-11, they shall be permitted, where mounted in any position, if they conform to Section 501-9(b)(2).

(2) Fixed Luminaires (Lighting Fixtures). Luminaires (lighting fixtures) for fixed lighting shall be protected from physical damage by suitable guards or by location. Where there is danger that falling sparks or hot metal from lamps or fixtures might ignite localized concentrations of flammable vapors or gases, suitable enclosures or other effective protective means shall be provided. Where lamps are of a size or type that may, under normal operating conditions, reach surface temperatures exceeding 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved, fixtures shall comply with (a)(1) or shall be of a type that has been tested in order to determine the marked operating temperature or temperature class~~range~~ (T Code).

(3) Pendant Luminaires (Lighting Fixtures). Pendant luminaires (lighting fixtures) shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, or by other approved means. For rigid stems longer than 300 mm (12 in.)~~(305 mm)~~, permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) ~~(305 mm)~~above the lower end of the stem, or flexibility in the form of an identified ~~-~~fitting or flexible connector shall be provided not more than 300 mm (12 in.) ~~(305 mm)~~ from the point of attachment to the supporting box or fitting.

(4) Switches. Switches that are a part of an assembled fixture or of an individual lampholder shall comply with Section 501-6(b)(1).

(5) Starting Equipment. Starting and control equipment for electric-discharge lamps shall comply with Section 501-7(b).

Exception: A thermal protector potted into a thermally protected fluorescent lamp ballast if the luminaire (lighting fixture) is identified ~~approved~~ for the location~~s of this class and division~~.

501-10. Utilization Equipment

(a) Class I, Division 1. In Class I, Division 1 locations, all utilization equipment shall be identified ~~approved~~ for Class I, Division 1 locations.

(b) Class I, Division 2. In Class I, Division 2 locations, all utilization equipment shall comply with the following.

(1) Heaters. Electrically heated utilization equipment shall conform with either item (a) or (b).

(a) The heater shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved on any surface that is exposed to the gas or vapor when continuously energized at the maximum rated ambient temperature. If a temperature controller is not provided, these conditions shall apply when the heater is operated at 120 percent of rated voltage.

Exception No. 1: For motor-mounted anticondensation space heaters, see Section 501-8(b).

Exception No. 2: A current-limiting device is applied to the circuit serving the heater that will limit the current in the heater to a value less than that required to raise the heater surface temperature to 80 percent of the ignition temperature.

(b) The heater shall be identified ~~approved~~ for Class I, Division 1 locations.

Exception: Electrical resistance heat tracing identified ~~approved~~ for Class I, Division 2 locations.

(2) Motors. Motors of motor-driven utilization equipment shall comply with Section 501-8(b).

(3) Switches, Circuit Breakers, and Fuses. Switches, circuit breakers, and fuses shall comply with Section 501-6(b).

501-11. Flexible Cords, Class I, Divisions 1 and 2. A flexible cord shall be permitted for connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit. Flexible cord shall also be permitted for that portion of the circuit where the fixed wiring methods of Section 501-4(a) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment, in an industrial establishment where conditions of maintenance and engineering supervision ensure that only qualified persons will install and service the installation, and the flexible cord is protected by location or by a suitable guard from damage. The length of the flexible cord shall be continuous. Where flexible cords are used, the cords shall be as follows:

(1) Of a type listed ~~approved~~for extra-hard usage;

(2) Contain, in addition to the conductors of the circuit, a grounding conductor complying with Section 400-23;

(3) Connected to terminals or to supply conductors in an approved manner;

(4) Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections; and

(5) Be provided with suitable seals where the flexible cord enters boxes, fittings, or enclosures of the explosionproof type.

Exception: As provided in Sections 501-3(b)(6) and 501-4(b).

Electric submersible pumps with means for removal without entering the wet-pit shall be considered portable utilization equipment. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be permitted. Electric mixers intended for travel into and out of open-type mixing tanks or vats shall be considered portable utilization equipment.

FPN: See Section 501-13 for flexible cords exposed to liquids having a deleterious effect on the conductor insulation.

501-12. Receptacles and Attachment Plugs, Class I, Divisions 1 and 2. Receptacles and attachment plugs shall be of the type providing for connection to the grounding conductor of a flexible cord and shall be identified ~~approved~~ for the location.

Exception: As provided in Section 501-3(b)(6).

501-13. Conductor Insulation, Class I, Divisions 1 and 2. Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type identified ~~approved~~ for use under such conditions; or the insulation shall be protected by a sheath of lead or by other approved means.

501-14. Signaling, Alarm, Remote-Control, and Communications Systems

(a) Class I, Division 1. In Class I, Division 1 locations, all apparatus and equipment of signaling, alarm, remote-control, and communications systems, regardless of voltage, shall be identified ~~-~~ for Class I, Division 1 locations, and all wiring shall comply with Sections 501-4(a) and 501-5(a) and (c).

(b) Class I, Division 2. In Class I, Division 2 locations, signaling, alarm, remote-control, and communications systems shall comply with the following.

(1) Contacts. Switches, circuit breakers, and make-and-break contacts of pushbuttons,
relays, alarm bells, and horns shall have enclosures identified ~~approved~~ for Class I, Division 1 locations in accordance with Section 501-3(a).

Exception: General-purpose enclosures shall be permitted if current-interrupting contacts are one of the following:
a. Immersed in oil, or
b. Enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or
c. In nonincendive circuits, or
d. Part of a listed nonincendive component

(2) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with Section 501-3(b)(2).

(3) Protectors. Enclosures shall be provided for lightning protective devices and for fuses. Such enclosures shall be permitted to be of the general-purpose type.

(4) Wiring and Sealing. All wiring shall comply with Sections 501-4(b) and 501-5(b) and (c).

501-15. Live Parts, Class I, Divisions 1 and 2. There shall be no exposed live parts.

501-16. Grounding, Class I, Divisions 1 and 2. Wiring and equipment in Class I, Division 1 and 2 locations shall be grounded as specified in Article 250 and with the following additional requirements.

(a) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.

Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in Sections 250-32(a), (b), and (c), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.

FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.

(b) Types of Equipment Grounding Conductors. Where flexible metal conduit or liquidtight flexible metal conduit is used as permitted in Section 501-4(b) and is to be relied on to complete a sole equipment grounding path, it shall be installed with internal or

external bonding jumpers in parallel with each conduit and complying with Section 250-102.

Exception: In Class I, Division 2 locations, the bonding jumper shall be permitted to be deleted where all the following conditions are met.
a. Listed liquidtight flexible metal conduit 1.8 m (6 ft) ~~(1.83 m)~~ or less in length, with fittings listed for grounding, is used.
b. Overcurrent protection in the circuit is limited to 10 amperes or less.
c. The load is not a power utilization load.

501-17. Surge Protection

(a) Class I, Division 1. Surge arresters, including their installation and connection, shall comply with Article 280. The surge arresters and capacitors shall be installed in enclosures identified ~~approved~~ for Class I, Division 1 locations. Surge-protective capacitors shall be of a type designed for specific duty.

(b) Class I, Division 2. Surge arresters shall be nonarcing, such as metal-oxide varistor (MOV), sealed type, and surge-protective capacitors shall be of a type designed for specific duty. Installation and connection shall comply with Article 280. Enclosures shall be permitted to be of the general-purpose type. Surge protection of types other than described above shall be installed in enclosures identified ~~approved~~ for Class I, Division 1 locations.

501-18. Multiwire Branch Circuits. In a Class I, Division 1 location, a multiwire branch circuit shall not be permitted.

Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.

PANEL STATEMENT: The action on this Comment, which is a rewrite of Article 501, incorporates all applicable actions on Comments 14-43 through 14-84.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
COMMENT ON AFFIRMATIVE:
BRIESCH: Since Article 505 was rewritten by Comment 14-126, the reference in the second sentence of Section 501-1 is no longer correct. It should be revised from 505-10 to 505-9. Section 505-10 does not exist in the new Article 505.
In Section 501-5(d)(1) in the third sentence, change "aluminum" to "metallic." Section 501-4(a)(1)(c) was revised to change "aluminum" to "Metallic" by the Panel's acceptance of Proposals 14-59a and 14-78. It appears that this correlation was overlooked in Section 501-5(d)(1). As currently worded, one could conclude that only aluminum sheathed cables need to be sealed in this manner and not cables with other types of sheaths. This is not the intent of the requirement and would result in cables with other than aluminum sheaths being improperly sealed.
COOK: I agree with the reorganization of Article 501 and most of the actions taken by the panel. I do not support action on comment 14-81 and expressed the negative on that comment. I also believe the following editorial changes should be made:
• Section 501-4(a)(1)(a), the Exception No. 1: should be changed to Exception:
• Section 501-4(a)(1)(a) Exception, the reference to Section 515-5(a) has been relocated to Section 515-8(a) in the reorganization of Article 515.
I also believe that when proposal 14-78 was accepted during the ROP to change proposed Section 501-4(a)(1)(c) from "...corrugated aluminum sheath, ..." to "...corrugated metallic sheath,...", that a correlation change should have been made to proposed Section 501-5(d)(1). This action was not discussed by the panel, however, I do not believe that the intent is to only require cable seals on aluminum MC-HL cable and not require them on metal sheathed cables. I also do not believe that this was the intent of the submitter of proposal 14-78.
• In Section 501-1, revise "505-10" to "505-9". (correlation)
• In Section 501-5(a)(1) Exception, change "Exception to 501-5(a)(1)(a)" to "Exception to 501-5(a)(1)". (editorial)
GOODMAN: Panel members Mr. Briesch, Mr. Cook, Mr. Jagunich, and O'Meara have identified typographical, syntax, cross-reference, and other minor errors in the section. I support the correction of these items as "editorial" by the Panel Chair and NFPA staff, provided no changes are made to the content of the effected sections.
JAGUNICH: 1) The exception to 501-5(a)(1) is stated as an Exception to (a)(1)(a) which is a section that does not exist.
2) The Exception itself is so worded that it is not clear what the exception allows. Add words at the very beginning of the exception, as follows:
"Exception to (a)(1): Seals are not required for conduit entering ...".
OMEARA: Recommend making editorial changes (corrections to this rewrite of Article 501 as follows:
501-1: In the second sentence change, "...in accordance with Section 505-10..." to "... in accordance with Section 505-9...".

(Log #1492)

14- 49 - (501-1): Reject
SUBMITTER: David N. Bishop, David N. Bishop, Consultant
COMMENT ON PROPOSAL NO: 14-60
RECOMMENDATION: Reconsider 14-60, but change as follows:
Revise third bullet: Combustible gas detector equipment is installed in accordance with ~~industrial practices~~ API RP500.
Delete last bullet: ~~appropriate alarms with ventilation or interlocks are provided~~
SUBSTANTIATION: This practice has been followed by the offshore oil and gas industry for approximately 30 years with no known incidents as a result. It is allowed by Dept. of Interior, Minerals management Service federal regulations. The last "bullet" is unnecessary as it is addressed by API RP 500. Similar wording should be included in Article 505, but referencing API RP505 vs. API RP500.
PANEL ACTION: Reject.
PANEL STATEMENT: The NEC Style Manual does not allow reference of other standards in mandatory text. The submitter is referred to the action on Comment 14-51.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #1951)

14- 50 - (501-1): Accept in Principle
SUBMITTER: David Wechsler, Union Carbide Corp.
COMMENT ON PROPOSAL NO: 14-60
RECOMMENDATION: It is understood that the NEC is primarily an electrical installation document; however, the NEC does include installation techniques such as purged and pressurized areas and ventilating pipes. The use of gas detection equipment as a method of protection in hazardous (classified) locations is related to such techniques. Gas detection equipment is capable of providing indication of the presence of combustible gases prior to reaching lower explosive limits and is capable of providing alarms with ventilation or interlocks. The original proposed text has been modified to incorporate a more defined set of electrical installation criteria to allow for proper process evaluation, but introduces no new concepts or requirements that have not had prior public exposure.
Following the Exception under 501-1 add the following text:
Permanently mounted combustible gas detection equipment may be used as a means for reducing the need for special electrical equipment provided that the location is continuously monitored by combustible gas detection equipment that is:
• listed and marked both as performance tested and as suitable for use in hazardous (classified) locations,
• installed in accordance with industrial practices,
• used in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation,
• actuating ventilation equipment or other means designed to prevent the concentration of gas from reaching the lower explosive limit when the gas concentration reaches 20% of the lower explosive limit,
• automatically de-energizing the equipment being protected when the gas concentration reaches 40% of the lower explosive limit,
• automatically de-energizing the equipment being protected upon failure of the gas detection equipment; and
• providing an adequate number of installed sensors to ensure the sensing of combustible gas in the protected area covers all areas where such gas might accumulate.
FPN No. 1: For suggested minimum performance specifications and guidance in the selection of gas detection equipment, see ISA S12.13.01, Performance Requirements, Combustible Gas Detectors.
FPN No. 2: For suggested installation, operation and maintenance guidance, see ISA RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments.
FPN No. 3: For guidance in the installation of gas detection equipment, see ANSI/API RP 500, Recommended Practice for Classification of Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2.

SUBSTANTIATION: Equipment necessary to be placed in hazardous (classified) locations which cannot meet specific hazardous location protection techniques currently requires purged/pressurized protection techniques. This is not always possible or desirable under all installation considerations. For many years gas detection equipment has been used as a method of protection in petroleum facilities in accordance with ANSI/API RP 500, Recommended Practice Classification of Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2 and within hazardous location facilities in Canada in accordance with the Canadian Electrical Code (CEC) with no reported incidents. Gas detection equipment is capable of providing indication of the presence of combustible gases prior to reaching lower explosive limits and is capable of providing alarms with ventilation or interlocks. To ensure proper gas detection equipment functionality under such critical conditions, an existing ISA standard S12.13.01, Performance Requirements, Combustible Gas Detectors, will provide guidance on gas detection equipment performance requirements and an existing ISA recommended practice RP 12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments, will provide user guidance on the proper use of gas detection equipment. In conclusion, this additional method of protection should be considered for equipment which cannot meet the proper hazardous (classified) location requirements, but is necessary to be installed in such locations.

PANEL ACTION: Accept in Principle.
See action on Comment 14-51.

PANEL STATEMENT: The action on Comment 14-51 satisfies the intent of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

EXPLANATION OF NEGATIVE:
COOK: See my Explanation of Negative on Comment 14-51.

(Log #2326)

14- 51 - (501-1): Accept in Principle

Note: The Technical Correlating Committee directs that the definition in 500-2 read: "Combustible Gas Detection System. A protection technique utilizing stationary gas detectors in industrial establishments." to remove the mandatory requirements from the definition. The Technical Correlating Committee further directs that the Panel Action on 500-7(K) be revised to read as follows to correct the style manual violation in the text:

"(K) Combustible Gas Detection System. A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public access and where the conditions of maintenance and supervision ensure that only qualified persons will service the installation. Gas detection equipment shall be listed for detection of the specific gas or vapor to be encountered. Where such a system is installed, equipment specified in (1), (2), or (3) shall be permitted.

(1) Inadequate Ventilation. In a Class I, Division 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Division 2 locations shall be permitted.

(2) Interior of a Building. In a building located in, or with an opening into, a Class I, Division 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted.

(3) Interior of a Control Panel. In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases or vapors, electrical equipment suitable for Class I, Division 2 locations shall be permitted.

FPN No. 1: For further information, see ANSI/ISA-12.13.01, Performance Requirements, Combustible Gas Detectors.

FPN No. 2: For further information, see ANSI/API RP 500, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 or Division 2.

FPN No. 3: For further information, see ISA-RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments."

SUBMITTER: Jon Miller, Detector Electronics Corp.

COMMENT ON PROPOSAL NO: 14-60

RECOMMENDATION: The action of the panel to reject this proposal would eliminate a beneficial electrical installation practice that could be used in place of a purged and pressurized protection technique. The proposed wording has been developed based upon the purged and pressurized enclosure Fine Print Note (FPN) in Article 501 of the NEC with additional text for electrical installation guidance. The use of gas detection equipment as a method of protection in hazardous (classified) locations has equivalent process evaluation and installation requirement complexity to that of purged and pressurized enclosures. It is recommended that further consideration be given to gas detection equipment as a method of protection in hazardous (classified) locations.

The initial proposed wording is as follows:

501-1. General

The general rules of this Code shall apply to the electric wiring and equipment in locations classified as Class I in Section 500-7.

Equipment listed and marked in accordance with Section 505-10 for use in Class I, Zone 0, 1, or 2 locations shall be permitted in Class I, Division 2 locations for the same gas and with a suitable temperature rating.

Exception: As modified by this article.

Permanently mounted combustible gas detection equipment may be used as a means for reducing the need for special electrical equipment when:

- combustible gas detection equipment is listed and marked both as performance tested and as suitable for use in hazardous (classified) locations,
- combustible gas detection equipment is installed in accordance with industrial practices,
- used in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and
- appropriate alarms with ventilation or interlocks are provided.

FPN 1: For suggested minimum performance specifications and guidance in the selection of gas detection equipment, see ISA S12.13.01, Performance Requirements, Combustible Gas Detectors.

FPN 2: For suggested installation, operation and maintenance guidance, see ISA RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments.

FPN 3: For guidance in the installation of gas detection equipment, see ANSI/API RP 500, Recommended Practice for Classification of Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2.

SUBSTANTIATION: Equipment necessary to be placed in hazardous (classified) locations that cannot meet specific hazardous location protection techniques currently requires a purged and pressurized enclosure protection method. This is not always possible or desirable under all installation considerations. For many years gas detection equipment has been used as a method of protection in petroleum facilities in accordance with ANSI/API RP 500, Recommended Practice for Classification of Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2 and within hazardous location facilities in Canada in accordance with the Canadian Electrical Code (CEC) with no reported incidents. Gas detection equipment is capable of providing indication of the presence of combustible gases prior to reaching lower explosive limits and is capable of providing alarms with ventilation or interlocks. To ensure proper gas detection equipment functionality under such critical conditions, an existing ISA standard S12.13.01, Performance Requirements, Combustible Gas Detectors, will provide guidance on gas detection equipment performance requirements and an existing ISA Recommended Practice RP12.12.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments, will provide user guidance on the proper use of gas detection equipment. These documents offer an equivalent level of complexity to that of the ANSI/NFPA 496 purged and pressurized enclosure practices. In conclusion, this additional method of protection should be considered for equipment that cannot meet the proper hazardous (classified) location requirements, but is necessary to be installed in such locations.

PANEL ACTION: Accept in Principle.
Add the following new definition to 500-2:

"Combustible Gas Detection System. A protection technique utilizing stationary gas detectors in industrial establishments which under specific conditions permits the use of equipment suitable for Class I, Division 2 locations to be used in a Class I, Division 1 location or the use of equipment suitable for unclassified locations to be used in a Class I, Division 2 locations."

Add the following new Paragraph (k) to 500-7: "(k) Combustible Gas Detection System. A Combustible gas detection system incorporating combustible gas detectors used in industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, is a protection technique permitted under the following conditions:

1) In a Class I, Division 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Division 2 locations shall be permitted.

2) In a building located in, or with an opening into, a Class I, Division 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted.

3) In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases or vapors, electrical equipment suitable for Class I, Division 2 locations shall be permitted.

Gas detection equipment shall be listed for detection of the specific gas or vapor to be encountered.

FPN: For further information, see ANSI/ISA-12.13.01, Performance Requirements, Combustible Gas Detectors.

Use of this technique for each of the applications above includes adherence to established industrial practices and requirements.

FPN No. 1: For further information, see ANSI/API RP 500, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 or Division 2."

FPN No. 2: For further information, see ISA-RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments."

Renumber existing (k) to (l).

PANEL STATEMENT: The Panel agrees to applying gas detection systems in industrial establishments and selected uses. This is in keeping with long-standing practices of existing industry standards.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

COOK: The International Association of Electrical Inspectors supports any technology that results in safe electrical systems. We believe that a combustible gas detection system could be effectively used as a protection technique in Class I locations where knowledgeable designers, installers, and users have access to and apply all applicable industry standards. We do not however, support the text as proposed. We do not believe that the text provides specific requirements that our members would be able to enforce. It is recognized that providing all the information required to ensure safe application would be difficult and possibly outside the scope of the NEC. Inspectors, many of whom work for government agencies, would have difficulty converting the referenced or any other recommended practices into mandatory requirements. Without the ability to enforce all the provisions of the referenced documents, installations that would otherwise be safe, could be very dangerous. It is believed that authorities having jurisdiction (AHJ's) currently have the flexibility to accept this technology and do so using Section 500-4(i) Other Protection Techniques, of the 1999 NEC, where adequate supporting
information is made available and it can be demonstrated that the technology will be properly applied.

COMMENT ON AFFIRMATIVE:

ALEXANDER: This affirmative comment is being attached to the initial ballot in order to permit my Code-Making Panel 14 colleagues to respond to it, as they feel appropriate. I am documenting some items here for design and enforcement reference. Hopefully, they will also appear in the 2002 NEC Handbook.

During the discussion on Comments 14-51 and 14-155, it was the consensus of Code-Making Panel 14 that a "Combustible Gas Detection System" does not actually alter the area classification - it simply permits using reduced installation/protection methods under certain very specific conditions.

Code-Making Panel 14 also agreed that, while gas detection systems have been used successfully in those specific conditions, they were not currently a specifically recognized protection method in either Section 500-7 or 505-8 and Code-Making Panel 14 wanted to validate those installations that are consistent with the new text of section 500-7(k) or 505-8(i).

The new definitions in Sections 500-2 and 505-2 are not in conflict with the above, but I do not believe that it is immediately apparent that the electrical area classification is not actually altered.

Since the protection technique will be limited to the specific conditions noted in Sections 500-7(k) or 505-8(i), I do not believe that this is a problem at the moment; however, Comments 14-51 and 14-155 actually desired a more generalized permitted use of gas detection systems. While Code-Making Panel 14 was open to the concept, we felt that the guidance proposed was insufficient.

I suggested that the submitter might wish to contact the NFPA and propose a committee project to develop a standard for gas detection systems similar to NFPA 496.

GOODMAN: Panel member Mr. Alexander provided an Affirmative Comment with the initial ballot as both a means to solicit response from other panel members and to provide additional information "documenting some items for design and enforcement references." While the opportunity to respond is appreciated, I do not believe that this comment section is the appropriate forum to set design and enforcement references nor is it correct to identify panel consensus which were never reached during the panel meeting.

During the discussions and panel actions on Comments 14-51 and 14-155, several points of view were discussed at some length regarding the area classification of the locations in which gas detection systems were employed. While cases for both changing and not changing the classification of the location were presented, there was no Panel 14 voting or consensus achieved as to whether or not the use of gas detection equipment permitted/required the change of the area classification of the location. It is noted that the new section on gas detection closely follows API RP 500 which has included the use of gas detection equipment in the petroleum industry for many years. API RP 500 uses the words "designated" and "considered" when reducing the area classification based on the use of combustible gas detection equipment. The area classification drawings, therefore, typically show the classification as designated after employing the combustible gas detection equipment.

Without a consensus of Panel 14 regarding this issue, inclusion into the 2002 NEC Handbook or the use of the comment as a design or enforcement reference would be misleading and should not be made.

(Log #2277)

14- 52 - (501-3(a)): Accept in Principle

SUBMITTER: Larry E. Fuhrman, City of Titusville

COMMENT ON PROPOSAL NO: 14-63 and 14-65

RECOMMENDATION: Revise text as follows:

(a) In Class I, Division I, locations, meters, instrument transformers, resistors, rectifiers, and thermonic tubes, shall be provided with enclosures ~~approved~~ "listed" for Class I, Division I locations.

SUBSTANTIATION: Panel Action on other similar proposals was to accept the change from approved to "listed". Enclosures for Class I, Division I, are readily available and a non listed enclosure should not be approved by the Authority Having Jurisdiction. This action would make it clear to the installer and the Authority Having Jurisdiction that it is the Panel's intent to require listed equipment in Class I, Division I areas. See 501-3(b)(1).

PANEL ACTION: Accept in Principle.

In the first sentence of 501-3(a), change the word "approved" to "identified".

PANEL STATEMENT: The word "identified" is more appropriate.

(Log #2278)

14- 55 - (501-4(3)): Reject
Note: See Technical Correlating Committee action on Comment 14-51.
SUBMITTER: Larry E. Fuhrman, City of Titusville
COMMENT ON PROPOSAL NO: 14-59a
RECOMMENDATION: Revise text as follows:
(3) All boxes fittings and joints shall be ~~approved~~ "listed" for Class I, Division I.
SUBSTANTIATION: Panel Action on all equipment utilized in Class 1, Division 1, locations consistently Accepted in Part proposals changed the word approved to "listed". This comment, if accepted, would keep the consistency of the requirements for Class 1, Division 1.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes that "approved" is the appropriate term for this application.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #478)

14- 56 - (501-4(a)(1)): Reject
SUBMITTER: William T. Fiske, Intertek Testing Services
COMMENT ON PROPOSAL NO: 14-76
RECOMMENDATION: The proposal should be accepted, thus reversing panel action.
SUBSTANTIATION: We believe that the panel statement in the ROP is erroneous. The submitter has, in fact, substantiated that going to 3.5 threads engaged does not significantly increase the risk of fire or explosion.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its position of requiring five threads fully engaged.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #893)

14- 57 - (501-4(a)(1)): Reject
SUBMITTER: William G. Lawrence, Jr., S. Yarmouth, MA
COMMENT ON PROPOSAL NO: 14-76
RECOMMENDATION: Proposal 14-76 should be accepted as proposed.
Consideration should also be given to the location of the requirement. As the minimum thread engagement is applicable to more than just conduit, a better location would be the "general" requirements section [500-8(d)] of Article 500 in a similar manner to the requirement presented in Article 505 [505.9(D) of the preprint]. The requirement, be it 3.5 or 5, should be located in similar sections of the articles.
SUBSTANTIATION: Research work conducted by the Electrical Equipment Certification Service (EECS/BASEEFA/MECS) in the United Kingdom has concluded that 2.3 hand-tight tapered threads will not transmit an explosion. The 2.3 threads represents at least 150 percent safety factor on the proposed 3.5 minimum thread wrench-tight engagement. The conclusions of the research work are provided and demonstrate that the integrity of the installation is not compromised.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: While the information provided indicates that the reduced number of thread engagements proposed may not contribute to additional flame transmission, the panel believes that there are advantages to requiring an engagement of five threads.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
LAWRENCE: Comment 14-57 should have been accepted. The panel's rejection of Proposal 14-76 was based on "a lack of technical substantiation". I believe that the submitter provided the requested technical substantiation with Comment 14-57. In the panel's rejection of Comment 14-57, they agreed that the provided test report confirmed that the proposed reduced thread engagement would not contribute to an increased risk of flame transmission, but there are other "advantages" to the current five thread minimum engagement. The panel was remiss in their failure to detail how any of those undefined "advantages" affected the rationale for their rejection, and, therefore, did not comply with 4-4.6.3 of the Regulations Governing Committee Projects.

(Log #2312)

14- 58 - (501-4(a)(1)): Reject
SUBMITTER: Joseph H. Kuczka, Killark
COMMENT ON PROPOSAL NO: 14-76
RECOMMENDATION: This proposal should be reconsidered. This new requirement should be permitted in the interest of international harmonization.
SUBSTANTIATION: If this change is considered to compromise safety, then the use of straight threaded couplings to HPT conduit should not be permitted.
PANEL ACTION: Reject.
PANEL STATEMENT: See Comments 14-56 and 14-57.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #1018)

14- 60 - (501-4(b)): Accept in Principle
SUBMITTER: Nicholas Ludlam, Factory Mutual Research
COMMENT ON PROPOSAL NO: 14-83
RECOMMENDATION: Although I agree with the panel statement it does not go far enough. The addition of simple apparatus to a nonincendive field wiring circuit was not covered in the panel statement.
(b) Class I, Division 2. In Class I, Division 2 locations, threaded rigid metal conduit, threaded steel intermediate metal conduit, enclosed gasketed busways, enclosed gasketed wireways, or Type PLTC cable in accordance with the provisions of Article 725, or Type ITC cable in cable trays, in raceways, supported by messenger wire, or directly buried where the cable is listed for this use; Type MI, MC , MV or TC cable with approved termination fittings shall be the wiring method employed. Type ITC, PLTC, MI, MC, MV or TC cable shall be permitted to be installed in cable tray systems and shall be installed in a manner to avoid tensile stress at the termination fittings. Boxes, fittings, and joints shall not be required to be exposionproof except as required by Sections 501-3(b)(1), 501-6(b)(1), and 501-14(b)(1). Where provisions must be made for limited flexibility, as at motor terminals, flexible metal fittings, flexible metal conduit with approved fittings, liquidtight flexible metal conduit with approved.
FPN: See Section 501-16(b) for grounding requirements where flexible conduit is used.
Exception: Nonincendive field wiring shall be permitted using any of the methods suitable for wiring in unclassified locations.
Nonincendive field wiring systems shall be installed in accordance with the control drawing(s).
Exception: A simple apparatus that does not interconnect nonincendive field wiring circuits.
FPN: The control drawing identification is marked on the apparatus.
SUBSTANTIATION: The use of the control drawing for interconnecting nonincendive field wiring systems was accepted as part of the original panel action.

The addition of simple apparatus as defined in 504-2 was included in the original proposal but the substantiation omitted. This is similar to the situation for intrinsically safe circuits where 'simple apparatus' can be added to the circuit without the need to resubmit it for listing and without it being specifically covered by the control drawing. This part of the proposal brings the use of simple apparatus in nonincendive field wiring into line with intrinsically safe circuits. The proposed FPN does not include a requirement as stated by the panel, and is actually identical to the wording used in 504-10 of the existing code. The order of the Exception and FPN have been switched so that the exception does not appear to be part of the FPN.

PANEL ACTION: Accept in Principle.

In 501-4(b)(3) add a second sentence to read as follows:

"Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit."

Also add a Fine Print Note to read as follows:

"FPN: Simple apparatus is defined in Section 504-2."

In addition, delete the words " the intrinsic safety of" from the definition of "simple apparatus" in 504-2.

PANEL STATEMENT: The panel action accomplishes the intent of the commenter by inserting the language into the new draft text.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

(Log #2327)

14- 61 - (501-4(b)): Accept in Principle in Part

Note: The Technical Correlating Committee understands that the panel action should have been to add a new paragraph to 501-4(B)(3) as shown in the text of the rewrite for Article 501 in Comment 14-48.

SUBMITTER: Nicholas Ludlam, Factory Mutual Research

COMMENT ON PROPOSAL NO: 14-84

RECOMMENDATION: I think that the Panel misunderstood the problems associated with Nonincendive Field Wiring.

Separation of Nonincendive Field Wring Conductors

(a) From Nonincendive Field Wiring Conductors.

(1) Open Wiring. Conductors and cables of nonincendive field wiring circuits not in raceways or cable trays shall be separated at least 1.97 in. (50 mm) and secured from conductors and cables of any other circuits.

(2) In Raceways, Cable Trays and Cables. Conductors of nonincendive field wiring circuits shall not be placed in any raceway, cable tray, or cable with conductors of any other circuit.

Exception No. 1: Where conductors of nonincendive field wiring circuits are separated from conductors of incendive field wiring circuits by a distance of at least 1.97 in. (50 mm) and secured, or by a grounded metal partition or an approved insulating partition.

FPN: No. 20 gauge sheet metal partitions 0.0359 in. (912 mm) or thicker are generally considered acceptable.

Exception No. 2: Where either (1) all of the nonincendive field wiring circuit conductors or (2) all of the incendive field wiring circuit conductors are in grounded metal-sheathed or metal-clad cables where the sheathing or cladding is capable of carrying fault current to ground.

FPN: Cables meeting the requirements of Articles 330 and 334 are typical of those considered acceptable.

(3) Within Enclosures.

a. Conductors of nonincendive field wiring circuits shall be separated at least 1.97 in. (50 mm) from conductors of any incendive field wiring circuits, or as specified in Section 501-4(b)(a)(2).

b. All conductors shall be secured so that any conductor that might come loose from a terminal cannot come in contact with another terminal.

FPN No, 1: The use of separate wiring compartments for the nonincendive field wiring and incendive field wiring terminals is the preferred method of complying with this requirement.

FPN No. 2: Physical barriers such as grounded metal partitions or approved insulating partitions or approved restricted access wiring ducts separated from other such ducts by at least 3/4 in. (19 mm) can be used to help ensure the required separation of the wiring.

(b) From Different Nonincendive Field Wiring Circuit Conductors. Different nonincendive field wiring circuits shall be in separate cables or shall be separated from each other by one of the following means.

1. The conductors of each circuit are within a grounded metal shield.

2. The conductors of each circuit have insulation with a minimum thickness of 0.01 in. (254 mm).

Exception: Unless otherwise approved.

SUBSTANTIATION: It seems to me that there is a hole in the current NEC for nonincendive field wiring circuits. Class 2 Circuits [725-41 and Chapter 9 Tables 11(a) and 11(b)] are circuits in which the power is limited and which as a result can be considered not to be a source risk of fire or shock. By comparison with the tables in ISA 12.12:1994, any Associated Nonincendive Field Wiring output can also be categorized as a Class 2 power supply. Class 2 and 3 circuits can be wired in any cable suitable for ordinary locations [726-61 Exception 1]. In addition, faults are not considered to occur in the wiring for a Class 2 or Class 3 circuit, and Class 2 or Class 3 power sources shall not have the output connections paralleled or otherwise interconnected unless listed for such interconnection. But Nonincendive Field wiring circuits do consider the wiring opening, shorting and grounding. So if you have a Class 2 circuit which is also a Nonincendive field wiring circuit, then it can be run in ordinary location wiring with no regard to the mechanical protection afforded by the PLTC cable that are to be used for other Class 2 circuits in Hazardous Locations. (It can also be wired in any other type of cable provided it is adequately supported and protected from mechanical damage, and not just PLTC - 725-61(d)). Considering also that Class 2 circuits cannot be mixed with any other circuit [except Class 3 circuits 725-54(b)(2)] unless by the exception listed in 504b. But since there is no restriction on the number and type of circuits run in the same ordinary location cable, and because we have to consider the faults, we can have the situation where a shorting of the outputs of the circuit gives rise to a situation where the voltage and current in the cable no longer are nonignition capable, and are no longer Class 2 circuits.

Some examples of this are: A 4-20mA circuit will normally operate at 24V, and a maximum current under normal operation of 22mA. For nonincendive field wiring we have to consider the case where the outputs are shorted together. The maximum current is then dependent on the current limiting within the power source. This typically is 100mA but could be as much as 245mA. 24V 100mA is nonignition capable for Class I Groups A and B by comparison with the ignition curves in ISA 12.12:1994. But if you have a circuit such as a PLC then you will have more than one output. If there are more than 3 outputs for this PLC, and the outputs are all 24V 100mA then by comparison with the ignition curves in ISA 12.12:1994 this IS ignition capable for Class I Groups A and B. In order to make this Nonincendive Field Wiring a usable concept, we need to define a method of segregating circuits. The proposal was an attempt to correct this omission from the NEC. The added text is based on the current 504-30.

Note: Although this example is for Class I the same problems apply for Class II although the ignition energies permitted are higher.

PANEL ACTION: Accept in Principle in Part.

Add a new section to 501-4(b)(3) to read "Separate nonincendive field wiring circuits shall be:

a) in separate cables, or

b) in multiconductor cables where the conductors of each circuit are within a grounded metal shield, or

c) in multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in)."

PANEL STATEMENT: The panel action satisfies the intent of the submitter, with regard to separation of conductors in cables.

14- 66 - (501-5(b) Exception No. 1): Reject
SUBMITTER: Joe Cox, Bluff City, TN
COMMENT ON PROPOSAL NO: 14-99
RECOMMENDATION: The panel should have accepted the proposal.
SUBSTANTIATION: Threaded metal conduit couplings should be allowed in a conduit run through a division 2 location between two unclassified locations without conduit seals where exiting the classified location.
Exception No. 2 under the same article allows conduit systems containing (unreadable word) fittings, couplings, unions, etc. to pass from division 2 to unclassified locations without a boundary seal, provided the conduit system is in one room and opens to another wiring system. This proposal is similar, in that it proposes that insufficient quantities of flammable materials will be introduced into the conduit and travel to an adjacent location creating a hazardous condition.
Threaded couplings are allowed in Division 1 conduit systems. If the panel believes these offer tight fitting threads sufficient to exhaust and cool exploding vapors, then the same tight fit should be adequate to prevent nonexploding vapor migration.
A Division 2 location is not expected to be hazardous but a very small percentage of the time. Does the panel expect that during this short time enough vapor will migrate through the coupling threads and create a hazardous condition in the unclassified location? Common sense should indicate otherwise.
PANEL ACTION: Reject.
PANEL STATEMENT: No new technical substantiation has been provided.

(Log #492)

14- 79 - (501-14(b)(1)): Reject
SUBMITTER: William T. Fiske, Intertek Testing Services
COMMENT ON PROPOSAL NO: 14-186, 14-187
RECOMMENDATION: Revise as follows:
"... shall have enclosures ~~approved~~ listed for Class I, Division 1 locations...".
SUBSTANTIATION: Listed Class I, Division 1 enclosures are readily available.
Acceptance of this proposal would change panel action from accept to accept in principle.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel has concluded that the appropriate term is "identified".
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

(Log #150)

14- 80 - (501-15): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 14-188
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 14-318a. The Technical Correlating Committee understands that there is no change to 501-15. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel has reconsidered this issue and confirms that the text was intended for Article 505, not Article 501.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

(Log #686)

14- 81 - (501-16(a)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 14-191
RECOMMENDATION: This proposal should be accepted, either as is, or in principle.
SUBSTANTIATION: It is unclear whether the panel statement means the existing text is intended to be more stringent than Article 250 or the proposed changes would make it more stringent (the proposed change would bring this section into agreement with Article 250, which is not the case now). This part of this section could also simply state "Bonding shall comply with Section 250-100," and still have the same effect.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirement in Article 501 is more rigorous than Article 250 requirements, and is so intended. The substantiation accompanying proposal 14-191 does not support a change to Article 501.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COOK: I agree with submitter of comment and proposal. Current text in 501-16(a) addresses bonding where locknut-bushing and double-locknut contacts are encountered. Proposed text would also address wiring methods with single locknuts and shoulders of connectors, which I believe is the intent of the panel. I do not agree with the Panel Statement.

ARTICLE 502 — CLASS II LOCATIONS

(Log #152)

14- 85 - (502): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 14-200
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the Technical Correlating Committee direction to reconsider Proposal 14-200. The original Proposal 14-200 is accepted in principle with the following changes(section numbers are 1999 NEC):
-Section 502-5(2), change "10 ft. (3.05m)" to "3.05m (10 ft.)".
-Also, in 502-9, change "0.021 in. (533 um)" to "0.53 mm (0.021 in)".
PANEL STATEMENT: Revised text provides more consistent use of metric units from Article 500 through 516 and consistency with CMP-8 action on conduit. CMP-14 recognizes that some changes involve extracted material, however changes were made based on Standards Council direction provided at their October 6, 2000 meeting.

14- 86 - (502): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 14-200a
RECOMMENDATION: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. Further, it was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel, with further consideration given to the comments expressed in the voting, specifically with respect to comments that the accepted Proposal does not accurately reflect what was agreed upon by the Panel. It is the understanding of the Technical Correlating Committee that this proposal is modified by Proposals 14-201, 14-202, 14-204, 14-205, 14-206, 14-207, 14-207a, 14-208, 14-209, 14-210, 14-210a, 14-211, 14-212, 14-213, 14-216, 14-219, 14-223,14-224, 14-227, 14-228, 14-231, 14-232, 14-233, 14-234, 14-235, 14-236, 14-239, 14-240, 14-243, 14-244, 14-245, 14-246, 14-249, 14-250, 14-251, 14-252, 14-255, 14-256, 14-257, 14-258, 14-259, 14-262, 14-263, 14-264, 14-265, 14-266, 14-267, 14-268, 14-269, 14-270, and 14-271. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.

14- 89 - (502): Reject
SUBMITTER: David Wechsler, Union Carbide Corp.
COMMENT ON PROPOSAL NO: 14-200a
RECOMMENDATION: Replace "identified" with the prior NEC wording.
SUBSTANTIATION: The proposed definition for "identified" contains an important FPN that is fundamental to the entire reason for having this definition. This definition also differs from the Article 100 definition. It was the action of the Technical Correlating Committee that the Article 100 definition be used and that the FPN be eliminated since it contains permissive language that is not permitted by the NEC Style Manual. With the elimination of this definition, the text must be reverted to that of the current code.
PANEL ACTION: Reject.
PANEL STATEMENT: See action on Comment 14-90.

14- 90 - (502): Accept in Principle
Note: The Technical Correlating Committee directs that "lighting fixtues" be changed to "luminaires (lighting fixtures)" in 502-11(a)(40.
SUBMITTER: James D. Cospolich, Waldemar S. Nelson & Co., Inc.
COMMENT ON PROPOSAL NO: 14-200a
RECOMMENDATION: Please see the following revised text which represents what I believe to be the correct wording that Code Making Panel 14 voted on and accepted during the January 2000 ROP meeting. The shaded wording represents what I consider to be revisions and corrections. Some of this shaded wording is very important for the technical accuracy and intent of the article.

ARTICLE 502 -- Class II Locations

502-1. General

The general rules of this Code shall apply to the electric wiring and equipment in locations classified as Class II locations in Section 500-5(c)~~500-8~~.

Exception: As modified by this article.

Dust-ignitionproof, as used in this article, shall mean enclosed in a manner that will exclude dusts and, where installed and protected in accordance with this Code, will not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.

FPN: For further information on dust-ignitionproof enclosures, see Type 9 enclosure in Enclosures for Electrical Equipment, ANSI/NEMA 250-1991, and Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations, ANSI/UL 1203-1994.

Equipment installed in Class II locations shall be able to function at full rating without developing surface temperatures high enough to cause excessive dehydration or gradual carbonization of any organic dust deposits that may occur.

FPN: Dust that is carbonized or excessively dry is highly susceptible to spontaneous ignition.

Equipment and wiring of the type defined in Article 100 as explosionproof shall not be required and shall not be acceptable in Class II locations unless identified ~~approved~~ [14-201, 14-202]-for such locations.

Where Class II, Group E dusts are present in hazardous quantities, there are only Division 1 locations.

502-2. Transformers and Capacitors

(a) Class II, Division 1. In Class II, Division 1 locations, transformers and capacitors shall comply with the following.

(1) Containing Liquid that Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed only in ~~approved~~[14-204,14-205]-vaults complying with Sections 450-41 through 450-48, and, in addition, the following shall apply.

a. Doors or other openings communicating with the Division 1 location shall have self-closing fire doors on both sides of the wall, and the doors shall be carefully fitted and provided with suitable seals (such as weather stripping) to minimize the entrance of dust into the vault.

b. Vent openings and ducts shall communicate only with the outside air.

c. Suitable pressure-relief openings communicating with the outside air shall be provided.

(2) Not Containing Liquid that Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with Sections 450-41 through 450-48 or be identified ~~approved~~ [14-206,14-207]-as a complete assembly, including terminal connections for Class II locations.

(3) Metal Dusts. No transformer or capacitor shall be installed in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present.

(b) Class II, Division 2. In Class II, Division 2 locations, transformers and capacitors shall comply with the following.

(1) Containing Liquid that Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed in vaults that comply with Sections 450-41 through 450-48.

(2) Containing Askarel. Transformers containing askarel and rated in excess of 25 kVA shall be as follows:

a. Provided with pressure-relief vents

b. Provided with a means for absorbing any gases generated by arcing inside the case, or the pressure-relief vents shall be connected to a chimney or flue that will carry such gases outside the building

c. Have an airspace of not less than 6 in. (152 mm) between the transformer cases and any adjacent combustible material

(3) Dry-Type Transformers. Dry-type transformers shall be installed in vaults or shall have their windings and terminal connections enclosed in tight metal housings without ventilating or other openings and shall operate at not over 600 volts, nominal.

502-4. Wiring Methods

Wiring methods shall comply with (a) or ~~and~~ (b). (CP-1409 to correlate with 501-4)

(a) Class II, Division 1. In Class II, Division 1 locations, threaded rigid metal conduit, threaded steel intermediate metal conduit, or Type MI cable with termination fittings listed ~~approved~~ [14-208,14-209]-for the location shall be the wiring method employed. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

Exception: In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type MC cable, listed for use in Class II, Division 1 locations, with a gas/vaportight continuous corrugated metallic ~~aluminum~~ [14-210]-sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application shall be permitted.

(1) Fittings and Boxes. Fittings and boxes shall be provided with threaded bosses for connection to conduit or cable terminations and shall be dust-tight. Fittings and boxes in which taps, joints, or terminal connections are made, or that are used in Group E, shall be identified for Class II locations.~~, shall have close fitting covers, and shall have no openings (such as holes for attachment screws) through which dust might enter or through which sparks or burning material might escape. Fittings and boxes in which taps, joints, or terminal connections are made, or that are used in locations where dusts are of a combustible, electrically conductive nature, shall be approved for Class II locations.~~ (14-211,14-212,CP-1408)

(2) Flexible Connections. Where necessary to employ flexible connections, dusttight flexible connectors, liquidtight flexible metal conduit with approved fittings, liquidtight flexible nonmetallic conduit with listed ~~approved~~ fittings, or flexible cord listed ~~approved~~ for extra-hard usage and provided with bushed fittings shall be used. Where flexible cords are used, they shall comply with Section 502-12. Where flexible connections are subject to oil or other corrosive conditions, the insulation of the conductors shall be of a type listed ~~approved~~ for the condition or shall be protected by means of a suitable sheath. [14-213]

FPN: See Section 502-16(b) for grounding requirements where flexible conduit is used.

(b) Class II, Division 2. In Class II, Division 2 locations, rigid metal conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways, Type MC or MI cable with listed ~~approved~~ [14-216,14-219]-termination fittings, Type PLTC in cable trays, Type ITC in cable trays, or Type MC, MI, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed.

Exception No. 1: Nonincendive field wiring shall be permitted using any of the methods suitable for wiring in nonhazardous ~~ordinary~~ locations including Chapter 7 and 8 wiring methods.(14-220)

Exception No. 2: Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the above required spacings.

(1) Boxes and Fittings. All boxes and fittings shall be dusttight. (14-221,14-222)

~~(1) Wireways, Fittings, and Boxes. Wireways, fittings, and boxes in which taps, joints, or terminal connections are made shall be designed to minimize the entrance of dust and (1) shall be provided with telescoping or close fitting covers or other effective means to prevent the escape of sparks or burning material and (2) shall have no openings (such as holes for attachment screws) through which, after installation, sparks or burning material might escape or through which adjacent combustible material might be ignited.~~

(2) Flexible Connections. Where flexible connections are necessary, (a)(2) shall apply.

Rewrite of above section 502-4 to correlate with 501-4 and as modified by Proposals

502-4. Wiring Methods

Wiring methods shall comply with (a) or (b). (CP-1409 to correlate with 501-4)

(a) Class II, Division 1.

(1) In Class II, Division 1 locations, the following wiring methods shall be permitted:

(a) Threaded rigid metal conduit, or threaded steel intermediate metal conduit may be used.

(b) Type MI cable with termination fittings listed [14-208,14-209] for the location. Type MI cable shall be installed and supported in a manner to

avoid tensile stress at the termination fittings.

(c) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type MC cable, listed for use in Class II, Division 1 locations, with a gas/vaportight continuous corrugated metallic [14-210] sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application shall be permitted.

(d) Fittings and boxes shall be provided with threaded bosses for connection to conduit or cable terminations and shall be dust-tight. Fittings and boxes in which taps, joints, or terminal connections are made, or that are used in Group E, shall be identified for Class II locations. (14-211,14-212,CP-1408)

(e) Where necessary to employ flexible connections, dusttight flexible connectors, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord listed for extra-hard usage and provided with bushed fittings shall be used. Where flexible cords are used, they shall comply with Section 502-12. Where flexible connections are subject to oil or other corrosive conditions, the insulation of the conductors shall be of a type listed for the condition or shall be protected by means of a suitable sheath. [14-213]

FPN: See Section 502-16(b) for grounding requirements where flexible conduit is used.

(b) Class II, Division 2.

(1) In Class II, Division 2 locations, the following wiring methods shall be permitted:

a. Rigid metal conduit, intermediate metal conduit, electrical metallic tubing,
b. Dusttight wireways,
c. Type MC or MI cable with listed [14-216,14-219]termination fittings,
d. Type PLTC in cable trays,
e. Type ITC in cable trays,
f. Type MC, MI, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed.

Exception: Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the above required spacings.

(2) Where provision must be made for flexibility apply 502-4 (a)(1)(e.)

(3) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for nonhazardous [14-81,14-88,1401, 14-220] locations, including Chapter 7 and 8 wiring methods. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). (14-83)

(4) All boxes and fittings shall be dusttight. (14-221,14-222)

502-5. Sealing, Class II, Divisions 1 and 2

Where a raceway provides communication between an enclosure that is required to be dust-ignitionproof and one that is not, suitable means shall be provided to prevent the entrance of dust into the dust-ignitionproof enclosure through the raceway. One of the following means shall be permitted:
1. A permanent and effective seal,
2. A horizontal raceway not less than 10 ft (3.05 m) long, or
3. A vertical raceway not less than 5 ft (1.52 m) long and extending downward from the dust-ignitionproof enclosure

Where a raceway provides communication between an enclosure that is required to be dust-ignitionproof and an enclosure in an unclassified location, seals shall not be required.
Sealing fittings shall be accessible.
Seals shall not be required to be explosionproof.
FPN: Electrical sealing putty is a method of sealing.

502-6. Switches, Circuit Breakers, Motor Controllers, and Fuses

(a) Class II, Division 1. In Class II, Division 1 locations, switches, circuit breakers, motor controllers, and fuses shall comply with the following:
(1) Type Required. Switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices that are intended to interrupt current during normal operation or that are installed where combustible dusts of an electrically conductive nature may be present, shall be provided with identified ~~approved~~ [14-223,14-224] dust-ignitionproof enclosures.
(2) Isolating Switches. Disconnecting and isolating switches containing no fuses and not intended to interrupt current and not installed where dusts may be of an electrically conductive nature shall be provided with tight metal enclosures that shall be designed to minimize the entrance of dust and that shall (1) be equipped with telescoping or close-fitting covers or with other effective means to prevent the escape of sparks or burning material and (2) have no openings (such as holes for attachment screws) through which, after installation, sparks or burning material might escape or through which exterior accumulations of dust or adjacent combustible material might be ignited.

(3) Metal Dusts. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fuses, switches, motor controllers, and circuit breakers shall have enclosures identified ~~specifically approved~~(14-225,14-226)-for such locations.

(b) Class II, Division 2. In Class II, Division 2 locations, enclosures for fuses, switches, circuit breakers, and motor controllers, including pushbuttons, relays, and similar devices, shall be dusttight.

502-7. Control Transformers and Resistors

(a) Class II, Division 1. In Class II, Division 1 locations, control transformers, solenoids, impedance coils, resistors, and any overcurrent devices or switching mechanisms associated with them shall have dust-ignitionproof enclosures approved for Class II locations. No control transformer, impedance coil, or resistor shall be installed in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present unless provided with an enclosure identified ~~approved~~[14-227, 14-228]-for the specific location.

(b) Class II, Division 2. In Class II, Division 2 locations, transformers and resistors shall comply with the following.
(1) Switching Mechanisms. Switching mechanisms (including overcurrent devices) associated with control transformers, solenoids, impedance coils, and resistors shall be provided with dusttight enclosures.
(2) Coils and Windings. Where not located in the same enclosure with switching mechanisms, control transformers, solenoids, and impedance coils shall be provided with tight metal housings without ventilating openings.
(3) Resistors. Resistors and resistance devices shall have dust-ignitionproof enclosures identified ~~approved~~ for Class II locations.(14-229,14-230)
Exception: Where the maximum normal operating temperature of the resistor will not exceed 120ºC (248ºF), nonadjustable resistors or resistors that are part of an automatically timed starting sequence shall be permitted to have enclosures complying with (b)(2).

502-8. Motors and Generators

(a) Class II, Division 1. In Class II, Division 1 locations, motors, generators, and other rotating electrical machinery shall be
1. Identified ~~Approved~~[14-231, 14-232]-for Class II, Division 1 locations, or
2. Totally enclosed pipe-ventilated, meeting temperature limitations in Section 502-1.

(b) Class II, Division 2. In Class II, Division 2 locations, motors, generators, and other rotating electrical equipment shall be totally enclosed nonventilated, totally enclosed pipe-ventilated, totally enclosed water–air cooled, totally enclosed fan-cooled or dust-ignitionproof for which maximum full-load external temperature shall be in accordance with Section 500-8(c)(2) ~~500-5(f)~~ for normal operation when operating in free air (not dust blanketed) and shall have no external openings.
Exception: If the authority having jurisdiction believes accumulations of nonconductive, nonabrasive dust will be moderate and if machines can be easily reached for routine cleaning and maintenance, the following shall be permitted to be installed:
a. Standard open-type machines without sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent,

overloading, and overtemperature devices), or integral resistance devices
b. Standard open-type machines with such contacts, switching mechanisms, or resistance devices enclosed within dusttight housings without ventilating or other openings
c. Self-cleaning textile motors of the squirrel-cage type

502-9. Ventilating Piping
Ventilating pipes for motors, generators, or other rotating electric machinery, or for enclosures for electric equipment, shall be of metal not less than 0.021 in. (533 µm) in thickness, or of equally substantial noncombustible material, and shall comply with the following:
1. Lead directly to a source of clean air outside of buildings,
2. Be screened at the outer ends to prevent the entrance of small animals or birds, and
3. Be protected against physical damage and against rusting or other corrosive influences
Ventilating pipes shall also comply with (a) and (b).

(a) Class II, Division 1. In Class II, Division 1 locations, ventilating pipes, including their connections to motors or to the dust-ignitionproof enclosures for other equipment, shall be dusttight throughout their length. For metal pipes, seams and joints shall comply with one of the following:
1. Be riveted and soldered,
2. Be bolted and soldered,
3. Be welded, or
4. Be rendered dusttight by some other equally effective means

(b) Class II, Division 2. In Class II, Division 2 locations, ventilating pipes and their connections shall be sufficiently tight to prevent the entrance of appreciable quantities of dust into the ventilated equipment or enclosure and to prevent the escape of sparks, flame, or burning material that might ignite dust accumulations or combustible material in the vicinity. For metal pipes, lock seams and riveted or welded joints shall be permitted; and tight-fitting slip joints shall be permitted where some flexibility is necessary, as at connections to motors.

502-10. Utilization Equipment
(a) Class II, Division 1. In Class II, Division 1 locations, all utilization equipment shall be identified ~~approved~~ [14-233,14-234] for Class II locations. Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, such equipment shall be approved for the specific location.

(b) Class II, Division 2. In Class II, Division 2 locations, all utilization equipment shall comply with the following.
(1) Heaters. Electrically heated utilization equipment shall be identified ~~approved~~ [14-235,14-236]-for Class II locations.
Exception: Metal-enclosed radiant heating panel equipment shall be dusttight and marked in accordance with Section 500-8 (b)~~500-5(d)~~.
(2) Motors. Motors of motor-driven utilization equipment shall comply with Section 502-8(b).
(3) Switches, Circuit Breakers, and Fuses. Enclosures for switches, circuit breakers, and fuses shall be dusttight.
(4) Transformers, Solenoids, Impedance Coils, and Resistors. Transformers, solenoids, impedance coils, and resistors shall comply with Section 502-7(b).

502-11. Lighting Fixtures
Lighting fixtures shall comply with (a) and (b).
(a) Class II, Division 1. In Class II, Division 1 locations, lighting fixtures for fixed and portable lighting shall comply with the following.
(1) ~~Approved~~ Fixtures. Each fixture shall be identified ~~approved~~ for Class II locations and shall be clearly marked to indicate the maximum wattage of the lamp for which it is designed ~~approved~~. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fixtures for fixed or portable lighting and all auxiliary equipment shall be identified ~~approved~~ for the specific location. (14-237,14-238)
(2) Physical Damage. Each fixture shall be protected against physical damage by a suitable guard or by location.
(3) Pendant Fixtures. Pendant fixtures shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 12 in. (305 mm), permanent and effective bracing against lateral displacement shall be provided at a level not more than 12 in. (305 mm) above the lower end of the stem, or flexibility in the form of a fitting or a flexible connector listed ~~approved~~[14-240,14-243]-for the location shall be provided not more than 12 in. (305 mm) from the point of attachment to the supporting box or fitting. Threaded joints shall be provided with set-screws or other effective means to prevent loosening. Where wiring between an outlet box or fitting and a pendant fixture is not enclosed in conduit, flexible cord listed ~~approved~~ [14-239,14-244]-for hard usage shall be used, and suitable seals shall be provided where the cord enters the fixture and the outlet box or fitting. Flexible cord shall not serve as the supporting means for a fixture.

(4) Supports. Boxes, box assemblies, or fittings used for the support of lighting fixtures shall be identified ~~approved~~ [14-245,14-246]-for Class II locations.

(b) Class II, Division 2. In Class II, Division 2 locations, lighting fixtures shall comply with the following.
(1) Portable Lighting Equipment. Portable lighting equipment shall be identified ~~approved~~ for Class II locations. They shall be clearly marked to indicate the maximum wattage of lamps for which they are designed~~approved~~ [14-247,14-248].
(2) Fixed Lighting. Lighting fixtures for fixed lighting, where not of a type identified ~~approved~~ [14-249,14-250]-for Class II locations, shall provide enclosures for lamps and lampholders that shall be designed to minimize the deposit of dust on lamps and to prevent the escape of sparks, burning material, or hot metal. Each fixture shall be clearly marked to indicate the maximum wattage of the lamp that shall be permitted without exceeding an exposed surface temperature in accordance with Section 500-8 (c)(2)~~500-5(f~~) under normal conditions of use.
(3) Physical Damage. Lighting fixtures for fixed lighting shall be protected from physical damage by suitable guards or by location.
(4) Pendant Fixtures. Pendant fixtures shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 12 in. (305 mm), permanent and effective bracing against lateral displacement shall be provided at a level not more than 12 in. (305 mm) above the lower end of the stem, or flexibility in the form of an approved fitting or a flexible connector shall be provided not more than 12 in. (305 mm) from the point of attachment to the supporting box or fitting. Where wiring between an outlet box or fitting and a pendant fixture is not enclosed in conduit, flexible cord listed ~~approved~~ [14-251,14-256]-for hard usage shall be used. Flexible cord shall not serve as the supporting means for a fixture.
(5) Electric-Discharge Lamps. Starting and control equipment for electric-discharge lamps shall comply with the requirements of Section 502-7(b).

502-12. Flexible Cords — Class II, Divisions 1 and 2
Flexible cords used in Class II locations shall comply with the following:
1. Be of a type listed ~~approved~~[14-258,14-259]-for extra-hard usage,
FPN: Flexible cord listed for hard usage as permitted by Sections 502-11 (a) (3) and (b) (4). (14-257)
2. Contain, in addition to the conductors of the circuit, a grounding conductor complying with Section 400-23,
3. Be connected to terminals or to supply conductors in an approved manner,
4. Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections, and
5. Be provided with suitable seals to prevent the entrance of dust where the flexible cord enters boxes or fittings that are required to be dust-ignitionproof

502-13. Receptacles and Attachment Plugs
(a) Class II, Division 1. In Class II, Division 1 locations, receptacles and attachment plugs shall be of the type providing for connection to the grounding conductor of the flexible cord and shall be identified ~~approved~~[14-262,14-263]-for Class II locations.

(b) Class II, Division 2. In Class II, Division 2 locations, receptacles and attachment plugs shall be of the type that provide for connection to the grounding conductor of the flexible cord and shall be designed so that connection to the supply circuit cannot be made or broken while live parts are exposed.

502-14. Signaling, Alarm, Remote-Control, and Communications Systems; and Meters, Instruments, and Relays
FPN: See Article 800 for rules governing the installation of communications circuits.

(a) Class II, Division 1. In Class II, Division 1 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with the following:

(1) Wiring Methods. The wiring method shall comply with Section 502-4(a).
(2) Contacts. Switches, circuit breakers, relays, contactors, fuses and current-breaking contacts for bells, horns, howlers, sirens, and other devices in which sparks or arcs may be produced shall be provided with enclosures identified ~~approved~~ [14-264,14-265] for a Class II location.
Exception: Where current-breaking contacts are immersed in oil or where the interruption of current occurs within a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.
(3) Resistors and Similar Equipment. Resistors, transformers, choke coils, rectifiers, thermionic tubes, and other heat-generating equipment shall be provided with enclosures identified ~~approved~~ [14-266,14-267] for Class II locations.
Exception: Where resistors or similar equipment are immersed in oil or enclosed in a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.
(4) Rotating Machinery. Motors, generators, and other rotating electric machinery shall comply with Section 502-8(a).
(5) Combustible, Electrically Conductive Dusts. Where dusts are of a combustible, electrically conductive nature, all wiring and equipment shall be identified ~~approved~~ [14-268,14-269] for Class II locations.
(6) Metal Dusts. Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, all apparatus and equipment shall be identified ~~approved~~ [14-270,14-271] for the specific conditions.

(b) Class II, Division 2. In Class II, Division 2 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with the following.
(1) Contacts. Enclosures shall comply with (a)(2), or contacts shall have tight metal enclosures designed to minimize the entrance of dust and shall have telescoping or tight-fitting covers and no openings through which, after installation, sparks or burning material might escape.
Exception: In nonincendive circuits, enclosures shall be permitted to be of the general-purpose type.
(2) Transformers and Similar Equipment. The windings and terminal connections of transformers, choke coils, and similar equipment shall be provided with tight metal enclosures without ventilating openings.
(3) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with (a)(3).
Exception: Enclosures for thermionic tubes, nonadjustable resistors, or rectifiers for which maximum operating temperature will not exceed 120ºC (248ºF) shall be permitted to be of the general-purpose type.
(4) Rotating Machinery. Motors, generators, and other rotating electric machinery shall comply with Section 502-8(b).
(5) Wiring Methods. The wiring method shall comply with Section 502-4(b).

502-15. Live Parts, Class II, Divisions 1 and 2
Live parts shall not be exposed.

502-16. Grounding, Class II, Divisions 1 and 2
Wiring and equipment in Class II, Divisions 1 and 2 locations shall be grounded as specified in Article 250 and with the following additional requirements.
(a) Bonding. The locknut-bushing and double-locknut types of contact shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class II locations and the point of grounding for service equipment or point of grounding of a separately derived system.
Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode conductor are connected together on the line side of the building or structure disconnecting means as specified in Sections 250-32(a), (b), and (c), if the branch-circuit overcurrent protection is located on the load side of the disconnecting means.
FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.
(b) Types of Equipment Grounding Conductors. Where flexible conduit is used as permitted in Section 502-4, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with Section 250-102.
Exception: In Class II, Division 2 locations, the bonding jumper shall be permitted to be deleted where all the following conditions are met.
a. Listed liquidtight flexible metal conduit 6 ft (1.83 m) or less in length, with fittings listed for grounding, is used.
b. Overcurrent protection in the circuit is limited to 10 amperes or less.
c. The load is not a power utilization load.

502-17. Surge Protection — Class II, Divisions 1 and 2
Surge arresters, including their installation and connection, shall comply with Article 280. In addition, surge arresters, if installed in a Class II, Division 1 location, shall be in suitable enclosures.
Surge-protective capacitors shall be of a type designed for specific duty.

502-18. Multiwire Branch Circuits
In a Class II, Division 1 location, a multiwire branch circuit shall not be permitted.
Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.
SUBSTANTIATION: During the January 2000 ROP meeting, Code Making Panel 14 was challenged with a very difficult task due to the large number of proposals that required action, the technical content of the requested revisions, and the Technical Correlating Committee formatting changes. As a result, it was very difficult for the NEC staff assigned to Code Making Panel 14 to keep up with the actions taking place. This comment's intent is to clarify what took place and make necessary revisions.
PANEL ACTION: Accept in Principle.
Revise Article 502 to read as follows:

ARTICLE 502
[Comment 14-90]

Class II Locations

502-1. General

The general rules of this Code shall apply to the electric wiring and equipment in locations classified as Class II locations in Section 500-5(c)~~500-8~~.

Exception: As modified by this article.

~~**Dust ignitionproof**, as used in this article, shall mean enclosed in a manner that will exclude dusts and, where installed and protected in accordance with this Code, will not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.~~

~~FPN: For further information on dust ignitionproof enclosures, see Type 9 enclosure in Enclosures for Electrical Equipment, ANSI/NEMA 250-1991, and Explosionproof and Dust Ignitionproof Electrical Equipment for Hazardous (Classified) Locations, ANSI/UL 1203-1994.~~

Equipment installed in Class II locations shall be able to function at full rating without developing surface temperatures high enough to cause excessive dehydration or gradual carbonization of any organic dust deposits that may occur.

FPN: Dust that is carbonized or excessively dry is highly susceptible to spontaneous ignition.

Explosionproof e~~E~~quipment and wiring ~~of the type defined in Article 100 as explosionproof~~ shall not be required and shall not be acceptable in Class II locations unless identified ~~approved~~ for such locations. Where Class II, Group E dusts are present in hazardous quantities, there are only Division 1 locations.

502-2. Transformers and Capacitors

(a) Class II, Division 1. In Class II, Division 1 locations, transformers and capacitors shall comply with the following.

(1) Containing Liquid that Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed only in ~~approved~~ vaults complying with Sections 450-41 through 450-48, and, in addition, the following shall apply.

a. Doors or other openings communicating with the Division 1 location shall have self-closing fire doors on both sides of the wall, and the doors shall be carefully fitted and provided with suitable seals (such as weather stripping) to minimize the entrance of dust into the vault.
b. Vent openings and ducts shall communicate only with the outside air.

c. Suitable pressure-relief openings communicating with the outside air shall be provided.

(2) Not Containing Liquid that Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with Sections 450-41 through 450-48 or be identified ~~approved~~ as a complete assembly, including terminal connections for Class II locations.

(3) Metal Dusts. No transformer or capacitor shall be installed in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present.

(b) Class II, Division 2. In Class II, Division 2 locations, transformers and capacitors shall comply with the following.

(1) Containing Liquid that Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed in vaults that comply with Sections 450-41 through 450-48.

(2) Containing Askarel. Transformers containing askarel and rated in excess of 25 kVA shall be as follows:

a. Provided with pressure-relief vents
b. Provided with a means for absorbing any gases generated by arcing inside the case, or the pressure-relief vents shall be connected to a chimney or flue that will carry such gases outside the building
c. Have an airspace of not less than 150 mm (6 in.) ~~(152 mm)~~ between the transformer cases and any adjacent combustible material

(3) Dry-Type Transformers. Dry-type transformers shall be installed in vaults or shall have their windings and terminal connections enclosed in tight metal housings without ventilating or other openings and shall operate at not over 600 volts, nominal.

~~**502-4. Wiring Methods**~~
~~Wiring methods shall comply with (a) or and (b). (CP-1409 to correlate with 501-4)~~

~~**(a) Class II, Division 1.** In Class II, Division 1 locations, threaded rigid metal conduit, threaded steel intermediate metal conduit, or Type MI cable with termination fittings listed approved [14-208,14-209] for the location shall be the wiring method employed. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.~~
~~Exception: In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type MC cable, listed for use in Class II, Division 1 locations, with a gas/vaportight continuous corrugated metallic aluminum [14-210] sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application shall be permitted.~~

~~(1) Fittings and Boxes. Fittings and boxes shall be provided with threaded bosses for connection to conduit or cable terminations and shall be dust-tight. Fittings and boxes in which taps, joints, or terminal connections are made, or that are used in Group E, shall be identified for Class II locations., shall have close-fitting covers, and shall have no openings (such as holes for attachment screws) through which dust might enter or through which sparks or burning material might escape. Fittings and boxes in which taps, joints, or terminal connections are made, or that are used in locations where dusts are of a combustible, electrically conductive nature, shall be approved for Class II locations. (14-211,14-212,CP-1408)~~

~~(2) Flexible Connections. Where necessary to employ flexible connections, dusttight flexible connectors, liquidtight flexible metal conduit with approved fittings, liquidtight flexible nonmetallic conduit with listed approved fittings, or flexible cord listed approved for extra-hard usage and provided with bushed fittings shall be used. Where flexible cords are used, they shall comply with Section 502-12. Where flexible connections are subject to oil or other corrosive conditions, the insulation of the conductors shall be of a type listed approved for the condition or shall be protected by means of a suitable sheath. [14-213]~~
~~FPN: See Section 502-16(b) for grounding requirements where flexible conduit is used.~~

~~**(b) Class II, Division 2.** In Class II, Division 2 locations, rigid metal conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways, Type MC or MI cable with listed approved [14-216,14-219] termination fittings, Type PLTC in cable trays, Type ITC in cable trays, or Type MC, MI, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed.~~
~~Exception No. 1: Nonincendive field wiring shall be permitted using any of the methods suitable for wiring in nonhazardous ordinary locations including Chapter 7 and 8 wiring methods.(14-220)~~
~~Exception No. 2: Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the above required spacings.~~

~~(1) Boxes and Fittings. All boxes and fittings shall be dusttight. (14-221,14-222)~~

~~(1) Wireways, Fittings, and Boxes. Wireways, fittings, and boxes in which taps, joints, or terminal connections are made shall be designed to minimize the entrance of dust and (1) shall be provided with telescoping or close fitting covers or other effective means to prevent the escape of sparks or burning material and (2) shall have no openings (such as holes for attachment screws) through which, after installation, sparks or burning material might escape or through which adjacent combustible material might be ignited.~~

~~(2) Flexible Connections. Where flexible connections are necessary, (a)(2) shall apply.~~

~~**Rewrite of above section 502-4 to correlate with 501-4 and as modified by Proposals**~~
502-4. Wiring Methods. Wiring methods shall comply with (a) or (b).

(a) Class II, Division 1.

(1) In Class II, Division 1 locations, the following wiring methods shall be permitted:

(a) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.
(b) Type MI cable with termination fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.
(c) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type MC cable, listed for use in Class II, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application shall be permitted.
(d) Fittings and boxes shall be provided with threaded bosses for connection to conduit or cable terminations and shall be dust-tight. Fittings and boxes in which taps, joints, or terminal connections are made, or that are used in Group E locations, shall be identified for Class II locations.
(e) Where necessary to employ flexible connections, dusttight flexible connectors, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord listed for extra-hard usage and provided with bushed fittings shall be used. Where flexible cords are used, they shall comply with Section 502-12. Where flexible connections are subject to oil or other corrosive conditions, the insulation of the conductors shall be of a type listed for the condition or shall be protected by means of a suitable sheath.

FPN: See Section 502-16(b) for grounding requirements where flexible conduit is used.

(b) Class II, Division 2.

(1) In Class II, Division 2 locations, the following wiring methods shall be permitted:

(a) All wiring methods permitted in 502-4(a)
(b) Rigid metal conduit, intermediate metal conduit, electrical metallic tubing,
Dusttight wireways,
(c) Type MC or MI cable with listed termination fittings,
(d) Type PLTC in cable trays,
(e) Type ITC in cable trays,
(f) Type MC, MI, or TC cable installed in ladder, ventilated

trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed.

Exception: Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the above required spacings.

(2) Where provision must be made for flexibility 502-4 (a)(1)(e) shall apply.

(3) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified ~~nonhazardous~~locations~~, including Chapter 7 and 8 wiring methods~~. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

FPN: Simple apparatus is defined in Section 504-2.

Separate nonincendive field wiring circuits shall be:

(a) in separate cables, or
(b) in multiconductor cables where the conductors of each circuit are within a grounded metal shield, or
(c) in multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in).

(4) All boxes and fittings shall be dusttight.

502-5. Sealing, Class II, Divisions 1 and 2. Where a raceway provides communication between an enclosure that is required to be dust-ignitionproof and one that is not, suitable means shall be provided to prevent the entrance of dust into the dust-ignitionproof enclosure through the raceway. One of the following means shall be permitted:

1. A permanent and effective seal,
2. A horizontal raceway not less than 3.05m (10 ft.)~~10 ft (3.05 m)~~ long, or
3. A vertical raceway not less than 1.5 m (5 ft) ~~(1.52 m)~~long and extending downward from the dust-ignitionproof enclosure

Where a raceway provides communication between an enclosure that is required to be dust-ignitionproof and an enclosure in an unclassified location, seals shall not be required.

Sealing fittings shall be accessible.

Seals shall not be required to be explosionproof.

FPN: Electrical sealing putty is a method of sealing.

502-6. Switches, Circuit Breakers, Motor Controllers, and Fuses.

(a) Class II, Division 1. In Class II, Division 1 locations, switches, circuit breakers, motor controllers, and fuses shall comply with the following:
(1) Type Required. Switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices that are intended to interrupt current during normal operation or that are installed where combustible dusts of an electrically conductive nature may be present, shall be provided with identified ~~approved~~ dust-ignitionproof enclosures.

(2) Isolating Switches. Disconnecting and isolating switches containing no fuses and not intended to interrupt current and not installed where dusts may be of an electrically conductive nature shall be provided with tight metal enclosures that shall be designed to minimize the entrance of dust and that shall (1) be equipped with telescoping or close-fitting covers or with other effective means to prevent the escape of sparks or burning material and (2) have no openings (such as holes for attachment screws) through which, after installation, sparks or burning material might escape or through which exterior accumulations of dust or adjacent combustible material might be ignited.

(3) Metal Dusts. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fuses, switches, motor controllers, and circuit breakers shall have enclosures identified ~~specifically approved~~ for such locations.

(b) Class II, Division 2. In Class II, Division 2 locations, enclosures for fuses, switches, circuit breakers, and motor controllers, including pushbuttons, relays, and similar devices, shall be dusttight.

502-7. Control Transformers and Resistors

(a) Class II, Division 1. In Class II, Division 1 locations, control transformers, solenoids, impedance coils, resistors, and any overcurrent devices or switching mechanisms associated with them shall have dust-ignitionproof enclosures identified ~~approved~~ for Class II locations. No control transformer, impedance coil, or resistor shall be installed in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present unless provided with an enclosure identified ~~ap~~ for the specific location.

(b) Class II, Division 2. In Class II, Division 2 locations, transformers and resistors shall comply with the following.

(1) Switching Mechanisms. Switching mechanisms (including overcurrent devices) associated with control transformers, solenoids, impedance coils, and resistors shall be provided with dusttight enclosures.

(2) Coils and Windings. Where not located in the same enclosure with switching mechanisms, control transformers, solenoids, and impedance coils shall be provided with tight metal housings without ventilating openings.

(3) Resistors. Resistors and resistance devices shall have dust-ignitionproof enclosures ~~-~~identified ~~approved~~ for Class II locations.

Exception: Where the maximum normal operating temperature of the resistor will not exceed 120ºC (248ºF), nonadjustable resistors or resistors that are part of an automatically timed starting sequence shall be permitted to have enclosures complying with (b)(2).

502-8. Motors and Generators

(a) Class II, Division 1. In Class II, Division 1 locations, motors, generators, and other rotating electrical machinery shall be

1. Identified ~~Approved~~ for Class II, Division 1 locations, or
2. Totally enclosed pipe-ventilated, meeting temperature limitations in Section 502-1.

(b) Class II, Division 2. In Class II, Division 2 locations, motors, generators, and other rotating electrical equipment shall be totally enclosed nonventilated, totally enclosed pipe-ventilated, totally enclosed water–air cooled, totally enclosed fan-cooled or dust-ignitionproof for which maximum full-load external temperature shall be in accordance with Section 500-8(c)(2) ~~500-5(f)~~ for normal operation when operating in free air (not dust blanketed) and shall have no external openings.

Exception: If the authority having jurisdiction believes accumulations of nonconductive, nonabrasive dust will be moderate and if machines can be easily reached for routine cleaning and maintenance, the following shall be permitted to be installed:
a. Standard open-type machines without sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices
b. Standard open-type machines with such contacts, switching mechanisms, or resistance devices enclosed within dusttight housings without ventilating or other openings
c. Self-cleaning textile motors of the squirrel-cage type

502-9. Ventilating Piping. Ventilating pipes for motors, generators, or other rotating electric machinery, or for enclosures for electric equipment, shall be of metal not less than 0.53 mm (0.021 in.) ~~(533 µm)~~ in thickness, or of equally substantial noncombustible material, and shall comply with the following:

1. Lead directly to a source of clean air outside of buildings,
2. Be screened at the outer ends to prevent the entrance of small animals or birds, and

3. Be protected against physical damage and against rusting or other corrosive influences.

Ventilating pipes shall also comply with (a) and (b).

(a) Class II, Division 1. In Class II, Division 1 locations, ventilating pipes, including their connections to motors or to the dust-ignitionproof enclosures for other equipment, shall be dusttight throughout their length. For metal pipes, seams and joints shall comply with one of the following:

1. Be riveted and soldered,
2. Be bolted and soldered,
3. Be welded, or
4. Be rendered dusttight by some other equally effective means

(b) Class II, Division 2. In Class II, Division 2 locations, ventilating pipes and their connections shall be sufficiently tight to prevent the entrance of appreciable quantities of dust into the ventilated equipment or enclosure and to prevent the escape of sparks, flame, or burning material that might ignite dust accumulations or combustible material in the vicinity. For metal pipes, lock seams and riveted or welded joints shall be permitted; and tight-fitting slip joints shall be permitted where some flexibility is necessary, as at connections to motors.

502-10. Utilization Equipment

(a) Class II, Division 1. In Class II, Division 1 locations, all utilization equipment shall be identified ~~approved~~ for Class II locations. Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, such equipment shall be identified ~~approved~~ for the specific location.

(b) Class II, Division 2. In Class II, Division 2 locations, all utilization equipment shall comply with the following.

(1) Heaters. Electrically heated utilization equipment shall be identified ~~approved~~ for Class II locations.

Exception: Metal-enclosed radiant heating panel equipment shall be dusttight and marked in accordance with Section 500-8 (b)~~500-5(d)~~.

(2) Motors. Motors of motor-driven utilization equipment shall comply with Section 502-8(b).

(3) Switches, Circuit Breakers, and Fuses. Enclosures for switches, circuit breakers, and fuses shall be dusttight.

(4) Transformers, Solenoids, Impedance Coils, and Resistors. Transformers, solenoids, impedance coils, and resistors shall comply with Section 502-7(b).

502-11. Luminaires (Lighting Fixtures). Luminaires (Lighting fixtures) shall comply with (a) and (b).

(a) Class II, Division 1. In Class II, Division 1 locations, luminaires (lighting fixtures) for fixed and portable lighting shall comply with the following.

(1) ~~Approved~~ Fixtures. Each fixture shall be identified ~~approved~~ for Class II locations and shall be clearly marked to indicate the maximum wattage of the lamp for which it is designed~~approved~~. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fixtures for fixed or portable lighting and all auxiliary equipment shall be identified ~~approved~~ for the specific location.

(2) Physical Damage. Each fixture shall be protected against physical damage by a suitable guard or by location.

(3) Pendant Fixtures. Pendant fixtures shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 300 mm (12 in.) ~~(305 mm)~~, permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) ~~(305 mm)~~ above the lower end of the stem, or flexibility in the form of a fitting or a flexible connector listed ~~approved~~ for the location shall be provided not more than 300 mm (12 in.) ~~(305 mm)~~ from the point of attachment to the supporting box or fitting. Threaded joints shall be provided with set-screws or other effective means to prevent loosening. Where wiring between an outlet box or fitting and a pendant fixture is not enclosed in conduit, flexible cord listed ~~approved~~ for hard usage shall be used, and suitable seals shall be provided where the cord enters the fixture and the outlet box or fitting. Flexible cord shall not serve as the supporting means for a fixture.

(4) Supports. Boxes, box assemblies, or fittings used for the support of lighting fixtures shall be identified ~~approved~~ for Class II locations.

(b) Class II, Division 2. In Class II, Division 2 locations, luminaires (lighting fixtures) shall comply with the following.

(1) Portable Lighting Equipment. Portable lighting equipment shall be identified ~~approved~~ for Class II locations. They shall be clearly marked to indicate the maximum wattage of lamps for which they are designed~~approved~~.

(2) Fixed Lighting. Luminaires (Lighting fixtures) for fixed lighting, where not of a type identified ~~approved~~ for Class II locations, shall provide enclosures for lamps and lampholders that shall be designed to minimize the deposit of dust on lamps and to prevent the escape of sparks, burning material, or hot metal. Each fixture shall be clearly marked to indicate the maximum wattage of the lamp that shall be permitted without exceeding an exposed surface temperature in accordance with Section 500-8 (c)(2)~~500-5(f)~~ under normal conditions of use.

(3) Physical Damage. Luminaires (l~~l~~ighting fixtures) for fixed lighting shall be protected from physical damage by suitable guards or by location.

(4) Pendant Fixtures. Pendant fixtures shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 300 mm (12 in.) ~~(305 mm)~~, permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm (12 in.) ~~(305 mm)~~ above the lower end of the stem, or flexibility in the form of an identified ~~approved~~ fitting or a flexible connector shall be provided not more than 300 mm (12 in.) ~~(305 mm)~~ from the point of attachment to the supporting box or fitting. Where wiring between an outlet box or fitting and a pendant fixture is not enclosed in conduit, flexible cord listed ~~approved~~ for hard usage shall be used. Flexible cord shall not serve as the supporting means for a fixture.

(5) Electric-Discharge Lamps. Starting and control equipment for electric-discharge lamps shall comply with the requirements of Section 502-7(b).

502-12. Flexible Cords — Class II, Divisions 1 and 2. Flexible cords used in Class II locations shall comply with the following:

1. Be of a type listed ~~approved~~ for extra-hard usage,

Exception~~FPN~~: Flexible cord listed for hard usage as permitted by Sections 502-11 (a) (3) and (b)(4).

2. Contain, in addition to the conductors of the circuit, a grounding conductor complying with Section 400-23,
3. Be connected to terminals or to supply conductors in an approved manner,
4. Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections, and
5. Be provided with suitable seals to prevent the entrance of dust where the flexible cord enters boxes or fittings that are required to be dust-ignitionproof

502-13. Receptacles and Attachment Plugs

(a) Class II, Division 1. In Class II, Division 1 locations, receptacles and attachment plugs shall be of the type providing for connection to the grounding conductor of the flexible cord and shall be identified ~~approved~~ for Class II locations.

(b) Class II, Division 2. In Class II, Division 2 locations, receptacles and attachment plugs shall be of the type that provide for connection to the grounding conductor of the flexible cord and shall be designed so that connection to the supply circuit cannot be made or broken while live parts are exposed.

502-14. Signaling, Alarm, Remote-Control, and Communications Systems; and Meters, Instruments, and Relays

FPN: See Article 800 for rules governing the installation of communications circuits.

(a) Class II, Division 1. In Class II, Division 1 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with the following:

(1) Wiring Methods. The wiring method shall comply with Section 502-4(a).

(2) Contacts. Switches, circuit breakers, relays, contactors, fuses and current-breaking contacts for bells, horns, howlers, sirens, and other devices in which sparks or arcs may be produced shall be provided with enclosures identified ~~approved~~ for a Class II location.

Exception: Where current-breaking contacts are immersed in oil or where the interruption of current occurs within a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.

(3) Resistors and Similar Equipment. Resistors, transformers, choke coils, rectifiers, thermionic tubes, and other heat-generating equipment shall be provided with enclosures identified ~~approved~~ for Class II locations.

Exception: Where resistors or similar equipment are immersed in oil or enclosed in a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.

(4) Rotating Machinery. Motors, generators, and other rotating electric machinery shall comply with Section 502-8(a).

(5) Combustible, Electrically Conductive Dusts. Where dusts are of a combustible, electrically conductive nature, all wiring and equipment shall be identified ~~approved~~ for Class II locations.

(6) Metal Dusts. Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, all apparatus and equipment shall be identified ~~approved~~ for the specific conditions.

(b) Class II, Division 2. In Class II, Division 2 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with the following.

(1) Contacts. Enclosures shall comply with (a)(2), or contacts shall have tight metal enclosures designed to minimize the entrance of dust and shall have telescoping or tight-fitting covers and no openings through which, after installation, sparks or burning material might escape.

Exception: In nonincendive circuits, enclosures shall be permitted to be of the general-purpose type.

(2) Transformers and Similar Equipment. The windings and terminal connections of transformers, choke coils, and similar equipment shall be provided with tight metal enclosures without ventilating openings.

(3) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with (a)(3).

Exception: Enclosures for thermionic tubes, nonadjustable resistors, or rectifiers for which maximum operating temperature will not exceed 120°C (248°F) shall be permitted to be of the general-purpose type.

(4) Rotating Machinery. Motors, generators, and other rotating electric machinery shall comply with Section 502-8(b).

(5) Wiring Methods. The wiring method shall comply with Section 502-4(b).

502-15. Live Parts, Class II, Divisions 1 and 2. Live parts shall not be exposed.

502-16. Grounding, Class II, Divisions 1 and 2 Wiring and equipment in Class II, Divisions 1 and 2 locations shall be grounded as specified in Article 250 and with the following additional requirements.

(a) Bonding. The locknut-bushing and double-locknut types of contact shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class II locations and the point of grounding for service equipment or point of grounding of a separately derived system.

Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode conductor are connected together on the line side of the building or structure disconnecting means as specified in Sections 250-32(a), (b), and (c), if the branch-circuit overcurrent protection is located on the load side of the disconnecting means.

FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.

(b) Types of Equipment Grounding Conductors. Where flexible conduit is used as permitted in Section 502-4, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with Section 250-102.

Exception: In Class II, Division 2 locations, the bonding jumper shall be permitted to be deleted where all the following conditions are met.
a. Listed liquidtight flexible metal conduit 1.8 m (6 ft) ~~(1.83 m)~~ or less in length, with fittings listed for grounding, is used.
b. Overcurrent protection in the circuit is limited to 10 amperes or less.
c. The load is not a power utilization load.

502-17. Surge Protection — Class II, Divisions 1 and 2. Surge arresters, including their installation and connection, shall comply with Article 280. In addition, surge arresters, if installed in a Class II, Division 1 location, shall be in suitable enclosures. Surge-protective capacitors shall be of a type designed for specific duty.

502-18. Multiwire Branch Circuits. In a Class II, Division 1 location, a multiwire branch circuit shall not be permitted.

Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.

PANEL STATEMENT: The action on this Comment, which is a rewrite of Article 502, incorporates all applicable actions on Comments 14-85 through 14-96.

14- 91 - (502-1-Dust-ignitionproof): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 14-203
RECOMMENDATION: The Technical Correlating Committee directs that the Panel clarify the Panel Action and Statement on this Proposal. Companion Proposal 1-127 was rejected by Code-Making Panel 1. Code-Making Panel 14 has included a definition for Dust-ignitionproof in both Articles 500 (Proposal 14-2a) and 502 (Proposal 14-200a) and has not deleted the text as recommended by the submitter. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Delete the definition of "dust-ignitionproof" and its Fine Print Note in 502-1.
PANEL STATEMENT: The definition and the Fine Print Note now appears in Section 500-2.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #1398)

14- 92 - (502-4(b)): Reject
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 14-217
RECOMMENDATION: New text as follows:
(6) Types CATVP, CATVR, or CATV in cable trays, in raceways, supported by messenger wire, or otherwise adequately supported and mechanically protected by angles, struts, channels, or other mechanical means.
SUBSTANTIATION: To agree with the action taken by Panel 16 on proposal 16-319.
PANEL ACTION: Reject.
PANEL STATEMENT: See action on Comment 14-63.

(Log #2328)

14- 94 - (502-4(b)): Accept in Principle in Part
Note: The Technical Correlating Committee understands that the accepted text modifies the Panel Action on Comment 14-90 and is added to 502-4(b)(3), as shown in the text of the rewrite to Article 502 in Comment 14-90.
SUBMITTER: Nicholas Ludlam, Factory Mutual Research
COMMENT ON PROPOSAL NO: 14-218
RECOMMENDATION: I think that the Panel misunderstood the problems associated with Nonincendive Field Wiring.
Separation of Nonincendive Field Wiring Conductors
(a) From Nonincendive Field Wiring Conductors.
(1) Open Wiring. Conductors and cables of nonincendive field wiring circuits not in raceways or cable trays shall be separated at least 1.97 in. (50 mm) and secured from conductors and cables of any other circuits.
(2) In Raceways, Cable Trays, and Cables. Conductors of nonincendive field wiring circuits shall not be placed in any raceway, cable tray, or cable with conductors of any other circuit.
Exception No. 1: Where conductors of nonincendive field wiring circuits are separated from conductors of incendive field wiring circuits by a distance of at least 1.97 in. (50 mm) and secured, or by a grounded metal partition or an approved insulating partition.
FPN: No. 20 gauge sheet metal partitions 0.0359 in. (912 mm) or thicker are generally considered acceptable.
Exception No. 2: Where either (1) all of the nonincendive field wiring circuit conductors or (2) all of the incendive field wiring circuit conductors are in grounded metal-sheathed or metal-clad cables where the sheathing or cladding is capable of carrying fault current to ground.
FPN: Cables meeting the requirements of Articles 330 and 334 are typical of those considered acceptable.
(3) Within Enclosures.
a. Conductors of nonincendive field wiring circuits shall be separated at least 1.97 in. (50 mm) from conductors of any incendive field wiring circuits, or as specified in Section 501-4(b)(a)(2).
b. All conductors shall be secured so that any conductor that might come loose from a terminal cannot come in contact with another terminal.
FPN No. 1: The use of separate wiring compartments for the nonincendive field wiring and incendive field wiring terminals is the preferred method of complying with this requirement.
FPN No. 2: Physical barriers such as grounded metal partitions or approved insulating partitions or approved restricted access wiring ducts separated from other such ducts by at least 3/4 in. (19 mm) can be used to help ensure the required separation of the wiring.
(b) From Different Nonincendive Field Wiring Circuit Conductors. Different nonincendive field wiring circuits shall be in separate cables or shall be separated from each other by one of the following means.
FPN No. 2: Physical barriers such as grounded metal partitions or approved insulating partitions or approved restricted access wiring ducts separated from other such ducts by at least 3/4 in. (19 mm) can be used to help ensure the required separation of the wiring.
(b) From Different Nonincendive Field Wiring Circuit Conductors. Different nonincendive field wiring circuits shall be in separate cables or shall be separated from each other by one of the following means.
1. The conductors of each circuit are within a grounded metal shield.
2. The conductors of each circuit have insulation with a minimum thickness of 0.01 in. (254 mm).
Exception: Unless otherwise approved.
SUBSTANTIATION: The Exception to allow ordinary location wiring in Class III hazardous (Classified) locations should be added to correspond with 501-4(b) and 502-4(b). Class 2 circuits [725-41 and Chapter 9 Tables 11(a) and 11(b)] are circuits in which the power is limited and which as a result can be considered not to be a source risk of fire or shock. By comparison with the tables in ISA 12.12:1994, any Associated Nonincendive Field Wiring output can also be categorized as a Class 2 power supply. Class 2 and 3 circuits can be wired in any cable suitable for ordinary locations [726-61 Exception 1]. In addition, faults are not considered to occur in the wiring for a Class 2 or Class 3 circuit, and Class 2 or Class 3 power sources shall not have the output connections paralleled or otherwise interconnected unless listed for such interconnection. But Nonincendive Field wiring circuits do consider the wiring opening, shorting and grounding. So if you have a Class 2 circuit which is also a Nonincendive field wiring circuit, then it can be run in ordinary location wiring with no regard to the mechanical protection afforded by the PLTC cable that are to be used for other Class 2 circuits in Hazardous Locations. (It can also be wired in any other type of cable provided it is adequately supported and protected from mechanical damage, and not just PLTC - 725-61(d). Considering also that Class 2 circuits cannot be mixed with any other circuit [except Class 3 circuits 725-54(b)(2)] unless by the exception listed in 504b. But since there is no restriction on the number and type of circuits run in the same ordinary location cable, and because we have to consider the faults, we can have the situation where a shorting of the outputs of the circuit gives rise to a situation where the voltage and current in the cable no longer are nonignition capable, and are no longer Class 2 circuits.
Some examples of this are: A 4-20mA circuit will normally operate at 24V, and a maximum current under normal operation of 22mA. For nonincendive field wiring we have to consider the case where the outputs are shorted together. The maximum current is then dependent on the current limiting within the power source. This typically is 100mA but could be as much as 245mA. 24V 100mA is nonignition capable for Class I Groups A and B by comparison with the ignition curves in ISA 12.12:1994. But if you have a circuit such as a PLC then you will have more than one output. If there are more than 3 outputs for this PLC, and the outputs are all 24V 100mA then by comparison with the ignition curves in ISA 12.12:1994 this IS ignition capable for Class I Groups A and B. In order to make this Nonincendive Field Wiring a usable concept, we need to define a method of segregating circuits. The proposal was an attempt to correct this omission from the NEC. The added text is based on the current 504-30.
Note: Although this example is for Class I the same problems apply for Class III although the ignition energies permitted are higher.
PANEL ACTION: Accept in Principle in Part.
Add the following text to 502-4(b):
"Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.
FPN: Simple apparatus is defined in Section 504-2.
Separate nonincendive field wiring circuits shall be:
a) in separate cables, or
b) in multiconductor cables where the conductors of each circuit are within a grounded metal shield, or
c) in multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in)."
Also, delete "including Chapter 7 and 8 wiring methods" from the first sentence.
PANEL STATEMENT: The panel action satisfies the intent of the submitter, with regard to separation of conductors in cables. Information from Comment 14-60 was also inserted to provide consistency between 501-4(b) and 502-4(b).

SUBMITTER: Nicholas Ludlam, Factory Mutual Research
COMMENT ON PROPOSAL NO: 14-280
RECOMMENDATION: I think that the committee misunderstood the problems associated with Nonincendive Field Wiring.
Exception No. 2: Nonincendive field wiring shall be permitted using any of the methods suitable for wiring in ordinary locations.
Separation of Nonincendive Field Wiring Conductors
(a) From Nonincendive Field Wiring Conductors.
(1) Open Wiring. Conductors and cables of nonincendive field wiring circuits not in raceways or cable trays shall be separated at least 1.97 in. (50 mm) and secured from conductors and cables of any other wiring.
Exception: Where either (1) all of the nonincendive field wiring circuit conductors are in Type MI or MC cables or (2) all of the other circuit conductors are in raceways or Type MI or MC cables where the sheathing or cladding is capable of carrying fault current to ground.
(2) In Raceways, Cable Trays, and Cables. Conductors of nonincendive field wiring circuits shall not be placed in any raceway, cable tray, or cable with conductors of any other wiring.
Exception No. 1: Where conductors of nonincendive field wiring circuits are separated from conductors of incendive field wiring circuits by a distance of at least 1.97 in. (50 mm) and secured, or by a grounded metal partition or an approved insulating partition.
FPN: No. 20 gauge sheet metal partitions 0.0359 in. (912 mm) or thicker are generally considered acceptable.
Exception No. 2: Where either (1) all of the nonincendive field wiring circuit conductors or (2) all of the other wiring conductors are in grounded metal-sheathed or metal-clad cables where the sheathing or cladding is capable of carrying fault current to ground.
FPN: Cables meeting the requirements of Articles 330 and 334 are typical of those considered acceptable.
(3) Within Enclosures.
a.) Conductors of nonincendive field wiring circuits shall be separated at least 1.97 in. (50 mm) from conductors of any other field wiring, or as specified in Section 503-(?)(a)(2).
b.) All conductors shall be secured so that any conductor that might come loose from a terminal cannot come in contact with another terminal.
FPN No. 1: The use of separate wiring compartments for the nonincendive field wiring and other field wiring terminals is the preferred method of complying with this requirement.
1. The conductors of each circuit are within a grounded metal shield.
2. The conductors of each circuit have insulation with a minimum thickness of 0.01 in. (254 mm).
Exception: Unless otherwise approved.
SUBSTANTIATION: It seems to me that there is a hole in the current NEC for nonincendive field wiring circuits. Class 2 circuits [725-41 and Chapter 9 tables 11(a) and 11(b)] are circuits in which the power is limited and which as a result can be considered not to be a source risk of fire or shock. By comparison with the tables in ISA 12.12:1994, any Associated Nonincendive Field Wiring output can also be categorized as a Class 2 power supply. Class 2 and 3 circuits can be wired in any cable suitable for ordinary locations [726-61 Exception 1]. In addition, faults are not considered to occur in the wiring for a Class 2 or Class 3 circuit, and Class 2 or Class 3 power sources shall not have the output connections paralleled or otherwise interconnected unless listed for such interconnection. But Nonincendive Field wiring circuits do consider the wiring opening, shorting and grounding. So if you have a Class 2 circuit which is also a Nonincendive field wiring circuit, then it can be run in ordinary location wiring with no regard to the mechanical protection afforded by the PLTC cable that are to be used for other Class 2 circuits in Hazardous Locations. (It can also be wired in any other type of cable provide it is adequately supported and protected from mechanical damage, and not just PLTC - 725-61(d). Considering also that Class 2 circuits cannot be mixed with any other circuit [except Class 3 circuits 725-54(b)(2)] unless by the exception listed in 504 b. But since there is no restriction on the number and type of circuits run in the same ordinary location cable, and because we have to consider the faults, we can have the situation where a shorting of the outputs of the circuit gives rise to a situation where the voltage and current in the cable no longer are nonignition capable, and are no longer Class 2 circuits.
Some examples of this are: A 4-20mA circuit will normally operate at 24V, and a maximum current under normal operation of 22mA. For nonincendive field wiring we have to consider the case where the outputs are shorted together. The maximum current is then dependent on the current limiting within the power source. This typically is 100mA but could be as much as 250mA. 24V 100mA is nonignition capable for Class I Groups A and B by comparison with

the ignition curves in ISA 12.12:1994. But if you have a circuit such as a PLC then you will have more than one output. If there are more than 3 outputs for this PLC, and the outputs are all 24V 100mA then by comparison with the ignition curves in ISA 12.12:1994 this IS ignition capable for Class I Groups A and B. In order to make this Nonincendive Field Wiring a usable concept, we need to define a method of segregating circuits. The proposal was an attempt to correct this omission from the NEC. The added text is based on the current 504-30.
PANEL ACTION: Reject.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
COMMENT ON AFFIRMATIVE:
SABAN: Below are identified concerns of safety with regards to installation practices which cause for very unsafe conditions.
1) Armored cable U.G.
a) Shovels nick outerjacket
b) Earth settles "pulls out."
c) Rock drop on it more than 2 1/2 #/ft
d) Not to use outside if 20 degrees Fahrenheit or less
e) How to maintain? UG? Inspect UG? Outer jacket damage visible?
f) Bending crunches cable
g) People worker walk on it, before cover
2) Issues A.G.
a) bending radius done too tight
b) C1D1 connectors don't (seems, only my opinion) bond to the copper ceil inside terminator to continuous corrugated sheath
c) Need to have 45 degree terminators
d) When larger MC cables are used ... can wobble a little (breaks seal and the armor cracks).
e) Cable tray installation not allowed room above equipment, cable trays installed horizontal above switchgear, MCCs are being installed with vertical distance between too close, therefore not allowing proper radius bending and results in outer jacket and metal sheath being damaged.
f) Sidewall pressure will damage metal sheath when pulling at 90 degrees utilizing a pulley if proper rigging and sufficient manpower is not utilized.
g) supports - utilizing unistrut strap damages jacket and armor of the armored cable and the same with other types of straps utilized for conduit shall not be utilized for armor cables.
h) as a conduit sleeve is utilized for a armored cable, as it emerges through the sleeve a grommeted type connector shall be used so the outer jacket does not get damaged against the bushing or the side of the conduit.
i) Due to the concerns of bonding the armored cable shall always have a ground wire.
j) Manufacturing criteria and installation practices are different between USA and Canada and why Canada installs (if they do) outside when manufacturers' information states not to be used when temperatures less than 17 degrees F. Marking of this type of cable is not consistent with installation practices.

The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Incorporate into Article 504 the changes proposed by Proposal 14-294.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #1949)

14- 102 - (504): Reject
SUBMITTER: David Wechsler, Union Carbide Corp.
COMMENT ON PROPOSAL NO: 14-294a
RECOMMENDATION: Replace "identified" with the prior NEC wording.
SUBSTANTIATION: The proposed definition for "identified" contains an important FPN that is fundamental to the entire reason for having this definition. This definition also differs from the Article 100 definition. It was the action of the Technical Correlating Committee that the Article 100 definition be used and that the FPN be eliminated since it contains permissive language that is not permitted by the NEC Style Manual. With the elimination of this definition, the text must be reverted to that of the current code.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel has concluded that the correct terms are now being used.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

(Log #495)

14- 104 - (504-2, FPN No. 2, FPN No. 3): Accept
SUBMITTER: William T. Fiske, Intertek Testing Services
COMMENT ON PROPOSAL NO: 14-294a
RECOMMENDATION: Omit proposed FPN No. 2 and FPN No. 3.
SUBSTANTIATION: As Mr. Cook suggests in comment on vote, FPN No. 2 contains requirements, contradicting the style manual. FPN No. 3 is so far off the subject, it would tend to confuse more than clarify. Acceptance of this comment would change panel action from accept to accept in part.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #1016)

14- 105 - (504-2-Control Drawing): Accept in Principle
SUBMITTER: Nicholas Ludlam, Factory Mutual Research
COMMENT ON PROPOSAL NO: 14-296
RECOMMENDATION: Proposal 14-296, Move the definition of "Control Drawing" to 500.2 Definitions
Control Drawing. A drawing or other document provided by the manufacturer of the intrinsically safe or associated apparatus, or of the nonincendive field wiring equipment or associated nonincendive field wiring equipment, that details the allowed interconnections between the intrinsically safe and associated apparatus, or between the nonincendive field wiring equipment or associated nonincendive field wiring equipment.
SUBSTANTIATION: The panel has already accepted that control drawings are used for nonincendive field wiring in Proposal 14-83 to 501-4(b), so this definition needs to be in the general section and not just in 504.
PANEL ACTION: Accept in Principle.
Revise the proposed definition as follows and add to 500-2: "Control Drawing. A drawing or other document provided by the manufacturer of the intrinsically safe or associated apparatus, or of the nonincendive field wiring apparatus or associated nonincendive field wiring apparatus, that details the allowed interconnections between the intrinsically safe and associated apparatus, or between the nonincendive field wiring apparatus or associated nonincendive field wiring apparatus."
Replace the definition in 504-2 with the following: "Control Drawing. See definition in 500-2."
PANEL STATEMENT: The panel recognizes the need to define "control drawing" for nonincendive and intrinsic safety and has added an appropriate definition to 500-2.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
COMMENT ON AFFIRMATIVE:
SABAN: Definition of control drawing does and will confuse installers since a point to point drawing is truly required to be done by qualified registered professional engineer. Therefore, definition really should stay inside 504 so that no installation problems will be borne on the installer in the field.

(Log #496)

14- 106 - (504-4): Accept in Principle
SUBMITTER: William T. Fiske, Intertek Testing Services
COMMENT ON PROPOSAL NO: 14-300, 14-301
RECOMMENDATION: Revise as follows:
"All intrinsically safe apparatus shall be ~~approved~~ listed."
SUBSTANTIATION: Listed i.s. apparatus is readily available. Techniques for evaluating intrinsically safe apparatus are highly specialized, and could not be performed outside a qualified testing laboratory. The probable consequences of (allegedly) intrinsically safe apparatus' failure to perform are grave. Acceptance of this comment would change panel action from accept to accept in principle.
PANEL ACTION: Accept in Principle.
Revise 504.4 to read: "Equipment. All intrinsically safe apparatus and associated apparatus shall be listed."
Retain the exception as currently worded.
PANEL STATEMENT: The panel has concluded that "listed" is the proper term and that associated apparatus also should be listed. Removal of the word "approval" from the title is editorial and provides consistency with Article 505.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #497)

14- 107 - (504-4, Exception): Accept
SUBMITTER: William T. Fiske, Intertek Testing Services
COMMENT ON PROPOSAL NO: 14-302
RECOMMENDATION: Panel action should be upheld.
SUBSTANTIATION: This comment relates to Mr. Cook's comment on vote. Per 110-2, all electric apparatus must be approved. The question is whether or not simple apparatus need be listed. By virtue of the very low energy levels involved, simple apparatus is not listed.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COOK: I disagree with the panel action that prohibits an AHJ from requiring some basis for approval. The definition of simple apparatus in 504-2 requires the device to neither generate nor store more than 1.2 volts, .1 ampere, 25 milliwatts, or 20 microjoules. These devices might not require "listing" for hazardous locations, but as indicated in the comment, very low energy levels are required and determining these energy levels is not something that could be done without some basis acceptable to the authority having jurisdiction. Measuring milliwatts and microjoules is not a task that field inspectors should be required to perform. The basis for approval could be that the device was listed for use in ordinary (unclassified) locations.

(Log #498)

14- 108 - (504-4, Exception): Accept
SUBMITTER: William T. Fiske, Intertek Testing Services
COMMENT ON PROPOSAL NO: 14-303
RECOMMENDATION: Panel action should be upheld.
SUBSTANTIATION: A comment on this proposal, separate from comment on 14-302, is warranted because the panel statement on 14-303 referred back to the 14-302 statement. It should not. Proposal 14-303 was different, and deserves a different response. The panel's reason for rejecting 14-303 should be that the substantiation does not support the proposed removal of the exception.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COOK: I disagree with the comment and substantiation. The text of the 1999 NEC said "Simple apparatus, as described on control drawing, shall not be required to be approved." The substantiation for the removal of the Exception was that Section 110-2 requires all equipment to be approved. The 1999 text was in direct conflict with one of the most basic requirements of the NEC.

(Log #499)

14- 109 - (504-30(2) Exception No. 1): Reject
SUBMITTER: William T. Fiske, Intertek Testing Services
COMMENT ON PROPOSAL NO: 14-309, 14-310
RECOMMENDATION: Revise as follows:
"... a grounded metal partition or an ~~approved~~ insulating partition."
SUBSTANTIATION: "Identifying" an insulating barrier would accomplish nothing. As component parts, barriers are not generally "listed," and there are no apparent methods available to authorities having jurisdiction to "approve" them. Thus, as noted in Mr. Cook's comment on vote, the best adjective is none at all. Acceptance of this comment changes the panel's action from reject to accept in part.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that "approved" is the appropriate term in this application.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COOK: I agree with the submitter. I do not see that there is any difference in an approved insulating partition and an insulating partition. If the AHJ needs to look for something special, then the panel should provide some guidelines for the AHJ to determine if the special insulating partition has been provided.

(Log #500)

14- 110 - (504-30(a)(3)b, FPN No. 2): Reject
SUBMITTER: William T. Fiske, Intertek Testing Services
COMMENT ON PROPOSAL NO: 14-311, 14-312
RECOMMENDATION: Revise as follows:
"Physical barriers such as grounded metal partitions or ~~approved~~ insulating partitions or ~~approved~~ restricted access wiring ducts...".
SUBSTANTIATION: In this context, "approved," makes the fine print note a requirement.
Acceptance of this comment would change panel action from reject to accept in part.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that "approved" is the appropriate term in this application.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COOK: I disagree with panel action and panel statement. Restricted access wiring ducts are certainly identified and available with listings from many manufacturers under category (ZOYX) in the UL Green Book. With listed products available, I can not understand any reason for using an unlisted product.

(Log #423)

14- 111 - (504-60(b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 14-315
RECOMMENDATION: Accept in principle, revise panel action:
(b) Unclassified or nonhazardous locations. In unclassified or nonhazardous locations where metal raceways <u>metal-covered cables, metal cable trays, or metal auxiliary gutters</u> are used for intrinsically safe system wiring <u>and extended into</u> hazardous (classified) locations <u>they and</u> associated apparatus shall be bonded in accordance with 501-16(a), 502-16(a), 503-16(a), or 502-52, as applicable.
SUBSTANTIATION: Present wording is somewhat confusing. It covers bonding of associated apparatus in unclassified locations where metal raceways are used but doesn't include use of metal-covered cables or metal cable trays. Use of metal raceways is the only reason to require the special bonding. It doesn't seem to require the bonding of metal raceways which extend from the unclassified locations into the classified location. Metal-covered cables can also have junction points where bonding can be done.
PANEL ACTION: Reject.
PANEL STATEMENT: The comment does not address the panel's statement that cable trays and auxiliary gutters are covered elsewhere.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #2196)

14- 112 - (504-60(b)): Accept in Principle
SUBMITTER: Mark Goodman, BP (ARCO)
COMMENT ON PROPOSAL NO: 14-315
RECOMMENDATION: Replace "Nonhazardous" with "Unclassified" in both the section title and text.
SUBSTANTIATION: This comment is in support of the original proposal to change nonhazardous to unclassified.
This proposal should have been "Accept" and not "Accept in Principle". The Panel Action is contrary to the submitter's intent and justification. The correct term is "unclassified" and should be used consistently throughout the code sections to avoid confusion and misapplication.
PANEL ACTION: Accept in Principle.
Change section title to "Unclassified Locations" and delete the words "or nonhazardous" in the text.
PANEL STATEMENT: The panel action removes redundant terms.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

14- 113 - (504-60(b)): Accept
SUBMITTER: Mark Goodman, BP (ARCO)
COMMENT ON PROPOSAL NO: 14-316
RECOMMENDATION: Replace "Nonhazardous" with "Unclassified" in both the title and text.
SUBSTANTIATION: This comment is in support of the original proposal and substantiation.
This proposal should have been "Accept" and not "Accept in Principle in Part". The Panel Action is contrary to the submitter's intent and justification. The correct term is "unclassified" and should be used consistently throughout the code sections to avoid confusion and misapplication. This proposal along with other companion proposals referenced in the submitter's substantiation are designed to remove the term "nonhazardous" from the NEC, not add and define the term.
PANEL ACTION: Accept.
PANEL STATEMENT: See action on Comment 14-112.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #689)

14- 114 - (504-80(b)): Accept in Principle
Note: The Technical Correlating Committee understands that the action on this comment further modifies the action on Comment 14-115.
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 14-317
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: What is the panel's definition of the term "open wiring"? My understanding is that it is individual conductors that are not part of a cable assembly or are not installed in a raceway, and I believe that the term is used in that context in other Code Articles.
PANEL ACTION: Accept in Principle.
Replace the words "open wiring" with "other wiring methods".
PANEL STATEMENT: This action meets the intent of the commenter and provides the required identification in all wiring methods.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #1529)

14- 115 - (504-80(b)): Accept in Principle in Part
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 14-318
RECOMMENDATION: This proposal should be accepted in principle and revised as follows:
(b) Wiring. Raceways, cable trays, and open wiring for intrinsically safe system wiring shall be identified with permanently affixed labels with the wording "Intrinsic Safety Wiring" or equivalent. The label

shall be located so as to be visible after installation and placed so that they may be readily traced through the entire length of the installation. Exposed isolated sections of raceways, cables, and open wiring shall be labeled. Spacing between labels shall not be more than ~~25~~ 10 ft (7.62 m).
SUBSTANTIATION: We request that the panel reconsider the panel action on proposal 14-318. This proposal has identified a probable safety concern relating to rooms or spaces less than 25 feet which can leave sections of these raceways or cables without the proper identification labels. By reducing the spacing requirement from 25 feet to 10 feet the possibility of having isolated sections of unmarked intrinsically safe circuits is reduced. Examples include intrinsically safe conduit and cabling systems that run through small rooms, blind stairwells, corridors, and other similar isolated or congested areas.
PANEL ACTION: Accept in Principle in Part.
Revise 504-80(b) to read: "Raceways, cable trays, and open wiring for intrinsically safe system wiring shall be identified with permanently affixed labels with the wording "Intrinsic Safety Wiring" or equivalent. The label shall be located so as to be visible after installation and placed so that they may be readily traced through the entire length of the installation. Intrinsic safety circuit labels shall appear in every section of the wiring system that is separated by enclosures, walls, partitions, or floors. Spacing between labels shall not be more than 7.5 m (25 ft)."
PANEL STATEMENT: The panel action meets the intent of the commenter. This action ensures that the I.S. circuit can be traced through separated areas. Reducing the maximum length between labels may not accomplish this objective.

14- 125 - (505): Accept
SUBMITTER: Mark Goodman, BP (ARCO)
COMMENT ON PROPOSAL NO: 14-318a
RECOMMENDATION: Delete the term and definition of "Nonhazardous" from the revised Article 505, Section 505-2 Definitions.
SUBSTANTIATION: This comment recommends the removal of the term, Nonhazardous, its definition, and use for the following reasons.
1. This term was added as part of the Panel Chairman assigned Task group responsible for reorganizing the information in Article 505. This term and definition are new material and beyond the scope of the Panel Chair's direction.
2. The added term and definition was not part of any proposal made to the panel and has no substantiation for its inclusion.
3. Several proposals (14-316, 14-323, and 14-352 &14-356) specifically requested that the term "nonhazardous" currently used in the Article be deleted and substituted with the term "unclassified".
4. This term adds an additional area classification location that does not currently exist in related standards and practices (API 500, 505, and NFPA 497 for example) or in most company documentation systems.
5. The term is misleading. The implication of "nonhazardous" is that there are no hazards. There are hazards other than electrical area classification such as caustics, acids, radiation, etc. Using the term "unclassified" is becoming widely accepted and recognized as specific to electrical area classification. "Nonhazardous" is much too broad.
6. The term is not needed. An area is either "Classified", requiring specifically identified or approved equipment suitable for the location or "Unclassified", not requiring equipment so identified or approved. The term will only add confusion and potential misapplication.
7. By its definition, "Nonhazardous Locations. Locations which are not required to have been evaluated". Whoever makes the determination that the location is not required to be evaluated has just evaluated the location. It is also not at all clear how or who would make that determination.
For the above reasons, the term "Nonhazardous", its definition and use should be removed from Article 505 (and 500).

The Technical Correlating Committee directs that "Table 505-9(3)" be changed to "Table 505-9(d)(1)".

The Technical Correlating Committee directs that "Table 505-9(b)(2)" be changed to "Table 505-9(c)(2)(d)".

The Technical Correlating Committee directs that "Table 505-9(b)(2)" be changed to "Table 505-9(c)".

The Technical Correlating Committee directs that "Figure 505-9(b)(1)" be changed to "Figure 505-9(c)(2)".

The Technical Correlating Committee directs that "Figure 505-9(b)(1)" be changed to "Figure 505-9(c)(2)" and the reference in the 4th line of the Figure be changed from "505-5, FPN No.2" to "505-6, FPN No. 2".

The Technical Correlating Committee directs that "Table 505-9(b)(1)" be changed to "Table 505-9(c)(2)(d)".

The Technical Correlating Committee directs that "Table 505-9(b)(2)" be changed to "Table 505-9(c)".

SUBMITTER: James D. Cospolich, Waldemar S. Nelson & Co., Inc.

COMMENT ON PROPOSAL NO: 14-318a

RECOMMENDATION: Please see the following revised text which represents what I believe to be the correct wording that Code Making Panel 14 voted on and accepted during the January 2000 ROP meeting. The shaded wording represents what I consider to be revisions and corrections. Some of this shaded wording is very important for the technical accuracy and intent of the article.

ARTICLE 505 -- Class I, Zone 0, 1, and 2 Locations

505-1 Scope [unchanged]

This article covers the requirements for the zone classification system as an alternative to the division classification system covered in Article 500 for electrical and electronic equipment and wiring for all voltages in Class I, Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases, vapors, or liquids.

FPN: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Division 1 or Division 2; Class II, Division 1 or Division 2; and Class III, Division 1 or Division 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, or combustible dusts or fibers, refer to Articles 500 through 504.

[new] 505-2 Definitions. For purposes of this article, the following definitions apply. [14-320,CP140x]

Identified (as applied to equipment). Recognizable as suitable for the specific purpose, function, use, environment, application, etc., where prescribed in a particular Code requirement.

FPN: Suitability of equipment for a specific purpose, environment, or application may be determined by:

1. equipment listing or labeling;
2. **evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation; or**
3. other evidence acceptable to the authority having jurisdiction such as a manufacturer's self certification or an owner's engineering judgment.

(See definitions of *Labeled* and *Listed*)

[CP140?-500 rewrite, Panel action Cook actions, correlation w/500]

Unclassified Locations. Locations that have been evaluated by the classification process defined in Section 500-5(a) or Section 505-5 (a) and determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof. [14-323, CP140x]

Nonhazardous Locations. Locations which are not required to have been evaluated by the process defined in 500-5 (a) or 505-5 (a). [CP140x]

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with an electrical installation, as well as any portable or transportable device having a battery or other electrical power source. (14-6)

Flameproof. Type of protection where the enclosure will withstand an internal explosion of a flammable mixture that has penetrated into the interior, without suffering damage and without causing ignition, through any joints or structural openings in the enclosure, of an external explosive gas atmosphere consisting of one or more of the gases or vapors for which it is designed.

FPN: See Electrical Apparatus for Use In Class I, Zone 1 and 2 Hazardous (Classified) Locations, Type of Protection — Flameproof "d," ISA S12.22.01-1998; Electrical Apparatus for Explosive Gas Atmospheres, Part 1 — Construction and Verification Test of Flameproof Enclosures of Electrical Apparatus, IEC 60079-1-1990 and Amendment No. 1 (1993).

Purged and Pressurized. Type of protection for electrical equipment that uses the technique of guarding against the ingress of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere.

FPN No. 1: See Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

FPN No. 2: See Electrical Apparatus for Explosive Gas Atmospheres - Part 2: Electrical Apparatus, Type of Protection "p," IEC 60079-2-1983; and Electrical Apparatus for Explosive Gas Atmospheres - Part 13: Construction and Use of Rooms or Buildings Protected by Pressurization, IEC 60079-13-1982.

Intrinsic Safety. Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

FPN No. 1: See Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Hazardous Locations, ANSI/UL 913-1997; Electrical Apparatus for Use in Class I, Zones 0, 1 and 2 Hazardous (Classified) Locations - Intrinsic Safety "i", ISA S12.02.01-1999; Electrical Apparatus for Explosive Gas Atmospheres — Part 11: Intrinsic Safety "i," IEC 60079-11-1999.

FPN No. 2: Intrinsic safety is designated type of protection "ia" by ISA S12.02.01 and IEC 60079-11 for use in Zone 0 locations. Intrinsic safety is designated type of protection "ib" by ISA S12.02.01 and IEC 60079-11 for use in Zone 1 locations.

FPN No. 3: Intrinsically safe associated apparatus, designated by [ia] or [ib], is connected to intrinsically safe equipment ("ia" or "ib" respectively), but is located outside the hazardous (classified) location unless also protected by another type of protection (such as flameproof).

Type of Protection "n." Type of protection where electrical equipment, in normal operation, is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.

FPN: see Electrical Apparatus for Explosive Gas Atmospheres, Part 15 — Electrical Apparatus with Type of Protection "n," IEC 60079-15-1987.

Oil Immersion "o." Type of protection where electrical equipment is immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Oil-Immersion "o," ISA S12.26.01 — 1998; and Electrical Apparatus for Explosive Gas Atmospheres, Part 6 — Oil-Immersion "o," IEC 60079-6-1995.

Increased Safety "e." Type of protection applied to electrical equipment that does not produce arcs or sparks in normal service and under specified abnormal conditions, in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.

FPN: See Electrical Apparatus for Use in Class I,

Zone 1 Hazardous (Classified) Locations, Type of Protection — Increased Safety "e," ISA S12.16.01-1998; and Electrical Apparatus for Explosive Gas Atmospheres — Part 7: Increased Safety "e," IEC 60079-7-1990, Amendment No. 1 (1991), and Amendment No. 2 (1993).

Encapsulation "m." Type of protection where electrical parts that could ignite an explosive atmosphere by either sparking or heating are enclosed in a compound in such a way that this explosive atmosphere cannot be ignited.

FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection — Encapsulation "m," ISA S12.23.01-1998, and Electrical Apparatus for Explosive Gas Atmospheres — Part 18: Encapsulation "m," IEC 60079-18-1992.

Powder Filling "q." Type of protection where electrical parts capable of igniting an explosive atmosphere are fixed in position and completely surrounded by filling material (glass or quartz powder) to prevent the ignition of an external explosive atmosphere.
FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection — Powder Filling "q," ISA S12.25.01-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 5: Powder Filling, Type of Protection "q," IEC 60079-5-1967.

505-3. ~~[505-2]~~Other Articles
All other applicable rules contained in this Code shall apply to electrical equipment and wiring installed in hazardous (classified) locations.
Exception: As modified by Article 504 and this article.

505-4 General
(a) ~~[505-10 (c)]~~ Documentation for Industrial Occupancies.
All areas in industrial occupancies designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

FPN: For examples of area classification drawings, see Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2, ISA RP12.24.01-1998; Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2, ANSI/API RP 505-1997; Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas, IEC 60079-10-1995; and Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.

(b) ~~[505-5]~~ Reference Standards.

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with standards of the National Fire Protection Association (NFPA), the American Petroleum Institute (API), the Instrument Society of America (ISA), and the International Electrotechnical Committee (IEC) that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.
FPN No. 2: For further information on the classification of locations, see Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2, ISA RP12.24.01-1998; Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2, ANSI/API RP 505-1997; Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas, IEC 60079-10-1995; and Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.
FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see Recommended Practice on Static Electricity, NFPA 77-1993; Standard for the Installation of Lightning Protection Systems, NFPA 780-1997; and Protection Against Ignitions Arising Out of Static Lightning and Stray Currents, API RP 2003-1991.
FPN No. 4: For further information on ventilation, see Flammable and Combustible Liquids Code, NFPA 30-1996, and Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2, ANSI/API RP 505-1997, Section 6.6.
FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassifed and Class I, Zone 0, Zone 1, and Zone 2 Locations, ANSI/API RP 14FZ-2000.
FPN No. 6: For further information on the installation of electrical equipment in hazardous (classified) locations in general, see Electrical Apparatus for Explosive Gas Atmospheres — Part 14: Electrical Installations in Explosive Gas Atmospheres (Other than Mines), IEC 60079-14-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 16: Artificial Ventilation for the Protection of Analyzer(s) Houses, IEC 60079-16-1990.
FPN No. 7: For further information on application of electrical equipment in hazardous (classified locations in general, see Electrical Apparatus for Use in Class I, Zones 0 and 1, Hazardous (Classified) Locations: General Requirements, ISA S12.00.01-1999; and Definitions and Information Pertaining to Electrical Apparatus in Hazardous (Classified) Locations, ISA S12.01.01-1999.

505-5 Classifications of Locations

(a) ~~[505-3(a)]~~Classification of Locations. Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified.
Each room, section, or area shall be considered individually in determining its classification.

FPN No. 1: See Section 505-7 for restrictions on area classification.
FPN No. 2: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in reduced level of classification or in an unclassified location and, thus, to reduce the amount of special equipment required. [14-323]

Rooms and areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation, may be classified as "unclassified" locations.

FPN: For further information regarding classification and ventilation of areas involving ammonia, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989 (14-39)

(b) Class I Zone Locations.
Class I Zone locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures. Class I Zone locations shall include those specified in (1), (2) and (3).

(1) ~~[505-9 (a)]~~ Class I, Zone 0. A Class I, Zone 0 location is a location
(a) ~~[505-9 (a) (1)]~~ In which ignitible concentrations of flammable gases or vapors are present continuously, or
(b) ~~[505-9 (a) (2)]~~ In which ignitible concentrations of flammable gases or vapors are present for long periods of time.

FPN No. 1: As a guide in determining when flammable gases or vapors are present continuously or for long periods of time, refer to Recommended Practice for Classification of Locations for Electrical Installations of Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2, ANSI/API RP 505-1997; Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2, ISA S12.24.01-1998; Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous Areas, IEC 60079-10-1995; and Area Classification Code for Petroleum Installations, Model Code, Part 15, Institute of Petroleum.

FPN No. 2: This classification includes locations inside vented tanks or vessels that contain volatile flammable liquids; inside inadequately vented spraying or coating enclosures, where volatile flammable solvents are used; between the inner and outer roof sections of a floating roof tank containing volatile flammable liquids; inside open vessels, tanks and pits containing volatile flammable liquids; the interior of an exhaust duct that is used to vent ignitible concentrations of gases or vapors; and inside inadequately ventilated enclosures that contain normally venting instruments utilizing or analyzing flammable fluids and venting to the inside of the enclosures.

FPN No. 3: It is not good practice to install electrical equipment in Zone 0 locations except when the equipment is essential to the process or when other locations are not feasible. [See Section 505-3(a) FPN No. 2.] If it is necessary to install electrical systems in a Zone 0 location, it is good practice to install intrinsically safe systems as described by Article 504.

(2) ~~[505-9 (b)]~~ **Class I, Zone 1**. A Class I, Zone 1 location is a location
(a) ~~[505-9 (b) (1)]~~ In which ignitible concentrations of flammable gases or vapors are likely to exist under normal operating conditions; or
(b) ~~[505-9 (b) (2)]~~ In which ignitible concentrations of flammable gases or vapors may exist frequently because of repair or maintenance operations or because of leakage; or
(c) ~~[505-9 (b) (3)]~~ In which equipment is operated or processes are carried on, of such a nature that equipment breakdown or faulty operations could result in the release of ignitible concentrations of flammable gases or vapors and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition; or
(d) ~~[505-9 (b) (4)]~~ That is adjacent to a Class I, Zone 0 location from which ignitible concentrations of vapors could be communicated, unless communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

FPN No. 1: Normal operations is considered the situation when plant equipment is operating within its design parameters. Minor releases of flammable material may be part of normal operations. Minor releases include the releases from mechanical packings on pumps. Failures that involve repair or shutdown (such as the breakdown of pump seats and flange gaskets, and spillage caused by accidents) are not considered normal operation.

FPN No. 2: This classification usually includes locations where volatile flammable liquids or liquefied flammable gases are transferred from one container to another. In areas in the vicinity of spraying and painting operations where flammable solvents are used; adequately ventilated drying rooms or compartments for evaporation of flammable solvents; adequately ventilated locations containing fat and oil extraction equipment using volatile flammable solvents; portions of cleaning and dyeing plants where volatile flammable liquids are used; adequately ventilated gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape; inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids; the interiors of refrigerators and freezers in which volatile flammable materials are stored in the open, lightly stoppered, or easily ruptured containers; and other locations where ignitible concentrations of flammable vapors or gases are likely to occur in the course of normal operation, but not classified Zone 0.

(3) ~~[505-9 (c)]~~ **Class I, Zone 2**. A Class I, Zone 2 location is a location
(a) ~~[505-9 (c) (1)]~~ In which ignitible concentrations of flammable gases or vapors are not likely to occur in normal operation and if they do occur will exist only for a short period; or
(b) ~~[505-9 (c) (2)]~~ In which volatile flammable liquids, flammable gases, or flammable vapors are handled, processed, or used, but in which the liquids, gases, or vapors normally are confined within closed containers of closed systems from which they can escape, only as a result of accidental rupture or breakdown of the containers or system, or as a result of the abnormal operation of the equipment with which the liquids or gases are handled, processed, or used; or
(c) ~~[505-9 (c) (3)]~~ In which ignitible concentrations of flammable gases or vapors normally are prevented by positive mechanical ventilation, but which may become hazardous as a result of failure or abnormal operation of the ventilation equipment; or
(d) ~~[505-9 (c) (4)]~~ That is adjacent to a Class I, Zone 1 location, from which ignitible concentrations of flammable gases or vapors could be communicated, unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.

FPN: The Zone 2 classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used, but which would become hazardous only in case of an accident or of some unusual operating condition.

505-6 ~~[505-7]~~ Material Groups

~~[505-7]~~ For purposes of testing, approval, and area classification, various air mixtures (not oxygen enriched) shall be grouped as required in (a), (b), and (c).

FPN: Group I is intended for use in describing atmospheres that contain firedamp (a mixture of gases, composed mostly of methane, found underground, usually in mines). This Code does not apply to installations underground in mines. See Section 90-2(b).

Group II shall be subdivided into IIC, IIB, and IIA, as noted in (a), (b), and (c), according to the nature of the gas or vapor, for protection techniques "d," "ia," "ib," "[ia]," and "[ib]," and, where applicable, "n" and "o."

FPN No. 1: The gas and vapor subdivision as described above is based on the maximum experimental safe gap (MESG), minimum igniting current (MIC), or both. Test equipment for determining the MESG is described in Construction and Verification Tests of Flameproof Enclosures of Electrical Apparatus, IEC 60079-1A-1975, Amendment No. 1 (1993) and UL Technical Report No. 58 (1993). The test equipment for determining MIC is described in Spark-Test Apparatus for Intrinsically-Safe Circuits, IEC 60079-3-1990. The classification of gases or vapors according to their maximum experimental safe gaps and minimum igniting currents is described in Classification of Mixtures of Gases or Vapours with Air According to Their Maximum Experimental Safe Gaps and Minimum Igniting Currents, IEC 60079-12-1978.

FPN No. 2: Verification of electrical equipment utilizing protection techniques "e," "m," "p," and "q," due to design technique, does not require tests involving MESG or MIC. Therefore, Group II is not required to be subdivided for these protection techniques.

FPN No. 3: It is necessary that the meanings of the different equipment markings and Group II classifications be carefully observed to avoid confusion with Class I, Divisions 1 and 2, Groups A, B, C, and D.

(a) Class I Zone Group Classifications. Class I Zone groups shall be as follows:

(1) ~~[505-7 (a)]~~ ˣGroup IIC. Atmospheres containing acetylene, hydrogen, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.50 mm or minimum igniting current ratio (MIC ratio) less than or equal to 0.45.

FPN: Group IIC is equivalent to a combination of Class I, Group A, and Class I, Group B, as described in Sections 500-6 (a) (1) and 6 (a) (2)).

(2) ~~[505-7 (b)]~~ ˣGroup IIB. Atmospheres containing acetaldehyde, ethylene, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either maximum experimental safe gap (MESG) values greater than 0.50 mm and less than or equal to 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.45 and less than or equal to 0.80.

FPN: Group IIB is equivalent to Class I, Group C, as described in Section 500-6 (a)(3).

(3) ~~[505-7 (c)]~~ ˣGroup IIA. Atmospheres containing acetone, ammonia, ethyl alcohol, gasoline, methane, propane, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experiment safe gap (MESG) value greater than 0.90 mm or minimum igniting current ratio (MIC ratio) greater than

0.80.

FPN: Group IIA is equivalent to Class I, Group D as described in Section 500-6 (a)(4).

505-7 ~~[505-6]~~ Special Precaution
Article 505 requires equipment construction and installation that will ensure safe performance under conditions of proper use and maintenance.

FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to the installation and maintenance of electrical equipment in hazardous (classified) locations.

FPN No. 2: Low ambient conditions require special consideration. Electrical equipment depending on the protection techniques described by Section 505-8 (a) may not be suitable for use at temperatures lower than -25ºC (-13ºF) unless they are approved for use at lower temperatures. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified Class I, Zones 0, 1, or 2 at normal ambient temperature.

~~[505-6(a)]~~ (14-348)

(a) ~~[505-6(b)]~~ Dual Classification. In instances of areas within the same facility classified separately, Class I, Zone 2 locations shall be permitted to abut, but not overlap, Class I, Division 2 locations. Class I, Zone 0 or Zone 1 locations shall not abut Class I, Division 1 or Division 2 locations.

(b) ~~[505-6(c)]~~ Reclassification Permitted. A Class I, Division 1 or Division 2 location shall be permitted to be reclassified as a Class I, Zone 0, Zone 1, or Zone 2 location provided all of the space that is classified because of a single flammable gas or vapor source is reclassified under the requirements of this article.

(c) Solid Obstacles. Flameproof equipment with flanged joints shall not be installed such that the flange openings are closer than the distances shown in Table 505-7 ~~505-15~~ to any solid obstacle that is not a part of the equipment (such as steelworks, walls, weather guards, mounting brackets, pipes, or other electrical equipment) unless the equipment is listed for a smaller distance of separation. [14-364]

Table 505-7 ~~15~~. Minimum Distance of Obstructions from Flameproof "d" Flange Openings

Gas Group	Minimum Distance In.	Minimum Distance Mm
IIC	1 37/64	40
IIB	1 3/16	30
IIA	25/64	10

505- 8 ~~[505-4]~~ Protection Techniques
The following shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.

FPN: For additional information, see Electrical Apparatus for Use in Class I, Zones 0 and 1 Hazardous (Classified) Locations General Requirements, ISA S12.00.01-1999; Definitions and Information Pertaining to Electrical Apparatus in Hazardous (Classified) Locations, ISA S12.01.01-1999; Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations, ANSI/UL 2279, 1997; and Electrical Apparatus for Explosive Gas Atmospheres - Part 0: General Requirements, IEC 60079-0-1983, Amendment No. 1 (1987), and Amendment No. 2 (1991).

(a) ~~[505-4(a)]~~ Flameproof "d." This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

(b) ~~[505-4(b)]~~ Purged and Pressurized. This protection technique shall be permitted for equipment in those Class I, Zone 1 or Zone 2 locations for which it is approved.

(c) ~~[505-4(c)]~~ Intrinsic Safety. This protection technique shall be permitted for equipment in Class I, Zone 0 or Zone 1 locations for which it is approved.

(d) ~~[505-4(d)]~~ Type of Protection "n." This protection technique shall be permitted for equipment in Class I, Zone 2 locations. Type of protection "n" is further subdivided into nA, nC, and nR.

FPN: See Table 505-9(b) (1) for the descriptions of subdivisions for type of protection "n."

(e) ~~[505-4(e)]~~ Oil Immersion "o." This protection technique shall be permitted for equipment in Class I, Zone 1 locations.

(f) ~~[505-4(f)]~~ Increased Safety "e." This protection technique shall be permitted for equipment in Class I, Zone 1 locations.

(g) ~~[505-4(g)]~~ Encapsulation "m." This protection technique shall be permitted for equipment in Class I, Zone 1 locations.

(h) ~~[505-4(h)]~~ Powder Filling "q." This protection technique shall be permitted for equipment in Class I, Zone 1 locations.

505-9 Equipment

(a) ~~[505-10 (a)]~~ Listing.
(1) Equipment that is listed for a Zone 0 location shall be permitted in a Zone 1 or Zone 2 location of the same gas or vapor. Equipment that is listed for a Zone 1 location shall be permitted in a Zone 2 location of the same gas or vapor.

(2) ~~[505-7(d)]~~ Equipment shall be permitted to be listed for a specific gas or vapor, specific mixtures of gases or vapors, or any specific combination of gases or vapors.

FPN: One common example is equipment marked for "IIB + H2."

(b) ~~[505-10(b)]~~ Marking
Equipment shall be marked in accordance with (1) or (2).
(1) ~~[505-10(b)(1)]~~ Division Equipment. Equipment identified for Class I, Division 1 or Class I, Division 2 shall, in addition to being marked in accordance with Section 500-6(d), be permitted to be marked with the following:
a. Class I, Zone 1 or Class I, Zone 2 (as applicable), and
b. Applicable gas classification group(s) in accordance with Table 505-9(b)(2), and
c. Temperature classification in accordance with Section 505-9(3)

(2) ~~[505-10(b)(2)]~~ Zone Equipment. Equipment meeting one or more of the protection techniques described in Section 505-5 shall be marked with the following in the order shown:
a. Class
b. Zone
c. Symbol "AEx"
d. Protection technique(s) in accordance with Table 505-9(b)(2)
e. Applicable gas classification group(s) in accordance with Table 505-9(b)(2)
f. Temperature classification in accordance with Section 505-9(c)
Exception: Intrinsically safe associated apparatus shall be required to be marked only with (c), (d), and (e).

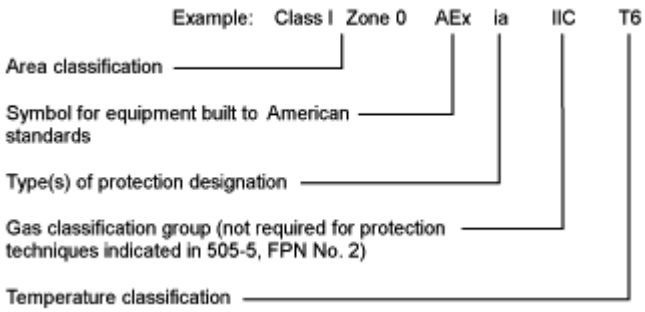
FPN No. 1: An example of such a required marking is "Class I, Zone 0, AEx ia IIC T6."

Electrical equipment of types of protection "e," "m," "p," or "q," shall be marked Group II. Electrical equipment of types of protection "d," "ia," "ib," "[ia]," or "[ib]" shall be marked Group IIA, or IIB, or IIC, or for a specific gas or vapor. Electrical equipment of types of protection "n" shall be marked Group II unless it contains enclosed-break devices, nonincendive components, or energy-limited equipment or circuits, in which case it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor. Electrical equipment of other types of protection shall be marked Group II unless the type of protection utilized by the equipment requires that it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor.

FPN No. 2: An explanation of the marking that is required follows.

Figure 505-9(b)(1) ~~[505-10(b)(1)]~~

[FIX THIS REFERENCE ERROR IN FIGURE 505-9: "…indicated in 505-5, FPN



No. 2)" should read "…indicated in 505-6, FPN No.2)"]

Table 505-9(b)(1). Types of Protection Designation

Designation	Technique	Zone*
d	Flameproof enclosure	1
e	Increased safety	1
ia	Intrinsic safety	0
ib	Intrinsic safety	1
[ia]	Intrinsically safe associated apparatus	Unclassified or Nonhazardous
[ib]	Intrinsically safe associated apparatus	Unclassified or Nonhazardous
m	Encapsulation	1
nA	Nonsparking equipment	2

Table 505-9(b)(2). ~~[505-10(b)(2)]~~ Gas Classification Groups

Gas Group	Comment
IIC	See Section 505-6(a)(1)
IIB	See Section 505-6(a) (2)
IIA	See Section 505-6(a)(3)

(c)~~[505-8]~~ Class I Temperature

The temperature marking specified below ~~in Section 505-10(b)~~ shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

FPN: For information regarding ignition temperatures of gases and vapors, see Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997; Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, NFPA 325-1994; and Electrical Apparatus for Explosive Gas Atmospheres, Data for Flammable Gases and Vapours, Relating to the Use of Electrical Apparatus, IEC 60079-20-1996.

(1) ~~[505-10(b)(3)]~~ **Temperature Classifications.** Approved equipment shall be marked to show the operating temperature or temperature class referenced to a 40ºC (104ºF) ambient. The temperature class, if provided, shall be indicated using the temperature class (T Code) shown in Table 505-9 (c).

Table 505-9(c). ~~[505-10(b)(3)]~~ Classification of Maximum Surface Temperature for Group II Electrical Equipment

Temperature Class (T Code)	Maximum Surface Temperature (ºC)
T1	≤450
T2	≤300
T3	≤200
T4	≤135
T5	≤100
T6	≤85

Electrical equipment designed for use in the ambient temperature range between -20ºC and +40ºC shall require no additional temperature marking.

Electrical equipment that is designed for use in a range of ambient temperatures other than -20ºC and +40ºC is considered to be special; and the ambient temperature range shall then be marked on the equipment, including either the symbol "Ta" or "Tamb" together with the special range of ambient temperatures. As an example, such a marking might be "-30ºC Ta + 40ºC."

Electrical equipment suitable for ambient temperatures exceeding 40ºC (104ºF) shall be marked with both the maximum ambient temperature and the operating temperature or temperature class at that ambient temperature.

Exception No. 1: Equipment of the nonheat-producing type, such as conduit fittings, and equipment of the heat-producing type having a maximum temperature of not more than 100ºC (212ºF) shall not be required to have a marked operating temperature or temperature class.

Exception No. 2: Equipment approved for Class I, Division 1 or Division 2 locations as permitted by Sections 505-20(b) and (c) shall be permitted to be marked in accordance with Section 500-6(d) and Table 500-6(d).

(d) ~~[505-3(b))]~~ **Threading**

All threaded conduit or fittings referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) standard conduit cutting die that provides _-in. taper per foot. Such conduit shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof or flameproof integrity of the conduit system where applicable. Threaded joints shall be made up with at least five threads fully engaged.

Equipment provided with threaded entries for field wiring connections shall be installed in accordance with (1) or (2).

(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.

FPN: Threading specifications for NPT threads are located in Pipe Threads, General Purpose (Inch), ANSI/ASME B1.20.1-1983.

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in Metric Screw Threads, ISO 965/1-1980, and Metric Screw Threads, ISO 965/3-1980.

505-15.~~[505-15]~~[14-364] Wiring Methods. Wiring methods shall maintain the integrity of protection techniques and shall comply with (a), (b), or (c).

(a) Class I, Zone 0. In Class I, Zone 0 locations, only intrinsically safe wiring methods in accordance with Article 504 shall be permitted.

FPN: Article 504 only includes protection technique "ia."

(b) Class I, Zone 1.

(1) In Class I, Zone 1 locations, the following wiring methods shall be permitted:

(a) Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application.

FPN: See Sections 334-3 and 334-4 for restrictions on use of Type MC cable.

(b) Type ITC-HL cable, listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage, Type TC cable shall be permitted if listed as suitable for use as open wiring and provided with a gas/vaportight overall jacket of suitable polymeric material and provided with separate grounding conductors in accordance with Section 250-122. Cable termination fittings shall be listed for the application. The open wiring shall not exceed lengths of 15 feet.

FPN: Type TC cable listed for use as open wiring meets the crush and impact requirements of Type MC cable.

(d) Type MI cable with termination fittings approved for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(e) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(f) Rigid nonmetallic conduit complying with Article 347 shall be permitted where encased in a concrete envelope a minimum of 2 in. (50.8 mm) thick and provided with not less than 24 in. (610 mm) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 24 in. (610 mm) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.

(2) Where necessary to employ flexible connections, flexible fittings listed for Class I, Zone 1 or Division 1 locations or flexible cord in accordance with the provisions of Section 505-17 shall be permitted.

(c) Class I, Zone 2.

(1) In Class I, Zone 2 locations, the following wiring methods shall be permitted:

(a) All wiring methods permitted by Article 505-15(b).

(b) Types MI, MC, MV, or TC cable with approved termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings;

(c) Type ITC cable in cable trays, in raceways, supported by messenger wire, where afforded mechanical protection and run as open wiring, or directly buried where the cable is listed for this use;

(d) Type PLTC cable in accordance with the provisions of Article 725, or in cable tray systems. PLTC shall be installed in a manner to avoid tensile stress at the termination fittings;

(e) enclosed gasketed busways, enclosed gasketed wireways;

(f) threaded rigid metal conduit, threaded steel intermediate metal conduit;

(g) Nonincendive field wiring using any of the wiring methods suitable for nonhazardous locations, including Chapter 7 and 8 wiring methods.

(2) Where provision must be made for limited flexibility, flexible metal fittings, flexible metal conduit with approved fittings, liquidtight flexible metal conduit with approved fittings, liquidtight flexible nonmetallic conduit with approved fittings, or flexible cord in accordance with the provisions of Section 505-17 shall be permitted.

FPN: See Section 505-25(b) for grounding requirements where flexible conduit is used.

[new- NFPA check formating]

505-16. Sealing and Drainage. Seals in conduit and cable systems shall comply with (a) through (e). Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.

FPN No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal, and through conductors passing through the seal. See Section 505-16(c)(2)(b). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See Section 505-16(d)(2).

FPN No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than No. 2. Special conductor constructions, e.g., compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.

(a) Zone 0. In Class I, Zone 0 locations, seals shall be located as follows.

(1) Seals shall be provided within 10 ft (3.05 m) of where a conduit leaves a Zone 0 location. There shall be no unions, couplings, boxes, or fittings, except reducers at the seal, in the conduit run between the seal and the point at which the conduit leaves the location.

Exception: A rigid unbroken conduit that passes completely through the Zone 0 location with no fittings less than 12 in. (305 mm) beyond each boundary, shall not be required to be sealed, if the termination points of the unbroken conduit are in unclassified locations.

(2) Seals shall be provided on cables at the first point of termination after entry into the Zone 0 location.

(3) Seals shall not be required to be explosionproof or flameproof.

(b) Zone 1. In Class I, Zone 1 locations, seals shall be located as follows.

(1) Conduit seals shall be provided for each conduit entering enclosures having type of protection 'd' or 'e'.

Exception: Where the enclosure having type of protection 'd' is marked to indicate that a seal is not required.

(2) Conduit seals shall be provided for each conduit entering explosionproof equipment as follows.

a. In each conduit entry into an explosionproof enclosure where either (1) the enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors, that may produce arcs, sparks, or high temperatures that are considered to be an ignition source in normal operation, or (2) the entry is 2-in. size or larger and the enclosure contains terminals, splices, or taps. For the purposes of this section high temperatures shall be considered to be any

temperatures exceeding 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved.

Exception: Conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors are

1. Enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or

2. Immersed in oil, or

3. Enclosed within a factory-sealed explosionproof chamber located within the enclosure, approved for the location, and marked "factory sealed" or equivalent, unless the entry is 2 in. size or larger.

Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal.

b. Conduit seals shall be installed within 18 in. (457 mm) from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and Cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.

c. Where two or more explosionproof enclosures for which conduit seals are required under (b)(2) are connected by nipples or by runs of conduit not more than 36 in. (914 mm) long, a single conduit seal in each such nipple connection or run of conduit shall be considered sufficient if located not more than 18 in. (457 mm) from either enclosure.

(3) In each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 18 in. (457 mm) from the pressurized enclosure.

FPN No. 1: Installing the seal as close as possible to the enclosure will reduce problems with purging the dead airspace in the pressurized conduit.

FPN No. 2: For further information, see Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

(4) In each conduit run leaving a Class I, Zone 1 location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Zone 1 portion of the conduit from being communicated to the conduit beyond the seal. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 1 location.

Exception: Metal conduit containing no unions, couplings, boxes, or fittings that passes completely through a Class I, Zone 1 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not require a conduit seal if the termination points of the unbroken conduit are in unclassified locations.

(5) Conduits containing cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Zone 1 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor and the outer jacket.

Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered as a single conductor by sealing the cable in the conduit within 18 in. (457 mm) of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods. For shielded cables and twisted pair cables, it shall not be required to remove the shielding material or separate the twisted pair.

(6) Each multiconductor cable in conduit shall be considered as a single conductor if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with (d).

(7) Cable seals shall be provided for each cable entering flameproof or explosionproof enclosures. The seal shall comply with (d).

(8) Cables shall be sealed at the point at which they leave the Zone 1 location.

Exception: Where cable is sealed at the termination point.

(c) Zone 2. In Class I, Zone 2 locations, seals shall be located as follows.

(1) Conduit seals shall be located as follows.

(a) For connections to enclosures that are required to be flameproof or explosionproof, a conduit seal shall be provided in accordance with (b)(1) and (b)(2). All portions of the conduit run or nipple between the seal and such enclosure shall comply with Section 505-16(b).

(2) In each conduit run passing from a Class I, Zone 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Zone 2 portion of the conduit from being communicated to the conduit beyond the seal. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Zone 2 location, and a threaded connection shall be used at the sealing fitting. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 2 location.

Exception No. 1: Metal conduit containing no unions, couplings, boxes or fittings that passes completely through a Class I, Zone 2 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.

Exception No. 2: Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or open wiring shall not be required to be sealed where passing from the Class I, Zone 2 location into the unclassified location. The unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The conduits shall not terminate at an enclosure containing an ignition source in normal operation.

Exception No. 3: Conduit systems passing from an enclosure or room that is unclassified as a result of pressurization into a Class I, Zone 2 location shall not require a seal at the boundary.

FPN: For further information, refer to Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Class I, Zone 2 location into an unclassified location if the following conditions are met:

1. No part of the conduit system segment passes through a Class I, Zone 0 or Class I, Zone 1 location where the conduit contains unions, couplings, boxes, or fittings within 12 in. (305 mm) of the Class I, Zone 0 or Class I, Zone 1 location; and

2. The conduit system segment is located entirely in outdoor locations; and

3. The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system; and

4. The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location; and

5. The conduit system segment is sealed at its entry to each enclosure or fitting housing terminals, splices, or taps in Class I, Zone 2 locations.

(3) Cable seals shall be located as follows.

(a) Cables entering enclosures required to be flameproof or explosionproof shall be sealed at the point of entrance. The seal shall comply with (d). Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Zone 2 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors. Multiconductor cables in conduit shall be sealed as described in (b)(4).

Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Class I, Zone 2 location shall not require a seal at the boundary.

Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

(b) Cables with a gas/vaportight continuous sheath and that will not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in (3)(a). The minimum length of such cable run shall not be less than that length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings [0.007 ft3/hour (198 cm3/hour) of air at a pressure of 6 in. of water (1493 pascals)].

FPN No. 1: See Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations, ANSI/UL 886-1994.

FPN No. 2: The cable core does not include the interstices of the conductor strands.

(c) Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall not be required to be sealed except as required in (3)(a), unless the cable is attached to process equipment or devices that may cause a pressure in excess of 6 in. of water (1493 pascals) to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified area.

Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, Zone 2 location without seals.

(d) Cables that do not have gas/vaportight continuous sheath shall be sealed at the boundary of the Zone 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.

FPN: The cable sheath may be either metal or a nonmetallic material.

(d) Class I, Zones 0, 1 and 2. Where required, seals in Class I, Zones 0, 1 and 2 locations shall comply with the following.

(1) Fittings. Enclosures for connections or equipment shall be provided with an integral means for sealing, or sealing fittings for Class I locations shall be used. Sealing fittings shall be accessible. Sealing fittings shall be listed for use with one or more specific compounds and shall be accessible.

(2) Compound. The compound shall provide a seal against passage of gas or vapors through the seal fitting, shall not be affected by the surrounding atmosphere or liquids, and shall not have a melting point of less than 93ºC (200ºF).

(3) Thickness of Compounds. In a completed seal, the minimum thickness of the sealing compound shall not be less than the trade size of the sealing fitting and, in no case, less than 5/8 in. (16 mm).

Exception: Listed cable sealing fittings shall not be required to have a minimum thickness equal to the trade size of the fitting.

(4) Splices and Taps. Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.

(5) Conductor Fill. The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless it is specifically listed for a higher percentage of fill.

(e) Drainage.

(1) Control Equipment. Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.

(2) Motors and Generators. Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize entrance of liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.

(3) Canned Pumps, Process or Service Connections, Etc. For canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend upon a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the electrical conduit system, an additional approved seal, barrier, or other means shall be provided to prevent the flammable or combustible fluid from entering the conduit system beyond the additional devices or means, if the primary seal fails.

The additional approved seal or barrier and the interconnecting enclosure shall meet the temperature and pressure conditions to which they will be subjected upon failure of the primary seal, unless other approved means are provided to accomplish the purpose above.

Drains, vents, or other devices shall be provided so that primary seal leakage will be obvious.

(14-368)

505-17. Flexible Cords, Class I, Zones 1 and 2. A flexible cord shall be permitted for connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit. Flexible cord shall also be permitted for that portion of the circuit where the fixed wiring methods of Section 505-15(b) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment, in an industrial establishment where conditions of maintenance and engineering supervision ensure that only qualified persons will install and service the installation, and the flexible cord is protected by location or by a suitable guard from damage. The length of the flexible cord shall be continuous. Where flexible cords are used, the cords shall be as follows:

1. Of a type listed ~~approved~~ for extra-hard usage;
2. Contain, in addition to the conductors of the circuit, a grounding conductor complying with Section 400-23;
3. Connected to terminals or to supply conductors in an approved manner;
4. Be supported by clamps or by other suitable means in such a manner that there will be no tension no the terminal connections; and
5. Be provided with suitable seals where the flexible cord enters boxes, fittings, or enclosures that are required to be explosionproof or flameproof.

Exception: As provided in 505-15(c).

Electric submersible pumps with means for removal without entering the wet-pit shall be considered portable utilization equipment. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be permitted.

Electric mixers intended for travel into and out of open-type mixing tanks or vats shall be considered portable utilization equipment.

FPN: See Section 505-18 for flexible cords exposed to liquids having a deleterious effect on the conductor insulation.

[14-173]

505-18. Conductors and Conductor Insulation.

1) For Type of Protection “e”, field wiring conductors shall be copper. (14-365)

2) Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type approved for use under such conditions; or the insulation shall

be protected by a sheath of lead or by other approved means. (14-181)

505-19. Live Parts. There shall be no exposed live parts.(14-188)

505-20. Equipment

(a) Zone 0. In Class I, Zone 0 locations, only equipment specifically listed and marked as suitable for the location shall be permitted.

Exception: Intrinsically safe equipment listed for use in Class I, Division 1 locations for the same gas, or as permitted by Section 505-9(a)(2), and with a suitable temperature classification shall be permitted. [correlation Art500 temperature]

(b) Zone 1. In Class I, Zone 1 locations, only equipment specifically identified and marked as suitable for the location shall be permitted. [correlation with Cook identifed & Art 500, CP140?, CP140x,]

Exception: Equipment approved for use in Class I, Division 1 or listed for use in Class I, Zone 0 locations for the same gas, or as permitted by Section 505-9(a)(2) and with a suitable temperature classification shall be permitted.

(c) Zone 2. In Class I, Zone 2 locations, only equipment specifically identified and marked as suitable for the location shall be permitted. [see above]

Exception No. 1: Equipment identified for use in Class I, Zone 0 or Zone 1 locations for the same gas, or as permitted by Section 505-9(a)(2), and with a suitable temperature classification, shall be permitted.

Exception No. 2: Equipment identified for use in Class I, Division 1 or Division 2 locations for the same gas, or as permitted by Section 505-9(a)(2) and with a suitable temperature classification shall be permitted.

Exception No. 3: In Class I, Zone 2 locations, the installation of open or nonexplosionproof or nonflameproof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Zone 2 location shall be permitted.

FPN No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.

FPN No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitible gases or vapors is suspected, clean air purging may be needed immediately prior to and during start-up periods.

(d) Manufacturer's Instructions. Electrical equipment installed in hazardous (classified) locations shall be installed in accordance with the instructions (if any) provided by the manufacturer.

505-21. Multiwire Branch Circuits. In a Class I, Zone 1 location, a multiwire branch circuit shall not be permitted.

Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously. [14-198]

505-22.~~[505-21]~~Increased Safety "e" Motors and Generators. In Class I, Zone 1 locations, Increased Safety "e" motors and generators of all voltage ratings shall be listed for Class I, Zone 1 locations, and shall comply with the following.

1. Motors shall be marked with the current ratio, IA/IN, and time, tE;
2. Motors shall have controllers marked with the model or identification number, output rating (horsepower or kilowatt), full-load amperes, starting current ratio (IA/IN), and time (tE) of the motors that they are intended to protect; the controller marking shall also include the specific overload protection type (and setting, if applicable) that is listed with the motor or generator;
3. Connections shall be made with the specific terminals listed with the motor or generator;
4. Terminal housings shall be permitted to be of substantial, nonmetallic, nonburning material provided an internal grounding means between the motor frame and the equipment grounding connection is incorporated within the housing;
5. The provisions of Part C of Article 430 shall apply regardless of the voltage rating of the motor;
6. The motors shall be protected against overload by a separate overload device that is responsive to motor current. This device shall be selected to trip or shall be rated in accordance with the listing of the motor and its overload protection;
7. Sections 430-34 and 430-44 shall not apply to such motors; and
8. The motor overload protection shall not be shunted or cut out during the starting period.

505-25. Grounding and Bonding. Grounding and bonding shall comply with Article 250 and the following additional requirements.

(a) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.

Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in Sections 250-32(a), (b), and (c), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.

FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.

(b) Types of Equipment Grounding Conductors. Where flexible metal conduit or liquidtight flexible metal conduit is used as permitted in Section 505-15(c) and is to be relied on to complete a sole equipment grounding path, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with Section 250-102.

Exception: In Class I, Zone 2 locations, the bonding jumper shall be permitted to be deleted where all the following conditions are met.

a. Listed liquidtight flexible metal conduit 6 ft (1.83 m) or less in length, with fittings listed for grounding, is used.

b. Overcurrent protection in the circuit is limited to 10 amperes or less.

c. The load is not a power utilization load.

SUBSTANTIATION: During the January 2000 ROP meeting, Code Making Panel 14 was challenged with a very difficult task due to the large number of proposals that required action, the technical content of the requested revisions, and the Technical Correlating Committee formatting changes. As a result, it was very difficult for the NEC staff assigned to Code Making Panel 14 to keep up with the actions taking place. This comment's intent is to clarify what took place and make necessary revisions.

PANEL ACTION: Accept in Principle.

Revise Article 505 to read as follow:

ARTICLE 505
[Comment 14-126]

Class I, Zone 0, 1, and 2 Locations

505-1 Scope. This article covers the requirements for the zone classification system as an alternative to the division classification system covered in Article 500 for electrical and electronic equipment and wiring for all voltages in Class I, Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases, vapors, or liquids.

FPN: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Division 1 or Division 2; Class II, Division 1 or Division 2; and Class III, Division 1 or Division 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, or combustible dusts or fibers, refer to Articles 500 through 504.

505-2 Definitions. For purposes of this article, the following definitions apply.

Combustible Gas Detection System. A protection technique utilizing stationary gas detectors in industrial establishments which under specific conditions permits the use of equipment suitable for Class I, Zone 2 locations to be used in a Class I, Zone 1 location or the use of equipment suitable for unclassified locations to be used in a Class I, Zone 2 locations.

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with an electrical installation.

FPN: Portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, could potentially become an ignition source in hazardous (classified) locations. Equipment suitable for the location or safety procedures to ensure safe operation of this equipment should be employed.

Encapsulation "m." Type of protection where electrical parts that could ignite an explosive atmosphere by either sparking or heating are enclosed in a compound in such a way that this explosive atmosphere cannot be ignited.

FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection — Encapsulation "m," ISA -- 12.23.01-1998, and Electrical Apparatus for Explosive Gas Atmospheres — Part 18: Encapsulation "m," IEC 60079-18-1992; Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations, ANSI/UL 2279-1997(Part 18).

Flameproof "d". Type of protection where the enclosure will withstand an internal explosion of a flammable mixture that has penetrated into the interior, without suffering damage and without causing ignition, through any joints or structural openings in the enclosure, of an external explosive gas atmosphere consisting of one or more of the gases or vapors for which it is designed.

FPN: See Electrical Apparatus for Use In Class I, Zone 1 and 2 Hazardous (Classified) Locations, Type of Protection — Flameproof "d," ISA -- 12.22.01-1998; Electrical Apparatus for Explosive Gas Atmospheres, Part 1 — Construction and Verification Test of Flameproof Enclosures of Electrical Apparatus, IEC 60079-1-2000; Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations, ANSI/UL 2279-1997(Part 1)

Increased Safety "e." Type of protection applied to electrical equipment that does not produce arcs or sparks in normal service and under specified abnormal conditions, in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.

FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Increased Safety "e," ISA -- 12.16.01-1998; and Electrical Apparatus for Explosive Gas Atmospheres — Part 7: Increased Safety "e," IEC 60079-7-1990, Amendment No. 1 (1991), and Amendment No. 2 (1993); Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations, ANSI/UL 2279-1997(Part 7).

Intrinsic Safety "i". Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

FPN No. 1: See Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Hazardous Locations, ANSI/UL 913-1997; Electrical Apparatus for Use in Class I, Zones 0, 1 and 2 Hazardous (Classified) Locations - Intrinsic Safety "i", ISA --12.02.01-1999; Electrical Apparatus for Explosive Gas Atmospheres — Part 11: Intrinsic Safety "i," IEC 60079-11-1999; Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations, ANSI/UL 2279-1997(Part 11)

FPN No. 2: Intrinsic safety is designated type of protection "ia" for use in Zone 0 locations. Intrinsic safety is designated type of protection "ib" for use in Zone 1 locations.

FPN No. 3: Intrinsically safe associated apparatus, designated by [ia] or [ib], is connected to intrinsically safe apparatus ("ia" or "ib" respectively), but is located outside the hazardous (classified) location unless also protected by another type of protection (such as flameproof).

Oil Immersion "o." Type of protection where electrical equipment is immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Oil-Immersion "o," ISA -- 12.26.01 — 1998; and Electrical Apparatus for Explosive Gas Atmospheres, Part 6 — Oil-Immersion "o," IEC 60079-6-1995; Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations, ANSI/UL 2279-1997(Part 6).

Powder Filling "q." Type of protection where electrical parts capable of igniting an explosive atmosphere are fixed in position and completely surrounded by filling material (glass or quartz powder) to prevent the ignition of an external explosive atmosphere.

FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection — Powder Filling "q," ISA -- 12.25.01-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 5: Powder Filling, Type of Protection "q," IEC 60079-5-1996; Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations, ANSI/UL 2279-1997(Part 5).

Purged and Pressurized. Type of protection for electrical equipment that uses the technique of guarding against the ingress of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere.

FPN No. 1: See Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

FPN No. 2: See Electrical Apparatus for Explosive Gas Atmospheres - Part 2: Electrical Apparatus, Type of Protection "p," IEC 60079-2-2000; and Electrical Apparatus for Explosive Gas Atmospheres - Part 13: Construction and Use of Rooms or Buildings Protected by Pressurization, IEC 60079-13-1982.

Type of Protection "n." Type of protection where electrical equipment, in normal operation, is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.

FPN: see Electrical Apparatus for Explosive Gas Atmospheres, Part 15 — Electrical Apparatus with Type of Protection "n," IEC 60079-15-2000; Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations, ANSI/UL 2279-1997(Part 15).

Unclassified Locations. Locations determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof.

505-3. Other Articles. All other applicable rules contained in this Code shall apply to electrical equipment and wiring installed in hazardous (classified) locations.

Exception: As modified by Article 504 and this article.

505-4 General

(a) Documentation for Industrial Occupancies. All areas in industrial occupancies designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

FPN: For examples of area classification drawings, see Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2, ANSI/API RP 505-1997; Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2, ISA -- RP12.24.01-1998; Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas, IEC 60079-10-1995; and Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.

(b) Reference Standards. Important information relating to topics covered in Chapter 5 may be found in other publications.

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with standards of the National Fire Protection Association (NFPA), the American Petroleum Institute (API), the ISA — Instrumentation, Systems, and Automation Society (ISA), and the International Electrotechnical Commission (IEC) that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

FPN No. 2: For further information on the classification of locations, see Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2, ANSI/API RP 505-1997; Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2, ISA -- RP12.24.01-1998; Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas, IEC 60079-10-1995; and Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.

FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see Recommended Practice on Static Electricity, NFPA 77-2000; Standard for the Installation of Lightning Protection Systems, NFPA 780-1997; and Protection Against Ignitions Arising Out of Static Lightning and Stray Currents, API RP 2003-1998.

FPN No. 4: For further information on ventilation, see Flammable and Combustible Liquids Code, NFPA 30-2000, and Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2, ANSI/API RP 505-1997.

FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassifed and Class I, Zone 0, Zone 1, and Zone 2 Locations, ANSI/API RP 14FZ-2000.

FPN No. 6: For further information on the installation of electrical equipment in hazardous (classified) locations in general, see Electrical Apparatus for Explosive Gas Atmospheres — Part 14: Electrical Installations in Explosive Gas Atmospheres (Other than Mines), IEC 60079-14-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 16: Artificial Ventilation for the Protection of Analyzer(s) Houses, IEC 60079-16-1990.

FPN No. 7: For further information on application of electrical equipment in hazardous (classified locations in general, see Electrical Apparatus for Use in Class I, Zones 0 and 1, Hazardous (Classified) Locations: General Requirements, ISA -- 12.00.01-1999; and Definitions and Information Pertaining to Electrical Apparatus in Hazardous (Classified) Locations, ISA -- 12.01.01-1999;; Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations, ANSI/UL 2279-1997(Part 0).

505-5 Classifications of Locations

(a) Classification of Locations. Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified. Each room, section, or area shall be considered individually in determining its classification.

FPN No. 1: See Section 505-7 for restrictions on area classification.

FPN No. 2: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in reduced level of classification or in an unclassified location and, thus, to reduce the amount of special equipment required. [14-323]

Rooms and areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation, may be classified as "unclassified" locations.

FPN: For further information regarding classification and ventilation of areas involving ammonia, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989 (14-39)

(b) Class I, Zone 0, 1, and 2 Locations. Class I, Zone 0, 1, and 2 locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures. Class I, Zone 0, 1, and 2 locations shall include those specified in (1), (2) and (3).

(1) Class I, Zone 0. A Class I, Zone 0 location is a location

(a) In which ignitible concentrations of flammable gases or vapors are present continuously, or
(b) In which ignitible concentrations of flammable gases or vapors are present for long periods of time.

FPN No. 1: As a guide in determining when flammable gases or vapors are present continuously or for long periods of time, refer to Recommended Practice for Classification of Locations for Electrical Installations of Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2, ANSI/API RP 505-1997; Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2, ISA -- 12.24.01-1998; Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous Areas, IEC 60079-10-1995; and Area Classification Code for Petroleum Installations, Model Code, Part 15, Institute of Petroleum.

FPN No. 2: This classification includes locations inside vented tanks or vessels that contain volatile flammable liquids; inside inadequately vented spraying or coating enclosures, where volatile flammable solvents are used; between the inner and outer roof sections of a floating roof tank containing volatile flammable liquids; inside open vessels, tanks and pits containing volatile flammable liquids; the interior of an exhaust duct that is used to vent ignitible concentrations of gases or vapors; and inside inadequately ventilated enclosures that contain normally venting instruments utilizing or analyzing flammable fluids and venting to the inside of the enclosures.

FPN No. 3: It is not good practice to install electrical equipment in Zone 0 locations except when the equipment is essential to the process or when other locations are not feasible. [See Section 505-3(a) FPN No. 2.] If it is necessary to install electrical systems in a Zone 0 location, it is good practice to install intrinsically safe systems as described by Article 504.

(2) Class I, Zone 1. A Class I, Zone 1 location is a location

(a) In which ignitible concentrations of flammable gases or vapors are likely to exist under normal operating conditions; or
(b) In which ignitible concentrations of flammable gases or vapors may exist frequently because of repair or maintenance operations or because of leakage; or
(c) In which equipment is operated or processes are carried on, of such a nature that equipment breakdown or faulty operations could result in the release of ignitible concentrations of flammable gases or vapors and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition; or
(d) That is adjacent to a Class I, Zone 0 location from which ignitible concentrations of vapors could be communicated, unless communication is prevented by

adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

FPN No. 1: Normal operations is considered the situation when plant equipment is operating within its design parameters. Minor releases of flammable material may be part of normal operations. Minor releases include the releases from mechanical packings on pumps. Failures that involve repair or shutdown (such as the breakdown of pump seals and flange gaskets, and spillage caused by accidents) are not considered normal operation.

FPN No. 2: This classification usually includes locations where volatile flammable liquids or liquefied flammable gases are transferred from one container to another. In areas in the vicinity of spraying and painting operations where flammable solvents are used; adequately ventilated drying rooms or compartments for evaporation of flammable solvents; adequately ventilated locations containing fat and oil extraction equipment using volatile flammable solvents; portions of cleaning and dyeing plants where volatile flammable liquids are used; adequately ventilated gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape; inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids; the interiors of refrigerators and freezers in which volatile flammable materials are stored in the open, lightly stoppered, or easily ruptured containers; and other locations where ignitible concentrations of flammable vapors or gases are likely to occur in the course of normal operation, but not classified Zone 0.

(3) Class I, Zone 2. A Class I, Zone 2 location is a location

(a) In which ignitible concentrations of flammable gases or vapors are not likely to occur in normal operation and if they do occur will exist only for a short period; or
(b) In which volatile flammable liquids, flammable gases, or flammable vapors are handled, processed, or used, but in which the liquids, gases, or vapors normally are confined within closed containers of closed systems from which they can escape, only as a result of accidental rupture or breakdown of the containers or system, or as a result of the abnormal operation of the equipment with which the liquids or gases are handled, processed, or used; or
(c) In which ignitible concentrations of flammable gases or vapors normally are prevented by positive mechanical ventilation, but which may become hazardous as a result of failure or abnormal operation of the ventilation equipment; or
(d) That is adjacent to a Class I, Zone 1 location, from which ignitible concentrations of flammable gases or vapors could be communicated, unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.

FPN: The Zone 2 classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used, but which would become hazardous only in case of an accident or of some unusual operating condition.

505-6 Material Groups. For purposes of testing, approval, and area classification, various air mixtures (not oxygen enriched) shall be grouped as required in (a), (b), and (c).

FPN: Group I is intended for use in describing atmospheres that contain firedamp (a mixture of gases, composed mostly of methane, found underground, usually in mines). This Code does not apply to installations underground in mines. See Section 90-2(b).

Group II shall be subdivided into IIC, IIB, and IIA, as noted in (a), (b), and (c), according to the nature of the gas or vapor, for protection techniques "d," "ia," "ib," "[ia]," and "[ib]," and, where applicable, "n" and "o."

FPN No. 1: The gas and vapor subdivision as described above is based on the maximum experimental safe gap (MESG), minimum igniting current (MIC), or both. Test equipment for determining the MESG is described in Construction and Verification Tests of Flameproof Enclosures of Electrical Apparatus, IEC 60079-1A-1975, Amendment No. 1 (1993) and UL Technical Report No. 58 (1993). The test equipment for determining MIC is described in Electrical Apparatus for Explosive Gas Atmospheres — Part 11: Intrinsic Safety "i," IEC 60079-11-1999. The classification of gases or vapors according to their maximum experimental safe gaps and minimum igniting currents is described in Classification of Mixtures of Gases or Vapours with Air According to Their Maximum Experimental Safe Gaps and Minimum Igniting Currents, IEC 60079-12-1978.

FPN No. 2: Verification of electrical equipment utilizing protection techniques "e," "m," "p," and "q," due to design technique, does not require tests involving MESG or MIC. Therefore, Group II is not required to be subdivided for these protection techniques.

FPN No. 3: It is necessary that the meanings of the different equipment markings and Group II classifications be carefully observed to avoid confusion with Class I, Divisions 1 and 2, Groups A, B, C, and D.

(a) Class I, Zone 0, 1, and 2, Group Classifications. Class I, Zone 0, 1, and 2, groups shall be as follows:

(1) ˝Group IIC. Atmospheres containing acetylene, hydrogen, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.50 mm or minimum igniting current ratio (MIC ratio) less than or equal to 0.45.

FPN: Group IIC is equivalent to a combination of Class I, Group A, and Class I, Group B, as described in Sections 500-6 (a) (1) and 6 (a) (2)).

(2) ˝Group IIB. Atmospheres containing acetaldehyde, ethylene, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either maximum experimental safe gap (MESG) values greater than 0.50 mm and less than or equal to 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.45 and less than or equal to 0.80.

FPN: Group IIB is equivalent to Class I, Group C, as described in Section 500-6 (a)(3).

(3) ˝Group IIA. Atmospheres containing acetone, ammonia, ethyl alcohol, gasoline, methane, propane, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experiment safe gap (MESG) value greater than 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.80.

FPN: Group IIA is equivalent to Class I, Group D as described in Section 500-6 (a)(4).

505-7 Special Precaution. Article 505 requires equipment construction and installation that will ensure safe performance under conditions of proper use and maintenance.

FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to the installation and maintenance of electrical equipment in hazardous (classified) locations.

FPN No. 2: Low ambient conditions require special consideration. Electrical equipment depending on the protection techniques described by Section 505-8 (a) may not be suitable for use at temperatures lower than -20ºC (-4ºF) unless they are identified for use at lower temperatures. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified Class I, Zones 0, 1, or 2 at normal ambient temperature.

(a) Supervision of Work. Classification of areas and selection of equipment and wiring methods shall be under the supervision of a qualified Registered Professional Engineer.

(b) Dual Classification. In instances of areas within the same facility classified separately, Class I, Zone 2 locations shall be permitted to abut, but not overlap, Class I, Division 2 locations. Class I, Zone 0 or Zone 1 locations shall not abut Class I, Division 1 or Division 2 locations.

(c) Reclassification Permitted. A Class I, Division 1 or Division 2 location shall be permitted to be reclassified as a Class I, Zone 0, Zone 1, or Zone 2 location provided all of the space that is classified because of a single flammable gas or vapor source is reclassified under the requirements of this article.

(d) Solid Obstacles. Flameproof equipment with flanged joints shall not be installed such that the flange openings are closer than the distances shown in Table 505-7 to any solid obstacle that is not a part of the equipment (such as steelworks, walls, weather guards, mounting brackets, pipes, or other electrical equipment) unless the equipment is listed for a smaller distance of separation.

Table 505-7. Minimum Distance of Obstructions from Flameproof "d" Flange Openings

	Minimum Distance	
Gas Group	mm	In.
IIC	40	1 37/64
IIB	30	1 3/16
IIA	10	25/64

505- 8 Protection Techniques. The following shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.

FPN: For additional information, see Electrical Apparatus for Use in Class I, Zones 0 and 1 Hazardous (Classified) Locations General Requirements, ISA -- 12.00.01-1999; Definitions and Information Pertaining to Electrical Apparatus in Hazardous (Classified) Locations, ISA -- 12.01.01-1999; Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations, ANSI/UL 2279, 1997; and Electrical Apparatus for Explosive Gas Atmospheres - Part 0: General Requirements, IEC 60079-0-1998.

(a) Flameproof "d." This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

(b) Purged and Pressurized. This protection technique shall be permitted for equipment in those Class I, Zone 1 or Zone 2 locations for which it is identified.

(c) Intrinsic Safety. This protection technique shall be permitted for apparatus and associated apparatus in Class I, Zone 0, Zone 1, or Zone 2 locations for which it is listed.

(d) Type of Protection "n." This protection technique shall be permitted for equipment in Class I, Zone 2 locations. Type of protection "n" is further subdivided into nA, nC, and nR.

FPN: See Table 505-9(b) (1) for the descriptions of subdivisions for type of protection "n."

(e) Oil Immersion "o." This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

(f) Increased Safety "e." This protection technique shall be permitted for equipment in Class I, Zone 1, or Zone 2 locations.

(g) Encapsulation "m." This protection technique shall be permitted for equipment in Class I, Zone 1, or Zone 2 locations.

(h) Powder Filling "q." This protection technique shall be permitted for equipment in Class I, Zone 1, or Zone 2 locations.

(i) Combustible Gas Detection System. A combustible gas detection system incorporating combustible gas detectors used in industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, is a protection technique permitted under the following conditions:

(1) In a Class I, Zone 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Zone 2 locations shall be permitted.
(2) In a building located in, or with an opening into, a Class I, Zone 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted.
(3) In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases or vapors, electrical equipment suitable for Class I, Zone 2 locations shall be permitted.
Gas detection equipment shall be listed for detection of the specific gas or vapor to be encountered.

FPN: For further information, see ANSI/ISA-12.13.01, Performance Requirements, Combustible Gas Detectors.

Use of this technique for each of the applications above includes adherence to established industrial practices and requirements.

FPN No. 1: For further information, see ANSI/API RP 505, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2.

FPN No. 2: For further information, see ISA-RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments.

505-9 Suitability of Equipment

(a) Suitability. Suitability of identified equipment shall be determined by:

(1) Equipment listing or labeling, or
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation, or
(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment.

(b) Listing.

(1) Equipment that is listed for a Zone 0 location shall be permitted in a Zone 1 or Zone 2 location of the same gas or vapor. Equipment that is listed for a Zone 1 location shall be permitted in a Zone 2 location of the same gas or vapor.

(2) Equipment shall be permitted to be listed for a specific gas or vapor, specific mixtures of gases or vapors, or any specific combination of gases or vapors.

FPN: One common example is equipment marked for "IIB + H2."

(c) Marking. Equipment shall be marked in accordance with (1) or (2).

(1) Division Equipment. Equipment identified for Class I, Division 1 or Class I, Division 2 shall, in addition to being marked in accordance with Section 500-6(d), be permitted to be marked with the following:

(a) Class I, Zone 1 or Class I, Zone 2 (as applicable), and
(b) Applicable gas classification group(s) in accordance with Table 505-9(b)(2), and
(c) Temperature classification in accordance with Section 505-9(3)

(2) Zone Equipment. Equipment meeting one or more of the protection techniques described in Section 505-5 shall be marked with the following in the order shown:

(a) Class
(b) Zone
(c) Symbol "AEx"
(d) Protection technique(s) in accordance with Table 505-9(b)(2)
(e) Applicable gas classification group(s) in accordance with Table 505-9(b)(2)
(f) Temperature classification in accordance with Section 505-9(c)

Exception: Intrinsically safe associated apparatus shall be required to be marked only with (c), (d), and (e).

Electrical equipment of types of protection "e," "m," "p," or "q," shall be marked Group II. Electrical equipment of types of protection "d," "ia," "ib," "[ia]," or "[ib]" shall be marked Group IIA, or IIB, or IIC, or for a specific gas or vapor. Electrical equipment of types of protection "n" shall be marked Group II unless it contains enclosed-break devices, nonincendive components, or energy-limited equipment or circuits, in which case it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor. Electrical equipment of other types of protection shall be marked Group II unless the type of protection utilized by the equipment requires that it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor.

FPN : An example of such a required marking is "Class I, Zone 0, AEx ia IIC T6." An explanation of the marking that is required is shown in Figure 505-9(b)(1).

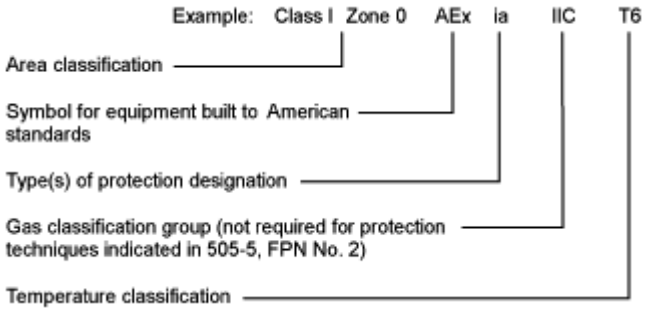

Figure 505-9(b)(1) ~~[505-10(b)(1)]~~

Table 505-9(b)(1). Types of Protection Designation

Designation	Technique	Zone*
d	Flameproof enclosure	1
e	Increased safety	1
ia	Intrinsic safety	0
ib	Intrinsic safety	1
[ia]	Intrinsically safe associated apparatus	Unclassified
[ib]	Intrinsically safe associated apparatus	Unclassified
m	Encapsulation	1
nA	Nonsparking equipment	2
nC	Sparking equipment in which the contacts are suitably protected other than by restricted breathing enclosure	2
nR	Restricted breathing enclosure	2
o	Oil immersion	1
p	Purged and pressurized	1 or 2
q	Powder filled	1

* Does not address use where a combination of techniques is used.

Table 505-9(b)(2). ~~[505-10(b)(2)]~~ Gas Classification Groups

Gas Group	Comment
IIC	See Section 505-6(a)(1)
IIB	See Section 505-6(a) (2)
IIA	See Section 505-6(a)(3)

(c) Class I Temperature. The temperature marking specified below ~~in Section 505-10(b)~~ shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

FPN: For information regarding ignition temperatures of gases and vapors, see Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997; and Electrical Apparatus for Explosive Gas Atmospheres, Data for Flammable Gases and Vapours, Relating to the Use of Electrical Apparatus, IEC 60079-20-1996.

(1) Temperature Classifications. Equipment shall be marked to show the operating temperature or temperature class referenced to a 40ºC (104ºF) ambient. The temperature class, if provided, shall be indicated using the temperature class (T Code) shown in Table 505-9 (c).

Table 505-9(c). ~~[505-10(b)(3)]~~ Classification of Maximum Surface Temperature for Group II Electrical Equipment

Temperature Class (T Code)	Maximum Surface Temperature (ºC)
T1	≤450
T2	≤300
T3	≤200
T4	≤135
T5	≤100
T6	≤85

Electrical equipment designed for use in the ambient temperature range between -20ºC and +40ºC shall require no additional ambient temperature marking.
Electrical equipment that is designed for use in a range of ambient temperatures other than -20ºC and +40ºC is considered to be special; and the ambient temperature range shall then be marked on the equipment, including either the symbol "Ta" or "Tamb" together with the special range of ambient temperatures. As an example, such a marking might be "-30ºC ≤ Ta ≤ + 40ºC."
Electrical equipment suitable for ambient temperatures exceeding 40ºC (104ºF) shall be marked with both the maximum ambient temperature and the operating temperature or temperature class at that ambient temperature.

Exception No. 1: Equipment of the nonheat-producing type, such as conduit fittings, and equipment of the heat-producing type having a maximum temperature of not more than 100ºC (212ºF) shall not be required to have a marked operating temperature or temperature class.
Exception No. 2: Equipment identified for Class I, Division 1 or Division 2 locations as permitted by Sections 505-20(b) and (c) shall be permitted to be marked in accordance with Section 500-6(d) and Table 500-6(d).

(d) Threading. All threaded conduit referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) standard conduit cutting die that provides a taper of 1 in 16 (_-in. taper per foot). Such conduit shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof or flameproof integrity of the conduit system where applicable. Threaded joints shall be made up with at least five threads fully engaged for entries into flameproof or explosionproof equipment.

Equipment provided with threaded entries for field wiring connections shall be installed in accordance with (1) or (2).

(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.

FPN: Thread form specifications for NPT threads are located in Pipe Threads, General Purpose (Inch), ANSI/ASME B1.20.1-1983.

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in Metric Screw Threads, ISO 965/1-1980, and Metric Screw Threads, ISO 965/3-1980.

505-15. Wiring Methods. Wiring methods shall maintain the integrity of protection techniques and shall comply with (a), (b), or (c).

(a) Class I, Zone 0. In Class I, Zone 0 locations, only intrinsically safe wiring methods in accordance with Article 504 shall be permitted.

FPN: Article 504 only includes protection technique "ia."

(b) Class I, Zone 1.

(1) In Class I, Zone 1 locations, the following wiring methods shall be permitted:

(a) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application.

FPN: See Sections 334-3 and 334-4 for restrictions on use of Type MC cable.

(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage, Type ITC-HL cable, listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application.

(c) Type MI cable with termination fittings listed for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(d) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(e) Rigid nonmetallic conduit complying with Article 347 shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.

(2) Where necessary to employ flexible connections, flexible fittings listed for Class I, Zone 1 or Division 1 locations or flexible cord in accordance with the provisions of Section 505-17 shall be permitted.

(c) Class I, Zone 2.

(1) In Class I, Zone 2 locations, the following wiring methods shall be permitted:

(a) All wiring methods permitted by Article 505-15(b).
(b) Types MI, MC, MV, or TC cable with termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings;
(c) Type ITC cable in cable trays, in raceways, supported by messenger wire, where afforded mechanical protection and run as open wiring, or directly buried where the cable is listed for this use;
(d) Type PLTC cable in accordance with the provisions of Article 725, or in cable tray systems. PLTC shall be installed in a manner to avoid tensile stress at the termination fittings;
(e) enclosed gasketed busways, enclosed gasketed wireways;
(f) threaded rigid metal conduit, threaded steel intermediate metal conduit;
(g) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

FPN: Simple apparatus is defined in Section 504-2.

Separate nonincendive field wiring circuits shall be:

(a) in separate cables, or
(b) in multiconductor cables where the conductors of each circuit are within a grounded metal shield, or
(c) in multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in).

(2) Where provision must be made for limited flexibility, flexible metal fittings, flexible metal conduit with listed fittings, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord in accordance with the provisions of Section 505-17 shall be permitted.

FPN: See Section 505-25(b) for grounding requirements where flexible conduit is used.

505-16. Sealing and Drainage. Seals in conduit and cable systems shall comply with (a) through (e). Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.

FPN No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal, and through conductors passing through the seal. See Section 505-16(c)(2)(b). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See Section 505-16(d)(2).

FPN No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than No. 2. Special conductor constructions, e.g., compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.

(a) Zone 0. In Class I, Zone 0 locations, seals shall be located as follows.

(1) Seals shall be provided within 3.05 m (10 ft.) of where a conduit leaves a Zone 0 location. There shall be no unions, couplings, boxes, or fittings, except listed reducers at the seal, in the conduit run between the seal and the point at which the conduit leaves the location.

Exception: A rigid unbroken conduit that passes completely through the Zone 0 location with no fittings less than 300 mm (12 in.) beyond each boundary, shall not be required to be sealed, if the termination points of the unbroken conduit are in unclassified locations.

(2) Seals shall be provided on cables at the first point of termination after entry into the Zone 0 location.

(3) Seals shall not be required to be explosionproof or flameproof.

(b) Zone 1. In Class I, Zone 1 locations, seals shall be located as follows.

(1) Conduit seals shall be provided for each conduit entering enclosures having type of protection 'd' or 'e'.

Exception: Where the enclosure having type of protection 'd' is marked to indicate that a seal is not required.

(2) Conduit seals shall be provided for each conduit entering explosionproof equipment as follows.

(a) In each conduit entry into an explosionproof enclosure where either (1) the enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors, that may produce arcs, sparks, or high temperatures that are considered to be an ignition source in normal operation, or (2) the entry is metric designator 53 (trade size 2) or larger and the enclosure contains terminals, splices, or taps. For the purposes of this section high temperatures shall be considered to be any temperatures exceeding 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved.

Exception: Conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors are

1. Enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or
2. Immersed in oil, or
3. Enclosed within a factory-sealed explosionproof chamber located within the enclosure,identified for the location, and marked "factory sealed" or equivalent, unless the entry is metric designator 53 (trade size 2) or larger.
Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal.

(b) Conduit seals shall be installed within 450 mm (18 in.) from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and Cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.

(c) Where two or more explosionproof enclosures for which conduit seals are required under (b)(2) are connected by nipples or by runs of conduit not more than 900 mm (36 in.) long, a single conduit seal in each such nipple connection or run of conduit shall be considered sufficient if located not more than 450 mm (18 in.) from either enclosure.

(3) In each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 450 mm (18 in.) from the pressurized enclosure.

FPN No. 1: Installing the seal as close as possible to the enclosure will reduce problems with purging the dead airspace in the pressurized conduit.

FPN No. 2: For further information, see Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

(4) In each conduit run leaving a Class I, Zone 1 location. The sealing fitting shall be permitted on either side of the boundary of such location within 3.05 m (10 ft) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Zone 1 portion of the conduit from being communicated to the conduit beyond the seal. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 1 location.

Exception: Metal conduit containing no unions, couplings, boxes, or fittings that passes completely through a Class I, Zone 1 location with no fittings less than 300 mm (12 in.) beyond each boundary shall not require a conduit seal if the termination points of the unbroken conduit are in unclassified locations.

(5) Conduits containing cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Zone 1 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor and the outer jacket.

Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered as a single conductor by sealing the cable in the conduit within 450 mm (18 in.) of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods. For shielded cables and twisted pair cables, it shall not be required to remove the shielding material or separate the twisted pair.

(6) Each multiconductor cable in conduit shall be considered as a single conductor if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with 505-16(d).

(7) Cable seals shall be provided for each cable entering flameproof or explosionproof enclosures. The seal shall comply with 505-16(d).

(8) Cables shall be sealed at the point at which they leave the Zone 1 location.

Exception: Where cable is sealed at the termination point.

(c) Zone 2. In Class I, Zone 2 locations, seals shall be located as follows.

(1) Conduit seals shall be located as follows.

(a) For connections to enclosures that are required to be flameproof or explosionproof, a conduit seal shall be provided in accordance with 505-16 (b)(1) and 505-16 (b)(2). All portions of the conduit run or nipple between the seal and such enclosure shall comply with Section 505-16(b).

(b) In each conduit run passing from a Class I, Zone 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 3.05 m (10 ft) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Zone 2 portion of the conduit from being communicated to the conduit beyond the seal. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Zone 2 location, and a threaded connection shall be used at the sealing fitting. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 2 location.

Exception No. 1: Metal conduit containing no unions, couplings, boxes or fittings that passes completely through a Class I, Zone 2 location with no fittings less than 300 mm (12 in.) beyond each boundary shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.

Exception No. 2: Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or open wiring shall not be required to be sealed where passing from the Class I, Zone 2 location into the unclassified location. The unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The conduits shall not terminate at an enclosure containing an ignition source in normal operation.

Exception No. 3: Conduit systems passing from an enclosure or room that is unclassified as a result of pressurization into a Class I, Zone 2 location shall not require a seal at the boundary.

FPN: For further information, refer to Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Class I, Zone 2 location into an unclassified location if the following conditions are met:

1. No part of the conduit system segment passes through a Class I, Zone 0 or Class I, Zone 1 location where the conduit contains unions, couplings, boxes, or fittings within 300 mm (12 in.) of the Class I, Zone 0 or Class I, Zone 1 location; and

2. The conduit system segment is located entirely in outdoor locations; and

3. The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system; and

4. The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location; and

5. The conduit system segment is sealed at its entry to each enclosure or fitting housing terminals, splices, or taps in Class I, Zone 2 locations.

(2) Cable seals shall be located as follows.

(a) Cables entering enclosures required to be flameproof or explosionproof shall be sealed at the point of entrance. The seal shall comply with 505-16(d). Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Zone 2 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors. Multiconductor cables in conduit shall be sealed as described in 505-16 (b)(4).

Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Class I, Zone 2 location shall not require a seal at the boundary.

Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

(b) Cables with a gas/vaportight continuous sheath and that will not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in 505-16 (c)(2)(a). The minimum length of such cable run shall not be less than that length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings [200 cm3/hour (0.007 ft3/hour) of air at a pressure of 1500 pascals (6 in. of water)].

FPN No. 1: See Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations, ANSI/UL 886-1994.

FPN No. 2: The cable core does not include the interstices of the conductor strands.

(c) Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall not be required to be sealed except as required in 505-16(c)(2)(a), unless the cable is attached to process equipment or devices that may cause a pressure in excess of 1500 pascals (6 in. of water) to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified area.

Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, Zone 2 location without seals.

(d) Cables that do not have gas/vaportight continuous sheath shall be sealed at the boundary of the Zone 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.

FPN: The cable sheath may be either metal or a nonmetallic material.

(d) Class I, Zones 0, 1 and 2. Where required, seals in Class I, Zones 0, 1 and 2 locations shall comply with the following.

(1) Fittings. Enclosures for connections or equipment shall be provided with an integral means for sealing, or sealing fittings listed for the location shall be used. Sealing fittings shall be listed for use with one or more specific compounds and shall be accessible.

(2) Compound. The compound shall provide a seal against passage of gas or vapors through the seal fitting, shall not be affected by the surrounding atmosphere or liquids, and shall not have a melting point of less than 93ºC (200ºF).

(3) Thickness of Compounds. In a completed seal, the minimum thickness of the sealing compound shall not be less than the trade size of the sealing fitting and, in no case, less than 16 mm (5/8 in.).

Exception: Listed cable sealing fittings shall not be required to have a minimum thickness equal to the trade size of the fitting.

(4) Splices and Taps. Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.

(5) Conductor Fill. The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless it is specifically listed for a higher percentage of fill.

(e) Drainage.

(1) Control Equipment. Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.

(2) Motors and Generators. Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize entrance of liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.

(3) Canned Pumps, Process or Service Connections, Etc. For canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend upon a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the electrical conduit system, an additional approved seal, barrier, or other means shall be provided to prevent the flammable or combustible fluid from entering the conduit system beyond the additional devices or means, if the primary seal fails.

The additional approved seal or barrier and the interconnecting enclosure shall meet the temperature and pressure conditions to which they will be subjected upon failure of the primary seal, unless other approved means are provided to accomplish the purpose above.

Drains, vents, or other devices shall be provided so that primary seal leakage will be obvious.

505-17. Flexible Cords, Class I, Zones 1 and 2. A flexible cord shall be permitted for connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit. Flexible cord shall also be permitted for that portion of the circuit where the fixed wiring methods of Section 505-15(b) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment, in an industrial establishment where conditions of maintenance and engineering supervision ensure that only qualified persons will install and service the installation, and the flexible cord is protected by location or by a suitable guard from damage. The length of the flexible cord shall be continuous. Where flexible cords are used, the cords shall be as follows:

1. Of a type listed ~~approved~~ for extra-hard usage;
2. Contain, in addition to the conductors of the circuit, a grounding conductor complying with Section 400-23;
3. Connected to terminals or to supply conductors in an approved manner;
4. Be supported by clamps or by other suitable means in such a manner that there will be no tension no the terminal connections; and

5. Be provided with listed seals where the flexible cord enters boxes, fittings, or enclosures that are required to be explosionproof or flameproof.

Exception: As provided in 505-15(c).

Electric submersible pumps with means for removal without entering the wet-pit shall be considered portable utilization equipment. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be permitted.

Electric mixers intended for travel into and out of open-type mixing tanks or vats shall be considered portable utilization equipment.

FPN: See Section 505-18 for flexible cords exposed to liquids having a deleterious effect on the conductor insulation.

505-18. Conductors and Conductor Insulation.

(1) For Type of Protection "e", field wiring conductors shall be copper.

(2) Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type identified for use under such conditions; or the insulation shall be protected by a sheath of lead or by other approved means.

505-19. Live Parts. There shall be no exposed live parts.

505-20. Equipment

(a) Zone 0. In Class I, Zone 0 locations, only equipment specifically listed and marked as suitable for the location shall be permitted.

Exception: Intrinsically safe apparatus listed for use in Class I, Division 1 locations for the same gas, or as permitted by Section 505-9(b)(2), and with a suitable temperature class shall be permitted.

(b) Zone 1. In Class I, Zone 1 locations, only equipment specifically listed and marked as suitable for the location shall be permitted.

Exception No. 1: Equipment identified for use in Class I, Division 1 or listed for use in Class I, Zone 0 locations for the same gas, or as permitted by Section 505-9(b)(2) and with a suitable temperature class shall be permitted.

Exception No. 2: Equipment identified for Class I, Zone 1, type of protection "p" shall be permitted.

(c) Zone 2. In Class I, Zone 2 locations, only equipment specifically listed and marked as suitable for the location shall be permitted.

Exception No. 1: Equipment listed for use in Class I, Zone 0 or Zone 1 locations for the same gas, or as permitted by Section 505-9(b)(2), and with a suitable temperature class, shall be permitted.

Exception No. 2: Equipment identified for Class I, Zone 1 or Zone 2, type of protection "p" shall be permitted.

Exception No. 3: Equipment identified for use in Class I, Division 1 or Division 2 locations for the same gas, or as permitted by Section 505-9(b)(2) and with a suitable temperature class shall be permitted.

Exception No. 3: In Class I, Zone 2 locations, the installation of open or nonexplosionproof or nonflameproof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Zone 2 location shall be permitted.

FPN No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.

FPN No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitible gases or vapors is suspected, clean air purging may be needed immediately prior to and during start-up periods.

(d) Manufacturer's Instructions. Electrical equipment installed in hazardous (classified) locations shall be installed in accordance with the instructions (if any) provided by the manufacturer.

505-21. Multiwire Branch Circuits. In a Class I, Zone 1 location, a multiwire branch circuit shall not be permitted.

Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.

505-22. Increased Safety "e" Motors and Generators. In Class I, Zone 1 locations, Increased Safety "e" motors and generators of all voltage ratings shall be listed for Class I, Zone 1 locations, and shall comply with the following.

1. Motors shall be marked with the current ratio, I_A / I_N, and time, t_E;
2. Motors shall have controllers marked with the model or identification number, output rating (horsepower or kilowatt), full-load amperes, starting current ratio (I_A / I_N), and time (t_E) of the motors that they are intended to protect; the controller marking shall also include the specific overload protection type (and setting, if applicable) that is listed with the motor or generator;
3. Connections shall be made with the specific terminals listed with the motor or generator;
4. Terminal housings shall be permitted to be of substantial, nonmetallic, nonburning material provided an internal grounding means between the motor frame and the equipment grounding connection is incorporated within the housing;
5. The provisions of Part C of Article 430 shall apply regardless of the voltage rating of the motor;
6. The motors shall be protected against overload by a separate overload device that is responsive to motor current. This device shall be selected to trip or shall be rated in accordance with the listing of the motor and its overload protection;
7. Sections 430-32(c) and 430-44 shall not apply to such motors; and
8. The motor overload protection shall not be shunted or cut out during the starting period.

505-25. Grounding and Bonding. Grounding and bonding shall comply with Article 250 and the following additional requirements.

(a) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.

Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in Sections 250-32(a), (b), and (c), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.

FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.

(b) Types of Equipment Grounding Conductors. Where flexible metal conduit or liquidtight flexible metal conduit is used as permitted in Section 505-15(c) and is to be relied on to complete a sole equipment grounding path, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with Section 250-102.

Exception: In Class I, Zone 2 locations, the bonding jumper shall be permitted to be deleted where all the following conditions are met.

a. Listed liquidtight flexible metal conduit 1.8 m (6 ft) or less in length, with fittings listed for grounding, is used.
b. Overcurrent protection in the circuit is limited to 10 amperes or less.
c. The load is not a power utilization load.

PANEL STATEMENT: The action on this Comment, which is a rewrite of Article 505, incorporates all applicable actions on Comments 14-117 through 14-156. The revised text also includes modifications to provide consistency and correlation with other Articles of Chapter 5.

AFFIRMATIVE: 14
COMMENT ON AFFIRMATIVE:
BRIESCH: Editorial Corrections:
In Section 505-9(c)(2)(d), the reference should be to table 505-9(b)(1) not 505-9(b)(2).
In Section 505-9(d) in the parentheses at the end of the first sentence,add "3/4" so that it reads "(3/4 in. taper per foot)." This was inadvertently deleted.
There are two sections designated 505-9(c). The first being "Marking" and the second being "Class I Temperature." "Class I Temperature" should become 505-9(d) and then "Threading" which is now 505-9(d) becomes 505-9(e).
COOK: I agree with the reorganization of Article 505 and most of the actions taken by the panel. I do not support action on comment 14-155 and expressed the negative on that comment. I also believe that the following are typing and/or editorial errors:
• pages 9 & 10, Section 505-9, has two part (c)'s
• page 11, Section 505-9(d), should read; .....taper of 1 in 16 (3/4-in. taper per foot).
In Section 505-8(d) FPN, change "Table 505-9(b)(1)" to "Table 505-9(c)(2)(d)". (correlation)
Adjust references and numbering throughout Section 505-9 for subsections, figures, and tables as follows to keep from having two subsections marked (c):

505-9 Suitability of Equipment

(a) Suitability. Suitability of identified equipment shall be determined by:

(1) Equipment listing or labeling, or
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation, or
(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment.

(b) Listing.

(1) Equipment that is listed for a Zone O location shall be permitted in a Zone 1 or Zone 2 location of the same gas or vapor. Equipment that is listed for a Zone 1 location shall be permitted in a Zone 2 location of the same gas or vapor.

(2) Equipment shall be permitted to be listed for a specific gas or vapor, specific mixtures of gases or vapors, or any specific combination of gases or vapors.

FPN: One common example is equipment marked for "IIB + H_2."

(c) Marking. Equipment shall be marked in accordance with (1) or (2).

(1) Division Equipment. Equipment identified for Class I, Division 1 or Class I, Division 2 shall, in addition to being marked in accordance with Section ~~500-6(d),~~ 500-8(b), be permitted to be marked with the following:

I. Class I, Zone 1 or Class I, Zone 2 (as applicable), and
II. Applicable gas classification group(s) in accordance with Table 505-9~~(b)(2),~~ (c)(2)(e)and
III. Temperature classification in accordance with Section 505-9~~(3)~~(d)

(2) Zone Equipment. Equipment meeting one or more or the protection techniques described in Section 505-~~5~~ 8 shall be marked with the following in the order shown:

I. Class
II. Zone
III. Symbol "AEx"
IV. Protection technique(s) in accordance with Table 505-9~~(b)(2)~~(c)(2)(d)
V. Applicable gas classification group(s) in accordance with Table 505-9~~(b)(2)~~(c)(2)(e)
VI. Temperature classification in accordance with Section 505-9~~(c)~~(d)

Exception: Intrinsically safe associated apparatus shall be required to be marked only with (c), (d), and (e).

Electrical equipment of types or protection "e," "m," "p," or "q," shall be marked Group II. Electrical equipment of types of protection "d," "ia," " ib," "[ia]," or "[ib,]" shall be marked Group IIA, or IIB, or IIC, or for a specific gas or vapor. Electrical equipment of types of protection "n" shall be marked Group II unless it contains enclosed-break devices, nonincendive components, or energy-limited equipment or circuits, in which case it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor. Electrical equipment of other types of protection shall be marked Group II unless the type of protection utilized by the equipment requires that it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor.

FPN: An example of such a required marking is "Class I, Zone 0, AEx ia IIC T6." An explanation of the marking that is required is shown in Figure 505-9~~(b)(1).~~(c)(2)

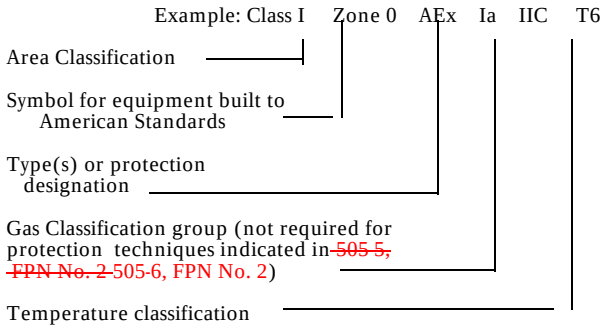

Figure 505-9~~(b)(1)~~(c)(2)

Table 505-9~~(b)(1).~~ (c)(2)(d) Types of Protection Designation

Designation	Technique	Zone*
d	Flameproof enclosure	1
e	Increased safety	1
ia	Intrinsic safety	0
ib	Intrinsic safety	1
[ia]	Intrinsically safe associated apparatus	Unclassified
[ib]	Intrinsically safe associated apparatus	Unclassified
m	Encapsulation	1
nA	Nonsparking equipment	2
nC	Sparking equipment in which the contacts are suitably protected other than by restricted breathing enclosure	2
nR	Restricted breathing enclosure	2
o	Oil immersion	1
p	Purged and pressurized	1 or 2
q	Powder filled	1

*Does not address use where a combination of techniques is used.

Table 505-9~~(b)(2).~~ (c)(2)(e)Gas Classification Groups

Gas Group	Comment
IIC	See Section 505-6(a)(1)
IIB	See Section 505-6(a)(2)
IIA	See Section 505-6(a)(3)

(~~c~~d) Class I Temperature. The temperature marking specified below shall not exceed the ignition temperature of the specific gas or vapor to be encountered.
FPN: For information regarding ignition temperatures of gases and vapors, see Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical

Installations in Chemical Process Areas, NFPA 497-1997; and Electrical Apparatus for Explosive Gas Atmospheres, Data for Flammable Gases or Vapours, Relating to the Use of Electrical Apparatus, IEC 60079-20-1996.

(1) Temperature Classifications. Equipment shall be marked to show the operating temperature or temperature class referenced to a 40°C (104°F) ambient. The temperature class, if provided, shall be indicated using the temperature class (T Code) shown in Table 505-9~~(c).~~(d).

Table 505-9~~(c).~~(d). Classification of Maximum Surface Temperature for Group II Electrical Equipment

Temperature Class (T Code)	Maximum Surface Temperature (°C)
T1	≤450
T2	≤300
T3	≤200
T4	≤135
T5	≤100
T6	≤85

Electrical equipment designed for use in the ambient temperature range between –20°C and +40°C shall require no additional ambient temperature marking.
Electrical equipment that is designed for use in a range of ambient temperatures other than –20°C and +40°C is considered to be special; and the ambient temperature range shall then be marked on the equipment, including either the symbol "Ta" or "Tamb" together with the special range of ambient temperatures. As an example, such a marking might be "-30°C≤Ta≤+40°C."
Electrical equipment suitable for ambient temperatures exceeding 40°C (104°F) shall be marked with both the maximum ambient temperature and the operating temperature class at that ambient temperature.

Exception No. 1: Equipment of the nonheat-producing type, such as conduit fittings, and equipment of the heat-producing type having a maximum temperature of not more than 100°C (212°F) shall not be required to have a marked operating temperature or temperature class.
Exception No. 2: Equipment identified for Class I, Division 1 or Division 2 locations as permitted by Sections 505-20(b) Exception No.1 and (c) Exception No. 3 shall be permitted to be marked in accordance with Section ~~500-6(d)~~ 500-8(b) and Table ~~500-6(d).~~500-8(b).

(~~d~~e) Threading. All threaded conduit referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) standard conduit cutting die that provides a taper of 1 in 16 (3/4-in. taper per foot). Such conduit shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof or flameproof integrity of the conduit system where applicable. Threaded joints shall be made up with at least five threads fully engaged for entries into flameproof or explosionproof equipment.

Equipment provided with threaded entries for field wiring connections shall be installed in accordance with (1) or (2).

(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.

FPN: Thread form specifications for NPT threads are located in Pipe Threads, General Purpose (Inch), ANSI/ASME B1.20.1-1983.

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in Metric Screw Threads, ISO 965/1-1980, and Metric Screw Threads, ISO 965/3-1980.

- In Section 505-17(4), change "no tension no the terminal" to "no tension on the terminal".

GOODMAN: Panel members Mr. Briesch, Mr. Cook, and Mr. O'Meara have identified typographical, syntax, cross-reference, and other minor errors in the section. I support the correction of these items as "editorial" by the Panel Chair and NFPA staff, provided no changes are made to the content of the effected sections.
OMEARA: Recommend making editorial and other changes (corrections) to this rewrite of Section 505 as follows:
505-2, Electrical and Electronic Equipment definition. Last sentence of the added FPN contains language not permitted by the style manual (Equipment ...should be employed). I recommend changing this sentence to make it advisory in nature as follows: "Using equipment suitable for the hazardous location or using safety procedures to ensure the safe operation of equipment in hazardous (classified) locations are two ways to ensure personnel, safety."
505-5(a): Delete "14-323" in brackets after FPN No. 2. Delete "14-39" in parentheses after the last FPN.
505-9: During the rewrite of this section, a paragraph (a) was added. This caused problems with subsequent paragraph numbering, which should be corrected as follows:
1) The figure now marked "Figure 505-9(b)(1)" is no longer associated with paragraph 505-9(b)(1). Change the figure to "Figure 505-9(c)(2)" to indicate its proper association.
2) The table now marked "Table 505-9(b)(1)" is no longer associated with paragraph 505-9(b)(1). Change the title to "Table 505-9(c)(2)(a)" to indicate its proper association.
3) The table now marked "Table 505-9(b)(2)" is no longer associated with paragraph 505-9(b)(2). Change the title to "Table 505-9(c)(1)" to indicate its proper association.
4) Paragraph marked "(c) Class I Temperature" should be changed to "(d) Class I Temperature."
5) The table now marked "Table 505-9(c)" is no longer associated with paragraph 505-9(c). Change the title to "Table 505-9(d)."
6) Paragraph marked "(d) Threading." should be changed to "(e) Threading."
7) Delete "lined through" items/verbiage at the figure title, table titles, and first line of section titled Class I Temperature.
505-9(b)(2): In the FPN, change the "2" following the letter "H" to a subscript to indicate hydrogen; thus the sentence would read, "... equipment marked for "IIB + H_2".
505-9(c)(1): Change, "... in accordance with Section 500-6(d)..." to "in accordance with Section 505-8(b)...".
505-9(c)(1)(b): Change "...in accordance with Table 505-9(b)(2)..." to "in accordance with Table 505-9(c)(1)...".
505-9(c)(1)(c): Change, "...in accordance with Section 505-9(3)" to "...in accordance with Section 505-9(d)."
505-9(c)(2): Change, "...described in Section 505-5..." to "... described in Section 505-8...".
505-9(c)(2)(d): Change, "... in accordance with Table 505-9(b)(2)" to "... in accordance with Table 505-9(c)(2)(a)."
505-9(c)(2)(e): Change, "... in accordance with Table 505-9(b)(2)" to "... in accordance with Table 505-9(c)(1)."
505-9(c)(2)(f): Change, "... in accordance with Table 505-9(c)" to "... in accordance with Table 505-9(d)."
505-9(c)(2) FPN: Change, "...shown in Figure 505-9(b)(1)" to "... shown in Figure 505-9(c)(2)."
505-9(d)(1): Change, "...shown in Table 505-9(c)" to "...shown in Table 505-9(d)."
505-9(d)(1) Exception 2: Change, "... in accordance with Section 500-6(d) and Table 500-6(d)" to "... in accordance with Section 500-8(b) and Table 500-8(b)."
505-9(e) Threading: Insert "3/4 " at blank in first sentence to make it read, "... provides a taper of 1 in. 16 (3/4 in. taper per foot)."
505-17. In the description of useable flexible cords, line number 1, delete the lined through word "approved." In line number 4, change the second "no" to "on" so that the sentence reads, "...there will no tension on the terminal connections."

(Log #2361)

14- 127 - (505-Unclassified Locations): Accept
SUBMITTER: David Wechsler, Union Carbide Corp.
COMMENT ON PROPOSAL NO: 14-318a
RECOMMENDATION: Delete the definition "nonhazardous", replace the word "nonhazardous" with "unclassified" throughout Chapter 5, and modify the defined term "unclassified" as follows:
Unclassified Locations. Locations determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof.
SUBSTANTIATION: As stated in the original proposal, the term "unclassified" is the appropriate term that agrees with NFPA 497 and API terminology. The use of the term "nonhazardous" as expressed in the committee ballots should not be used, nor defined further, nor referenced within Chapter 5 articles. The term "unclassified" has been slightly modified to better apply in the text where the word "nonhazardous" was used.
PANEL ACTION: Accept.

14- 128 - (505-3(a), FPN No. 20): Accept
SUBMITTER: Mark Goodman, BP (ARCO)
COMMENT ON PROPOSAL NO: 14-323
RECOMMENDATION: Replace "nonhazardous" with "unclassified".
SUBSTANTIATION: This comment is in support of the original proposal and substantiation.
This proposal should have been "Accept" and not "Accept in Principle". The Panel Action is contrary to the submitter's intent and justification. The correct term is "unclassified" and should be used consistently throughout the code sections to avoid confusion and misapplication. This proposal along with other companion proposals referenced in the submitter's substantiation are designed to remove the term "nonhazardous" from the NEC, not add and define the term.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #669)

14- 129 - (505-3(b)): Accept
SUBMITTER: Jack A. Gruber, Wheatland Tube Co.
COMMENT ON PROPOSAL NO: 14-13
RECOMMENDATION: I agree with the proposed change for 505-3(b).
SUBSTANTIATION: With regard to the panel statement, I have the following comments:
The metric designators submitted for the conduit are the same ones currently listed in the 1999 NEC (346-6(b), FPN, and do not represent a change or new material. These metric designators are also currently listed in the UL Standards (6, 797, 1242) and also in the ANSI documents (C80.1, C80.3 and C80.6). These are designators and should not be an exact conversion because they are dimensionless designators. The UL and ANSI documents selected these designators because they were taken from the International Electrotechnical Commission IEC 981 which is an International Standard for Extra-Heavy Duty Rigid Steel Conduits for Electrical Installations. The metric designators should remain as presented by the NEC Metric Conversion Task Group.
The length of the conduit is correct at 3.05 m as it is currently produced by all U.S. conduit manufacturers. The NEC Metric Conversion Task Group retained the 3.05 m due to current industry practice and the finished conduit length should remain as presented by the NEC Metric Conversion Task Group.
The Metric Screw Threads in ISO 365 are true metric threads. However, all threaded domestic conduit is threaded to the ANSI/ASME B1.20.1 Standard for Pipe Threads, General Purpose (inch) and these inch-pound units have been soft converted to metric values in IEC 981 and have also been incorporated into the UL documents (UL 6, UL 797 and UL 1242, as well as the ANSI C80 documents (C80.1, C80.3 and C80.6). The IEC 981 International Standard for Extra-Heavy Duty Rigid Steel Conduits for Electrical Installations should also be referenced in the FPN as the standard to which all domestic conduit is threaded. The NEC Metric Conversion Task Group discussed this issue and the US Conduit threads are produced in conformance to the ANSI/ASME B 1.20.1 and the IEC 981 Standards.
PANEL ACTION: Accept.
See action on Comment 14-126.
PANEL STATEMENT: The panel action on Comment 14-126 will reflect the complete text of Article 505.

14- 131 - (505-6(a)): Reject
SUBMITTER: William T. Fiske, Intertek Testing Services
COMMENT ON PROPOSAL NO: 14-348
RECOMMENDATION: Panel action should be upheld.
SUBSTANTIATION: The comment supports the panel action; however, we do not fully agree with submitter's substantiation. The NEC does not set forth professional qualifications in any other section, and should not do so here. Whether the subject be area classification or some other aspect of electrical systems design, experienced and qualified people should be involved. Whether or not these individuals need to be licensed professional engineers is established by State regulations, as it should be.
PANEL ACTION: Reject.
PANEL STATEMENT: Based on the substantiation statements of Comments 14-132, 14-133, and 14-134, the panel has reinstated the text in question.

(Log #1528)

14- 132 - (505-6(a)): Accept
SUBMITTER: Michael J. Johnston, International Association of Electrical Inspectors
COMMENT ON PROPOSAL NO: 14-348
RECOMMENDATION: This proposal should be rejected for the 2002 NEC.
SUBSTANTIATION: The proposal should be rejected because the zone classification system of classifying hazardous locations, although not new to the NEC, without doubt is still new to the field. We agree with the four comments to the negative to reject this proposal for at least one more code cycle. This will allow additional time for installers as well as registered professionals to become more familiar as this new method of classification is utilized on a more regular basis.

Typically industry learning curves can take up to 10 years to achieve minimum competency levels, and to totally adjust to new technologies and requirements. This should not be considered a restriction, but more as a continued safe guard to allow time for transition.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
ZIPSE: The requirement for only a "qualified Registered Professional Engineer" entered the code in Article 500 in 1996. At that time, I supported this requirement as a concession to a member in order to obtain his vote. (The lesson learned Do Not Horse Trade as you will not get your half.)
In the 1999 edition, the requirement was retained even though Article 505 was an almost exact copy of Article 500 and 501. Anyone familiar with the basic requirements of the division requirements, contained in Articles 500 and 501, should be familiar with the requirements of Article 505, since they read the same.
The cries of leave the requirement in for one more cycle were heard last code cycle. Now, the same cries are heard again. We hear that the requirements are new to the field. Does that mean that the field lacks the basic understanding of those ancient basic requirements of Articles 500 and 501?
If Article 505 had been written new from the ground up then one could accept the requirement, but it was copied from Articles 500 and 501.
What this isolated requirement means is restraint of trade. Those most knowledgeable in applying the zone requirements such as the Chairman of Code Making Panel 14, probably most of the writers of Code Books and Code Columns in magazines, salesmen, etc. are prohibited from designing Article 505 installations. Since Article 505 is similar to Articles 500 and 501, there should be no restriction just on Article 505, but the same restriction should apply to Articles 500, 501, 502, 503 and 504.
Again,the question begs answering; what makes Article 505 so different from Articles 500 and 501 that a restraint of trade requirement is required when Article 505 is used when it is basically the same as Article 500 and 501 except the word "division" is used in Article 500 and 501 where as in Article 505 the word "zone" is used.
This requirement, "qualified Registered Professional Engineer" gives the inspector and owner an unwarranted confidence that the work will be correctly designed and a license to all P.E.s to do zone work. As a P.E., I would like to have the whole code restricted to having just P.E.s doing all code associated work, including nonpublic designs where P.E.s are not normally required.

(Log #1907)

14- 133 - (505-6(a)): Accept
SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers
COMMENT ON PROPOSAL NO: 14-348
RECOMMENDATION: Reject this proposal.
SUBSTANTIATION: The proposal should be rejected because the zone classification system of classifying hazardous locations, although not new to the NEC, is without doubt still new to the field. We agree with the four comments to the negative to reject this proposal. As Mr. Cook pointed out in his explanation of negative, the use of Article 505 poses major challenges even to qualified registered professional engineers. Typically industry learning curves can take up to 10 years to achieve minimum competency levels, and to totally adjust to new technologies and requirements. This should not be considered a restriction, but more as a continued safe guard to allow time for transition. Subsection 505-6(a) must remain to clearly require that decisions involving classifications, equipment and wiring methods be made by qualified persons.
This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.

14- 135 - (505-7(f)): Hold
SUBMITTER: Robert L. Seitz, Artech Engineering
COMMENT ON PROPOSAL NO: 14-318a
RECOMMENDATION: Add the following words to this section:
Where type "e" equipment is installed, every conductor that enters the type "e" equipment shall be terminated, properly at an approved type "e" termination.
SUBSTANTIATION: What to do with "spare" conductors is what brought this issue to light. In Division 1 equipment there is no requirement for special termination so spare conductors are often not terminated and are just folded into the enclosure with wire nut caps or heat shrink to prevent exposed conductor from making contact with other parts of the enclosure. For Type "e" the method of protection is determined by the termination. The requirement to terminate is not included within the ANSI standard as these are field conductors. It is important that this requirement be stated somewhere and NFPA 70 is the only place left.
PANEL ACTION: Hold.
PANEL STATEMENT: This comment introduces a concept that has not had public review.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
COMMENT ON AFFIRMATIVE:
LAWRENCE: Panel statement notes that this comment "introduces a concept that has not had public review". The panel statement should have referenced 110-14(b) which states in part, "All splices and joints and the free ends of conductors shall be covered with an insulation equivalent to that of the conductor or with an insulating device identified for the purpose", which already requires insulation or termination of "spare" conductors. The submitter's comment is thus not new material, but a proposed limitation of the means by which "spare" conductors in an increased Safety "e" terminal box can be either insulated or terminated to include only "e" terminals. The panel statement as written could be construed to mean that "spare" cables in an increased safety terminal box require no additional treatment, which is not a true statement.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #894)

14- 137 - (505-9(d)): Reject
SUBMITTER: William G. Lawrence, Jr., S. Yarmouth, MA
COMMENT ON PROPOSAL NO: 14-318a
RECOMMENDATION: The text of the proposed Section 505-9(d) needs to be correlated with the text of 501-4(a)(1) with respect to the minimum engagement of threaded joints. If a minimum of 3.5 is accepted in Article 500/501, the same value needs to be reflected here.

It should be noted the requirement for minimum thread engagement appears in the "general" requirements section [505.9(D) of the preprint] of Article 505, but appears in the "wiring methods" requirements section [501-4(a)(1)] of the existing Article 500. The requirement, be it 3.5 or 5, should be located in similar sections of the articles.
SUBSTANTIATION: The 3.5 minimum tapered thread engagement can be justified based on research work conducted by the Electrical Equipment Certification Service (EECS/BASEEFA/MECS) in the United Kingdom which concluded that 2.3 hand-tight tapered threads will not transmit an explosion. The 2.3 threads represents at least 150 percent safety factor on the proposed 3.5 minimum thread wrench-tight engagement. The conclusions of the research work are provided and demonstrate that the integrity of the installation is not compromised.

Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: While the information provided indicates that the reduced number of thread engagements proposed may not contribute to additional flame transmission, the panel believes that there are advantages to requiring an engagement of five threads.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
LAWRENCE: Comment 14-137 should have been accepted. In the panel's rejection of Comment 14-137, they agreed that the provided test report confirmed that the proposed reduced thread engagement would not contribute to an increased risk of flame transmission, but there are other "advantages" to the current five thread minimum engagement. The panel was remiss in their failure to detail how any of those undefined "advantages" affected the rationale for their rejection, and, therefore, did not comply with 4-4.6.3 of the Regulations Governing Committee Projects.

SUBMITTER: Mark Goodman, BP (ARCO)
COMMENT ON PROPOSAL NO: 14-356
RECOMMENDATION: Replace "nonhazardous" with "unclassified" in two places within the table.
SUBSTANTIATION: This comment is in support of the original proposal and substantiation.

This proposal should have been "Accept" and not "Accept in Principle". The Panel Action is contrary to the submitter's intent and justification. The correct term is "unclassified" and should be used consistently throughout the code sections to avoid confusion and misapplication. This proposal along with the other companion proposals referenced in the submitter's substantiation are designed to remove the term "nonhazardous" from the NEC.
PANEL ACTION: Accept.

14- 141 - (505-15):
Note: The Technical Correlating Committee directs that this Comment be reported as "Accept in Part", based on the Panel Action on Comment 14-126.
SUBMITTER: Arthur V. Pack, Jr., The Okonite Co.
COMMENT ON PROPOSAL NO: 14-364
RECOMMENDATION: I recommend that proposal 14-364 be rejected for safety considerations.
SUBSTANTIATION: We have conducted corona tests of multi-conductor 600V TC cables with an overall jacket in our laboratory. At a voltage of 2400V, the cable exhibited surface discharge (arcing) on the outside of the overall jacket. Under conditions of voltage surge due to equipment failure, switching variable frequency drives, etc., 2400V can be achieved. This can ignite or explode mixtures of flammable gasses and air.
PANEL ACTION: Accept.

14- 142 - (505-15): Accept in Part
SUBMITTER: Will E. McBride, BP Exploration Alaska
COMMENT ON PROPOSAL NO: 14-364
RECOMMENDATION: Revise 505-15 to read:

505-15. Wiring Methods. Wiring methods shall maintain the integrity of protection techniques and shall comply with (a), (b), or (c).

(a) Class I, Zone 0. In Class I, Zone 0 locations only intrinsically safe wiring methods in accordance with Article 504 shall be permitted.

FPN: Article 504 only includes protection technique "ia".

(b) Class I, Zone 1.

(1) In Class I, Zone 1 locations, the following wiring methods shall be permitted:

(a) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate equipment grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application.

FPN: See Sections 334-3 and 334-4 for restrictions on use of Type MC cable.

(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage. Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, provided with separate equipment grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage, Type TC cable shall be permitted if listed as suitable for use as open wiring and provided with a gas/vaportight overall jacket of suitable polymeric material and provided with separate equipment grounding conductors in accordance with Section 250-122. Cable termination fittings shall be listed for the application. The open wiring shall not exceed lengths of 6 ft.

FPN: Type TC cable listed for use as open wiring meets the crush and impact requirements of Type MC-HL cable.

(d) Type MI cable with termination fittings approved for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(e) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(f) Rigid nonmetallic conduit complying with Article 347 shall be permitted where encased in a concrete envelope a minimum of 2 in. (50.8 mm) thick and provided with not less than 24 in. (610 mm) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 24 in. (610 mm) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.

(2) Where necessary to employ flexible connections, flexible fittings listed for Class I, Zone 1 or Division 1 locations or flexible cord in accordance with the provisions of Section 505-17 shall be permitted.

(3) All boxes and fittings shall be listed for Class I, Zone 1 or identified Class I, Division 1.

SUBSTANTIATION: Changes concerning MC-HL, ITC-HL, and TC-HL Cables.

a). For 505-15(b)(1)(a) and (b): The use of cable in Zone locations should be limited to "Industrial Establishments until the use of Zone equipment is better understood in the USA.

b). For 505-15(b)(1)(b): ITC-HL Cable should have a dedicated ground wire since the enclosures used on Zone Locations may be non-metalic.

c). For 505-15(b)(1)(c): The use of Type TC Cable listed for use as "Open Wiring" should be limited to 6 ft to assure it is neither subject to physical damage nor subjected to undue strain. The panel action to change this to 15 ft was without basis.

d). For 505-15(b)(1)(c): The exception to types MC-HL, and ITC-HL cables recognizes and permits the use of a special Tray Cable (suggested as TC-HL) between enclosures within Class I, Zone 1 that use the type of protection increased safety. This type of cable is appropriate for connection between enclosures utilizing the type of protection 'e' since this type of protection does not contain a source of ignition. TC cable complying with Article 340-4(6), per UL 1277 and must further meet the crush and impact requirements of type MC-HL cable, per UL 2225 cannot be located where it is subject to physical damage and must be identified for use. The Exception to permit this specific Type TC cable between enclosures with type protection 'e' is an important Exception because it recognizes perhaps the most important wiring method in Class I, Zone 1 locations. The wiring methods of Class I, Zone 1 locations are Increased Safety, Flameproof and Intrinsic Safety, and without this exception, the wiring methods would not be complete.

This wiring method recognizes the important fact of the Zone System that Class I, Zone 1 does not have the same level of risk as Class I, Division 1 locations. A cable that meets the crush and impact requirements of MC-HL cable, must be protected from physical abuse, can only be used in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation and where the Classification of areas, selection of equipment and wiring methods are under the supervision of a qualified Registered Professional Engineer is not a source of ignition and is safe for connection between enclosures using the type of protection 'e'. The level of protection afforded by this type of TC Cable is consistent with the level of protection provided by enclosures with type of protection 'e'.

PANEL ACTION: Accept in Part.

See action on Comment 14-126.

PANEL STATEMENT: Item (c) [TC cable] has not been accepted, per action on Comment 14-144.

Item (3) is included in the requirements of 505-20.

Other modifications to this proposal are included in the action to Comment 14-126, Article 505 rewrite, based on actions on Comments 14-145 and 14-146.

(Log #963)

14- 143 - (505-15(b)): Reject

SUBMITTER: Robert L. Seitz, Artech Engineering

COMMENT ON PROPOSAL NO: 14-318a

RECOMMENDATION: Delete text as follows:

An explosion proof seal, constructed in accordance with Section 501-5(c), shall be provided for each conduit entering an enclosure having type of protection ~~"e" or~~ "d" except where the type of protection "d" enclosure is marked to indicate that a seal is not required.

SUBSTANTIATION: Type "e" enclosures cannot contain an explosion, or prevent the entrance of combustible gas. Where conduits connect between type "e" and type "d" enclosures ,the conduit would already be required to have a seal installed at the type "d" end. Connection of conduits between two or more type "e" enclosures should require no explosion proof seals.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed text that the commenter suggested be deleted and the substantiation is technically incorrect, as a conduit seal is required in a conduit run entering a Type "e" enclosure in order to prevent the conduit from propagating an explosion into the Type "e" enclosure and to maintain the IP54 rating of the enclosure.

(Log #451)

14- 144 - (505-15(b) Exception No. 1): Accept

SUBMITTER: H. R. Stewart, HRS Consulting

COMMENT ON PROPOSAL NO: 14-364

RECOMMENDATION: Delete in Total:

Exception No. 1: In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage, listed Type TC cable with a gas/vapor tight overall jacket of suitable polymeric material, complying with the requirements of Article 340.4(6), with separate grounding conductors in accordance with Section 250.122, and provided with termination fittings listed for the application shall be permitted between enclosures utilizing the increased safety method of protection technique "e", within the Zone 1 location.

SUBSTANTIATION: The Exception No. 1 as proposed would allow Type TC cable which meets the crush and impact of Type MC cable to be used in a Zone 1 location. Meeting the crush and impact values of Type MC cable is not equivalent to meeting the currently required physical properties of cable approved for use in Zone 1 locations.

There is no assurance of having a "gas/vaportight sheath by any testing requirements". There is also no method to assure that the polymeric sheath is gas/vaportight after installation. It is very questionable that a suitable termination could be designed to meet the Type "e" protection technique and not damage a polymeric sheath beyond use.

In the substantiation statement 1(d), the last sentence which states "the level of protection afforded by the use of this type of TC cable is consistent with the level of protection provided by enclosures with type of protection 'e'." This is an undocumented statement with no technical support. There are test requirements for Type "e" enclosures and cable glands. There are no test requirements for the Type TC cable to show gas/vaportight withstand capability or continuity before or after installation.

In almost every industrialized country in the world, cable approved for use in a Zone 1 area is required to have a metallic sheath or armor. The use of an unarmored cable in a Zone 1 area is a drastic departure from worldwide practices with no technical substantiation to justify this position.
PANEL ACTION: Accept.
PANEL STATEMENT: Acceptance of this comment is intended to preclude the use of TC cable in a Zone 1 location.

(Log #869)

14- 145 - (505-15(b)(1) and Exception): Reject
SUBMITTER: Frank H. Rocchio, The Okonite Co., Inc.
COMMENT ON PROPOSAL NO: 14-364
RECOMMENDATION: This comment is to support the Technical Correlating Committee instructions that 14-364 (505-15) be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
This proposal should be reworded to:
A. 505-15(b)(1) Remove "or ITC-HL".
B. 505-15(b)(1) Exception No. 1 Remove in its entirety.
SUBSTANTIATION: A. ITC-HL does not have a test protocol to determine the -HL listing and will likely never have one as much of this type cable contains bare drains which will prevent it from passing either an impact or crush test.
B. Type TC cable of the type known as "open wiring" is listed here. The test protocols for both UL 1569, Metal Clad cable and UL 1277, Electrical Power and Control Tray Cables with Optional Optical-Fiber Members are identical. The practical results of the test are greatly different. While Type MC cable has none or very few failures in the impact test, Type TC cable has to be built up to come close to passing the requirement of 8 out of 10 impacts for the open wiring listing. The electrical failure mechanism between a Type MC cable and a Type TC cable with the ground required for open wiring is completely different. Until such time as a Type TC cable will pass 10 out of 10 impact tests, this cable should not be permitted as open wiring and should not be permitted to leave the tray.
In addition, the crush and impact tests of Type MC-HL is greater than the crush and impact requirements of either Type MC or "open wiring" Type TC.

	Type MC-HL	Type MC or "open wiring" Type TC
Impact		
14 AWG	25 lbs at 1 ft = 25 ft-lbs	10 lbs at 1.5 ft = 15 ft-lbs
2 AWG	50 lbs at 1 ft = 50 ft-lbs	50 lbs at 1 ft = 50 ft lbs
Cold Impact		
at -25C	3 lbs at 3 ft = 9 ft-lbs	Not Required
Optional		
at -40C	3 lbs at 3 ft = 9 ft-lbs	Not Rquired
Crush		
14 AWG	1500 lbf	1000 lbf
2 AWG	2000 lbs	2000 lbf

Until such time as "open wiring" Type TC cable meets the requirements of Type MC-HL, it should not be permitted in any Class 1, Division 1 or Class 1, Zone 1 area.
PANEL ACTION: Reject.
PANEL STATEMENT: Panel actions on Comments 14-126 and 14-142 will retain certain portions of this section and ITC-HL cable is included as acceptable in the panel action on Comment 14-126. (Note: Exception No. 1 has been removed per Comment 14-144.)

(Log #1480)

14- 148 - (505-15(b)(2)): Reject
SUBMITTER: Robert L. Seitz, Artech Engineering
COMMENT ON PROPOSAL NO: 14-318a
RECOMMENDATION: Add new text to read as follows:
Allow the installation of liquidtight flexible metal conduit in certain applications in Zone 1 areas.
Exception No. 1: Where conduits or cables are connected to type "e" enclosures, liquidtight flexible metal conduit shall be permitted.
Exception No. 2: Where conduit or cables are connected to type "d" or Division 1 enclosures, liquidtight flexible metal conduit shall be permitted provided a conduit seal is installed between the flexible connections and the explosionproof enclosure.
SUBSTANTIATION: While the new language of Article 505 allows the use of Division 1 flexible fitting, more options are needed. For type "e" enclosures an explosion proof fitting is not necessary. Liquidtight would be more desirable than serve duty cord.
For Divison 1 or type "d" enclosures used in a Zone 1 where the enclosure only houses terminations, and no arcing or sparking components are installed, use of explosionproof flexible fittings adds no value to the safety but often results in less desirable installations.
NOTE: Supporting Material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: No technical substantiation was submitted to support the recommendation.

(Log #450)

14- 150 - (505-15(c)): Accept
SUBMITTER: H. R. Stewart, HRS Consulting
COMMENT ON PROPOSAL NO: 14-364
RECOMMENDATION: Delete in total Sub Clause (c):
(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage, Type TC cable shall be permitted if listed as suitable for use as open wiring and provided with a gas/vaportight overall jacket of suitable polymeric material and provided with separate equipment grounding conductors in accordance with Section 250-122. Cable termination fittings shall be listed for the application. The open wiring shall not exceed lengths of 15 ft.
FPN: Type TC cable listed for use as open wiring meets the crush and impact requirements of Type MC cable.
SUBSTANTIATION: This appears to be a rewrite of Exception No. 1 to put it into positive terms. This should be rejected for the same reason for rejecting the Exception No. 1. These are:
Sub Clause (c) as written would permit Type TC cable to be used in a Zone 1 location.
Meeting the crush and impact values of Type MC cable is not equivalent to meeting the currently required physical properties of cable approved for use in Zone 1 locations.
There is no assurance of having a "gas/vaportight sheath by any testing requirements." There is also no method to assure that the polymeric sheath is gas/vaportight after installation.
It is very questionable that a suitable termination could be designed to meet the Type "e" protection technique and not damage a polymeric sheath beyond use.
In the panel statement, it is indicated that the level of protection afforded by the use of this type TC cable is consistent with the level of protection provided by enclosures with type of protection "e". This is an undocumented statement with no technical support. There are test requirements for Type "e" enclosures and cable glands. There are no test requirements for the Type TC cable to show gas/vaportight withstand capability or continuity before or after installation.
In almost every industrialized country in the world, cable approved for use in a Zone 1 areas is required to have a metallic sheath or armor. The use of an unarmored cable in a Zone 1 area is a drastic departure from worldwide practices with no technical substantiation to justify this position.

14- 151 - (505-16(b)(1)): Reject
SUBMITTER: Robert L. Seitz, Artech Engineering
COMMENT ON PROPOSAL NO: 14-318a
RECOMMENDATION: Delete text as follows:
(1) Conduit seals shall be provided for each conduit entering enclosures having type of protection 'd'. ~~or 'e'.~~
SUBSTANTIATION: Type 'e' enclosures cannot contain explosion, or prevent the entry of combustible gas. Connection of conduit to a type 'e' enclosure does not automatically imply that the other end of the conduit is connected to a type 'd' or Division 4 type explosion proof enclosure. Conduits can be connected between two or more type 'e' enclosures and should require no conduit seal fitting in any case. Where conduits connect between type 'd' and type 'e' enclosures, this paragraph does require a conduit seal at the type 'd' end.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed text that the commenter suggested be deleted and the substantiation is technically incorrect, as a conduit seal is required in a conduit run entering a Type "e" enclosure in order to prevent the conduit from propagating an explosion into the Type "e" enclosure and to maintain the IP54 rating of the enclosure.

(Log #1952)

14- 154 - (505-20(e)): Accept in Principle
SUBMITTER: David Wechsler, Union Carbide Corp.
COMMENT ON PROPOSAL NO: 14-353
RECOMMENDATION: It is understood that the NEC is primarily an electrical installation document; however, the NEC does include installation techniques such as purged and pressurized areas and ventilating pipes. The use of gas detection equipment as a method of protection in hazardous (classified) locations is related to such techniques. Gas detection equipment is capable of providing indication of the presence of combustible gases prior to reaching lower explosive limits and is capable of providing alarms with ventilation or interlocks. The original proposed text has been modified to incorporate a more defined set of electrical installation criteria to allow for proper process evaluation.
Add the following new text:
505-20*(e) Permanently mounted combustible gas detection equipment may be used as a means for reducing the need for special electrical equipment provided that the location is continuously monitored by combustible gas detection equipment that is:
• listed and marked both as performance tested and as suitable for use in hazardous (classified) locations,
• installed in accordance with industrial practices,
• used in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation,
• actuating ventilation equipment or other means designed to prevent the concentration of gas from reaching the lower explosive limit when the gas concentration reaches 20% of the lower explosive limit,
• automatically de-energizing the equipment being protected when the gas concentration reaches 40% of the lower explosive limit,
• automatically de-energizing the equipment being protected upon failure of the gas detection equipment; and
• providing an adequate number of installed sensors to ensure the sensing of combustible gas in the protected area covers all areas where such gas might accumulate.
FPN No. 1: For suggested minimum performance specifications and guidance in the selection of gas detection equipment, see ISA S12.13.01, Performance Requirements, Combustible Gas Detectors.
FPN No. 2: For suggested installation, operation and maintenance guidance, see ISA RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments.
FPN No. 3: For guidance in the installation of gas detection equipment, see ANSI/API RP 505, Recommended Practice for Classification of Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2.
SUBSTANTIATION: Equipment necessary to be placed in hazardous (classified) locations which cannot meet specific hazardous location protection techniques currently requires purged/pressurized protection techniques. This is not always possible or desirable under all installation considerations. For many years gas detection equipment has been used as a method of protection in petroleum facilities in accordance with ANSI/API RP 505, Recommended Practice Classification of Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2 and within hazardous location facilities in Canada in accordance with the Canadian Electrical Code (CEC) with no reported incidents. Gas detection equipment is capable of providing indication of the presence of combustible gases prior to reaching lower explosive limits and is capable of providing alarms with ventilation or interlocks. To ensure proper gas detection equipment functionality under such critical conditions, an existing ISA standard S12.13.01, Performance Requirements, Combustible Gas Detectors, will provide guidance on gas detection equipment performance requirements and an existing ISA recommended practice RP 12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments, will provide user guidance on the proper use of gas detection equipment. In conclusion, this additional method of protection should be considered for equipment which cannot meet the proper hazardous (classified) location requirements, but is necessary to be installed in such locations.
PANEL ACTION: Accept in Principle.
See action on Comment 14-155.
PANEL STATEMENT: The action on Comment 14-155 addresses this issue.

EXPLANATION OF NEGATIVE:
COOK: See my Explanation of Negative on Comment 14-51
COMMENT ON AFFIRMATIVE:
SABAN: It was stated that a "smart box" should be included that prints out a tape which tells date, time, detector activated and why. I believe this is a good idea and I believe to declassify will make for very unsafe conditions, just as purge and pressurization are making conditions exist less safe.
I believe the above did not have public review.

(Log #2325)

14- 155 - (505-20(e)): Accept in Principle
Note: The Technical Correlating Committee directs that the definition in 505-2 read: "Combustible Gas Detection System. A protection technique utilizing stationary gas detectors in industrial establishments." to remove the mandatory requirements from the definition.
The Technical Correlating Committee further directs that the Panel Action on 505-8(I) be revised to read as follows to correct the style manual violation in the text:
"(I) Combustible Gas Detection System. A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public access and where the conditions of maintenance and supervision ensure that only qualified persons will service the installation. Gas detection equipment shall be listed for detection of the specific gas or vapor to be encountered. Where such a system is installed, equipment specified in (1), (2), or (3) shall be permitted.
(1) Inadequate Ventilation. In a Class I, Zone 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Zone 2 locations shall be permitted.
(2) Interior of a Building. In a building located in, or with an opening into, a Class I, Zone 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted.
(3) Interior of a Control Panel. In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases or vapors, electrical equipment suitable for Class I, Zone 2 locations shall be permitted.
FPN No. 1: For further information, see ANSI/ISA-12.13.01, Performance Requirements, Combustible Gas Detectors.
FPN No. 2: For further information, see ANSI/API RP 500, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 or Division 2."
FPN No. 3: For further information, see ISA-RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments."
SUBMITTER: Jon Miller, Detector Electronics Corp.
COMMENT ON PROPOSAL NO: 14-373
RECOMMENDATION: The action of the panel to reject this proposal would eliminate a beneficial electrical installation practice that could be used in place of a purged and pressurized protection technique. The proposed wording has been developed based upon

the purged and pressurized enclosure Fine Print Note (FPN) in Article 501 of the NEC with additional text for electrical installation guidance. The use of gas detection equipment as a method of protection in hazardous (classified) locations has equivalent process evaluation and installation requirement complexity to that of purged and pressurized enclosures. It is recommended that further consideration be given to gas detection equipment as a method of protection in hazardous (classified) locations.

The initial proposed wording is as follows:

505-20(e): Permanently mounted combustible gas detection equipment may be used as a means for reducing the need for special electrical equipment when:

- combustible gas detection equipment is listed and marked both as performance tested and as suitable for use in hazardous (classified) locations,
- combustible gas detection equipment is installed in accordance with industrial practices,
- used in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and
- appropriate alarms with ventilation or interlocks are provided.

FPN 1: For suggested minimum performance specifications and guidance in the selection of gas detection equipment, see ISA S12.13.01, "Performance Requirements, Combustible Gas Detectors.

FPN 2: For suggested installation, operation and maintenance guidance, see RP12.13.02. Installation, Operation, and Maintenance of Combustible Gas Detection Instruments.

FPN 3: For guidance in the installation of gas detection equipment, see ANSI/API RP 505, Recommended Practice for Classification of Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2.

SUBSTANTIATION: Equipment necessary to be placed in hazardous (classified) locations that cannot meet specific hazardous location protection techniques currently requires a purged and pressurized enclosure protection method. This is not always possible or desirable under all installation considerations. For many years gas detection equipment has been used as a method of protection in petroleum facilities in accordance with ANSI/API RP505, Recommended Practice for Classification of Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2 and within hazardous location facilities in Canada in accordance with the Canadian Electrical Code (CEC) with no reported incidents. Gas detection equipment is capable of providing indication of the presence of combustible gases prior to reaching lower explosive limits and is capable of providing alarms with ventilation or interlocks. To ensure proper gas detection equipment functionality under such critical conditions, an existing ISA standard S12.13.01, Performance Requirements, Combustible Gas Detectors, will provide guidance on gas detection equipment performance requirements and an existing ISA recommended practice RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments, will provide user guidance on the proper use of gas detection equipment. These documents offer an equivalent level of complexity to that of the ANSI/NFPA 496 purged and pressurized enclosure practices. In conclusion, this additional method of protection should be considered for equipment that cannot meet the proper hazardous (classified) location requirements, but is necessary to be installed in such locations.

PANEL ACTION: Accept in Principle.

Add the following new definition to 505-2:

"Combustible Gas Detection System. A protection technique utilizing stationary gas detectors in industrial establishments which under specific conditions permits the use of equipment suitable for Class I, Zone 2 locations to be used in a Class I, Zone 1 location or the use of equipment suitable for unclassified locations to be used in a Class I, Zone 2 locations."

Add the following new Paragraph (i) to 505-8: "(i) Combustible Gas Detection System. A Combustible gas detection system incorporating combustible gas detectors used in industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, is a protection technique permitted under the following conditions:

1) In a Class I, Zone 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Zone 2 locations shall be permitted.

2) In a building located in, or with an opening into, a Class I, Zone 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted.

3) In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases or vapors, electrical equipment suitable for Class I, Zone 2 locations shall be permitted. Gas detection equipment shall be listed for detection of the specific gas or vapor to be encountered.

FPN: For further information, see ANSI/ISA-12.13.01, Performance Requirements, Combustible Gas Detectors.

Use of this technique for each of the applications above includes adherence to established industrial practices and requirements.

FPN No. 1: For further information, see ANSI/API RP 505, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2.

FPN No. 2: For further information, see ISA-RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments."

PANEL STATEMENT: The panel agrees to applying gas detection systems in industrial establishments and selected uses. This is in keeping with long-standing practices of existing industry standards.

(Log #699)

14- 161 - (511-2): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 14-381
RECOMMENDATION: The entire proposal should be accepted.
SUBSTANTIATION: The primary focus of the proposed changes is to eliminate the exception to Section 511-3(b), which is ambiguous. If the intent of the exception is to apply Table 514-2 only to pits or depressions below floor level, as indicated by the panel comment, it should refer to "Pits and depressions below floor level in lubrication and service rooms," not "lubrication and repair rooms" (there is no apparent reason why the exception should not apply to the entire room). The term "service room" is undefined, and the added text clarifies the type of activities permitted, as discussed in the proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: The important point of the existing exception is, "without dispensing", rather than what a "service room" might be.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

14- 165 - (511-3(c)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 14-388
RECOMMENDATION: This proposal should be accepted as written.
SUBSTANTIATION: As stated by the panel, the provisions of earlier editions of the Code are not justification for the proposed change, but they are relevant to the extent that they show how provisions equivalent to those proposed were inadvertently deleted. If the effect of the deletion was recognized, the intent of the present Code must be to prohibit declassification under such conditions. The present language clearly does not recognize isolation of adjoining areas by elevation or curbs. If the panel believes that such separations are acceptable, the proposal should be accepted to clearly state that intent and eliminate continuing controversy.
PANEL ACTION: Reject.
PANEL STATEMENT: That which was proposed is presently Code section 511-3(a). To accept the proposal would create a redundant requirement.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #692)

14- 166 - (511-4): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 14-393
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: Section 501-5(b)(2), Exception No. 1 applies to very few raceways in or under a concrete slab because all but the shortest runs have at least one coupling in the in- or under-floor portion of the run and are required to be sealed under the present language. Couplings or unions installed according to the Code and embedded in concrete or fill under the floor of a Division 2 location do not present significant opportunity for migration of vapors into a raceway. The proposed change would permit deletion of seals where a raceway extends unbroken through the classified area above the floor, bringing the Code into conformance with common, practical, and safe industry practice.
PANEL ACTION: Reject.
PANEL STATEMENT: Locations covered by Article 511 must also comply with requirements of Article 501, except where modified by provisions of Article 511. There is no reason to repeat parts of Article 501 in other Articles relating to Classified locations.

COMMENT ON PROPOSAL NO: 14-394
RECOMMENDATION: Proposal should be accept or accept in principle.
SUBSTANTIATION: See explanation of negative ballot.
PANEL ACTION: Reject.
PANEL STATEMENT: The current text addresses the needs of the situation. The requirements of Article 501 for seals at boundaries applies.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COOK: The purpose for the proposal was to provide common wording for underground or in slab wiring and associated seals in the specific occupancies. The submitter assumed that the restrictions for this wiring are based on hazardous materials entering the raceways and trying to prevent the migration of the liquids, gases or vapors to an ignition source at the end of the raceway. It seems that the hazardous materials associated with at least Articles 511-515 are very similar and that preventing this migration could be done with common wording. Since different words are used in each Article, the code language leads users to believe that gas entering a raceway under a commercial garage will react differently than gas entering a raceway under a drive at a dispensing station. I do not believe this is true and believe that common language could be used. Based on the various words shown below, and questions that are asked over and over, I believe the existing wording causes confusion and should be changed. If this set of words is a problem, some technical reason should be provided for rejecting the proposal, so that acceptable wording could be proposed.
511-4. Wiring and Equipment in Class I Locations
Within Class I locations as defined in Section 511-3, wiring and equipment shall conform to applicable provisions of Article 501. Raceways embedded in a masonry wall or buried beneath a floor shall be considered to be within the Class I location above the floor if any connections or extensions lead into or through such areas.
511-5. Sealing
Approved seals conforming to the requirements of Section 501-5 shall be provided, and Section 501-5(b)(2) shall apply to horizontal as well as vertical boundaries of the defined Class I locations.
513-4. Wiring and Equipment in Class I Locations
All wiring and equipment that is or may be installed or operated within any of the Class I locations defined in Section 513-3 shall comply with the applicable provisions of Article 501. All wiring installed in or under the hangar floor shall comply with the requirements for Class I, Division 1 locations.
513-8. Sealing
Approved seals shall be provided in accordance with Section 501-5. Sealing requirements specified in Sections 501-5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations. Raceways embedded in a concrete floor or buried beneath a floor shall be considered to be within the Class I location above the floor.
514-8. Underground Wiring
Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit. Any portion of electrical wiring or equipment that is below the surface of a Class I, Division 1 or Division 2 location (as defined in Table 514-2) shall be considered to be in a Class I, Division 1 location, which shall extend at least to the point of emergence above grade. Refer to Table 300-5.
514-7. Sealing
(a) At Dispenser. An approved seal shall be provided in each conduit run entering or leaving a dispenser or any cavities or enclosures in direct communication therewith. The sealing fitting shall be the first fitting after the conduit emerges from the earth or concrete.
(b) At Boundary. Additional seals shall be provided in accordance with Section 501-5. Sections 501-5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations.
515-5. Underground Wiring
(a) Wiring Method. Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit or, where buried under not less than 2 ft (610 mm) of cover, shall be permitted in rigid nonmetallic conduit or an approved cable. Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 2 ft (610 mm) of the conduit run to emergence or to the point of connection to the aboveground raceway. Where cable is used, it shall be enclosed in threaded rigid metal conduit or threaded steel intermediate metal conduit from the point of lowest buried cable level to the point of connection to the aboveground raceway.
515-6. Sealing
Sealing requirements in Sections 501-5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations. Buried raceways under defined Class I locations shall be considered to be within a Class I, Division 1 location.
516-7. Wiring and Equipment Above Class I and II Locations

(a) Wiring. All fixed wiring above the Class I and II locations shall be in metal raceways, rigid nonmetallic conduit, or electrical nonmetallic tubing, or shall be Type MI, TC, or MC cable. Cellular metal floor raceways shall be permitted only for supplying ceiling outlets or extensions to the area below the floor of a Class I or II location, but such raceways shall have no connections leading into or through the Class I or II location above the floor unless suitable seals are provided.
I do not believe that the panel has addressed the technical concerns of the proposal.

(Log #693)

14- 168 - (511-6(a)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 14-399
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: Although the panel states that the "current text correctly expresses the intent of Code-Making Panel 14," because of several previous additions to the permitted wiring methods, the language has become redundant and poorly constructed. Concise, logical ordering of the permitted methods will make this section more "user friendly."
PANEL ACTION: Reject.
PANEL STATEMENT: This would be an editorial change, but one which, if made, would likely lead some readers to believe that flexible metal conduit and liquidtight flexible metal conduit are not permitted, beginning in 2002.

(Log #696)

14- 170 - (511-6(c)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 14-404
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: The requirements of this section are no different than the general Code requirements, and need not be repeated here. It adds nothing useful to the Code and contributes to the bloat that is making the Code more difficult to us. If this section is essential to articles in this chapter, similar material should be added to Articles 514, 515 and 516. The present text is erroneous in that it requires the grounded conductor to be connected to "the 'grounded' terminal of any utilization equipment supplied." This further implies that the utilization equipment must have provisions for connection of a grounded conductor. Removing this section would not affect wiring practices, but would reduce Code clutter.
PANEL ACTION: Reject.
PANEL STATEMENT: Contrary to the submitter's substantiation, the referenced section (which is now 511-16) does contain provisions not found in Article 250.

SUBMITTER: Monte R. Ewing, State of Wisconsin
COMMENT ON PROPOSAL NO: 14-413
RECOMMENDATION: Delete entire section.
SUBSTANTIATION: This should be a general requirement that is found in Article 210. When this section was originated it was due to electrical shocks from metal wheel car creepers cutting into lighting and tool cords. I entirely agree with the need for this GFCI requirement however, Article 511 only applies where flammable fuel is involved. There are many combustible fuel repair garages that share the same hazard for which this section was created but there is presently no requirement for GFCI protection in those garages. I submitted a proposal to Code-Making Panel 2, it is found as Proposal 2-81 on page 124 in the ROP. I believe that Code-Making Panel 14 can understand what I am pointing out here and that I am not applying dwelling application to commercial repair garages.
PANEL ACTION: Reject.
PANEL STATEMENT: Given the significant safety issues, the panel concludes the requirement must remain in Article 511, at least until such time as the GFCI requirement appears in Article 210.

It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the recommendation to reconsider. Change the wording of the sign required by 513.7(F), 513.10(B), 513.10(C)(2), 513.10(D)(1) to read:
"WARNING - KEEP 5 FT CLEAR OF AIRCRAFT ENGINES AND FUEL TANK AREAS" or
"WARNING - KEEP 1.5 METERS CLEAR OF AIRCRAFT ENGINES AND FUEL TANK AREAS."
PANEL STATEMENT: The revised sign text meets the intent of both the Technical Correlating Committee and the Technical Committee on Airport Facilities.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
COMMENT ON AFFIRMATIVE:
OMEARA: The panel action is not stated completely. It should be modified to read as follows:
"The panel accepts the recommendation to reconsider and has accepted the changes as proposed by Proposal 14-415, with the following modification: Change the wording of the sign...".

(Log #695)

14- 179 - (513-5(d)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 14-435
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: The requirements of this section are no different than the general Code requirements, and need not be repeated here. It adds nothing useful to the Code and contributes to the bloat that is making the Code more difficult to use. If this section is essential to articles in this chapter, similar material should be added to Articles 514, 515 and 516. The present text is erroneous in that it requires the grounded conductor to be connected to "the 'grounded' terminal of any utilization equipment supplied." This further implies that the utilization equipment must have provisions for connection of

a grounded conductor. Removing this section would not affect wiring practices, but would reduce Code clutter.
PANEL ACTION: Reject.
PANEL STATEMENT: Contrary to submitter's substantiation, Section 513-5(d) does contain provisions not found in Article 250.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

14- 180 - (513-6(a)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 14-437
RECOMMENDATION: Complete proposal should be accepted.
SUBSTANTIATION: ` As the panel states, equipment that releases sparks or hot metal would not be desirable over a pit or below-grade area, but this section addresses only equipment less than 10 ft above the wings and engine enclosures of aircraft, not pits and below-grade areas. Therefore, only Section 513-3(c) is generally relevant, and (b) is relevant only if the wings or engine enclosures are less than 18 in. above the floor. The exception is unnecessary since such "cut off" areas, by definition, do not house aircraft. This section could more simply begin: "In other than Class I locations, equipment that is less than 10 ft above wings and engine enclosures....".
PANEL ACTION: Reject.
PANEL STATEMENT: The panel maintains its position as stated in the 2002 NEC ROP.

(Log #701)

14- 191 - (515-5(a)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 14-483
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: It is unclear what technical justification the panel expects in support of this proposal. It is self-evident that underground cable wiring methods do not necessarily have a "point of connection to the aboveground raceway," as specified in this section. There is no technical justification other than that. Cable wiring methods are not prohibited in unclassified areas of bulk plants. As stated in the proposal, the depth below finished grade and height above grade for the protective raceway are taken from Section 300-5(d).
PANEL ACTION: Reject.

PANEL STATEMENT: Section 300-5(d) covers the physical protection of wiring in unclassified areas. Section 515-5(a) applies to wiring in hazardous locations.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
COMMENT ON AFFIRMATIVE:
COOK: I do not agree with the second sentence of the panel statement, "Section 515-5(a) applies to wiring within hazardous location." This section deals with underground wiring. Area classification for Bulk Storage Plants is covered in Section 515-2 and Table 515-2. I do not see where underground spaces, other than pits or tanks, are considered classified areas. This seems correct since a classified area would require an ignitible concentration and that seems unlikely to occur underground without some cavity that included oxygen. This is part of the confusion associated with my negative ballots on comments 14-167, 176,187, and 192.

(Log #2171)

ARTICLE 516 — SPRAY APPLICATION, DIPPING, AND COATING PROCESSES

(Log #172)

14- 193 - (516): Accept
Note: The Technical Correlating Committee understands that the action on this Comment will modify the Panel Action on Proposal 14-487.
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 14-486
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Revise Article 516 as follows (numbering based on 1999 NEC):
In 516-2(a)(4) of 1999 NEC, change "5 ft (1.52 m)" to "1.5 m (5 ft)" and "1 ft (305 mm)" to "300 mm (12 in)"
In 516-2(a)(5) of 1999 NEC, change "25 ft (7.62 m)" to "7.5 m (25 ft)" in two places.
In 516-2(b)(1) of 1999 NEC, change "20 ft (6.10 m)" to "6 m (20 ft)" and "10 ft (3.05 m)" to "3 m (10 ft)"
In Figure 516-2(b)(1) of 1999 NEC, change "20 ft (6100 mm)" to "6 m (20 ft)" and "10 ft (3050 mm)" to "3 m (10 ft)"
In 516-2(b)(2)(a) of 1999 NEC, change "5 ft (1525 mm)" to "1.5 m (5 ft)" and "3 ft (915 mm)" to "900 mm (3 ft)"
In Figure 516-2(b)(2) of 1999 NEC, change "3 ft R (915 mm)" to "900 mm R (3 ft)" in twelve places; "5 ft R (1525 mm)" to "1.5 m R (5 ft)" in two places; and "10 ft R (3050 mm)" to "3 m R (10 ft)" in two places.
In 516-2(b)(2)(b) of the 1999 NEC, change "10 ft (3050 mm)" to "3 m (10 ft)" and "3 ft (915 mm)" to "900 mm (3 ft)"
In 516-2(b)(3) of the 1999 NEC, change "3 ft (914 mm)" to "900 mm (3 ft)" in two places
In 516-2(b)(4) of the 1999 NEC, change "3 ft (914 mm)" to "900 mm (3 ft)"
In Figure 516-2(b)(4) of the 1999 NEC, change "3 ft R" to "900 mm R (3 ft)" in seven places.
In 516-2(b)(5) of the 1999 NEC, change "3 ft (914 mm)" to "900 mm (3 ft)"
In Figure 516-2(b)(5) of the 1999 NEC, change "3 ft (1 m)" to "900 mm (3 ft)" in six places; change "5 ft (1.5 m)" to "1.5 m (5 ft)" in six places; change "20 ft (6.1 m)" to "6 m (20 ft)" in two places.
In 516-2(b)(6) of the 1999 NEC, change "20 ft (6.1 m) to "6 m (20 ft)"
In 516-2(b)(6) Exception of the 1999 NEC, change "5 ft◊ (0.46 m◊)" to "0.46 m◊ (5 ft◊)" and "5 gal (18.9 L)" to "19 L (5 gal)"
In 516-2(c) Exception of the 1999 NEC, change "3 ft (914 mm)" to "900 mm (3 ft)"
In 516-3(d) Exception No. 2(b) of the 1999 NEC, change "18 in. (45.7 cm)" to "450 mm (18 in.)"
Make all other recommended changes as proposed in Proposal 14-486.
PANEL STATEMENT: The revised text provides more consistent use of metric units from Article 500 through 516 and consistency with CMP-8 action on conduit. CMP-14 recognizes that some changes involve extracted material, however changes were made based on Standards Council direction provided in their October 6, 2000 meeting.

(Log #173)

14- 194 - (516): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 14-487
RECOMMENDATION: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposals 14-420,14-488, 14-489, 14-490, 14-491, 14-492, 14-493, 14-494, 14-495, 14-496, 14-497, 14-498, 14-499, 14-500, 14-501, 14-502, 14-503, 14-504, 14-505, 14-506, 14-507, 14-508, 14-509, 14-510, and 14-511. The Technical Correlating Committee directs the Panel to reconsider and clarify the Panel Action on this Proposal. Note references in 516-10(a), 516-10(a)(10)c, and others to sections 516-5, which is deleted in accordance with the Panel Action. The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual specifically with respect to 516-10. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
In the draft of the 2002 NEC, revise Section 516.4(E) to read: "(E) Electrostatic Equipment. Electrostatic spraying or detearing equipment shall be installed and used only as provided in Section 516.10."
Also revise the last four sentences of Section 516.10(A) to read: "Where robot or programming procedures involve manual manipulation of the robot arm while spraying with the high voltage on, the provisions of Section 516.10(B) shall apply. The installation of electrostatic spraying equipment shall comply with Section 516.10(A)(1) through (10). Spray equipment shall be listed. All automatic electrostatic equipment systems shall comply with Section 516.10(A)(1) through (9)."
PANEL STATEMENT: These changes correct errors in cross references that occurred during the rewrite of Article 516.

ARTICLE 517 — HEALTH CARE FACILITIES

(Log #2398)

17- 13 - (517(xx)): Reject
SUBMITTER: Jan Zemplenyi, Bel Red Ambulatory Surgical Center
COMMENT ON PROPOSAL NO: 17-4
RECOMMENDATION: All facilities which provide sedation or general anesthesia shall be equipped with a back-up power mechanical generator or high-grade battery system with sufficient power and duration to assure the ability to conclude any operative procedure safely.
SUBSTANTIATION: The following is the contents of a letter I sent to Mr. Mayer Zimmerman of the Health Care Financing Administration on September 8, 2000:

It is clear to me that the amount of necessary kilowatts of back-up power depends on the size of the facility, and also on the time necessary for the completion of any procedures in progress when the black-out occurs. In our facility, we do not need large amounts of back-up power supplied for many hours in order to complete safely any of my operations. Our patient monitors are equipped with two-hour internal battery backup. Thus, in the first two hours of a blackout, we only need continuous power for the operating room lights and brief bursts of interrupted power for the electrocautery. Furthermore, the requirements are not different whether we use general or I.V. sedation anesthesia because the anesthesia machine does not use electrical power. The power system we have provides more than two hours of backup power so that I am not limited to only a two-hour duration. In my eleven years of performing office-based ambulatory surgery, I needed back-up power only once, and the Sola battery system we currently have worked out very well. We also test our battery system monthly. It functions instantaneously, and it provides us with the supply of clean current needed for our equipment.

In my recent research into the subject of backup power, I came across several battery systems including the Concorde batteries, which are used by the military and civil aviation industry for emergency power for their critical systems. Clearly, I think that my critical power requirements do not exceed those of F/A-18 or an F-117 Stealth fighter aircraft. In fact, as compared to a gasoline or diesel generator, and appropriately sized battery/inverter system provides a source of quiet, clean, reliable, and instantaneous power. Modern batteries are extremely reliable and maintenance free, whereas a generator needs to be "exercised and loaded" about once per month in order to be reliable. With a generator, there are other issues related to noise, storage and flammability of fuel. In addition, the quality of the electrical current generated can be deleterious to the electronic equipment since the waveform is not uniformly sinusoidal. In contrast, modern high-quality batteries and inverter systems provide clean sine wave, constant instantaneous current.

In summary, I feel that the requirement to retrofit my small ambulatory surgical center with a mechanical generator (prime mover) equipped with a transfer switch, is an expensive, burdensome requirement and a hardship. In my opinion, it will not add in any way to the safety of my surgical patients. I also know that, in general, certain modern battery/inverter systems can provide a superior alternative to generators, especially in instances when the total power requirements are relatively small and rather clearly defined. I strongly believe that further rational modification to the current rules iis n order, especially within view of new developments in battery power technology.

PANEL ACTION: Reject.
PANEL STATEMENT: The proposal number referenced does not deal with the subject of the submitter's recommendation. In addition there was no specific NEC reference section specified. The submitter may wish to consider Section 517-45(c)(1) which addresses power source requirements for ambulatory health care facilities. This section is extracted material from NFPA 99.

17- 14 - (517-3): Accept in Principle
Note: The Technical Correlating Committee understands that the Panel Action on Proposal 17-6a modifies this Comment.
SUBMITTER: David Eric Lees, Georgetown University Medical Center
COMMENT ON PROPOSAL NO: 17-9
RECOMMENDATION: As a practicing anesthesiologist I am unfamiliar with the term "relative analgesia" used in the subcommittee recommendation.
Delete use of word "relative."
SUBSTANTIATION: Cannot locate term "relative analgesia" in any contemporary anesthesiology text.
PANEL ACTION: Accept in Principle.
Extract the definition of "relative analgesia" from NFPA 99 and add it to 517-3 to read as follows:
"Relative Analgesia. A state of sedation and partial block of pain perception produced in a patient by the inhalation of concentrations of nitrous oxide insufficient to produce loss of consciousness (conscious sedation). [NFPA 99: 2-2]"
PANEL STATEMENT: The submitter's comment is based on the lack of definition of the term "relative analgesia". The definition for this term is contained in NFPA 99. Although the panel agrees with the submitter, NFPA 99 has jurisdiction for this term, and the NEC must correlate with the term as contained in NFPA 99.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #1798)

17- 16 - (517-10(b)(2)): Reject
SUBMITTER: Robert J. Clarey, Cutler-Hammer, Inc.
COMMENT ON PROPOSAL NO: 2-102, 2-103 & 2-114
RECOMMENDATION: Add a sentence to the end of paragraph 517-10(b)(2):
All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere outlets installed in limited care facility bedrooms shall be protected by an arc-fault circuit interrupter(s).
SUBSTANTIATION: Proposals 2-102, 2-103, and 2-114 contain a sentence dealing with enhanced safety protection for the branch circuits of Limited Care Facility Bedrooms. The action of the Technical Correlating Committee has been to refer these proposals to Code-Making Panel 17 to be considered as a public comment. Cutler-Hammer urges acceptance of this enhanced branch circuit protection for the reasons provided in the substantiation to the proposals. In

particular, Limited Care Facility Bedrooms would then have the same AFCI protection as Dwelling Unit Bedrooms (Section 210-12). Cutler-Hammer had directed Proposal 2-103 to Code Making Panel 2 because there were no apparent individual requirements for the branch circuits protection of the Limited Care Facility bedrooms in Article 517. With redirection of the proposal(s) to Code Making Panel 17, it seems possible that the requirement could be included in 517-10 as shown. An alternative could be to include the requirement under a separate heading: H. Arc-Fault circuit Protection for Limited Care Facility Bedrooms.
PANEL ACTION: Reject.
PANEL STATEMENT: There is insufficient evidence at this time to mandate the use of arc-fault circuit interrupter(s) in limited care facilities. The use of arc-fault circuit interrupter(s) is not precluded.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
WHITE: I think Article 517 should be held to the same standard as 210-12. If it can save a life in a single family dwelling, it should do the same in a limited care facility.

(Log #2092)

17- 17 - (517-13(a) Exception No. 1): Reject
SUBMITTER: George A. Straniero, AFC Cable Systems
COMMENT ON PROPOSAL NO: 17-16
RECOMMENDATION: Accept the proposal as modified.
SUBSTANTIATION: "Metal Raceways shall not be required where Listed Types MI, MC, or AC Cables are used, provided the outer metal armor or sheath of the cable is identified as an acceptable grounding return path, or where Size No. 14, 12 or 10 AWG Type MC cable with a grounding return path consisting of combined interlocked metal armor and grounding conductor, Listed for this purpose, is used in lengths not exceeding 100 ft with fittings identified for grounding."
The modified text includes a requirement that the grounding return path, consisting of combined interlocked metal armor and grounding conductor, be Listed for this purpose. This additional requirement addresses the panel's concerns regarding the metal sheath being identified as an acceptable grounding path and will be reflected in the UL Guide information.
PANEL ACTION: Reject.
PANEL STATEMENT: The outer sheath of interlocked armor Type MC cable is not itself identified as an acceptable grounding path and therefore does not meet the conditions of Exception No. 1.
The intent is to have 2 independent grounding means: one being the outer metal armor or sheath itself, and the other being the insulated copper conductor. Each grounding path must be considered independently of the other for any length. The combination of an insulated grounding conductor and the metal sheath together is not considered to be equivalent to one of the independent means.

(Log #1025)

17- 18 - (517-13(a) Exception No. 3): Reject
SUBMITTER: Joseph A. Ross, Ross Electrical Assessments
COMMENT ON PROPOSAL NO: 17-17
RECOMMENDATION: Delete Exception No. 3.
SUBSTANTIATION: Section 517-13(a) spells out the wiring methods for the "patient care area."
Exception No. 3 attempts to address the wiring methods "outside the patient care area."
Are not many other areas "outside the patient care areas"? Would it not be impractical to include several exceptions to cover all these other areas? There are other sections of the Code that adequately address wiring methods permitted in these other areas.
PANEL ACTION: Reject.
PANEL STATEMENT: The exception's intent is to clarify that Section 517-13(a) applies only to patient care areas. Deleting Exception No. 3 will require a second independent means for grounding of fixtures and switches outside the patient vicinity which is not the panel's intent. The exception does not address areas outside the patient care area, just outside the patient vicinity which is still within the patient care area.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:

(Log #207)

10- 70 - (517-17(b) (New)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 17-23
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 10 for action in Article 240. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the action of the Technical Correlating Committee to consider and take action on Proposal 17-23.
The panel action is to reject Proposal 17-23.
PANEL STATEMENT: Proposal 17-23 requests a second level of ground-fault protection for multiple occupancy buildings one or more of which is health care. Protection against ground-fault conditions is provided by the first level of ground-fault protection, if installed. The second level, as proposed, is to support service continuity. This presents additional requirements for building occupants that are non-health care occupancies. In a multiple occupancy building, containing one or more health care occupancies, the requirement of service continuity falls upon the health care occupancies. The panel suggests the submitter look for other ways within Article 517 to achieve the desired levels of service continuity, such as a UPS system.

17- 19 - (517-30(3) Exception No. .7): Reject
SUBMITTER: Jim Silva, St. Luke's Hospital
COMMENT ON PROPOSAL NO: 17-39
RECOMMENDATION: Add the following new text:
Exception No. 7: In existing walls and partitions where receptacles, switches, etc. are to be added, flexible metal raceways and cable assemblies may be fished. The flexible metal raceway or cable assembly shall enter the partition within 8 in. of a junction box where the branch circuit is supplied by a nonflexible metal raceway.
SUBSTANTIATION: Although these wiring methods do not supply sole mechanical protection of the conductors, in a wall or partition where the flexible metal raceway or cable assembly is not accessible, the wall supplies sufficient mechanical protection from physical damage. In NFPA 70-A95 17-40a the substantiation states that within medical headwalls flexible metal raceways and cable assemblies are mechanically protected. There is little or no difference in construction of the patient headwall or an existing wall or partition. What is proposed by this exception is no different than what is industry standard for headwalls and is inspected by the authority having jurisdiction in-house inspections by qualified personnel.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel assumes that the correct proposal reference is Proposal 17-29 and the correct section reference is 517-30(c)(3).
No evidence has been presented to suggest that the wall supplies sufficient mechanical protection as stated by the submitter. There is a difference in construction of a patient headwall as compared to an existing wall or partition. A patient headwall is constructed under controlled factory conditions and the listing evaluates mechanical protection of wiring contained within the headwall.

17- 20 - (517-30(3) Exception No. 7): Reject
SUBMITTER: Jim Silva, St. Luke's Hospital
COMMENT ON PROPOSAL NO: 17-39
RECOMMENDATION: Exception No. 7: In existing walls and partitions where receptacles, switches, etc. are to added, flexible metal raceways and cable assemblies may be fished. The flexible metal raceway or cable assembly shall enter the partition within 8 inches of a junction box where the branch circuit is supplied by a nonflexible metal raceway.
SUBSTANTIATION: Although these wiring methods do not supply sole mechanical protection of the conductors, in a wall or partition where the flexible metal raceway or cable assembly is not accessible the wall supplies sufficient mechanical protection from physical damage. In NFPA 70-A95 17-40a the substantiation states that within medical headwalls flexible metal raceways and cable assemblies are mechanically protected.
In healthcare facilities patient environments change rapidly. The need for emergency power to supply new equipment is constantly being requested. When the code change was enforced in the 1996 code cycle, it created a hardship in installing switches, outlets for power in existing conditions by forcing the channeling of walls and partitions to comply with 517-30(3). In some cases due to hygienic and infection protocols control surface metal raceways are not an option. This has resulted in increased installation costs and has forced some upgrades of the emergency system to be canceled, causing a hardship by not providing the best quality healthcare that every person deserves.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to the panel action and statement on Comment 17-19.

17- 21 - (517-30(b)(4)): Accept in Part
SUBMITTER: Lawrence A. Bey, Onan Corp.
COMMENT ON PROPOSAL NO: 17-31b
RECOMMENDATION: Replace ~~essential electrical system~~ with transfer switch in the third sentence only.
Delete ~~(210 kW).~~
SUBSTANTIATION: Limiting the size of the single transfer switch makes more sense than limiting the demand on the system. The reference to kW implies a power factor, which leads most to believe that it is the size of the generator set that determines if a single transfer switch is permitted. It should be permissible to use a larger generator set where the size of the single transfer switch is the limiting factor.
PANEL ACTION: Accept in Part.
The panel accepts the part of the recommendation to delete the "(120 kW)" reference after the 150 kVA value. {The panel notes that the value shown in 2002 NEC ROP "(210 kW)" was incorrect.}
The panel rejects the replacement of "essential electrical system" with "transfer switch."
PANEL STATEMENT: The panel intends that the use of a single transfer switch shall depend on the demand on the essential electrical system not the transfer switch.

(Log #1514)

17- 23 - (517-30(c)(3)): Hold
SUBMITTER: Joseph A. Ross, Ross Electrical Assessments
COMMENT ON PROPOSAL NO: 17-35
RECOMMENDATION: Revise Section 517-30(c)(3) as follows:
(3) Mechanical Protection of the Emergency System. The wiring of the emergency system of a hospital shall be mechanically protected by installation in nonflexible metal raceways.
Where the hospital building is above 23 m (75 ft) in height, emergency feeder circuit wiring shall be in accordance with the conditions of Section 700-9(d)(1) of this Code.
SUBSTANTIATION: It is to be noted that over the years, no other Code Making Panel has been as diligent as Code Making Panel 17 in the pursuit to provide a high-level of protection for emergency conductors. The Panel Statement specifies, "The panel has chosen to accomplish this (protection) by requiring nonflexible metallic raceway systems, MI or in encasement of concrete."
Section 700-9(d) includes additional requirements for emergency systems for buildings above 75 ft in height and provides a laundry list of occupancy classes and a hospital building is conspicuously absent. Section 700-9(d)(1) provides additional listed and other protective methods that are not included in Section 517-30(c)(3) and, therefore, are not permitted.
Code Making Panel 17 may opt for other text, other than this proposal, to include additional protective methods, but hospital buildings cannot continue through another cycle of the Code and be the only type building excluded from the occupancy classes. If anything, hospital buildings should provide a high-level of protection of emergency systems more so than any other building.
PANEL ACTION: Hold.
PANEL STATEMENT: The recommendation adds new material regarding the concept of building height that has not had public review.

(Log #2098)

17- 24 - (517-30(c)(3)): Reject
SUBMITTER: George W. Flach, Nat'l Armored Cable Mfrs' Assn. (NACMA)
COMMENT ON PROPOSAL NO: 17-37
RECOMMENDATION: Accept the proposal.
SUBSTANTIATION: The proposal requests an exception for a safe and reasonable use of AC cable based on the additional mechanical protection provided by the cables metallic sheath. The panel statement that it does not want to expand the use of AC cable does not address the statement of problem stated by the proposal that currently it is necessary to tear open sections of existing walls to add a circuit and that the mechanical protection provided by AC cable and the wall itself will protect the wiring.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its action on Proposal 17-37. The panel acknowledges the difficulty involved in adding circuits and devices in existing construction. However, the panel believes that the safety benefits outweigh the difficulties involved in meeting the code requirements. Fishing Type AC cable does not provide the requisite mechanical protection and support required for the emergency system.

17- 25 - (517-30(c)(3) Exception No. 5): Reject
SUBMITTER: Joseph A. Ross, Ross Electrical Assessments
COMMENT ON PROPOSAL NO: 17-36
RECOMMENDATION: Revise Exception No. 5 as follows:
Exception No. 5: Flexible metal raceways and cable assemblies shall be permitted to be used in listed prefabricated medical headwalls, listed office furnishings, or where necessary for flexible connection to equipment, or no longer than 3m (10 ft) where used to fish branch circuits in existing walls.
SUBSTANTIATION: The submitters of Proposals 17-36 and 17-37 have presented a real world problem. Typically, the walls of health care facilities are of concrete block and tile construction. In an existing facility, as is presently required, to retrofit a receptacle outlet is to chop open a concrete block or tile wall and lay in approximately 8 feet of "nonflexible" raceway and then repair the wall (very unsightly and impractical).
It should be permitted to fish the voids of the blocks or tile with a limited length of a flexible method, as any electrician can do and has done. A block or tile wall containing a limited length of a flexible method will more than provide the mechanical protection required for emergency systems.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its action on Proposal 17-36. The panel acknowledges the difficulty involved in adding circuits and devices in existing construction. However, the panel believes that the safety benefits outweigh the difficulties involved in meeting the code requirements. Fishing flexible metal raceways and cable assemblies does not provide the requisite mechanical protection and support required for the emergency system. The panel does not agree that block or tile walls will provide the necessary protection and support.

(Log #753)

17- 26 - (517-30(d)): Reject
SUBMITTER: Lawrence A. Bey, Onan Corp.
COMMENT ON PROPOSAL NO: 17-30c
RECOMMENDATION: Reject Proposal 17-30c. Delete all of the current wording of 517-30(d) except for the second sentence of the second paragraph, so that all that remains is as follows:
(d) Capacity of Systems. The generator set(s) shall have sufficient capacity and proper rating to meet the maximum actual demand likely to be produced by the connected load of the essential electrical system(s) at any one time.
SUBSTANTIATION: While it is true that hospital emergency systems are different from emergency systems in commercial or assembly buildings, the generator sets are sized the same way based on the characteristics of the actual loads, both starting and running requirements, and the load step sequence. The big problem over the years has been oversizing of the generator sets in hospitals, such that the hospital typically does not have enough transferable load to adequately exercise the engine(s), particularly diesel engines. With oversized engine-generator sets, there are substantial costs involved to bring in dummy load banks to exercise the engine(s). This comment is intended to encourage optimized sizing, not oversizing.
The single sentence remaining from this comment would be less likely to result in oversizing, and then the requirement for generator capacity would match in both Article 517 and NFPA 99. The wording of current 517-30(d) that this comment would delete tends towards "worst case" sizing rather than optimized sizing. Generally, sizing a generator set based on feeder calculations is a short cut that will result in oversizing, because of the 125 percent factor typically applied to load currents in most all of the branches. Sizing based on connected load alone is a worst case situation, particularly where load steps are ignored. Demand factors are not used for sizing recommendations by any generator set manufacturer in the industry. Historical data may be used occasionally, but typically only where an existing generator set is being replaced, and even in that case it is best to do the calculations of actual load starting and running requirements. The current sentence on feeder sizing is redundant to requirements already existing in Articles 215 and 220.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes that requirements in the first paragraph of 517-30(d) are needed to establish requirements for the capacity of the essential electrical system. In addition, the first sentence of the second paragraph is needed to emphasize the requirements for feeders.
The panel believes that a set of options is needed for proper sizing of emergency generators to address the needs of the various health care applications.

ARTICLE 518 — PLACES OF ASSEMBLY

(Log #667)

15- 22 - (518): Hold
Note: The Technical Correlating Committee acknowledges the concern expressed by the submitter relative to correlating with other NFPA documents. The Technical Correlating Committee also acknowledges that the Chair of Code-Making Panel 15 will appoint a special Task Group and will also instruct the Chair to include representation from NFPA 101 and NFPA 5000 Committees on the Task Group.
SUBMITTER: James R. Quiter, Rolf Jensen & Assoc., Inc.
COMMENT ON PROPOSAL NO: 15-11
RECOMMENDATION: Revise the title of Article 518 as follows:
Article 518 - Places of Assembly Occupancies
Revise 518-1 as follows:
518-1. Scope. This article covers all buildings of portions of buildings or structures designed or intended for the assembly gathering together of 100 or more persons for deliberation, worship, entertainment, eating, drinking, amusement, awaiting transportation, or similar uses.
Revise 518-2(a) as follows:
(a) Examples. Assembly occupancies Places of assembly shall include, but not be limited …
Also, change "place of assembly" to "assembly occupancy" in 240-2, 333-4, 336-5(a), 518-3(a), 640-3(e), and 770-21 (2 locations).
SUBSTANTIATION: I serve as Chair of the NFPA Technical Correlating Committee on Safety to Life (TCC). At its September 26-27, 2000 meeting, the TCC discussed NEC Proposal 15-11 and drafted this comment. I am submitting the comment in my name, in lieu of that of the TCC, because there was not sufficient time to letter ballot the TCC prior to the October 27 comment closing date. The NFPA regulations addressing the submittal of comments to technical committees/panels outside one's own project require letter balloting by the committee that wants to submit the comment.
The current language of 518-1 is not restrictive enough in scope to accomplish its intent. The loosely defined phrase "for the ASSEMBLY of 100 or more persons" is deficient in not specifying the purpose for which the persons have assembled. Via the current wording, a space/area with 100 desks and 100 chairs in an office building would be subject to the provisions of Article 518, yet this doesn't appear to be the intent of Article 518. From the list of examples in 518-2(a),

which acknowledges via its wording that the list of examples is not all inclusive, it appears that the provisions of Article 518 are meant to apply to groups of 100 or more persons if the people have gathered together for purposes that the Life Safety Code and the model building codes refer to as constituting an assembly occupancy. It appears that Article 518 is not meant to apply to all gatherings of 100 persons or more regardless of those persons' reason for gathering.

The wording revisions proposed would accomplish two things:

1. The new wording will clarify the intent of the scope of Article 518; the current wording is unclear.

2. The new wording will create consistency in terminology among three premier documents within NFPA's arsenal of codes for the built environment - NFPA 70 NEC, NFPA 101 Life Safety Code, and NFPA 5000 (proposed) Building Code. None of these documents should attempt to function in a vacuum without consideration of the others. We owe it to our constituency to work toward consistency and avoid conflicting language.

PANEL ACTION: Hold.

PANEL STATEMENT: The panel holds this comment and Proposals 15-11 and 15-11a. The panel has reviewed its actions on Proposals 15-11 and 15-11a in light of the comments received. Resolution to these issues would require new language and possible alteration of the scope, which is not in Panel 15's purview. Therefore, the action of the panel on these comments and proposals is to "Hold for Further Study" and the language that exists in the 1999 Edition of the NEC remains. A special Task Group appointed by the Panel Chair will develop a proposal or proposals for the 2005 cycle to resolve these issues.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NEGATIVE: 4

NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

AMOS: I disagree with the panel action to hold this comment for further study.

The panel has wrestled with the list of examples for as long as I have been a member of panel 15. It has been stated time after time that no list can be all-inclusive and a list will always be subjective. By establishing "assembly occupancy" in place of the existing list, we would be in conformance with other NFPA documents. Placing this comment on hold will only add three more years to the confusion.

JOHNSON: NFPA codes, especially those as closely related as NFPA 70 and NFPA 101, should not have two abstract terms having the same meaning. I do not have a strong feeling about the merit of either term but the majority of NFPA documents prefer "Assembly Occupancies." over "Places of Assembly." We do not need a task group and a three-year delay to make such a logical change.

HIRSCHLER: I oppose the action by the panel. The issue of the definition of places of assembly or of assembly occupancies, and of the associated list has been in front of the panel for several cycles (at least the three cycles I have served on the panel) and there is no justification for the panel not to act on it and "hold it for further study". Article 518 in the NEC has a unique definition of something it calls "places of assembly". There are 18 references to "Places of Assembly" in the NFPA Codes, as follows:

1. NFPA 1: 10-2.2.2* Interior finish shall be limited to that permitted in Class A places of assembly as specified in NFPA 101®, Life Safety Code®.

2. NFPA 70: Article 240 A. General - 240-2. Protection of Equipment. Equipment shall be protected against overcurrent in accordance with the article in this Code that covers the type of equipment as specified in the following list:
Places of Assembly Article 518

3. NFPA 70: 333-4. Uses Not Permitted. Type AC cable shall not be used where prohibited elsewhere in this Code, including the following:
1. In theaters and similar locations, except as provided in Article 518, Places of Assembly

4. NFPA 70: 336-5. Uses Not Permitted (a) Types NM, NMC, and NMS. Types NM, NMC, and NMS cables shall not be used in the following:
1. In any multifamily dwelling or other structure exceeding three floors above grade. For the purpose of this article, the first floor of a building shall be that floor that has 50 percent or more of the exterior wall surface area level with or above finished grade. One additional level that is the first level and not designed for human habitation and used only for vehicle parking, storage, or similar use shall be permitted.
2. As service-entrance cable
3. In commercial garages having hazardous (classified) locations as provided in Section 511-3
4. In theaters and similar locations, except as provided in Article 518, Places of Assembly

5. NFPA 70: ARTICLE 518 -- Places of Assembly
518-1. Scope. This article covers all buildings or portions of buildings or structures designed or intended for the assembly of 100 or more persons.

6. NFPA 70: 518-2. General Classifications
(a) Examples. Places of assembly shall include, but not be limited to, the following:

7. NFPA 70: 518-3. Other Articles. (a) Hazardous (Classified) Areas. Electrical installations in hazardous (classified) areas located in places of assembly shall comply with Article 500.

8. NFPA 70: 640-3. Locations and Other Articles. Circuits and equipment shall comply with (a) through (k), as applicable.
e) Places of Assembly. Equipment used in places of assembly shall comply with Article 518.

9. NFPA 70: 700-1. Scope. The provisions of this article apply to the electrical safety of the installation, operation, and maintenance of emergency systems consisting of circuits and equipment intended to supply, distribute, and control electricity for illumination or power, or both, to required facilities when the normal electrical supply or system is interrupted.
FPN No. 3: Emergency systems are generally installed in places of assembly where artificial illumination is required for safe exiting and for panic control in buildings subject to occupancy by large numbers of persons, such as hotels, theaters, sports arenas, health care facilities, and similar institutions. Emergency systems may also provide power for such functions as ventilation where essential to maintain life, fire detection and alarm systems, elevators, fire pumps, public safety communications systems, industrial processes where current interruption would produce serious life safety or health hazards, and similar functions.

10. NFPA 70: 700-21. Switch Location. All manual switches for controlling emergency circuits shall be in locations convenient to authorized persons responsible for their actuation. In places of assembly, such as theaters, a switch for controlling emergency lighting systems shall be located in the lobby or at a place conveniently accessible thereto.

11. NFPA 72: Table A-4-3.2 Average Ambient Sound Level According to Location
Places of Assembly 55 dBa

12. NFPA 102: A-9-5 Patrols or Fire Details. Because of the variety of types of places of assembly covered in this standard, no general requirement for patrols or fire watchers has been included. The committee fully recognizes the importance of this feature of fire protection, however, and believes that a system of well-trained patrols or fire watchers should be maintained in every place of assembly where fire hazards might develop.

13. NFPA 110: A-2-2.4.1. Typically, Level 1 systems are intended to automatically supply illumination or power, or both, to critical areas and equipment in the event of failure of the primary supply or in the event of danger to elements of a system intended to supply, distribute, and control power and illumination essential for safety to human life. Level 1 systems generally are installed in places of assembly where artificial illumination is required for safe exiting and for panic control in buildings subject to occupancy by large numbers of people.

14. NFPA 111: A-2-2.5.1. Typically, Level 1 systems are intended to automatically supply illumination or power, or both, to critical areas and equipment in the event of failure of the normal supply or in the event of damage to elements of a system intended to supply, distribute, and control power and illumination essential for safety to human life. Level 1 systems generally are installed in places of assembly where artificial illumination is necessary for safe exiting and for panic control in buildings subject to occupancy by large numbers of people.

15. NFPA 415: 2-1.2* Interior finish shall be limited to that permitted in Class A places of assembly as specified in NFPA 101®, Life Safety Code®.

16. NFPA 1201: A-14-5.2. In the past, most fire prevention activities were limited to a small nucleus of full-time specialists who might be civilian or uniformed personnel. ... Fire companies also should be used to perform occupancy inspections in places of assembly (e.g., nightclubs, sporting events, special events), after normal business hours, to check for overcrowding, locked or blocked exits, and other similar violations. Fire companies or personnel should not be used to "stand by" for these events.

17. NFPA 1620: 9-3 Physical Elements and Site Considerations. 9-3.1. Places of assembly may occur within other occupancies. The pre-incident planning concepts of this chapter should be utilized for these areas.

18. NFPA 1620: 9-7 Emergency Operations. 9-7.1. Consideration of life safety at places of assembly should be the major point addressed by the plan.

Out of those 18 references, 2 are incorrect, because they reference

"places of assembly from NFPA 101", and NFPA 101 does not mention "places of assembly" (numbers 1 and 15), and 9 are under the responsibility of CMP 15 (all those from the NEC). This leaves only 7 references to "places of assembly" in the entire set of NFPA codes, and all of them (as is obvious from the enumeration made) could easily refer to "assembly occupancies" instead, as they are just concepts and do not refer to a specific requirement.

The NFPA Codes have 118 references to "Assembly Occupancies" (even before the multiple references that will appear in NFPA 5000, the Building Code), including 67 in NFPA 101, 21 in NFPA 101B, 15 in NFPA 1 and even 2 in NFPA 70. It also has 98 references to "assembly occupancy", including 65 in NFPA 101, 15 in NFPA 101B, and 8 in NFPA 1. All other codes (both the new International Building Code and the traditional 3 regional model building codes) in the US reference the term "Assembly Occupancies". It is absolutely way past the time for CMP 15 to cease trying to have its own unique language and adopt a consensus language for the country. Comment 15-22 tried to do this and described correctly 7 of the 9 places where the term is referenced (it erred in calling for 770-21 when it should have stated 700-1 and 700-21, but the sense was clear). It also gave a proper description for "assembly occupancies", as taken from the Life Safety Code, NFPA 101. The discussion at the CMP meeting that NFPA 101 describes an "assembly occupancy" as having 50 people and CMP 15 wants to have restricted wiring only for places where 100 or more people are gathered is just a way of avoiding a decision. It is not uncommon in code applications for terms to have the same meaning but different thresholds in different applications; thus, CMP 15 could continue to state that an "assembly occupancy" for the NEC is a place where 100 or more people gather to conduct certain activities. The other "rationale" expressed was that there was an interest in expanding the use of a "place of assembly" to locations such as open-space offices, factories or shops: this is obviously not what is intended when anyone talks about an assembly occupancy.

This comment should have been accepted, with the correction made to the two typing errors on references.

KOVACIK: Hold is the incorrect action for this comment. The panel statement implies this is new material and it did not have the authority to revise the scope of Article 518. The panel had all of the material it needed to revise the scope and provide correlation with the panel action on 518-2 as reported in the ROP. This material was provided in the comments on voting on proposal 15-11a and the public comments submitted on 15-11 and 15-11a. The panel could have drafted a suitable scope statement for recommendation to the Technical Correlating Committee. The panel was nearly unanimous in agreeing that the list of examples in 518-2 was a source of confusion and should be deleted. The only outstanding issue appeared to be the need to clarify what is meant by "places of assembly" which the present scope statement does not with the list of examples deleted. Suitable text had been suggested, the source of which was the Appendix of NFPA 101, Life Safety Code. Unfortunately, the panel could not agree on the exact wording and after considerable discussion decided to leave 518-2 as it appears in the 1999 NEC. All of the efforts expended over the past year to write a better code for this Article were lost.

COMMENT ON AFFIRMATIVE:

KLEIN: 1. The need to coordinate with other codes was expressed repeatedly in this and other comments, as well as during the deliberations. We must be cautious that we don't take this too far - we can't be absolute - because there are different considerations from many perspectives. As pointed out during debate, different rules apply to places of assembly depending upon the capacity and type of the particular occupancy.

VANNICE: One of the historical purposes of Article 518 was to separate and better define the non-theatre assembly occupancies found in the Life Safety Code. Therefore, it might be appropriate to align Article 518 with the LSC Assembly Occupancies. We must remember, however, that Articles 520 and 525 cover some Assembly Occupancies. We should either retain the differently defined Places of Assembly or except Articles 520 and 525 from Assembly Occupancies in the NEC.

The Panel Statement to Proposal 15-11 was to provide a reference point to which we could agree or disagree. It was pointed out that the statement "assembly of 100 or more persons anywhere for any reason" was overly inclusive. A suggested solution to Section 518-2(a), which was placed on Hold, was offered as follows:

Examples: Places of assembly (assembly occupancies) are characterized by the presence or potential presence of crowds with attendant panic hazard in case of fire or other emergency. They are generally or occasionally open to the public, and the occupants, who are present voluntarily, are not ordinarily subject to discipline or control. Such buildings or structures are ordinarily occupied by able-bodied persons and are not used for sleeping purposes. Places of assembly shall include, but not limited to, the following: (List of Examples)

This added wording clarifies further what a Place of Assembly is, and is derived from draft language in proposed NFPA 5000. Comments range from saying the existing language is either too restrictive, so that it would apply to offices or factories, to not being restricting enough. The above language clarifies that, and is generally consistent with NFPA 101 and the proposed NFPA 5000.

It may or may not be desirable to keep the list of examples; however, some sort of defining paragraph other than the scope needs to be retained. Note that in the LSC the list of examples has been banished to Annex A.

SUBMITTER: James K. Lathrop, Koffel Assoc., Inc.

COMMENT ON PROPOSAL NO: 15-11a

RECOMMENDATION: Accept proposal as modified below:

Revise 518 to read as follows:

Article 518 - ~~Places of~~ Assembly Occupancies

Revise 518-1 as follows:

518-1 Scope. This article covers all buildings or portions of buildings or structures designed or intended for the ~~assembly~~ gathering together of 100 or more persons for such purposes as deliberation, worship, entertainment, eating, drinking, amusement, awaiting transportation, or similar purposes.

Delete 518-2(a) and renumber 518-2(b).

SUBSTANTIATION: Without the change suggested above deleting the list would be a significant change in the scope of the document with no justification. This is more than just deleting a list. It is changing the total scope of the Article. Without the list, the Code will be worse, not better. However, by properly defining an assembly use, as is defined in the Life Safety Code and all the model building codes and in the proposed NFPA 5000, deleting the list will not be as problematic.

Without the suggested revision the Panel is now saying that this article applies to factories, open plan office buildings, open dormitory prisons and military barracks, stores, open plan schools, and large warehouses and distribution facilities. Where is the justification for this significant increase in scope?

If one follows the history of the NEC since 1975, when Article 518 first went into the code, it has never been substantiated that "Place of Assembly" in the NEC is any different than "Place of Assembly" in the Life Safety Code or the model building codes. Although the other codes eventually modernized the term to "assembly occupancies" the basic definition was the same. When I was Chief Life Safety Engineer for NFPA, I often discussed this article with the NEC staff due to the fact that NEC used 100 vs. the Life Safety Code 50 people. We repeatedly came to the same conclusion that was not a conflict because the NEC was just using a larger number for wiring purposes (similar to the 100 the Life Safety Code used for panic/fire exit hardware.) It was never discussed that the NEC meant something totally different from the Life Safety Code.

Quoting from the scope of Article 518 in the 1975 NEC: "This article covers all buildings or that part of a building or structure designed or intended for use by 100 or more persons for assembly purposes, such as dining, meeting, entertainment, lectures, bowling, worship, dancing or exhibition, and includes museums, gymnasiums, armories, group rooms, mortuaries, skating rinks, pool rooms, places of awaiting transportation, places for deliberation (court rooms), places for sporting events, and similar purposes." It does not say any place you gather together 100 or more people. The intent has always been to apply to the gathering together of 100 or more people for assembly purposes.

As pointed out by the Panel the list is just that a list. Is not all inclusive. However, every use on the list is an assembly use. How does the Panel now say that non-assembly uses will be included? Where is the justification to extend this beyond the uses that all model codes include in the assembly category?

In summary, the Panel is trying to significantly increase the scope of the article through the deletion of a list. Although deleting lists is usually a good idea, the base definition must be proper. As is remaining in the NEC, the base requirement without the list is not adequate and has not been justified by the Panel.

PANEL ACTION: Hold.

PANEL STATEMENT: The panel holds this comment and Proposals 15-11 and 15-11a. The panel has reviewed its actions on Proposals 15-11 and 15-11a in light of the comments received. Resolution to these issues would require new language and possible alteration of the

scope, which is not in Panel 15's purview. Therefore, the action of the panel on these comments and proposals is to "Hold for Further Study" and the language that exists in the 1999 Edition of the NEC remains. A special Task Group appointed by the Panel Chair will develop a proposal or proposals for the 2005 cycle to resolve these issues.

COMMENT ON PROPOSAL NO: 15-11
RECOMMENDATION: Continue to reject this proposal.
SUBSTANTIATION: Rejection of this proposal is right in line with the Code-Making Panel 15 interpretation of the intent of Article 518 over the years. The Panel has been especially astute in recognizing that the NEC charge is to deal with electrical issues, including ALL hazards arising from the use of electricity. The NFPA Board of Directors acknowledged years ago that those hazards include fire hazards. The Panel has long included the increased risks that exist where over 100 persons are intended to be present. In the interest of aiding in their continued assessment of the nonmetallic wiring methods that are not permitted by Article 518, comments on Article 336 and Article 331, as well as back-up documents are forwarded as part of this comment and comment on 15-11a. Also included is a comment to Proposal 7-145 developed by the NFPA 3-story Task Group as the basic response to proposed expanded use of NM Cable. These documents should be helpful to Code-Making Panel 15 in their continuing review of this issue.
Note: Supporting Material is available for review at NFPA Headquarters.
PANEL ACTION: Hold.
PANEL STATEMENT: The panel holds this comment and Proposals 15-11 and 15-11a. The panel has reviewed its actions on Proposals 15-11 and 15-11a in light of the comments received. Resolution to these issues would require new language and possible alteration of the scope, which is not in Panel 15's purview. Therefore, the action of the panel on these comments and proposals is to "Hold for Further Study" and the language that exists in the 1999 Edition of the NEC remains. EXPLANATION OF NEGATIVE:
JOHNSON: See my Explanation of Negative Vote on Comment 15-22.
HIRSCHLER: I oppose the action by the panel. This comment should have been accepted in principle and referred to action on accepted comment 15-22. See my comments on 15-22.
KOVACIK: See my Explanation of Negative Vote on Comment 15-22.
COMMENT ON AFFIRMATIVE:
KLEIN: See my Comment on Affirmative on Comment 15-22.
VANNICE: See last paragraph of panel statement to Proposal 15-11. This concept is amplified in a letter from NFPA's Mr. Cote included in the documents given us. He states: "the scope clearly states that it (CMP) shall have primary responsibility for preparing documents on minimizing the risk of electrical shock and as a potential ignition source of fires and explosions."
Historically, Article 518 was created to deal with issues including the fact that wiring methods in Places of Public Assembly are often subjected to more adverse conditions than normal, and that the gathering together of larger groups of people warrant additional safety factors. The concern isn't just to get people out of the building safely, but to reduce the likelihood of having them need to get out. This is especially true of people assembled voluntarily and not ordinarily subject to discipline or control.
The Panel toured the Phoenix Civic Plaza Convention Center. There we learned that a walk-through is conducted with each new client. The purpose of this walk-through is so that when the client receives a bill for all the damage to the facility, they will understand and pay it. After an exhibition, typically there is one to two days of required repair work to the electrical system, mechanical system, walls, etc. due to damage by fork lifts, carts, and crates, etc. We also saw that the ceiling has only one surface with conduits exposed to the workers on the top side.
I have been watching the construction of some offices. The contractor applied plywood with a nail gun. Approximately 10 percent of the nails missed the stud (and its metal plate) and entered the wall cavity grazing the NM cable. This observation increased concerns with respect to walls that are heavily "used" such as museums. Museum walls are an example of such use. Pictures and sculpture are hung and re-hung, often not with picture hooks, but with toggle bolts and lag screws. These walls are screwed, nailed and drilled into blindly with regularity, up to the point of requiring the surface to be replaced. Spaces that are likely to be reconfigured or are used for multiple purposes require additional safety factors.

15- 26 - (518-1, 518-2(a)): Hold
Note: See Technical Correlating Committee action on Comment 15-22.
SUBMITTER: James K. Lathrop, Koffel Assoc., Inc.
COMMENT ON PROPOSAL NO: 15-11
RECOMMENDATION: Accept proposal as originally submitted.
SUBSTANTIATION: The panel statement is without technical justification and inconsistent with other NFPA documents. It states "They are buildings or portions of buildings or structures designed or intended for the assembly of 100 or more persons anywhere for any reason, except where modified elsewhere by the NEC." Is the panel now saying that factories, open plan office buildings, open dormitory prisons and military barracks, stores, open plan schools, and large warehouses and distribution facilities are now Places of Assembly? If so, where is the justification for this significant increase in scope.
If one follows the history of the NEC since 1975, when Article 518 first went into the code, it has never been substantiated that "Place of

Assembly" in the NEC is any different than "Place of Assembly" in the Life Safety Code or the model building codes. Although the other codes eventually modernized the term to "assembly occupancies" the basic definition was the same. When I was Chief Life Safety Engineer for NFPA, I often discussed this article with the NEC staff due to the fact that the NEC used 100 vs the Life Safety Code 50 people. We repeatedly came to the same conclusion that this was not a conflict because the NEC was just using a larger number for wiring purposes (similar to the 100 the Life Safety Code uses for panic/fire exit hardware.) It was never discussed that the NEC meant something totally different from the Life Safety Code.

Quoting from the scope of Article 518 in the 1975 NEC: "This article covers all buildings or that part of a building or structure designed or intended for use by 100 or more persons for assembly purposes, such as dining, meeting, entertainment, lectures, bowling, worship, dancing or exhibition, and includes museums, gymnasiums, armories, group rooms, mortuaries, skating rinks, pool rooms, places of awaiting transportation, places for deliberation (court rooms), places for sporting events, and similar purposes." It does not say any place you gather together 100 or more people. The intent has always been to apply to the gathering together of 100 or more people for assembly purposes.

By the way, a building defined by NFPA in its glossary of terms as: "Building: Any structure used or intended for supporting or sheltering any use or occupancy." Therefore an open platform is a building since it is a structure that is supporting a use or occupancy. However, this is not a significant issue and if the panel wishes to accept in principle but retain "building or structure" there is no objection. That is not a justification for rejecting the whole proposal.

As pointed out by the Panel the list is just that a list. Is not all inclusive. However, every use on the list is an assembly use. How does the panel now say that non-assembly uses will be included? Where is the justification to extend this beyond the uses that all model codes include in the assembly category.

In the last four paragraphs of the Panel statement the panel lays out a very good reason for the elimination of Article 518. The Panel does an excellent job of explaining that the requirements are based on the number of people and not the electricity. Why does the gathering together of 100 people, regardless of the reason, make electricity, or the wiring system behave any differently? The Panel clearly lays it out; "Possible electrical induced hazards include".

Fire - no different based on the number of people - the wiring methods and the electricity do not behave differently.

Smoke - is a different type of smoke given off due to the number of people?

Toxicity - why is this different, is the toxicity different if a wiring method burns in a hospital or a school verses an assembly use?

Structural Integrity - Is the Panel saying that structural integrity is more important in an assembly use than in a high rise?

Burns, shocks, explosions, blinding flashes, and electrocutions - this is totally independent of the number of people. Where does the fire record show this to be different based on the building containing an assembly use?

In summary, the Panel is trying to significantly increase the scope of the article through its Panel statement. The Panel must provide significant justification for such action. Since the Panel statement can be considered part of the developmental record, the statement must be withdrawn regardless of action on this comment.

PANEL ACTION: Hold.

PANEL STATEMENT: The panel holds this comment and Proposals 15-11 and 15-11a. The panel has reviewed its actions on Proposals 15-11 and 15-11a in light of the comments received. Resolution to these issues would require new language and possible alteration of the scope, which is not in Panel 15's purview. Therefore, the action of the panel on these comments and proposals is to "Hold for Further Study" and the language that exists in the 1999 Edition of the NEC remains. A special Task Group appointed by the Panel Chair will develop a proposal or proposals for the 2005 cycle to resolve these issues.

15- 28 - (518-2): Accept

SUBMITTER: Technical Correlating Committee National Electrical Code

COMMENT ON PROPOSAL NO: 15-11a

RECOMMENDATION: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.

SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.

PANEL ACTION: Accept.

PANEL STATEMENT: Refer to the panel action and statement on Comments 15-22, 23, 24, 26, 27, 29, 30.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16
NEGATIVE: 2
NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

HIRSCHLER: I oppose the action by the panel. This comment should have been accepted and referred to action on accepted in principle comment 15-29. See my comments on 15-29 and 15-22.

JOHNSON: See my Explanation of Negative Vote on Comment 15-22.

(Log #1836)

15- 29 - (518-2): Hold

Note: See Technical Correlating Committee action on Comment 15-22.

SUBMITTER: Patricia Horton, Elaine Thompson, Allied Tube & Conduit

COMMENT ON PROPOSAL NO: 15-11(a)

RECOMMENDATION: Accept this proposal in principle, but add back a charging paragraph as noted by Mr. Vannice in his comment, and as noted by the Technical Correlating Committee. New paragraph to read as follows:

(a) Places of Assembly. Places of assembly shall include all buildings or portions of buildings or structures designed or intended to be occupied by 100 or more persons at any given time.

Leave "Multiple Occupancies (b), and Theatrical Areas (c)," as contained in the 1999 NEC.

SUBSTANTIATION: The decision to delete this list will clarify the long expressed intent of Code-Making Panel 15. Section (a) has always clearly stated the list is examples only, and not all inclusive. The reasoning contained in the Panel statement for 15-11 certainly provided their overall thinking. Documentation in support of our comments on 15-11, 15-11a, 15-16, 15-17, and 15-18 has been provided as a package to the Code-Making Panel as overall information on the nonmetallic wiring methods that are regulated in Article 518. This is provided for the record and further edification of the Panel. For detailed information readers of the ROC are referred to comments on Proposal 7-145.

Note: Supporting Material is available for review at NFPA Headquarters.

PANEL ACTION: Hold.

PANEL STATEMENT: The panel holds this comment and Proposals 15-11 and 15-11a. The panel has reviewed its actions on Proposals 15-11 and 15-11a in light of the comments received. Resolution to these issues would require new language and possible alteration of the scope, which is not in Panel 15's purview. Therefore, the action of the panel on these comments and proposals is to "Hold for Further Study" and the language that exists in the 1999 Edition of the NEC remains. A special Task Group appointed by the Panel Chair will develop a proposal or proposals for the 2005 cycle to resolve these issues.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

NEGATIVE: 3

NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

HIRSCHLER: I oppose the action by the panel. This comment should have been accepted in principle and proposal 15-11a continued to be accepted. This would have been the logical thing to do. The list contained in Article 518 is a list of arbitrary examples that is not all-inclusive, and was never intended to be all-inclusive, and its use causes great difficulties to people trying to decide where Article 518 applies. The list is as follows:

(a) Examples. Places of assembly shall include, but not be limited to, the following:

Armories	Courtrooms
Assembly halls	Dance halls
Auditoriums	Dining facilities
Auditoriums within	Exhibition halls
Business establishments	Gymnasiums
Mercantile establishments	Mortuary chapels
Other occupancies	Multipurpose rooms
Schools	Museums
Bowling lanes	Places of awaiting transportation
Church chapels	Pool rooms
Club rooms	Restaurants
Conference rooms	Skating rinks

Does this mean that a cathedral, or even an auditorium within a cathedral, doesn't count? they probably do count. What about a lunch room within a factory? What about a library? What about a court room? The list of potential places excluded is probably larger than the list of places included in the list. There is no justification for including this list, which has been a headache (and a growing one as the cycles have gone on). The list should have remained deleted, as the panel correctly did on Proposal 15-11a.

If the panel wished to add a charging paragraph instead of the list it could have used the definition as incorporated in comment 15-22, namely:

(a) Assembly occupancies: assembly occupancies shall include buildings or portions of buildings or structures designed or intended for the gathering together of 100 or more persons for deliberation, worship, entertainment, eating, drinking, amusement, awaiting transportation or similar uses."

See also my comment on comment 15-22.

JOHNSON: See my Explanation of Negative Vote on Comment 15-22.

KOVACIK: See my Explanation of Negative Vote on Comment 15-22.

(Log #1909)

15- 30 - (518-2): Hold

Note: See Technical Correlating Committee action on Comment 15-22.

SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers

COMMENT ON PROPOSAL NO: 15-11a

RECOMMENDATION: Reject this proposal.

SUBSTANTIATION: Deleting the list of examples will not help the user of this code. In fact the user of this code will be confused by this action. Removal of the examples listed will decrease the usability of Article 518.

The text in 518-2a clearly states "Places of assembly shall include, but not be limited to, the following:" informing the user that the list of examples is not all-inclusive.

This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.

(Log #803)

15- 33 - (518-4(a), Exception): Reject
SUBMITTER: David H. Kendall, Carlon
COMMENT ON PROPOSAL NO: 15-15
RECOMMENDATION: This proposal should continue to be accepted.
SUBSTANTIATION: The proposal does not in away change the existing requirements for ENT per Section 518-4 where it states for nonmetallic raceways that it shall be encased in not less than 2 in. of concrete. Optical Fiber/Communication Raceways are made from the same materials used on the insulation of the Optical Fiber Cabling. The raceways are required to meet the same fire characteristics as the cable for both smoke and/or flame spread in a plenum or a riser. Only plenum rated cables are allowed to be used in a plenum rated raceway, etc. See Section 770-53.
At no time are these raceways permitted to have electrical conductors installed inside them. Optical Fiber/Communication Raceways are used strictly for cable management for Optical Fiber/Communication cables. These cables can be installed in the same application without the use of either metal or nonmetallic raceways.
PANEL ACTION: Reject.
PANEL STATEMENT: With the rejection of this comment, the panel notes that this action also rejects Proposal 15-15.
The last paragraph of the substantiation is false. Sections 770-5(c) and -52 specifically refer to optical fiber cables which are conductive but not designed for carrying electrical current and composite, which include current carrying electrical conductors (required to be classified in accordance with the type of electrical conductor). While an initial installation may not include either of these types, there is no way to guarantee that they wouldn't be added in the future. Therefore, the type of raceway allowed must be compatible with any of the types of optical cable which may be installed.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
NEGATIVE: 1
NOT RETURNED: 1 Kalbfeld
EXPLANATION OF NEGATIVE:
HIRSCHLER: I oppose the action by the panel. This comment should have been accepted or accepted in part. Section 518-4(a) permits, by exception, fixed wiring methods listed for
a. Audio signal processing, amplification, and reproduction equipment, by Article 640
b. Communications circuits, by Article 800
c. Class 2 and Class 3 remote-control and signaling circuits, by Article 725
d. Fire alarm circuits, by Article 760
The rejection of optical fiber cables and raceways, listed by Article 770, based on the flimsy excuse that such raceways contain nonmetallic raceways (as stated in the substantiation in accepted comment 15-31) or that they may contain electrical conductors (as stated in the panel statement for rejected comment 15-33) is representative of an ingrained prejudice by panel members. The action ignores the fact that it was pointed out repeatedly to the panel that, for consistency' sake: (a) wiring methods per articles 640, 800, 725 and 760 (all permitted) also contain electrical conductors, (b) the panel could have accepted only those optical fiber cables that contain no electrical conductors, (c) the panel could have accepted only those optical fiber cables that are not associated with non metallic raceways and (d) the panel could have restricted the use of optical fiber cables to those meeting plenum cable requirements (which would then have to meet much better fire performance requirements than the other wiring methods). During the panel deliberations I made a motion that the comment be accepted in part in principle by restricting the acceptance to those optical fiber systems listed by Article 770 and which do not contain electrical conductors, do not contain nonmetallic raceways and are listed for use in plenums; there was no second to the motion. The fact that the panel was unwilling to consider any of those alternatives clearly indicates either a lack of understanding of wiring methods or a prejudice against plastic materials.

(Log #1566)

15- 34 - (518-4(a), Exception): Accept
SUBMITTER: Steven R. Terry, Production Arts Lighting Inc.
COMMENT ON PROPOSAL NO: 15-15
RECOMMENDATION: The reference to optical fiber cables and Article 770 should be deleted - the proposal should be rejected.
SUBSTANTIATION: The proposal suggests that the use of certain nonmetallic raceways is acceptable for fiber optic installation in places of public assembly. The placement of the proposal in 518-4(a) allows the use of a nonmetallic wiring method without any restriction. The allowance of other nonmetallic methods in Places of Assembly is covered in Section 518-4(c), which limits the use of such methods to spaces with a finish rating. The Code Panel has previously ruled on numerous occasions that the introduction of nonmetallic wiring methods into Article 518 venues without a finish rating for protection is not acceptable. This proposal should be rejected, for all the reasons that the panel has rejected such nonmetallic wiring methods in the past for use in places of public assembly without a finish rating.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #1826)

15- 37 - (518-4(b) & (c)): Reject
SUBMITTER: Marshall A. Klein, Marshall A. Klein & Assoc., Inc.
COMMENT ON PROPOSAL NO: 15-17
RECOMMENDATION: Accept original proposal.
SUBSTANTIATION: (Please note that this is the identical issue covered under ROP Code Proposal 15-34-(522-5(a) and (c)) (Log #3246)).

We would like to address the Panel's Statements for rejection. (Panel's Statements are italicized, our responses are not).

"The fire hazard assessment presented does not address a realistic heat input into the NM cable.

Our comments: The Sullivan Report, on page 9, Section 1.4.2 noted that the heat input for the Cone Calorimeter Test for both ENT and the NM Cable was $5kW/m^2$. The original "Fire Hazard Analysis; The Use of ENMT" that was submitted with the 1987 NEC TCR Code Proposal 8-49 (including the 1987 NEC TCD 8-32 and 8-32A) to remove the three story limit for ENMT used the same heat input of $5kW/m^2$. This was noted on the original submitted report on Part B, Section 1.0 first paragraph. Both these reports were submitted to Panel 15 as part of the substantiation for this Code Proposal. Why would this heat input be adequate for ENT's approval, but NOT for NM Cable? Seems like a double standard? The heat input from both reports was used only to determine when ENT and NM Cable start to decompose (which is at 347°F). This information was input into the fire model so the fire model knew when to terminate its evaluation of the performance of the wiring methods within the ceiling and wall spaces. When the fire model reached the decomposition temperature of the PVC material (ENT and NM Cable), the fire modeling could terminate. In fact, the Sullivan Fire Modeling actually used a much lower termination temperature to provide very conservative results (error on the side of safety). Instead of using 347°F, Sullivan used the maximum electrical rating of the conductors, 194°F, as the termination point for the fire modeling. Sullivan had a safety factor of 153°F under the actual decomposition temperature of the ENT and NM Cable. Therefore, this part of the Panel's Statement is irrelevant to the acceptance of this code proposal.

"NM cable is made of plasticized PVC and not rigid PVC, it is not required to be highly fire retarded and would ignite under conditions of fairly low heat input generating a significant amount of heat and potentially spreading the flame beyond the area of origin. Electrical nonmetallic tubing and rigid nonmetallic conduit are made of rigid PVC, which will not ignite unless an intense heat source is applied and continues to be imposed on the raceway and that is why they are permitted in this section."

Our comments: The Code Calorimeter Tests show the plasticized PVC as well as rigid PVC will decompose at the same temperature, which is logical, since they are both plastics. Electrical wiring methods in concealed spaces, based on NFPA Fire Data submitted to Panel 7, are not a major source of flame spread in properly firestopped and draftstopped spaces. Both the NEC and the Model Building Codes provide stringent firestopping/draftstopping requirements to be followed for installing electrical wiring through walls and floor spaces. The 15 minute finish rating was imposed on ENT back in 1985 addressing the concern for fires outside the concealed spaces that cover the wiring system, not for the concern with a fire within the concealed space. Such a fire within the concealed space is a very rare occurrence based on actual fire data.

"Support documentation addresses flammability and toxicity issues as they relate to survivability. However, another issue is protection of the conductors so they don't become the source of ignition."

Our comments: Nonmetallic-sheathed cable does not present an ignition source problem. It has been well documented in recent years that nonmetallic-sheathed cable does not present an ignition source problem. NFPA 921, "Guide for Fire and Explosion Investigation" makes it clear that electrical conductors, including nonmetallic-sheathed cable, are not common sources of ignition. Fire data supports this conclusion. See NFPA 921-98, Sections 14-11.4, 14-11.5, A-14-11.4, and Appendix B on referenced publications.

"Section 336-6(b) doesn't allow for this - it states "The cable shall be protected from physical damage where necessary..." - this proposal would negate that requirement. The thermal barrier required for ENT and RNMC does not necessarily provide this physical protection."

Our comments: Section 336-6 "Exposed Work", provide the requirements for the use of NM Cable when used outside of walls and ceilings. That's why it is entitled "Exposed "Work". This code proposal would not negate Section 336-6(b). Section 336-6(b) was never intended to be applicable, and has never been applied, to NM Cable installed inside concealed spaces. If this code proposal is accepted, all the other installation requirements under Article 336, Part B, "Installation" would still be applicable to NM Cable installed under this code proposal.

In summation, the Panel's Statement contains comments of questionable technical merit when compared to the technical substantiation provided with the original code proposal. We would hope the Panel revisits this issue and accepts this code proposal based on its technical merits.
PANEL ACTION: Reject.
PANEL STATEMENT: Type NM cable does not equal or exceed the fire safety of wiring methods already allowed. The information provided in the comments of 2002 NEC ROP 7-145, page 486 more than document enough reasons to not allow the usage of Type NM cable is places of public assembly.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
ABSTENTION: 1
NOT RETURNED: 1 Kalbfeld
COMMENT ON AFFIRMATIVE:
KLEIN: 1. The commentor refers to 333-6 "Exposed Work" for when NM Cable is used outside of walls and ceilings. In many of these "518" venues, there is no wiring system that could be considered as not exposed - being behind a wall or a ceiling does not constitute non-exposure. In the tour many of the panel members took of the Phoenix Civic Plaza (a large Convention Center adjacent to the panel meetings), the conduit on the "back side" of a ceiling in one of the exhibit halls we toured was exposed with 15 ft clear to the building structure. This space was a working area containing numerous catwalks for access to control areas and mounting of specialty lumniaires (lighting fixtures).
VANNICE: See my Comment on Affirmative on Comment 15-24.
It appears that in Article 336, Code-Making Panel 7 rejected all attempts to expand the use of NM cable. They must have concerns that we should be aware of.
EXPLANATION OF ABSTENTION:
BOYER: See my Explanation of Abstention on Comment 15-25.

(Log #1827)

15- 38 - (518-4(b) and (c)): Reject
SUBMITTER: Marshall A. Klein, Marshall A. Klein & Assoc., Inc.
COMMENT ON PROPOSAL NO: 15-17
RECOMMENDATION: Revise text as follows:
518-4 Wiring Methods
(a) (No changes)
(b) Nonrated Types of Construction. Nonmetallic-sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid non-metallic conduit shall be permitted to be installed in those buildings or portions thereof that are not required to be of a fire-rated type of construction classification by the applicable building code.
FPN: Types of non ~~F~~fire-rate construction classifications are described ~~in the fire resistive classification used~~ in building codes.
SUBSTANTIATION: (Please note that this is the identical issue covered under ROP Code Proposal 15-34-(522-5(a) and (c)) (Log #3246).

Based on the Panel Statement on our original code proposal, we have submitted two separate comments to address our concern on how this Section of Code reads in the existing Code vs. how this restriction is unwarranted for NM Cable.

As additional information for this Panel to consider when reviewing this comment, the NEC NM Task Group at its August 27-30, 200o, meeting confirmed with UL's representative on the Task Group, Mr. Tom Guida, that electrical wiring installed within a fire-rated wall or ceiling does not have any impact on the integrity of the fire rating of the wall or ceiling (Enclosure 4 of the August 2000 Meeting Minutes Question #11 and Answer). As also noted in the minutes of this Task

Group, under Item 00-8-4C, "Review of UL Information", Chairman Trainer had a phone conversation with Mr. Walke of UL that confirmed Mr. Guida's answer on this issue.

This code comment follows-up on the vague and ambiguous wording of 518-4(b). The Panel did not answer our questions on the original intent of 518-4(b) which were:

1. Is the intent of this section to prohibit the use of wiring methods listed in 518-4(b) in buildings that are of "fire rated" construction type classifications such a 5A (One Hour Protected Wood Frame), 3A (Protected Ordinary), 2A/2B (Protected Noncombustible), or 1A/1B (Fire Resistive) under the Model Building Codes?
2. Is the intent of this section to allow the use of wiring methods listed in 518-4(b) in buildings that are of "non-fire rated" construction type classifications such as 5B (Unprotected Wood Frame), 3B (Unprotected Ordinary), or 2C (Unprotected Noncombustible)?
3. Is the intent of this section to allow the use of wiring methods listed in 518-4(b) in nonfire rated walls of buildings that are of "fire rated" construction type classifications such as 5A (One Hour Protected Wood Frame), 3A (Protected Ordinary), 2A/2B (Protected Noncombustible), or 1A/1B (Fire Resistive) under the Model Building Codes?
4. Is the intent of this section to prohibit the use of wiring methods listed in 518-4(b) in fire rated walls in buildings that are of "non-fire rated" construction type classifications such as 5B (Unprotected Wood Frame), 3B (Unprotected Ordinary), or 2C (Unprotected Noncombustible)?

Questions #1 and #2 relate to the wiring methods allowed or prohibited for a building, whereas questions #3 and #4 relate to wiring methods in individual walls in a building. By sprinklering a building, the building's wall ratings can be reduced from one hour down to "0" fire rating. Such sprinkler allowances are permitted in all types of building construction types, regardless of fire rated or non-fire rated building construction types.

We noted in my substantiation of our original code proposal that the Electrical Code Handbook's commentary on page 672 is even more confusing trying to explain this bizarre restriction where one side of a storage room can use one type of wiring, but the other side of the storage room adjoining the corridor cannot. If the Figure 518-2 on page 672 was in a sprinklered building of a fire rated construction type classification, all the double lined walls shown as fire rated walls would be permitted to be non-fire rated walls. Therefore, does the building's overall construction type classification govern the application of Section 518-4(a), or does the wiring method only depend on the fire rating of the building element assembly (wall, floor, column, etc.) the wires are located in?

If the application of Section 518-4(b) is intended to apply to non-fire rated types of construction, then I could have the "lesser fire resistant" wiring in non-fire rated walls, and the "better fire resistant" wiring in the fire rated walls. From a fire protection/life safety standpoint, would this be "backwards"? Therefore, the only logical application of Section 518-4(b) would be in buildings of non-fire rated type of construction.

In summary, if the Panel still insists on limiting the use of the wiring methods in Section 518-4(b), such limitation only makes sense when it is related to the construction classification of the building as a whole, not to fire rated building elements in an otherwise non-fire rated construction classification type of building. If the Panel agrees with this understanding of the intent and application of this section of the Code, the revised wording will accomplish this in a clear and unambiguous manner.

PANEL ACTION: Reject.

PANEL STATEMENT: The existing wording clearly identifies the intent of CMP-15. Some of the assertions on building classification and derating by using sprinklers are not accurate. Some building classifications that require sprinklers are not allowed to be derated because of the occupancy.

COMMENT ON AFFIRMATIVE:

HIRSCHLER: I am concerned that the panel did not seem to appreciate that there is a lack of clarity that was identified by the submitter. I agree with the panel action, but I feel that some change in wording is probably required, and would have hoped for some guidance in the panel statement.

VANNICE: See my Comment on Affirmative on Comment 15-37.

(Log #1837)

15- 39 - (518-4(b) and (c)): Reject

SUBMITTER: Patricia Horton, Elaine Thompson, Allied Tube & Conduit

COMMENT ON PROPOSAL NO: 15-16

RECOMMENDATION: Accept this proposal in part by deleting 518-4(b) as suggested by the proponent. Do not accept the other proposed changes.

SUBSTANTIATION: The proponent has raised sufficient questions to warrant deletion of this section until the next code cycle would permit development of text that responds to these questions. Many changes have occurred in the International Building Code that have not necessarily been correlated with the intent of Article 518. Fire ratings of assemblies have been lowered in exchange for sprinklers. Often these sprinkler systems are permitted to be other than a full NFPA 13 system, and would not require concealed spaces to have sprinklers. As clarified by the Code-Making Panel in Proposal 11-a, if the area or building is designed or intended to be occupied by 100 or more persons the safer wiring methods need to be employed. For buildings and structures that do not meet the 100 person criteria, Articles 336, 331, 333 and 347 will regulate the use of NM cable and ENT. It is also important to note that buildings are frequently built outside of the jurisdictional limits of a building code and only later annexed into the jurisdiction. The wiring method will already be in place. Electrical wiring can be a source of ignition and is primarily located in concealed spaces. The section proposed to be deleted could have a safety impact where the NEC is used and a Building Code is not. The Beverly Hills Supper Club is a perfect example of the hazard that could occur if hundreds of people were gathered in such a building with overhead spaces loaded with NM cable. This section is not needed. Comments to 7-145 by the 3-story Task Group, and comments by others, detail why N/M cable is not equivalent to currently permitted wiring methods. In the interest of space, readers of the ROC are referred to these comments. The comments and back-up documentation have been supplied to CMP 15. The Panel's attention is called particularly to the fire characteristics contained in the documentation, and the concern for fires originating in concealed spaces where NM cable can be a source of ignition with delayed detection.

Note: Supporting Material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: There is no justification for eliminating Section 518-4(b) which are acceptable wiring methods for this article. Proposal 15-16 remains rejected.

15- 40 - (518-4(c)): Accept

SUBMITTER: Technical Correlating Committee National Electrical Code

COMMENT ON PROPOSAL NO: 15-18

RECOMMENDATION: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.

SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.

PANEL ACTION: Accept.

PANEL STATEMENT: Reject the proposal. The substantiation does not provide technical merit or data to expand the uses already permitted. Refer to the panel statement in Proposal 15-41.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

NEGATIVE: 3

NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

AMOS: I'm voting against the panel action on this proposal. The Technical Correlating Committee obviously recognized the validity of the negative comments and asked the panel to reconsider the action to reject proposal 15-18. The panel accepted the Technical Correlating Committee recommendation but failed to overturn their original rejection. The panel statement said in part, "the substantiation does not provide technical merit". However, the panel did not provide any substantiation of its own for not accepting the original proposal. There have been countless examples provided by Dr. Hirschler both in his negative comment and at the panel meeting, sighting a number of statistics showing the long history of its safe use. Nonmetallic tubing and rigid nonmetallic conduit is already allowed in a myriad of locations that meet the same criteria as the submitter suggests. There are no statistical reasons for not allowing this product and the panel, does not provide any technical data to support not expanding its use".

HIRSCHLER: I oppose the action by the panel. This comment should have referred to action on accept of comment 15-41. I will reproduce my own comments on proposal 15-18, which the Technical Correlating Committee demanded should be further considered (together with those by the other dissenters: Peter Amos and Michael Glenn).

Marcelo Hirschler comment on opposition to panel action on rejecting proposal 15-18: "No evidence exists of fire fatalities resulting from the use of electrical nonmetallic tubing (ENT) or rigid nonmetallic conduit (RNMC) protected by a wall with a 15 min finish rating. None of these wiring methods are new, they both have a long history of safe use: PVC conduits were introduced in the early 1960's and RNMC was first approved for use in the NEC in 1968, while ENT was first approved in the NEC in 1984.

Furthermore, the panel was already informed in previous cycles that (a) electrical cables installed within ENT can continue to function, when the ENT is installed in code-compliant fashion, even after a fire in the place of assembly has reached flashover; (b) ENT meets the physical property requirements of NEMA and UL for listing for this application, in terms of crushing resistance, impact resistance and tensile and (c) both ENT and RNMC have been safely used for 9 years in the Reedy Creek Improvement District {by now a longer period}. It has also been shown earlier that the use of nonmetallic raceways (electrical nonmetallic tubing (ENT) and rigid nonmetallic conduit (RNMC)) in the occupancies allowed by the code, with the protection required by the code, does not introduce any significant additional hazard to the occupants, or hinder escape in any way. In all the occupancies mentioned in the code there is extra protection, in terms of means of egress, already provided by the model building codes.

Moreover, the fire load (as represented by the combustible materials and products in the room) in places of assembly includes seating for the attendance (which is intended for 100 or more persons). Thus, it is likely that at least 5,000 pounds (100 times a 50 pound seat) of combustible material, of high flammability (since there are no mandatory requirements of fire performance of seating), is present in the assembly room. The fire resulting from ignition of this mass of combustibles vastly exceeds the potential contribution of a few pounds of non metallic conduit installed behind a half inch gypsum board wall.

The standard material used in ENT and in RNMC is unplasticized poly(vinyl chloride) (unplasticized PVC), which is of very low combustibility. In fact, unplasticized PVC will only burn when subjected to intense heat or flame and will cease burning as soon as the source of heat or flame is withdrawn from its vicinity. In terms of fire hazard, the key question is: "How big is the fire?" The answer is given by the maximum heat release rate. A burning object will spread a fire to nearby products only if it gives off enough heat to ignite them. Moreover, the heat has to be released fast enough not to be dissipated or lost while traveling through the cold air surrounding anything not on fire. The rate of heat release has been shown to be much more important than either ease of ignition, smoke toxicity or flame spread in controlling the time available for potential victims of a fire to escape. The maximum rate of heat released by unplasticized PVC when it burns is smaller than that of almost any nonmetallic material, and is indistinguishable from the heat released by the ignition source itself in many cases. The addition of PVC rigid nonmetallic conduit and electrical nonmetallic conduit in concealed spaces does not add any significant fire hazard to such spaces, due to the excellent fire performance of PVC and the good history of safe use of the product.

It is informative to compare the rate of heat release of unplasticized PVC (material used to make electrical nonmetallic tubing or rigid nonmetallic conduit) with that of the polyurethane foam typically used as the resilient material in an auditorium seat (when considering equal areas):

Product	Conduit PVC	Chair Polyurethane Foam
Incident Heat Flux: 20 kW/m^2		
Peak rate of heat release	50-100 kW/m^2	250-300 kW/m^2
Incident Heat Flux: 40 kW/m^2		
Peak rate of heat release	120-180 kW/m^2	700-750 kW/m^2
Weight of Products	0.1 - 0.2 pounds per foot of raceway	50-100 pounds per seat

This proposal should have been approved, or at least approved in part if the panel believes that there is a specific hazard associated with one or more of the additional uses proposed. The panel statement is inadequate: the panel should have justified why each individual additional occupancy recommended for permitted use of ENMT and RMC is inappropriate for such use. For example it is unclear what additional hazard is associated with university classrooms that is not inherent on other meeting rooms."

The proposal recommended adding a number of applications for use of nonmetallic raceways: club rooms, college classrooms, university classrooms, courtrooms, drinking establishments, mortuary chapels, museums, passenger stations, terminals of air, surface, underground and marine public transportation facilities, libraries and places of religious worship. The proposal had an extensive technical substantiation, and additional information was presented to the panel in this and earlier cycles. The panel rejected the proposal with the simple statement: "The substantiation does not provide technical merit or data to expand the uses already permitted." The panel statement for the Technical Correlating Committee comment says "the substantiation does not provide technical merit or data to expand the uses already permitted". However, in none of the cases does the panel address any of the individual occupancies for which the proposal is asking for an expanded use of nonmetallic raceway. If the panel was concerned, as stated during the discussion, about lack of fire safety in one or more of the occupancies suggested, it should have addressed the specific occupancy involved. If the panel was concerned, as also stated during the discussion, about the physical or mechanical integrity of the wiring methods, it should have stated that. Instead the panel exhibited, once more, either lack of understanding or lack of willingness to understand "new" technologies, even if they have long histories of safe use. See also my comments on comment 15-41.

JOHNSON: I agree with the reasoning expressed in the voting on the original proposal. An unprejudiced study of the material supplied, and there were dozens of pages of it, shows that all things considered the record shows no loss of life because electrical nonmetallic tubing (ENT) or rigid nonmetallic conduit (RNMC) was used. Failures occur because the insulation on wire inside the conduit fails, not because the conduit fails. Nonmetallic conduit does not burn or melt readily. Indeed, since it is an insulator of heat, the insulation inside the conduit may hold up longer in a fire and breakdown of the insulation between the conductor and conduit cannot cause a failure. No other testing is needed.

(Log #1601)

15- 41 - (518-4(c)): Reject

SUBMITTER: James K. Lathrop, Koffel Assoc., Inc.

COMMENT ON PROPOSAL NO: 15-18

RECOMMENDATION: Accept proposal as originally submitted.

SUBSTANTIATION: The panel has not provided adequate justification to reject the proposal. NFPA regulations mandate that any rejection must include a panel statement that address the issues provided in the submitter's original substantiation. The failure of the panel to do this makes it difficult to rebut the panel's reasons since no technical reasons for the rejection were provided.

As stated in the original proposal, there is no justification to prohibit the use of electrical nonmetallic tubing and rigid nonmetallic conduit in the additional uses lists. The NFPA 101, Life Safety Code that is charged with the protection of life against fire in buildings does not establish any different requirements amongst these types of assembly occupancies. In fact, the scope of the Technical Correlating Committee on Safety to Life establishes that Committee as the Committee to have primary responsibility for documents on the protection of human life from fire and other circumstances capable of producing similar consequences. The Technical Committee on Assembly Occupancies and Membrane Structures is established as the

Committee having primary responsibility for documents on protection of human life from fire and other circumstances capable of producing similar consequences in assembly occupancies. Due to the fact that the Life Safety Code does not have different requirements for the uses listed, the NEC should justify the differences based on electrical safety. It has not done so. Recognizing that the NEC is also usually used with a building code, it should be noted that the International Building Code (IBC) developed by all three model building code organizations in the United States breaks assembly occupancies into five groups, A-1 through A-5. Of those five groups the current list n 518-4(c) involves two, A-2 and A-3. Since the IBC does not establish different requirements within a use category and uses in both A-2 and A-3 are currently allowed by the NEC, it makes no sense not to allow the additional uses specified. Similarly, the new NFPA 5000 will use occupancies based on NFPA 101. It will make no sense for the NEC to be out of sync with both NFPA 5000 and NFPA 101 as well as the IBC.

None of the additional uses present any hazard to life due to electrical installations greater than those already on the list do. Not adding these to the list in 518-4(c) actually extends the prohibition without substantiation.

Without any historical or research data to validate their action, the panel has consistently rejected logical expansion of the list of uses where ENT and RNMC are permitted for assembly occupancies. ENT and RNMC are permitted wiring methods in high-rise buildings; residential occupancies, including board and care facilities; health care facilities; and detention and correctional occupancies. Clearly if they can be used in these occupancies, many of which are defend in place occupancies, fire, smoke, and toxicity is not an issue. In these occupancies the fire history has been improving over the last several years. Since the mid-1980's the fire history in these occupancies, where ENT and RNMC are permitted, has improved consistently with other occupancies. Graphs (copies provided) based on NFPA data reflecting fire history for fixed wiring fires in occupancies were ENT and RNMC have been permitted for several years and occupancies where it has not. "Libraries, Museums, and Court Room Buildings." "Passenger Terminals," and "Theaters and Studios" represent that group where ENT has not been permitted in rated construction. There is noting in this data that can be used to condemn the use of ENT or RNMC. In most of the cases the numbers are so low that even one fire often skews the data. It should be noted that the dollar loss data is not adjusted for inflation and therefore small increases are actually decreases if one compensates for inflation. There is nothing in this data that supports the prohibition of ENT or RNMC even in uses that are not addressed by the proposal this comment supports.

ENT and RNMC have been used for decades with and without the 15-minute finish rating. In today's very litigious society if there were any injuries or deaths or serious fires in which ENT played a role, the manufacturer would be quickly aware of it. Carlon is not aware of any such cases. There is no justification, by analysis, by data, by litigation or by case law for the prohibitions that the panel keeps insisting upon.

A review of previous panel substantiations for not permitting ENT or RNMC in similar applications has not revealed any technical rational for the prohibition. The rejection of Proposal 15-29 during the last code cycle was based on a substantiation that lacked any technical merit. Electrical wiring methods do not behave differently because they are in assembly occupancy. Most other occupancies can have many more than 100 people in them and ENT or RNMC is permitted. The Life Safety Code and the model building codes address the problems of people being unfamiliar with their surroundings, which is a key element in assembly occupancies. There is no valid reason to prohibit ENT or RNMC in the proposed listed uses.

We also bring the Panel's attention to the negative ballot comments by Mr. Amos, Mr. Glenn and Mr. Hirshler. We incorporate those comments by reference and therefore request the panel address the technical points presented in these ballot comments.

Note: Supporting material available for review upon request at NFPA headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The technical merits have not been shown to be equal to or greater than the existing wiring methods. The statistics and lack of supporting source data for the graphs provided did not provide a compelling reason to change the original panel action on the proposal. Specifically, there are no percentages shown as to the ratios of plastic wiring methods versus metallic wiring methods. In addition, no statistics were provided for current wiring methods in places of assembly. Refer to the panel statement of Proposal 15-11.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14
NEGATIVE: 3
ABSTENTION: 1
NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

GLENN: I am voting against the panel action to reject the original Proposal 15-18 as well as Comment 15-41. As stated in my comment against the panel action to reject 15-18 Log #3228 during the ROP stage, the panel's original statement that the substantiation does not provide technical merit or data to expand the use of ENT and RNMC to these other venues does not follow good reason. The submitter's original substantiation of the NFPA Annual Fire Loss Report showed that in the locations where ENT and RNMC are now used that there has been a decrease not an increase in fires. For the applications of this article, these materials would require a covering of 2 inches of concrete or location behind a fire rated wall. Furthermore, ENT and RNMC are listed for these types of applications. During the comment stage, the submitter supplied 27 pages of graphs documenting the statistics of the number of fires and injuries supporting the successful record of ENT and RNMC from 1980 through 1997. The submitter has more than substantiated and documented that this material is as good as the cable now allowed. The panel statement "the technical merits have not been shown to be equal to or greater than the existing wiring methods." is incorrect. All of the substantiation more than documented that this material is equal to MI cable. It appears to me that the panel keeps thinking that everything has to be equal to rigid conduit and this is not the case. If this material is not allowed, then some of the materials now permitted should be eliminated as well. I see no good reason for rejecting neither the original proposal nor the supporting documentation submitted during the comment cycle.

HIRSCHLER: I oppose the action by the panel. This comment should have been accepted.

The panel statement incredibly says that the statistics and lack of supporting source for the graphs "did not provide a compelling reason to change the original action". For the information of the readers: the submitter presented 28 graphs "based on NFPA data" (as stated in the substantiation, meaning that they were generated by the NFPA department of statistics). The graphs presented data on fire losses caused by fixed wiring fires. The information addressed number of fires, number of fire deaths, number of fire injuries, and amount of dollar losses in seven types of occupancies: office buildings, hotels and motels, apartments, theaters and studios, passenger terminals, eating and drinking establishments, and libraries, museums, and court room buildings. In each case, data was presented for "protected construction" and for "unprotected construction".

The following Table shows just the fire death data, but 4 such tables could have been constructed with the data provided. The data clearly indicates that fire losses caused by ignition of fixed wiring are minimal, and that there is no statistical significant difference between the various occupancies, some of which permit the use of nonmetallic raceways and some of which do not.

INSERT TABLE HERE Landscaped Table of Fire Fatality Fire Data from NFPA **See Table on following page.**

Table of Fire Fatality Data from NFPA Caused by Fixed Wiring Fires in Various Occupancies

Year	Fixed Wiring Fires # Fire Deaths Protected Construct-ion Office Buildings.	Fixed Wiring Fires # Fire Deaths Unprotected Construction Office Buildings. 1987	0	0	0	0	0	13	0	0	0	0	0	0	0	2
1988	0	0	0	0	13	9	0	0	0	0	0	0	0	0
1989	0	0	0	0	7	9	0	0	0	0	0	0	0	0
1990	0	0	0	0	9	11	0	0	0	0	0	0	0	0
1991	0	0	0	0	0	3	0	0	0	0	0	0	0	0
1992	0	0	0	0	0	6	0	0	0	0	0	0	0	0
1993	0	0	0	0	3	0	0	0	0	0	0	0	0	0
1994	0	0	0	0	4	8	0	0	0	0	1	0	0	0
1995	0	0	0	0	0	0	0	0	0	0	0	0	0	0
1996	0	0	0	0	3	4	0	0	0	0	0	0	0	0
1997	0	0	0	0	9	0	0	0	0	0	0	0	0	0

The panel statement also, again incredibly, states that "no statistics were provided for current wiring methods in places of assembly" when clearly theaters and studios, passenger terminals, eating and drinking establishments, and libraries, museums, and court room buildings are all places of assembly, according to Article 518.

Once more, the panel refused to address any of the individual occupancies requested. See also my comments on comment 15-40.

JOHNSON: See my Explanation of Negative Vote on Comment 15-40.

COMMENT ON AFFIRMATIVE:

KLEIN: 1. There are numerous problems with the Commentor's substantiation that are not addressed by the Panel statement, some of which were discussed during the Panel's deliberations, some of which were not.

2. In one part of the commentor's substantiation, he states that: "...ENT and RNMC are permitted wiring methods in...health care facilities;...". This is not an accurate statement, and in fact is misleading. Such methods are permitted in some areas of health care facilities, such as corridors and offices. But in Patient Care Areas, which is just about everywhere else, metal conduit or raceways are required, and a separate (isolated) ground is also required (517-13). Exceptions are allowed, but do not include allowing ENT or RNMC.

3. Part of the substantiation refers to a set of graphs. These graphs "based on NFPA data reflecting fire history for fixed wiring fires" are unclear in several ways. First, there was no backup material provided for the data. None of it can be correlated to the data in the NFPA "Fire Loss in the U.S. 1999" report or associated with any of the other reports available through NFPA's Web Site (except possibly a customized report which we have not been presented). The graphs titled: "Fixed Wiring Fires" are unclear as to the source of ignition. Is the title as stated because the fire started in the wiring or because the fire involved the fixed wiring?

4. The graphs refer to "Unprotected Construction" and "Protected Construction" but does not define these terms. In view of the topic (518-4) being addressed, these terms probably refer to fire rated or non-fire rated construction. However, if this is not the case, we have another area where the data presented may not be pertinent, or properly address the situation. Also, the graphs are presented on different scales, so a quick review may be misleading. Are we dealing with absolute numbers , or "per capita" data.

5. Examining the graphs, it appears the commentor's argument fails for expanded use of ENT or RNMC as it is clear that theaters and studios, where only metal conduit is allowed, fare much better than other spaces, in particular with respect to injury or death. How can such an examination support the use of non-metallic conduit in theaters and studios, as there can be no data to support the case? Examining the graphs on the basis of fire rated or non-fire rated construction does appear to show that fire rated construction is actually more prone to fire in most cases, which is somewhat counter-intuitive. Also, if construction type is the criteria, how do we know what portion of the occupancies where both types of conduit are allowed is metal conduit or nonmetallic conduit? There are at least four variables, but only two are presented.

6. What also isn't reported is the cause of death or injury. Is the cause fire related or due to electrical shock? Did a person die because they were shocked, but couldn't get out and ultimately succumbed to fire and smoke? Part of the Code's purpose is the "practical safeguarding of persons and property from hazards arising from the use of electricity." One of these hazards is electrical shock. Fire and toxicity are also hazards, which the panel cannot ignore. The commentor would have us only address electrical shock (but does not address this himself) and does not worry about these other issues.

7. The commentor (and other proponents) most often address the issue of toxicity with respect to nonmetallic conduit. One often stated example is that the toxicity of such materials should not be an issue because the content of theater seats is much more toxic than nonmetallic conduit. However, it is unlikely that an electrical fire will start in a seat, but it can start in the conduit. What they have failed to address is the shock hazard. The data presented in the proposal phase of this cycle and the comment phase of the previous cycle tried to show that the mechanical strength of certain nonmetallic conduits is greater than metal conduit. Failure of the conduits was identified by a short in the wiring. However, the wiring method used in the nonmetallic conduit - twisting the conductors to ensure the grounding conductor is involved and a short occurs with a failure - does not reflect a real world installation. So, in the cases, where a nonmetallic conduit does fail even at a higher level of mechanical damage than the corresponding metal conduit, there is a very low probability that there will be a short to the grounding conductor which in turn would activate the overcurrent protection and thus eliminate the shock hazard and the risk of ignition within the nonmetallic conduit. With metal conduit, there is a very high probability that a fault will result in a short to ground and overcurrent protection activation.

8. A real world example: An exhibit in a lobby of a theater or convention center with large objects hung on a wall for display. A nail gun or a toggle bolt is used, the stud is missed, and the conduit and a hot conductor are penetrated. In the case of metal conduit, the hot conductor is shorted to ground via the nail or toggle bolt and the metal conduit. For nonmetallic conduit, unless the grounding conductor is also penetrated, the nail or toggle bolt is electrically hot, presenting a shock hazard outside the wall (no matter its rating). Depending on the involvement of other conductors, a "roasting short" could be initiated which could lead to fire.

KRAMER: In proposal 15-18 it was claimed "there is no justification to prohibit the use of electrical nonmetallic tubing and rigid nonmetallic conduit in the additional uses lists." It is also repeated in this comment. Currently, club rooms, college and university classrooms, courtrooms, drinking establishments, mortuary chapels, museums, passenger stations and terminals of air, surface, underground, and marine public transportation facilities and libraries are not part of 518-4(c) and as such, justification is not needed to leave the code unchanged.

Part of the substantiation refers to the use of RNMC and ENT in health care facilities, but in some uses, metallic raceway or type MI are exclusively required.

The fact that ENT and RNMC are allowed in health care, detention and correction facilities, which are 'defend in place' occupancies, is not germane to places of assemblies, many of which have large transient populations who are not familiar with the lay-out of the facility. The ratio of staff (guard, nurse, waiter) to client (inmate, patient, customer) is also much higher in the non-places of assembly.

There are also some unique characteristics in some of the proposed additional occupancies. Some of them may be quite large with electrical panels located several hundred feet apart. In these instances, conduit runs of over 100 feet could be installed. As the distance to the panel with the circuit protective device in it increases, the impedance of a circuit in a fault condition becomes critical. It has been shown (A. P. S. Meliopoulos, et al., Performance Evaluation of Steel-Conduit-Enclosed Power Systems, IEEE trans. Ind. Applicat., Vol. 35, No. 3, May/June 1999, pp 515-523) that in a metallic conduit system (due to the saturation of the steel conduit), the length of the circuit can be longer and still allow operation of the protective devices than an installation using a nonmetallic conduit with the same sized wires.

LANNI: Article 518 NEC exists because of the history of large losses of life in places of assembly. This is due to panic and mob-like reactions of people in crowded spaces. Since its inception the NEC committees over the years have chosen metal raceways in order to provide maximum integrity to the permanent wiring systems of Article 518. As metal raceways have been the standard, newer methods have been compared to them in an effort not to diminish safety in any way. When comparing plastic raceways to metal raceways (as they relate to mechanical strength, flammability, toxicity, smoke production, and other performance issues), it has been observed that the metal raceways are superior. Consideration has always been given to the overall characteristics of the raceways instead of one particular aspect or property. Anyone who has burned or cut PVC conduit knows how it smells and smokes or how easily it shears.

Although the plastic raceways are relatively safe, it is impossible to judge what exact level of safety is allowable in the sensitive area of places of assembly. NFPA relies on the broad experience of its committees and the professional organizations that they represent to judge the merits of the proposed changes to the code. The committee has been cautious and has decided on the side of safety. The result has been the consistent rejection of PVC plastic as a safe as, or safer method of raceway.

PVC performs well in corrosive atmospheres and will outperform metal raceways in that specific application.

VANNICE: See my Comment on Affirmative on Comment 15-24.

It is important to know what information has been left out as it is to know what information is included. Since the information presented is in support of a specific change in the Code, it does not contain a balanced analysis of both sides of the issue. I asked for details as to how the presented information was collected and received no viable answer. I have since reviewed the "1999 US Fire Loss" in the Sept./Oct. 2000 NFPA Journal including the statement at the end "Where we get our information". Knowing that the presented information was extracted directly from such articles in the manner described would have been more compelling. The actual source of the data should have been provided so that conditions and assumptions could be evaluated.

The supporting documentation indicates deaths and injuries due to fires. It does not indicate deaths and injuries due to non-fire electrical causes.

In one part of the commentor's substantiation he states that :

"...ENT and RNMC are permitted wiring methods in...health care facilities;...". This is not an accurate statement, and in fact is misleading. Such methods are permitted in some areas of health care facilities, such as corridors and offices. But in Patient Care Areas, which is just about everywhere else, metal raceways are required, and a separate (isolated) ground is also required (517-13). Exceptions are allowed, but do not include allowing ENT or RNMC. Generalizations tend to cover up important details.
EXPLANATION OF ABSTENTION:
BOYER: See my Explanation of Abstention on Comment 15-25.

(Log #1602)

15- 42 - (518-4(c)): Reject
SUBMITTER: James K. Lathrop, Koffel Assoc., Inc.
COMMENT ON PROPOSAL NO: 15-18
RECOMMENDATION: Revise 518-4(c) to read as follows:
(c) Spaces with Finish Rating. Electrical nonmetallic tubing and rigid nonmetallic conduit shall ~~be permitted to~~ not be installed in armories, exhibition halls, and gymnasiums, ~~conference and meeting rooms in hotels or motels, dining facilities, restaurants, and church chapels,~~. In other locations, it shall be permitted where
(1) The electrical nonmetallic tubing or rigid nonmetallic conduit is installed concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.
(2) The electrical nonmetallic tubing or rigid nonmetallic conduit is installed above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.
Electrical nonmetallic tubing and rigid nonmetallic conduit are not recognized for use in other space used for environmental air in accordance with Section 300-22(c).
FPN: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature rise of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.
SUBSTANTIATION: The panel continues to not provide adequate justification for the restrictions on ENT and RNMC in Article 518 above and beyond the general restrictions of the NEC. At the Panel ROP meeting it was suggested that the list should include where ENT and RNMC should not be used rather than where it can be used. The purpose of this comment is to incorporate that suggestion. Since the panel has been unable to develop a technical substantiation for the reason for the existing restrictions, we have included in the list those areas mentioned in the past as areas where the product could be exposed to physical damage. Although we may not concur with the restrictions, we believe the proposed list to be an attempt to reflect those areas mentioned at the ROP meeting and in prior discussions.
With this comment we include the supporting statement and data in our comment to 518-4(c) including the substantiation's for the negative ballot and request that the panel address the technical issues.
PANEL ACTION: Reject.
PANEL STATEMENT: There has been no substantiation or documentation shown to expand the use of ENT and RNMC into the additional occupancies. Based on physical considerations, armories, exhibition halls and gymnasiums are not the only venues that are inappropriate for these wiring methods.

ARTICLE 520 — THEATERS, AUDIENCE AREAS OF MOTION PICTURE AND TELEVISION STUDIOS, AND SIMILAR LOCATIONS

(Log #537)

15- 45 - (520 Title): Reject
SUBMITTER: Paul Petit, American Insulated Wire Corp.
COMMENT ON PROPOSAL NO: 15-20
RECOMMENDATION: "Performance Areas" should be deleted from the proposed text.
SUBSTANTIATION: Performance Areas mentioned in the proposal are normally outdoor performance areas which should be correctly covered by Article 525, which requires that the flexible cords and cables, when used outdoors, shall be listed for wet locations. Article 520 allows cables to be used outdoors, but does not mandate that they be listed for wet locations, (which it should). In that sense, Article 520 is not more stringent than Article 525. Unless this proposal is changed to mandate "wet locations cables", when these performance

areas (or other) are located outdoors, this proposal should correctly be rejected.
PANEL ACTION: Reject.
PANEL STATEMENT: The new verbiage is appropriate for the title.
Several proposals were made and accepted making it clear that theatrical type venues were managed and operated and used equipment differently than carnival type venues. This delineation affects much more equipment than just the cable . Article 400 already requires cable suitable for use and location. In Article 520 venues there are uses of cable "outdoors" which are not subject to sunlight and standing water. In Article 525 venues the cables are frequently subject to standing water, and are used day after day.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
NEGATIVE: 1
NOT RETURNED: 1 Kalbfeld
EXPLANATION OF NEGATIVE:
HIRSCHLER: I oppose the action by the panel. This comment should have been accepted in principle, with the following action, namely adding to 520-5 (a) a statement that "when used outdoors, flexible cords and cables shall also be listed for wet locations and be sunlight resistant". This is an example of a case where the panel chose not to consider safety issues. Clearly, when performances are held outdoors, inclement weather is a distinct possibility, and cables should be required to be suitable for use in wet locations or under intense sunlight.
COMMENT ON AFFIRMATIVE:
KLEIN: Performance areas are not normally outdoors. Article 400-3 requires all flexible cords and cables to be suitable for the conditions of use.

(Log #536)

15- 46 - (520-1): Reject
SUBMITTER: Paul Petit, American Insulated Wire Corp.
COMMENT ON PROPOSAL NO: 15-21
RECOMMENDATION: Proposed new wording "indoor or outdoor" should read "indoor" only. "or outdoor" should be deleted from the text.
SUBSTANTIATION: Article 520 allows for cables to be used outdoors but does not mandate that they be listed for wet locations. All cables used outdoors are subjected to wet locations, and should be covered under Article 525, which has such a provision. Until Article 520 mandates a wet location requirement for outdoor used cords, the "outdoor" reference should remain deleted from the text.
PANEL ACTION: Reject.
PANEL STATEMENT: Article 520 venues that are wet locations or that are subject to sunlight are already required to use wet location and sunlight resistant cable by Sections 400-3 and 110-11.

(Log #1828)

15- 48 - (520-5(a) & (c)): Reject
SUBMITTER: Marshall A. Klein, Marshall A. Klein & Assoc., Inc.
COMMENT ON PROPOSAL NO: 15-34
RECOMMENDATION: Revise text as follows:
~~522~~ 520-5 Wiring Methods
(a) & (b) (No changes)
(c) Nonrated Types of Construction. Nonmetallic-sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid non-metallic conduit shall be permitted to be installed in those buildings or portions thereof that are not required to be of a fire-rated type of construction classification by the applicable building code.
FPN: Types of nonfire-rated construction classifications are described in buildings codes.
SUBSTANTIATION: (Please note that this the identical issue covered under ROP Code Proposal 15-17-(518-4(b) and (c)) (Log #4098).
Based on the Panel Statement on our original code proposal, we have submitted two separate comments to address our concern on how this Section of Code reads in the existing Code vs. how this restriction is unwarranted for NM Cable.
As additional information for this Panel to consider when reviewing this comment, the NEC NM Task Group at its August 27-30, 200o, meeting confirmed with UL's representative on the Task Group, Mr. Tom Guida, that electrical wiring installed within a fire-rated wall or ceiling does not have any impact on the integrity of the fire rating of the wall or ceiling (Enclosure 4 of the August 2000 Meeting Minutes Question #11 and Answer). As also noted in the minutes of this Task Group, under Item 00-8-4C, "Review of UL Information", Chairman Trainer had a phone conversation with Mr. Walke of UL that confirmed Mr. Guida's answer on this issue.
This code comment follows-up on the vague and ambiguous wording of 520-5(c). The Panel did not answer our questions on the original intent of 520-5(c) which were:
1. Is the intent of this section to prohibit the use of wiring methods listed in 520-5(c) in buildings that are of "fire rated" construction type classifications such as 5A (One Hour Protected Wood Frame), 3A (Protected Ordinary), 2A/2B (Protected Noncombustible), or 1A/1B (Fire Resistive) under the Model Building Codes?
2. Is the intent of this section to allow the use of wiring methods listed in 520-5(c) in buildings that are of "non-fire rated" construction type classifications such as 5B (Unprotected Wood Frame), 3B (Unprotected Ordinary), or 2C (Unprotected Noncombustible)?
3. Is the intent of this section to allow the use of wiring methods listed in 520-5(c) in nonfire rated walls of buildings that are of "fire rated" construction type classifications such as 5A (One Hour Protected Wood Frame), 3A (Protected Ordinary), 2A/2B (Protected Noncombustible), or 1A/1B (Fire Resistive) under the Model Building Codes?
4. Is the intent of this section to prohibit the use of wiring methods listed in 520-5(c) in fire rated walls in buildings that are of "non-fire rated" construction type classifications such as 5B (Unprotected Wood Frame), 3B (Unprotected Ordinary), or 2C (Unprotected Noncombustible)?
Questions #1 and #2 relate to the wiring methods allowed or prohibited for a building, whereas questions #3 and #4 relate to wiring methods in individual walls in a building. By sprinklering a building, the building's wall ratings can be reduced from one hour down to "0" fire rating. Such sprinkler allowances are permitted in all types of building construction types, regardless of fire rated or non-fire rated building construction types.
We noted in my substantiation of our original code proposal that the Electrical Code Handbook's commentary on page 672 is even more confusing trying to explain this bizarre restriction where one side of a storage room can use one type of wiring, but the other side of the storage room adjoining the corridor cannot. If the Figure 518-2 on page 672 was in a sprinklered building of a fire rated construction type classification, all the double lined walls shown as fire rated walls would be permitted to be non-fire rated walls. Therefore, does the building's overall construction type classification govern the

application of Section 520-5(c), or does the wiring method only depend on the fire rating of the building element assembly (wall, floor, column, etc.) the wires are located in?

If the application of Section 520-5(c) is intended to apply to non-fire rated types of construction, then I could have the "lesser fire resistant" wiring in non-fire rated walls, and the "better fire resistant" wiring in the fire rated walls. From a fire protection/life safety standpoint, would this be "backwards"? Therefore, the only logical application of Section 520-5(c) would be in buildings of non-fire rated type of construction.

In summary, if the Panel still insists on limiting the use of the wiring methods in Section 520-5(c), such limitation only makes sense when it is related to the construction classification of the building as a whole, not to fire rated building elements in an otherwise non-fire rated construction classification type of building. If the Panel agrees with this understanding of the intent and application of this section of the Code, the revised wording will accomplish this in a clear and unambiguous manner.

PANEL ACTION: Reject.

15- 49 - (520-5(a) & (c)): Reject

SUBMITTER: Marshall A. Klein, Marshall A. Klein & Assoc., Inc.

COMMENT ON PROPOSAL NO: 15-34

RECOMMENDATION: Accept the original proposal.

SUBSTANTIATION: (Please not that this is the identical issue covered under ROP Code Proposal 15-17-(518-4(b) and (c)) (Log #4098).

We would like to address the Panel's Statements for rejection. (Panel's Statements are italicized, our responses are not).

Panel Statement on this Proposal - 15-34 was: *Refer to panel action and statement on Proposal 15-17."* Panel Statement on Proposal 15-17: *The fire hazard assessment presented does not address a realistic heat input into the NM cable.""*

Our comments: The Sullivan Report, on page 9, Section 1.4.2 noted that the heat input for the Cone Calorimeter Test for both ENT and the NM Cable was $5kW/m^2$. The original "Fire Hazard Analysis; The Use of ENMT" that was submitted with the 1987 NEC TCR Code Proposal 8-49 (including the 1987 NEC TCD 8-32 and 8-32A) to remove the three story limit for ENMT used the same heat input of $5kW/m^2$. This was noted on the original submitted report on Part B, Section 1.0 first paragraph. Both these reports were submitted to Panel 15 as part of the substantiation for this Code Proposal. Why would this heat input be adequate for ENT's approval, but NOT for NM Cable? Seems like a double standard? The heat input from both reports was used only to determine when ENT and NM Cable start to decompose (which is at 347°F). This information was input into the fire model so the fire model knew when to terminate its evaluation of the performance of the wiring methods within the ceiling and wall spaces. When the fire model reached the decomposition temperature of the PVC material (ENT and NM Cable), the fire modeling could terminate. In fact, the Sullivan Fire Modeling actually used a much lower termination temperature to provide very conservative results (error on the side of safety). Instead of using 347°F, Sullivan used the maximum electrical rating of the conductors, 194°F, as the termination point for the fire modeling. Sullivan had a safety factor of 153°F under the actual decomposition temperature of the ENT and NM Cable. Therefore, this part of the Panel's Statement is irrelevant to the acceptance of this code proposal.

"*NM cable is made of plasticized PVC and not rigid PVC, it is not required to be highly fire retarded and would ignite under conditions of fairly low heat input generating a significant amount of heat and potentially spreading the flame beyond the area of origin. Electrical nonmetallic tubing and rigid nonmetallic conduit are made of rigid PVC, which will not ignite unless an intense heat source is applied and continues to be imposed on the raceway and that is why they are permitted in this section.""*

Our comments: The Code Calorimeter Tests show the plasticized PVC as well as rigid PVC will decompose at the same temperature, which is logical, since they are both plastics. Electrical wiring methods in concealed spaces, based on NFPA Fire Data submitted to Panel 7, are not a major source of flame spread in properly firestopped and draftstopped spaces. Both the NEC and the Model Building Codes provide stringent firestopping/draftstopping requirements to be followed for installing electrical wiring through walls and floor spaces. The 15 minute finish rating was imposed on ENT back in 1985 addressing the concern for fires outside the concealed spaces that cover the wiring system, not for the concern with a fire within the concealed space. Such a fire within the concealed space is a very rare occurrence based on actual fire data.

"*Support documentation addresses flammability and toxicity issues as they relate to survivability. However, another issue is protection of the conductors so they don't become the source of ignition."*

Our comments: Nonmetallic-sheathed cable does not present an ignition source problem. It has been well documented in recent years that nonmetallic-sheathed cable does not present an ignition source problem. NFPA 921, "Guide for Fire and Explosion Investigation" makes it clear that electrical conductors, including nonmetallic-sheathed cable, are not common sources of ignition. Fire data supports this conclusion. See NFPA 921-98, Sections 14-11.4, 14-11.5, A-14-11.4, and Appendix B on referenced publications.

"*Section 336-6(b) doesn't allow for this - it states "The cable shall be protected from physical damage where necessary..." - this proposal would negate that requirement. The thermal barrier required for ENT and RNMC does not necessarily provide this physical protection.""*

Our comments: Section 336-6 "Exposed Work", provides the requirements for the use of NM Cable when used outside of walls and ceilings. That's why it is entitled "Exposed "Work". This code proposal would not negate Section 336-6(b). Section 336-6(b) was never intended to be applicable, and has never been applied, to NM Cable installed inside concealed spaces. If this code proposal is accepted, all the other installation requirements under Article 336, Part B, "Installation" would still be applicable to NM Cable installed under this code proposal.

In summation, the Panel's Statement contains comments of questionable technical merit when compared to the technical substantiation provided with the original code proposal. We would hope the Panel revisits this issue and accepts this code proposal based on its technical merits.

PANEL ACTION: Reject.

PANEL STATEMENT: Refer to panel action and statement on Comment 15-37.

SUBMITTER: George W. Flach, Nat'l Armored Cable Mfrs' Assn. (NACMA)

COMMENT ON PROPOSAL NO: 15-24

RECOMMENDATION: Continue to accept the proposal.

SUBSTANTIATION: Dr. Hirschler's "explanation of negative" comment for this proposal requested substantiation concerning the physical integrity and fire safety characteristics of Type AC as compared to the currently permitted Type MC cable.

The physical integrity of Type AC cable is equal to that of MC cable. The thickness of the outer metallic sheath of Type AC cable required by Underwriters Laboratories is 25 mils. The thickness of the outer metallic sheath of Type MC cable is permitted to be less than 25 mils.

Both AC cable and MC cable comply with the UL 1685 Vertical Tray and Smoke Release requirements and in accordance with their respective UL standards may be marked for use in cable trays and may be marked "-LS" signifying "Limited Smoke".

The physical integrity and fire safety characteristics of Type AC are equal to the currently permitted Type MC cable.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16

NEGATIVE: 1

ABSTENTION: 1

NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

HIRSCHLER: I oppose the action by the panel. This comment should have been rejected. As I have stated in my comment on the accepted proposal (which the Technical Correlating Committee considered to be worthy of further consideration as a public comment

when made on Proposal 15-66): "There has been no substantiation introduced to show that AC cable exhibits the physical integrity that this panel has always required for wiring methods used in theaters. Moreover, AC cable has not been shown to have the same fire safety characteristics of MI cable or MC cable, because of the insulated conductors, which do not have to meet sufficient fire safety requirements." It should be noted that article 333, to which armored cable is listed, says the uses permitted are those "where not subject to physical damage" because of its "flexible metal enclosure". Moreover, the insulated conductors can be ones made of THHN, THW, THHW, TW, UF, etc., per Table 310-13, none of which exhibit very high fire performance (if any). The fire performance exhibited by armored cable is simply based on the fact that it is enclosed by metal, but the burning of the insulated conductors (if the enclosure were pierced or damaged) would be fairly substantial. This is clearly an example of differential treatment applied to "armored cable" as opposed to "nonmetallic raceway", which exhibits better flame spread / heat release performance and equivalent mechanical strength.
EXPLANATION OF ABSTENTION:
FLACH: My classification is "independent expert."

RECOMMENDATION: The Proposal should have been accepted in principal. Revise wording to read:
(5) Supply Conductors Not Reduced in ~~Ampacity~~ Size. Supply conductors not reduced in ~~ampacity~~ size under the provisions of Section 520-53(h)(3) or Section 520-53(h)(4)shall be permitted to pass through holes specifically designed for the purpose. If penetration is through the fire-resistant-rated wall, it shall be in accordance with Section 300-21.
SUBSTANTIATION: The proposer is correct that the existing wording does to make sense. What is a "supply conductor not reduced in ampacity"? The revised wording would clarify this.
PANEL ACTION: Accept.

ARTICLE 525 — CARNIVALS, CIRCUSES, FAIRS, AND SIMILAR EVENTS

(Log #534)

15- 56 - (525-1): Reject
SUBMITTER: Paul Petit, American Insulated Wire Corp.
COMMENT ON PROPOSAL NO: 15-39
RECOMMENDATION: Revise as follows:
"Traveling Attractions" should not be deleted from the proposed text.

SUBSTANTIATION: "Traveling Attractions" mentioned in the text can be outdoor performance areas which should be correctly covered by Article 525, which requires that the flexible cords and cables, when used outdoors, shall be listed for wet locations. Article 520 allows cables to be used outdoors, but does not mandate that they be listed for wet locations, (which it should). Unless Article 520 is changed to mandate "wet locations cables", when these traveling attractions (or other) are located outdoors, this proposal should correctly be rejected.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "traveling attractions" is too general and can be applicable to either Article 520 or 525.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
NEGATIVE: 1
NOT RETURNED: 1 Kalbfeld
EXPLANATION OF NEGATIVE:
HIRSCHLER: I oppose the action by the panel. This comment should have been accepted in principle, with the recommendation I made in my comment on 15-45.

(Log #535)

15- 57 - (525-1): Reject
SUBMITTER: Paul Petit, American Insulated Wire Corp.
COMMENT ON PROPOSAL NO: 15-38
RECOMMENDATION: The word "exhibitions" should not be deleted from the text.
SUBSTANTIATION: The reference to "exhibitions" being already covered by Article 518 is erroneous, as Article 518 specifically references exhibition halls. "Exhibitions" can be outdoors exhibitions, not necessarily in halls. Article 518 only references that the wiring comply with Article 520, and Article 520 makes no provisions for wet locations. When this wiring is exposed to water outdoors, the word "exhibitions" should properly remain in the text.
PANEL ACTION: Reject.
PANEL STATEMENT: The term does not specifically identify the functions applicable to Article 525.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
NEGATIVE: 1
NOT RETURNED: 1 Kalbfeld
EXPLANATION OF NEGATIVE:

(Log #181)

15- 58 - (525-13(f)): Accept
Note: The Technical Correlating Committee understands that as a result of the Panel Action on Proposal 15-37, the Section will be numbered 525.20(G).
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 15-47
RECOMMENDATION: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Revise action on Proposal 15-47 so 525-13(f) reads:
Protection. Flexible cords or cables accessible to the public shall be arranged to minimize the tripping hazard and shall be permitted to be covered with nonconductive matting, provided that the matting does not constitute a greater tripping hazard than the uncovered cables. It shall be permitted to bury cables. The requirements of 300.5 shall not apply.
PANEL STATEMENT: Due to the panel's action on proposal 15-37, this becomes 525.20(G)
Field circumstances will determine the most viable option. There is no need to remove nonconductive matting. It will be difficult to enforce "shallow". **NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE:** 19

(Log #182)

15- 59 - (525-18):
Note: The Technical Correlating Committee directs that Proposal 15-50a and Comment 15-59 be reported as "Hold" so that the panel can address the reference to the NEMA configurations in the mandatory text.
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 15-50a
RECOMMENDATION: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Revise the panel action of Proposal 15-50a to read as follows:
"525.18 Ground-Fault Circuit-Interrupter (GFCI) Protection.
(A) GFCI Protection Required.
(1) General-Use 15- and 20-Ampere, 125-volt Receptacles. Those 125-Volt, single-phase , 15- and 20-ampere NEMA configuration 5-15 and 5-20 receptacles that are either used during disassembly and reassembly or that are readily accessible to the general public shall have listed ground-fault circuit-interrupter (GFCI) protection.
(2) Other Applicable Sections. Receptacles which require GFCI protection under other sections shall include those addressed in the following sections:
(1) 551.40(C)
(2) 551.41(C)
(3) 680.6
(4) 680.43(A)
(5) 680.44
(6) 680.51(A)
(7) 680.56(A)
(8) 680.57(B)
(B) GFCI Protection Not Required.
(1) Egress Lighting. Egress lighting shall not be connected to the load side of terminals of a ground-fault circuit-interrupter receptacle. Branch circuits which supply egress lighting shall not be protected by a GFCI circuit breaker.
(2) Other Receptacles. Receptacle other than NEMA 5-15 or 5-20 which only facilitate quick and safe disconnecting and reconnecting of electrical equipment shall be permitted to have GFCI protection."
PANEL STATEMENT: The panel understands that Section 525-18 will now become Section 525.23. The text has been revised to comply with the Manual of Style.

(Log #2244)

15- 61 - (525-23 (New)): Reject
SUBMITTER: Tom Dunn, San Jose, CA
COMMENT ON PROPOSAL NO: 15-57
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: 1) Following is panel 5's statement to proposal 5-128, "PANEL STATEMENT: If supplying portable wiring, then 250-34 applies. If there is a need for a special occupancy, then it should be placed within that special occupancy article."

2) Panel 16 accepted proposal 16-2, which will add 640-3(1), which will read as follows: "… Grounding of portable and vehicle-mounted generators shall be in accordance with Section 250-34."

Panels 5 and 16 clearly state that generators supplying portable wiring do not require a grounding electrode. Also, that this should be included in article 525.

525 specifically covers portable wiring. This needs to be addressed in 525 to clarify that 250-34 applies to generators used for carnival power.

The restriction in 250-34, that reads: "The generator supplies only equipment mounted on the generator or cord- and plug-connected equipment through receptacles mounted on the generator, or both, and …", should not apply to carnival generators. What difference does it make, pertaining to the grounding electrode, if the distribution wires are connected to the generator through receptacles or some other method? Also, this restriction has never been understood by any authorities having jurisdiction who I have talked with.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms the reason for rejection as stated in the panel statement for Proposal 15-57.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
NEGATIVE: 1
NOT RETURNED: 1 Kalbfeld
EXPLANATION OF NEGATIVE:
DUNN: Comment 15-61 should have been; Accepted in Principle - in part.

The panel statement should have been: The panel accepts the following wording which satisfies the submitter's intent.

525-23. Grounding Electrode. The frame of a portable generator shall not be required to be grounded and shall be permitted to serve as the grounding electrode for a portable wiring system supplied by the generator under the following conditions:
(a) The output of the generator is not higher than 250 volts, and
(b) No voltage(s) higher than 250 Volts is (are) distributed.
Due to the panel's action on proposal 15-37, this becomes 525-33.

Substantiation: The Panel's statement in rejecting this comment (15-61), does not address the submitter's substantiation that Panels 5 and 16 have indicated that 525 should include a provision about the grounding of portable generators.

Admittedly, the submitter should have proposed some text. In fact, at the Panel meeting, it appeared that the Panel was going to vote against the motion to accept, and move to accept in principle - in part, including the text above. However, the panel quickly moved to reject the comment (15-61), merely restating the Panel's statement for rejecting the original proposal (15-57).

The Panel's statement in rejecting the original proposal (15-57) contains a reason for having a grounding electrode that is undesirable and some inappropriate references to Section 250. Following is a breakdown of the Panel's Statement into its three sentences with comments about each sentence.

The first sentence reads: "The purpose of the a grounding electrode is the primary reference point in creating a grounded system." My substantiation for voting negative to the Panel's rejection of the original proposal (15-57) portrayed a situation where disconnecting the "grounding electrode" was necessary to prevent the ponies from being electrocuted. This was to show why having carnival generators referenced to ground is undesirable.

The second sentence reads, "The requirements for grounding of generators are addressed in 250-30 and 250-34." However, 250-30 pertains to the grounding of separately derived systems. Article 100 defines a separately derived system as, "A premises wiring system whose power is derived from…". 525 addresses portable wiring, 525 does not address premises wiring. Therefore, 250-30 does not apply.

Referencing 250-34, as suggested in the second sentence of the panel's statement, will cause confusion because 250-34 mandates the following condition, "(1) The generator supplies only equipment mounted on the generator or cord- and plug-connected equipment through receptacles mounted on the generator, or both…". Trying to comply with this condition would not be possible for a carnival.

The third sentence in the panel's statement is: "System grounding requirements are addressed in 250-20. 250-20 defines which alternating-current circuits and systems shall be grounded. There are four systems listed - (a), (b), (c), and (d), and none of these apply to 525 for the following reasons:

"(a) Alternating-Current Circuits of Less than 50 Volts." which does not apply because the generator output will be 120/208 volts.

"(b) Alternating-Current Systems of 50 Volts to 1000 Volts. Alternating-current systems of 50 volts to 1000 volts that supply premises wiring and premises wiring systems…", 525 addresses portable wiring, 525 does address not premises wiring. Therefore, (b) doesn't apply.

"(c) Alternating-Current Systems of 1 kV and Over.", which will not apply because of the voltage restrictions included in the proposed text.

"(d) Separately Derived Systems.", which does not apply for the same reason that 250-30 is not applicable"

To summarize: The panel's statement contains references that are not applicable to Section 525. The panel's statement has not substantiated their disagreement with the submitter's substantiation. The panel will have ignored both the direction of Panel 5, and the precedent of Panel 16 by rejecting this comment.

ARTICLE 530 — MOTION PICTURE AND TELEVISION STUDIOS AND SIMILAR LOCATIONS

(Log #1447)

15- 63 - (530-8(a)): Accept in Principle
SUBMITTER: Kenneth E. Vannice, Rep. U.S. Insitute for Theatre Technology Engineering Commission
COMMENT ON PROPOSAL NO: 15-72
RECOMMENDATION: Revise new section 647-8(a) as follows:
(a) Disconnecting Means. All lighting equipment luminaires and associated control equipment, if provided, shall have a disconnecting means that simultaneously opens all ungrounded conductors~~, and~~ that shall be located within sight of the luminaire or be capable of being locked in the open position.
SUBSTANTIATION: The concern surrounding a disconnecting means for lighting fixtures relates to the safe re-lamping of a luminaire on a branch circuit where both sides of the circuit are 60v above ground. As written and modified by the Panel, the proposal calls for the disconnect being "within sight". Within sight of what? This needs to be clarified so that personnel changing a lamp can either see the switch or be assured that it is locked off. In addition, "lighting equipment" is too vague and needs to be tightened to specify luminaires and control equipment. Also editorially, the current word "and" refers back to the lighting equipment, not the disconnect. The word "that" is more correct.

PANEL ACTION: Accept in Principle.
Revise 647.8(a) of the panel action of Proposal 15-72 as follows:
A) Disconnecting Means. All luminaires (lighting fixtures) connected to separately derived systems operating at 60 volts to ground, and associated control equipment, if provided, shall have a disconnecting means that simultaneously opens all ungrounded conductors. The disconnecting means shall be located within sight of the luminaire (lighting fixture) or be capable of being locked in the open position.
PANEL STATEMENT: The revised text more clearly expresses the requirement and meets the intent of the submitter.

(Log #1508)

15- 64 - (530-10): Reject
SUBMITTER: Richard D. Thompson, Thompson Associates
COMMENT ON PROPOSAL NO: 15-65
RECOMMENDATION: Reverse the decision of the technical panel and accept this proposal based on the following substantiation.
SUBSTANTIATION: This proposal was submitted to both Code Making Panel 15 responsible for Article 530, Motion Picture and Television Studios and Similar Locations, as well as to Code Making Panel 2 for inclusion into Table 220-3(a). [Reference Log 1886, 2-264]. Code Making Panel 2 rejected this proposal on the basis that Table 220-3(a) applies only to general lighting loads. The panel questioned whether or not the set lighting load of a motion picture or television soundstage is a general lighting load.
In light of that Committee Statement, it can be interpreted as a non-general lighting load. It is a specific electrical lighting load for the set lighting. Using Code Making Panel 2's interpretation, the general lighting load for a TV or film soundstage would be the work lights, as they provide general illumination to the space.
Code Making Panel 15 however, in their panel Statement, stated, "The production lighting load calculation parameters are more appropriately placed in Article 220."
Since these two panels have taken opposite opinions as to where best to locate this proposal, we ask the Technical Correlating Committee and Code Making Panel 15 to incorporate this requirement into Article 530, using the original substantiation which accompanied this proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: A motion picture and television lighting load can range from a few kilowatts to a few megawatts. These loads are normally supplied by augmenting the existing building service which must serve all or none of the lighting load according to the owners desires.

FLACH: My classification is "independent expert."

(Log #186)

15- 67 - (530 Part G): Accept
Note: The Technical Correlating Committee advises that placement of articles is the responsibility of the Technical Correlating Committee and the Technical Correlating Committee agrees with the relocation of 530 Part G to new Article 647.
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 15-72
RECOMMENDATION: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee rejects the Panel Action.
The Technical Correlating Committee directs that the Scope be revised to read as follows: "This article covers the installation and wiring of separately derived systems operating at 120 volts line-to-line and 60 volts to ground for sensitive electronic equipment." The Technical Correlating Committee directs the Panel to place the limitation to commercial and industrial occupancies elsewhere in the article.
This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Revise 647.1 and 647.3 to read as follows:
"647.1. Scope. This article covers the installation and wiring of separately derived systems operating at 120 volts line-to-line and 60 volts to ground for sensitive electronic equipment."
"647.3. General. Use of a separately derived 120-volt single-phase 3-wire system with 60 volts on each of two ungrounded conductors to a grounded neutral conductor shall be permitted for the purpose of reducing objectionable noise in sensitive electronic equipment locations provided that the following conditions apply:
(1) The system is installed only in commercial or industrial occupancies.
(2) The system's use is restricted to areas under close supervision by qualified personnel.
(3) All of the requirements in 647.4 through 647.8 are met."

PANEL STATEMENT: This change accomplishes the direction of the Technical Correlating Committee and maintains the intent of limiting the use of this article to commercial and industrial occupancies.

(Log #572)

19- 10 - (547-2): Accept in Principle
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
COMMENT ON PROPOSAL NO: 19-11
RECOMMENDATION: Revise 547-2 as follows:
547-2. ~~Other Articles.~~ Definitions. ~~For agricultural buildings not having conditions as specified in Section 547-1, the electrical installations shall be made in accordance with the applicable articles in this code.~~
Distribution Point. An electrical supply point from which service drops, service laterals, feeders, or branch circuits to agricultural buildings, associated farm dwelling(s), and associated buildings under single management are supplied.
FPN No. 1: Distribution Points are also known as the Center Yard Pole, Meter Pole, or the Common Distribution Point.
FPN No. 2: The Service Point as defined in Article 100 is typically at the Distribution Point.
Equipotential Plane. An area accessible to livestock where a wire mesh or other conductive elements are embedded in concrete or earth, are bonded to all metal structures and fixed nonelectrical equipment that may become energized, and are connected to the electrical grounding system to prevent a difference in voltage from developing within the plane.
SUBSTANTIATION: Acceptance of this comment will complete the action contemplated by the panel with regard to Proposals 19-11, 19-21, and 19-28. This was to create a new Section 547-2 which contains the definitions of the two terms unique to Article 547. The existing text of 547-2 is deleted as it is not needed.
If a building does not have the conditions specified in the scope of this article, it is not necessary to comply with the specific rules in Article 547. The general rules of the code would apply. This comment further modifies the panel's action on Proposal 19-21 by removing from the definition, the last sentence and inserting it as new FPN No. 2. This text is explanatory and not germane to the definition. Additionally, this comment modifies Proposal 19-28 in two ways. First, the words "or earth" are added after the word "concrete". The panel's action of Proposal 19-26a introduces a requirement for an equipotential plane in certain dirt surface areas. Without the words "or earth" in the definition, it would be required to embed the conductive elements in concrete even though the surface area is dirt. I do not believe this was the panel's intent. Second, the last sentence in the definition of an equipotential plane is deleted. A companion proposal will suggest adding that sentence to 547-9. I believe that the panel's intent was only to exempt poultry buildings or areas from the equipotential plane requirements. The language used, "For this article livestock does not include poultry", could be construed as exempting poultry buildings or areas from all the requirements of Article 547 in total. This is not the case. The panel I believe, only intended to exempt these areas from the requirements of an equipotential plane.
PANEL ACTION: Accept in Principle.
Revise 547-2 as follows:
547-2. ~~Other Articles.~~ Definitions. ~~For agricultural buildings not having conditions as specified in Section 547-1, the electrical installations shall be made in accordance with the applicable articles~~

~~in this code.~~
Distribution Point. An electrical supply point from which service drops, service laterals, feeders, or branch circuits to agricultural buildings, associated farm dwelling(s), and associated buildings under single management are supplied.
FPN No. 1: Distribution Points are also known as the Center Yard Pole, Meter Pole, or the Common Distribution Point.
FPN No. 2: The Service Point as defined in Article 100 is typically at the Distribution Point.
Equipotential Plane. An area where wire mesh or other conductive elements are embedded in or placed under concrete, bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to prevent a difference in voltage from developing within the plane.
PANEL STATEMENT: Accepted with editorial revisions.

(Log #CC1901)

19- 10a - (547-4): Accept
Note: The Technical Correlating Committee understands that the panel action is to revise 547-4(c) only.
SUBMITTER: CMP 19
COMMENT ON PROPOSAL NO: 19-16
RECOMMENDATION: Revise 547-4 to read:
547-4(c). Equipment Enclosures, Boxes, Conduit Bodies, and Fittings.
(1) Excessive Dust. Equipment enclosures, boxes, conduit bodies, and fittings installed in areas of buildings where excessive dust may be present shall be designed to minimize the entrance of dust and shall have no openings (such as holes for attachment screws) through which dust could enter the enclosure.
(2) Damp or Wet Locations. In damp or wet locations, equipment enclosures, boxes, conduit bodies, and fittings shall be placed or equipped so as to prevent moisture from entering or accumulating within the enclosure, box , conduit body, or fitting. In wet locations, including normally dry or damp locations where surfaces are periodically washed or sprayed with water, boxes, conduit bodies, and fittings shall be listed for use in wet locations, and equipment enclosures shall be weatherproof.
(3) Corrosive Atmosphere. Where wet dust, excessive moisture, corrosive gases or vapors, or other corrosive conditions may be present, equipment enclosures, boxes, conduit bodies, and fittings shall have corrosion resistance properties suitable for the conditions.
FPN No. 1: See Table 430-91 for appropriate enclosure type designations.
FPN No. 2: Aluminum and magnetic ferrous materials may corrode in agricultural environments.
SUBSTANTIATION: Based on several comments, the Panel reviewed its action on proposal 19-16 and accepts the proposal with the deletion of the first sentence which is redundant.
PANEL ACTION: Accept.

(Log #213)

19- 11 - (547-4(a)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 19-14
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 7-12. This action will be considered by the Panel as a Public Comment. The Technical Correlating Committee understands that the action on this Proposal further modifies the action on Proposal 19-13.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
PANEL STATEMENT: Refer to panel action on Comment 19-13.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #570)

19- 12 - (547-4(a)): Reject
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
COMMENT ON PROPOSAL NO: 19-14
RECOMMENDATION: Continue to accept the proposal.
SUBSTANTIATION: The original substantiation stated that open wiring on insulators is not suitable in the INTERIOR (emphasis added) of modern agricultural buildings. The panel believed that to be true and felt that for the locations described in 547-1(a), it was more appropriate to require a higher degree of protection for the wiring methods rather than installing single, insulated conductors.
Additional restrictions placed on the interior installations by Article 547 can cause confusion when attempting to apply the provisions of Article 320 since the rules in 547 modify or amend those in 320. 320-3 permits the use of open wiring on insulators where subject to corrosive vapors. Article 547 does not. The fact that CMP 7 rejected the companion proposal does not pose a conflict as open wiring on insulators could still be used at an agricultural establishment as the service or feeder conductors where run outside, or in areas that do not fall within the scope of Article 547. I believe the term "establishment" as stated in 320-3 can be used to indicate the use permitted on the property in general and Article 547 further restricts this wiring method for the particular areas within its scope. I believe that CMP 7 was correct in its rejection as there was no substantiation to remove the permitted use everywhere at an agricultural establishment. I also believe that CMP 19 was correct in accepting the proposal to remove the permission as a wiring method within the particular areas under the scope of Article 547.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to Panel Action on Comment 19-13.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #1020)

19- 13 - (547-4(a)): Accept in Principle
SUBMITTER: James K. Hinrichs, State of Washington, Department of Labor & Industries
COMMENT ON PROPOSAL NO: 19-14
RECOMMENDATION: Replace the proposed Section 547(a) with the following:
547-4. Wiring Methods.
(a) Wiring Systems. Type UF, NMC, copper SE cables, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, or other cables or raceways suitable for the location, with approved termination fittings, shall be the wiring method employed. Article 320 and Article 502 wiring methods shall be permitted for areas described in Section 547-1(a).
FPN: See Sections 300-7 and 347-9 for installation of raceway systems exposed to widely different temperatures.
SUBSTANTIATION: Article 320 - Open Wiring on Insulators is a recognized wiring method of the 1999 edition of the National Electrical Code and continues to be recognized. This wiring method has been used for decades and if properly installed constitutes a safe wring method. To eliminate this wiring method from Article 547 would cause confusion within the electrical industry, and be unnecessarily costly to the end use customer. There would be numerous electrical installations of this type within agricultural buildings that would not be able to be upgraded or repaired using this wiring method if this code change occurs. There does not appear to be any documentation to substantiate removal of this wiring method from Section 547-4(a)
PANEL ACTION: Accept in Principle.
Replace the proposed Section 547(a) with the following:
547-4. Wiring Methods.
(a) Wiring Systems. Type UF, NMC, copper SE cables, jacketed Type MC cable, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, or other cables or raceways suitable for the location, with approved termination fittings, shall be the wiring method employed. Article 320 and Article 502 wiring methods shall be permitted for areas described in Section 547-1(a).
FPN: See Sections 300-7 and 347-9 for installation of raceway systems exposed to widely different temperatures.
PANEL STATEMENT: The comment is accepted and a revision made in Proposal 19-13 is added. This reverses Panel action on Proposal 19-14.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #1440)

19- 14 - (547-4(a)): Reject
SUBMITTER: Barry Bauman, Alliante Energy/Rep. American Society of Agricultural Engineers
COMMENT ON PROPOSAL NO: 19-14
RECOMMENDATION: 19-14 should be accepted as proposed.
SUBSTANTIATION: The clip on luminaries used in NEC 320 agricultural installations do not conform to NEC 547.8. Consequently, these installations do not conform to the NEC. Due to their loss experience, insurance companies will either not insure buildings wired with Open Wiring On Insulators or they will impose a much higher rate.
A similar comment is to be submitted for Proposal 7-12.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to Panel Action on Comment 19-13.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #690)

19- 15 - (547-4(c)): Accept in Principle
SUBMITTER: William E. Bickner, Stillwater, MN
COMMENT ON PROPOSAL NO: 19-16
RECOMMENDATION: The panel revisions to the proposed changes should be reviewed to address the concerns stated below.
SUBSTANTIATION: The term "dustproof" should not be used. A proposal has been accepted to delete that term from Article 100. UL and NEMA standards address "dusttight" equipment, but the term "dustproof" is not generally used in reference to enclosures and boxes. "Dusttight" implies a more stringent construction than does the proposed language. The proposed changes would permit "weatherproof" enclosures, as provided for wet locations according to Section 373-2(a). To require "watertight" enclosures would be more restrictive and preclude the use of enclosures such a NEMA 4.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to Comment 19-15a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8
COMMENT ON AFFIRMATIVE:
BAUMAN: Should refer to Comment 19-10a. There is no 19-10a.
LAROCCA: The Panel Statement should read: "Refer to Comment 19-10a" rather than 19-15a. It appears that the panel comment originally identified as 19-15a was renumbered as 19-10a to fit into the sequence of comments.
MCCULLOUGH: In the panel statement, change the referenced comment number to 19-10a. Coment 19-15a was the number used during the panel meeting and was subsequently changed after the statement was written.

(Log #2109)

19- 16 - (547-4(c)): Accept in Principle
SUBMITTER: Truman C. Surbrook, Michigan State University
COMMENT ON PROPOSAL NO: 19-16
RECOMMENDATION: Agree with Panel's action to Accept in Principle, but disagree with Panel's action to change "weatherproof" to "watertight" in 547-4(c)(2). Change watertight back to weatherproof.
SUBSTANTIATION: This issue was discussed in the past, and watertight was changed to weatherproof to solve a problem of water accumulating inside enclosures and causing malfunctions. Junction and device boxes and enclosures in the 1984 NEC were required to be watertight, but changed to weatherproof in the 1987 NEC. Other enclosures were always required to only be weatherproof even in the 1984 NEC. It is not possible to prevent water vapor from entering enclosures, but it is difficult to get it out once it accumulates. Watertight enclosures do not breathe to equalize vapor pressure. Changes in temperature will cause condensation inside enclosures that frequently contain electronic equipment. Condensation on electronic components and circuit boards will cause malfunctions. These enclosures generally installed in wet locations must be permitted to breathe. Please do not make a step back by changing weatherproof to watertight.
The Panel did not provide any data that would justify this change from weatherproof to watertight. Please do not create a problem by making this change. For controllers, switches, circuit breakers, and fuses, the enclosure has been weatherproof as far back as the 1978 NEC which is the oldest Code I had available.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to Comment 19-10a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:

MCCULLOUGH: In the panel statement, change the referenced comment number to 19-10a. Coment 19-15a was the number used during the panel meeting and was subsequently changed after the statement was written.

(Log #1706)

19- 17 - (547-4(c)(2)): Accept in Principle
SUBMITTER: Douglas Fak, Interlochen, MI
COMMENT ON PROPOSAL NO: 19-16
RECOMMENDATION: Agree with action to Accept in Principle in Part, but in 547-4(c)(2) change the word "watertight" in the Code Panels action to "Weatherproof".
SUBSTANTIATION: The Code Panel incorrectly changed the word weatherproof to watertight. In 547-5(a), the Code requires that enclosures be weatherproof, not watertight. The original proposal used weatherproof, not watertight. The Code Panel gave no justification for this change. Mr. McNeive voted negative for similar reasons.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to Comment 19-10a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8
COMMENT ON AFFIRMATIVE:
BAUMAN: Should refer to Comment 19-10a. There is no 19-15a.

MCCULLOUGH: In the panel statement, change the referenced comment number to 19-10a. Coment 19-15a was the number used during the panel meeting and was subsequently changed after the statement was written.

(Log #2237)

19- 18 - (547-4(c)(2)): Accept in Principle
SUBMITTER: Thomas J. Garvey, Milwaukee, WI
COMMENT ON PROPOSAL NO: 19-16
RECOMMENDATION: Revise the first sentence of (2) to read:
In damp or wet locations, equipment enclosures, boxes, conduit bodies, and fittings, shall be placed or equipped so as to prevent moisture from ~~entering or~~ accumulating within the enclosure,...
SUBSTANTIATION: As expressed in the submitter's substantiation, the intent of this section is to prevent accumulation of moisture. There is no practical way to prevent moisture from entering the enclosure. Conduits and cables do not block out the ambient air. The free movement of air will ensure that condensation will occur at some point in time. Equipment can continue to function safely as long as excess moisture is allowed to drain.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to Comment 19-10a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8
COMMENT ON AFFIRMATIVE:
BAUMAN: Should refer to Comment 19-10a. There is no 19-15a.

(Log #2302)

19- 19 - (547-5): Accept in Principle
SUBMITTER: Robert J. Flick, Alliant Energy
COMMENT ON PROPOSAL NO: 19-16
RECOMMENDATION: Revise as follows:
"... In wet locations, including normally dry or damp locations where surfaces are periodically washed or sprayed with water, boxes, conduit

bodies, and fittings shall be listed for use in wet locations and equipment enclosures shall be ~~watertight~~ weatherproof."
SUBSTANTIATION: An environment with very high humidity will have condensation. Condensation can occur both inside and outside of enclosures. It is very important to prevent moisture from entering an enclosure, but more important to provide a means of preventing water from accumulating within the enclosure through a breather or drain plug.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to Comment 19-10a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8
COMMENT ON AFFIRMATIVE:
BAUMAN: Should refer to Comment 19-10a. There is no 19-15a.

COMMENT ON AFFIRMATIVE:
LAROCCA: The Panel Statement should read: "Refer to Comment 19-19a" rather than 19-23a. It appears that the panel comment originally identified as 19-23a was renumbered as 19-19a to fit into the sequence of comments.
MCCULLOUGH: In the panel statement, change the referenced comment number to 19-19a. Comment 19-23a was the number used during the panel meeting and was subsequently changed after the statement was written.

(Log #1021)

19- 21 - (547-8): Reject
SUBMITTER: James K. Hinrichs, State of Washington, Department of Labor & Industries
COMMENT ON PROPOSAL NO: 19-18a
RECOMMENDATION: The following language needs to be deleted from the proposal submitted by Code Making Panel 19:
Article 547-8(a)(2) Series Disconnects. Where the serving utility provides a disconnecting means as part of their service requirements and this disconnecting means is determined to meet the requirements of this section, an additional disconnecting means shall not be required.
And then change (3) to (2); change (4) to (3); change (5) to (4); change (6) to (5).
SUBSTANTIATION: The language in the above mentioned portion of the Code Making Panel 19 proposal would not be enforceable by the authority having jurisdiction and would create misunderstandings and confusion for the electrical installer and the consumer because in most cases the authority having jurisdiction is not allowed to inspect upstream from the Service Point. Furthermore Section 90-2(b)(5) of the 1999 NEC would preclude this section becoming part of the NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to action on Comment 19-19a which addresses the submitter's concerns.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8
COMMENT ON AFFIRMATIVE:
LAROCCA: See my Comment on Affirmative on Comment 19-20.

(Log #1263)

19- 22 - (547-8): Reject
SUBMITTER: David A. Kerr, Jr., Friendsville, PA
COMMENT ON PROPOSAL NO: 19-18a
RECOMMENDATION: Accept in principle.
SUBSTANTIATION: This looks like a big improvement in readability. I'm not sure there is any need to require disconnect at meter pole. Article 230 permits service conductors to go from a house to a garage, although I think this should be restricted to big buildings with fire pumps, or other real needs. The utility can and will cut the transformer. Mr. SImmons doesn't seem to think a same size EGC is necessary. Only purged and pressurized will keep barn air out of equipment. It's the Jersey shore times ten. Connections need Noalox. AA8000 wire seems fine when terminals die.
PANEL ACTION: Reject.
PANEL STATEMENT: No specific proposal is made as required by 4-4.5 (c) of the NFPA Regulations Governing Committee Projects.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #1790)

19- 23 - (547-8): Reject
SUBMITTER: Alan Manche, Square D Co.
COMMENT ON PROPOSAL NO: 19-18a
RECOMMENDATION: The panel should reconsider and reject this proposal returning to the 1999 NEC wording.
SUBSTANTIATION: These revisions introduce more problems than it solves. 547-8(A) in this proposal permits the disconnect at the distribution point to be classified as the service disconnect. It further permits the disconnect to be supplied by the utility or to be customer owned at the distribution point. 547-8(A)(4) states that the disconnect to be exempt from overload protection. It is not clear how short-circuit protection is addressed at the distribution point.
Depending on the interpretation of this section, a safety concern exists for the unprotected conductors and switch at the distribution point if overcurrent protection is not required. Although a utility owned, pole mounted switch may be appropriately designed for a short circuit condition, a significant concern rests with a customer owned enclosed switch that is not protected from short circuit conditions. The present wording may be interpreted to permit the use of an unfused switch at the distribution point without any overcurrent protection immediately adjacent. Unfused switches are permitted to be marked Suitable for Use as Service Equipment because of the requirement in 230-91 requiring the overcurrent protection to be an integral part of the service disconnect or immediately adjacent. The overcurrent device is protecting that switch. Permitting an unfused switch at the distribution point and the overcurrent protection to be located at the building establishes a significant safety hazard when the switch is called upon to carry short circuit current, the switch is no longer protected.
If a switch is installed at the distribution point without overcurrent protection either integral or immediately adjacent there to. A possible fault on the conductors (possibly long length of conductors) would expose the switch to extremely high fault currents resulting in the possible concerns. The 1999 language clearly addresses this issue that the disconnect be SUSE.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to Comment 19-19a where the panel has revised the section and addresses the submitter's concerns.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8
COMMENT ON AFFIRMATIVE:

(Log #CC1902)

19- 19a - (547-8): Accept
SUBMITTER: CMP 19
COMMENT ON PROPOSAL NO: 19-18a
RECOMMENDATION: Revise 547-8 to read:
547-8. Electrical Supply to Buildings or Structures from a Distribution Point
(A). Site Isolating Device. A disconnecting means shall be installed at the distribution point where two or more agricultural buildings, structures, associated farm dwelling(s) or other buildings are supplied from the distribution point. For the purposes of applying the requirements of this Section, this disconnecting means, shall be classified as a site isolating device and shall have provisions for bonding the grounding electrode conductor to the grounded conductor.
(1) Purpose. The disconnecting means shall simultaneously interrupt all ungrounded conductors for the purposes of isolation, system maintenance, emergency disconnection or connection of optional standby systems.
(2) Series Disconnects. An additional disconnecting means shall not be required where the serving utility provides a disconnecting means as part of their service requirements and this disconnecting means is accessible to the user and meets the requirements of this section.
(3) Rating. The disconnecting means shall be rated for the calculated load as determined by Part D of Article 220.
(4) Overcurrent. The disconnecting means shall not be required to contain overcurrent protection.
(5) Accessibility. Where not readily accessible, the disconnecting means shall be capable of operation from a readily accessible point.
(6) Grounding. The grounded conductor of the system shall be connected to a grounding electrode through a grounding electrode conductor at the disconnecting means.
(B) Electrical Supply. The buildings or structures shall be permitted to be supplied by either (1) or (2):
(1) Building(s) or Structure(s). Where the disconnecting means and overcurrent protection are located at the buildings or structures, the supply conductors shall be sized in accordance with Part D of Article 220 and installed in accordance with the requirements of Part B of Article 225.
For each building or structure the conditions in either (a) or (b) shall be permitted.
(a) The grounded circuit conductor shall be permitted to be connected to the building disconnecting means and to the grounding electrode system of that building or structure where all the requirements of 250-32(B)(2) are met.
(b) A separate equipment grounding conductor shall be run with the supply conductors to the building(s) or structure(s) and the following conditions shall be met:
1. The equipment grounding conductor is the same size as the largest supply conductor, if of the same material, or is adjusted in size in accordance with the equivalent size columns of Table 250-122 if of different materials.
2. The equipment grounding conductor is bonded to the grounded circuit conductor at the disconnecting means enclosure at the distribution point or at the source of a separately derived system.
3. A grounding electrode system is provided in accordance with Part C of Article 250 and connected to the equipment grounding conductor at the building (s) or structure(s) disconnecting means.
4. The grounded circuit conductor is not connected to a grounding electrode or to any equipment grounding conductor on the load side of the distribution point.
(2) Disconnecting Means and Overcurrent Protection at the Distribution Point. Where the disconnecting means and overcurrent protection for each set of feeder conductors is located at the distribution point, feeders to building(s) or structure(s) shall meet the requirements of 250.32 and Article 225 Parts A and B.
FPN: Methods to reduce neutral-to-earth voltages in livestock facilities include supplying buildings or structures with four-wire single-phase services, sizing of three-wire service conductors to limit voltage drop to 2 percent, and connecting loads line-to-line.
(C) Underground Equipment Grounding Conductors. Where livestock is housed, any portion of the equipment grounding conductor run underground to the building or structure shall be insulated or covered copper.
SUBSTANTIATION: Several comments were submitted on this subject. The panel revises the section to accommodate all the concerns expressed.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 7
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
MCNEIVE: This comment and the original proposal decrease electrical safety. They would result in increased lengths of unprotected conductors, which in turn, exposes the switch and personnel to additional hazards. For the safety of personnel that might be exposed in the zone before the first overcurrent device, NEMA considers that overcurrent protection is required at the isolating device.
COMMENT ON AFFIRMATIVE:
BAUMAN: In 547-8(b)(1)(a) the reference should be 250.32 not 250?32.

(Log #569)

19- 24 - (547-8(a)(6) and (b)(1)): Accept in Principle
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
COMMENT ON PROPOSAL NO: 19-18a
RECOMMENDATION: Revise the following portions of the proposal as follows:
(A)(6) Grounding. The grounded conductor of the system shall be grounded at the ~~distribution~~ disconnecting means and be connected to a grounding electrode through a grounding conductor.
(B)(1) Disconnecting Means and Overcurrent Protection Located at the Building(s) or Structure(s). Where the disconnecting means and overcurrent protection are located at the buildings or structures supplied by the conductors, the conductors shall be sized in accordance with Part D of Article 220 and installed in accordance with the requirements of Part B of Article 225. Conductors of the supply system shall meet the clearances specified in 225.18 and 230.24(b).
(Remainder unchanged)
SUBSTANTIATION: The whole topic of (A) is about requirements for or at the disconnecting means. I believe the panel meant to use the word "disconnecting" rather than "distribution".
The change in (B)(1) is to conform to 4.1.1 of the NEC Style Manual requirements with regard to references to an entire article.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to Comment 19-19a.

COMMENT ON PROPOSAL NO: 19-26a
RECOMMENDATION: Change panel action from accept, to accept in part. Delete paragraph B in the proposal.
SUBSTANTIATION: Installing wire mesh in dirt floors of animal feeding and living areas is an extreme hazard. Animals will dig into the dirt and the wire mesh will be exposed, (this is very evident where water is present). Some animals that will be exposed to this hazard are very expensive and valuable, such as race horses and show horses. Owners will not want their animals exposed to this type of physical hazard just to minimize exposure to a very low voltage that in most cases is questionable if it has any effect on the animals.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to action on Comment 19-37.

19- 29 - (547-9): Accept in Principle
SUBMITTER: Truman C. Surbrook, Michigan State University
COMMENT ON PROPOSAL NO: 19-26a
RECOMMENDATION: Change Accept to Accept in Part and delete paragraph (B) of what will be 547.10 in the Code.
SUBSTANTIATION: Installing a metal mesh in the earth around equipment such as watering devices will result in injury to livestock. These areas will get wet and at some times of the year livestock will sink into the wet earth far enough to make contact with the equipotential plane elements. They are likely to get caught in the metal mesh and will become injured trying to free themselves. I have personally witnessed such damage to livestock. It is an ugly sight and definitely inhumane treatment of livestock. There has been no evidence presented to the Panel that would justify the installation of a metal mesh in earth either outside or inside buildings. The section that should be deleted states horse stalls as an example. Show horses in some cases are valued in the hundreds of thousands of dollars, and race horses are sometimes valued in the millions. Do not make this awful mistake. Even if evidence becomes available in the future that such an installation is recommended, there must be a better way.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to action on Comment 19-37.

(Log #1671)

19- 32 - (547-9(c)): Reject
SUBMITTER: Stephen Vitale, Battle Creek, MI
COMMENT ON PROPOSAL NO: 19-33
RECOMMENDATION: Change reject to accept.
SUBSTANTIATION: The problem of circuit tampering stated by the submitter is justified for general use circuits in livestock buildings, and these circuits are used for many applications on a daily basis. The wet conditions and long conductor runs will result in nuisance tripping. The grounding requirement in section in 547-4(f) will provide adequate safety and GFCIs are not needed.
PANEL ACTION: Reject.
PANEL STATEMENT: The GFCI requirements are to protect life and property in wet and damp environments. Nuisance tripping can be alleviated by design and maintenance.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #1703)

19- 33 - (547-9(c)): Reject
SUBMITTER: John Corbat, Breckenridge, MI
COMMENT ON PROPOSAL NO: 19-33
RECOMMENDATION: Change Reject to Accept.
SUBSTANTIATION: The original submitter's substantiation is correct. The Code Panel apparently does not understand the devices that are plugged into general use receptacles in livestock buildings. Loss of heat lamps can result in animal deaths. Loss of power to heat tapes can result in broken pipes and ruined equipment. General use receptacles in livestock barns are not only used for temporary power tools, but are frequently used for a variety of equipment for which failure of the circuit can result in ruined equipment and even animal death. Section 547-4(f) is extra grounding to ensure safety. If this rule is followed, there is no need to go to a GFCI that when nuisance tripping occurs, there will be tampering to make sure it does not happen again.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to panel statement on Comment 19-32.

(Log #2111)

19- 34 - (547-9(c)): Reject
SUBMITTER: Jonathan R. Althouse, Michigan State University
COMMENT ON PROPOSAL NO: 19-36
RECOMMENDATION: Change Reject to Accept.
SUBSTANTIATION: No accident statistics have been provided by the Panel that justified the requirement of GFCI protection on general use receptacles in buildings with equipotential planes. The Panel is evidently not aware of the equipment that is supplied by general use receptacles in livestock buildings. These receptacles are not simply convenience outlets. These receptacles are used for electrical devices that can even result in animal death if the circuit trips off. The long runs and high humidity will result in nuisance tripping. Section 547-4(f) requires grounding that is beyond most other types of installations. This extra grounding is sufficient to provide the safety that is needed. Agricultural operators will tamper with these circuits when nuisance tripping occurs, often rendering the circuit unsafe for operation.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to panel statement on Comment 19-32.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #2112)

19- 35 - (547-9(c)): Reject
SUBMITTER: Jonathan R. Althouse, Michigan State University
COMMENT ON PROPOSAL NO: 19-34
RECOMMENDATION: Change Accept in Principle to Reject.
SUBSTANTIATION: No accident statistics have been provided by to justify GFCI protection for general use receptacles in areas with equipotential plans. Now the Panel has approved GFCI protection for outdoor and all wet locations. That just about includes every location on a farm. Why not require them in the same locations for commercial and industrial establishments. There is probably a greater need for them in those locations. If there was a justification for them in industrial and commercial locations, OSHA probably would have required them in those locations long ago. General use receptacles outdoors are frequently used for powering portable motorized equipment. Nuisance tripping will occur. Outdoor general use receptacles will supply equipment frequently with long extension cord runs. There will be nuisance tripping. The grounding requirements of Section 547-4(f) are adequate to provide a reasonable degree of safety to personnel from electrical shock. This change will cause more problems than it attempts to solve.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to panel statement on Comment 19-32.

19- 36 - (547-9(c)): Accept
SUBMITTER: Thomas J. Garvey, Milwaukee, WI
COMMENT ON PROPOSAL NO: 19-34
RECOMMENDATION: Revise the list of locations where GFCI protection is required, to read:
(1) In areas having an equipotential plane.
(2) Outdoors
(3) Damp or Wet Locations.
SUBSTANTIATION: The submitter equated the level of protection to be equal to outdoor and in wet areas of the farm dwelling. The only wet area in a typical farm dwelling is the inside of a tub or shower area. No receptacles permitted there. Yet other "damp" locations in the dwelling are required to have GFCI protected receptacles. An unfinished basement may be damp or dry yet general use receptacle outlets are required to be GFCI protected. The environment inside of a barn is much more hostile than the dwelling basement. Higher levels of moisture, direct contact with a damp concrete or earthen floor, somewhat corrosive atmosphere, increased levels of physical damage to extension cords and portable appliances are all conditions that I commonly observe in the barn. The use of portable appliances to groom animals, heat or de-ice water, and employ portable tools are common. This presents the same type of hazard that permitted Panel 2 to add requirements for GFCI protection in dwelling kitchens, bathrooms, and unfinished basements.
The use of GFCI protection for personnel is also required in commercial garages, and is required with the conditions and use of electrical appliances similar to that of the barn.
PANEL ACTION: Accept.

(Log #1442)

19- 37 - (547-10): Accept in Principle
Note: **The Technical Correlating Committee understands that the Panel Action on Comment 19-10 modifies the action on this Comment.**
The Technical Correlating Committee directs that "does" be changed to "shall" in the first sentence of 547.10 to comply with 3.1.1 of the NEC Style Manual.
SUBMITTER: Barry Bauman, Alliant Energy/Rep. American Society of Agricultural Engineers
COMMENT ON PROPOSAL NO: 19-26a
RECOMMENDATION: Replace the proposed language in Proposal 19-26a with:
547.10 Equipotential Planes and Bonding of Equipotential Planes
A) Buildings or Areas Within Buildings Requiring Equipotential Planes. Equipotential planes shall be installed in all concrete floor confinement areas of livestock buildings that contain metallic equipment that is accessible to animals and likely to become energized.
B) Areas Requiring Equipotential Planes. Outdoor dirt and concrete

surface confinement areas, such as feedlots, shall have equipotential planes installed around metallic equipment that is accessible to animals and likely to become energized. The equipotential plane shall encompass the area around the equipment where the animal will stand while accessing the equipment.

C) Areas Not Requiring Equipotential Planes. In dirt confinement areas with metallic equipment that is accessible to animals and likely to become energized and where concrete surfaces are detrimental to animal well being, an equipotential plane shall not be required. However, all circuits providing electric power to equipment that is accessible to animals in the confinement area shall have GFCI protection.

D) Bonding. Equipotential planes shall be bonded to the electrical grounding system. The bonding conductor shall be copper, insulated, covered or bare, and not smaller than 8 AWG. The means of bonding to wire mesh or conductive elements shall be by pressure connectors or clamps of brass, copper, copper alloy, or an equally substantial approved means. Slatted floors that are supported by structures that are a part of an equipotential plane shall not require bonding.

FPN No. 1: Methods to establish equipotential planes are described in "Equipotential Planes in Animal Containment Areas", American Society of Agricultural Engineers (ASAE) EP473-1997.

FPN No. 2: Low grounding electrode system resistances may reduce potential differences in livestock facilities.

SUBSTANTIATION: The requirements for equipotential planes have been reorganized to clarify the area where equipotential planes are necessary. A separate section was added for "Areas Not Requiring Equipotential Planes." This section addresses requirements for dirt confinement areas that have equipment that is accessible to animals.

PANEL ACTION: Accept in Principle.

Accept the proposal with the following revisions:

1. Revise 547-10 to read:

547.10 Equipotential Planes and Bonding of Equipotential Planes. For the purposes of this section, the term "livestock" does not include poultry.

(A) Areas Requiring Equipotential Planes. Equipotential planes shall be installed in all concrete floor confinement areas of livestock buildings that contain metallic equipment that is accessible to animals and likely to become energized. Outdoor confinement areas, such as feedlots, shall have equipotential planes installed around metallic equipment that is accessible to animals and likely to become energized. The equipotential plane shall encompass the area around the equipment where the animal stands while accessing the equipment.

(B) Areas Not Requiring Equipotential Planes. Equipotential planes shall not be required in dirt confinement areas containing metallic equipment that is accessible to animals and likely to become energized. All circuits providing electric power to equipment that is accessible to animals in dirt confinement areas shall have GFCI protection.

(C) Bonding. Equipotential planes shall be bonded to the electrical grounding system. The bonding conductor shall be copper, insulated, covered or bare, and not smaller than 8 AWG. The means of bonding to wire mesh or conductive elements shall be by pressure connectors or clamps of brass, copper, copper alloy, or an equally substantial approved means. Slatted floors that are supported by structures that are a part of an equipotential plane shall not require bonding.

FPN No. 1: Methods to establish equipotential planes are described in Equipotential Planes in Animal Containment Areas, American Society of Agricultural Engineers (ASAE) EP473-2001.

FPN No. 2: Low grounding electrode system resistances may reduce potential differences in livestock facilities.

PANEL STATEMENT: The intent of the commentor, and the submitter of other comments on the subject, is accomplished in the revisions that clairfy that equipotential planes are not required in dirt areas.

Comment 19-26 is also incorporated in the revision.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8

VOTE ON PANEL ACTION:

AFFIRMATIVE: 8

(Log #2303)

19- 38 - (547-10): Accept in Principle

SUBMITTER: Robert J. Flick, Alliant Energy

COMMENT ON PROPOSAL NO: 19-30

RECOMMENDATION: Revise as follows:

(B) Areas Requiring Equipotential Planes. Outdoor and <u>indoor</u> concrete surface confinement areas such as feedlots, ~~and indoor or outdoor dirt surface areas such as horse stalls and feedlots~~ shall have equipotential planes installed around metallic equipment that is accessible to animals and likely to become energized. The equipotential plane shall encompass the area around the equipment where the animal will stand while accessing the equipment.

SUBSTANTIATION: A plane would need to be buried many feet below the surface that the livestock is standing on to ensure that the livestock can not dig down to the plane and be harmed by it. Equipotential planes are rarely if every installed under dirt surfaces and builders/inspectors have minimal information on how to install a plane under dirt and what to require.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to action on Comment 19-37.

19- 41 - (550-2-Manufactured Home): Reject
SUBMITTER: Robert Molde, Xeel Energy
COMMENT ON PROPOSAL NO: 19-39
RECOMMENDATION: We do not agree with the proposal as accepted. The labeling that presently identifies a building as a manufactured home has been removed from this proposed wording. We propose that the committee reinsert the wording "that bears a label identifying it as a manufactured home" after the word "structure" in the first line of the proposed definition.
SUBSTANTIATION: The present definitions in the NEC for manufactured homes and mobile homes causes confusion between electrical contractors and utilities serving the home. Utilities identify a manufactured home by the labeling. It is our understanding that not all transportable-homes are wired the same. Removing the label will only add confusion.
PANEL ACTION: Reject.
PANEL STATEMENT: The FPN to 550.1 in the 2002 edition will refer the user to Part 3280, Manufactured Home Safety Standards and NFPA 501 where labeling requirements are located.

(Log #1186)

19- 44 - (550-23(a)): Reject
SUBMITTER: Joseph D. Baber, Minnesota State Board of Electricity
COMMENT ON PROPOSAL NO: 19-61
RECOMMENDATION: Provide an exception to 550-23(a) as follows:

Exception: Service equipment for both mobile and manufactured homes located on private property shall be permitted to be in sight from and not more than 100 ft from the exterior wall of the home it serves provided that all of the conditions listed in 550-23(b) are met.

SUBSTANTIATION: In addition to the substantiation I presented in my original proposal, I would like to add my safety concern speaking as a member of a rural fire department. Procedure for most fire departments is the disconnection of power to the home before any water is used. The service disconnect that is required to be within 30 ft is usually adjacent to the home and almost always near a propane tank. These fires are extremely hot and well underway by the time the firefighters arrive. The close proximity of the service disconnect and the propane tank put the firefighters in a dangerous situation. Most of the time, these homes and their contents are a total loss because of the risk involved. I'm sure the NFPA has these statistics.

Note: Supporting material available for review upon request at NFPA headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel affirms its reason for rejection in the ROP and notes that technical justification of the proposed distance is still not provided. In the ROC for the 1996 edition extensive comments, with technical justification, were received to reject a proposal to change the distance to 50 ft.

Spacing of propane tanks is covered by NFPA 58, Liquefied Petroleum Gas Code.

(Log #916)

19- 48 - (550-23(d)): Accept
SUBMITTER: Gary R. Davis, Saratoga Springs, NY
COMMENT ON PROPOSAL NO: 19-65
RECOMMENDATION: This proposal as it would read below should be "accept in principle" with the suggested additions shown:

550.23(d) Additional Outside Electrical Equipment. Means for connecting a mobile home accessory building or structure, or additional electrical equipment located outside a mobile home by a fixed wiring method shall be provided in either the mobile home service equipment or the local external disconnecting means permitted in Section 550.23(a).

SUBSTANTIATION: The issue concerns the elimination of 230-82, Exception No. 2 from the 1996 NEC. When that Exception was removed, it clarified that a tenant breaker in metering equipment was to be considered the "Service Equipment." As a result, "multiple meter packs" would not be able to be used in mobile home parks because they have provisions for the tenant breaker only. The intent of the NEC is to provide a means for connecting outside equipment without using the panel inside the mobile home and the local external disconnecting means permitted in Section 550.23(a) is certainly an alternate location that could be used to serve other outside equipment. However, the NEC currently has this requirement for the "Service Equipment." Prior to the elimination of 230-82, Exception No. 2 from the 1996 NEC, it was permitted to consider the disconnect at the metering merely that, a disconnect ahead of service equipment. The "local disconnect" was then established as the actual "Service Equipment" and everybody was happy.

The language needs to be clarified in order to prevent the combination meter-breaker center from being a violation and to permit the requirements of 550.23(d) to be met at the local disconnect. I have taken another attempt at the rewrite to make the section more clear.
PANEL ACTION: Accept.

AFFIRMATIVE: 13

(Log #1365)

19- 49 - (550-23(d)): Accept in Principle
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co/EEI
COMMENT ON PROPOSAL NO: 19-65
RECOMMENDATION: This Proposal should be "Accept in Principle".
SUBSTANTIATION: The Panel did not provide specific technical substantiation to reject the proposal. Please refer to the sketch provided and commentary to gain a better understanding of the problem and the need to "Accept In Principle".

The key issue here is that the additional disconnect is not service equipment. The combination meter-breaker center becomes the "service equipment". The disconnect contained in the combination meter-breaker center is not permitted ahead of a "service disconnect" (see Section 230-82). The combination meter-breaker center, in fact, becomes the service equipment and the "local disconnect" is no more than a sub-panel being fed from a feeder. Just because the local disconnect is to be listed for use as service equipment doesn't mean it is service equipment. The language needs to be clarified in order prevent the combination meter-breaker center from being a violation and to permit the requirements of 550-23(d) to be met at the local disconnect.

NOTE: Supporting Material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle.

19- 50a - (550-25 (New)): Reject
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
COMMENT ON PROPOSAL NO: 19-69
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: To further state my negative vote on the proposal, NFPA 501 is slated to become the primary source of construction standards for manufactured housing and be incorporated into the HUD Part 3280 rules. It will contain the "what you need" requirements for electrical installations. The NEC is a referenced standard and basically would be used for the "how you do it" requirements. If there are inconsistencies between the rules of the NEC and the Federal Standard, the Federal Standard preempts. As such, placing the requirement for AFCIs in the NEC will not accomplish the goal of requiring their installation in manufactured housing. The NFPA 501 committee rejected the

proposal for adding this requirement in the 2000 edition of NFPA 501. CMP 19's action on Proposal 19-37 was to ensures consistency with NFPA 501. That was the panel's statement. Acceptance of this proposal ensure inconsistency with respect to the AFCI issue. This comment is not intended to debate the merits of AFCIs it is only to point out that relative to construction requirements for manufactured housing, placing this rule in the NEC will not result in the installation of AFCIs in a manufactured home. It will merely place two excellent NFPA documents at odds with each other.
PANEL ACTION: Reject.
PANEL STATEMENT: The Panel affirms its action on the proposal.

(Log #1799)

19- 50 - (550-25): Accept
SUBMITTER: Robert J. Clarey, Cutler-Hammer, Inc.
COMMENT ON PROPOSAL NO: 19-69
RECOMMENDATION: Continue to accept in principle in part.
SUBSTANTIATION: The Code Making Panel, by their action, have ensured that the bedrooms of mobile homes and manufactured homes will receive the same AFCI protection as dwelling unit bedrooms (NEC 210-12). With respect to Mr. McCullough's comment, we consider that it is timely to include this safety requirement in the National Electrical Code. The NEC safety requirements for bedrooms will be consistent and there can be subsequent discussion with NFPA 501. With respect to Mr. Weakley's comment, at the proposal stage there was considerable panel discussion about the relevance of Chapters 1 through 4 to manufactured homes. Cutler-Hammer considers that inclusion of the requirement in 550-25 is the correct approach, and that possible redundancy is more than offset by the provision of increased fire safety. The other comment was that the product would eventually be an integral part of all circuit breakers, and by reference would be covered in other articles. This situation, however, is many years in the future. The present code panel action is a necessary first step towards overall protection for dwelling units, mobile homes and manufactured homes.
PANEL ACTION: Accept.

19- 52 - (550-32): Reject
SUBMITTER: Mike Theisen, St. Cloud, MN
COMMENT ON PROPOSAL NO: 19-57, 19-60, 19-61
RECOMMENDATION: Please reconsider the proposals which would allow for a manufactured home, located on private property, to have the service/disconnecting means located more than 30 ft from the manufactured home. This can be accomplished by adding text to the last sentence of section 550.32(B) as follows:
Where the service equipment is not installed in or on the unit, the installation shall comply with ~~the other provisions of this section~~ all of the following requirements:
(1) The manufactured home is secured to a permanent foundation and located on private property.
(2) The remote service/disconnecting means is located within sight from and not more than 100 ft from the exterior wall of the manufactured home.
SUBSTANTIATION: Owner/occupants of manufactured homes are required to purchase redundant equipment, pay for the additional installation time for that equipment, and have to contend with an additional obstacle in their yard; all of which appears to be overkill. Economically disadvantaged people can afford a manufactured home more readily than purchase a site built home. The "mobile home park" requirements applied to private property are discriminating against these folks, who cannot afford these extra costs.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to statement on Comment 19-45.

ARTICLE 551 — RECREATIONAL VEHICLES AND RECREATIONAL VEHICLE PARKS

(Log #219)

19- 54 - (551-2-Recreational Vehicle Site): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 19-73
RECOMMENDATION: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
PANEL STATEMENT: Refer to the substantiation on Comment 19-55.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #555)

19- 55 - (551-2-Recreational Vehicle Site): Accept
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
COMMENT ON PROPOSAL NO: 19-73
RECOMMENDATION: Continue to accept the panel action.
SUBSTANTIATION: The panel has accepted the submitter's text and substantiation on the premise that this text was the single consistent definition for the term as determined by the glossary project. The panel was also advised by a member that the document number had been changed and the panel statement reflects that. The March 2000 CD-ROM version of NFPA 1194 contains the following definitions: [Note that the text of A-1-3 is

from Appendix A and is not an actual definition]

Camping Unit. A tent or other type of portable shelter intended, designed, or used for temporary human occupancy.

Camping Unit Site. A specific area within a campground or recreational vehicle park that is set aside for uses as a temporary living site by a camping unit. [See also definitions of Recreational Vehicle Site (including A-1-3) and Recreational Unit Site.]

Recreational Unit Site. Either a recreational vehicle site or a camping unit site. [See definitions of Recreational Vehicle Site (including A-1-3) and Camping Unit Site.]

Recreational Vehicle Site*. A plot of ground within a recreational vehicle park set aside for the accommodation of a recreational vehicle on a temporary basis that can be used as either a recreational vehicle site or as a camping unit site. (See definition of Camping Unit Site.)

A-1-3 Recreational Vehicle Site. The term "recreational unit site" (see definition) is used in this standard when it is desired to describe conditions that apply equally to a "recreational vehicle site" and to a "camping unit site" (see definitions).

If the panel were to substitute the term "Camping Unit Site" in place of "Recreational Vehicle Site" as the defined term, the two documents would be even further apart. This would then entail adding a further definition of what a Camping Unit is and neither "Camping Unit" or "Camping Unit Site" mention a recreational vehicle except by a parenthetical note. All references throughout Article 551 would have to be checked in context to determine which term should be used in a particular section. I believe this would introduce too much confusion at the comment stage and may possibly introduce new material that has not had adequate public review.

PANEL ACTION: Accept.

SUBMITTER: Kent Perkins, RVIA

COMMENT ON PROPOSAL NO: 19-79

RECOMMENDATION: Revise the proposal to read as follows:

.... in the closed position or refrigerators with a 120V function shall not be...

SUBSTANTIATION: If the refrigerator has a 120V function, it does not matter if the 120V function has automatic priority over the 12V function. The customer will not use the 12V function on a nonautomatic mode selection refrigerator where the 120V function is present. 12 volts are not as efficient as 120 volts. Also, refrigerator instructions indicate 12V function is only for maintenance during travel and after cooling is accomplished. Therefore, a refrigerator with 120V function should not be included as a load when conducting converter rating calculations.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

VEENSTRA: I concur with negative ballot and comment by Mike Zieman.

ZIEMAN: The acceptance of this comment by the committee creates a dangerous and hazardous electrical installation which is unparalleled in the NEC.

First, and as background, we need to remember that the current 1999 NEC and all previous editions require that the refrigerator load be included in calculating or sizing the converter. The original proposal as submitted by Terry Current of Jayco, Inc., and accepted by the committee would exclude "refrigerators with 120-volt function priority over 12-volt function". This change can be justified since as soon as the RV is connected to 120-volts the refrigerator will automatically switch from 12-volt to 120-volt, thus the refrigerator load will never be applied to the converter.

The subject comment submitted by RVIA eliminates the automatic "function priority" and has the net effect of allowing the 12-volt refrigerator load (which is significant) to be supplied by the converter without sizing the converter for this additional load. The proponent states that this will not happen because "... the customer will not use the 12V function on a nonautomatic mode selection refrigerator where the 120V function is present." I strongly disagree that we can rely on the "customer" to replace the automatic function priority requirement. And if we do rely on the "customer" as the proponent puts forth what are the consequences of repeatable overloading the converter when the customer fails, as he surely will, to switch over to 120-volt operation?

I believe the following is a scenario which will be repeated thousands of times if we eliminate the automatic function priority requirement. The nonautomatic function priority refrigerator will be set in the 12-volt mode during travel. The RV owner then pulls into an RV site and connects his power supply cord to 120/240 forgetting to first manually switch the refrigerator to 120-volt operation. As other 12-volt loads such as space heaters, water heaters, lights, etc. kick in the converter trips its breaker or kicks out on its over temperature thermal protection. If the RV owner is bright, he may figure out why this keeps happening and start manually switching the refrigerator each time he connects to 120/240 power. The less bright owner will take his RV back to the dealer or manufacturer and ask them to fix the "problem" with the converter that keeps kicking out. Worse yet some owners will do nothing subjecting the converter to many overload cycles which could potentially damage the over temperature thermal protection leading to fires or other catastrophes.

The proponent also implies that we can rely on the customer to follow the "... refrigerator instructions..." which state to only use the 12-volt mode in travel, etc. I do not believe this is prudent.

Lastly, I would like to draw an analogy and ask a rhetorical question. Would we allow two 15-amp air conditions to be placed on a single 20-amp circuit based solely upon reliance on the "customer" to follow inconspicuous "instructions" to only operate one unit at a time?

Currently, the 12-volt refrigerator load is always included in sizing the converter. The original proposal allows a justifiable exception when the refrigerator has automatic function priority. The proposal put forth in the comment from RVIA will create a hazard not to mention thousands of RV owners inconvenienced by converters which keep kicking out. If the RV manufacturer wants to exclude the 12-volt refrigerator load from the converter let him spend the few extra dollars to upgrade the refrigerator from nonautomatic function priority to automatic function priority.

(Log #289)

19- 57 - (551-20(c)): Accept in Principle

SUBMITTER: Kent Perkins, RVIA

COMMENT ON PROPOSAL NO: 19-80

RECOMMENDATION: Accept original proposal but change to the unit shall ~~should~~ be provided...

SUBSTANTIATION: The original proposal prevents a potentially unsafe situation concerning the path of fault currents in specific situations and should be accepted.

PANEL ACTION: Accept in Principle.

Revise 551-20(c) to read:

(c) Bonding Voltage Converter Enclosures. The noncurrent-carrying metal enclosure of the voltage converter shall be bonded to the frame of the vehicle with a minimum 8 AWG copper conductor. The voltage converter shall be provided with a separate chassis bonding conductor that shall not be used as a current carrying conductor.

PANEL STATEMENT: The comment is accepted, and the second sentence is revised editorially for clarity.

19- 58 - (551-44): Reject

SUBMITTER: Kent Perkins, RVIA

COMMENT ON PROPOSAL NO: 19-83

RECOMMENDATION: Reject the panel action to change this paragraph.

SUBSTANTIATION: There is nothing unsafe about an RV having two (or more) properly installed power supply assemblies. The lack of proper service to supply RVs with increasing overall load capacities should be corrected by a change in the park service(s), not the RV. The market has already shown that customers desire RVs with higher total electrical load capacity, and increased service capability at the parks is needed.

PANEL ACTION: Reject.

PANEL STATEMENT: The use of more than one power supply assembly can overload the conductors for the site services. It would also nullify Table 551-73.

COMMENT ON AFFIRMATIVE:
SABIN-MERCADO: The requested change could be supported if a proposal(s) were submitted and approved to amend Section 551.73 and Table 551.73 as needed for the 2005 NEC.

(Log #2389)

19- 59 - (551-44): Reject
SUBMITTER: John Nelson, Alfa Leisure Inc.
COMMENT ON PROPOSAL NO: 19-83
RECOMMENDATION: I urge the panel to reject the recommendation to revise (551-44) adding, "Each recreational vehicle should have one and only of the following main power supply assemblies.
SUBSTANTIATION: If a recreational vehicle park wants to assure that consumers do not exceed the calculated load at a park, it is a simple and low cost matter to use a disconnecting means rated to the highest rated receptacle at the site. The proliferation of adapters and other "cheaters" that are not listed cannot be controlled by RV manufacturers or parks and are a fact of life.
More than one power assembly can be installed on an RV and be safe following existing code. Restricting RV manufacturers from supplying more than one power assembly is not the solution. If there is a safety problem, it is on the line side of the site, and it is the responsibility and under the control of the park.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to Comment 19-58.

19- 65 - (551-77(d)): Accept
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
COMMENT ON PROPOSAL NO: 19-115
RECOMMENDATION: Continue to accept panel action.
SUBSTANTIATION: The panel did not wish to increase the height allowance to 6 ft 7 in. at this time based solely on the submitter's recommendation. The desire for consistency with 380-8(a) contemplated by the submitter and the Technical Correlating Committee while admirable, may not be the entire issue here. 380-8(a) deals only with switches and circuit breakers used as switches whereas the site supply equipment covered in 551-77(d) may, and will probably, consist of more than just a switch or circuit breaker. RVs are plug-in units and the power outlets provided for this purpose are by definition part of the supply equipment. Introducing a change at the comment stage to raise the height of this entire assembly would in my opinion, introduce new material that has not had sufficient public comment. Relates to this, the panel should probably look at 551-77(c) as well since the section requires a minimum access height of 6 1/2 feet with no language to take into account a greater height of equipment as is done in 110-26(e). This whole issue should be dealt with for the 2005 cycle and the panel should introduce language that clarifies what part of the site equipment the height restriction applies to. Finally, the whole metrication issue raises some possible inconsistencies where the SI unit of 2.0 m equals 6 ft 6 in. in some sections and 6 ft 7 in. in others. I believe that all of the instances of 6 ft 6 in. in the code relate to height requirements and the Technical Correlating Committee or the Usability Task Group should decide what dimension we should be referencing.

19- 72 - (550-2-Manufactured Home): Accept

SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ

COMMENT ON PROPOSAL NO: 19-39

RECOMMENDATION: Change panel action to accept in principle and revise the text as follows:

Manufactured Home. A structure, transportable in one or more sections, that is ~~8 body ft (24.4 cm)~~ 24.4 cm (8 body ft) or more in width or ~~40 body ft (1219 cm)~~ 1219 cm (40 body ft) or more in length in the traveling mode or, when erected on site, is ~~320 ft (28 m2)~~28m^2(320 ft^2) or more; which is built on a chassis and designed to be used as a dwelling, with or without a permanent foundation, when connected to the required utilities, including the plumbing, heating, air conditioning, and electrical systems contained therein. Calculations used to determine the number of ~~sq ft~~ square meters (square feet) in a structure will be based on the structure's exterior dimensions, measured at the largest horizontal projections when erected on site. These dimension include all expandable rooms, cabinets, and other projections containing interior space, but do not include inside bay windows.

For the purpose of this code, and unless otherwise indicated, the term mobile home includes manufactured homes.

SUBSTANTIATION: The revisions reflect the direction of the Technical Correlating Committee with regards to metrication. The panel's intent was to replace the technical definition of manufactured home found in 550.2 and retain the additional language of the last sentence from the existing definition.

PANEL ACTION: Accept.

1. Accept and revise the metric units as follows:
   2.5 m (8 body ft)
   12 m (40 body ft)
   30 m2 (320 ft2)
2. FPNs unchanged

BAUMAN: The NEC reference for this comment should be 551-10(a) not 555-10(a).

LAROCCA: The heading should refer to Section 551-10(a) through (h) rather than 555-10(a) through (h).

(Log #1472)

19- 74 - (555-11(a)): Reject

SUBMITTER: Vincent J. Saporita, Cooper Bussmann

COMMENT ON PROPOSAL NO: 19-135

RECOMMENDATION: This part should be rejected.

SUBSTANTIATION: This is a restraint of trade.

There is no technical substantiation provided to exclude the use of fuses for this application. There are applications where fuses provide the only acceptable overcurrent protection, such as for HVAC equipment where the nameplate shows a "maximum fuse size". There are other applications where fuses are used as part of tested, listed, and marked series rated systems. To disallow fuses for these applications will create a hardship for the contractor and owner. Finally, 90-1(b) already states that provisions of the Code man not necessarily be convenient, so this proposed exclusion of fuses to avoid the difficulty of replacing them has no place in the Code.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel has made its decisions on a safety basis, as has the NFPA 303 committee on the same subject.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9

VOTE ON PANEL ACTION:

AFFIRMATIVE: 8

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

MCNEIVE: Correlation with NFPA 303 is not sufficient substantiation for this change. The substantiation behind the requirement in 303 has not been brought forward to Code-Making Panel 19. Convenience does not in any way substantiate the elimination of proven technology when it does not benefit safety. This is in effect what this change would accomplish.

(Log #558)

19- 75 - (555-12): Accept

SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ

COMMENT ON PROPOSAL NO: 19-135

RECOMMENDATION: Revise 555.12 as follows:

555.12 Load Calculations for Service and Feeder Conductors. General lighting and other loads shall be calculated in accordance with Article 220 and in addition ~~T~~ the load for each service and/or feeder circuit supplying receptacles that provide shore power for boats shall be calculated using the demand factors shown in Table 555.12. These calculations shall be permitted to be modified as indicated in notes (1) and (2). ~~General lighting and other loads shallb e calculated in accordance with Article 220. The minimum rating and size of conductors shall comply with Article 215 or Article 230 as applicable.~~

SUBSTANTIATION: Added text to the beginning of the sentence is done to comply with the Technical Correlating Committee direction and NEC Style Manual. Section 4.1.1 allows a reference to an entire article where additional requirements are specified. This is the case here. 555.12 contains specific requirements for determining the load of the shore power receptacles which are meant to be added to any other loads as determined from Article 220. The last sentence dealing with the minimum rating and size of conductors is deleted as it is redundant. There is nothing in Article 555 that modifies the basic minimum size and rating requirements from Articles 215 or 230 so the requirement is covered by 90.3.

PANEL ACTION: Accept.

19- 77 - (555-19): Reject
SUBMITTER: John Wirtz, Midwest Electrical Products
COMMENT ON PROPOSAL NO: 19-135
RECOMMENDATION: Add to 555.19 "The area below the receptacles shall be free of any other component (switch or circuit breaker handle, receptacle, or the like), the access to which would be blocked by the flexible cord (Shore Power Cord) attached to the receptacle."
SUBSTANTIATION: This change is based on UL 231 Power Outlets 8.2.8 which states that a receptacle other than the duplex type that is mounted with its face in a vertical plane shall be positioned so that the grounding contact is at the top and the area below the receptacle shall be free of any other component (switch or circuit breaker handle, receptacle, or the like), the access to which would be blocked by the flexible cord attached to a right-angle attachment plug. I believe that UL placed this in UL 231 to make sure there is not an obstruction to the disconnect or any other device when a right angled attachment plug is used. With the addition of the 555.19(2), the face position will not be mounted in the vertical position, to allow for strain relief. But, with this improved design, the shore power cord will hang close to the Marine Power Outlet, similar to a flexible cord attached to a right-angled plug. With this change, the cord could obstruct access to any component (switch or circuit breaker handle, receptacle, or the like).
PANEL ACTION: Reject.
PANEL STATEMENT: The commentors concerns are covered by the product standards. See Section 110-3(b).

COMMENT ON AFFIRMATIVE:
MCCULLOUGH: The panel statement should be clarified to indicate that Code-Making Panel 19 is using the language from NFPA 303 for consistency. It is not a formal extract. Code-Making Panel 19 wishes to remain the cognizant authority for the language contained in Article 555 with respect to electrical requirements.

(Log #554)

19- 80 - (555-19(a)(2)): Accept
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
COMMENT ON PROPOSAL NO: 19-135
RECOMMENDATION: Revise 555.19(A)(2) as follows:
(2) Strain Relief. Means shall be provided where necessary to reduce the strain on the plug and receptacle caused by the weight and catenary angle of the shore power cord ~~, by either of the following methods:~~
~~(1) The receptacle face shall be at any angle from horizontal to 65 degrees below horizontal. See Figure 555.19(A)(2)(1).~~
Delete Figure 555.19(A)(2)(1).
~~(2) Separate mechanical strain relief which will not damage the shore power cord.~~
SUBSTANTIATION: The section of NFPA 303 (3-14.1) that was the basis for this language has been modified by the NFPA 303 committee for the 2000 edition of that standard. The requirements for strain relief either by providing separate mechanical means or by installing the outlet at an angle have been deleted. Much of the argument centered on the issue of the angle to be used, whether this placed an undue restriction upon the manufacturers of certain marine equipment, and if in fact installing the receptacles in the vertical position actually caused a safety problem with the cords. Since CMP 19 was not privy to all of the discussion it would seem prudent to not require such specific requirements in the NEC. The NFPA 303 Committee did, however, retain the concept of providing some form of strain relief. They opted to include an appendix note in A-3-14 as follows: "A-3.14.1 Considerations should be made to reduce the hazards resulting from opening and misalignment of plug/receptacle connections caused by the strain to receptacles intended to supply shore power to boats due to the weight and catenary of the shore power cable. Such considerations may include the installation of receptacles with faces angled in a direction to reduce the strain of the cable, reinforcement of the receptacle, other means to support the cable when such connections are made, or be properly attaching the plug." The accompanying panel statement reads as follows: "The Committee accepted the recommendation to delete the proposed requirement in this section. The committee remains concerned with the possibility of problems caused by the strain resulting from connected shore power cables or inadequately supported shore power cables. This appendix offers some guidance to users of this

standard without being in the form of a mandatory requirement."
It is obvious that the possibility of damage to cords, plugs, and receptacles exists and the language used in the revised text will require that the Authority Having Jurisdiction make a determination of whether or not some form of strain relief is required based on that particular installation. Some people may say that this language is unenforceable but in reality it is no different from many other rules in the code such as protecting a wiring method from physical damage. In those cases the Authority Having Jurisdiction makes a determination based on the specifics of that installation and that particular set of circumstances. I believe it more than logical to apply this concept to this very real possibility. While not offering this as part of my comment, it may be advisable to include the language from the A-3.14.1 appendix note in this section as a fine print note to provide guidance to the Authority Having Jurisdiction with regard to the possible problem and some of the solutions.

COMMENT ON PROPOSAL NO: 19-135
RECOMMENDATION: Delete the following text:
~~Strain Relief. Means shall be provided to reduce the strain on the plug and receptacle caused by the weight and catenary angle of the shore power cord by either of the following methods:~~
SUBSTANTIATION: There is no justification for this requirement. If this were a problem, an angling requirement would have been imposed on boat manufacturers. There are literally tens of thousands of power outlets which have been in use for many years with no means to reduce the strain on the plug and with no apparent safety problem. This "problem" appears to be a marketing scheme rather than a safety issue. Please see memorandum I have provided (Memorandum not provided with comment). This issue was also addressed in TIA No. 492 issued by the Standards Council on October 1, 1996. This issue was also addressed by the NFPA 303 Committee which deleted this language from the text and added Appendix Note to 303-20-(3-14.1(b)) with the following language:
A-3-14.1 Considerations should be made to reduce the hazards from opening and mis-alignment of plug/receptacle connections caused by the strain to receptacles intended to supply shore power to boats due to the weight and catenary of the shore power cable. Such considerations may include the installation of receptacles with faces angled in a direction to reduce the strain of the cable, reinforcement of the receptacle, other means to support the cable which such connections are made, or by properly attaching the plug.
If NFPA 70, Article 555, is to conform with NFPA 303, the proposed language should be deleted.
PANEL ACTION: Reject.

19- 84 - (555-19(a)(2)1): Accept
SUBMITTER: McClanahan Ingles, Sea Technology, Inc.
COMMENT ON PROPOSAL NO: 19-135
RECOMMENDATION: Delete the following text:
~~The receptacle face shall be at any angle form horizontal to 65 degrees below horizontal. See Figure 555.19(A)(2)(1).~~
SUBSTANTIATION: If NFPA 70, Section 555.19(A) is to conform with NFPA 303-22-(3-14.1(b).1), the action of that committee in deleting this language is important to review. The following are my comments to the 303 Committee:
As NFPA 303 Committee member Mr. Roberts noted in his comment, there is no substantiation that existing power outlets placed in a vertical orientation and used with proper weatherproof boots are not dangerous or problematic. Therefore, the Committee should not consider adopting this language. Furthermore, the Committee's comments would leave one to believe that the Committee was changing only the degrees from 55 degrees to 65 degrees, however, the NFPA 303 Committee changed the language to change the method of measurement of the angle. Prior to TIA No. 492, the Committee had adopted language that required the receptacle to face downward at any angle from horizontal to 55 degrees above horizontal. The new proposal contains a requirement that the receptacle face at any angle from horizontal to 65 degrees below horizontal. The Committee's statement appears to ignore this distinction. In addition, there appears to be no justification for requiring adherence to any particular angle as stated in Committee member Roberts' comments. This issue was also addressed by the Standards Council in TIA No. 492. This was corrected by the NFPA 303 Committee. Please note current wording of NFPA 303-22-(3-14.1(b).1) which deleted the proposed language. If NFPA 70, Article 555 is to conform with NFPA 303, the proposed language should be deleted.
PANEL ACTION: Accept.

COMMENT ON PROPOSAL NO: 18-101
RECOMMENDATION: This proposal should have been rejected.
SUBSTANTIATION: I have reproduced the submitter's test and get the identical graph that was submitted to the panel to substantiate this request. The electrical field generated in all four cases are approximately identical. The only change was to the duration of the ringing voltage time that field remained high. GTO cable will not in any way reduce this field. The test shows this. If the panel wishes, we can set up this identical test for them when they meet here in Phoenix, AZ. Test invalid.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 18-48.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:

KIEFFER: 1. The submitters of 18-44, 18-45 and 18-48 provided no technical substantiation with their comments or any supplemental written material prior to the meeting for our study and consideration. I personally called one of the submitters and requested this information. It was not provided. This alone should have been sufficient to reject these proposals.

2. The submitters were permitted to make an oral presentation to the panel. During that presentation they claimed to have replicated some of the testing used to develop Proposal 18-101 yet they submitted no technical data from their testing, photographs or other proof that the testing occurred. When questioned regarding one of the tests, their responses clearly indicated this was not a duplication of the original testing. They answered that the tubing was not flickering. Flickering neon tubing is caused by a continuous capacitance state and would have occurred if they duplicated the test. The lack of this visual indication is clear evidence that they did not duplicate the original test.

They claimed to have obtained test setup information from me. As I stated, that was a false claim. Mr. Recnsock and Mr. Yee called me months ago, asking general questions about my testing and results. They never requested information concerning the test setup and how to replicate those tests.

3. The submitters did testify that the secondary circuit(s) they tested did begin failing. As I recall they stated, within 30 minutes after starting their test. Their presentation focused on redirecting our attention from a secondary circuit failure due to overloading, towards questioning the validity of a properly developed ANSI standard for GTO: a standard which has recently been revised with more restrictive test conditions. Yet, they offered no real evidence to indicate that this standard is faulty. Their convoluted "logic" appears to be that if you place GTO in a secondary circuit that is improperly designed with an overload condition, and the GTO fails, then there must be something wrong with the standard for that conductor. This "logic" would be true for every conductor in use in every circuit covered by the code.

4. During the 1996 code cycle, the panel action on Article 600 would have resulted in no code sections specifying maximum lengths of conductor in conduit for secondary circuits. The panel's logic was that this issue was a system design concern which should not be addressed in the code. That panel position was overturned on appeal by the standards council. Restrictions to the length of conductor in conduit were included in Article 600. It appears clear to me, that although there may be additional provisions in the code which also address electrical safety, secondary circuit design is a valid area which should be of concern to the panel and when there is clearly demonstrated circuit failure appropriate restrictions should be included in the code.

We must ignore the attempts to redirect our efforts towards criticism of UL and valid ANSI standards. The submitter's discussed on this subject is void of valid logic. We're left with a verbal presentation which confirms the existence of an overload circuit that fails rapidly. The presentation is clearly in support of adoption of the original proposal, and does not support their submitted written comments. In addition, they stated that their testing focused on neon filled tubing because that is where they believe the major problems occur. Therefore, their presentation is in support of acceptance of Comment 18-46 which was submitted on behalf of the International Sign Association.

Proposal 18-101 and Comment 18-46 will result in a secondary circuit load that passes the transformer manufacturers' load test when the minimum specified length of neon filled tubing is installed on a grounded metal surface, with listed insulated tube supports, with 10 feet of GTO in 1/2 in. flexible metal conduit from each high-voltage terminal to the first tube, and with short lengths of GTO in metal conduit providing the wiring connection between each tube. This would define, for example, normal field installed skeleton tubing mounted on a metal building. Any additional length of GTO in conduit to the first tube would result in a necessary reduction in total tubing length below the lengths listed in the transformer manufacturers' footage charts.

Part B of Article 600 only covers unlisted field installed skeleton tubing. An ANSI standard, which might include detailed circuit loading instructions, is not available. It is therefore prudent to structure Part B to provide proper guidance to AHJs and tubing installers to avoid overloaded conditions during the most hazardous, normally expected installation.

Comments 18-44, 18-45 and 18-48 must be rejected and Comment 18-47 must be accepted.

(Log #1513)

(Log #1796)

18- 47 - (600-32(j)): Reject
SUBMITTER: Stephen G. Kieffer, Randall K. Wright, Kieffer & Co., & 21st Century Signs
COMMENT ON PROPOSAL NO: 18-101
RECOMMENDATION: At the end of (j)(1)(a) insert "which is supplying power to neon tubing filled exclusively with Neon or Helium gas or a mixture of those two gases." So the section will read:
"(j) Length of Secondary Circuit Conductors.
(1) Secondary conductor to the first electrode. The length of secondary conductors from a high voltage terminal or lead of a transformer or electronic power supply to the first neon tube electrode shall not exceed:
(a) 3 m (10 ft.) when installed in metal conduit or tubing for a transformer or electronic power supply rated 45 ma or less which is supplying power to neon tubing filled exclusively with Neon or Helium gas or a mixture of those two gases.
(b) 6 m (20 ft) when installed in metal conduit or tubing for a transformer or electronic power supply rated greater than 45 ma.
(c) 15 m (50 ft.) when installed in nonmetallic conduit.
(2) Other secondary circuit conductors. All other sections of secondary circuit conductor in a neon tube circuit shall be as short as practicable."
SUBSTANTIATION: The original documentation submitted with the ROP clearly displays operating differences between neon gas filled tubing and mercury tubing. Industry experience has shown that only neon filled tubing, when operated with long lengths of GTO in metal conduit, results in potentially hazardous circuits. The high voltage spikes depicted in the oscilloscope displays of neon filled tubing included with the ROP substantiated field experience.
The original ROP did not consider this distinction between neon and mercury tubes in the belief that AHJs might have difficulty in distinguishing between the various gas used in neon tubing. In fact, neon tubes are easily distinguished as the gas produced a unique, easily identifiable red color.
Further feedback from the industry has resulted in this comment, which recommends that the code must recognize this distinction and only limit the installations which include neon tubing filled with neon or helium gas. Mercury tubing does not present a hazard when operated with conductors in metal conduit in lengths up to 20 feet. The ROP did not contain substantiation for restricting mercury tubing.
Helium is four times as resistant as neon, and although not commonly used in commercial application, must be included in this restriction for those rare cases where it is used.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to panel action and statement on Comment 18-48.

KIEFFER: See my explanation of negative vote on Comment 18-44.

(Log #2131)

18- 48 - (600-32(j)): Accept in Principle
Note: The Technical Correlating Committee understands that the panel action on this Comment is the final action on this section, including the addition of the words "or lead" after the word "terminal" in (1).
SUBMITTER: David Yee, Scottsdale, AZ
COMMENT ON PROPOSAL NO: 18-101
RECOMMENDATION: The proposal should be rejected because the data submitted (waveform photos) does not substantiate the proposals to decrease the length to 10 ft.
SUBSTANTIATION: The waveforms show that the peak to peak voltage did not change. There were no differences in voltage with a reduction in length of cable.
PANEL ACTION: Accept in Principle.
Revise the text in Section 600.32(J) to read as follows:
"(J) Length of Secondary Circuit conductors.
(1) Secondary conductor to the first electrode. The length of secondary circuit conductors from a high voltage terminal of a transformer or electronic power supply to the first neon tube electrode shall not exceed:
(a) 6m (20 ft.) when installed in metal conduit or tubing.
(b) 15m (50 ft.) when installed in nonmetallic conduit.
(2) Other secondary circuit conductors. All other sections of secondary circuit conductor in a neon tube circuit shall be as short as practicable."
PANEL STATEMENT: The submitter made a presentation at the ROC meeting convincing the panel to retain the text from the 1999 NEC.
It appears that certain issues in the present use of GTO cable in electric sign installations (sharp bends, sharp/point contact, homogeneity of the cable insulation material, concentrated ozone environment within the conduit and installation instructions provided by the transformer manufacturers as related to GTO installation) are not fully addressed in the current standard UL 814 and UL 2161. CMP 18 recommends UL review these issues and consider further revisions to UL 814 and UL 2161 to address them.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
KIEFFER: See my explanation of negative vote on Comment 18-44.

COMMENT ON AFFIRMATIVE:
PIERCE: Before this article is revised further, substantive third party data needs to be generated regarding the issues of length of GTO, conduit size/length and material, and length of tubing and transformer capacity. I further suspect that the GTO cable standard UL 814 is still not anticipating or addressing all of these issues.

ARTICLE 604 — MANUFACTURED WIRING SYSTEMS

(Log #224)

19- 87 - (604-6, Exceptions No. 4 through No. 9): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 19-150
RECOMMENDATION: The Technical Correlating Committee notes that the word "clause" will be deleted. The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual 3.1.4 relative to the excessive use of Exceptions. The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal regarding the cables added in the Exception to 604-6(a)(1) and (2). This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
PANEL STATEMENT: Refer to comment 19-90.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #2262)

19- 88 - (604-6 Exception No. 3): Reject
SUBMITTER: Don Miletich, Cooper Lighting Div.
COMMENT ON PROPOSAL NO: 19-149
RECOMMENDATION: Change the proposed wording to exclude electric-discharge fixtures since they are covered by Section 410-30(c). Item 3 of the proposed wording should read as follows:
(3) Flexible Cord ~~Exception No. 3 to (1) and (2):~~ Flexible cord suitable for hard usage, with minimum No. 12 conductors, shall be permitted as part of a listed factory-made assembly not exceeding 6 ft (1.83 m) in length when making a transition between components of a manufactured wiring system and utilization equipment (excluding electric-discharge fixtures covered by 410-30(c), not permanently secured to the building structure. The cord shall be visible for its entire length and shall not be subject to strain or physical damage.
SUBSTANTIATION: The addition of this exception in the 1999 edition of the NEC has created confusion in the field with electrical inspection authorities in that this requirement is being interpreted as applying to electric-discharge lighting fixtures even though Section 410-30(c) has no limitation on cord length or wire gauge. The reason this exception was added in the 1999 code cycle is to permit the use of flexible cords as branch circuit extensions when connecting displays and other portable products that are typically provided with outlets (See 1999 NEC Handbook). Equipment covered by Section 410-30(c) is listed equipment of known electrical load. Therefore, there is no reason to limit its use to 6 ft and 12 AWG. Proposed wording change would clarify original intent of this article.
PANEL ACTION: Reject.
PANEL STATEMENT: Insufficient substantiation is provided to expand the use of flexible cords in manufactured wiring systems.
The original intent of the article was not to allow manufactured wiring systems consisting of flexible cords for this application.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #2275)

19- 89 - (604-6(3), Exception (New)): Reject
SUBMITTER: Richard Bauman, City of Kenosha Electircal Inspection
COMMENT ON PROPOSAL NO: 19-149
RECOMMENDATION: Add exception for (3) Flexible Cord:
Exception No. 1: A luminaire (fixture) tap, maximum 1.8 m (6 ft) long, intended for connection to a single luminaire (fixture) shall be permitted to contain conductors smaller than 12 AWG but not smaller than 18 AWG.
SUBSTANTIATION: Since flexible cord has been approved as a wiring method, the above exception should be added to promote uniformity with the wiring methods of 604-6. There is no justification for the limitation of the flexible cord wiring method as compared to flexible metal conduit with this type of installation.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to Comment 19-88.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #573)

19- 90 - (604-6(a)(1)and 2): Accept
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
COMMENT ON PROPOSAL NO: 19-150
RECOMMENDATION: Revise 604.6(A)(1) and (2) as follows:
(1) Cables. Cable shall be listed armored cable or metal-clad cable containing nominal 600-volt 10 or 12 AWG copper-insulated conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.
Other cables as listed in 725.61, 800-50, 820-50, and 830-5 shall be permitted in manufactured wiring systems for wiring of equipment within the scope of their respective articles.
(2) Conduits. Conduit shall be listed flexible metal conduit or listed liquidtight flexible conduit containing nominal 600-volt 10 or 12 AWG copper-insulated conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.
Exception No. 1 to (1) and (2): A luminaire (fixture) tap, maximum 1.8 m (6 ft) long, intended for connection to a single luminaire (fixture) shall be permitted to contain conductors smaller than 12 AWG but not smaller than 18 AWG.
Exception No. 2 to (1) and (2): Conductors smaller than 12 AWG shall be permitted for remote-control, signaling, or communications circuits. The assembly shall be listed for the purpose.
~~Exception No. 3 to (1) and (2) Cables listed in 725.61 shall be permitted for wiring of devices and appliances identified in Article 725.~~
~~Exception No. 4 to (1) and (2): Cables listed in 800.50 shall be permitted for wiring of equipment identified in 800.1.~~
~~Exception No. 5 to (1) and (2): Cables listed in 820.50 shall be permitted for wiring of equipment identified in 820.1.~~
~~Exception No. 6 to (1) and (2): Cables listed in 830.5 shall be permitted for wiring of equipment identified in 830.1.~~
SUBSTANTIATION: Exceptions are deleted to comply with Technical Correlating Committee direction and the NEC Style Manual. The added last sentence to (A)(1) incorporates the intent of the exceptions which was to recognize that there are Manufactured Wiring Systems made which utilize cable types conforming to Articles 725, 800, 820, and 830. These systems are for use with equipment covered in the scope statements of the respective articles.
PANEL ACTION: Accept.

ARTICLE 605 — OFFICE FURNISHINGS (CONSISTING OF LIGHTING ACCESSORIES AND WIRED PARTITIONS)

(Log #372)

18- 49 - (605-8(c)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 18-112
RECOMMENDATION: Accept in principle revised: (c) Individual partitions or groups of partitions shall not contain more than ten ~~thirteen~~ single or multiple receptacles ~~15-ampere 125-volt receptacle outlets~~ where supplied by a cord terminated with a 15-ampere rated attachment plug, nor more than thirteen single or multiple receptacles where supplied by a cord terminated with a 20-ampere rated attachment plug. Receptacles shall be rated 15-amperes 125-volts where the attachment plug is rated 15-amperes, and 15- or 20-amperes 125-volts where the attachment plug is rated 20-amperes. The computed load for the circuit supplying the partitions shall be in accordance with 220-3(b)(9) based on the number of receptacles contained in the partition(s).

FPN: See 210-21(b)(1) where a single partition receptacle is installed on an individual branch circuit.
SUBSTANTIATION: The panel statement that the partition is "likely to be" connected to a 15-ampere circuit is conjecture. The minimum No. 12 cord specified in (a) is suitable for a 20-ampere circuit. This section doesn't preclude either a 15 or 20-ampere circuit.

The limiting number "thirteen" appears based of 180va per receptacle which equals 2340 va, which is the receptacle limit for a 20-ampere circuit, while the limit for a 15-ampere circuit is ten receptacles. Where partitions of 605-6 and 605-7 are installed these total limits would apply whether or not connected to a separate circuit. They don't have any restrictions to 15-ampere receptacles. Section 605-2(b) would apply 210-21(b).

Thirteen outlets does not limit the number of receptacles and may be interpreted as modifying 220-3(b)(9). If the maximum number of outlets each contained two receptacles there would be a total of twenty-six, in violation of 210-19(a) if 220-3(b)(9) applies.

The proposal correlates the number and ratings of receptacles with the rating of attachment plug and proposes a load computation which excludes the supply receptacle since it is provided primarily to permit relocation of partitions. The proposed FPN clarifies that a partition with only a single receptacle supplied by a 20-ampere circuit requires a 20-ampere rated receptacle.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided any additional technical substantiation with his comment.

COMMENT ON AFFIRMATIVE:
PIERCE: Before this Article is revised further, substantive third party data needs to be generated regarding the issues of length of GTO, conduit size/length and material, length of tubing and transformer capacity. I further suspect that the GTO cable standard UL 814 is still not anticipating or addressing all of these issues.

ARTICLE 610 — CRANES AND HOISTS

(Log #128)

7- 125 - (610-11): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 12-15
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 7 to correlate the action in Article 333. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Delete 333-4(5) [(333-12(5),in Proposal 7-89a)].
PANEL STATEMENT: This action correlates with the permission to use Type AC cable in 610-11.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #626)

12- 5 - (610-11): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 12-15
RECOMMENDATION: Accept in principle revised:

Wiring Method. Conductors shall be enclosed in raceways or be Type AC cable with insulated grounding conductor, Type MC cable, or Type MI cable unless otherwise permitted or required in (a) through (e).

(a) No change
(b) No change
(c) Where flexible connections are necessary to motors and ~~similar~~ equipment, flexible stranded conductors shall be installed in flexible metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, multiconductor flexible cord ~~cable~~ or an approved nonmetallic enclosure.
SUBSTANTIATION: Where flexible connections are necessary (c) does not permit stranded conductors but requires them. What equipment is "similar" to motors? "Otherwise permitted" multiconductor cable of (c) seems to exempt requirements of the first paragraph and includes stranded conductors of NM or SE cables. Subsection (e) and 610-13(c) suggest that multiconductor cord is intended.
PANEL ACTION: Accept in Principle in Part.
The panel accepts the addition of the words "or required" in the first part of the comment. The panel accepts in principle part (c) of the comment and revises text to read as follows: "Where flexible connections are necessary, flexible stranded conductors shall be used. Conductors shall be in flexible metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, multiconductor cable, or an approved nonmetallic flexible raceway."

The panel rejects the proposed change of the word "cable" to "flexible cord".
PANEL STATEMENT: The panel accepts the submitter's concerns that part (c) does not "permit" flexible stranded conductors, but "requires" them. The revision made by the panel clarifies that this section requires flexible stranded conductors.

The panel does not accept the submitter's concerns regarding the use of the words "flexible cord" rather than "cable". It is the intent of this section to permit cable and not restrict it to flexible cord.

COMMENT ON PROPOSAL NO: 12-42

RECOMMENDATION: Request that the panel reconsider its action and accept Proposal 12-42.

SUBSTANTIATION: The current NFPA-70, NEC, Article 620 does not address the new type elevator installations covered in the ASME, A17.1 Elevator Safety Code. The terms "control rooms" and "control spaces" are presently used in the A17.1 Elevator Safety Code. The elevator industry understanding of these terms is as follows:

Control Room - A fully enclosed control space outside the hoistway, intended for full bodily entry by authorized personnel only, which contains the elevator motor controller. The room may also contain associated elevator electrical and/or mechanical equipment, except for the elevator driving machine or the hydraulic machine in the case of a hydraulic elevator.

NOTE: See figure 1 *

Control Space - A space inside or outside the hoistway, intended to be accessed with or without full bodily entry by authorized personnel only, which contains the elevator motor controller. This space may also contain associated elevator electrical and/or mechanical equipment, except for the elevator driving machine or the hydraulic machine in the case of a hydraulic elevator.

NOTE: See Figure 2 *

* These figures depict only a few examples and are not to be construed as the only possible configurations. The addition of these terms to the NEC are intended to make sure that the Electrical Code addresses those installation configurations that are addressed in the A17.1 Elevator Safety Code. The terminology used in Article 620 should reflect the terminology used in A17.1.

12- 19 - (620-25-Control Room, Control Space, Machinery Space (New)): Accept

SUBMITTER: Nick Marchitto, Otis Elevator Co./Rep. National Elevator Industry Inc. (NEII)

COMMENT ON PROPOSAL NO: 12-45

RECOMMENDATION: Request that the Panel reconsider a portion of its action and accept Proposal 12-45 in part (b) concerning the use of the words "control room" and "control space".

SUBSTANTIATION: The current NFPA-70, NEC, Article 620 does not address the new type elevator installations covered in the ASME, A17.1 Elevator Safety Code. The terms "control rooms" and "control spaces" are presently used in the A17.1 Elevator Safety

Code. The elevator industry understanding of these terms is as follows:

Control Room - A fully enclosed control space outside the hoistway, intended for full bodily entry by authorized personnel only, which contains the elevator motor controller. The room may also contain associated elevator electrical and/or mechanical equipment, except for the elevator driving machine or the hydraulic machine in the case of a hydraulic elevator.
NOTE: See figure 1 *

Control Space - A space inside or outside the hoistway, intended to be accessed with or without full bodily entry by authorized personnel only, which contains the elevator motor controller. This space may also contain associated elevator electrical and/or mechanical equipment, except for the elevator driving machine or the hydraulic machine in the case of a hydraulic elevator.
NOTE: See Figure 2 *

* These figures depict only a few examples and are not to be construed as the only possible configurations. The addition of these terms to the NEC are intended to make sure that the Electrical Code addresses those installation configurations that are addressed in the A17.1 Elevator Safety Code. The terminology used in Article 620 should reflect the terminology used in A17.1.

In support of the proposal for a new section 620-25, reference is made to existing terms used in both the NEC and the A17.1 Codes:

Machine Room - A fully enclosed machinery space outside the hoistway, intended for full bodily entry by authorized personnel only, which contains the elevator driving machine or the hydraulic machine in the case of a hydraulic elevator. The room may also contain associated elevator electrical and/or mechanical equipment.
NOTE: See figure 3

Machinery Space - A space inside or outside the hoistway, intended to be accessed with or without full bodily entry by authorized personnel only, which contains elevator mechanical equipment, and may also contain associated elevator electrical equipment. This space may also contain the elevator driving machine.
NOTE: See previous figures 1 & 2

These figures depict only a few examples and are not to be construed as the only possible configurations.

Note: Supporting material is available for review at NFPA Headquarters

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NOT RETURNED: 2 Kelley, Laney

COMMENT ON AFFIRMATIVE:

MARCHITTO: In the original Proposal 12-48, the wording from the 1999 NEC (620-44) was inadvertently miscopied in creating the proposal. This erroneous wording has been carried through to the ROC Panel Action and was never noticed. I did not discover the incorrect wording until after I sent in my affirmative vote on the ROC ballot. I firmly believe that the panel acted in good faith on the proposal and would not object to correcting the original 1999 NEC wording in that part of the code that is not being changed.

Therefore, in Comment 12-22 change the words "Traveling cables shall be continued to be permitted..." to "Traveling cables shall be permitted to be continued...".

This is the correct wording as it appears in the 1999 NEC and should appear in the 2002 NEC. The transposed words "continued to be permitted" was never intended by the submitter (alas, it was I) to be a change and to be a part of the proposal.

(Log #1904)

12- 23 - (620-51(a)): Accept

SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers

COMMENT ON PROPOSAL NO: 12-49

RECOMMENDATION: Accept this proposal in principle.

Replace "430-109 Exception No. 3" with "430-109 (c)". The rest of the proposal remains unchanged.

SUBSTANTIATION: The intent of this proposal has merit. It provides a disconnecting means within sight of the wheelchair lift. Unfortunately, the submitter accidentally referenced material from the 1996 NEC. The above suggested change references the 1999 NEC.

This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NOT RETURNED: 2 Kelley, Laney

(Log #2365)

12- 24 - (620-51(a)): Accept in Principle

SUBMITTER: Monte R. Ewing, State of Wisconsin

COMMENT ON PROPOSAL NO: 12-49

RECOMMENDATION: The disconnecting means shall be an enclosed externally operable fuses motor circuit switch or circuit breaker. Where an individual branch circuit supplies a wheelchair lift, the disconnecting means shall be permitted to comply with 430-109. Disconnects shall be capable of being locked in the open position. The disconnecting means shall be a listed device.

SUBSTANTIATION: Most lifts are wired with individual branch circuits. There is typically no machine room associated with these chair lifts since they are selfcontained. The lift enclosure does not typically provide for disconnect workspace per 110-26 but 620-51(c) requires the disconnect to be readily accessible to the lift. If the installer uses 430-109(c) as an option they can locate the disconnect accessible to the lift without having a workspace problem with 110-26.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Comment 12-23 which meets the submitter's intent.

(Log #2120)

12- 30 - (620-62): Reject
SUBMITTER: George Gregory, Square D Company
COMMENT ON PROPOSAL NO: 12-58
RECOMMENDATION: Accept Proposal 12-58.
SUBSTANTIATION: The intent of Proposal 12-58 is to help assure that selective coordination exists for ground-fault conditions as well as for other conditions. It is well known and documented that a very high percentage of faults are ground faults. For example, IEEE Standard 242-1986 states on page 271, "The majority of electric faults involve ground. Even those that are initiated as phase-to-phase will spread quickly to any adjacent metallic housing, conduit, or tray that provides a return path to the system grounding point."

Overcurrent protective devices alone may provide selective coordination in many cases. However, some choices of overcurrent protection will not provide for selective coordination with ground-fault protection installed as required by 230-95 or for other reasons.

The ground-fault protection on the main circuit breaker is set at the maximum setting. It does not coordinate selectively with the 400 A fuse and is in a race with the 250 A fuse.

The wording for the proposal was written to parallel that in 517-17. It is not intended to imply that additional ground-fault protection devices are always required. Perhaps more simple wording such as the addition of "including ground fault protective devices" at the end of the present sentence would be adequate.

Note: Supporting Material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not offered sufficient new technical substantiation to support his original Proposal 12-58, which was rejected for lack of technical substantiation. The submitter agrees in his substantiation that additional ground-fault protective devices are not always required in this type of installation and the panel is of the opinion that the concerns of the submitter would best be handled by design on each installation.

ARTICLE 625 — ELECTRIC VEHICLE CHARGING SYSTEM EQUIPMENT

(Log #312)

12- 32 - (625-17): Accept in Part
SUBMITTER: Craig B. Toepfer, Ford Motor Company
COMMENT ON PROPOSAL NO: 12-66
RECOMMENDATION: Present wording:

625.17 Cable … The overall length of the cable shall not exceed 7.5 m (25 ft). Where the electric vehicle supply equipment cable is suspended from overhead or is intended for portable use within the facility, the overall length of the cable shall be permitted to exceed 7.5 m (25 ft) if equipped with a cable management system that is identified and listed as suitable for the purpose.

Proposed wording:

625.17 Cable … The overall length of the cable shall not exceed 7.5 m (25 ft) unless equipped with a cable management system that is identified and listed as suitable for the purpose…
SUBSTANTIATION: The revised wording more clearly reflects the intent of the revision in a more concise general manner to comply with the requirements of the NEC Style Manual with respect to positive language text.

The proposed text has been reviewed with and accepted by the original submitter.
PANEL ACTION: Accept in Part.
In the first sentence, delete the words "identified and".
PANEL STATEMENT: The panel deleted the words "identified and" because they are redundant.

ARTICLE 630 — ELECTRIC WELDERS

(Log #133)

12- 33 - (630-11): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 12-72
RECOMMENDATION: The Technical Correlating Committee directs that the Panel revise the Panel Action relative to the Fine Print Note in accordance with 3.1 of the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Revise 630.11(b) to read as follows:

(b) Group of Welders. Conductor ampacity shall be based on the individual currents determined in 630-11(a) as the sum of 100 percent of the two largest welders, plus 85 percent of the third largest welder, plus 70 percent of the fourth largest welder, plus 60 percent of all remaining welders.

Exception: Percentage values lower than those given in (b) shall be permitted in cases where the work is such that a high-operating duty cycle for individual welders is impossible.

FPN: Duty cycle considers welder loading based on the use to be made of each welder and the number of welders supplied by the conductors that will be in use at the same time. The load value used for each welder considers both the magnitude and the duration of the load while the welder is in use.

PANEL STATEMENT: The panel accepts the direction of the Technical Correlating Committee and has revised the wording of 630.11(b). This revision turns the former FPN into properly formatted mandatory language. The rule for calculating ampacity has been reformatted and a FPN has been added, which will assist in applying the new exception.

(Log #852)

12- 34 - (630-15, FPN (New)): Accept in Principle
SUBMITTER: Larry F. Miller, National Electrical Manufacturers Association (NEMA)
COMMENT ON PROPOSAL NO: 12-75
RECOMMENDATION: The panel should continue to accept the proposal in principal in part but the following fine print note should be added:
FPN: Where grounding of a welding secondary circuit is required by local regulation or when needed to minimize electromagnetic interference, it is not good practice for welding current to flow in the equipment grounding conductors.
SUBSTANTIATION: NEMA agrees with the code-making panel 12 assessment that the Section 630-15 proposal addressed workplace procedures rather than equipment installation concerns, the normal purview of the NEC. Nevertheless, NEMA believes that the 2002 NEC would do its users a service by indicating that welding current may flow in the equipment grounding conductors–a potential safety hazard–depending on the workpiece grounding procedure used. Therefore, NEMA proposes that a Fine Print Note (a revision of the FPN originally proposed) be added to Section 630-15.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Comment 12-35.

(Log #1130)

12- 35 - (630-15, FPN (New)): Accept
SUBMITTER: Paul Dobrowsky, Holley, NY
COMMENT ON PROPOSAL NO: 12-75
RECOMMENDATION: Continue to accept the proposal as modified and add the following fine print note.
FPN: Connecting welder secondary circuits to grounded objects can create parallel paths and can cause objectionable current over equipment grounding conductors.
SUBSTANTIATION: Welder secondary circuits should not be considered premises wiring. Flexible cords, used to supply portable grounded tools and equipment, have been "melted" in a spiral fashion (following the equipment grounding conductor "spiral" in the cord). The most probable cause was having a welder secondary clamped to a metal work table on which the tool was laying. Similar incidents occurred with work lights that were clamped to the work surface.
This comment was developed and reviewed by a task group consisting of Paul Dobrowsky (CMP 5), Andre Cartal (CMP 12), David Dini (CMP 1 and CMP 5), Michael Johnston (CMP 5), Charles Mello (CMP 5), and Gregory Steinman (CMP 5).
PANEL ACTION: Accept.

ARTICLE 640 — AUDIO SIGNAL PROCESSING, AMPLIFICATION, AND REPRODUCTION EQUIPMENT

(Log #1569)

16- 3 - (640-2-Abandoned Cable): Accept in Principle
SUBMITTER: Wayne G. Carson, Carson Assoc. Inc.
COMMENT ON PROPOSAL NO: 16-1a
RECOMMENDATION: Add definition:
Abandoned Cable: Cable that is not terminated at both ends, not connected to equipment, or not identified for future use with a tag.
SUBSTANTIATION: Section 640.3(A) includes a requirement to remove abandoned cable but abandoned cable is not defined in this section. It is not believed that this is new material as the term "abandoned cable" was added to this section. Also, the definition has been added to five other sections (725-2, 760-2, 770-2, 800-2, and 820-2). This comment provides consistency between sections of the code and assists the user in understanding terms used in the code.
PANEL ACTION: Accept in Principle.
Revise the recommendation to read as follows:
"Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag."
PANEL STATEMENT: The revised text expresses the intended definition and complies with the Manual of Style.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22
VOTE ON PANEL ACTION:

CAUDILL: The Society of the Plastics Industries could not reach a consensus position on this issue.

(Log #1577)

16- 6 - (640-3(a)): Accept in Principle in Part
SUBMITTER: Wayne G. Carson, Carson Assoc. Inc.
COMMENT ON PROPOSAL NO: 16-1a
RECOMMENDATION: Revise text to read as follows:
Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.
Abandoned cables not intended for future use shall not be permitted to remain.
FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

SUBSTANTIATION: This definition under the section entitled "Spread of Fire or Products of Combustion" is not consistent throughout the Code. This comment uses language from ROP 16-250 [850-52(B)] to provide a consistent requirement throughout the code.

The same comment is being made for the following sections:
645-5D6 (ROP 12-106)
725-3B (ROP 16-80)
760-3A (ROP 16-144)
770-3A (ROP 16-176)
820-3A (ROP 16-313)
820-52B (ROP 16-311)
830-3A (ROP 16-364)
830-58B (ROP 16-368)

PANEL ACTION: Accept in Principle in Part.
PANEL STATEMENT: The panel accepts in principle the statement regarding abandoned cables. Refer to panel action on Comment 16-4. This satisfies the submitter's concerns.

The current reference to Section 300-21 satisfies the balance of the comment, which is rejected. That portion of the comment repeats the text of Section 300-21.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 22

(Log #2387)

16- 7 - (640-3(a)): Accept in Principle
SUBMITTER: Toxicity Technical Advisory Committee
COMMENT ON PROPOSAL NO: 16-1a
RECOMMENDATION: The TTAC finds that this is an issue of fire hazard analysis and less one of toxic hazard.
SUBSTANTIATION: Summary of Proposal: Unused signal cable should be removed.

Toxicity Issues: The TTAC comments on Proposals 7-135 and 7-137 (Comment 7-45) on toxic potency apply here as well. Since there is no limit on the amount of active cables, and since the flammability and smoke toxicity properties of neither the existing nor new cables are specified, it is impossible to assess the added impact of the abandoned cable on toxic hazard.

In this context, the NFPA TTAC builds on the recommendation of the Task Group on Nonmetallic-Sheathed Cable to the NEC Technical Correlating Committee and recommends that methodology and data be developed to enable comparing the contribution to fire hazard (and toxic fire hazard in particular) of the various types of allowed wiring products.

General Statements: This comment was developed by the NFPA Toxicity Technical Adviosry Committee. Members of this committee are as follows: Richard G. Gann, Ph.D., Chair; Craig Beyler, Ph.D; Edward V. Clougherty, Ph.D; Christopher Laux, AIA, CBO; James P. Lyon, Ph.D; and Richard Pehrson, Ph.D.

The 12 proposals for the 2002 NEC that were forwarded to the Toxicitiy Technical Advisory Committee (TTAC) on May 26, 2000 for comment all involve potential changes in the mass and location of combustible or degradable (C/D) materials within a building. Such changes might affect the fire's rate of heat release, the single most important variable affecting hazard to people since it is the driving force leading to the spread of fire and products of combustion. Having been advised that the NEC task groups contain the necessary expertise to address fire growth and overall fire hazard, the TTAC is only submitting comments on the impacts of the proposed changes on smoke toxicity and toxic hazard.

In the following comments, references to "occupants" are meant to include firefighters operating in accordance with NFPA 1500.

The composition of the C/D products, and thus the smoke generated in a fire, may evolve over time. Thus, the TTAC comments apply to general changes in the mass and location of C/D products and are not limited to the current formulation of such products.

Section 331-1 of the NEC requires that the toxicity characteristics of NMT be no worse than those of unplasticized PVC, but does not name those characteristics nor cite a test method for measuring them. NFPA 269 was developed for such purposes. It can be used to provide (a) data on the lethal toxic potency of smoke and (b) gas yields of key toxicants for use in fire hazard modeling. Section 331-1 should be modified to note both the method to be used and that these are the data to be provided. A prescriptive (e.g., LC_{50}) comparison with unplasticized PVC should be replaced by a comparison of Toxic hazard of the proposed product and unplasticized PVC.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to the panel action and statement on Comment 16-4. The Code Making Panel appreciates the Technical Toxicity Advisory Committee support for the removal of abandoned cables.

The panel assumes that the "Summary of Proposal" is actually the "Recommendation."

(Log #1641)

16- 10 - (640-6): Reject
SUBMITTER: Andy Scott, National Cable Television Association
COMMENT ON PROPOSAL NO: 16-2a
RECOMMENDATION: Reject Proposal 16-2a.
SUBSTANTIATION: NCTA, on behalf of the cable television industry, strongly urges Panel 16 to reject these proposals. While attachment every 5 ft may be a practice in many cases, it also may be overly restrictive and unnecessary in others. The requirement to support cables every 5 ft is outside the scope of the code. The NCTA urges Panel 16 not to allow the NEC to serve as an Installation Manual.
PANEL ACTION: Reject.
PANEL STATEMENT: This proposal provides additional rules for the mechanical execution of the work. Since there are additional rules, the fine print note is not necessary. This provides parallel

requirements to those used in Articles 725, 760, 770, 800, 820 and 830. Although the panel rejected the submitter's comment to reject Proposal 16-2a, the panel did act to remove the 5 ft attachment requirement that the submitter requested.

ARTICLE 645 — INFORMATION TECHNOLOGY EQUIPMENT

(Log #134)

12- 36 - (645-2): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 12-80
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 12-79. See Technical Correlating Committee action on Proposal 12-79. This Proposal is a Comment that was Held for Further Study during the processing of the 1999 NEC. As such, the Technical Correlating Committee directs that the Panel act upon this Proposal based on its merits. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel continues to reject Proposal 12-80 as it included recommendations that were not electrical in nature. The panel accepted Proposal 12-79 as it was submitted by a task-group consisting of members from both CMP-12 and the committee on Electronic Computer Systems and was relating only to electrical requirements.
PANEL STATEMENT: The panel accepts the direction of the Technical Correlating Committee and recognizes that additional correlation would be an asset. Panel 12 requests that the Technical Correlating Committee recognize that the scope of NFPA 75 does not correspond to the scope of Article 645. All the requirements of a computer room in NFPA 75 are not necessary to gain the relaxations granted by Article 645 of the NEC.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 2 Kelley, Laney

(Log #1571)

12- 37 - (645-2-Abandoned Cable): Reject
SUBMITTER: Wayne G. Carson, Carson Assoc. Inc.
COMMENT ON PROPOSAL NO: 12-106
RECOMMENDATION: Add definition section 645.2:
Abandoned Cable: Cable that is not terminated at both ends, not connected to equipment, or not identified for future use with a tag.
Renumber existing section 645.2 to 645.3.
SUBSTANTIATION: Section 645.5 includes a requirement to remove abandoned cable but abandoned cable is not defined in this section. It is not believed that this is new material as the term "abandoned cable" was added to this section of the Code. Also, the definition has been added to five other sections (725-2, 760-2, 770-2, 800-2, and 820-2). This comment provides consistency between sections of the code and assists the user in understanding terms used in the code.
PANEL ACTION: Reject.
PANEL STATEMENT: See the panel statement on Proposal 12-106. Any cable could be marked "for future use". Regardless of the actions of Panel 16 relating to abandoned cables, the jurisdiction of under-floor spaces in information technology equipment rooms is within the scope of Panel 12. It is the opinion of the panel that tagging or marking of abandoned cables does not solve the many demonstrated problems of increased safety hazards in under-floor spaces and does not in any way restrict the amount of cables that can be marked for future use.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
NOT RETURNED: 2 Kelley, Laney
EXPLANATION OF NEGATIVE:
WHITE: Negative vote on panel action "to reject" the proposal should be accepted. Abandoned cable and spare cable need to be defined for the authority having jurisdiction and by identifying cables for "future use" with tags, it will allow the authority having jurisdiction to enforce the code and allows the user to have cables for emergencies and future expansion.
COMMENT ON AFFIRMATIVE:
TROUT: Jurisdiction over Information Technology Rooms is within the scope of Code-Making Panel 12 and not with Code-Making Panel 16. The accumulation of abandoned cables under raised floors in these rooms creates a tremendous combustible fuel load. Recognizing this fact, many fire prevention jurisdictions demand that these cables be removed in the interest of fire safety. There is, in fact, considerable information in the many proposals submitted showing justification for the removal of these abandoned cables. The efforts by these many persons to have these abandoned cables removed is commendable until they present a definition of abandoned cables that appears to be designed to provide a manner in which the abandoned cables may be permitted to remain under the guise of "future use." I believe the panel action taken on these comments is proper and in accordance with the purpose of the code.

(Log #833)

12- 38 - (645-2(a)): Reject
SUBMITTER: Roger Witt, State Farm Ins. Co.
COMMENT ON PROPOSAL NO: 12-82
RECOMMENDATION: The proposal should stand as originally submitted.
SUBSTANTIATION: With the help of NFPA staff, we have researched the origin of the Emergency Power Off requirement in data processing rooms.
Unfortunately there were no documents that could help determine the original intent or reason. If we create a logical reason for the original need of the EPO it may follow this path:
- The cables under the raised floor did not have a flame spread rating providing fuel for the fire and possibly some toxicity depending on the wire insulation
- The HVAC system could fan the flame, and recirculate smoke
- The electrical system could provide the source of ignition.

With the above we have the three components of a fire
- fuel
- oxygen
- source of ignition

The thought of removing any or all of three components (by the use of EPO) would help in reducing the adverse affects of fire. The benefit could also be:
- containment of smoke
- reduce the spread of toxic fumes due to the burning of wire insulation materials
- A handy spot for the firemen or others to shut down the electricity in the room when water spray is eminent

Over the years the codes have become more stringent in requiring less hazardous materials to be used in the data center. Fire protection systems have also become more sophisticated.
- cables under the floor must be plenum rated
- VESDA systems are often installed for early warning fire detection

• Smoke detectors on the supply side and sometimes return side of the modular cooling units or the air handling units supplying environmental air to the room and under the raised floor are required to shut down those systems upon the sensing of smoke. NFPA 90-4

• The fire fighters are often aware of main power source to a building and the NEC requires notification of alternate power source be posted.

• Building codes are requiring fire sprinkler systems in the data room (all depending on size of building).

• Main frame computers have high temperature shutoff devices.

When the code was written, attitudes, materials and code requirements were different. There was less information (data) on computers so in relative terms less was at stake if the computers were put out of operation (by accident or malicious cause). Today, banking, ATM machines, medical records, billing, and many other functions are important to the everyday life of people. The loss of operation of data centers can cause irreparable damage in the personal and business life of people who rely on the data.

Operation of the EPO is not simply a case of turning off the power to the data room where one might think "what's the big deal just turn it back on". Abrupt changes in the power source (either on or off) causes a transient voltage condition that more often than not, damages computer equipment. Depending on the equipment destroyed, the data center can be severely crippled waiting on replacement equipment.

Mr. Jones took a poll on the activation of EPO [fire emergency vs accidental activation]. None of the NFPA 75 members found an instance where it was required in a fire situation and most activation remembered was accidental.

The information I have from members of the Uptime Institute notes that all of the EPO operations have been accidental. No one will report malicious operations due to the sensitivity of the event, but it does happen.

Guards may help prevent accidental operation of the EPO as long as they are well marked and possibly annunciated, but guards will not prevent malicious operation of the device.

The point to be made is that data centers are no longer isolated to a single company's business but computer operations are now an important part of many business and are imperative in the daily lives of many people whether it be their financial dealings, medical information, or personal concerns. Since the EPO was first introduced as a safety feature, more stringent codes are in place, newer materials, and more sophisticated fire detection systems are available, it is possible to eliminate the EPO as a requirement in the code and still maintain the safety it was intended to provide.

Since activation of the EPO can cause premature equipment failure and public concern, and since there is no verifiable evidence that the EPO has been used for its intended purpose, the proposal should stand as originally submitted to effectively remove the requirement for the Emergency Power Off device.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel reaffirms its position that the disconnecting means required by Section 645-10 is consistent with the purpose of the NEC. The submitter has offered no new substantiation that would serve to change the opinion of the panel.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 1

NOT RETURNED: 2 Kelley, Laney

EXPLANATION OF NEGATIVE:

JONES: I agree witht he submitter and think this requirement is outdated. The NEC should consider alternatives to this disconnecting means that will still be consistent with the purpose of the NEC.

COMMENT ON AFFIRMATIVE:

POCH: I think it is important to point out that since: 1) a poll of NFPA 75 members found no incident of EPO activation for a fire situation, but almost every member could identify an accidental cause; and, 2) the Uptime Institute also recalled that all remembered activations of an EPO switch in a computer room were of an accidental nature. Because of the two reasons stated, for computer rooms, we should consider more restrictive placement and double action activation requirements.

(Log #832)

12- 39 - (645-2(b)): Reject

SUBMITTER: Roger Witt, State Farm Ins. Co.

COMMENT ON PROPOSAL NO: 12-83

RECOMMENDATION: The proposal should stand as originally submitted.

SUBSTANTIATION: With the help of NFPA staff, we have researched the origin of the Emergency Power Off requirement in data processing rooms.

Unfortunately there were no documents that could help determine the original intent or reason. If we create a logical reason for the original need of the EPO it may follow this path:

• The cables under the raised floor did not have a flame spread rating providing fuel for the fire and possibly some toxicity depending on the wire insulation

EXPLANATION OF NEGATIVE:
JONES: See my Explanation of Negative on Comment 12-38.

(Log #135)

12- 40 - (645-5(d)(2)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 12-96
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the actions on Proposals 12-97, 12-98, and 12-99. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
Revise 645-5(d)(2) to read as follows:
"(2) The branch-circuit supply conductors to receptacles or field-wired equipment are in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, electrical nonmetallic tubing, metal wireway, nonmetallic wireway, surface metal raceway with metal cover, nonmetallic surface raceway, flexible metal conduit, liquid-tight flexible metal conduit or liquidtight flexible nonmetallic conduit, Type MI cable, Type MC cable, or Type AC cable. These supply conductors shall be installed in accordance with the requirements of Section 300-11."
PANEL STATEMENT: The panel accepts the direction of the TCC. The panel has combined and correlated Proposals 12-96, 12-97, 12-98, and 12-99.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 2 Kelley, Laney

(Log #2290)

12- 41 - (645-5(d)(3)): Reject
SUBMITTER: Christopher R. Pharo, Marlton, NJ
COMMENT ON PROPOSAL NO: 12-100
RECOMMENDATION: I agree with this proposal.
SUBSTANTIATION: It is important to realize that after construction has been completed, others will have access to the space below the raised floor. People who work in these Information Technology Areas may decide to run cables via the raised floor system. The problem comes in when they do not know what wiring methods are approved.
By placing smoke detectors under the raised floor to cease air distribution, the plenum issue should no longer be in question and a method of safeguarding people and property is in place.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel rejects the comment and reaffirms their original action on the proposal. The submitter has not provided any substantiation that the terminology "sensation" is a better term than the panel's action of replacing "sensation" with "detection".
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 2 Kelley, Laney

(Log #136)

12- 42 - (645-5(d)(5)c): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 12-103
RECOMMENDATION: The Technical Correlating Committee directs that the Panel clarify the action on this Proposal with regard to the term "Green/Yellow". See Section 250-119 for the identification of equipment grounding conductors. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
On Proposal 12-103, the panel wishes to change the action of "accept" to "accept in principle".
Replace "green/yellow" with "green with one or more yellow stripes".
PANEL STATEMENT: The panel accepts the direction of the Technical Correlating Committee. The terminology in 250-119, "green or green with one or more yellow stripes" has been substituted in Proposal 12-103.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 2 Kelley, Laney

(Log #600)

12- 44 - (645-5(d)(5)c): Accept
SUBMITTER: John E. Propst, Equilon Enterprises, LLC
COMMENT ON PROPOSAL NO: 12-105
RECOMMENDATION: The purpose for this comment is to support the original proposal and to reject the action of the panel.
SUBSTANTIATION: As noted in the substantiation, ITC cable was added to the 1996 NEC and inadvertently left out of Article 645. Mr. White has provided the additional technical substantiation requested by the panel in his explanation of negative ballot. Since being introduced into the 1996 NEC, Type ITC cable has been widely and very successfully used in the petrochemical industry.
PANEL ACTION: Accept.
PANEL STATEMENT: See panel action and statement on Comment 12-45.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
NOT RETURNED: 2 Kelley, Laney
EXPLANATION OF NEGATIVE:
TROUT: See my explanation of negative vote on Comment 12-45.

(Log #1380)

12- 45 - (645-5(d)(5)c): Accept
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 12-105
RECOMMENDATION: The Proposal Should be accepted
SUBSTANTIATION: Mr. White's explanation of negative vote (included below) provides the technical substantiation requested by the panel statement.

"ITC cable, per Section 727-6, shall be insulated conductors in sizes No. 22 through 12. The conductor material shall be copper or thermocouple alloy. Insulation on the conductor shall be rated 300 volts. Shielding shall be permitted. The cable shall be listed as being resistant to the spread of fire. The outer jacket shall be sun light and moisture resistant. Where a smooth metallic sheath, continuous corrugated metallic sheath, or interlocking tape armour is applied over the nonmetallic sheath, an overall nonmetallic jacket shall be permitted to be applied, but not required. In Section 727-4, under "Users Permitted": No. 7 states: "ITC cable is permitted under raised floors in control rooms and rack rooms where arranged to prevent damage to the cable." Code-Making Panel 16 accepted Proposal 16-102 to allow ITC cable under raised floors in information technology rooms' equipment rooms in accordance with Section 645-5(d)(5)(c)."
PANEL ACTION: Accept.
The panel reverses its action on Proposal 12-105 from "reject" to "accept".
PANEL STATEMENT: The panel emphasizes that the addition of ITC cable must be followed by "(Article 727)" to be assured that it is recognized that this cable can only be used under the requirements of Article 727.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 2
NOT RETURNED: 2 Kelley, Laney
EXPLANATION OF NEGATIVE:
CARTAL: Code-Making Panel 16 has no jurisdiction regarding the type of wiring or cable that is permitted in a raised floor area of an information technology room so the substantiation citing their approval is not valid.

My vote was based on the premise that the present restrictions in Article 727 would still apply, limiting ITC cable to industrial establishment only.

TROUT: The panel action should have been "Accept in Principle."

In the original proposal and in the comments there was no indication that the submitter or those making comments intended that the use of ITC cable under raised floors in an information technology room would be restricted to such use only in industrial establishments. The placing of parenthesis enclosed 727 after ITC suggests that this use would be adhered to but based on the substantiation I find no assurance that this is the intent. I cannot find anything in the style manual that indicates that the use of "ITC (727) means in accordance with Article 727. I believe this needs clarification.

ITC cable is permitted to be used in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation. There was no substantiation indicating that this cable would be used under raised floors only in information technology rooms located in industrial establishments.

The submitter's statement in the substantiation that "Code-Making Panel 16 accepted a proposal to allow ITC cables under raised floors in information technology rooms in accordance with Section 645-5(d)(5)(c)" is incorrect. Jurisdiction over Article 645, Information Technology Equipment is within the scope of Code-Making Panel 12.

I believe that an exception to Section 645-5(d)(5)(c) stating "ITC cable in industrial establishments in accordance with the requirements of Article 727." would have assured compliance.

(Log #1937)

12- 59 - (645-5(d)(5)c): Accept
SUBMITTER: David Wechsler, Union Carbide Corp.
COMMENT ON PROPOSAL NO: 12-105
RECOMMENDATION: Add "ITC (Article 727)" to the first sentence.
SUBSTANTIATION: The referenced section (645-5(d)(5)(c) currently recognizes Types C12, C13 and PLTC (Article 725). A direct comparison of the product specifications for Type PLTC, defined within UL-13, and Type ITC, defined in UL-2250, will reveal that ITC is subjected to more rigorous tests than PLTC. Additionally, while a Type ITC may be dual marked as an ITC/PLTC, not all PLTCs may be marked as ITC, again mostly due to more stringent dielectric testing. The Panel is welcome to compare these two product specifications. Unfortunately, copyright prohibits me from extracting copies of these product specifications and submitting these to the Panel for verification. The Panel or its representative can contact Underwriter laboratories' cable expert, Mr. Tom Guida at ULs Melville offices (516-271-6200) for verification of the assertions made in this comment that support the inclusion of ITC in the referenced NEC section.

A brief historical review reflects that along with the introduction of Type DP cable and that long debate over data processing cables and fire resistance testing, that types C12, C13, PLTC, were first added to the 1993 NEC, as meeting an "equal-to" fire test to data processing cables., The accepted basis for Committee acceptance of this information was the UL cable product specification that referenced the same vertical flame testing done for both PLTC and ITC.
PANEL ACTION: Accept.
PANEL STATEMENT: See panel action and statement on Comment 12-45.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
NOT RETURNED: 2 Kelley, Laney
EXPLANATION OF NEGATIVE:
TROUT: See my explanation of negative vote on Comment 12-45.

(Log #138)

12- 46 - (645-5(d)(6) (New)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 12-106
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 16-80. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel accepts the direction of the Technical Correlating Committee. The panel is of the opinion that the requirements for cables under a raised floor in an Information Technology Room, present different considerations than the areas under the jurisdiction of Panel 16, and therefore reaffirms its action on Proposal 12-106. Additional correlation is not appropriate.

(Log #576)

12- 47 - (645-5(d)(6) (New)): Reject
SUBMITTER: Joe Cox, Bluff City, TN
COMMENT ON PROPOSAL NO: 12-106
RECOMMENDATION: The panel should have rejected the proposal.
SUBSTANTIATION: The submitter provides no evidence of any safety concerns with the present code. He does point out that no indication of increased fire hazard exists.

This is a housekeeping issue. Owners/designers/installers who see the benefits of good housekeeping will take care to keep the number of cables under the floors to a reasonable number. Those that do not would only have to tag the circuits for future use. In either case, the proposed requirements in the NEC will not serve to remove any of the unused cables.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 12-37.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
NOT RETURNED: 2 Kelley, Laney

EXPLANATION OF NEGATIVE:
WHITE: Negative vote on the panel action to reject. There has not been sufficient substantiation that a problem exists. The panel is making it mandatory that all cables are removed even if there is adequate space for cooling and fire detection/suppression exists. This is an unnecessary labor effort and it also can run the risk of unplanned shutdowns of critical equipment.

(Log #658)

12- 48 - (645-5(d)(6) (New)): Reject
SUBMITTER: T. Neil Thorla, I/N Tek
COMMENT ON PROPOSAL NO: 12-106
RECOMMENDATION: Reject the proposal.
SUBSTANTIATION: The substantiation for this proposal provides no technical data to support the addition of this requirement. The substantiation actually speaks against the proposal by stating "the fire record of cables in concealed spaces, both above ceilings and below floors, remain excellent." In order to adopt a proposal that will have such far reaching ramifications, the Panel should require a more defendable substantiation than "this type of preventative action is worthwhile."
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 12-37.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:

(Log #659)

12- 49 - (645-5(d)(6) (New)): Reject
SUBMITTER: T. Neil Thorla, I/N Tek
COMMENT ON PROPOSAL NO: 12-106
RECOMMENDATION: Delay the application of this requirement by adding text stating:
This requirement shall become effective 1/1/2005.
SUBSTANTIATION: This proposal will create retroactive requirements making many installations noncompliant as of the effective date of this standard. Building owners will need ample time to make and execute plans for compliance. In an established IT equipment room, the abandoned cables will be on the bottom of the pile, likely intertwined with active cables. Attempting to pull out an abandoned cable intact is likely to disturb the operation of the IT equipment by placing tension on the active cables and connectors. It may be possible to remove abandoned cables by exposing them and cutting them into short pieces, without disturbing the IT equipment operation, unless the wrong cable is cut!

The IT equipment could be installed in a central processing center for credit card approval, or as the central coordinating system for a large chemical plant. In the latter case, the potential threat to life safety due to an error in removing abandoned cables is likely far worse than the hazard created by leaving abandoned cables intact.

In order to safely remove abandoned cables, the IT equipment needs to be shut down and de-energized in an orderly fashion, the cables removed, the equipment restarted and the system retested for proper operation. In a large IT complex, this will require a great deal of planning and coordination. It may even require the purchase and installation of additional equipment to take over the tasks of the equipment taken out of service to safely remove the abandoned cables.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 12-37. In addition, the panel is of the opinion that the requirement for the removal of abandoned cables is not of a nature that would require a delayed effective date.

WHITE: Negative vote on the panel action to reject, see my explanation of negative vote on Comment 12-37.

(Log #1578)

12- 52 - (645-5(d)(6)): Reject
SUBMITTER: Wayne G. Carson, Carson Assoc. Inc.
COMMENT ON PROPOSAL NO: 12-106
RECOMMENDATION: Revise text to read as follows:
Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

Abandoned cables not intended for future use shall not be permitted to remain.

FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.
SUBSTANTIATION: This definition under the section entitled "Spread of Fire or Products of Combustion" is not consistent throughout the Code. This comment uses language from ROP 16-250 [850-52(B)] to provide a consistent requirement throughout the code.

The same comment is being made for the following sections:
640-3A (ROP 16-1a)
725-3B (ROP 16-80)
760-3A (ROP 16-144)
770-3A (ROP 16-176)

820-3A (ROP 16-313)
820-52B (ROP 16-311)
830-3A (ROP 16-364)
830-58B (ROP 16-368)
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's concerns are addressed in Sections 645-2(e) and 300-21. For information regarding the recommendation on abandoned cables, see panel action and statement on Comment 12-37.

(Log #1903)

12- 54 - (645-5(d)(6)): Accept
SUBMITTER: Michael I. Callanan, International Brotherhood of Electrical Workers
COMMENT ON PROPOSAL NO: 12-106
RECOMMENDATION: Continue to Accept this proposal in principle.
SUBSTANTIATION: In accordance with the instructions of the TCC to reconsider and correlate this proposal with Proposal 16-80, this proposal should continue to be accepted in principle as originally passed by the panel so that it reads, "(6) Abandoned cables shall not be permitted to remain."
The definition of "abandoned cables" accepted in 16-273, 16-189, 16-154, 16-109 and 16-32 render the above wording more appropriate than wording found in 16-80. The definition(s) makes the phrase "not intended for future use" unnecessary. It is recognized that the definitions as listed above do not affect Article 645, but it is assumed that the definitions for "abandoned cables" will be moved to Article 100 by direction of the TCC.
This comment represents the official position of the International Brotherhood of Electrical Workers Codes & Standards Committee.
PANEL ACTION: Accept.

(Log #660)

12- 55 - (645-5(d)(6), Exception (New)): Accept in Principle
SUBMITTER: T. Neil Thorla, I/N Tek
COMMENT ON PROPOSAL NO: 12-106
RECOMMENDATION: Add the following exception:
Exception: Cables that are contained within metallic raceways.
SUBSTANTIATION: There is little fire hazard associated with cables contained in metallic raceways, since the raceway isolates the fuel source from the source of oxygen.
PANEL ACTION: Accept in Principle.
In proposal 12-106, revise text in the panel action to read:
(6) Abandoned cables shall not be permitted to remain unless contained within metal raceways.
PANEL STATEMENT: The panel's revisions address the submitter's concerns. The proposed exception has been changed to mandatory text.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
NOT RETURNED: 2 Kelley, Laney
EXPLANATION OF NEGATIVE:
POCH: The reason for Code-Making Panel 12 to only accept in principle this proposal was that it was dropping the phrase "...not intended for future use." because it wasn't enforceable. Now, the reason is being changed for an exception for cables in a metal raceway. I disagree with Code-Making Panel 12's altering the reason for accepting in principle, because its original reasoning was valid, and making exceptions only increases the total amount of abandoned cable in a given area.

(Log #661)

12- 56 - (645-5(d)(6), Exception (New)): Reject
SUBMITTER: T. Neil Thorla, I/N Tek
COMMENT ON PROPOSAL NO: 12-106
RECOMMENDATION: Add the following exception:
Exception: Where the under floor area is protected by a listed fire suppression system.
SUBSTANTIATION: Building owners who have invested in fire suppression systems should not be subjected to the requirement of removing abandoned cables. A fire suppression system mitigates the hazard by removing the source of heat, or oxygen, or both. Removing the source of fuel should not be the only acceptable means of mitigating the fire hazard. In fact, a fire suppression system should provide a greater degree of protection, since it will protect active cables as well as abandoned cables.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel is of the opinion that a listed fire suppression system may not adequately solve the problem of the increased fuel load caused by abandoned cables being left in the underfloor area.

(Log #662)

12- 57 - (645-5(d)(6), Exception (New)): Reject
SUBMITTER: T. Neil Thorla, I/N Tek
COMMENT ON PROPOSAL NO: 12-106
RECOMMENDATION: Add the following exception:
Exception: Where the abandoned cables are protected with a listed fire stop system.
SUBSTANTIATION: Many types of fire stop systems are available for cabling installed in cable trays. Systems employing coating of tray cables with flame-retardant mastic should be suitable to mitigate fire hazards associated with cables installed in under floor areas. The inclusion of the exception, in conjunction with delaying the effective date of this requirement, should provide ample time for listing agencies to develop requirements, and manufacturers to qualify their products.
This will provide an acceptable alternate means of compliance in cases where the act of removing abandoned cables could create a greater potential hazard than leaving them intact.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel is of the opinion that a listed fire stop system may not adequately solve the problem of the increased fuel load caused by abandoned cables being left in the underfloor area.

12- 58 - (645-5(d)(6)-Abandoned Cable (New)): Reject
SUBMITTER: Francis W. Peri, Communications Design Corporation
COMMENT ON PROPOSAL NO: 12-106
RECOMMENDATION: Continue to accept this proposal and add this definition for abandoned cable.

Abandoned Cable. Installed cable that is neither terminated at both ends at equipment, nor identified for future use with a tag.
SUBSTANTIATION: Association of Cabling Professionals (ACP) agrees with the proposals made by BICSI for Articles 725, 760, 770, 800, and 820. Acceptance of this comment correlates with Panel 16 actions.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 12-37 and Comment 12-46.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 2
NOT RETURNED: 2 Kelley, Laney
EXPLANATION OF NEGATIVE:

POCH: This comment should be accepted in principle because it uses terminology that is enforceable in defining what is abandoned cable. However, the word "documented" should replace "identified", to read as follows: "Abandoned Cable. Installed Cable that is neither terminated at both ends of the equipment, nor ~~identified~~ documented for future use with a tag."

WHITE: Negative vote on the panel action to reject, see my explanation of negative vote on Comment 12-37.

(Log #831)

12- 60 - (645-10): Reject
SUBMITTER: Roger Witt, State Farm Ins. Co.
COMMENT ON PROPOSAL NO: 12-108
RECOMMENDATION: The proposal should stand as originally submitted.
SUBSTANTIATION: With the help of NFPA staff, we have researched the origin of the Emergency Power Off requirement in data processing rooms.

Unfortunately there were no documents that could help determine the original intent or reason. If we create a logical reason for the original need of the EPO it may follow this path:

- The cables under the raised floor did not have a flame spread rating providing fuel for the fire and possibly some toxicity depending on the wire insulation
- The HVAC system could fan the flame, and recirculate smoke
- The electrical system could provide the source of ignition.

With the above we have the three components of a fire

- fuel
- oxygen
- source of ignition

The thought of removing any or all of three components (by the use of EPO) would help in reducing the adverse affects of fire. The benefit could also be:

- containment of smoke
- reduce the spread of toxic fumes due to the burning of wire insulation materials
- A handy spot for the firemen or others to shut down the electricity in the room when water spray is eminent

Over the years the codes have become more stringent in requiring less hazardous materials to be used in the data center. Fire protection systems have also become more sophisticated.

- cables under the floor must be plenum rated
- VESDA systems are often installed for early warning fire detection
- Smoke detectors on the supply side and sometimes return side of the modular cooling units or the air handling units supplying environmental air to the room and under the raised floor are required to shut down those systems upon the sensing of smoke. NFPA 90-4
- The fire fighters are often aware of main power source to a building and the NEC requires notification of alternate power source be posted.
- Building codes are requiring fire sprinkler systems in the data room (all depending on size of building).
- Main frame computers have high temperature shutoff devices.

When the code was written, attitudes, materials and code requirements were different. There was less information (data) on computers so in relative terms less was at stake if the computers were put out of operation (by accident or malicious cause). Today, banking, ATM machines, medical records, billing, and many other functions are important to the everyday life of people. The loss of operation of data centers can cause irreparable damage in the personal and business life of people who rely on the data.

Operation of the EPO is not simply a case of turning off the power to the data room where one might think "what's the big deal just turn it back on". Abrupt changes in the power source (either on or off) causes a transient voltage condition that more often than not, damages computer equipment. Depending on the equipment destroyed, the data center can be severely crippled waiting on replacement equipment.

Mr. Jones took a poll on the activation of EPO [fire emergency vs accidental activation]. None of the NFPA 75 members found an instance where it was required in a fire situation and most activation remembered was accidental.

The information I have from members of the Uptime Institute notes that all of the EPO operations have been accidental. No one will report malicious operations due to the sensitivity of the event, but it does happen.

Guards may help prevent accidental operation of the EPO as long as they are well marked and possibly annunciated, but guards will not prevent malicious operation of the device.

The point to be made is that data centers are no longer isolated to a single company's business but computer operations are now an important part of many business and are imperative in the daily lives of many people whether it be their financial dealings, medical information, or personal concerns. Since the EPO was first introduced as a safety feature, more stringent codes are in place, newer materials, and more sophisticated fire detection systems are available, it is possible to eliminate the EPO as a requirement in the code and still maintain the safety it was intended to provide.

Since activation of the EPO can cause premature equipment failure and public concern, and since there is no verifiable evidence that the EPO has been used for its intended purpose, the proposal should stand as originally submitted to effectively remove the requirement for the Emergency Power Off device.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Comment 12-38.

JONES: See my Explanation of Negative on Comment 12-38.

(Log #1382)

12- 61 - (645-10): Reject
SUBMITTER: Kari Barrett, American Chemistry Council
COMMENT ON PROPOSAL NO: 12-110
RECOMMENDATION: Delete the following text:

Where a push button is used to disconnect power, pushing the button in shall disconnect power.
SUBSTANTIATION: Throughout the process industry, computers are now controlling very critical processes and an inadvertent shutdown can result in unnecessary exposure to the environment or operators. The pushbutton as recommended, push to disconnect, can be activated by mistake and chemical processes must be shutdown properly. The submitter references NFPA 79, which is the standard for machinery, not processes. I can understand personnel operating machinery should have the ability to shut down the machinery should an operator get in trouble. Chemical processes if not shut down properly can cause many problems. Therefore, the disconnecting device should be left up to the discretion of the user.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its action on Proposal 12-110. Means are readily available to prevent inadvertent operation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 2
NOT RETURNED: 2 Kelley, Laney
EXPLANATION OF NEGATIVE:

JONES: This is a design issue and should not be a requirement of the NEC. In some cases, a push button that is a pull to disconnect may be more appropriate than a push to disconnect.

WHITE: Negative vote on panel action to accept. There have been too many shutdowns of critical processes due to accidental

contact with emergency push buttons that are pushed in to disconnect power. Computer systems now control very critical processes that when inadvertently shut down result in personnel injury and/or environmental releases. This is unacceptable.

A push to disconnect push button with a cover as is suggested in the proposal requires two hands to operate, whereas a pull to disconnect power button can still be operated with one hand.

(Log #830)

12- 62 - (645-11): Reject
SUBMITTER: Roger Witt, State Farm Ins. Co.
COMMENT ON PROPOSAL NO: 12-111
RECOMMENDATION: The proposal should stand as originally submitted.
SUBSTANTIATION: With the help of NFPA staff, we have researched the origin of the Emergency Power Off requirement in data processing rooms.

Unfortunately there were no documents that could help determine the original intent or reason. If we create a logical reason for the original need of the EPO it may follow this path:

- The cables under the raised floor did not have a flame spread rating providing fuel for the fire and possibly some toxicity depending on the wire insulation
- The HVAC system could fan the flame, and recirculate smoke
- The electrical system could provide the source of ignition.

With the above we have the three components of a fire

- fuel
- oxygen
- source of ignition

The thought of removing any or all of three components (by the use of EPO) would help in reducing the adverse affects of fire. The benefit could also be:

- containment of smoke
- reduce the spread of toxic fumes due to the burning of wire insulation materials
- A handy spot for the firemen or others to shut down the electricity in the room when water spray is eminent

Over the years the codes have become more stringent in requiring less hazardous materials to be used in the data center. Fire protection systems have also become more sophisticated.

- cables under the floor must be plenum rated
- VESDA systems are often installed for early warning fire detection
- Smoke detectors on the supply side and sometimes return side of the modular cooling units or the air handling units supplying environmental air to the room and under the raised floor are required to shut down those systems upon the sensing of smoke. NFPA 90-4
- The fire fighters are often aware of main power source to a building and the NEC requires notification of alternate power source be posted.
- Building codes are requiring fire sprinkler systems in the data room (all depending on size of building).
- Main frame computers have high temperature shutoff devices.

When the code was written, attitudes, materials and code requirements were different. There was less information (data) on computers so in relative terms less was at stake if the computers were put out of operation (by accident or malicious cause). Today, banking, ATM machines, medical records, billing, and many other functions are important to the everyday life of people. The loss of operation of data centers can cause irreparable damage in the personal and business life of people who rely on the data.

Operation of the EPO is not simply a case of turning off the power to the data room where one might think "what's the big deal just turn it back on". Abrupt changes in the power source (either on or off) causes a transient voltage condition that more often than not, damages computer equipment. Depending on the equipment destroyed, the data center can be severely crippled waiting on replacement equipment.

Mr. Jones took a poll on the activation of EPO [fire emergency vs accidental activation]. None of the NFPA 75 members found an instance where it was required in a fire situation and most activation remembered was accidental.

The information I have from members of the Uptime Institute notes that all of the EPO operations have been accidental. No one will report malicious operations due to the sensitivity of the event, but it does happen.

Guards may help prevent accidental operation of the EPO as long as they are well marked and possibly annunciated, but guards will not prevent malicious operation of the device.

The point to be made is that data centers are no longer isolated to a single company's business but computer operations are now an important part of many business and are imperative in the daily lives of many people whether it be their financial dealings, medical information, or personal concerns. Since the EPO was first introduced as a safety feature, more stringent codes are in place, newer materials, and more sophisticated fire detection systems are available, it is possible to eliminate the EPO as a requirement in the code and still maintain the safety it was intended to provide.

Since activation of the EPO can cause premature equipment failure and public concern, and since there is no verifiable evidence that the EPO has been used for its intended purpose, the proposal should stand as originally submitted to effectively remove the requirement for the Emergency Power Off device.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its position that the disconnecting means required by Section 645-10 is consistent with the purpose of the NEC. The submitter has offered no new substantiation that would serve to change the opinion of the panel.

(Log #1448)

15- 69 - (647-8(b)): Accept in Principle
SUBMITTER: Kenneth E. Vannice, Rep. U.S. Insitute for Theatre Technology Engineering Commission
COMMENT ON PROPOSAL NO: 15-72
RECOMMENDATION: Revise new section 647-8(b) as follows:
(b) All luminaires shall be permanently installed and listed, ~~and ballast operated.~~
SUBSTANTIATION: If the goal of this section is to allow noise reduction in lighting systems, why eliminate dimmer operated tungsten sources which are a potential noise source? While it has not been proven that 60v balanced power improves this type of noise, why eliminate nonballasted luminaires from this section?
PANEL ACTION: Accept in Principle.
Revise 647.8(B) of the panel action of Proposal 15-72 to read as follows:
(B) Luminaires. All luminaires (lighting fixtures) shall be permanently installed and listed for connection to a separately derived system at 120 Volts line-to-line and 60 volts to ground.
PANEL STATEMENT: The revised text meets the intent of the submitter while clarifying the listing requirement of the luminaire.

ARTICLE 665 — INDUCTION AND DIELECTRIC HEATING EQUIPMENT

(Log #1652)

12- 63 - (665-5): Accept in Part
SUBMITTER: Thomas M. Burke, Underwriters Laboratories Inc.
COMMENT ON PROPOSAL NO: 12-114
RECOMMENDATION: Revise text as follows:
"665-5 Output Circuit. The output circuit shall include all output components external to the converting device, including contactors, switches, bus bars, and other conductors. Unless guarded in accordance with Section 110-27(a), ~~the current flow form the output circuit to ground under operating and ground fault conditions shall be limited to a value which does not cause more than~~ voltage at 50 volts or more to ground shall not be present ~~to appear~~ on any ~~accessible~~ live part of the heating equipment and its load under operating conditions. The output circuit shall be permitted to be isolated to ground."
SUBSTANTIATION: The requirement in proposed Section 665-5 is written in the form of a product standard and not an installation code. Also, the proposed wording is unenforceable by an authority having jurisdiction (i.e. determining "current flow from the output circuit to ground," in particular under "ground fault conditions."). The recommended wording would more accurately align proposed Section 665-5 to existing Section 110-27(a) of the Code, which the Task Group has indicated is the basis behind the proposed voltage limitations. If voltage regulation to 50 V under a ground fault condition is a critically important safety feature, a method for an

authority having jurisdiction to determine compliance should also be part of the Code. Also, Section 110-2(a) requires guarding of parts operating at 50 V or more. The present proposal requires guarding of parts operating above 50 V.
PANEL ACTION: Accept in Part.
In the original proposal, replace "more than 50 volts" with "50 volts or more".
PANEL STATEMENT: The panel agrees with the submitter that the recommended wording "50 volts or more" would more accurately align proposed Section 665-5 to existing Section 110-27(a). The panel does not agree with the submitter that the proposed wording is unenforceable. The authority having jurisdiction does not have to determine the "current flow from the output circuit to ground"; only the voltage to ground needs to be determined. Also, it is very important that Section 665-5 not be revised as submitted because the revised language would only protect the operator under "operating conditions". Metal penetration to the coil is a fault condition that can be reasonably expected at some time. Therefore, it is very important to limit the voltage on the load to less than 50 volts under operating and fault conditions.

ARTICLE 668 — ELECTROLYTIC CELLS

(Log #367)

12- 64 - (668-21(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 12-119
RECOMMENDATION: Accept proposal.
SUBSTANTIATION: The panel statement that the last sentence of this section somehow specifies the secondary is ungrounded is not accurate. This section merely states "circuits" shall be ungrounded. Isolating or isolated type secondaries of transformers may be grounded and many are required to be grounded. If a 3-wire three-phase circuit is supplied from a wye-grounded transformer secondary the circuit is ungrounded but the secondary is grounded. Similar proposals (18-86, 20-36) have been accepted which may result in noncompliance with 3.3.5 of the Style Manual.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided any additional substantiation that would cause the panel to reverse its action on Proposal 12-119. In addition, the statements made by the submitter are technically incorrect.

ARTICLE 670 INDUSTRIAL MACHINERY

(Log #1666)

11- 243 - (670-4(b)): Reject
SUBMITTER: Melvin K. Sanders, TECo., Inc.
COMMENT ON PROPOSAL NO: 11-112
RECOMMENDATION: Revise the second and third sentence of Section 670-4(b) and add information addressing the panel's concern about supplementary overcurrent protection:
(b) Overcurrent Protection. A machine shall be considered as an individual unit and therefore shall be provided with a disconnecting means. ~~The~~ This disconnecting means shall be permitted to be supplied by branch circuits protected by either fuses or circuit breakers. The disconnecting means shall not be required to incorporate overcurrent protection. Where furnished as part of the machine, overcurrent protection shall consist of a single circuit breaker or set of fuse~~s,~~ and the machine shall bear the marking required in Section 670-3~~, and the supply conductors shall be considered either as feeders or taps as covered by Section 240-21.~~ Supplementary overcurrent protection shall not be permitted except as part of an identified component assembly.
SUBSTANTIATION: "The" changed to "This" in the second sentence to clarify this applies to the machine disconnecting means being supplied by a branch circuit. Supply conductors to machines meet the definition of branch-circuits in Article 100, as supplying power to an outlet as it is defined in Article 100. These loads may be further subdivided within or on the machine and at that point provided with additional overcurrent protection as provided for in Section 240-10 that is unique for proper machine operation.
The additional sentence will prohibit using supplementary overcurrent protection, and is general enough to address the stated concern of the panel and also acknowledges that vendor components do contain supplementary protection (e.g., electronic power modules for specialized machine functions, critical items that use current differential or special thermal detection) based upon manufacturer's design limits as covered in Section 240-10 (1999 Edition).
The use of taps within and on a machine is addressed within NFPA 79 in Clause 8.4 (1997 Edition) based on machine activities and mimics the rules in NEC Section 240-21 (1999 Edition).
PANEL ACTION: Reject.
PANEL STATEMENT: The supply to a machine may be a branch circuit, a feeder, or a tap.

SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 20-30
RECOMMENDATION: It was the action of the Technical Correlating Committee that this Proposal be reported as "Accept" to correlate with the action on Proposal 1-222. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2064)

20- 10 - (680): Accept in Principle in Part
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
COMMENT ON PROPOSAL NO: 20-30a
RECOMMENDATION: Make the following changes in the rewritten Article 680:
680.6. In 680.6(2), (3), and (7), change "pool or fountain" to "artificially contained body of water".
680.8 (Table). The 0-750V clearance should be increased to 6.9 m (22.5 ft) for the water surface and the structural clearances should go to 4.4 m (14.5 ft).
680.8(B). (B) Communications Systems. Communication, radio, and television coaxial cables ~~covered by~~ within the scope of Articles 800 through 820 shall be permitted at a height of not less than 3.0 m (10 ft) above swimming and wading pools, diving structures, and observation stands, towers, or platforms.
680.22(A)(3). Add (s) to "receptacle" and "branch circuit" to correlate with "no fewer than". Change the clearance to 3.0 m (10 ft).
680.22(A)(5). Modify the second sentence, as follows: "Receptacles that supply pool pump motors and that are rated 15 or 20 amperes ..."
680.23(F)(1) FPN. Delete this note.
680.23(F)(1) Ex. Reword as follows:
Exception: Where connecting to transformers for pool lights, liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted ~~to be used when installed in accordance with Article 351~~. The length shall not exceed 6 ft (1.83 m) for any one length, nor exceed 10 ft (3.05 m) in total length used.
680.25(A-B). Revise as follows:
(A) Wiring Methods. Feeders shall be installed in rigid metal

conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or rigid nonmetallic conduit. Electrical metallic tubing shall be permitted where installed on or within a building, and electrical nonmetallic tubing shall be permitted where installed within a building.

Exception: An existing feeder between an existing remote panelboard and service equipment shall be permitted to run in flexible metal conduit, or in an approved cable assembly that includes an equipment grounding conductor within its outer sheath ~~with an insulated or covered equipment grounding conductor.~~ The equipment grounding conductor shall comply with 250.24(A)(5).

(B) Grounding. An ~~insulated~~ equipment grounding conductor shall be installed with the feeder conductors between the grounding terminal of the pool equipment panelboard and the grounding terminal of the applicable service equipment or source of a separately derived system. For other than (1) existing feeders covered in 680.25(A) Exception, or (2) feeders to separate buildings that do not utilize an insulated equipment grounding conductor in accordance with 680.25(B)(2), this equipment grounding conductor shall be insulated.

(1) Size. This conductor shall be sized in accordance with 250.122 but not smaller than No. 12. On separately derived systems, this conductor shall be sized in accordance with Table 250.66 but not smaller than No. 8.

(2) Separate Buildings. A ~~panelboard at~~ feeder to a separate building shall be permitted to supply swimming pool equipment branch circuits, or feeders supplying swimming pool equipment branch circuits, if the ~~feeder meets~~ grounding arrangements in the separate building meet the requirements ~~for grounding~~ in 250.32. ~~Where installed, a separate equipment grounding conductor shall be an insulated conductor.~~

680.42(C). Amend the new paragraph as follows:

(C) Interior Wiring to Outdoor Installations. In the interior of a one-family dwelling or in the interior of another building or structure associated with a one-family dwelling, any of the wiring methods recognized in Chapter 3 of this Code that contain a copper equipment grounding conductor that is insulated or enclosed within the outer sheath of the wiring method and not smaller than No. 12 shall be permitted to be used for the connection to motor, heating, and control loads that are part of a self-contained spa or hot tub, or a packaged spa or hot tub equipment assembly. Wiring to an underwater light shall comply with 680.23 or 680.33.

680.43(D)(5). Revise as follows: (5) Electrical devices and controls that are not associated with the spa or hot tub ~~and that are~~ but located ~~not less than~~ within 1.5 m (5 ft) from such units~~; otherwise they shall be bonded to the spa or hot tub system~~.

680.43(E)(3). Revise as follows: "A solid copper conductor, insulated, covered, or bare, not smaller than No. 8."

680.44. Insert the words "shall be" ahead of "protected."

680.57(D) and (E). Delete the word "Section" (three times).

680.62(B)(5): Revise as follows: (5) Electrical devices and controls that are not associated with the therapeutic tub ~~and that are~~ but located ~~a minimum of~~ within 1.5 m (5 ft) from such units~~; otherwise they shall be bonded to the therapeutic tub system~~.

SUBSTANTIATION: This comment reacts to comments in the voting, and a further review of the article rewrite, as follows:

680.2. Do not change from the panel action. The terms "fixed" "portable" and "stationary" are used all over Article 680 and should be defined for the purposes of the article, for clarity. If the panel wishes to further refine the definitions, it may do so in the comment period, but the definitions are certainly appropriate. Proposal 20-5 applied to a Chapter 4 article, and need not necessarily serve as a precedent in Chapter 6. In fact Chapter 5 articles also define these terms for their own purposes. (See Sections 550-2, 551-2, and 552-2 which references the other two.)

680.6. The panel didn't want to use the phrase "contained body of water" in the original proposal, justifiably, due to the possibility of confusion with natural bodies of water that are nonetheless "contained." The problem is that this general part of the article must be written to encompass all the parts that follow. The grounding provisions must apply to spas, hot tubs, therapeutic tubs, and hydromassage bathtubs. None of these items are pools or fountains, which is why the original proposal referred to "contained body of water." Adding the word "artificially" addresses the panel's concerns, while making the rules properly generic.

680.7. Do not change the panel action. Lifting the 20 ampere limitation was substantiated in the proposal. There are larger (2 hp) swimming pool pumps on the market that may nuisance trip a 20 ampere circuit, and for which Article 430 would allow far larger branch-circuit short-circuit and ground-fault protective devices. Section 305-6(A) now requires GFCI protection on 125-volt 30-ampere temporary wiring outlets, indicating a market for larger equipment. Restricting these applications to 20 amperes is no longer warranted technically, and will provoke countless local amendments, particularly in northern states where this equipment is routinely removed for the cold season. This section has never limited voltage to 240 volts.

680.8. Do not change the general wording. The words should remain as the panel accepted them. If the service point is the point of attachment on the building, then the drop is beyond the scope of the NEC, and the NESC applies. However, there are instances where the service point on an overhead service is at the pole or property line. In such cases the NEC applies to the service drop conductors, and if the rule were changed to only cover feeders and branch circuits the result would be a gap in coverage.

680.8 (Table). The previous comments notwithstanding, there isn't any reason to maintain a conflict between the NESC and NEC over clearances, as suggested in the voting.

680.8(B). Since "within the scope of" effectively refers to only single sections, the first sections of those three articles, the submitter assumes this wording complies with 4.1.1 of the Style Manual. It flows much better than individual section notation, while getting away from the panel action that directly referenced the entire articles.

680.22(A)(3). The use of potential plural construction is a grammatical correction. The reference to a fountain is out of the scope of this part of the article, and is not included in the 1999 source material. The 5-ft distance was erroneously reduced from the original 10-ft without substantiation and is not correlated with 680.22(A)(4) following, and needs to return to the original 3 m (10 ft).

680.22(A)(5). Editorial clarification to indicate that the rating applies to the receptacles and not the motors.

680.22(C). Note that the panel action on Proposal 20-44 potentially moots old FI 87-4 re 15V and 5 mA max devices. NFPA staff should process this FI for withdrawal.

680.23(F)(1) FPN. It contains a reference to an entire article, and adds so little that it isn't worth deciding which parts ought to remain in the note.

680.23(F)(1) Ex. Eliminates a whole article reference problem, one which will be exacerbated by the pending split of Article 351. Section 90-3 already covers the mandatory application of Chapter 3 requirements in this case.

680.25(A-B). This comment changes 680.25(A) Exception to clarify that the allowance for an existing feeder has different aspects depending on whether the issue is flexible metal conduit or a cable assembly. In the case of flexible metal conduit, the exception is for the wiring method only; the insulated equipment grounding conductor rule continues to apply. In the case of a cable assembly, the exception for existing installations does allow a Type SER feeder. The comment wording is based on the revision for romex on motor circuits in Section 680.21(A)(4), which was changed in recognition that a bare EGC under a cable sheath does not meet the definition for a covered conductor in Article 100. This wording and 680.21(A)(4) must line up. In addition, there is an additional sentence to assure compliance with 250.24(A)(5). This lines up with the wording in the next subsection [680.25(B)(2)] to assure compliance with 250.32 in the case of second buildings. Pool equipment with conductive surfaces connected to a panel supplied with a feeder utilizing a common grounded and grounding conductor will be subjected to continual surface voltage fluctuations depending on voltage drop stemming from the varying amount of neutral current flowing through the grounded conductor. These fluctuations pose a safety problem in a pool environment.

This comment also changes 680.25(B) to remove a conflict between its language and 680.25(A) Exception and 680.25(B)(2), neither of which require insulated equipment grounding conductors in all instances. The final change in 680.25(B)(2) addresses the fact that feeders are far from the only required elements of compliance with 250.32 and the wording must be broadened to clarify that all elements of 250.32 must be met in order for this allowance to be safe. In addition, separate buildings may themselves contain feeders running from their main distribution to subpanels supplying swimming pool equipment. This comment clarifies that the allowance is only for the main supply feeder to the separate building, and not a subfeeder within the building which should follow the same rules as for a feeder in the main building. Only on the main supply feeder, which will have a grounding electrode connected at the load end in the separate building, is there equivalent safety to that afforded at the service entrance.

680.26(B)(2). Do not change the panel action. The extension of the bonding requirement to a metallic forming shell of low voltage equipment was substantiated. The panel should reflect on the fact that the bonding philosophy underlying Article 680 provisions relates to UL research in the early 1960s, when UL volunteers actually subjected themselves to pool ambients. That research showed a drowning hazard due to disorientation, particularly with the head submerged and water in the ear canal. Those effects became noticeable at about 4 volts, well below present low-voltage lighting designs. If the present code text is being used to justify low-voltage fixtures with unbonded metallic forming shells, then this change is indeed timely. Note that the proposal never asked that these fixtures be grounded per se, which means that no equipment grounding conductor need be run in the supply to the fixtures. However, if they incorporate a metal forming shell (it was the submitter's understanding that they do not customarily do so), then that forming shell should be incorporated into the bonding grid.

680.42(C). Proposal 20-118 was sold on the basis that any Chapter 3 wiring can be used in tre interior of a single family dwelling for these units if installed indoors. That was correct on the 1996 NEC, but not so on the 1999 NEC, which requires adherence to Parts A and B except as modified in Section 680.41. No provision in Section 680-41 (1999 NEC) modifies the raceway requirements for underwater lights. This comment restores the 1999 requirement, which was removed without proper benefit of technical substantiation.

680-43(D)(5). This corrects an error in the original proposal that was overlooked in processing. The intent was to recast the present code language as positive, and using consistent syntax with other items on the list, as required by the new Style Manual. The submitted language inadvertently came from a file in progress and was never completed, resulting in contradictory wording.

680.43(E)(3). This makes the wording consistent with 680.26(C) and 680.62(C).

680.44. These words are in both the Proposal 20-31 and the panel action on Proposal 20-31. In translating the legislative format of the panel action on the proposal into the normal text of Panel Proposal 20-30a, these words were inadvertently dropped.

680.57(D) and (E). Style.

680.62(B)(5). This corrects an error in the original proposal that was overlooked in processing. The intent was to recast the present code language as positive, and using consistent syntax with other items on the list, as required by the new Style Manual. The submitted language inadvertently came from a file in progress and was never completed, resulting in contradictory wording.

PANEL ACTION: Accept in Principle in Part.

After the last sentence to 680-1 add to read as follows "The term "body of water" used throughout Part I applies to all bodies of water covered in this scope unless otherwise amended."

In Section 680.6(2),(3) and (7) change the term "pool or fountain" to "specified body of water".

Revise 680.8 (Table) to read as follows. "The 0-750V clearance should be increased to 6.9 m (22.5 ft) for the water surface and the structural clearances should go to 4.4 m (14.5 ft)."

Revise 680.8(B) to read as follows: "(B) Communications Systems. Communication, radio, and television coaxial cables within the scope of Articles 800 through 820 shall be permitted at a height of not less than 3.0 m (10 ft) above swimming and wading pools, diving structures, and observation stands, towers, or platforms."

In 680.22(A)(3) change the clearance from 1.5m (5 Ft) to 3.0 m (10 ft).

In the draft of the 2002 NEC revise the second sentence of Section 680.22(A)(5) to read as follows: "Receptacles that supply pool pump motors and that are rated 15 or 20 amperes , 120 volt through 240 volt, single phase, shall be provided with GFCI protection."

In Section 680.23(F)(1) FPN. Delete this note.

In Section 680.23(F)(1) exception Reword as follows: "Exception: Where connecting to transformers for pool lights, liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted. The length shall not exceed 6 ft (1.83 m) for any one length, nor exceed 10 ft (3.05 m) in total length used."

Revise Section 680.25(A) and (B) to read as follows: "(A) Wiring Methods. Feeders shall be installed in rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or rigid nonmetallic conduit. Electrical metallic tubing shall be permitted where installed on or within a building, and electrical nonmetallic tubing shall be permitted where installed within a building.

Exception: An existing feeder between an existing remote panelboard and service equipment shall be permitted to run in flexible metal conduit or an approved cable assembly that includes an equipment grounding conductor within its outer sheath. The equipment grounding conductor shall comply with 250.24(A)(5).

(B) Grounding. An equipment grounding conductor shall be installed with the feeder conductors between the grounding terminal of the pool equipment panelboard and the grounding terminal of the applicable service equipment or source of a separately derived system. For other than (1) existing feeders covered in 680.25(A) Exception, or (2) feeders to separate buildings that do not utilize an insulated equipment grounding conductor in accordance with 680.25(B)(2), this equipment grounding conductor shall be insulated.

(1) Size. This conductor shall be sized in accordance with 250.122 but not smaller than No. 12. On separately derived systems, this conductor shall be sized in accordance with Table 250.66 but not smaller than No. 8.

(2) Separate Buildings. A feeder to a separate building shall be permitted to supply swimming pool equipment branch circuits, or feeders supplying swimming pool equipment branch circuits, if the grounding arrangements in the separate building meet the requirements in 250.32. Where installed, a separate equipment grounding conductor shall be an insulated conductor."

Revise Section 680.42(C) to read as follows:

"(C) Interior Wiring to Outdoor Installations. In the interior of a one-family dwelling or in the interior of another building or structure associated with a one-family dwelling, any of the wiring methods recognized in Chapter 3 of this Code that contain a copper equipment grounding conductor that is insulated or enclosed within the outer sheath of the wiring method and not smaller than No. 12 shall be permitted to be used for the connection to motor, heating, and control loads that are part of a self-contained spa or hot tub, or a packaged spa or hot tub equipment assembly. Wiring to an underwater light shall comply with 680.23 or 680.33."

Revise Section 680.43(D)(5) to read as follows:"(5) Electrical devices and controls that are not associated with the spa or hot tub but located within 1.5 m (5 ft) from such units.

Revise Section 680.43(E)(3) to read as follows: "A solid copper conductor, insulated, covered, or bare, not smaller than No. 8."

In Section 680.44 insert the words "shall be" ahead of "protected."

In Section 680.57(D) and (E). Delete the word "Section" (three times).

In Section 680.62(B)(5) revise as follows: "(5) Electrical devices and controls that are not associated with the therapeutic tub but located within 1.5 m (5 ft) from such unit."

PANEL STATEMENT: In Section 680-6 the panel accepted in principle and changed the term pool or fountain to specified body of water which meets the intent of the submitters concerns.

In Section 680-22(A)(3) the panel did not add the (s) to receptacle and branch circuit as it would not clarify the current text.

In Section 680-25 (B)(2) the panel accepted this change but retained the last sentence for new installations as the need still exists.

20- 11 - (680-1 (New)): Reject

SUBMITTER: Gary Boughton, Town of Ridgefield, CT

COMMENT ON PROPOSAL NO: 20-29

RECOMMENDATION: Change 1.0m (42 in.) to 1.07m (42 in.).

SUBSTANTIATION: 42 in. is 1.07m.

PANEL ACTION: Reject.

PANEL STATEMENT: Proposal 20-29 provided the committee with the proper hard conversions as per NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

COMMENT ON AFFIRMATIVE:

LABRAKE: The Metrication Task Group of the Technical Correlating Committee agreed on the general SI unit of 1.0 m to represent existing U.S. Customary units of 40 in. and 42 in. throughout the NEC as a hard conversion. This information was used in Proposal 20-29 where the existing 42 in. conversion to SI units was not deemed to be "extracted material" and hard conversion from the Task Group's results was determined as 1.0 m. The panel has not determined that a soft conversion is necessary to maintain the 1999 NEC value for a higher level of safety.

(Log #765)

20- 12 - (680-3(a)): Accept
SUBMITTER: Richard E. Loyd, Perryville, AR
COMMENT ON PROPOSAL NO: 20-34
RECOMMENDATION: Reconsider this proposal and hold for further study, appoint a committee to investigate the need for expanding Article 680 to cover these installations or create a new article for the 2005 NEC cycle.
SUBSTANTIATION: See my Comment on Proposal 20-32.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel has formed a task group to investigate the need of a new article to cover these type of installations. This includes bodies of water that involve electrical equipment that is not covered by Article 680.

20- 13 - (680-3(a)): Accept
SUBMITTER: Richard E. Loyd, Perryville, AR
COMMENT ON PROPOSAL NO: 20-32
RECOMMENDATION: Reconsider this proposal and hold for further study, appoint a committee to investigate the need for expanding Article 680 to cover these installations or create a new article for the 2005 NEC cycle.
SUBSTANTIATION: I disagree with Code-Making Panel 20 and the NEC Technical Correlating Committee, in rejecting this proposal which points out a serious safety concern.
Fish Farms have been a controversy for many years and have similar safety concerns to pools since harvesting the fish often requires the farmers to enter the water regularly. IAEI meetings in the south have reported electrocutions many times in the past in these facilities. Many of the aerators and pumps in the lakes-ponds-water containment areas listed by the proponents of Proposals 20-32 and 20-34 are powered by 480 volt motors. Many have lighting. Golf course streams, lakes, etc., are also a serious concern.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel has formed a task group to investigate the need of a new article to cover these type of installations. This includes bodies of water that involve electrical equipment that is not covered by Article 680.

20- 14 - (680-6(a)(1)): Reject
SUBMITTER: Art Cummins, City of Decatur
COMMENT ON PROPOSAL NO: 20-38
RECOMMENDATION: Revise as follows:
A receptacle(s) that provides power for a water-pump motor(s) for, or other loads directly related to the circulation and sanitation system, a permanently installed pool or fountain, as permitted in Section 680-7, shall be permitted to be at least 10 feet from the inside walls of the pool or fountain and be protected by a ground fault circuit interrupter.
SUBSTANTIATION: The 10 ft area around a pool or fountain is usually wet and would be hazardous for persons to plug or unplug cords and relying on the integrity of the GFCI as the sole means of protection.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 680-22(A)(5) of the rewrite contains the requirements that address his concerns.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2209)

20- 15 - (680-6(a)(2)): Accept
SUBMITTER: Robert H. Keis, Dover, DE
COMMENT ON PROPOSAL NO: 20-30a
RECOMMENDATION: Change 1.5 m (5 ft) to 3 m (10 ft).
SUBSTANTIATION: With the long rewrite text it is hard to find the correct section numbers and proposals. The requirements for receptacle locations around swimming pools have always been 10 to 20 feet.
680-22(A)(2) Other receptacles, Location. Other receptacles shall be not less than 3.0 m (10 ft) from the inside walls of a pool.
In the draft copy (shown below and also in this Proposal 20-30a, this distance has been changed to require a receptacle within 5 to 20 feet. I think the confusion was caused by modifying a proposal and then some renumbering. In Proposal 20-29 (ROP Page 1124) under recommendation for Section 680-6(a)(2) item No. 4, the distance remained the same, (10 ft) only the metric and feet dimensions are reversed. In Proposal 20-39 (ROP page 1165) where the recommendation was made to add an exception to permit a receptacle within 5 feet the "panel action was to "Revise 680-6(a) by adding a new item (3) to read: – In the draft copy from the ROP CD for this section, this proposal became item (4). See below.
Item (4) should take care of the submitter's problem of 5 feet and the general rule in new 680-22 (A)(3) should read 3 m (10 ft) instead of 1.5 m (5 ft).
Otherwise, the rule for locations receptacles grounding swimming pools will be a minimum of 5 ft instead of 10 ft. The new (4) will act as the exception for those areas that do not have enough distance to make the 10 foot rule.
Text should read:
(3) Dwelling Unit(s). If a permanently installed pool is installed at a dwelling unit(s), no fewer than one 125-volt, 15- or 20-ampere receptacle on a general-purpose branch circuit shall be located not less than ~~1.5 m (5 ft)~~ 3 m (10 ft) from and not more than 6.0 m (20 ft) from the inside wall of the pool. This receptacle shall be located not more than 2.0 m (6 ft 6 in.) above the floor, platform, or grade level serving the pool.
(ROP 20-29)
(4) Restricted Space. Where a pool is within 3.0 m (10 ft) of a dwelling and the dimension of the lot preclude meeting the required clearances, not more than one receptacle outlet shall be permitted if not less than 1.5 m (5 ft) measured horizontally from the inside wall of the pool. (ROP 20-29, 20-39) DRAFT
PANEL ACTION: Accept.
PANEL STATEMENT: See panel action on comment 20-10.

ARTICLE 680 — SWIMMING POOLS, FOUNTAINS, AND SIMILAR INSTALLATIONS

(Log #228)

20- 16 - (680-6(d)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 20-50
RECOMMENDATION: The Technical Correlating Committee directs the Panel to clarify the Panel Action and Statement on this Proposal, specific to the proposed addition of "One and Two Family" to the section title. It is not clear where this action is covered by the rewrite of Article 680 in Proposal 20-30a. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the Technical Correlating Committee comment to reconsider this proposal. The panel accepts in principle in part Proposal 20-50. The panel reaffirms its rejection of adding the title "One and Two family" in the Section title of 680-21.
PANEL STATEMENT: The panel action on Proposal 20-50 was to accept in principle. The principle that the panel agreed with was that motors, regardless of where they are installed should be treated the same. The panel has accomplished this in Section 680-21. Therefore, there is no need to include the phrase "One and Two family" in the Section title of 680-21.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1366)

20- 17 - (Table 680-8): Accept in Principle
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co/EEI
COMMENT ON PROPOSAL NO: 20-30a
RECOMMENDATION: This proposal should be accept in principle.

1. Corrections should be made to change the words in the column descriptions of Table 680.8 as follows:
Delete "supply or" and after "service drop", add "feeder or branch circuit or supply lines associated with separately derived systems."

2. In addition, the first column of the '0 to 750V-Ground cables' clearances needs to be changed to 6.9m (22.5 ft) for "a" and 4.4m (14.5 ft) for "B" in Table 680.8.

SUBSTANTIATION: 1. Code-Making Panel 4's actions taken on this NEC cycle's Proposals 4-13 (re: Section 225-21), 4-63 (re: Section 230-21), and 4-98 (re: Section 230-51) to distinguish between utility services and customer-installed outside feeders and branch circuits. Code-Making Panel 4's intent on these is that the service drop to the meter is not always under NESC jurisdiction. When this section was originally developed, the discrepancy between the NEC and NESC was noted and understood. However, it was considered as the best at that time to be able to differentiate between utility services and outdoor feeders and branch circuits installed by others that later has become the issue. Also, refer to the panel's action taken on NFPA 70 A98 ROP Proposal 20-103.

2. In addition, the first column of the '0 to 750V-Ground cables' clearances needs to be harmonized with the 1997 NESC values. The description of cables in the first column of Table 680.8 corresponds to Rule 230C2 of the 1997 NESC. Please note that in using these values directly from the NESC table that adjustments are not factored for the sag of overhead conductors due to the effects of temperature, wind, and ice loading. These factors need to be considered in these NEC clearances as they are in the NESC through its rules and it is suggested that the Technical Correlating Committee's task group on harmonization with the NESC evaluate this issue for resolution.
PANEL ACTION: Accept in Principle.
Correct the words in the column descriptions of Table 680.8 as follows:
Delete "supply or service drop " from both columns.

In addition, the first column of the '0 to 750V-Ground cables' clearances needs to be changed from (22 ft.) to 6.9m (22.5 ft) for "a" and (14 ft.) to 4.4m (14.5 ft) for "B" in Table 680.8.
PANEL STATEMENT: The elimination of the words "supply or service drop" will address the submitter's intent.

The panel accepts the second part of the submitter's comment.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1367)

20- 18 - (680-8(a), FPN): Accept in Principle
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co/EEI
COMMENT ON PROPOSAL NO: 20-30a
RECOMMENDATION: This proposal should be accept in principle. Corrections should be made to 680.8(A) to add a Fine Print Note to describe what is meant by "open overhead wiring" after the words "service drop" as follows:

"FPN: Open overhead wiring typically refers to feeder or branch circuit or supply lines associated with separately derived systems."
SUBSTANTIATION: Code-Making Panel 4's actions taken on this NEC cycle's Proposal 4-13 (re: Section 225-21), 4-63 (re: Section 230-21), and 4-98 (re: Section 230-51) to distinguish between utility services and customer-installed outside feeders and branch circuits. Code-Making Panel 4's intent on these is that the service drop to the meter is not always under NESC jurisdiction. Also, refer to the panel's action taken on NFPA 70 A98 ROP Proposal 20-103.
PANEL ACTION: Accept in Principle.
In the draft for the 2002 NEC add a Fine Print Note after Section 680-8(A) to read as follows: "FPN: Open overhead wiring as used in this article typically refers to conductor(s) not in an enclosed raceway."
PANEL STATEMENT: The panel addressed the concern of the submitter and reworded the fine print note to accurately clarify the meaning of open overhead wiring as used in this article.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
LABRAKE: The new FPN will help distinguish that the clearances of overhead conductors in Article 680 only apply to those that are related to premises wiring and not of those under the jurisdiction of the supplying utility as regulated through the states and the National Electrical Safety Code (NESC). The NESC establishes minimum clearances of utility overhead conductors near pools.

(Log #591)

20- 19 - (680-9, Exception (New)): Hold
SUBMITTER: Thomas L. Harman, Univ. of Houston Cleark Lake
COMMENT ON PROPOSAL NO: 20-29
RECOMMENDATION: Added text:

Exception: Listed instantaneous electric water heaters shall have their loads subdivided as defined in Article 422.

Panel 20 accepted Proposal 20-6 for Article 422-11 and allowed "listed instantaneous electric water heaters" to have their heating elements subdivided into circuits not exceeding 120 amperes and protected at not more than 150 amperes. This exception should also apply to electric pool water heaters.
SUBSTANTIATION: Due to the technological advances in tankless (instantaneous) water heater design, I believe that Section 680-9 should not apply as presently written to water heaters that are protected within their rating. If an instantaneous water heater is a listed (UL) product that has been field tested with a variety of supply circuits, there is no technical or safety reason to limit the branch circuit protection to 60 amperes or cause the loads to be subdivided to 48 amperes.

This requirement for water heaters was introduced in the 1975 code with the justification that heaters with "small internal conductors" might be protected by unspecified sizes of overcurrent devices.

The restrictions on overcurrent protection of water heaters in the present code are unnecessarily restrictive for the new types of instantaneous water heaters. No technical justification has been given to limit the loads to 48 amperes. Field experience and testing has indicated that the design and control of today's instantaneous water heaters allows for their safe installation as described in the proposal (20-6) accepted for Article 422-11.

For example, an instantaneous water heater with four elements drawing a maximum of 25 amperes each would require four 30-ampere branch circuits by the present wording of the NEC. A safer alternative would be to subdivide the loads using two elements each on a 60-ampere circuit as allowed by the exception that will be incorporated in Article 422-1. Then, only two circuit breakers need be turned off to disconnect the unit. Since the heater must be a listed appliance, the internal wiring would be sufficient for the 60-ampere circuits.
PANEL ACTION: Hold.
PANEL STATEMENT: This comment introduces new material and should be held until the next cycle as per Section 4-4.6.2.2 of the NFPA Regulations Governing Committee Projects.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #424)

20- 20 - (680-10): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 20-59
RECOMMENDATION: Accept proposal.
SUBSTANTIATION: Where metal conduit not supplying pool equipment cannot be routed 5 ft or more from the pool it should be required to be bonded to the common bonding grid. The panel states that earth cover is not a barrier (arguable) and bonding is required by the Code. Section 680-22(a)(4) does not cover such conduits nor does 680-22(a)(5) since underground conduits within 5 ft horizontally are not likely to be within 12 ft above maximum pool water level. Section 680-22(a)(5) appears directed to metal that is exposed and subject to contact by persons.
PANEL ACTION: Reject.
PANEL STATEMENT: The NEC now requires that conduit to be bonded. The panel does not consider earth to be a barrier.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #826)

20- 21 - (680-12): Accept in Principle
SUBMITTER: Mike Theisen, St. Cloud, MN
COMMENT ON PROPOSAL NO: 20-62a
RECOMMENDATION: Editorial changes to first sentence to read as follows:

One or more disconnecting means, for disconnecting ~~from~~ all ungrounded conductors, shall be provided for all utilization equipment other than lighting.

SUBSTANTIATION: The current sentence structure is confusing and difficult to read.
PANEL ACTION: Accept in Principle.
Revise first sentence to read as follows:
"One or more means to disconnect all ungrounded conductors shall be provided for all utilization equipment other than lighting."
PANEL STATEMENT: The panel accepts the submitters comment in principle and has made editorial changes for clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #902)

20- 22 - (680-12):

Note: It was the action of the Technical Correlating Committee that this comment be reported as "Hold" because the panel states that the comment introdces new material that has not had public review.

SUBMITTER: Art Cummins, City of Decatur
COMMENT ON PROPOSAL NO: 20-62a
RECOMMENDATION: Add new text:

Safety Disconnecting Means. One or more disconnecting means from all ungrounded conductors shall be provided for all utilization equipment other than lighting. Each means shall be accessible and within sight from persons using the pool, spa or hot tubs, and shall be at least 5 ft from nearest edge of water.

SUBSTANTIATION: The original proposal (20-75) for the 1996 code was intended to be used for the safety of people using the various utilization equipment. The disconnecting means for motors - pumps are already covered in Article 430 and water heating equipment is covered in Article 422. The IAEI Analysis of the 1999 NEC also states the case for emergency use for the disconnects.
PANEL ACTION: Reject.
PANEL STATEMENT: This comment introduces new text material and should be rejected in accordance with the Regulations Governing Committee Projects Section 4-4.6.2.2
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2113)

20- 23 - (680-22(a)(1)): Accept in Principle
SUBMITTER: Dennis L. Rowe, NY Board of Fire Underwriters
COMMENT ON PROPOSAL NO: 20-82
RECOMMENDATION: Revise text as follows:

"...Where reinforcing steel is effectively insulted by a listed encapsulating...".

SUBSTANTIATION: The Panel erred in removeing the listing requirement for a product that is intended to serve as an insulating material.

The National Electrical Code requirements for providing an adequate surface for proper bonding of metal, that may become electrically energized, is time honored and should not be abandoned without technical substantiation.

The practices of installing epoxy or plastic coated rebar in the structure and deck of swimming pools, without adequate bonding of the rebar, has proven to be hazardous in at least two documented cases in California.

Note: Supporting material available for review upon request at NFPA headquarters.

PANEL ACTION: Accept in Principle.
In Section 680.26(B)(1) of the Draft of the 2002 after the last sentence add a sentence to read as follows: "Where reinforcing steel is encapsulated with a non-conductive compound, provisions shall be made for an alternate means to eliminate voltage gradients which would otherwise be provided by unencapsulated, bonded reinforcing steel."
PANEL STATEMENT: The panel recognized the potential hazard and the additional text will address the commenters concerns.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
LABRAKE: The panel assigned a Task Group to research this encapsulated reinforcing steel situation further and the need for an equipotential plane as was suggested in Proposal 20-87. There is a need to substantiate evidence that an equipotential plane should be required for pools. This can be an intricate design issue to maintain safe step and touch voltages and requiring a minimum loop conductive element may either not be sufficient or could present greater risk to an individual's step or touch shock hazard within reach of the pool while standing outside the loop. As a minimum, the Task Group needs to consider varying soil resistivities, maximum equipotential plane resistance, and maximum tolerable voltage rise for possible maximum phase to ground fault current situations. IEEE Standard No. 80 can be a source reference to begin engineering studies.

(Log #1368)

20- 24 - (680-22(a)(4)): Reject
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co/EEI
COMMENT ON PROPOSAL NO: 20-84
RECOMMENDATION: This proposal to add the following second paragraph should be rejected and the following wording should be deleted:

"Where a double insulated water pump motor is installed under the provisions of this exception, a solid No. 8 copper conductor that is of sufficient length to make a bonding connection to a replacement motor shall be extended from the bonding grid to an accessible point in the motor vicinity. Where there is no connectionsbetween the swimming pool bonding grid and the equipment grounding system for the premises, this bonding conductor shall be connected to the equipment grounding conductor of the motor circuit."

SUBSTANTIATION: The proponent has not submitted evidence or supporting documentation that this issue is creating a safety hazard. It appears to be more of a design preference. While the Code does contain some design specifications, they are there to address a specific safety issue. This is not a safety issue and should not be included in the Code.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel understands the concerns of the submitter but recognizes the need to minimize the difference of potential between the bonding grid and the equipment grounding system.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
LABRAKE: The decision by Panel 20 to require the installation of a No. 8 AWG solid copper bonding conductor for use with double insulated motors is both unnecessary and arbitrary. The proposal 20-84 submitted no substantiation justifying this requirement. Its installation "for future use" may never be necessary. Any suggestion that future motor replacements would not be done according to NEC requirements is an unsubstantiated assumption. A requirement as such for possible "future use only" adds both unnecessary costs and construction effort to the initial installation and can be viewed as an attempt by the panel to discredit the benefits of double insulated motors.

(Log #2208)

20- 25 - (680-22(b)(1)): Reject
SUBMITTER: Robert H. Keis, Dover, DE
COMMENT ON PROPOSAL NO: 20-85
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: I don't know what the panel wants in the way of substantiation. But I will try again. Section 680-22(a) requires the bonding together of all metal parts. Section 680-22(b) tells us how to accomplish this required bonding. This section also tells the "common bonding grid" shall be permitted to be any of the following: THIS IS WHERE THE PROBLEM IS.

(1) "The structural reinforcing steel of a concrete pool where the reinforcing rods are bonded together by the usual steel tie wires or the equivalent."

All homeowners and most electricians feel that "wire mesh" is part of the reinforcing steel of the pool. Wire mesh is made up of thin steel (think of heavy coat hangers) that are welded together in 4 inch squares and is usually 4 feet wide and comes in rolls as a rule. It is laid down in the deck concrete to add strength to the concrete. It is also sometimes used in the walls of pools instead of re-bar. The difference is that the reinforcing rods (re-bar) are usually 3/8 or 1/2 inch steel bars up to 20 feet long. The bars are tied tightly to each other, and all others usually at 9 to 10 inch intervals. Each piece of re-bar may be tied to as many as 15 or 20 other pieces. This makes a very good electrically tight mat. In fact, this assembly can be climbed on getting into and out of the pool.

Now, wire mesh as I said is nothing more than heavy coat hangers welded together. The "usual steel tie wires" mentioned in the (1) above, can never be tied tight enough on the material to make it electrically safe. It is usually just tied helter-skelter to keep it in place while the concrete is being poured. In fact, a lot of times, the mesh has one end of wire looped over a piece in the adjoining section with not even a thin piece of wire to hold them together. To the concrete man, this is all that is needed to hold it in place until the concrete is poured.

Section 680-22 - Bonding. This section tells us why we are required to bond the metal parts of a pool.

In part this section says this;... but only that it shall be employed to eliminate voltage gradients in the pool areas as prescribed.

How can we eliminate voltage gradients if we do not properly bond this material into the pool structure?

Try wrapping a piece of copper or steel wire around two coat hangers and see if they are tight. By tight, I mean electrically tight. If these two coat hangers were two pieces of wire mesh in a concrete pool or deck they would only be tight enough to hold the material together while the concrete is being poured.

Code Making Panel 19 recognized the hazard for livestock confinement areas and inserted this text concerning the bonding of wire mesh in the concrete to protect cows:

547-9. Bonding and Equipotential Plane.

(a) Definition of Equipotential Plane. An area accessible to livestock where a wire mesh or other conductive elements are embedded in concrete, are bonded to all metal structures and fixed nonelectrical metal equipment that may become energized and are connected to the electrical grounding system to prevent a difference in voltage from developing within the plane. For this section, livestock does not include poultry.

(b) General. Wire mesh or other conductive elements shall be installed in the concrete floor of livestock confinement areas and be bonded to the building grounding electrode system to provide an equipotential plane that may have voltage gradient ramps at entrances and exits that are traversed daily by the same livestock. The bonding conductor shall be copper, insulated, covered or bare, and not smaller than No. 8. The means of bonding to wire mesh or conductive elements shall be by pressure connectors or clamps of brass, copper, copper alloy or an equally substantial approved means.

Not all swimming pools use wire mesh in the deck or in the pool walls. This would be a design consideration. But, if it is used, it should be properly bonded into the pool. I guess it is kind of like "unit equipments" in Article 700. The code doesn't say where we need them, but is is very explicit on how they are to be connected, IF they are installed.

It seems that we should at least give the swimming public the same protection that is required for cows.

PANEL ACTION: Reject.

PANEL STATEMENT: Section 680-26(c)(1) of Proposal 20-30a requires bonding the mesh to the grounding grid by suitable means. The issue of bonding the wire mesh to wire mesh using usual steel tie wires is acceptable when made tight.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

EGAN: Section 680-22(B) of the 1999 code was changed to recognize exothermic welding as a means of connecting to a common bonding grid. This change also recognizes pressure connections and clamps that are specifically listed for the purpose. Since wire mesh is a metallic part of the pool structure, it should be required to be bonded. The submitter has presented a valid recommendation to require adequate bonding.

(Log #1627)

20- 26 - (680-25): Reject

SUBMITTER: Gilbert L. Thompson, MEIA Codes and Standards

COMMENT ON PROPOSAL NO: 20-30a

RECOMMENDATION: 680-25 - feeders part (b)2 separate buildings in the last sentence remove the period and add the words "unless run in an approved cable assembly".

SUBSTANTIATION: Many separate buildings are adjacent to the pool itself, but are far enough away from the treated water that the feeder conductors would not be involved in the deteriorating effect when covered by a corrosive resistance outer cover.

PANEL ACTION: Reject.

PANEL STATEMENT: It is the panels intent to install an insulated ground wire whether run in cable or otherwise. Refer to panel action and statement on Comment 20-10.

20- 27 - (680-25(a)):

Note: It was the action of the Technical Correlating Committee that this comment be reported as "Hold" because the panel states that the comment introduces new material that has not had public review.

SUBMITTER: Monte R. Ewing, State of Wisconsin

COMMENT ON PROPOSAL NO: 20-30a

RECOMMENDATION: Revise as follows:

Feeders shall be installed in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, liquidtight flexible metallic conduit, or liquidtight flexible nonmetallic conduit. Electrical metallic tubing shall be permitted where installed on or within a building or structure. Electrical nonmetallic tubing and listed metal-clad cable containing an insulated equipment grounding conductor shall be permitted where installed within a building.

SUBSTANTIATION: I thought the panel may have overlooked the use of flexible metallic liquidtight conduit and the wood decking below a hot tub may be called a structure rather than a building by some states. The MC cable with an insulated equipment grounding conductor will provide the panel's intent of providing an insulated equipment grounding conductor and a physical protective covering. Sometimes nonflexible piping is difficult to install (such as where fished) and another option to liquidtight conduit (which is difficult to pull conductors through on long rungs) would help.

PANEL ACTION: Reject.

PANEL STATEMENT: The original requirement in Section 680-25(d) of the 1999 NEC and rewritten as Section 680-25(A) of the draft of the 2002 NEC did not include liquidtight metal flexible conduit or type MC cable. To introduce wiring methods at this stage of the process would be introducing new material that has not received public review or comment.

20- 28 - (680-25(b)(3), Exception): Accept

Note: The Technical Correlating Committee understands that the accepted revision is to 680.23(F)(1), Exception of the Proposal 20-30a Rewrite of Article 680.

SUBMITTER: David H. Kendall, Carlon

COMMENT ON PROPOSAL NO: 20-97

RECOMMENDATION: This proposal should be accepted with the revised wording. This revision should be added to the end of the exception as a last sentence:

Liquidtight Flexible Nonmetallic Conduit, Type B (LFNC-B), shall be permitted in lengths longer than 1.8 m (6 ft).

SUBSTANTIATION: The original proposal was to clarify that Liquidtight Flexible Nonmetallic Conduit, Type B (LFNC-B) is allowed to be used in lengths longer than 1.8 m per Section 351-23(a)(5).

It was not intended to introduce the 3/8 in. Trade Size. The comment omits the reference to any trade sizes. All conduit sizing shall be determined per Table 1 of Chapter 9.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
EGAN: Proposal 20-97 was rejected in the ROP segment of the code cycle. Previously, the restrictions limited liquidtight flexible nonmetallic conduit to lengths no longer than 1.8 m (6 ft). The acceptance of this comment removes all restrictions on the length allowed whether it be 1.8 m (6 ft); 2.7 m (9 ft); 18 m (60 ft), etc.

(Log #229)

20- 29 - (680-26): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 20-103
RECOMMENDATION: It was the action of the Technical Correlating Committee that the Panel reconsider this Proposal as it is within the Scope of the NEC. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the Tecnical Correlating Committee comment to reconsider this proposal. The panel reaffirms its rejection of Proposal 20-103.
PANEL STATEMENT: The submitter does not cite any incidents where failure to power a pool cover to open or close caused injury. His proposal would require a GFCI itself to be physically located within five feet of the controller, and subjected to a harsher environment than if it were remotely located. The tripping of a GFCI is an indication of a ground fault problem which requires further evaluation than simply resetting the GFCI. The problem is best addressed through installing pool covers that can be manually operated in an emergency rather than mandating GFCI location.

(Log #230)

20- 30 - (680-26): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 20-105
RECOMMENDATION: It was the action of the Technical Correlating Committee that the Panel reconsider this Proposal as it is within the Scope of the NEC. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the Technical Correlating Committee comment to reconsider this proposal. The panel reaffirms its rejection of Proposal 20-105.
PANEL STATEMENT: The proposed requirement is arbitrary. The present wording of Section 680-27(B) of Proposal 20-30a requires a permanent cover.

20- 31 - (680-26): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
COMMENT ON PROPOSAL NO: 20-106
RECOMMENDATION: It was the action of the Technical Correlating Committee that the Panel reconsider this Proposal as it is within the Scope of the NEC. This action will be considered by the Panel as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept.
The panel accepts the Technical Correlating Committee comment to reconsider this proposal. The panel accepts in principal in part Proposal 20-106. Add after the last sentence of Section 680-27(B)(1) to read as follows:
"The device which controls the operation of the motor for an electrically operated pool cover shall be located so the operator has full view of the pool."
The panel rejects the 35 foot requirement that was in the Proposal 20-106.
PANEL STATEMENT: The panel accepted Proposal 20-106 in principal in part. No substantiation was provided for the 35 foot requirement.

(Log #425)

20- 32 - (680-41(d)(3)e): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
COMMENT ON PROPOSAL NO: 20-122
RECOMMENDATION: Accept proposal.
SUBSTANTIATION: There is no proposed change to allow any wiring method as indicated by the panel statement. Wiring methods shall comply with 680-40 or 680-41, as applicable. The proposal is intended to cover raceways which are not "conduit", and metal-covered cables. Type AC, MI, MC cables and EMT are not presently included.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's concerns are already addressed Section 680-43(D)(4) of Proposal 20-30a .
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #827)

20- 33 - (680-42(a)): Reject
SUBMITTER: Mike Theisen, St. Cloud, MN
COMMENT ON PROPOSAL NO: 20-30a
RECOMMENDATION: Relocate the phrase "where protected by a ground-fault circuit interrupter" from the end of section 680.42(A)(2) to the end of section 680.42(A), which would then apply the GFCI requirement to both "flexible conduit" and "cord- and plug-connections".
That section would then read:
(A) Flexible Connections. Listed packaged spa or hot tub equipment assemblies or self-contained spas or hot tubs utilizing a factory installed or assembled control panel or panelboard shall be permitted to use flexible connections, where protected by a ground-fault circuit interrupter, as covered in (1) and (2):
(1) Flexible Conduit. (no changes)
(2) Cord-and Plug-Connections. Cord and plug connections with a cord not longer than 4.6 m (15 ft) shall be permitted ~~where protected by a ground-fault circuit interrupter.~~
SUBSTANTIATION: The rewrite of this section seams to have lost the GFCI requirement for the flexible conduit connections, when the two wiring methods were separated. In the 1999 edition NEC; Section 680-40(a) indicated that GFCI protection is required for all flexible connections.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 680-44 of Proposal 20-30a addresses the submitter's concerns.
