Note: To assist the reader in reviewing the NEC ROP, a preprint of Proposed NFPA 70 is available and may be downloaded from NFPA's (or separate NEC) website, www.nfpa.org. It is also available per request on CD ROM or in print copy from NFPA by calling Customer Service at 1-800-344-3555.

(Log #1158n)

1- 1 - (Entire Document): Accept

NOTE: The Technical Correlating Committee directs that the term "luminaire" be accepted as shown by the panel, but be followed by the existing term in parenthesis. This action is intended to provide consistency throughout the code.

SUBMITTER: William Buckson, Hubbell Lighting Inc.

RECOMMENDATION: Replace the terms "lighting fixture", "lighting fixtures" and "fixture", "fixtures" with "luminaire", "luminaires" appearing throughout the following Sections. Exception, where fixture or fixtures are used in conjunction with wire or wires, or in Chapter 8.

Please see companion proposal, adding the term luminaire to Article 100, definitions, and deleting the FPN in Article 410-1.

Replace "Fixture" with "Luminaire" in the following Sections:

Sections 210-6, 210-19, 220-3, 250-148, Sections 300-3, 300-15, 300-16,, 305-4, 331-11, 350-10, 350-18, 351-8, 351-27, 363-12, 364-12, 370-16, 370-23, 370-25, 370-27, Sections 410-3, 410 B, 410-4, 410-6, 410-8, 410-C, 410-10, 410-11, 410-12, 410-13, 410-14, 410 D, 410-15, 410-16, 410-18, 410-22, 410-23, 410-28, 410-30, 410-35, 410-37, 410-46, 410-65, 410-66, 410-67, 410-71, 410-73, 410-76, 410-77, 410-91, 410-105, Sections 501-9, 502-11, 503-9, 520-63, 525-13, 547-7, 550-11, 551-41, 551-43, 551-53, 551-55, 552-54, 552-56, Sections 604-6, 610-12, 680-4, 680-6, 680-20, 680-21, 680-22, 680-32, 680-51.

Replace "Fixtures" with "Luminaires" in the following Sections:

Sections 210-19, 225-7, 250-4, Sections 300-11, 300-14, 300-15, 300-22, 331-4, 331-11, 333-7, 342-7, 347-2, 347-3, 348-5, 349-10, 350-10, 350-18, 351-8, 351-24, 351-27, 364-12, 370-23, Sections 400-7, 402-10, 410-1, 410-3, 410-4, 410-5, 410-6, 410-7, 410-8, 410-11, 410-15, 410-16, 410-17, 410-18, 410-20, 410-21, 410-22, 410-23, 410-24, 410-30, 410-31, 410G, 410-35, 410-36, 410-37, 410-39, 410-46, 410 M, 410-64, 410-65, 410N, 410-68, 410-70, 410-73, 410-74, 410-76, 410-77, 410-81, 410-104, 424-38, 424-39, 424-41, 424-93, Sections 501-9, 502-11, 503-9, 511-6, 513-5, 517-13, 517-61, 517-63, 520-42, 520-45, 520-61, 520-63, 530-17, 530-18, 530-51, 550-1, 550-2, 550-8, 550-9, 550-12, 550-15, 551-20, 551-53, 551-60, 552-20, 552-54, 552-58, 552-60, Sections 620-21, 670-2, 680-5, 680-6, 680-20, 680-25, 680-41, 680-51, 690-7, Sections 701-11, 701-12.

Replace "Lighting Fixture" with "Luminaire" in the following Sections:

Article 100, Sections 210-52, 220-3, Sections 334-10, 336-18, 370-27, Article 410, Sections 410-16, 410-77, Sections 501-9, 520-2, 530-2, 547-7, 550-9, 551-53, 551-55, 552-41, 552-54, 552-56, Sections 680-4, 680-6, 680-7, 680-20, 680-21, 680-25, 680-32, 680-51.

Replace "Lighting Fixtures" with "Luminaires" in the following Sections:

Article 100, Section 110-26, Sections 210-6, 210-23, 210-24, 220-3, 225-7, 240-2, 240-10, 250-4, 250-112, Sections 331-11, 333-7, 342-7, 349-10, 350-10, 351-24, 351-27, 364-12, 370-23, Sections 400-11, 402-2, 402-10, Article 410, Sections 410-1, 410-14, 410-15, 410-16, 410-30, 410-73, 410-80, 410-100, 411-2, 424-39, 424-93, Sections 500-5, 501-6, 501-9, 502-11, 503-9, 503-12, 517-30, 517-41, 517-61, 520-81, 547-7, 550-9, 551-10, 551-43, 551-53, 552-10, 552-54, Sections 600-3, 680-6, 680-20, 680-24, 680-25, 680-32, 680-41, 680-51, 680-61, 680-62, 680-71, Section 700-9.

SUBSTANTIATION: 1. Lighting standards that have or are being developed, revised and adopted by the U.S., Canada, and Mexico are utilizing the IES term Luminaire in lieu of the term fixture. This includes the new UL/CSA BI-NATIONAL luminaire standard, which will ultimately replace the UL 1570, 1571, and 1572 standards. (These are the very standards used to evaluate the lighting products required to be Listed and Approved, according to the NEC and verified by the Authorities Having Jurisdiction).

2. The Canadian Electrical Code has used the luminaire term for the last ten years.

3. The Tri-NATIONAL lighting standard currently being developed will be designated as a luminaire standard.

4. The National Electrical Manufacturers Association has recently retitled its "Lighting Fixture Section, to Luminaire Section".

5. The U.S. National Committee's Technical Advisory Group to the IEC is working on exporting U.S. lighting perspectives into luminaire (IEC) standards.

6. There are initiatives underway by both NEMA and the NFPA to promote and solidify the use of the NEC from a global perspective. The NEC and its IEC counterpart, IEC 60364, have recently undergone an equivalency review conducted by UL, NFPA, IAEC, NIST, and NEMA as part of this global strategy.

7. If the NEC is ever to be considered as an International Standard, it must utilize the proper terminology.

8. The FPN under 410-1 denotes that luminaire is an international term. International does not mean European only, international, includes the U.S.

9. The term fixture, is archaic and a misnomer. The term fixture has many meanings and connotations. A fixture could refer to a building part, any type or number of gas, plumbing, machine, electric or appliance components, a familiar element or feature or even an individual that has been in a position for a long time. The term luminaire however, by its very formulation, communicates its meaning in a more clear and succinct manner, reducing the possibility of misunderstanding or misapplication of the term.

PANEL ACTION: Accept.

PANEL STATEMENT: CMP-1 recommends that the TCC correlate this proposal.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

COMMENT ON AFFIRMATIVE:

TROGLIA: The word "luminaire" should be replaced first with the former term in parentheses after the word for at least the duration of the next Code cycle in each of the CMPs affected.

(Log #1930)

1- 2 - (Entire Document): Accept in Principle

SUBMITTER: Jon P. Farren, Farren Engineering, Inc.

RECOMMENDATION: For entire document, replace "lighting fixture" and "fixture" with the correct term luminaire.

SUBSTANTIATION: Illuminating Engineering Society of North America (IESNA), Lighting Design Lab in Seattle, WA and all other professional lighting organizations prefer the term luminaire.

Also, this will reduce confusion with reference to plumbing fixtures.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The Panel believes its action on Proposal 1-1 meets the intent of the Submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

(Log #1158)

2- 1 - (Entire Document): Accept

NOTE: The Technical Correlating Committee understands that the panel has accepted those portions of the Proposal which fall under its Scope. The Technical Correlating Committee directs that the term "luminaire" be accepted as shown by the panel, but be followed by the existing term in parenthesis. This action is intended to provide consistency throughout the code.

SUBMITTER: William Buckson, Hubbell Lighting Inc.

RECOMMENDATION: Replace the terms "lighting fixture", "lighting fixtures" and "fixture", "fixtures" with "luminaire", "luminaires" appearing throughout the following Sections. Exception, where fixture or fixtures are used in conjunction with wire or wires, or in Chapter 8.

Please see companion proposal, adding the term luminaire to Article 100, definitions, and deleting the FPN in Article 410-1.

Replace "Fixture" with "Luminaire" in the following Sections:

Sections 210-6, 210-19, 220-3, 250-148, Sections 300-3, 300-15, 300-16,, 305-4, 331-11, 350-10, 350-18, 351-8, 351-27, 363-12, 364-12, 370-16, 370-23, 370-25, 370-27, Sections 410-3, 410 B, 410-4, 410-6, 410-8, 410-C, 410-10, 410-11, 410-12, 410-13, 410-14, 410 D, 410-15, 410-16, 410-18, 410-22, 410-23, 410-28, 410-30, 410-35, 410-37, 410-46, 410-65, 410-66, 410-67, 410-71, 410-73, 410-76, 410-77, 410-91, 410-105, Sections 501-9, 502-11, 503-9, 520-63, 525-13, 547-7, 550-11, 551-41, 551-43, 551-53, 551-55, 552-54, 552-56, Sections 604-6, 610-12, 680-4, 680-6, 680-20, 680-21, 680-22, 680-32, 680-51.

Replace "Fixtures" with "Luminaires" in the following Sections:

Sections 210-19, 225-7, 250-4, Sections 300-11, 300-14, 300-15, 300-22, 331-4, 331-11, 333-7, 342-7, 347-2, 347-3, 348-5, 349-10, 350-10, 350-18, 351-8, 351-24, 351-27, 364-12, 370-23, Sections 400-7, 402-10, 410-1, 410-3, 410-4, 410-5, 410-6, 410-7, 410-8, 410-11, 410-15, 410-16, 410-17, 410-18, 410-20, 410-21, 410-22, 410-23, 410-24, 410-30, 410-31, 410G, 410-35, 410-36, 410-37, 410-39, 410-46, 410 M, 410-64, 410-65, 410N, 410-68, 410-70, 410-73, 410-74, 410-76, 410-77, 410-81, 410-104, 424-38, 424-39, 424-41, 424-93, Sections 501-9, 502-11, 503-9, 511-6, 513-5, 517-13, 517-61, 517-63, 520-42, 520-45, 520-61, 520-63,

530-17, 530-18, 530-51, 550-1, 550-2, 550-8, 550-9, 550-12, 550-15, 551-20, 551-53, 551-60, 552-20, 552-54, 552-58, 552-60, Sections 620-21, 670-2, 680-5, 680-6, 680-20, 680-25, 680-41, 680-51, 690-7, Sections 701-11, 701-12.

Replace "Lighting Fixture" with "Luminaire" in the following Sections:

Article 100, Sections 210-52, 220-3, Sections 334-10, 336-18, 370-27, Article 410, Sections 410-16, 410-77, Sections 501-9, 520-2, 530-2, 547-7, 550-9, 551-53, 551-55, 552-41, 552-54, 552-56, Sections 680-4, 680-6, 680-7, 680-20, 680-21, 680-25, 680-32, 680-51.

Replace "Lighting Fixtures" with "Luminaires" in the following Sections:

Article 100, Section 110-26, Sections 210-6, 210-23, 210-24, 220-3, 225-7, 240-2, 240-10, 250-4, 250-112, Sections 331-11, 333-7, 342-7, 349-10, 350-10, 351-24, 351-27, 364-12, 370-23, Sections 400-11, 402-2, 402-10, Article 410, Sections 410-1, 410-14, 410-15, 410-16, 410-30, 410-73, 410-80, 410-100, 411-2, 424-39, 424-93, Sections 500-5, 501-6, 501-9, 502-11, 503-9, 503-12, 517-30, 517-41, 517-61, 520-81, 547-7, 550-9, 551-10, 551-43, 551-53, 552-10, 552-54, Sections 600-3, 680-6, 680-20, 680-24, 680-25, 680-32, 680-41, 680-51, 680-61, 680-62, 680-71, Section 700-9.

SUBSTANTIATION: 1. Lighting standards that have or are being developed, revised and adopted by the U.S., Canada, and Mexico are utilizing the IES term Luminaire in lieu of the term fixture. This includes the new UL/CSA BI-NATIONAL luminaire standard, which will ultimately replace the UL 1570, 1571, and 1572 standards. (These are the very standards used to evaluate the lighting products required to be Listed and Approved, according to the NEC and verified by the Authorities Having Jurisdiction).

2. The Canadian Electrical Code has used the luminaire term for the last ten years.

3. The Tri-NATIONAL lighting standard currently being developed will be designated as a luminaire standard.

4. The National Electrical Manufacturers Association has recently retitled its "Lighting Fixture Section, to Luminaire Section".

5. The U.S. National Committee's Technical Advisory Group to the IEC is working on exporting U.S. lighting perspectives into luminaire (IEC) standards.

6. There are initiatives underway by both NEMA and the NFPA to promote and solidify the use of the NEC from a global perspective. The NEC and its IEC counterpart, IEC 60364, have recently undergone an equivalency review conducted by UL, NFPA, IAEC, NIST, and NEMA as part of this global strategy.

7. If the NEC is ever to be considered as an International Standard, it must utilize the proper terminology.

8. The FPN under 410-1 denotes that luminaire is an international term. International does not mean European only, international, includes the U.S.

9. The term fixture, is archaic and a misnomer. The term fixture has many meanings and connotations. A fixture could refer to a building part, any type or number of gas, plumbing, machine, electric or appliance components, a familiar element or feature or even an individual that has been in a position for a long time. The term luminaire however, by its very formulation, communicates its meaning in a more clear and succinct manner, reducing the possibility of misunderstanding or misapplication of the term.

PANEL ACTION: Accept.

PANEL STATEMENT: The panel is concerned with the average electrician's recognition of this term as it is not found in Webster's Encyclopedia unabridged dictionary of the English language.

Replace "Fixtures" with "Luminaires" in the following Sections:

Sections 210-19, 225-7, 250-4, Sections 300-11, 300-14, 300-15, 300-22, 331-4, 331-11, 333-7, 342-7, 347-2, 347-3, 348-5, 349-10, 350-10, 350-18, 351-8, 351-24, 351-27, 364-12, 370-23, Sections 400-7, 402-10, 410-1, 410-3, 410-4, 410-5, 410-6, 410-7, 410-8, 410-11, 410-15, 410-16, 410-17, 410-18, 410-20, 410-21, 410-22, 410-23, 410-24, 410-30, 410-31, 410G, 410-35, 410-36, 410-37, 410-39, 410-46, 410 M, 410-64, 410-65, 410N, 410-68, 410-70, 410-73, 410-74, 410-76, 410-77, 410-81, 410-104, 424-38, 424-39, 424-41, 424-93, Sections 501-9, 502-11, 503-9, 511-6, 513-5, 517-13, 517-61, 517-63, 520-42, 520-45, 520-61, 520-63, 530-17, 530-18, 530-51, 550-1, 550-2, 550-8, 550-9, 550-12, 550-15, 551-20, 551-53, 551-60, 552-20, 552-54, 552-58, 552-60, Sections 620-21, 670-2, 680-5, 680-6, 680-20, 680-25, 680-41, 680-51, 690-7, Sections 701-11, 701-12.

Replace "Lighting Fixture" with "Luminaire" in the following Sections:

Article 100, Sections 210-52, 220-3, Sections 334-10, 336-18, 370-27, Article 410, Sections 410-16, 410-77, Sections 501-9, 520-2, 530-2, 547-7, 550-9, 551-53, 551-55, 552-41, 552-54, 552-56, Sections 680-4, 680-6, 680-7, 680-20, 680-21, 680-25, 680-32, 680-51.

Replace "Lighting Fixtures" with "Luminaires" in the following Sections:

Article 100, Section 110-26, Sections 210-6, 210-23, 210-24, 220-3, 225-7, 240-2, 240-10, 250-4, 250-112, Sections 331-11, 333-7, 342-7, 349-10, 350-10, 351-24, 351-27, 364-12, 370-23, Sections 400-11, 402-2, 402-10, Article 410, Sections 410-1, 410-14, 410-15, 410-16, 410-30, 410-73, 410-80, 410-100, 411-2, 424-39, 424-93, Sections 500-5, 501-6, 501-9, 502-11, 503-9, 503-12, 517-30, 517-41, 517-61, 520-81, 547-7, 550-9, 551-10, 551-43, 551-53, 552-10, 552-54, Sections 600-3, 680-6, 680-20, 680-24, 680-25, 680-32, 680-41, 680-51, 680-61, 680-62, 680-71, Section 700-9.

SUBSTANTIATION: 1. Lighting standards that have or are being developed, revised and adopted by the U.S., Canada, and Mexico are utilizing the IES term Luminaire in lieu of the term fixture. This includes the new UL/CSA BI-NATIONAL luminaire standard, which will ultimately replace the UL 1570, 1571, and 1572 standards. (These are the very standards used to evaluate the lighting products required to be Listed and Approved, according to the NEC and verified by the Authorities Having Jurisdiction).

2. The Canadian Electrical Code has used the luminaire term for the last ten years.

3. The Tri-NATIONAL lighting standard currently being developed will be designated as a luminaire standard.

4. The National Electrical Manufacturers Association has recently retitled its "Lighting Fixture Section, to Luminaire Section".

5. The U.S. National Committee's Technical Advisory Group to the IEC is working on exporting U.S. lighting perspectives into luminaire (IEC) standards.

6. There are initiatives underway by both NEMA and the NFPA to promote and solidify the use of the NEC from a global perspective. The NEC and its IEC counterpart, IEC 60364, have recently undergone an equivalency review conducted by UL, NFPA, IAEC, NIST, and NEMA as part of this global strategy.

7. If the NEC is ever to be considered as an International Standard, it must utilize the proper terminology.

8. The FPN under 410-1 denotes that luminaire is an international term. International does not mean European only, international, includes the U.S.

9. The term fixture, is archaic and a misnomer. The term fixture has many meanings and connotations. A fixture could refer to a building part, any type or number of gas, plumbing, machine, electric or appliance components, a familiar element or feature or even an individual that has been in a position for a long time. The

term luminaire however, by its very formulation, communicates its meaning in a more clear and succinct manner, reducing the possibility of misunderstanding or misapplication of the term.
PANEL ACTION: Accept in Principle in Part.
Replace the terms "fixture" with "luminaire (fixture)" appearing throughout the following Sections: 300-3, 300-15, 300-16, 305-4,
Replace "fixtures" with "luminaires (fixtures)" in the following sections: 300-11, 300-14, 300-15, 300-22, and 690-7.
PANEL STATEMENT: The panel accepted the change to those sections which are the responsibility of CMP 3. The existing terminology was retained in parentheses as an aid to the code user.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1930b)

3- 2 - (Entire Document): Accept in Principle
SUBMITTER: Jon P. Farren, Farren Engineering, Inc.
RECOMMENDATION: For entire document, replace "lighting fixture" and "fixture" with the correct term luminaire.
SUBSTANTIATION: Illuminating Engineering Society of North America (IESNA), Lighting Design Lab in Seattle, WA and all other professional lighting organizations prefer the term luminaire.
Also, this will reduce confusion with reference to plumbing fixtures.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and panel statement on Proposal 3-1.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1930c)

4- 1 - (Entire Document): Accept in Principle
SUBMITTER: Jon P. Farren, Farren Engineering, Inc.
RECOMMENDATION: For entire document, replace "lighting fixture" and "fixture" with the correct term luminaire.
SUBSTANTIATION: Illuminating Engineering Society of North America (IESNA), Lighting Design Lab in Seattle, WA and all other professional lighting organizations prefer the term luminaire.
Also, this will reduce confusion with reference to plumbing fixtures.
PANEL ACTION: Accept in Principle.
Accept the proposed changes to those sections under the jurisdiction of CMP 4 with the retention of the current term as a parenthetical reference after each change in terms.
The panel has identified that the proposed terminology change will occur only in Section 225-7(c).
PANEL STATEMENT: The panel's action will aid the industry in understanding the change in terminology.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1158a)

5- 1 - (Entire Document): Accept
Note: The Technical Correlating Committee directs that the term "luminaire" be accepted as shown by the panel, but be followed by the existing term in parenthesis. This action is intended to provide consistency throughout the code.
SUBMITTER: William Buckson, Hubbell Lighting Inc.
RECOMMENDATION: Replace the terms "lighting fixture", "lighting fixtures" and "fixture", "fixtures"
with "luminaire", "luminaires" appearing throughout the following Sections. Exception, where fixture or fixtures are used in conjunction with wire or wires, or in Chapter 8.
Please see companion proposal, adding the term luminaire to Article 100, definitions, and deleting the FPN in Article 410-1.
Replace "Fixture" with "Luminaire" in the following Sections:
Sections 210-6, 210-19, 220-3, 250-148, Sections 300-3, 300-15, 300-16,, 305-4, 331-11, 350-10, 350-18, 351-8, 351-27, 363-12, 364-12, 370-16, 370-23, 370-25, 370-27, Sections 410-3, 410 B, 410-4, 410-6, 410-8, 410-C, 410-10, 410-11, 410-12, 410-13, 410-14, 410 D, 410-15, 410-16, 410-18, 410-22, 410-23, 410-28, 410-30, 410-35, 410-37, 410-46, 410-65, 410-66, 410-67, 410-71, 410-73, 410-76, 410-77, 410-91, 410-105, Sections 501-9, 502-11, 503-9, 520-63, 525-13, 547-7, 550-11, 551-41, 551-43, 551-53, 551-55, 552-54, 552-56, Sections 604-6, 610-12, 680-4, 680-6, 680-20, 680-21, 680-22, 680-32, 680-51.
Replace "Fixtures" with "Luminaires" in the following Sections:
Sections 210-19, 225-7, 250-4, Sections 300-11, 300-14, 300-15, 300-22, 331-4, 331-11, 333-7, 342-7, 347-2, 347-3, 348-5, 349-10, 350-10, 350-18, 351-8, 351-24, 351-27, 364-12, 370-23, Sections 400-7, 402-10, 410-1, 410-3, 410-4, 410-5, 410-6, 410-7, 410-8, 410-11, 410-15, 410-16, 410-17, 410-18, 410-20, 410-21, 410-22, 410-23, 410-24, 410-30, 410-31, 410G, 410-35, 410-36, 410-37, 410-39, 410-46, 410 M, 410-64, 410-65, 410N, 410-68, 410-70, 410-73, 410-74, 410-76, 410-77, 410-81, 410-104, 424-38, 424-39, 424-41, 424-93, Sections 501-9, 502-11, 503-9, 511-6, 513-5, 517-13, 517-61, 517-63, 520-42, 520-45, 520-61, 520-63, 530-17, 530-18, 530-51, 550-1, 550-2, 550-8, 550-9, 550-12, 550-15, 551-20, 551-53, 551-60, 552-20, 552-54, 552-58, 552-60, Sections 620-21, 670-2, 680-5, 680-6, 680-20, 680-25, 680-41, 680-51, 690-7, Sections 701-11, 701-12.
Replace "Lighting Fixture" with "Luminaire" in the following Sections:
Article 100, Sections 210-52, 220-3, Sections 334-10, 336-18, 370-27, Article 410, Sections 410-16, 410-77, Sections 501-9, 520-2, 530-2, 547-7, 550-9, 551-53, 551-55, 552-41, 552-54, 552-56, Sections 680-4, 680-6, 680-7, 680-20, 680-21, 680-25, 680-32, 680-51.
Replace "Lighting Fixtures" with "Luminaires" in the following Sections:
Article 100, Section 110-26, Sections 210-6, 210-23, 210-24, 220-3, 225-7, 240-2, 240-10, 250-4, 250-112, Sections 331-11, 333-7, 342-7, 349-10, 350-10, 351-24, 351-27, 364-12, 370-23, Sections 400-11, 402-2, 402-10, Article 410, Sections 410-1, 410-14, 410-15, 410-16, 410-30, 410-73, 410-80, 410-100, 411-2, 424-39, 424-93, Sections 500-5, 501-6, 501-9, 502-11, 503-9, 503-12, 517-30, 517-41, 517-61, 520-81, 547-7, 550-9, 551-10, 551-43, 551-53, 552-10, 552-54, Sections 600-3, 680-6, 680-20, 680-24, 680-25, 680-32, 680-41, 680-51, 680-61, 680-62, 680-71, Section 700-9.
SUBSTANTIATION: 1. Lighting standards that have or are being developed, revised and adopted by the U.S., Canada, and Mexico are utilizing the IES term Luminaire in lieu of the term fixture. This includes the new UL/CSA BI-NATIONAL luminaire standard, which will ultimately replace the UL 1570, 1571, and 1572 standards. (These are the very standards used to evaluate the lighting products required to be Listed and Approved, according to the NEC and verified by the Authorities Having Jurisdiction).
2. The Canadian Electrical Code has used the luminaire term for the last ten years.
3. The Tri-NATIONAL lighting standard currently being developed will be designated as a luminaire standard.
4. The National Electrical Manufacturers Association has recently retitled its "Lighting Fixture Section, to Luminaire Section".
5. The U.S. National Committee's Technical Advisory Group to the IEC is working on exporting U.S. lighting perspectives into luminaire (IEC) standards.
6. There are initiatives underway by both NEMA and the NFPA to promote and solidify the use of the NEC from a global perspective. The NEC and its IEC counterpart, IEC 60364, have recently undergone an equivalency review conducted by UL, NFPA, IAEC, NIST, and NEMA as part of this global strategy.
7. If the NEC is ever to be considered as an International Standard, it must utilize the proper terminology.
8. The FPN under 410-1 denotes that luminaire is an international term. International does not mean European only, international, includes the U.S.
9. The term fixture, is archaic and a misnomer. The term fixture has many meanings and connotations. A fixture could refer to a building part, any type or number of gas, plumbing, machine, electric or appliance components, a familiar element or feature or even an individual that has been in a position for a long time. The term luminaire however, by its very formulation, communicates its meaning in a more clear and succinct manner, reducing the possibility of misunderstanding or misapplication of the term.
PANEL ACTION: Accept.
PANEL STATEMENT: Accept those parts that apply to the jurisdiction of Panel 5 only.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
COMMENT ON AFFIRMATIVE:
BRETT: I agree with the Panel's Action on this proposal but because of the low recognition factor of "luminare" or "luminaries" I believe usability would be served if the current word or phrase being replaced should appear in parentheses immediately after the replaced term for at least the 2002 code.
DOBROWSKY: The changes to existing Section 250-4 are dependent on corresponding changes to Article 410.

WHITE: Although I am voting in the affirmative I recommend that the term "luminare" be placed first with the former term in parentheses after it for at least the duration of the next code cycle.

(Log #1930d)

5- 2 - (Entire Document): Reject
SUBMITTER: Jon P. Farren, Farren Engineering, Inc.
RECOMMENDATION: For entire document, replace "lighting fixture" and "fixture" with the correct term luminaire.
SUBSTANTIATION: Illuminating Engineering Society of North America (IESNA), Lighting Design Lab in Seattle, WA and all other professional lighting organizations prefer the term luminaire.
Also, this will reduce confusion with reference to plumbing fixtures.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no specific recommendation made by the submitter in the proposal. Section 4.3.3(c) of the Regulations Governing Committee Projects requires proposals to include proposed text, including the wording to be added, revised (and/or) revise, or deleted. However, see action on Proposal 5-1.

Note: The Technical Correlating Committee understands that the panel has accepted those portions of the Proposal which fall under its Scope. The Technical Correlating Committee directs that the term "luminaire" be accepted as shown by the panel, but be followed by the existing term in parenthesis. This action is intended to provide consistency throughout the code.
SUBMITTER: Jon P. Farren, Farren Engineering, Inc.
RECOMMENDATION: For entire document, replace "lighting fixture" and "fixture" with the correct term luminaire.
SUBSTANTIATION: Illuminating Engineering Society of North America (IESNA), Lighting Design Lab in Seattle, WA and all other professional lighting organizations prefer the term luminaire.
Also, this will reduce confusion with reference to plumbing fixtures.
PANEL ACTION: Accept.
PANEL STATEMENT: See Proposal 6-1 for additional information.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1158j)

7- 1 - (Entire Document): Accept in Principle in Part
SUBMITTER: William Buckson, Hubbell Lighting Inc.
RECOMMENDATION: Replace the terms "lighting fixture", "lighting fixtures" and "fixture", "fixtures" with "luminaire", "luminaires" appearing throughout the following Sections. Exception, where fixture or fixtures are used in conjunction with wire or wires, or in Chapter 8.

Please see companion proposal, adding the term luminaire to Article 100, definitions, and deleting the FPN in Article 410-1.

Replace "Fixture" with "Luminaire" in the following Sections:
Sections 210-6, 210-19, 220-3, 250-148, Sections 300-3, 300-15, 300-16,, 305-4, 331-11, 350-10, 350-18, 351-8, 351-27, 363-12, 364-12, 370-16, 370-23, 370-25, 370-27, Sections 410-3, 410 B, 410-4, 410-6, 410-8, 410-C, 410-10, 410-11, 410-12, 410-13, 410-14, 410 D, 410-15, 410-16, 410-18, 410-22, 410-23, 410-28, 410-30, 410-35, 410-37, 410-46, 410-65, 410-66, 410-67, 410-71, 410-73, 410-76, 410-77, 410-91, 410-105, Sections 501-9, 502-11, 503-9, 520-63, 525-13, 547-7, 550-11, 551-41, 551-43, 551-53, 551-55, 552-54, 552-56, Sections 604-6, 610-12, 680-4, 680-6, 680-20, 680-21, 680-22, 680-32, 680-51.

Replace "Fixtures" with "Luminaires" in the following Sections:
Sections 210-19, 225-7, 250-4, Sections 300-11, 300-14, 300-15, 300-22, 331-4, 331-11, 333-7, 342-7, 347-2, 347-3, 348-5, 349-10, 350-10, 350-18, 351-8, 351-24, 351-27, 364-12, 370-23, Sections 400-7, 402-10, 410-1, 410-3, 410-4, 410-5, 410-6, 410-7, 410-8, 410-11, 410-15, 410-16, 410-17, 410-18, 410-20, 410-21, 410-22, 410-23, 410-24, 410-30, 410-31, 410G, 410-35, 410-36, 410-37, 410-39, 410-46, 410 M, 410-64, 410-65, 410N, 410-68, 410-70, 410-73, 410-74, 410-76, 410-77, 410-81, 410-104, 424-38, 424-39, 424-41, 424-93, Sections 501-9, 502-11, 503-9, 511-6, 513-5, 517-13, 517-61, 517-63, 520-42, 520-45, 520-61, 520-63, 530-17, 530-18, 530-51, 550-1, 550-2, 550-8, 550-9, 550-12, 550-15, 551-20, 551-53, 551-60, 552-20, 552-54, 552-58, 552-60, Sections 620-21, 670-2, 680-5, 680-6, 680-20, 680-25, 680-41, 680-51, 690-7, Sections 701-11, 701-12.

Replace "Lighting Fixture" with "Luminaire" in the following Sections:
Article 100, Sections 210-52, 220-3, Sections 334-10, 336-18, 370-27, Article 410, Sections 410-16, 410-77, Sections 501-9, 520-2, 530-2, 547-7, 550-9, 551-53, 551-55, 552-41, 552-54, 552-56, Sections 680-4, 680-6, 680-7, 680-20, 680-21, 680-25, 680-32, 680-51.

Replace "Lighting Fixtures" with "Luminaires" in the following Sections:
Article 100, Section 110-26, Sections 210-6, 210-23, 210-24, 220-3, 225-7, 240-2, 240-10, 250-4, 250-112, Sections 331-11, 333-7, 342-7, 349-10, 350-10, 351-24, 351-27, 364-12, 370-23, Sections 400-11, 402-2, 402-10, Article 410, Sections 410-1, 410-14, 410-15, 410-16, 410-30, 410-73, 410-80, 410-100, 411-2, 424-39, 424-93, Sections 500-5, 501-6, 501-9, 502-11, 503-9, 503-12, 517-30, 517-41, 517-61, 520-81, 547-7, 550-9, 551-10, 551-43, 551-53, 552-10, 552-54, Sections 600-3, 680-6, 680-20, 680-24, 680-25, 680-32, 680-41, 680-51, 680-61, 680-62, 680-71, Section 700-9.

SUBSTANTIATION: 1. Lighting standards that have or are being developed, revised and adopted by the U.S., Canada, and Mexico are utilizing the IES term Luminaire in lieu of the term fixture. This includes the new UL/CSA BI-NATIONAL luminaire standard, which will ultimately replace the UL 1570, 1571, and 1572 standards. (These are the very standards used to evaluate the lighting products required to be Listed and Approved, according to the NEC and verified by the Authorities Having Jurisdiction).

2. The Canadian Electrical Code has used the luminaire term for the last ten years.

3. The Tri-NATIONAL lighting standard currently being developed will be designated as a luminaire standard.

4. The National Electrical Manufacturers Association has recently retitled its "Lighting Fixture Section, to Luminaire Section".

5. The U.S. National Committee's Technical Advisory Group to the IEC is working on exporting U.S. lighting perspectives into luminaire (IEC) standards.

6. There are initiatives underway by both NEMA and the NFPA to promote and solidify the use of the NEC from a global perspective. The NEC and its IEC counterpart, IEC 60364, have recently undergone an equivalency review conducted by UL, NFPA, IAEC, NIST, and NEMA as part of this global strategy.

7. If the NEC is ever to be considered as an International Standard, it must utilize the proper terminology.

8. The FPN under 410-1 denotes that luminaire is an international term. International does not mean European only, international, includes the U.S.

9. The term fixture, is archaic and a misnomer. The term fixture has many meanings and connotations. A fixture could refer to a building part, any type or number of gas, plumbing, machine, electric or appliance components, a familiar element or feature or even an individual that has been in a position for a long time. The term luminaire however, by its very formulation, communicates its meaning in a more clear and succinct manner, reducing the possibility of misunderstanding or misapplication of the term.

PANEL ACTION: Accept in Principle in Part.
Accept the proposed changes to those sections under the jurisdiction of CMP 7 with the retention of the current term as a parenthetical reference after each change in terms. Do not make the proposed change to 363-12.

PANEL STATEMENT: The panel's action is to aid the industry in understanding the terminology change. The reference in 363-12 refers to more than just luminaires. Not all fixtures are luminaires. There is equipment that contains lamps (such as a paddle fan) that is not a luminaire.

(Log #1930h)

9- 1 - (Entire Document): Accept in Principle

Note: The Technical Correlating Committee directs that the term "luminaire" be accepted as shown by the panel, but be followed by the existing term in parenthesis. This action is intended to provide consistency throughout the code.

SUBMITTER: Jon P. Farren, Farren Engineering, Inc.

RECOMMENDATION: For entire document, replace "lighting fixture" and "fixture" with the correct term luminaire.

SUBSTANTIATION: Illuminating Engineering Society of North America (IESNA), Lighting Design Lab in Seattle, WA and all other professional lighting organizations prefer the term luminaire.

Also, this will reduce confusion with reference to plumbing fixtures.

PANEL ACTION: Accept in Principle.

In Section 370-16(b)(1) Exception, change "fixture" to "luminaire".

In Section 370-23(e), change the title to read "… Without Devices, Luminaries, or Lampholders." Revise the text to read "… support a luminaire, lampholder, or other equipment." The panel advises that this action modifies the panel action on Proposal 9-29.

In Section 370-23(f), change the title to read "… With Devices, Luminaries, or Lampholders." Revise the text to read "… support a luminaire, lampholder, or other equipment …". The panel advises that this action modifies the panel action on Proposal 9-29.

In Section 370-23(f) Exception No. 2, change as follows:

In the parent text, revise to read "… luminaire or lampholder support, or to support a wiring enclosure that is an integral part of a luminaire."

In item (c), change "fixture" to "luminaire or lampholder".

In item (d), change "fixture" to "luminaire".

In item (f), revise to read "at the luminaire or lampholder end, the …" and "… the luminaire shall be secured directly …".

The panel advises that this action modifies the panel action on Proposal 9-29.

In Section 370-23(h)(2), change "lighting fixtures" to "luminaries" in the first paragraph, and change "at the fixture end" to "at the luminaire end." In the second paragraph, change "A fixture supported" to "A luminaire supported".

In Section 370-25 change "or fixture canopy" to "or luminaire canopy".

In Section 370-25 FPN, change "fixture" to "luminaire".

In Section 370-25(b), change "fixture" to "luminaire".

In Section 370-27(a), revise the title to read "Boxes at Luminaire Outlets." In the text, change "lighting fixture outlets" to "luminaire or lampholder outlets" and change "a lighting fixture" to "a luminaire".

In Section 370-27(a) Exception, change "A fixture" to "A luminaire or lampholder" and "… provided the fixture or its supporting yoke" to "… provided the lampholder, luminaire, or its supporting yoke ..."

The panel advises that this action modifies the panel action on Proposal 9-39.

In Section 370-27(b) as created by panel action on Proposal 9-36, change "Fixture" to "Luminaire" in the title. Change "lighting fixtures" to "luminaries" and "lighting fixture" to "luminaire."

PANEL STATEMENT: The panel action meets the intent of the submitter. Lampholders are not the same as luminaries, and need to be considered separately in order to properly implement the change in terminology.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

COMMENT ON AFFIRMATIVE:

CROUSHORE: I affirm the panel's action to change to the term "luminaire" throughout Article 370. However, the former terms such as (fixture) or (lighting fixture) should be placed in parenthesis after the word "luminaire" for at least the duration of the next code cycle to aid in understanding the change. The term "fixture" is widely used and understood throughout the electrical industry. The term fixture typically relates more to the enclosure and hardware of the equipment rather than the light producing elements such as the lamps, the reflectors and the diffuser. This change may cause confusion due to the elimination of the common term of "fixture".

(Log #1930i)

10- 1 - (Entire Document): Accept

Note: The Technical Correlating Committee understands that the panel has accepted those portions of the Proposal which fall under its Scope. The Technical Correlating Committee directs that the term "luminaire" be accepted as shown by the panel, but be followed by the existing term in parenthesis. This action is intended to provide consistency throughout the code.

SUBMITTER: Jon P. Farren, Farren Engineering, Inc.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

COMMENT ON AFFIRMATIVE:

ELDRIDGE: I agree with the panel action to accept the term "luminaire". However, the word "luminaire" should be placed first with the word "fixture" in parentheses after the words for "at least" the duration of the next code cycle.

(Log #1158m)

11- 1 - (Entire Document): Reject

SUBMITTER: William Buckson, Hubbell Lighting Inc.

RECOMMENDATION: Replace the terms "lighting fixture", "lighting fixtures" and "fixture", "fixtures"

with "luminaire", "luminaires" appearing throughout the following Sections. Exception, where fixture or fixtures are used in conjunction with wire or wires, or in Chapter 8.

Please see companion proposal, adding the term luminaire to Article 100, definitions, and deleting the FPN in Article 410-1.

Replace "Fixture" with "Luminaire" in the following Sections:

Sections 210-6, 210-19, 220-3, 250-148, Sections 300-3, 300-15, 300-16,, 305-4, 331-11, 350-10, 350-18, 351-8, 351-27, 363-12, 364-12, 370-16, 370-23, 370-25, 370-27, Sections 410-3, 410 B, 410-4, 410-6, 410-8, 410-C, 410-10, 410-11, 410-12, 410-13, 410-14, 410 D, 410-15, 410-16, 410-18, 410-22, 410-23, 410-28, 410-30, 410-35, 410-37, 410-46, 410-65, 410-66, 410-67, 410-71, 410-73, 410-76, 410-77, 410-91, 410-105, Sections 501-9, 502-11, 503-9, 520-63, 525-13, 547-7, 550-11, 551-41, 551-43, 551-53, 551-55, 552-54, 552-56, Sections 604-6, 610-12, 680-4, 680-6, 680-20, 680-21, 680-22, 680-32, 680-51.

Replace "Fixtures" with "Luminaires" in the following Sections:

Sections 210-19, 225-7, 250-4, Sections 300-11, 300-14, 300-15, 300-22, 331-4, 331-11, 333-7, 342-7, 347-2, 347-3, 348-5, 349-10, 350-10, 350-18, 351-8, 351-24, 351-27, 364-12, 370-23, Sections 400-7, 402-10, 410-1, 410-3, 410-4, 410-5, 410-6, 410-7, 410-8, 410-11, 410-15, 410-16, 410-17, 410-18, 410-20, 410-21, 410-22, 410-23, 410-24, 410-30, 410-31, 410G, 410-35, 410-36, 410-37, 410-39, 410-46, 410 M, 410-64, 410-65, 410N, 410-68, 410-70, 410-73, 410-74, 410-76, 410-77, 410-81, 410-104, 424-38, 424-39, 424-41, 424-93, Sections 501-9, 502-11, 503-9, 511-6, 513-5, 517-13, 517-61, 517-63, 520-42, 520-45, 520-61, 520-63, 530-17, 530-18, 530-51, 550-1, 550-2, 550-8, 550-9, 550-12, 550-15, 551-20, 551-53, 551-60, 552-20, 552-54, 552-58, 552-60, Sections 620-21, 670-2, 680-5, 680-6, 680-20, 680-25, 680-41, 680-51, 690-7, Sections 701-11, 701-12.

Replace "Lighting Fixture" with "Luminaire" in the following Sections:

Article 100, Sections 210-52, 220-3, Sections 334-10, 336-18, 370-27, Article 410, Sections 410-16, 410-77, Sections 501-9, 520-2, 530-2, 547-7, 550-9, 551-53, 551-55, 552-41, 552-54, 552-56, Sections 680-4, 680-6, 680-7, 680-20, 680-21, 680-25, 680-32, 680-51.

Replace "Lighting Fixtures" with "Luminaires" in the following Sections:

Article 100, Section 110-26, Sections 210-6, 210-23, 210-24, 220-3, 225-7, 240-2, 240-10, 250-4, 250-112, Sections 331-11, 333-7, 342-7, 349-10, 350-10, 351-24, 351-27, 364-12, 370-23, Sections 400-11, 402-2, 402-10, Article 410, Sections 410-1, 410-14, 410-15, 410-16, 410-30, 410-73, 410-80, 410-100, 411-2, 424-39, 424-93, Sections 500-5, 501-6, 501-9, 502-11, 503-9, 503-12, 517-30, 517-41, 517-61, 520-81, 547-7, 550-9, 551-10, 551-43, 551-53, 552-10, 552-54, Sections 600-3, 680-6, 680-20, 680-24, 680-25, 680-32, 680-41, 680-51, 680-61, 680-62, 680-71, Section 700-9.

SUBSTANTIATION: 1. Lighting standards that have or are being developed, revised and adopted by the U.S., Canada, and Mexico are utilizing the IES term Luminaire in lieu of the term fixture. This includes the new UL/CSA BI-NATIONAL luminaire standard, which will ultimately replace the UL 1570, 1571, and 1572 standards. (These are the very standards used to evaluate the lighting products required to be Listed and Approved, according to the NEC and verified by the Authorities Having Jurisdiction).

2. The Canadian Electrical Code has used the luminaire term for the last ten years.

3. The Tri-NATIONAL lighting standard currently being developed will be designated as a luminaire standard.

4. The National Electrical Manufacturers Association has recently retitled its "Lighting Fixture Section, to Luminaire Section".

5. The U.S. National Committee's Technical Advisory Group to the IEC is working on exporting U.S. lighting perspectives into luminaire (IEC) standards.

6. There are initiatives underway by both NEMA and the NFPA to promote and solidify the use of the NEC from a global perspective. The NEC and its IEC counterpart, IEC 60364, have recently undergone an equivalency review conducted by UL, NFPA, IAEC, NIST, and NEMA as part of this global strategy.

7. If the NEC is ever to be considered as an International Standard, it must utilize the proper terminology.

8. The FPN under 410-1 denotes that luminaire is an international term. International does not mean European only, international, includes the U.S.

9. The term fixture, is archaic and a misnomer. The term fixture has many meanings and connotations. A fixture could refer to a building part, any type or number of gas, plumbing, machine, electric or appliance components, a familiar element or feature or even an individual that has been in a position for a long time. The term luminaire however, by its very formulation, communicates its meaning in a more clear and succinct manner, reducing the possibility of misunderstanding or misapplication of the term.

PANEL ACTION: Reject.

PANEL STATEMENT: The fixtures in 670-2 are not lighting fixtures.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

(Log #1930j)

11- 2 - (Entire Document): Reject

SUBMITTER: Jon P. Farren, Farren Engineering, Inc.

RECOMMENDATION: For entire document, replace "lighting fixture" and "fixture" with the correct term luminaire.

SUBSTANTIATION: Illuminating Engineering Society of North America (IESNA), Lighting Design Lab in Seattle, WA and all other professional lighting organizations prefer the term luminaire.

Also, this will reduce confusion with reference to plumbing fixtures.

PANEL ACTION: Reject.

PANEL STATEMENT: See the Panel action on Proposal 11-1.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

(Log #1158h)

12- 1 - (Entire Document): Accept in Part

Note: The Technical Correlating Committee directs that the term "luminaire" be accepted as shown by the panel, but be followed by the existing term in parenthesis. This action is intended to provide consistency throughout the code.

SUBMITTER: William Buckson, Hubbell Lighting Inc.

RECOMMENDATION: Replace the terms "lighting fixture", "lighting fixtures" and "fixture", "fixtures"

with "luminaire", "luminaires" appearing throughout the following Sections. Exception, where fixture or fixtures are used in conjunction with wire or wires, or in Chapter 8.

Please see companion proposal, adding the term luminaire to Article 100, definitions, and deleting the FPN in Article 410-1.

Replace "Fixture" with "Luminaire" in the following Sections:

Sections 210-6, 210-19, 220-3, 250-148, Sections 300-3, 300-15, 300-16,, 305-4, 331-11, 350-10, 350-18, 351-8, 351-27, 363-12, 364-12, 370-16, 370-23, 370-25, 370-27, Sections 410-3, 410 B, 410-4, 410-6, 410-8, 410-C, 410-10, 410-11, 410-12, 410-13, 410-14, 410 D, 410-15, 410-16, 410-18, 410-22, 410-23, 410-28, 410-30, 410-35, 410-37, 410-46, 410-65, 410-66, 410-67, 410-71, 410-73, 410-76, 410-77, 410-91, 410-105, Sections 501-9, 502-11, 503-9, 520-63, 525-13, 547-7, 550-11, 551-41, 551-43, 551-53, 551-55, 552-54, 552-56, Sections 604-6, 610-12, 680-4, 680-6, 680-20, 680-21, 680-22, 680-32, 680-51.

Replace "Fixtures" with "Luminaires" in the following Sections:

Sections 210-19, 225-7, 250-4, Sections 300-11, 300-14, 300-15, 300-22, 331-4, 331-11, 333-7, 342-7, 347-2, 347-3, 348-5, 349-10, 350-10, 350-18, 351-8, 351-24, 351-27, 364-12, 370-23, Sections 400-7, 402-10, 410-1, 410-3, 410-4, 410-5, 410-6, 410-7, 410-8, 410-11, 410-15, 410-16, 410-17, 410-18, 410-20, 410-21, 410-22, 410-23, 410-24, 410-30, 410-31, 410G, 410-35, 410-36, 410-37, 410-39, 410-46, 410 M, 410-64, 410-65, 410N, 410-68, 410-70, 410-73, 410-74, 410-76, 410-77, 410-81, 410-104, 424-38, 424-39, 424-41, 424-93, Sections 501-9, 502-11, 503-9, 511-6, 513-5, 517-13, 517-61, 517-63, 520-42, 520-45, 520-61, 520-63, 530-17, 530-18, 530-51, 550-1, 550-2, 550-8, 550-9, 550-12, 550-15, 551-20, 551-53, 551-60, 552-20, 552-54, 552-58, 552-60, Sections 620-21, 670-2, 680-5, 680-6, 680-20, 680-25, 680-41, 680-51, 690-7, Sections 701-11, 701-12.

Replace "Lighting Fixture" with "Luminaire" in the following Sections:

Article 100, Sections 210-52, 220-3, Sections 334-10, 336-18, 370-27, Article 410, Sections 410-16, 410-77, Sections 501-9, 520-2, 530-2, 547-7, 550-9, 551-53, 551-55, 552-41, 552-54, 552-56, Sections 680-4, 680-6, 680-7, 680-20, 680-21, 680-25, 680-32, 680-51.

Replace "Lighting Fixtures" with "Luminaires" in the following Sections:

Article 100, Section 110-26, Sections 210-6, 210-23, 210-24, 220-3, 225-7, 240-2, 240-10, 250-4, 250-112, Sections 331-11, 333-7, 342-7, 349-10, 350-10, 351-24, 351-27, 364-12, 370-23, Sections 400-11, 402-2, 402-10, Article 410, Sections 410-1, 410-14, 410-15, 410-16, 410-30, 410-73, 410-80, 410-100, 411-2, 424-39, 424-93, Sections 500-5, 501-6, 501-9, 502-11, 503-9, 503-12, 517-30, 517-41, 517-61, 520-81, 547-7, 550-9, 551-10, 551-43, 551-53, 552-10, 552-54, Sections 600-3, 680-6, 680-20, 680-24, 680-25, 680-32, 680-41, 680-51, 680-61, 680-62, 680-71, Section 700-9.

SUBSTANTIATION: 1. Lighting standards that have or are being developed, revised and adopted by the U.S., Canada, and Mexico are utilizing the IES term Luminaire in lieu of the term fixture. This includes the new UL/CSA BI-NATIONAL luminaire standard, which will ultimately replace the UL 1570, 1571, and 1572 standards. (These are the very standards used to evaluate the lighting products required to be Listed and Approved, according to the NEC and verified by the Authorities Having Jurisdiction).

2. The Canadian Electrical Code has used the luminaire term for the last ten years.

3. The Tri-NATIONAL lighting standard currently being developed will be designated as a luminaire standard.

4. The National Electrical Manufacturers Association has recently retitled its "Lighting Fixture Section, to Luminaire Section".

5. The U.S. National Committee's Technical Advisory Group to the IEC is working on exporting U.S. lighting perspectives into luminaire (IEC) standards.

6. There are initiatives underway by both NEMA and the NFPA to promote and solidify the use of the NEC from a global perspective. The NEC and its IEC counterpart, IEC 60364, have recently undergone an equivalency review conducted by UL, NFPA, IAEC, NIST, and NEMA as part of this global strategy.

7. If the NEC is ever to be considered as an International Standard, it must utilize the proper terminology.

8. The FPN under 410-1 denotes that luminaire is an international term. International does not mean European only, international, includes the U.S.

9. The term fixture, is archaic and a misnomer. The term fixture has many meanings and connotations. A fixture could refer to a building part, any type or number of gas, plumbing, machine, electric or appliance components, a familiar element or feature or even an individual that has been in a position for a long time. The term luminaire however, by its very formulation, communicates its meaning in a more clear and succinct manner, reducing the possibility of misunderstanding or misapplication of the term.

PANEL ACTION: Accept in Part.

Replace the term "Fixture(s)" with "luminaire(s)" in 610-12 and 620-21.

PANEL STATEMENT: The panel is acting only on those sections over which it has jurisdiction. The panel concurs with the new definition in Article 100 and the panel also concurs with the deletion of the FPN 410-1.

Note: The Technical Correlating Committee understands that the panel has accepted those portions of the Proposal which fall under its Scope. The Technical Correlating Committee directs that the term "luminaire" be accepted as shown by the panel, but be followed by the existing term in parenthesis. This action is intended to provide consistency throughout the code.

SUBMITTER: William Buckson, Hubbell Lighting Inc.

RECOMMENDATION: Replace the terms "lighting fixture", "lighting fixtures" and "fixture", "fixtures" with "luminaire", "luminaires" appearing throughout the following Sections. Exception, where fixture or fixtures are used in conjunction with wire or wires, or in Chapter 8.

Please see companion proposal, adding the term luminaire to Article 100, definitions, and deleting the FPN in Article 410-1.

Replace "Fixture" with "Luminaire" in the following Sections:

Sections 210-6, 210-19, 220-3, 250-148, Sections 300-3, 300-15, 300-16,, 305-4, 331-11, 350-10, 350-18, 351-8, 351-27, 363-12, 364-12, 370-16, 370-23, 370-25, 370-27, Sections 410-3, 410 B, 410-4, 410-6, 410-8, 410-C, 410-10, 410-11, 410-12, 410-13, 410-14, 410 D, 410-15, 410-16, 410-18, 410-22, 410-23, 410-28, 410-30, 410-35, 410-37, 410-46, 410-65, 410-66, 410-67, 410-71, 410-73, 410-76, 410-77, 410-91, 410-105, Sections 501-9, 502-11, 503-9, 520-63, 525-13, 547-7, 550-11, 551-41, 551-43, 551-53, 551-55, 552-54, 552-56, Sections 604-6, 610-12, 680-4, 680-6, 680-20, 680-21, 680-22, 680-32, 680-51.

Replace "Fixtures" with "Luminaires" in the following Sections:

Sections 210-19, 225-7, 250-4, Sections 300-11, 300-14, 300-15, 300-22, 331-4, 331-11, 333-7, 342-7, 347-2, 347-3, 348-5, 349-10, 350-10, 350-18, 351-8, 351-24, 351-27, 364-12, 370-23, Sections 400-7, 402-10, 410-1, 410-3, 410-4, 410-5, 410-6, 410-7, 410-8, 410-11, 410-15, 410-16, 410-17, 410-18, 410-20, 410-21, 410-22, 410-23, 410-24, 410-30, 410-31, 410G, 410-35, 410-36, 410-37, 410-39, 410-46, 410 M, 410-64, 410-65, 410N, 410-68, 410-70, 410-73, 410-74, 410-76, 410-77, 410-81, 410-104, 424-38, 424-39, 424-41, 424-93, Sections 501-9, 502-11, 503-9, 511-6, 513-5, 517-13, 517-61, 517-63, 520-42, 520-45, 520-61, 520-63, 530-17, 530-18, 530-51, 550-1, 550-2, 550-8, 550-9, 550-12, 550-15, 551-20, 551-53, 551-60, 552-20, 552-54, 552-58, 552-60, Sections 620-21, 670-2, 680-5, 680-6, 680-20, 680-25, 680-41, 680-51, 690-7, Sections 701-11, 701-12.

Replace "Lighting Fixture" with "Luminaire" in the following Sections:

Article 100, Sections 210-52, 220-3, Sections 334-10, 336-18, 370-27, Article 410, Sections 410-16, 410-77, Sections 501-9, 520-2, 530-2, 547-7, 550-9, 551-53, 551-55, 552-41, 552-54, 552-56, Sections 680-4, 680-6, 680-7, 680-20, 680-21, 680-25, 680-32, 680-51.

Replace "Lighting Fixtures" with "Luminaires" in the following Sections:

Article 100, Section 110-26, Sections 210-6, 210-23, 210-24, 220-3, 225-7, 240-2, 240-10, 250-4, 250-112, Sections 331-11, 333-7, 342-7, 349-10, 350-10, 351-24, 351-27, 364-12, 370-23, Sections 400-11, 402-2, 402-10, Article 410, Sections 410-1, 410-14, 410-15, 410-16, 410-30, 410-73, 410-80, 410-100, 411-2, 424-39, 424-93, Sections 500-5, 501-6, 501-9, 502-11, 503-9, 503-12, 517-30, 517-41, 517-61, 520-81, 547-7, 550-9, 551-10, 551-43, 551-53, 552-10, 552-54, Sections 600-3, 680-6, 680-20, 680-24, 680-25, 680-32, 680-41, 680-51, 680-61, 680-62, 680-71, Section 700-9.

SUBSTANTIATION: 1. Lighting standards that have or are being developed, revised and adopted by the U.S., Canada, and Mexico are utilizing the IES term Luminaire in lieu of the term fixture. This includes the new UL/CSA BI-NATIONAL luminaire standard, which will ultimately replace the UL 1570, 1571, and 1572 standards. (These are the very standards used to evaluate the lighting products required to be Listed and Approved, according to the NEC and verified by the Authorities Having Jurisdiction).

2. The Canadian Electrical Code has used the luminaire term for the last ten years.

3. The Tri-NATIONAL lighting standard currently being developed will be designated as a luminaire standard.

4. The National Electrical Manufacturers Association has recently retitled its "Lighting Fixture Section, to Luminaire Section".

5. The U.S. National Committee's Technical Advisory Group to the IEC is working on exporting U.S. lighting perspectives into luminaire (IEC) standards.

6. There are initiatives underway by both NEMA and the NFPA to promote and solidify the use of the NEC from a global perspective. The NEC and its IEC counterpart, IEC 60364, have recently undergone an equivalency review conducted by UL, NFPA, IAEC, NIST, and NEMA as part of this global strategy.

7. If the NEC is ever to be considered as an International Standard, it must utilize the proper terminology.

8. The FPN under 410-1 denotes that luminaire is an international term. International does not mean European only, international, includes the U.S.

9. The term fixture, is archaic and a misnomer. The term fixture has many meanings and connotations. A fixture could refer to a building part, any type or number of gas, plumbing, machine, electric or appliance components, a familiar element or feature or even an individual that has been in a position for a long time. The term luminaire however, by its very formulation, communicates its meaning in a more clear and succinct manner, reducing the possibility of misunderstanding or misapplication of the term.

PANEL ACTION: Accept.

PANEL STATEMENT: The action on this proposal is contingent upon acceptance by Code Making Panel 18 of an identical proposal on Article 410.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

COMMENT ON AFFIRMATIVE:

OMEARA: The original term(s) being replaced should be retained in parenthetical form for one code cycle.

(Log #1930m)

14- 2 - (Entire Document): Accept

SUBMITTER: Jon P. Farren, Farren Engineering, Inc.

RECOMMENDATION: For entire document, replace "lighting fixture" and "fixture" with the correct term luminaire.

SUBSTANTIATION: Illuminating Engineering Society of North America (IESNA), Lighting Design Lab in Seattle, WA and all other professional lighting organizations prefer the term luminaire.

Also, this will reduce confusion with reference to plumbing fixtures.

PANEL ACTION: Accept.

PANEL STATEMENT: See action on Proposal 14-1 (Log #1158e).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

COMMENT ON AFFIRMATIVE:

OMEARA: The original term(s) being replaced should be retained in parenthetical form for one code cycle.

(Log #1158f)

15- 1 - (Entire Document): Accept in Principle in Part

Note: The Technical Correlating Committee directs that the term "luminaire" be accepted as shown by the panel, but be followed by the existing term in parenthesis. This action is intended to provide consistency throughout the code.

SUBMITTER: William Buckson, Hubbell Lighting Inc.

RECOMMENDATION: Replace the terms "lighting fixture", "lighting fixtures" and "fixture", "fixtures" with "luminaire", "luminaires" appearing throughout the following Sections. Exception, where fixture or fixtures are used in conjunction with wire or wires, or in Chapter 8.

Please see companion proposal, adding the term luminaire to Article 100, definitions, and deleting the FPN in Article 410-1.

Replace "Fixture" with "Luminaire" in the following Sections:

Sections 210-6, 210-19, 220-3, 250-148, Sections 300-3, 300-15, 300-16,, 305-4, 331-11, 350-10, 350-18, 351-8, 351-27, 363-12, 364-12, 370-16, 370-23, 370-25, 370-27, Sections 410-3, 410 B, 410-4, 410-6, 410-8, 410-C, 410-10, 410-11, 410-12, 410-13, 410-14, 410 D, 410-15, 410-16, 410-18, 410-22, 410-23, 410-28, 410-30, 410-35, 410-37, 410-46, 410-65, 410-66, 410-67, 410-71, 410-73, 410-76, 410-77, 410-91, 410-105, Sections 501-9, 502-11, 503-9, 520-63, 525-13, 547-7, 550-11, 551-41, 551-43, 551-53, 551-55, 552-54, 552-56, Sections 604-6, 610-12, 680-4, 680-6, 680-20, 680-21, 680-22, 680-32, 680-51.

Replace "Fixtures" with "Luminaires" in the following Sections:

Sections 210-19, 225-7, 250-4, Sections 300-11, 300-14, 300-15, 300-22, 331-4, 331-11, 333-7, 342-7, 347-2, 347-3, 348-5, 349-10, 350-10, 350-18, 351-8, 351-24, 351-27, 364-12, 370-23, Sections 400-7, 402-10, 410-1, 410-3, 410-4, 410-5, 410-6, 410-7, 410-8, 410-11, 410-15, 410-16, 410-17, 410-18, 410-20, 410-21, 410-22, 410-23, 410-24, 410-30, 410-31, 410G, 410-35, 410-36, 410-37, 410-39, 410-46, 410 M, 410-64, 410-65, 410N, 410-68, 410-70, 410-73, 410-74, 410-76, 410-77, 410-81, 410-104, 424-38, 424-39, 424-41, 424-93, Sections 501-9, 502-11, 503-9, 511-6, 513-5, 517-13, 517-61, 517-63, 520-42, 520-45, 520-61, 520-63, 530-17, 530-18, 530-51, 550-1, 550-2, 550-8, 550-9, 550-12, 550-15, 551-20, 551-53, 551-60, 552-20, 552-54, 552-58, 552-60, Sections 620-21, 670-2, 680-5, 680-6, 680-20, 680-25, 680-41, 680-51, 690-7, Sections 701-11, 701-12.

Replace "Lighting Fixture" with "Luminaire" in the following Sections:

Article 100, Sections 210-52, 220-3, Sections 334-10, 336-18, 370-27, Article 410, Sections 410-16, 410-77, Sections 501-9, 520-2, 530-2, 547-7, 550-9, 551-53, 551-55, 552-41, 552-54, 552-56, Sections 680-4, 680-6, 680-7, 680-20, 680-21, 680-25, 680-32, 680-51.

Replace "Lighting Fixtures" with "Luminaires" in the following Sections:

Article 100, Section 110-26, Sections 210-6, 210-23, 210-24, 220-3, 225-7, 240-2, 240-10, 250-4, 250-112, Sections 331-11, 333-7, 342-7, 349-10, 350-10, 351-24, 351-27, 364-12, 370-23, Sections 400-11, 402-2, 402-10, Article 410, Sections 410-1, 410-14, 410-15, 410-16, 410-30, 410-73, 410-80, 410-100, 411-2, 424-39, 424-93, Sections 500-5, 501-6, 501-9, 502-11, 503-9, 503-12, 517-30, 517-41, 517-61, 520-81, 547-7, 550-9, 551-10, 551-43, 551-53, 552-10, 552-54, Sections 600-3, 680-6, 680-20, 680-24, 680-25, 680-32, 680-41, 680-51, 680-61, 680-62, 680-71, Section 700-9.

SUBSTANTIATION: 1. Lighting standards that have or are being developed, revised and adopted by the U.S., Canada, and Mexico are utilizing the IES term Luminaire in lieu of the term fixture. This includes the new UL/CSA BI-NATIONAL luminaire standard, which will ultimately replace the UL 1570, 1571, and 1572 standards. (These are the very standards used to evaluate the lighting products required to be Listed and Approved, according to the NEC and verified by the Authorities Having Jurisdiction).

2. The Canadian Electrical Code has used the luminaire term for the last ten years.

3. The Tri-NATIONAL lighting standard currently being developed will be designated as a luminaire standard.

4. The National Electrical Manufacturers Association has recently retitled its "Lighting Fixture Section, to Luminaire Section".

5. The U.S. National Committee's Technical Advisory Group to the IEC is working on exporting U.S. lighting perspectives into luminaire (IEC) standards.

6. There are initiatives underway by both NEMA and the NFPA to promote and solidify the use of the NEC from a global perspective. The NEC and its IEC counterpart, IEC 60364, have recently undergone an equivalency review conducted by UL, NFPA, IAEC, NIST, and NEMA as part of this global strategy.

7. If the NEC is ever to be considered as an International Standard, it must utilize the proper terminology.

8. The FPN under 410-1 denotes that luminaire is an international term. International does not mean European only, international, includes the U.S.

9. The term fixture, is archaic and a misnomer. The term fixture has many meanings and connotations. A fixture could refer to a building part, any type or number of gas, plumbing, machine, electric or appliance components, a familiar element or feature or even an individual that has been in a position for a long time. The term luminaire however, by its very formulation, communicates its meaning in a more clear and succinct manner, reducing the possibility of misunderstanding or misapplication of the term.

PANEL ACTION: Accept in Principle in Part.

The following items of the submitter's recommendation are accepted:

In 520-2, replace the words "lighting fixture" with the word "luminaire" in the definitions of the terms "Stand Lamp (Work Light)" and "Strip Light."

In 520-81,replace the words "lighting fixtures" with the word "luminaires."

In 525-13(g), replace the word "fixture" with the word "luminaire."

In 530-2, replace the words "lighting fixture" with the word "luminaire" in the definition of the term "Stand Lamp (Work Light)."

In 530-18(g), replace the word "fixtures" with the word "luminaires."

In 700-9(b)2, and 3, replace the words "lighting fixtures" with the word "luminaires."

The following items of the submitter's recommendation are accepted in principle:

In 520-42, replace the words "strip light fixtures" with the words "strip lights."

In 520-45, delete the words "or fixtures."

In 520-61, replace the words "lamp fixtures" with the word "lamps" in three places.

In 530-17, replace the words "lamp fixtures" with the word "lamps" in four places.

In 700-12(e) [not 701-12], replace the words "Emergency illumination fixtures" with the words "Emergency luminaires" in the last sentence of the last paragraph.

In 701-11(f), replace the words "Legally required standby illumination fixtures" with the words "Legally required standby luminaires" in the last sentence of the last paragraph.

The following item of the submitter's recommendation are rejected:

In 530-51, the proposed change from "fixtures" to "luminaires."

The remaining items of the submitter's recommendation are not within the scope of CMP 15.

PANEL STATEMENT: The items accepted in principle are revised to more clearly reflect the requirements of the code and meet the intent of the submitter.

The item for 530-51 was rejected because the fixture may not be a luminaire, so the more generic usage of fixture is appropriate.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

NEGATIVE: 3

EXPLANATION OF NEGATIVE:

HIRSCHLER: I believe this action is ill advised: the panel should consider whether this is not a change that will make the NEC less user friendly, as there are many more people who know what a "lighting fixture" is than people who know what a "luminaire" is, and the first group certainly includes me. A search for the word "luminaire" in dictionaries, including the Encyclopedia Britannica and the "spell-check" function of word processors fails to find the term.

KLEIN: Illuminating Engineering Society of North America's definition of Luminaire:

"A complete lighting unit consisting of a lamp or lamps and ballast(s) (when applicable) together with the parts designed to distribute the light, to position and protect the lamps, and to connect the lamps to the power supply."

The Panel members are reminded while reviewing this negative response, that a lamp without a connection to power does not produce light of heat or potential hazard. Once connected to power, a lamp is part of a luminaire.

520-2 Currently the code reads:

"Border Light. A permanently installed overhead strip light." I believe, in response to Proposal 15-1 it should read as follows:

Border Light. A permanently installed overhead strip luminaire.

The accepted Panel motion revises the definition of Stand Lamp (Work Light). As follows:

"A portable stand that contains a general-purpose luminaire or lamp holder with guard for the purpose of providing general illumination on the stage or in the auditorium."

I believe in response to Proposal 15-1 and in light (no pun intended) of the definition of a luminaire the code text should read as follows omitting the reference to "a lamp holder with guard" which is within the definition of a luminaire:

Stand Lamp (Work Light). A portable stand that contains a general-purpose luminaire for the purpose of providing general illumination on the stage or in the auditorium.

525-13(g) Inside Tents and Concessions. The accepted Panel motion revises the code text as follows:

"All temporary lamps for general illumination shall be protected from accidental breakage by a suitable luminaire or lampholder." I believe in response to proposal 15-1 and in accord with the definition of luminaire, the code text should read as follows omitting the reference to "lamp holder" which is within the definition of a luminaire:

All temporary lamps for general illumination shall be protected from accidental breakage by a suitable luminaire.

520-2 The accepted Panel motion revises the definition of Stand Lamp (Work Light) as follows:

"A portable stand that contains a general-purpose luminaire or lamp holder with guard for the purpose of providing general illumination in the studio or stage."

I believe in response to Proposal 15-1 and in accord with the definition of a luminaire, the code text should read as follows omitting the reference to a "lamp holder with guard" which is within the definition of a luminaire:

Stand Lamp (Work Light). A portable stand that contains a general-purpose luminaire for the purpose of providing general illumination in the studio or stage.

530-18(g) No comment – Panel Action acceptable.

700-9(b) 2 & 3 No comment – Panel Action acceptable.

520-42 Panel Action acceptable.

520-45: The deletion of the words "or fixtures" changes the meaning of this section of the code and does not address the submitter's intention. The intention of this code section is to require permanent receptacles on stages to be rated in amperes with branch circuit conductors installed in accordance with Articles 310 and 400, <u>whether or not they are used for power or lighting equipment.</u> Deletion of the words "or fixtures" would eliminate the application of this section to permanently installed receptacles used for lighting equipment on stages.

I believe the first sentence of Section 520-45 Receptacles should read as follows:

Receptacles for electrical equipment or luminaires on stages shall be rated in amperes.

520-61 The existing text of this section is as follows:

520-61 Arc Lamp Fixtures. Arc lamp fixtures, including enclosed arc lamp fixtures and associated ballasts, shall be listed. Interconnecting cord sets and interconnecting cords and cables shall be extra-hard usage type and listed.

The proposed wording based upon the Panel Action is:

520-61 Arc Lamps. Arc lamps, including enclosed arc lamps and associated ballasts, shall be listed. Interconnecting cord sets and interconnecting cords and cables shall be extra-hard usage type and listed.

This proposed wording, if interpreted literally, would only require the listing of the lamp, the ballast, and the interconnecting cords and cables – NOT the socket, the parts designed to distribute the light, the parts to position and protect the lamps, the lamp enclosure and the connection of the ballasts to a power supply. For these reasons, I believe a more precise interpretation of the submitter's intention to be as follows.

Section 520-61 should be retitled to Arc Lamp Luminaires and the first sentence should be modified to read as follows:

Arc lamp luminaires, including enclosed arc lamp luminaires and associated ballasts shall be listed.

530-17 Applying the same logic as in Section 520-61 above, I believe the appropriate modification to this section is as follows:

Section 530-17 should be retitled to Portable Arc Lamp Luminaires with the two subsections renamed and their first sentences modified as follows:

(b)Portable Carbon Arc Luminaires

Portable carbon arc luminaires shall be substantially constructed.

(a)Portable Noncarbon Arc Electric-Discharge Luminaires

Portable Noncarbon Arc Electric-Discharge Luminaires

Portable noncarbon arc luminaires, including enclosed arc lamp luminaires and their associated ballasts shall be listed.

700-12(e) No comment – Panel Action acceptable.

701-11(f) No comment – Panel Action acceptable.

530-51 Based upon the definition of a luminaire, the connection of a lamp to power occurs at or within a luminaire. If a lamp is installed in or at a "fixture" which is energized, it is a luminaire by definition. The Panel Statement, therefore is incorrect.

The current code language is:

Lamps in Cellulose Nitrate Film Storage Vaults. Lamps in cellulose nitrate film storage vaults shall be installed in rigid fixtures of the glass-enclosed and gasketed type. Lamps shall be controlled by a switch having a pole in each ungrounded conductor…

This code section should be modified as follows:

Luminaires in Cellulose Nitrate Film Storage Vaults. Luminaires in cellulose nitrate film storage vaults shall be of the glass-enclosed and gasketed type rigidly fastened to the surface on which they are mounted. These luminaires shall be controlled by a switch having a pole in each ungrounded conductor…

In addition to the submitter's proposed Panel Actions, I believe the intention of the proposer would be best served by modification of the following code sections:

Current code language:

520-62 Bracket Fixture Wiring.

(a) Bracket Wiring. Brackets for use on scenery shall be wired internally, and the fixture stem shall be carried through to the back of the scenery where a bushing shall be placed on the end of the stem. Externally wired brackets or other fixtures shall be permitted where wired with cords designed for hard usage that extend through scenery and without joint or splice in canopy of fixture back and terminate in an approved-type stage connector located, where practical, within 18 in. (457 mm) of the fixture.

(b) Mounting. Fixtures shall be securely fastened in place.

Proposed code language:

520-63 Bracket Luminaire Wiring.

(c) Bracket Wiring. Brackets for use on scenery shall be wired internally and the luminaire stem shall be carried through to the back of the scenery where a bushing shall be placed on the end of the stem. Externally wired brackets or other luminaires shall be permitted where wired with cords designed for hard usage that extend through scenery and without joint or splice in canopy of luminaire and terminate in an approved-type stage connector located, where practical, within 18 in. (457 mm).

(d)Mounting. Bracket Luminaires shall be securely fastened in place.

Current code language (based upon Panel Action):

Old Section 520-13(g) Inside Tents and Concessions

New Section: 525-21(b) Portable Wiring Inside Tents and Concessions. Electrical wiring for lighting, where installed inside of tents and concessions, shall be securely installed, and where subject to physical damage, shall be provided with mechanical protection. All lamps for general illumination shall be protected from accidental breakage by a suitable fixture or lampholder with a guard.

Proposed code language:

525-21(b) Portable Wiring Inside Tents and Concessions. Electrical wiring for lighting, where installed inside of tents and concessions, shall be securely installed, and where subject to physical damage, shall be provided with mechanical protection. All lamps for general illumination shall be protected from accidental breakage by a guard or installed within a protective luminaire.

Current code language:

530-16. Portable Lamps. Portable lamps and work lights shall be equipped with flexible cords, composition or metal sheathed porcelain sockets, and substantial guards.

Exception: Portable lamps used as properties in a motion picture set or television stage set, on a studio stage or lot, or on location shall not be considered to be portable lamps for the purpose of this section.

Proposed code language:

530-16 Portable Lamps. Portable luminaires and work lights shall be equipped with flexible cords, and composition or metal sheathed porcelain sockets, and substantial guards.

Exception: Portable luminaires used as properties in a motion picture set or television stage set, on a studio stage or lot, or on location shall not be considered to be portable luminaires for the purpose of this section.

Current code language:

D. Viewing, Cutting, and Patching Tables

530-41 Lamps at Tables. Only composition or metal-sheathed, porcelain, keyless lampholders equipped with suitable means to guard lamps from physical damage and from film scrap shall be used at patching, viewing, and cutting tables.

Proposed code language

D. Viewing, Cutting, and Patching Tables

530-42 Luminaires at Tables. Only composition or metal-sheathed, porcelain, keyless luminaires equipped with suitable means to guard lamps from physical damage and from film scrap shall be used at patching, viewing, and cutting tables.

Current code language:

700-16 Emergency Illumination. Emergency illumination shall include all required means of egress lighting, illuminated exit signs, and all other lights specified as necessary to provide required illumination…

Proposed code language:

700-16 Emergency Illumination. Emergency illumination shall include all required means of egress lighting, illuminated exit signs, and all other luminaires specified as necessary to provide required illumination…

Current code language:

700-17 Circuits for Emergency Lighting. Such installations shall provide either one of the following: (1) an emergency lighting supply, independent of the general lighting supply with provisions for automatically transferring the emergency lights upon the event of failure of the general lighting system supply, or (2)…

Proposed code language:

700-17 Circuits for Emergency Lighting. Such installations shall provide either one of the following: (1) an emergency lighting supply, independent of the general lighting supply, with provisions for automatically transferring the emergency luminaires upon the event of failure of the general lighting system supply, or (2)…

Current code language:

700-20 Exception No. 2: Additional switches that act only to put emergency lights into operation but not disconnect them shall be permissible.

Proposed code language:

700-20 Exception No. 2: Additional switches that act only to put emergency luminaires into operation but not disconnect them shall be permissible.

Current code language:

700-22 Exterior Lights. Those lights on the exterior of a building that are not required for illumination when there is sufficient daylight shall be permitted to be controlled by an automatic light-actuated device.

Proposed code language:

700-23 Exterior Luminaries. Those luminaires on the exterior of a building that are not required for illumination when there is sufficient daylight shall be permitted to be controlled by an automatic light-actuated device.

LANNI: The word luminaire is not in general use, thus it will add confusion, and it is not user friendly. Luminaire is not in the dictionary in Microsoft word, or in the American Heritage dictionary. It is not used by the electrical trades or the set lighting trades as the description of a lighting apparatus. When using the Internet, YAHOO! shows 278 matches for lighting fixtures and only 23 for luminaire, a difference of 255 sites. Other search engines reflect the same results. If manufactures don't list their products as luminaires it is because they realize that their customers don't recognize the term. If the people who buy, sell, install, and use lighting fixtures do not use the word luminaire, the NEC shouldn't use it either. Luminaire may be a European word, however, English is a more global language than French.

COMMENT ON AFFIRMATIVE:

AMOS: I agree with the Panel's Action to change the reference to fixtures, to Luminaries. However, the word "Luminaire" should be placed first, with the former term in parentheses after for at least the next Code cycle to ensure a common understanding.

(Log #1930n)

15- 2 - (Entire Document): Accept in Principle in Part

SUBMITTER: Jon P. Farren, Farren Engineering, Inc.

RECOMMENDATION: For entire document, replace "lighting fixture" and "fixture" with the correct term luminaire.

SUBSTANTIATION: Illuminating Engineering Society of North America (IESNA), Lighting Design Lab in Seattle, WA and all other professional lighting organizations prefer the term luminaire.

Also, this will reduce confusion with reference to plumbing fixtures.

PANEL ACTION: Accept in Principle in Part.

PANEL STATEMENT: Refer to panel action and statement on Proposal 15-1.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

NEGATIVE: 3

EXPLANATION OF NEGATIVE:

HIRSCHLER: See my Explanation of Negative Vote on Proposal 15-1.

KLEIN: See my Explanation of Negative Vote on Proposal 5-1.

LANNI: The National Electrical Code is not a design manual, and lighting engineers preferences shouldn't be accepted if the result is that the majority of users are forced to learn a new term. The submitter's suggestion that anyone referring to an electrical code would confuse it with a plumbing code is rather far fetched. This change will cause confusion among electricians, inspectors, and the buying public. As the French are so concerned with keeping their language "pure" why are we inserting a French word into our terminology thus making it inconsistent with our usage of the word light. Lights, downlights, indirect light, lighting, sunlight, worklight, exit light, daylight, high light, candlelight, moonlight, lighting systems, are all terms used in conjunction with lighting fixtures. Are we to refer to a downlight as a ??? A spotlight is a spot luminaire? A flashlight is now what? The word light is combined with other words to form the text of our language and substituting "luminaire" is not as simple a change as some would have us believe. English is confusing by the very fact that is combines German and Latin and Greek roots and rules and is inconsistent. This is a classic case of inserting a Latin root into a German form. English is taught as a second language in many, many countries and is more global than French. The Europeans should be adapting to English instead of the reverse.

None of my IBEW electricians use the word luminaire, the Local 728 Set Lighting Electricians do not use the term either. Manufactures advertise their products as lighting fixtures. See YAHOO - Search examples I have provided. We have put a lot of effort to make the code user friendly, why reverse the trend. If the word (luminaire) was printed next to the term "lighting fixture" the NEC would become just as consistent with other codes not in English.

Note: Supporting material is available for review at NFPA Headquarters.

(Log #1930o)

16- 1 - (Entire Document): Accept in Principle

NOTE: The Technical Correlating Committee understands that the panel has accepted those portions of the Proposal which fall under its Scope.

SUBMITTER: Jon P. Farren, Farren Engineering, Inc.

RECOMMENDATION: For entire document, replace "lighting fixture" and "fixture" with the correct term <u>luminaire.</u>

SUBSTANTIATION: Illuminating Engineering Society of North America (IESNA), Lighting Design Lab in Seattle, WA and all other professional lighting organizations prefer the term <u>luminaire.</u>

Also, this will reduce confusion with reference to plumbing fixtures.

PANEL ACTION: Accept in Principle.

The panel agrees with the substitution of the word "luminaire" for lighting fixture. Add the words "(lighting fixture)" after the term "luminaire"

PANEL STATEMENT: The added wording in parentheses is needed for those who may not be familiar with the term.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 23

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

NEGATIVE: 3

EXPLANATION OF NEGATIVE:

KAHN: While many organizations may prefer the term "luminaire", I believe that many users of the Code might be confused with a substitution of terms at this time. The Panel correctly added the parenthesis with the term "lighting fixture" but I do not think that goes far enough. To properly introduce the term "luminaire", it should be the term added in the parenthesis for the 2002 NEC. For the following code the change as approved would follow. By that time code users will have become familiar with the change.

I do not agree with the submitter's substantiation that this change "will reduce confusion with reference to plumbing fixtures". The NEC does not apply to plumbing fixtures.

LANNI: The word luminaire is not in general use, thus it will add confusion and it is not user friendly. Luminaire is not in the dictionary in microsoft word, or in the American Heritage Dictionary. It is not used by the electrical trades or the set lighting trades as the description of a lighting apparatus. When using the internet, YAHOO shows 278 matches for lighting fixtures and only 23 for luminaire, a difference of 255 sites. Other search engines reflect the same results. If manufacturers don't list their products as luminaires, it is because they realize that their customers don't recognize the term. If the people who buy, sell, install, and use lighting fixtures do not use the word luminaire, the NEC shouldn't use it either. Luminaire may be a European word, however, English is a more global language than French.

SPEER: The panel's statement indicates that users of the code may not be familiar with the term "luminaire", I concur. The original term "lighting fixture" is recognized throughout the industry and should remain in use. No improvement to the code, either in use or application, will result from this proposed change.

(Log #1930p)

17- 2 - (Entire Document): Accept in Principle

SUBMITTER: Jon P. Farren, Farren Engineering, Inc.

RECOMMENDATION: For entire document, replace "lighting fixture" and "fixture" with the correct term <u>luminaire.</u>

SUBSTANTIATION: Illuminating Engineering Society of North America (IESNA), Lighting Design Lab in Seattle, WA and all other professional lighting organizations prefer the term <u>luminaire.</u>

Also, this will reduce confusion with reference to plumbing fixtures.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to the panel action on Proposal 17-1 which meets the intent of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

NOT RETURNED: 3 Clark, Nash, Telecky

EXPLANATION OF NEGATIVE:

HILLEBRAND: While many organizations may prefer the term "luminaire", I believe that many of the users of the code might be confused with a substitution of terms at this time. To properly introduce the term "luminaire", it should be introduced in a parenthesis right after each place where the term "lighting fixture" is used for the 2002 NEC. In the following code, the parenthesis can be deleted. By that time code users will have become familiar with the change.

I do not agree with the submitter's substantiation that this change "will reduce confusion with reference to plumbing fixtures". The NEC does not apply to plumbing fixtures.

(Log #1158l)

17- 1 - (Entire Document): Accept

NOTE: The Technical Correlating Committee understands that the panel has accepted those portions of the Proposal which fall under its Scope. The Technical Correlating Committee directs that the term "luminaire" be accepted as shown by the panel, but be followed by the existing term in parenthesis. This action is intended to provide consistency throughout the code.

SUBMITTER: William Buckson, Hubbell Lighting Inc.

RECOMMENDATION: Replace the terms "lighting fixture", "lighting fixtures" and "fixture", "fixtures"

with "luminaire", "luminaires" appearing throughout the following Sections. Exception, where fixture or fixtures are used in conjunction with wire or wires, or in Chapter 8.

Please see companion proposal, adding the term luminaire to Article 100, definitions, and deleting the FPN in Article 410-1.

<u>Replace "Fixture" with "Luminaire"</u> in the following Sections: Sections 210-6, 210-19, 220-3, 250-148, Sections 300-3, 300-15, 300-16,, 305-4, 331-11, 350-10, 350-18, 351-8, 351-27, 363-12, 364-12, 370-16, 370-23, 370-25, 370-27, Sections 410-3, 410 B, 410-4, 410-6, 410-8, 410-C, 410-10, 410-11, 410-12, 410-13, 410-14, 410 D, 410-15, 410-16, 410-18, 410-22, 410-23, 410-28, 410-30, 410-35, 410-37, 410-46, 410-65, 410-66, 410-67, 410-71, 410-73, 410-76, 410-77, 410-91, 410-105, Sections 501-9, 502-11, 503-9, 520-63, 525-13, 547-7, 550-11, 551-41, 551-43, 551-53, 551-55, 552-54, 552-56, Sections 604-6, 610-12, 680-4, 680-6, 680-20, 680-21, 680-22, 680-32, 680-51.

<u>Replace "Fixtures" with "Luminaires"</u> in the following Sections: Sections 210-19, 225-7, 250-4, Sections 300-11, 300-14, 300-15, 300-22, 331-4, 331-11, 333-7, 342-7, 347-2, 347-3, 348-5, 349-10, 350-10, 350-18, 351-8, 351-24, 351-27, 364-12, 370-23, Sections 400-7, 402-10, 410-1, 410-3, 410-4, 410-5, 410-6, 410-7, 410-8, 410-11, 410-15, 410-16, 410-17, 410-18, 410-20, 410-21, 410-22, 410-23, 410-24, 410-30, 410-31, 410G, 410-35, 410-36, 410-37, 410-39, 410-46, 410 M, 410-64, 410-65, 410N, 410-68, 410-70, 410-73, 410-74, 410-76, 410-77, 410-81, 410-104, 424-38, 424-39, 424-41, 424-93, Sections 501-9, 502-11, 503-9, 511-6, 513-5, 517-13, 517-61, 517-63, 520-42, 520-45, 520-61, 520-63, 530-17, 530-18, 530-51, 550-1, 550-2, 550-8, 550-9, 550-12, 550-15, 551-20, 551-53, 551-60, 552-20, 552-54, 552-58, 552-60, Sections 620-21, 670-2, 680-5, 680-6, 680-20, 680-25, 680-41, 680-51, 690-7,

Sections 701-11, 701-12.
Replace "Lighting Fixture" with "Luminaire" in the following Sections:
Article 100, Sections 210-52, 220-3, Sections 334-10, 336-18, 370-27, Article 410, Sections 410-16, 410-77, Sections 501-9, 520-2, 530-2, 547-7, 550-9, 551-53, 551-55, 552-41, 552-54, 552-56, Sections 680-4, 680-6, 680-7, 680-20, 680-21, 680-25, 680-32, 680-51.
Replace "Lighting Fixtures" with "Luminaires" in the following Sections:
Article 100, Section 110-26, Sections 210-6, 210-23, 210-24, 220-3, 225-7, 240-2, 240-10, 250-4, 250-112, Sections 331-11, 333-7, 342-7, 349-10, 350-10, 351-24, 351-27, 364-12, 370-23, Sections 400-11, 402-2, 402-10, Article 410, Sections 410-1, 410-14, 410-15, 410-16, 410-30, 410-73, 410-80, 410-100, 411-2, 424-39, 424-93, Sections 500-5, 501-6, 501-9, 502-11, 503-9, 503-12, 517-30, 517-41, 517-61, 520-81, 547-7, 550-9, 551-10, 551-43, 551-53, 552-10, 552-54, Sections 600-3, 680-6, 680-20, 680-24, 680-25, 680-32, 680-41, 680-51, 680-61, 680-62, 680-71, Section 700-9.
SUBSTANTIATION: 1. Lighting standards that have or are being developed, revised and adopted by the U.S., Canada, and Mexico are utilizing the IES term Luminaire in lieu of the term fixture. This includes the new UL/CSA BI-NATIONAL luminaire standard, which will ultimately replace the UL 1570, 1571, and 1572 standards. (These are the very standards used to evaluate the lighting products required to be Listed and Approved, according to the NEC and verified by the Authorities Having Jurisdiction).
2. The Canadian Electrical Code has used the luminaire term for the last ten years.
3. The Tri-NATIONAL lighting standard currently being developed will be designated as a luminaire standard.
4. The National Electrical Manufacturers Association has recently retitled its "Lighting Fixture Section, to Luminaire Section".
5. The U.S. National Committee's Technical Advisory Group to the IEC is working on exporting U.S. lighting perspectives into luminaire (IEC) standards.
6. There are initiatives underway by both NEMA and the NFPA to promote and solidify the use of the NEC from a global perspective. The NEC and its IEC counterpart, IEC 60364, have recently undergone an equivalency review conducted by UL, NFPA, IAEC, NIST, and NEMA as part of this global strategy.
7. If the NEC is ever to be considered as an International Standard, it must utilize the proper terminology.
8. The FPN under 410-1 denotes that luminaire is an international term. International does not mean European only, international, includes the U.S.
9. The term fixture, is archaic and a misnomer. The term fixture has many meanings and connotations. A fixture could refer to a building part, any type or number of gas, plumbing, machine, electric or appliance components, a familiar element or feature or even an individual that has been in a position for a long time. The term luminaire however, by its very formulation, communicates its meaning in a more clear and succinct manner, reducing the possibility of misunderstanding or misapplication of the term.
PANEL ACTION: Accept.

COMMENT ON AFFIRMATIVE:
WALL: The terms "lighting fixture," "lighting fixtures," "fixture" and "fixtures" are more widely recognized in the United States than "luminaire(s)": however, "luminaire(s)" is more widely recognized internationally. To ease the transition, both terms should be included for one code cycle: the term "luminaire(s)" followed by the term "lighting fixture(s)" in parentheses, for example: "luminaire (lighting fixture)."

(Log #1930q)

18- 2 - (Entire Document): Accept in Principle
SUBMITTER: Jon P. Farren, Farren Engineering, Inc.
RECOMMENDATION: For entire document, replace "lighting fixture" and "fixture" with the correct term luminaire.
SUBSTANTIATION: Illuminating Engineering Society of North America (IESNA), Lighting Design Lab in Seattle, WA and all other professional lighting organizations prefer the term luminaire.
Also, this will reduce confusion with reference to plumbing fixtures.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement under Proposal 18-1.

Note: The Technical Correlating Committee directs that the term "luminaire" be accepted as shown by the panel, but be followed by the existing term in parenthesis on all Proposals except those amended by Panel Action Text. This action is intended to provide consistency throughout the code. In additon, the Technical Correlating Committee directs the panel to clarify their action relative to the last line of the Panel Action. This action will be considered by the Panel as a Public Comment.
SUBMITTER: William Buckson, Hubbell Lighting Inc.
RECOMMENDATION: Replace the terms "lighting fixture", "lighting fixtures" and "fixture", "fixtures"
with "luminaire", "luminaires" appearing throughout the following Sections. Exception, where fixture or fixtures are used in conjunction with wire or wires, or in Chapter 8.
Please see companion proposal, adding the term luminaire to Article 100, definitions, and deleting the FPN in Article 410-1.
Replace "Fixture" with "Luminaire" in the following Sections:
Sections 210-6, 210-19, 220-3, 250-148, Sections 300-3, 300-15, 300-16,, 305-4, 331-11, 350-10, 350-18, 351-8, 351-27, 363-12, 364-12, 370-16, 370-23, 370-25, 370-27, Sections 410-3, 410 B, 410-4, 410-6, 410-8, 410-C, 410-10, 410-11, 410-12, 410-13, 410-14, 410 D, 410-15, 410-16, 410-18, 410-22, 410-23, 410-28, 410-30, 410-35, 410-37, 410-46, 410-65, 410-66, 410-67, 410-71, 410-73, 410-76, 410-77, 410-91, 410-105, Sections 501-9, 502-11, 503-9, 520-63, 525-13, 547-7, 550-11, 551-41, 551-43, 551-53, 551-55, 552-54, 552-56, Sections 604-6, 610-12, 680-4, 680-6, 680-20, 680-21, 680-22, 680-32, 680-51.
Replace "Fixtures" with "Luminaires" in the following Sections:
Sections 210-19, 225-7, 250-4, Sections 300-11, 300-14, 300-15, 300-22, 331-4, 331-11, 333-7, 342-7, 347-2, 347-3, 348-5, 349-10, 350-10, 350-18, 351-8, 351-24, 351-27, 364-12, 370-23, Sections 400-7, 402-10, 410-1, 410-3, 410-4, 410-5, 410-6, 410-7, 410-8, 410-11, 410-15, 410-16, 410-17, 410-18, 410-20, 410-21, 410-22, 410-23, 410-24, 410-30, 410-31, 410G, 410-35, 410-36, 410-37, 410-39, 410-46, 410 M, 410-64, 410-65, 410N, 410-68, 410-70, 410-73, 410-74, 410-76, 410-77, 410-81, 410-104, 424-38, 424-39, 424-41, 424-93, Sections 501-9, 502-11, 503-9, 511-6, 513-5, 517-13, 517-61, 517-63, 520-42, 520-45, 520-61, 520-63, 530-17, 530-18, 530-51, 550-1, 550-2, 550-8, 550-9, 550-12, 550-15, 551-20, 551-53, 551-60, 552-20, 552-54, 552-58, 552-60, Sections 620-21, 670-2, 680-5, 680-6, 680-20, 680-25, 680-41, 680-51, 690-7, Sections 701-11, 701-12.
Replace "Lighting Fixture" with "Luminaire" in the following Sections:
Article 100, Sections 210-52, 220-3, Sections 334-10, 336-18, 370-27, Article 410, Sections 410-16, 410-77, Sections 501-9, 520-2, 530-2, 547-7, 550-9, 551-53, 551-55, 552-41, 552-54, 552-56, Sections 680-4, 680-6, 680-7, 680-20, 680-21, 680-25, 680-32, 680-51.
Replace "Lighting Fixtures" with "Luminaires" in the following Sections:
Article 100, Section 110-26, Sections 210-6, 210-23, 210-24, 220-3, 225-7, 240-2, 240-10, 250-4, 250-112, Sections 331-11, 333-7, 342-7, 349-10, 350-10, 351-24, 351-27, 364-12, 370-23, Sections 400-11, 402-2, 402-10, Article 410, Sections 410-1, 410-14, 410-15, 410-16, 410-30, 410-73, 410-80, 410-100, 411-2, 424-39, 424-93, Sections 500-5, 501-6, 501-9, 502-11, 503-9, 503-12, 517-30, 517-41, 517-61, 520-81, 547-7, 550-9, 551-10, 551-43, 551-53, 552-10, 552-54, Sections 600-3, 680-6, 680-20, 680-24, 680-25, 680-32, 680-41, 680-51, 680-61, 680-62, 680-71, Section 700-9.
SUBSTANTIATION: 1. Lighting standards that have or are being developed, revised and adopted by the U.S., Canada, and Mexico are utilizing the IES term Luminaire in lieu of the term fixture. This includes the new UL/CSA BI-NATIONAL luminaire standard, which will ultimately replace the UL 1570, 1571, and 1572 standards. (These are the very standards used to evaluate the lighting products required to be Listed and Approved, according to the NEC and verified by the Authorities Having Jurisdiction).
2. The Canadian Electrical Code has used the luminaire term for the last ten years.
3. The Tri-NATIONAL lighting standard currently being developed will be designated as a luminaire standard.
4. The National Electrical Manufacturers Association has recently retitled its "Lighting Fixture Section, to Luminaire Section".
5. The U.S. National Committee's Technical Advisory Group to the IEC is working on exporting U.S. lighting perspectives into luminaire (IEC) standards.
6. There are initiatives underway by both NEMA and the NFPA to promote and solidify the use of the NEC from a global perspective. The NEC and its IEC counterpart, IEC 60364, have recently undergone an equivalency review conducted by UL, NFPA, IAEC, NIST, and NEMA as part of this global strategy.
7. If the NEC is ever to be considered as an International Standard, it must utilize the proper terminology.
8. The FPN under 410-1 denotes that luminaire is an international term. International does not mean European only, international, includes the U.S.
9. The term fixture, is archaic and a misnomer. The term fixture has many meanings and connotations. A fixture could refer to a building part, any type or number of gas, plumbing, machine, electric or appliance components, a familiar element or feature or even an individual that has been in a position for a long time. The term luminaire however, by its very formulation, communicates its meaning in a more clear and succinct manner, reducing the possibility of misunderstanding or misapplication of the term.
PANEL ACTION: Accept in Principle in Part.
Accept all proposals in Articles 545, 547, 550, 551, 552, 553, 555, 604, and 675 except those amended as follows:
551-20(d) title and text----change "Fixtures" to "Fixtures, Including Luminaires," and "Fixtures" to "Fixtures, including luminaires,".
551-43(b) --first reference, change "fixture" to "fixture, including a luminaire," (second reference accepted as proposed).
551-60(a) --change "Fixtures" to "Fixtures, including luminaires,".
552-20(d) title and text-- change "Fixtures" to "Fixtures, Including Luminaires," and "Fixtures" to "Fixtures, including luminaires," respectively.
552-56(e)-- change "fixture" to "fixture, including a luminaire,".
552-59 title and text-- change "Fixtures" to "Fixtures, Including Luminaires," and "fixtures" to "fixtures, including luminaires,".
552-60(a)--Change "Fixtures" to "Fixtures, including luminaires,".
604-6(a)(2) Exception 1-- change "fixtures" to "fixtures, including luminaires,".
PANEL STATEMENT: Only the proposals in Articles 545, 547, 550, 551, 552, 553, 555, 604, and 675 are within the scope of CMP 19. The proposal is too broad in its recommendation. While the use of the existing word "fixture(s)" and term "lighting fixture(s)" often is clearly in reference to lighting products, in other places, the word "fixture(s)" may be interpreted to include a broader range of equipment. The panel considered the word "equipment" to replace "fixture(s)" where lighting products may not be exclusively intended but believed it to be too broad a reference as defined in the NEC. In such situations, our recommendation "(a) fixture(s), including (a) luminaire(s),..." serves to sufficiently expand the scope of "fixture(s)" while not expanding it so broadly as "equipment."
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

COMMENT ON AFFIRMATIVE:
SABIN-MERCADO: EL&P affirms Panel actions to change to the term "luminaire" throughout the Code. An affirmative comment will be made that indicates the word "luminaire" should be placed first with the former term in parentheses after the word for at least the duration of the next Code cycle in each of the CMPs affected.

(Log #1930r)

19- 2 - (Entire Document): Accept in Principle in Part

NOTE: See Technical Correlating Committee Note on Proposal 19-1.

SUBMITTER: Jon P. Farren, Farren Engineering, Inc.

RECOMMENDATION: For entire document, replace "lighting fixture" and "fixture" with the correct term luminaire.

SUBSTANTIATION: Illuminating Engineering Society of North America (IESNA), Lighting Design Lab in Seattle, WA and all other professional lighting organizations prefer the term luminaire.

Also, this will reduce confusion with reference to plumbing fixtures.

PANEL ACTION: Accept in Principle in Part.

Accept all proposals in Articles 545, 547, 550, 551, 552, 553, 555, 604, and 675 except those amended as follows:

(Log #1158i)

20- 1 - (Entire Document): Accept in Principle in Part

SUBMITTER: William Buckson, Hubbell Lighting Inc.

RECOMMENDATION: Replace the terms "lighting fixture", "lighting fixtures" and "fixture", "fixtures"

with "luminaire", "luminaires" appearing throughout the following Sections. Exception, where fixture or fixtures are used in conjunction with wire or wires, or in Chapter 8.

Please see companion proposal, adding the term luminaire to Article 100, definitions, and deleting the FPN in Article 410-1.

Replace "Fixture" with "Luminaire" in the following Sections:

Sections 210-6, 210-19, 220-3, 250-148, Sections 300-3, 300-15, 300-16,, 305-4, 331-11, 350-10, 350-18, 351-8, 351-27, 363-12, 364-12, 370-16, 370-23, 370-25, 370-27, Sections 410-3, 410 B, 410-4, 410-6, 410-8, 410-C, 410-10, 410-11, 410-12, 410-13, 410-14, 410 D, 410-15, 410-16, 410-18, 410-22, 410-23, 410-28, 410-30, 410-35, 410-37, 410-46, 410-65, 410-66, 410-67, 410-71, 410-73, 410-76, 410-77, 410-91, 410-105, Sections 501-9, 502-11, 503-9, 520-63, 525-13, 547-7, 550-11, 551-41, 551-43, 551-53, 551-55, 552-54, 552-56, Sections 604-6, 610-12, 680-4, 680-6, 680-20, 680-21, 680-22, 680-32, 680-51.

Replace "Fixtures" with "Luminaires" in the following Sections:

Sections 210-19, 225-7, 250-4, Sections 300-11, 300-14, 300-15, 300-22, 331-4, 331-11, 333-7, 342-7, 347-2, 347-3, 348-5, 349-10, 350-10, 350-18, 351-8, 351-24, 351-27, 364-12, 370-23, Sections 400-7, 402-10, 410-1, 410-3, 410-4, 410-5, 410-6, 410-7, 410-8, 410-11, 410-15, 410-16, 410-17, 410-18, 410-20, 410-21, 410-22, 410-23, 410-24, 410-30, 410-31, 410G, 410-35, 410-36, 410-37, 410-39, 410-46, 410 M, 410-64, 410-65, 410N, 410-68, 410-70, 410-73, 410-74, 410-76, 410-77, 410-81, 410-104, 424-38, 424-39, 424-41, 424-93, Sections 501-9, 502-11, 503-9, 511-6, 513-5, 517-13, 517-61, 517-63, 520-42, 520-45, 520-61, 520-63, 530-17, 530-18, 530-51, 550-1, 550-2, 550-8, 550-9, 550-12, 550-15, 551-20, 551-53, 551-60, 552-20, 552-54, 552-58, 552-60, Sections 620-21, 670-2, 680-5, 680-6, 680-20, 680-25, 680-41, 680-51, 690-7, Sections 701-11, 701-12.

Replace "Lighting Fixture" with "Luminaire" in the following Sections:

Article 100, Sections 210-52, 220-3, Sections 334-10, 336-18, 370-27, Article 410, Sections 410-16, 410-77, Sections 501-9, 520-2, 530-2, 547-7, 550-9, 551-53, 551-55, 552-41, 552-54, 552-56, Sections 680-4, 680-6, 680-7, 680-20, 680-21, 680-25, 680-32, 680-51.

Replace "Lighting Fixtures" with "Luminaires" in the following Sections:

Article 100, Section 110-26, Sections 210-6, 210-23, 210-24, 220-3, 225-7, 240-2, 240-10, 250-4, 250-112, Sections 331-11, 333-7, 342-7, 349-10, 350-10, 351-24, 351-27, 364-12, 370-23, Sections 400-11, 402-2, 402-10, Article 410, Sections 410-1, 410-14, 410-15, 410-16, 410-30, 410-73, 410-80, 410-100, 411-2, 424-39, 424-93, Sections 500-5, 501-6, 501-9, 502-11, 503-9, 503-12, 517-30, 517-41, 517-61, 520-81, 547-7, 550-9, 551-10, 551-43, 551-53, 552-10, 552-54, Sections 600-3, 680-6, 680-20, 680-24, 680-25, 680-32, 680-41, 680-51, 680-61, 680-62, 680-71, Section 700-9.

SUBSTANTIATION: 1. Lighting standards that have or are being developed, revised and adopted by the U.S., Canada, and Mexico are utilizing the IES term Luminaire in lieu of the term fixture. This includes the new UL/CSA BI-NATIONAL luminaire standard, which will ultimately replace the UL 1570, 1571, and 1572 standards. (These are the very standards used to evaluate the lighting products required to be Listed and Approved, according to the NEC and verified by the Authorities Having Jurisdiction).

2. The Canadian Electrical Code has used the luminaire term for the last ten years.

3. The Tri-NATIONAL lighting standard currently being developed will be designated as a luminaire standard.

4. The National Electrical Manufacturers Association has recently retitled its "Lighting Fixture Section, to Luminaire Section".

5. The U.S. National Committee's Technical Advisory Group to the IEC is working on exporting U.S. lighting perspectives into luminaire (IEC) standards.

6. There are initiatives underway by both NEMA and the NFPA to promote and solidify the use of the NEC from a global perspective. The NEC and its IEC counterpart, IEC 60364, have recently undergone an equivalency review conducted by UL, NFPA, IAEC, NIST, and NEMA as part of this global strategy.

7. If the NEC is ever to be considered as an International Standard, it must utilize the proper terminology.

8. The FPN under 410-1 denotes that luminaire is an international term. International does not mean European only, international, includes the U.S.

9. The term fixture, is archaic and a misnomer. The term fixture has many meanings and connotations. A fixture could refer to a building part, any type or number of gas, plumbing, machine, electric or appliance components, a familiar element or feature or even an individual that has been in a position for a long time. The term luminaire however, by its very formulation, communicates its meaning in a more clear and succinct manner, reducing the possibility of misunderstanding or misapplication of the term.

PANEL ACTION: Accept in Principle in Part.

In Article 424, replace the terms "fixture", "fixtures", "lighting fixture", and "lighting fixtures" with "luminaire" or "luminaires", as appropriate, in the locations noted. Also, for each occurrence of these terms, include the former term in parentheses after the word "luminaire(s)".

E.G. "luminaire (lighting fixture)".

In 424-38(C): 1 place

In 424-39: 2 places

In 424-41(J): 1 place

In 424-93(A)(3): 2 places

In Proposal 20-30a, the rewrite of Article 680, replace the terms "fixture", "fixtures", "lighting fixture", and "lighting fixtures" with "luminaire" or "luminaires", as appropriate, in the locations noted in the following table. Also, for each occurrence of these terms, include the former term in parentheses after the word "luminaire(s)".

E.G. "luminaire (lighting fixture)"

PANEL STATEMENT: The panel accepts this change to "luminaire(s)" on the condition that panels 1 and 18 also accept this change. This requires a definition acceptable to Panel 1 to be added to Article 100. These changes need to be incorporated into Article 424 and into the rewrite of Article 680 in Panel Proposal 20-30a.

RECOMMENDATION:

Article 80 - Administration and Enforcement

(*This article is informative unless specifically adopted by the local jurisdiction adopting the National Electrical Code. See Section 80-5.***)**

80-1 Scope. The following functions shall be covered:
(1) The inspection of electrical installations as covered by Section 90-2
(2) The investigation of fires caused by electrical installations
(3) The review of construction plans, drawings, and specifications for electrical systems
(4) The design, alteration, modification, construction, maintenance, and testing of electrical systems and equipment
(5) The regulation and control of electrical installations at special events including but not limited to exhibits, trade shows, amusement parks, and other similar special occupancies.

80-2 Definitions.
Authority Having Jurisdiction. The organization, office, or individual responsible for approving equipment, an installation, or procedure.
FPN: See 80-13(a) for use of this term.
Electrical Inspector. An individual meeting the requirements of 80-27 and authorized to perform electrical inspections.
Chief Electrical Inspector. An electrical inspector who is either the authority having jurisdiction or is designated by the authority having jurisdiction and is responsible for administering the requirements of this Code.
80-3 Purpose. The purpose of this article shall be to provide requirements for administration and enforcement of the National Electrical Code.
80-5 Adoption. Article 80 shall not apply unless specifically adopted by the local jurisdiction adopting the National Electrical Code.
80-7 Title. The title of this Code shall be NFPA 70, National Electrical Code®, of the National Fire Protection Association. The short title of this Code shall be the NEC®.
80-9 Application.
(a) New Installations. This Code applies to new installations. Buildings with construction permits dated after the adoption of this shall comply with the requirements of this Code.
(b) Existing Installations. Existing electrical installations that do not comply with the provisions of this Code shall be permitted to be continued in use unless the authority having jurisdiction determines that the lack of conformity with this Code presents an imminent danger to occupants. Where changes are required for correction of hazards, a reasonable amount of time shall be given for compliance, depending on the degree of the hazard.

(c) Additions, Alterations, or Repairs. Additions, alterations, or repairs to any building, structure, or premises shall conform to that required of a new building without requiring the existing building to comply with all the requirements of this Code. Additions, alterations, installations, or repairs shall not cause an existing building to become unsafe or adversely affect the performance of the building as determined by the authority having jurisdiction. Electrical wiring added to an existing service, feeder, or branch circuit shall not result in an installation that violates the provisions of the Code in force at the time the additions are made.

80-11 Occupancy of Building or Structure.

(a) New Construction. No newly constructed building shall be occupied in whole or in part in violation of the provisions of this Code.

(b) Existing Buildings. Existing buildings that are occupied at the time of adoption of this Code shall be permitted to remain in use provided:

(1) The occupancy classification remains unchanged, and
(2) There exists no condition deemed hazardous to life or property that would constitute an imminent danger

80-13 Authority. Where used in this Article, the term authority having jurisdiction shall include the chief electrical inspector or other individuals designated by the governing body. This Code shall be administered and enforced by the authority having jurisdiction designated by the governing authority as follows:

(a) The authority having jurisdiction shall be permitted to render interpretations of this Code in order to provide clarification to its requirements, as permitted by Section 90-4.

(b) When the use of any electrical equipment or its installations shall be found to be dangerous to human life or property, the authority having jurisdiction is hereby empowered to have the premises disconnected from its source of electric supply, as established by the Board. When such equipment or installation has been so condemned and/or disconnected, a notice shall be placed thereon listing the causes for the condemnation or disconnection or both and the penalty under 80-23 for the unlawful use thereof, and written notice of such condemnation and/or disconnection and the causes therefore shall be given within 24 hours to the owners and/or the occupant of such building, structure, or premises. It shall be unlawful for any person to remove the said notice and/or reconnect the electric equipment to its source of electric supply, and/or to use or permit to be used electric power in any such electric equipment until such causes for the condemnation and/or disconnection have been remedied to the satisfaction of the inspection authorities.

(c) The authority having jurisdiction shall be permitted to delegate to other qualified individuals such powers as necessary for the proper administration and enforcement of this Code.

(d) Police, fire, and other enforcement agencies shall have authority to render necessary assistance in the enforcement of this Code when requested to do so by the authority having jurisdiction.

(e) The authority having jurisdiction shall be authorized to inspect, at all reasonable times, any building or premises for dangerous or hazardous conditions or equipment as set forth in this Code . The authority having jurisdiction shall be permitted to order any person(s) to remove or remedy such dangerous or hazardous condition or equipment. Any person(s) failing to comply with such order shall be in violation of this Code.

(f) Where the authority having jurisdiction deems that conditions hazardous to life and property exist, the authority having jurisdiction shall be permitted to require such hazardous conditions that are in violation of this Code to be corrected.

(g) To the full extent permitted by law, any authority having jurisdiction engaged in inspection work shall be authorized at all reasonable times to enter and examine any building, structure, or premises for the purpose of making electrical inspections. Before entering a premises, the authority having jurisdiction shall obtain the consent of the occupant thereof or obtain a court warrant authorizing entry for the purpose of inspection except in those instances where an emergency exists. As used in this section, "emergency" means circumstances that the authority having jurisdiction knows, or has reason to believe, exist and that reasonably can constitute immediate danger to life and property.

(h) Persons authorized to enter and inspect buildings, structures, and premises as herein set forth shall be identified by proper credentials issued by this governing authority.

(i) Persons shall not interfere with an authority having jurisdiction carrying out any duties or functions prescribed by this Code.

(j) Persons shall not use a badge, uniform, or other credentials to impersonate the authority having jurisdiction.

(k) The authority having jurisdiction shall be permitted to investigate the cause, origin, and circumstances of any fire, explosion, or other hazardous condition.

(l) The authority having jurisdiction shall be permitted to require plans and specifications to ensure compliance with this Code.

(m) Whenever any installation subject to inspection prior to use is covered or concealed without having first been inspected, the authority having jurisdiction shall be permitted to require that such work be exposed for inspection. The authority having jurisdiction shall be notified when the installation is ready for inspection and shall conduct the inspection within ___ days.

(n) The authority having jurisdiction shall be permitted to order the immediate evacuation of any occupied building deemed unsafe when such building has hazardous conditions that present imminent danger to building occupants.

(o) The authority having jurisdiction shall be permitted to waive specific requirements in this Code or permit alternate methods where it is assured that equivalent objectives can be achieved by establishing and maintaining effective safety. Technical documentation shall be submitted to the authority having jurisdiction to demonstrate equivalency and the system, method, or device is approved for the intended purpose.

(p) Each application for a waiver of a specific electrical requirement shall be filed with the authority having jurisdiction and shall be accompanied by such evidence, letters, statements, results of tests, or other supporting information as required to justify the request. The authority having jurisdiction shall keep a record of actions on such applications, and a signed copy of the authority having jurisdiction's decision shall be provided for the applicant.

80-15 Electrical Board.

(a) Creation of the Electrical Board. There is hereby created the Electrical Board of the _____ of _____ hereinafter designated as the Board.

(b) Appointments. Board members shall be appointed by the Governor with the advice and consent of the Senate (or by the Mayor with the advice and consent of the Council, or the equivalent).

(1) Members of the Board shall be chosen in a manner to reflect a balanced representation of individuals or organizations. The Chair of the Board shall be elected by the Board membership.

(2) The Chief Electrical Inspector in the jurisdiction adopting this Article authorized in 80-15(b)(3(a) shall be the nonvoting secretary of the Board. Where the Chief Electrical Inspector of a local municipality serves a Board at a state level, he or she shall be permitted to serve as a voting member of the Board.

(3) The board shall consist of not fewer than five voting members. Board members shall be selected from the following:

(a) Chief Electrical Inspector from a local government (for State Board only)
(b) An electrical contractor operating in the jurisdiction
(c) A licensed professional engineer engaged primarily in the design or maintenance of electrical installations
(d) A journeyman electrician

(4) Additional membership shall be selected from the:

(a) A master (supervising) electrician
(b) The Fire Marshal (or Fire Chief).
(c) A representative of the property/casualty insurance industry.
(d) A representative of an electric power utility operating in the jurisdiction.
(e) A representative of electrical manufacturers primarily and actively engaged in producing materials, fittings, devices, appliances, fixtures, or apparatus used as part of or in connection with electrical installations.
(f) A member of the labor organization that represents the primary electrical workforce.
(g) A member from the public who is not affiliated with any other designated group.

(c) Terms. Of the members first appointed, _____ shall be appointed for a term of 1 year, _____ for a term of 2 years, _____ for a term of 3 years, and _____ for a term of 4 years, and thereafter each appointment shall be for a term of 4 years or until a successor is appointed. The Chair of the Board shall appointed for a term not to exceed ____ years.

(d) Compensation. Each appointed member shall receive the sum of _____dollars ($_____) for each day during which the member attends a meeting of the Board and, in addition thereto, shall be reimbursed for direct lodging, travel and meal expenses as covered by policies and procedures established by the jurisdiction.

(e) Quorum. A quorum as established by the Board operating procedures shall be required to conduct Board business. The Board shall hold such meetings as necessary to carry out the purposes of Article 80. The Chair or a majority of the members of the Board shall have the authority to call meetings of the Board.

(f) Duties. It shall be the duty of the Board to:
(1) Adopt the necessary rules and regulations to administer and enforce Article 80.
(2) Establish qualifications of electrical inspectors.
(3) To revoke or suspend the recognition of any inspector's certificate for the jurisdiction.
(4) After advance notice of the public hearings and the execution of such hearings, as established by law, the Board is authorized to establish and update the provisions for the safety of electrical installations to conform with the current edition of the National Electrical Code (NFPA 70) and other nationally recognized safety standards for electrical installations, and;
(5) Establish procedures for recognition of electrical safety standards and acceptance of equipment conforming to these standards.

(g) Appeals.
(1) Review of Decisions. Any person, firm or corporation may register an appeal with the Board for a review of any decision of the Chief Electrical Inspector or of any Electrical Inspector, provided that such appeal is made in writing within fifteen (15) days after such person, firm or corporation shall have been notified. Upon receipt of such appeal, said Board shall, if requested by the person making the appeal, hold a public hearing and proceed to determine whether the action of the Board, or the Chief Electrical Inspector or of the Electrical Inspector complies with this law and, within fifteen (15) days after receipt of the appeal or after holding the hearing shall make a decision in accordance with its findings.
(2) Conditions. Any person shall be permitted to appeal a decision of the authority having jurisdiction to the Board when it is claimed that any one or more of the following conditions exist:
(a) The true intent of the codes or ordinances described in this Code has been incorrectly interpreted
(b) The provisions of the codes or ordinances do not fully apply
(c) A decision is unreasonable or arbitrary as it applies to alternatives or new materials
(3) Submission of Appeals. An appeal shall be submitted to the authority having jurisdiction in writing within 15 calendar days of notification of violation outlining the Code provision from which relief is sought and the remedy proposed.

(h) Meetings and Records. Meetings and records of the Board shall conform to the following:
(1) Meetings of the Board shall be open to the public as required by law.
(2) Records of meetings of the Board shall be available for review during normal business hours, as required by law.

80-17 Records and Reports. The authority having jurisdiction shall retain records as follows:

(a) Retention. The authority having jurisdiction shall keep a record of all electrical inspections, including the date of such inspections and a summary of any violations found to exist, the date of the services of notices, and a record of the final disposition of all violations. All required records shall be maintained until their usefulness has been served or as otherwise required by law.

(b) Availability. A record of examinations, approvals, and variances granted shall be maintained by the authority having jurisdiction and shall be available for public review as prescribed by law during normal business hours.

80-19 Permits and Approvals. Permits and approvals shall conform to the following:

(a) Application.

(1) Activity authorized by a permit issued under this Code shall be conducted by the permittee or the permittee's agents or employees in compliance with all requirements of this Code applicable thereto and in accordance with the approved plans and specifications. No permit issued under this Code shall be interpreted to justify a violation of any provision of this Code or any other applicable law or regulation. Any addition or alteration of approved plans or specifications shall be approved in advance by the authority having jurisdiction, as evidenced by the issuance of a new or amended permit.

(2) A copy of the permit shall be posted or otherwise readily accessible at each work site or carried by the permit holder as specified by the authority having jurisdiction.

(b) Content. Permits shall be issued by the authority having jurisdiction and shall bear the name and signature of the authority having jurisdiction or that of the authority having jurisdiction's designated representative. In addition, the permit shall indicate:
(1) Operation or activities for which the permit is issued.
(2) Address or location where the operation or activity is to be conducted
(3) Name and address of the permittee
(4) Permit number and date of issuance
(5) Period of validity of the permit
(6) Inspection requirements

(c) Issuance of Permits. The authority having jurisdiction shall be authorized to establish and issue permits, certificates, notices, and approvals, or orders pertaining to electrical safety hazards pursuant to 80-23, except that no permit will be required to execute any of the classes of electrical work specified in the following:
(1) Installation or replacement of equipment such as lamps, and electric utilization equipment approved for connection to suitable permanently installed receptacles. Replacement of flush or snap switches, fuses, lamp sockets and receptacles, and other minor maintenance and repair work, such as replacing worn cords and tightening connections on a wiring device.
(2) The process of manufacturing, testing, servicing, or repairing of electric equipment or apparatus.

(d) Annual Permits. In lieu of an individual permit for each installation or alteration, an annual permit shall, upon application, therefore, be issued to any person, firm or corporation regularly employing one or more employees for the installation, alteration, and maintenance of electric equipment in or on buildings or premises owned or occupied by the applicant for the permit. Upon application, an electrical contractor as agent for the owner or tenant shall be issued an annual permit. The applicant shall keep records of all work done and such records shall be transmitted periodically to the Electrical Inspector.

(e) Fees. Any political subdivision which has been provided for electrical inspection in accordance with the provisions of Article 80 may establish fees which shall be paid by the applicant for a permit before the permit is issued.

(f) Inspection and Approvals.
(1) Upon the completion of any installation of electrical equipment which has been made under a permit other than an annual permit, it shall be the duty of the person, firm or corporation making the installation to notify the Electrical Inspector having jurisdiction, who shall inspect the work within a reasonable time.
(2) Where the Inspector finds the installation to be in conformity with the statutes of all applicable local ordinances, and all rules and regulations, the Inspector shall issue to the person, firm or corporation making the installation a certificate of approval, with duplicate copy for delivery to the owner, authorizing the connection to the supply of electricity and shall send written notice of such authorization to the supplier of electric service. When a certificate of temporary approval is issued authorizing the connection of an installation, such certificates shall be issued to expire at a time to be stated therein and shall be revocable by the Electrical Inspector for cause.
(3) When any portion of the electrical installation within the jurisdiction of an Electrical Inspector is to be hidden from view by the permanent placement of parts of the building, the person, firm or corporation installing the equipment shall notify the Electrical Inspector, and such equipment shall not be concealed until it has been approved by the Electrical Inspector or until _____ days have elapsed from the time of such notification; provided that on large installations, where the concealment of equipment proceeds continuously, the person, firm or corporation installing the equipment shall give the Electrical

Inspector due notice in advance, and inspections shall be made periodically during the progress of the work.

(4) At regular intervals, the Electrical Inspector having jurisdiction shall visit all buildings and premises where work may be done under annual permits and shall inspect all electric equipment installed under such permits since the date of the previous inspection. The Electrical Inspector shall issue a certificate of approval for such work as is found to be in conformity with the provisions of Article 80 and all applicable ordinances, orders, rules and regulations, after payments of all required fees.

(5) If, upon inspection, any installation is found not be fully in conformity with the provisions of Article 80, and all applicable ordinances, rules and regulations, the Inspector making the inspection shall at once forward to the person, firm or corporation making the installation a written notice stating the defects which have been found to exist.

Revocation of Permits. Revocation of permits shall conform to the following:

(1) The authority having jurisdiction shall be permitted to revoke a permit or approval issued if any violation of this Code is found upon inspection or in case there have been any false statements or misrepresentations submitted in the application or plans on which the permit or approval was based.

(2) Any attempt to defraud or otherwise deliberately or knowingly design, install, service, maintain, operate, sell, represent for sale, falsify records, reports, or applications, or other related activity in violation of the requirements prescribed by this Code shall be a violation of this Code. Such violations shall be cause for immediate suspension or revocation of any related licenses, certificates, or permits issued by this jurisdiction. In addition, any such violation shall be subject to any other criminal or civil penalties as available by the laws of this jurisdiction.

(3) Revocation shall be constituted when the permittee is duly notified by the authority having jurisdiction.

(4) Any person who engages in any business, operation, or occupation, or uses any premises, after the permit issued therefore has been suspended or revoked pursuant to the provisions of this Code, and before such suspended permit has been reinstated or a new permit issued, shall be in violation of this Code.

(5) A permit shall be predicated upon compliance with the requirements of this Code and shall constitute written authority issued by the authority having jurisdiction to install electrical equipment. Any permit issued under this Code shall not take the place of any other license or permit required by other regulations or laws of this jurisdiction.

(6) The authority having jurisdiction shall be permitted to require an inspection prior to the issuance of a permit.

A permit issued under this Code shall continue until revoked or for the period of time designated on the permit. The permit shall be issued to one person or business only and for the location or purpose described in the permit. Any change that affects any of the conditions of the permit shall require a new or amended permit.

(g) Applications and Extensions. Applications and extensions of permits shall conform to the following:

(1) The authority having jurisdiction shall be permitted to grant an extension of the permit time period upon presentation by the permittee of a satisfactory reason for failure to start or complete the work or activity authorized by the permit.

(2) Applications for permits shall be made to the authority having jurisdiction on forms provided by the jurisdiction and shall include the applicant's answers in full to inquiries set forth on such forms. Applications for permits shall be accompanied by such data as required by the authority having jurisdiction, such as plans and specifications, location, etc. Fees shall be determined as required by local laws.

(3) The authority having jurisdiction shall review all applications submitted and issue permits as required. If an application for a permit is rejected by the authority having jurisdiction, the applicant shall be advised of the reasons for such rejection. Permits for activities requiring evidence of financial responsibility by the jurisdiction shall not be issued unless proof of required financial responsibility is furnished.

80-21 Plans Review. Review of plans and specifications shall conform to the following:

(a) Authority. For new construction, modification, or rehabilitation, the authority having jurisdiction shall be permitted to review construction documents and drawings.

(b) Responsibility of the Applicant. It shall be the responsibility of the applicant to ensure that:

(1) The construction documents include all of the electrical requirements

(2) The construction documents and drawings are correct and in compliance with the applicable codes and standards

(c) Responsibility of the Authority Having Jurisdiction. It shall be the responsibility of the authority having jurisdiction to promulgate rules that cover the following:

(1) Review of construction documents and drawings within established time frames for the purpose of acceptance or providing reasons for non-acceptance

(2) Review and approval by the authority having jurisdiction shall not relieve the applicant of the responsibility of compliance with this Code.

(3) Where field conditions necessitate any substantial change from the approved plan, the authority having jurisdiction shall be permitted to require the corrected plans be submitted for approval.

80-23 Notice of Violations, Penalties. Notice of violations and penalties shall conform to the following:

(a) Violations.

(1) Whenever the authority having jurisdiction determines that there are violations of this Code, a written notice shall be issued to confirm such findings.

(2) Any order or notice issued pursuant to this Code shall be served upon the owner, operator, occupant, or other person responsible for the condition or violation, either by personal service, mail, or by delivering the same to, and leaving it with, some person of responsibility upon the premises. For unattended or abandoned locations, a copy of such order or notice shall be posted on the premises in a conspicuous place at or near the entrance to such premises and the order or notice shall be mailed by registered or certified mail, with return receipt requested, to the last known address of the owner, occupant, or both.

(b) Penalties.

(1) Any person who fails to comply with the provisions of this Code or who fails to carry out an order made pursuant of this Code or violates any condition attached to a permit, approval, or certificate shall be subject to the penalties established by this jurisdiction.

(2) Failure to comply with the time limits of an abatement notice or other corrective notice issued by the authority having jurisdiction shall result in each day that such violation continues being regarded as a new and separate offense.

(3) Any person, firm, or corporation who shall willfully violate any of the applicable provisions of this article shall be guilty of a misdemeanor and, and upon conviction thereof, shall be punished by a fine of not less than _____dollars ($_____) nor more than _____dollars ($_____) for each offense, together with the costs of prosecution and/or imprisonment for not less than_____(_____) days nor more than_____(_____)days.

80-25 Connection to Electricity Supply. Connections to the electric supply shall conform to the following:

(a) Authorization. Except where work is done under an annual permit and except as otherwise provided in 80-25, it shall be unlawful for any person, firm or corporation to make connection to a supply of electricity or to supply electricity to any electric equipment installation for which a permit is required or which has been disconnected or ordered to be disconnected.

(b) Special Consideration. By special permission of the authority having jurisdiction, temporary power shall be permitted to be supplied to the premises for specific needs of the construction project. The Board shall determine what needs are permitted under this provision.

(c) Notification. If, within _____ business days after the Electrical Inspector is notified of the completion of an installation of electric equipment, other than a temporary approval installation, the Electrical Inspector has neither authorized connection nor disapproved the installation, the supplier of electricity is authorized to make connections and supply electricity to such installation.

(d) Other Territories. If an installation or electric equipment is located in any territory where an Electrical Inspector has not been authorized or is not required to make inspections, the supplier of electricity is authorized to make connections and supply electricity to such installations.
(e) Disconnection. Where a connection is made to an installation that has not been inspected, as outlined in the preceding paragraphs of this Section, the supplier of electricity shall immediately report such connection to the Chief Electrical Inspector. If, upon subsequent inspection, it is found that the installation is not in conformity with the provisions of Article 80, the Chief Electrical Inspector shall notify the person, firm, or corporation making the installation to rectify the defects and, if such work is not completed within fifteen (15) business days or a longer period which may be specified by the Board, the Board shall have the authority to cause the disconnection of that portion of the installation that is not in conformity.

80-27 Inspector's Qualifications.
(a) Certificate. All electrical inspectors shall be certified by a nationally recognized inspector certification program accepted by the Board. The certification program shall specifically qualify the inspector in electrical inspections. No person shall be employed as an Electrical Inspector unless that person is the holder of an Electrical Inspector's certificate of qualification issued by the Board, except that any person who on the date on which this law went into effect was serving as a legally appointed Electrical Inspector of _____ shall, upon application and payment of the prescribed fee and without examination, be issued a special certificate permitting him or her to continue to serve as an Electrical Inspector in the same territory.
(b) Experience. Electrical inspector applicants shall:
(1) have a demonstrated knowledge of the standard materials and methods used in the installation of electric equipment, and
(2) be well versed in the approved methods of construction for safety to persons and property, and
(3) be well versed in the statues of _____ relating to electrical work and the National Electrical Code, as approved by the American National Standards Institute, and
(4) have had at least ____ years experience as an Electrical Inspector or ____ years in the installation of electrical equipment. In lieu of such experience, the applicant shall be a graduate in electrical engineering, or of a similar curriculum of a college or university considered by the Board as having suitable requirements for graduation and shall have had two ____ years practical electrical experience.
(c) Re-certification. Electrical inspectors shall be re-certified as established by provisions of the applicable certification program.
(d) Revocation and Suspension of Authority. The Board shall have the authority to revoke an inspector's authority to conduct inspections within a jurisdiction.

80-29 Liability for Damages. Article 80 shall be construed to affect the responsibility or liability of any party owning, operating, controlling, or installing any electric equipment for damages to persons or property caused by an defect therein, not shall the _____ nor any of its employees be held as assuming any such liability by reason of the inspection, re-inspection, or other examination authorized.

80-31 Validity. If any section, subsection, sentence, clause, or phrase of Article 80 is for any reason held to be unconstitutional, such decision shall not affect the validity of the remaining portions of Article 80.

80-33 Repeal of Conflicting Acts. All Acts or parts of Acts in conflict with the provisions of Article 80 are hereby repealed.

80-35 Effective Date. Article 80 shall take effect_____(_____) days after its passage and publication.

SUBSTANTIATION: This proposed material was developed to provide a standardized set of administrative rules for use with the National Electrical Code® (NEC®). Standardized administrative rules will allow for more consistent adoption, use, and enforcement of the NEC®. Additionally, the proposed requirements develop requirements for establishment of electrical board and qualification requirements for inspection officials. This new article replaces NFPA 70L, Administrative Rules, and consolidates the requirements of NFPA 70L with the NEC®. NFPA 70L was a separate document and has been out of print since 1987. It should be noted that Article 80 would only be part of the NEC® if specifically adopted by the adopting jurisdiction.

The NEC® Task Group on Administrative Rules developed this proposal.

ARTICLE 90 — INTRODUCTION

(Log #2105)

1- 4 - (90-1(a), FPN (New)): Reject
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Add a Fine Print Note at the end of Article 90-1(a) as follows:
FPN: For more information on electrical safety, consult NFPA 70E, 1995 edition, Electrical Safety Requirements for Employee Workplaces.
SUBSTANTIATION: This Fine Print Note would aid individuals and companies that use the NEC in finding additional printed information on safety.
PANEL ACTION: Reject.
PANEL STATEMENT: This section explains the purpose of the NEC. Adding a reference to another standard does not help in explaining the purpose of the NEC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
PRICHARD: The NEC addresses electrical installations. A FPN referencing NFPA 70E is needed to inform users where to look for electrical safety requirements for employee workplaces.

(Log #2867)

1- 5 - (90-1(c)): Accept
SUBMITTER: J. F. Cox, Wylie, TX
RECOMMENDATION: Delete the wording:
~~(c) Intention. This Code is not intended as a design specification nor an instruction manual for untrained persons.~~
SUBSTANTIATION: Section 90-1(a) describes the purpose of the National Electrical Code. There is no need to identify what it not intended to accomplish. There have been occasions where the wording in Section 90-1(c) has been used to oppose the addition of Code rules because they included requirements involving design criteria even though the objective of those rules was safety. Many rules are included in the Code that are design in nature but still fall within the "practical safeguarding of persons and property from hazards arising from the use of electricity." It is also unnecessary to state that the Code is not intended as "an instruction manual for untrained persons". Section 90-1(c) is not necessary for the proper interpretation and application of the NEC.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
DINI: I agree with Mr. Minick's Comment on Negative Vote. No technical substantiation was submitted to remove the wording that clarifies the NEC is not an instructional manual for untrained persons. Many Code-Making Panels depend on this second declaration in 90-1(c) to make it clear that the many technical terms and technical requirements incorporated into the Code's language are not directed at persons not trained in the ability to understand such language and provisions. This proposal should be rejected.
MINICK: This historic Code section declaration provides clarity involving those persons attempting to use the rules of the National Electrical Code and should be retained. The clarity provided for users of the Code in this section far outweigh any negative ramifications involving misdirected opposition to any specific proposal. This clarifying statement can be traced back to the 1937 NEC when the wording stated, "The Code is to be regarded neither as a design specification nor as an instruction manual for untrained persons". Proposal 1-5 is merely an alternative approach concerning a desire by the submitter to mirror a similar ill-advised proposal

from the same base source in the 1999 NEC revision cycle. The present wording provides all Code-Making Panels with a much needed and desired reference in dealing with design proposals to the NEC. There is no technical substantiation to try and foster the concept that design requirements should be generally incorporated into the Code merely because it is stated by some that the Code currently contains many design related requirements. While it continues that there are numerous installations, which may require something, more than the minimum requirements of the NEC, it also continues to be the designer, not the NEC, who must determine if additional provisions are necessary for a safe installation.

Also, no technical substantiation was submitted to remove the wording that clarifies the NEC is not an instruction manual for untrained persons. All NEC Code-Making Panels depend on this second declaration in 90-1(c) to make clear that the many technical terms and technical requirements incorporated into the Code's language are not directed at persons not trained in the ability to understand such language and provisions. If this deletion moves forward, does the electrical industry now believe that anyone with any level of electrical ability should be able to install electrical materials in a safe and workmanlike manner using the NEC? It is hoped that is not the case as the requirements that have been developed over the many years of the NEC editions have clearly depended on skilled installers to properly apply the requirements that have been developed. This proposal should be rejected.

PARKS: I fully agree with Mr. Minick's Comment on Negative Vote.

(Log #1)

1- 6 - (90-1(d) (New)): Accept

NOTE: This Proposal originates from Tentative Interim Amendment 99-1 issued by the Standards Council on January 14, 1999.

SUBMITTER: Paul Duks, Underwriters Laboratories Inc.

RECOMMENDATION: Add a new 90-1(d) and Fine Print Note (FPN) to read as follows:

(d) Relation to International Standards. The requirements in this Code address the fundamental principles of protection for safety contained in International Standard "Electrical Installations of Buildings, IEC 60364-1, Section 131.

FPN: IEC 60364-1, Section 131 contains fundamental principles of protection for safety that encompass: protection against electric shock, protection against thermal effects, protection against overcurrent, protection against fault currents, and protection against overvoltage. All of the above potential hazards are addressed by the requirements in this Code.

SUBSTANTIATION: The National Electrical Code has been adopted and used in a number of countries of the world for some time, Yet suitability of the Code for use internationally is not evident from the document itself. Addition of Section 90-1(d) on relation of the Code to international standards would provide confirmation that the fundamental principles of protection for safety, as published by the International Electrotechnical Commission (IEC), are addressed in the NEC, and therefore, would enhance the adoption of the Code with or without local amendments in countries which do not have established rules for electrical installations.

The potential hazards which the fundamental principles of protection for safety cover are contained in the NEC as follows:

General - Sec. 90-1(a) Purpose; Sec. 110-3 Examination, Identification, Installation, and Use of Equipment.

Protection Against Electric Shock - Sec. 110-17(a) Live Parts Guarded Against Accidental Contact; Sec. 110-34 Workspace and Guarding; Art. 430, Part K Protection of Live Parts (motor installations); Sec. 725-2 Class 2 Circuits.

Protection Against thermal Effects - Sec. 110-18 Arcing Parts; Sec. 410-5 Fixtures Near Combustible Material; Sec. 384-7 Location Relative to Easily Ignitable Material.

Protection Against Overcurrent - Art. 240 Overcurrent protection.

Protection Against Fault Currents - Sec. 250-51 Effect Grounding Path; Art. 240 Overcurrent Protection; Art. 430, Parts D & E Motor Feeder and Branch Circuit Short-Circuit and Ground Fault Protection.

Protection Against Overvoltage -

Fault between circuits: Sec. 300-3(c) Conductors of Different Systems; Sec. 725-54 Installation of Conductors and Equipment (Class 2 Circuits).

Due to atmospheric phenomena or switching: Art. 280 Surge Arresters; Art. 800, Part C Protection (Communications Circuits); Product Standards.

Emergency Nature: It is noted that significant efforts are being made in many areas of the world to promote IEC and ISO (International Organization on Standardization) standards. The NEC is an essential part of the US Safety System, and its future can be enhanced by the Code gaining more international acceptance. It is necessary that the proposed statement be incorporated into the NEC at the earliest possible time to be in synchronism with the present efforts being made by the National Fire Protection Assn. in promotion of NFPA standards internationally. The proposed TIA does not contain any technical changes.

PANEL ACTION: Accept.

(Log #1496)

1- 7 - (90-1(d) (New)): Accept

SUBMITTER: Paul Duks, Buffalo Grove, IL

RECOMMENDATION: Add underlined words:

(d) Relation to International Standards. The requirements in this Code address the fundamental principles of protection for safety contained in International <u>Electrotechnical Commission</u> Standard "Electrical Installations of Buildings," IEC 60364-1, Section 131.

FPN unchanged.

SUBSTANTIATION: The organization responsible for the referenced standard needs to be identified.

PANEL ACTION: Accept.

The Panel modifies the text accepted in proposal 1-6 in accordance with this recommendation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #1674)

1- 8 - (90-1(d) (New)): Reject

SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions

RECOMMENDATION: Add Section 90-1(d) as follows:

90-1(d) Retroactivity. Unless otherwise noted, provisions of the current edition of this code shall not apply to existing facilities, equipment, structures, or installations that have been previously approved as complying with earlier editions of this code unless the authority having jurisdiction has determined that the existing facilities, equipment, structures, or installations involve a distinct hazard to persons or property. Existing facilities, equipment, structures, or installations shall be those in place prior to the adoption of this edition of the Code by the authority having jurisdiction. This code edition shall apply to additions or modifications to portions of existing facilities, equipment, structures, or installations that are performed subsequent to its adoption by the authority having jurisdiction.

SUBSTANTIATION: The code currently contains no statement regarding its retroactivity, leaving the interpretation of this important matter to users and enforcers of the code. This has led to confusion regarding the application of new requirements, nonuniform enforcement by authorities having jurisdiction, and local unauthorized interpretations regarding retroactivity.

This proposal attempts to provide guidance to both users and enforcers of the code regarding its application in situations where existing facilities, equipment, structures, or installations are being modified, but much of the existing installation remains untouched. It also provides the authority having jurisdiction the opportunity, where safety is a concern, to require upgrading of the entire installation. Finally, it provides clear direction that the newly added or modified facilities, equipment, structures, or installations must meet the current edition of the code subsequent to its adoption by the authority having jurisdiction.

PANEL ACTION: Reject.

PANEL STATEMENT: Section 90-1(a) identifies the purpose of the code as the practical safeguarding of persons and properties arising from the use of electricity and Section 90-4 states that it is intended to be suitable for mandatory application. Adopting jurisdictions should be the ones that make the determination as to the retroactivity of code rules. The NEC can not usurp the authority of the local jurisdiction in adopting ordinances.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias
COMMENT ON AFFIRMATIVE:
ANTHONY: This is a good proposal and strikes resonance with design professionals who often face tough choices when building new systems upon old, operationally inadequate, and unsafe systems. I will only add that the Panel Statement on this proposal might have referred the submitter to Article 80 included in Proposal 1-3 (Log #1768). Section 80-9 of that article contains some language on the subject of how the Authority Having Jurisdiction should handle hazards in existing installations.
PARKS: The panel statement failed to deal with the submitter's real problem that local inspectors are usurping their own jurisdiction's authority by requiring retrofit of existing electrical installations. This appears to be the reason that the new Article 80 includes a nonretroactivity clause which will clarify the Authority Having Jurisdiction's intent to its inspectors. While the panel is correct that the NEC cannot usurp the authority of local jurisdictions, it could clarify the NEC intent, which obviously is not to make new code provisions retroactive.

(Log #51)

1- 9 - (90-2): Accept in Principle
NOTE: The following proposal consists of Comment 1-18 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-13 was:
Add:
(6) Installations of conductors and equipment for lighting, installed by the electric utility for use by others in or on public or private buildings or other structures; along public highways, streets, roads, etc.; or outdoors on private property.
SUBMITTER: Albert L. Washington, H.B Frazer
RECOMMENDATION: The Panel should accept this proposal as revised:
(6) The installation of equipment and conductors by utilities on public or private buildings, including outdoors.
SUBSTANTIATION: Electrical installations by electric utilities on private property must fall under the rule of the NEC. This must be enforced to maintain "The safeguarding of persons and property." Anytime electrical installation is done in the private market, it must be done in accordance with NFPA 70.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. The panel does not necessarily agree with the submitter's substantiation.

(Log #52)

1- 10 - (90-2): Accept in Principle
NOTE: The following proposal consists of Comment 1-18a on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].
SUBMITTER: CMP 1
RECOMMENDATION: The panel chooses to make the following changes to Section 90-2 of the 1996 NEC:
Revise the wording in existing Section 90-2(a)(1) to read as follows:
(1) Installations of electric conductors and equipment within or on public and private buildings or other structures, including mobile homes, recreational vehicles, and floating buildings; and other premises such as yards, carnivals, commercial and private parking, and other lots, and industrial substations."
Revise existing Section 90-2(b)(5) to read as follows:
(5) Installations, including associated lighting, under the exclusive control and use of electric utilities, for the purpose of communications, metering, generation, control, transformation, transmission, or distribution of electric energy. Such installations shall be located in buildings used exclusively for such purposes; outdoors on property owned or leased by the utility, on or along public highways, streets, roadways, etc.; or outdoors on private property by easements or other established rights."
Add a new Item (6) to Section 90-2(b) to read as follows:
(6) Installations under the exclusive control of electric utilities for lighting along public highways, streets, roadways, etc."
SUBSTANTIATION: To clarify the intent of the applicability of the Code and to meet the intent of numerous public comments dealing with this issue.
PANEL ACTION: Accept in Principle.
1.) Revise 90-2(a) to read as follows:
90-2(a) Covered. This Code covers the installation of electric conductors, electric equipment, signaling and communications conductors and equipment, and fiber optic cables and raceways for the following:
1. Public and private premises including buildings, structures, mobile homes, recreational vehicles, and floating buildings.
2. Yards, lots, parking lots, carnivals, and industrial substations.
3. Installations of conductors and equipment that connect to the supply of electricity.
4. Installations used by the electric utility, such as office buildings, warehouses, garages, machine shops, and recreational buildings, that are not an integral part of a generating plant, substation, or control center.
The existing FPN to remain as is.
2.) Revise 90-2(b)(5) to read as follows:
90-2(b)(5) Installations under the exclusive control of an electric utility where such installations consist of wiring for service drops or laterals or are located in legally established easements, right-of-ways, or on property owned or leased by the electric utility for the purpose of communications, metering, generation, control, transformation, transmission, or distribution of electric energy.
PANEL STATEMENT: 1.) This proposal is the result of the Technical Correlating Committee reporting as "hold" proposal number 1-13 and comment number 1-18a from the 1999 NEC cycle.
2.) Section 90-2(a) is editorially revised to add clarity by grouping similar types of installations together.
3.) The revised wording of Section 90-2(b)(5) is an effort to simplify the provisions regarding the types of installations not covered by the NEC and to retain the original meaning. Section 90-2 has addressed the issues that have caused much disagreement over the past several years. Section 90-2(a) has clearly included wiring in parking lots for decades. Older versions of the Code simply refer to those areas not covered as installations or equipment employed by a electric utility "in the exercise of its function as a utility..."
When the wording was revised to specifically identify the types of installations as being for the purpose of communications, metering, generation, control, transformation, transmission, or distribution of electric energy, it reflected the types of installations considered necessary for a electric utility to exercise its function as a utility. This type of coverage identifies aspects of utility functions from the generation of power to the delivery to the customer. Only those types of installations are not covered by the Code. End-use installations, such as building wiring, area lighting, parking lot lighting, irrigation pumps, etc., are covered by the NEC and are not excluded by this Section.
Equipment mounted on or included as part of the types of installations listed in this Section are not covered by the NEC. This includes lighting equipment installed on utility installations, such as poles supporting transmission or distribution lines.
It is recognized that some Public Service Commissions, Utility Commissions, or other state and local jurisdictions may adopt rules or standards covering electric utilities regarding street lighting, area lighting, or other types of installations that differ from those contained in the NEC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
TROGLIA: The Panel Statement refers to older versions of the code in which installations of equipment employed by an electric utility "in the exercise of its function as a utility": were referred to as not covered. Street and area lighting installations are considered by most utility regulatory bodies as utility functions under their jurisdiction. This remains as true today as it has for the last century. When many utilities first started out, their "only" business was street and area lighting. Most utilities have been in the outdoor lighting business longer than any of the contractors working in their service areas. To say that outdoor area lighting installations are not recognized as an "exercise of its function as a utility" may make sense to anyone who doesn't want utilities to be in the business, but it certainly doesn't make sense to those of us who work for utilities and have been installing outdoor area lights for our entire working careers. There is absolutely no historical basis for mistakenly assuming that "installing outdoor area lighting" is not a recognized

utility function! It was 100 years ago, it is now, and it probably will still be 100 years from now. We recognize it, our utility regulatory commissions recognize it, and our customers recognize it. The only ones who don't recognize this as a legitimate utility business function are those who would gain financially if we were forced out of the business. With the acceptance of this proposed text, jurisdictions adopting the NEC will be in conflict with the jurisdictions regulating utilities under the NESC. This conflict will have to be resolved in each and every jurisdiction adopting the 2002 NEC. This does not facilitate the objective of developing a code that is uniformly and readily adoptable by the jurisdictions without change.

I believe that the objective of clarifying the scope of the NEC and facilitating its uniform and ready adoption without change is best met by accepting the concepts presented in Proposal 1-11 (Log #4151). That proposal establishes the "service point" as the demarcation between "premises wiring" covered by the NEC, and supply system wiring covered by the NESC. The terms "Service Point" and "Premises Wiring System" are clearly defined in the NEC and are readily identifiable on any premises. Although the Service Point may be in a different location on different installations, it is still a very clearly identified and defined point of location on every premises. In my opinion, using the NEC approved and accepted definition of the service point is the only way to reconcile the differences between the scopes of the NEC and the NESC. See my comment on vote on Proposal 1-11 (Log #4151).

The Panel should also reconsider their action in revising the text of 90-2(b)(5) for unintended consequences. As revised, the NEC would cover utility revenue metering unless it is on utility owned or leased property or in legally established easements or rights-of-way. The NEC has never covered utility metering, under their exclusive control regardless of its location. This can be corrected by revising the proposed text as follows:

90-2(b)(5) Installations under exclusive control of an electric utility where such installations consist of wiring for service drops, laterals or metering ~~laterals~~ or are located in legally established easements, right-of-ways, or on property owned or leased by the electric utility for the purpose of communications, ~~metering,~~ generation control transformation, transmission, or distribution of electric energy.

COMMENT ON AFFIRMATIVE:

COX: I support the Panel Action to accept this proposal but recommend consideration of alternative wording that may more clearly identify what is intended by the terms "easements" and "right-of-ways". It seems clear that the majority of CMP-1 members understand these designated areas as being those either established by governmental agencies, such as Public Service Commissions, or recognized by those agencies and are not just contractual agreements between an electric utility and a property owner to install electrical wiring on the customer's property. It is recommended that the wording in 90-2(b)(5) be revised by adding the words shown by the underline and deleting the characters identified by ~~strikeout~~.

"90-2(b)(5) Installations under the exclusive control of an electric utility where such installations consist of wiring for service drops or laterals or are located in legally established easements, or right-of-ways either designated by or recognized by Public Service Commissions, Utility Commissions or other regulatory agency having jurisdiction for such installations; or on property owned or leased by the electric utility, for the purpose of communications, metering, generation, control, transformation, transmission, or distribution of electric energy."

(Log #4151)

1- 11 - (90-2): Accept in Principle

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Revise as follows:

(a) Covered. This Code covers the following.

(1) Installations of premises wiring systems including electric conductors and equipment within or on public and private buildings or other structures, including mobile homes, recreational vehicles, and floating buildings; and other premises such as yards, carnival, parking, and other lots, and industrial substations.

~~FPN: For additional information concerning such installations in an industrial or multibuilding complex, see the National Electrical Safety Code, ANSI C2 1997.~~

~~(2) Installations of conductors and equipment that connect to the supply of electricity.~~

~~(3)~~ (2) Installations of other outside conductors and equipment ~~on the premises~~ that are a part of the premises wiring system.

(3) Installation of electrical power sources not under the exclusive control of electric utilities.

(4) Installations of optical fiber cables and raceways.

(5) Installations in buildings used by the electric utility, such as office buildings, warehouses, garages, machine shops, and recreational buildings, that are not an integral part of a generating plant, substation, or control center.

(6) Installations of electric utilities on the load side of the service point of a premises wiring system other than those under their exclusive control and for their exclusive use for the purposes of metering, control, and communications.

(7) Installations of electric utilities on the supply side of the service points of premises wiring systems that are not under their exclusive control.

(b) Not Covered. This Code does not cover the following.

(1) Installations in ships, watercraft other than floating buildings, railway rolling stock, aircraft, or automotive vehicles other than mobile homes and recreational vehicles.

FPN: While the scope of this Code indicates that the Code does not cover installations in ships, portions of this Code are incorporated by reference into Title 46, Code of Federal Regulations, Parts 110-113.

(2) Installations underground in mines and self-propelled mobile surface mining machinery and its attendant electrical trailing cable.

(3) Installations of railways for generation, transformation, transmission, or distribution of power used exclusively for operation of rolling stock or installations used exclusively for signaling and communications purposes.

(4) Installations of communications equipment under the exclusive control of communications utilities located outdoors or in building spaces used exclusively for such installations.

~~(5) Installations, including associated lighting, under the exclusive control of electric utilities for the purpose of communications, metering, generation, control, transformation, transmission, or distribution of electric energy. Such installations shall be located in buildings used exclusively by utilities for such purposes; outdoors on property owned or leased by the utility; on or along public highways, streets, roads, etc.; or outdoors on private property by established rights such as easements.~~

(5) Installations on the supply side of the service point, and exclusively operated, maintained, and controlled on a continuing basis by electric utilities, or by entities recognized by the jurisdiction as having substantially equivalent organizational permanence, engineering supervision, and workforce training.

FPN: For additional information concerning such installations in an industrial or multibuilding complex, see the National Electrical Safety Code, ANSI C2-1997.

(c) Special Permission. The authority having jurisdiction for enforcing this Code may grant exception for the installation of conductors and equipment that are not under the exclusive control of the electric utilities and are used to connect the electric utility supply system to the service-entrance conductors of the premises served, provided such installations are outside a building or terminate immediately inside a building wall.

SUBSTANTIATION: This proposal is based in part on the work of a TCC authorized task group that met in June, 1999, but which failed to sustain consensus on the letter ballot and through the TCC afterwards. It is substantially altered, however, based on my comment on vote within the task group. The proposal (equivalent to the task group in this respect) relocates existing Section 90-2(b)(5) into Section 90-2(a) as shown by recasting the language affirmatively, in terms of what the Code does cover. The most important difference from the task group recommendation, however, is that this proposal recommends a new Section 90-2(b)(5).

This single paragraph holds the key to finally end approximately seventy years of conflict and overlapping jurisdictional boundaries between the NESC and the NEC. Unless we focus on these concepts we miss the premises that underlie the NESC. If we look at NESC requirements outside this context, we inevitably see a free lunch for utilities and an unacceptable diminution of safety. Such a view is unfair, and intellectually dishonest. The NESC trades off reductions in installation requirements for increases in supervision by virtue of its intended audience.

Criticizing the lack of separate equipment grounding (per NESC) out of this context, for example, has as much consistency as criticizing a major industrial occupancy for running a medium-voltage transformer with 250% secondary protection. Now, the industrial occupancy traded off a reduction in secondary protection for enhanced supervision. Is it unsafe? If improperly supervised for the foreseeable future, yes. If properly supervised as contemplated in Table 450-3(a), no. Therefore, is it less safe than the normal 125%? Here's the real point: It's only less safe if you ignore the

operational context. That sort of tradeoff occurs all over the NEC. By now we're used to it.

Is a street light grounded to the grounded conductor unsafe? If it isn't exclusively under the control of utility (or equivalent) personnel for the foreseeable future, yes. If properly operated and controlled as contemplated in the NESC, no. There won't be any peace between the two codes until we look at their differences in this context. This proposal clearly establishes that context through this paragraph. What follows is a more detailed analysis of its provisions. The key is exempting certain highly qualified entities from NEC provisions upon a showing that they possess equivalence to traditional utility operational performance.

They would need to show equivalence in engineering supervision. This would presumably involve a track record of qualified engineering supervision of this work, by people who are accountable to state licensing authorities for their work in the electrical discipline.

They would need to show equivalence in workforce training. This would presumably involve similar training as that provided for utility line crews operating with equivalent voltages and other conditions. This would involve training significantly over and beyond the fact of electrical trade licensure in my jurisdiction. Too often we think of a license as demonstrative of qualification. This work involves a different code than the one under which trade electricians receive licensure. Under no trade licensure program I am aware of, in this country or elsewhere, do licensing authorities judge workforce qualifications under the NESC. Remember, the NESC isn't just an installation standard. It's also a maintenance and workplace safety standard.

They would need to demonstrate organizational permanence. There must be evidence that the entity assuming this responsibility will, in fact, carry out its responsibilities under the premise that there be continuing control, maintenance, and supervision. The word "continuing" is without limit as to time, and therefore means the foreseeable future.

With respect to procedure, the phrasing "recognized by the jurisdiction" is different from the usual reference to an AHJ. This is intentional. No inspector should be engaged in or asked to take responsibility for determinations of organizational permanence, for example. That should involve some formal process established under the prevailing laws and regulations, and presumably allowing for public comment.

A companion proposal redefines service point accordingly. ("The point of connection between the premises wiring and the facilities of the serving utility, or the facilities of a serving entity recognized by the jurisdiction as having substantially equivalent organizational permanence, engineering supervision, and workforce training.") This allows the reapplication of Article 230 to the interior of these industrial facilities (another correlating proposal deletes the phrase "of utility conductors" from the premises wiring definition).

The result would be a Code that tells it as it is. There are large industrial campuses using the NESC for major elements of their outdoor distribution systems. The NEC would otherwise claim these under Article 225. I am a well-bruised but still standing veteran of the battle to include manholes in the NEC, and that effort only succeeded after my panel allowed the DuPonts of the world to continue using the NESC for their outdoor distributions. I frequently represent electrical viewpoints to legislative leaders and committees. Anyone who thinks they're going to fiddle with Section 90-2 and end up forcing these major employers to revamp their campuses so as to become the sole province of conventional electrical trade licensure needs to meet some of the people I deal with in this process.

To accept this proposal would demonstrate to political authorities a level of sophistication and maturity unusual in a self-regulated industry. It is squarely rooted in safety and not market share. It removes from our table all competitive issues, because the NEC only gets mud on its face when it tries to influence them. There's no question that some utilities have abused their rate base revenue to compete with electrical contractors. However, in terms of electrical distribution, their activities constitute a natural monopoly, and natural monopolies are always subject to state regulation. That's where those battles must be fought.

In fact, in my state we are seeing the reverse problem, namely, utility attempts to relocate service points in such a manner as to make NESC installations become premises wiring with no assurances of adequate and continuing controls. We are now in the midst of a major regulatory initiative to restrict such activities. We want to retain utility control over this work until and unless it has been reworked to the NEC, and the language in this proposal would strengthen those attempts.

I have not included in this proposal another task group initiative, that of allowing other entities NESC privileges, in effect, for providing parking lot lighting. The reason is that I doubt its practicality; I question whether any contractor would be really able to demonstrate the ability to meet equivalent expectations in terms, for example, of organizational permanence. However, it isn't impossible and the panel may want to think more carefully about this point. What follows is the way I would submit an expanded Section 90-2(c) to address the point. It differs from the task group recommendation in terms of formatting and the use of the term "area" instead of "parking lot," to describe lighting. Most importantly, it incorporates my language defining the essential characteristics of an entity truly qualified to operate on the utility playing field:

(c) Special Permission. The authority having jurisdiction for enforcing this Code may grant exception for the installation of conductors and equipment that are not under the exclusive control of the electric utilities and are used <u>for one of the following purposes:</u>

<u>(1) To connect the electric utility supply system to the service-entrance conductors of the premises served, provided such installations are outside a building or terminate immediately inside a building wall.</u>

<u>(2) To provide area lighting provided such installations are outside and not attached to a building and are exclusively operated, maintained, and controlled by entities recognized by the jurisdiction as having substantially equivalent organizational permanence, engineering supervision, and workforce training to that of electric utilities operating within the same jurisdiction.</u>

I commend this proposal to CMP 1 and also to the TCC to the extent it follows up on the task group suggestions regarding continued efforts to harmonize the NEC and the NESC.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Proposal 1-10. The panel does not necessarily agree with the submitter's substantiation. The panel does not agree that the use of the term "service point" will adequately clarify this issue for most users of the NEC.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

NOT RETURNED: 1 Macias

EXPLANATION OF NEGATIVE:

TROGLIA: In effect, the Panel rejected this proposal. I believe it should be accepted. I agree fully with the proposal and I disagree with the Panel's contention that the use of the term "service point" will not adequately clarify the scope issue. The term is clearly defined in the Code and is readily identifiable on any premises. This proposal reconciles the scopes of the NEC and the NESC and enables their uniform adoption and enforcement without change. It resolves the problems with Proposal 1-10 (Log #52) that are identified in my comment on vote on that proposal.

(Log #53)

1- 12 - (90-2(a), (b)): Accept in Principle

NOTE: The following proposal consists of Comment 1-19 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].

SUBMITTER: Jan Bardin, Florida East Coast Electrical JATC

RECOMMENDATION: Please reconsider and accept this proposal.

SUBSTANTIATION: Allowing utility companies to perform stated work without complying with the NEC, would jeopardize the safety of the public and others and violate the intent of "safeguarding of persons and property from hazards arising from the use of electricity."

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Proposal 1-10. The panel does not agree with the submitter's substantiation. No evidence was submitted that installations performed by utilities in accordance with the NESC are unsafe.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

NOT RETURNED: 1 Macias

EXPLANATION OF NEGATIVE:

TROGLIA: This proposal should be rejected. I disagree with Proposal 1-13 in the 1998 ROP and its substantiation. I disagree that

Proposal 1-10 (Log #52) adequately clarifies the NEC scope, however I agree with the Panel Statement on this proposal. See my comment on vote on Proposals 1-10 (Log #52) and 1-11 (Log #4151).

(Log #2923)

1- 13 - (90-2(a)(6) (New)): Accept in Principle
SUBMITTER: Frank Pologruto, Rep. IBEW L.U. 98
RECOMMENDATION: Add a paragraph to 90-2(a) to read:
(6) Installations of conductors for lighting and power on private property by a utility company.
SUBSTANTIATION: Since the deregulation of the utility companies, they have been doing electrical installations on private property using their National Electrical Safety Code, (NESC), which is no comparison to the National Electrical Code.
If electrical contractors have to install electrical conductors and equipment according to the National Electrical Code, why should the utility company doing work on private property get away with installing the job according to their NESC.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. The substantiation does not appear to support the recommendation. The panel does not agree with the submitter's substantiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
TROGLIA: I disagree with the proposal and its intent. I disagree that Proposal 1-10 (Log #52) adequately clarifies the NEC scope, however I agree with the Panel Statement on this proposal. See my comment on vote on Proposals 1-10 (Log #52) and 1-11 (Log #4151).

(Log #2161)

1- 14 - (90-2(a)(1)): Accept in Principle
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
Installation of electric conductors and equipment, within or on public and private buildings or other structures, including mobile homes, recreational vehicles, and floating buildings; and other premises such as yards, carnivals, parking, and other lots~~,~~; and industrial substations.
[replace comma with semicolon after lots]
SUBSTANTIATION: This is an editorial change.
It is current editorial practice to use a semicolon to separate a series of items which themselves contain commas.
One semicolon was used, I believe it was an oversight not to use the other required semicolon.
PANEL ACTION: Accept in Principle.

(Log #4005)

1- 15 - (90-2(a)(1)): Reject
SUBMITTER: Lawrence J. Bradley, NECA Penn-Del-Jersey
RECOMMENDATION: Add two new sentences:
90-2. Scope.
(a) Covered. This Code covers the following:
1. Installations of electric conductors and equipment within or on public and private buildings or other structures, including mobile homes, recreational vehicles, and floating buildings; and other premises such as yards, carnival, parking, and other lots, and industrial substations. <u>This shall include all electric conductors and equipment which is owned or leased and maintained by any entity. This shall not apply to residential installations of not more than two dusk to dawn type lights installed on a pole which also supports utility conductors.</u>
SUBSTANTIATION: The problem and reason for this proposal is one that the members of CMP-1 are very familiar with and can be summarized as follows:
The NEC is the most widely recognized and used standard for electrical installations in the United States. The NEC governs all parts of the electrical installation from the service point to the last outlet in any occupancy. Electrical Contractors must follow the rules of the NEC in all installations.
The problem begins with entities (utilities) who claim they are not required to follow the more stringent rules of the NEC. This creates serious problems for all electrical installations.
Good code is easy to read, practical and enforceable.
Is 90-2 easy to read? It would seem to until we attempt to apply it!
Is 90-2 practical? Requiring Electrical Contractors to follow this Code and at the same time, on the same installation allowing utilities to ignore the safety driven requirements of this Code is by no stretch of anyone's imagination practical.
Is 90-2 enforceable? Absolutely not!! The Inspector cannot force the utility to comply with the rules of the NEC when they are on private property installing electric conductors and equipment for private utilization because they claim exemption from a safety driven code due to the fact that an owner chose to lease the conductors or equipment rather than to own them.
The problem has been intensified by the lack of the NEC to clear up 90-2. CMP-1 made an attempt to clear this up only to have the Correlating Committee step in and hold all actions.
The problem here is a simple one. Utility companies want to be excluded from the requirements of the NEC. Utility companies do not use the NEC, they use the NESC.
The primary concern Code Making Panel members on CMP-1 on this issue is to make sure that they can continue to be exempt from the Code.
Mr. Troglia clearly states in his explanation of his negative vote to Comment 1-18a in the last cycle that utilities intend to ignore the safety driven requirements of the National Electrical Code when equipment or conductors are leased. Mr. Troglia does not attempt to place language into the NEC to allow anyone (other than utilities) to be exempt from the requirements of the NEC when leasing electric conductors or equipment.
When will the NEC take a stand on this issue? Should we wait until utilities begin to lease entire distribution systems in large commercial and industrial applications? Or should we wait for contractors to get in the business of leasing electric conductors and equipment and claim the same sanctuary which is now owned by the utilities, we don't need to follow the rules of the NEC this installation is leased!
We are the users of this Code. We do not wish to have the NEC in any way, shape or form even attempt to dictate, who can or cannot do an installation. We want the NEC to apply to all installations without regard to whether the conductors or equipment are owned or leased.
CMP-1 is faced this cycle with a difficult task on this issue. The Panel can take steps to include all conductors and equipment whether owned or leased. This will set the record straight and require all installations be installed in conformance with the NEC.
The Panel may choose to ignore this and other proposals which will continue to allow exceptions from this Code to specific entities and not others doing the same type of installations. To take this road will be a dangerous one for the future of the NEC. Installations which are leased have the same potential to cause damage to property and injury or perhaps death to persons.
We are the users of this code. Why does the NEC continue to be heavily influenced by those who do not use this Code?
PANEL ACTION: Reject.
PANEL STATEMENT: The panel is unclear as to the submitter's definition of the word "entity". In addition, the submitter has not provided technical substantiation to justify the restriction on the number of lighting fixtures permitted on a pole.

NOT RETURNED: 1 Macias

(Log #54)

1- 16 - (90-2(a)(6) (New)): Accept in Principle
NOTE: The following proposal consists of Comment 1-32 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].
SUBMITTER: Robert H. Keis, Dover, DE
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: Regardless of what the panel feels the present wording says, there is much confusion and misunderstanding in interpretation of this section. This proposal will help to clarify

intent. If the wording "along public highways, streets, roads, etc., is a problem, I think most states and cities probably have laws which exempt these areas from code compliance anyway, or delete those words from the new rule. We do need some help on this.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10.

(Log #57)

1- 19 - (90-2(a)(6) (New)): Accept in Principle
NOTE: The following proposal consists of Comment 1-35 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].
SUBMITTER: David E. Shapiro, Rep. Safety First Electrical Contracting
RECOMMENDATION: Change wording: "(6) Installations of conductors and equipment for lighting, installed by the electric utility for use by others in or on public or private buildings or other structures; along public highways, streets, roads, etc.; or outdoors on private property." Proposing revised text:
"(6) Conductors and equipment for lighting, installed by the electric utility for use by others.
(7) Installations of conductors and equipment for lighting, in or on private buildings or other structures or on private property."
SUBSTANTIATION: As the negative CMP member comments indicate, unnecessary confusion and disputation remain with the present text. There is a place for utility-installed and -maintained lighting, outside the jurisdiction of the NEC. The NEC must, however, be enforced where nonutility personnel are likely to deal with the systems. The two situations where that is likely to be are where the systems are explicitly installed for use by others, and where the utility intends to control the systems, but where, because of location on others' premises, it is likely that others will nonetheless be involved. Because those are disparate reasons, separate paragraphs seem appropriate.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10.

(Log #71)

1- 33 - (90-2(a)(6) (New)): Accept in Principle
NOTE: The following proposal consists of Comment 1-51 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].
SUBMITTER: David A. Williams, Delta Twp Lansing, MI
RECOMMENDATION: Add text to read as follows:
(6) Installations of conductors and equipment for lighting by electric utility companies for parking lot and underground street lighting.
SUBSTANTIATION: The deregulation of the utility companies will create additional problems with them doing electrical work and not performing the work to the code. CMP 1 has made it clear that parking lot lighting is covered by the NEC. Due to previous wording of the NEC this message is not being enforced. The area I inspect had an attorney interpret 90-2 to say that the utility companies are exempt from parking lot and street lighting. If the views of the code making panel are not written clearly you might as well not bother. I have seen numerous installations by utility companies for parking lot lighting and underground street lighting that are a death trap waiting to happen. I hope the code panel will consider making corrections to the wording of these sections before we start counting bodies.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. The panel does not agree with the submitter's substantiation. No evidence was submitted that installations performed by utilities in accordance with the NESC are unsafe.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
TROGLIA: This proposal should be rejected. I disagree with Proposal 1-13 in the 1998 ROP and Comment 1-51 in the 1998 ROC and their substantiations. I disagree that Proposal 1-10 (Log #52) adequately clarifies the NEC scope, however I agree with the Panel Statement on this proposal. See my comment on vote on Proposals 1-10 (Log #52) and 1-11 (Log #4151).

(Log #72)

1- 34 - (90-2(a)(6) (New)): Accept in Principle
NOTE: The following proposal consists of Comment 1-52 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].
SUBMITTER: Michael O'Connell, Mass Electric Construction Co.
RECOMMENDATION: Installations of conductors and equipment installed by the electric utility for use by others in or on public or private buildings.
SUBSTANTIATION: The utility companies are not subject to the application of the NEC. The NEC was created to safeguard persons/property. By granting the utility companies the ability to work on the load side of the distribution grid the purpose for creating the NEC will be corrupted.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. The panel does not agree with the submitter's substantiation. No evidence was submitted that installations performed by utilities in accordance with the NESC are unsafe.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

SUBMITTER: Carl Lewis, Mass Electric Construction Co.
RECOMMENDATION: The Panel should reconsider and accept this proposal as revised:
(c) Installations of conductors and equipment installed by the electric utility for use by others in or on public or private buildings or outside private property.
SUBSTANTIATION: Is the practical safeguarding of persons and property from hazards present from the use of electricity? Utilities should be recorded to follow NEC when they provide for private use.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. The panel does not agree with the submitter's substantiation.

NOTE: The following proposal consists of Comment 1-68 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].
SUBMITTER: James A. Weldon, Rep. IBEW Local 728
RECOMMENDATION: The Panel should reconsider and accept this proposal as revised:
(6) Installations of conductors and equipment installed by the electric utility for use by others in or on public or private buildings or outdoors on private property.
SUBSTANTIATION: The utilities are in direct competition with electrical contractors and they jump at every opportunity to get around NEC and local permitting and inspection requirements. Substantiation can be found for utility abuses in Florida. Thousands of load management systems sold by utility companies are installed by sub-subcontractors, often so called, "self employed' who make installations on a piece-work basis who are frequently unlicensed/unqualified installers. This became rampant when the utilities were successful in exempting these load management systems from permitting and inspections by legislative action.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. The submitter's substantiation appears to be more related to the local rules and regulations.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:

NOTE: The following proposal consists of Comment 1-69 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].
SUBMITTER: John L. Somers, Rep. IBEW Local 728
RECOMMENDATION: The Panel should reconsider and accept this proposal as revised:
(6) Installations of conductors and equipment installed by the electric utility for use by others in or on public or private buildings or outdoors on private property.
SUBSTANTIATION: This new article will permit items that I consider to be unsafe in the following areas:
A. (Article 250-84) Ignores the resistance requirements.
B. Will permit the multiple grounding of grounded conductors.
C. (Article 250-83(c)) This change would allow a reduction in the electrode size.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. This substantiation does not support the recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

SUBMITTER: James T. Dollard, Jr., Local Union #98 IBEW
RECOMMENDATION: The Panel should reconsider and accept this proposal as revised:
(6) Installations of conductors and equipment installed by the electric utility for use by others in or on public or private buildings or outdoors on private property.
SUBSTANTIATION: The purpose of the NEC is "the practical safeguarding of persons and property from hazards arising from the use of electricity." Installations performed by utilities must not be granted exemption from the provisions of the NEC where they provide for private utilization. This must include all public places where general lighting is installed. Section 90-2(b)(5) is presently being applied to allow utilities to leave their domain of generation, transformation, etc., and enter the private market with no requirement to provide safe installations in accordance with NFPA 70.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. The panel does not agree with the submitter's substantiation.

1- 52 - (90-2(a)(6) (New)): Accept in Principle
NOTE: The following proposal consists of Comment 1-87 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].
SUBMITTER: John O'Leary, E.G. Sawyer Elec.
RECOMMENDATION: The Panel should reconsider and accept this proposal as revised:
(6) Installations of conductors and equipment installed by the electric utility for use by others in or on public or private buildings or outdoors on private property.

SUBSTANTIATION: The purpose of the NEC is safeguarding of persons and property. Installations by the utilities should be done with the same purpose. Section 90-2(b)(5) of the NEC allows utilities to enter the private market without requirements for safe installations.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. The panel does not agree with the submitter's substantiation. No evidence was submitted that installations performed by utilities in accordance with the NESC are unsafe.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
TROGLIA: This proposal should be rejected. I disagree with Proposal 1-13 in the 1998 ROP and Comment 1-87 in the 1998 ROC and their substantiations. I disagree that Proposal 1-10 (Log #52) adequately clarifies the NEC scope, however I agree with the Panel Statement on this proposal. See my comment on vote on Proposals 1-10 (Log #52) and 1-11 (Log #4151).

(Log #91)

1- 53 - (90-2(a)(6) (New)): Accept in Principle
NOTE: The following proposal consists of Comment 1-89 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9(Log #51)].
SUBMITTER: Patrick O'Brien, JM Electrical
RECOMMENDATION: The Panel should reconsider and accept this proposal as revised:
Installation of conductors and equipment installed by the electric utility for use by others in or on public or private building or outdoors on private property.
SUBSTANTIATION: Installations performed by the utilities must not be granted exemption from the NEC.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. The panel does not agree with the submitter's substantiation.

(Log #96)

1- 58 - (90-2(a)(6) (New)): Accept in Principle
NOTE: The following proposal consists of Comment 1-100 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].
SUBMITTER: Thomas A. Dzeda, D&H Construction Services, Inc.
RECOMMENDATION: Panel should accept proposal.
SUBSTANTIATION: A substantial quantity of utility employees are not licensed, or tested, in "medium" voltage applications. To allow them to work in a position where they are not inspected or required to pull permits and yet still accessible to the general public and following the direction of a distant utility engineer denies the reasons and safety procedures of the NEC.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. The panel does not agree with the submitter's substantiation. No evidence was submitted that installations performed by utilities in accordance with the NESC are unsafe. The present code covers installations on any part of the premises wiring system regardless of who does the work.

NOTE: The following proposal consists of Comment 1-126 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].
SUBMITTER: Palmer Hickman, IBEW Local 380 JATC
RECOMMENDATION: I am requesting CMP 1 reconsider their vote on Proposal 1-13 and accept the proposed revision as submitted to add the following:
(6) Installations of conductors and equipment for lighting installed by the electric utility for use by others in or on public or private buildings or other structures; along public highways, streets, roads, etc.; or outdoors on private property.
SUBSTANTIATION: I disagree with the Panel Statement in their view that this proposal would create more confusion than it attempts to alleviate. Utility companies are apparently broadening the scope of their work including such areas as parking lot lighting on private property. Section 90-2(b)(5) is very clear that easements are granted for installations under the exclusive control of electric utilities for a specific list which does not include private or public buildings used by others.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

NOTE: The following proposal consists of Comment 1-128 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].
SUBMITTER: Mark Alexander, Medlar Electric
RECOMMENDATION: The Panel should reconsider and accept this proposal as revised:
(6) Installations of conductors and equipment installed by the electric utility for use by others in or on public or private buildings or outdoors on private property.
SUBSTANTIATION: In this time of deregulation of utilities, I feel that without Proposal 1-13 the confusion and interpretation of Section 90-2(b)(5) could endanger, not safeguard, persons and property from hazards arising from the use of electricity. The utilities must follow the same guidelines when they enter areas of private property, such as parking lot lighting. Proposal 1-13 does not state that utilities cannot perform these installations, but are not exempt from the NEC provision.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. The present code covers installations on any part of the premises wiring system regardless of who does the work.

EXPLANATION OF NEGATIVE:
TROGLIA: This proposal should be rejected. I disagree with Proposal 1-13 in the 1998 ROP and Comment 1-131 in the 1998 ROC and their substantiations. I disagree that Proposal 1-10 (Log #52) adequately clarifies the NEC scope, however I agree with the Panel Statement on this proposal. See my comment on vote on Proposals 1-10 (Log #52) and 1-11 (Log #4151).

(Log #109)

1- 71 - (90-2(a)(6) (New)): Accept in Principle
NOTE: The following proposal consists of Comment 1-132 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].
SUBMITTER: James M. Naughton, Boston Globe
RECOMMENDATION: I would like the Panel to reconsider this proposal as reviewed to say: Installation of conductors and equipment for lighting on public or private buildings or other structures; along public highways, streets, roads, etc.; or outdoors on private property shall be installed in accordance with NFPA 70.
SUBSTANTIATION: In the workplace there is still very much confusion with the utility companies performing electrical construction work on public and private properties. The 1996 NEC 90-2(a)(5) does not do enough to clear up this problem.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10.

TROGLIA: This proposal should be rejected. I disagree with Proposal 1-13 in the 1998 ROP and Comment 1-132 in the 1998 ROC and their substantiations. I disagree that Proposal 1-10 (Log #52) adequately clarifies the NEC scope. See my comment on vote on Proposals 1-10 (Log #52) and 1-11 (Log #4151).

(Log #110)

1- 72 - (90-2(a)(6) (New)): Accept in Principle
NOTE: The following proposal consists of Comment 1-133 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].
SUBMITTER: Christopher Pharo, IBEW Local 98/Rep. IBEW Local 98/Eastern Code Advisory
RECOMMENDATION: This proposal should be accepted.
SUBSTANTIATION: Article 90-2(b)(5) explains when and where utility companies can install Code exempt power circuits for lighting "under the exclusive control of electric utilities...". This proposal states that "This Code covers installations of conductors and equipment for lighting, installed by the electric utility for use by others in or on public or private buildings or other structures; along public highways, streets, roads, etc.; or outdoors on private property". The "by others" referred to is clearly not the electric utility and therefore, the installation must be Code compliant. The submitter makes a difficult concept easy to understand.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10.

SUBMITTER: John A. Badini, Jr.
RECOMMENDATION: Panel should accept and reconsider this proposal to be revised.
Add: Installations of conductors and equipment for lighting installed by the electric utility for use by others in or on public or private buildings or other structures, along public highways, street, roads, etc. or outdoors on private property.
SUBSTANTIATION: The purpose of the NEC is to make it as safe and practical for all persons and properties of hazards that arise in the electrical field. Utilities must not be granted exemption from the provisions of the NEC. This should include all public and private places where lighting is installed. They are allowed to leave their domain and enter private areas with no requirements.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. The present code covers installations on any part of the premises wiring system regardless of who does the work.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

NOTE: The following proposal consists of Comment 1-146 on Proposal 1-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 1-9 (Log #51)].
SUBMITTER: John R. Creasman, IBEW Local 728
RECOMMENDATION: The Panel should reconsider their decision and accept the proposal for 1-13.
SUBSTANTIATION: Proposal 1-13 is very important to the purpose of the Code, Article 90-1(a). The purpose of this article is the safeguard of persons and property from hazards arising from the use of electricity. Without this proposal, utilities could be installing work any place they deem an easement or right of way, placing the public in direct contact with installations not covered by the NEC.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. The panel does not agree with the submitter's substantiation. No evidence was submitted that installations performed by utilities in accordance with the NESC are unsafe. The present code covers installations on any part of the premises wiring system regardless of who does the work.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

(Log #604)

1- 81 - (90-2(a)(6) (New)): Accept in Principle
NOTE: The Technical Correlating Committee directs that this Proposal be forwarded to Code Making Panel 16 for information.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Add a new Section 90-2(a)(6) to read as follows:
"Installations of signaling and communications conductors and equipment within or on public and private buildings or other structures, including mobile homes, recreational vehicles, and floating buildings; and other premises such as yards, carnival, parking, and other lots, and industrial substations."
SUBSTANTIATION: This is to clarify that signaling and communications conductors and equipment are included in the scope of electrical conductors and equipment as stated in Section 90-2(a)(1). Task Group discussions have identified that confusion may exist because there are users of the code who do not identify signaling and communications conductors and equipment as a part of the electrical installation. In addition, the Task Group on Communications Systems recommends that this proposal be forwarded to CMP 16 for information and review.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel action and statement on Proposal 1-10 appears to satisfy the intent of the submitter.

NOT RETURNED: 1 Macias

(Log #4009)

1- 82 - (90-2(a)(6) (New)): Accept in Principle
SUBMITTER: Christopher Pharo, Rep. IBEW
RECOMMENDATION: This proposal is to add Part (6) after Part (5).
Section 90-2(a)(6) (new) Installations of conductors and equipment for commercial or private parking lot lighting.
SUBSTANTIATION: The NEC recognizes the need for less stringent requirements when it comes to the generation and distribution of electrical power. Making the utilities comply with the NEC would be cost prohibitive for the public. The above proposal attempts to clarify a confusing scope issue. If this lighting is needed by the utilities for their generation and distribution of electrical power then, by all means, this installation should not be covered by the NEC. However, if this lighting is necessary for the public's safety in commercial and private parking lots then this installation should, with no question, fall into the jurisdiction of the NEC.
However, in today's atmosphere of deregulation, the utilities see this ever increasing piece of the marketplace. This does not pose a problem, after all, the consumer will ultimately be rewarded for this capitalistic approach. My only concern is that if the utilities want to step outside of their arena, then they should abide by the NEC like everyone else. Perhaps, Mr. Wissman said it best in his explanation of the negative in the previous ROP- "Those who participate in making the rules should be willing to follow the rules."
By placing this Part (6) in Section (a), there leaves no doubt as to exactly what is under the exclusive control of the utilities for their economical generation and distribution of electrical energy.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 1-10. The panel does not necessarily agree with all of the submitter's substantiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
TROGLIA: I disagree with this proposal and its intent. I disagree that Proposal 1-10 (Log #52) adequately clarifies the NEC scope. See my comment on vote on Proposals 1-10 (Log #52) and 1-11 (Log #4151).

(Log #2041)

1- 83 - (90-2(b)): Reject
SUBMITTER: Edward G. Jacobson, Los Alamos, NM
RECOMMENDATION: Add after (5):
"(6) Equipment and installations of equipment used exclusively for scientific research activities and for which conditions of use and supervision ensure that only qualified persons operate, maintain, and modify."
SUBSTANTIATION: It is possible to attempt to apply the Code to equipment and systems of equipment, wiring, and protective devices that the Code is not intended to cover. A simple example was an attempt to apply Article 427 to an installation of heaters on vacuum piping to which access was restricted by three features, there was no explosion hazard, the potential shock hazard was completely mitigated, and any potential fire would have been completely contained. Something more complex is the assembly of mostly unlisted components used to generate 750 kVDC. An elaborate arrangement of mechanical locks, electrical interlocks, Faraday cage, and wire-screen barriers ensures only qualified persons have access. It has been operated, maintained, and modified without incident for over 25 years. One might think it should be obvious to Authorities Having Jurisdiction that the Code does not apply to this installation just as it does not apply to "communications equipment under the exclusive control of communications utilities" 90-2(b)(4) and to non-office and non-shop areas of electric utilities 90-2(b)(5). The analogies are often not obvious: hence, the need for specific mention in the Code.
PANEL ACTION: Reject.
PANEL STATEMENT: Where such exemptions from the requirements of the National Electrical Code are necessary for research activities, they would best be handled by local authorities and on a specific site basis based on the needs and abilities of the affected parties. The exemption requested by this proposal is too broad in scope and could lead to misinterpretation concerning commonly installed electrical equipment. Also, see the present NEC provisions in Section 305-3(c) for temporary installations for tests, experiments, and development work.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias
COMMENT ON AFFIRMATIVE:
ANTHONY: This situation occurs in many of our nation's universities where a great deal of scientific research occurs in environments which are also classified as places of assembly. Many highly-educated scientific and engineering professionals believe themselves qualified to work on power delivery circuits without specific training. It is best to have the Authority Having Jurisdiction present in such situations to confirm "the abilities of the affected parties" so that they do not put their own lives, or the lives of others at risk.

(Log #3901)

1- 84 - (90-2(b)(5)): Reject
SUBMITTER: Alfred A. Fiorello, Fiorello Electric Inc.
RECOMMENDATION: Last part of last sentence omit "~~or outdoors on private property by established rights such as easements.~~"
SUBSTANTIATION: Many installations of 10 ft parking lot lighting poles with no overcurrent protection and power not marked or identified as being from the utility.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation does not identify a specific problem that will be solved by deleting the words identified in the recommendation.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #119)

1- 85 - (90-2(b)(6)): Accept in Principle
NOTE: The following proposal consists of Comment 1-152 on Proposal 1-17 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-17 was:
Add new 90-2(b)(6) to read as follows:
(6) Installations of highway, street and area lighting and traffic signals including associated wiring, under the exclusive control of electric utilities or entity authorized by local government.
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: The proposal should be accepted in principle. Instead of the recommended action, however, revise Section 90-2(b)(5) to read as follows:
(5) Installations, including ~~associated lighting~~ utilization equipment, on the line side of the service point and under the exclusive control of electric utilities for the purpose of communications, metering, generation, control, transformation, transmission, ~~or~~ distribution, or utilization of electric energy. Such installations shall be located in buildings used exclusively by utilities for such purposes; outdoors on property owned or leased by the utility; on or along public highways, streets, roads, etc.; or outdoors on private property by established rights such as easements.
SUBSTANTIATION: The submitter is indeed on to a problem in the 1996 NEC: What exactly does the term "associated lighting" really mean? In analyzing that change I drew a commercial parking lot with outdoor lights fed from an overhead distribution line running along a public street. Everyone agreed that the street lighting belonged to the NESC, but after I passed the last transformer and went light to light with what amounted to a branch circuit, was that still "associated" with the electric distribution?
I asked the chair of CMP 1, and he was unequivocal: CMP 1 had definitely clarified that point and the NEC did apply. I asked the utility principal and he was equally unequivocal: CMP 1 had definitely clarified the point and the NEC did not apply. When I put the answers together the waffling began in earnest. Remember, good code isn't necessarily code you agree with, it's code that will be universally understood, interpreted and applied in a consistent way. Obviously the existing wording fails that test.
We need to separate the safety issue from the competitive issue. The safety issue belongs to the Code, and the competitive issue belongs to utility regulators. The entire premise behind allowing the NESC, substantially different from the NEC, to apply to utility work is a simple one: The workforce, training, and workplace culture in the utility environment is fundamentally different than for premises wiring. Therefore different standards can be applied to installations under their exclusive control. The wording in this comment makes that clear. To reinforce the point it resurrects the service point wording that was in the FPN in 1993 but which was lost in the 1996 rewrite.
With that in place, the exclusion can apply to any utilization equipment provided it is in generation facilities, or outdoors, but under exclusive utility control. Remember, street lighting is utilization equipment. Suppose a utility supplies a run of street lights fed from underground cables. Suppose there isn't any distribution associated with this circuit for some reason. For example, suppose the utility distribution runs through back yards, but the municipality agrees to pay for street lighting on the road. That street lighting could be considered to be outside the reach of the present exclusion. Does anyone on CMP 1 seriously believe that such lighting should be under the NEC, but identical lighting sitting above and fed from a utility distribution trench next to the street belongs to the NESC? Is there a single jurisdiction in this country attempting to enforce such a restriction?
This is not a foreign concept to the Code. Throughout the Code there are permissions to relax requirements based on a showing of qualified maintenance and supervision. This is simply another example, one that we have been quite used to for generations. This comment is in basic agreement with the original proposal, but editorially preferable because it doesn't create an additional subsection, covers all utilization equipment, and brings back the service point concept which is critical to the proper application of many Code rules.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See action and statement on Proposal 1-10 for what is covered and what is not covered in the proposed revision of Section 90-2. The panel believes that Proposal 1-10 meets the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias
COMMENT ON AFFIRMATIVE:
TROGLIA: I agree with the Panel Action, however I believe Proposal 1-10 (Log #52) does not meet the intent of the submitter. I believe acceptance of Proposal 1-11 (Log #4151) will meet the intent of the submitter.

(Log #614)

1- 86 - (90-2(c)): Reject
SUBMITTER: Rick Stringfield, Westinghouse Savannah River Co.
RECOMMENDATION: Add to final sentence:
"and an effective measure of safety is established and maintained."
SUBSTANTIATION: In keeping with the rulings of 90-4, safety must be established and maintained with any installation. This is especially true with waivers and exceptions to the rules.
PANEL ACTION: Reject.
PANEL STATEMENT: Equivalent provisions of this proposals are already covered in Section 90-1 and in 90-4.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2)

1- 87 - (90-3): Reject
NOTE: The following proposal consists of Comment 1-153 on Proposal 1-21 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-21 was:
In the first paragraph, revise "Chapters 5, 6, and 7" in two places to "Chapters 5, 6, 7, and 8", and delete the second paragraph which begins with "Chapter 8...".
SUBMITTER: George M. Lanier, EST
RECOMMENDATION: Either accept Proposal 1-21 or hold it for further study.
SUBSTANTIATION: I agree with the Panel that giving Chapter 8 special status was originally justified and became a successful time tested provision. But, we all know that times change and that it is risky to stay with old truths without reviewing them in the present context, especially when safety is concerned. I am not sure of the nature of the technical data the Panel is looking for. We all know that the communications industry is no longer the same as the one that was granted the special status. And, I feel certain that most of us

would agree that the changes are of a sufficient magnitude to warrant a Panel review to determine if that special status is still justified. It was my hope that the Panel would appoint a Task Group between the ROP and ROC to conduct the review. Since that did not happen, I would now accept the alternative of holding my Proposal for further study to give the Panel the time it needs to give my Proposal the consideration it deserves.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation does not provide technical data to warrant a change to a time tested provision to the NEC. The panel reaffirms that Chapter 8 is not subject to the requirements of Chapters 1 through 7, except where those requirements are specifically referenced in Chapter 8. See panel action on proposal 1-91 and 1-92.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias
COMMENT ON AFFIRMATIVE:
COX: I support the Panel Action to reject this proposal at this time but believe that Chapter 8 should be considered the same as Chapters 5 through 7 as to the application of the general provisions of the Code. It is premature at this time to make Chapter 8 subject to the general provisions of the Code because it has not been clearly demonstrated that all provisions in Chapter 8 have been reviewed to determine what impact the action would have. The submitter of Proposal 1-21 in the 1998 ROP is correct in his conclusion that procedures used for the installation of communications circuits have undergone major changes since the provisions in 90-3 to give independent status for Chapter 8 was adopted. Communications wiring and equipment are functionally associated in many situations and it is important that Code rules are properly applied to provide the necessary level of safety while including provisions to allow the equipment to function properly. Because of the close relationship with wiring and electrical equipment, the status of Chapter 8 should be changed during the 2005 NEC cycle. This will provide sufficient time for all rules in Chapter 8 to be reviewed and substantiation provided for any modification of general Code rules.

(Log #3)

1- 88 - (90-3): Reject
NOTE: The following proposal consists of Comment 1-154 on Proposal 1-21 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-21 was:
In the first paragraph, revise "Chapters 5, 6, and 7" in two places to "Chapters 5, 6, 7, and 8", and delete the second paragraph which begins with "Chapter 8...".
SUBMITTER: Larry Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Accept Proposal 1-21 as written.
SUBSTANTIATION: We agree that giving Chapter 8 special status may have been originally justified while it developed over time, but we all know that times change, as has Chapter 8 and that it is risky to stay with old ideals without reviewing them in the present context, especially when safety is a concern. We all realize that the communications industry is no longer the same as the one that was granted the special status and we feel certain that a majority of NEC users would agree that the changes are of a sufficient magnitude to warrant a Panel review to determine if that special status is still justified.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation does not provide technical data to warrant a change to a time tested provision to the NEC. The panel reaffirms that Chapter 8 is not subject to the requirements of Chapters 1 through 7, except where those requirements are specifically referenced in Chapter 8. See panel action on proposal 1-91 and 1-92.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias
COMMENT ON AFFIRMATIVE:
COX: See my Comment on Affirmative on Proposal 1-87.
FISKE: While concurring the the panel action to "accept" the proposal, we remain concerned that the proposed definition is too broad. As proposed, the definition would include driveways and drainage canals among "structures". We do not believe such a sweeping definition would aid in understanding the NEC.

(Log #4)

1- 89 - (90-3): Reject
NOTE: The following proposal consists of Comment 1-155 on Proposal 1-23 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-23 was:
90-3. Code Arrangement. This Code is divided into the Introduction and nine chapters. Chapter 1, 2, 3 and 4 apply generally; Chapters 5, 6, and 7 apply to special occupancies, special equipment, or other special conditions; Chapter 8 applies to communications systems, specifically as it relates to the communications service entrance to the building or structure. These latter chapters supplement or modify the general rules. Chapters 1 through 4 apply except as amended by Chapters 5, 6, 7, and 8 for the particular conditions.
~~Chapter 8 covers communications systems and is independent of the other chapters except where they are specifically referenced therein.~~
Chapter 9 consists of tables and examples.
Material identified by the superscript letter "x" includes text extracted from other NFPA documents as identified in Appendix A.
SUBMITTER: Roger Witt, State Farm Ins. Co.
RECOMMENDATION: Revise as follows: 90-3. Code Arrangement. This Code is divided into the Introduction and nine chapters. Chapter 1,2,3 and 4 apply generally; Chapters 5, 6, and 7 apply to special occupancies, special equipment, or other special conditions; Chapter 8 applies to communications systems, specifically as it relates to the communications service entrance to the building or structure. These latter chapters supplement or modify the general rules. Chapter 1 through 4 apply except as amended by Chapters 5,6,7 and 8 for the particular conditions.
~~Chapter 8 covers communications systems and is independent of the other chapters except where they are specifically referenced therein~~
SUBSTANTIATION: Proposed and rejected with "Panel Statement" "The substantiation does not provide technical data to warrant a change to a time tested provision to the NEC" There is a proposed and "accepted" article in chapter 8: Proposed Article 830 - Network-Powered Broadband Communications Systems: that seriously requires the inclusion of Chapter 8 work subject to the first 7 chapters of the NEC. Proposed article 830 references quite a few provisions of the earlier chapters, but modifies grounding provisions, overcurrent provisions, and possibly a few other rules that are important for the safety of the public. By including Chapter 8, Code enforcement can apply to the communications wiring methods. My original comment was based on code enforcement of grounding to prevent electrical hazards, and with the proposed 830 section it appears even more relevant since the system relating to 830 provides voltage and current to the occupancy.
Futher Research: Prior to the annual meeting, check the grounding on your house and your neighbors house, see if you can determine if the Telephone and TV services have a single point ground common to the electrcial service. This represents only data points, the requirement of single point grounding is valid, as it is stated in the NEC, but the "time tested provision" stated by the ROP PANEL, to me, eludes to the thought that single point grounding is indeed practiced. One of the important parts of a code enforcement program is to ensure or promote the safety and welfare of the public. Without enforceable codes, this cannot happen.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation does not provide technical data to warrant a change to a time tested provision to the NEC. The panel reaffirms that Chapter 8 is not subject to the requirements of Chapters 1 through 7, except where those requirements are specifically referenced in Chapter 8. See panel action on proposal 1-91 and 1-92.

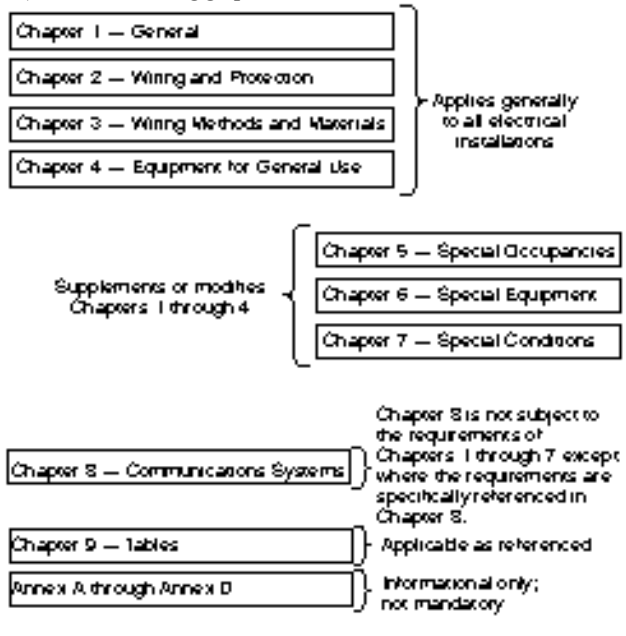
(Log #1397)

1- 91 - (90-3): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1) Revise the second paragraph of 90-3 as follows:
Chapter 8 covers communications systems and is ~~independent~~ not subject to the requirements of Chapters 1 through 7 ~~of the other chapters~~ except where ~~they~~ the requirements are specifically referenced ~~therein~~ in Chapter 8.
2) Delete the last sentence of 90-3 ~~"Material identified by the superscript letter "x" includes text extracted from other National Fire Protection Association (NFPA) documents identified in Appendix A."~~
3) Add the following graphic as an FPN before the 90-3 text.



4) Add a new last paragraph as follows: "Annexes are not part of the requirements of this Code, but included for informational purposes only."
SUBSTANTIATION: This proposal was prepared through efforts of the by the NEC Task Group on Usability and the TCC Task group on Communication Systems.
1) The revision to the second paragraph is proposed because the word "independent" has been misinterpreted to imply that communications systems are not covered by the Code and, therefore, not subject to inspection by the authority having jurisdiction.
2) Deleting the last sentence corresponds with the changes in the NEC Style Manual in Clause 4.3.2.3. Extracts will no longer be identified by the superscript method, but by showing the extract reference following the material. This change makes the last sentence of 90-3 unnecessary.
3) The proposed graphic is to add a pictorial view of the Code arrangement. The arrangement of the Code plays a significant role in the proper understanding and application of the rules. Although the present 90-3 indicates the arrangement rules, the Task Group on Usability believes that the graphic will help users in grasping what the text says. The new style manual provides emphasis to the panels to avoid duplicative references to other parts of the Code where the application is already covered by 90-3. As such, a clear understanding of the arrangement is needed.
4) A new last paragraph was added to explain the application of Annexes relative to other code material.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #605)

1- 92 - (90-4): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise the first paragraph of Section 90-4 to read as follows:
"This code is intended to be suitable for mandatory application by governmental bodies that exercise legal jurisdiction over electrical installations, including signaling and communications systems, and for use by insurance inspectors. The authority having jurisdiction for enforcement of the Code will have the responsibility for making interpretations of the rules, for deciding on the approval of equipment and materials, and for granting the special permission contemplated in a number of rules."
SUBSTANTIATION: The Task Group on Communications Systems' discussions have identified that confusion may exist because there are users of the Code who do not identify signaling and communications conductors and equipment as part of the electrical installation. Specifically, the Task Group has determined that some communications systems installations may not be subject to inspection because of this confusion. This proposal clarifies that signaling and communications conductors and equipment are included in the scope of enforcement as stated in Section 90-4. In addition, the Task Group recommends that this proposal be forwarded to CMP 16 for information and review.
Task Group Recommendation: The Task Group has addressed the specific issues raised by Comments 1-153, 1-154, and 1-155 (held in 1999 Code cycle). Based on the above findings and Task Group proposals for the 2002 Code cycle, the Task Group recommends that Comments 1-153, 1-154, and 1-155 be rejected.
PANEL ACTION: Accept.

(Log #4152)

1- 93 - (90-4): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
By special permission, the authority having jurisdiction may waive specific requirements in this Code or permit alternate methods where it is assured that equivalent objectives can be achieved by establishing and maintaining effective safety.
SUBSTANTIATION: Throughout the NEC, when we want to allow the AHJ to be able to vary a specific rule, we ask for the special permission process in instances of particular gravity. That doesn't subtract from the authority of the AHJ, but it does assure accountability through the written record. It continues to boggle my mind, that here where the AHJ has the authority to invent new performance-based code provisions based on equivalence, no equivalent accountability exists. If there is any single act by an AHJ throughout the spectrum of code enforcement that should demand this accountability, surely it is in this paragraph of this section.
PANEL ACTION: Accept.

PANEL STATEMENT: For clarification purposes, this change affects paragraph No. 2 as shown by only the underlined words. The remainder of Section 90-4 is unchanged

(Log #3289)

1- 95 - (90-7, FPN No. 3): Accept
SUBMITTER: James T. Pauley, Square D Co.
RECOMMENDATION: Add the follow as a new FPN No. 3
FPN No. 3: Annex A contains an informative list of product safety standards for electrical equipment.
SUBSTANTIATION: This is a companion proposal to the proposal to add a new Annex A for a list of product safety standards used for listing of products. The objective of the FPN is to simply call the users attention to the informative list contained in Annex A. Annex A was chosen because the existing Annex A will be removed by virtue of the new style manual requirements relative to extract identification.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
PRICHARD: The Panel Action to accept this proposal to include a FPN referencing Annex A was made without benefit of seeing or reviewing Annex A. See my vote on Proposal 1-315.

(Log #443)

1- 96 - (90-9): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Replace Section 90-9 with the following:
90-9. Units of Measurement.
(a) Measurement System of Preference. For the purpose of this Code, metric units of measurement are in accordance with the modernized metric system known as the International System of Units (SI).
(b) Dual System of Units. The SI units shall appear first, and the inch-pound units shall immediately follow in parenthesis. The conversions from the inch-pound units to SI units shall be based on hard conversion except as provided in (c).
(c) Permitted Uses of Soft Conversion. The following cases shall not be required to use hard conversion and shall be permitted to use soft conversion.
(1) Trade Sizes. Where the actual measured size of a product is not the same as the nominal size, trade size designators shall be used rather than dimensions. Trade practices shall be followed in all cases.
(2) Extracted Material. Where material is extracted from another standard, the context of the original material shall not be compromised or violated. Any editing of the extracted text shall be confined to making the style consistent with that of the NEC.
(3) Industry Practice. Where industry practice is to express units in inch-pound units, the inclusion of SI units shall not be required.
(4) Safety. Where hard conversion to SI would impact safety.
(d) Compliance. The conversion from inch-pound units to SI units shall be permitted to be an approximate conversion. Compliance with the numbers shown in either the SI system or the inch-pound system shall constitute compliance with this Code.
FPN No. 1: "Hard" conversion is considered a change in dimensions or properties of an item into new sizes that might or might not be interchangeable with the sizes used in the original measurement. "Soft" conversion is considered a direct mathematical conversion and involves a change in the description of an existing measurement but not in the actual dimension.
FPN No. 2: SI conversions are based on IEEE/ASTM SI 10-1997, Standard for the Use of the International System of Units (SI): The Modern Metric System.
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4. with respect to the placement of units and values of measurement. See supporting information titled "Metrication information for CMP Members".
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle.
Modify 90-9(c)(4) of this proposal to read as follows:
(4) Safety. Where hard conversion to SI would <u>have a negative</u> impact <u>on</u> safety.
PANEL STATEMENT: This was revised editorially to be more specific.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #1839)

1- 97 - (90-9): Accept in Principle in Part
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise the second paragraph of 90-9 to read:
The SI units shall appear first and the inch-pound units shall immediately following in parenthesis. In tables, there shall be separate columns for the SI units and the inch-pound units.
SUBSTANTIATION: As the code is converted to SI units as the primary units, the code will be more user friendly if the SI units and the inch-pound units are in separate columns in Tables. It will also make it easier for countries outside the U.S. to adopt the code by simply omitting the inch-pound columns when their country practice is SI units.
The SI proposal for 90-9 submitted by the TCC does not address tables.
PANEL ACTION: Accept in Principle in Part.
The panel accepts the first sentence of recommended action in principle.
Reject the remainder of the proposal.
PANEL STATEMENT: The panel rejects the remainder of the proposal because editorial guidance does not belong in the NEC. See Proposal 1-96.

ARTICLE 100 — DEFINITIONS

(Log #2933)

1- 98 - (100): Accept in Principle

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 18 for information.
SUBMITTER: Bernard J. Mezger, American Lighting Association
RECOMMENDATION: Incorporate "luminaire" into the 2002 NEC:

(a) To incorporate the use of the inclusive wording "luminaire" throughout the Code wherever the ambiguous wording "fixture" or "lighting fixture" is used an the intent and meaning is a complete lighting unit consisting of a fixture and the lamp(s), called a "luminaire".

(b) Add the definition of "luminaire" to Article 100-1 as follows:

Luminaire. A complete lighting unit consisting of a lamp, or lamps, and a ballast (when applicable), together with the parts designed to distribute the light, to position the lamp(s), and connect the lamp(s) to the power supply.

(c) Delete the FPN from Article 410-1 (and identical definition).

SUBSTANTIATION: Clarify the true meaning and intent of the item described as a "fixture", or a "lighting fixture", by providing the proper wording for a complete lighting unit. A luminaire consists of a fixture plus lamp(s). The definition and use proposed is consistent with that published and used by IESNA and NEMA.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel believes its action on Proposals 1-1 and 1-165 meet the intent of the Submitter. Refer to CMP-18 for information.

NOT RETURNED: 1 Macias

(Log #3930)

1- 99 - (100-Ambient Temperature (New)): Reject
SUBMITTER: Charles J. Palmieri, Palmieri Assoc.
RECOMMENDATION: Add new definition as follows:

Ambient Temperature. The temperature of the surrounding medium, usually used to refer to the temperature of the air in which a structure is situated or a device operates.

SUBSTANTIATION: There are 48 hits throughout the NEC referencing the term ambient temperature, without technical reference to this term. It is my understanding that terms used in more than one article may be defined in Article 100 per the Style Manual.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes the term "ambient temperature" is in common use throughout the electrical industry, its meaning is well understood and a definition is not needed in Article 100 for proper application of Code requirements.

(Log #422)

1- 100 - (100-Ampacity): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise as follows:

The current in amperes that a conductor can carry continuously under the conditions of use, as specified in this Code. ~~without exceeding its temperature rating.~~

SUBSTANTIATION: Editorial. Bare conductors have no temperature rating. Where bare conductors are permitted, their ampacity is prescribed by Section 310-15(b)(3), Table 310-21, and UL listing for service cable which considers the ampacity of the bare conductor the same as the insulated conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not necessarily agree with the submitter's substantiation. There is no evidence that the present definition is being misunderstood.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #1986)

1- 101 - (100-Ampacity): Reject
SUBMITTER: John E. Conley, Stratford, CT
RECOMMENDATION: Revise "ampacity" definition as follows:

Ampacity. Allowable current-carrying capacity of electrical conductors expressed in amperes.

Ampacity (scientific): The current in amperes that a conductor can carry continuously under conditions of use without exceeding its temperature rating.

SUBSTANTIATION: This proposal was rejected for the 1999 NEC because scientific ampacities were not so designated in the text. A number of correlating proposals are offered herewith to introduce scientific ampacities where appropriate.

Sections in the NEC like 310-10 have specific warnings against exceeding the temperature ratings of insulated conductors. Overheated conductors can be dangerous. Scientific ampacities establish the continuous current limits that such conductors can handle without overheating. The proposed definition (which is actually the existing definition retitled) is very precise in addressing that concept. That very precision makes it unacceptable for establishing conductor ampacities except in closely defined circumstances. It completely ignores other important criteria used to establish conductor ampacities in a more general sense. See the FPN discussion in 310-15(b). Important ampacity tables as, for example, 310-16 through 310-20, 400-5(A), and 402-5 have ampacities derived using several factors and, therefore do not meet the specificity demanded by the scientific definition. A table like 310-21 cannot comply because the scientific ampacity is specific to insulated conductors. Table 610-14(a) gives ampacities for short-time or intermittent currents, obviously outside the scope of continuous current demanded by the scientific definition.

The proposed new, more general, definition covers all present usage of the terms ampacity and ampacities. (Note that scientific ampacities are a defined sub-group within the category). The submitter attempted to find and study all the numerous references to ampacity in the Code, and offers changes only in cases which he considered appropriate. Individual Panels may wish to study their references to determine whether further correlation would be appropriate.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "scientific ampacity" does not appear in the NEC. Also, the term is unnecessary for the proper application of the NEC. The present definiton of ampacity works very well.

(Log #650)

1- 102 - (100-Attachment (Plug Cap) (Plug)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

A device that, by insertion in a receptacle or cord connector, establishes connection between the conductors of the attached flexible cord and the conductors connected permanently to the receptacle or cord connector.

SUBSTANTIATION: Cord connectors accept attachment plugs. A cord connector does not appear to be a receptacle (as defined) even though considered as a receptacle outlet by Section 210-50(a) under certain conditions. All cord connectors are not installed as pendants. See Article 305, Sections 422-16(b)(3), 422-32(a) for example.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed text does not enhance the definition from a practical view. The definition of receptacle from Article 100 does include cord connectors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2104)

1- 103 - (100-Authority Having Jurisdiction): Accept

Note: The Technical Correlating Committee directs that in the FPN change "because" to "since". This is to provide consistency with the Regulations Governing Committee Projects. This action will be considered as a public comment.

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: Add the following definition and FPN to Article 100:

Authority Having Jurisdiction. The organization, office, or individual responsible for approving equipment, materials, an installation, or a procedure.

NOTE: The phrase "authority having jurisdiction" is used in NFPA documents in a broad manner because jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

SUBSTANTIATION: Sections 1-1, 1-2, and 4-1 of the NFPA Regulations Governing NFPA Committee Projects (Nov. 18, 1998) Manual of Style provides that the NFPA Rules and Regulations Covering Committee Projects shall contain a uniform definition of "authority having jurisdiction." Section 3-3.6.1 of the NFPA Regulations Governing NFPA Committee Projects states:

"3-3.6.1 Definitions. Where the following terms, commonly found in the Association Technical Committee Documents, are used or defined in the body of the text, they shall be consistent with the intent of these meanings. "Definitions" shall not be altered unless approved by the Council. Such altered definition shall be clear and unambiguous in the context in which it is used."

The NFPA Regulations go on to provide the following definition:

Authority Having Jurisdiction. The organization, office, or individual responsible for approving equipment, materials, an installation, or a procedure.

NOTE: The phrase "authority having jurisdiction" is used in NFPA documents in a broad manner because jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction."

This definition of "authority having jurisdiction" is currently in over 200 other NFPA Codes as well as being included in the NEC Handbook.

Addition of this definition would alleviate the potential concern that the NEC exclusion of this "standard" definition implies that the NEC's intended definition is somehow different than the NFPA standard definition.

PANEL ACTION: Accept.

Editorially change "NOTE" to "FPN."

1- 104 - (100-Automatic): Accept

SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.

RECOMMENDATION: Revise as follows:

Self-acting, operating by its own mechanism when actuated by some impersonal influence, as, for example, a change in current ~~strength,~~ pressure, temperature, or mechanical means.

SUBSTANTIATION: Delete the word "strength." The term current is well understood and used throughout the Code. See Article 100 definition for Interrupting Rating, and Overload, for example. The NEC Style Manual 3.2.4 states, "Standard terms have been established through accepted use or by definition and are to be used in preference to similar terms that do not have such recognition." The term current strength is not in common usage and this is the only usage of current strength in the code.

PANEL ACTION: Accept.

(Log #1872)

1- 105 - (100-Bathroom): Reject

SUBMITTER: Ric Thomson, Candler Hospital, Engr Dept.

RECOMMENDATION: Define what an "area" is when used in definition of a "bathroom." How big is an "area"? Sq-footage, etc. Define "area" or redefine "bathroom."

SUBSTANTIATION: When the state fire marshal inspects our hospital, he always says something about our patient rooms in general care areas, where we have a basin, and there is a switch/receptacle combination next to it. In the patient room, there is another room which contains a tub and toilet. The fire marshall says we should have a GFI receptacle by the basin, I question this because of present definition of a "bathroom", but what is an "area" our basin is outside of the room with the tub and toilet our facility is twenty years old. To me this is a very confusing issue, one of the most confusing in the NEC.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal does not contain recommended text as required by Section 4-3.3(c) of the Regulations Governing Committee Projects.

(Log #4282)

1- 107 - (100-Bonding Jumper, Main): Reject

NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for comment.

SUBMITTER: Charles F. Mello, Milwaukie, OR

RECOMMENDATION: Revise text as follows:

Bonding Jumper, Main. The connection between the grounded circuit conductor and the equipment grounding conductor. ~~at the service.~~

SUBSTANTIATION: The changes to the definition of "Service" that started with the 1987 NEC have impacted how installations for feeders to separate buildings and separately derived system are completed. Under the old definition in a very broad sense, the feeder to a new building became a "service" and a separately derived system created a new "service." To overcome the restrictions placed with the present definition, new terms have been utilized when in fact what is being installed is a main bonding jumper. The bonding jumper for a second building is sized and installed the same as if it were a main bonding jumper at a service. The bonding jumper for a

separately derived system is sized and installed at the source or at the first disconnect the same as a main bonding jumper is at a service. There is no technical reason to name the conductor that connects the grounded circuit conductor to the equipment grounding conductors and possibly the grounding electrode conductor at a service any differently than the conductor that connects the grounded circuit conductor to the equipment grounding conductor and grounding electrode conductor at a separately derived system or separate building. Making this change will enhance usability and reduce confusion by redundant use of terms that in essence mean the same thing.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "Bonding Jumper, Main" is correctly separated from the term "bonding jumper" to ensure the specific identification of the connection between grounded feeder and branch grounding conductors and the grounded service conductor at the service. The panel refers this action to CMP-5.

AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #666)

1- 108 - (100-Branch Circuit): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise definition of Branch Circuit to read as follows:
Branch Circuit. The circuit conductors between the final branch circuit overcurrent protection device protecting the circuit and the outlet(s).
SUBSTANTIATION: Editorial. The final overcurrent device may be a supplementary device. Supplementary type overcurrent devices may or may not be approved for branch circuit protection since there is no definition. The intent appears to apply to the required branch circuit OCD. The definiton of feeder makes this distinction.
PANEL ACTION: Reject.
PANEL STATEMENT: Supplementary overcurrent devices do not normally protect the circuit in its entirety. The emphasis in the present definition is understood to include the entire conductors of the circuit. Section 240-10 prohibits supplementary overcurrent protection as a substitute for branch circuit protection.

(Log #256)

1- 110 - (100-Branch Circuit, Multiwire (New)): Reject
SUBMITTER: Charles M. Trout, Maron Electric Co.
RECOMMENDATION: Revise the definition of "Branch Circuit, Multiwire" to read as follows:
Branch Circuit, Multiwire. A branch circuit which consists of two or more phase conductors that have a potential difference between them, and a conductor that has an equal potential difference between it and each of the phase conductors of the circuit and is connected to the common/return conductor of the system.
SUBSTANTIATION: Multi-wire branch circuits are used in systems which are not intentionally grounded. Refer to Sections 250-1(1), 250-1(6), 250-21, 250-22, 250-24(d), 250-30(b) and 250-32(c) for circuits or systems which are not required or not permitted to be grounded. The present definition applies only to intentionally grounded systems and incorrectly refers to a neutral conductor. See proposed definition of "Neutral".
PANEL ACTION: Reject.
PANEL STATEMENT: The term "Multiwire Branch Circuit" is not applicable to the referenced Code sections, which refer to systems that are permitted to be ungrounded. These sections do not use the term "Multiwire Branch Circuit". The term is only applicable to the circuit as presently defined.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #663)

1- 112 - (100-Circuit Breaker, Interruptor Switch): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise definition of Circuit Breaker to read as follows:
Circuit Breaker. A switching device capable of ~~making, carrying, and breaking~~ safely closing a circuit, conducting and interrupting, currents under normal circuit conditions, and also ~~making, carrying for a specified time, and breaking currents~~ capable of safely performing these functions under specified abnormal conditions, such as those of short circuit.
Revise definition of Interruptor Switch to read as follows:
Interruptor Switch. A switch capable of safely closing a circuit, conducting, ~~making, carrying,~~ and interrupting specified currents.
SUBSTANTIATION: Editorial. A circuit breaker may be capable of closing on carrying, and interrupting currents even though not rated to do so safely. Switching devices are not capable of literally "making" current.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes the proposal addresses the definition of circuit breaker in Part B of Article 100 listed under "Switching Devices". The proposal does not add clarity and proposes a requirement in the definition. The term "making" current is in common use in describing the functions of circuit breakers over 600 volts.

(Log #4313)

1- 113 - (100-Circuit Integrity Cable (New)): Reject
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 15 and 16 for comment.
SUBMITTER: Edward Walton, Marlborough, CT
RECOMMENDATION: Add the following definition:
Circuit Integrity Cable. A cables ability to continue to function after exposure to specific fire conditions for a specified period of time.
SUBSTANTIATION: The term circuit integrity is used throughout Article 760 and is a requirement called out in Article 700 [700-9(d)(1)(f)]. As used, circuit integrity does not define a particular

cable but is a characteristic that could apply to any cable and therefore its definition should be consistent throughout the Code. The definition will distinguish circuit integrity cables from fire retardant or fire resistant cables that have no circuit integrity.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel is unsure that the term "circuit integrity" has a common meaning as used in both Sections 700-9(d)(1)(f) and 760-2. Refer this proposal to both CMP-15 and CMP-16.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2561)

1- 114 - (100-Circuit Integrity (CI) Cable): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 16 for comment.
SUBMITTER: Wayne D. Moore, Hughes Assoc., Inc./Rep. Rockbestos-Surprenant Cable Corp.
RECOMMENDATION: Move current definition for "Fire Alarm Circuit Integrity (CI) Cable" found in Article 760-2 and revise definition to read:
Circuitry Integrity (CI) Cable: Cable used to ensure continued operation of critical circuits during a specified time under fire conditions.
SUBSTANTIATION: The term "Circuit Integrity" is used in two sections 760-2 and 700-9(d)1.(f). It seems to make more sense to define the term in Article 100 so that the user of the code would understand the term's use in both locations.
PANEL ACTION: Reject.
PANEL STATEMENT: The two present NEC references listed in the substantiation are not the same. One section's cable type is required to be both listed and be functional for a specific time period while the other section's cable type has no such requirements.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:

(Log #3932)

1- 115 - (100-Commercial (New)): Reject
SUBMITTER: Charles J. Palmieri, Palmieri Assoc.
RECOMMENDATION: Add new definition as follows:
Commercial. A qualifying term referring to premises that under normal business employ a permanent or semi-permanent staff for the activity of exchanging ideas, opinions, or retailing a product or group of products or the transportation of such products or a like.
SUBSTANTIATION: There are over 45 hits in the 1999 Code referencing the term commercial. In many instances the application of specific wiring methods and various items of utilization equipment may be installed in either retail, residential, or manufacturing locations. It is imperative that the Code Making Panel clarify these occupancies to enable the authority that has jurisdiction to evaluate each installation in a consistent manner. Beyond retailing locations the term commercial may be applied to such locations as banks and schools.
PANEL ACTION: Reject.
PANEL STATEMENT: 1. Many Code references are to commercial equipment, not commercial buildings. Commercial-grade equipment is defined by the product standards, for example, compare the Standard for Motor-Operated Commercial Food Preparing Machines, UL 763, to the Standard for Motor-Operated Household Food Preparing Machines, ANSI/UL 982.
2. In reality, commercial is better defined by what it is not (residential, industrial) than by what it is.
3. This is not a common definition used to identify an occupancy.
4. The proposed text would equally apply to industrial occupancies as well as a home office.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #257)

1- 116 - (100-Common/Return Conductor (New)): Reject
SUBMITTER: Charles M. Trout, Maron Electric Co.
RECOMMENDATION: Add the following new definition to read:
Common/Return Conductor. The conductor in a multi-wire circuit or system which is used to carry the unbalanced load of the phase conductors in that circuit or system. In a grounded circuit or system, this is the conductor which is intentionally grounded.
SUBSTANTIATION: This conductor is mistakenly referred to as the neutral conductor whether the loads on the phase conductors are balanced or not. This conductor is in a neutral state or condition only when the phase conductors of that circuit or system are balanced. In this condition, this conductor does not conduct, it is neutral. This conductor is also referred to as the grounded conductor. It is the intentionally grounded conductor in those circuits or systems which are intentionally grounded. Refer to Sections 250-1(1), 250-1(6), 250-21, 250-22, 250-24(d), 250-30(b) and 250-32(c) for circuits or systems which are not required or not permitted to be grounded. Therefore, to refer to the common/return conductor as the grounded conductor would only be correct if the circuit or system were intentionally grounded. This definition is needed to properly designate respective components of a circuit.
PANEL ACTION: Reject.
PANEL STATEMENT: The term Common/Return Conductor" is not used in the Code and therefore does not require a definition. See panel action on Proposal 1-110.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #632)

1- 117 - (100-Concealed): Reject
SUBMITTER: Charles M. Trout, Maron Electric Co. Inc.
RECOMMENDATION: Change definition of Concealed as follows:
Concealed. ~~Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.~~ Not visible to public view. Covered or kept from sight.
SUBSTANTIATION: The present definition treats concealed as being inaccessible. Using Webster's Dictionary, wiring in the canopy of a lighting fixture is concealed (not visible to public view) but it is accessible by lowering the canopy. The wiring is not visible or exposed but it is accessible. What do we mean when in Section 410-8(a)(5) we say "concealed behind building walls, structural ceilings, suspended ceilings, dropped ceilings or floors?" Certainly, they are concealed but in suspended ceilings or dropped ceilings they are also accessible. There is no reason for definitions in the NEC to differ from those which can be found in Webster's dictionary. I submit that if it is concealed, you cannot see it but it may be accessible and if it's exposed you certainly can see it, unless you somehow cover it to conceal it. See my proposal to change definition of "exposed" (as applied to wiring methods).
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that the existing definition is more usable. Changing this definition could result in unintended consequences to other NEC articles.

(Log #652)

1- 118 - (100-Conductor: Covered): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
~~A~~ An uninsulated conductor ~~encased~~ within a ~~material~~ cable jacket or armor ~~of composition or thickness that is not recognized by this Code as insulation.~~
SUBSTANTIATION: "Encased" infers individually embedded and surrounded. This type of conductor is not indicated in Code tables (except Table 310-21) and Code users have no information relative to ampacity, dimensions, temperature ratings, raceway fill, etc. This type conductor is apparently not a listed product. This creates a problem with Sections 110-2, 110-3, 110-11, 240-3, etc.
I believe covered conductor originally applied to one dubbed "weatherproof," encased in asphaltic-impregnated material widely used in the past for aerial outdoor spans. It appears to be rarely

used today and may be unavailable. "Covered" conductors appear to more appropriately be applied to (bare) conductors contained in cables such as Type SE, NM, UF, etc.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed definition is too restrictive as to what is considered a "covered conductor". Conductors not considered by the NEC as insulated exist in many forms and are in common use in the industry.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #653)

1- 120 - (100-Continuous Load): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
A load, or portion of a load, other than motors, ~~where the maximum~~ for which current is expected to continue for three hours or more.
SUBSTANTIATION: The panel statement for Comment 1-174 in the 1998 ROC indicated motor loads continuing for three hours or more are not excluded from the definition and that a load is not continuous unless the maximum current continues for three hours or more. This is a correct interpretation of the literal wording and the reason for this proposal. The definition is suitable only for nonmotor loads where the maximum load is all continuous. The panel concept does not harmonize with Article 430 rules which only apply a multiplier to the largest motor supplied by a set of conductors, not each motor. Motors may be designated continuous duty which is not the same as continuous, in code context.
Consider the following examples:
No. 1. Feeder (or service) conductors supply a total multiple motor load of 356 amperes and a lighting load of 35 amperes, all load for eight hours continuous; the largest motor is rated 65 amperes FLA. Panel statement and the definition indicate the load is continuous since the maximum current continues for three hours or more. Section 215-2(a) requires conductors with a minimum ampacity of 400 amperes times 125 percent, or 500 amperes. However, Section 220-4(a) indicates only the largest motor requires the 125 percent multiplier, which requires minimum conductor ampacity of 365 amperes, plus 25 percent of 65 amperes, plus 125 percent of 35 amperes, or 425 amperes. Does the definition and Section 215-2(a) or Section 220-4(a) have precedence?
No. 2. A set of conductors supplies a total maximum load of 18 amperes for lighting operating for three hours or more and 2 amperes of other load operating for less than three hours. This combined load doesn't meet the definition of continuous load since the maximum load is not for three hours or more. The conductor ampacity can be 20 amperes. If the conductors supplied only the lighting load it meets the definition of continuous, and minimum conductor ampacity is required to be 18 times 125 percent, or 22.5 amperes. This doesn't make sense.
While there may be few reported problems with the definition, I believe this is because it is not interpreted literally, but in accordance with the proposed revision and as indicated in Section 220-4(a). General practice I have observed is to increase the volt-amperes of any portion of the load continuing for three hours or more by 25 percent to arrive at minimum ratings for conductors, panelboards, and services. Example No. D3 in Appendix D appears to follow this procedure, which is also indicated in Section 430-24.
PANEL ACTION: Reject.
PANEL STATEMENT: The present definition is correct, clear, and is to be applied literally. The Submitter appears to be confusing total circuit loading with the maximum current of a single load to which the definition is to be applied.

(Log #2919)

1- 122 - (100-Coordintion (Selective) (New)): Accept
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 10 for comment.
SUBMITTER: Joseph A. Tedesco, Boston, MA
RECOMMENDATION: Add the following definition:
Coordination (Selective). Proper localization of a fault condition to restrict outages to the equipment affected, accomplished by the choice of selective fault-protective devices.
SUBSTANTIATION: Coordination, Selective Coordination and Coordinated are found in 240-12, 230-95, 620-62, 685-2, and 700-25. This definition should replace the one found in 240-12 because the word (phrase) is used in at least five places in the Code.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel refers this to CMP-10.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
MINICK: All references in the substantiation, including the several referenced Fine Print Notes, all refer to coordinated overcurrent protection as addressed in Section 240-12, Electrical System Coordination. As Section 240-12 provides the conditions on which a system of coordination shall be based, the logical conclusion is that Section 240-12 is presently the best suited NEC location for the definition of coordination as this definition relates to the orderly shutdown of electrical systems and should remain as a technical definition under the purview of Code-Making Panel 10.

(Log #654)

1- 123 - (100-Cord Connector (Body) (Separable Connector) (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add a definition for Cord Connector (Body) (Separable Connector) to read as follows:
Cord Connector (Body) (Separable Connector) A female contact device intended to be wired on the load end of a flexible cord for use as an extension from an outlet to provide a detachable electrical connection to an attachment plug or male flanged inlet.
SUBSTANTIATION: Cord connectors, separable connectors, are indicated in more than one article, e.g., Sections 200-10(b); 210-7; 210-50(a), 250-124(a); 410-29; 410-30(b)(c)(3); 410-56(g)(i); 410-58; 422-16(a)(3); 422-32; 511-6(c); 511-9(c); 513-5(d); 513-12(b); 520-53(k); 525-13(d); 525-15(d); 530-22; 551-46(a)(1), etc. Cord connector, connector, and separable connector as used in this code appear to refer to a common similar type female temporary connection device, although the different designations may infer otherwise. For Code purposes a definition would be useful as it is for receptacles and attachment plus, even though it is generally understood what those devices are.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes this definition is more appropriate for the product standards. This substantiation does not identify any problem of misinterpretation in the NEC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #320)

1- 124 - (100-Damp Location): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 6 and 18 for comment.
SUBMITTER: James F. Pierce, Intertek Testing Services NA Inc.
RECOMMENDATION: Delete and add as follows:
Location:
Damp Location: (Remove existing wording and replace with):
Locations protected from weather and not subject to saturation with water or other liquids but subject to moderate degrees of moisture.
SUBSTANTIATION: A simplified definition is needed that doesn't rely on a list of examples. Architectural designs vary significantly; therefore, designation of a specific area as a damp location is best left to the authority having jurisdiction who would base the decision of the definition and not a list of examples.
PANEL ACTION: Accept in Principle.
Revise the proposed definition to read as follows:
Damp Location: (Remove existing wording and replace with):
Locations protected from weather and not subject to saturation with water or other liquids but subject to moderate degrees of moisture. Examples of such locations include partially protected locations under canopies, marquees, roofed open porches, and like locations, and interior locations subject to moderate degrees of moisture, such as some basements, some barns, and some cold-storage warehouses.
PANEL STATEMENT: The panel concludes that the list of examples is useful. The list is beneficial to installers and inspectors in complying with the code rules. The panel refers this action to CMP-6 and CMP-18.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
MINICK: The revised definition of "damp location" uses the exact same words (weather, saturation, other liquids) as the definition of "wet location", but in an opposite way. Therefore, the definition of "damp location" is an inverse definition to the term "wet location" and is redundant. The term "moderate", while not identified by the NEC Style Manual as a vague word, is in fact a vague term that could hold different degrees of meaning depending on the individual defining the term. By the new wording (weather), it could be construed that this definition would only apply to outdoor locations. This revision does not add clarity to the present definition.

(Log #1041)

1- 125 - (100-Dedicated Circuit (New)): Reject
SUBMITTER: Charles M. Trout, Maron Electric Co. Inc.
RECOMMENDATION: Add a new definition to read:
Dedicated Circuit. A circuit with an overcurrent device and a return conductor which are designated for exclusive use of that circuit.
SUBSTANTIATION: To be dedicated all parts of the circuit must be dedicated or exclusive to that circuit. If the return conductor if shared by another circuit it also means the phase conductor is shared any time both circuits are energized. If the return conductor were to become open the "dedicated" circuit would be completely dependent on circumstances affecting the other circuit. A dedicated circuit should not be a part of a multiwire circuit. See my proposal for new definition of "Separate Circuit."
PANEL ACTION: Reject.
PANEL STATEMENT: The term "dedicated circuit" is not used in the Code and therefore does not warrant a definition.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #655)

1- 126 - (100-Disconnecting Means): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise Disconnecting Means (Disconnect) A device or group of devices consisting of a switch(es), circuit breaker(s) or other switching devices or other means permitted in this Code (by which) (whereby) the device load side ungrounded conductor(s), and where permitted or required, the grounded conductor(s) ~~of a circuit~~ can be disconnected from the device supply side conductors. ~~their source of supply~~.
SUBSTANTIATION: Editorial. the present unmodified "other means" is so broad it includes terminals, splicing devices, etc. Many sections referring to disconnecting means contain specifics, such as switch, circuit breaker, horsepower, simultaneous operation, locking provisions, etc. which in effect determine the type disconnecting means. Some sections permit or require grounded conductor. SWITCHING (disconnection) under specified conditions. A device which disconnects only ungrounded conductors of a circuit that contains a grounded conductor does not literally comply with the definition since the grounded conductor is a circuit conductor connected to the source of supply. This is not a conflict where the sections specify disconnection of ungrounded conductors, but sections which do not specify that, suggest the grounded conductors per definition, are also to be disconnected. Numerous sections specify disconnecting means without a reference to type, horsepower, simultaneous opening, etc., whereby a terminal connection or splicing device would literally comply with "other means" of the definition. Code users should not have to infer intent. Limiting "other means" to those permitted in the Code would clarify the term.
A disconnect does not literally comply with the definition if it disconnects only load side conductors and supply side conductors are not disconnected from the source of supply.
Where two switches (disconnecting means) supply one set of fuses as covered in the exception for Section 490-27(b)(7), opening one switch only disconnects the load side conductors from the supply side conductors to that switch and not necessarily from the source of power provided by the other switch.
Sections where other than switches or circuit breakers are permitted:
230-75
305-4(e)
422-31
422-32
424-20
426-51
430-109(f)
440-13
440-63
668-13(b)
669-8(b)
690-13 FPN
Sections with no specifics:
240-40
422-33(a)(b)
424-19(a)(c)(1)(2)
424-65
426-50

430-74(a)
445-10
660-5
680-12
PANEL ACTION: Reject.
PANEL STATEMENT: The requirements for disconnecting means are specified in the relevant Code sections and the proposed definition does not add clarity or facilitate its application.

(Log #2415)

1- 128 - (100-Dustproof): Accept
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 19 for consideration in Article 547.
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Delete the definition of the term "Dustproof."
SUBSTANTIATION: The term "dustproof" could be found in only one other place in the Code - Section 547-5(a), which improperly requires enclosures to be "dustproof." This term is not used in the UL electrical equipment directory in reference to enclosures or boxes, nor in the NEMA enclosure type designations. Submitter has submitted a proposal for Article 547 that will, if accepted, obviate the need for this term.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias
COMMENT ON AFFIRMATIVE:
COX: Recommend adding a statement in the Panel Action that refers the action on this proposal to CMP-19 for information.

(Log #2414)

1- 129 - (100-Dusttight): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Revise the definition of the term "Dusttight" as shown below:
"Dusttight. Constructed so that dust will not enter the enclosing case under specified test conditions and listed for Class II locations."
SUBSTANTIATION: The present definition states that dusttight enclosures are "constructed so that dust will not enter the enclosing case under specified test conditions" (emphasis added). This requires evaluation according to a published standard, strongly implying listing by a recoginzed testing laboratory. If that is the intent, it should be clearly stated. The specifier, installer, or AHJ can not practically determine whether the testing requirement has been met without listing.
PANEL ACTION: Reject.
PANEL STATEMENT: Class II is not the only application for dust-tight enclosures. In fact dust-tight is NEMA Type 13 not NEMA Type 9. Furthermore, prevention of the entrance of dust is only part of the Class II enclosure rating process. Also, the proposed definition contains a requirement which is prohibited by Section 2.2.2 of the NEC Style Manual.

(Log #5)

1- 131 - (100-Electric-Discharge Lighting): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 18 for information.
NOTE: The following proposal consists of Comment 1-176 on Proposal 1-75 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-75 was:
Add a new definition as follows:
Electric-Discharge Lighting: Systems of illumination utilizing fluorescent lamps, high intensity discharge (HID) lamps, or neon tubing.
SUBMITTER: Thomas E. Trainor, City of San Diego, CA
RECOMMENDATION: Proposal No. 1-75 was referred to CMP 18 for comment by the Technical Correlating Committee at the request of CMP 1.
SUBSTANTIATION: The Chairman of CMP 18 established a Task Group to represent the Panel in reviewing this proposal. The Task Group consisted of Stephen Kieffer, Jim Pierce and Tim Wall, with myself as Chair.
The Task Group recommends that the proposal to add the defintion of Electric-Discharge Lighting to Article 100 be accepted.
The recommendation of the Task Group is based on the following:
1) "Electric-Discharge Lighting" is a technical term used in more than one Article of the NEC. (Specifically Articles 100, 210, 225, 300, 310, 380, 400, 410, 450, 530, and 600.)
2) The proposed defintion is consistent with the way the term is used in all of these articles.
3) Locating the definition of "Electric-Discharge Lighting" in Article 100 will help to clarify related terminology such as "Electric-Discharge Lighting Fixture", "Electric-Discharge Lighting System", "Electric-Discharge Lighting Equipment" and "Electric-Discharge Lamp" which are all used in other Articles of the NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not believe that a definition for electric-discharge lighting is necessary in Article 100. Also, see action on proposal 1-132. By action of reject on this Proposal, the panel also rejects Proposal 1-75 of the 1999 NEC and the associated Comment 1-176 of the 1999 NEC. Refer this to CMP-18.

(Log #349)

1- 132 - (100-Electric-discharge Lighting): Accept

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 18 for information.

SUBMITTER: John D. Minick, Grand Prairie, TX

RECOMMENDATION: Reject NFPA 70 - A98 ROP Proposal 1-75 (Log #3718) and uphold the original CMP 1 action of "reject", and reject NFPA 70 A98 ROC Comment 1-176 (Log #309) which was held for the 2002 NEC revision cycle.

SUBSTANTIATION: TCC Chairman Harold Ware appointed John Minick, NEC CMP 1 Chairman, to chair a Task Group of NEC CMP1 and 18 members, plus any other persons as needed to recommend specific actions relating to NFPA 70 - A98 ROP Proposal 1-75 and NFPA 70 - A98 ROC Comment 1-176 concerning a proposed definition of "Electric-Discharge Lighting" that was submitted for the 1999 NEC. CMP 1 members John Troglia and Brooke Stauffer along with CMP 18 members Ken Kempel and Bernard Mezger were appointed by Task Group Chairman Minick to form the Task Group. Also, the NEMA Lighting Fixtures Section and the NEMA Lamp Section were consulted for suggestions and recommendations on this subject matter. Basically, the members of the Task Group unanimously recommend that no definition for Electrical-Discharge Lighting be included in NEC Article 100 for the reasons as stated below.

The inclusion of a definition for the term "electrical discharge lighting", outside that already included in National Electrical Code Article 600, would seem to be a controversial solution looking for a problem. To date, and also within Proposal 1-75 for revision of the 1999 National Electrical Code, no real problem has ever been identified that would demand such a singular or unique definition in National Electrical Code Article 100. On the other hand, there are indications that would support the exclusion of a singular definition of electrical discharge lighting in Article 100. By CMP 1's panel statement on Proposal 1-75, "the definition submitted appears to serve systems serving electric signs and outline lighting" and also states that "there is no substantiation that the proposed definition would be acceptable for lighting fixtures covered in Article 410". It was pointed out by one Task Group member that there is no National Electrical Code generic definition of "lamps" or "lighting" or "illumination" as these terms would apply to a lighting product with only general references being defined as a part of their relationship to either application or installation of lighting. Examples of such definitions are "lighting outlet" and "outline lighting". The fact that a single definition of electric discharge lighting may not always fit all lighting categories in all applications was questioned by several of the Task Group members. As an example, is "neon lighting" a true lighting source as compared to true HID type lighting, or is it merely a decorative amenity that does in fact produce light? Another Task Group member raised the question of including "cold cathode" lighting if "neon" type lighting was included. In essence, such a singular definition of electric discharge lighting may indeed raise more questions that it may solve as such a definition may not always fit all situations in all occasions.

PANEL ACTION: Accept.

PANEL STATEMENT: Refer this to CMP-18 for information.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #656)

1- 134 - (100-Enclosed): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise definition of Enclosed to read as follows:

Surrounded by a case, housing, fence, or walls that prevent persons from accidentally contacting energized parts, or contained in a raceway, cable jacket or armor, or other equipment approved for enclosing conductors.

SUBSTANTIATION: Many code sections use phrases such as "enclosed in a raceway", "enclosed within the same raceway", "enclosed in a metallic sheath", and similar phrases. Many code users may conclude that "case" and "housing" do not include raceways or cable armor since the definition of enclosure relates case or housing to apparatus.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal does not add clarity to the definition and contains a variation of the word being defined.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #657)

1- 135 - (100-Enclosure): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise definition of enclosure to read as follows:

The case or housing of apparatus, raceways, cable jacket or armor, or other equipment approved for enclosing conductors, or the fence or walls... (remainder unchanged)

SUBSTANTIATION: Editorial. Many code sections equate raceways, cable armor conduit bodies, boxes, etc. with enclosures, while other sections indicate they are not enclosures. The proposal would include auxiliary gutters, conduit bodies, boxes, cablebus framework, etc., which are not cases or housing for apparatus.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal does not add clarity to the definition and contains a variation of the word being defined.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2154)

1- 136 - (100-Energized): Accept

SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.

RECOMMENDATION: Revise the definition of Energized as follows:

Electrically connected to a source of voltage ~~potential difference~~.

SUBSTANTIATION: The term "potential difference" should be avoided if possible per the NEC Style Manual.

"The term voltage is well understood and shall be used in preference to other terms such as potential," [NEC Style Manual 3.2.5.5 Voltage]. Voltage is defined in Article 100 as a "...difference of potential...".

PANEL ACTION: Accept.

NOT RETURNED: 1 Macias

(Log #631)

1- 138 - (100-Exposed (as Applied to Wiring Methods)): Reject
SUBMITTER: Charles M. Trout, Maron Electric Co. Inc.
RECOMMENDATION: Change definition of Exposed (As applied to wiring methods) as follows:
Exposed (As applied to wiring methods). On or attached to the surface or ~~behind panels designed to allow access.~~ Visible to view without removal of panels or obstructions.
SUBSTANTIATION: The present definition treats exposed as being the same as accessible. Prior to the 1999 NEC it referenced See "Accessible: (As applied to wiring methods)" as part of the definition. This part of the definition was deleted in the 1999 NEC and neither the ROP or the ROC appears to include reasoning for this. Using Webster's Dictionary which tells us that "to expose" is to uncover or bring into view means, that while it is not uncovered or not in view, it is not exposed. The problem with using the present definition is that it renders part of the Code such as the exception to Section 250-50 as useless or in fact dangerous with regard to the purpose of Section 250-50. As an example, if this exception had read in part "the entire length of the interior metal water pipe that is being used for the conductor is accessible" rather than saying exposed, would it serve the purpose it was intended for? Why do we say in Section 318-6(h) that cable tray shall be "exposed and accessible" when under the present definitions they are one and the same. Prior to 1971, the NEC definition of exposed was "not concealed" but since the definition of concealed paralleled "inaccessible", the definition of exposed was changed to parallel "accessible". We have two pair of words, each pair having opposite meanings. Something is either "exposed" or "concealed" and something is either "accessible" or "inaccessible'". I believe it's time to correct our definitions. See my proposal to change definition of concealed.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing definition is expressly limited to wiring methods. Changing this definition could result in unintended consequences to other NEC articles.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #4379)

1- 139 - (100-Fastened in Place (New)): Reject
SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Add the following definition:
Fastened In Place (as applied to utilization equipment). Equipment that is held in position by fasteners, piping, hose connections, or other means.
SUBSTANTIATION: Utilization equipment, such as waste disposals, swimming pool pumps, etc., that is held in place by piping or hose connections without the use of specific additional fasteners is being interpreted as not being fastened in place. Permissible loads and computation of loads on circuits and receptacle outlet locations are being compromised. This term is used in more than one article, therefore belongs in Article 100.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes the submitter's intent is satisfied by the existing NEC requirements in Section 110-13(a) and supported by most product standards.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2323)

1- 140 - (100-Feeder, Motor): Reject
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 11 for information.
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add a new definition to read as follows:
Feeder, Motor. Any feeder, including those that serve panelboards, switch boards, and motor control centers, that carries current to supply a motor.
SUBSTANTIATION: There is confusion as to what exactly a motor feeder is, and corresponding difficulty in apply the relative code sections.
Many believe that once a motor branch circuit or feeder is terminated at a panel, switchboard or motor control center, it no longer is treated as a motor feeder for the purposes of sizing and protection. There are some circumstances that this may present problems, such as sizing the overcurrent device in such a manner as to permit a motor to start.
This definition would go a long way to clearing up the difficulty in the use of articles 430-62 and 63 as well as making the code more user friendly.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed definition is considered unnecessary and does not add clarity to the use of the term. Refer to CMP-11 for information.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2929)

1- 141 - (100-Garage): Accept in Principle
SUBMITTER: Robert R. Sallaz, City of Munroe Falls, OH
RECOMMENDATION: Revise the definition to read as follows:
Garage. A building or portion of a building in which one or more self-propelled vehicles ~~carrying volatile flammable liquid for fuel or power~~ are kept for use, sale, storage, rental, repair, exhibition or demonstrating purposes. ~~and all that portion of a building that is on or below the floor or floors in which such vehicles are kept and that is not separated therefrom by suitable cutoffs.~~ For commercial garages see Section 511-1.
SUBSTANTIATION: The current 66 word sentence defining "garage" is too lengthy, unclear, and does not apply to the term as used in Section 625-29 for electrical vehicles. By making the current FPN the second sentence it will follow the Style Manual.
PANEL ACTION: Accept in Principle.
Revise the definition to read as follows:
"Garage. A building or portion of a building in which one or more self-propelled vehicles can be kept for use, sale, storage, rental, repair, exhibition or demonstration purposes.
FPN: For commercial garages, repair and storage, see Article 511."
PANEL STATEMENT: The panel agrees with the submitter, but prefers the reference to Article 511 as a FPN.

(Log #3061)

1- 142 - (100-Ground-Fault Circuit Interrupter): Accept in Principle in Part
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Change the definition to define Class A protection.
Ground-Fault Circuit Interrupter. A device intended for the protection of personnel that functions to de-energize a circuit or portion thereof within an established period of time when a current to ground exceeds ~~some predetermined value that is less than that required to operate the overcurrent protective device of the supply circuit~~ the values established for a Class A device. Class A, when applied to a Ground-Fault Circuit Interrupter, is a device that:
(a) will interrupt the circuit to the load when the interrupter ground fault current is 6 mA or more in a time not greater than given by the equation:

$$T = (20/I)^{1.43}$$

where:
T = time in seconds, and
I = ground-fault current in rms milliamperes for fault currents between 6 mA and the maximum voltage divided by 500 ohms.

(b) and will not interrupt the circuit to the load when the ground fault current is 4 mA or less (when the ambient air temperature is

less than -5°C or more than 40°C, the minimum trip current may be 3.5 mA instead of 4 mA).

(c) and is capable of keeping within the requirements in (a) should the identified circuit conductor (neutral) become inadvertently grounded between the interrupter and the load.

The prime function of a Class A GFCI, therefore, is to provide protection against hazardous electric shocks from leakage currents flowing to ground from defective circuits or equipment. It does not provide protection against shock should a person make contact with two of the circuit conductors on the load side of the GFCI.

SUBSTANTIATION: Requirements in the Code are for Class A protection. The current definition is unclear with respect to what constitutes "protection of personnel" or what the "established period of time" is. By specifically calling out the requirement for a Class A device, the ambiguities are eliminated.

PANEL ACTION: Accept in Principle in Part.

Revise the definition to read as follows:

"Ground-Fault Circuit Interrupter. A device intended for the protection of personnel that functions to de-energize a circuit or portion thereof within an established period of time when a current to ground exceeds the values established for a Class A device.

FPN: Class A ground-fault circuit interrupters trip when the current to ground has a value in the range of 4 to 6 mA. For further information, see Standard for Ground-Fault Circuit Interrupters, UL 943."

PANEL STATEMENT: The panel concludes that this revision meets the submitter's intent without including a requirement in the definition.

(Log #1544)

1- 143 - (100-Grounded Condcutor, FPN (New)): Reject

SUBMITTER: Thomas J. Conlan, Conlan's "The Electrician Inc."

RECOMMENDATION: Revise definition to read as follows:

Grounded Conductor:

A system or circuit conductor that is intentionally grounded.

Add a fine print note:

FPN: Basically a grounded conductor is a conductor designed to carry current, for example in a 2 conductor power cord that contains a grounded conductor (polarized/identified) as addressed in Article 200 and 400 and a hot conductor basically addressed in Article 240. Also electrical training to the theory of Kirchoffs law dictates that whatever current goes into a circuit must come out, which relates to if 1 amp goes in the hot conductor, 1 amp leaves through the grounded conductor so the grounded conductor is a current carrying conductor.

SUBSTANTIATION: The definition is very confusing to most electrical people and no solid definition has really been established as to the training and design of the conductor.

It would solve a lot of problems to insert a fine print note and what the conductor was designed to do.

Food for thought - the grounding conductor is designed to carry fault current.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed Fine Print Note is not entirely correct. The Fine Print Note does not add clarity to the definition of grounded conductor. The substantiation does not identify any specific problems that would be solved by the addition of the proposed Fine Print Note.

1- 144 - (100-Grounding Electrode (New)): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for information.

SUBMITTER: J. Philip Simmons, Olympia, WA

RECOMMENDATION: Add the following definition:

Grounding Electrode. A conducting element used to connect electrical systems or electrical equipment to earth.

SUBSTANTIATION: This term needs to be defined in Article 100 as it is used in several articles in the NEC. Articles where this term is used include 250, 280, 501, 502, 503, 504, 545, 547, 551, 553, 640, 675, 690, 800, 810, 820, and 830.

PANEL ACTION: Reject.

PANEL STATEMENT: The substantiation does not identify a problem requiring an additional definition. The panel refers this proposal to CMP-5 for action.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #658)

1- 145 - (100-Grounding Electrode Conductor): Accept in Principle

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise definition of Grounding Electrode Conductor to read as follows:

The conductor used to connect the grounding electrode to the equipment grounding conductor, to the grounded conductor, or to both, ~~of the circuit~~ at the service ~~equipment, or~~ at ~~the source of~~ a separately derived system or other derived system.

SUBSTANTIATION: The definition does not literally apply to a (grounding electrode) conductor attached to a service at a location other than service equipment as permitted by Section 250-24(a)(1)(d), nor to a conductor attached at a point remote from the source of a separately derived system as permitted by Section 250-30(a)(1)(2), nor to a grounding conductor for sources which are not services or separately derived systems.

Outside secondary conductors from a separately derived system per Section 240-21(b)(4) could have a grounding connection at the disc/overcurrent device which may be far from the source.

An alternate power source generator used with a solid neutral connection to a transformer secondary results in neither source meeting the definition of separately derived. (See my proposal for Section 250-51).

Transformers supplying secondary ties per Section 450-6 also do not appear to meet the definition of separately derived systems and the definition doesn't cover the grounding conductor for such systems.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The panel believes that the action on proposal 1-146 meets the intention of the submitter.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #3346)

1- 146 - (100-Grounding Electrode Conductor): Accept in Principle

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for comment.

SUBMITTER: Paul Dobrowsky, Holley, NY

RECOMMENDATION: Revise as follows:

Grounding Electrode Conductor. The conductor used to connect the equipment grounding conductor, the grounded conductor, or both ~~grounding electrode(s) equipment grounding conductor, to the grounded conductor, or to both, of the circuit~~ at the service equipment, at each building or structure where supplied from a common service, or at the source of a separately derived system.

SUBSTANTIATION: The language needs to be the same for services, separately derived systems, and where multiple buildings or structures exist. The conductor being connected to an electrode should be consistently defined whether it is at the service or at a building supplied by a feeder. The term grounding electrode conductor should be used consistently where circuits or systems are connected to a grounding electrode.

A proposal has been submitted to modify Section 250-32(f) to be consistent with the proposed change here.

PANEL ACTION: Accept in Principle.

Revise proposed text as follows: "Grounding Electrode Conductor. The conductor used to connect the grounding electrode to the equipment grounding conductor, to the grounded conductor, or to both, at the service equipment, at each building or structure where supplied from a common service, or at the source of a separately derived system."

PANEL STATEMENT: The definition needs to indicate that the grounding electrode conductor is connected to the grounding electrode. Refer to CMP-5 for comment.

(Log #3781)

1- 147 - (100-Grounding System): Reject
SUBMITTER: Behzad Eghtesady, City of Los Angeles, CA
RECOMMENDATION: Grounding System. It consists of all interconnected grounding connections in a specific power system that is isolated from adjacent grounding system. The isolation is provided by transformer primary and secondary windings that are coupled only by magnetic means. Such system boundaries are defined by the lack of a physical connection that is either metallic or through a significantly high impedance.
SUBSTANTIATION: Currently there are no definition for what is a system ground. The current Webster or any other technical dictionary does not contain any such definitions.
Providing this definition will clarify the intend of the code that:
1. There be more than one system ground within a given installation.
2. Clarify the difference between equipment ground and system ground.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed definition contains the term being defined and contains a requirement that is prohibited by Section 2.2.2 of the NEC Style Manual.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #3787)

1- 148 - (100-Habitable Room (Space) (New)): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 2 for action in Article 210.
SUBMITTER: John I. Williamson, Minnesota Board of Electricity
RECOMMENDATION: Create a new definition for Habitable Room (Space) that could be applicable throughout the code including, but not limited to, Section 210-8(a)(2)
Habitable Room (Space). A habitable room (space) is space in a structure for living, sleeping, eating or cooking. Bathrooms, toilet compartments, closets, hallways, storage or utility space, and similar areas are not considered habitable space.
SUBSTANTIATION: Substantiation - There currently is no definition in the code for "habitable room" (space). The typical dictionary definition for "habitable" is too ambiguous to be relied on for code application. This proposed definition appears to be correlated with the use of the word "habitable" in the following sections including, but not limited to: Section 210-8, Section 210-52, and Section 210-70. Although building codes will usually contain a definition for habitable room, the electrical code is enforced in many jurisdictions that do not adopt a basic building code. The electrical code is often relied upon as a stand-alone document and must include definitions for specific non-electrical terms.
PANEL ACTION: Reject.
PANEL STATEMENT: The National Electrical Code does not generally classify occupancies or spaces within buildings. This type of classification is best left to the building code provisions of which the term "habitable room" is one of the spaces defined in the 2000 International Building Code and is almost identical to the proposed definition. Forward to CMP-2 for action on proposed new definition.

1- 150 - (100-In Sight From (Within Sight From, Within Sight)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise definition of In Sight From (Within Sight From, Within Sight) to read as follows:
Where this Code specifies that one equipment shall be "in sight from", "within sight from", or "within sight", etc. of another equipment, the specified equipment <u>shall be immediately adjacent to the other, or where normally illuminated so as</u> to be visible <u>from the other equipment, shall</u> ~~and~~ not be more than 50 ft (15.24 m) distant from the other <u>equipment.</u>
SUBSTANTIATION: Proposal specifically invokes an illumination requirement (natural or artificial) which is only inferred by the word "visible". Equipment which complies when there is illumination won't comply when lighting is off in a building or where outside during darkness and no specifically required illumination is provided.
"Normally illuminated" provides for natural or artificial type when the location is occupied by a person(s).
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed definition does not add clarity to the present definition. The term "adjacent" is vague and unenforcable according to the Style Manual.

(Log #1400)

1- 151 - (100-In Sight From (Within Sight From, Within Sight)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise definition of "In Sight From (Within Sight From, Within Sight)" to read as follows:
Where this Code specifies that one equipment shall be "in sight from", within sight from", or "within sight", etc., of another equipment, the specified equipment is to be ~~visible~~ <u>in direct line of sight from,</u> and not more than 50 ft. (15.24m) distant from the other.
SUBSTANTIATION: Editorial. Dictionary definition of "visible" is "capable of being seen", "perceptable of vision", "in full view or readily seen". A disconnecting means located 50 ft from a motor controller and complying with the rule while there is adequate artificial or natural illumination may not be visible from the controller when there is no artificial or natural illumination at the disconnecting means. For example, in a plant during night time shudown where local illumination is provided at the controller and motor location for maintenance or repair but with no illumination at the remote disconnecting means. Where a motor controller at an oil well pump or similar outdoor installation is 50 ft. from a service disconnect serving as the disconnecting means for the motor and controller and no artificial illumination is provided at the disconnect, it may not be visible during night time or dense fog. A disconnecting means for air conditioning equipment installed outdoors and 50 ft. distant may not be visible under the same conditions.
Section 110-26(d) only requires illumination for certain equipment, and then only where installed indoors.
"Direct line of sight" sould provide for visibility under "normal" conditions but does not impose the condition to always be visible. A strict interpretation of the rule would require artificial illumination at the disconnecting means, and prohibit installations where dense fog may occur.
Additionally, the absence of the word "from" after "visible" is literally unclear whether the equipment is to be merely visible, or visible from the other equipment, which is the intent but not plainly stated. Ambiguity does not serve the Code well.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation does not support the recommended change. The panel concludes that the present language in the definition adequately addresses situations where one piece of equipment is not in sight of another without regard to the time of day.

NOT RETURNED: 1 Macias

(Log #3931)

1- 152 - (100-Industrial (New)): Reject
SUBMITTER: Charles J. Palmieri, Palmieri Assoc.
RECOMMENDATION: Add new definition as follows:
Industrial. A qualifying term referring to premises that under normal business employ a permanent or semi-permanent staff for the purpose of activity is to manufacture and distribution a product or group of products.
SUBSTANTIATION: There are over 70 hits in the 1999 Code referencing the term industrial. In many instances the application of specific wiring methods and various items of utilization equipment may be installed in either retail, residential, or manufacturing locations. It is imperative that the Code Making Panel clarify these occupancies to enable the authority that has jurisdiction to evaluate each installation in a consistent manner.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "industrial" is in common use, is well understood, and does not need a definition in Article 100. The proposed definition might well encompass a commercial operation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:

NOT RETURNED: 1 Macias

(Log #2322)

1- 153 - (100-Industrial Occupancy (New)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add a new definition to read as follows:
Industrial Occupancy. For the purposes of the NEC, To be an Industrial occupancy, all of the following conditions must be met.
(1) Conditions of maintenance and engineering supervision ensure that only qualified persons will monitor and service the system.
(2) The premises wiring system has 2500 kVA or greater of load used in industrial process(es), manufacturing activities, or both, as calculated in accordance with Article 220.
(3) The premises has at least one service that is more than 150 volts to ground and more than 300 volts phase-to-phase.
SUBSTANTIATION: There is no definition of just what an industrial occupancy is, even though it shows up in the NEC over 70 times.
This definition would give individuals utilizing the code clear guidelines as to just what an industrial occupancy is, in addition to making the code more user friendly. It has been argued that industrial occupancies include facilities such as data processing, large multi-building commercial facilities and can be utilized for facilities such as high schools.
There are possible problems that may arise if this is approved. Sections 240-21(c)(3) and 250-21 may be clouded by this submission, but on a whole these are minor and the local authority having jurisdiction may grant leeway on these two sections.
Note that this definition parallels Section 240-91.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed definition contains a requirement which is prohibited by Section 2.2.2 of the NEC Style Manual.

(Log #3642)

1- 154 - (100-Interrupting Rating): Reject
SUBMITTER: Jim Brozer, Acton, MA
RECOMMENDATION: Add the following as a second Fine Print Note to the definition of Interrupting Rating:
"Multi-pole overcurrent devices have both a multi-pole interrupting rating and a single-pole interrupting rating at any one particular voltage."
SUBSTANTIATION: This addition is needed because most users do not understand that 2 and 3 pole overcurrent devices have two (2) interrupting ratings. This needs to be pointed out so that the users can properly apply these products. I have provided a copy of Table 7.1.7.2 from UL 489 that lists the single-pole interrupting ratings under the bold "Individual" columns.
Single-pole interrupting ratings become especially critical on corner grounded delta systems, resistance grounded systems, center point grounded delta systems, and ungrounded systems, all systems where one or two faults can cause full voltage to appear across one pole, thus necessitating compliance with single-pole interrupting ratings.
For example, using the table 7.1.7.2 from UL 489, all 60 amp, 480 volts, 3-pole circuit breakers have an 8,600 ampere single-pole interrupting rating. The table is used for the minimum interrupting ratings tests. There is no similar table for the higher interrupting ratings tests. Therefore, you could have a 0-800 amp, 480 volt molded case circuit breaker, with a marked interrupting rating of 100,000 amperes, that was only tested at 8,660 amperes with 480 volts across one pole. This is a serious issue that can be addressed by bringing it to the attention of users so that they can apply these devices within their ratings.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: Specific test conditions do not affect the definition of "Interrupting Rating".

(Log #347)

1- 156 - (100-Kitchen (New)): Reject
SUBMITTER: Mike Melaney, Moraine Park Technical College
RECOMMENDATION: Add a definition for kitchen to read as follows:
Kitchen. A separate room with permanent means for cooking and food preparation and one or more of the following; 1 sink, dishwasher, trash compactor, refrigerator.
SUBSTANTIATION: 1) Section 210-52(b)(3) requires no small appliance branch circuit shall serve more than 1 kitchen, but there is no definition of a kitchen.
2) In hotel rooms, a dorm refrigerator with a microwave on top could be considered a kitchen which makes the room a dwelling unit requiring more circuits.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "kitchen" is in common use, is well understood, and does not need a definition in Article 100 for proper application of the Code rules.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #3789)

1- 157 - (100-Kitchen (New)): Reject
SUBMITTER: John I. Williamson, Minnesota Board of Electricity
RECOMMENDATION: Create a new definition for Kitchen that could be applicable throughout the code.
Kitchen. An area generally designated for storage, preparation, cooking, and serving of food. Cleaning and washing of food equipment and utensils also is conducted in this area.
SUBSTANTIATION: Substantiation - There currently is no definition in the code for "kitchen". The typical dictionary definition for "kitchen" is too ambiguous to be relied on for code application. This proposed definition appears to be correlated with the use of the word "kitchen" throughout the code. Very often the electrical code is relied upon as a stand-alone document in non-building code areas and must include definitions for specific non-electrical terms. Section 210-52(b)(3) states that no small-appliance branch circuit shall serve more than one "kitchen". This new definition will enable authorities having jurisdiction to better differentiate between kitchens and the increasingly common large wet bar areas that may have the "appearance" of being a kitchen.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "kitchen" is in common use, is well understood, and does not need a definition in Article 100 for proper application of the Code rules.

(Log #3414)

1- 158 - (100-Labeled): Reject
SUBMITTER: Nicholas T. Abbatiello, Spencerport, NY
RECOMMENDATION: Revise the definition of "Labeled" to read:
"...that maintains periodic inspection of production of labeled equipment and materials or who field evaluates unique equipment and machinery, and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner."
SUBSTANTIATION: Many agencies now have "Field Evaluation" programs in which an experienced "Field Engineer" performs an evaluation of the equipment at the manufacturer's site. If the equipment, which is usually utilization type equipment such as industrial machinery, is acceptable, a "Field Evaluation Label" is applied. This machinery is or equipment is a one-of-a-kind and will not be subject to periodic inspections. As the definition of "Labeled" is now written, the "Field Evaluation Label" is technically not acceptable as periodic inspection of production of the labeled equipment is not performed.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel realizes that labeling of field evaluated equipment does not involve periodic inspections, however the panel concludes that the existing definition of Labeled is broad enough that field evaluation is included. It is not necessary to specifically name field evaluation in the definition.

NOT RETURNED: 1 Macias

(Log #2208)

1- 159 - (100-Labeled, Listed): Reject
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction (approved) and concerned with product evaluation,...
Listed. Equipment, materials, or services included in a list published by an organization that is acceptable to the authority having jurisdiction (approved) and concerned with evaluation of products or services,...
SUBSTANTIATION: "Approved" is defined in Article 100 of the NEC as "acceptable to the authority having jurisdiction." By adding this word here parenthetically within these definitions, it gives increased awareness and exposure to the reader of the code emphasizing the meaning of the word "approved" as used in the code.
PANEL ACTION: Reject.
PANEL STATEMENT: The parenthetical use of the word approved adds no additional meaning or clarity to the definition.

(Log #2380)

1- 160 - (100-Liquid, Combustible (New), Liquid, Flammable (New)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Add the following definitions:
Liquid, Combustible: A liquid designated as Class II, III, IIIA, or IIIB, having a flash point at or above 100°F (37.8°C).
Liquid, Flammable: A liquid designated as Class IA, IB, or IC, having a flash point below 100°F (37.8°C) and having a vapor pressure not exceeding 40 psia at 100°F (37.8°C).
Revise the term below as shown, to group the entries alphabetically:
~~Volatile flammable liquid~~ Liquid, volatile flammable.
SUBSTANTIATION: Definitions of these terms would be helpful to Code users, who often seem to be unsure whether the requirements for Class I locations apply to liquids such as jet fuel, diesel fuel, or paint thinner. The definitions proposed are based on those in NFPA 497.
PANEL ACTION: Reject.
PANEL STATEMENT: The controlling document for these definitions is NFPA 30, not NFPA 497. Although technically correct, these definitions are not complete and those requiring a complete defintion should be directed to NFPA 30.

(Log #4153)

1- 161 - (100-Listed): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
Listed. Equipment, materials, or services included in a list published by an organization that is acceptable to the authority having jurisdiction and concerned with evaluation of products or services, that maintains periodic inspection of production of listed equipment or materials or periodic evaluation of services, and whose listing states that either the equipment, material, or services meets ~~identified~~ appropriate designated standards or has been tested and found suitable for a specified purpose.
SUBSTANTIATION: This was Comment 1-42B in the prior cycle. It restores the wording of the 1996 NEC, which should never have been changed. This wording was put there by one of the greatest UL participants in the NEC process throughout its history. The point remains valid, that listing was meaningless without listing in conformity to the appropriate standard, which needed to be designated by that agency. Now that NFPA has gotten the message and revised Section 3-3.6.1 of the Regulations accordingly, the NEC should follow suit.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel accepts the recommended language which is consistent with the definition of listed in the Regulations Governing Committee Projects.

(Log #3135)

1- 162 - (100-Live Parts): Accept in Principle
SUBMITTER: Joseph J. Andrews, Electrical Safety Resources, Inc.
RECOMMENDATION: Revise the definition of "Live Parts" to read:
Live Parts. Electric conductors, buses, terminals or components that are a shock hazard when uninsulated or exposed.
SUBSTANTIATION: The current definition of live parts is very confusing. It reads, "Electric conductors, buses, terminals, or components that are uninsulated or exposed and a shock hazard exists." There are no punctuation marks among the words "uninsulated or exposed and a shock hazard exists." One does not know whether the word "exposed" goes with "uninsulated" or if it goes with "and a shock hazard exists."

Under NFPA 70E, Proposal 70E-48 (which tried to change the definition, but was rejected), the following Committee Statement was made: "The concept of live parts requires two conditions to be present before a part is considered live. Condition no. 1 is uninsulated or exposed. The second condition is where a shock hazard exists." This statement indicates that there should at least be a comma after the word "exposed."

However, even with the addition of a comma, there is still confusion with interpretation of the existing words. This confusion leads to the question, "Are uninsulated bus bars, in an enclosure with its door closed, considered live parts?" Traditionally, the answer would have been "yes." But now, some people are saying "no," with the explanation that uninsulated energized bus bars in an enclosure are not a shock hazard since they are protected from contact by the enclosure. This logic implies that the parts change state from "live" to "not live" depending upon the opening and closing of a door. There is also question about whether or not overhead lines are to be considered "live" since they are usually unreachable by other than qualified persons, and therefore not a normal shock hazard.

At the NFPA 70E meeting on comments in June, 1999, there was a lot of discussion and disagreement about this definition, indicating that there is a need for clarification. The Committee decided not to change the definition because it is now in the NEC, and that the same definition should apply to all NFPA 70 series documents, with the NEC being the lead document (Committee Statement on Comment 70E-10). Based on that statement, change has to be made in the NEC first. The definition now existing in the NEC was proposed and accepted for the 1996 NEC, and was derived from the definition placed in the 1995 edition of NFPA 70E. That definition, in turn, originated in the NEC Manual of Style.

The proposed definition maintains the two conditions stated by the NFPA 70E Committee, while rearranging the words to improve understanding.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Proposal 1-163.

(Log #4425)

1- 163 - (100-Live Parts): Accept in Principle

SUBMITTER: Paul Dobrowsky, Holley, NY

RECOMMENDATION: Revise text as follows:

Live Parts. Electric conductors, buses, terminals, or components that are uninsulated or exposed ~~and a shock hazard exists~~.

SUBSTANTIATION: Based on the existing definition, live components placed in an enclosure are no longer considered live parts because a shock hazard does not exist (to the general public). Live parts are typically required to be guarded by enclosure or elevation. Once that is accomplished are they then not considered live parts? An individual in close proximity to live parts that are elevated may be exposed to a hazard. The definition of the components should not change depending on whether they are guarded or not.

PANEL ACTION: Accept in Principle.

Revise proposal as follows: Live Parts. Electric conductors, buses, terminals or components that present a shock hazard while energized.

PANEL STATEMENT: The listed items should be considered "live parts" if they present a shock hazard to anyone regardless of whether they are insulated, uninsulated, enclosed or exposed. This definition meets the intent of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

NOT RETURNED: 1 Macias

EXPLANATION OF NEGATIVE:

MINICK: The new definition is inconsistent with the way the term is now used in the National Electrical Code. The definition as proposed does not add clarification and in fact may be less clear.

(Log #3399)

1- 164 - (100-Location-Dry Location): Reject

SUBMITTER: Brian Spindle, S&A Electric

RECOMMENDATION: Add new text to the definition to read as follows:

"The inside of a raintight raceway which is installed above grade and arranged to drain shall be considered a dry location."

SUBSTANTIATION: 1. Clarification of this point is needed in the body of NEC.

2. Wire need not be dereated in locations which truly are dry.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed definition contains a requirement which is prohibited by Section 2.2.2 of the NEC Style Manual.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #1157)

1- 165 - (100-Luminaire): Accept in Principle

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 18 for information.

SUBMITTER: William Buckson, Hubbell Lighting Inc.

RECOMMENDATION: Remove the FPN under 410-1 and add the term Luminaire to Chapter 1, Article 100 Definitions, as follows:

Luminaire. A complete lighting unit consisting of a lamp or lamps together with the parts designed to distribute the light, to position and protect the lamps, and to connect the lamps to the power supply.

(See the companion proposal for replacing the terms "lighting fixture, lighting fixtures" and "fixture, Fixtures" with "luminaire, luminaires").

SUBSTANTIATION: 1. Lighting standards that have or are being developed, revised and adopted by the U.S., Canada, and Mexico are utilizing the IES term Luminaire in lieu of the term fixture. This includes the new UL/CSA BI-NATIONAL <u>luminaire</u> standard, which will ultimately replace the UL 1570, 1571, and 1572 standards. (These are the very standards used to evaluate the lighting products required to be Listed and Approved, according to the NEC and verified by the Authorities Having Jurisdiction).

2. The Canadian Electrical Code has used the luminaire term for the last ten years.

3. The Tri-NATIONAL lighting standard currently being developed will be designated as a <u>luminaire</u> standard.

4. The National Electrical Manufacturers Association has recently retitled its "Lighting Fixture Section, to <u>Luminaire</u> Section".

5. The U.S. National Committee's Technical Advisory Group to the IEC is working on exporting U.S. lighting perspectives into <u>luminaire</u> (IEC) standards.

6. There are initiatives underway by both NEMA and the NFPA to promote and solidify the use of the NEC from a global perspective. The NEC and its IEC counterpart, IEC 60364, have recently undergone an equivalency review conducted by UL, NFPA, IAEC, NIST, and NEMA as part of this global strategy.

7. If the NEC is ever to be considered as an International Standard, it must utilize the proper terminology.

8. The FPN under 410-1 denotes that luminaire is an international term. International does not mean European only, international, includes the U.S.

9. The term fixture, is archaic and a misnomer. The term fixture has many meanings and connotations. A fixture could refer to a building part, any type or number of gas, plumbing, machine, electric or appliance components, a familiar element or feature or even an individual that has been in a position for a long time. The term luminaire however, by its very formulation, communicates its meaning in a more clear and succinct manner, reducing the possibility of misunderstanding or misapplication of the term.

PANEL ACTION: Accept in Principle.

Revise the definition to read as follows:.

"Luminaire. A complete lighting unit consisting of a lamp or lamps together with the parts designed to distribute the light, to position and protect the lamps and ballast (where applicable), and to connect the lamps to the power supply."

PANEL STATEMENT: The panel believes the definition should include reference to ballasts. Refer to CMP-18 for action and removal of the FPN as proposed.

(Log #3133)

1- 166 - (100-Metal-Enclosed Power Switchgear (New)): Accept
Note: The Technical Correlating Committee directs the panel to review the use of the word "may" in accordance with 3.1 of the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Christopher Henry, Fluor Daniel
RECOMMENDATION: Add the following definition:
Metal-Enclosed Power Switchgear. A switchgear assembly completely enclosed on all sides and top with sheet metal (except for ventilating openings and inspection windows) containing primary power circuit switching or interrupting devices, or both, with buses and connections. The assembly may include control and auxiliary devices. Access to the interior of the enclosure is provided by doors or removable covers, or both.
SUBSTANTIATION: This definition is taken from IEEE Standard C37.20.2-1993, Section 2.1.9.2. While it is understood that metal-clad and arc-resistant types of switchgear are all metal-enclosed power switchgear, industry commonly uses "metal-enclosed," "metal-clad," and "arc-resistant" as three separate and distinct types of switchgear. The addition of the above definition clarifies what I believe to be the intent of the Code: to include metal-clad and arc-resistant switchgear as types of metal-enclosed switchgear.
PANEL ACTION: Accept.

(Log #350)

1- 167 - (100-Multi-building Campus-Style Complex (New)): Reject
SUBMITTER: Kenneth W. Birringer, University of Michigan/Rep. Univ. of Michigan Facilities Planning and Design
RECOMMENDATION: Add a definition for multi-building campus-style complex to read as follows:
Multi-building campus-style complex. A group of buildings or a single property and under single management in which a common system of conductors and equipment for the delivery of energy to these buildings is under the same management.
SUBSTANTIATION: A. With the exception of a few sections, the NEC is based on a model of a single utility service supplying a single premises. This proposed change combined with two others provides a means by which the Authority Having Jurisdiction can apply the NEC with consistency to nonutility, inter-building power distribution systems at multi-building campus-style complexes including universities and industrial complexes.
B. In addition, this proposed change provides a definition for the term "multi-building campus-style complex" which was introduced but not defined in Article 695 of the 1996 NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: The term is used only in Article 695 and does not warrant a definition in Article 100.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias
COMMENT ON AFFIRMATIVE:
ANTHONY: This comment is provided on behalf of the higher education industry in general and for an esteemed colleague in particular. The Panel's substantiation is consistent with past practice in other, similar proposals requesting definitions. I agree with the prevailing sentiment that some judicious compromise on the matter of which definitions should be included in the code must be struck to keep the NEC useable. Admittedly, some definitions that presently appear in this section may not meet the same criterion and probably ought to be removed. If 30-odd revisions to the NEC hasn't yet yielded a definition of "neutral"; the definition of a "multi-building campus-style complex" is not likely to come any time soon. The submitter's point about the need to see in the NEC more articulation of the specific requirements for campus-style facilities is not without merit, however; even if the term remains undefined.

(Log #254)

1- 168 - (100-Neutral (New)): Reject
SUBMITTER: Charles M. Trout, Maron Electric Co.
RECOMMENDATION: Add the following new definition to read:
Neutral. The state or condition of the common/return conductor, in a multi-wire circuit or system, when the loads on the phase conductors in that circuit or system are balanced.
SUBSTANTIATION: The term "neutral" is loosely and mistakenly used and accepted by the entire electrical industry. Neutral is not the name of a conductor. It is the state of a conductor, the state in which there is no current flow in a common/return conductor. Thus, the common/return conductor of a multi-wire circuit is in a neutral state when the loads on the phase conductors are balanced. But the return conductor of a two-wire circuit can never be in a neutral state because it is always carrying the return current of the phase conductor. Webster says that "neutral" is belonging to a neutral state, having no electrical charge or not aligned with any side. This proposed terminology would be more useful than current code language because it is technically more accurate and it distinguishes the "neutral state" of a conductor whether it is in a circuit where this conductor is intentionally grounded or is used in an ungrounded system.
This proposal relates to two other proposals for definitions namely: Return conductor and Common Return Conductor.
PANEL ACTION: Reject.
PANEL STATEMENT: A neutral conductor remains a neutral conductor whether the load is balanced or not. The substantiation does not demonstrate a need for a definition.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2758)

1- 169 - (100-Neutral (New)): Reject
SUBMITTER: Joseph A. Tedesco, Nat'l Technology Transfer, Inc.
RECOMMENDATION: Add definition as follows:
Neutral. A grounded conductor having the same voltage to each ungrounded conductor of the same 3-wire, or 4-wire circuit.
SUBSTANTIATION: Here is a start, although I realize not all neutrals are grounded. The term should be defined in the NEC. CMP 5 will review this same proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: A neutral conductor is not always a grounded conductor and a grounded conductor is not always a neutral conductor.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #3004)

1- 170 - (100-Neutral (New)): Reject
SUBMITTER: Rea Hamilton, Abbott Labs
RECOMMENDATION: Add definition for neutral to read as follows:
Neutral. A system or circuit conductor that is intentionally grounded.
SUBSTANTIATION: The common terminology for a grounded conductor is the word neutral and should be added to the code definitions.
PANEL ACTION: Reject.
PANEL STATEMENT: A neutral conductor is not always a grounded conductor and a grounded conductor is not always a neutral conductor.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2833)

1- 171 - (100-Neutral, Neutral Conductor (New)): Reject
SUBMITTER: Melvin K. Sanders, Ankeny, IA
RECOMMENDATION: Add a new definition to read as follows:
Neutral, Neutral Conductor. Point or circuit conductor path by which unbalanced currents reenter the source.
SUBSTANTIATION: Attempting to define a neutral that can be accommodated by the NEC has been known to make strong men fall to their knees and women and children weep. Used extensively throughout the electrical industry, it falls into the category of "I know what it is when I see it even if I can not define it". Section 220-22 requires one to calculate it and Article 310 requires one to investigate it as to whether it provides additional heat stress to conductors in a common raceway or cable, yet when queried, it is identified rather lamely as "The middle wire."
It is part of a circuit path but does not have to be grounded in order to perform as intended.
Therefore, it is not correctly identified as the "grounded conductor" [even though it must be grounded, such as in NEC Section 250-20(b)(1) and (2)]. Some grounded conductors may in fact be a deliberately grounded phase conductor of a corner-grounded three-phase three-wire "delta" connected source and are definitely not a "neutral" as those who have touched them accidentally know.
These issues were consulted while developing the proposed words:
310-15(b)4a: Normally balanced currents from one or two or more phases to a conductor common to the single phase or the poly-phases.
310-15(b)4b: Two phases and a common for a "Wye" system that has current in the common conductor approximately equal to the current in the phase or phases supplying line-to-neutral loads.
310-15(b)4c: Three phases from "Wye" systems that has a conductor common to the three phases and the supplied loads cause frequencies to be higher than the source power line 60 Hz even though the load currents may be equal in the phases.
Also:
"Wye" connected capacitor banks where one bank fails.
Faults that return to the source by any path.
Allows for fault currents to return to the source via the neutral path (IEC refers to this as the PEN).
Balancing currents circulating within the source are not neutral currents under this proposal.
Allow for multi-grounded system neutral currents to return to the source.
PANEL ACTION: Reject.
PANEL STATEMENT: This definition does not take into account harmonic currents. The substantiation does not indicate a need for this definition nor does it point out a problem.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2321)

1- 172 - (100-On Site Generator): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add a new definition to read as follows:
On Site Generator. An on site generator is one that is meant to be the primary source of supply to any service.
SUBSTANTIATION: There is no definition of what an on site generator is, even though it is used in several places in the code including Fire Pumps in NEC 695.
PANEL ACTION: Reject.
PANEL STATEMENT: An on-site generator need not be the primary source of power. Supply to a service is only through connection to the serving utility.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #339)

1- 173 - (100-On-Site Power Production Facility (New) and Standby Power Production Facility (New)): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 15 for consideration. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Richard Schneider, Lancaster, SC
RECOMMENDATION: Add the following definitions to 695-2:
On-Site Power Production Facility. (ref. 695-3(a)(2)) A facility producing electric power "on-site" intended to serve as the normal supply of electric power. It differs from standby power production facility in that it is expected to be normally, constantly energized.
Standby Power Production Facility (ref. 695-3(b)) A facility producing electric power "on-site" intended to serve as the alternate supply of electric power. It differs from on-site power production facility in that it is not expected to be normally, constantly energized.
SUBSTANTIATION: Present 695-3(a)(2) uses the term "on-site power production facility" which is undefined in NFPA 70 and NFPA 20 and are applying fire pump controllers erroneously. Authorities having jurisdiction have no present guidance.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "On-site Power Production Facility" only appears in Section 695-3(a)(2) and the term "Standby Power Production Facility" is not contained within the National Electrical Code, therefore, neither term is presently used in two or more Articles. The panel refers this proposal to Code-Making Panel 15 for action.

NOT RETURNED: 1 Macias

(Log #660)

1- 174 - (100-Oven, Wall-mounted): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 2, 19, and 20 for comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete definition or alternatively, revise:
A separate oven for cooking purposes, ~~and~~ consisting of one or more electric heating elements, internal wiring, and built-in or separately mounted controls, designed and intended for installation in or on a wall or in a cabinet.
SUBSTANTIATION: Present definition is unneeded as the term defines itself, as do other appliances such as electric range, clothes dryer, water heater, etc., which are commonly defined terms. It does not specify whether heating elements are electric (assumed) or gas (not excluded) and doesn't distinguish an oven part of a range.
PANEL ACTION: Accept in Part.
Delete definition of Oven, Wall-Mounted in Article 100.
PANEL STATEMENT: This definition was deleted as this term is commonly understood by both industry and non-industry and does not require a specific definition to be understood in applying NEC requirements. Refer this proposal to CMP-2, CMP-19, and CMP-20.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #661)

1- 175 - (100-Panelboard): Accept
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise definition of Panelboard to read as follows:
A single panel or group of panel units designed for assembly in the form of a single panel; including buses, automatic overcurrent devices and equipped with or without switches for the control of light, heat, or power circuits; designed to be placed in a cabinet or cutout box ~~placed in or against a wall or partition~~ and accessible only from the front.
SUBSTANTIATION: Editorial. The definition infers in or against a wall is the only acceptable mounting for a panelboard. Many are suitably installed on posts or poles, or angle iron or strut assemblies and some are suitable for floor mounting. The UL "white book" does not indicate such restrictions.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
DINI: I agree with Mr. Minick's Comment on Negative Vote. The present definition provides guidance to differentiate product application and safety rules between "panelboards" that are generally mounted to a vertical support and "switchboards" that are generally freestanding and mounted to the floor. The "placed in or against a wall or partition" gives the user of the NEC clear permission to place the panelboard enclosure "within any wall" or "against a partition" in a building or in a switchboard application.
MINICK: The present definition provides guidance to differentiate product application and safety rules between "Panelboards" that are generally mounted to a vertical support and "Switchboards" that are generally free standing and mounted to the floor. Panelboards may also be mounted within a switchboard section but the entire list of product application was not intended to be placed in the text. The "placed in or against a wall or partition" gives the user of the NEC clear permission to place the panelboard enclosure "within a wall" or "against a partition" in a building or in a switchboard application.

(Log #4154)

1- 176 - (100-Premises Wiring): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
Premises Wiring (System). That interior and exterior wiring, including power, lighting, control, and signal circuit wiring together with all of their associated hardware, fittings, and wiring devices, both permanently and temporarily installed, that extends from the service point ~~of utility conductors~~ or source of power such as a battery, a solar photovoltaic system, or a generator, transformer, or converter windings, to the outlet(s). Such wiring does not include wiring internal to appliances, fixtures, motors, controllers, motor control centers, and similar equipment.
SUBSTANTIATION: This is a companion proposal to one submitted as part of a comprehensive overhaul of Section 90-2 for the purposes of eliminating conflicts with the NESC. That proposal recognizes an unavoidable political reality, namely, that there are some major industrial players who are using the NESC for their medium voltage campus outdoor distributions, and that they will continue to do so for the foreseeable future. This modification, along with another one covering the definition of service point, establishes the appropriate demarcation, where the two codes interface.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel accepts this recommendation based on the fact that the term "of utility conductors" is redundant.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #318)

1- 177 - (100-Qualified Person): Reject
SUBMITTER: Mark Reese, Nineveh, IN
RECOMMENDATION: Revise definition of Qualified Person to read as follows:
~~One familiar.~~ One who has been formally trained in a nationally recognized program that includes information and hands on experience with the construction and operation of the equipment involved.
SUBSTANTIATION: Ignorance of the basic principals of electrical theory, and the lack of hands on training, can be deadly for the person performing the work. It can also be dangerous for the person performing maintenance.
PANEL ACTION: Reject.
PANEL STATEMENT: Being formally trained in a nationally recognized program is not the only way for as person to become a qualified person. Lack of formalized training also does not mean that a person is ignorant of the basic principals of electric theory.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #3800)

1- 178 - (100-Qualified Person): Accept in Principle in Part
SUBMITTER: Jack H. Zewe, Electrical Consultants, Inc.
RECOMMENDATION: Revise Article 100- Definition for a Qualified Person:
Old text: Qualified Person: One familiar with the construction and operation of the equipment and the hazards involved.
Revised test: One who has skills and knowledge of the construction and operation of the equipment and has received specific safety training on the hazards involved.
From OSHA 29 CFR: 1910.332(b)(3)
(3) Additional requirements for qualified persons. Qualified persons (i.e. those permitted to work on or near exposed energized parts) shall, at a minimum, be trained in and familiar with the following:
OSHA 29 CFR 1910.332(b)(3)(I)
(I) The skills and techniques necessary to distinguish exposed live parts from other parts of
electric equipment.
OSHA 29 CFR 1910.332(b)(3)(ii)
(ii) The skills and techniques necessary to determine the nominal voltage of exposed live parts,
and
OSHA 29 CFR 1910.332(b)(3)(iii)
(iii) The safe approach clearance distances specified by OSHA 29 CFR 1910.333 and the
corresponding voltages to which the qualified person will be exposed.
Note 1: For the purposes of OSHA 29 CFR 1910.331 through 1910.335, a person must have
the safety training required in order to be considered a qualified person.
Note 2: Qualified persons whose work on energized equipment involves either direct contact or
contact by means of tools or materials must also have the training needed to meet 1910.333(C)(2)
SUBSTANTIATION: Align the NFPA definition with the requirements of OSHA Electrical Safe Work Practices requirements. The present definition is weak and does not provide guidance on "who" is authorized to work on electrical equipment that may be energized. The OSHA Electrical Safe
Work Practices Training requirements are very specific on "who" and "what" a person must be able to do (SKILLS)to be considered QUALIFIED.
PANEL ACTION: Accept in Principle in Part.
Revise the definition of Qualified Person to read as follows:
"Qualified Person. One who has skills and knowledge related to the construction and operation of the equipment and has received safety training on the hazards involved."
PANEL STATEMENT: It is not necessary to repeat OSHA requirements in the NEC. The panel concludes that safety training is important.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #662)

1- 179 - (100-Raceway): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 8 for information.

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise definition of Raceway to read as follows:

Raceway. ~~An enclosed~~ A channel of metal or nonmetallic material designed expressly for holding wires, cables, or busbars, with additional functions as permitted in this code. Raceways include, but are not limited to, rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible conduit, electrical nonmetallic tubing, electrical metallic tubing, underfloor raceways, cellular concrete floor raceways, cellular metal floor raceways, surface raceways, wireways, cablebus, and busways.

SUBSTANTIATION: Editorial. Some raceways are not totally enclosed ("surrounded by") such as lighting busway, trolley busway, and strut-type raceway (Article 363).

Cablebus certainly appears to meet the definition of raceway. A similar Proposal 1-82 in the A92 TCR was accepted; action on Proposal 1-88 in the A95 ROP removed it from the definition. Substantiation for Proposal 1-88 was based on raceways being required to be continuous which would not permit a discontinuity where conductors pass through walls (open conductors) or where they terminate in switchgear to transformer rooms without framework connection to the equipment (transition to open wiring).

However, such transitions are inferred for raceways by Section 300-16 and can be considered a junction point or splicing point as covered in Section 300-18 which doesn't require raceways to be continuous for the entire length of the circuit.

If cablebus is not a raceway there is no provision similar to Section 300-16 for transitions to open wiring.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel concludes that enclosed is important. Removing the term "enclosed" from the definition could include other wiring methods and materials not considered raceways. Including Cablebus would not be consistant with the definition in Article 365. Refer to CMP-8 for information.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #1830)

1- 180 - (100-Raceway): Reject

SUBMITTER: Peter Fernandez, Peco Energy

RECOMMENDATION: Add:

"metal poles supporting lighting fixtures."

SUBSTANTIATION: See Article 410, Part D, Section 410-15(b) which indicates that a raceway is "a metal pole used to support lighting fixtures."

PANEL ACTION: Reject.

PANEL STATEMENT: Metal poles supporting lighting fixtures are permitted to be raceways only if the conditions specified in 410-15(b) are met. Otherwise they are not raceways and cannot be included in the definition.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #3332)

1- 181 - (100-Remote-Control Circuit): Accept

Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.

SUBMITTER: Paul Dobrowsky, Holley, NY

RECOMMENDATION: Delete the word "remote" from the definition heading. The heading should be Control Circuit.

SUBSTANTIATION: The word remote is vague and adds no value. How far away is considered remote? If the control circuit and "controlled equipment" is in the same enclosure is it still considered remote?

A similar proposal has been submitted for Article 725.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 2

NOT RETURNED: 1 Macias

EXPLANATION OF NEGATIVE:

DINI: This proposal should be rejected. Code-Making Panel 16, which considered a companion proposal (16-30) to remove the word "remote" from article 725 rejected this idea. They considered the term "remote" to be necessary, the appropriate word, and understood by all.

MINICK: The existing definition is correct. The term "remote" distinguishes control located outside the equipment enclosure from that located inside the enclosure. It should also be noted that Panel 16 rejected companion proposal 16-30 to remove the word "remote" from Article 725.

(Log #255)

1- 182 - (100-Return conductor (New)): Reject

SUBMITTER: Charles M. Trout, Maron Electric Co.

RECOMMENDATION: Add the following new definition to read:

Return Conductor. The conductor in a single two wire circuit or system which is used to carry the load of the phase conductor in that circuit or system back to the source. In a grounded circuit or system, this is the conductor which is intentionally grounded.

SUBSTANTIATION: Too often this conductor is mistakenly referred to as the neutral conductor. It is not a conductor which can be in a neutral state or condition. This conductor is also referred to as the grounded conductor. It is the intentionally grounded conductor in those circuits or systems which are intentionally grounded. Refer to Sections 250-1(1), 250-1(6), 250-21, 250-22, 250-24(d), 250-30(b) and 250-32(c) for circuits or systems which are not required or not permitted to be grounded. Therefore, to refer to the return conductor as the grounded conductor would only be correct if the system or circuit were intentionally grounded. This definition is needed to properly designate respective components of a circuit.

PANEL ACTION: Reject.

PANEL STATEMENT: The term "Return Conductor" is not used in the Code in the sense proposed and therefore does not require a definition. See Panel action on proposal 1-110.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #1040)

1- 183 - (100-Separate Circuit (New)): Reject

SUBMITTER: Charles M. Trout, Maron Electric Co. Inc.

RECOMMENDATION: Add a new definition to read:

Separate Circuit. A circuit that has a defined load on the overcurrent device but which permits the return or grounded conductor to be shared with another circuit.

SUBSTANTIATION: The terms "separate circuit" and "dedicated circuit" are used in the National Electrical Code without any difference in meaning between the two terms. I believe definitions should be made to differentiate between these two terms. A circuit can be separate from other circuits in that its overcurrent protective device is designed to protect a defined load. Its return or grounded conductor may be shared with another circuit, if desired, without affecting the purpose of the circuit and its overcurrent protection. See my proposal for new definition for "Dedicated Circuit".

PANEL ACTION: Reject.

PANEL STATEMENT: The term "separate conductor" is not used in the Code in the sense proposed and therefore the proposed definition does not agree with the present use of the term. See panel action and statement on Proposal 1-125.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #3123)

1- 184 - (100-Service Equipment): Reject
SUBMITTER: Neil F. LaBrake, Jr., Niagara Mohawk Power Corp.
RECOMMENDATION: Change:
Article 100 Definitions.
Service Equipment. The necessary disconnecting and overcurrent equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service conductors to a building or other structure, or an otherwise designated area, and intended to constitute the main control and cutoff of the supply from the service point.
SUBSTANTIATION: This change is necessary to clarify the intent for the main service equipment function. As an example, some transfer switches are manufactured, listed and labeled "suitable for use as service equipment" and contain only a disconnecting device along with necessary grounding provisions for service equipment. Although the listing agency qualifies the equipment in this manner, they do indicate the installation shall meet national and local requirements. The practice typically recognized as the local requirement is that service equipment needs to be comprised of a switch and fuse or circuit breaker to meet the necessary disconnecting and overcurrent function at the load end of service conductors. The service equipment could contain these devices in one enclosure or within grouped enclosures. In outdoor high voltage stations, the devices are grouped within the same switchyard.
This change will mitigate conflicts of installation arrangements with the requirements of authorities having jurisdiction of the electric supply and the National Electrical Code. See supporting 1999 NEC Article 230, Part F, and Section 230-91.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal does not add anything to the definition of service equipment, but appears to have an objective of placing a requirement for installation of overcurrent devices in the definition. The requirements for service equipment are necessarily included in Article 230.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #4155)

1- 185 - (100-Service Point): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
Service Point. The point of connection between the ~~facilities of the serving utility and the~~ premises wiring and the facilities of the serving utility, or the facilities of a serving entity recognized by the jurisdiction as having substantially equivalent organizational permanence, engineering supervision, and workforce training.
SUBSTANTIATION: This is a companion proposal to one submitted as part of a comprehensive overhaul of Section 90-2 for the purposes of eliminating conflicts with the NESC. That proposal recognizes an unavoidable political reality, namely, that there are some major industrial players who are using the NESC for their medium voltage campus outdoor distributions, and that they will continue to do so for the foreseeable future. This modification, along with another one covering the definition of premises wiring, establishes the appropriate demarcation, where the two codes interface. Please refer to the proposal on Section 90-2 for more substantiation.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposals 1-10 and 1-11. The existing definition of service point is more appropriate and complements the definition of service. No technical substantiation was submitted that would support the recognition of non-utility entities in installing electrical conductors and equipment without benefit of the requirements of the National Electrical Code. The code panel disagrees that this proposal would eliminate conflicts, if any exist, between the NEC and NESC concerning the definition of service point.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
TROGLIA: This is a companion proposal to Proposal 1-11 (Log #4151) that contains the rationale for use of the service point as the demarcation between supply systems and premises wiring and reconciles the scopes of the NEC and NESC. See my comment on vote on Proposals 1-10 (Log #52) and 1-11 (Log #4151).
COMMENT ON AFFIRMATIVE:
ANTHONY: There is integrity of purpose in this and other related proposals on subjects related to service point. The submitter should be applauded for keeping the debate on the subject lively and healthy.

(Log #1164)

1- 186 - (100-Service-Entrance Conductors, Overhead System): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise text to read:
"The service conductors between the terminals of the service equipment and a point usually outside of the building, clear of building walls, where usually joined by tap or splice to the service drop."
Or alternatively add:
FPN: There may be no tap or splice where jacketed multiconductor service cable is employed for the service drop and service-entrance conductors.
SUBSTANTIATION: Edit. Where a jacketed multiconductor service cable is employed as a service drop and continues unbroken as service-entrance conductors there is no tap or splice at the transition. I believe this type installation is done in some parts of the country, and recognized by the exception for Section 230-54(e).
PANEL ACTION: Reject.
PANEL STATEMENT: The existing definition has not resulted in any reported misunderstanding. The word "usually" does not add clarity to the present wording. The proposed Fine Print Note is unclear. No technical substantiation was submitted to support the recommendation.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2320)

1- 187 - (100-Standby Source of Supply (New)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add a new definition to read as follows:
Standby Source of Supply. A standby source of supply may be any source of supply that is meant to be available should the primary supply system become unavailable.
SUBSTANTIATION: There is some question within the electrical community of what a standby system is. Many feel that if for example, a generator feeds an emergency system, the generator becomes an emergency generator and may not feed any other loads. Others feel that only the system, I.E. emergency, legally required, optional etc, is to be classed as such and the generator in this example, is merely a standby generator.
The purpose of this proposal is to clarify that any redundant source of supply is in fact a standby source of supply.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "standby source of supply" is not used in the Code and therefore does not warrant a definition.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias
COMMENT ON AFFIRMATIVE:
ANTHONY: I will only add to the Panel's substantiation by referring the submitter to Chapter 7 and to the Fine Print Notes that contain other references. While "standby source of supply" does not appear, the words "standby source" appear 3 times and "standby" appears some 32 times.

(Log #1935)

1- 188 - (100-Structure): Accept
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section IAEI
RECOMMENDATION: Provide the following definition in Article 100: Structure. That which is built or constructed.
SUBSTANTIATION: The above term is used in more than 100 places in the NEC. These places are in more than 15 different articles under the responsibility of several different code panels. Having heard several different opinions from several different code panel members through the years, it seems obvious that to provide uniform interpretation of this term, a definition should be provided.

This is the definition in the proposed 2000 International Building Code which will likely be used by many building inspection departments across the country. This definition would allow the architect and electrical engineer, the general contractor and the electrical contractor and the building inspector and electrical inspector to all use the same definition.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2901)

1- 189 - (100-Structure (New)): Accept in Principle
SUBMITTER: James H. Maxfield, Dover, NH
RECOMMENDATION: Add a new definition to read as follows:
Structure. That which is constructed or built or erected or a portion thereof.
SUBSTANTIATION: The word structure is used throughout the NEC in several locations but is not defined. The definition is intentionally broad so as to include within the NEC everything that is built whether it is constructed solely from electrical components or not. For example, the addition of the definition would clarify the fact that the NEC considers a meter pedestal a structure.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel prefers the definition found in Proposal 1-188. See Proposal 1-188.

(Log #2152)

1- 192 - (100-Switching Devices, Circuit Breaker): Accept
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise the definition of Switching Devices, Circuit Breaker, as follows:
A switching device capable of making, carrying, and interrupting ~~breaking~~ currents under normal circuit conditions..., and interrupting ~~breaking~~ currents under specified abnormal circuit conditions,...
SUBSTANTIATION: The phrase "breaking currents" should be replaced with the phrase "interrupting currents" for consistency. CMP 1 has previously accepted a similar proposal. See A98-ROP 1-98a (Log #CP108).
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
MINICK: The term "breaking" is correct in context of this specific definition and is consistent with current product standards.

(Log #4036)

1- 193 - (100-Telecommunications): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 16 for information.
SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l
RECOMMENDATION: Add:
Telecommunications. Any transmission, emission, and reception of signs, signals, writings, images, and sounds, that is, information of any nature by cable, radio, optical, or other electromagnetic systems.
Adoption of this proposal and associated proposals will effect various Panels and the Correlating Committee. Sections that are effected include:
Communication to telecommunications: 520-5. (a) Exception; 830-10. (d)
Communications to telecommunications: 90-2. (b) 3; 90-2. (b) 4; 90-2 (b) 5; 90-3.; 210-25.; 225-2.; 225-14 (d) 1; 225-14 (d) 2; 225-14 (d) 3; 225-14 (d) 4; 250-4; 250-92. (b) FPN No. 2; 318-3. (a); 328-17.; 328-36.; 336-30 (a) (3); 400-4. (Table 400-4, including note 5 and 11); 501-14.; 501-14 (a); 501-14 (b); 502-14; 502-14 FPN; 502-14 (a); 502-14 (b); 517-30. (c) (3) Exception 2; 517-32. (d); 517-32. (f); 517-40. (a) Exception c.; 517-42 (d); 517-42 (g); 517 F.; 517-80.; 517-80. FPN; 518-4 (a) Exception b.; 530-11. Exception; 604-1.: 604-6 (a) 2. Exception No. 2; 620-36.; 625-17; 640-21 (b); 640-21 (c); 640-42. (b); 640-42. (c); 645-5 (d); 645-5 (e); 645-6 FPN; 700-1 FPN No. 3; 701-2. FPN; 702-2. Telephone to Telecommunications: 517-33 (a) 7.; 800-1 the second "telephone" to become "telecommunications"; 800-50 Exception No. 3 FPN No. 1.

Within figures: 760-61; 800-53; 820-53.

SUBSTANTIATION: Telecommunications is a term that is adopted by ANSI in their related standards to identify those transmissions in the proposed definition. Inclusion of this definition will harmonize this Code with other ANSI approved industry standards. This harmonization will provide a common understanding of the relationship between this safety code and performance standards.
PANEL ACTION: Reject.
PANEL STATEMENT: It is premature to make this universal change. The new NFPA Technical Committee on Telecommunication has not adopted a definition of this term. Refer to CMP-16.

(Log #2759)

1- 194 - (100-Temporary Wiring (New)): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 3 for information.

SUBMITTER: Joseph A. Tedesco, Nat'l Technology Transfer, Inc.
RECOMMENDATION: Add definition as follows:

Temporary Wiring. Approved wiring for power and lighting during a period of construction, remodeling, maintenance, repair, or demolition, and decorative lighting, carnival power and lighting or similar purposes.

SUBSTANTIATION: Extracted text from NFPA 1, 1997, edition, Fire Prevention Code. CMP 3 will review this same proposal. This term should be defined.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed definition includes wiring and equipment that may be part of the permanent electrical installation. Refer to CMP-3 for action.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2103)

1- 195 - (100-Unclassified Locations (New)): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 14 for information

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Add a new definition to read:

Unclassified Locations. Locations which are neither Class I, Division 1; Class I, Division 2, Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2, or any combination thereof.

SUBSTANTIATION: The term "Classified" refers to the type of material/hazard potential involved, i.e., Class I, Division 1, Class II, Division 2, etc. Terms such as nonhazardous and unclassified are used in both the NEC, the Uniform Building Code (UBC) and other NFPA documents. The term nonhazardous infers that the area has "no" hazards while the term "unclassified" more clearly correlates with the condition of being reviewed but found not to need classification. This action provides needed correlation with other NFPA documents, such as NFPA 497. Additionally the term "nonhazardous" is used 7 times within various parts of the NEC and in at lest one place in the NEC the meaning of nonhazardous applies to voltages and not classification. A companion proposal has been made to change the term "nonhazardous" to "unclassified" as appropriate elsewhere in the NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: CMP-1 agrees there may be a problem, however, CMP-1 does not believe the definition belongs in Article 100 as the term "unclassified" only relates to Chapter 5. Article 100 does not presently contain the definition of "classified". Refer to CMP-14.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias
COMMENT ON AFFIRMATIVE:
PRICHARD: A definition for "unclassified locations" is needed. CMP-14 has included this definition in Article 500.

(Log #445)

1- 196 - (100-Volatile Flammable Liquid): Accept

SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise the definition of "Volatile Flammable Liquid" to read:

"A flammable liquid having a flash point below 38°C (100°F), or a flammable liquid whose temperature is above its flash point, or a Class II combustible liquid having a vapor pressure not exceeding 276 kPa (40 psia) (~~276 kPa~~) at 38°C (100°F) whose temperature is above its flash point."

SUBSTANTIATION: The change is to facilitate practical application of the numeric value in SI units. This proposed revision is intended to comply with NFPA 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #362)

1- 197 - (100-Wet Bar (New)): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 2 for information.

SUBMITTER: Bob K. Middleton, State of Idaho Div. of Building Safety
RECOMMENDATION: Add a definition for wet bar to read as follows:

Wet bar. A bar for mixing drinks (as in a home) that contains a sink with running water.

SUBSTANTIATION: The code needs to define what a wet bar is. As some authorities having jurisdiction are saying that a counter in a utility room is a wet bar - the receptacle has to be ground fault protected. This was not the intent of the panel.
PANEL ACTION: Reject.
PANEL STATEMENT: The term is used only in Article 210 and does not warrant a definition in Article 100. Refer to CMP-2 for information.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #4466)

1- 198 - (100-Wet Bar (New)): Reject

SUBMITTER: David Skeen, Nugent Electric
RECOMMENDATION: To add the definition of a wet bar.
SUBSTANTIATION: None given.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal does not contain recommended text as required by Section 4-3.3(c) of the Regulations Governing Committee Projects. The proposal does not

contain substantiation as required by Section 4-3.3(d) of the Regulations Governing Committee Projects.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #321)

1- 199 - (100-Wet Location): Reject
SUBMITTER: James F. Pierce, Intertek Testing Services NA Inc.
RECOMMENDATION: Revise as follows:
Location:
Wet Location: Installations underground or in concrete slabs or masonry in direct contact with the earth, and locations subject to saturation with water or other liquids. ~~such as vehicle washing areas, and locations exposed to weather and unprotected.~~
SUBSTANTIATION: A simplified definition is needed that doesn't rely on a list of examples. Architectural designs vary significantly; therefore, designation of a specific area as a wet location is best left to the authority having jurisdiction who would base the decision on the definition and not a list of examples.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed definition does not improve on the present definition. The panel disagrees that a variable example list of wet locations is not desirable. The present list provides a range of examples to which authorities can compare similar locations that are being considered during inspection procedures.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2209)

1- 200 - (100-1, 100-2 Definitions, 100-10, 100-11): Reject
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
100-1. Scope. This article contains only those definitions essential to the proper application of this code...
A. General
100-2. Definitions. Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish,...
B. Over 600 Volts Nominal.
100-10 Application of Definitions. Whereas the preceding definitions are intended to apply wherever the terms are used throughout this code,...
100-11 Definitions. Electronically Actuated Fuse. An overcurrent protective device that generally consists of a control module that provides current sensing...
SUBSTANTIATION: This is the only article within the NEC that is not divided into sections. The NEC Style Manual 2.1.3 states, "Articles are divided into sections and sometimes into parts." By adding these section division and titles, Article 100 will be consistent with every other article in the code.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel intends to follow the NEC style manual as directed by the Technical Correlating Committee.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

Note: The sequence no. 1-201 was not used.

ARTICLE 110 — REQUIREMENTS FOR ELECTRICAL INSTALLATIONS

(Log #446)

1- 202 - (110): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Section 110-26(a), Exception No. 1, replace "30 in. (762 mm)" with "750 mm (30 in.)".
2. In Section 110-26(a)(2), replace "30 in. (762 mm)" with "750 mm (30 in.)".
3. In Section 110-26(a)(3), replace "6 in. (153 mm)" with "150 mm (6 in.)".
4. In Section 110-26(c) 2nd paragraph, replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
5. In Section 110-26(c) 2nd paragraph, replace "24 in. (610 mm)" with "600 mm (24 in.)".
6. In Section 110-26(c) 2nd paragraph, replace "6 1/2 ft (1.98 m)" with "2.0 m (6 1/2 ft)".
7. In Section 110-26(e) in 2 locations, replace "6 1/2 ft (1.98 m)" with "2.0 m (6 1/2 ft)".
8. In Section 110-26(f)(1)(a), replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
9. In Section 110-27(a)(4), replace "8 ft (2.44 m)" with "2.5 m (8 ft)".
10. In Section 110-31 2nd paragraph, replace "7 ft (2.13 m)" with "2.1 m (7 ft)".
11. In Section 110-31 2nd paragraph, replace "6 ft (1.80 m)" with "1.8 m (6 ft)".
12. In Section 110-31 2nd paragraph, replace "1-ft (305 mm)" with "300 mm (1 ft)".
13. In Section 110-31(c), replace "8 ft (2.44 m)" with "2.5 m (8 ft)".
14. In Section 110-32, replace "6 1/2 ft (1.98 m)" with "2.0 m (6 1/2 ft)".
15. In Section 110-32, replace "3 ft (914 mm)" with "900 mm (3 ft)".
16. In Section 110-33(a), replace "24 in. (610 mm)" with "600 mm (24 in.)".
17. In Section 110-33(a), replace "6 1/2 ft (1.98 m)" with "2.0 m (6 1/2 ft)".
18. In Section 110-33(a)(1), replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
19. In Section 110-34(a), Exception, replace "30 in. (762 mm)" with "750 mm (30 in.)".
20. In Section 110-54(a), replace "1000 ft (305 m)" with "300 m (1000 ft)".

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept in Principle.
Revise Item No. 1 and 5 to reflect a soft conversion. The new conversions are as follows:
Item No. 1 is revised from 750 mm to 762 mm.
Item No. 5 is revised from 600 mm to 610 mm.
PANEL STATEMENT: The panel chose a soft metric conversion because the panel considered these critical to safe work clearances.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #4457)

1- 203 - (110): Reject
SUBMITTER: David E. Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
RECOMMENDATION: Add the following text:
"...and like locations including the underside of equipment where exposed to moisture."
SUBSTANTIATION: The use of indoor-type connectors on underside of outdoor equipment such as meterbases, AC compressors, and disconnects is common practice. This appears to violate Section 100-3(b), and 90-4 is commonly construed as requiring written authorization. Nevertheless, given that manufacturers do provide for drainage by the way their cabinets' sheet metal does not quite meet at the bottom, the justification for this practice appears to rest on the "like locations" category in this section. However, the other examples are structural. Possible Code change aside, a committee statement on this matter in the ROP would be useful.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal appears to address Article 100 definition of Damp Location. The substantiation suggests an enforcement problem and not a problem with the definition.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #CP101)

1- 203a - (110-1): Accept
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. The Technical Correlating Committee directs that Code-Making Panel 1 correlate this Proposal with the information in the Technical Correlating Committee Note on Proposal 1-308. This action will be considered by the Panel as a Public Comment.
SUBMITTER: CMP 1
RECOMMENDATION: Add the following to Article 110.
"110-1 Scope: This article covers general requirements for the examination and approval, installation and use, access to and spaces about electrical conductors and equipment."
SUBSTANTIATION: CMP-1 complies with the direction of the TCC and Section 2.2.1 of the Style Manual to add a scope statement to Article 110.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

COMMENT ON AFFIRMATIVE:
COX: Recommend adding the following sentence to the Panel Action.
"The Panel recognizes that the Technical Correlating Committee has responsibility over the Scope of Articles and submits this proposal for consideration and recommends approval of the proposed language."

(Log #4314)

1- 204 - (110-3): Reject
SUBMITTER: Scott T. MacDonald, Collyn Ferris, Aquadoor Inc.
RECOMMENDATION: Add the following text:
The location, application, and life expectancy of the safety grounding systems and the determination as to their suitability.
SUBSTANTIATION: a. In real life, the location of bonding clips, grounding clips, and their wires, is often left to the equipment installer. They sometimes cut corners by not removing the paint below a bonding clip or choosing a place that is easy to ground but may not be the best spot due to motion, paint, corrosion, part to part resistance, etc., etc. The bonding/grounding location should be predetermined, if possible, by electrical engineering experts.
b. Application refers to, is this the proper wire, clip, screw, and metal?
c. Life expectancy means, how long will the part last, and should it last as long as the product?
d. The example I can give in my field, pool covers, is many pool cover companies were using aluminum bonding clips that were factory installed over paint. In this situation aluminum bonding clips are not to code and the life expectancy of the clip is very low. This should have been reviewed by the listing company and stopped/corrected before listing.
PANEL ACTION: Reject.
PANEL STATEMENT: The list in Section 110-3 is not intended to be all-inclusive, but examples of evaluation considerations. The concerns of the submitter appear to be covered in the existing list.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2106)

1- 205 - (110-3(a)(1), FPN): Reject
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Revise the second sentence of the fine print note to read:
"Suitability of equipment may be evidenced by listing, labeling, or for specialized or custom designed equipment, by manufacturer's certification, when manufacturer's test data or engineering evaluation are supplied by the owners or installers."
SUBSTANTIATION: Many times during examination of equipment, the manufacturer's test data and engineering evaluations are not in evidence. There have been cases where complete electrical rework has been required instead of evaluating the data and evaluations.
By adding this clarifying sentence to the FPN, the Authority Having Jurisdiction should have a better understanding and consider alternate suitability justifications.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed wording does not improve the application of provisions in this Section. The example of listing and labeling merely identifies a source of information upon which the Authority Having Jurisdiction can rely for support of approval of equipment but it does not limit it to that source. Listing and labeling are based on the compliance with recognized product safety standard. The proposed new wording is likely to cause confusion because it can be interpreted to have various meanings. The Authority Having Jurisdiction has the responsibility under the existing Code wording to approve equipment, and as such, has the authority to review applicable data regarding one-of-a kind or custom designed equipment and decide upon approval.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
PRICHARD: The proposal would add a FPN, not a mandatory rule. This could lead some Authorities Having Jurisdiction to at least consider alternate suitability justifications. Many times, the owner or installer can provide manufacturer's test data or engineering evaluations to the Authority Having Jurisdiction.

(Log #1809)

1- 205a - (110-3(b), FPN (New)): Reject
SUBMITTER: Nicholas Ludlam, Factory Mutual Research
RECOMMENDATION: Add a fine print note to read as follows:
FPN: Installation instructions may be provided on a certificate supplied with the apparatus.
SUBSTANTIATION: The IEC 60079 Series of standards, on which the ANSI/ISA S12 series of standards, and ANSI/UL2279 are both based, require a certificate number as part of the apparatus marking. ISA and UL have both taken this requirement out of their versions of the Zone standards. Manufacturers are increasingly asking for certificates as evidence to users that the product is Listed. If the format of the certificate number is consistent between the NRTLs then the users and the AHJs will be able to find the information needed quickly, especially on items such as Ex components. See also proposal on 505(10)(b).
PANEL ACTION: Reject.
PANEL STATEMENT: The existing wording in this section does not prohibit supplying installation instructions on a certificate supplied with equipment.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #1137)

1- 206 - (110-3(c) (New)): Reject
SUBMITTER: Bob K. Middleton, Rep. State of Idaho
RECOMMENDATION: Add a new Section 110-3(c) to read:
"The receptacles required by this Code shall have the proper voltage and the other equipment required by this Code shall function upon completion of the project."
SUBSTANTIATION: The intent of the Code is that everything shall work when the job is complete, but I can find nothing in the Code that states this.
PANEL ACTION: Reject.
PANEL STATEMENT: The Submitter is referred to Section 90-1(b). Compliance with the provisions of the Code will result in an installation that is essentially free from hazard. Adequacy or performance of the resulting installation is not necessarily contemplated by the Code provisions and is not within the purview of the AHJ.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias
COMMENT ON AFFIRMATIVE:
ANTHONY: This seems to be a perfectly reasonable expectation; that receptacles should be capable of supplying potential to utilization equipment at the completion of a project. One can visualize, however, situations in which operational or contractual situations result in de-engerized receptacles, if only temporarily. If, however, receptacles do not work because of an error in the construction, it should be a signal that a dangerous condition may exist-something completely within the purview of the Authority Having Jurisdiction. The issues are related and the submitter has raised an important point even though not exclusively a "code point".

(Log #2760)

1- 207 - (110-3(c)): Reject
SUBMITTER: Joseph A. Tedesco, Nat'l Technology Transfer, Inc.
RECOMMENDATION: Add new text:
Permanent wiring abandoned in place shall be tagged or otherwise identified at its termination and junction points as "Abandoned in Place" or removed from all accessible areas and insulated from contact with other live electrical wiring or devices.
SUBSTANTIATION: Electrical fire safety section 3-2.4 in NFPA 1 Fire Prevention Code should be added to NEC 2002.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided any substantiation to address such a broad requirement. The establishment and enforcement procedures concerning maintenance requirements and identification of electrical equipment not in use is better left to other codes and documents such as NFPA 1.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
ANTHONY: This seems to me to be a modest proposal. It does not require removal of old cable which, while recommended, is not always practical. It simply asks for them to be tagged from this point forward. Furthermore, it is theoretically possible - though, admittedly unlikely - that voltages can be induced in abandoned cables in proximity to energized cables. A combustible material in contact with a live end could pose a fire hazard.

(Log #3895)

1- 208 - (110-4): Reject
SUBMITTER: Joseph Misrahi, PBS&J
RECOMMENDATION: Delete: "The voltage rating of the equipment shall not be less than the nominal voltage of a circuit to which it is connected."
SUBSTANTIATION: In general, motor voltage ratings are less than nominal voltages shown in Article 100.
PANEL ACTION: Reject.
PANEL STATEMENT: The voltage rating of motors falls within the ranges associated with nominal voltages in Voltage Ratings for Electric Power Systems and Equipment (60 Hz), ANSI C84.1. The nominal voltages referenced in Article 100 are examples only.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2886)

1- 209 - (110-7): Reject
SUBMITTER: James Maldonado, City of Tempe, AZ/Rep. Central Arizona Chapter IAEI
RECOMMENDATION: Add a new paragraph to the end of section to read as follows:
All equipment rated at 1,000 amperes or more shall be tested in conformance with UL Standard 869, or 891 for insulation breakdown prior to its being energized. This test shall be performed by an independent testing facility or agency approved by the Authority Having Jurisdiction.
SUBSTANTIATION: This section only refers to wiring being free from short circuits or grounds. However, all equipment should be tested for insulation integrity after installation and prior to its being energized. Experience has shown that things occasionally happen to electrical switchboards, panel boards, motor control centers and other similar large pieces of equipment when it leaves the manufacturing facility, until the time it is off loaded at the job site and finally installed. Insulating bushings have cracked, hardware has loosened, insulation integrity can be compromised and not all occurrences have been visible to visual observation or have been detected by the use of a DC meg-ohm meter.
However, an AC high potential test such as the requirements of UL 869, or 891, can pick up these ground faults or shorts. Additionally, much of this large equipment is assembled in the field, leaving chances for tools being left in the equipment, or shavings of metal from phase to ground or any hardware or tools being left in the equipment, and never found until after the equipment is energized. Equipment smaller than 1000 amperes usually does not require field assembly and is more easily transported to its final installation destination. This test required by this proposal are nondestructive and have exposed many problems prior to energization. This has been a requirement in the Phoenix metro area for over 6 years.
PANEL ACTION: Reject.
PANEL STATEMENT: No technical substantiation was submitted to warrant a requirement to field test all equipment rated at 1,000 amps or more as outlined in the proposal. Section 110-12 presently addresses the concerns of the submitter. It is not the purpose of the National Electrical Code to establish and limit which product-testing standards may be used. In this case, standards other than those outlined in the proposal may be more appropriate.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #3641)

1- 210 - (110-9): Reject
SUBMITTER: Jim Brozer, Acton, MA
RECOMMENDATION: Add a new third paragraph to Section 110-9 to read as follows:
"Multi-pole circuit breakers shall have a single-pole interrupting rating sufficient for the nominal circuit voltage and current that is available at the line terminals of the circuit breaker when utilized on corner grounded systems, resistance grounded systems, ungrounded systems and center point grounded delta systems."
SUBSTANTIATION: This new third paragraph is needed to make it clear that multi-pole overcurrent devices, when applied on certain systems, must have an adequate single-pole interrupting rating in order to assure that the circuit will be opened safely.
Single-pole interrupting ratings become critical when full voltage can appear across only one pole. Take for example a resistance grounded system. This type of system is popular with industrials because the first fault to ground is of such a low value that the phase overcurrent devices do not open. The plant continues to run. Maintenance crews plan the shutdown to fix the fault. No unplanned downtime. Unfortunately, some facilities are understaffed, and the original fault to ground may remain for many days or even weeks. When this occurs, it becomes very possible for a second phase to go to ground, thus creating a phase-to-phase fault. This can put full voltage across only one pole of the overcurrent device. It is for a case like this that the single-pole interrupting rating must be adequate. Table 7.1.7.2 of UL 489 provides the only guidance in this area. Single-pole ratings are provided under the "Individual" columns. These are the only short-circuit tests in UL

480 that test for full voltage across one pole. Take for example, a 3-pole, 100 amp, 480 volt molded case circuit breaker. It may have a marked 3-pole interrupting rating of 42,000 amperes but its single-pole rating is only 8,660 amps. This is the one that is circled in the tabled. That's a big difference, big enough to cause a safety concern. This issue can be safely resolved by simply making people aware of the situation, by modifying Section 110-9, so that they can safely apply the devices within their tested limits.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The product standard does not assign a single pole rating to a multipole circuit breaker. The table referenced, 7.1.7.2 of UL489, tabulates the minimum test current values for one of several test sequences of the program, based on the current rating of the circuit breaker. This table is not intended for the maximum short circuit rating of the circuit breaker. The submitter's substantiation describes an installation that does not comply with the requirements of 110-9.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #4007)

1- 211 - (110-9): Reject

SUBMITTER: Robert B. Alexander, Fluor Daniel

RECOMMENDATION: Add text after the first sentence to read:

The available short-circuit current shall be permitted to exceed the interrupting rating of the equipment for not more than two seconds during an automatically controlled, closed transition, power transfer.

SUBSTANTIATION: References:

Proposal 1-174 NFPA 70-A98 ROP.

Proposal 1-175 NFPA 70-A98 ROP.

Comment 1-215 NFPA 70-A98 ROC.

Comment 1-216 NFPA 70-A98 ROC.

Comment 1-217 NFPA 70-A98 ROC.

A reading of the above proposals and comments has left several users in confusion as to the intent of the Panel. Since I was an original submitter, I have been questioned several times as to the Panel's intent. Currently I recommend rating the equipment based on calculated contributions from both sources. I do not believe it is technically necessary, but I do not believe that the current wording can be interpreted otherwise.

I am personally opposed to any manual system of closed transfer; the potential to leave equipment in a dangerous condition is too great.

I take some encouragement that the Panel obviously reread my Proposal 1-175 when rejecting Comment 1-215. The Panel statement simply challenged the two-second interval, but otherwise seemed to accept it. I will attempt to justify it now. The systems that would most commonly use the proposed wording are normally-opened, automatic, secondary selective, distribution equipment. The actual interval of parallel operation during an automatically controlled transition is typically, on the order of 8-16 cycles. This is obviously considerably less than the two seconds suggested. However, the submitter is aware of a few automatic transfer switches that use molded case circuit breakers as the switching devices. The mechanical linkages that control the transfer have enough "slop" that the actual time of the closed transition is a bit less than two seconds.

As pointed out in the original proposal, the transfer itself will not precipitate a downstream fault where the danger is downstream devices being over stressed. The devices used for switching cannot actually see contributions from both sources, whereas downstream devices potentially could. The probability of the concurrent failure required to actually create a dangerous condition is infinitesimal.

Finally, as pointed out in several of the proposals and comments, these are commonly applied configurations in industrial facilities, especially continuous process ones, with a long history of success.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: Complex systems design criteria such as closed transition are inappropriate for specific inclusion in the NEC. Existing sections, such as 90-4 may be an appropriate avenue to deal with such issues.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

NOT RETURNED: 1 Macias

EXPLANATION OF NEGATIVE:

FLOYD: Proposal 1-211 (Log #4007) brings attention to a design and application issue that is not adequately addressed by product standards and the NEC. Some manufacturers have addressed this performance rating in their product literature, while others have not. From a user's perspective, this proposal will help assure a safe application and installation as noted in the proposal substantiation.

(Log #664)

1- 212 - (110-10): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise penultimate sentence:

This fault shall be assumed to be either between two or more of the circuit conductors or between any <u>ungrounded</u> circuit conductor and ~~the~~ <u>a</u> grounding conductor(s) ~~or enclosing metal raceway.~~

SUBSTANTIATION: Editorial. A grounded circuit conductor is not normally considered for ground faults. "An enclosing metal raceway" is somewhat superfluous, as if it is grounded it will be a grounding conductor, and if ungrounded it is not pertinent to the section.

PANEL ACTION: Reject.

PANEL STATEMENT: The grounded conductor is a current carrying conductor. Deleting the reference to metal raceways may lead to a misintrepretation of this section.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #2324)

1- 213 - (110-10): Reject

SUBMITTER: Mark Ptashkin, City of Phoenix, AZ

RECOMMENDATION: Add the following underlined text to the section.

110-10. Circuit Impedance and Other Characteristics. The overcurrent protective devices, <u>conductors,</u> the total impedance, the component short-circuit current ratings, and other characteristics of the circuit to be protected shall be selected and coordinated to permit the circuit-protective devices used to clear a fault to do so without extensive damage to the electrical components of the circuit. This fault shall be assumed to be either between two or more of the circuit conductors, or between any circuit conductor and the grounding conductor or enclosing metal raceway. Listed products applied in accordance with their listing shall be considered to meet the requirements of this section.

SUBSTANTIATION: Due to the absence of the word, the conductors are often overlooked, or passed over when short circuit ratings are addressed for other portions of the circuit. In many cases, the conductors may actually be the weak link in the system, and it should be clearly shown that they must be addressed.

The addition of the word conductors in this paragraph will clearly show that they are to be considered when applying this section as well as making the code more user friendly.

PANEL ACTION: Reject.

PANEL STATEMENT: The existing requirement provides that faults be cleared without extensive damage to the electrical components of the circuit. Conductors are an electrical component of the circuit.

AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #3938)

1- 215 - (110-12(a)): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 9 for comment.
SUBMITTER: William F. Laidler, Town of Hanover, MA
RECOMMENDATION: Revise text as follows:
(a) Unused Openings. Unused openings in ~~boxes~~ enclosures, raceways, auxiliary gutters, cabinets, equipment cases, or housings shall be effectively closed to afford protection substantially equivalent to the wall of the equipment. Where metal plugs or plates are used with nonmetallic cabinets or cutout boxes, they shall be recessed at least 1/4 in. (6.35 mm) from the outer surface.
SUBSTANTIATION: Section 373-4 addresses the procedures for closing unused openings in enclosures only, I have submitted a proposal to strike that entire section and address those requirements in one place. In the interest of creating a more usable and readable code the repetition of information throughout the document should be minimized. The word enclosure in this paragraph is all inclusive and addresses various wiring methods and articles within the code.
PANEL ACTION: Reject.
PANEL STATEMENT: As defined, the term "enclosure" has a broad meaning. The panel concurs that the present wording better conveys the intent of the requirements as it already meets the intent of the submitter.

(Log #3673)

1- 217 - (110-12(c)): Reject
SUBMITTER: George Ferguson, Eastern Michigan Univ.
RECOMMENDATION: Add text as follows:
110-12(c) Integrity of Electrical Equipment and Connections. External moving and internal parts of electrical equipment, ...or deteriorated by corrosion, chemical action, or overheating. This includes devices, cover plates, hinges, and hardware for enclosure doors. This rule shall apply to those performing or causing the performance the damage or painting of the equipment.
SUBSTANTIATION: There is a great deal of damage and expense occurring because of layers of paint applied to devices, covers, hinges, locks, and other moving parts of electrical equipment. There has been a lot of disagreement between the building owners, electrical inspectors, and electrical contractors of the cost and conditions to remedy this condition. The added wording will help to access responsibility to those responsible and perhaps reduce the problem in the future.
PANEL ACTION: Reject.
PANEL STATEMENT: The problem described in the substantiation is adequately addressed in the second sentence of 110-12(c).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2048)

1- 218 - (110-12(e) (New)): Accept in Principle
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Add a new section to read as follows:
(e) Terminations. Terminations for all electrical connections to devices and equipment shall be torqued as required by the manufacture of such electrical device or equipment.
SUBSTANTIATION: Terminations are not being installed as required by the manufacture and only LISTED electrical devices and equipment require the torquing of terminations of current carrying conductors be shown on the enclosure of electrical equipment.
Adding this section will require all equipment be supplied with the torquing requirements.
PANEL ACTION: Accept in Principle.
Add a new section to read as follows:
"(d) Terminations. Terminations for electrical connections to devices and equipment shall be torqued as required by the manufacturer of the electrical device or equipment."
PANEL STATEMENT: The panel does not necessarily agree with the submitter's substantiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
MINICK: Section 110-3(b) currently instructs users to follow all manufacturer instructions included in the listing and labeling of listed and labeled equipment. The intent of the submitter is presently addressed in Section 110-14 and the Fine Print Note. This additional wording is redundant.

(Log #2049)

1- 219 - (110-12(f) (New)): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Add a new section to read as follows:
(f) Seismic Zones. Electrical equipment located in Seismic Zones 2,3, and 4, shall be supported to resist the forces that can be imposed. Supporting requirements shall be designed by a structural engineer and detail drawings shall be available to the authority having jurisdiction.
SUBSTANTIATION: Electrical equipment is presently being installed in areas of seismic zones 2,3, and 4 without this requirement in the codes.
The NEC should require this. The building codes do not adequately cover systems such as electrical.
Electrical systems are the main backbone of any building to allow the people to have time to exit the structure.
Presently installed electrical systems disregard the seismic loads imposed on the electrical installation.
History has shown the number of failures and this section will correct this oversight.
PANEL ACTION: Reject.
PANEL STATEMENT: This is a design issue and is best left to the building structural requirements as imposed through the building codes or other appropriate standards. No technical substantiation was submitted to support the recommendation.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #1458)

1- 220 - (110-13): Reject
SUBMITTER: Joseph E. McCann, City of Coral Springs, FL
RECOMMENDATION: Add new text to read as follows:
Electrical equipment mounted overhead (such as transformers suspended on all thread) should be fastened by approved means other than lead shields or anchors.
SUBSTANTIATION: The use of lead shields overhead to mount heavy electrical equipment should be eliminated due to the low melting point of lead 650°. Equipment could fall on to a firefighter while fighting fires.
PANEL ACTION: Reject.
PANEL STATEMENT: Substantiation is insufficient to prohibit the general use of the referenced devices for all overhead electrical installations.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #1678)

1- 221 - (110-13(a)): Reject
SUBMITTER: Terry L. Carlson, Nebraska State Electrical Board
RECOMMENDATION: Add new sentence after first sentence in current text to read as follows:
(a) Electrical equipment likely to require maintenance or servicing shall be mounted at such height and location as to allow safe working access for those persons servicing the equipment.
SUBSTANTIATION: Inspectors find equipment enclosures, fuse disconnects, and circuit breaker enclosures mounted so low to the floor or finished grade that they must get down on their knees or lower in order to inspect them. Anyone who tries to service the equipment after the installation also must lay down in many cases to work on the equipment. This proposal will require the installation to allow safe working access.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 110-26 requires sufficient space and access for safe operation and maintenance of the equipment. A code rule such as this would be too restrictive for such items as switchgear, motor control centers, unit substations, etc.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #1048)

1- 222 - (110-14): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise 110-14 as follows:
110-14(a) - change "No. 10" to "10 AWG".
110-14(c)(1) - change "Nos. 14 through 1 conductors" to "14 through 1 AWG conductors".
110-14(c)(2) - change "No. 1" to "1 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel has no knowledge of the specific agreement that "AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America."

(Log #4156)

1- 225 - (110-14(a)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
(a) Terminals. Connection of conductors to terminal parts shall ensure a thoroughly good connection without damaging the conductors and shall be made by means of pressure connectors (including set-screw type), solder lugs, or splices to flexible leads. Connection by means of wire-binding screws or studs and nuts that have upturned lugs or the equivalent shall be permitted for No. 10 or smaller solid conductors. Where stranded conductors are terminated on and not looped through such terminals, the terminals shall be identified for such use, or the strands at the terminals shall be made solid.
Terminals for more than one conductor and terminals used to connect aluminum shall be so identified.
SUBSTANTIATION: Surprisingly, it isn't a violation of any listing requirement to used side-wired devices with stranded wire. Normally such devices are used without problems for residential applications with solid wire, but nothing restricts them to such applications. Present product standards don't adequately address the near impossibility of back-wrapping 19-stranded conductors under a screw head, especially on lower quality devices. Take receptacles, for example. At present UL 498 appears to have no testing protocol to adequately assure the containment of stranded wires on binding screw lugs. Paragraph 12.5 simply parrots the present NEC rule under discussion here. Conductors looping through devices are okay because insulation on both sides of the skinned section of wire contains the strands. If necessary, a little work with a soldering tool quickly makes a solid conductor out of a stranded one.
The Panel action in the previous cycle rejecting this language is out of touch with the everyday experience of journeyman electricians. A number of highly qualified individuals have discussed the problem with the standard privately, pointing to the issue of stranding characteristics. They were referring to the fact that the standard was drawn at a time when the stranded conductors typically used with these devices, if stranded wire were ever actually used, would be 7-strand instead of today's 19-strand conductors, which makes the problem even worse today.
The proposal is a properly worded, common sense approach to a real enforcement headache. It will not impose any significant costs on the industry, due to the use of the word "identified." That is intentionally different from "listing;" it allows general recognition in

manufacturer's catalogs which is generally already indicated as a marketing advantage. Over time, UL can phase in a minor revision to the standard with minimal disruption. The wording has been working well in Massachusetts, where it has been in force as code for several cycles.

Finally, to respond to NEMA Comment 1-237, on which the Panel based its final rejection in the 1999 cycle, the NEC contains many product design requirements. There's a good reason for this. The NFPA process is an open, consensus based one, and the UL process is not; UL always agrees that its process is, most emphatically, not a consensus one. Therefore many times the NEC has been used to force a change in a product standard. No apologies offered on that score.

The other issue raised in the NEMA comment had to do with solder and cold flow. This strains the boundaries of common sense. The idea that a stranded conductor with its strands tinned could make a less reliable connection than the same conductor with those same strands free to move around under a screw, however well they may have been twisted, is frankly unbelievable. Should credible substantiation emerge on this point, then the Panel could simply remove the allowance for solder. More to the point, however, is that upon the adoption of this proposal, UL will revise the product standard to provide meaningful termination requirements for these conductors.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal addresses product design requirements and is not appropriate for an installation Code. Provisions that allow field alteration of a listed or unlisted manufactured wiring product with unknown non-standardized materials is not appropriate. The substantiation does not include specific identification of field problems.

NOT RETURNED: 1 Macias

(Log #1497)

1- 226 - (110-14(c)): Reject

SUBMITTER: Bill Whitlow, Lockwood Greene

RECOMMENDATION: Revise text as follows:

(c) Temperature Limitations. The temperature rating associated with the ampacity of a conductor shall be selected and coordinated so as not to exceed the lowest temperature rating of any connected termination, conductor, or device. ~~Conductors with temperature ratings higher than specified for terminations shall be permitted to be used for ampacity adjustment, correction, or both.~~ Ampacity adjustment and correction shall not be applied in determining conductor ampacity for complying with the termination temperature rating.

FPN: The operating temperature of a conductor in conduit or cable may exceed the temperature rating of the termination to which the same conductor is connected.

SUBSTANTIATION: The second sentence, "Conductors...shall be...used for...adjustment..." is grammatically incorrect and is confusing. The added text more clearly expresses the intent that the ampacity for terminations is to be calculated separately and independent from the ampacity for wire in conduit.

PANEL ACTION: Reject.

PANEL STATEMENT: The Submitter is incorrect in his belief that "ampacity adjustment and correction" shall not be applied in determining conductor ampacity for complying with the termination temperature rating.

NOT RETURNED: 1 Macias

(Log #3285)

1- 227 - (110-14(c)): Accept

SUBMITTER: James T. Pauley, Square D Co.

RECOMMENDATION: Revise NEC 110-14(c) with the additions (underlined) and deletions (strike through) as shown. The entire text of 110-14(c) is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.

(c) Temperature Limitations. The temperature rating associated with the ampacity of a conductor shall be selected and coordinated so as not to exceed the lowest temperature rating of any connected termination, conductor, or device. Conductors with temperature ratings higher than specified for terminations shall be permitted to be used for ampacity adjustment, correction, or both.

(1) Equipment Provisions. The determination of termination provisions of equipment shall be based on (a) or (b). Unless the equipment is listed and marked otherwise, conductor ampacities used in determining equipment termination provisions shall be based on Table 310-16 as appropriately modified by 310-15(b)(1) through (7).

~~(1)~~ (a) Termination provisions of equipment for circuits rated 100 amperes or less, or marked for Nos. 14 through 1 conductors, shall be used only for one of the following.

~~a.~~(1) Conductors rated 60°C (140°F), or

~~b.~~(2) Conductors with higher temperature ratings, provided the ampacity of such conductors is determined based on the 60°C (140°F) ampacity of the conductor size used, or

~~c.~~(3) Conductors with higher temperature ratings if the equipment is listed and identified for use with such conductors, or

~~d.~~(4) For motors marked with design letters B, C, D, or E, conductors having an insulation rating of 75°C (167°F) or higher shall be permitted to be used provided the ampacity of such conductors does not exceed the 75°C (167°F) ampacity.

~~(2)~~ (b) Termination provisions of equipment for circuits rated over 100 amperes, or marked for conductors larger than No. 1, shall be used only for

~~a.~~(1) Conductors rated 75°C (167°F), or

~~b.~~(2) Conductors with higher temperature ratings provided the ampacity of such conductors does not exceed the 75°C (167°F) ampacity of the conductor size used, or up to their ampacity if the equipment is listed and identified for use with such conductors.

(2) Separate Connector Provisions. ~~(3)~~ Separately installed pressure connectors shall be used with conductors at the ampacities not exceeding the ampacity at the listed and identified temperature rating of the connector.

FPN: With respect to Sections 110-14(c)(1), and (2), ~~and (3),~~ equipment markings or listing information may additionally restrict the sizing and temperature ratings of connected conductors.

SUBSTANTIATION: The objective of this proposal is to clear up confusion relative to what ampacities are used to determine the proper conductor size at equipment terminations. When 600V and less equipment is evaluated relative to the appropriate temperature characteristics of the terminations, conductors sized based on Table 310-16 are used. The UL General Information Directory (pages 1 and 2) clearly indicates that the 60C and 75C provisions for equipment have been determined using conductors from Table 310-16. However, if an installer or designer is not aware of the UL guide card information, they may attempt to select conductors based on the Tables other than 310-16. This is especially true if a wiring method is used that allows the use of ampacities such as those in 310-17. This can result in overheated terminations at the equipment. Clearly, the ampacities shown in other tables (such as 310-17) could be used for various conditions that the wiring method is subject to (ambient, ampacity correction, etc.), but the conductor size at the termination must be based on ampacities from Table 310-16.

This proposal does not have any new impact on the equipment or the wiring methods; it simply adds a rule from the listing information into the Code because it is an installation and equipment selection issue.

In addition the proposal provides for a slight renumbering to easily accommodate the reference to the Table and adds titles to the Level 2 subdivision as required by the NEC Style Manual.

PANEL ACTION: Accept.

(Log #2245)

1- 228 - (110-14(c)(1)): Accept in Principle

SUBMITTER: Steven R. Musial, II, Pittsburgh, PA

RECOMMENDATION: Revise text as follows:

110-14(c)(1) "Termination provisions of equipment for circuits rated 100 amperes or less (after the application of all derating factors), or marked...".

SUBSTANTIATION: It is easy to select the wrong temperature column in Table 310-16 if derating factors are not applied, such as, 1.25 for continuous loads, 0.8 for 4, 5, or 6 current carrying conductors in a conduit or derating for higher than 30°C ambient temperatures.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The panel believes that the action on Proposal 1-227 meets the intent of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #665)

1- 229 - (110-14(c)(1)(b); (2)(b); (3)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(1)(b) Conductors with higher temperature ratings, provided the ampacity of such conductors is determined based on the 60°C (140°F) ampacity of the conductor ~~size used~~ for a conductor length not less than 6 ft (1.83 m) from the equipment termination provisions, or
(2)(b) Conductors with higher temperature ratings provided the ampacities of such conductors does not exceed the 75°C (167°F) ampacity of the conductor size used, for a conductor length not less than 6 ft (1.83 m) from the equipment terminations, or up to their ampacity if the equipment is listed and identified for use with such conductors.
(3) Separately installed pressure connectors shall be ~~used with conductors at the ampacities not exceeding the ampacity at the listed and identified temperature rating of the connector~~ listed for use with the number, size, and material of the conductor used and in accordance with their temperature and voltage rating.
FPN: No change.
SUBSTANTIATION: The provisions of this section appear to require the entire length of conductor comply with the ampacity/temperature requirements, whereby higher ampacity/temperature rated conductors cannot be utilized except for correction/adjustment factors. This in effect, does not allow for higher rated ampacities to be used for any part of the circuit far removed from equipment terminations. Prior to inclusion of these requirements in the Code to comply with listing requirements (Section 110-3(b)) some jurisdictions would permit a splice at some distance from the equipment terminations to conductors sized for higher ampacities at their rated temperature, which can result in a smaller size conductor for portions of a circuit. This is economically advantageous and does not negate the reasons for the requirements if the splicing devices are suitably rated.
The proposed 6 ft is arbitrary; if the panel believes the basic premise of the proposal has merit that figure could be adjusted.
Sections 310-15(b)(2) Exception No. 4 and 310-60(b)(1) Exception provide for different ampacity ratings for portions of circuits.
The proposal for (3) is intended for clarity and inclusion of other factors.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation does not support the recommendation.

(Log #531)

1- 230 - (110-14(c)(1)d): Reject
SUBMITTER: Charles B. Schram, Wilmette, IL
RECOMMENDATION: Revise Section 110-14(c)(1)d by adding "(1)" after the word "provided" in the third line, and by adding the following at the end of the sentence:
"and (2) the terminations for such conductors at the controller meet the provisions of Section 110-14(c)(1)(c)."
SUBSTANTIATION: The substantiation for Comment No. 1-248 in the 1998 NEC ROC referred to "the vast majority of motor control devices" as being suitable for connection of conductors selected on the basis of either 60 Deg. C or 75 Deg. C ampacities. However, this does not include all such devices. There is nothing to prevent listing of motor control devices that do not meet the condition of Section 110-14(c)(1)(c), other than revising the several product safety standards for such devices to force compliance at some time in the future. The proposal is intended only to close the "loophole" provided by the present wording of Section 110-14(c)(1)(d), without necessitating revisions of several product safety standards.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed language is redundant to 110-14(c)(1)(c).

(Log #1499)

1- 233 - (110-15 (New)): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 2, 4, and 9 for comment.
SUBMITTER: Larry D. Wendt, State of Idaho/Rep. I.A.E.I.
RECOMMENDATION: Add the following text:
110-15. High-Leg Marking. On a 4-wire, delta-connected system where the midpoint of one phase winding is grounded to supply lighting and similar loads, the conductor or busbar having the higher phase voltage to ground shall be durably and permanently marked by an outer finish that is orange in color, or by other effective means. Such identification shall be placed at each point on the system where a connection is made if the grounded conductor is also present. On switchboards or panelboards, the "B" phase shall be that phase having the higher voltage to ground. See Section 384-3(f) for phase arrangement of busbars. Other busbar arrangements shall be permitted for additions to existing installations and shall be marked.
Exception: Equipment within the same single section or multisection switchboard or panelboard as the meter on 3-phase, 4-wire, delta-connected systems shall be permitted to have the same configuration as the metering equipment.
SUBSTANTIATION: High-leg marking is a requirement that should be in Section 110 where it would apply to all types of installations instead of to services, feeders, and switchboards and panelboards. The new Section 110-15 will meet the intent of the Code and also simplify it. Please coordinate with the proposals on Sections 210-4(d), 215-8, 230-56, 384-3(e), and 384-3(f).
PANEL ACTION: Accept in Part.

Accept the first two sentences of the proposal to read as follows:
"110-15. High-Leg Marking. On a 4-wire, delta-connected system where the midpoint of one phase winding is grounded to supply lighting and similar loads, the conductor or busbar having the higher phase voltage to ground shall be durably and permanently marked by an outer finish that is orange in color, or by other effective means. Such identification shall be placed at each point on the system where a connection is made if the grounded conductor is also present."
Reject the balance of the proposal.
PANEL STATEMENT: That part of the proposal after sentence two, including the exception is rejected because it does not address high-leg marking, relates only to switchboard and panelboard configuration, and should continue to be addressed in 384-3(f). Refer to CMP-2, CMP-4, and CMP-9 for comment.

(Log #2563)

1- 235 - (110-15 (New)): Accept in Principle
NOTE: The Technical Correlating Committee directs the panel to change "residential" to "dwelling" to comply with current word usage. In addition, the Technical Correlating Committee directs the panel to use the proper metrication in the text. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Ray A. Jones, Electrical Safety Consulting Services, Inc. (ESCS, Inc.)
RECOMMENDATION: Add the following new section:
110-15. Flash Protection. For other than residential occupancies, switchboards, panelboards, loadcenters and motor control centers shall be marked in the field to indicate the incident energy in calories per square centimeter for a worker at a distance of 18 in.
SUBSTANTIATION: Significant number of electricians are being seriously burned and often killed from an accidental electrical flash while working equipment "hot." Most of these serious accidents can be eliminated or significantly reduced if the electricians wear the proper type of protective clothing. If switchboards, panelboards, loadcenters, and motor control centers were individually marked with the incident energy, the personnel would easily know what type of protective clothing to wear, because its rating is based upon the available incident energy in calories per square centimeter. These calculations can easily be made by an engineer or a knowledgeable contractor by using a formula which was presented in an IEEE paper by R.L. Doughty, T.E. Neal, and H.L. Floyd II, "Predicting Incident Energy to Better Manage the Electric Arc Hazard on 600 V Power Distribution Systems", Record of Conference Papers IEEE IAS 45th Annual Petroleum and Chemical Industry Conference, September 28-30, 1998. This formula also appears in the 2000 edition of NFPA 70E, Electrical Safety Requirements for Employee Workplaces. The formula is $E_{MB} = 1038.7 D_B^{1.4738} t_A [0.0093F^2 - 0.3453F + 5.9675]$
Where E_{MB} = incident energy from a box in cal/cm^2
D_E = Distance from arc in inches. Assume 18 inches for this calculation.
t_A = Arc duration in seconds
F = Bolted fault short circuit current
These requirements do not include residential occupancies because the available short circuit current is generally low enough so as not to be of a major concern.
PANEL ACTION: Accept in Principle.
Add the following new section:
"110-16. Flash Protection. Switchboards, panelboards, and motor control centers installed in other than residential occupancies shall be marked in the field to indicate the incident energy in calories per square centimeter for a worker at a distance of 18 in.
FPN: See NFPA 70E-2000, Electrical Safety Requirements for Employee Workplaces for calculation methods and charts related to incident energy."
PANEL STATEMENT: The term "loadcenter" was removed since it it did not appear in Article 384. The FPN was added to give further direction to the user. The panel concludes the revised proposal meets the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 1 Macias
EXPLANATION OF NEGATIVE:
MINICK: The requirement is not enforceable and will not improve electrical safety. The three published methods of calculating incident energy result in considerably different values. This would create a dilemma for the authority having jurisdiction in trying to enforce some specific value. In addition, the FPN refers to NFPA 70E-2000 for calculation methods. NFPA 70E-2000 only contains one reference on how to perform the calculation of incident energy and this is a non-enforceable (informative) annex. The NFPA 70E committee specifically placed this material in an informative annex because of the variation in calculation methods. Furthermore, the incident energy value has little meaning to the electrical worker.
Process industries, such as pharmaceuticals, typically must work on "hot" equipment. This is recognized as a serious problem, but the proposed solution does not provide a suitable answer. The NFPA 70E committee is addressing this problem and it would be better to wait for the experts in this area to devise a solution that can be added to NFPA 70E, rather than the more general NEC.
COMMENT ON AFFIRMATIVE:
ANTHONY: Acceptance of this proposal is a bold stroke on behalf of electrician safety. It could be a very costly addition to the NEC, however, if it raises engineering costs for building owners. Applying this proposal could be as simple as computing short circuit at the service entrance and using it as the maximum fault current at all panels throughout the building. On this basis, protective gear for electricians could be selected.
Applying this proposal could also get much more complicated if investigations into comparative arc duration times of protective devices need to be investigated. Fault current distribution profiles may need to be determined in very large buildings. It also favors protective devices that open circuits based upon rate of change in current; namely, fuses. Thus, the proposal has the potential for being quite controversial in many quarters of the industry. Nevertheless, at this stage in the code-making process, it is better to err on the side of safety. I hope for lively and engaging debate on this subject in the ROC stage of 2002 NEC.

(Log #315)

1- 236 - (110-18): Reject
SUBMITTER: Charles J. McKnight, Indianapolis, IN
RECOMMENDATION: Add the following text to 110-18:
These parts shall be marked as to the hazard and these markings shall be of sufficient durability to withstand the environment involved.
SUBSTANTIATION: This will help to readily identify hazards and help to prevent possible injuries.
PANEL ACTION: Reject.
PANEL STATEMENT: The determination that arcing parts exist can be made without the need for marking all such equipment.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #6)

1- 237 - (110-22): Accept in Principle

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 10 for comment.

NOTE: The following proposal consists of Comment 1-281 on Proposal 1-268 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-268 was:

Revise the 2nd paragraph as follows:

"Where circuit breakers or fuses are applied in ~~compliance with~~ series combination ratings ~~marked on the equipment by the manufacturer~~, the equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating."

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: The proposal should be accepted in principle. Revise the first sentence of the second paragraph of that section to read as follows:

"Where circuit breakers or fuses are applied in ~~compliance with~~ series combination ratings ~~marked on the equipment by the manufacturer~~, or otherwise in compliance with the provisions of Section 240-83(c), the equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating."

SUBSTANTIATION: This comment is a companion to one made on Proposal 10-110 which did indeed make the change cited by the proposal submitter. CMP 1 must now correlate these two provisions. This comment should be accepted provisionally based on continued CMP 10 acceptance of the other proposal in some form, as now seems likely. This wording allows correlation between the two sections without needing to know in exactly what form the revision in Section 240-83(c) emerges, which we can't really tell at this point. My companion comment suggests a more restrictive form, and the split panel vote and Correlating Committee note suggests that this is a work in progress.

PANEL ACTION: Accept in Principle.

Revise the first sentence of the second paragraph to read as follows:

"Where circuit breakers or fuses are applied in compliance with the provisions of Section 240-86 for series combination ratings, the equipment enclosure(s) shall be legibly marked at each piece of equipment to indicate the equipment has been applied with a series combination rating."

Remove the FPN.

PANEL STATEMENT: The panel concludes that this revised wording meets the intent of the submitter. Refer to CMP-10 for comment.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #667)

1- 238 - (110-22): Accept in Principle

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

Identification of Disconnecting Means. Each disconnecting means ~~required by this Code~~ for motors and appliances, and each service, feeder, or branch circuit ~~at the point where it originates~~ shall be legibly marked to indicate its purpose unless located and arranged so the purpose is evident.

(remainder unchanged)

SUBSTANTIATION: The syntax does not make this rule clear. The heading refers to disconnecting means but "at the point where it originates" appears to refer to the service, feeder, or branch circuit supply connection point. For services, and conductors installed under tap rules the disconnect will not usually be at the originating point of the circuit and may be a substantial distance away. For example Section 240-21(b)(5) permits unlimited tap length on the supply side of the disconnecting means. Identification of the disconnect is a higher safety priority than the originating point of the circuit. Identification of disconnects which are not required by the Code is just as important as they perform the same function and many times are the most accessible and operated devices. The unintended operation of a disconnecting means due to lack of identification can have serious consequences.

PANEL ACTION: Accept in Principle.

Revise the first paragrah to read as follows:

"110-22. Identification of Disconnecting Means. Each disconnecting means shall be legibly marked to indicate its purpose unless located and arranged so the purpose is evident. The marking shall be of sufficient durability to withstand the environment involved."

The remainder of this section is addressed in the panel actions of Proposals 1-237 and 1-241.

PANEL STATEMENT: The panel concludes that the revised wording satisfies the concerns of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

(Log #2325)

1- 239 - (110-22): Accept in Principle

SUBMITTER: Mark Ptashkin, City of Phoenix, AZ

RECOMMENDATION: New text to be added is underlined.

"Where circuit breakers or fuses are applied in compliance with the series combination ratings marked on the equipment by the manufacturer, the equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating. This marking shall be required at each piece of equipment that is part of a series combination system. The marking shall be readily visible and state the following:"

SUBSTANTIATION: The intent of this proposal is to clearly require that a label or other suitable means must be applied at all equipment that is part of a series rated system. For example it a 65/10 series rated system is installed (65 k upstream device, 10 k downstream device) a label indicating that it is part of a series rated system must be applied at both locations. If it is part of a "3 tier" system a label is required at all 3 locations. This will clarify that all pieces of a series rated system should be clearly marked so that any individual replacing or repairing devices or equipment is notified that they must use identified replacement components.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The panel believes that the action on Proposal 1-237 meets the intent of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #2884)

1- 240 - (110-22): Accept in Principle

SUBMITTER: George J. Ockuly, Cooper Bussmann

RECOMMENDATION: Delete the words "by the manufacturer" from the first sentence of the second paragraph.

SUBSTANTIATION: This change to the text is required to correlate with my proposal for 240-86. Marking by the manufacturer may not be possible for older systems that may be perfectly usable when properly protected by current-limiting devices. For example, some manufacturers of switchgear are no longer in business, but their equipment is still perfectly usable.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The panel believes that the action on Proposal 1-237 meets the intent of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #3257)

1- 241 - (110-22): Reject

SUBMITTER: Alan Manche, Square D Co.

RECOMMENDATION: Revise the second paragraph of 110-22 with the addition (underlined) as shown. The entire text is shown for clarity, but only those changes shown underlined are part of this proposal.

Where circuit breakers or fuses are applied in compliance with the series combination ratings marked on the equipment by the manufacturer, the equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating. The marking shall be readily visible and state the following or equivalent:

CAUTION - SERIES COMBINATION SYSTEM
RATED ____ AMPERES. IDENTIFIED
REPLACEMENT COMPONENTS REQUIRED.

SUBSTANTIATION: The explicit nature of the present wording is causing field problems in the acceptance of appropriate warning signs or markings. The ANSI Z535 series of standards provides the proper procedure in establishing a hazard sign or marking. ANSI Z535.4 provides the information about what should be contained in a hazard sign or label. This includes a message panel that identifies the hazard, indicates how to avoid the hazard and advises the probable consequence of not avoiding the hazard.

The objective of the NEC wording is to generally convey the basic message requirement to user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would allow a hazard sign to comply with the NEC, but be formated in accordance with Z535.4.

PANEL ACTION: Reject.

PANEL STATEMENT: The term "equivalent" is vague, subjective and can lead to misleading words intended to identify a possible hazard. Refer to the new NEC Style Manual, Section 3.2.1.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #2213)

1- 242 - (110-23 (New)): Reject

SUBMITTER: Ravindra H. Ganatra, Alcan Cable

RECOMMENDATION: Add the following new text in the General Section of Article 110:

110-23. Flame or fire tests. Where not a part of a flame or fire tested cable assembly, or not installed in metallic raceways, or not installed in a flame or fire tested nonmetallic raceways, individual conductors where required shall meet applicable flame or fire test. Additionally, wire and cable products shall meet applicable requirements in following applications:

(1) Cables installed in construction Types III, IV, and V. Cables installed in Types III, IV, and V constructions shall meet a vertical flame test.

FPN No. 1: Building construction types are defined in NFPA 220 - 1998, Standard on Types of Building Construction, or the applicable building code, or both.

FPN No. 2: Vertical flame test is defined in UL 1581 - 1997, Reference Standard for Electrical Wires, Cables, and Flexible Cords. Products such as Types NM, SE, UF, etc. meet the requirements of this test.

(2) Cables installed in construction Types I and II; in cable trays; and in ducts, plenums, and other spaces not used to transport environmental air. Cables utilized in a construction Types I and II, in cable trays, and in ducts, plenums, and other spaces not used to transport environmental air shall meet a vertical tray flame test.

FPN No. 1: Building construction types are defined in NFPA 220 - 1998, Standard on Types of Building Construction, or the applicable building code, or both.

FPN No. 2: Vertical tray flame test is defined in UL 1685 - 1997, Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. Products such as Types AC, TC, MC, etc. meet the requirements of vertical tray flame test in this standard. Products marked for "limited smoke" meet the requirements of vertical tray flame test and smoke-release measurements in this standard.

(3) Cables installed vertically in shafts. Cables installed vertically in shafts shall meet a large-scale fire test for riser cables.

FPN: Large-scale fire test for riser cables is defined in UL 1666 - 1997, Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts. Types CL3R and CL2R, shown in Table 725-61, are examples of riser cables that meet the requirements of this test.

(4) Cables installed in ducts, plenums, and other spaces used to transport environmental air. Cables installed in ducts, plenums, and other spaces used to transport environmental air without the cables being enclosed in raceways in those spaces shall be capable of meeting a large-scale fire test for plenum cables.

FPN: Large-scale fire test for riser cables is defined in UL 910 - 1998, Test for Flame-Propagation and Smoke-Density Values for Electrical and Optical-Fiber Cables used in Spaces Transporting Environmental Air. Types CL3P and CL2P, shown in Table 725-61, are examples of plenum cables that meet the requirements of this test.

SUBSTANTIATION: [Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively, in this Code. This is a general proposal that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]

Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of phrase "flame tested" or "fire tested" informs the user that the product shall be tested against the requirements for a specific flame test or fire test and directs the user's attention to seek further understanding about the given product's performance.

This proposal reflects the current relationship between the requirements in the Code and the applicable product standards for wire and cable products that are recognized in the Code. It is proposed to add this section in the general section of this article because the requirements for flame or fire test can be either product specific, or construction specific, or application specific. For example, flame test requirements for types of conductors recognized in Table 310-13 is covered in the applicable product standards for each type. Construction specific requirements can match the flame test performance requirement with type of building construction. Application specific requirements for installations in vertical risers and plenum spaces used for environmental air require products that can meet the applicable fire tests for their suitability in such applications.

Also, requirements for flame or fire tests for other products, where required, can be added in this section in the future.

Insulation and jacketing materials used with conductors and cables are required to provide necessary electrical, mechanical and flame or fire test performance in accordance with the requirements of the Code and the applicable product standards. In general, any improvement in one of these properties comes at the expense of the other two properties. This recommendation may facilitate harmonization of codes and standards. Also, it can promote development of cables that can deliver improved performance in all three properties whereby the insulation on conductor provides improved electrical and mechanical performance along with needed flame test performance. The overall assembly, on the other hand, can be designed and manufactured such that it provides improved mechanical and flame or fire test performance along with needed electrical performance. The overall product may have less smoke and less toxicity than products used today, which is a desirable goal.

Referencing of other NFPA standards and the test standards in the Fine Print Notes is in accordance with the latest editions of the NFPA Manual of Style and NEC Style Manual.

PANEL ACTION: Reject.

PANEL STATEMENT: The term "flame retardant" is used throughout the Code as a means of expressing to the user that the cables resist the spread of flames, albeit the test methods are often not defined. The term "flame tested" would be similarly undefined but can be understood to mean a test which does not necessarily measure the ability of a cable to resist the spread of flame-propagation (which is implied by "retardant"). Propagation is of paramount importance for conductors and cables. The Fine Print Notes in the proposal are not accurate in all cases in reflecting the flame test requirements in the product standards. Some articles of the NEC offer suggestions for the tests appropriate for the required level of flame retardance. Other articles rely on the product standards to provide such information. The panel suggests that specific proposals be made wherever the generic reference to "flame retardant" is not sufficient.

6- 3 - (110-23 (New)): Reject

SUBMITTER: Ravindra H. Ganatra, Alcan Cable

RECOMMENDATION: Add the following new text in the General Section of Article 110:

110-23. Flame or fire tests. Where not a part of a flame or fire tested cable assembly, or not installed in metallic raceways, or not installed in a flame or fire tested nonmetallic raceways, individual conductors where required shall meet applicable flame or fire test. Additionally, wire and cable products shall meet applicable requirements in following applications:

(1) Cables installed in construction Types III, IV, and V. Cables installed in Types III, IV, and V constructions shall meet a vertical flame test.

FPN No. 1: Building construction types are defined in NFPA 220 - 1998, Standard on Types of Building Construction, or the applicable building code, or both.
FPN No. 2: Vertical flame test is defined in UL 1581 - 1997, Reference Standard for Electrical Wires, Cables, and Flexible Cords. Products such as Types NM, SE, UF, etc. meet the requirements of this test.
(2) Cables installed in construction Types I and II; in cable trays; and in ducts, plenums, and other spaces not used to transport environmental air. Cables utilized in a construction Types I and II, in cable trays, and in ducts, plenums, and other spaces not used to transport environmental air shall meet a vertical tray flame test.
FPN No. 1: Building construction types are defined in NFPA 220 - 1998, Standard on Types of Building Construction, or the applicable building code, or both.
FPN No. 2: Vertical tray flame test is defined in UL 1685 - 1997, Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. Products such as Types AC, TC, MC, etc. meet the requirements of vertical tray flame test in this standard. Products marked for "limited smoke" meet the requirements of vertical tray flame test and smoke-release measurements in this standard.
(3) Cables installed vertically in shafts. Cables installed vertically in shafts shall meet a large-scale fire test for riser cables.
FPN: Large-scale fire test for riser cables is defined in UL 1666 - 1997, Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts. Types CL3R and CL2R, shown in Table 725-61, are examples of riser cables that meet the requirements of this test.
(4) Cables installed in ducts, plenums, and other spaces used to transport environmental air. Cables installed in ducts, plenums, and other spaces used to transport environmental air without the cables being enclosed in raceways in those spaces shall be capable of meeting a large-scale fire test for plenum cables.
FPN: Large-scale fire test for riser cables is defined in UL 910 - 1998, Test for Flame-Propagation and Smoke-Density Values for Electrical and Optical-Fiber Cables used in Spaces Transporting Environmental Air. Types CL3P and CL2P, shown in Table 725-61, are examples of plenum cables that meet the requirements of this test.
SUBSTANTIATION: [Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively, in this Code. This is a general proposal that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of phrase "flame tested" or "fire tested" informs the user that the product shall be tested against the requirements for a specific flame test or fire test and directs the user's attention to seek further understanding about the given product's performance.
This proposal reflects the current relationship between the requirements in the Code and the applicable product standards for wire and cable products that are recognized in the Code. It is proposed to add this section in the general section of this article because the requirements for flame or fire test can be either product specific, or construction specific, or application specific. For example, flame test requirements for types of conductors recognized in Table 310-13 is covered in the applicable product standards for each type. Construction specific requirements can match the flame test performance requirement with type of building construction. Application specific requirements for installations in vertical risers and plenum spaces used for environmental air require products that can meet the applicable fire tests for their suitability in such applications.
Also, requirements for flame or fire tests for other products, where required, can be added in this section in the future.
Insulation and jacketing materials used with conductors and cables are required to provide necessary electrical, mechanical and flame or fire test performance in accordance with the requirements of the Code and the applicable product standards. In general, any improvement in one of these properties comes at the expense of the other two properties. This recommendation may facilitate harmonization of codes and standards. Also, it can promote development of cables that can deliver improved performance in all three properties whereby the insulation on conductor provides improved electrical and mechanical performance along with needed flame test performance. The overall assembly, on the other hand, can be designed and manufactured such that it provides improved mechanical and flame or fire test performance along with needed electrical performance. The overall product may have less smoke and less toxicity than products used today, which is a desirable goal.
Referencing of other NFPA standards and the test standards in the Fine Print Notes is in accordance with the latest editions of the NFPA Manual of Style and NEC Style Manual.
PANEL ACTION: Reject.
PANEL STATEMENT: Cables are listed for their flame retardant properties and some of their applications are referenced in the Code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
GANATRA: The panel should have either Accepted or Accepted in Principle this proposal. Proposal reflects the existing installations in the US and Canada. Panel Action could be to add a definition in Article 310:
"Flame Retardant. Where specified, products meet this requirement in accordance with the applicable product standard."
COMMENT ON AFFIRMATIVE:
GALAN: In addition to the information stated in the Panel Statement, it should be noted that the second sentence of proposed Paragraph 110-23, as written, allows for a conductor which is installed in a raceway to be exempt from a flame test. This goes against the present philosophy of the NEC. This would allow a construction, such as USE cable, which does not comply with a flame test and is presently not Listed, for installation inside a building, to be used throughout a building. UL's Guide information for Service-Entrance Cable states "Types USE and USE-2 are not suitable for use in premises or aboveground except to terminate at the service equipment or metering equipment." Sections 338-2 and 338-4(b) indicate that USE is not for use inside a building. Presently, all single conductor building wires (e.g., XHHW, RHW, THWN, and THW) must comply with a flame test. This proposal would allow for that to change, which is a step backward.

(Log #4345)

1- 243 - (110-23 (New)): Accept
SUBMITTER: Robert B. Alexander, Fluor Daniel
RECOMMENDATION: ADD a new section to read
Current Transformers. Unused current transformers, associated with potentially energized circuits, shall be short circuited.
SUBSTANTIATION: Section 450-1 Exception 1 specifically exempts current transformers from consideration in the rest of Article 450.
Open circuited current transformers can cause lethal voltages and fires. CTs not actively used in control, measurement or protection of potentially energized circuits should be short circuited.
PANEL ACTION: Accept.

(Log #3312)

1- 244 - (110-24 (New)): Reject
SUBMITTER: Jack Wells, Pass & Seymour/Legrand
RECOMMENDATION: Add a new Section 110-24 to read as follows:
110-24. Identification of Receptacles. Receptacles installed on a branch circuit shall be legibly marked to identify the disconnecting means for the branch circuit.
SUBSTANTIATION: To safely perform maintenance at a receptacle outlet, the circuit should be disconnected from the source of supply. Identifying the branch circuit disconnecting means at the receptacle will prompt personnel to recognize that the branch circuit disconnect must be open before beginning work at the receptacle outlet. This requirement in conjunction with identification of the disconnecting means in Section 110-22 provides easily accessible information that will result in an increased level of safety for personnel working at a receptacle outlet.
PANEL ACTION: Reject.

PANEL STATEMENT: This requirement seems extreme. Receptacles associated with a particular disconnect can be referenced at the disconnect.

(Log #1505)

1- 245 - (110-26): Accept in Principle
SUBMITTER: Junior L. Owings, Rep. Oregon Chapter Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text as follows:
110-26. Spaces About Electrical Equipment. Sufficient access and working space shall be provided and maintained about all electric equipment to permit ready and safe operation and maintenance of such equipment. Enclosures housing electrical apparatus that are controlled by lock and key shall be considered accessible to qualified persons. ...
(f) Dedicated Equipment Space. Equipment within the scope of Article 384, and motor control centers, shall be located in dedicated spaces and protected from damage as covered in (1) and (2).
Exception: Control equipment that by its very nature or because of other rules of the Code must be adjacent to or within sight of its operating machinery shall be permitted in those locations.
(1) Indoor. For indoor installations, the dedicated space shall comply with the following.
a. Dedicated Electrical Space. The space equal to the width and depth of the equipment and extending from the floor to a height of 6 ft (1.83 m) above the equipment or to the structural ceiling, whichever is lower, shall be dedicated to the electrical installation. No piping, ducts, or equipment foreign to the electrical installation shall be located in this zone.
Exception: Equipment that is isolated from the foreign equipment by height or physical enclosures or covers that will afford adequate mechanical protection from vehicular traffic or accidental contact by unauthorized personnel or that complies with b., shall be permitted in areas that do not have the dedicated space described in this rule.
b. Foreign Systems. The ~~space~~ area above the dedicated space required by 110-26(f)(1)(a), may contain foreign systems provided protection is installed to avoid damage from condensation, leaks, or breaks in such foreign systems. ~~equal to the width and depth of the equipment shall be kept clear of foreign systems unless protection is provided to avoid damage from condensation, leaks, or breaks in such foreign systems. This zone shall extend from the top of the electrical equipment to the structural ceiling.~~
c. Sprinkler Protection. Sprinkler protection shall be permitted for the dedicated space where the piping complies with this section.
d. Suspended Ceilings. A dropped, suspended, or similar ceiling that does not add strength to the building structure shall not be considered a structural ceiling.
(2) Outdoor. Outdoor electrical equipment shall be installed in suitable enclosures and shall be protected from accidental contact by unauthorized personnel, or by vehicular traffic, or by accidental spillage or leakage from piping systems. The working clearance space shall include the zone described in Section 110-26(a). No architectural appurtenance or other equipment shall be located in this zone.
SUBSTANTIATION: The wording between Sections 110-26(f)(1)(a) and 110-26(f)(1)(b) is unclear and confusing and could be in conflict with each other with the intent of the requirements. The proposed changes to the wording should clarify the confusion and potential conflict. This establishes that there is a truly dedicated space and that only the space above 6 feet above the equipment, if any, to the structural ceiling may have foreign systems installed only if the foreign system meets the requirements of having protection installed for the electrical equipment due to leaks, condensation, or breaks.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel concludes that Proposal 1-271a meets the submitter's intent.

1- 247 - (110-26): Accept in Principle
SUBMITTER: Frank Pologruto, Rep. IBEW L.U. 98
RECOMMENDATION: Add a paragraph to 110-26 to read:
"Electrical equipment rooms with transformers that have a rating of 750 kVA or greater shall have doors that swing out into egress, equipped with panic hardware."
SUBSTANTIATION: In the last three code cycles, proposals to add this device to be included in the National Electrical Code. The response that was generated by the comments on proposals was indeed a concern for safety for electricians working in these electrical rooms.
I personally experienced a ground fault explosion of an electrical transformer where the entire building was put out of service, the personnel in the room had trouble getting out of the room due to the door being shut and had difficulty turning the door knob.
The panel statement suggested that this proposal be submitted to the Life Safety Code, however, the verbal response from the Life Safety Code was the same as the NEC. With safety in mind one can only be bewildered by a negative response from both the NEC and the Life Safety Code.
The unfortunate aspects of this proposal is that we have to submit a casualties count in order to get our point across. This proposal should belong in the National Electrical Code, especially if the Section 450-43(c) requires doors that swing out and equipped with panic bars, the panel can certainly see the need to change their position on panic bars in electrical rooms.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel believes that Proposal 1-260a addresses the submitter's concerns.

(Log #2097)

1- 252 - (Table 110-26(a) Note): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Add at the start of each Condition before the words (exposed live parts) the following words (the enclosure or)
Condition 1 — The enclosure or exposed live parts on one side and no live or grounded parts on the other side of the working space, or the enclosure or exposed live parts on both sides effectively guarded by suitable wood or other insulating materials. Insulated wire or insulated busbars operating at not over 300 volts to ground shall not be considered live parts.
Condition 2 — The enclosure or exposed live parts on one side and grounded parts on the other side. Concrete, brick, or tile walls shall be considered as grounded.
Condition 3 — The enclosure or exposed live parts on both sides of the work space (not guarded as provided in Condition 1) with the operator between.
SUBSTANTIATION: The main section refers to the enclosure but the conditions do not.
By adding these words will correlate the main requirement to the conditions.
This will make the notes more understandable.
Appears that the intent is to require the enclosure to the conditions but does not state in conditions.

Table 110-26(a) Working Spaces

Nominal Voltage to ground	Minimum Clear Distance Condition 1	Condition 2	Condition 3
0-150	900 mm (3 ft)	900 mm (3 ft)	900 mm (3 ft)
151-600	900 mm (3 ft)	1 m (3 1/2 ft)	1.2 m (4 ft)

Note: Where the conditions are as follows:

Conditions 1, 2 and 3 remain unchanged.

PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that the additional wording does not add clarity to the requirements. Refer to Proposal 1-252a.

1- 252a - (110-26(a)(1)): Accept
SUBMITTER: CMP 1
RECOMMENDATION: Revise text as follows:

(1) Depth of Working Space. The depth of the working space in the direction of live parts shall not be less than ~~indicated~~ that specified in Table 110-26(a), ~~except where~~unless the requirements in (a), (b), or (c) are met. Distances shall be measured from the exposed live parts ~~if such are exposed~~,or from the enclosure or opening if ~~such~~ the live parts are enclosed.

Table 110-26(a) Working Spaces

Nominal Voltage to ground	Minimum Clear Distance Condition 1	Condition 2	Condition 3
0-150	900 mm (3 ft)	900 mm (3 ft)	900 mm (3 ft)
151-600	900 mm (3 ft)	1 m (3 1/2 ft)	1.2 m (4 ft)

Note: Where the conditions are as follows:
Conditions 1, 2 and 3 remain unchanged.

~~Exception No. 1:~~ (a) Dead-front assemblies. Working space shall not be required in back or sides of assemblies, such as dead-front switchboards or motor control centers, ~~where there are no renewable or adjustable parts, such as fuses or switches, on the back or sides and~~ where all connections and all renewable or adjustable parts, such as fuses or switches, are accessible from locations other than the back or sides. Where rear access is required to work on ~~de-energized~~ non-electrical parts on the back of enclosed equipment, a minimum horizontal working space of 762 mm (30 in.) ~~horizontally~~ shall be provided.
~~Exception No. 2:~~ (b) Low voltage. By special permission, smaller working spaces shall be permitted where all uninsulated parts ~~are at a voltage~~ operate at no greater than 30 volts rms, 42 volts peak, or 60 volts dc.
~~Exception No. 3:~~ (c) Existing buildings. In existing buildings where electrical equipment . . . [no change to balance of text]
SUBSTANTIATION: The substantiation for this panel proposal is as follows:
a.) To minimize the use of exceptions and express Code requirements in positive language as required by 3.1.4 of the NEC Style Manual.
b.) To incorporate metric changes into Table 110-26(a).
c.) To substitute the word non-electrical for de-energized in 110-26(a)(1) for clarity.
d.) To retain the soft metric conversion of 30 inches equals 762 mm in Section 110-26(a)(1) for safety reasons to avoid reducing the work space.
e.) To incorporate some of the material from Proposals 1-254 and 1-287 and 1-250.
PANEL ACTION: Accept.

NOT RETURNED: 1 Macias

(Log #397)

1- 255 - (110-26(a)(2)): Reject
SUBMITTER: Michael J. Hartley, Rep. IBEW Local 292
RECOMMENDATION: Revise 110-26(a)(2) to read as follows:
(2) Width of Working Space. The width of working space in front of the electric equipment shall be the width of the equipment or 30 in. (762 mm) whichever is greater. It shall also be kept a minimum of 12 in. away from any wall perpendicular to equipment. In all cases...
SUBSTANTIATION: With room getting taken away consistently by architects from the electrical rooms, I am more and more seeing panels stuffed into room corners making a front on view of breaker landing spots almost impossible to do without compromising safety of the wireman.

PANEL ACTION: Reject.
PANEL STATEMENT: The proposal seems to address location of equipment rather than the width of the work space. There is no substantiation presented for increasing the width of the work space beyond the present requirements.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2805)

1- 256 - (110-26(a)(2)): Reject
SUBMITTER: Bud Swathwood, Bud Swathwood Consulting
RECOMMENDATION: Add sentence to paragraph (2) to read:
In addition to the space for the 90 degree opening of the door there shall be 6 in. space more than the width of the door and the opposite wall or boundry.
SUBSTANTIATION: This addition will make it clear that there must be enough space allowed for large doors especially, to open easily. Some installers leave only enough room for the doors to open and sometimes scrape the opposite wall or "bind" when opened. This addition will also help to meet the OSHA standard 1910.303 (g) (i) (1)(i).
PANEL ACTION: Reject.
PANEL STATEMENT: The concern of the submitter is addressed in existing Section 110-26(a)(2). Also, there is no substantiation for increasing the work space dimension.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #4157)

1- 257 - (110-26(a)(2) Exception No. 2): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise Exception No. 2 as follows:
Exception No. 2: By special permission, smaller spaces may be permitted (1) where it is judged that the particular arrangement of the installation will provide adequate accessibility; or (2) where all uninsulated parts are at a voltage no greater than 30 volts RMS, 42 volts peak, or 60 volts dc.
SUBSTANTIATION: This proposal restores the 1993 NEC permission for the inspector, by special permission, to allow clearance reductions where "the particular arrangement of the installation will provide adequate accessibility." The lack of this language routinely sends inspectors off into Section 90-4, which is far less desirable, and which doesn't even invoke special permission. The special permission process is appropriate in the many instances where clearances cannot quite be obtained.
I can remember granting special permission under this rule in a case where the clearance to part of the panel front was 36 inches, but due to an unusual opposing wall construction, another part of the panel only had 33 inches of clearance (36 inches was required). Here, the fact that the opposing wall was wood, and that the space was very well lit, and the fact that not allowing the location would have dramatically escalated the cost of the job without significantly increasing safety, all combined to make my decision fairly easy. Another example involved spacing between a 24-ft switchboard lineup and an opposing masonry wall. Yes, there was the required 42 in., except where a 6 ft by 4 ft air intake grille protruded into the room 1 1/2 in. due to an oversight. With the degree of qualified maintenance and supervision involved at this facility, again the inspector had a clear conscience in not requiring reconstruction of the room at negligible safety benefit.
In the real world, inspectors have to confront these problems and make decisions based on the total picture. The Code should resume allowing this sort of latitude instead of making officious bureaucrats out of the inspectors who have to live with these decisions. This permission continues very successfully in Massachusetts by state rule since it dropped from the 1996 NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel understands that the referenced section is 110-26(a)(1), Exception No. 2. The panel reaffirms that this provision is covered by 90-4.

(Log #373)

1- 258 - (110-26(a)(3)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add:
Meters, recorders, and similar apparatus that are installed as an integral part of listed equipment shall be permitted to extend not more than 12 in. (305 mm) beyond the front of the electrical equipment.
SUBSTANTIATION: The allowance for a 6 in. intrusion into the work space appears to be concerned with associated equipment such as small transformers, wireways or gutters, and the like although "equipment" (apparatus) may be construed to include watt-hour meters, etc. Such meters in separate sockets or part of a combination panelboard for smaller services are generally 6 in. or less in depth. However watt-hour, kilovar, etc. meters mounted on some switchboards and panelboards may have a depth exceeding 6 in. Work space measured from the face of such apparatus could be interpreted to require an increase in the required space fromt he switchboard enclosure for the entire length of the equipment per (a)(2).
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not included any substantiation of an actual field problem.

NOT RETURNED: 1 Macias

(Log #648)

1- 259 - (110-26(a)(3)e): Reject
SUBMITTER: Bruce Fairweather, Electrical Safety Inc.
RECOMMENDATION: New subparagraph 1. Branches from busways installed in accordance with section 364-8 (b) and retractable cable containers shall maintain a minimum headroom clearance of 6 and 1/2 feet between the drop cable connector or the container and the floor.
SUBSTANTIATION: Many industrial plants have setup and test stations that require equipment to be tested prior to packaging and shipping. In my surveys of these sites I find numerous cases where the length of the vertical bus drop cable from the strain relief is quite long encroaching into what would otherwise be walking space and aisle. The encroachment has resulted in head injuries when an employee comes in contact with the dangling connector. There doesn't appear to be specific language anywhere on minimum headroom clearance for bus drop cable or retractable cable assemblies. This should provide it.
PANEL ACTION: Reject.
PANEL STATEMENT: The problem described is not related to required working space about electrical equipment covered by this Section.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4471)

1- 260 - (110-26(b)): Reject
SUBMITTER: Roy Mundt, Miller-Eads Electrical Contractors
RECOMMENDATION: Recommend that crash bars be put on all electrical closets so that no knobs have to be turned in case of an emergency.
SUBSTANTIATION: If one person is in an electrical closet and something goes wrong they must find the knobs and turn. But if crash bars were installed all you have to do is hit the bar with any part of your body and you're out the door.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal does not contain recommended text as required by Section 4-3.3(c) of the Regulations Governing Committee Projects.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #CP103)

1- 260a - (110-26(c)): Accept
SUBMITTER: CMP 1
RECOMMENDATION: Revise as follows:
(c) ~~Access and~~ Entrance to Working Space. ~~At least one entrance of sufficient area shall be provided to give access to the working spaces about electrical equipment.~~
(1) Minimum Required. At least one entrance of sufficient area shall be provided to give access to the working space about electrical equipment.
(2) Large Equipment. For equipment rated 1200 amperes or more and over 1.8 m (6 ft) ~~(1.83 m)~~ wide that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to the required working space not less than 610 mm (24 in.) ~~(610 mm)~~ wide and 2.0 m (6_ ft) ~~(1.98 m)~~ high at each end of the working space. Where the entrance has a personnel door(s), the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.
A single entrance to the required working space shall be permitted where either of the conditions in (a) or (b) are met.
~~Exception No. 1:~~ (a) Unobstructed exit. Where the location permits a continuous and unobstructed way of exit travel, ~~one means of access~~ a single entrance to the working space shall be permitted.
(b) Extra working space. Where the depth of the working space is twice that required by 110-26(a), a single entrance shall be permitted. It shall be located so that the distance from the equipment to the nearest edge of the entrance is not less than the "Minimum Clear Distance" specified in Table 110-26(a) for equipment operating at that voltage and in that condition.
~~Exception No. 2: Where the work space required by Section 110-26(a) is doubled, only one entrance to the work space is required. It shall be located so the edge of the entrance nearest the equipment is the minimum clear distance given in Table 110-26(a) away from such equipment.~~
SUBSTANTIATION: The substantiation for this panel proposal CP103 is as follows:
a.) To minimize the use of exceptions and express Code requirements in positive language as required by 3.1.4 of the NEC Style Manual.
b.) Incorporate metric changes.
c.) Retained the soft metric conversion of 24 inches equals 610 mm in Section 110-26(c)(2) for safety reasons to avoid reducing the opening to the required workspace.
e.) Incorporated some of the material from Proposals 1-247 and 1-287 and 1-250.
f.) The panel recognizes that the safety of workers who are exposed to energized conductors is of great concern. The revision will limit the application of the requirement for panic hardware to personnel doors to workspaces where doors are provided.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #668)

1- 261 - (110-26(c) and Exception No. 1): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add to second paragraph:
"Width determination shall be applied to contiguous equipment supplied by a common set of conductors."
Revise Exception No. 1 to read as follows:
Exception No. 1: Where the location permits a continuous and unobstructed way of exit travel without passing through the required work space one means of access shall be permitted.
SUBSTANTIATION: Width should be indicated to apply to the width totality of separate equipment where installed side-by-side (with side panels) and individually fed from above or through nipples between equipment sides by the same set of conductors. This is essentially the same as one equipment.
The exception may have contemplated an exit travel at right angles from equipment, but can be construed as permitting exit travel parallel to equipment and within required work space. In a U-shaped configuration of equipment, one entrance at the open end would be at "each end" and technically conform to the exception, or may be interpreted as complying with Exception No. 2. If an electrical mishap occurs at the entrance (exit) end a person would have to exit near the occurance.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes the present language is clear. Requirements for access to work space are not dependent on the nature of supply to the equipment. Exiting the working space through the required means of access may well require traveling through the workspace.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #1456)

1- 262 - (110-26(c)): Reject
SUBMITTER: Daniel McIntyre, Town of Westwood, MA
RECOMMENDATION: Insert "400 ampere".
Delete "1200 ampere or more and over 6 ft wide."
(c) Access and Entrance to Working Space. At least one entrance of sufficient area shall be provided to give access to the working space about electric equipment.
For equipment rated ~~1200 amperes or more and over 6 ft (1.83 m) wide~~ that contains overcurrent devices, switching devices, or control devices, there shall be one entrance not less than 24 in. (610 mm) wide and 6 1/2 ft (1.98 m) high at each end of the work space.
SUBSTANTIATION: Residential homes with 400 ampere and larger services, are installing generator backup power, requiring large transfer switches to be installed and in some cases in very restricted access locations.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation provided is insufficient to justify the proposed change.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2887)

1- 263 - (110-26(c)): Accept in Principle in Part
SUBMITTER: James Maldonado, City of Tempe, AZ/Rep. Central Arizona Chapter IAEI
RECOMMENDATION: Add new paragraph at the end of Section 110-26(c) after Exceptions No. 1 and 2 to read as follows:
All rooms or spaces as described in Section 110-26(a), dedicated to electric equipment, shall have all doors open outward. Such doors shall be a minimum of 24 in. (610 mm) wide and 6-1/2 ft (1.98m) high.
SUBSTANTIATION: Electrical equipment less than 1200 amps does not require any specific size of access and entrance to working space. There is also no requirement to be able to exit the working space after a person enters. If an emergency occurs, there will not be adequate access for emergency teams. If the entrance or access door opens inward and slows down emergency egress during a fault the severity of burns and bodily injury a person may receive is directly related to the distance a person is away from the faulting equipment. An inward opening door restricts that exiting speed and increases the possibility of more severe injuries.
PANEL ACTION: Accept in Principle in Part.
PANEL STATEMENT: The panel rejects the "all rooms" requirement as being overly restrictive. The panel believes that panel Proposal 1-260a partially addresses the submitter's concern of egress. The substantiation does not totally support the recommendations.

(Log #2888)

1- 264 - (110-26(c)): Reject
SUBMITTER: James Maldonado, City of Tempe, AZ/Rep. Central Arizona Chapter IAEI
RECOMMENDATION: Add a new paragraph at the end of Section 110-26(c) after Exceptions No. 1 and 2 to read as follows:
Access and Entrance to Working Space.
For electric equipment having hinged doors or panels, a clear means of egress shall be provided when doors or panels are open in any position. Such means of egress shall not be less than 24 in. (610 mm) in width.
SUBSTANTIATION: This requirement allows for emergency egress from electrical equipment when the door or panels block the means

of access or egress. Since 24 in. is required as a means of access it is unclear when this clearance is required, with or without the doors open. There have been many times equipment has been installed close to walls or other equipment that when the doors are open the access and egress space is reduced or eliminated. This clear path is essential during emergencies.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal would, in effect, require an increase in size of the work space. There is no substantiation that work spaces need to be larger than those required in Table 110-26(a). The situation described by the submitter is best addressed by safe work practices.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:

NOT RETURNED: 1 Macias

(Log #3846)

1- 265 - (110-26(c)): Accept in Principle
SUBMITTER: Lanny McMahill, Phoenix, AZ
RECOMMENDATION: Add the following text:
Entrance doors shall open outward from the working space. Such doors shall be not less than 24 in. (610 mm) wide and 6-1/2 ft (1.98 m) high.
SUBSTANTIATION: The possibility of a door opening into a working space can create a potential unsafe condition for service personnel. Requiring the doors to open outward from the working space eliminates this problem. Sufficient area is not defined in the Code. Requiring a minimum size door clarifies sufficient area.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel believes that the submitter's concerns are addressed in Proposal 1-260a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #4459)

1- 266 - (110-26(c)): Reject
SUBMITTER: David E. Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
RECOMMENDATION: Add the following text:
At least one entrance of sufficient area , providing a continuous and unobstructed way of exit travel, shall be provided.
SUBSTANTIATION: "Sufficient area" is a difficult judgment call, which is most likely why the language guidance for the NEC discourages the use of terms such as "sufficient." In dealing with equipment rated less than 1200 amperes, the presently-required space is adequate for the actual work. However, even aside from the fact that it can be reduced by setting down a panelboard cover, it is marginally adequate for flinching and meaningless in terms of the need to flee. I can prevail upon customers to clear the required working space. It will help, though, to have a section that says, "See to it that you can get at your fuse box when there is urgent need. See to it that I don't have to clamber over cardboard boxes that stand between the 30 inches by three feet if I need to get away from your panel without moving like a crab sideways." To get at the fuse box of one lady in her mid-80's, I had to crawl through a structure that once had been a wall-in-the-making, consisting of vertical two-by-fours on 16 inch centers with a horizontal, firestop type bracing member between them about three feet up. Was the area adequately illuminated? A judgment call. I couldn't say no with absolute certainty, until I stood in front of the panel, where I couldn't help but block the light with my body. Based on her experience in changing fuses (actually, in having others change fuses--she just couldn't get at them) she offered me a candle! Was all this absurd? Yes. Illegal? Not explicitly. Other cases are harder to call, but still dangerous.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirement is to assure access to the work space. Requiring and maintaining a path through the building is not within the Scope of the NEC Committee. The problem addressed may best be handled by the use of safe work practices or housekeeping.

(Log #301)

1- 268 - (110-26(d)): Accept in Principle
SUBMITTER: Vincent Metallo, Sr., Baltimore County, MD
RECOMMENDATION: Revise 110-26(d) to read as follows:
Additional lighting fixtures shall not be required where the work space is illuminated by an adjacent light source (or as permitted by 210-70(a)(1) Exception No. 1.
SUBSTANTIATION: Many times panels are located in habital rooms of dwelling units. The lighting requirements for these rooms can be met by a switched controlled receptacle by 210-70(a)(1) Exception No. 1. Inspectors are requiring lighting fixtures in front of these panels even if these rooms have a switched controlled receptacle. If 210-70(a)(1) Exception No. 1 provides proper illumination for the room, then it provides proper illumination for a panel in this room.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel agrees with the submitter's substantiation, but chose to make the recommended addition in Proposal 1-269. The panel believes that the submitter was addressing the second sentence only.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #669)

1- 269 - (110-26(d)): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise second sentence:
Additional lighting outlets ~~fixtures~~ shall not be required where the work space is illuminated by an adjacent light source.
SUBSTANTIATION: Editorial. The definition of lighting outlet includes provisions for a lampholder or pendant cord terminating in a lampholder, which are apparently not considered lighting fixtures, per se. Present wording infers if additional lighting is required, lampholders are not permitted.
PANEL ACTION: Accept in Principle.
Revise Section 110-26(d) to read as follows:
"(d) Illumination. Illumination shall be provided for all working spaces about service equipment, switchboards, panelboards, or motor control centers installed indoors. Additional lighting outlets fixtures shall not be required where the work space is illuminated by an adjacent light source or as permitted by 210-70(a)(1), Exception No. 1. In electrical equipment rooms, the illumination shall not be controlled by automatic means only."
PANEL STATEMENT: CMP-1 does not want proposal 1-1 to affect this proposal. The reference to Section 210-70 was added to clarify which lighting sources are permitted. See panel action and statement on Proposal 1-268.

(Log #CP104)

1- 271a - (110-26(f)): Accept
SUBMITTER: CMP 1
RECOMMENDATION: Revise Section 110-26(f) to read as follows:
(f) Dedicated Equipment Space. ~~Equipment within the scope of Article 384, and~~ All switchboards, panelboards, distribution boards and motor control centers shall be located in dedicated spaces and protected from damage ~~as covered in (1) and (2)~~.
Exception: Control equipment that by its very nature or because of other rules of the Code must be adjacent to or within sight of its operating machinery shall be permitted in those locations.
(1) Indoor. Indoor installations~~, the dedicated space~~ shall comply with the following.
(a) Dedicated Electrical Space. The space equal to the width and depth of the equipment and extending from the floor to a height of 1.8 m (6 ft.) above the equipment or to the structural ceiling, whichever is lower, shall be dedicated to the electrical installation. No piping, ducts, leak protection apparatus, or other equipment foreign to the electrical installation shall be located in this zone.
Exception: ~~Equipment that is isolated from the foreign equipment by height or physical enclosures or covers that will afford adequate mechanical protection from vehicular traffic or accidental contact by unauthorized personnel or that complies with (b), shall be permitted in areas that do not have the dedicated space described in this rule.~~ Suspended ceilings with removable panels shall be permitted within the 1.8 m (6 ft.) zone.
(b) Foreign Systems. The area above the dedicated space required by 110-26(f)(1)(a) shall be permitted to contain foreign systems provided protection is installed to avoid damage to the electrical equipment from condensation, leaks, or breaks in such foreign systems.
(c) Sprinkler Protection. Sprinkler protection shall be permitted for the dedicated space where the piping complies with this section.
(d) Suspended Ceilings. A dropped, suspended, or similar ceiling that does not add strength to the building structure shall not be considered a structural ceiling.
(2) Outdoor. Outdoor electrical equipment shall be installed in suitable enclosures and shall be protected from accidental contact by unauthorized personnel, or by vehicular traffic, or by accidental spillage or leakage from piping systems. The working clearance space shall include the zone described in Section 110-26(a). No architectural appurtenance or other equipment shall be located in this zone.
SUBSTANTIATION: The panel provides the following substantiation:
a.) The panel identified specific equipment to be covered by this section for clarity.
b.) The panel clarified that leak protection apparatus is not allowed in the dedicated space.
c.) The panel modified the exception to allow suspended ceilings with removeable panels in the dedicated space.
d.) The panel revised (b) foreign systems to specifically identify where these foreign system are allowed.
e.) The panel placed hard metric dimensions before inch-pound units.
PANEL ACTION: Accept.

NOT RETURNED: 1 Macias

(Log #3756)

1- 273 - (110-26(f)): Accept in Principle
SUBMITTER: Timothy M. Croushore, Allegheny Power Service Corp.
RECOMMENDATION: 1. Delete the exception to 110-26(f)(1)(a) Dedicated Electrical Space.
2. Reword (b) and (c) to read as follows:
(b) Foreign Liquid Systems. The space equal to the width and depth of the equipment shall be kept clear of foreign liquid systems unless protection is provided to avoid damage from condensation, leaks, or breaks in such foreign liquid systems. This zone shall extend from the top of the electrical equipment to the structural ceiling.
(c) Sprinkler Protection. Sprinkler protection shall be permitted for the dedicated space where the piping is outside of the dedicated space as required in (a) Dedicated Electrical Space, above and where the electrical equipment is protected from damage from condensation, leaks, or breaks in the piping.
Exception: Dry pipe sprinkler systems shall not be required to have protection from damage from condensation, leaks, or breaks.
SUBSTANTIATION: The above changes fix the conflicting text problems with current language of Section 110-26(f) and the exception to 110-26(f)(1)(a) Dedicated Electrical Space.
PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The panel concludes that Proposal 1-271a addresses the problem identified in the submitter's substantiation.

1- 274 - (110-26(f)): Accept in Principle
SUBMITTER: Thomas E. Trainor, City of San Diego, CA
RECOMMENDATION: Revise Section 110-26(f) to read as follows:
(f) Dedicated Equipment Space. Equipment within the scope of Article 384, and motor control centers, shall be located in dedicated spaces and protected from damage ~~as covered in (1) and (2)~~.
Exception: Control equipment that by its very nature or because of other rules of the Code must be adjacent to or within sight of its operating machinery shall be permitted in those locations.
(1) Indoor. ~~For i~~ Indoor installations~~, the dedicated space~~ shall comply with the following.
a. Dedicated Electrical Space. The space equal to the width and depth of the equipment and extending from the floor to a height of 6 ft (1.83 m) above the equipment or to the structural ceiling, whichever is lower, shall be dedicated to the electrical installation. No piping, ducts, or equipment foreign to the electrical installation shall be located in this zone.
~~Exception: Equipment that is isolated from the foreign equipment by height or physical enclosures or covers that will afford adequate mechanical protection from vehicular traffic or accidental contact by unauthorized personnel or that complies with b., shall be permitted in areas that do not have the dedicated space described in this rule.~~
b. Foreign Systems. ~~The space equal to the width and depth of the equipment shall be kept clear of foreign systems unless protection is provided to avoid damage from condensation, leaks, or breaks in such foreign systems. This zone shall extend from the top of the electrical equipment to the structural ceiling.~~ Piping, ducts, and other equipment foreign to the electrical installation shall be permitted above the dedicated electrical space where shields or covers are installed that protect the electrical equipment from condensation, leaks, or breaks in such foreign systems.
c. Sprinkler Protection. Sprinkler protection shall be permitted for the dedicated space where the piping complies with this section.
d. Suspended Ceilings. A dropped, suspended, or similar ceiling that does not add strength to the building structure shall not be considered a structural ceiling.
(2) Outdoor. Outdoor electrical equipment shall be installed in suitable enclosures and shall be protected from accidental contact by unauthorized personnel, or by vehicular traffic, or by accidental spillage or leakage from piping systems. The working clearance space shall include the zone described in Section 110-26(a). No architectural appurtenance or other equipment shall be located in this zone.
SUBSTANTIATION: Subsection (1)(a) requires a minimum dedicated space above switchboards and motor control centers to allow for the safe and proper installation of conduit or cable entering or leaving such equipment. Equipment foreign to the electrical installation is prohibited in this dedicated space.
As presently written, Subsection (1)(b) directly contradicts Subsection (1)(a) by permitting ducts and piping in the area above switchboards so long as protection is provided from leaks or spillage. Subsection (1)(b) specifically allows this "protection" to be installed at the top of the equipment and totally ignores the need for conduit and cable space in order for this equipment to be properly and safely installed. The need for a minimum dedicated "wiring" space was fully documented in several proposals for the 1999 NEC and accepted by the panel in Subsection (1)(a). It is necessary and important for Subsection (1)(b) to be revised to recognize this minimum requirement.
Previous editions of the NEC have implied that protection is required from accidental spillage or leakage from piping systems, from damage by vehicular traffic, and to prevent accidental contact by unauthorized personnel. This implication arises because of the mention of these issues in the exception to (1)(a). In my opinion, this exception is meaningless since it provides exceptions to requirements that don't exist in (1)(a). In fact, it was first written to provide relief from the 25 ft requirement in industrial plants and, with the change to 6 ft, is not longer needed. The proposed revision includes the deletion of the exception and the deletion of the reference to "(1) and (2)" in (f) so that the basic requirement is to provide protection from damage. Trying to list all of the specific ways this equipment could be damaged is inappropriate. If one type of damage is not on the list, then there is no requirement to provide protection for it.
If this proposal is accepted, Section 110-26(f) would read as follows:
(f) Dedicated Equipment Space. Equipment within the scope of Article 384, and motor control centers, shall be located in dedicated spaces and protected from damage.
Exception: Control equipment that by its very nature or because of other rules of the Code must be adjacent to or within sight of its operating machinery shall be permitted in those locations.
(1) Indoor. Indoor installations shall comply with the following:
a. Dedicated Electrical Space. The space equal to the width and depth of the equipment and extending from the floor to a height of 6 ft (1.83 m) above the equipment or to the structural ceiling, whichever is lower, shall be dedicated to the electrical installation. No piping, ducts, or equipment foreign to the electrical installation shall be located in this zone.
b. Foreign Systems. Piping, ducts, and other equipment foreign to the electrical installation shall be permitted above the dedicated electrical space where shields or covers are installed that protect the electrical equipment from condensation, leaks, or breaks in such foreign systems.
c. Sprinkler Protection. Sprinkler protection shall be permitted for the dedicated space where the piping complies with this section.
d. Suspended Ceilings. A dropped, suspended, or similar ceiling that does not add strength to the building structure shall not be considered a structural ceiling.
(2) Outdoor. Outdoor electrical equipment shall be installed in suitable enclosures and shall be protected from accidental contact by unauthorized personnel, or by vehicular traffic, or by accidental spillage or leakage from piping systems. The working clearance space shall include the zone described in Section 110-26(a). No architectural appurtenance or other equipment shall be located in this zone.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel concludes that Proposal 1-271a meets the submitter's intent.

1- 275 - (110-26(f)): Accept in Part
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
(f) Dedicated Equipment Space. Equipment within the scope of Article 384, and motor control centers, shall be located in dedicated spaces and protected from damage as covered in (1) and (2).
Exception: Control equipment that by its very nature or because of other rules of the Code must be adjacent to or within sight of its operating machinery shall be permitted in those locations.
(1) Indoor. For indoor installations, ~~the dedicated space shall comply with the following.~~
a. Dedicated Electrical Space. ~~The space equal to the width and depth of the equipment and extending from the floor to a height of 6 ft (1.83 m) above the equipment or to the structural ceiling, whichever is lower, shall be dedicated to the electrical installation. No piping, ducts, or equipment foreign to the electrical installation shall be located in this zone.~~
~~Exception: Equipment that is isolated from the foreign equipment by height or physical enclosures or covers that will afford adequate mechanical protection from vehicular traffic or accidental contact by unauthorized personnel or that complies with b., shall be permitted in areas that do not have the dedicated space described in this rule.~~
~~b. Foreign Systems.~~ The space equal to the width and depth of the equipment shall be kept clear of foreign systems unless protection is provided to avoid damage from condensation, leaks, or breaks in such foreign systems. This zone shall extend from the top of the electrical equipment to the structural ceiling.
~~c. Sprinkler Protection.~~ Sprinkler protection shall be permitted for the dedicated space where the piping complies with this section.
~~d. Suspended Ceilings.~~ A dropped, suspended, or similar ceiling that does not add strength to the building structure shall not be considered a structural ceiling.
(2) Outdoor. Outdoor electrical equipment shall be installed in suitable enclosures and shall be protected from accidental contact by unauthorized personnel, or by vehicular traffic, or by accidental spillage or leakage from piping systems. The working clearance space shall include the zone described in Section 110-26(a). No architectural appurtenance or other equipment shall be located in this zone.

As revised, the subsection would read as follows:

(f) Dedicated Equipment Space. Equipment within the scope of Article 384, and motor control centers, shall be located in dedicated spaces and protected from damage as covered in (1) and (2).

Exception: Control equipment that by its very nature or because of other rules of the Code must be adjacent to or within sight of its operating machinery shall be permitted in those locations.

(1) Indoor. For indoor installations, the space equal to the width and depth of the equipment shall be kept clear of foreign systems unless protection is provided to avoid damage from condensation, leaks, or breaks in such foreign systems. This zone shall extend from the top of the electrical equipment to the structural ceiling. Sprinkler protection shall be permitted for the dedicated space where the piping complies with this section. A dropped, suspended, or similar ceiling that does not add strength to the building structure shall not be considered a structural ceiling.

(2) Outdoor. Outdoor electrical equipment shall be installed in suitable enclosures and shall be protected from accidental contact by unauthorized personnel, or by vehicular traffic, or by accidental spillage or leakage from piping systems. The working clearance space shall include the zone described in Section 110-26(a). No architectural appurtenance or other equipment shall be located in this zone.

SUBSTANTIATION: This, effectively, is the version CMP 9 voted at the end of the 1996 Code cycle. It's simple, and straightforward. It addresses genuine safety issues and nothing else. Absolutely nothing else. It doesn't substantively differ from the present requirements, but it's a lot easier to read. Now it's true that there isn't a 6 ft rule here, but there really isn't one in the 1999 NEC either. That's because present Section 110-26(f)(1)(a) Exception concludes by saying "or complies with (b)." Since (b) only requires leak protection, that's how you end up, although there's a lot of eye wash along the way. This proposal presents the straightforward version.

This topic has become a very loaded one on an emotional level. I want to take this opportunity to put it in some historical perspective for the perspective of CMP 1, which is looking at it for the first time. Since a good part of this discussion will focus on that exception, for simplicity, here it is:

Exception: Equipment that is isolated from the foreign equipment by height or physical enclosures or covers that will afford adequate mechanical protection from vehicular traffic or accidental contact by unauthorized personnel or that complies with (b), shall be permitted in areas that do not have the dedicated space described in this rule.

When the dedicated space rule first appeared in the NEC (the 1981 edition), it carried with it essentially the same exception, with one crucial difference: It only applied to "Equipment <u>located throughout industrial plants…</u>" That allowance followed this rule intact through the years until this cycle.

When CMP 9 took up this issue during the 1999 NEC comment period, the Panel decided to work from two comments on its earlier work that didn't mention any dimensions at all. One comment asked for a dedicated 6-ft zone <u>while retaining the 1996 exception intact,</u> and one suggested reorganizing the 1996 NEC requirements to tease out the foreign systems rule, but make no other substantive change.

A Panel member moved to combine the two comments, adding the dedicated 6-ft clearance to the reorganization proposal. That was the main motion. I immediately moved to amend the motion by stripping the four words "located throughout industrial plants" from the exception.

Now CMP 9 members discussed the merits of whether there was any reason other than politics to prevent other occupancies than industrials from using an allowance that had been in place for six Code cycles without reported incident. <u>Not one single member of the Panel could think of any safety reason why that should not be so.</u> Why should only industrial occupancies, some with tremendous process fluid exposures, be allowed to use drip shields? Why indeed, when a single family home had to rack a panel out from the wall just because the plumber got there first, and ran a sewer pipe past the panel location? <u>Even underneath the panel,</u> with no exceptions allowed? <u>Even with Type NM cable</u> as the wiring method, which hardly requires anything approaching 6 ft to entrain into a panel?

Not one single member of CMP 9 could think of a safety reason to vote no on the amendment, and it carried unanimously, with one abstaining vote. Subsequently, another Panel member pointed out that with the foreign system rule (b) separated from the principal rule (a), the exception had to be further amended to reference the following paragraph, and so it was. If you have the dedicated space, use it. If you don't, use the appropriate equipment or provide adequate barriers.

<u>Is there a safety issue?</u> The back and sides of electrical equipment comprise 5 sides of a rectangular solid. You can exit any one of those sides safely, although the more options you have, the better the overall design. So, what about the proverbial air duct running 2-in. above a panel? Under the present exception, could you get away with a drip shield to protect against condensation, and locate a panel at that point? Absolutely; you don't "have the dedicated space described in this rule" and thereby qualify for the exception.

Are we all going to die because you can't exit vertically in that case? I don't think so. What about a column-width panel in the webbing of a vertical I column? Horrors—two whole sides of the panel, and the back, completely obstructed! Some members of my former EC&M panel, including former CMP 1 member Bill Summers, have been in the position of having to defend enforcement of the prior version of this rule in front of a disinterested authority. The result? With no safety issue at hand, enforcement of the rule lost every time.

It gets even better when you look at medium voltage installations. Former Section 710-9, now relocated as Section 110-34(f), allows the same thing as this proposal would allow for 600V and below:

<u>(f) Protection of Service Equipment, Metal-Enclosed Power Switchgear, and Industrial Control Assemblies.</u> Pipes or ducts foreign to the electrical installation that require periodic maintenance or whose malfunction would endanger the operation of the electrical system shall not be located in the vicinity of the service equipment, metal-enclosed power switchgear, or industrial control assemblies. Protection shall be provided where necessary to avoid damage from condensation leaks and breaks in such foreign systems. Piping and other facilities shall not be considered foreign if provided for fire protection of the electrical installation.

This section actually has a longer pedigree than the rule for 600V and below, having first entered the 1975 NEC. Here again, the rule squarely addresses safety, allowing for the arrangement of field protection if necessary. This proposal avoids having more stringent rules for lower hazard work (600V and below.)

Communication is the key. Let's try to remember that we don't own the real estate. In the end the owners have to live with whatever decisions they make about sacrificing future workability on the altar of low initial costs. There are always ways, often very expensive, for you to get wiring extensions out of overly cramped electrical rooms, and done safely. I know, because I've carried tools for years and I've had to do it often.

It's our job, though, to carry this burden of communicating with other professionals. We must not ask the Code to do it for us. If we were to succeed, we'd only lose in the end, because in so doing we destroy the moral authority of a Code squarely based on minimum safety, and not the convenience of its users. Remember, other interests want to take the NEC away from our industry. Ultimately, public authorities outside our industry will make that decision. They never heard of Ohm's Law, but they'll spot something that looks and smells like an economic benefit to a special interest masquerading as a safety rule from far off.

If CMP 1 accepts this proposal, they'll just have to look somewhere else.

PANEL ACTION: Accept in Part.

PANEL STATEMENT: The panel accepts the deletion of the exception by Proposal 1-271a. The Panel chooses to retain a 6 foot dedicated space above the equipment.

(Log #2520)

1- 278 - (110-26(f)(1)a): Reject
SUBMITTER: Richard P. Owen, City of St. Paul, MN
RECOMMENDATION: Revise as follows:
(a) Dedicated Electrical Space. The space equal to the width and depth of the equipment and extending from the floor to a height of ~~6 ft (1.83m)~~10 ft (3.05m) above the equipment or to the structural ceiling, whichever is lower, shall be dedicated to the electrical installation. No piping, ducts, or equipment foreign to the electrical installation shall be located in this zone.
SUBSTANTIATION: The reduction of the dedicated space above equipment from 25 ft to 6 ft above the equipment made some larger equipment installations difficult, if not impossible to accomplish. To have only 6 ft above a large switchboard to install several large capacity busways from the top of the switchboard is in some cases unworkable.
Even an installation as small as a surface-mounted panelboard runs into difficulty in some cases, since the distance from the top of the panelboard to the nonstructural ceiling must be subtracted from the 6 ft space. In some installations, depending on the height of the nonstructural ceiling, it may leave very little room above the ceiling for cables, raceways, etc. to be installed in a "neat and workmanlike manner" below the ceiling, and still have enough room above the nonstructural ceiling to be able to direct these raceways or cables out to the rest of the electrical system. I think that the additional 4 ft I would propose to add to the dedicated space would allow the electricians, who are the primary focus of this Code, to install their equipment properly, but would still leave space for other trades to use the former dedicated space for their own purposes.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation is insufficient to justify increased dedicated space as proposed.

1- 281 - (110-26(f)(1)a, Exception): Reject
SUBMITTER: John I. Williamson, Minnesota Board of Electricity
RECOMMENDATION: Modify the wording in the exception in part, as follows:
Exception: Equipment that is isolated from the foreign equipment … shall be permitted in existing buildings that do not have the dedicated space described in this rule.
SUBSTANTIATION: Substantiation - For new construction, there should not be any exception to the main rules of 110-26(f)(1)(a) or (b). Careful design and planning can ensure proper dedicated workspace. However, an exception is appropriate for "existing buildings" that are renovated, whereby the exception to the main rule is offset by the overall improvements that are made to the building's electrical system. Inspection authorities all too often are expected to approve electrical installations for which a serious lack of careful design and underlying economic factors result in electrical equipment areas that are undersized. Very often these areas violate all of the requirements for working space, clear space, access and entrance to working space, and dedicated equipment space, and ultimately increase the risk of injury to personnel.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not consider a general relaxation of the requirements for dedicated space in existing buildings is warranted. The provisions of Section 90-4 can be invoked where deemed necessary.

(Log #2789)

1- 283 - (110-26(f)(1)b): Accept in Principle
SUBMITTER: Richard P. Owen, City of St. Paul, MN
RECOMMENDATION: Revise as follows:
(b) Foreign Systems. The space equal to the width and depth of the equipment shall be kept clear of foreign systems unless protection is provided to avoid damage from condensation, leaks, or breaks in such foreign systems. Any protection required by this

section shall be placed outside the dedicated space as described in 110-26(f)(1)(a). This zone shall extend from the top of the electrical equipment to the structural ceiling.
SUBSTANTIATION: This section may imply that any protection against spillage, etc. onto electrical equipment must be out of the dedicated space, but unless it is specifically stated, the arguments we have encountered would continue. I think the 6 ft dedicated space is an absolute minimum to allow electricians to install their raceways, etc. above equipment. To allow some type of "awning", "trough" or other such spillage protection within that 6 ft space makes installations difficult, if not impossible to do.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel concludes that Proposal 1-271a meets the submitter's intent.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #3611)

1- 284 - (110-26(f)(1)(b)): Accept in Principle
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read as follows:
110-26. Spaces About Electrical Equipment. Sufficient access and working space shall be provided and maintained about all electric equipment to permit ready and safe operation and maintenance of such equipment. Enclosures housing electric apparatus that are controlled by lock and key shall be considered accessible to qualified persons.
[subparagraphs (a) to (e) remain the same]
(f) Dedicated Equipment Space. Equipment within the scope of Article 384, and motor control centers, shall be located in dedicated spaces and protected from damage as covered in (1) and (2).
Exception: Control equipment that by its very nature or because of other rules of the Code must be adjacent to or within sight of its operating machinery shall be permitted in those locations.
(1) Indoor. For indoor installations, dedicated space shall comply with the following.
a. Dedicated Electrical Space. The space equal to the width and depth of the equipment and extending from the floor to a height of 6 ft (1.83 m) above the equipment or to the structural ceiling, whichever is lower, shall be dedicated to the electrical installation. No piping, ducts, or equipment foreign to the electrical installation shall be located in this zone.
Exception: Equipment that is isolated from the foreign equipment by height or physical enclosures or covers that will afford adequate mechanical protection from vehicular traffic, or accidental contact by unauthorized personnel or that complies with b., shall be permitted in areas that do not have the dedicated space described in this rule.
b. Foreign Systems. The ~~space~~ area above the dedicated space required by 110-26(f)(1)(a), ~~may~~ shall be permitted to contain foreign systems provided protection is installed to avoid damage to the electrical equipment from condensation, leaks, or breaks in such foreign systems, ~~equal to the width and depth of the equipment shall be kept clear of foreign systems unless protection is provided to avoid damage from condensation, leaks, or breaks in such foreign systems. This zone shall extend from the top of the electrical equipment to the structural ceiling.~~
c. Sprinkler Protection. Sprinkler protection shall be permitted for the dedicated space where the piping complies with this section.
d. Suspended Ceilings. A dropped, suspended, or similar ceiling that does not add strength to the building structure shall not be considered a structural ceiling.
(2) Outdoor. Outdoor electrical equipment shall be installed in suitable enclosures and shall be protected from accidental contact by unauthorized personnel, or by vehicular traffic, or by accidental spillage or leakage from piping systems. The working clearance space shall include the zone described in Section 110-26(a). No architectural appurtenance or other equipment shall be located in this zone.
SUBSTANTIATION: The wording between Sections 110-26(f)(1)(a) and 110-26(f)(1)(b) is unclear and confusing and could be in conflict with each other with the intent of the requirements. The proposed changes to the wording should clarify the confusion and potential conflict. The proposed text establishes that there is a truly dedicated space and that only that space that may exist above 6 ft above the equipment, if any, to the structural ceiling may have foreign systems installed and then only if the foreign system meets the requirement of having protection installed for the electrical equipment due to leaks, condensation or breaks.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel concludes that Proposal 1-271a meets the submitter's intent.

1- 285 - (110-26(f)(2)): Reject
SUBMITTER: John A. Hoffman, Centre Region Code Admin.
RECOMMENDATION: New additional sentence at the end of paragraph: Outdoor electrical equipment shall not be located within 10 ft of a fire department connection or a fire hydrant.
SUBSTANTIATION: This new sentence will provide fire department personnel with safe, adequate clearance to electrical equipment that is likely to be energized while connecting hose. Service equipment, pad mounted transformers, air conditioning units and like equipment can hinder the efforts of fire department personnel even though 110-26 clearances have been met. In addition, the extended clearance will afford a greater degree of safety for fire department personnel particularly during inclement weather. A similar proposal for clearance will be submitted to NFPA 13.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: While the panel is cognizant to the need for fire hydrant connection clearance, there is no substantiation that Fire Department operations are impeded or jeopardized by the presence of electrical or any other equipment in the vicinity of hose connections.

(Log #4448)

1- 286 - (110-26(g) (New)): Reject
SUBMITTER: Frants Marvin Jensen, Consolidated Engr Labs
RECOMMENDATION: Add new Section 110-26(g) as follows:
All workspace in this section shall be substantially flat and level.
Exception: Areas required to be arranged to drain.
SUBSTANTIATION: This should be self explanatory: Too many times we see panels in stairways, services on the exterior with no flat space to stand. It is very awkward to work on energized equipment while trying to keep your footing.
PANEL ACTION: Reject.
PANEL STATEMENT: It is impracticable to require all floors or platforms to be level for a number of reasons. Ramps are common in structures and, depending on the slope, do not necessarily present an impediment to the safe operation and maintenance of electrical equipment. The use of the term "substantially" as proposed is unenforceable per Section 3.2.1 of the National Electrical Code Style Manual.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2050)

1- 287 - (110-26(l)): Accept in Principle
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Change Exception No. 1 and No. 3 to positive text and change Exception No. 2 to Exception to read as follows:
(1) Depth of Working Space. The depth of the working space in the direction of access to live parts shall not be less than indicated in Table 110-26(a). Distances shall be measured from the live parts if such are exposed or from the enclosure front or opening if such are enclosed.
Table 110-26(a) to remain as is now in the code with notes:
Exception: By special permission, smaller spaces shall be permitted where all uninsulated parts are at a voltage no greater than 30 volts rms, 42 volts peak, or 60 volts dc.
Working space shall not be required in back or sides of assemblies, such as dead-front switchboards or motor control centers, where

there are no renewable or adjustable parts, such as fuses or switches, on the back or sides and where all connections are accessible from locations other than the back or sides. Where rear access is required to work on de-energized parts on the back of enclosed equipment, a minimum working space of 30 in. (762 mm) horizontally shall be provided.

In existing buildings where electrical equipment is being replaced, Condition 2 working clearance shall be permitted between dead-front switchboards, panelboards, or motor control centers located across the aisle from each other where conditions of maintenance and supervision ensure that written procedures have been adopted to prohibit equipment on both sides of the aisle from being open at the same time and qualified persons who are authorized will service the installation.

SUBSTANTIATION: The Exception that remains is to be placed before the two added paragraphs.

There is no technical changes intended.

This will eliminate two exceptions and make the code easier to read.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The panel understands the submitter is intending to revise Section 110-26(a)(1). The panel believes that the action on Proposal 1-252a meets the intent of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #2746)

1- 288 - (110-27(b)): Reject

SUBMITTER: Joseph N. Fiorello, Sr., Fiorello Electric Inc.

RECOMMENDATION: Revise as follows:

(b) In locations where electrical equipment is likely to be exposed to physical damage, enclosures or guards shall be so arranged and of such strength to prevent such damage. (In an area deemed to be a flood zone by Federal or state bodies, electrical equipment shall not be installed below grade level.)

SUBSTANTIATION: During Hurricane Floyd, as an electrical inspector part of a FEMA advance team, I noted a problem of accessibility. When the emergency personnel as well as the occupants needed to shut off power they were unable to. During this time and after the waters receded, many persons were put in extremely hazardous positions not being able to turn off the power for safety.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal would not necessarily prevent the problem addressed in the substantiation. In flood zones, water can rise above grade level.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #1465)

1- 289 - (110-31): Accept in Principle

SUBMITTER: William M. Lewis, Eli Lilly and Co.

RECOMMENDATION: In Section 110-31 after second paragraph, insert:

The distance from the fence to live parts shall be not less than the following:

601 to 13799 volts	10 ft (3.05 m)
13800 to 230,000 volts	15 ft (4.57 m)
Over 230,000 volts	18 ft (5.49 m)

FPN: For clearances of conductors for specific system voltages and typical BIL ratings see National Electrical Safety Code, ANSI C2-1997.

SUBSTANTIATION: This proposal was developed by the Task Group based on the Task Group's review and discussion of the current requirements of Articles 225, 230, 100, 110, 240, and 250. This proposal is one of 14 which makes up the Task Group's response to a recommendation by a TCC task group on usability in 1995. In considering the needed proposals, emphasis was placed on including in the NEC, practices which are recognized in the electrical industry as necessary for safe installation of over 600 volt systems. This is to provide guidance and direction for installation of these facilities which have not historically been included in the NEC.

The Task Group participants consisted of William M. Lewis, (CMP 4), committee chair; Carl J. Fredericks (CMP 10); Tom Adams (CMP 4); John Beck (Chairman CMP 4); Mark Sumrall (CMP 4); Barry Hornberger, (CMP 13); William T. Beutler, P.E.; William Long, NEMA

Interested persons (nonparticipants): Robert J. Pollock (CMP 4 and TCC); Merton Bunker (NFPA); Mark Earley (NFPA)

PANEL ACTION: Accept in Principle.

Revise table to place the metric dimensions first and inch-pound units second.

PANEL STATEMENT: The dimensions are interchanged to comply with the new NEC Style Manual.

(Log #670)

1- 290 - (110-31(a)(1)): Accept

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise first sentence: Indoor electrical installations that are ~~open~~ accessible to unqualified persons shall be made with metal-enclosed equipment. ~~or shall be enclosed in a vault or in an area to which access is controlled by a lock.~~

SUBSTANTIATION: Enclosed in a vault or controlled by a lock is considered by the first paragraph to be accessible to qualified persons only. This subsection relates to installations accessible to unqualified persons which is a different condition and the rule should apply to that condition. "In a vault or locked" is not accessible to unqualified persons. "Accessible" is defined and preferable to "open".

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #CP105)

1- 291a - (110-33): Accept

SUBMITTER: CMP 1

RECOMMENDATION: Revise as follows;

110-33. Entrance and Access to Work Space

(A) Entrance. At least one entrance not less than 610 mm (24 in.) ~~(610 mm)~~ wide and 2.0 m (6 1/2 ft) ~~(1.98 m)~~ high shall be provided to give access to the working space about electric equipment. Where the entrance has a personnel door(s), the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.

(1) Large Equipment. On switchboard and control panels exceeding 1.8 m (6)1/2 ft ~~(1.83 m)~~ in width, there shall be one entrance at each end of the equipment ~~such boards~~.

A single entrance to the required working space shall be permitted where either of the conditions in (a) or (b) are met.

(a) Unobstructed exit. Where the location permits a continuous and unobstructed way of exit travel, a single entrance to the working space shall be permitted.

~~unless the location of the switchboards and control panels permits a continuous and unobstructed way of exit travel, or unless the work space required in Section 110-34(a) is doubled.~~

(b) Extra working space. Where the depth of the working space is twice that required by 110-34(a), a single entrance shall be permitted. It shall be located so that the distance from the equipment to the nearest edge of the entrance is not less than the "Minimum Clear Distance" specified in Table 110-34(a) for equipment operating at that voltage and in that condition.

~~(2.) Where one entrance to the working space is permitted under the conditions described in (1), the entrance shall be located so that the edge of the entrance nearest the switchboards and control panels is the minimum clear distance given in Table 110-34(a) away from such equipment.~~

(2) ~~(3.)~~ Guarding. Where bare energized parts at any voltage or insulated energized parts above 600 volts, nominal, to ground are located adjacent to such entrance, they shall be suitably guarded.

(B) Access. Permanent ladders or stairways shall be provided to give safe access to the working space around electric equipment installed on platforms, balconies, mezzanine floors, or in attic or roof rooms or spaces.

SUBSTANTIATION: The substantiation for this Proposal CP105 is as follows:

a) The revision utilizes parallel construction to the similar requirements for under 600-volt installations as recommended in the Style Manual Section 3.3.5.

b.) Incorporate metric changes.

c.) Retained the soft metric conversion of 24 inches equals 610 mm in Section 110-33(a) for safety reasons to avoid reducing the opening to the required workspace.

d.) Incorporated some of the material from Proposals 1-292, 1-293, 1-294 and 1-295.

e.) The panel recognizes that the safety of workers who are exposed to energized conductors is of great concern. The revision will limit the application of the requirement for panic hardware to personnel doors to workspaces where doors are provided.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #2889)

1- 292 - (110-33(a)): Accept in Principle
SUBMITTER: James Maldonado, City of Tempe, AZ/Rep. Central Arizona Chapter IAEI
RECOMMENDATION: Section 110-33(a) add new paragraph at the end of this section to read as follows:

All rooms or spaces as described in Section 110-34(a), dedicated to electric equipment, shall have all doors open outward. Such doors shall be a minimum of 24 in. (610 mm) wide and 6-1/2 ft (1.98m) high).

SUBSTANTIATION: Electrical equipment less than 1200 amps does not require any specific size of access and entrance to working space. There is also no requirement to be able to exit the working space after a person enters. If an emergency occurs, there will not be adequate access for emergency teams. If the entrance or access door opens inward and slows down emergency egress during a fault the severity of burns and bodily injury a person may receive is directly related to the distance a person is away from the faulting equipment. An inward opening door restricts that exiting speed and increases the possibility of more severe injuries.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See Proposal 1-291a. The panel does not agree with the submitter's substantiation contained in the first sentence.

(Log #2890)

1- 293 - (110-33(a)): Reject
SUBMITTER: James Maldonado, City of Tempe, AZ/Rep. Central Arizona Chapter IAEI
RECOMMENDATION: Add a new paragraph at the end of Section 110-33(a) to read as follows:

For electric equipment having hinged doors or panels, a clear means of egress shall be provided when doors or panels are open in any position. Such means of egress shall not be less than 24 in. (610mm) in width.

SUBSTANTIATION: This requirement allows for emergency egress from electrical equipment when the door or panels block the means of access or egress. Since 24 in. is required as a means of access it is unclear when this clearance is required, with or without the doors open. There have been many times equipment has been installed close to walls or other equipment that when the doors are open the access and egress space is reduced or eliminated. This clear path is essential during emergencies.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided any technical substantiation to warrant increasing the workspace beyond that required in Section 110-34. See panel action and panel statement on Proposal 1-291a.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 1 Macias

(Log #3259)

1- 296 - (110-34): Reject
SUBMITTER: Alan Manche, Square D Co.
RECOMMENDATION: Revise NEC 110-34 with the additions (underlined) and deletions (strike through) as shown. The entire text of 110-34 and 110-34(a) is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.

110-34. Work Space and Guarding. Sufficient access and working space shall be provided and maintained about all electric equipment to permit ready and safe operation and maintenance of such equipment.

(a) Working Space. Except as elsewhere required or permitted in this Code, equipment likely to require examination, adjustment, servicing, or maintenance while energized shall have ~~the minimum~~ clear working space in the direction of access to live parts of the electrical equipment and shall not be less than specified in Table 110-34(a). Distances shall be measured from the live parts, if such are exposed, or from the enclosure front or opening if such are enclosed.

SUBSTANTIATION: The proposal accomplishes the objective of providing some consistency with 110-26. The first change indicates that you have to have sufficient access and space about all electrical equipment to allow it to be operated.

The revision in (a) parallels the requirement in 110-26(a) that "working space" is required where the equipment might be adjusted, maintained, examined or serviced while energized. The presently language could be interpreted to require "working space" about any piece of >600V equipment regardless of whether it might be worked on while energized. This view would seem to be counter to the stated need that the working space is determine based on access to live parts.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed intoductory text added to 110-34 is presently contained in Section 110-32. The submitter has not provided substantiation to support the proposed recommendation in Section 110-34(a).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:

NOT RETURNED: 1 Macias

(Log #448)

1- 297 - (Table 110-34(a)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise Table 110-34(a) to read as follows:

~~*Table 110-34(a) Minimum Depth of Clear Working Space at Electrical Equipment*~~

Nominal Voltage to Ground	Minimum Clear Distance		
	Condition 1	Condition 2	Condition 3
601-2500 V	900 mm (3 ft)	1.2 m (4 ft)	1.5 m (5 ft)
2501-9000 V	1.2 m (4 ft)	1.5 m (5 ft)	1.8 m (6 ft)
9000-25,000 V	1.5 m (5 ft)	1.8 m (6 ft)	2.8 m (9 ft)
25,001 – 75 kV	1.8 m (6 ft)	2.5 m (8 ft)	3.0 m (10 ft)
Above 75 kV	2.5 m (8 ft)	3.0 m (10 ft)	3.7 m (12 ft)

Note: Where the conditions are as follows:

Conditions 1, 2 and 3 remain unchanged.

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show the SI units as the preferred and inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept.
PANEL STATEMENT: Editorially revise proposed table to replace 9000 -25,000 V with 9001-25,000 V to match Table 110-34(a) from the 1999 NEC.

(Log #2098)

1- 300 - (Table 110-34(a) Note): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Add at the start of each Condition before the words (exposed live parts) the following words (the enclosure or)
Condition 1 — The enclosure or exposed live parts on one side and no live or grounded parts on the other side of the working space, or the enclosure or exposed live parts on both sides effectively guarded by suitable wood or other insulating materials. Insulated wire or insulated busbars operating at not over 300 volts to ground shall not be considered live parts.
Condition 2 — The enclosure or exposed live parts on one side and grounded parts on the other side. Concrete, brick, or tile walls shall be considered as grounded.
Condition 3 — The enclosure or exposed live parts on both sides of the work space (not guarded as provided in Condition 1) with the operator between.
SUBSTANTIATION: The main section refers to the enclosure but the conditions do not.
By adding these words will correlate the main requirement to the conditions.
This will make the notes more understandable.
Appears that the intent is to require the enclosure to the conditions but does not state in conditions.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that the additional wording does not add clarity to the requirements.

NOT RETURNED: 1 Macias

(Log #671)

1- 301 - (110-34(b), (c)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(b) Separation from Low-voltage Equipment. Where switches, cutouts, or other equipment operating at 600 volts, nominal, or less, are installed in a room or enclosure where there are exposed live parts or exposed conductors ~~wiring~~ operating at over 600 volts, nominal, the high-voltage equipment shall be effectively separated from the space occupied by the low-voltage equipment by a suitable partition, fence, or screen.
Exception: Switches or other equipment operating at 600 volts, nominal, or less, and serving only the high-voltage equipment ~~within the high-voltage vault, room, or enclosure,~~ shall be permitted ~~to be installed in the high-voltage room, or vault operating at over 600 volts, nominal,~~ without a partition, fence or screen if accessible to qualified persons only.
(c) Locked Rooms or Enclosures. The entrance(s) to all ~~buildings,~~ vaults, rooms, or other enclosures containing live parts or exposed conductors operating at over 600 volts, nominal, shall be kept locked, access being allowed only to qualified persons, unless such entrance(s) is ~~are~~ under the observation of a ~~qualified~~ person authorized to forbid entry, at all times.

SUBSTANTIATION: In (b) exposed wiring could apply to over 600 volt conductors in surface-mounted rigid metal conduit, which in general would not require special separation or isolation. Subsection (c) references exposed conductors.

The rule of (b) permits low-voltage equipment if separation is provided whether or not serving only high-voltage equipment and doesn't deny access to unqualified persons since the partitioned area is required to be locked per (c). The exception literally nullifies the rule by requiring a relation between low- and high-voltage equipment and limiting access to qualified persons even where separation is provided since it is not based on a condition such as the omission of the partition, which seems to be the intent. The multiple references in the exception to the high-voltage enclosure are superfluous as it is stated in the rule.

In (c) the literal wording broadly requires all building entrances to be kept locked even where the equipment room comprises only a small part of the building. The definition of enclosure indicates fences, walls, etc., for a particular purpose. The proposed addition for (c) specifies obvious access requirements for qualified persons and deletes requirement for a qualified person since a security guard, for example, should not have to meet Article 100 definition of qualified person.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel appreciates the submitter's complete subsection and exception text recommendation using strikethrough for recommended text deletion and underlining for recommended text addition. However, several key words were both omitted and added without benefit of strikethrough and underline identification. As several of the omitted and added words are key to the requirements, the panel was uncertain as to the submitter's intent.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #3260)

1- 302 - (110-34(c)): Reject

SUBMITTER: Alan Manche, Square D Co.

RECOMMENDATION: Revise the second paragraph of 110-34(c) with the additions (underlined) and deletions (strike through) as shown. The entire text of paragraph is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.

Where the voltage exceeds 600 volts, nominal, permanent and conspicuous warning signs shall be provided~~, reading as follows:~~ with the following words or equivalent.

DANGER - HIGH VOLTAGE - KEEP OUT

SUBSTANTIATION: The explicit nature of the present wording is causing field problems in the acceptance of appropriate warning signs or markings. The ANSI Z535 series of standards provides the proper procedure in establishing a hazard sign or marking. ANSI Z535.4 provides the information about what should be contained in a hazard sign or label. This includes a message panel that identifies the hazard, indicates how to avoid the hazard and advises the probable consequence of not avoiding the hazard. The objective of the NEC wording is to generally convey the basic message requirement to user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would allow a hazard sign to comply with the NEC, but be formated in accordance with Z535.4.

PANEL ACTION: Reject.

PANEL STATEMENT: The term "equivalent" is vague, subjective and can lead to misleading words intended to identify a possible hazard. Refer to the new NEC Style Manual, Section 3.2.1.

(Log #3783)

1- 303 - (110-34(c)): Reject

SUBMITTER: Jack H. Zewe, Electrical Consultants, Inc.

RECOMMENDATION: Revise section 110-34 c, warning sign requirements.

Old Text: Danger- High Voltage – Keep Out

Proposed Text: Danger-Hazardous Voltage - Unqualified Personnel - Keep Out

SUBSTANTIATION: Present wording does not reflect the requirements of OSHA Electrical Safe Work Practices. The present wording implies that the person viewing the warning sign would or should have know what "High Voltage" is. High Voltage is a relative term and may mean something different to manny people. OSHA requires warnign signs that tell a person of a HAZARD and WHAT to DO. If you take the present Warning Sign language literaly, no one could work in or proceed pass a sign that states, Warning- Keep Out. There are no exceptions that follwing the present sign requirements. Electrical Workers violate this Keep Out warning every day.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed wording is not mandated by OSHA. The present wording adaquately identifies the hazard involved.

(Log #1466)

1- 305 - (Table 110-34(e)): Accept in Principle
SUBMITTER: William M. Lewis, Eli Lilly and Co.
RECOMMENDATION: Change the 8 ft 6 in. to 9 ft and the 9 ft to 9 ft 6 in. in two places.
SUBSTANTIATION: For consistency with Table 124-1 of the NESC.
This proposal was developed by the Task Group based on the Task Group's review and discussion of the current requirements of Articles 225, 230, 100, 110, 240, and 250. This proposal is one of 14 which makes up the Task Group's response to a recommendation by a TCC task group on usability in 1995. In considering the needed proposals, emphasis was placed on including in the NEC, practices which are recognized in the electrical industry as necessary for safe installation of over 600 volt systems. This is to provide guidance and direction for installation of these facilities which have not historically been included in the NEC.
The Task Group participants consisted of William M. Lewis (CMP 4), committee chair; Carl J. Fredericks (CMP 10); Tom Adams (CMP 4); John Beck (Chairman CMP 4); Mark Sumrall (CMP 4); Barry Hornberger, (CMP 13); William T. Beutler, P.E.; William Long, NEMA
Interested persons (nonparticipants): Robert J. Pollock (CMP 4 and TCC); Merton Bunker (NFPA); Mark Earley (NFPA)
PANEL ACTION: Accept in Principle.
Add metric dimensions as follows:
Change the 8 ft 6 in. to 2.8 m (9 ft) in one place and the 9 ft to 2.9 m (9 ft 6 in.) in two places.
PANEL STATEMENT: Editorially add metric dimensions to the dimensions in this proposal. The panel believes that the intent of the submitter was to increase the dimensions in all three rows of the table. See Proposal 1-304 for actual table revisions.

NOT RETURNED: 1 Macias

(Log #2448)

1- 306 - (110-34(f)): Reject
SUBMITTER: John A. Hoffman, Centre Region Code Admin.
RECOMMENDATION: Revise as follows:
Pipes or ducts foreign to the electrical installation that require periodic maintenance or whose malfunction would endanger the operation of the electrical system shall not be located within 20 ft extending in all directions from service equipment, metal enclosed power switchgear, or industrial assemblies. This zone shall extend from the floor to the structure ceiling.
SUBSTANTIATION: The wording in the 1999 edition states that pipes or ducts foreign to the electrical installation shall not be located "in the vicinity" of the service equipment, metal enclosed power switchgear or industrial control assemblies. This wording is too ambiguous for inspectors to use. It calls on the inspector to make a determination of an acceptable clearance which is not enforced unilaterally nationwide. If the inspector errs in their judgement of an acceptable clearance (5 ft, 8 ft, 10 ft). Failure of piping systems could produce catastrophic results for which he or she could now be held liable. The change affords a standard for the inspector to use as an acceptable clearance.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is considered too restrictive and the panel prefers the performance language as presently contained in Section 110-34(f).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:

(Log #4447)

1- 307 - (110-34(g) (New)): Reject
SUBMITTER: Frants Marvin Jensen, Consolidated Engr Labs
RECOMMENDATION: Add new Paragraph (g) as follows:
All workspace in this section shall be substantially flat and level.
Exception: Areas required to be arranged to drain.
SUBSTANTIATION: This should be self explanatory: Too often we see switchyards with the required clearances built into a hillside but no footing or place to stand in front of the equipment, especially when using a "hot stick."
PANEL ACTION: Reject.
PANEL STATEMENT: It is impracticable to require all floors or platforms to be level for a number of reasons. Ramps are common in structures and, depending on the slope, do not necessarily present an impediment to the safe operation and maintenance of electrical equipment. The use of the term "substantially" as proposed is unenforceable per Section 3.2.1 of the National Electrical Code Style Manual.

(Log #3859)

1- 308 - (110 Part D): Accept
NOTE: The Technical Correlating Committee rejects the panel action to move the material noting that it is outside the Scope of Article 490. It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 13 for information.
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Move Part D of Article 110 to be Part E of Article 490.
Renumber existing Part E of Article 490 to Part F.
SUBSTANTIATION: It seems Part D of Article 110 belongs in Article 490 for the following reasons:
1. Article 110 generally applies to all electrical installations.
2. The present Part D of Article 110 applies to a very narrow class of installation.
3. Article 490 applies to the over 600 volt equipment class of installation covered in existing Part D of Article 110.

4. Existing Part D of Article 490 covers the closely related "Mobile and Portable Equipment." Note the following text from Section 490-51(a) indicating what is covered in Part D: "(a) Covered. The provisions of this part shall apply to installations and use of high-voltage power distribution and utilization equipment that is portable or mobile, or both, such as substations and switch houses mounted on skids, trailers, or cars; mobile shovels; draglines; cranes; hoists, drills; dredges; compressors; pumps; conveyors; underground excavators; and the like."

5. Compare what is covered in Part D of Article 490 with the following text from Section 110-51(a) indicating what is covered in Part D of Article 110 and note the similarity: "(a) Covered. The provisions of this part shall apply to installation and use of high-voltage power distribution and utilization equipment that is portable and/or mobile, such as substations, trailers, or cars, mobile shovels, draglines, hoists, drills, dredges, compressors, pumps, conveyors, underground excavators, and the like."

6. Locating the text from Part D of Article 110 in Article 490 will improve the organization and user-friendliness of the Code.

PANEL ACTION: Accept.

PANEL STATEMENT: The panel agrees with the submitter that this material is more appropriate for CMP-13. CMP-1 recognizes that relocating Part D. Tunnel Installations Over 600 Volts, Nominal is under the purview of the TCC. Refer to CMP-13 for comment.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 1 Macias

(Log #672)

1- 309 - (110-51(a), FPN (New)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Add a fine print note to 110-51(a) to read as follows:

FPN: See Section 90-2(b)(2) for installatons not covered by this code.

SUBSTANTIATION: Editorial. Code users may easily overlook the provisions of Section 90-2(b)(2) where focused on this section.

PANEL ACTION: Reject.

PANEL STATEMENT: There are many locations in the Code where a reference to the scope might be made. However, the value added by such references is minimal for the "trained person" contemplated in Section 90-1.

1- 310 - (110-58): Accept in Principle

NOTE: The following proposal consists of Comment 1-295 on Proposal 1-271 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 1-271 was:

The Technical Correlating Committee has agreed that this proposal be submitted to the panel as a public proposal.

A. Move the following text from Article 710 into Article 110, Part B and place as appropriate.

~~710 32.~~ 110-XX. Circuit Conductors. [move to Article 110, Part B.]

Circuit conductors shall be permitted to be installed in raceways, in cable trays, as metal-clad cable, as bare wire, cable, and busbars, or as Type MV cables, or conductors as provided in Sections ~~710 4 through 710 6~~ 300-XX through 300-XX. Bare live conductors shall conform with Sections ~~710 33 and 710 34~~ 110-XX and 110-XX.

Insulators, together with their mounting and conductor attachments, where used as supports for wires, single-conductor cables, or busbars, shall be capable of safely withstanding the maximum magnetic forces that would prevail when two or more conductors of a circuit were subjected to short-circuit current.

Open runs of insulated wires and cables having a bare lead sheath or a braided outer covering shall be supported in a manner designed to prevent physical damage to the braid or sheath. Supports for lead-covered cables shall be designed to prevent electrolysis of the sheath.

~~710 33.~~ 110-XX. Minimum Space Separation. [move to Article 110, Part B.]

In field-fabricated installations, the minimum air separation between bare live conductors and between such conductors and adjacent grounded surfaces shall not be less than the values given in Table ~~710 33~~ 110-XX. These values shall not apply to interior portions or exterior terminals of equipment designed, manufactured, and tested in accordance with accepted national standards.

Table ~~710 33.~~ 110-XX. Minimum Clearance of Live Parts*

Nominal Voltage Rating, kV	Impulse Withstand, B.I.L. kV		Minimum Clearance of Live Parts, in Inches			
			Phase-to-Phase		Phase-to-Ground	
	Indoors	Outdoors	Indoors	Outdoors	Indoors	Outdoors
2.4-4.16	60	95	4.5	7	3.0	6
7.2	75	95	5.5	7	4.0	6
13.8	95	110	7.5	12	5.0	7
14.4	110	110	9.0	12	6.5	7
23	125	150	10.5	15	7.5	10
34.5	150	150	12.5	15	9.5	10

69		200		18		13
115		250		21		17
138		250		21		17
161		350		31		25
230		550		53		42
		550		53		42
		650		63		50
		650		63		50
		750		72		58
		750		72		58
		900		89		71
		1050		105		83

For SI units: 1 in. = 25.4 mm.

*The values given are the minimum clearance for rigid parts and bare conductors under favorable service conditions. They shall be increased for conductor movement or under unfavorable service conditions or wherever space limitations permit. The selection of the associated impulse withstand voltage for a particular system voltage is determined by the characteristics of the surge protective equipment.

B. Move the following text from Article 710, Part F into Article 110, as a new Part and place as appropriate.

~~F.~~ X. Tunnel Installations, Over 600 Volts, Nominal

~~710-51.~~ 110-XX. General.

(a) Covered. The provisions of this part shall apply to installation and use of high-voltage power distribution and utilization equipment that is portable and/or mobile, such as substations, trailers, or cars, mobile shovels, draglines, hoists, drills, dredges, compressors, pumps, conveyors, underground excavators, and the like.

(b) Other Articles. The requirements of this part shall be additional to, or amendatory of, those prescribed in Articles 100 through ~~710~~ 490 of this Code. Special attention shall be paid to Article 250.

(c) Protection Against Physical Damage. Conductors and cables in tunnels shall be located above the tunnel floor and so placed or guarded to protect them from physical damage.

~~710-52.~~ 110-XX. Overcurrent Protection.

Motor-operated equipment shall be protected from overcurrent in accordance with Article 430. Transformers shall be protected from overcurrent in accordance with Article 450.

~~710-53.~~ 110-XX. Conductors.

High-voltage conductors in tunnels shall be installed in (1) metal conduit or other metal raceway, (2) Type MC cable, or (3) other approved multiconductor cable. Multiconductor portable cable shall be permitted to supply mobile equipment.

~~710-54.~~ 110-XX. Bonding and Equipment Grounding Conductor.

(a) Grounded and Bonded. All noncurrent-carrying metal parts of electric equipment and all metal raceways and cable sheaths shall be effectively grounded and bonded to all metal pipes and rails at the portal and at intervals not exceeding 1000 ft (305 m) throughout the tunnel.

(b) Equipment Grounding Conductor. An equipment grounding conductor shall be run with circuit conductors inside the metal raceway or inside the multiconductor cable jacket. The equipment grounding conductor shall be permitted to be insulated or bare.

~~710-55.~~ 110-XX. Transformers, Switches, and Electric Equipment.

All transformers, switches, motor controllers, motors, rectifiers, and other equipment installed below ground shall be protected from physical damage by location or guarding.

~~710-56.~~ 110-XX. Energized Parts.

Bare terminals of transformers, switches, motor controllers, and other equipment shall be enclosed to prevent accidental contact with energized parts.

~~710-57.~~ 110-XX. Ventilation System Controls.

Electrical controls for the ventilation system shall be so arranged that the airflow can be reversed.

~~710-58.~~ 110-XX. Disconnecting Means.

A switching device meeting the requirements of Article 430 or 450 shall be installed at each transformer or motor location for disconnecting the transformer or motor. The switching device shall open all ungrounded conductors of a circuit simultaneously.

~~710-59.~~ 110-XX. Enclosures.

Enclosures for use in tunnels shall be dripproof, weatherproof, or submersible as required by the environmental conditions. Switch or contactor enclosures shall not be used as junction boxes or raceways for conductors feeding through or tapping off to other switches, unless special designs are used to provide adequate space for this purpose.

~~710-60.~~ 110-XX. Grounding.

Tunnel equipment shall be grounded in accordance with Article 250.

SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Accept in principle revised as follows:

110-58. Disconnecting Means. A ~~switching device meeting the requirements of Articles 430 or 450~~ switch or circuit breaker that simultaneously opens all ungrounded conductors of the circuit shall be installed at each transformer or motor location for disconnecting the transformer or motor. The switching device shall open all ungrounded conductors of a circuit simultaneously. The switch or circuit breaker for a motor shall comply with the requirements of Article 430. The switch or circuit breaker for a transformer shall have an ampere rating not less than the ampacity of the transformer supply conductors.

SUBSTANTIATION: Editorial. Article 450 does not appear to have requirements for transformer primary disconnecting means. This comment indicates switches and circuit breakers in case the Panel intent is not to include all types of switching devices such as contactors.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel believes that the action on Proposal 1-311 meets the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #673)

1- 311 - (110-58): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

Disconnecting Means. A ~~switching device~~ switch or circuit breaker which simultaneously opens all ungrounded conductors of the circuit ~~meeting the requirements of Article 430 or 450~~ shall be installed (within sight of) (immediately adjacent to) each transformer or motor location for disconnecting the transformer or motor. The switch or circuit breaker for a transformer shall have an ampere rating not less than the ampacity of the transformer supply conductors. The switch or circuit breaker for a motor shall comply with the applicable requirements of Article 430. ~~The switching device shall open all ungrounded conductors of a circuit simultaneously.~~ (alternate choices in parenthesis.)

SUBSTANTIATION: A switch or circuit breaker is proposed as the switching device as they can normally be operated at their location, whereas a switching device such as a contactor remotely controlled can literally comply. Article 450 does not appear to have requirements for transformer primary disconnecting means.
PANEL ACTION: Accept in Principle.
Revise to read as follows:

Disconnecting Means. A ~~switching device~~ switch or circuit breaker which simultaneously opens all ungrounded conductors of the circuit ~~meeting the requirements of Article 430 or 450~~ shall be installed within sight of each transformer or motor location for disconnecting the transformer or motor. The switch or circuit breaker for a transformer shall have an ampere rating not less than the ampacity of the transformer supply conductors. The switch or circuit breaker for a motor shall comply with the applicable requirements of Article 430. ~~The switching device shall open all ungrounded conductors of a circuit simultaneously.~~"

PANEL STATEMENT: The panel chose the language "within sight of" as the prefered language from the recommendation.

ARTICLE 200 — USE AND IDENTIFICATION OF GROUNDED CONDUCTORS

(Log #2560)

5- 3 - (200): Reject
SUBMITTER: Fred W. Brown, HI Electron
RECOMMENDATION: Delete the phrase "natural gray."
SUBSTANTIATION: The color "natural gray" is not available as an insulation color from any electrical conductor manufacturer. The use of the phase "natural gray" gives the false impression that the color "gray" is acceptable for a grounded conductor identification. The use of a gray colored conductor, in parts of the United States, is for ungrounded conductor identification. The phrase "natural gray" in the 1999 NEC presents an electrical safety hazard.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not intend to prohibit the use of gray as a grounded conductor. The panel recognizes that natural gray is not defined and that gray colored insulated conductors are commonly used to identify grounded conductors. Also, see panel action and statement on Proposal 5-9.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16

(Log #3005)

5- 4 - (200): Reject
SUBMITTER: Rea Hamilton, Abbott Labs
RECOMMENDATION: Replace all references to the words ~~grounded~~ conductor with the words neutral conductor.
SUBSTANTIATION: Grounding is a very complex, misunderstood subject and the overuse of the word ground only adds to the confusion. Terminology clarification is needed to make the code more understandable.
PANEL ACTION: Reject.
PANEL STATEMENT: Conductors are defined based on where they are connected to the electrical supply system and their function. A neutral conductor is understood to be connected to the neutral or common point of an electrical supply system. Some systems such as a delta do not have a physical neutral connection point. The corner of a delta system (connection of two phase windings) may be grounded but is not a neutral point. The grounded conductor of a 2-wire circuit is also not a neutral conductor.

(Log #1745)

5- 6 - (200-1): Reject
SUBMITTER: Jamie McNamara, Hastings, MN
RECOMMENDATION: Revise to read as follows:
200-1. Scope
This article provides requirements for the following:
1. Identification of terminals and conductors.
SUBSTANTIATION: To clarify that the scope of this article cover the use and identification of white, white with three stripes and natural gray conductor used as grounded as well as ungrounded conductor. An example is for the white conductor used as the supply (hot ungrounded conductor) in a cable as permitted in 200-7 (c) (2).
PANEL ACTION: Reject.
PANEL STATEMENT: The scope already covers conductors as items two and three in the list.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16

(Log #4300)

5- 7 - (200-4 (New)): Reject
SUBMITTER: Charles F. Mello, Milwaukie, OR
RECOMMENDATION: Add new text to read as follows:
"For the purposes of grounded conductor identification, the color gray shall be defined as having a neutral coloration on the Munsell color scale of not less than 4.5 and not greater than 7.0 with 6.0 being the ideal median."
SUBSTANTIATION: The color "natural gray" is not defined by any product standard nor color standard and therefore to establish this as a suitable color for grounded circuit identification is impossible to enforce. For over 30 years the electrical industry has specified and used "gray" colored wire as the alternate identifier to white to comply with Article 200 requirements. There are literally 1000s of installations made with gray colored wire used for this purpose. Surveys of inspectors and installers across the Untied States have identified very few that use gray for other than a grounded conductor. In previous code cycles the issue of defining gray so that it was not too light to be confused with white and not too dark gray to be confused with black prevented resolution of this issue. ANSI/EIA Standard 359A is used by the electrical industry as the basis for color coding of wire and to establish the neutral base, hue and chroma that defines the color. The basis for this color scale is the Munsell color standard. NEMA uses this Munsell system for its definition of NEMA gray such as is used for receptacles colored gray. That color is defined by Munsell as N6. ANSI gray as typically found for painted electrical enclosures is Munsell N6.1 (commonly referred to as ASA 61). By establishing the limitations using a known color system for the gray to be used for the grounded conductor identification, then the potential confusion with white and black is eliminated. The NEMA manufacturing standards and UL wire and cable standards also then have a basis for determining compliance. Lastly, the electrical inspector will have a basis to determine if an installation of gray used for this purpose meets the requirements by using a readily available color scale if needed. With the limitations in Section 200-7, gray could not be used for any other purpose. This change will provide for the continuation of what has been a long standing industry practice and resolve the difficulties with enforcement.
PANEL ACTION: Reject.
PANEL STATEMENT: By providing a very specific color range for gray, a user could install a darker or lighter color gray as an ungrounded conductor. It is the panels intent that all grays are to be used only as a grounded conductor. See panel action and statement on Proposal 5-9.

(Log #1049)

5- 8 - (200-6): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise 200-6 as follows:
200-6(a) - change "No. 6" to "6 AWG" in two places.
200-6(b) - change "No. 6" to "6 AWG" in two places.
200-6(c) - change "No. 4" to "4 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
COMMENT ON AFFIRMATIVE:
DOBROWSKY: The AWG designation should also be added to the NEC Style Manual.

(Log #2107)

5- 9 - (200-6): Accept in Principle

NOTE: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the actions on Proposals 5-10, 5-11, 5-12, 5-16, 5-17, 5-19, 5-21, 5-23, 5-28, 5-31, 5-33, 5-35, 5-37, 5-47, 5-49, and 5-52. It was also the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 6 in sections 310-12(c) and 400-22, Code-Making Panel 7 in Section 363-19, and Code-Making Panel 15 in section 520-53(h)(2) for action.

This action will be considered by the Panel as a Public Comment by all Code-Making Panels mentioned in this Note.

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: Delete the word "natural" from Section 200-6 and where similarly used in the NEC.

SUBSTANTIATION: Natural gray is no longer manufactured. Basic colors not shades or gradation of color are typically used for identification means. The present language could be interpreted as allowing a conductor having light gray colored insulation to be used as an ungrounded conductor, creating a more dangerous condition.

PANEL ACTION: Accept in Principle.

Additionally, add a new FPN to each section wherever the term "natural gray" is changed to "gray". This new FPN is to read as follows:

"FPN: The color gray may have been used in the past as an ungrounded conductor. Care should be taken when working on existing systems."

PANEL STATEMENT: The panel recognizes that natural gray is not defined and that gray colored insulated conductors are commonly used to identify grounded conductors. The panel also recognizes that gray has also been used as an ungrounded conductor. Therefore the panel is adding a FPN to caution the user. Refer to CMP's 6, 7, and 15 for information.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

DIAZ: The term "natural gray" is outdated and not really applicable to modern wiring systems. Having first appeared in the 1923 NEC, the term was probably used to describe unbleached cotton, which was permitted as insulation to identify a grounded conductor. The color of unpigmented pvc or rubber would probably best describe natural gray in modern wiring systems, however, this is rarely, if ever, used today. The need for a unique but obtainable wire for the grounded conductor of a second system when more than one voltage system is used in a building can be appreciated. However, this proposal would permit the use of gray to identify the grounded conductor where only a single system exists. To permit such a widespread use of gray as a grounded conductor can become a serious safety concern, especially when gray has previously been permitted for identification of an ungrounded conductor. To prevent that from occurring, gray should be added only in Section 200-6(d) as an alternate method to using white with a readily distinguishable different colored stripe. Proposal 5-26 accomplishes this accepting gray to identify a grounded conductor for systems exceeding 150V, where two or more voltage systems are used in the same building. This would eliminate the potential for confusion over gray conductors in residential dwellings and similar installations where untrained professionals may be attempting electrical repairs or circuit additions. Having gray specified in the code in this manner would not permit it to become the color identifying the grounded conductor in a single system installation, such as a home.

COMMENT ON AFFIRMATIVE:

MELLO: The issue of "gray" and "natural gray" has existed to some degree for over 40 years and has been an issue for at least three Code cycles. The advent of plastic insulation in the 1960's permitted more and better coloring of these insulating materials. Although the actual source of the color "natural gray" is not precisely known, it is known that it is not defined by any product standard and does not exist in today' s products. For many reasons gray insulated wire has been used all over the United States to identify a grounded conductor. Although this was technically incorrect as a substitute for "natural gray", the practice has been long and widespread. Gray colored insulated wire has also properly been used as an ungrounded conductor. Based on show-of-hands surveys conducted at many meetings with a broad spectrum of electrical people all over the country, the use of gray over the last 30 years as a grounded conductor was substantially higher than its use as an ungrounded conductor was. The Panel had three choices to resolve this issue. First, they could do nothing, which would only perpetuate potentially hazardous conditions with mixed use because of the lack of application of a defined color. Second, delete "natural gray" and effectively "gray" for use as a grounded conductor. The result of this could create a hazard for all those existing installations where gray had been used to identify the grounded conductor. Third, delete only the word "natural" and recognize what has been a widespread industry practice but also to acknowledge the hazard, believed to be limited, where gray wire had been previously used for an ungrounded conductor. This Panel Action appears to cause the least impact while the addition of the Fine Print Note alerts personnel to the potential hazard. The Fine Print Note should be considered good practice for anyone commencing work on existing circuit - understand the circuit and what the purpose of each conductor is even beyond any assumptions based on colors of the insulation.

(Log #3672)

5- 10 - (200-6): Accept in Principle

SUBMITTER: George Ferguson, Eastern Michigan Univ.

RECOMMENDATION: Revise text as follows:

200-6(a) Sizes No. 6 or Smaller. An insulated grounded conductor of No. 6 or smaller shall be identified by a continuous white or ~~natural~~ gray outer finish... Wires that have their outer covering finished to show a white or ~~natural~~ gray color...

SUBSTANTIATION: There is a widespread use of brown, orange, yellow (boy) for 460/277 volt three phase wiring, with a THHN gray conductor for the grounded neutral. It should be time for the NEC to coordinate with industry practice. The arguments I have heard against dropping the "natural" have just as good an argument that this can be dealt with reasonably.

1) "That is it difficult to distinguish between black and gray."

(a) Anyone who has worked with a grounded white and an ungrounded yellow in anything but bright light knows this is as difficult to distinguish.

(b) Often the Code requires items that are not yet available on the market (i.e., conductors with "three or more continuous white stripes) [200-6(a)] or "arc-fault circuit-interrupter" [210-12]. In this case I believe that the wire manufacturers can develop a suitable gray.

2) The "natural" gray referred to in the NEC is not really a readily available item for common use anymore. Keep the Code current with today's standard. If gray THHN were to be widely used as ungrounded, there would be much confusion and danger where the gray THHN has been used as a grounded conductor.

PANEL ACTION: Accept in Principle.

(Log #4284)

5- 12 - (200-6): Accept in Principle in Part

SUBMITTER: Charles F. Mello, Milwaukie, OR

RECOMMENDATION: Revise to read as follows:

(a) Sizes No. 6 or Smaller. An insulated grounded conductor of No. 6 or smaller shall be identified by a continuous white or ~~natural~~ gray outer finish or by three continuous white stripes on other than green insulation along its entire length. Wires that have their outer

covering finished to show a white or ~~natural~~ gray color but have colored tracer threads in the braid identifying the source of manufacture shall be considered as meeting the provisions of this section. Insulated grounded conductors shall also be permitted to be identified as follows:

(1) The grounded conductor of a mineral-insulated, metal-sheathed cable shall be identified at the time of installation by distinctive marking at its terminations.

(2) A single-conductor, sunlight-resistant, outdoor rated cable used as a grounded conductor in photovoltaic power systems as permitted in Section 690-31 shall be identified at the time of installation by distinctive white marking at all terminations.

(3) Fixture wire shall comply with the requirements for grounded conductor identification as specified in Section 402-8.

(4) For aerial cable, the identification shall be as above, or by means of a ridge located on the cable so as to identify it.

(b) Sizes Larger than No. 6. An insulated grounded conductor larger than No. 6 shall be identified either by a white or ~~natural~~ gray outer finish or by three continuous white stripes on other than green installations along its entire lengthor at the time of installation by a distinctive white marking at its terminations. This marking shall encircle the conductor or insulation.

(c) Flexible Cords. An insulated conductor that is intended for use as a grounded conductor, where contained within a flexible cord, shall be identified by a white or ~~natural~~ gray outer finish or by three continuous white stripes on other than green insualtion or by methods permitted by Section 400.22.

(d) Grounded Conductors of Different Systems. Where grounded conductors of different systems are installed in the same raceway, cable, box, auxiliary gutter, or other type enclosure, one system grounded conductor ~~if required,~~ shall have an outer covering conforming to Section 200.6(a) or 200.6(b). Each other system grounded conductor shall have an outer covering of white with readily distinguishable stripes (not green) running along the insulation, or other and different means of identification as allowed by Section 200-6 (a) or (b) that will distinguish each system grounded conductor.

(e) Grounded Conductors in Multiconductor Cables. The insulated grounded conductors in a multiconductor cable, shall be identified by a continuous white or ~~natural~~ gray outer finish or by three continuous white stripes on other than green insulation along its entire length. Multiconductor flat cable No. 4 or larger shall be permitted to employ an external ridge in the grounded conductor.

SUBSTANTIATION: Delete the word natural since the color natural gray is not defined and in fact does not exist as a specified color for wire insulation. This proposal goes with the definition of gray within a specified range of color per the Munsell color system as used by industry for wire color coding. The definition of the gray is provided in another proposal.

PANEL ACTION: Accept in Principle in Part.

Accept the deletion of "natural".

Reject the deletion of "if required"

PANEL STATEMENT: See panel action and statement on Proposal 5-9. The panel concludes that "if required" is important and there is no technical substantiation to remove this phrase.

5- 13 - (200-6(a)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

(a) Sizes No. 6 or Smaller. An insulated grounded conductor of No. 6 or smaller shall be identified by a continuous white ~~or natural gray~~ outer finish or by three continuous white stripes on other than green insulation along its entire length. Wires that have their outer covering finished to show a white ~~or natural gray~~ color but have colored tracer threads in the braid identifying the source of manufacture shall be considered as meeting the provisions of this section. Insulated grounded conductors shall also be permitted to be identified as follows:

(1) The grounded conductor of a mineral-insulated, metal-sheathed cable shall be permitted to be identified at the time of installation by a durable and distinctive white marking that shall encircle the insulating sleeve at its terminations.

(2) A single-conductor, sunlight-resistant, ~~outdoor rated~~ Type SE, UF, or USE cable used as a grounded conductor in solar photovoltaic power systems as permitted in Section 690-31 shall be permitted to be identified at the time of installation by a durable and distinctive white marking that shall encircle the insulation at all terminations.

(3) Fixture wire shall be permitted ~~comply~~ to be identified in accordance with the requirements for grounded conductor identification as specified in Section 402-8.

(4) For multiconductor aerial cable the identification shall be permitted ~~as above or~~ by means of a ridge located on the cable so as to identify ~~it~~ the grounded conductor.

(b) Sizes Larger than No. 6. An insulated grounded conductor larger than No. 6 shall be identified in accordance with (a) above, ~~either by a white or natural gray outer finish or by three continuous white stripes along its entire length~~ or at the time of installation by a durable distinctive white color marking at ~~its termination~~ each termination, at each junction point except conduit bodies that do not contain splices or unused hubs, and at intervals not exceeding 6 ft (1.83 m), with not less than one such marking, where the conductor is installed in a wireway, auxiliary gutter or cable tray. This marking shall encircle the conductor insulation.

(c) No change.

(d) Grounded Conductors of Different Systems. Where grounded conductors of different systems are installed in the same raceway, cablebus, cable, box, cable tray, auxiliary gutter, or other type enclosure, one system grounded conductor ~~if required,~~ shall have an outer covering conforming to Section 200-6(a) or 200-6(b). Each other system grounded conductor shall have an outer covering of white with three readily distinguishable stripes (not green) running along the insulation, ~~or other and different means of identification as allowed by Section 200 (a) or (b) that will distinguish each system grounded conductor.~~ Where acceptable to the authority having jurisdiction, where one conductor larger than No. 6 is identified at the time of installation in accordance with (b) above, additional grounded conductors larger than No. 6 shall be permitted to be identified at the time of installation in accordance with (b) above, except that durable and permanent tagging in lieu of color shall distinguish the additional grounded conductors.

(e) Grounded Conductors in Multiconductor Cables. The insulated grounded conductors in a multiconductor cable, other than Type MI, shall be identified by a continuous white ~~or natural gray~~ outer finish or by three continuous white stripes on other than green insulation along its entire length. Multiconductor flat cable No. 4 or larger shall be permitted to employ an external ridge in the grounded conductor.

Exception No. 1: Where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, grounded conductors in multiconductor cables shall be permitted to be permanently identified at their terminations at the time of installation by a durable and distinctive white marking that shall encircle the conductor insulation, or other equally effective means.

Exception No. 2: The grounded conductor of a multiconductor varnished-cloth-insulated cable shall be permitted to be identified at its terminations at the time of installation by a durable and distinctive white marking that shall encircle the conductor insulation, or other equally effective means.

SUBSTANTIATION: Natural gray is deleted due to widespread disagreement about its use. Section (a)(2), (b), and (e) exceptions do not specify natural gray, nor does (b) for field marking.

For editorial consistency "permitted" should be used in (a)(1), (2), (3) since those provisions are permitted by the first paragraph and the wording of (2) can infer white insulation is not permitted.

The present (a)(1) does not specify color of the "distinctive" marking.

The proposal requirement to encircle the conductor insulation should be applied to all field-marked conductors as it is a good requirement but only specified in (b).

The proposal for (b) includes marking at junction points where the conductor runs through boxes, contactors, switch enclosures, wireways, gutters, and cable trays without a splice (termination). Present wording does not require marking and differs from Sections 230-56 and 250-119(a) which require marking at junction points and where accessible.

An insulated grounded conductor larger than No. 6 run through a conduit body without splices or unused hubs does not appear to warrant identification.

The latter part of the proposal for (d) would cover a (perhaps rare) condition where multiple larger than No. 6 field-marked conductors are commingled, apparently permitted by reference to (b), but which only provides for white color marking.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and statement on Proposal 5-3. This rewrite does not add clarity to the section. The 6 feet addition is not substantiated.

5- 14 - (200-6(a)): Reject
SUBMITTER: Richard E. Loyd, Perryville, AR
RECOMMENDATION: Revise as follows:
(a) Sizes No. 6 or Smaller. An insulated grounded conductor of No. 6 or smaller shall be identified by a continuous white ~~or natural gray outer finish~~ or by three continuous white stripes on other than green insulation along its entire length. Wires that have their outer covering finished to show a white ~~or natural gray~~ color but have colored tracer threads in the braid identifying the source of manufacture shall be considered as meeting the provisions of this section. Insulated grounded conductors shall also be permitted to be identified as follows.
SUBSTANTIATION: This term is undefined. The past Chairman of CMP 5 and others with historical data as to where this term originally came from all relate to products or product manufacturing process that has not been used for the past 35 to 50 years. Since it is a term that was used to define a product no longer made it should be deleted to eliminate the confusion that continues to exist in the industry.
There are many shades of white and many shades of black. How does one determine if gray is a shade of black or white? Different manufactures use various shades of each color and often two or three different manufactures wire will be installed on the same job site. The continued use of the term causes confusion and is or could be a safety issue that might result in life threatening shock hazard.
PANEL ACTION: Reject.

(Log #3318)

5- 15 - (200-6(a) and (b)): Reject
SUBMITTER: Paul E. Phelan, Rep. New Hampshire Electrical Contractors Assn.
RECOMMENDATION: Revise as follows:
200-6(a)
Sizes No. ~~6~~ 10 smaller.
An insulated grounded conductor of No. ~~6~~ 10 or smaller shall be identified...
200-6(b)
Sizes larger than No. ~~6~~ 10
An insulated grounded conductor larger than No. ~~6~~ 10 shall be identified...
SUBSTANTIATION: Change the provisions of 200-6(a) and (b) to allow identification of the grounded conductor at the time of installation by distinctive white markings at its terminations to include sizes No. 8 and No. 6.
Not all suppliers stock No. 8 and/or No. 6 in white. This change would assist the contractor by requiring less conductor colors in the larger sizes and would expedite installation.
PANEL ACTION: Reject.
PANEL STATEMENT: The lack of availability by some electrical suppliers is not technical substantiation for a change. Suppliers will stock materials where there is a demand for it.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
DOBROWSKY: This proposal should be accepted. Conductors with white or gray insulation in sizes larger than 6 AWG could also be manufactured and stocked. Conductors in size 10 AWG and smaller are most commonly used for branch circuits and are readily available with colored insulation. If termination marking is acceptable and considered safe for 4 AWG and larger why not in sizes 6 AWG and 8 AWG.

(Log #3319)

5- 16 - (200-6(a), (b), (c), and (e)): Accept in Principle
SUBMITTER: Paul E. Phelan, Rep. New Hampshire Electrical Contractors Assn.
RECOMMENDATION: Revise as follows:
(a) An insulated grounded conductor of No. 6 or smaller shall be identified by a continuous white or ~~natural~~ grey outer finish...
(b) ... continuous white or ~~natural~~ grey...
(c)... by a white or ~~natural~~ grey
SUBSTANTIATION: Delete the word "natural" from references to the grounded identification in this and all subsequent appropriate sections of this code. The word as used is archaic - probably dating back to when the outer covering of an insulated conductor was fabric (unbleached cotton).
Plastic-insulated conductors are grey when grey and the word natural has no significance and therefore tends to add confusion to an already difficult document.
PANEL ACTION: Accept in Principle.

(Log #2879)

5- 25 - (200-6(d)): Reject
SUBMITTER: Gary Wright, Master Electrical Contractors Inc./Rep. Independent Electrical Contractors Assn.
RECOMMENDATION: Add text to read as follows:
The grounded conductor of all premises wiring may be referred to as the neutral conductor. The neutral conductor ~~may~~ shall be marked white or grey with a continuous outer sheath or with tape or other permanent means.
SUBSTANTIATION: The clear and concise approach of the code can and is often confusing concerning the definition of grounded and grounding. The everyday reference of a grounded conductor as the neutral should be recognized in the practical application of the code.
PANEL ACTION: Reject.
PANEL STATEMENT: Not all grounded conductors are neutrals.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16

(Log #4159)

5- 26 - (200-6(d)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
(d) Grounded Conductors of Different Systems. Where conductors of different systems are installed in the same raceway, cable, box, auxiliary gutter, or other types of enclosure, ~~one system grounded conductor, if required,~~ each grounded conductor shall have an outer covering conforming to Section 200-6(a) or 200-6(b), and shall be identified by system. Where the identification is by color, white shall be used on systems not exceeding 150 volts to ground, and gray shall be used for systems exceeding 150 volts to ground. Where additional systems are present, each other system grounded conductor shall have an outer covering of white with an identifiable colored stripe (not green) running along the insulation, or other and different means of identification as allowed by Section 200-6(a) or (b) that will distinguish each system grounded conductor.
SUBSTANTIATION: This proposal calls for the controlled color gray. If this cannot be distinguished from white (responding to prior CMP 5 rejections), is not yellow subject to the same confusion? The Code must recognize reality. No one is using white wire with stripes, because it is only available on a minimum order of about 40,000 feet. The result is greater confusion, because there is no rule that can be readily enforced. At the time the Massachusetts Electrical Code recognized reality (1993 cycle) and incorporated this rule, we surveyed electrical supply houses across the state and couldn't find a single one with striped wire available.
The Code should represent a consensus of the industry as to what is practicable. There is indeed a consensus, across the country, and it is to do what the proposal calls for. We have discussed this issue with numerous leading wire manufacturers, and they all continue to give the same answers: Yes, we can make striped white wire. No, we can't remember selling any. To be worthwhile, we would have to run (answers vary here between 40,000 to 50,000) feet. The result is arbitrary to virtually nonexistent enforcement of the rules.
The panel should bear in mind that "natural gray" came into the Code in 1923 to reflect uncolored latex and the cotton cloth served around it. At the time it was a reasonable change, but true "natural gray" insulation hasn't been made since the obsolescence of that technology roughly two generations ago. Retention of the term only serves to continue the illusion that gray wire is an option under present rules. Actually, by the literal text, gray wire is fully eligible for use as an ungrounded conductor. The panel continuing inaction on this subject, as duly recognized by its IAEI chair in the last cycle, perpetuates an actual hazard.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no substantiation for requiring white for systems not exceeding 150 volts to ground although that may be common practice. The present wording permits different colors for different systems, but does not specify the colors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
DIAZ: The need for a unique but obtainable wire for the grounded conductor of a second system when more than one voltage system is used in a building can be appreciated. Gray should be added only in Section 200-6(d) as an alternate method to using white with a readily distinguishable different colored stripe. Proposal 5-26 accomplishes this accepting gray to identify a grounded conductor for systems exceeding 150V, where two or more voltage systems are used in the same building. This would eliminate the potential for confusion over gray conductors in residential dwellings and similar installations where untrained professionals may be attempting electrical repairs or circuit additions. See comment for Proposal 5-9.

(Log #2512)

5- 27 - (200-6(e)): Reject

(Log #2030)

5- 18 - (200-6(e) Exception No. 3): Reject
SUBMITTER: Daniel Kurelowech, The Scripps Research Inst.
RECOMMENDATION: Delete entire exception.
SUBSTANTIATION: My comment is directed at the topic: Different systems in the same enclosure/raceway.

The NEC Section 210-5(a): Color code for branch ciruits, states that a grounded conductor of a different system is to be identified by a colored stripe on the insulation. NEC Section 200-6(a), Exception No. 3, modifies this obligation for markings at the termination points if only qualified persons will be servicing the electrical installation.

My problems are these:

1. Some contractors take this exception with minimal compliance.
2. Some contractors just tape the hot and neutral of the different system together. (Is this a different system, or a dedicated neutral?)
3. Devices in walls can be clearly marked for panel designation, but circuits pulled through the device box are rarely marked as a different system.
4. Although a facility has qualified electricians on site, nonqualified maintanence personnel may trouble shoot some minor electrical problems.

My request is this:

1. Delete Exception No. 3, of Section 200-6(a).
2. Modify Section 210-5(a)so it cannot be used for general use, such as receptacles, lights, switches, etc.

PANEL ACTION: Reject.
PANEL STATEMENT: The panel is unclear as to the recommendation. Section 200-6(a) contains no exception.

(Log #2022)

5- 29 - (200-6(f)): Reject
SUBMITTER: Jerry Knoerr, Village of Greendale, Village of Mukwonago, WI
RECOMMENDATION: Add new text to read:

"Add in conduit runs that run concealed, when a piece of metal conduit is used to either go in the floor, wall, etc. that would be concealed and PVC conduit is run in between and the other end is also a metal conduit, a label should be added at the panel board, junction box, or switchboard stating that a ground wire is required for circuits or feeders in this conduit run. The label should be permanent and posted at appropriate locations." Recommend that the panel decide where it should be installed.

SUBSTANTIATION: In industrial plants, shopping centers, etc. it is becoming more apparent that they will take a piece of IMC or rigid and go down in the floor or in the wall for protection, and then they run PVC concealed in the area for less cost and labor. I'm very concerned by the fact that a number of contractors may be working on the facility after the initial installation and has no way of knowing ground wire is required.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal appears to deal with an issue on equipment grounding and the necessity to require a conductor (wiring method). The proposed requirement is already required by Section 250-96. The article solely deals with the use and identification of grounded circuit conductors and terminal.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
COMMENT ON AFFIRMATIVE:

BRETT: The Panel is correct in rejecting this proposal because the recommended text addition is not appropriate to the section referenced however, I believe it has merit. I do not agree with the Panel Statement that it is currently required by Section 250-96.

I am aware of an incident were an electrician was severely injured. The original electrical contractor installed PVC conduit underground but used steel conduit above ground and for the stub-ups. Because of financial problems, a second contractor was hired to complete the installation. Unaware of the discontinuous ground path, a separate equipment grounding conductor was not installed.

I believe that if a tag or label was placed, as the submitter recommends, at both ends of the circuit this incident may have been avoided.

I believe that if accepted during the ROC meeting the recommended text should be placed in a new Section 250-120(d) or added to Section 250-120(a).

(Log #675)

5- 30 - (200-7): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

Use of Insulation of a white ~~or natural gray~~ color or with ~~three~~ continuous white stripes.

(a) The following shall be used only for the grounded circuit conductor, unless otherwise permitted in (b) and (c):

(1) A conductor with continuous white ~~or natural gray~~ insulation ~~covering.~~

(2) A conductor with ~~three~~ continuous white stripes on other than green insulation.

(3) A marking ~~at the termination~~ of white ~~or natural gray color,~~ excluding any marking required by Section 310-11.

(b) Circuits of Less than 50 Volts. A conductor with white ~~or natural gray~~ color insulation or ~~three~~ continuous white stripes, or having a marking of white ~~or natural gray~~ color, excluding any marking required by Section 310-11, shall not be required to be grounded ~~only~~ except as required by Section 250-20(a).

(c) Circuits of 50 Volts or More. The use of insulation that is white ~~or natural gray~~ or that has ~~three~~ continuous white stripes, for other than a grounded conductor shall be permitted only in accordance with (1) and (2) ~~through (3)~~ below.

(1) If part of a cable assembly and where the insulation is permanently reidentified to indicate its use as an ungrounded conductor by ~~painting or other effective means~~ marking other than white that shall encircle the conductor insulation at each termination. ~~and at each location where the conductor is visible and accessible.~~

(2) Delete.

~~(3)~~ (2) Where a flexible cord, having one conductor identified by a white or natural gray outer finish ~~or by three continuous white stripes~~ or by any other means ~~permitted~~ specified by Section 400-22, is used for connecting an appliance or equipment permitted in Section 400-7. ~~This shall apply to flexible cords connected to outlets whether or not the outlet is supplied by a circuit that has a grounded conductor.~~

SUBSTANTIATION: Editorial. Natural gray is deleted due to ongoing controversy of what constitutes this color. It is not permitted as a color for field marking of larger than No. 6 conductors nor as continuous striping color.

While Section 200-6(a) specifies three continuous white stripes for a grounded conductor identification, the number of stripes should not be noted in this section, as it literally does not limit a conductor with one or two white stripes from being used as other than a grounded conductor. An ungrounded conductor with one or two white stripes is an invitation to safety problems. I have seen specialty striping done on conductors after manufacture, and if two stripes, (or one, or four) are not covered by this section, and used as ungrounded conductors, the fine distinction between number of stripes can be lost. Deletion of the word "three" in this section does not alter the requirement for "three" in Section 200-6(a).

In (a)(3) and (b) "the termination" (singular) may infer the load end only; a conductor with white marking in a junction or pull box without splice (termination) should be limited to a grounded conductor. Natural gray is deleted in (a)(3) as a (field) marking; not permitted in Section 200-6(b).

For technical correctness any marking required by Section 310-11 which may be white should be excluded.

Section (c)(1) is revised, to correlate with field marking requirement of Section 200-6(b) to encircle the insulation, which is a good requirement for field marking of all conductors. "Visible and accessible" are two concurrent conditions and is unnecessary since conductor termnations are generally required to be accessible but not visible. Visible is not Code-defined but a reasonable interpretation would be that a conductor above a dropped ceiling or in an enclosure is not visible, but is accessible.

In (c)(2) the prohibition of a white reidentified conductor from the switch to the outlet is a holdover from the previous code when the white conductor if used as the supply was not required to be reidentified... This is in conflict with (c)(1) which doesn't prohibit a reidentified white conductor on the load side of a snap switch, fused switch, circuit breaker, or other device. If two separate cables are installed to a switch of this section (supply and load) there is no switch loop and the white reidentified conductor could be used as a conductor from the switch to the outlet. The provisions of (c)(1) and (2) do not correlate well and indicate or suggest a hazard peculiar to single-pole, 3-way or 4-way switch loops but not switch loops for a 3-pole 3-phase switch.

Section 400-22 has required means of identification, which doesn't seem to include three white stripes in the individual conductor. The last sentence of (c)(3) seems superfluous as the subject of (c) relates to use as ungrounded conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 5-3. This rewrite does not add clarity to the section. The submitter has not provided substantiation that three stripes is a problem. The reference to Section 310-11 is incorrect and has nothing to do with

identification for use, but is for wire markings required for manufacturers.

(Log #4285)

5- 31 - (200-7): Accept in Principle
SUBMITTER: Charles F. Mello, Milwaukie, OR
RECOMMENDATION: Revise text to read as follows:
200.7. Use of Insulation of a White or ~~Natural~~ Gray Color or With Three Continuous White Stripes.
(a) General. The following shall be used only for the grounded circuit conductor, unless otherwise permitted in (b) and (c).
1. A conductor with continuous white or ~~natural~~ gray covering
2. A conductor with three continuous white stripes on other than green insulation
3. A marking at the termination of white or ~~natural~~ gray color
(b) Circuits of Less than 50 Volts. A conductor with white or ~~natural~~ gray color insulation or three continuous white stripes or having a marking of white or ~~natural~~ gray at the termination for circuits of less than 50 volts shall be required to be grounded only as required by Section 250.20(a).
(c) Circuits of 50 Volts or More. The use of insulation that is white or ~~natural~~ gray or that has three continuous white stripes for other than a grounded conductor for circuits of 50 volts or more shall be permitted only as in (1) through (3).
1. If part of a cable assembly and where the insulation is permanently re-identified to indicate its use as an ungrounded conductor, by painting or other effective means at its termination, and at each location where the conductor is visible and accessible.
2. Where a cable contains an insulated conductor for single-pole, 3-way, or 4-way switch loops, and the conductor with white or ~~natural~~ gray insulation or a marking of three continuous white stripes is used the supply to the switch, but not as a return conductor from the switch to the switched outlet. In these applications, the conductor with white or ~~natural~~ gray insulation or with three continuous white stripes shall be permanently re-identified to indicate its use by painting or other effective means at its termination's and at each location where the conductor is visible and accessible.
3. Where a flexible cord, having one conductor identified by a white or ~~natural~~ gray outer finish or three continuous white stripes or by any other means permitted by Section 400.22, is used for connecting an appliance or equipment permitted by Section 400.7. This shall apply to flexible cords connected to outlets whether or not the outlet is supplied by a circuit that has a grounded conductor.
SUBSTANTIATION: Delete the word natural since the color natural gray is not defined and in fact does not exist as a specified color for wire insulation. This proposal goes with the definition of gray within a specified range of color per the Munsell color system as used by industry for wire color coding. The definition of the gray is provided in another proposal.

5- 38 - (200-7(c)): Reject
SUBMITTER: Charles J. Palmieri, Palmieri Assoc.
RECOMMENDATION: Strike the following as indicated, also replace and or renumber as I have in the text below:
(c) Circuits of 50 Volts or More. The use of insulation that is white or natural gray or that has three continuous white stripes for other than a grounded conductor for circuits of 50 volts or more shall be permitted only as in (1) through (3).
2. Where a cable contains an insulated conductor for single-pole, 3-way, or 4-way switch loops, and the conductor with white or natural gray insulation or a marking of three continuous white stripes is used for the supply to the switch, but not as a return conductor from the switch to the switched outlet. In these applications, ~~the conductor with white or natural gray insulation or with three continuous white stripes shall be required to be permanently re-identified to indicate its sue by painting or other effective means at its terminations and at each location where the conductor is visible and accessible.~~ Re-identification of the conductor with white or natural gray insulation or a marking of three continuous white stripes will not be required.
SUBSTANTIATION: During the last code making process CMP No. 5 extracted the many exceptions to this section and rewrote them into positive text. Through the process one submitter sited electricians and apprentices (A98 ROP 5-30) applying the white wire in switch loops incorrectly and creating a cornucopia of errors throughout North America. Frankly it's not happening! Another proposal indicated remodeling contractors. For the 30 odd years that I've been working in this industry the only people I have encountered that miss apply this color code are nonelectricians and the last time I checked the amateurs refused to spend the $50 bucks for a code book! Simply this practice of using the white wire in a factory assembled cable as a hot leg to the switch, with the unidentified conductor as the return (switch leg) to the load has worked good and lasted a long time, and the beauty was we all knew it! Usually a code panel will refuse to accept a proposal such as the one 1996 without documentation of a safety infraction (CPSC or other reliable source), apparently there was not one available during the last code cycle. Accept the revised text and let the professionals get on with earning a living.
PANEL ACTION: Reject.
PANEL STATEMENT: Field identification is inexpensive, easily accomplished and supports the safety concept of identifying all conductors that are ungrounded.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

EXPLANATION OF NEGATIVE:
RAPPAPORT: The original proposal to require reidentification (A98 ROP 5-30) was based upon an instructor who often had to correct Journeymen on the proper wiring of 3-way switch loops. The documentation did not indicate any problems in the field with single pole switches or that the problem with 3 and 4-way switching was related to the fact that there was a white wire. This proposal relates only to cables with a white wire and one or two other colored wires. For single pole switches, there is no confusion with a white

wire at the switch since there are only two wires to connect. For 3 and 4-way switches, I fail to see how reidentifying the white wire helps someone who is unclear on the concept of switching from two or more locations. If the white wire is reidentified "blue", which two colors are the messengers? Is that any different than using the red and white as the messengers and having the black as the return to the luminaire? There are a total of seven proposals to revert back to the pre 1999 wording with documentation that it has not and is not a problem in the field. (Three and 4-way switching may always be a problem with some people.) It seems to me that the change to the 1999 NEC was an attempt to make things uniform and nice rather than base a change on identified field problems.

(Log #3925)

5- 39 - (200-7(c)): Reject
SUBMITTER: Charles J. Palmieri, Palmieri Assoc.
RECOMMENDATION: Strike the following as indicated, also replace and or renumber as I have in the text below:
(c) Circuits of 50 Volts or More. The use of insulation that is white or natural gray or that has three continuous white stripes for other than a grounded conductor for circuits of 50 volts or more shall be permitted only as in ~~(1) through (3).~~ Replace with (1) and (2).
1. If part of a cable assembly and where the insulation is permanently re-identified to indicate its use as an ungrounded conductor, by painting or other effective means at its termination, and at each location where the conductor is visible and accessible.
~~2. Where a cable contains an insulated conductor for single pole, 3-way, or 4-way switch loops, and the conductor with white or natural gray insulation or a marking of three continuous white stripes is used for the supply to the switch, but not as a return conductor from the switch to the switched outlet. In these applications, the conductor with white or natural gray insulation or with three continuous white stripes shall be permanently re-identified to indicate its use by painting or other effective means at its terminations and at each location where the conductor is visible and accessible.~~
2. Where a flexible cord, having one conductor identified by a white or natural gray outer finish or three continuous white stripes or by any other means permitted by Section 400.22, is used for connecting an appliance or equipment permitted by Section 400.7. This shall apply to flexible cords connected to outlets whether or not the outlet is supplied by a circuit that has a grounded conductor.
SUBSTANTIATION: The two paragraphs are redundant. Paragraph (1) allows the use of a cable conductor that is marked white or natural gray or has three or more white stripes as a ungrounded circuit conductor if effectively re-identified.
PANEL ACTION: Reject.
PANEL STATEMENT: Although 200-7(c)(2) may appear to be redundant, it adds clarity in that the Code requires single pole, three-way , and four-way switch legs (and travelers) to be reidentified as ungrounded conductors.

5- 43 - (200-7(c)(2)): Reject
SUBMITTER: Barry F. Tower, Patten, ME
RECOMMENDATION: Replace the last sentence with the following:
In these applications, reidentification of the conductor with white or natural gray insulation or with three continuous white stripes shall not be required.
SUBSTANTIATION: This proposal essentially changes the "code" back to the way it was for generations. It was changed in 1999 (ROP 5-30) because of one person's concern that "weekend warriors" could get into trouble replacing a switch. Absolutely no evidence

was presented to show that there was any safety hazard with this long standing practice. Do you really think that the "weekend warriors" will bother to reidentify the white conductor on switch loops? They never reidentify the white conductor when they wire up their own 240V water heater. In fact, the average home handyman will not recognize reidentification at all. Most of us use electrical tape to reidentify an ungrounded conductor. That electrical tape has real meaning to the professional (usually a 240V circuit), but has absolutely no meaning to the "weekend warrior". To them it is just some tape (perhaps repairing a damaged wire). As far as training new electricians is concerned, the concept of "switch loops" is really very easy compared to other things that they must learn before they are ready to go out into the field. Any professional electrician immediately recognizes "switch loops" at a glance from three feet away. When we see a single pole switch with a black conductor on one terminal and a white one on the other - we instantly know everything that we need to know about how that switch is wired. While replacing such a switch, there are two wires and there are two screws on the switch - what could be simpler? If they don't know how to wire that switch, then they should call a professional. The "code" is not intended to be an instruction manual for untrained persons. Again, there was absolutely no safety issue here unless the homeowner didn't know enough to turn off the circuit breaker before beginning work. Reidentification won't prevent them from getting a shock. In the case of 3-way or 4-way switches, the worst thing that the homeowner can do is wire the switch in a way that it won't work properly. Reidentification would not help them anyway. They probably don't understand what the common terminal is on a 3-way switch. They won't notice that the screw is a darker color on the common terminal, or if they do they might assume that the reidentified conductor always goes on the common terminal. That would be an incorrect assumption. In some cases (power goes to the light first, then to the first 3-way switch, and then continues on to the other 3-way switch) the white wire would go on the common terminal. In another case (power goes to the light first, then it splits and goes to both switches with two cables) the white wire will be one of the traveler conductors and will not go to the common terminal of that 3-way switch. Reidentification of the white conductor on 3-way and 4-way switches can cause more confusion than it will solve (even for electricians). Reidentification of the white conductor on 240V circuits such as 240V water heaters, pump motors, etc. does serve a safety purpose. Reidentification of the white conductor in this case is usually the way that we immediately discover the voltage of the circuit. A 240V circuit presents a much greater electrocution hazard than a 120V circuit because many older homes still have two plug type fuses supplying 240V loads. In this case, it reminds us that there are two fuses to remove - not one. The entire paragraph of 200-7(c)(2) now says nothing at all. The first sentence has to do with making sure that the white conductor is used for the supply to the switch, and the other one requires reidentification. Reidentification is already covered in part 1. There should be no need to require the white conductor to be used for the supply to the switch, if reidentification is required anyway. It is just a lot of circular words. If you do not accept this proposal, you should at least delete the entire paragraph (see my other alternate proposal).

(Log #1443)

5- 44 - (200-7(c)(2)): Reject
SUBMITTER: Barry F. Tower, Patten, ME
RECOMMENDATION: Delete the entire paragraph (both sentences).
SUBSTANTIATION: This is an alternate to another proposal that I have submitted. I would very much prefer that you accept the other one instead.

The entire paragraph of 200-7(c)(2) now says almost nothing at all as it is. The first sentence has to do with making sure that the white conductor is used for the supply to the switch, and the other sentence requires reidentification.

There would be no need to require the white conductor to be used for the supply to the switch since reidentification is now required as of 1999. There is no possible situation where an installation would be safer using a reidentified white conductor as the supply to the switch than if the reidentified white conductor was used as the return from the switch. The whole reason for requiring that the white conductor be used as the supply to the switch was that it actually was a reliable way to identify the conductors. It insured that we wouldn't be left with two white wires to connect to the lampholder. Now that is all history. That requirement is now obsolete because of a stricter requirement that requires reidentification of all white conductors. Since the reidentification is already covered in 200-7(c)(2), the entire paragraph should just be deleted.
PANEL ACTION: Reject.

5- 45 - (200-7(c)(2)): Reject
SUBMITTER: Daniel L. Robertus, State of Montana Electrical Insp. Dept.
RECOMMENDATION: Revise as follows:
"but not as a return conductor from the switch to the switched outlet. ~~In these applications, the conductor with white or natural gray insulation or with three continuous white stripes shall be permanently reidentified to indicate its use by painting or other effective mans at its terminations and at each location where the conductor is visible and accessible.~~
SUBSTANTIATION: It has been common practice and knowledge that the white conductor in romex cable, when used as a switch leg, was not a grounded conductor. This remarking requirement is an attempt to provide protection to a person who is not qualified to work on the installation in the first place. This requirement will be an unnecessary time consuming process for the installer, increasing the costs of the installation, and providing no further protection to the uneducated person who may come in contact with the conductor.
PANEL ACTION: Reject.

(Log #4160)

5- 48 - (200-7(c)(2)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./ Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
(2) Where a cable contains an insulated conductor for single-pole, 3-way, or 4-way switch loops, and the conductor with white or natural gray insulation or a marking of three continuous white stripes is used for the supply to the switch, but not as a return conductor from the switch to the switched outlet. In these applica-tions, reidentification of the conductor with white or natural gray insulation or with three continuous white stripes shall not be required. ~~be permanently re-identified to indicate its use by painting or other effective means at its terminations and at each location where the conductor is visible and accessible.~~
SUBSTANTIATION: The only substantiation for this change in the 1999 NEC addressed wiring practice by an unqualified in-dividual. By doing so, CMP 5 started down a dangerous path without any end, namely, to try to write this Code for the benefit of untrained persons, in contravention of Sec. 90-1(c). Generations of electricians have been trained in how to wire switch legs. It's a subject every first year apprentice learns. The NEC should re-turn to the 1996 principle, which had been in the NEC since before the 1937 Code. The people who use this Code won't be confused by a switch leg, and the people who don't use this Code won't know the signifi-cance of white vs. black anyway. By this proposal, Massachusetts gives notice that it has continued the old practice without incident.
PANEL ACTION: Reject.

(Log #2507)

5- 51 - (200-10(d)): Reject
SUBMITTER: Richard E. Loyd, Perryville, AR
RECOMMENDATION: Revise as follows:
(d) Screw Shell Devices with Leads. For screw shell devices with attached leads, the conductor attached to the screw shell shall have a white ~~or natural gray finish.~~ The outer finish of the other conductor shall be of a solid color that will not be confused with the white ~~or natural gray finish~~ used to identify the grounded conductor.
SUBSTANTIATION: This term is undefined. The past Chairman of CMP 5 and others with historical data as to where this term originally came from all relate to products or product manufacturing process that has not been used for the past 35 to 50 years. Since it is a term that was used to define a product no longer made it should be deleted to eliminate the confusion that continues to exist in the industry.
There are many shades of white and many shades of black. How does one determine if gray is a shade of black or white? Different manufactures use various shades of each color and often two or three different manufactures wire will be installed on the same job site. The continued use of the term causes confusion and is or could be a safety issue that might result in life threatening shock hazard.
PANEL ACTION: Reject.

ARTICLE 210 — BRANCH CIRCUITS

(Log #450)

2- 3 - (210): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Section 210-6(d)(1)(a), replace "22 ft. (6.71 m)" with "6.7 m (22 ft)".
2. In Section 210-6(d)(1)(b), replace "18 ft. (5.49 m)" with "5.5 m (18 ft)".
3. In Section 210-8(a)(7), replace "6 ft. (1.83 m)" with "1.8 m (6 ft)".
4. In Section 210-19(d), Exception No. 1(a), replace "18 in. (457 mm)" with "450 mm (18 in.)".
5. In Section 210-19(d), Exception No. 1(c), replace "18 in. (457 mm)" with "450 mm (18 in.)".
6. In Section 210-50(c), replace "6 ft. (1.83 m)" with "1.8 m (6 ft)".
7. In Section 210-52, replace "5 1/2 ft. (1.68 m)" with "1.7 m (5 1/2 ft)".
8. In Section 210-52(a)(1), replace "6 ft. (1.83 m)" with "1.8 m (6 ft)".
9. In Section 210-52(a)(2)(a), replace "2 ft. (610 mm)" with "600 mm (2 ft)".
10. In Section 210-52(a)(3), replace "18 in. (457 mm)" with "450 mm (18 in.)".
11. In Section 210-52(c)(1), replace "12 in. (305 mm)" with "300 mm (12 in.)".
12. In Section 210-52(c)(1), replace "24 in. (610 mm)" with "600 mm (24 in.)".
13. In Section 210-52(c)(2), replace "24 in. (610 mm)" with "600 mm (24 in.)".
14. In Section 210-52(c)(2), replace "12 in. (305 mm)" with "300 mm (12 in.)".
15. In Section 210-52(c)(3), replace "24 in. (610 mm)" with "600 mm (24 in.)".
16. In Section 210-52(c)(3), replace "12 in. (305 mm)" with "300 mm (12 in.)".
17. In Section 210-52(c)(5), replace "18 in. (458 mm)" with "450 mm (18 in.)".
18. In Section 210-52(c)(5), Exception, replace "12 in. (305 mm)" with "300 mm (12 in.)".
19. In Section 210-52(c)(5), Exception, replace "6 in. (153 mm)" with "150 mm (12 in.)".
20. In Section 210-52(c)(5) Exception (b), replace "18 in. (458 mm)" with "450 mm (18 in.)".
21. In Section 210-52(d), replace "36 in. (914 mm)" with "900 mm (3 ft)".
22. In Section 210-52(e), replace "6 1/2 ft (1.98 m)" with "2.0 m (6 1/2 ft)."
23. In Section 210-52(h), replace "10 ft (3.05 m)" with "3.0 m (10 ft)".
24. In Section 210-62, replace "12 linear ft (3.66 m)" with "3.7 linear m (12 ft)".
25. In Section 210-63, replace "25 ft (7.62 m)" with "7.5 m (25 ft)".
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show the SI units as the preferred and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept in Principle.
In item 19 of the proposal, change "(12 in.)" to "(6 in.)".
PANEL STATEMENT: The panel accepts the concept, however, has corrected what is believed to be a typographical error in Item 19.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BROWN: The use of "hard Conversions" should be reevaluated. The proposed metric measurements do not correlate with the respective English measurements as used in such documents as model building codes, and standards such as ANSI A117.1. The Technical Correlating Committee should correlate all of these metric changes in the NEC with those dimensions already accepted throughout the industry.

(Log #1151)

2- 4 - (210): Reject
SUBMITTER: Don R. Fowlkes, City of Chattanooga, TN
RECOMMENDATION: Possible wording:
"Somewhere in Article 210 or 300 needs heading "Complete Wiring System".
SUBSTANTIATION: Before an electrical wiring system can be considered complete, it must form proper connections between the power source and the final outlet and/or load.
As an inspector, I am required to refer to a code reference to disapprove any code violation. At present, there is no code reference stating when wiring is incomplete (namely branch circuits). It would help the inspectors to be able to cite a code reference when wiring is not complete. Any wording to this effect would be very helpful.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided specific proposed code text in accordance with Section 4-3.3 of the Regulations Governing Committee Projects. The submitter's intent was not clear.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2933a)

2- 5 - (210, 220): Accept in Principle

Note: See the Technical Correlating Committee Note on Proposal 2-1.

SUBMITTER: Bernard J. Mezger, American Lighting Association

RECOMMENDATION: Incorporate "luminaire" into the 2002 NEC:

(a) To incorporate the use of the inclusive wording "luminaire" throughout the Code wherever the ambiguous wording "fixture" or "lighting fixture" is used an the intent and meaning is a complete lighting unit consisting of a fixture and the lamp(s), called a "luminaire".

(b) Add the definition of "luminaire" to Article 100-1 as follows:

Luminaire. A complete lighting unit consisting of a lamp, or lamps, and a ballast (when applicable), together with the parts designed to distribute the light, to position the lamp(s), and connect the lamp(s) to the power supply.

(c) Delete the FPN from Article 410-1 (and identical definition).

SUBSTANTIATION: Clarify the true meaning and intent of the item described as a "fixture", or a "lighting fixture", by providing the proper wording for a complete lighting unit. A luminaire consists of a fixture plus lamp(s). The definition and use proposed is consistent with that published and used by IESNA and NEMA.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Proposal 2-1.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #677)

2- 6 - (210-3, Exception): Accept in Principle in Part

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

Exception: Multioutlet branch circuits <u>rated higher</u> ~~greater~~ than 50-amperes shall be permitted to supply nonlighting loads on ~~industrial~~ premises where maintenance and supervision <u>ensure</u> ~~indicate~~ that <u>only</u> qualified persons will service equipment the installation.

SUBSTANTIATION: The type of occupancy should not be a prime criterion for safety. Since "industrial" is not Code-defined the exception can be interpreted as not applying to premises such as institutional, airports, sewage treatment plants, government facilities, and other nonindustrial installations where it would be useful, even where maintenance and supervision are by qualified persons. The condition of qualified persons should be "ensured" not "indicated" which is a weaker term. "Ensured" is the term used in similar exceptions. "Only" qualified persons should be indicated; present wording does not exclude others.

PANEL ACTION: Accept in Principle in Part.

The panel accepts the portion of the proposal relative to the use of the term "ensure" and "only", so that the Exception reads as follows:

"Exception: Multioutlet branch circuits greater than 50 amperes shall be permitted to supply nonlighting outlet loads on industrial premises where conditions of maintenance and supervision ensure that only qualified persons will service the equipment."

The panel rejects the remainder of the proposal.

PANEL STATEMENT: The panel notes that the term "greater" conveys the appropriate meaning. The panel does not accept the deletion of "industrial" since the original exception was designed specifically for those installations and the submitter has not presented any substantiation to expand the locations.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #3652)

2- 7 - (210-4): Reject

SUBMITTER: Mahlon Davenport, Rep. Commonwealth Code Inspection Service Inc.

RECOMMENDATION: Revise text to read as follows:

"All <u>ungrounded conductors of multi-wire circuits, with common neutral, must open simultaneously and</u> shall originate from the same panelboard."

SUBSTANTIATION: Neutral may overload if common trip breakers are not used to assure circuit wires are not on same phase.

PANEL ACTION: Reject.

PANEL STATEMENT: The requirements for common trip circuit breakers are covered by Section 240-20(b). If the ungrounded circuit conductors do not originate on separate phases, the circuit would not be a multiwire branch circuit by definition and Section 210-4 would not apply.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #429)

2- 8 - (210-4(a) and 210-4(c) FPN): Reject

SUBMITTER: Vohn N. Peeler, Faith, NC

RECOMMENDATION: Remove the FPN under 210-4(c) and put that information in 210-4(a) as follows:

Drop the period after "panelboard" and add the following: <u>and all grounded device connections must comply with Section 300-13(b).</u>

SUBSTANTIATION: This eliminates an FPN and puts the reference in the text where it is easier to notice.

PANEL ACTION: Reject.

PANEL STATEMENT: The text that indicates the panelboard in question is where the branch circuit originated provides clarity to the section. Moving the Fine Print Note into the mandatory text is unnecessary, since Section 300-13(b) would already be mandatory because it is in Article 300.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #678)

2- 9 - (210-4(b), (d)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

(b) Dwelling Units. In dwelling units a multiwire branch circuit supplying more than one device or equipment on the same yoke shall be provided with a means to disconnect simultaneously all ungrounded conductors at the panelboard <u>or other device</u> where the branch circuit originated.

(d) Identification of Ungrounded Conductors. Where more than one nominal voltage system, <u>or systems with different characteristics or systems supplied by different services</u> exists in a building <u>or other structure,</u> the ungrounded conductors of a multiwire ~~branch~~ circuit shall be <u>distinctly</u> identified by phase and system. The means of identification shall be permanently posted at each ~~branch circuit~~ <u>panelboard, switchboard, other circuit supply point.</u>

SUBSTANTIATION: Multiwire circuits may be supplied by ac and dc systems with the same voltage such as 120/240-volts for which identification is not required. Likewise, multiwire circuits of the same voltage may be supplied by different services. These circuits may occasionally be installed in the same enclosure. It seems such circuits also warrant distinct identification.

If safety warrants identification for multiwire branch circuits, why not feeders? Some feeders and branch circuits may employ the same size and number of conductors. Since circuits may originate from other than panelboards, such as switchboards, circuit, and fused switches, they are proposed for identification also. The intent is apparently to require identification which will distinguish systems, but this is not explicit, and one should not have to rely on intent.

A dam, oil derrick, or the like may not be considered as buildings, and such other structures should be included.

PANEL ACTION: Reject.

PANEL STATEMENT: Multiwire branch circuits are presently required to originate from the same panelboard and not other devices. Additional text referencing different characteristics or systems is more confusing, as the existing text is sufficient.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #334)

2- 10 - (210-4(d)): Reject

SUBMITTER: Mike Theisen, St. Cloud, MN

RECOMMENDATION: At the end of the last sentence of section 210-4(d) add text to read:

This means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means and

shall be permanently posted at each branch-circuit panelboard which contains one or more multiwire branch circuits.
SUBSTANTIATION: This added text may help clarify that the "identification of ungrounded conductors" is not to be retroactive to all existing panelboards in the building, which may not contain multiwire branch circuits, even though more than one nominal voltage exists in the building.
PANEL ACTION: Reject.
PANEL STATEMENT: The additional text does not further clarify the intent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1500)

2- 11 - (210-4(d)): Reject
SUBMITTER: Larry D. Wendt, State of Idaho/Rep. I.A.E.I.
RECOMMENDATION: Add the following text:
210-4(d) Identification of Ungrounded Conductors. Where more than one nominal voltage system exists in a building, each ungrounded conductor of a multiwire branch circuit where accessible, shall be identified by phase and system. This means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means and shall be permanently posted at each branch-circuit panelboard. See Section 110-15 for High-Leg Marking.
SUBSTANTIATION: This new sentence will make it clear that the marking required on the high-leg pertains to branch circuits as well as to services, feeders, and switchboards and panelboards. Please coordinate with the proposals on Sections 110-15, 215-8, 384-3(e), and 384-3(f).
PANEL ACTION: Reject.
PANEL STATEMENT: There is no substantiation presented to require that the high-leg be marked for branch circuits.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2019)

2- 12 - (210-4(d)): Reject
SUBMITTER: Jerry Knoerr, Village of Greendale, Village of Mukwonago, WI
RECOMMENDATION: Add new text to read:
"On any new panel or switchboard a provision shall be made in the label of the panel to provide the coding requirements such as blue, red, white, etc. that can be written in the field for the different systems in the building."
SUBSTANTIATION: It would be very helpful at this location so that everyone who looked in the panel could determine if there was any marking showing different voltages in the building.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirements in 210-4(d) are to provide an identification means for multiwire branch circuits where more than one nominal voltage system exists in the building. There is no requirement for general color coding as indicated in the substantiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2523)

2- 13 - (210-4(d)): Reject
SUBMITTER: Richard P. Owen, City of St. Paul, MN
RECOMMENDATION: Revise as follows:
(d) Identification of Ungrounded Conductors. Where more than one nominal voltage system exists in a building, each ungrounded conductor of a ~~multiwire~~ branch circuit, where accessible, shall be identified by phase and system...
SUBSTANTIATION: Since the intent of this Section would seem to be to allow identification of differing systems within the same building, why should this now be required only for multiwire branch circuits? Identification of either single-phase or three-phase circuits, which could occupy the same raceway, trough, etc. as the multiwire circuits should be required for the qualified person to maintain the system after installation.
PANEL ACTION: Reject.
PANEL STATEMENT: The intent of the identification of ungrounded conductors in this section applies specifically to multiwire branch circuits.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3829)

2- 14 - (210-4(d)): Reject
SUBMITTER: Jasmin Dzabic, Rick Berajen, Riviera Electric
RECOMMENDATION: To standardize undergrounded conductors coloring for high and low voltages. The standard colors most widely used are: black, red, blue and white for low voltages and brown, orange, yellow and gray for high voltages.
SUBSTANTIATION: There are no standards for ungrounded conductors colors which can cause confusion and possible hazards.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided specific proposed code text in accordance with Section 4-3.3 of the Regulations Governing Committee Projects. There are methods to provide the identification required by this section other than color coding.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3164)

2- 15 - (210-4(e) (New)): Reject
SUBMITTER: Michael L. Last, Na'alehu, HI
RECOMMENDATION: Add the following text:
(e) Identification of Conductors. All grounded and ungrounded conductors of each multiwire branch circuit shall be identified as part of each particular multiwire branch circuit. Identification shall be at the origination panelboard and at all other locations where conductors, both grounded and ungrounded, are present. The means of identification shall be permanent.
SUBSTANTIATION: It is in the interest of safety that multiwire branch circuits be permanently identified to insure that all (two or three) ungrounded conductors originate from different lines (phases). Additionally, the continuity of the grounded conductor must always be maintained. If two or more ungrounded conductors of a multiwire branch circuit originate from the same line (phase), there exists the possibility that the current in the grounded conductor will exceed its capacity. If there is a loss of integrity in the grounded conductor while the ungrounded conductors are intact, a condition of severe voltage unbalance could result. The requirements of Section 300-13(b) do NOT ensure against these hazards. The submitter (in his capacity as an electrical professional) has documented instances in which the absence of this proposal contributed to numerous occurrences of serious consequences and the compromising of the safety of personnel and equipment. This proposal will greatly reduce the hazards associated with multiwire branch circuits.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient substantiation. His substantiation refers to something other than a multiwire branch circuit. Refer to the definition of multiwire branch circuit in Article 100.

SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Revise Section 210-6 as shown below:
210-6. Branch-Circuit Voltage Limitations. The nominal voltage of branch circuits shall not exceed the values permitted by (a) through (e) below.
[(a) through (d) unchanged]
(e) Over 600 volts Between Conductors. Branch circuits exceeding 600 volts, nominal, between conductors shall be permitted to supply

utilization equipment, other than lighting equipment, that is supervised and maintained by qualified persons.
SUBSTANTIATION: The voltage limitation for lighting units and cord- and plug-connected loads of 1440 va or less in dwelling units and guest rooms of hotels, etc., is properly established under Section 210-6(a). The permissive language of (b) through (d), interpreted literally, does not prohibit higher nominal voltages than those stated for branch circuits supplying other loads. For example, it is not a violation of Section 210-6(c)(4) to supply lighting fixtures equipped with "lampholders, other than the screw-shell type, applied within their voltage ratings" from branch circuits of more than 277 volts. Stating that 277 volts "shall be permitted" is not synonymous with stating that 600 volts, for example, is not permitted.
If it is erroneously assumed that the present language permits only those voltages that "shall be permitted," and prohibits higher voltages, nominal branch-circuit voltages of more than 600 volts are prohibited for industrial/commercial utilization equipment because "cord- and plug-connected or permanently connected utilization equipment" is specifically covered under present (b) through (d), which do not permit higher voltages. The proposed changes eliminate this anomaly, which resulted from editorial changes in the 1987 Code.
PANEL ACTION: Accept in Principle in Part.
Revise the proposed wording to read as follows:
"The nominal voltage of branch circuits shall not exceed the values permitted by (a) through (e)".
Add a new (e) to read as follows:
"(e) Over 600 Volts Between Conductors. Circuits exceeding 600 volts nominal between conductors shall be permitted to supply utilization equipment in installations where conditions of maintenance and supervision ensure that only qualified persons will service the installation."
PANEL STATEMENT: The revised wording meets the intent of the submitter, and provides clarity. The panel did not accept the exclusion of lighting equipment, as there are applications for specialized lighting systems in the over 600 volt category.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
BECKER: This proposal appears to be unnecessary. The substantiation states that "if it is erroneously assumed..." that voltages over 600 volts are prohibited, there may be a problem. It should be clear that items that are not specifically "included" are not, therefore "excluded". This proposal, if accepted, would establish a dangerous precedent for other Code Articles.
SIDHOM: I agree with Mr. Becker's Explanation of Negative Vote.

(Log #CP203)

2- 17a - (210-7): Accept
SUBMITTER: CMP 2
RECOMMENDATION: In the submitter's recommendation on Proposal 2-18, add the following subdivision titles to (d) (1-3) to read as follows:
"(1) Grounding Type Receptacles.
(2) Ground-Fault Circuit-Interrupters.
(3) Nongrounding-Type Receptacles."
SUBSTANTIATION: To comply with 2.1.5.2 of the NEC Style Manual.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #597)

2- 17 - (210-7): Reject
SUBMITTER: Martin Sallach, Lincoln Electric
RECOMMENDATION: Article 210-7, new section to be inserted between section (c) and (d):
Method of Wiring. Where connected to a branch circuit supplying two or more receptacles or outlets, and where the device has terminals that are intended to receive two or more wires, both the incoming and outgoing circuit conductors may be terminated directly at the device.
SUBSTANTIATION: Many local municipalities continue to require that only one pair of conductors be terminated at the receptacle. This requires the use of wire nuts to make the splice on the box. If the wrong size of wire nut is selected or does not adequately grab all of the wires a poor connection is created. Additionally, the receptacle box begins to become overcrowded. The majority of the commercially available receptacles are designed and tested to accommodate terminating both the incoming and outgoing conductors. Inserting this paragraph into the code will establish a wiring method that provides a more secure termination.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: This method of wiring is already allowed for approved devices listed for this purpose.

(Log #635)

2- 18 - (210-7): Accept in Principle
NOTE: The Technical Correlating Committee advises that placement of Articles is the responsibility of the Technical Correlating Committee, and the Technical Correlating Committee assigns Article 406 as the proposed new Article. Final responsibility for the Article will reside with Code-Making Panel 18 upon completion of the NEC 2002 Code cycle. The Technical Correlating Committee directs that this Proposal be referred to Code-Making Panel 18 for information.
SUBMITTER: Jack Wells, Pass & Seymour/Legrand
RECOMMENDATION: Relocate Section 210-7 to proposed new Article 420 as Section 420-3 titled General Installation Requirements and add a new general statement.
420-3~~210-7~~. General Installation Requirements. Receptacle outlets shall be located in branch circuits in accordance with Part C of Article 210. General installation requirements shall be in accordance with (a) through (f) below:
(a) Grounding Type. Receptacles installed on 15- and 20-ampere branch circuits shall be of the grounding type. Grounding-type receptacles shall be installed only on circuits of the voltage class and current for which they are rated, except as provided in Tables 210-21(b)(2) and (b)(3).
Exception: Nongrounding-type receptacles installed in accordance with Section ~~210-7~~ 420-3(d).
(b) To Be Grounded. Receptacles and cord connectors that have grounding contacts shall have those contacts effectively grounded.
Exception No. 1: Receptacles mounted on portable and vehicle-mounted generators in accordance with Section 250-34.
Exception No. 2: Replacement receptacles as permitted by Section ~~210-7~~420-3(d).
(c) Method of Grounding. The grounding contacts of receptacles and cord connectors shall be grounded by connection to the equipment grounding conductor of the circuit supplying the receptacle or cord connector.
FPN: For installation requirements for the reduction of electrical noise, see Section 250-146(d). The branch-circuit wiring method shall include or provide an equipment grounding conductor to which the grounding contacts of the receptacle or cord connector shall be connected.
FPN No. 1: Section 250-118 describes acceptable grounding means.
FPN No. 2: For extensions of existing branch circuits, see Section 250-130.
(d) Replacements. Replacement of receptacles shall comply with (1), (2), and (3) as applicable.
(1) Where a grounding means exists in the receptacle enclosure or a grounding conductor is installed in accordance with Section 250-130(c), grounding-type receptacles shall be used and shall be connected to the grounding conductor in accordance with Sections ~~210-7~~420-3(c) or 250-130(c).
(2) Ground-fault circuit-interrupter protected receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in this code.
(3) Where a grounding means does not exist in the receptacle enclosure, the installation shall comply with (a), (b), or (c).
(a) A nongrounding-type receptacle(s) shall be permitted to be replaced with another nongrounding-type receptacle(s).
(b) A nongrounding-type receptacle(s) shall be permitted to be replaced with a ground-fault circuit interrupter-type receptacle(s). These receptacles shall be marked "No Equipment Ground." An

equipment grounding conductor shall not be connected from the ground-fault circuit interrupter-type receptacle to any outlet supplied from the ground-fault circuit interrupter receptacle.

(c) A nongrounding-type receptacle(s) shall be permitted to be replaced with a grounding-type receptacle(s) where supplied through a ground-fault circuit interrupter. Grounding-type receptacles supplied through the ground-fault circuit interrupter shall be marked "GFCI Protected" and "No Equipment Ground." An equipment grounding conductor shall not be connected between the grounding-type receptacles.

(e) Cord- and Plug-Connected Equipment. The installation of grounding-type receptacles shall not be used as a requirement that all cord- and plug-connected equipment be of the grounded type.

FPN: See Section 250-114 for types of cord- and plug-connected equipment to be grounded.

(f) Non-interchangeable Types. Receptacles connected to circuits that have different voltages, frequencies, or types of current (ac or dc) on the same premises shall be of such design that the attachment plugs used on these circuits are not interchangeable.

SUBSTANTIATION: These are general installation requirements. They are more in line with the scope of proposed Article 420 than the scope of Article 210. Over many Code cycles the general installation and construction requirements for receptacles, attachment plugs and cord connectors have been adopted in various sections of the Code. The intent of this proposal is to locate the general installation requirements for receptacles and cord connectors to the new Article 420. New Article 420 covers requirements for installation, mounting, grounding and non-interchangeability. This proposal brings the related requirements into a single article thereby making it easier for the code user to locate them.

Article 420 establishes general requirements for how receptacles are to be installed. Article 210 appropriately establishes where receptacle outlets are to be installed. The proposed new general statement directs the user to Article 210 for receptacle outlet location requirements.

This proposal was developed by a Task Group of CMP 18 appointed by the chairman to consider separating 1999 NEC Article 410 into two articles, one covering fixtures and the other covering receptacles, attachment plugs and cord connectors. This Task Group was appointed in response to Proposal 18-55 for the revision of the 1996 NEC.

PANEL ACTION: Accept in Principle.

The panel accepts the submitter's recommendation to relocate the material in 210-7 into a new Chapter 4 article.

In addition, create a new 210-7 to read as follows:

"210-7 Branch Circuit Receptacle Requirements. Receptacle outlets shall be located in branch circuits in accordance with Part C of Article 210. Specific requirements for receptacles are covered in Article 420."

PANEL STATEMENT: The panel has approved the relocation and has developed a new 210-7 to cover the requirements specific to branch circuits in Article 210.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

(Log #639)

2- 19 - (210-7): Accept in Principle

SUBMITTER: Jack Wells, Pass & Seymour/Legrand

RECOMMENDATION: Add Section 210-7, changing only the appropriate section references within the text, to proposed new Article 420 as Section 420-3 titled General Installation Requirements.

~~420-3~~210-7. General Installation Requirements. Receptacle outlets shall be located in branch circuits in accordance with Part C of Article 210. General installation requirements shall be in accordance with (a) through (f) below:

(a) Grounding Type. Receptacles installed on 15- and 20-ampere branch circuits shall be of the grounding type. Grounding-type receptacles shall be installed only on circuits of the voltage class and current for which they are rated, except as provided in Tables 210-21(b)(2) and (b)(3).

Exception: Nongrounding-type receptacles installed in accordance with Section ~~210-7~~ 420-3(d).

(b) To Be Grounded . Receptacles and cord connectors that have grounding contacts shall have those contacts effectively grounded.

Exception No. 1: Receptacles mounted on portable and vehicle-mounted generators in accordance with Section 250-34.

Exception No. 2: Replacement receptacles as permitted by Section ~~210-7~~ 420-3(d).

(c) Methods of Grounding. The grounding contacts of receptacles and cord connectors shall be grounded by connection to the equipment grounding conductor of the circuit supplying the receptacle or cord connector.

FPN No. 1: For installation requirements for the reduction of electrical noise, see Section 250-146(d). The branch-circuit wiring method shall include or provide an equipment grounding conductor to which the grounding contacts of the receptacle or cord connector shall be connected.

FPN No. 2: Section 250-118 describes acceptable grounding means.

FPN No. 3: For extensions of existing branch circuits, see Section 250-130.

(d) Replacements. Replacement of receptacles shall comply with (1), (2), and (3) as applicable.

(1) Where a grounding means exists in the receptacle enclosure or a grounding conductor is installed in accordance with Section 250-130(c), grounding-type receptacles shall be used and shall be connected to the grounding conductor in accordance with Sections ~~210-7~~ 420-3(c) or 250-130(c).

(2) Ground-fault circuit-interrupter protected receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in this code.

(3) Where a grounding means does not exist in the receptacle enclosure, the installation shall comply with (a), (b), or (c).

(a) A nongrounding-type receptacle(s) shall be permitted to be replaced with another nongrounding-type receptacle(s).

(b) A nongrounding-type receptacle(s) shall be permitted to be replaced with a ground-fault circuit interrupter-type of receptacle(s). These receptacles shall be marked "No Equipment Ground." An equipment grounding conductor shall not be connected from the ground-fault circuit-interrupter-type receptacle to any outlet supplied from the ground-fault circuit-interrupter receptacle.

(c) A nongrounding-type receptacle(s) shall be permitted to be replaced with a grounding-type receptacle(s) where supplied through a ground-fault circuit interrupter. Grounding-type receptacles supplied through the ground-fault circuit interrupter shall be marked "GFCI Protected" and "No Equipment Ground". An equipment grounding conductor shall not be connected between the grounding-type receptacles.

(e) Cord- and Plug-Connected Equipment. The installation of grounding-type receptacles shall not be used as a requirement that all cord- and plug-connected equipment be of the grounded type.

FPN: See Section 250-114 for types of cord- and plug-connected equipment to be grounded.

(f) Non-interchangeable Types. Receptacles connected to circuits that have different voltages, frequencies, or types of current (ac or dc) on the same premises shall be of such design that the attachment plugs used on these circuits are not interchangeable.

SUBSTANTIATION: These are general installation requirements. They are more in line with the scope of proposed Article 420 than the scope of Article 210. Over many Code cycles the general installation and construction requirements for receptacles, attachment plugs and cord connectors have been adopted in various sections of the code. The intent of this proposal is to locate the general installation requirements for receptacles and cord connectors to the new Article 420. New Article 420 covers requirements for installation, mounting, grounding and noninterchangeability. This proposal brings the related requirements into a single article thereby making it easier for the code user to locate them.

This proposal was developed by a Task Group of CMP 18 appointed by the chairman to consider separating 1999 NEC Article 410 into two articles, one covering fixtures and the other covering receptacles, attachment plugs and cord connectors. This Task Group was appointed in response to Proposal 18-55 for the revision of the 1996 NEC.

(Log #4469)

2- 20 - (210-7(a)(1)): Reject

NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 18 for information.

SUBMITTER: Gordon E. Berg, W. St. Paul, MN

RECOMMENDATION: Add new text to read:
"The ungrounded screws on 15- and 20-amp receptacles shall be covered or protected before receptacles are installed in a metal box."
SUBSTANTIATION: The ungrounded receptacle screws on 15- and 20-amp receptacles should be covered before securing them in a metal electrical box. This additional protection would prohibit loose unused screws, strands of wire or a uncentered receptacle from coming in contact with the grounded edge of an electrical box and also avoid the danger of exposed screws should the plates ever come off or break.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter describes a workmanship issue that is not properly addressed by the recommendation. Receptacles and boxes designed and installed in accordance with existing standards should not encounter this problem. The panel requests the Technical Correlating Committee forward this proposal to Code-Making Panel 18 for information.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4452)

2- 21 - (210-7(d)(3)(a)): Reject
SUBMITTER: David E. Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
RECOMMENDATION: Revise text to read as follows:
"...permitted to be replaced with another nongrounding-type receptacle. Such a receptacle shall be marked, by a means integral to the receptacle, "no equipment ground."
SUBSTANTIATION: A two-prong receptacle as replacement may well be, and very commonly is, used with a three-prong adapter; this marking should dissuade some users from doing so. In every second or third older house I look at I find three-prong adapters that rely on receptacles cover screws for grounding. To the best of my recollection, over the twenty-some years I have been contracting and consulting in older homes, none of these have been tested to confirm the presence, of ground until I happened on them.
Where are the bodies? We protect the public by grounding three-prong equipment; we consider this need to be substantiated by adequate evidence. There always will be people who willfully defeat safety measures; this proposal is not about protecting them, but about protecting the vast majority of people who are threatened due to ignorance. Section 230(c)(3)(b) and (c) service the same function. This will not address existing nongrounding type receptacles, but the Code cannot require retrofitting parts of the electrical system that are not being worked on. The phrasing,"permanently and durably.0" presently is construed to mean, "having a paper label taped on." This arguably is acceptable in the case of GFCI protection precisely because in large measure GFCI coverage protects life whether users are aware of it or not, whether integral grounding is present or not. However, every inspector and every installer is aware that these are peeled off and painted over. If integral to devices, say embossing, these are more likely to remain visible — in part because they are less likely to be unattractive. This does not force the hand of ANSI committees, as authorities having jurisdiction do not require the use of products that are not on the market. However, it does make the statement that this protection is important to life safety. I have submitted the relevant part of a page from the instructions for utilization equipment that explicitly warn against the use of such adapters. I have many others that warn against defeating grounding. Why include such instructions except for the fact that adapters so commonly do constitute "cheaters." Explicit, integral wording is likely to cut down on such practices.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: Marking by a means integral to the receptacle would be of little value to the user given the limited space available on the receptacle face.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1163)

2- 22 - (210-7(d)(3)b): Reject
SUBMITTER: Richard E. Manrod, Mesa, AZ
RECOMMENDATION: Revise text to read:
210-7(d)(3)b. A non-grounding-type receptacle(s) shall be permitted to be replaced with a listed ground-fault circuit-interrupter-type (GFCI) of receptacle(s). These receptacles shall have the ground pin opening, but without the ability to connect to ground. They shall be marked "NO EQUIPMENT GROUND." An equipment grounding conductor shall not be connected from the ground-fault circuit-interrupter-type receptacle to any outlet supplied from the ground-fault circuit-interrupter receptacle.
SUBSTANTIATION: Many of the homes wired before the early 1960's were wired using either two wire Nonmetallic-Sheathed Cable (Romex) or Knob and Tube wiring. Most of these installations used a metal box.
There is a good possibility that the older insulation (RR, RHW, TW, etc.) on those solid wires, could crack with age or may have been nicked during installation. When a GFCI receptacle is installed in those single gang metal boxes, there is a possibility of the hot conductor touching the metal box.
The GFCI receptacle's ground pin is connected to the metal box through the mounting screw and strap. A live connection from the box may then be made to the GFCIs ground pin. The outer case or housing of any equipment (i.e., drill motor, kitchen appliance, etc.) connected to the GFCI will become energized thus creating a shock hazard with possible injury or death.
A special GFCI receptacle, marked "FOR NON-GROUNDED APPLICATIONS ONLY" should be used where a ground is not available. This special GFCI should not have the ground pin brought out for connection.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has described a theoretical situation that could also occur with a two wire receptable used with a ground adapter. The GFCI does provide for improved safety above what was in the original installation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3666)

2- 23 - (210-7(d)(3)(b) and (c)): Reject
SUBMITTER: James M. Naughton, Boston Globe
RECOMMENDATION: Delete (b) and (c) in its entirety.
SUBSTANTIATION: The practice of replacing nongrounding type receptacles has been a controversial issue since the time GFCI receptacles were introduced in the early 1970s.
The receptacle being replaced is fed by a two wire ungrounded system that in most cases is at least fifty years old.
The consumer does not think of the wiring system being used, that's our responsibility. To label or mark a ground-fault circuit interrupter receptacle in reality does not last. Receptacles and covers are painted, wallpapered and blocked making it unreadable.
Two wire ungrounded systems have served their purpose. This is the time we should update the circuit to a grounded system.
PANEL ACTION: Reject.
PANEL STATEMENT: The GFCI provides a method to replace older two wire receptacles with a method that improves safety for the user.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1043)

2- 24 - (210-7(g)): Reject
SUBMITTER: Randall S. Bell, Greenwood, IN
RECOMMENDATION: I would like to propose that Receptacles have to be ground up.
SUBSTANTIATION: I have looked and studied that it would be safer for people. I think it would be a very good thing for the NEC to adopt this proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no evidence to support a required orientation of the ground pin for a receptacle outlet. The panel notes that receptacles have been installed with the ground pin up,

down, and horizontally for many years with no established trend of one orientation being safer than the other.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1896)

2- 25 - (210-7(g) (New)): Reject
SUBMITTER: Charles M. Trout, Maron Electric Co. Inc.
RECOMMENDATION: Add a new paragraph (g) to read:
(g) Multiple Receptacles. Where more than one receptacle is mounted on the same yoke means shall be provided to disconnect simultaneously all ungrounded conductors feeding these receptacles at the panelboard where the branch circuit(s) originate.
SUBSTANTIATION: As presently written Section 210-4(b) refers to multi-wire circuits in dwelling units. The protection intended by that section should not be limited to dwelling units. Extending that protection to other than dwelling units would be justifiably within the purpose of the National Electrical Code.
Limiting the protection intended to only multi-wire circuits allows the installer to remove the break off tabs from both the ungrounded and the grounded terminals on the receptacle and feed the two separate receptacles on the same yoke with separate ungrounded and separate grounded conductors (not a multi-wire circuit) in any type of occupancy and circumvent the intended protection of Section 210-4(b). The listing as shown in the UL White Book refers only to the removal of tabs from these receptacles for their use in multi-wire circuits but does not expressly state that this is a requirement. The fact that the tabs are present on the grounded terminal of the receptacles indicates their use is anticipated.
Prohibiting the manufacture of receptacles with break off tabs on the grounded terminal would be the best answer to prevent persons from unintentionally working on energized circuits they had thought were disconnected. This of course would not help the person in other than dwelling units and this is an important consideration.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's concern is noted, however, the submitter relates the proposal to multiwire branch circuits but does not provide substantiation that the proposal presents the same hazard as multiwire branch circuits.

(Log #3865)

2- 26 - (210-7(g) (New)): Accept in Principle
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Add a new Section 210-7(g) to read as follows:
"Receptacle Outlet Position. Receptacle outlets in dwelling units shall not be installed in a face-up position in the work surfaces or countertops."
SUBSTANTIATION: At the present time, similar or identical wording is found in three locations in Article 210.
Section 210-8(a)(7) where the subject is GFCI protection, not location of the receptacle outlet.
Section 210-52(c)(5) which covers the location requirements for receptacle outlets in dwelling unit kitchens and dining rooms.
Section 210-52(d) for location of receptacle outlets for dwelling unit bathrooms.
It seems that locating the requirement in one location will suffice and correct the improper wording in Section 210-8(a)(7).
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 2-53.

(Log #410)

2- 28 - (210-8): Reject
SUBMITTER: Randy L. Smith, Las Vegas, NV
RECOMMENDATION: Add new text as follows:
Where self-contained ground-fault circuit-interrupter receptacles are used to meet the requirements of 210-8(4), receptacles shall be marked for personnel protection as provided in Article 110, to identify the branch circuit panelboard, and branch circuit disconnecting means.
SUBSTANTIATION: In the last 5 years, I have changed out approximately 50 of these receptacles in open areas. In each case the receptacle was deadfront, and the line side branch circuit was energized. The only way to determine this is to remove the receptacle. In areas such as in Article 680 G, this is clearly a potentially hazardous removal. In the last 6 months, I have seen 250 of these receptacles installed for the associated equipment of Article 680 G, and in each area there is probability of water, and grounded metal conditions. Each of these installations were inspected and passed.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's intent is not clear as to what is proposed to be marked and what GFCI is in question.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2925)

2- 29 - (210-8): Reject
SUBMITTER: Frank Pologruto, Rep. IBEW L.U. 98
RECOMMENDATION: Add to Section 210-8:
"All 20 ampere, 125 volt receptacles in commercial kitchens shall have GFCI protection."
SUBSTANTIATION: The GFCI protection has protected people for over twenty years, and has expanded to areas like garages, outdoors, basement, etc., however, commercial kitchens are not mentioned in the code.
In commercial kitchens 20 ampere, 125 volt receptacles are constantly in use for small kitchen appliances, that are exposed to metal sinks, stoves, etc., that are conductive and should be GFCI protected.
Shouldn't commercial kitchen personnel be protected by the same GFCI protection that residential kitchens have?
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter relates the requirement to dwelling units but has provided no substantiation to show that the same potential hazard exists for nondwelling units. The original substantiation for GFCI protection on kitchen and wet bar receptacles is related to dwelling unit applications.

210.8. Ground-Fault Circuit-Interrupter Protection for Personnel.
(a) Dwelling Units...
(3) Outdoors. The device(s) providing ground-fault circuit-interrupter protection for personnel shall incorporate features that render the device incapable of being reset unless its proper operation is verified by the successful completion of the built-in in supervisory test.
SUBSTANTIATION: Data available from the files of the U.S. Consumer Product Safety Commission (CPSC) and Underwriters Laboratory (UL) indicate that a significant number of ground-fault circuit-interrupter (GFCI) devices installed in the field are inoperative. Current product is capable of restoring power when the GFCI no longer provides personal protection. Analysis has shown that GFCI(s) could be damaged by nearby lightning strikes and voltage surges. High voltage surges can cause GFCI(s) to trip in the process of damaging various electronic components. This proposal would prevent a nonfunctioning GFCI from being reset and restoring unprotected power, as can presently occur.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: With the support of Underwriters Laboratories Inc., the GFCI manufacturers of the National Electrical Manufacturers Association are in the process of conducting a comprehensive national survey to evaluate the performance of GFCIs installed in the electrical infrastructure. The panel understands that UL will issue a bulletin stating that no action will be taken regarding revision of the GFCI standard, UL943, until the data from the GFCI survey is compiled and analyzed.
The submitter proposes a design change that may or may not be supported by the outcome of the GFCI survey. It is the understanding of the panel that UL will take the necessary action to revise the product standard to accommodate any GFCI changes that may be indicated by an analysis of the GFCI survey data.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
NISSEN: The concept of utilizing advancements in product technology to enhance the effectiveness of personnel protection devices should be encouraged, as well as the efforts of the National Electrical Manufacturers Association to study the state of GFCI units in the field, learn if units are non-operational, and if so, to determine the extent and cause of their non-operation. If as a result of this study, additional product requirements are deemed necessary, these changes more appropriately belong in the product safety standard, and not in the NEC.

(Log #3834)

2- 33 - (210-8(3)): Reject
SUBMITTER: Buck Chavarrios, Riviera Electric
RECOMMENDATION: Revise text to read as follows:
210-8(3) Other than Dwelling Unit. All 125 volt single phase 15- and 20-ampere receptacles installed in locations specified below shall have ground-fault-circuit interrupters protection for personnel.
(1) Bathrooms
(2) Rooftops
(3) Outdoors.
SUBSTANTIATION: To reduce the risk of any electrical hazards to the general public or commercial building personnel to prevent any lawsuits that could come from these risks.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient substantiation to show that the potential hazards exist through the use of outdoor receptacles for nondwelling applications. Some proposals received on this topic suggest that GFCI protection on all outdoor receptacles is necessary because it is provided for dwelling units. However, it was how those receptacles were used at dwelling units that resulted in the requirement. The original data that justified dwelling unit applications is not directly applicable to nondwelling unit applications.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
ABSTENTION: 1
EXPLANATION OF ABSTENTION:
PAULEY: NEMA acknowledges the Panel Statement, but recognizes that safety would be enhanced if all 125V, 15 and 20A outdoor receptacles were protected by a GFCI. NEMA encourages public comments with supporting data.

(Log #388)

2- 34 - (210-8(a)): Reject
SUBMITTER: Mitchell R. Iles, City of Rogers Insp. Division, AR
RECOMMENDATION: Add receptacles within 6 ft of water source require GFCI protection (residential).
SUBSTANTIATION: In laundry rooms with sinks no provision is specified. They are not bar sinks. Slop sinks may also be included.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 2-36.

(Log #1912)

2- 35 - (210-8(a)): Reject
SUBMITTER: Michael J. Johnston, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read as follows:
210-8. Ground-Fault Circuit-Interrupter Protection for Personnel
FPN: See Section 215-9 for ground-fault circuit-interrupter protection for personnel on feeders.

(a) ~~Dwelling Units.~~ All Occupancies. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified below shall have ground-fault circuit-interrupter protection for personnel.

1. Bathrooms.
2. Garages, and also accessory buildings that have a floor located at or below grade level not intended as habitable rooms and limited to storage areas, work areas, and areas of similar use.

Exception No. 1: Receptacles that are not readily accessible.

Exception No. 2: A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved from one place to another, and that is cord-and plug-connected in accordance with Section 400-7(a)(6), (a)(7), or (a)(8).

Receptacles installed under the exceptions to Section 210-8(a)(2) shall not be considered as meeting the requirements of Section 210-52(g).

3. Outdoors.

Exception: Receptacles that are not readily accessible and are supplied by a dedicated branch circuit for electric snow-melting or deicing equipment shall be permitted to be installed in accordance with the applicable provisions of Article 426.

4. Crawl spaces. Where the crawl space is at or below grade level.
5. Unfinished basements. For purposes of this section, unfinished basements are defined as portions or areas of the basement not intended as habitable rooms and limited to storage areas, work areas, and the like.

Exception No. 1: Receptacles that are not readily accessible.

Exception No. 2: A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved from one place to another, and that is cord-and plug-connected in accordance with Section 400-7(a)(6), (a)(7), or (a)(8).

Receptacles installed under the exceptions to Section 210-8(a)(5) shall not be considered as meeting the requirements of Section 210-52(g).

6. Kitchens. Where the receptacles are installed to serve the countertop surfaces.
7. Wet bar sinks. Where the receptacles are installed to serve the countertop surfaces and are located within 6 ft (1.83 m) of the outside edge of the wet bar sink. Receptacle outlets shall not be installed in a face-up position in the work surfaces or countertops.

SUBSTANTIATION: The requirement for GFCI receptacles should not be different for a kitchen, bathroom, crawl space, outdoor, unfinished basement, garages, storage-work area, and wet bar sink in commercial building since the degree of hazard is the same. People service babies, make coffee, do all cooking the same in a dwelling. Servicing equipment is the same in all occupancies. What makes other than dwelling units locations less hazardous? It should only make sense to apply the same requirements to all locations. Personnel safety should be the first consideration in evaluating this proposal. The receptacles in these locations named in this section should all be afforded the protection of GFCI. They provide the same protection whether it's commercial occupancy or residential.

PANEL ACTION: Reject.

PANEL STATEMENT: Insufficient substantiation has been presented to extend all of the GFCI requirements to all occupancies. The original substantiation to add the requirements outlined in Section 210-8(a) is based on data provided for dwelling unit applications.

AFFIRMATIVE: 12

(Log #2891)

2- 36 - (210-8(a) and (b)): Reject

SUBMITTER: James Maldonado, City of Tempe, AZ/Rep. Central Arizona Chapter IAEI

RECOMMENDATION: Revise Section 210-8 (a) as follows:

Changing Dwelling Units to All Occupancies and add new section (8) to read as follows:

(8) Within 6 ft (1.83 m) of any sink, wash basin, tub, or shower.

Delete Section (b).

SUBSTANTIATION: The requirement for GFCI protection of receptacles should be no different for kitchens, bathrooms, crawl spaces, outdoors, unfinished basements, garages, storage work areas or wet bar sinks in commercial buildings since the same degree of hazard exists.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has presented insufficient substantiation to show that the receptacles around other sinks in dwelling units and in other than dwelling units, such as laundry sinks, tubs, basins or showers, are used in similar fashion as kitchen sinks and wet bar sinks in dwelling units, and present the same potential hazard.

2- 39 - (210-8(a)(1)): Reject

SUBMITTER: Harold R. Endean, III, Township of Montville, NJ

RECOMMENDATION: After the following word... "Bathrooms", add "See Section 210-52(d)."

SUBSTANTIATION: I feel that when an inspector is out in the field trying to answer questions or looking up in the code book it is very easy to overlook Section 250-52(d).

PANEL ACTION: Reject.

PANEL STATEMENT: Section 210-8 deals with GFCI requirements. The proposed reference would not add any clarity.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #2750)

2- 40 - (210-8(a)(2)): Reject

SUBMITTER: Joseph N. Fiorello, Sr., Fiorello Electric Inc.

RECOMMENDATION: Revise as follows:

(2) Garages, and accessory buildings that have a floor located at or below grade level (~~not intended as habitable rooms and limited to storage areas, work areas, and areas of similar use.~~)

SUBSTANTIATION: During Hurricane Floyd, while working as an electrical inspector as part of a FEMA advance team, I noted that buildings of the above said article had been flooded. Occupants in their haste to remove water and humidity were forced to use non-GFCI receptacles for pumps, dehumidifiers and fans. Although the areas were finished as the code states, these areas pose significant danger to occupants and should be GFI protected. If an area not suitable for habitable use is protected, all the more an area that is suitable for habitable use.

PANEL ACTION: Reject.
PANEL STATEMENT: The submitter is requesting a change based on a hazard during a natural disaster such as a flood. The hazards under such conditions can be numerous and cannot be anticipated by the NEC rules.

(Log #2454)

2- 44 - (210-8(a)(3)): Reject
SUBMITTER: William H. King, Jr., U.S. Consumer Product Safety Comm.
RECOMMENDATION: Revise as follows:
210-8. Ground-Fault Circuit-Interrupter Protection for Personnel.
(a) Dwelling Units....
(3) Outdoors. The device(s) providing ground-fault circuit-interrupter protection for personnel shall remove the power normally available for the loads at protected receptacles, and not restore this power, if the protection device fails to operate as intended in the test mode.
SUBSTANTIATION: Data available from the files of the U.S. Consumer Product Safety Commission (CPSC) and Underwriters Laboratories (UL) indicate that a significant number of ground-fault circuit-interrupter (GFCI) devices installed in the field are inoperative. Until recently, the only GFCI devices that were available did not remove electrical power to loads when the device failed to operate as intended in the test mode. For example, when a GFCI test button was pushed and the reset button did not actuate, the GFCI still permitted the delivery of electrical power. Now, however, GFCIs are available that prevent the restoration of electrical power when the device is tested and fails the test. Such enhanced GFCIs should be used, as a minimum, to protect outdoor receptacles, because outdoor receptacles are considered to be high risk locations with many grounded surfaces.
PANEL ACTION: Reject.

(Log #2553)

2- 45 - (210-8(a)(5)): Reject
SUBMITTER: James B. Mahoney, D&D Electrical Cont., Inc.
RECOMMENDATION: Revise as follows:
Unfinished or finished below grade basements where standing water may collect from water piping, drains, forced hot water piping for heat or ground water shall require GFI protection for all receptacles within the walls of the below grade basement. GFI protection shall be required in all below grade dwelling areas unfinished or habitable for all receptacle circuits dedicated or not.
SUBSTANTIATION: I am requesting this life saving change be made in memory of my only brother (name deleted) who died under the stated conditions above. He was entering his basement level bedroom in my parent's home (constructed a finished basement in the 70's) on June 13th 1998. The basement had been flooded with approximately 3 inches of water from a rain storm. As he entered the room he slipped and fell, knocking over a table lamp causing his electrocution and death. Please make this change.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel recognizes the benefits provided by GFCI and has dealt diligently over the years to require GFCIs in areas where hazards can be foreseen. The incident referenced by the submitter occurred during flooding which can introduce many electrical (as well as other) hazards.
Although the submitter indicates a specific incident involving a basement, an occurrence such as flooding could happen at any level of the dwelling unit. The NEC cannot add general installation rules attempting to anticipate such hazards as may occur during a flood.

AFFIRMATIVE: 12

(Log #4161)

2- 48 - (210-8(a)(5) Exception No. 3): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Insert a new Exception No. 3 as follows:
Exception No. 3: A receptacle supplying a permanently installed fire alarm or burglar alarm system.
SUBSTANTIATION: The panel justified rejection of this proposal in the prior cycle by saying such receptacles were covered under Exception No. 1. In order to qualify under that exception, the receptacle would have to not be readily accessible. That would mean reachable without resort to climbing over obstacles or resorting to ladders or step stools or the like. Most receptacles installed in dwelling basements don't meet these criteria, and therefore don't qualify under the exception.
A single energized receptacle installed for this purpose doesn't present any shock hazard, and unplugging the system to access the receptacle for other purposes would be extremely unlikely given the service receptacle already required by Section 210-52(e) and the fact that unplugging the system would send it immediately into an audible trouble condition. Acceptance of this proposal would assist installers in meeting the performance requirements of the rewritten household fire warning chapter in the 1999 NFPA 72.
Note that system transformers can still be used under the provisions of this change. If the installer uses a single receptacle, a No. 6 fender washer placed under one of the cover mounting screws secures the transformer. Alternatively, a conventional duplex receptacle could be used if the connecting tabs on both sides were broken out, allowing only one of the two receptacles to be energized.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter provided no substantiation that fire or burglar alarm systems have been a concern in tripping GFCIs. The panel notes that this requirement is not found in the rewrite of Chapter 8 of the 1999 National Fire Alarm Code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
BROWN: An appliance, in this case the control panel for a fire alarm system, could be installed under Exception No. 2, thus meeting the submitter's concerns.

(Log #1455)

2- 49 - (210-8(a)(6)): Reject
SUBMITTER: Jeff J. Eilers, Bright Electric
RECOMMENDATION: None.
SUBSTANTIATION: If a kitchen counter and/or cabinets extend pass a dividing door way and/or desk is adjoining. At what point is the (code 210-8(a)(6)) to be GFCI or is the desk area at a different height (of counter) not consider kitchen?
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has made no recommendation in accordance with the requirements of 4-3.3 of the Regulations Governing Committee Projects.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2286)

2- 50 - (210-8(a)(6)): Reject
SUBMITTER: Arthur A. Baron, Winthrop, MA
RECOMMENDATION: Revise text to read as follows:
"Kitchen counter receptacles that require GFIs be fed with GFIs in panel not be GFI receptacles."
SUBSTANTIATION: In the event that GFI receptacles in counter plug have to be replaced homeowner will replace with the much cheaper non-GFI receptacle.
PANEL ACTION: Reject.
PANEL STATEMENT: The Code does not specify the type of device used to provide the GFCI protection. GFCI receptacles have been in use for years with excellent success in the field. The NEC cannot anticipate all future code violations that might be created by a user.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2752)

2- 51 - (210-8(a)(6)): Reject
SUBMITTER: Joseph N. Fiorello, Sr., Fiorello Electric Inc.
RECOMMENDATION: Revise as follows:
(6) Kitchens. Where the receptacles are installed to serve the countertop surfaces. (<u>Any outlet installed in adjacent areas within 6 ft of the kitchen sink.</u>)
SUBSTANTIATION: While inspecting, I came across a kitchen with a window passage into an adjoining living room. The widow sill was built large enough to accommodate an appliance and receptacles were installed on the living room side. This was not countertop space and was not in the kitchen, but GFI protection was needed. The window passage was directly in front of the sink 4 inches about the countertop.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has presented a specific construction instance that would be subject to interpretation by the Authority Having Jurisdiction. The panel intends this requirement to provide GFCI protection for receptacles that serve kitchen countertop surfaces, regardless of the location of the receptacle.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2856)

2- 52 - (210-8(a)(6) and (7)): Reject
SUBMITTER: Bill F. Neitzel, Madison, WI
RECOMMENDATION: Combine Sections 210-8(a)(6) and 210-8(a)(7) to read as follows:
(6) Kitchens and Wet Bar Areas. Where the receptacles are installed to serve the countertop surfaces. Receptacle outlets shall not be installed in a face-up position in the work surfaces or countertops.

SUBSTANTIATION: Wet bar areas offer the same hazards as kitchen countertops. Typically the same type of appliances are utilized, causing the same potential problems. Combining these articles will treat these areas similarly regarding GFCI protection.
PANEL ACTION: Reject.
PANEL STATEMENT: There is insufficient substantiation to show that wet bar sinks present the same potential hazard as kitchen countertops. Because of the wide and varying use and arrangement of wet bars, the panel believes that the 6-foot minimum is necessary.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #637)

2- 53 - (210-8(a)(7)): Accept in Principle in Part
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 18 for information.
SUBMITTER: Jack Wells, Pass & Seymour/Legrand
RECOMMENDATION: Add the second sentence of Section 210-8(a)(7) to proposed new Article 420 as Section 420-4(e) titled Receptacles in Work Surfaces or Countertops.

420-4. Receptacle Mounting. Receptacles shall be mounted in boxes, or assemblies designed for the purpose, and such boxes or assemblies shall be securely fastened in place.

(a) Receptacles mounted in boxes that are set back of the wall surface, as permitted in Section 370-20, shall be installed so that the mounting yoke or strap of the receptacle is held rigidly at the surface of the wall.

(b) Receptacles mounted in boxes that are flush with the wall surface,or project therefrom shall be installed so that the mounting yoke or strap of the receptacle is held rigidly against the box or raised box cover.

(c) Receptacles Mounted on Covers. Receptacles mounted to and supported by a cover shall be held rigidly against the cover by more than one screw.

Exception: Receptacles shall be permitted to be mounted to and supported by a device assembly or box cover listed and identified for rigidly securing receptacles by a single screw or by other means.

(d) Position of Receptacle Faces. After installation, receptacle faces shall be flush with or project from faceplates of insulating material and shall project a minimum of 0.015 in. (0.381 mm) from metal faceplates.

(e) ~~7.~~ Receptacles in Work Surfaces and Counter tops. ~~Wet bar sinks. Where the receptacles are installed to serve the countertop surfaces and are located within 6 ft (1.83 m) of the outside edge of the wet bar sink.~~ Receptacles ~~outlets~~ shall not be installed in a face-up position in the work surfaces or countertops.

(f) Exposed Terminals. Receptacles shall be enclosed so that the live wiring terminals are not exposed to contact.

SUBSTANTIATION: This is a general installation requirement. It is more in line with the scope of proposed Article 420 than the scope of Article 210. Over many code cycles the general installation and construction requirements for receptacles, attachment plugs and cord connectors have been adopted in various sections of the code. The intent of this proposal is to locate the general installation requirements for receptacles and cord connectors to the new Article 420. New Article 420 covers requirements for installation, mounting grounding and non-interchangeability. This proposal brings the related requirements into a single Article thereby making it easier for the code user to locate them.

This proposal was developed by a Task Group of CMP 18 appointed by the chairman to consider separating 1999 NEC Article 410 into two articles, one covering fixtures and the other covering receptacles, attachment plugs and cord connectors. This Task Group was appointed in response to Proposal 18-55 for the revision of the 1996 NEC.
PANEL ACTION: Accept in Principle in Part.
Revise (e) of the proposal to read as follows:
"(e) Receptacles in Countertops and Similar Work Surfaces in Dwelling Units. Receptacles shall not be installed in a face-up position in countertops or similar work surfaces."
PANEL STATEMENT: The panel accepts the relocation of the material from Article 210 to Chapter 4. The panel does not accept the expansion of the requirement beyond dwelling units because the necessity has not been substantiated.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #638)

2- 54 - (210-8(a)(7)): Accept in Principle
SUBMITTER: Jack Wells, Pass & Seymour/Legrand
RECOMMENDATION: Relocate the second sentence of Section 210-8(a)(7) to proposed new Article 420 as Section 420-4(e) titled Receptacles in Work Surfaces or Countertops. Revise 210-8(a)(7) by deleting the second sentence.

210-8(a)(7) Wet bar sinks. Where the receptacles are installed to serve the countertop surfaces and are located within 6 ft (1.83 m) of the outside edge of the wet bar sink. ~~Receptacle outlets shall not be installed in a face-up position in the work surfaces or countertops.~~

420-4(e)~~(a)7.~~ Receptacles in Work Surfaces and Countertops. ~~Wet bar sinks. Where the receptacles are installed to serve the countertop surfaces and are located within 6 ft (1.83 m) of the outside edge of the wet bar sink.~~ Receptacles ~~outlets~~ shall not be installed in a face-up position in the work surfaces or countertops.

SUBSTANTIATION: This is a general installation requirement. It is more in line with the scope of proposed Article 420 than the scope of Article 210. Over many Code cycles the general installation and construction requirements for receptacles, attachment plugs and cord connectors have been adopted in various sections of the code. The intent of this proposal is to locate the general installation requirements for receptacles and cord connectors to the new Article 420. New Article 420 covers requirements for installation, mounting, grounding and non-interchangeability. This proposal brings the related requirements into a single article thereby making it easier for the code user to locate them.

The Task Group recognizes that by moving this requirement, the application is expanded from receptacles mounted adjacent to wet bars to a general requirement wherever receptacles are mounted in work surfaces or countertops. The task group believes a safety hazard exists wherever receptacles are mounted face up because foreign materials are likely to enter the receptacle and come in contact with current carrying parts.

This proposal was developed by a Task Group of CMP 18 appointed by the chairman to consider separating 1999 NEC Article 410 into two articles, one covering fixtures and the other covering receptacles, attachment plugs and cord connectors. This Task Group was appointed in response to Proposal 18-55 for the revision of the 1996 NEC.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 2-53.

(Log #3866)

2- 55 - (210-8(a)(7)): Accept
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Revise text to read as follows:

(7) Wet Bar Sinks. Where the receptacles are installed to serve the countertop surfaces and are located within 6 ft (1.83 m) of the outside edge of the wet bar sink. ~~Receptacle outlets shall not be installed in a face-up position in the work surfaces or countertops.~~

SUBSTANTIATION: This is a companion proposal to one that intends to locate this requirement in Section 210-7 so it will apply to all dwelling unit receptacle outlets.

In reality, the orientation of the receptacle has nothing to do with whether GFCI protection should be required but its proximity to the wet bar sink.
PANEL ACTION: Accept.
PANEL STATEMENT: See panel actions and statements on Proposals 2-53 and 2-54.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4462)

2- 56 - (210-8(a)(7)): Reject
SUBMITTER: Charles M. Williams, Stealth Electric
RECOMMENDATION: This article should be changed to include any sink area.
SUBSTANTIATION: Currently, break-room sinks, utility and laundry sinks are not covered. GFCI protection can only enhance safety.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-36.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #440)

2- 57 - (210-8(a)(8) (New)): Accept
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 19 for information
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
RECOMMENDATION: Add new 210-8(a)(8) to read as follows:
(8) Boathouses.
SUBSTANTIATION: This proposal adds back to 210-8(a) the requirement for GFCI protection in residential boathouses that was removed in the 1996 edition and relocated to Article 555. A proposal has been submitted to CMP 19 (recognizing that the TCC has jurisdiction over scope requirements) that would remove single-family private residential docking facilities from the scope of Article 555. If this proposal is accepted, outlets installed in those locations would be exempt from the GFCI requirements. Since they would not be technically considered outdoor outlets on residential property, the requirement needs to be added here. Outlets in boathouses at other than single-family docking facilities would be required to have GFCI protection by Article 555 and this protection should be afforded to these areas at single-family facilities as well.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel's action is contingent upon Code-Making Panel 19's acceptance of the proposal to change the scope of Article 555.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1685)

2- 58 - (210-8(a)(8) (New)): Reject
SUBMITTER: Kevin M. Weigman, Northeast Wisconsin Technical College
RECOMMENDATION: Add a new Section 210-8(a)(8) to read as follows:
(8) Vanities with sinks located in bedrooms. Where receptacles are installed to serve countertop surfaces and are located within 6 ft (1.83 m) of the outside edge of the vanity sink. Receptacle outlets shall not be installed in a face-up position in the work surfaces or countertop.
SUBSTANTIATION: It is becoming a common practice in homes to have a dressing table/vanity with a sink located in the master bedroom. The same electrical shock hazards would exist at the vanity with a sink located in the bedroom as a sink located in the bathroom.
PANEL ACTION: Reject.
PANEL STATEMENT: The definition of "bathroom" states that it is an "area including...". This provides the authority having jurisdiction the ability to determine if such sinks fall under the requirements of 210-8(a)(1).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3811)

2- 59 - (210-8(a)(8) (New)): Reject
SUBMITTER: Douglas Hansen, Codecheck
RECOMMENDATION: Add a new item (8) to read:
"Laundry Rooms. Where the receptacles are intended to serve laundry countertop surfaces or accessories other than clothes washers."
SUBSTANTIATION: Appliances used around laundry sinks subject users to the same hazards as near kitchen or wet bar sinks.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-36.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:

(Log #296)

2- 60 - (210-8(b)): Reject
SUBMITTER: Ronald Deering, City of Potage, MI
RECOMMENDATION: Revise 210-8(b) to read as follows:
(1) Bathrooms
(2) Rooftops
(3) Kitchens
Exception No. 1: Receptacles that are not readily accessible.
Exception No. 2: Receptacles that are dedicated to serving cord and plug connected appliances in accordance with Section 400-7(a)(6), (a)(8).
(4) Receptacles installed within 6 ft (1.83 m) of the outside edge of a sink or lavatory.
SUBSTANTIATION: Many receptacle locations which would fall under items (3) and (4), are accessible to employees and customers to be used on a regular basis.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statements on Proposals 2-29 and 2-36.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #387)

2- 61 - (210-8(b)): Reject
SUBMITTER: Mitchell R. Iles, City of Rogers Insp. Division, AR
RECOMMENDATION: Add GFCI receptacle to kitchen counter and within 6 ft of water source.
SUBSTANTIATION: In commercial occupancies, the protection for personnel need to be in kitchens and close to water sources. Lots of untrained or unsupervised personnel work around water. Most of it is on metal counters with no ground fault provided in schools with counters with sinks in them.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-36.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2029)

2- 62 - (210-8(b)): Reject
SUBMITTER: Michael L. Lenon, B&D Electric
RECOMMENDATION: Revise text to read:
"Other than Dwelling Units. All 125 volt single-phase 15 and 20-ampere receptacles installed in the location specified below shall have ground fault circuit interrupter protection for personnel (1) bathrooms (2) rooftops (3) all outside receptacles."
SUBSTANTIATION: Schools, offices, and churches, etc. have unprotected outside receptacles. All receptacles must have GFCI protection outside. This will save people from getting electrocuted and shocked.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-33.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
MERICLE: I vote no on Panel Action. I agree with the submitter. Logic suggests that the hazards with respect to receptacles located outdoors are similar whether associated with dwelling units or other types of structures.

(Log #2834)

2- 63 - (210-8(b)): Reject
SUBMITTER: Melvin K. Sanders, Ankeny, IA
RECOMMENDATION: Add a new bullet to include kitchens as (2) and renumber rooftops to (3), so it would read:
(b) Other than Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified below shall have ground-fault circuit-interrupter protection for personnel.
(1) Bathrooms
(2) Kitchens
(3) Rooftops.
SUBSTANTIATION: It is recognized that areas where water and other liquids are used when food is prepared in kitchens of restaurants, school food services, institutional facilities and the like pose electrical shock hazards. At present it is necessary to rely upon the general "Wet Location" definition in Article 100, which does not always provide adequate guidance as to its applicability in these locations, and there is no specific ground-fault circuit interrupter protection required. In addition, not all food is prepared at a sink-counter-top arrangement such in a dwelling but generally takes place at metal counter- or tabletops scattered around the room which are electrically conductive under normal conditions. These tops may not be near the sink itself but still use pans and basins for part of the process. The normal high-speed activity associated with preparing hundreds and sometimes a thousand or more meals at a time create many opportunities for liquids to get into the electrical outlets and on the floor creating hazard currents paths.
Another problem is the provided receptacle outlets may be on differing phases so the shock exposure may involve line-to-line as well as line-to-neutral and line-to-equipment and neutral to equipment. Many procedures involve soaking vegetables and fruits in pans and basins, running and splashing water over some items, and allowing meats, fruits and vegetables to thaw with liquids standing on the working tops as well as accidental spillage on the floor until such time as it can be cleaned up.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statements on Proposals 2-29 and 2-36.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

MERICLE: See my Explanation of Negative on Proposal 2-62.

(Log #3131)

2- 65 - (210-8(b)): Reject
SUBMITTER: James O'Driscoll, Larry C. McCrae Inc.
RECOMMENDATION: Revise as follows:
GFCI Protection.
(b) Other than Dwelling Units. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations specified below shall have ground-fault circuit-interrupter protection for personnel.
(1) Bathrooms
(2) Rooftops
(3) Outdoors. Where the receptacles are readily accessible to the public.
SUBSTANTIATION: Non-GFCI receptacles I have installed in these other than dwelling unit buildings are being used for a variety of purposes. Working in and out of these buildings I have not yet seen anyone injured, but there exists a lot of potential hazard. I have seen a landscaper use an electric hedge trimmer around a working lawn sprinkler system. Varieties of people are plugging in cordsets with skinned outer jackets. I even witnessed a plumbing contractor unstop a drain with his electric snake plugged into an outdoor receptacle with no GFCI protection. This is a personnel hazard which can be reduced by providing GFCI protection at these outlets. As an electrical contractor I recommend to building owners and maintenance personnel to install GFCI receptacles at all of these outdoor locations mentioned above.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-33.

(Log #1873)

2- 68 - (210-8(b)(1)): Reject
SUBMITTER: Ric Thomson, Candler Hospital, Engr Dept.
RECOMMENDATION: Revise as follows:
(1) Bathrooms.
(a) Receptacles located within 6 ft of basin, tub, toilets or shower shall be GFI protected, not all receptacles.

SUBSTANTIATION: Because of vague definition of a "bathroom", and no definition of "area," you could wind up with a whole room of GFI protected receptacles, especially in a hospital patient room, which is not a good idea, because of nuisance tripping and medical equipment.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient substantiation to exclude the GFCI requirement for all bathroom receptacles other than those receptacles located within the six foot rule in other than dwelling units. GFCI receptacles in hosptial patient rooms are covered by Section 517-21.

(Log #1688)

2- 74 - (210-8(b)(3) (New)): Reject
SUBMITTER: Harold R. Endean, III, Township of Montville, NJ
RECOMMENDATION: Add a new section after (2) Rooftop. The new section would be:
(3) Garages and grade-level portions of unfinished accessory buildings used for storage or work areas.
SUBSTANTIATION: I feel that there should be ground fault protection in accessory buildings in commercial dwellings just like we have in residential buildings. The same safety issues are there just like in a residential home. People will be using regular receptacles outside and inside garages where maintenance of equipment could be going on. The same exceptions in 210-8(a)(2) can still be left in the new 210-8(b)(3) section. This new section will help to cover those buildings that fall between dwelling garages and commercial garages.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter relates the requirements to dwelling units, however, the submitter presents insufficient substantiation specific to nondwelling units. The original data that justified dwelling unit applications is not directly applicable to nondwelling unit applications.

(Log #2046)

2- 76 - (210-8(b)(3) (New)): Reject
SUBMITTER: Lucinda Mallalieu, Newell Electrical
RECOMMENDATION: Add new text to read:
210-8 Ground Fault Circuit Interrupter Protection for Personnel.
(b) Other than Dwelling Units.
(3) Outside.
SUBSTANTIATION: While many of the outside receptacles on buildings other than dwelling units are used for fixed appliances, such as vending machines, many are not. A lot of them are used for outdoor maintenance and landscape equipment. A majority of the time this equipment is used with extension cords. As we know, many electricity-related injuries, deaths, and fires involve the use of faulty extension cords.
Furthermore, when additions and renovations are made to the buildings, often the nearest outside receptacle is used for temporary construction power. In many areas labor codes require the use of GFCI receptacles for construction equipment.
I believe that GFCI receptacles should be required for receptacles outside buildings other than dwelling units for the safety of personnel using them in the course of their daily work.
PANEL ACTION: Reject.

2- 81 - (210-8(b)(3) (New)): Reject
SUBMITTER: Monte R. Ewing, State of Wisconsin
RECOMMENDATION: Add new text to read as follows:
(3) Repair or storage areas of garages where located readily accessible at or below grade level.
SUBSTANTIATION: A similar requirement is found in Section 210-8(a)(2) and Section 511-10. The problem is 210-8(a)(2) only applies to dwelling unit related garages and 511-10 only applies to commercial garages where repairing or storing self propelled motor vehicles which utilize volatile flammable liquids. Neither of the existing Sections apply to repair or storage garages used for diesel fuel (combustible liquid) motor vehicles. The same hazard exists here as covered in the existing two sections, however, these types of occupancies were overlooked due to the Scope of Article 511. The State of Wisconsin has created a code to cover these occupancies and I feel this needs to be addressed in the National Electrical Code.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-74.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4405)

2- 82 - (210-8(b)(3) (New)): Reject
SUBMITTER: Leo F. Martin, Martin Electrical & Technical Training Services
RECOMMENDATION: Add a new subparagraph (3) and two Exceptions as follows:
"All general purpose 125 volt, single phase 15- or 20-ampere rated receptacles installed outdoors shall have GFCI protection for personnel.
Exception No. 1: Receptacle outlets not readily accessible.
Exception No. 2: Single receptacles of the NEMA L-5 15R or 20R type installed for a specific use. These receptacles shall also comply with Section 410.57.
SUBSTANTIATION: Section 210-8(a) requires GFCI protection for general purpose receptacle outlets installed outdoors-dwelling units. Section 305-6 requires GFCI protection for receptacle outlets installed or used for temporary wiring. Section 210-63 FPN references back to 210-8 which requires GFCI protection for these outlets if they are installed or located on rooftops or in crawl spaces if the crawl space is located at or below grade level.
I am aware that the GFCI requirements of 210-8 for dwelling unit arose because of the manner in which receptacles installed in locations listed in 210-8(a) were/are used. However, in other than dwelling units outdoor general purpose receptacle outlets are not required. If an outdoor receptacle outlet is installed in these locations for a specific use and GFCI protection would be a problem then Exception No. 2 could be applied. If an outdoor receptacle outlet is installed for general purpose use, this receptacle outlet would be used for temporary power or lighting the same or very similar conditions that necessitated the GFCI protection mandated in Sections 210-63 and 305-6 (temporary use of power or lighting during installation, maintenance, or repair of equipment or grounds) would be present during the use of this outdoor general purpose receptacle outlet(s) in other than dwelling units. The same substantiation used to include GFCI protection in Sections 210-63 and 305-6 would be applicable to this new subparagraph and Exceptions.
PANEL ACTION: Reject.

2- 83 - (210-8(c) (New)): Reject
SUBMITTER: Tim Hughes/Craig Guest, Upper Bucks County Area Vocational Technical School
RECOMMENDATION: Add a new 210-8(c) to read as follows:
Laundry receptacles, as required by 210-52(f), shall have ground fault circuit interrupter protection for personnel.
SUBSTANTIATION: Laundry areas frequently contain a utility sink adjacent to laundry appliances. The presence of water in this area presents a potential shock hazard. The additional possibility of a malfunction in an appliance increases the potential for a shock hazard to be present. For this reason, the receptacle outlet required by Section 210-52(f) should be provided with ground fault circuit interrupter protection.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-36.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #451)

2- 84 - (210-11(b)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Replace the first sentence of Section 210-11(b) with the following sentence:
"Where the load is computed on a volt-ampere/square meter or square foot ~~(0.93m^2)~~ basis, the wiring system up to and including the branch-circuit panelboard(s) shall be provided to serve not less than the calculated load."
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., show the SI units as the preferred and the inch-pound units immediately following in parenthesis. Specific values of measurement are not shown since they are not necessary in this section. The proposed revision of Table 220-3(a) includes both volt-ampere loads per square meter and per square foot.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #679)

2- 85 - (210-11(b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(b) Load Evenly Proportioned Among Branch Circuits. ~~Where the load is computed on a volt-ampere per square foot (0.093 sq m) basis the~~ The wiring system up to and including the branch-circuit panelboard(s) shall be provided to serve not less than the ~~calculated~~ computed load. Where the load is computed on a volt-amepre per square foot (0.093 sq m) basis or volt-ampere per circuit basis this load shall be evenly proportioned insofar as practicable, among multioutlet branch circuits within the panelboard(s), except the branch circuit(s) required in (c)(3) below. Branch-circuit overcurrent devices ~~and circuits~~ need only be provided ~~installed to serve the connected load~~ for circuits installed.
SUBSTANTIATION: The requirement for an adequate wiring system to and including panelboards should not be limited to loads computed on a va/sq ft basis. Volt-ampere per circuit loads such as small appliance circuits, laundry circuits, and sign outlet circuits seem to be reasonable included with the va/sq ft computed load. It is impractical to require the load (in essence the square foot area) to be exactly the same for each circuit, and this is apparently not vigorously enforced. The bathroom branch circuit(s) is included in the va/sq ft computation and unless excluded would normally be the determinant as to how many sq feet could be served by each va/sq ft circuit. Likewise, any "extra" general lighting circuits which may serve a small sq ft area.
The requirement for branch-circuit overcurrent devices and circuits for connected loads is flawed; a branch circuit serving only general-use receptacles or small appliance circuit receptacles has no connected load, only computed load. Present wording indicates such circuits need not be installed, even though required by other Code rules.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's assertion is incorrect. The small appliances, laundry circuits and sign outlet circuits are not included in the volt-ampere/square foot calculated load.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2160)

2- 86 - (210-11(b)): Accept in Principle
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
Branch-circuit overcurrent devices and current devices and circuits shall only be required to ~~need only~~ be installed to serve the connected load.
SUBSTANTIATION: This is a permissive rule that should follow the rule in the NEC Section 90-5(b). The only difference here is using the phrase shall only be required instead of shall not be required. The intent of the rule is being followed.
The phrase "need only" is used no where else in the Code except in Appendix D, Example No. D3.
Also, the Foreword to the NEC Style Manual states, "It is vitally important that the text be as explicit as possible and that maximum consistency be achieved in the language used in the text."
PANEL ACTION: Accept in Principle.
Revise the proposed wording to read as follows:
"Branch-circuit overcurrent devices and circuits shall only be required to be installed to serve the connected load."
PANEL STATEMENT: The revisions meet the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:

(Log #3817)

2- 87 - (210-11(c)(1)): Reject
SUBMITTER: Roy Smith, Riviera Electric
RECOMMENDATION: Move 210-11(c)(1) and combine it with 220-16(a) so you don't have to keep jumping from 220-16(a) to 210-11(c)(1).
SUBSTANTIATION: Combine them.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel's intent is keep the requirements for required branch circuits separate from the requirements for calculating loads, which is covered by the scope of Article 220.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4412)

2- 88 - (210-11(c)(1)): Accept in Principle
SUBMITTER: Joseph Andre, City of Bellevue, WA
RECOMMENDATION: Add the phrase "125 volt," between the words "more" and "20-ampere".
The revised text of the sentence will read:
"In addition to the number of branch circuits required by other parts of this section, two or more 125 volt, 20-ampere small appliance branch circuits shall be provided for all receptacle outlets specified by Section 210.52(b)."
SUBSTANTIATION: Foreign appliances are increasingly finding their way into homes in the United States, many of which operate at different voltages and frequencies than is the conventional standard. This revised wording will make it clear that any small appliance receptacles installed for other than 125 volt equipment will not meet the requirements of 210-11(c)(1).
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 2-153a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:

2- 97 - (210-11(c)(3), Exception): Reject
SUBMITTER: James M. Imlah, City of Hillsboro, OR
RECOMMENDATION: Delete the following:
~~Exception: Where the 20 ampere circuit supplies a single bathroom, outlets for other equipment within the same bathroom shall be permitted to be supplied in accordance with Section 210-23(a).~~
SUBSTANTIATION: Please delete the exception! By allowing other equipment within the bathroom room to be connected to the receptacle 20-amepre circuit there may not be enough capacity to handle equipment that may be plugged in the receptacle. It is possible with a heat-fan, heat-fan-light, and an appliance like a hair dryer, curling iron or other types of appliance to cause the circuit to trip and in effect causing an overload condition. The overload condition can also cause heating effects that could cause looseness of connections and creating arcing problems on the line side of the receptacle. I have seen loading problems occur in some bathroom remodels in our local area. The heating effect on conductors is bad and can be compounded with some of the older type conductors found in remodels. Even with loading calculations as per NEC 210-23, there can still be circuit-overloading problems, when these type of appliances are used. I realize we are not to design or plan for future loads, but in this case we have to do something to stop overloading issues. Please keep the 20 amp circuit receptacle for the bathroom appliances and not allow other loads to be piggybacked on.
PANEL ACTION: Reject.
PANEL STATEMENT: The exception was added during the 1999 NEC Cycle to address proposals and comments from submitters indicating that some degree of balance on the 20 amp requirement is necessary. The panel maintains that same position.

2- 98 - (210-11(d) (New)): Reject
SUBMITTER: David T. Brender, Cooper Development Assn. Inc.
RECOMMENDATION: Add text to read as follows:
<u>(d) Dwelling Garage and Outdoor Receptacles. Branch-circuit conductors shall not be smaller than 12 AWG to the garage receptacle outlet(s).</u>
SUBSTANTIATION: The USA has experienced an increased usage of outdoor electrical appliances and the use of longer extension cords which, even when sized correctly, pose a risk of fire due to motor overheating and failing due to excessive voltage drop. As homes continue to be built larger and larger, as panelboards are located more often at the end of the house, with an increase in the number of electrical appliances in a typical home, and with appliances having increased power consumption, the risk of overloaded conductors has dramatically increased. Just as the minimum conductor size for bathrooms was increased due to the change in the type of appliances used on the bathroom circuit, the minimum conductor size for branch circuits should be increased to 12 AWG. The increase in minimum size will increase safety by reducing the risk of overloaded circuits and the need to rewire existing circuits. The increase to 12 AWG will also decrease the cable impedance, which will cause the overcurrent device to operate more quickly for long runs of cable found in larger dwellings. The overcurrent device ampacity is not intended to be changed by this proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: No. 14 AWG is the Code recognized minimum branch circuit size copper conductor. The proposal does not provide sufficient substantiation to require a larger size for these outlets. Voltage drop is a design consideration that must be dealt with by the installer / designer for each installation.

(Log #4129)

2- 99 - (210-11(d) (New)): Reject
SUBMITTER: David T. Brender, Cooper Development Assn. Inc.
RECOMMENDATION: Add text to read as follows:
(d) Dwelling Unit - Habitable Room Branch Circuits. Branch-circuit conductors shall not be smaller than 12 AWG.
SUBSTANTIATION: As reported in the Eleventh Edition of "Fire in the United States 1987-1996," published by United States Fire Administration National Fire Data Center, fires caused by electrical distribution are the 4th most common cause of fire. The areas where fires most often occur are in the sleeping rooms, lounge areas (living rooms) and kitchens. 20 amp circuits are required in the kitchen, bathroom, and laundry room to address the risk of fire. As homes continue to be built larger and larger, as panelboards are located more often at the end of the house, with an increase in the number of electrical appliances in a typical home, and with appliances having increased power consumption and more stringent power quality demands, the risk of overloaded conductors and occurrence of unacceptable circuit voltage drops have dramatically increased. Recent research (International Telework Association and Council-report released October 27, 1999) indicates that 19.2 million people, or 10 percent of the U.S. workforce, now telecommute, supporting the growing residential use of the computers, printers, fax machines, copiers, etc. In fact, 55 percent of all U.S. households now have one or more computers (Parts Associates, Forum99, October 1999), and this is expected to grow further to 75-80 percent within the next 10 years. Just as the minimum conductor size for bathrooms was increased due to the change in the type of appliances used on the bathroom circuit, the minimum conductor size for all branch circuits should be increased to 12 AWG. The increase in minimum size will increase safety by reducing the risk of overloaded circuits and the need to rewire existing circuits to meet the needs of heavily loaded circuits and sensitive electronic equipment. The increase to 12 AWG will decrease the cable impedance which will cause the overcurrent device to operate more quickly for long runs of cable found in larger dwellings. The overcurrent device ampacity is not intended to be changed by this proposal.
PANEL ACTION: Reject.

2- 100 - (210-11(d) (New)): Reject
SUBMITTER: David T. Brender, Cooper Development Assn. Inc.
RECOMMENDATION: Add text to read as follows:
(d) Commercial Installations. Branch-circuit conductors shall not be smaller than 12 AWG.
SUBSTANTIATION: The fine print notes let the user know to check the conductor's ampacity rating, temperature limit, and voltage drop. Ampacity rating and temperature limits are addressed in the NEC but are not generally applied. Voltage drop is only addressed through the fine print. As commercial installations continue with an increase in the quantity of electrical equipment and with equipment having increased power consumption and more stringent power quality demands, the risk of overloaded conductors and occurrence of unacceptable circuit voltage drops have dramatically increased. Just as the minimum conductor size for bathrooms was increased due to the change in the type of appliances used on the bathroom circuit, the minimum conductor size for all branch circuits in commercial installations should be increased to 12 AWG. The increase in minimum size will increase safety by reducing the risk of overloaded circuits and the need to rewire existing circuits to meet the needs of heavily loaded circuits, increased harmonic loads and sensitive electronic equipment. As reported in the Eleventh Edition of "Fire in the United States 1987-1996," published by United States Fire Administration National Fire Data Center, the leading causes of 1996 nonresidential structure fires in stores, offices, and basic industry are attributed to electrical distribution. The overcurrent device ampacity is not intended to be changed by this proposal.
PANEL ACTION: Reject.

NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BROWN: This proposal should be accepted. See my comment on Proposal 2-106.

(Log #2744)

2- 102 - (210-12): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 17 for further consideration in Article 517. This will be considered as a public comment.
SUBMITTER: A. Dan Chisholm, Healthcare Circuit News
RECOMMENDATION: Revise as follows:
(b) Dwelling Unit Bedrooms. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere ~~receptacle~~ outlets installed in dwelling unit bedrooms shall be protected by an arc-fault circuit interrupter(s). This requirement shall become effective January 1, 2002.
(c) Limited Care Facility Bedrooms. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere outlets installed in limited care facility bedrooms shall be protected by an arc-fault circuit interrupter(s).
SUBSTANTIATION: The 1999 National Electrical Code mandates the protection of the branch circuits that supply the receptacle outlets installed in dwelling unit bedrooms. I can agree that bedroom circuits need to be protected, but I cannot understand the restriction to "receptacle outlets." The objective of the 1999 code change was to increase the fire protection of bedrooms, and in that case all of the bedroom outlets should be protected. Here I note that the code defines an outlet as "A point on the wiring system at which current is taken to supply utilization equipment." Further, utilization equipment is code defined as "Equipment that utilizes electric energy for electronic, electromechanical, chemical, heating, lighting, or similar outlets."
I am proposing that the word "receptacle" be deleted from the present code language. This would then mandate protection, for example, of the permanently installed lighting fixture-outlets within a bedroom.
With respect to my proposed new requirement for AFCI protection of the branch circuits associated with the bedrooms of Limited Care Facilities, I am convinced that these devices will serve a vital fire-protection function. As defined in 517-3, a Limited Care Facility is "A building or part thereof used on a 24-hour basis for the housing of four or more persons who are incapable of self-preservation because of age, physical limitation due to accident or illness, or mental limitations, such as mental retardation/developmental disability, mental illness, or chemical dependency". These facilities, with occupants who are incapable of self preservation, deserve the very finest of fire-mitigating technology. AFCIs, with their demonstrated capability of detecting arcing faults and interrupting these faults, represent such technology and should be mandated for the branch circuits supplying the bedroom outlets of these facilities.
PANEL ACTION: Accept in Part.
The panel accepts the deletion of "receptacle" in (b) of the proposal, and rejects the remainder of the proposal.
PANEL STATEMENT: The limited care facility issue is outside the scope of Code-Making Panel 2 and recommends that the Technical Correlating Committee forward this item to Code-Making Panel 17 for action.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BROWN: This "Accepted in Part" proposal, in essence adding supposed AFCI protection for any permanently mounted lighting, should be rejected. During an emergency situation, or nuisance tripping of the AFCI device, one would want this type of area lighting to be available to rectify any problems

---

(Log #2847)

2- 103 - (210-12): Accept in Principle

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 17 for further consideration in Article 517. This will be considered as a Public Comment.

SUBMITTER: Robert J. Clarey, Cutler-Hammer, Inc.

RECOMMENDATION: Revise text as follows:

(b) Dwelling Unit Bedrooms. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere ~~receptacle~~ outlets installed in dwelling unit bedrooms shall be protected by an arc-fault circuit interrupter(s). This requirement shall become effective January 1, 2002.

(c) Dwelling Unit Living Areas. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere outlets installed in dwelling units living areas shall be protected by an arc-fault circuit interrupter(s).

FPN: A dwelling unit living area is any space, that can be normally occupied, other than bedrooms, bathrooms, toilet compartments, kitchens, closets, halls, storage, garage or utility spaces.

(d) Guest Rooms. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere outlets installed in guest rooms in hotels, motels, and similar occupancies shall be protected by an arc-fault circuit interrupter(s) in accordance with the requirements for dwelling units in 210-12(b) and 210-12(c).

(e) Limited Care Facility Bedrooms. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere outlets installed in limited care facility bedrooms shall be protected by an arc-fault circuit interrupter(s).

SUBSTANTIATION: The 1999 National Electrical Code mandates the protection of all branch circuits that supply receptacle outlets installed in dwelling unit bedrooms. This Code wording was influenced, in part, by Comments during the 1999 Code Cycle, such as Comment 2-65 (1). That Comment addresses the enhanced safety provided by AFCIs in sleeping and living areas; areas that were identified as being most prone to electrical fires as a result of low voltage arcing. The present proposal is aimed at broadening the protection of AFCIs to the branch circuits supplying all bedroom outlets in dwelling units, in guest rooms and in limited care facilities. It is also aimed at broadening the protection of AFCIs to the branch circuits of living areas in dwelling units and in guest rooms.

During the last Code Cycle, Comment 2-65 was Accepted in Principle, and the present Code text in 210-12 of the 1999 National Electrical Code reflects the Panel Action wording on Comment 2-65. The associated Panel Statement (1) reads:

"The Panel has limited the requirements to dwelling unit bedrooms to permit these new devices to be introduced into the public domain on a gradual basis.

The panel also notes that this does not prohibit their use in other circuits throughout dwelling units. An effective date of January 1, 2002 was established to allow industry to accommodate the new requirement and to allow a transition period".

The substantiation for the present proposal is as follows:

With respect to 210-12(b), the present restriction to bedroom receptacle outlets only partially satisfies the intended protection of the circuits supplying dwelling unit bedrooms. These rooms are also associated with lighting outlets, and the branch circuits supplying these lighting outlets should also be protected. The proposal, therefore, is to delete the word "receptacle" in order to provide AFCI protection to the circuits supplying all bedroom outlets.

With respect to 210-12(c), the proposal is the extend AFCI fire protection to the circuits supplying dwelling unit living areas. This change, in conjunction with 210-12(b), would provide AFCI protection to the circuits supplying outlets in all dwelling unit rooms with the exception of bathrooms, toilet compartments, kitchens, closets, halls, storage, garage or utility spaces.

With respect to 210-12(d), the intent is to extend the enhanced safety benefits of AFCIs in dwelling units to comparable occupancy locations (bedrooms and living areas) in the guest rooms (210-60) of hotels, motels and similar occupancies.

With respect to 210-12(e), the intent is to extend the enhanced safety benefits of AFCIs to the bedrooms of Limited Care Facilities as defined in 517-3. These facilities cater to persons who are incapable of self-preservation or who suffer from some form of mental limitation. These handicaps complicate the rapid exiting of buildings, and fire safety needs to be increased by the addition of AFCIs.

This overall Code proposal is justified on the basis of enhanced safety. The U.S. Consumer Product Safety Commission has published (2), for example, 1996 Residential Fire Loss Estimates. CPSC provides estimates of the fires losses, in residential structures, for the total electrical distribution system. For 1996 the estimate is 41600 fires, 370 civilian deaths, 1430 civilian injuries, and $682.5M in property losses. Many of these fires and much of this loss of life could have been prevented by AFCIs. But for AFCIs to be effective, it is necessary to provide arc fault detection and protection to as many dwelling-unit supply-circuits as possible. The Code proposal is also justified by the changes, since the last Code cycle, which demonstrate that industry has indeed accommodated to the new requirements.

First, in February 1999, Underwriters Laboratories published the first Edition of UL 1699 "Arc-Fault Circuit-Interrupters" (3). The branch/feeder AFCIs described in that document are substantially identical to the "AFCIs classified for mitigating the effects of arcing faults" that were available during the 1999 Code cycle, and that were previously described in a draft standard. The branch/feeder AFCIs described in UL 1699 protect the installed wiring, and also provide protection against line to neutral and line to ground arcing faults in the cords connected to the outlets. The existence of this standard, and of the associated branch/feeder products, indicates that the products have matured. Second, many circuit breaker manufacturers now offer combination circuit breakers and branch/feeder AFCIs. Thus AFCI devices are readily available. Third, manufacturers have gained hundreds of millions of operating-hours experience with AFCIs. The consumers have benefited from the enhanced arcing fault protection.

Further, consumers have not experienced "nuisance tripping" due to the false identification of circuit waveforms such as the inrush transients to motors, and the normally occurring arcing waveforms associated with devices such as thermostats, motors, and switches.

Fourth, AFCI manufacturers have made numerous AFCI presentations to fire inspectors, electrical inspectors, and other groups concerned with public safety. This has raised awareness of both the technology and the associated safety potential, and the overwhelming response has been both positive and enthusiastic.

Fifth, in 1999 the Consumer Product Safety Commission has made a brief report (4) entitled "Preventing Home Fires: Arc Fault Circuit Interrupters (AFCIs)". This report includes the statement, "Several years ago, a CPSC study identified arc fault detection as a promising new technology. Since then, CPSC electrical engineers have tested the new AFCIs on the market and found these products to be effective". Thus AFCIs have moved from the conceptual stage, as discussed in the 1995 UL Report for CPSC "Technology for Detecting and Monitoring Conditions that Could Cause Electrical Wiring System Fires" to the practical stage. In particular, AFCIs are available on the market and are effective.

In view of the positive changes that have occurred since the last cycle, and the continuing heavy toll in human lives, in human injury, and in property losses occasioned by electrical distribution fires, the Code Panel is urged to adopt this proposal. The objective is to optimize protection for dwelling unit bedrooms, for dwelling unit living area circuits, for the comparable guest rooms of hotels and motels, and for the bedrooms of limited care facilities.

Note: Supporting material is available upon request at NFPA Headquarters.

PANEL ACTION: Accept in Part.

The panel accepts the deletion of the term "receptacle" in (b) of the proposal. The panel rejects the remainder of the proposal.

PANEL STATEMENT: The panel rejects the submitter's requested expansion of the AFCIs usage beyond the dwelling unit bedroom circuits.

The panel continues to support the introduction of this product, based on the data received and reviewed on this subject, but believes it is prudent to limit the requirement to bedrooms to gain further experience.

The limited care facility issue is outside the scope of Code-Making Panel 2 and recommends that the Technical Correlating Committee forward this item to Code-Making Panel 17 for action.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

BROWN: See my Explanation of Negative Vote on Proposal 2-102.

COMMENT ON AFFIRMATIVE:
MOORE: The EEI/ELP Group continues to support the introduction of this product, but questions the effectiveness due to the pickup level of the two types of AFIs. The parallel device is tested for a minimum pickup level of 75 amperes and the series device is tested for a minimum pickup of five amperes. The series device would require a five ampere load to be energized during operation. Most bedroom circuits would not have a load of that amplitude, especially while the occupant is asleep. Additional data and further product development is needed prior to extended usage.
NISSEN: The increased use of AFCIs as an effective means of reducing arcing-fault fires should be supported. The gaining of experience with these devices in all bedroom circuits is encouraged so that their usage can be expanded to other rooms and facilities that could benefit by the added protection which they would afford.

(Log #3010)

2- 104 - (210-12): Reject
SUBMITTER: Bernard A. Schwartz, Schwartz Fire Specialists/Rep. Nat'l Multi-Family Housing Council
RECOMMENDATION: Revise as follows:
(b) All branch circuits that supply 125-volt, single phase, 15- and 20-ampere receptacle outlets installed in dwelling unit bedrooms shall be protected by an arc-fault circuit interrupter(s). This requirement shall become effective January 1, 2002. For purposes of this section, the installation of an arc-fault circuit interrupter at the receptacle with all receptacles in the bedroom supplied through that protected receptacle shall be deemed compliant.
SUBSTANTIATION: The available fire data, as well as 30 years of investigating fires and 15 years with the Consumer Product Safety Commission indicates that statistically valid information regarding electrical fires and their causes is lacking and that the number of fires starting inside the walls, in straight runs of cable is insignificant. This belief is also supported by:
a. Comments to Log #2276 in 1998 NEC comments
b. Comments to Log #1820 in 1998 NEC comments
c. Comments to Log #2525 in 1998 NEC comments
d. Comments to Log #2524 in 1998 NEC comments
e. CPSC report dated December 1987 "Residential Electrical Distribution System Fires."
The load center device provides a high level of fault protection for the wires in the wall and a lower level of protection for devices plugged into the receptacle. The receptacle device provides a high level of protection for devices plugged into the receptacle and a lower level of protection for the wiring in the wall. Since neither device is perfect, if one device is to required, than both devices should be allowed to accumulate field experience to demonstrate which is most effective.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel actions and statements on Proposals 2-108 and 2-110. The panel does not agree that the data submitted for the 1999 NEC did not support the present AFCI requirement for branch circuit wiring.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BROWN: Please read the substantiation submitted by the submitter. This proposal should be accepted. Also, see my comment on proposal 2-106

(Log #4348)

2- 106 - (210-12): Reject
SUBMITTER: Lawrence Brown, Nat'l Assn. of Home Builders
RECOMMENDATION: Delete Section 210-12 in its entirety.
SUBSTANTIATION: The acceptance of this requirement during the 1999 NEC development cycle was based on a CPSC study that was too limited in the scope of its analysis of losses in residential dwelling environments. Fire damage resulting from arc-fault causes is only a very small percentage of total residential property losses. The data should have included losses from all perils including other causes of fire losses (cooking, arson, etc.) and natural disaster-related damage from wind, earthquake, and flooding. The percentage and actual dollar losses from fires that originates in electrical wiring within the walls is substantially lower than originally perceived. Further, the data did not address the issue of whether the lack of a working smoke alarm contributed to the death.
Also missing is data that relates directly to the year the dwelling was built. This should be shown in relationship to the percentage of related electrical fires from all yearly periods. This directly relates to the wiring methods (open wiring, loom, cloth covered NM Cable) associated with each fire. This also relates to the edition of the building, fire and electrical codes in force at that time. Complete data would show that the Nonmetallic Sheathed Cable within the walls of buildings constructed to today's standards and codes is extremely low compared to the type of electrical wiring installed ten or twenty years ago. It would seem from the proposals submitted during the 1999 cycle that all of the electrical wiring materials manufactured, sold and installed today is defective. This is not true.
Another basic problem is that the technology used for the AFCI breaker will only detect an arc in the wiring up to, and possibly including the receptacle. The receptacle and any equipment pluged into the receptacle are unprotected by the breaker. The installation of an AFCI breaker seems to be only a partial fix to a very small percentage of all residential fires. With this requirement being applied only to bedrooms, the percentage is even smaller.
The cost-benefit to society of installing these breakers should also be considered. The committee was told these breakers would cost the same as a GFCI breaker. This is not true. The wholesale cost is approximately $85.00. It may be that society ends up spending $5.00 to save $1.00. Society may be better served, and save more lives, if this money was spent to upgrade smoke alarms in all existing dwellings.
All told, there are many problems with this new requirement. Incomplete and inaccurate data should not be the basis for an NEC code change. Before complete and accurate data is analyzed, and the electrical manufacturing industry addresses all of the technical problems to produce a more complete device, this requirement should be removed from the NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: AFCIs Listed to UL 1699 are available, and the standard addresses efficacy, unwanted (nuisance) operation and operation inhibition. Cost should not be an issue for the panel to resolve. The panel reviewed a large amount of data, heard presentations on various positions on AFCIs, and received public comment on the topic. Upon that review, the panel arrived at the requirements in the 1999 NEC and continues to support that established position.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BROWN: This proposal should be accepted. Wrong. It was wrong for the Panel to accept this requirement during the 1999 NEC ROC. To have a better understanding of the many basic problems, you need to read the negative comments on the original proposal. These can be found on pages 111 through 116 of the 1998 Annual Meeting, National Electrical Code Committee Report on Proposals.
These comments, pointing out the fundamental problems with the device, still hold truth today. The standard by which they are developed and tested, the CPSC and other studies used by the proponents to force this product into the NEC are still of concern. Though, most important is the fact that this device will NOT solve the problems the manuacturer's stated was the real intent of pushing these devices into the marketplace through a mandate in the NEC.
It was the engineer from Underwriters Laboratories who showed the panel the basic techncal problems with the device. It will not be able to detect all arcs that may produce a fire. Asked if the device will detect and trip all arcs between the breaker and the first outlet the answer was NO! The same held true for the area of the device,

the area from the device to the appliance, and of the appliance itself. Asked what percentage of arcs may be detected, and the answer is they do not know.

This could partly be caused by the inability for manufacturers to produce a product that solves all of the problems as shown in the UL study performed for CPSC. UL developed 14 test methods for the devices to pass to be reliable. These tests were developed based on identifiable causes of residential electrical wiring fires. The UL standard used to manufacture and test this product is only over a year old. It was rushed through development only to satisfy the needs of the manufacturers as it relates to their specific product. As it turns out, the devices can pass only 4 of the tests. Not the full 14 test methods needed for this product to protect residential occupancies as outlined in the UL-CPSC study. More to the point, the tests only use nonmetallic sheathed cable with a grounding conductor. Not the common single conductor concealed wiring method installed on older dwellings.

Another problem with the CPSC study is the inability of the data to accurately ascertain the specific area of origin of the electrical fire. The study also did not indicate the actural type of wiring method, or the age of the dwelling. If all of this information is known, it would better indicate where the real problem exists. It would be hard to believe that the nonmetallic sheathed cable - ROMEX - being installed today is the overwhelming cause of residential electrical fires. The CPSC study did reach the conclusion that further testing needed to be performed. So we now have a mandate for a product that is unreliable in its ability to protect.

The high cost of this product is also a concern. The manufacturers repeatedly stated at the ROC meeting that the cost of this product would be the same as a GFCI device. This is not true. The manufacturer's catalog lists the devices at around $160.00 each. A check of the wholesale price was approximately $95.00.

So now we have an unreliable product at a high price.

Then we have the manufacturers statements on losses due to concealed electrical wiring. Square-D in their product brochure states "CPSC estimates electrical equipment causes 155,100 or 34 percent of the 451,000 fires in residential structures." This is very misleading. Using current NFPA estimates based in the U.S. Fire Administration's National Fire Incident Reporting System (NFIRS), the total residential fire losses due to all electrical causes is only 13.75 percent of the total residential fire losses. Now, using the same data, the losses due to electrical wirng within the walls is only 5.49 percent of the total residential fire losses. This is not the 34 percent insinuated by the manufacturers.

Now, we have an unreliable product, at a very high price compared to the losses it may save.

Using the NFPA data and the 1999 NEC requirements, if the devices were 100 percet reliable, consumers will spend $240,000,000 to cover losses of ony $30,900,000. Well over seven (7) times the total losses. If this product is expanded to include all circuits in a dwelling, the public would spend over $2,400,000,000 to prevent losses of $253,600,000. This is approximately 9.5 times the actual loss. And, this is based on 100 percent effectiveness. As noted, above, UL cannot determine the effectiveness of the product. Even more disturbing is a recently published article by UL stating property losses of over $1.5 billion. From the standpoint of cost-effective regulatory mandates, the requirement in the NEC for this product is unacceptable.

This whole situation reminds one of the mandates for CO detectors. All studies have shown the location for installation of the detector to be reliably effective canot be determned. Furthermore, there are numerous problems with the technology and the manufacturing of the detector. Recalls and public announcements as to the problems are constant. It may be partly due to a rush by manufacturers to get the detectors into the marketplace.

The AFCI is also a product that is untested in relationship to the actual problem that may exist, or its ability to effectively control them. Until a more complete study of the actual causes of residential electrical fire is available, and a product can be developed to meet those needs, mandates for AFCIs should not be included in the NEC. Society should not be mandated to spend 10-20 times the amount of money that may be saved without a solid basis for the expense.

(Log #2881)

2- 107 - (210-12(a)): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 3-124. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Robert R. Kent, Electrical Contracting, Inc.

RECOMMENDATION: Remove the definition of arc-fault circuit interupter from this section and put it in Article 100 DEFINITIONS.

SUBSTANTIATION: This definition should be in Article 100. As I understand, the thought behind the many changes in the '99 NEC was to make it more user friendly. This then would also be a step to help in that direction.

PANEL ACTION: Reject.

PANEL STATEMENT: Based on the NEC Style Manual 2.2.2.1, the definition of AFCI should not be included in Article 100, unless the term is used in more than one article.

AFFIRMATIVE: 12

(Log #3308)

2- 108 - (210-12(a) and (b)): Reject

SUBMITTER: Jack Wells, Pass & Seymour/Legrand

RECOMMENDATION: Revise to read as follows:

210-12. Arc-Fault Protection.

(a) Definition. An arc-fault circuit-interrupter is a device intended to provide protection from the effects of arc faults by recognizing characteristics unique to hazardous arcing and by functioning to deenergize the circuit when an arc fault is detected. An arc fault that occurs between the line and neutral or the line and ground conductors is a parallel arc fault. An arc fault that occurs in a single conductor, either line or neutral, is a series arc.

(b) Dwelling Unit Bedrooms. Arc-fault circuit-interrupter(s) shall provide protection for dwelling unit bedrooms as specified in either (1) or (2).

(1) All branch circuits that supply 125-volt single phase, 15 and 20-ampere receptacle outlets installed in dwelling unit bedrooms shall be protected by arc-fault circuit-interrupter(s) installed in the panelboard at the origin of the branch circuit. The arc-fault circuit-interrupter shall provide arc fault protection for the branch circuit wiring.

(2) All 125-volt, single phase, 15- and 20-ampere receptacles in dwelling unit bedrooms shall be protected by a receptacle type combination arc-fault circuit-interrupter installed as the first receptacle in all branch circuits serving dwelling unit bedroom receptacles. The receptacle type combination arc-fault circuit-interrupter shall provide series arc fault protection for the branch wiring and the extension wiring on the line and load side of the receptacle and parallel arc fault protection for the branch circuit wiring and the extension wiring on the load side of the receptacle for all 125-volt single phase, 15- and 20-ampere receptacles in dwelling unit bedrooms.

SUBSTANTIATION:

° Section 210-12(b) in the 1999 NEC requires protection of only the circuit conductors between the final overcurrent device and the outlet. This section states that branch circuits dwelling unit bedroom receptacles shall be protected by arc-fault circuit-interrupters. Branch circuits are defined in Article 100 as "The circuit conductors between the final overcurrent device protecting the circuit ad the outlet(s)."

° Since the adoption of this requirement, two significant events have occurred.

1. UL 1699 covering AFCIs has been finalized and published. This standard establishes several different types of AFCIs that provide differing levels of arc fault protection for different types of arc faults.

2. A new type of receptacle arc-fault circuit-interrupter has been developed. This device is listed by UL as a combination arc-fault circuit-interrupter embodies in an outlet receptacle type device.

° As a consequence of these developments not contemplated by CMP 2 during the initial deliberation concerning AFCIs, the current requirement needs to be revised to recognize the various types of AFCIs.

° The addition of the definition of series and parallel arcs will assist users in understanding the type of arc fault that may occur and provide a basis for understanding of the application of various types of AFCIs.

° The following are definitions of permanently wired arc fault circuit-interrupters that appear in UL 1699:

Branch/Feeder Arc Fault Circuit Interrupter. A device intended to be installed at the origin of a branch circuit or feeder, such as a panelboard. It is intended to provide protection of the branch circuit wiring the feeder wiring, or both, against unwanted effects of arcing. This device also provides limited protection to branch circuit extension wiring. It may be a circuit-breaker type device or a device in its own enclosure mounted at or near a panelboard.

Outlet Circuit Arc-Fault Circuit-Interrupter - A device intended to be installed at a branch circuit outlet, such as at an outlet box. It is intended to provide protection of cord sets and power supply cords connected to it (when provided with receptacle outlets) against the unwanted effects of arcing. This device may provide feed through protection of the cord sets and power supply cords connected to downstream receptacles.

Combination Arc-Fault Circuit Interrupter - An AFCI which complies with the requirements for both branch/feeder and outlet circuit AFCIs. It is intended to protect downstream branch wiring and cord sets and power supply cords.

The following table is an excerpt from Table 50.2 in UL 1699. It shows the arc fault test requirements that permanently wired AFCIs are required to meet.

Tests	Branch Feeder AFCI	Combination AFCI	Outlet Circuit AFCI w/Feed	Outlet Circuit AFCI w/o Feed
(a) CarbonizedPath Arc Ignition NM-B Insulation Cut	X	X		
(b) Carbonized Path Arc Interruption Test	X	X	X	
SPT-2 Insulation Cut	X	X		
NM-B Insulation Cut				
(c) Carbonized Path Arc Clearing Time Test		X	X	X
SPT-2 Insulation Cut				
(d) Point Contact Arc Test				
SPT-W Insulation Cut	X	X		X
NM-B Insulation Cut	X	X		

It is important to recognize the type of arc fault each of these test represent in order to understand the level of protection provided by different types of AFCI.

The carbonized path arc ignition test (a) is test for detection of a series arc. This test represents an arc fault in a single conductor of a 3-conductor NM-B cable. The time to clear the arc fault is not specified. The cable used as test sample is wrapped with tape in the area where the arc occurs. The taped area is loosely wrapped with a cotton indicator. The AFCI must clear the fault before a cotton indicator ignites. In the case of a branch/feeder AFCI which may only detect parallel faults, this test is likely to be satisfactorily complied with because the series fault quickly develops into a parallel fault to the equipment grounding conductor. In the case of the combination and outlet circuit AFCI, the fault is detected as a series fault.

The carbonized path arc clearing time test (c) is also a test for detection of a series arc. However, this test represents an arc fault in a single conductor of a 2-conductor SPT-2 cord. The AFCI must clear the arc fault in 1 second or less. A branch/feeder AFCI is not required to provide protection for this type of fault.

Both the carbonized path arc interruption test (b) and the point contact arc test (d) are intended to detect parallel arcs. Although the arcing paths are created by a different methods for each test, both tests create a condition of arcing between two conductors of either a 3-conductor NM-B cable or a 2-conductor SPT-2 cord. In both tests the AFCI must clear the arc fault within 8 half cycles of arcing that occur within a period of 0.5 seconds.

° An issue not directly addressed in the UL standard is series type arcing faults that may occur at loose binding screw terminals, push-in terminals, twist-on wire connectors and similar terminations in the fixed branch circuit wiring. An roc that occurs at this type of termination will appear to an AFCI as very similar to a series arc fault in a single conductor. The closest related case to a termination type of arc fault in the UL test table is the carbonized path arc clearing time test (c) which is used to detect a series arc in a single conductor of an SPT-cord. A combination AFCI and outlet circuit AFCI are subjected to this test but a branch/feeder AFCI is not. These two arcing conductors are closely related because an arc fault in single conductor occurring either in a cord, or at a terminal, occurs at a location where the arc cannot easily develop into a ground fault or into a parallel arc to another conductor. The ignition of combustible material in close proximity will likely occur by the time this type of series arc progresses to a parallel arc or a ground fault. Consequently, the UL test that requires clearing the series arc fault in 1 second or less is critical in preventing the development of a fire hazard created by allowing the series arc to progress to either a parallel arc or a ground fault.

Detection of series type arc faults at terminations by the receptacle type combination AFCI is an important features that must not be overlooked when specifying an AFCI for arc fault protection. This proposal permits selection of a receptacle type combination AFCI that provide this type of series arc fault protection.

° It is evident from the test table that the different types of AFCIs provide different levels and types of arc fault protection. For example, the branch/feeder AFCI is not required to provide series arc fault protection for SPT-2 cords although parallel arc fault protection for an SPT-2 cord must be provided. Likewise, a branch/feeder AFCI in UL 1699 states that this device provides only "limited protection" of branch circuit extension wiring such as extension cords ad power supply cords.

The levels of protection provided by different types of AFCIs must be considered when selecting a device to provide arc fault protection.

° Section 210-12(b) in the 1999 NEC requires protection of the branch circuit conductors from the final overcurrent device to the outlet. This protection is most likely to be provided by the installation of the branch/feeder AFCI at the panelboard. Although the branch-feeder AFCI provides protection for the branch circuit conductors and "limited protection" for parallel arc faults in cords, the UL test program does not require this type of AFCI to p protect against a series arc fault in a 2-conductor extension or power supply cord used to connect a load to the branch circuit.

There are many loads used in dwelling unit bedrooms and other rooms in a home that are cord connected to the branch circuit. Some of these loads such as clothes irons, space heaters, and multiple loads on extension cords can create a serious arcing hazard when connected to the branch circuit by a extension or power supply cord that has a damaged single conductor. The damaged single conductor in the cord used with these types of loads can easily develop into arc fault condition that must be cleared quickly before it becomes fire hazard.

One result of this proposal is to permit selection of an AFCI that provides protection for a series arc in a 2-conductor cord.

° The arc fault tests in UL 16999 have been developed to demonstrate the ability of an AFCI to detect an arc fault on the downstream side of the AFCI. However, the nature of series arcs and the technology used in the design of the UL listed receptacle type combination AFCI results in the ability of this type of AFCI to clear series arc both on the upstream and downstream side of the AFCI. Thus, the receptacle type combination AFCI provides series arc fault protection for the fixed branch circuit wiring from the panelboard to the outlet as well as series and parallel arc fault protection on the load side of the AFCI for the fixed branch circuit wiring, extension cords and power supply cords.

° This proposal provides the option of installing either a receptacle type combination AFCI or a branch/feeder AFCI. Both of these products offer effective arc fault protection. The NEC should be revised to permit the installation of either product.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel statement on Proposal 2-110.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
MERICLE: I vote no on the Panel Action. There exists a wealth of testing data which attests to the effectiveness of these devices in helping to prevent fires.
NISSEN: The concept present in this proposal should be accepted. The submitter has not suggested expanding AFCIs beyond the bedroom branch circuits. The substantiation addresses an alternate method of protecting bedroom circuits with a combination type AFCI. See also my comment on Proposal 2-110.

(Log #2102)

2- 109 - (210-12(b)): Reject
SUBMITTER: Chip Pudims, Hubbell Inc.
RECOMMENDATION: Revise text to read as follows:
Dwelling Unit Bedrooms.
(1) All branch circuits that supply 125-volt, single-phase, 15 and 20-ampere outlets installed in dwelling unit bedrooms shall be protected by a Branch/Feeder arc-fault circuit interrupter(s).
(2) All 125-volt, single-phase, 15 and 20-ampere receptacle outlets installed in dwelling unit bedrooms shall be protected by an Outlet/Circuit arc-fault circuit interrupter(s).
Exception: A combination unit shall be permitted to provide both Branch/Feeder and Outlet/Circuit arc-fault protection required by (1) and (2) above.
SUBSTANTIATION: Existing Code requires arc-fault protection solely for branch-feeder circuits and does not require protection for extension or power-supply cords. Independent studies have cited extension wiring as potentially significant sources of residential electrical fires, that result from arc-faults. Extension and power-supply cords are more susceptible to abuse than branch circuit wiring and can be of far less robust construction; such as 18 AWG SPT flexible cord (i.e., zip cord). Additional requirements will provide a significant increase in the level of safety.
UL 1699 identifies different levels of protection for "branch/feeder" vs. "outlet" type arc-fault circuit-interrupters and "expects a coordinated system of protection". By definition UL recognizes Branch/Feeder AFCIs provide "limited" protection to extension wiring, while Outlet AFCIs are intended to protect "cord sets and power supply cords". Branch/Feeder AFCIs do not protect against series arcs in extension wiring and series arcs are likely to occur because they only require a single break in the wire. UL 1699 requires different levels of performance testing for each type of protection and allows for a "combination" AFCI if all elements of the coordinated system are met.
As of submittal of this proposal, Outlet AFCIs, Listed to UL 1699, are not available, but are being developed and will become available by the NEC effective date of January 1, 2002. In the interest of safety, NEC Section 90-4 specifically permits "new products, constructions, or materials that may not yet be available at the time the Code is adopted." In the interim, Section 90-4 allows the enforcement of previous adopted editions of the Code. The 1984 NEC Handbook rationalizes Section 90-4 because of the greater than 2 year time lag between proposal and adoption of the Code. This Code proposal provides for an increased degree of safety in dwelling unit bedrooms, due to the additional protection for extension and power-supply cords.
The submitter requests the opportunity to present this proposal and any advances in Outlet/Circuit AFCI technology, that may occur in the next few months, to the CMP at the January 2000 meeting.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 2-110.

PAULEY: See my Explanation of Negative Vote on Proposal 2-110.

(Log #2262)

2- 110 - (210-12(b)): Accept in Part
SUBMITTER: Steve Campolo, Leviton Manufacturing Co., Inc.
RECOMMENDATION: Revise text as follows:
210-12(b) Dwelling Unit Bedrooms. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere receptacle outlets installed in dwelling unit bedrooms shall be protected by a Branch/Feeder arc-fault circuit interrupter(s). All 125-volt, single-phase, 15- and 20-ampere receptacles in dwelling unit bedrooms shall be protected by an Outlet/Circuit arc-fault circuit interrupter(s). ~~This requirement shall become effective January 1, 2002.~~
SUBSTANTIATION: Article 100 defines the branch circuit as "The circuit conductors between the final overcurrent device protecting the circuit and the outlet(s)." Applying this definition to Section 210-12(b) of the NEC and the definitions of UL 1699 results in a requirement that provides arc fault protection only for the fixed wiring from the overcurrent device to the receptacle outlet. This indicates that branch circuit extensions may remain unprotected. Expanding the requirement to provide arc fault protection for the receptacles and the wiring extending from the receptacles (e.g., extension cords and power supply cords) greatly increases the level of safety afforded by AFCIs. In fact, it may be argued that exposed extension cords and power supply cords are subject to considerably greater abuse than fixed wiring and are more susceptible to abuse resulting in an arcing condition.
Underwriters Laboratories Inc. issued the first edition of UL 1699, UL Standard for Safety for Arc-Fault Circuit-Interrupters, on February 26, 1999. This standard defines different types of arc-fault circuit-interrupters. The definitions include the following:
A Branch/Feeder AFCI "...is intended to provide protection of the branch circuit wiring, feeder wiring, or both, against the unwanted effects of arcing. This device also provides limited protection to branch circuit extension wiring." Simply, a Branch/Feeder AFCI is not required to offer low current arcing fault protection for branch extensions.
An Outlet Circuit AFCI "...is intended to provide protection of cord sets and power-supply cords connected to it (when provided with receptacle outlets) against the unwanted effects of arcing."
UL has indicated that a coordinated system of protection should emerge where combinations of the various types of AFCIs are used to increase the likelihood of the greatest possible degree of overall protection. This perspective is reinforced by the definitions of various types of AFCIs contained in UL 1699, which explains several different types of AFCIs.
It is apparent that the UL standard considers arc fault protection is important for both the fixed wiring of the branch circuit and the branch circuit extension wiring (Power Supply and Extension Cords). Based on the AFCIs that are defined in UL 1699, a complete system of arc fault protection may be provided by installing a Branch/Feeder AFCI in the panelboard and an Outlet Circuit AFCI at the receptacle. The branch is protected as well as branch extensions.
Adopting the proposed revision to 210-12(b) will result in a system that provides complete arc fault protection for both the fixed wiring and the branch circuit extension conductors by requiring installation of a coordinated system of AFCIs.
PANEL ACTION: Accept in Part.
The panel accepts the deletion of the last sentence in the proposal, and rejects the remainder of the proposal.
PANEL STATEMENT: The panel rejects the expansion of AFCIs beyond the bedroom branch circuits at this time. The panel continues to support the introduction of AFCIs, but intends at this time to limit the requirement to bedroom branch circuits until further data can be obtained and evaluated.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
NISSEN: The submitter has provided adequate substantiation for the need for both branch/feeder and outlet circuit AFCI protection I dwelling unit bedrooms, and that concept should be accepted.
PAULEY: NEMA supports the increase in protection that could be afforded by the addition of the outlet AFCI to Section 210-12. This addition would provide increased protection of cords and appliances connected to receptacle circuits and would enhance safety.

(Log #2745)

2- 111 - (210-12(b)): Reject
SUBMITTER: George D. Gregory, Square D Company
RECOMMENDATION: Revise as follows:
(b) Dwelling Unit Bedrooms. All 15- and 20-ampere, 125-volt, single-phase branch circuits that supply bedrooms shall be protected by a branch/feeder arc-fault circuit interrupter(s). Bedroom receptacle outlet circuits shall additionally have outlet circuit arc-fault circuit interrupter protection.
SUBSTANTIATION: This proposal is intended to accomplish four items:
1. Delete the effective date of January 1, 2002 since it will be redundant with the 2002 edition of the NEC.
2. Add protection at the branch for all 15- and 20-ampere circuits feeding bedrooms, not only receptacle outlets. This will add for protection for lighting circuits.
3. Clarify that protection is "branch/feeder" protection in correlation with the product listing.
4. Add a requirement for specific "outlet circuit" protection of receptacle outlets.
Regarding item 2, AFCI protection of lighting circuits or other dedicated circuits is needed since numbers of residential fires are initiated in lighting circuits. In fact, arcing faults can occur in any circuit.
Regarding item 3, the name branch/feeder AFCI was assigned to the device intended to protect branch or feeder circuits under the new UL 1699, Standard for Safety for Arc-Fault Circuit Interrupters.
Regarding item 4, the new UL 1669 Standard also identifies an outlet circuit AFCI that will add protection specific to protection of receptacle loads. The proposer recognizes that protection at the branch will provide protection against arcing causes of fires in fixed wiring system and considerable protection against such causes in cords and appliances. Outlet circuit protection can enhance the degree of protection.
What's New
Since Section 210-12 was added in the 1999 NEC, three significant things have occurred:
• UL 1699, Underwriters Laboratories, Inc. Standard for Safety for Arc-Fault Circuit Interrupters, dated 2/26/99, was published.
• AFCI products of at least three major manufacturers have been continuously available commercially in circuit breaker form.
• Circuit breaker AFCIs of at least three manufacturers have been Listed under UL 1699 as "Branch/Feeder AFCIs", intended for installation at branch circuits. Original products were classified by UL to an outline of investigation in the form of a proposed standard.
AFCIs have been installed in a number of homes since they were commercially introduced in 1997 as UL Classified products. There have been no reports of nuisance operation or fires of electrical origin in the homes in which they have been installed, to the knowledge of the proposer's employer. There have been testimonies of a number of users to their effectiveness in clearing hazardous circuit conditions and leading to corrections.
Electrical Fire Cause Reports
A report titled, "The U.S. Fire Problem Overview Report" dated March 1998 and published by NFPA discloses that there were 39,400 fires in residences caused by the electrical distribution system as an annual average in the period 1991-1995. [1] These fires are associated with 350 annual civilian deaths. Another 30,700 fires are caused by appliance operation in residences. Of these appliance-related fires, over 40 percent are from heat developed in electric dryers and are not from electrical causes directly. Of the remaining 60 percent, some portion of causes would be detected by the circuit breaker AFCI.
Of the 39,400 fires attributed to the distribution system, 36 percent are in fixed wiring, 18 percent are in cords and plugs, 11 percent are in switches or receptacle outlets, 11 percent are in lighting fixtures, according to the NFPA report. This data breakdown is corroborated by a report published in the January 1990 Fire Journal titled, "What Causes Wiring Fires in Residences" by Smith and McCoskrie of CPSC. [2] That report studied 149 fires in detail and found initial causes: 34 percent in fixed wiring, 19 percent in cords and plugs, 19 percent in switches and outlets, and 13 percent in lighting fixtures. In either set of data, over 60 percent of fires are from causes in the fixed wiring, switches, receptacle outlets and lighting fixtures that are part of the fixed electrical system of a residence.
In summarizing the above paragraphs, over 60 percent of fires attributed to the distribution system are in the fixed wiring system. Combining the distribution system and appliance related fires, over 35 percent of the total is in the fixed wiring system. This data soundly supports the present NEC language that requires AFCI protection at the branch.
Dwelling Rooms Affected
Fires from electrical causes originate in every room in residences. The three areas of most frequent origin, according to the National Fire Institute Reporting System (NFIRs) database for all recent years, are kitchens, bedrooms and living areas. Following these areas in frequency of fire origin are the unimproved areas such as attics, basements and crawl spaces. A convenient, but somewhat dated, breakdown of supporting data appears on page 11 of "CPSC Residential Electrical Distribution System Fires" report dated December 1987 by Smith and McCoskrie. [3] A more recent corroboration appears in "The U.S. Fire Problem Overview Report."[1]
This proposer understands that AFCI protection is needed for nearly all circuits in residences and not just those to bedroom circuits. However, this proposal suggests that the NEC continue to hold with the Panel's intent to initiate this section with protection of one of the most vulnerable locations in a residence, the bedroom. This action will permit an orderly introduction of a new product to the industry. With testimonials of protection already received, we can expect that justification for protection in other areas of residences will naturally follow.
Arcing Faults Cause Fires
Electric arcs can and do occur in damaged or uninsulated conductors from line to neutral, line to ground or within a single broken or separated conductor in series with a load. Electric arcs operate at temperatures of between 5,000 and 15,000°F and expel small particles of molten or burning materials from the center. An arc is clearly capable of igniting nearby materials, including electrical insulation, if it persists. The AFCI removes the potential cause of ignition by opening the arcing circuit within the parameters of the standard, greatly reducing the probability of fire from an electric arc.
Higher current arcs are more likely to cause a fire because of the higher energy in the arc disturbance. Greater current will melt more of the conductor metal and therefore expel more molten particles. The volume of hot, ionized gas emitted increases proportionally with energy. The branch/feeder AFCI in circuit breaker form is specifically oriented toward detecting these higher current arcs above 75 amperes and line-to-ground arcs of current levels from 5 amperes and greater under UL 1699. Commercially available B/F AFCIs will detect line-to-ground arcs of 30 milliamperes and above.
Discussion may point out that fires can be started by series arcs at lower current values, such as 5 amperes and even below. Research done by UL during the development of the standard revealed fire causes at 5 amperes and above under repeatable conditions. Following that research, it was demonstrated that arcs could cause fires with lower current arcs down to 1 ampere and possibly below. However, conditions that allow arc initiation to cause fire for the lower current arcs are difficult to establish.
AFCI Product Standard
The UL 1699 Standard requires testing of the AFCI through a rigorous set of tests for arc detection ability, unwanted operation tests (to avoid nuisance operation), and operation inhibition tests. The operation inhibition tests assure that the AFCI will detect an arc even though it may be connected electrically in series or parallel with loads that might attenuate, mask or otherwise tend to hide the arc signal.
Prior to the development of the AFCI Standard and before products were offered commercially, Square D Company conducted research to learn what arcing conditions cause fires. A part of that research involved collection of evidence from fires to which municipal fire fighters were called. Other evidence was collected from homes of Square D employees. Some of that evidence is discussed in an article published in the November 1997 EC&M Magazine. [4] The research disclosed a number of occurrences involving either short circuit (line-to-neutral faults) or arcing ground faults. The results of this internal research guided our decisions regarding input to the development of UL 1699 and to the development of a product that will address the kind of occurrences we found in the field.
An AFCI must detect potentially hazardous arcing conditions and open to denergize the hazard. It must also distinguish between normal energy and potentially hazardous energy. One method of distinguishing normal from hazardous conditions is by recognition of arcing characteristics in the electrical signal. A brief review of this approach is discussed in an IEEE paper titled "The Arc-Fault Circuit Interrupter: An Emerging Product." [5] This paper also clarifies that two primary methods of arc initiation are addressed in standardized testing. The first method is carbonized path arcing in which carbon tracking supports lower energy arcs and leads to pyrolyzation or

organic materials in the arc path. The second method is the short circuit such as might be caused by insulation damage.

Branch/Feeder and Outlet Circuit AFCIs

An AFCI intended for branch circuit application is called by UL 1699 a branch/feeder AFCI. The circuit breaker version is the only presently available form of the branch/feeder AFCI. The standard states that the branch/feeder AFCI "is intended to provide protection of the branch circuit wiring, feeder wiring, or both, against unwanted effects of arcing. This device also provides limited protection to branch circuit extension wiring." The branch/feeder AFCI provides full short circuit and ground-fault arc detection for all 2-wire cords and circuits as well as cords and circuits with a grounding conductor. However, it is not required to provide low-level series arc-fault protection that is desirable for 2-wire cords without a grounding conductor. It is therefore considered to provide limited protection of extension wiring.

The 2-wire protection does not seem so limited when we consider this fact from "The U.S. Home Product Report, 1992-1996 (Appliances and Equipment)" by Kimberly Rohr of NFPA. [6] On page 7, it clarifies that "The leading cause of cord and plug fires was short circuits and ground faults, which accounted for half or more of these fires, injuries and direct property damage. Fires caused by short circuits and ground faults also accounted for 38 percent of civilian fire deaths." The Branch/Feeder AFCIs are intended and tested for detecting these arcing short circuits and ground faults. That degree of protection extends to cords and plugs and appliances.

The UL 1699 Standard for AFCIs identifies an outlet circuit AFCI (outlet receptacle form) in addition to the branch/feeder AFCI (circuit breaker form). The two types are tested differently. Outlet circuit AFCIs are tested to detect low-level faults between 5 and 30 A such as might be found in series arcs. The branch/feeder AFCI is not tested for the low-level arcs in series with a load. On the other hand, the branch/feeder AFCI is tested with construction cable and wire in addition to cords. Outlet circuit AFCIs are not tested with building wire and cable. Having both devices in a circuit would provide protection for the greatest number of conditions. However, if one device were chosen, it must be the branch/feeder AFCI for the following reasons.

- The branch/feeder AFCI protects the fixed wiring system where the greatest numbers of fires from electrical causes originate.
- The branch/feeder AFCI provides good protection against effects of short-circuit and ground-fault arcing in extension and appliance wiring, though protection is considered limited because it is not required to detect series arcs at lower levels.
- The branch/feeder AFCI has been available for several years from three manufacturers and has exhibited good field experience.

Testimonials

1. An engineer employed by Underwriters Laboratories had circuit breaker AFCIs installed in a number of circuits in his house. When energized after installation, two of them tripped open. On the first, he unplugged all appliances connected to the circuit and then turned the AFCI on. He found a damaged lamp with line-to-ground arc that caused the AFCI to trip. On the second, he replaced the AFCI after unplugging all appliances and repeated attempts to energize it, unsuccessfully. The replacement AFCI also tripped open. After further examination of the circuit, he found a poor connection to an outlet receptacle to which the wire insulation had burnt back from the connection. After repairing it, the AFCI was energized successfully.
2. AFCI circuit breakers were installed in a number of houses in Florida near the Gulf coast in 1998. After installation, only two of these units tripped. In both cases, damage to conductor insulation was found to be the cause of low-level faults that were detected.
3. After AFCI circuit breakers were made commercially available, they were installed in a number of circuits in Square D plants. In one plant an appliance was pushed against its plug, damaging the plug. The AFCI tripped to protect the circuit. When the plug was examined afterward, it was found that the grounding pin connection had been twisted toward the line connection inside the plug housing and that arcing from line to ground had occurred. A second appliance had been jarred in the same situation. After a period of days the AFCI tripped again. No damage was apparent so the AFCI circuit breaker was turned on again to restore power. It was tripped again and was reset several times before the cause was located and corrected. The cause was an intermittent arc from line to ground within the second appliance. This second arcing condition was increasing in continuity as the arcing path became carbonized.
4. Since its commercial introduction, the AFCI circuit breaker has gained considerable respect. In the State of Vermont, an amendment to Section 210-12(b) was adopted to add branch AFCI protection for outlet receptacles in both living areas and bedrooms. Their effective date is January 2001 rather than 2002.

(Log #2816)

2- 112 - (210-12(b) and (c)): Accept in Part

SUBMITTER: Harvey E. Johnson, Estero, FL

RECOMMENDATION: Revise text as follows:

(b) Dwelling Unit Bedrooms. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere ~~receptacle~~ outlets installed in dwelling unit bedrooms shall be protected by an arc-fault circuit interrupter(s). This requirement shall become effective January 1, 2002.

(c) Dwelling Unit Living Areas. All branch circuits that supply 125-volt, single-phase 15- and 20-ampere outlets installed in dwelling unit living areas shall be protected by an arc-fault circuit interrupter(s).

FPN. A living area is any normally occupiable space in a residential occupancy, other than sleeping rooms or rooms that are intended for combination sleeping/living, bathrooms, toilet compartments, kitchens, closets, halls, storage or utility spaces and similar areas.

SUBSTANTIATION: During the past year I have visited many Electrical Shows and Inspector Meetings around the country. One technology that has created a great deal of interest is the Arc Fault Circuit Interrupter which has been demonstrated at many of these events by several manufacturers. The overwhelming response has been positive, and the most frequently asked question has been "Why does the Code only limit the technology to bedroom outlets?" In fact, most people consider that AFCIs should be used on all dwelling circuits.

At this time I am proposing that the circuits to all bedroom outlets be protected by AFCIs. It is difficult enough to explain to people why only bedrooms are protected without attempting to explain the further limitation to receptacle outlets. This can be resolved by removing the word "receptacle". AFCIs would then provide protection to all of the branch circuits which supply bedroom outlets, including the lighting outlets. Here I note that the AFCI protection is not limited solely to the branch circuit wiring, but AFCIs in the branch circuit also provide enhanced protection to the cords attached to the outlets.

With respect to my proposed application of AFCIs to the protection of branch circuit receptacles associated with living areas, I am responding to the question, raised at Electrical Shows and Inspector Meetings, "Why only bedrooms?" During the last Code cycle, the Code Making Panel was interested in the gradual introduction of the AFCi technology. However, during the past several years many manufacturers have introduced UL listed product, UL has issued a standard, there is increased customer awareness, and many devices have been installed. With this increased product availability and experience, I consider that the protection should be expanded. It is well recognized that bedroom and living areas are frequently associated with household electrical fires, and I therefore consider that both of these areas should be

protected without delay. This still falls well short of whole house protection.

I appreciate that the term "Living Areas" is not defined in the National Electrical Code. Here I am proposing that the NEC include, as a FPN, the definition adopted by the Vermont Code Making Authorities; namely "Any normally occupiable space in a residential occupancy, other than sleeping rooms or rooms that are intended for combination sleeping/living, bathrooms, toilet compartments, kitchens, closets, halls, storage or utility spaces and similar areas". Here I also note that Vermont has advanced the effective application date for Section 210-12(b) of the 1999 NEC from January 1, 2002 to January 1, 2001.

AFCIs at the branch circuit location, provide a significant safety enhancement that can impact the present tragic loss of human life, human injury and property damage. The devices are real, their protection is real, and their application is dependent on Code panel action.

PANEL ACTION: Accept in Part.

The panel accepts the deletion of "receptacle" in (b) of the proposal, and rejects the remainder of the proposal.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

BROWN: See my Explanation of Negative Vote on Proposal 2-102.

COMMENT ON AFFIRMATIVE:

NISSEN: See my Comment on Affirmative on Proposal 2-103.

(Log #3687)

2- 113 - (210-12(b)): Accept in Part

SUBMITTER: Steve Campolo, Leviton Manufacturing Co., Inc.

RECOMMENDATION: Revise text to read as follows:

210.12(b) Dwelling Unit Bedrooms. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere receptacle outlets installed in dwelling unit bedrooms shall be protected by a Branch/Feeder arc-fault circuit interrupter(s). All 125-volt, single-phase, 15- and 20-ampere receptacles in dwelling unit bedrooms shall be protected by an outlet/circuit arc-fault circuit interrupter(s). ~~This requirement shall become effective January 1, 2002.~~

SUBSTANTIATION: Article 100 defines the branch circuit as "The circuit conductors between the final overcurrent device protecting the circuit and the outlet(s)." Applying this definition to Section 210-12(b) of the NEC and the definitions of UL 1699 results in a requirement that provides arc fault protection only for the fixed wiring from the overcurrent device to the receptacle outlet. This indicates that branch circuit extensions may remain unprotected. Expanding the requirement to provide arc fault protection for the receptacles and the wiring extending from the receptacles (e.g., extension cords and power supply cords) greatly increases the level of safety afforded by AFCIs. In fact, it may be argued that exposed extension cords and power supply cords are subject to considerably greater abuse than fixed wiring and are more susceptible to abuse resulting in an arcing condition.

Underwriters Laboratories Inc. issued the first edition of UL 1699, UL Standard for Safety for Arc-Fault Circuit-Interrupters on February 26, 1999. This standard defines different types of arc-fault circuit-interrupters. The definitions include the following:

A Branch/Feeder AFCI "...is intended to provide protection of the branch circuit wiring feeder wiring, or both, against the unwanted effects of arcing. This device also provides limited protection to branch circuit extension wiring." Simply, a Branch/Feeder AFCI is not required to offer low current arcing fault protection for branch extensions.

An Outlet Circuit AFCI "...is intended to provide protection of cord sets and power-supply cords connected to it (when provided with receptacle outlets) against the unwanted effects of arcing."

UL has indicated that a coordinated system of protection should emerge where combinations of the various types of AFCIs are used to increase the likelihood of the greatest possible degree of overall protection. This perspective is reinforced by the definitions of various types of AFCIs contained in UL 1699, which explains several different types of AFCIs.

It is apparent that the UL standard considers arc fault protection is important for both the fixed wiring of the branch circuit and the branch circuit extension wiring (Power Supply and Extension Cords).

Based on the AFCIs that are defined in UL 1699, a complete system of arc fault protection may be provided by installing a Branch/Feeder AFCI in the panelboard and an Outlet Circuit AFCI at the receptacle. The branch is protected as well as branch extensions.

Adopting the proposed revision to 210-12(b) will result in a system that provides complete arc fault protection for both the fixed wiring and the branch circuit extension conductors by requiring installation of a coordinated system of AFCIs.

PANEL ACTION: Accept in Part.

The panel accepts the deletion of the last sentence in the proposal, and rejects the remainder of the proposal.

PANEL STATEMENT: See panel statement on Proposal 2-110.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

NISSEN: The submitter has provided adequate substantiation of the need for both branch/feeder and outlet circuit AFCI protection in dwelling unit bedrooms, and that concept should be accepted.

PAULEY: See my Explanation of Negative Vote on Proposal 2-110 (Log #2262).

(Log #3803)

2- 114 - (210-12(b)): Reject

NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 17 for action. This will be considered as a public comment.

SUBMITTER: Thomas D. Mock, Consumer Electronics Mfrs Assn.

RECOMMENDATION: Revise paragraph 210.12(b) as follows:

(b) Dwelling Unit Bedrooms All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere receptacle outlets installed in dwelling unit bedrooms shall be protected by an arc-fault circuit interrupter(s). This requirement shall become effective January 1, 2002

(c) Dwelling Unit Living Areas All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere outlets installed in dwelling unit living areas shall be protected by an arc-fault circuit interrupter(s).

FPN A dwelling unit living area is any space, that can be normally occupied, other than bedrooms, bathrooms, toilet compartments, kitchens, closets, halls, storage, garage or utility spaces.

(d) Guest rooms All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere outlets installed in guest rooms in hotels, motels, and similar occupancies shall be protected by an arc-fault circuit interrupter(s) in accordance with the requirements for dwelling units in 210.12(b) and 210.12(c) .

(e) Limited Care Facility Bedrooms All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere outlets installed in limited care facility bedrooms shall be protected by an arc-fault circuit interrupter(s).

SUBSTANTIATION: 1. The submitter would like to respectfully disagree with the need for further field experience before mandating wider application of these devices. Research into the reliability of these devices was undertaken by the Consumer Products Safety Commission and reported in the Consumer Product Safety Review, Volume 4, Summer 1999. The results of this report can be summarized as follows;

"Problems in home wiring, like arcing and sparking, are associated with more than 40,000 home fires each year. These fires claim over 350 lives and injure 1,400 victims annually.

Several years ago, a CPSC study identified arc fault detection as a promising new technology. Since then, CPSC electrical engineers have tested the new AFCIs on the market and found these products to be effective.

You may want to consider adding AFCI protection for both new and existing homes. Older homes with ordinary circuit breakers especially may benefit from the added protection against the arcing faults that can occur in aging wiring systems."

Further delay in the proper implementation of these devices does not appear warranted.

2. The sentence: "This requirement shall become effective January 1, 2002." should to be deleted since that is the nominally effective date for the 2002 NEC® anyway. There is no technical or product supply reason for extending the effective date due to adoption of this proposal.

3. The 1999 National Electrical Code mandates the protection of all branch circuits that supply receptacle outlets installed in dwelling unit bedrooms. This Code wording was influenced, in part, by Comments during the 1999 Code Cycle, such as Comment 2-65 (1).

That Comment addresses the enhanced safety provided by AFCIs in sleeping and living areas; areas that were identified as being most prone to electrical fires as a result of low voltage arcing. The present proposal is aimed at broadening the protection of AFCIs to the branch circuits supplying all bedroom outlets in dwelling units, in guest rooms and in limited care facilities. It is also aimed at broadening the protection of AFCIs to the branch circuits of living areas in dwelling units and in guest rooms.

The substantiation for the present proposal is as follows:

With respect to 210-12 (b), the present restriction to bedroom receptacle outlets only partially satisfies the intended protection of the circuits supplying dwelling unit bedrooms. These rooms are also associated with lighting outlets, and the branch circuits supplying these lighting outlets should also be protected. The proposal, therefore, is to delete the word "receptacle" in order to provide AFCI protection to the circuits supplying all bedroom outlets.

"The U.S. Fire Problem Overview Report, Leading Causes and Other Patterns And Trends" published by NFPA in May 1999, and hereafter referred to as the Overview Report, states,

"Electrical distribution equipment fires ranked second in property damage. Electrical distribution equipment includes: fixed wiring; transformers or associated overcurrent or disconnect equipment; meters or meter boxes; power switch gear or overcurrent protection devices; switches, receptacles or outlets; light fixtures, lamp holders, light fixtures, signs, or ballasts: cords or plugs; and lamps or light bulbs.

During the five year period from 1992 through 1996, electrical distribution equipment in the home caused an annual average of 39,100 structure fires, 360 civilian fire deaths, 1,480 civilian fire injuries and $579.3 million in direct property damage.

Electrical distribution equipment fires involved ranked:

- Fifth in number of home structure fires;
- Fourth in home fire deaths;
- Seventh in home fire injuries; and
- Second in direct property damage.

A study done by the U.S. Consumer Product Safety Commission in the mid 1980's examined detailed information about electrical equipment residential fires in specific cities. They found that improper alterations contributed to 37 percent of the fires; improper initial installations factored in 20 percent of the incidents; deterioration due to aging system components contributed to 17 percent of the fires; improper use was a factor in 15 percent of the incidents; inadequate electrical capacity contributed to another 15 percent; faulty products were implicated in 11 percent, and contributing factors were unknokn in 6 percent of the fires studied."

With respect to 210-12 (c), the proposal is to extend AFCI fire protection to the circuits supplying dwelling unit living areas. This change, in conjunction with 210-12(b), would provide AFCI protection to the circuits supplying outlets in all dwelling unit rooms with the exception of bathrooms, toilet compartments, kitchens, closets, halls, storage, garage or utility spaces.

The above referenced Overview Report also states that;

"One-third of the home civilian fire deaths resulted from fires that started in the living room, family room or den."

With respect to 210-12(d), the intent is to extend the enhanced safety benefits of AFCIs in dwelling units to comparable occupancy locations (bedrooms and living areas) in the guest rooms (210-60) of hotels, motels and similar occupancies.

With respect to 210-12(e), the intent is to extend the enhanced safety benefits of AFCIs to the bedrooms of Limited Care Facilities as defined in 517-3. These facilities cater to persons who may be incapable of self-preservation or may suffer from some physical or mental limitation which would hinder the rapid exiting of buildings in an emegency. Fire safety needs to be increased by the addition of AFCIs.

This overall Code proposal is justified on the basis of enhanced safety. According to the NFPA Overview Report, the data on structure fires in residential properties (based 0n 1992-1996 annual averages) shows totals of 448,700 fires, 3,765 civilian deaths, 20,520 civilian injuries and $4,475.3 million in direct property damage. Many of these fires and much of this loss of life could have been prevented by AFCIs. But for AFCIs to be effective, it is necessary to provide arc fault detection and protection to as many dwelling-unit supply-circuits as possible.

The state of Vermont has recognized the value of AFCIs. THE VERMONT ELECTRICAL SAFETY RULES - 1999 (Effective Date: August 1, 1999) include the following;

NFPA 70, National Electrical Code, (1999 edition) To meet the needs of Vermont, NFPA 70 is amended as follows:

-delete and replace as follows - article 210-12(b)

210-12(b) Dwelling Unit living Area and Bedrooms. All branch circuits that supply 125 volts, single phase, 15 and 20 ampere receptacle outlets installed in the dwelling unit living area and bedrooms shall be protected by an arc-fault circuit interrupter(s). (To achieve an orderly transition for compliance this Section shall take effect January 1, 2001).

In view of the positive changes that have occurred since the last cycle, and the continuing heavy toll in human lives, in human injury, and in property losses occasioned by electrical distribution fires, the Code Panel is urged to adopt these proposals. The objective is to optimize protection for dwelling unit bedrooms, for dwelling unit living area circuits, for the comparable guest rooms of hotels and motels, and for the bedrooms of limited care facilities.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel statement on Proposal 2-103.

The limited care facility issue is outside the Scope of Code-Making Panel 2 and the panel recommends that the Technical Correlating Committee forward this item to Code-Making Panel 17 for action.

(Log #4143)

2- 115 - (210-12(b) and (c)): Accept in Part

SUBMITTER: Philip M. Piqueira, General Electric Co.

RECOMMENDATION: Modify 210-12(b); Add 210-12(c); Add FPN:

(b) Dwelling Unit Bedrooms. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere ~~receptacle~~ outlets installed in dwelling unit bedrooms shall be protected by an arc-fault circuit interrupter(s). This requirement shall become effective January 1, 2002.

(c) Dwelling Unit Living Areas. All branch circuits that supply 125-volt, single phase, 15- and 20-ampere outlets installed in dwelling unit living areas shall be protected by an arc-fault interrupter(s).

FPN: A dwelling unit living area is any space, that can be normally occupied, other than bedrooms, bathrooms, toilet compartments, kitchens, closets, halls storage, garage or utility spaces.

SUBSTANTIATION: This proposal is intended to enhance the protection provided by arc-fault circuit interrupters as mandated by Section 210-12 of the 1999 National Electrical Code.

210-12(b). The present restriction of this article to bedroom receptacle outlets, while partially satisfying the intention of protecting circuits supplying bedrooms from low voltage arcing, creates a significant void in the protection of the entire bedroom. The deletion of receptacle from the present article would then enable all of the circuits, including those supplying lighting outlets to be protected.

210-12(c). The addition of dwelling unit living areas to this section of the National Electrical Code is a logical extension of the work which was begun during the 1999 code cycle. It is certainly naive to assume that only bedrooms are susceptible to the dangers of low voltage arcing and, consequently, this proposal would provide AFCI protection to all of the circuits supplying outlets in dwelling unit rooms.

During the 1999 code cycle, code panel #2, in responding to one of the AFCI proposals, stated that "The panel has limited the requirements to dwelling unit bedrooms to permit these new devices to be introduced into the public domain on a gradual basis...an effective date of January 1, 2002 was established to allow industry to accommodate the new requirement and to allow a transition period". It is important to note that his statement does question the need for arc-fault circuit interrupters but, instead, deals with limiting the use of these devices and extending the timing of implementation in order to allow industry to accommodate the introduction of this new technology more effectively.

However, since the introduction of this technology into the 1999 NEC, manufacturers have gained experience with hundreds of millions of hours of operating time with AFCIs. As a result of this experience, consumers have not only benefited from enhanced protection from arc faults, but have also not experienced nuisance tripping, a concern of some of the code panel members.

Further, the CPSC (Consumer Product Safety Commission) has stated the following on its web page, Preventing Home Fires: Arc Fault Circuit Interrupters (http://cpsc.gov/cpscpub/pubs/afci.html): "...Several years ago, a CPSC study identified arc fault detection as a promising new technology. Since then, CPSC electrical engineers have tested the new AFCIs on the market and found these products to be effective."

The most recent report by the CPSC on residential fire losses has estimated that there were 41,600 fires ($682 million in property damage) and 370 civilian deaths in 1996. Many of these fires and fatalities could have been prevented if arc fault circuit interrupters had protected those residences. Code Panel #2 can certainly play a valuable role in protecting the public if they act responsibly and adopt this proposal to expand AFCI protection.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept in Part.

The panel accepts the deletion of the word "receptacle" in (b) of the proposal, and rejects the remainder of the proposal.

(Log #4150)

2- 116 - (210-12(b)): Accept in Part

SUBMITTER: William Keezer, Bose Corp./Rep. Nat'l Systems Contractors Assn. (NSCA)

RECOMMENDATION: Revise paragraph 210-12(b) as follows:

(b) Dwelling Unit Living Areas and Bedrooms. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere receptacle outlets installed in the dwelling unit living areas and bedrooms shall be protected by an arc-fault circuit interrupter(s). ~~This requirement shall become effective January 1, 2002.~~

SUBSTANTIATION: Problems:

1. The 1999 NEC Handbook states that: "Restricting the requirement to bedroom circuits reflects the desire to gain field experience in a limited application before mandating installation of devices in other unit circuits. Bedrooms contain readily ignitable cloth and cotton materials, and occupants may be sleeping when ignition occurs and not likely able to take protective action rapidly." There are three issues to be addressed here:

1.1 The submitter respectfully disagrees with the contention that bedroom occupants are uniquely vulnerable to the consequences of fire initiation. The NFPA Journal frequently cites fires originating in other occupancy areas where the occupant was asleep when the fire started. These occupancy areas are usually a family room, den, TV room, or other room where the occupant falls asleep in a comfortable chair or sofa while reading, drinking, smoking, or watching TV.

1.2 Sleep is not a necessary prerequisite for failure to notice the start of a fire, nor is observing the start of a fire a guarantee of survival. It is far better if the fire never starts due to appropriate branch circuit protection.

1.3 Fire deaths and injuries happen in rooms other than the place of fire origin more than 50 percent of the time. A bedroom occupant is not protected from the initiation of a fire by an arc fault permitted to occur in a nonbedroom location within the house.

2. The sentence: "This requirement shall become effective January 1, 2002." should be deleted since that is the nominally effective date for the 2002 NEC anyway. There is no technical or product supply reason for extending the effectivity date due to adoption of this proposal.

Substantiation:

1. The State of Vermont has independently considered the issues of application inadequacy, product availability, product reliability and the improved life safety consequences of a revision such as the one proposed. The Vermont Electrical Safety Rules text replacement for 210-12(b) is fundamentally identical to this proposal and was adopted August 1999. The text of this document reads: "210-12(b) Dwelling Unit Living Area and Bedrooms. All branch circuits that supply 125 volts, single phase, 15 and 20 ampere receptacle outlets installed in the dwelling unit living area and bedrooms shall be protected by an arc-fault circuit interrupter(s). (To achieve an orderly transition for compliance this Section shall take effect January 1, 2001)." Note that the effective date for compliance with this more comprehensive requirement is one year earlier than that required in the 1999 NEC.

2. The substantiation for Proposal 2-128 (210-11-(New)) found on page #111 of the 1998 NEC Committee Report on Proposals (Annual Meeting - Cincinnati Ohio) contends that a significant percentage of electrical fires occur in permanently installed wiring or wiring devices. Such a fire could originate in a bedroom wall, but might have been caused by a circuit passing through that wall to service a kitchen, bathroom, garage, or other space within the occupancy. The circuit could even be servicing an outdoor outlet on a bedroom's exterior wall. The concept that protecting a bedroom branch circuit protects the bedroom occupant is a fallacy under such conditions.

3. In May of 1999, the NFPA published a report titled: The U.S. Fire Problem Overview Report - Leading Causes and Other Patterns and Trends (Marty Ahrens, Fire Analysis and Research Division, NFPA). Page 50 of that report supports the submitter's concern about restricting sufficient protection to bedrooms. The report states that "Half of all fire victims were fatally injured when outside the room of origin" (Actually, 57.6 percent).

4. In the same NFPA report, it is stated on page 55 that electrical distribution equipment fires ranked: fifth in number of home structure fires; fourth in home fire deaths, seventh in home fire injuries; and second in direct property damage. Electrical distribution equipment includes (but is not limited to) fixed wiring, transformers or associated overcurrent or disconnect equipment, overcurrent protection devices, switches, receptacles or outlets, cords and plugs. A U.S. Consumer Product Safety Commission study done in the mid-80's determined that improper initial installations was a factor in about 20 percent of all electrical equipment residential fires. This data supports the concern addressed in 2. above. The CPSC found that electrical distribution equipment faults were not unique to any one location of a dwelling.

Clarification:

The submitter would have preferred to state: "All branch circuits" without qualification. Limiting the circuits to receptacle outlets does address protection from arc faults in appliances and extension cords, even if not all branch circuit wiring is protected. With this proposal, what is NOT protected is the following: 1) branch circuits for lighting, 2) permanently installed appliances such as dishwashers and garbage disposals, and 3) branch circuits for 240 volt circuits such as air conditioners, heat and hot water. It is felt that this proposal is not an unreasonable increase in the protection provided by the original 210-12(b), but is not as comprehensive as it ultimately should be. It is proposed as a possible interim step toward total adoption of AFCIs for residential branch circuits in a future Code cycle.

PANEL ACTION: Accept in Part.

The panel accepts the deletion of the last sentence of the proposal, and rejects the remainder of the proposal.

2- 117 - (210-12(b) Exception No. 1 (New)): Reject

SUBMITTER: Charles G. Hendry, Hempstead, NY

RECOMMENDATION: Add new (b) Exception No. 1:

Exception No. 1: In addition to the required receptacle outlets, receptacles supplied by a dedicated circuit, (A/C units, electric heaters etc.) shall be exempt from AFCI protection.

SUBSTANTIATION: 1) This exception will take additional big loads off the bedroom AFCI breakers.

2) In our fire district area 2 1/2 square miles (120,000 people) we had 26 bedroom fires in the last 3 years, 3 electrical (2 extension cords, 1 receptacle), "none" in direct wired units in residential use.

PANEL ACTION: Reject.

PANEL STATEMENT: There is no substantiation to indicate that AFCIs should not protect all 15- and 20-amp, 125 volt bedroom outlet circuits.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #1193)

2- 118 - (210-12(b)(1) (New)): Reject

SUBMITTER: Charles G. Hendry, Hempstead, NY

RECOMMENDATION: Add new (b) (1) to read as follows:

(1) 15 AMP Branch Circuits shall be limited to 12 receptacle outlets and

20 AMP Branch Circuits limited to 14 receptacle outlets.

SUBSTANTIATION: 1) This will still allow up to three (3) bedrooms (average 4 receptacles a room) on the circuit but would limit all bedrooms and loads being installed on one (1) AFCI.
2) At a current cost of electricians price of $75-90 per AFCI all bedrooms will end up on one (1) AFCI (some electricians are cheap).
PANEL ACTION: Reject.
PANEL STATEMENT: The number of outlets connected to an AFCI does not affect its ability to provide protection.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2453)

2- 119 - (210-12(c) (New)): Reject
SUBMITTER: William H. King, Jr., U.S. Consumer Product Safety Comm.
RECOMMENDATION: Add new paragraph to Section 210-12 as follows:
(c) Lighting and Appliance Branch Circuits. Each existing 125-volt, single-phase, 15- and 20-ampere lighting and appliance branch circuit shall be individually protected by an arc-fault circuit interrupter when the service equipment is replaced.
FPN: See Section 230-XX (Editorial note: Section 230-XX is a proposed new section, submitted separately to the CMP for Article 230, to compliment this proposed new paragraph (c) to Section 210-12. For information purposes, the proposed new Section 230-XX reads as follows: 230-XX. Replacement of Service Equipment in Dwelling Units. When service equipment in dwelling units is replaced, each existing 125-volt, single-phase, 15- and 20-ampere lighting and appliance branch circuit shall be individually protected by an arc-fault circuit interrupter.)
SUBSTANTIATION: According to a study conducted by the U.S. Consumer Product Safety Commission (CPSC), "Residential Electrical Distribution System Fires", Smith & McCoskrie, 1987, fires originating in branch circuit wiring predominately occurred in dwellings over 20 years old, with the highest rates of fires occurring in dwellings over 40 years old. Older dwellings are frequently upgraded with replacement service equipment to accommodate an increase in the service rating to supply additional appliance and equipment loads. However, often times, the existing lighting and appliance branch circuits in dwelling units are not replaced when the service is upgraded, due to the increased cost, and/or the inability to evaluate the remaining life expectancy of the branch circuit conductors. The branch circuit conductors are frequently located in concealed spaces surrounded with thermal insulation, and could be in a deteriorated condition at the time the service is upgraded. This proposal is intended to remedy this situation with the addition of arc-fault circuit interruption (AFCI) protection against fire hazard conditions for the existing branch circuit conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal calls for a significant expansion of this device beyond the bedroom circuits. The panel does not intend to expand the code to require AFCIs in existing dwellings at this time.

(Log #2849)

2- 120 - (210-12(c) (New)): Reject
SUBMITTER: Donald M. King, Wilmington, DE
RECOMMENDATION: Add a new paragraph (c) to 210-12 to read as follows:
(c) Guest Rooms. All branch circuits supplying 125V single-phase 15- and 20- ampere receptacle outlets in guest rooms of hotels, motels, and similar occupancies shall be protected by an arc-fault circuit interrupter(s).
SUBSTANTIATION: Receptacle outlets and flexible cords that are installed behind furniture in guest rooms of hotels and motels are subject to the same risk of physical damage as those that are installed behind furniture in bedrooms of single family dwellings. Section 210-12(b) requires arc fault protection for branch circuits supplying receptacle outlets in bedrooms of single family dwellings. This added text would extend the same level of protection offered by this new technology to persons and property of similar occupancies.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-103.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:

COMMENT ON AFFIRMATIVE:
NISSEN: See my Comment on Affirmative on Proposal 2-103.

(Log #1050)

2- 121 - (210-19): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise 210-9 as follows:
210-19(c), Exception No. 2 - change "No. 10" to "10 AWG".
210-19(d) - change "No. 14" to "14 AWG".
210-19(d), Exception No. 2 - change "No. 14" to "14 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #392)

2- 122 - (210-19(a)): Reject
SUBMITTER: Glenn W. Zieseniss, Crown Point, IN
RECOMMENDATION: Add the following to the last sentence of the paragraph:
"and where adjustment or correction factors are applied, the ampacity of the conductor shall not be less than 100 percent of the noncontinuous load plus 100 percent of the continuous load."
SUBSTANTIATION: The existing text seems to imply that is a "stand alone" statement and other NEC sections, such as the first paragraph of 240-3 and 240-3(d), do not apply if the ampacity of the conductor was greater than or equal to 125 percent of the continuous load plus 100 percent of the noncontinuous load before applying any adjustment or correction factors. There is no text to indicate the minimum conductor ampacity required after any adjustment or correction factors are applied. It is possible for the calculated conductor ampacity to be less than 100 percent of the continuous and noncontinuous loads after adjustment and correction factors are applied.
PANEL ACTION: Reject.
PANEL STATEMENT: The last sentence of 210-19(a) establishes a minimum conductor size for the branch circuit that supplies any continuous loads. The first sentence of 210-19(a) provides the text that establishes the minimum conductor ampacity by stating that it shall not be less than the load to be served. Ampacities of conductors are determined from 310-15 and 210-19(a) FPN No.1 guides the user to that section.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #680)

2- 123 - (210-19(a)): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) General. Branch-circuit conductors shall have an ampacity not less than the maximum computed load to be served. Where a branch circuit supplies continuous load(s) or any combination of continuous and noncontinuous loads, the minimum branch-circuit conductor size, before the application of any adjustment or correction factors, shall have an allowable ampacity ~~equal to or greater~~ not less than the noncontinuous load(s), plus 125 percent of the continuous load(s) or the ampacity specified for motor circuit conductors in Sections 430-22; 430-24; 430-25; and 440-34, whichever is greater.
Exception No. 1: The correction factors for temperatures below 26°C (78°F) shall be permitted in determining the initial conductor ampacity.

Exception No. 2: Where the assembly, including any integral ~~the~~ overcurrent device(s) is listed for operation at 100 percent of its rating, the ampacity of the branch-circuit conductors shall be ~~permitted to be~~ not less than the sum of the continuous load(s) ~~plus~~ and the noncontinuous load(s), plus the ampacity specified for motor circuit conductors in Sections 430-22, 430-24, 430-25, and 440-34.

FPN No. 1: No change.

~~FPN No. 2: See Part B of Article 430 for minimum rating of motor branch circuit conductors.~~

FPN No. 3: No change.

FPN No. 4: No change.

SUBSTANTIATION: The word "computed" clarifies that total connected load is not necessarily intended. Some loads such as general-use receptacles may be only computed load. "Not less than" is editorial and consistent with that phrase in the first sentence.

The proposal allows the 125 percent increase in ampacity for (phantom) continuous load to be applied to motor conductor ampacity or the 25 percent increase for motor conductor ampacity to apply to continuous load conductor ampacity; the largest value is to be used. The 25 percent ampacity increase for motor circuit conductors is not for a phamtom load but for temporary motor overload and the general maximum rating for motor overload devices. Article 430 does not generally permit a 100 percent ampacity for motor circuit conductors whether or not operating for less than three hours. Section 430-24 does not reference a 125 percent ampacity for continuous load, but merely ampere rating of other loads.

Application of this section and those referenced in Articles 430 and 440 in the proposal for the same loads consisting of continuous and noncontinuous loads, including motors, can result in disparity between resulting minimum conductor sizes. Which articles have precedence?

Admittedly such disparities are not as likely for branch circuits as feeders due to consideration of overcurrent protection requirements, but they can occur, especially with combination-load equipment with supplementary overcurrent protection for various components and served by a branch circuit. The examples I have provided indicate such disparity.

Proposed Exception No. 1 is to allow for increased ampacity rating to be initially applied. While perhaps relatively minor and infrequently used it could be a critical allowance for some "borderline" ampacity ratings.

Exception No. 2 is revised to clarify that some assemblies such as unfused safety switches, transfer switches, and clock-operated switches are listed for continuous operation at 100 percent of rating. Present wording suggests the assemblies always contain overcurrent devices. Consideration for conductors which also supply a motor is added. If this proposal is accepted FPN No. 2 becomes superfluous.

The panel statement for Comment 1-174 in the 1998 ROC indicated motor loads continuing for three hours or more are not excluded from the definition of continuous load. Under that concept, conductors would have to have an ampacity of 125 percent of each motor rather than just the largest one, and if the motor operates for less than three hours no multiplier is required. Continuous load and continues duty are not the same in the context of the code.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept in Part.

The panel accepts the portion of the recommendation changing "equal to or greater" to "not less", and rejects the remainder of the recommendation.

PANEL STATEMENT: The rejected portions of the proposal are rejected based on the following:

1) The first sentence is accurate as written in the present code. Computed load would imply that conductors serving loads could have some additional computed factor applied. Article 220 provides the necessary information for determining the load in question.

2) The changes relative to motor circuit conductors are unnecessary. Section 210-2 clearly indicates that motor branch circuit conductors are sized in Article 430.

3) The proposed Exception No. 1 is unnecessary, since 310-15 already allows this to be applied to determine conductor ampacity.

4) The wording for "integral" overcurrent devices is unnecessary. The present requirement is for "listed assemblies" which covers the various arrangements of overcurrent devices.

5) FPN No. 2 is retained to provide correlation with 210-2.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2569)

2- 124 - (210-19(a)): Reject

SUBMITTER: Travis Lindsey, Bldg Dept., Clark County, NV

RECOMMENDATION: Revise as follows:

(a) Branch-circuit conductors shall have an ampacity not less than the load to be served and shall not be smaller than No. 12.

SUBSTANTIATION: In our jurisdiction we have rules limiting branch circuits to No. 12. We did this because there were problems with heating of conductors, overloaded circuits and tripping related to these conditions. Since enacting these regulations the number of problems have been reduced significantly.

Many times conductors have been applied incorrectly. Ambient temperature correction factors are not always considered. Most attics are hot enough for prolonged periods during the summer months that application of the correction factors would reduce the current carrying capacity of the No. 14 wire to a very small number. Increased heating occurs when these circuits are heavily loaded.

In cases such as single outlet appliance circuits serving refrigerators and similar loads, the circuits have been known to fatigue and deteriorate (oxidize and burn) at connection points, overcurrent devices and receptacles due to the high starting loads and the small wire size.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has presented insufficient technical substantiation that No. 14AWG conductors are creating safety concerns. Many of the situations described in the submitter's substantiation, such as high temperature in attics, have been dealt with through various changes elsewhere in the NEC.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

COMMENT ON AFFIRMATIVE:

BROWN: The actions by an Authority Having Jurisdiction arbitrarily deciding to change the requirements of the NEC without the benefit of specific fire loss data should not be the basis for a change in the NEC. The concerns of the submitter would be alleviated with proper installation inspection by a certified electrical inspector, and education of the installers through courses taught in their locality.

(Log #3156)

2- 125 - (210-19(a)): Reject

SUBMITTER: John Wyrick, Byron, MI

RECOMMENDATION: The second sentence of the exception should be deleted.

SUBSTANTIATION: The second sentence and the exception are inconsistent with each other. The tables in Article 310 give the safe allowable ampacity of conductors continuously. If their numbers are not correct, then change the tables. The second sentence is also very confusing when it comes to conductor derating.

PANEL ACTION: Reject.

PANEL STATEMENT: The text in Section 210-19(a) second sentence ensures proper conductor selection based upon the conductor sizes that are used for evaluating the devices where the conductor is connected. The same text was developed in Section 210-20(a) and works in conjunction with 210-19(a) to prevent overheating of the insulation at the termination point on the overcurrent protection device. The combination of proper sizing for both the conductor and the overcurrent protective device ensures that the overcurrent protection device operates as it was originally evaluated and listed.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4110)

2- 126 - (210-19(a)): Accept in Part

SUBMITTER: Truman C. Surbrook, Michigan State University

RECOMMENDATION: Revise the second sentence of the section as follows with the deletions and additions as indicated:

"Where a branch circuit supplies continuous loads or any combination of continuous and noncontinuous loads, the ~~minimum~~ branch-circuit conductor ~~size, before the application of any adjustment or correction factors,~~ shall have an allowable ampacity

~~equal to or greater~~ not less than the noncontinuous load plus 125 percent of the continuous load."
SUBSTANTIATION: The phrase "before the application of any adjustment or correction factors" is particularly confusing to electricians making conductor ampacity selection when adjustment factors are being used. Some apply the adjustment factors to the allowable ampacity found in the appropriate table and then compare it with 100 percent of both continuous load and noncontinuous load, others compare the adjusted allowable ampacity to the sum of 100 percent of the noncontinuous load and 125 percent of the continuous load. By removing the confusing statement, it makes the section clear that the adjusted allowable ampacity of the conductor is not permitted to be less than the sum of 100 percent of the noncontinuous load plus 125 percent of the continuous load.
PANEL ACTION: Accept in Part.
The panel accepts the change of "equal to or greater" to "not less". The remainder of the proposal is rejected.
PANEL STATEMENT: See panel action on Proposal 2-123. The text recommended for deletion is necessary for proper application of the section. The second sentence of 210-19(a) establishes the minimum conductor size permitted for a circuit supplying any continuous loads. Actual conductor allowable ampacity (relative to the load current) is determined by applying 310-15, including the adjustment factors. This allows the allowable ampacity calculation to take advantage of higher temperature ratings on conductor insulation.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4131)

2- 127 - (210-19(a)): Reject
SUBMITTER: David T. Brender, Cooper Development Assn. Inc.
RECOMMENDATION: Revise text to read as follows:
(a) General. Branch-circuit conductors shall have an ampacity not less than the maximum load to be served and shall not be smaller than 12 AWG.
SUBSTANTIATION: The fine print notes let the user know to check the conductor's ampacity rating, temperature limit, and voltage drop. Ampacity rating and temperature limits are addressed in the NEC but are not generally applied. Voltage drop is only addressed through the fine print note. As homes continue to be built larger and larger, as panelboards are located more often at the end of the house, with an increase in the number of electrical appliances in a typical home, and with appliances having increased power consumption and more stringent power quality demands, the risk of overloaded conductors and occurrence of unacceptable circuit voltage drops have dramatically increased. Just as the minimum conductor size for bathrooms was increased due to the change in the type of appliances used on the bathroom circuit, the minimum conductor size for all branch circuits should be increased to 12 AWG. The increase in minimum size will increase safety by reducing the risk of overloaded circuits and the need to rewire existing circuits to meet the needs of heavily loaded circuits, increased harmonic loads and sensitive electronic equipment. As reported in the Eleventh Edition of "Fire in the United States 1987-1996," published by United States Fire Administration National Fire Data Center, the leading causes of 1996 nonresidential structure fires in stores, offices, and basic industry are attributed to electrical distribution. This same publication also states that electrical distribution is the 4th most common cause of fire. The areas where fires most often occur are in the sleeping rooms, lounge areas (living rooms) and kitchens. The overcurrent device ampacity is not intended to be changed by this proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not agree that ampacity rating and temperature limits addressed in the NEC are not generally applied. Also, see panel statements on Proposals 2-98 and 2-124.

SUBMITTER: Charles W. Algood, A&A Electric Services Inc./Rep. L.U. 915 I.B.E.W.
RECOMMENDATION: Add FPN No. 5 to read as follows:
FPN No. 5: See Section 110-14(c) for temperature limitations of conductors.
SUBSTANTIATION: This UL Greenbook requirement is an essential factor in the selection of appropriate branch circuit conductors, especially at points of terminating the conductors, and the use of higher temperature rated conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel agrees that 110-14(c) is an important section, but its application in conductor selection is a much broader application than just 210-19. Adding another Fine Print Note in this section would not improve the usability since 110-14 is a general requirement.

(Log #4111)

2- 130 - (210-19(a), Exception): Accept in Principle
SUBMITTER: Truman C. Surbrook, Michigan State University
RECOMMENDATION: Revise the Exception as follows:
"Where the assembly, including the overcurrent devices protecting the branch circuit(s), is listed for operation at 100 percent of its rating, the allowable ampacity of the branch circuit conductors shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load, and not less than the rating of the overcurrent."
SUBSTANTIATION: The addition of the word "allowable" ampacity should make it clear that it is the ampacity under the prevailing conditions including the application of adjustment factors if they apply.
The rule for sizing conductors when the overcurrent device is listed for 100 percent operation and one that is not such listed can lead to widely different conductor sized for the same identical load. At least in the case where the overcurrent device is listed for 100 percent operation, the minimum allowable ampacity of the conductor should not be permitted to be less than the rating of the overcurrent device. The following example illustrates the point.
Example: If a branch circuit supplied a continuous load of 130 amperes and the overcurrent device and enclosure are listed for operation at 100 percent of its rating then the overcurrent device is permitted to be rated at 150 amperes. In this case the conductor is permitted to be sized based upon an allowable ampacity not less than 100 percent of the continuous load. If copper conductors are used with 75°C insulation and terminations, the maximum conductor size required would be AWG #1 which is listed in Table 310-16 as 130 amperes. If the overcurrent device had not been listed for 100 percent operation, the minimum overcurrent device rating for this load would have been 175 amperes and the minimum conductor size would have been AWG #2/0. This seems to be a wide difference in minimum conductor size for the same identical load

simply because one overcurrent device is rated for 100 percent operation and the other is not.
PANEL ACTION: Accept in Principle.
Revise the exception in the existing Code to read as follows:
"Exception: Where the assembly, including the overcurrent devices protecting the branch circuit(s), is listed for operation at 100 percent of its rating, the allowable ampacity of the branch circuit conductors shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load. In no case shall the ampacity be less than the rating of the overcurrent device."
PANEL STATEMENT: The panel has accepted the submitter's recommendation relative to the use of "allowable" in the exception. The submitter's wording can be interpreted to be permissive relative to the minimum sizing compared to the overcurrent device. As such, the panel has revised the exception to accomplish the objective using clearer language.

(Log #3851)

2- 131 - (210-19(b) Exception No. 1): Reject
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Revise as follows:
Exception No. 1: Tap conductors supplying electric ranges, wall-mounted electric ovens, and counter-mounted electric cooking units from a 50-ampere branch circuit shall have an ampacity of not less than 20 and shall be sufficient for the load to be serviced. The taps shall be longer than necessary for supplying power to the outlet for ~~servicing~~ the appliance within the same kitchen.
SUBSTANTIATION: Editorial. The term "servicing" has been fairly widely interpreted to include the supply whip that is provided by the appliance manufacturer. This change will make it clear that the tap is a branch circuit tap that terminates at the outlet for the appliance.
This revision brings the exception into compliance with the definition of "branch circuit" in Article. The branch circuit ends at the outlet and does not include the appliance whip. The appliance whip is supplied by the manufacturer of the listed appliance in accordance with the product safety standard. The added text "within the same kitchen" will prevent the tap from being made in one room and the appliances being in another. This will keep the taps to be not longer than necessary.
Finally, the conductors are protected from overload by being suitable for the load and from short-circuit by the overcurrent device on the line side.
PANEL ACTION: Reject.
PANEL STATEMENT: The text from Exception No. 1 entered the Code in the 1962 edition. At that time, the definition of branch circuit included all conductors up to the load. The objective of the exception was to allow a tap (including a factory supplied whip) from the cooking unit to the larger branch circuit. In 1971, the definition of branch circuit changed to be substantially what we have today. Although the branch circuit ends at the outlet, the language does provide guidance that the conductors extending to the cooking unit are not to be longer than necessary for servicing. If the whip is supplied with the appliance, it should be connected directly to the branch circuit junction box without another tap being
installed. For appliances that are supplied with a factory installed terminal box, the exception allows a set of tap conductors to be field installed between the junction box for the branch circuit and the terminals of the appliance.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #681)

2- 132 - (210-19(c)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Household Ranges and Cooking Appliances.
(1) Branch-circuit conductors supplying a household range~~s~~, a wall-mounted oven~~s~~, a counter-mounted cooking unit~~s~~, ~~and~~ or other similar household cooking appliances, or more than one such appliance shall have an ampacity not less than the rating of the branch circuit and not less than the ~~maximum~~ demand load to be served. ~~For ranges of~~ Where the branch circuit supplies only a single appliance with a nameplate rating over 8-3/4 kW, ~~or more,~~ the minimum branch circuit rating shall be 40-amperes.
Exception No. 1: ~~Tap conductors supplying electric ranges, wall-mounted ovens, and counter-mounted cooking units from a 50-ampere branch circuit shall have an ampacity of not less than 20 and shall be sufficient for the loads served. The taps shall not be longer than necessary for serving the appliance.~~ The neutral conductor of a 3-wire, 120/240 volt branch circuit that supplies only a single appliance with a nameplate rating over 8-3/4 kW shall be permitted to have an ampacity less than the ungrounded conductors but not less than 70 percent of the branch-circuit rating, and shall not be smaller than No. 10.
Exception No. 2: ~~The neutral conductor of a 3-wire branch circuit supplyuing a household electric range, a wall-mounted oven, or a counter-mounted cooking unit shall be permitted to be smaller than the ungrounded conductors where the maximum demand of a range of 8-3/4 kW or more rating has been computed according to Column A of Table 220-19, but shall have an ampacity of not less than 70 percent of the branch-circuit rating and shall not be smaller than No. 10.~~
(2) Where one or more electric cooking appliances is supplied by a single branch circuit, tap conductors shall have an ampacity not less than the load to be served, but shall not be required to have an ampacity higher than the branch-circuit conductors, and shall not be smaller thant he sizes specified in Table 210-24.
SUBSTANTIATION: Present wording is not clear whether it covers a branch circuit supplying a single appliance or more than one. "Similar" is proposed to differentiate other cooking appliances such as fry pans, cooking pots, small ovens, etc. "Maximum" load is not clear whether intended to be nameplate ratings or demand load of Table 220-19.
Present Exception No. 1 is not a true exception since this section relates to branch circuit conductors and the exception does not. The proposal incorporates it into the rule and clearly indicates it appplies to one or more appliances. The proposed (2) covers tap conductors by reference to Table 210-24, which covers other than 50-ampere circuits. It also allows for the condition where "sufficient for the load" could result in tap conductors with higher ampacity than the branch-circuit conductors. For example, tap conductors for a 12kW range require a higher ampacity than the branch-circuit conductors which may be based on 8kW demand. This situation can also occur where more than one appliance is supplied by a single branch circuit permitted to have a demand factor but the tap conductors may not. Since O.C.P. is specficially indicated to exceed 15-amperes, No. 14 tap conductors would comply with "ampacity of not less than 20" as Table 310-16 indicates an ampacity of 20 or 25. Is that the intent?
The proposal limits the neutral size reduction to 120/240 volt systems since the neutral of a 3-wire 208y/120 volt system carries approximately the same current as the ungrounded conductors.
Column C of Table 220-19 includes appliances up to 8-3/4 kW rating; the text of (c) and Exception No. 2 also include ranges of 8-3/4 kW which allows column A or C to be used. Subsection (c) requires a minimum branch-circuit rating of 40-amperes for 8-3/4 kW but column C allows a demand of 80 percent, or a 29-ampere ampacity at 240 volts. Ranges of 8-3/4 kW, singly, or with other appliances, results in a lower demand with use of column C rather than A. The proposal specifies over 8-3/4 kW. Note 2 for Table 220-19 states over 8-3/4 kW.
PANEL ACTION: Reject.
PANEL STATEMENT: The rejection of the proposal is based on the following:
1) The first sentence is clear that it applies to single or multiple cooking appliances by using language to indicate multiple units. The submitter speculates that there is confusion about what types of cooking equipment this is applicable to, but has presented no substantiation that the present text is a problem.
2) The reference to "demand" load is not needed since Article 220 determines how the "load" is determined. Article 220 is clear relative to cooking equipment load calculations.
3) The present reference to 8-3/4kW for a 40A circuit is the correct reference for a minimum circuit.
4) Exception No. 1 is necessary for this section. See panel statement on Proposal 2-131.
5) The revision to Exception No. 2 (proposed as Exception No. 1) is insufficiently substantiated. Although in a typically loaded 208Y/120V three wire circuit, the neutral carries approximately the same current when assuming single phase loads connected between phase and neutral, the loading for the cooking equipment is mostly across the phase conductors and the 70% permission has not been shown to be inadequate.
6) The new recommendation (2) is unnecessary since Article 220 appropriately describes how to determine the load associated with the cooking circuits.
Engineering data from a technical survey should be provided to substantiate the need for changes in load calculations.

AFFIRMATIVE: 12

(Log #3852)

2- 133 - (210-19(c) Exception No. 1): Accept in Principle
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Revise text to read as follows:

(c) Other Loads. Branch-circuit conductors supplying loads other than cooking appliances as covered in (b) above and as listed in Section 210-2 shall have an ampacity sufficient for the loads served and shall not be smaller than No. 14.

Exception No. 1: Tap conductors for such loads shall have an ampacity not less than 15 for circuits rated less than 40 amperes and not less than 20 for circuits rated at 40 or 50 amperes and only where these tap conductors supply any of the following loads:

a. Individual lampholders or fixtures with taps extending not longer than 18 in. (457 mm) beyond any portion of the lampholder or fixture.

b. A fixture having tap conductors as provided in Section 410-67 shall be not smaller than the load served.

SUBSTANTIATION: No guidance is given in Section 410-67 for the minimum size of conductor required for the lighting fixture tap and should be specified here. The "tap" conductors in Section 410-67 are usually of the same size as the branch circuit conductors (not a smaller size as contemplated in Section 240-3) but have an insulation temperature rating higher than the insulation of the branch circuit conductors.
PANEL ACTION: Accept in Principle.
In the main paragraph of 210-19(d) Exception No. 1, revise the text to read:

"Tap conductors shall have an ampacity sufficient for the load served. In addition, they shall have an ampacity of not less than 15 for circuits rated less than 40 amperes and not less than 20 for circuits rated at 40 or 50 amperes and only where these tap conductors supply any of the following loads:".

PANEL STATEMENT: The panel notes that the revision is to Section 210-19(d) rather than 210-19(c). The revision to the main paragraph of Exception No. 1 will make it clear that the tap conductors must always have an ampacity sufficient for the load served. This meets the submitter's intent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #682)

2- 134 - (210-19(d) Exception No. 1): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

Exception No. 1: Tap conductors for such loads shall ~~have an ampacity not less than 15 for circuits rated less than 40 amperes and not less than 20~~ not be smaller than No. 12 for circuits rated at 40 or 50-amperes ~~and only~~ where these tap conductors are the nonheating leads of utilization equipment covered in Articles 424, 426, 427, or supply any of the following loads:

a. No change
b. No change
c. No change
d. No change
~~e. Nonheating leads of deicing and snow-melting cables and mats.~~

SUBSTANTIATION: Editorial. The 15 ampere requirement is basically redundant since the No. 14 specified in the text will generally have an ampacity of 15 or higher. Since the exception relates to tap conductor ampacity it can be construed as modifying "ampacity sufficient for the load". Since the exception infers permitted overcurrent protection greater than 15 amperes, No. 14 ocnductors have an ampacity of 20 or 25 amperes per Table 310-16 and renders the ampacity requirements irrelevant. Fixture wires which may be used would be covered by the size requirements since Section 240-4 permits No. 14 for 30-amepre and under circuits and No. 12 for 40 and 50 ampere circuits.

Nonheating leads may be considered as tap conductors and if so this exception covers tap conductors supplying other tap conductors.

It appears reasonable to apply this exception to equipment covered in the articles noted; many of which utilized nonheaitng leads.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's recommendation does not improve clarity or usability. The present reference to the tap conductor ampacity is accurate. In addition, the submitter has provided no substantiation to extend the allowance to other than de-icing and snow melting cables or mats.

AFFIRMATIVE: 12

(Log #4132)

2- 135 - (210-19(e) (New)): Reject
SUBMITTER: David T. Brender, Cooper Development Assn. Inc.
RECOMMENDATION: Add new text to read as follows:

(e) Habitable Room Branch Circuits. Branch-circuit conductors serving habitable room receptacle outlet(s) shall not be smaller than 12 AWG.

SUBSTANTIATION: As reported in the Eleventh Edition of "Fire in the United States 1987-1996," published by United States Fire Administration National Fire Data Center, fires caused by electrical distribution are the 4th most common cause of fire. The areas where fires most often occur are in the sleeping rooms, lounge areas (living rooms) and kitchens. 20 amp circuits are required in the kitchen, bathroom and laundry room to address the risk of fire. As homes continue to be built larger and larger, as panelboards are located more often at the end of the house, with an increase in the number of electrical appliances in a typical home, and with appliances having increased power consumption and more stringent power quality demands, the risk of overloaded conductors and occurrence of unacceptable circuit voltage drops have dramatically increased. Recent research (International Telework Association and Council-report release October 27, 1999) indicates that 19.2 million people, or 10 percent of the U.S. workforce, now telecommute, supporting the growing residential use of computers, printers, fax machines, copiers, etc. In fact, 55 percent of all U.S. households now have one or more computers (Parks Associates, Forum99, October 1999), and this is expected to grow further to 75-80 percent within the next years. Just as the minimum conductor size for bathrooms was increased due to the change in the type of appliances used on the bathroom circuit, the minimum conductor size for branch circuits should be increased to 12 AWG. The increase in minimum size will increase safety by reducing the risk of overloaded circuits and the need to rewire existing circuits to meet the needs of heavily loaded circuit and sensitive electronic equipment. The overcurrent device ampacity is not intended to be changed by this proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statements on Proposals 2-98, 2-124, and 2-127.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2051)

2- 137 - (210-21): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Revise section 210-21 to read as follows:
Add the word (continuous) to the section 210-21(b) as shown in the revised wording below:
210-21 Outlet devices. Outlet devices shall have an ampere rating that is not less than the load to be served and shall comply with (a) and (b).
(a) Lampholders. Where connected to a branch circuit having a rating in excess of 20 amperes, lampholders shall be of the heavy-duty type. A heavy-duty lampholder shall have a rating of not less than 660 watts if of the admedium type and not less than 750 watts if of any other type.
(b) Receptacles.
1. A single receptacle installed on an individual branch circuit shall have an ampere rating of not less than that of the branch circuit and comply with Table 210-21(b)(2).
Exception No. 1: Where installed in accordance with Section 430-81(c).
Exception No. 2: A receptacle installed exclusively for the use of a cord- and plug-connected arc welder shall be permitted to have an ampere rating not less than the minimum branch-circuit conductor ampacity determined by Section 630-11(a) for arc welders.
FPN: See definition of Receptacle in Article 100.
2. Where connected to a branch circuit supplying two or more receptacles or outlets, a receptacle shall not supply a total cord- and plug-connected continuous load in excess of the maximum specified in Table 210-21(b)(2).

Table 210-21(b)(2). Maximum Cord- and Plug-Connected Continuous Load to Receptacle

Circuit Rating (Amperes)	Receptacle Rating (Amperes)	Maximum Continuous Load (Amperes)
15 or 20	15	12
20	20	16
30	30	24

rest of section 210-21 to remain as is.....(3).....
SUBSTANTIATION: This change is necessary to provide consistency between this section and section 384-16(d), 210-20, 210-19 and other sections requiring the 80 percent rule. Portable appliances (such as microwave units and hair dryers) and relocatable power taps are UL tested for a maximum of 1800 watts on a 15 ampere branch circuit and operate as a non continuous load on these branch circuits without a problem.
Panel 20 and Panel 2 have established a Study Task Group to bring some suggestions for a resolution of this issue.
UL 498 tests receptacles at 150 percent of their rating so limiting the load on as now required by Table 210-21(b)(2) for noncontinuous load is unnecessary.
See also Proposal 20-52 on page 668 of the 98 ROP.
Statement by panel: Quote" the substantiation does not justify the reduction in rating to 12 amperes and 16 amperes for appliances rated between 12 and 15 amperes and between 16 and 20 amperes respectively."
This Section as revised will make it mandatory for continuous loads only and not for noncontinuous loads.
However, the branch circuit requirements remain the same as do the receptacle sizes.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel has addressed the concept that the submitter has proposed in Proposal 2-143. The use of the term "continuous load" would allow the language to be applied to a wider range of appliances than what is presently being done in product listing. The approach taken in Proposal 2-143 addresses the issue, but limits the scope to a narrower range of products.

2- 138 - (210-21(b)): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 18 for information.
SUBMITTER: Jamie McNamara, Hastings, MN
RECOMMENDATION: Revise to read as follows:
210-21. Outlet Devices. ....
(3) Where connected to a branch circuit supplying two or more receptacles or outlets, receptacle ratings shall conform to the values listed in Table 210-21(b)(3), or where larger than 50 amperes, the receptacle rating shall not be less than the branch-circuit rating.
Exception No. 1: Receptacles for one or more cord- and plug-connected arc welders shall be permitted to have ampere ratings not less than the minimum branch-circuit conductor ampacity permitted by Section 630-11(a) or (b) as applicable for ac transformer and dc rectifier arc welders, and Section 630-21(a) or (b) as applicable for motor-generator arc welders.
Exception No. 2: The ampere rating of a receptacles installed for electric discharge lighting shall be permitted to be based 410-30 (c)
SUBSTANTIATION: It is not clear when a receptacle is installed pertaining to 410-30 (c) "Receptacles and attachment plugs shall be permitted to be of lower ampere rating than the branch circuit but not less than 125 percent of the fixture full-load current". This conflicts with Table 210-21 (b) (3) the table for example requires 30 amp receptacles for 30 amp circuits for electric discharge lighting, regardless of the load on the receptacle.
PANEL ACTION: Accept in Principle.
Add a new Exception No. 2 to existing 210-21(b)(3) to read:
"Exception No. 2: The ampere rating of a receptacle installed for electric discharge lighting shall be permitted to be based on 410-30(c)."
PANEL STATEMENT: The panel has accepted the submitter's recommendation, but has revised the wording to correct the grammatical inconsistencies.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3765)

2- 140 - (Table 210-21(b)(2)): Reject
SUBMITTER: Julie I. Ayres, Assn. of Home Appliance Mfrs
RECOMMENDATION: Add underlined text in Table 210-21(b)(2):

Table 210.21(b)(2) Maximum Cord-Plug-Connected Load to Receptacle

Circuit Rating Amperes	Receptacle Rating Amperes	Maximum Continuous Load Amperes
15 to 20	15	12
20	20	16
30	30	24

SUBSTANTIATION: A discrepancy exists in what is stated literally in Section 210-23(a) and Table 210-21(b)(2) in the National Electrical Code (NEC) and what occurs in field practice. Presently, many types of cord-connected appliances that are normally operated for periods of less than 3 hours employ attachment plugs utilized at 100 percent of the current rating of the plug. A Task Group comprised of members from code-making panel #2 and #20 met on 7/14/99 at Underwriters Laboratories Inc. in Northbrook, IL and developed examples of the diversity of products that utilize 100 percent of the current rating of the plug. These included intermittent duty products such as microwaves, power tools, personal care products, exercise machines, kitchen appliances, and lawn and garden equipment.

Evidence of problems stemming from excessive current do not exist with the above products. A review of manufacturers' complaint databases and the U.S. Consumer Product Safety Commission (CPSC) data shows no evidence of problems with cords on these appliances from excessive current draw.

The prevalence of these products has continued to increase in the marketplace with a continued decline in fire death rates. Data supplied by the National Fire Protection Association (NFPA)[1] states that the number of fire deaths for 1998 represents the lowest U.S. fire death toll in 20 years. This 2 year downward trend continued for consecutive years 1997 and 1998. The NFPA report indicates that home fire deaths fell by another 4.2 percent in 1998 bringing such rates to a new low.

Section 210-23(a) and Table 210-21(b)(2) in the NEC must be modified to clarify the discrepancies detailed above. Amending the code would be representative of current field practice and would not decrease the level of safety established by the NEC.

[1]Press release dated 8/11/99 released from NFPA titled "NFPA Announces U.S. Fire Losses on Decline"

2- 142a - (210-23): Accept
SUBMITTER: CMP 2
RECOMMENDATION: Revise existing 210-23(a) to read as follows:

"a) 15- and 20-Ampere Branch Circuits. A 15- or 20-ampere branch circuit shall be permitted to supply lighting units or other utilization equipment, or a combination of both, and shall comply with (1) and (2).

Exception: The small appliance branch circuits, laundry branch circuits, and bathroom branch circuits required in a dwelling unit(s) by Sections 210-11(c)(1), (2), and (3) shall supply only the receptacle outlets specified in that section.

(1) Cord- and Plug-Connected Equipment. The rating of any one cord- and plug-connected utilization equipment shall not exceed 80 percent of the branch-circuit ampere rating unless listed and marked to inform the user of the necessity for providing an individual branch circuit.

(2) Utilization Equipment Fastened in Place. The total rating of utilization equipment fastened in place, other than lighting fixtures, shall not exceed 50 percent of the branch-circuit ampere rating where lighting units, cord- and plug-connected utilization equipment not fastened in place, or both, are also supplied."

SUBSTANTIATION: The panel has revised Section 210-23 to improve readability, and has integrated the language accepted on Proposal 2-143.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
CARPENTER: Permitting marking cord- and plug-connected utilization equipment that exceeds 80 percent of the branch-circuit rating with a label that informs the user of the necessity of an individual branch circuit is expecting too much from the consumer. By merely informing the user by a tag that the equipment needs an individual branch circuit would be inviting code violations. A 15-ampere cord cap could be plugged into a 15-ampere receptacle on a 15- or 20-ampere branch circuit. If the plug fits, the user will connect it. It should not be assumed that just because there is a tag or label an individual branch circuit will be installed wherever one might use the appliance. This appears to be a condition that the listing process should address.

(Log #2052)

2- 141 - (210-23): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Revise section 210-23(a) by adding (operating as a continuous load) to the second sentence to read as follows:

210-23. Permissible Loads. In no case shall the load exceed the branch-circuit ampere rating. An individual branch circuit shall be permitted to supply any load for which it is rated. A branch circuit supplying two or more outlets or receptacles shall supply only the loads specified according to its size as specified in (a) through (d) and as summarized in Section 210-24 and Table 210-24.

(a) 15- and 20-Ampere Branch Circuits. A 15- or 20-ampere branch circuit shall be permitted to supply lighting units or other utilization equipment, or a combination of both. The rating of any one cord- and plug-connected utilization equipment operating as a continuous load shall not exceed 80 percent of the branch-circuit ampere rating. The total rating of utilization equipment fastened in place, other than lighting fixtures, shall not exceed 50 percent of the branch-circuit ampere rating where lighting units, cord- and plug-connected utilization equipment not fastened in place, or both, are also supplied.

Exception: The small appliance branch circuits, laundry branch circuits, and bathroom branch circuits required in a dwelling unit(s) by Sections 210-11(c)(1), (2), and (3) shall supply only the receptacle outlets specified in that section.

(b)..... (c).....(d).....to remain as now written.

SUBSTANTIATION: This change is required if the change to section 210-21 is accepted so that both Sections correlate.

Substantiantion for 210-21 as submitted:

This change is necessary to provide consistency between this section and section 384-16(d), 210-20, 210-19 and other sections requiring the 80 percent rule.

Portable appliances (such as microwave units and hair dryers) and relocatable power taps are UL tested for a maximum of 1800 watts on a 15 ampere branch circuit and operate as a non continuous load on these branch circuits without a problem.

Panel 20 and Panel 2 have established a Study Task Group to bring some suggestions for a resolution of this issue.

UL 498 tests receptacles at 150 percent of their rating so limiting the load on as now required by Table 210-21(b)(2) for noncontinuous load is unnecessary.

See also Proposal 20-52 on page 668 of the 98 ROP.

Statement by panel: Quote" the substantiation does not justify the reduction in rating to 12 amperes and 16 amperes for appliances rated between 12 and 15 amperes and between 16 and 20 amperes respectively."

This Section as revised will make it mandatory for continuous loads only and not for noncontinuous loads.

However, the branch circuit requirements remain the same as do the receptacle sizes.

PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-137.

(Log #4380)

2- 142 - (210-23): Reject
SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Add a new sentence as follows:
"For the purposes of this section, utilization equipment held in place by piping or hose connections shall be considered to be fastened in place."
SUBSTANTIATION: Utilization equipment, such as waste disposals, swimming pool pumps, etc., that is held in place by piping or hose connections without the use of specific additional fasteners is being interpreted as not being fastened in place. Permissible loads and computation of loads on circuits are being compromised.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel disagrees that all piping or hose connected equipment is considered to be fastened in place because some hoses used to connect blower or vacumn units can be flexible or movable.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3249)

2- 143 - (210-23(a)): Accept in Principle
SUBMITTER: Henry Jenkins, N.C. Ellis Cannady Chapter, IAEI
RECOMMENDATION: Revise text to read as follows:
(a) 15- and 20-Ampere Branch Circuits. A 15- or 20-ampere branch circuit shall be permitted to supply lighting units or other utilization equipment, or a combination of both. The rating of any one cord- and plug-connected utilization equipment shall not exceed 80 percent of the branch-circuit ampere rating unless listed and marked to inform the user of the necessity for providing an individual branch circuit. The total rating of utilization equipment fastened in place other than lighting fixtures, shall not exceed 50 percent of the branch-circuit ampere rating where lighting units, cord- and plug-connected utilization equipment not fastened in place, or both, are also supplied.
Exception: The small appliance branch circuits, laundry branch circuits, and bathroom branch circuits required in a dwelling unit(s) by Sections 210.11(c)(1), (2), and (3) shall supply only the receptacle outlets specified in that section.
SUBSTANTIATION: The proposal addresses the issues raised by Mr. King in Proposal 20-52 NFPA 70-A98 ROP and fulfills the direction of CMP-20 in its disposition of Comments 20-9 and 20-42 through 71.
Presently, many types of cord-connected appliances employ attachment plugs utilized at 100 percent of the current rating of the plug as illustrated by the table. The table does not cover all appliances and is only provided to illustrate that the requirements applied take into account the types of appliances and their intended use. The proposal recognizes presently existing field conditions and provides a means for addressing the safety of these products in their intended applications. Further work will need to be done to develop definitions for continuous and intermittent duty as applied to 15 amp and 20 amp cord and plug connected appliances so that product standards can specifically address the issues of branch circuit loading.
The work towards harmonization of the National Electrical Code and Canadian Electrical Code is also noted and it is suggested that the NEC TCC take action to include this issue as a topic for discussion within the harmonization effort.
(See table below)
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: After much discussion, the panel has accepted this proposal in principle and encourages public comment. The panel acknowledges that the table submitted with the substantiation represents present practice for listing, does not cover all appliances, and recognizes that it also includes commercial appliances. The wording of the proposal has been intergrated with the revisions in Proposal 2-142a.

(Log #3764)

2- 145 - (210-23(a)): Reject
SUBMITTER: Julie I. Ayres, Assn. of Home Appliance Mfrs
RECOMMENDATION: Revise text to read as follows:
(a) 15- and 20-Ampere Branch Circuits. A 15- or 20-ampere branch circuit shall be permitted to supply lighting units or other utilization equipment, or a combination of both. The rating of any one cord- and plug-connected utilization equipment operating under a continuous load shall not exceed 80 percent of the branch circuit ampere rating. The total rating of utilization equipment fastened in place, other than lighting fixtures, shall not exceed 50 percent of the branch-circuit ampere rating where lighting units, cord- and plug-connected utilization equipment not fastened in place, or both, are also supplied.
SUBSTANTIATION: A discrepancy exists in what is stated literally in Section 210-23(a) and Table 210-21(b)(2) in the National Electrical Code (NEC) and what occurs in field practice. Presently, many types of cord-connected appliances that are normally operated for periods of less than 3 hours employ attachment plugs utilized at 100 percent of the current rating of the plug. A Task Group comprised of members from code-making panel #2 and #20 met on 7/14/99 at Underwriters Laboratories Inc. in Northbrook, IL and developed examples of the diversity of products that utilize 100 percent of the current rating of the plug. These included intermittent duty products such as microwaves, power tools, personal care products, exercise machines, kitchen appliances, and lawn and garden equipment.
Evidence of problems stemming from excessive current do not exist with the above products. A review of manufacturers' complaint databases and the U.S. Consumer Product Safety Commission (CPSC) data shows no evidence of problems with cords on these appliances from excessive current draw.
The prevalence of these products has continued to increase in the marketplace with a continued decline in fire death rates. Data supplied by the National Fire Protection Association (NFPA)[1] states that the number of fire deaths for 1998 represents the lowest U.S. fire death toll in 20 years. This 2 year downward trend continued for consecutive years 1997 and 1998. The NFPA report indicates that home fire deaths fell by another 4.2 percent in 1998 bringing such rates to a new low.
Section 210-23(a) and Table 210-21(b)(2) in the NEC must be modified to clarify the discrepancies detailed above. Amending the code would be representative of current field practice and would not decrease the level of safety established by the NEC.
[1]Press release dated 8/11/99 released from NFPA titled "NFPA Announces U.S. Fire Losses on Decline"
PANEL ACTION: Reject.

2- 147 - (Table 210-24): Reject
SUBMITTER: Travis Lindsey, Bldg Dept., Clark County, NV
RECOMMENDATION: Revise Table 210-24 to require No. 12 minimum conductor size for 15 amp branch circuits.
This proposed change is intended to coordinate with the proposed change in 210-19(a).
(a) Branch-Circuit conductors shall have an ampacity not less than the load to be served and shall not be smaller than No. 12.
SUBSTANTIATION: In our jurisdiction we have rules limiting branch circuits to No. 12. We did this because there were problems with heating of conductors, overloaded circuits and tripping related to these conditions. Since enacting these regulations the number of problems have been reduced significantly.
Many times conductors have been applied incorrectly. Ambient temperature correction factors are not always considered. Most attics are hot enough for prolonged periods during the summer months that application of the correction factors would reduce the current carrying capacity of the No. 14 wire to a very small number. Increased heating occurs when these circuits are heavily loaded.
In cases such as single outlet appliance circuits serving refrigerators and similar loads, the circuits have been known to fatigue and deteriorate (oxidize and burn) at connection points, overcurrent devices and receptacles due to the high starting loads and the small wire size.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-124.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1766)

2- 148 - (Table 210-24, FPN): Accept in Principle
SUBMITTER: Edward Olson, Pendleton, SC
RECOMMENDATION: Add a fine print note to read as follows:
(FPN): The gauges listed in Table 210-24 for tap conductors are minimum values. The ampacities of the tap must conform to Section 310-15 and the overcurrent protection of the tap must adhere to Section 240-21.
SUBSTANTIATION: I have witnessed several instances were technicians and engineers have to refer to Table 210-24 as a conductor size reference. Thus asserting that 14 AWG taps to receptacles and lampholders can be connected to 12 AWG branch circuits protected by a single 20 AMP overcurrent device located at the service entrance, utilizing nonmetallic-sheathed cable in a one/two family dwelling.
PANEL ACTION: Accept in Principle.
Revise the existing first paragraph of 210-24 to read as follows:
"The requirements for circuits that have two or more outlets or receptacles, other than the receptacle circuits of Sections 210-11(c)(1) and (2), are summarized in Table 210-24. This table provides only a summary of minimum requirements. See 210-19, 210-20 and 210-21 for the specific requirements applying to branch circuits".
PANEL STATEMENT: The first paragraph of 210-24 has been revised to make it clear that the table provides only a summary of requirements and that the user must consult 210-19, 20 and 21 to apply the rules.
Also, the panel has removed the words "as specifically provided for above" in the first paragraph since they provide no reference to what is "above".
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1487)

2- 149 - (210-25): Reject
SUBMITTER: Northeastern Regional Fire Code Dev. Committee
RECOMMENDATION: Revise to read:
210-25. Common Area Branch Circuits. Branch circuits in dwelling units shall supply only loads within that dwelling unit or loads associated only with that dwelling unit. Branch circuits required for the purpose of lighting, central alarm, signal, communications, or other needs for public or common areas of ~~a~~

~~two family or~~ multifamily dwelling shall not be supplied from equipment that supplies an individual dwelling unit.
SUBSTANTIATION: The requirements of Section 210-25 provide an unnecessary burden on 2 family homes that contain common areas and are largely owner occupied. This section requires 2 family homes to install a separate meter and electric panel to serve as few as 3 smoke detectors and 1 light in the basement of a building where the dwelling units are one over the other and each dwelling unit has the required means of egress directly to outdoors. The cost of this separate service can be anywhere from $500.00 to $1,000.00.
Some electric utilities treat a separate "House Meter" as a commercial installation and often charge a minimum monthly fee of as much as $20.00 where the actual usage is only pennies. In most two-family dwellings there are no, or very small, common areas, these circuits could be added to one of the dwelling units.
This requirement is not in the current CABO One- and Two-Family Code. For consistency with the CABO Code and should be eliminated in the NEC.
Appliances, devices, circuits or panels in the common area could be marked as to which panel controls them to eliminate any safety concerns.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not agree that two family dwellings should be excluded from the rule. The common area loads are not limited to smoke alarms and lights, but have also included water pumps, sprinkler pumps, common boilers, etc.
This requirement is not in the CABO document because the CABO document is based on a previous edition of the NEC. The One- and Two-Family Dwelling Unit Code should be revised to reflect the requirements contained in the NEC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3683)

2- 150 - (210-26 (New)): Reject
SUBMITTER: Leonard F. Devine, Jr., W. Palm Beach County Bldg & Zoning, FL
RECOMMENDATION: Add new text to read as follows:
210.26 The maximum number of 120 volt outlets permitted per circuit in residential occupancies shall not exceed the provisions of Table 210.26.

Table 210.26 Maximum Number of Outlets Per Circuit for Residential Occupancies

Lighting outlets	12	11	10	9	8	7	6	5	4	3	2	1	0
Duplex receptacle	0	0	1	1	2	2	3	3	4	4	5	5	6

SUBSTANTIATION: This new section and table would provide a greater degree of safety for residential occupancies. The homeowner would have a greater degree of flexibility using today's many appliances, computers, televisions, etc.
PANEL ACTION: Reject.
PANEL STATEMENT: The outlets provided for dwelling units by the requirements in Section 210-52 are intended to be convenience outlets and adding outlets does not necessarily add load. There is no intent to limit the number of convenience outlets on a general branch circuit in a dwelling unit.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3238)

2- 151 - (210-50): Reject
SUBMITTER: Edward J. Fox, Jr., Orange County Bldg Div., FL
RECOMMENDATION: 210-50: There shall be a minimum of two (2) duplex receptacles in each office, and classroom. They shall be separated by a reasonable distance to provide access from different areas of the room.
SUBSTANTIATION: By providing receptacles that would normally not be installed for offices, and classrooms, the citizens would not have to use extension cords, nor would they have to hire an electrician to come in and add receptacles after they have taken occupancy.
All offices have many electrical appliances and it would be safer if these had receptacles to plug into instead of extension cords.
By providing a better electrical system up front, the citizens are not impacted by additional cost later due to adding more receptacles and circuits to handle an ever-increasing demand.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's proposed revision does not resolve the situation presented in the substantiation. The present code rule in 210-50(b) requires a receptacle where cord and plug connections are used. Adding a rule to provide two receptacles would not keep (or in some cases even minimize) the user from violating the Code and using an extension cord, since the final usage of the particular space is not known. For non-dwelling unit applications, proper planning and design must be used to provide adequate access to receptacle outlets. If the receptacles are not provided, then it would be necessary to have receptacles installed by a qualified person.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #684)

2- 152 - (210-50(a)): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Cord Pendants. A cord connector body that is ~~supported~~ supplied by a permanently ~~installed~~ connected cord ~~pendant~~ shall be considered a receptacle outlet.
SUBSTANTIATION: Editorial. Cord connector body seems to be the commonly used term. The distinction of limitation to a pendant infers other than pendants are not receptacles, such as may be permitted in Articles 305, 364, Sections 422-17(b), 422-22(a). Some code sections indicate receptacles and cord connectors are not the same, e.g., Sections 210-7(b)(c); Article 410 Part L, Sections 422-17(b); 422-22(a)(c); 305-4(d); 513-11(b); etc. If a permanently connected cord (where permitted) with cord connector body is not clearly designed as a receptacle many code requirements may not be deemed applicable, such as Sections 210-21(b)(1)(2)(3)(4); 220-13; 400-7(b); 410-56(a); 430-42(c); 430-81(c); 430-109, Exception No. 6; 440-55(b), etc.
PANEL ACTION: Accept in Part.
Revise the wording in existing Section 210-50(a) to read as follows:
"(a) Cord Pendants. A cord connector that is supplied by a permanently connected cord pendant shall be considered a receptacle outlet."
PANEL STATEMENT: The word "body" was rejected since the current terminology for this device is "cord connector," not "cord connector body." See UL's guide information for Attachment Plugs (AXGV) in Green (Electrical Construction Equipment) and White (General Information) Directories.
The panel accepted "supplied" as more appropriate since "supported" implies a physical attachment rather than an electrical connection.
The panel rejected the elimination of "pendant" in the sentence to make clear that "pendant" is the appropriate term as it applies here and in other parts of the Code. See Sections 370-23(h), 370-25(c), and 400-7.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2747)

2- 153 - (210-50(b)): Reject
SUBMITTER: Joseph N. Fiorello, Sr., Fiorello Electric Inc.
RECOMMENDATION: Revise as follows:
(b) Cord Connections. A receptacle outlet shall be installed wherever flexible cords with attachment plugs are used. Where flexible cords are permitted to be permanently connected, receptacles shall be permitted to be omitted for such cords. (Receptacles installed in the face down position shall be of the twist-lock type.)
SUBSTANTIATION: While inspecting a job that did utilize attachment plugs as permanent connections, the problem arose that when the cord reels supplying the required outlets were shaken the plugs pulled out from their connection. Also, I've encountered garage door openers that have shaken their attachment plug loose.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not presented sufficient evidence that there is a problem with properly installed receptacles in a face-down position. The panel notes that changing to twist-lock receptacles would render many devices such as garage door openers

and cord reels unusable because they are supplied with standard attachment caps.

(Log #CP202)

2- 153a - (210-52): Accept
SUBMITTER: CMP 2
RECOMMENDATION: Add a new first sentence to 210-52 to read as follows:
"This section provides requirements for 125-volt, 15- and 20-ampere receptacle outlets."
SUBSTANTIATION: The panel has added a new sentence to clarify that the required receptacles in Section 210-52 are to be 125-volt, 15- or 20-ampere configurations only.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2249)

2- 154 - (210-52): Reject
SUBMITTER: Dennis R. Scarfo, LDA Co.
RECOMMENDATION: I feel that all general purpose receptacles should be required to have the ground slot installed on top.
SUBSTANTIATION: Recently, I have become aware of this and I feel that it would be good practice and prevent a possible accident, if an object were to come in contact, possibly by dropping on the hot and neutral blades of a connected load. The ground slot installed on top would eliminate this possible danger.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no evidence to support a required orientation of the ground slot for a receptacle outlet. The panel notes that receptacles have been installed with the ground pin up and down (as well as horizontally) for many years with no established trend of one orientation being better than the other.
Other arguments include ones stating that keeping the grounding slot in the lower position will keep the grounding pin of an attachment plug connected to the receptacle for as long as possible if the plug starts to disengage.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3351)

2- 155 - (210-52): Accept in Principle
SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Delete all occurrences "of (in) dwelling unit" within this section. Revise as follows:
(a) General Provisions. In every kitchen, family room, dining room, living room, parlor, library, den, sunroom, bedroom, recreation room, or similar room or area ~~of dwelling units,~~ receptacle outlets shall be installed in accordance with the general provisions specified in (1) through (3).
(b) Small Appliances. 1. In the kitchen, pantry, breakfast room, dining room, or similar area ~~of a dwelling unit,~~ the two or more 20-ampere small-appliance branch circuits required by Section 210-11(c)(1) shall serve all receptacle outlets covered by Sections 210-52(a) and (c) and receptacle outlets for refrigeration equipment.
(c) Countertops. In kitchens and dining rooms ~~of dwelling units,~~ receptacle outlets for counter spaces shall be installed in accordance with (1) through (5).
(d) Bathrooms. ~~In dwelling units,~~ At ~~at~~ least one wall receptacle outlet shall be installed in bathrooms within 36 in. (914 mm) of the outside edge of each basin. The receptacle outlet shall be located on a wall that is adjacent to the basin location. See Section 210-8(a)(1).
(h) Hallways. ~~In dwelling units,~~ Hhallways of 10 ft (3.05 m) or more in length shall have at least one receptacle.
SUBSTANTIATION: Section 210-60 requires that 210-52 be bused for the installation requirements for receptacles in hotel and motel guest rooms. The phrase dwelling unit conflicts with this requirement. The phrase dwelling unit would remain in the title of Section 210-52 to maintain the requirement to dwelling units.

PANEL ACTION: Accept in Principle.
Revise 210-60(a) to read as follows:
"(a) General. Guest rooms in hotels, motels and similar occupancies shall have receptacle outlets installed in accordance with 210-52(a) and 210-52(d). Guest rooms meeting the definition of a dwelling unit, shall have receptacle outlets installed using all of the applicable rules in 210-52."
PANEL STATEMENT: The panel has kept the term dwelling unit in 210-52, but has revised 210-60 to make it clear as to what provisions of 210-52 apply to guest rooms. This accomplishes the objective of the submitter to make it clear as to what portions of 210-52 apply.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
BROWN: There is an inherent problem with trying to equate a "guest room" and a "dwelling unit". All definitions in the model building codes, and the documents of the NFPA family of codes and standards, including the NEC, reference a "dwelling unit" only to those occupancies in one- and two-family dwellings and multifamily dwellings. The definition of a "guest room" (and guest suite) is referenced only to those areas in hotel occupancies. In other words, a "guest room" cannot be a "dwelling unit". The last sentence of the revision should be changed to read: "Guest rooms shall have receptacle outlets installed using all of the applicable rules in Section 210-52." The intent of this requirement will not be changed.

(Log #2810)

2- 156 - (210-52(a), Exception (New)): Reject
SUBMITTER: Bud Swathwood, Bud Swathwood Consulting
RECOMMENDATION: Add an exception to read as follows:
Exception: A receptacle shall not be required in areas behind interior doors that will cover the receptacle when the door is open. These areas would include bedrooms, bathrooms, kitchens, etc.
SUBSTANTIATION: A problem we are having is the damaging of portable cords for lamps, sweepers etc., when doors are opened and these appliances are plugged into these outlets. There have been cases where people have tripped when walking into rooms and the cord is across the doorway after being plugged into these outlets.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel continues to maintain the long standing position that these receptacles are required. Frequently, the receptacles in these locations are the only ones remaining available for plugging in portable appliances (such as vacuum cleaners, etc.) after the furniture is in place in the room.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #685)

2- 157 - (210-52(a)(1)): Accept in Principle
Note: The Technical Correlating Committee understands that the values in the panel action are as accepted in the action on Proposal 2-3.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Spacing. Receptacles shall be installed so that no point along the floor line in any wall space is more than 6 ft (1.83 m) measured horizontally, from ~~an~~ a receptacle outlet in that space. ~~Receptacle outlets shall, insofar as practicable, be spaced equal distances apart.~~
SUBSTANTIATION: The requirement proposed to be deleted is not needed and if enforced can cause problems. Basic spacing is covered by the first paragraph and normally results in compliance with equal spacing. If, for example, three receptacle outlets are installed one foot apart for a particular need such as supply for an entertainment center a strict enforcement of the rule would require the same spacing for all other receptacle outlets. I believe this equal spacing requirement is a holdover from previous code when a minimum number of receptacle outlets (two?) was required per room, and justified by in effect requiring two receptacle outlets to be installed on opposite walls, not the same wall.
PANEL ACTION: Accept in Principle.

Revise existing Section 210-52(a)(1) to read as follows:
"(1) Spacing. Receptacles shall be installed so that no point along the floor line in any wall space is more than 6 ft (1.83 m), measured horizontally, from another receptacle outlet in that space."
PANEL STATEMENT: The panel has accepted the submitter's deletion of the second sentence and has revised the first sentence to make it clear that the spacing is from another receptacle outlet in the space.

AFFIRMATIVE: 12

(Log #360)

2- 158 - (210-52(a)(1), Exception (New)): Reject
SUBMITTER: James Goshey, Spruce Electric
RECOMMENDATION: Add an exception to read as follows:
Exception: A wall space 2 ft or larger which would be completely covered by a door in an open position, shall not be required to have a receptacle located within.
SUBSTANTIATION: A receptacle located behind an open door invites many hazards. It seems to encourage the use of a fixture cord or extension cord across a walkway, possibly under a rug or carpet runner.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-156.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:

(Log #288)

2- 162 - (210-52(a)(2)(a)): Reject
SUBMITTER: J. Michael Scott, Three Forks, MT
RECOMMENDATION: Revise text to read:
(a) Any space ~~2 ft (610 mm)~~ 4 ft (2440 mm) or more in width (including space measured around corners) and unbroken along the floor line by doorways, fireplaces, and similar openings.
SUBSTANTIATION: The existing text requires a receptacle on unusable wall sections and wall sections between closets. This provision should be a design criteria, and not a code requirement.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not agree that the two foot wall space section is unusable space. These spaces have tables with lamps or other similar furniture that need access to a receptacle. Also, this space serves to provide access to a convenience outlet that might otherwise be covered up by larger furniture and helps to eliminate the use of extension cords by persons attempting to locate a more permanent outlet in that space.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2429)

2- 163 - (210-52(a)(2)(a)): Reject
SUBMITTER: Dennis Kaunzner, City of Sierra-Vista, AZ
RECOMMENDATION: Revise text to read:
"Any space 2 ft or more in width and unbroken along the floor by doorways ~~fireplaces~~ and similar openings."
SUBSTANTIATION: Fireplaces are not defined as to what part of the fireplace constitutes wall space. If it were just the fire box there is not a problem but if you take the width of the overall fireplace (say it's 6 ft) then take 6 ft on each side of the fireplace you wind up with 18 ft. If you include the fireplace as wall space then you cut down the gap between receptacles. Fireplaces should have a receptacle fairly close to incorporate mantels with lights, clocks, Xmas trimmings, etc. to eliminate extension cords.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not agree that the fireplace opening needs any different treatment than a doorway.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #CP207)

2- 163a - (210-52(b)): Accept
SUBMITTER: CMP 2
RECOMMENDATION: In 210-52(b) add titles as follows:
"(1) Receptacle Outlets Served. In the kitchen...
(2) No Other Outlets. The two or more...
(3) Kitchen Receptacle Requirements. Receptacles installed in...".
SUBSTANTIATION: The panel has added titles to comply with the NEC Style Manual.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #289)

2- 164 - (210-52(b)(1)): Reject
SUBMITTER: J. Michael Scott, Three Forks, MT
RECOMMENDATION: Revise text to read:
(1) In the kitchen, pantry, breakfast room, dining room, or similar

area of a dwelling unit, the two or more 20 ampere small appliance branch circuits required by 210-11(c)(1) shall serve all receptacle outlets covered by Sections 210-52(a) and (c) and receptacle outlets for refrigeration equipment and may also supply the range hood fan.

SUBSTANTIATION: No reason why not.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not presented any substantiation. The panel addressed the range hood issue during the 1996 NEC cycle and concluded that it was not appropriate for the range hood to be connected to the small appliance branch circuit. Depending on the configuration, the range hood can add significant load to the small appliance circuit.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #686)

2- 165 - (210-52(b)(1) Exception No. 2): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Exception No. 2: ~~The receptacle outlet~~ A single receptacle for refrigeration equipment shall be permitted to be supplied from an individual branch circuit rated 15 amperes or greater.
SUBSTANTIATION: Editorial. An individual branch circuit (per definition) implies a single receptacle. The receptacle outlet (per definition) may contain several receptacles. A duplex receptacle at the edge of and above a countertop supplied by a small appliance circuit is not prohibited from supplying a refrigerator. The exception permits a 15 ampere circuit for such receptacle, with no load calculation required.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel has attempted to be reasonable with the exception and not require a single receptacle be used.
The panel notes that the exception permits an additional circuit to supply the refrigerator. It is recognized that frequently the receptacle is indeed located behind the refrigerator making the single receptacle requirement overly burdensome. Should the outlet be close to or above the countertop, it would not count as the required countertop outlet by 210-52(c) and another outlet would be required to be installed and connected to the small appliance branch circuit.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #588)

2- 166 - (210-52(b)(2) Exception No. 3 (New)): Reject
SUBMITTER: John Ziegler, Wentzel Electric
RECOMMENDATION: Add an exception to 210-52(b)(2) to read as follows:
Exception No. 3: A receptacle or direct wire for exhaust hood and light or microwave hood combination, shall be permitted on the small appliance branch circuit required in 210-52(b)(1).
SUBSTANTIATION: Problem. Exhaust hoods changed out to microwave hood combination overloads lighting circuit.
1) Microwave on counter would be on small appliance circuit anyway
2) Gas fired appliances have lights and small fans like hoods and are allowed
3) Referenced equipment should be on 3rd small appliance circuit (See additional submitted proposal)
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-164. The panel does not agree that placing the microwave/range hood on the small appliance branch circuit resolves what is indicated in the substantiation. The panel notes any load placed on the lighting circuit (as noted in the substantiation) would have to comply with 210-23.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4163)

2- 167 - (210-52(b)(2) Exception No. 3): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Add a third Exception as follows:
Exception No. 3: Where receptacles are located to serve a kitchen counter top on a peninsula or an island that is also a fixed room divider between two rooms, and where one of those rooms is not included in Section 210-52(b)(1), and where those receptacles qualify by their location and are used to meet the requirements of Section 210-52(a) for that room, those receptacles shall be permitted to be connected to a small appliance branch circuit.
SUBSTANTIATION: Many times a peninsula is the divider between two rooms. If one of those rooms does not qualify for small-appliance branch-circuit supplied receptacles, then there is a possibility of multiple receptacle outlets at one location. This is definitely unintended and a real burden. Small appliance branch circuits are unlikely to be compromised by the very occasional small loads represented by such items as floor lamps.
It is difficult to imagine a scenario where what would probably be the load connected to no more than one duplex receptacle would unduly burden a small-appliance branch circuit, except in a case where such a load would be an even greater burden on the associated lighting circuit. What isn't difficult to imagine is the consternation of a homeowner looking at the side of the peninsula between the kitchen area and the living room area, and seeing a receptacle just below the counter and a perimeter receptacle two feet below that. This in particular after he or she just threatened to sue the electrician and the municipal inspector for requiring the nice cherry finish to be disrupted by a receptacle.
In the last cycle CMP 2 responsibly recognized that owners simply aren't willing to tolerate tombstone receptacle outlets on flat islands. Any inspector will also tell you they don't want the visual effect of the sides of peninsulas or islands disrupted. I can remember holding a certificate of occupancy for eleven months while I fought with the homeowner about just one receptacle outlet on the side of his island. The electrician had no problem, it was just another opening to him. Remember, on the literal text, you couldn't even split a duplex receptacle with the top half on a small-appliance circuit and the lower half on the lighting circuit, because both halves would still service the countertop and qualify for mandatory inclusion on the small appliance circuit. One receptacle is enough at any given portion of a peninsula. One receptacle required at a point two feet above another on the same peninsula is absurd and unlikely to be enforced.
PANEL ACTION: Reject.
PANEL STATEMENT: The receptacles in the adjacent room should not be permitted on the small appliance branch circuit. Some of the constructions encountered would fit well into the submitter's concept, but others may indeed place a burden on the small appliance branch circuit. Given the wide and varying constructions, it is prudent to keep the receptacles delineated between the two rooms.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4164)

2- 168 - (210-52(b)(3)): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
3. Receptacles installed in a kitchen to serve countertop surfaces shall be supplied by ~~not less~~ no fewer than two small-appliance branch circuits, either or both of which shall also be permitted to supply receptacle outlets in the same kitchen and in other rooms specified in Section 210-52(b)(1). Additional small-appliance branch circuits shall be permitted to supply receptacle outlets in the kitchen and other rooms specified in Section 210-52(b)(1). No small-appliance branch circuit shall serve more than one kitchen.
SUBSTANTIATION: The Style Manual does not mandate that the code be written in violation of accepted principles of English grammar, contrary to popular opinion. That responsibility rests with the code making panels. When a number of items is countable, the term is "fewer" and when not, "less." For example, I might have less sand, but if that were the case, I probably would have fewer grains of sand. The terminology in the Style Manual about "not less than" is on a list, but the list is not an exclusive list. Furthermore, the example in the current style manual ("Shall have a clearance of not less than 5 cm…") is used correctly. See also Sections 280-24(a)(1) and 334-10(a) which use the words correctly.
PANEL ACTION: Accept.

(Log #423)

2- 174 - (210-52(c)(5), Exception): Reject
SUBMITTER: Larry N. Toyas, Toyas Brothers Electrical Contractors Inc./Rep. I.A.E.I.
RECOMMENDATION: Revise 210-52(c)(5) Exception to read as follows:
To comply with the conditions as specified in (a) or (b), receptacle outlets shall not be permitted to be mounted ~~not more than 12 in. (305 mm)~~ below the countertop.
SUBSTANTIATION: It was always apparent to me that a child could pull on a cord and get severely burned by an appliance that was plugged into an outlet below the countertop such as a coffee pot. When I asked about this code at a 1999 code seminar, I was told by the guest speaker that Colorado does not permit outlets below the countertop. Why are you allowing such a dangerous condition to exist. Please stop it before another child is hurt.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel shares concerns relative to the access of a side-mounted receptacle to children and that's why the language minimizes the installation of receptacles on the side of countertops as much as possible with the present products and construction methods. Parents will have to be prudent in their use of side-mounted receptacles where small children are present as they are with many other hazards in the home. The primary requirement is that the receptacles be mounted above the countertops.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
BROWN: There will be a need for the committee to consider the installation requirements for these outlets in relationship to their use by the physically handicapped. Forthcoming actions being taken by the development committee on ANSI A117.1 as soon as they are available. Some of the concerns have already been addressed by the Technical Committee on Electric on NFPA 501, Standard on Manufactured Homes.

(Log #1484)

2- 175 - (210-52(c)(5), Exception): Accept in Principle
Note: The Technical Correlating Committee understands that the values in the panel action are as accepted in the action on Proposal 2-3.
SUBMITTER: Martha Montana, Montana Interior Design
RECOMMENDATION: Revise exception to read as follows:
Exception: To comply with the conditions as specified in (a) or (b), receptacle outlets shall be permitted to be mounted not more

than 12 in. (305 mm) below the countertop. Receptacles mounted below the countertop in accordance with this exception shall not be located where the receptacle countertop extends more than 6 in. (153 mm) beyond the edge of the countertop measured horizontally its support base.

SUBSTANTIATION: As the code text is now written, a receptacle cannot be located on the bottom of the countertop. I would like to be able to use plug mold located within 6 in. of the edge of the countertop even if the countertop extended more than 6 in. beyond the base of the cabinet.
PANEL ACTION: Accept in Principle.
Revise the second sentence of existing Section 210-52(c)(5) Exception to read:
"Receptacles mounted below a countertop that extends more than 6 in. (153 mm) beyond its support base, shall be located so that they are not more than 6 in. (153 mm) from the outside edge of the countertop."
PANEL STATEMENT: The panel has revised the second sentence of the exception to provide specific guidance for receptacles mounted below an extended edge countertop. This wording would allow any method of locating these receptacles (including surface receptacles) provided they are within six inches of the outside edge of the countertop.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
CARPENTER: There has been considerable opposition for allowing receptacle outlets located below countertops to serve countertop spaces. The Panel has provided for a way to allow for a receptacle outlet no more than 12 in. below the countertop when certain conditions are met. This does not totally eliminate the danger of cords being draped over the countertop but, at least, does keep the cord close to the base cabinet. This proposal would allow the draped cord to hang out away from the base cabinet, more susceptible to being caught and pulling the equipment off the surface. These countertop extensions of more than 6 in. are usually used as eating surfaces with chairs or bar stools being used or stored under the area which increases the danger of hooking the cord and causing damage.
NISSEN: I am voting negative based on the negative comments of Mr. Carpenter and Mr. Roche on the proposal's receptacle outlets. I agree that there is a potential hazard in permitting a cord to be connected to this revised location, that is, beneath the overhanging countertop.
ROCHE: Where a countertop extends more than 6 in. beyond its support base, that portion of the countertop is likely to be used as a location for seating. People will be seated on chairs or stools at that countertop, and beside them will be dangling cords plugged into receptacles that would be allowed to be installed by this change. It is a certainty that cords would be hit and devices moved or pulled off the countertop. Restricting that receptacle to be within 6 in. of the outside edge of the countertop does not improve the situation. That 6 in. is a space where there is likely to be significant arm and leg movement by someone seated at the countertop.

(Log #3251)

2- 176 - (210-52(c)(5), Exception): Accept in Principle
SUBMITTER: Michael R. Fisher, Bluhm Electric Inc.
RECOMMENDATION: Revise text to read as follows:
Exception: To comply with the conditions as specified in (a) or (b), receptacle outlets shall be permitted to be mounted not more than 12 in. (305 mm) below countertop. Receptacles mounted below countertop in accordance with this exception shall ~~not be located where the countertop extends more than 6 in. 153 mm).~~ be located within 6 in. (153 mm) from where the countertop extends beyond its support base.
SUBSTANTIATION: Most countertops are extending beyond 6 in. from its support, so we are installing receptacles on sides of cabinets that are in the walkways of the kitchen so when the homeowner uses an appliance the cord end is in the walkway - but if installed under the countertop only the cord is along side, and less likely to be in the way. As long as the receptacle is 6 in. from the countertop, it does not matter how much the countertop extends beyond its support base.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 2-175.

2- 179 - (210-52(d)): Accept in Principle
NOTE: The following proposal consists of Comment 2-119 on Proposal 2-5 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 2-5 was:
Revise Articles 210, 215 and 220 as follows:

ARTICLE 210 -- BRANCH CIRCUITS

A. General Provisions
210-1. Scope. no changes
210-2. Other Articles for Specific-Purpose Branch Circuits. no changes
210-3. Rating. no changes
210-4. Multi-wire Branch Circuits. no changes
210-5. Color Code for Branch Circuits. no changes
210-6. Branch Circuit Voltage Limitations. no changes
210-7. Receptacles and Cord Connectors. no changes
210-8. Ground-Fault Circuit-Interrupter Protection for Personnel. no changes
210-9. Circuits Derived from Autotransformers. no changes
210-10. Ungrounded Conductors Tapped from Grounded Systems. no changes
210-11. Branch Circuits Required. Branch circuits for lighting and for appliances, including motor-operated appliances, shall be provided to supply the loads computed in accordance with Section 220-3. In addition, branch circuits shall be provided for specific loads not covered by Section 220-3 where required elsewhere in this Code and for dwelling unit loads as specified in (c) below.
(a) Number of Branch Circuits. The minimum number of branch circuits shall be determined from the total computed load and the size or rating of the circuits used. In all installations, the number of circuits shall be sufficient to supply the load served. In no case shall the load on any circuit exceed the maximum specified by Section 220-4.
(b) Load Evenly Proportioned Among Branch Circuits. Where the load is computed on a volt-amperes-per-square foot (0.093-sq m) basis, the wiring system up to and including the branch-circuit

panelboard(s) shall be provided to serve not less than the calculated load. This load shall be evenly proportioned among multioutlet branch circuits within the panelboard(s). Branch-circuit overcurrent devices and circuits need only be installed to serve the connected load.

(c) Dwelling Units

(1) Small Appliance Branch Circuits. In addition to the number of branch circuits required by other parts of this section, two or more 20-ampere small appliance branch circuits shall be provided for all receptacle outlets specified by Section 210-52(b).

(2) Laundry Branch Circuits. In addition to the number of branch circuits required by other parts of this section, at least one additional 20-ampere branch circuit shall be provided to supply the laundry receptacle outlet(s) required by Section 210-52(f). This circuit shall have no other outlets.

(3) Bathroom Branch Circuits. In addition to the number of branch circuits required by other parts of this section, at least one 20-ampere branch circuit shall be provided to supply bathroom receptacle outlets. Such circuits shall have no other outlets.

(FPN): See Examples 1(a), 1(b), 2(b), and 4(a), Chapter 9.

B. Branch-Circuit Ratings

210-19. Conductors -- Minimum Ampacity and Size.

(a) General. Branch-circuit conductors shall have an ampacity not less than the maximum load to be served. Where a branch circuit supplies continuous loads or any combination of continuous and noncontinuous loads, the minimum branch-circuit conductor size, without the application of any adjustment or correction factors, shall have an allowable ampacity equal to or greater than the noncontinuous load plus 125 percent of the continuous load. ~~In addition, conductors of multioutlet branch circuits supplying receptacles for cord-and-plug-connected loads shall have an ampacity of not less than the rating of the branch circuit. Cable assemblies where the neutral conductor is smaller than the ungrounded conductors shall be so marked.~~

Exception: Where the assembly including the overcurrent devices protecting the branch circuit are listed for operation at 100 percent of their rating, neither the ampere rating of the overcurrent device nor the ampacity of the branch circuit conductors shall be less than the sum of the continuous load plus the noncontinuous load.

(FPN No. 1): See Section 310-15 for ampacity ratings of conductors.

(FPN No. 2): See Part B of Article 430 for minimum rating of motor branch-circuit conductors.

(FPN No. 3): See Section 310-10 for temperature limitation of conductors.

(FPN No. 4): Conductors for branch circuits as defined in Article 100, sized to prevent a voltage drop exceeding 3 percent at the farthest outlet of power, heating, and lighting loads, or combinations of such loads and where the maximum total voltage drop on both feeders and branch circuits to the farthest outlet does not exceed 5 percent, will provide reasonable efficiency of operation. See Section 215-2 for voltage drop on feeder conductors.

(b) Multioutlet Branch Circuits. Conductors of multioutlet branch circuits supplying receptacles for cord- and plug-connected portable loads shall have an ampacity of not less than the rating of the branch circuit.

(c) Household Ranges and Cooking Appliances. Branch-circuit conductors supplying household ranges, wall-mounted ovens, counter-mounted cooking units, and other household cooking appliances shall have an ampacity not less than the rating of the branch circuit and not less than the maximum load to be served. For ranges of 8 3/4 kW or more rating, the minimum branch-circuit rating shall be 40 amperes.

Exception No. 1: Tap conductors supplying electric ranges, wall-mounted electric ovens, and counter-mounted electric cooking units from a 50-ampere branch circuit shall have an ampacity of not less than 20 and shall be sufficient for the load to be served. The taps shall not be longer than necessary for servicing the appliance.

Exception No. 2: The neutral conductor of a 3-wire branch circuit supplying a household electric range, a wall-mounted oven, or a counter-mounted cooking unit shall be permitted to be smaller than the ungrounded conductors where the maximum demand of a range of 8 3/4 kW or more rating has been computed according to Column A of Table 220-19, but shall have an ampacity of not less than 70 percent of the branch-circuit rating and shall not be smaller than No. 10.

(d) Other Loads. Branch-circuit conductors supplying loads other than those specified in Section 210-2 and other than cooking appliances as covered in (c~~b~~) above ~~and as listed in Section 210-2~~ shall have an ampacity sufficient for the loads served and shall not be smaller than No. 14.

Exception No. 1: Tap conductors for such loads shall have an ampacity not less than 15 for circuits rated less than 40 amperes and not less than 20 for circuits rated at 40 or 50 amperes and only where these tap conductors supply any of the following loads:

a. Individual lampholders or fixtures with taps extending not longer than 18 in. (457 mm) beyond any portion of the lampholder or fixture.

b. A fixture having tap conductors as provided in Section 410-67.

c. Individual outlets, other than receptacle outlets, with taps not over 18 in. (457 mm) long.

d. Infrared lamp industrial heating appliances.

e. Nonheating leads of deicing and snow-melting cables and mats.

Exception No. 2: Fixture wires and cords as permitted in Section 240-4.

210-20. Overcurrent Protection.

Branch-circuit conductors and equipment shall be protected by overcurrent protective devices having a rating or setting complying with (a) through (d) below. ~~(not exceeding that specified in Section 240-3 for conductors, (2) not exceeding that specified in the applicable articles referenced in Section 240-2 for equipment, and (3) as provided for outlet devices in Section 210-21.~~

(a) Continuous and Noncontinuous Loads. Where a branch circuit supplies continuous loads or any combination of continuous and noncontinuous loads, the rating of the overcurrent device shall not be less than the noncontinuous load plus 125 percent of the continuous load.

Exception: Where the assembly including the overcurrent devices protecting the branch circuit are listed for operation at 100 percent of their rating, neither the ampere rating of the overcurrent device nor the ampacity of the branch circuit conductors shall be less than the sum of the continuous load plus the noncontinuous load.

(b) Conductor Protection. Conductors shall be protected in accordance with Section 240-3.

Exception No. 1: Tap conductors as permitted in Section 210-19(d)~~(e)~~ shall be permitted to be protected by the branch-circuit overcurrent device.

Exception No. 2: Fixture wires and cords as permitted in Section 240-4.

~~(FPN): See Section 240-1 for the purpose of overcurrent protection and Sections 210-22 and 220-3 for continuous loads.~~

(c) Equipment. The rating or setting of the overcurrent protective device shall not exceed that specified in the applicable articles referenced in Section 240-2 for equipment.

(d) Outlet Devices. The rating or setting shall not exceed that specified in Section 210-21 for outlet devices.

210-21. Outlet Devices. - no changes

~~210-22. Maximum Loads.~~

The total load shall not exceed the rating of the branch circuit, and it shall not exceed the maximum loads specified in Sections 210-22(a) through (c) under the conditions specified therein.

~~(a) Motor-Operated and Combination Loads. Where a circuit supplies only motor-operated loads, Article 430 shall apply. Where a circuit supplies only air-conditioning equipment, refrigerating equipment, or both, Article 440 shall apply. For circuits supplying loads consisting of motor-operated utilization equipment that is fastened in place and that has a motor larger than 1/8 horsepower in combination with other loads, the total computed load shall be based on 125 percent of the largest motor load plus the sum of the other loads.~~

~~(b) Inductive Lighting Loads. For circuits supplying lighting units having ballasts, transformers, or autotransformers, the computed load shall be based on the total ampere ratings of such units and not on the total watts of the lamps.~~

~~(c) Other Loads. The rating of the branch-circuit overcurrent device serving continuous loads, such as store lighting and similar loads, shall be not less than the noncontinuous load plus 125~~

~~**percent of the continuous load. The minimum branch circuit conductor size, without the application of any adjustment or correction factors, shall have an allowable ampacity equal to or greater than the noncontinuous load plus 125 percent of the continuous load.**~~

~~*Exception: Circuits supplied by an assembly, together with its overcurrent devices, that is listed for continuous operation at 100 percent of its rating.*~~

~~**It shall be acceptable to apply demand factors for range loads in accordance with Table 220-19, including Note 4.**~~

210-21. Outlet Devices. - no changes

210-23. Permissible Loads.

In no case shall the load exceed the branch-circuit ampere rating. An individual branch circuit shall be permitted to supply any load for which it is rated. A branch circuit supplying two or more outlets or receptacles shall supply only the loads specified according to its size in (a) through (d) below and summarized in Section 210-24 and Table 210-24.

(a) 15- and 20-Ampere Branch Circuits. A 15- or 20-ampere branch circuit shall be permitted to supply lighting units, other utilization equipment, or a combination of both. The rating of any one cord- and plug-connected utilization equipment shall not exceed 80 percent of the branch-circuit ampere rating. The total rating of utilization equipment fastened in place shall not exceed 50 percent of the branch-circuit ampere rating where lighting units, cord- and plug-connected utilization equipment not fastened in place, or both, are also supplied.

Exception: The small appliance branch circuits, ~~and the~~ laundry branch circuits, and bathroom branch circuits required in a dwelling unit(s) by Sections 210-11(c)(1), (2), and (3) ~~220-4(b) and (c)~~ shall supply only the receptacle outlets specified in that section.

(b) 30-Ampere Branch Circuits. no changes

(c) 40- and 50-Ampere Branch Circuits. no changes

210-24. Branch-Circuit Requirements -- Summary. no changes

210-25. Common Area Branch Circuits. - no changes

C. Required Outlets

210-50. General. - no changes

210-52. Dwelling Unit Receptacle Outlets.

(a) General Provisions. - no changes

(b) Small Appliances.

(1) In the kitchen, pantry, breakfast room, dining room, or similar area of a dwelling unit, the two or more 20-ampere small appliance branch circuits required by Section 210-11(c)(1) ~~220-4(b)~~ shall serve all receptacle outlets covered by Sections 210-52(a) and (c) and receptacle outlets for refrigeration equipment.

Exception No. 1: In addition to the required receptacles specified by Section 210-52, switched receptacles supplied from a general-purpose branch circuit as defined in Section 210-70(a), Exception No. 1 shall be permitted.

Exception No. 2: The receptacle outlet for refrigeration equipment shall be permitted to be supplied from an individual branch circuit rated 15 amperes or greater.

(2) The two or more small appliance branch circuits specified in (b)(1) above shall have no other outlets.

Exception No. 1: A receptacle installed solely for the electrical supply to and support of an electric clock in any of the rooms specified above.

Exception No. 2: Receptacles installed to provide power for supplemental equipment and lighting on gas-fired ranges, ovens, or counter-mounted cooking units.

(3) Receptacles installed in the kitchen to serve countertop surfaces shall be supplied by not less than two small appliance branch circuits, either or both of which shall also be permitted to supply receptacle outlets in the kitchen and other rooms specified in Section 210-52(b)(1). Additional small appliance branch circuits shall be permitted to supply receptacle outlets in the kitchen and other rooms specified in Section 210-52(b)(1).

(c) Countertops. no changes

(d) Bathrooms. In dwelling units, at least one wall receptacle outlet shall be installed in bathrooms adjacent to each basin location. ~~Bathroom receptacle outlets shall be supplied by at least one 20-ampere branch circuit. Such circuits shall have no other outlets~~ See Section 210-8(a)(1).

Receptacle outlets shall not be installed in a face-up position in the work surfaces or countertops in a bathroom basin location.

(e) Outdoor Outlets. no changes

(f) Laundry Areas. no changes

(g) Basements and Garages. no changes

(h) Hallways. no changes

210-60. Guest Rooms. no changes

210-62. Show Windows. no changes

210-63. Heating, Air-Conditioning, and Refrigeration Equipment Outlet. no changes

210-70. Lighting Outlets Required. no changes

ARTICLE 215 -- FEEDERS

215-1. Scope.

This article covers the installation requirements, overcurrent protection requirements, ~~and~~ minimum size, and ampacity of conductors for feeders supplying branch-circuit loads as computed in accordance with Article 220.

Exception: Feeders for electrolytic cells as covered in Section 668-3(c), Exception Nos. 1 and 4.

215-2. Minimum Rating and Size.

(a) General. Feeder conductors shall have an ampacity not less than required to supply the load as computed in Parts B, C, and D of Article 220. The minimum feeder circuit conductor size, without the application of any adjustment or correction factors, shall have an allowable ampacity equal to or greater than the noncontinuous load plus 125 percent of the continuous load.

Exception: Where the assembly including the overcurrent devices protecting the feeder(s) are listed for operation at 100 percent of their rating, neither the ampere rating of the overcurrent device nor the ampacity of the feeder conductors shall be less than the sum of the continuous load plus the noncontinuous load.

Additional minimum sizes shall be as specified in (b), (c), and (d) below under the conditions stipulated.

~~**Feeder conductors shall have an ampacity not less than required to supply the load as computed in Parts B, C, and D. of Article 220. The minimum sizes shall be as specified in (a) and (b) below under the conditions stipulated. Feeder conductors for a dwelling unit or a mobile home need not be larger than service entrance conductors. Article 310, Note 3, Notes to Ampacity Tables of 0 to 2000 Volts, shall be permitted to be used for conductor size.**~~

(b) For Specified Circuits. The ampacity of feeder conductors shall not be less than 30 amperes where the load supplied consists of any of the following number and types of circuits: (1) two or more 2-wire branch circuits supplied by a 2-wire feeder; (2) more than two 2-wire branch circuits supplied by a 3-wire feeder; (3) two or more 3-wire branch circuits supplied by a 3-wire feeder; or (4) two or more 4-wire branch circuits supplied by a 3-phase, 4-wire feeder.

(c) Ampacity Relative to Service-Entrance Conductors. The feeder conductor ampacity shall not be less than that of the service-entrance conductors where the feeder conductors carry the total load supplied by service-entrance conductors with an ampacity of 55 amperes or less.

(d) Individual Dwelling Unit or Mobile Home Conductors. Feeder conductors for individual dwelling units or mobile homes need not be larger than service-entrance conductors. Article 310, Note 3, Notes to Ampacity Tables of 0 to 2000 Volts, shall be permitted to be used for conductor size.

(FPN No. 1): See Examples 1 through 10 in Chapter 9.

(FPN No. 2): Conductors for feeders as defined in Article 100, sized to prevent a voltage drop exceeding 3 percent at the farthest outlet of power, heating, and lighting loads, or combinations of such loads, and where the maximum total voltage drop on both feeders and branch circuits to the farthest outlet does not exceed 5 percent, will provide reasonable efficiency of operation.

(FPN No. 3): See Section 210-19(a) for voltage drop for branch circuits.

215-3. Overcurrent Protection.

Feeders shall be protected against overcurrent in accordance with the provisions of Part A of Article 240. Where a feeder supplies continuous loads or any combination of continuous and noncontinuous loads, the rating of the overcurrent device shall not be less than the noncontinuous load plus 125 percent of the continuous load.

Exception: Where the assembly including the overcurrent devices protecting the feeder(s) are listed for operation at 100 percent of their rating, neither the ampere rating of the overcurrent device nor the ampacity of the feeder conductors shall be less than the sum of the continuous load plus the noncontinuous load.

215-4. Feeders with Common Neutral. no changes

215-5. Diagrams of Feeders. no changes
215-6. Feeder Conductor Grounding Means. no changes
215-7. Ungrounded Conductors Tapped from Grounded Systems. no changes
215-8. Means of Identifying Conductor with the Higher Voltage to Ground. no changes
215-9. Ground-Fault Circuit-Interrupter Protection for Personnel. no changes
215-10. Ground-Fault Protection of Equipment. no changes
215-11. Circuits Derived from Autotransformers. no changes

ARTICLE 220 -- BRANCH-CIRCUIT, FEEDER, AND SERVICE CALCULATIONS

A. General

220-1. Scope.

This article provides requirements for ~~determining the number of branch circuits required and for~~ computing branch-circuit, feeder, and service loads.

Exception: Branch-circuit and feeder calculations for electrolytic cells as covered in Section 668-3(c), Exception Nos. 1 and 4.

220-2. Voltages. no changes

220-3. Computation of Branch Circuits Loads. Branch-circuit loads shall be computed as shown in (a) through (c) below.

~~(a) Continuous and Noncontinuous Loads. The branch circuit rating shall not be less than the noncontinuous load plus 125 percent of the continuous load. The minimum branch circuit conductor size without the application of any adjustment or correction factors, shall have an allowable ampacity equal to or greater than the noncontinuous load plus 125 percent of the continuous load.~~

~~Exception: Where the assembly, including overcurrent devices, is listed for continuous operation of 100 percent of its rating.~~

(a) Lighting Load for Specified ~~Listed~~ Occupancies. A unit load of not less than that specified in Table 220-3(~~ab~~) for occupancies specified ~~listed~~ therein shall constitute the minimum lighting load for each square foot (0.093 sq m) of floor area. The floor area for each floor shall be computed from the outside dimensions of the building, dwelling unit, or other area involved. For dwelling units, the computed floor area shall not include open porches, garages, or unused or unfinished spaces not adaptable for future use.

(FPN): The unit values herein are based on minimum load conditions and 100 percent power factor, and may not provide sufficient capacity for the installation contemplated.

(b) Other Loads -- All Occupancies. In all occupancies, the minimum load for each outlet for general-use receptacles and outlets not used for general illumination shall be not less than that computed in (1) through (10) below, ~~the following,~~ the loads shown being based on nominal branch-circuit voltages.

Exception: The loads of outlets serving switchboards and switching frames in telephone exchanges shall be waived from the computations.

(1) Specific appliances or loads. An ~~O~~outlet for a specific appliance or other load not covered in (2) through (9) below ~~except for a motor load~~ .....~~.~~shall be computed based on the ampere rating of appliance or load served.

(2) Electric Dryers and household electric cooking appliances. Load computations shall be permitted as specified ~~given~~ in Section 220-18 for electric dryers and Section 220-19 for electric ranges and other cooking appliances.

(3) Motor loads. Outlets for motor loads shall be computed in accordance with the requirements in ~~Articles 430~~ Sections 430-22 and 430-24 and Article 440. ~~(see Sections 430-22 and 430-24 and Article 440).~~

(4) Recessed lighting fixtures. An outlet supplying recessed lighting fixture(s) shall be computed based on the maximum volt-ampere rating of the equipment and lamps for which the fixture(s) is rated.

(5) Heavy duty lampholders. Outlets for heavy-duty lampholders shall be computed at a minimum of .....600 volt-amperes.

(6) Track lighting. Track lighting shall be computed based on Section 410-102. ~~(see Section 410-102)~~

(7) Sign and outline lighting. Sign and outline lighting outlets shall be computed at 1200 volt-amperes for each required branch circuit specified in Section 600-5(a).

(8) Show windows. Show windows shall be computed per Section 220-12.

(9) Fixed multioutlet assemblies. Fixed multioutlet assemblies used in other than dwelling units or the guest rooms of hotels or motels shall be computed in accordance with (a) or (b) below.

(a) Where appliances are unlikely to be used simultaneously, each 5 ft (1.52 m) or fraction thereof of each separate and continuous length shall be considered as one outlet of not less than 180 volt-amperes.

(b) Where appliances are likely to be used simultaneously, each 1 ft (305 mm) or fraction thereof shall be considered as an outlet of not less than 180 volt-amperes.

(10) Other outlets.~~*~~ ~~—~~Other outlets not covered in (1) through (9) above shall be computed based on 180 volt-amperes per outlet.

(a) For receptacle outlets, each single or each multiple receptacle on one strap shall be considered at not less than 180 volt-amperes.

(b) All general-use receptacle outlets of 20-ampere or less rating in one-family, two-family, and multi-family dwellings and in guest rooms of hotels and motels [except those connected to the receptacle circuits specified in Sections 210-11(c)(1) and (2)] shall be considered as outlets for general illumination, and are included in the general lighting load calculations of Section 220-3(a). No additional load calculations shall be required for such outlets.

(c)~~*~~ This provision shall not be applicable to receptacle outlets connected to the circuits specified in Sections 210-11(c)(1) and (2).~~220-4(b) and (c)~~

Exception No. 1: Where fixed multioutlet assemblies are employed, each 5 ft (1.52 m) or fraction thereof of each separate and continuous length shall be considered as one outlet of not less than 180 volt-amperes capacity unless appliances are likely to be used simultaneously. Where appliances are likely to be used simultaneously, each 1 ft (305 mm) or fraction thereof shall be considered as an outlet of not less than 180 volt-amperes. The requirements of this exception shall not apply to dwelling units or to the guest rooms of hotels or motels.

Exception No. 2: Table 220-19 shall be permitted for computing the load of household electric ranges.

Exception No. 3: A load of not less than 200 volt amperes per linear ft (305 mm) of show window, measured horizontally along its base, shall be permitted instead of the specified unit load per outlet.

Exception No. 4: The loads of outlets serving switchboards and switching frames in telephone exchanges shall be waived from the computations.

Exception No. 5: Section 220-18 shall be considered as a permitted method of computing the load for a household electric clothes dryer.

(c) Loads for Additions to Existing Installations. no changes

Table 220-3(a). General Lighting Loads by Occupancies

(at the bottom of Table 220-3(a) - revise the * footnote as follows:)

***See Section 220-3(b)(10)(b)~~-All general-use receptacle outlets of 20-ampere or less rating in one-family, two-family, and multifamily dwellings and in guest rooms of hotels and motels [except those connected to the receptacle circuits specified in Sections 220-4(b) and (c)[] shall be considered as outlets for general illumination, and no additional load calculations shall be required for such outlets.~~**

220-4. Maximum Loads. The total load shall not exceed the rating of the branch circuit, and it shall not exceed the maximum loads specified in (a) through (c) below under the conditions specified therein.

(a) Motor-Operated and Combination Loads. Where a circuit supplies only motor-operated loads, Article 430 shall apply. Where a circuit supplies only air-conditioning equipment, refrigerating equipment, or both, Article 440 shall apply. For circuits supplying loads consisting of motor-operated utilization equipment that is fastened in place and that has a motor larger than 1/8 horsepower in combination with other loads, the total computed load shall be based on 125 percent of the largest motor load plus the sum of the other loads.

(b) Inductive Lighting Loads. For circuits supplying lighting units having ballasts, transformers, or autotransformers, the computed load shall be based on the total ampere ratings of such units and not on the total watts of the lamps.

(c) Range Loads. It shall be acceptable to apply demand factors for range loads in accordance with Table 220-19, including Note 4. ~~220-4. Branch Circuits Required.~~

~~Branch circuits for lighting and for appliances, including motor operated appliances, shall be provided to supply the loads computed in accordance with Section 220-3. In addition, branch circuits shall be provided for specific loads not covered by Section 220-3 where required elsewhere in this Code; for small appliance loads as specified in (b) below; and for laundry loads as specified in (c) below..~~

~~(a) Number of Branch Circuits. The minimum number of branch circuits shall be determined from the total computed load and the size or rating of the circuits used. In all installations, the number of circuits shall be sufficient to supply the load served. In no case shall the load on any circuit exceed the maximum specified by Section 210-22~~

~~(b) Small Appliance Branch Circuits. Dwelling Unit. In addition to the number of branch circuits determined in accordance with (a) above, two or more 20 ampere small appliance branch circuits shall be provided for all receptacle outlets specified by Section 210-52 for the small appliance loads.~~

~~(c) Laundry Branch Circuits. Dwelling Unit. In addition to the number of branch circuits determined in accordance with (a) and (b) above, at least one additional 20-ampere branch circuit shall be provided to supply the laundry receptacle outlet(s) required by Section 210-52(f). This circuit shall have no other outlets.~~

~~(d) Load Evenly Proportioned Among Branch Circuits. Where the load is computed on a volt-amperes per square foot (0.093 sq m) basis, the wiring system up to and including the branch circuit panelboard(s) shall be provided to serve not less than the calculated load. This load shall be evenly proportioned among multioutlet branch circuits within the panelboard(s). Branch-circuit overcurrent devices and circuits need only be installed to serve the connected load.~~

~~(FPN): See Examples 1(a), 1(b), 2(b) and 4(a), Chapter 9.~~

B. Feeders and Services

220-10. General.

(a) ~~Ampacity and~~ Computed Loads. ~~Feeder conductors shall have sufficient ampacity to supply the load served. In no case shall the~~ The computed load of a feeder shall not be less than the sum of the loads on the branch circuits supplied as determined by Part A of this article after any applicable demand factors permitted by Parts B, C, or D have been applied.

(FPN): See Examples 1 through 10, Chapter 9. See Section 220-4(b) ~~210-22(b)~~ for maximum load in amperes permitted for lighting units operating at less than 100 percent power factor.

~~(b) Continuous and Noncontinuous Loads. Where a feeder supplies continuous loads or any combination of continuous and noncontinuous loads, the rating of the overcurrent device shall not be less than the noncontinuous load plus 125 percent of the continuous load. The minimum feeder circuit conductor size, without the application of any adjustment or correction factors, shall have an allowable ampacity equal to or greater than the noncontinuous load plus 125 percent of the continuous load.~~

~~Exception: Where the assembly including the overcurrent devices protecting the feeder(s) are listed for operation at 100 percent of their rating, neither the ampere rating of the overcurrent device nor the ampacity of the feeder conductors shall be less than the sum of the continuous load plus the noncontinuous load.~~

220-11. General Lighting. The demand factors specified ~~listed~~ in Table 220-11 shall apply to that portion of the total branch-circuit load computed for general illumination. They shall not be applied in determining the number of branch circuits for general illumination.

220-12. Show-Window Lighting. no changes

220-13. Receptacle Loads -- Nondwelling Units. In other than dwelling units, receptacle loads computed at not more than 180 volt-amperes per outlet in accordance with Section 220-3(b)(10) ~~220-3(c)(7)~~ and fixed multi-outlet assemblies computed in accordance with Section 220-3(b)(9) shall be permitted to be added to the lighting loads and made subject to the demand factors given in Table 220-11, or they shall be permitted to be made subject to the demand factors given in Table 220-13.

220-14. Motors. - no changes

220-15. Fixed Electric Space Heating. - no changes

220-16. Small Appliance and Laundry Loads -- Dwelling Unit.

(a) Small Appliance Circuit Load. In each dwelling unit, the feeder load shall be computed at 1500 volt-amperes for each 2-wire small appliance branch circuit required by Section 210-11(c)(1)~~220-4(b) for small appliances supplied by 15 or 20 ampere receptacles on 20 ampere branch circuits in the kitchen, pantry, dining room, and breakfast room.~~ . Where the load is subdivided through two or more feeders, the computed load for each shall include not less than 1500 volt-amperes for each 2-wire small appliance branch circuit~~.for small appliances.~~ These loads shall be permitted to be included with the general lighting load and subjected to the demand factors provided ~~permitted~~ in Table 220-11~~. for the general lighting load.~~

(b) Laundry Circuit Load. A feeder load of not less than 1500 volt-amperes shall be included for each 2-wire laundry branch circuit installed as required by Section 210-11(c)(2)~~220-4(c)~~. This load shall be permitted to be included with the general lighting load and subjected to the demand factors provided in Table 220-11. ~~It shall be permissible to include this load with the genial lighting load and subject it to the demand factors provided in Section 220-11.~~

220-17. Appliance Load -- Dwelling Unit(s). - no changes

220-18. Electric Clothes Dryers -- Dwelling Unit(s). - no changes

220-19. Electric Ranges and Other Cooking Appliances -- Dwelling Unit(s). - no changes

220-20. Kitchen Equipment -- Other than Dwelling Unit(s). - no changes

220-21. Noncoincident Loads. - no changes

220-22. Feeder Neutral Load. - no changes

C. Optional Calculations for Computing Feeder and Service Loads - no changes

D. Method for Computing Farm Loads no changes

SUBMITTER: Robert H. Keis, Dover, DE

RECOMMENDATION: Remove the word "basin" in the following sentence.

Receptacle outlets shall not be installed in a face-up position in the work surfaces or countertops in a bathroom basin location.

SUBSTANTIATION: There is just as much chance for spillage on the work surfaces in a bathroom without a basin as there is a work surface with a basin. This corrected wording can be found in the present Section 210-52(c)(5) for kitchen sinks and in new proposal 2-216 concerning wet bar sinks. Section 550-8(f)(2) prohibits a faceup outlet in any countertop as does 551-41(d). The only countertop you can put a face-up receptacle in is in a dwelling bathroom if it doesn't have a basin in it. This should not be considered new material as this section is in the process of a rewrite.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action on Proposal 2-53. This addresses the submitter's concern for bathroom work surfaces.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #CP209)

2- 178a - (210-52(d)): Accept

SUBMITTER: CMP 2

RECOMMENDATION: Delete the last phrase "See section 210-8(a)(1)" from Section 210-52(d).

SUBSTANTIATION: The panel has eliminated the mandatory cross-reference to comply with the Style Manual.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #3052)

2- 180 - (210-52(d)): Reject

SUBMITTER: Dwayne A. Gunnels, Clio, MI

RECOMMENDATION: Delete the second sentence:

~~The receptacle outlet shall be located on a wall that is adjacent to the basin location.~~

SUBSTANTIATION: The interpretation of the word adjacent is not clear. Locating the receptacle within 36 in. of the edge of the basin is sufficient. Frequently a large mirror is covering the wall in front of the basin. This is not a practical location for the receptacle. It should be possible to install on any wall as long as it is within 36 in. of the basin.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel had many public comments on this issue during the last code cycle. The word "adjacent" is defined in the dictionary to mean "next to". The objective is to not allow the receptacle on the wall in front of the basin (behind the user) and still meet the 36 in. requirement. This was the noted concern from submitters during the last code cycle.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #3192)

2- 181 - (210-52(d)): Reject
SUBMITTER: William J. Miner, Saginaw, MI
RECOMMENDATION: In the second line after the words "36 in." add the words measured horizontally so the section will read:
"... shall be installed in bathrooms within 36 in. (914 mm) measured horizontally of the...".
SUBSTANTIATION: In cases of large mirrors or tile walls where it isn't practical to place a receptacle, a person should be ~~able~~permitted to place the receptacle at any vertical point within 36 in. horizontally. The code isn't clear on whether the distance is horizontal vertical or shortest distance.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirement is that the receptacle be within 36 in. The Code is clear as the distance is to be the shortest distance where no other requirement is applicable. This prohibits installing receptacles at heights where they are impractical and could impose potential hazards.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3252)

2- 182 - (210-52(d)): Reject
SUBMITTER: Michael R. Fisher, Bluhm Electric Inc.
RECOMMENDATION: Revise text to read as follows:
"Bathrooms. In dwelling units, at least one wall receptacle outlet shall be installed in bathrooms, within ~~36 in. (914 mm)~~ the countertop it serves. The receptacle outlet for a single hung sink shall be located on a wall adjacent to the basin location. See Section 210.8(a)(1).
Receptacle outlets shall not be installed in face up position in the work surfaces or countertops of bathroom basin location."
SUBSTANTIATION: Within 36 in. of basin, we now have longer countertops, so the receptacles then is placed on the mirror or to the shallow side of the basin. If placed in mirror surface it becomes a problem for mirror installer to cut the proper hole size, which means we need to use sparkings and becomes difficult to use a GFCI receptacle, also the receptacles when mirror is cleaned is being constantly sprayed, which can cause a safety issue inside receptacles, and when placed on close, side of sink, you are always dragging your cord over the basin - a potential safety hazard. There appears that most of the appliances used in the bathroom, they do not need to be within 3 in. of basin for use.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel notes that the submitter's substantiation primarily concerns installation in a mirrored wall. If this is the desired location by the designer (or installer) there are many acceptable methods of installing the receptacle safely. The submitter's proposal would limit the number of alternatives available to meet the code requirement.

(Log #3864)

2- 183 - (210-52(d)): Accept
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Delete the existing second paragraph of this Section as shown:
"~~Receptacle outlets shall not be installed in a face-up position in the work surfaces or countertops in a bathroom basin location.~~
SUBSTANTIATION: This is a companion proposal to one that intends to locate this requirement in Section 210-7 so it will apply to all dwelling unit receptacle outlets.
PANEL ACTION: Accept.
PANEL STATEMENT: See panel action and statement on Proposal 2-53.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3926)

2- 184 - (210-52(d)): Reject
SUBMITTER: Charles J. Palmieri, Palmieri Assoc.
RECOMMENDATION: Add the following text to this section:
(d) Bathrooms. In dwelling units, at least one wall receptacle outlet shall be installed in bathrooms located above, but not more than 18 in. above the basin, and within 36 in. (914 mm) of the outside edge of each basin. The receptacle outlet shall be located on a wall that is adjacent to the basin location. See Section 210-8(a)(1).
SUBSTANTIATION: Section 210-52(c) Countertops (5) Receptacle Outlet Location is distinctive in locating outlets to serve a function be above the location to be served. In many other areas of the code both vertical and horizontal restrictions are established. Following that logic the same requirements for bathroom receptacles would be well served to be included in the 2002 Code.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirements in Section 210-52(d) meet the intent of the panel for the receptacle location, and no more restrictive placement is warranted based on the substantiation provided by the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

(Log #4112)

2- 186 - (210-52(d)): Reject
SUBMITTER: Truman C. Surbrook, Michigan State University
RECOMMENDATION: Delete the last sentence of the section.
SUBSTANTIATION: The word "adjacent" is confusing to many inspectors and installers. Frequently it is easier to install the receptacle on an adjoining wall when a full length mirror in on the wall in front of the basin.
PANEL ACTION: Reject.
PANEL STATEMENT: The word "adjacent" is necessary to avoid placing the receptacle on the wall behind the user. See also the panel statement on Proposal 2-180.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4113)

2- 187 - (210-52(d)): Reject
SUBMITTER: Robert Fick, Michigan State University
RECOMMENDATION: Add the words measured horizontally after the 36 in. so the section will read as follows:
"...shall be installed in bathrooms within 36 in. (914 mm) measured horizontally of the outside edge of the basin."
SUBSTANTIATION: It is not specified how the measurement is to be made. The measurement needs to be horizontal because tile or a mirror is frequently installed in front of the basin making it difficult to locate the receptacle other than measured horizontally.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-181.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4366)

2- 188 - (210-52(d)): Reject
SUBMITTER: Ed Stubbs, City of Atlanta, GA
RECOMMENDATION: Revise text as follows:
210-52. Dwelling Unit Receptacle Outlets. (Add to text)
(d) Bathrooms. In dwelling units, at least one wall receptacle outlet shall be installed in bathrooms within 36 in. (914 mm) of the outside edge of each basin. The receptacle outlet shall be located on a wall that is adjacent to the basin location. (Adjacent in this code shall be located above the basin if the basin is mounted in a wall to wall basin top or cabinet supporting the basin.) See Section 210-8(a)(1).
(Add to text) Exception No. 1: If the basin has a base only, the receptacle outlet shall be no lower than 12 in. (____ mm) below the basin edge and shall include the maximum of 36 in. (914 mm) away from the basin edge.
(Add to text) Exception No. 2: If the basin has a cabinet support and basin top; and is separated from a side wall, the receptacle outlet shall be no lower than 12 in. (____ mm) below the basin edge and shall include the maximum of 36 in. (914 mm) away from the basin edge.
SUBSTANTIATION: Making the requirement of 36 in. from the basin edge allows the contractor/owner to place the receptacle in the baseboard of the adjacent wall since you didn't specify a height requirement. Most of your bathroom basins are 30 in. above the floor. If you don't specify a height, they have and will put the outlet in the baseboard and some have moved it in the base of the cabinet of the basin. Well, isn't that within 36 in. of the basin? What is the intent? The code forces the owners to have a receptacle in the bathroom, but allows them to put it out of reach close to the floor and then forces others to get an extension cord because the equipment cord is to short to dry your hair. Are we not defeating the intent? A direction is needed to remove the debate on the location of the outlet. As an Inspector I am forced to debate with homeowners on the outlet height. Now the next issue is "what is a powder room?"
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-184.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #534)

2- 189 - (210-52(e)): Reject
SUBMITTER: John M. Vargo, City of Lorain, OH
RECOMMENDATION: Revise as follows:
For a one-family dwelling, each unit of a two-family dwelling and each (dwelling unit in "row" housing) that is at grade level, etc.
SUBSTANTIATION: Dwelling units in "row" housing should be included in 210-52(e) as per the 1999 NEC Handbook Figure 210.28. The one-family dwelling in Figure 210.28 must be changed to dwelling unit because it is a definition contradiction.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's description of row housing is not clear. Each house would be a one-family dwelling (constructed in accordance with the definition to be separate buildings), and would require a receptacle in front and back. If the "row houses" were actually units of a multi-family dwelling (multiple units in a single building) the requirement for receptacles in front and back would not be applicable.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
BROWN: The substantiation of the submitter noting the problems in the definitions in the NEC is well founded. The Technical Correlating Committee should take action to revise existing definitions, and also include new definitions that would better relate the requirements of the NEC to those found in the model building codes, and the documents of the NFPA family of codes and standards. With jurisdictions now adopting a "single correlated set" of construction codes for the built environment, this will increasingly become an issue of importance.

(Log #2020)

2- 189a - (210-52(e)): Reject
SUBMITTER: Jerry Knoerr, Village of Greendale, Village of Mukwonago, WI
RECOMMENDATION: Add sentence that an outdoor outlet be provided within 3 ft of all patio doors that exit to the ground level.
SUBSTANTIATION: There are frequently no outlets for people to use on a patio.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided substantiation to change the basic rule that requires a receptacle in the front and back of the dwelling unit. The substantiation indicates that the submitter is concerned with a convenience issue that must be dealt with by the designer.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2506)

2- 190 - (210-52(e)): Reject
SUBMITTER: Angelo S. Sperlongo, City of Coral Springs, FL
RECOMMENDATION: Revise as follows:
For a one-family dwelling and each unit of a two-family dwelling that is at grade level, at least one receptacle outlet accessible at grade level and not more than 6 1/2 ft above grade shall be installed at the front and back of the dwelling, the receptacle shall be installed outside of any enclosure added to back of the dwelling.
SUBSTANTIATION: To prevent the use of extension cords being run through doors and windows to get outside an enclosure. Many times an inground pool is added to a dwelling with an enclosure. The receptacle that was originally installed at back of dwelling is not accessible to backyard. I have witnessed extension cords run across a pool to get outside the enclosure.
PANEL ACTION: Reject.
PANEL STATEMENT: The code language requires that the receptacle be "accessible at grade level". If the user has to go inside an "enclosure" to get to the receptacle, then it is not accessible at grade level. The panel cannot anticipate what alterations might be made to the structure at a later date that might change the application of the rule.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:

(Log #2754)

2- 191 - (210-52(e)): Reject
SUBMITTER: Joseph N. Fiorello, Sr., Fiorello Electric Inc.
RECOMMENDATION: Revise as follows:
(e) Outdoor Outlets. For a one-family dwelling, and each unit of a two-family dwelling that is at grade level. ~~at least one~~.
(a) Receptacle outlet accessible at grade level and not more than 6 1/2 ft above grade shall be installed ~~at~~ to serve the front and back of the dwelling.
SUBSTANTIATION: The word at limits the installers options. As long as the outlet is located to serve the front and back such a definite location need not be given. If the intent of the code be one receptacle at each front and back the wording "~~at least one~~" "receptacle" should be deleted.
PANEL ACTION: Reject.
PANEL STATEMENT: The word "at" is used in this section to avoid the argument that a single receptacle installed on the side of the house serves both the front and back.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3159)

2- 192 - (210-52(e)): Reject
SUBMITTER: Richard Kownacki, Totowa, NJ
RECOMMENDATION: Add the following text:
Outdoor receptacle outlets shall not be installed less than 12 in. above finished grade.

SUBSTANTIATION: Currently, there is no minimum height requirement for outdoor receptacles. I have seen many receptacles installed only an inch or two above the ground, and some even lower. This close proximity to the ground virtually insures that water will enter the outlet box. Weatherproof receptacle covers are designed to prevent water from entering from above (rain), they do not effectively protect from water splashing upward from below, as from a heavy rain. Also, a few inches of wet snow can effectively place a receptacle under water.
Safety concerns: In dwelling units, receptacle replacement is commonly done by the homeowner or a handyman, usually, unqualified personnel. To replace a receptacle mounted in a box an inch off the ground and make wiring repairs, it is usually necessary to lie down on the ground. The ground is likely to be damp, there may or may not be any ground fault protection, and the circuit may or may not be energized. The hazards of these situations can be greatly reduced by establishing a minimum mounting height for outdoor receptacles. Twelve inches would seem to be a reasonable height.
PANEL ACTION: Reject.
PANEL STATEMENT: There are proper methods and materials that can be used to locate a receptacle in close proximity to the ground. The panel does not want to restrict the use of these materials. Listed wet location covers are evaluated for water splashing up from below.

(Log #4399)

2- 193 - (210-52(e)(1) (New)): Reject
SUBMITTER: Monte R. Ewing, State of Wisconsin
RECOMMENDATION: Add new text to read as follows:
(1) In multi-family dwellings at least one receptacle outlet accessible at grade level and not more than 6 ft 6 in. above grade shall be installed outdoors for each dwelling unit which is located at grade level and which has individual entrance/exit doors to grade.
SUBSTANTIATION: The same problem of people running cords through the exterior door exists for the grade level multi-family dwelling units as does the single- and two-family dwelling units (car heaters, radios, etc.). Keep in mind that there are lots of condominiums utilized as single family having to perform their own yard maintenance but the NEC does not require any exterior receptacles because these buildings are multi-family. The State of Wisconsin has had this requirement in their code for over three NEC code cycle now and I feel it needs to be addressed by the National Electrical Code.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel is not compelled by the limited substantiation that the rule should be applied to all dwelling units. In multi-family arrangements, issues associated with receptacle use only by the owner, and other abuses, can lead to other hazards.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1142)

2- 194 - (210-52(g) and 210-63): Reject
SUBMITTER: James A. Perkins, City of Rochester, NH
RECOMMENDATION: Revise 210-52(g) to read:
210-52(g) Basements and Garages. For a one-family dwelling, at least one receptacle outlet, in addition to any provided for laundry equipment, shall be installed in each basement and in each attached garage, and in each detached garage with electric power. See Sections 210-8(a)(2) and (a)(5). Where a portion of the basement is finished into a habitable room(s) the receptacle outlet required by this section shall be installed in the unfinished portion.
FPN: See Section 210-63 Requirement for installation of heating equipment service receptacle outlet in basements.
Revise 210-63 to read:
210-63. Heating, Air-Conditioning, and Refrigeration Equipment Outlet. A 125-volt, single phase, 15- or 20-ampere-rated receptacle outlet shall be installed at an accessible location for the servicing of heating, air-conditioning, and refrigeration equipment on rooftops, in attics, basements and crawl spaces. The receptacle shall be located on the same level and within 25 ft (7.62 m) of the heating, air-conditioning, and refrigeration equipment. The receptacle outlet shall not be connected to the load side of the equipment disconnecting means.
Exception: Rooftop equipment on one- and two-family dwellings.
FPN: See Section 210-8 for ground-fault circuit-interrupter requirements.
SUBSTANTIATION: During my inspections of many large new homes, I have found many to be in excess from 50 ft to 75 ft from the boilers (heating equipment) to the nearest basement receptacle outlet. I do believe that a service outlet in the heating equipment area of the basement could possibly eliminate later servicing hazards. Also, in commercial areas.
PANEL ACTION: Reject.
PANEL STATEMENT: Since the present code already requires a receptacle in the basement, the addition of language to specify the distance serves little purpose. The panel does not see any hazard presented if the receptacle in the basement is 50 ft. away. In the 210-63 locations, the distance is specified because the receptacle's sole purpose was to provide power for servicing in attics, rooftops, and crawl spaces.

(Log #3792)

2- 196 - (210-52(g)): Accept
SUBMITTER: John I. Williamson, Minnesota Board of Electricity
RECOMMENDATION: Modify the wording in the last sentence to read as follows:
"Where a portion of the basement is finished into one or more habitable rooms, each separate unfinished portion shall have a receptacle outlet installed in accordance with this section."
SUBSTANTIATION: Very often, basements that are finished into habitable rooms result in more than one discontinuous unfinished area. These unfinished areas may be widely separated at opposite ends of a basement. It does not create an undue hardship to require a receptacle outlet in each separate unfinished area. This new requirement, together with the requirement for GFCI protection, will help to increase life safety when portable tools and other cord- and plug-connected equipment is used in damp unfinished basement areas that may pose a higher risk of electric shock.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3398)

2- 197 - (210-52(h)): Reject
SUBMITTER: Donald Kuntz, Denton Electric

RECOMMENDATION: Revise text to read as follows:
"In dwelling units, hallways and clothes closets of 10 ft or more in length shall have at least one receptacle outlet."
SUBSTANTIATION: Closets of this size could use an outlet for many of the same reasons a hallway does, mainly for vacuum.
PANEL ACTION: Reject.
PANEL STATEMENT: The desire to have a receptacle in a clothes closet is a design issue and should not be required in all installations.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:

(Log #1875)

2- 198 - (210-55 (New)): Reject
SUBMITTER: Ivan Sucic, City of Willoughby Hills, OH
RECOMMENDATION: I propose the following new section to be added to the NEC under Article 210, Branch Circuits. (This is a direct quote from the International One- and Two-Family Dwelling Code 1998 - Section 316.)
Section 210.55 — Dwelling Unit Smoke Detectors.
210.71 Smoke detectors required. Smoke detectors shall be installed in each sleeping room, outside of each separate sleeping area in the immediate vicinity of the bedrooms and on each additional story of the dwelling, including crawl spaces and uninhabitable attics. In dwellings or dwelling units with split levels, a smoke detector needs be installed only on the upper level, provided the lower level is less than one full story below the upper level, except that if there is a door between levels, then a detector is required on each level. All detectors shall be interconnected such that the actuation of one alarm will activate all the alarms in the individual unit and shall provide an alarm which will be audible in all sleeping areas. All detectors shall be approved and listed and shall be installed in accordance with the manufacturer's instructions.
210.55.1 Alterations, repairs and additions. When alterations, repairs or additions requiring a permit occur, or when one or more sleeping rooms are added or created in existing dwellings, the entire building shall be provided with smoke detectors located as required for new dwellings; the smoke detectors shall be interconnected and hard wired.
Exception: Detectors shall not be interconnected and hard wired where the alterations, repairs or additions do not result in the exposure of electrical wiring by the removal of interior wall and ceiling finishes.
210.55.2 Power source. In new construction, the required smoke detectors shall receive their primary power from the building wiring when such wiring is served from a commercial source, and when primary power is interrupted, shall receive power from a battery. Wiring shall be permanent and without a disconnecting switch other than those required for overcurrent protection. Smoke detectors shall be permitted to be battery operated when installed in existing buildings or in buildings without commercial power or in buildings that undergo alterations, repairs or additions regulated by Section 316.1.1.
SUBSTANTIATION: At the present time smoke detector installations are required by Building Codes, but such installations are generally done by electrical contractors. Often these electrical contractors are bidding on jobs only per minimum requirements of the NEC. They base their bids on these minimum requirements and seldom refer to any building codes. If a building contractor or other subcontractor does not include smoke detectors in their bid specifications, the electrical contractor does not include them in their bid and does not do such installations.
In larger communities where there are separate electrical and building inspectors, the electrical inspector inspects only those items required by the NEC. The building inspector inspects per building codes. This leaves the installation of smoke detectors in limbo. There is confusing as to which inspector must approve or disapprove installations. Even in communities where one inspector does all inspections, the inspector is left with a problem of who to cite for any violations regarding smoke detectors, the electrical contractor or the general contractor.
Smoke detectors are electrical installations not required by NEC but are required only under building codes. If a requirement mandating installation of smoke detectors were included in the NEC as well as the building codes it would remove the ambiguity and confusion of responsibility.
PANEL ACTION: Reject.
PANEL STATEMENT: The placement of smoke detectors is covered by NFPA 101, The Life Safety Code. The NEC does provide guidance on how to get power to the detector, but requirements for the detector locations are not under the scope of the NEC. See NEC Section 90-1.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
BROWN: The submitter has submitted a proposal for the location and installation of smoke alarm devices, not one of the safety concerns of the electrical installation as found in the NEC. As noted by the submitter, the concerns for when smoke alarms are required are already outlined in the model building codes, and NFPA 101 - Life Safety Code. NFPA 72 - Fire Alarm Code, addresses the requirements of the installation of the smoke alarms when they are required. All things considered, if the electrician installs the electrical wiring and locates the alarm relative to the ceiling or wall in accordance with the instructions included with the listed smoke alarm, one need only be aware of which rooms require the installation of an alarm.

(Log #3236)

2- 199 - (210-60): Reject
SUBMITTER: Edward J. Fox, Jr., Orange County Bldg Div., FL
RECOMMENDATION: 210-60. Guest Rooms. Guestrooms in hotels, motels, and similar occupancies shall have receptacle outlets installed in accordance with Section 210-52. See Section 210-8(b)(1).
(b) Receptacle Placement. In applying the provisions of Section 210-52(a), the total number of receptacle outlets shall not be less than the minimum number that would comply with the provisions of that section by using 210-52(a)(1) guidelines only, excluding 210-52(a)(2) and (3).
SUBSTANTIATION: By excluding 210-52(a)(2) and (3) requirements, you are only measuring the total length of wall space in an area for a room whether it is including a door, movable panel, or short wall space. You are only concerned with the entire length of wall space.
I have seen many large hotel rooms that require far too many receptacles for hotel rooms due to doors, partitions, wall cut outs and configurations. When the furniture is fixed in place, basically the owners define the areas. When you have a fixed furniture layout, you know how and what uses the room is designed for, and you can design for that and not over design.
PANEL ACTION: Reject.
PANEL STATEMENT: Experience has shown that reducing the application of the rule would increase the use of extension cords in guest rooms.

AFFIRMATIVE: 12

(Log #2053)

2- 202 - (210-60(b)): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Add a new paragraph to Section 210-60(b) to read as follows:
(b) Receptacle Placement. In applying the provisions of Section 210-52(a), the total number of receptacle outlets shall not be less than the minimum number that would comply with the provisions of that section. These receptacle outlets shall be permitted to be located conveniently for permanent furniture layout. At least two receptacle outlets shall be readily accessible. Where receptacles are installed behind the bed, the receptacle shall be located to prevent the bed from contacting any attachment plug that may be installed, or the receptacle shall be provided with a suitable guard.
The two receptacles required to be readily accessible shall be located so that other room electrical equipment shall not utilized these outlets (such as TV's, lamps, and vibrating beds). One these receptacles shall be located adjacent to the telephone outlet, and the other readily accessible required receptacle shall be located within 5 ft (1.5 m) of the bed headboard.
SUBSTANTIATION: The location of these two receptacles are critical for the following reasons:
1. The business traveler now carries many different electronic devices-such as cell phone chargers, laptop computers with telephone connection requirements, portable printers, portable scanners, palm top organizers, and other electronic devices which require power to operate or to charge batteries.
2. Many physical disabled or medical impaired individuals traveling today require readily accessible power near the bed headboard to operate life support electrical equipment. Oxygen generators, respiratory breathing equipment, heart monitoring equipment, and other medical devices which require power to operate while the guest stays overnight or longer.
3. Power is also required to charge electrical wheel chairs.
4. Presently these people are checking into guest rooms with long extension cords and multiple plug aps to accommodate all these different devices.
PANEL ACTION: Reject.
PANEL STATEMENT: The present requirement that at least two of the receptacle outlets be readily accessible will provide for sufficient access by the occupant of the room.

(Log #2423)

2- 204 - (210-61 (New)): Reject
SUBMITTER: Dennis Kaunzner, City of Sierra-Vista, AZ
RECOMMENDATION: Add a Section 210-61 to read:
"All bathrooms are required to have at least one 120 volt receptacle - see Section 210-8(b)(1)."
SUBSTANTIATION: Bathrooms in other than dwelling units are being used for all sorts of uses such as hairstyling, shaving, portable heaters, floor cleaning equipment, etc. When there is no outlet in the bathroom a cord is run in through the door. When the door is metal it rubs the cord and energizes the door, creating a hazard of electric shock when the door gets opened while still touching the plumbing (sink). I've witnessed this problem in three instances. Two were in restaurant bathrooms where people traveling brought their own extension cord and ran it through the door creating this hazard. Although the owners of these bathrooms don't want people using their electricity it would still be cheaper than a lawsuit.
PANEL ACTION: Reject.
PANEL STATEMENT: Given the wide variety of nondwelling related bathrooms and their use, the decision to place a receptacle outlet in the bathroom is that of the designer and must be considered on a case-by-case basis.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3310)

2- 205 - (210-61 (New)): Reject
SUBMITTER: Jack Wells, Pass & Seymour/Legrand
RECOMMENDATION: Add a new section to read as follows:
210-61. Child Care. In child care areas such as day care centers, preschools, elementary schools and similar areas where children have access to receptacles, all 15- and 20 ampere, 125-volt receptacles shall be listed tamper resistant receptacles.
SUBSTANTIATION: Section 517-18(c) recognizes the hazard of children inserting conductive objects into receptacles in pediatric care areas. In the areas referred to in the proposal, children have ready access to receptacles and the same hazard exists. Adoption of the requirement for tamper resistant receptacles in pediatric care areas served to protect children from electrical shock. This same level of protection should be required wherever children are normally present for extended periods.
PANEL ACTION: Reject.
PANEL STATEMENT: Tamper resistant receptacles are not the sole method by which such protection can be provided. There are tamper resistant covers or inserts available. Proper child supervison is also necessary.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #313)

2- 206 - (210-63): Reject
SUBMITTER: Victor V. Timpanaro, Rep. Municipal Electrical Inspectors Assoc. of NJ, Inc.
RECOMMENDATION: Revise third sentence in 210-63 to read as follows:
The receptacle outlet shall not be connected to the line or load

side of the equipment disconnecting means when the branch circuit rating is greater than 20 amperes.
SUBSTANTIATION: This will prevent tap conductors from being installed on supply side of HVAC branch circuit conductors where their rating exceeds 20 amps. Since these are not feeder conductors, taps are not permitted here and the new language would prevent inspectors and installers from concluding that the receptacle outlet may be installed on the line side.
This language also would permit the receptacle outlet to be installed on line side of disconnecting means when conductors are rated 20 amperes or less, thereby having overcurrent protection by the branch circuit OCPD.
PANEL ACTION: Reject.
PANEL STATEMENT: 210-19(d) already addresses the issue of concern stated by the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #398)

2- 207 - (210-63): Reject
SUBMITTER: Peter Garthwaite, Garthwaite & Green Inc.
RECOMMENDATION: Revise 210-63 to read as follows:
A 125 volt single-phase 15- or 20 ampere-rated receptacle outlet shall be installed at an accessible location for the servicing of heating, air conditioning, and refrigeration equipment on rooftops and in attics, cellars and crawl spaces.
SUBSTANTIATION: In New England (Maine) many old houses do not have any receptacles in the cellar. Thus servicing or repairing a heating system in the middle of a cold night and plugging a drop light into light adaptor is unsafe and takes time. In many new houses, the heating system is set off in a utility room in the cellar where the rest of the cellar is finished and separated thus there is not a receptacle within the area or within 25 ft.
PANEL ACTION: Reject.
PANEL STATEMENT: The cellar is considered to be a basement and is covered by 210-52(g), which requires at least one receptacle outlet.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1687)

2- 208 - (210-63): Reject
SUBMITTER: Harold R. Endean, III, Township of Montville, NJ
RECOMMENDATION: After the following words... "on rooftops and in attics and crawl spaces."
Then add: "and outside HVAC equipment." Ground fault protection is required when receptacle is outside as required by Section 210-8(a)(3).
SUBSTANTIATION: I feel there should be a receptacle within 25 feet of all HVAC equipment. Especially the air compressors that are located outside of a dwelling. Whenever a repairperson comes to fix the equipment there is never an outlet nearby. Then the person would open up a window and plug into a receptacle inside the house. Therefore the person could be outside working on an air compressor without the benefit of ground fault protection. BOCA mechanical states that a receptacle must be located within 75 feet of an appliance. However, I feel that this is too far away. I believe that 25 feet would be a more safe distance for anyone working on HVAC equipment.
PANEL ACTION: Reject.
PANEL STATEMENT: 210-52(e) requires outside receptacles at the front and rear of dwellings that could be used for HVAC servicing.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1904)

2- 209 - (210-63): Reject
SUBMITTER: Michael L. Simmons, Simmons Electric Co.
RECOMMENDATION: Revise as follows:
"210-63. Heating, Air-Conditioning, and Refrigeration Equipment Outlet. A 125-volt, single-phase, 15- or 20- ampere-rated receptacle outlet shall be installed at an accessible location for the servicing of heating, air-conditioning, and refrigeration equipment ~~on rooftops and in attics and crawl spaces~~. The receptacle shall be located on the same level and within 25 feet (7.62m) of the heating, air-conditioning, and refrigeration equipment. The receptacle outlet shall not be connected to the load side of the equipment disconnecting means.
~~Exception: Rooftop equipment on one and two family dwellings.~~

FPN: See Section 210-8 for ground-fault circuit-interrupter requirements."
SUBSTANTIATION: Background: A very hazardous situation exists in the servicing of heating, air-conditioning, and refrigeration equipment. The current paragraph 210-63 requirements are not uniform in the safety protection provided for various applications. Paragraph 210-63 currently requires that a receptacle outlet be located near heating, air-conditioning, and refrigeration equipment; but the paragraph excludes coverage for all ground-level equipment and rooftop equipment in one and two family dwellings. HVAC (heating, ventilating, and air-conditioning) servicepeople, who are not necessarily required to be fully qualified electricians, usually service the equipment covered by paragraph 210-63.
Description of the Hazard: The most frequent need for an HVAC serviceperson to use a nearby receptacle outlet is for lighting; electrical power tools are a second need. Scheduled service calls are routine, but emergency service calls are also required on HVAC equipment at all hours of the day and night, including calls during wet weather or when the ground is wet after recent rain or snow. The vast majority of these calls are made for ground-level equipment at residences. Emergency calls are often made at night when lighting is required. It is normal practice for the serviceperson to plug into the nearest outlet they see during such service calls, but quite often there is not an outlet within sight. As a result, I have seen HVAC technicians plug into a non-GFI home outlet immediately inside the house, which was the nearest outlet available to the outside ground-level air-conditioner. Others will simply put jumpers inside the disconnect box to get power, putting themselves at risk to get the job done quickly. Connecting to a non-GFI outlet or using jumpers creates an immediate electrocution hazard if the ground is wet and there is a short in the equipment or extension cord.
These are clearly not acceptable servicing practices, but as a master electrician with experience in many states, I have seen them occur repeatedly, due either to ignorance of the seriousness of the hazard or due to the constant pressure on the serviceperson to accomplish the job efficiently and quickly. I do not know how many injuries/fatalities this causes nationwide every year.
Summary: The proposed deletions to paragraph 210-63 would have the effect of applying the same requirement to all equipment, regardless of the location of the equipment. The changes would thus extend safety protection uniformly to all equipment applications, including ground-level equipment, where the largest hazard exists. The cost would be the cost of an additional nearby outlet in those applications where none now exists. I believe this equipment cost is nominal compared to the increase in safety and the reduced medical cost and lost-wage cost from injuries/fatalities. An added benefit to this proposed change is that the nearby outlet will provide an additional convenience outlet to the homeowner or property maintenance personnel, who increasingly use outdoor electric appliances such as lawnmowers and weedcutters.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-208.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4165)

2- 210 - (210-63): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
"A 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlet shall be installed at an accessible lo-cation for servicing of heating, air conditioning, and refrigeration equipment located outdoors including on rooftops, and in attics and crawl spaces. The receptacle shall be located on the same level and within 25 ft (7.62 m) of the heating, air conditioning, and refrigeration equipment. The receptacle outlet shall not be connected to the load side of the equipment disconnecting means."
SUBSTANTIATION: This change will ensure that the ground level HRAC equipment will be treated the same way as those on rooftops, attics, and crawl spaces. It corresponds to mechanical code requirements, and eliminates the need for service personnel to run cords out of windows, etc. in order to work on this equipment.

PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-208.

(Log #4365)

2- 214 - (210-70): Reject
SUBMITTER: Ed Stubbs, City of Atlanta, GA
RECOMMENDATION: Revise text as follows:
210-70. Lighting Outlets Required. (Add to text)
(a) Dwelling Units
(1) Habitable Rooms
Exception No. 1: In other than kitchens and bathrooms, one or more receptacles controlled by a wall switch shall be permitted in lieu of lighting outlets. (In every kitchen and bathroom there shall be one or more lighting fixture installed with the lighting outlet.)
Exception No. 2: (no change)

Exception No. 3: (add to text) In every clothes closet where a lighting outlet is installed and meets the requirements of 410-8, shall have a fixture installed with the lighting outlets.
FPN: (add to text) It is the intent to assure that improper fixtures not installed over a lighting outlet such as keyless fixtures or track lights.
SUBSTANTIATION: As an inspector, I have come across incidents where the contractor is forced to install the improper fixture or just doesn't install the proper fixture in the closet, kitchen or bathroom that is not listed and labeled or sometimes not bonded or even came with a bonding means. All these code requirements on grounding and bonding, listing and label, and proper clearances and we turn right around and don't require fixtures in for a final. You can just blank them off. Now we leave it up to the owner to supply the fixtures that may not be safe and possibly installed improperly. Where does that leave the contractor and the authority having jurisdiction? Can we say liable? Sometimes contractors can only do what they are told, so it becomes a no win situation and the owner gets BURNED. Lighting outlets only specify a box with no fixture. I know it is not the intent of the code to require installation of fixtures. The requirement is for areas that do not want receptacles in lieu of lighting outlets. If you didn't require this existing code, people would install cord and plug lamps in the closets that could start a fire, or in the kitchen and bathroom be subject to a shock hazard. How safe is a closet without a listed fixture installed before the final?
PANEL ACTION: Reject.
PANEL STATEMENT: The application of the rules in 210-70(a) is to only require a properly installed lighting outlet. Adding a requirement to install a luminaire will not resolve instances where the installer knowingly chooses to violate the proper rules.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

Note: The sequence no. 2-215 was not used.

(Log #3853)

2- 216 - (210-70(a)): Accept in Principle
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Revise the existing third paragraph as follows:
"Where one or more lighting outlet(s) are installed for ~~in~~ interior stairways, there shall be a wall switch at each floor level to control the lighting outlet(s) where the stairway ~~difference~~ between floor levels has ~~is~~ six ~~steps~~ risers or more."
SUBSTANTIATION: Editorial, and to bring the usage of stairway risers into harmony with the building codes. The term "risers" is more precise than "steps" and is the preferable term. In addition, the building codes regulate the construction of stairs so the NEC term should agree.
The use of the term "riser" solves the issue as to whether or not the tread (floor surface) at the bottom of the stairs and tread (floor surface) at the top of the stairs is a step or not. The risers for the stairs can be more easily determined.
Accepting this proposal will provide for more uniform interpretation and application of the NEC and make it more "user-friendly".
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Proposal 2-226a which meets the intent of the submitter.

2- 219 - (210-70(a)(1)): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 9 for information. See panel action on Proposal 9-42.
SUBMITTER: Christopher Pharo, Rep. IBEW
RECOMMENDATION: This proposal is to add a sentence to the end of the section:
Article 210.70(a)(1) "...in every habitable room and bathroom. If a ceiling mounted outlet box is installed, it must be listed as suitable as the sole means of support for a ceiling suspended (paddle) fan."
SUBSTANTIATION: The average house today has 3 bedrooms, a kitchen, a family room, a dining room, and 1-1/2 bathrooms. The bedrooms usually comply with 210-70(a)(1) Exception No. 1. Bathrooms usually have a wall sconce above a mirror to meet compliance. The lighting outlet boxes in the kitchen, family room, and the dining room would most likely be the only areas affected by this code change. These three rooms would most likely have some sort of ceiling mounted outlet box.
This proposal would mandate that these three ceiling outlet boxes be listed and suitable as the sole means to support a ceiling suspended (paddle) fan. I do not feel that a $20.00 increase in costs between the old outlet boxes and the new outlet boxes is enough to justify the refusal of this proposal.
Consider this true scenario. A homeowner buys a paddle fan at his local home improvement center and decides to replace the existing hanging fixture in his kitchen with the paddle fan complete with a light kit. Initially it looks good and it even works. Two weeks later when the homeowner was cooking dinner, the fan came down from ceiling. The fan was still attached to the junction box and still had some drywall around it. The romex cable kept the fan from hitting the table because it was probably stapled within 12 in. from the box. Luckily, no people were injured nor was there a fire. It is obvious that a real hazard does exist.
I urge that you do not reject this proposal for the sake of $20.00 added to the price of a $110,000.00 home. I am sure the homeowner would be more than willing to part with his $20.00.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel recommends that the Technical Correlating Comittee refer this proposal to Code-Making Panel 9 for action.

(Log #4372)

2- 220 - (210-70(a)(1)): Reject
SUBMITTER: Joseph A. Hertel, Safety and Buildings Div., State of Wisconsin
RECOMMENDATION: Revise text to read as follows:
(1) Habitable Rooms. At least one wall switch-controlled lighting outlet shall be installed in every habitable room, kitchen, and bathroom.
SUBSTANTIATION: Many building codes do not recognize kitchens as habitable rooms. The addition of the word kitchen will clarify the intent of a wall switched lighting outlet in these rooms and correlate with the exception that requires a lighting outlet rather than a switched receptacle for kitchens and bathrooms.
PANEL ACTION: Reject.
PANEL STATEMENT: In reviewing the building codes, the panel does not find instances where kitchens are excluded from consideration as habitable rooms.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4454)

2- 221 - (210-70(a)(1)): Reject
SUBMITTER: David E. Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
RECOMMENDATION: Add new text to read as follows:
210.70(a)(1) Lighting Outlets Required, Habitable Rooms. At least one wall switch-controlled lighting outlet shall be installed in every habitable room and bathroom. Lighting outlets used to fulfill this requirement shall not have integral switching, or shall have integral switching disabled.
SUBSTANTIATION: The safety basis for the Section turns on the need to turn on a light to avoid stumbling or bumping into things. "Where are the bodies" does not really apply, because nobody is going to maintain records of the bumped shins cursed every evening, or even of the hips broken by people with osteoporosis who stumble and fall because there's no light. I have seen many instances where the people have inadvertently defeated the protection the light switch provides.
This proposal tries to maintain this protection. The part of the problem that we can reduce is related to the situation where a fixture came with a pull chain. This issue is especially common when paddle fans are used to replace existing light fixtures. Without independent wall switching, the fan is left on and the light turned off via its pull chain. Then the occupant leaves the room, perhaps turning the fan off at the wall switch, and, very commonly, forgetting to pull the chain on the light before leaving, to restore power to it. Subsequently, at night, someone returns, and has to grope their way to the fixture, after turning on the switch, and reach up for the light's pull chain, while not reaching up so high as to encounter the turning fan blades. This problem also occurs where a receptacle is employed to satisfy this section's requirement, in accordance with Exception No. 1. However, authorities having jurisdiction cannot do much about what homeowners do after final inspection.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirements in 210-70(a)(1) cover the installation of the lighting outlet and not the luminaire itself.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1683)

2- 222 - (210-70(a)(1) Exception No. 1): Reject
SUBMITTER: Keith M. Whitesel, Whitesel Electric
RECOMMENDATION: Revise as follows:
In other than ~~kitchens and~~ bathrooms...
SUBSTANTIATION: Section 210-52(b)(1) Exception No. 1 clearly allows a switched receptacle in a kitchen.

PANEL ACTION: Reject.
PANEL STATEMENT: The requirement in 210-52(b)(1) is applicable to areas other than kitchens including pantries, breakfast rooms, dining rooms, etc. This exception prevents the replacement of the required wall switch controlled lighting outlet in kitchens with a switched receptacle.

(Log #9)

9- 2 - (210-70(a)(1) Exception No. 2): Reject
NOTE: The following proposal consists of Comment 2-139 on Proposal 2-250 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 2-250 was:
Add new last sentence to 210-70 (a) Exception No. 3:
"The off position of the occupancy sensor shall remove all voltage from the controlled outlets or the sensor must be permanently engraved stating full voltage is present in the off position."
SUBMITTER: Douglas D. Myron, Mytech Corp.
RECOMMENDATION: Comments to the requirement that occupancy sensors in the "off" position remove all voltage from the supplied outlet.
Mytech supports the Panel's response of "Reject."
SUBSTANTIATION: Background: Occupancy sensors are control devices that turn lights on automatically when a room is occupied, and turns them off when the room is not occupied. First generation occupancy sensors were large surface mounted, 2 wire devices that contained an air gap switch, disconnecting voltage from the load when turning off the lights. The obtrusive style and appearance hindered market acceptance.
To reduce the size, cost and improve esthetics, occupancy sensor manufacturers began to eliminate the air gap switch using two different design techniques. Both of these techniques allows current (<.5 milli amps) to flow when the switch is in the off position to keep sensor electronics working.
Design Technique #1:
A 3-wire technique is used that removes line voltage from the load in off state and continuously applies .5 milli amps into conduit or building ground.
Design Technique #2:
A 2-wire technique is used and does not require conduit, building ground or neutral. However, when in the off state, the sensor is still powered and will supply less than .5 milli amps to the load.
Industry Direction:
Control devices are becoming more prevalent in homes and commercial buildings. Devices that typically performed simple functions are being replaced with high tech, multifunction products. To properly apply these new technologies requires education, training and new trade practices to keep pace with them. Our industry has worked very hard to maintain the safety of our products and have worked with UL to improve testing methodologies.
Comments:
• Developing a practice of relying only on the light switch to disconnect loads from the branch circuit is hazardous and should be handled with caution. In many applications, the light switch is not located in the immediate working area. It should always be a standard operating practice to treat loads deactivated in this manner as if full line voltage was applied.
• With proper education and training, it is possible with common instruments to identify devices that do not remove line voltage from the load.
• Mytech recommends that during installation of our product or maintenance to the lighting load, trip the circuit breaker. This is not only a safety issue but damage to the sensor can result if either device is misswired.
• Our switches in the off state are limited to less than the "Let Go" current of .5 milli amps.
• Without proper training, maintaining loads controlled by a simple 3-way switch can be just as hazardous. Without a voltmeter, it can be difficult to determine if voltage is or is not present at a load.
• Occupancy sensors are becoming small enough that adding legible labels to the front of the switch is not practical.
Conclusion:
Mytech supports the Panel's position of "Reject". This is a new technology and as our industry matures, so will its trade practices.

If the Panel has additional concerns or questions, I can bring them before the occupancy sensor committee of NEMA that meets every quarter.
PANEL ACTION: Reject.

(Log #10)

9- 3 - (210-70(a)(1) Exception No. 2): Accept in Principle
NOTE: The following proposal consists of Comment 2-140 on Proposal 2-250 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 2-250 was:
Add new last sentence to 210-70 (a) Exception No. 3:
"The off position of the occupancy sensor shall remove all voltage from the controlled outlets or the sensor must be permanently engraved stating full voltage is present in the off position."
SUBMITTER: , Pass & Seymour/Legrand
RECOMMENDATION: We recommend the Panel accept in principle this proposal and replace the submitter's text with the following:
"An occupancy sensor that has a marked OFF position shall disconnect all ungrounded conductors when in the off position."
SUBSTANTIATION: The Panel, "Listed occupancy sensors in the "off" position are required to remove all voltage from the supplied outlet," is incorrect. There are several different listed occupancy sensors on the market that incorporate the equivalent of a standby condition when in the off position. These devices <u>do not</u> remove all voltage from the circuit when in the off position. There are UL product standards that recognize that certain types of control devices function in this manner. The suggested text in this comment directly reflects the requirement in the product standards which permits an "off" or equivalent marking only if the ungrounded conductors are disconnected. Accepting this text permits the listing organizations to determine the appropriate marking for this type of product.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Proposal 9-88a.

(Log #11)

9- 4 - (210-70(a)(1) Exception No. 2): Accept in Principle in Part
NOTE: The following proposal consists of Comment 2-141 on Proposal 2-250 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 2-250 was:
Add new last sentence to 210-70 (a) Exception No. 3:
"The off position of the occupancy sensor shall remove all voltage from the controlled outlets or the sensor must be permanently engraved stating full voltage is present in the off position."
SUBMITTER: James T. Dollard, Jr., Local Union #98 IBEW
RECOMMENDATION: Accept Proposal 2-250.
SUBSTANTIATION: The Panel voted unanimously to reject this proposal on the assumption that as written in the Panel Statement: "Listed occupancy sensors in the "off" position are required to remove all voltage from the supplied outlet. Refer the product standards."
This is not true. Listed occupancy sensors in the "off" position are NOT required to remove all voltage from the supplied outlet.
The product standards do allow for .5 ma to flow in the situation as described in the proposal.
UL Field Engineers and one manufacturer have stated so in writing.
210-70(a) Exception No. 3 allows for these sensors in all dwellings.

The word OFF must mean the removal of all voltage. The fact that the amount of current flow available is below the "let go" level is not acceptable. A homeowner receiving a shock in this situation may not suffer from the amount of current flow through his/her body, but the resulting fall from a ladder could put them in the hospital or perhaps the grave.
NOTE: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle in Part.
1. The panel accepts in principle that the "off" position disconnects ungrounded conductors.
2. The panel does not accept the engraving of the switch stating that full voltage is present in the off position.
PANEL STATEMENT: See panel action and statement on Proposal 9-88a. The panel refers the submitter to the current standards that do not require engraving. The panel would like to point out that if a switch is not marked with an off position, voltage often is present.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #12)

9- 5 - (210-70(a)(1) Exception No. 2): Reject
NOTE: The following proposal consists of Comment 2-142 on Proposal 2-250 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 2-250 was:
Add new last sentence to 210-70 (a) Exception No. 3:
"The off position of the occupancy sensor shall remove all voltage from the controlled outlets or the sensor must be permanently engraved stating full voltage is present in the off position."
SUBMITTER: Larry Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: NEMA supports continued rejection of the proposal.
SUBSTANTIATION: OSHA has established a "Tagout/Lockout" procedure to ensure worker safety during electrical equipment/machine installation, maintenance or service. While lockout of individual branch circuit breakers may not be feasible, individual breakers can be tagged to indicate that a particular branch circuit is being worked on.
It is also a widely accepted fact that in order to ensure that a device or piece of equipment is completely deenergized, the branch circuit breaker feeding the device or equipment must be turned off. Merely turning off a switch on the device or the equipment does not guarantee deenergization and is not a proper or safe means of performing electrical work.
If the worker involved in the cited incident had followed proper safety procedures and turned the appropriate circuit breaker "OFF", he would not have experienced a shock.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 9-88a.

(Log #CP205)

2- 226a - (210-70(a)(2)): Accept
SUBMITTER: CMP 2
RECOMMENDATION: Revise existing Section 210-70(a)(2) as follows:
"(2) Additional Locations. Additional lighting outlets shall be installed in accordance with a, b, and c.
a. At least one wall switch-controlled lighting outlet shall be installed in hallways, stairways, attached garages, and detached garages with electric power.
b. For dwelling units, attached garages, and detached garages with electric power, at least one wall switch-controlled lighting outlet shall be installed to provide illumination on the exterior side of outdoor entrances or exits with grade level access. A vehicle door in a garage shall not be considered as an outdoor entrance or exit.
c. Where one or more lighting outlet(s) are installed for interior stairways, there shall be a wall switch at each floor level, and landing level that includes an entry way, to control the lighting outlet(s) where the stairway between floor levels has six risers or more.
Exception: In hallways, stairways, and at outdoor entrances, remote, central, or automatic control of lighting shall be permitted."
SUBSTANTIATION: This section has been rewritten to improve clarity, and has integrated the changes accepted in other proposals.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1146)

2- 223 - (210-70(a)(2)): Accept in Principle
SUBMITTER: Kenneth Higashi, Honolulu, HI
RECOMMENDATION: Revise text to read:
"Where lighting outlets installed in interior stairway, there shall be a switch at each ~~floor level~~ entry or exit into the stairway to control the lighting outlet where the difference between ~~floor level~~ entries or exits is six steps or more."
SUBSTANTIATION: There are many homes that have entries into a stairway that's between floor levels. Entering into a darken stairway and going to the floor level to turn the light on may cause tripping.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Proposal 2-226a which meets the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2021)

2- 224 - (210-70(a)(2)): Reject
SUBMITTER: Jerry Knoerr, Village of Greendale, Village of Mukwonago, WI
RECOMMENDATION: Add new text to read:
"The addition should be at a wall switch there shall be no more than 4 ft to the entrance of the stairway. In hallways the switch or switches shall be at the entrance of each end or each entrance of every hallway and shall be no more than _____ ft." Panel shall decide distance.
Also add that at all required exits a light switch controlling the interior lighting shall be provided.
SUBSTANTIATION: We are finding in a number of houses that they are combining the light switch with the hallway and stairs lighting so that people have to walk past open stairways without being able to turn on a light to see where they are going. They are saying that they have a switch at that level and therefore that is all the switching they need to control this area and the stairs.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-217.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2813)

2- 225 - (210-70(a)(2)): Reject
SUBMITTER: John E. Staires, Tulsa Code Seminars/Rep. Oklahoma Chapter IAEI
RECOMMENDATION: Remove the wording:
"~~and to provide illumination on the exterior side of outdoor entrances or exits with grade level access.~~"
Insert the wording:
"and to provide illumination on the exterior side of outdoor means of egress to grade level."
SUBSTANTIATION: As presently written, this sentence of 210-70(a)(2) does not provide for the situation where a second story or higher dwelling unit balcony or other platform has a staircase provided to grade level. The wording of this sentence would not require illumination for either the outdoor exit, the balcony or the staircase. This is obviously a life safety issue, due to the danger of exiting the dwelling unit over the staircase in the dark during normal conditions, and especially during emergency conditions.
PANEL ACTION: Reject.
PANEL STATEMENT: The necessity for an additional requirement to add exterior stairway lighting should be based on the type of stairway and is a design consideration.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3216)

2- 226 - (210-70(a)(2)): Reject
SUBMITTER: Jerry Feagans, Electrical Insp. Section, City of St. Louis, MO
RECOMMENDATION: Last sentence will read:
Where lighting outlets are installed in interior stairway, there shall be an illuminated wall switch at each floor level to control the lighting outlet where the difference between floor levels is six steps on more.
SUBSTANTIATION: The NEC already requires a wall switch at each floor level with BOCA's requirement for illuminated switches. As the code enforcement agency, it would be beneficial for us if the NEC had the same requirement. The illuminated switch makes it easier for the tenant to locate them in the dark.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: An illuminated switch is not needed to accomplish the necessary safety objectives. Providing an illuminated switch is not prohibited and is the prerogative of the designer.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3773)

2- 227 - (210-70(a)(2)): Reject
SUBMITTER: Joe Zsebe, City of Cudahy, WI
RECOMMENDATION: Revise text to read as follows:
(2) Additional Locations. At least one wall switch-controlled lighting outlet shall be installed in hallways, stairways, attached garages, and detached garages with electric power~~,; and to provide illumination~~ Illumination shall be provided on the exterior side of outdoor entrances or exits with grade level access. A vehicle door in a garage or service door of a detached garage shall not be considered as an outdoor entrance or exit.
SUBSTANTIATION: The use of the semi colon is not a strong enough degree of separation for the subject of the paragraph. If the code panel is not intending the exterior of detached garage entrance and exit doors to have illumination then, a new sentence is in order to return to the subject of the paragraph, i.e., dwelling unit requirements only. Some authorities having jurisdiction interpret the current language as requiring illumination at grade level entrance or exits at detached residential garages.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel has clarified the requirement for detached garages in the action taken on Proposal 2-226a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3793)

2- 228 - (210-70(a)(2)): Reject
SUBMITTER: John I. Williamson, Minnesota Board of Electricity
RECOMMENDATION: Modify this section as follows:
"Additional Locations. At least one wall switch-controlled lighting outlet shall be installed in hallways, stairways, attached garages, and detached garages with electric power. At least one wall switch-controlled lighting outlet shall be installed to provide illumination on the exterior side of dwelling unit and attached garage outdoor entrances or exits with grade level access."
The remainder of the paragraph and the exception that follows remain unchanged.
SUBSTANTIATION: The previous sentence structure and wording has created confusion among authorities having jurisdiction. Some authorities having jurisdiction have interpreted this section to require a wall switch-controlled lighting outlet on the exterior side of entrances at detached garages.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel has clarified the requirement for detached garages in the action taken on Proposal 2-226a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4166)

2- 229 - (210-70(a)(2)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
(2) Additional Locations. At least one wall switch-controlled lighting outlet shall be installed in hallways, stairways, attached garages, and detached garages with electric power; and to provide illumination on the exterior side of outdoor entrances or exits with grade level access. A vehicle door in a garage shall not be considered as an outdoor entrance or exit. Where lighting outlets are installed in interior stairways connecting finished areas or areas with a second exit, there shall be a wall switch at each floor level to control the lighting outlet where the difference between floor levels is six steps or more.
SUBSTANTIATION: A three-way switch at the end of a stairway into an unfinished area without an exit has no basis in safety, only design, and as such is beyond the scope of the Code. Previous examples cited by the panel in rejecting this over the years, such as darkrooms or work areas, probably would constitute a connection to finished areas if they were extensive. Transient occupants of such spaces would not be turning the light off and leaving themselves in darkness. This allowance has been in place in Massachusetts since the advent of the sixstep rule, without incident.
PANEL ACTION: Reject.
PANEL STATEMENT: Work areas are not restricted to finished areas. Activities can occur in unfinished areas requiring switches at both levels.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #314)

2- 230 - (210-70(a)(3), 210-70(c)): Reject
SUBMITTER: Victor V. Timpanaro, Rep. Municipal Electrical Inspectors Assoc. of NJ, Inc.
RECOMMENDATION: Revise 210-70(a)(3) to read as follows:
(3) For attics, underfloor spaces, utility rooms and basements, at least one lighting outlet with fixture containing a switch or controlled by a wall switch shall be installed where these spaces are used for storage or contain equipment requiring servicing.
SUBSTANTIATION: Many inspectors have argued that a lighting outlet is the junction box containing the branch circuit conductors and no switch may be inserted therein, while admitting that some fixtures may contain a switching means as an integral part. This language will help to clarify.
PANEL ACTION: Reject.
PANEL STATEMENT: Adding the text "with fixture" does not add clarity. The present requirement is that the outlet is to be controlled by a wall switch or that it contain some type of switching means, which could include the switching means in a fixture.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #404)

2- 231 - (210-70(a)(3)): Reject
SUBMITTER: Amos D. Lowrance, Jr., City of Chattanooga, TN
RECOMMENDATION: Revise 210-70(a)(3) to read as follows:
(3) Storage or Equipment Spaces. For attics, underfloor spaces, utility rooms, and basements, at least one lighting outlet containing a switch or controlled by a wall switch shall be installed where these spaces are used for storage or contain equipment requiring services. The control point for the lighting outlet required by this section shall be at the usual point of entry to these spaces. Additional lighting outlets may be permitted. The lighting outlet shall be provided at or near the equipment requiring services.
SUBSTANTIATION: As currently written, it is possible to have a single pole switch at the door and a pull chain on a lighting outlet controlled by the switch. When the service person pulls the chain on the outlet, then the switch no longer controls the lighting outlet.

PANEL ACTION: Reject.
PANEL STATEMENT: This recommendation would limit the control of the lighting outlet to a single location. There are instances where it may be preferred that the outlet be controlled from multiple points of entry, particularly in basements, utility rooms, and similar spaces.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:

(Log #2485)

2- 232 - (210-70(a)(3)): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 18 for action in Article 410. This action will be considered by the Panel as a Public Comment.
SUBMITTER: James M. Imlah, City of Hillsboro, OR
RECOMMENDATION: Revise as follows:
(3) Storage or Equipment Spaces. For attics, underfloor spaces, utility rooms, and basements, at least one lighting outlet containing a switch or controlled by a wall switch shall be installed where these spaces are used for storage or contain equipment requiring servicing. At least one point of control shall be at the usual point of entry to these spaces. The lighting outlet shall be provided at or near the equipment requiring servicing. Lighting required for attics or underfloor spaces shall have approved guards or be enclosed.
SUBSTANTIATION: Many times work being done in these areas are of limited area and the higher risk of fixture damage becomes apparent. The damage to a bulb in a fixture has created a shock potential to person(s) working in those areas. In attics the breaking of a bulb has been known to starting the burning of dry combustible materials in the area from hot glass and light elements falling within the area. In underfloor spaces the issue is the added potential of shock hazard from damp or wet ground with many grounded surfaces such as metallic ducts and metallic piping. Please consider lighting guards for fixtures in these locations for protection of persons and property.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 210-70(a)(3) only covers the lighting outlet. The panel requests that the Technical Correlating Committee refer this proposal to Code-Making Panel 18 for action.

AFFIRMATIVE: 12

(Log #4403)

2- 233 - (210-70(a)(4) (New)): Reject
SUBMITTER: Joseph Andre, City of Bellevue, WA
RECOMMENDATION: Add new section (a)(4) to read:
"For each of the following locations, a lighting fixture shall be installed to provide illumination: kitchens, bathrooms, hallways, stairways, attached garages, detached garages with electric power, and attics, underfloor spaces, utility rooms, and basements when a lighting outlet is required per 210.70(a)(3)."
SUBSTANTIATION: The current wording of Section 210-70(a), combined with the definition of a lighting outlet in Article 100, would permit a switch controlled receptacle or a box suitable for mounting a light fixture but with a blank cover to be installed in the locations identified in the proposed new text. It is improbable/impracticable to believe that a lamp would be installed in those locations, and a box without a fixture is also not the intent of this section. By mandating that there be illumination, the NEC would significantly reduce the hazard of tripping in an unlighted area.
The impact to the industry is minimal, as most installers recognize the intent and provide illumination in a completed installation.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirement for illumination of habitable rooms is not within the purview of Article 210. The objective for habitable rooms is to provide a lighting outlet so that acceptable illumination can be provided.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1684)

2- 234 - (210-70(c)): Accept
SUBMITTER: Keith M. Whitesel, Whitesel Electric
RECOMMENDATION: Change title from "Other Locations" to: "Other Than Dwelling Units."
SUBSTANTIATION: Clarification that this section applies to these spaces since 210-70(a)(3) applies to dwelling units.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3943)

2- 235 - (210-70(c)): Reject
SUBMITTER: Jim Crocker, Insp. Div, City of Chattanooga, TN
RECOMMENDATION: Revise text to read as follows:
210.70(c). Lighting Outlets Required. For attics and underfloor spaces containing equipment requiring servicing, such as heating, air conditioning, and refrigeration equipment. At least one lighting outlet ~~containing a switch~~ or controlled by a wall switch shall be installed at each entrance in such places. At least one point of control shall be at the usual points of entry to these places. ~~The~~ A lighting outlet shall be provided at ~~or near~~ the equipment requiring servicing, and as needed illuminate the path from the entrance to the equipment.
SUBSTANTIATION: In larger and newer homes and commercial buildings, there are often more than one entrance to attic spaces and in some, the roof changes may shadow the path to the equipment as I have seen more than once. One building had as many as eight attic entrances with walk boards between each.
PANEL ACTION: Reject.
PANEL STATEMENT: Although the designer can provide for a switching arrangement that covers more than one entry point, the objective of the code requirement is to require the switch at the usual point of entry. 210-70(c) only requires that the lighting outlets be installed, as the provision to provide illumination is not covered by this section.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2796)

2- 236 - (210-70(c)(3)): Reject
SUBMITTER: Phillip David Martin, City of Chattanooga, TN/Rep. Public Works-Insp. Div, Chattanooga, TN
RECOMMENDATION: Revise as follows:
(c) Other Locations. For attic, above ceiling locations and underfloor spaces containing equipment requiring servicing such as heating, air-conditioning, refrigeration equipment, and sign transformers.
SUBSTANTIATION: Sign transformers are usually located above ceilings or attic spaces where the code may not require lighting.
PANEL ACTION: Reject.
PANEL STATEMENT: There are many types of electrical equipment, including transformers, junction boxes, etc. that do not fall under the provision of equipment requiring service. The objective of the requirement is to provide a lighting outlet for equipment that requires routine maintenance activities.

ARTICLE 215 — FEEDERS

(Log #2868)

2- 237 - (215): Reject
SUBMITTER: Gary Wright, Master Electrical Contractors Inc.
RECOMMENDATION: Revise text to read as follows:
Each ungrounded conductor shall be identified according to phase (i.e. A, B, C). 120/240V nominal shall be identified as black, red, blue, 480 volt nominal shall be identified as brown, orange, yellow. Conductors shall be permanently identified with a continuous outer sheath or with tape or with other permanent means.
SUBSTANTIATION: The primary reason for this proposal is to establish a uniform code with which to identify the ungrounded conductor and phase thereby eliminating potential hazards of misidentification. Thus creating a safer work environment. The realistic potential of these hazards exists because of the diversity within the industry.
PANEL ACTION: Reject.
PANEL STATEMENT: Proper voltage testing and circuit tracing techniques cannot be safely replaced by a color code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
MERICLE: I vote no on the Panel Action. I agree with the submitter in his recommendation except that I believe the new text should read "277/480V", not just 480 volts. In past code cycles. there have been several proposals like this one and it appears there is a substantial amount of interest to use this color coding. The northeast has used and continues to use this identification with success. If it were mandated by the NEC the electrical industry would be a safer place to work. Color coding alone should not replace proper testing procedures, but it would alert an electrician that 277/480 is present. I realize that some industries, states and municipalities may have their own means of identification but with electricians traveling all over the country we would show consistency throughout.

(Log #4352)

2- 238 - (215-2, FPN No. 2): Reject
SUBMITTER: R. Gerald Irvine, Suffern, NY
RECOMMENDATION: Change FPN No. 2 to a requirement by inserting "shall be" before "sized" and deleting all after "5 percent" in the first sentence.
SUBSTANTIATION: Voltage drop limitations are necessary for proper equipment operation and for conservation of energy by reducing excessive line losses. ASHRAE (IESNA 90.1R Energy Conservation in New Buildings) also contains voltage drop limitations.
PANEL ACTION: Reject.
PANEL STATEMENT: Percentage of voltage drop is a design consideration based on conductor size, loading, and other factors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1021)

2- 239 - (215-2, FPN No. 4, No. 5, and No. 6 (New)): Reject
SUBMITTER: Charles W. Algood, A&A Electric Services Inc./Rep. L.U. 915 I.B.E.W.
RECOMMENDATION: Add FPN No. 4, No. 5, and No. 6 to read as follows:
FPN No. 4: See Section 310-10 for temperature limitations of conductors.
FPN No. 5: See Section 110-14(c) for temperature limitations of conductors.
FPN No. 6: See Section 310-15 for ampacity ratings of conductors.
SUBSTANTIATION: Two of these proposed FPNs are already present in Section 210-19(a). Since both sections address the selection of the correct conductors to carry noncontinuous and continuous loads, it is only good common sense that they also appear in Section 215-2.
The proposed FPN No. 5 is a "UL Greenbook", requirement on terminations, and is an essential factor in determining the correct conductor and its application at points of termination, and the use of higher temperature rated conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: The addition of the fine print note does not improve usability.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3150)

2- 240 - (215-2, Exception): Reject
SUBMITTER: Aaron Emmendorfer, O.S.C. Electric
RECOMMENDATION: Delete the exception.
SUBSTANTIATION: This section deals with feeder wire sizing, not overcurrent protection of feeders. Current is current whether the overcurrent device is rated for 100 percent operation or not. This rule should be the same in all cases.
PANEL ACTION: Reject.
PANEL STATEMENT: Deletion of the exception would require that the conductor be sized at 125 percent of the continuous load when the overcurrent protection is listed for operation at 100 percent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #393)

2- 241 - (215-2(a)): Reject
SUBMITTER: Glenn W. Zieseniss, Crown Point, IN
RECOMMENDATION: Add the following to the last sentence of the paragraph:
"and where adjustment or correction factors are applied, the ampacity of the conductor shall not be less than 100 percent of the noncontinuous load plus 100 percent of the continuous load."
SUBSTANTIATION: The existing text seems to imply that is a "stand alone" statement and other NEC sections, such as the first paragraph of 240-3 and 240-3(d), do not apply if the ampacity of the conductor was greater than or equal to 125 percent of the continuous load plus 100 percent of the noncontinuous load before applying any adjustment or correction factors. There is no text to indicate the minimum conductor ampacity required after any adjustment or correction factors are applied. It is possible for the calculated conductor ampacity to be less than 100 percent of the continuous and noncontinuous loads after adjustment and correction factors are applied.
PANEL ACTION: Reject.
PANEL STATEMENT: The first sentence of 215-2(a) provides the text that establishes the minimum conductor ampacity by stating that it shall not be less than the load to be served.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #688)

2- 242 - (215-2(a)): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read ad follows:
(a) General. Feeder conductors shall have an ampacity not less than required to supply the load as computed in Parts B, C, and D of Article 220. The minimum feeder conductor size before the application of any adjustment or correction factors, shall have an allowable ampacity ~~equal to or greater~~ not less than the noncontinuous load(s), plus 125 percent of the continuous load(s) or the ampacity specified for motor supply conductors in (Sections 430-22; 430-24; 430-25; 430-28; 440-32; 440-33; 440-34; and 440-35.) (Part B of Article 430 and Part D of Article 440,) whichever is greater.
(alternate choices in parentheses)
Exception No. 1: The correction factors for temperatures below 26°C (78°F) shall be permitted in determining the initial conductor ampacity.
Exception No. 2: Where the assembly, including any integral ~~the~~ overcurrent device(s) supplying ~~protecting~~ the feeder(s) is listed for operation at 100 percent of its rating, the ampacity of the feeder conductors shall ~~be permitted to~~ be not less than the sum of the noncontinuous load(s) ~~plus~~ and the continuous load(s),

plus the ampacity specified for motor supply conductors in (Sections 430-22; 430-24; 430-25; 430-28; 440-32; 440-33; 440-34; and 440-35.) (Part B of Article 430 and Part D of Article 440.)

(Alternate choices in parentheses)

Additional minimum sizes shall be as specified in (b), (c), and (d) under the conditions stipulated.

SUBSTANTIATION: Application of this section and Chapter 4 to the same noncontinuous, continuous, and motor loads can result in disparity between conductor sizes. Does Chapter 2 or 4 prevail? The examples I have provided indicate possible disparity.

The panel statement for Comment 1-174 in the 1998 ROC indicated motor loads continuing for three hours or more are not excluded from the definition of continuous load. This may be literally true but not in accordance with Articles 430 and 440 and common practice. Chapter 4 only requires the 125 percent factor for the largest motor (regardless of operating time), whereas if "continuous load," the factor would apply to all motors supplied by the feeder.

Since tap conductors on the supply side of a motor branch circuit overcurrent device is a feeder, per definition, the reference to Section 430-22 would clearly indicate it applies to that portion of the circuit conductors.

Proposed Exception No. 1 is to allow for increased ampacity rating where lower temperatures prevail. This could be critical for some "border-line" ampacities for installations underground or in controlled climate environments.

In Exception No. 2, wording is revised to clearly indicate nonfused switches, transfer switches, and clock-operated switches (listed for 100 percent of rating) can be used. Present wording suggests the assembly necessarily includes overcurrent devices. The word "supplying" supplants "protecting" to cover such assemblies and for technical correctness since overcurrent devices at the end of a tap limit protection to overloads. The reference to other chapters would correlate with ampacity requirements which in general do not permit 100 percent ampacity factor for continuous duty motors, which present wording appears to do, if the motors operate for less than three hours. Note that Section 430-24 requires motor conductor ampacity plus ampere rating of other loads, not conductor ampacity for continuous loads.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept in Part.

The panel accepts the portion of the recommendation changing "equal to or greater" to "not less", and rejects the remainder of the recommendation.

PANEL STATEMENT: The rejected portions of the proposal are rejected based on the following:

1) The first sentence is accurate as written in the present code. Computed load would imply that conductors serving loads could have some additional computed factor applied. Article 220 provides the necessary information for determining the load in question.

2) The changes relative to motor circuit conductors are unnecessary. 215-1 states that feeders are sized in accordance with Article 220. 220-3 states that Article 430 is used for motor loads.

3) The proposed Exception No. 1 is unnecessary, since 310-15 already allows this to be applied to determine conductor ampacity.

4) The wording for "integral" overcurrent devices is unnecessary. The present requirement is for "listed assemblies" which covers the various arrangements of overcurrent devices.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #4114)

2- 243 - (215-2(a)): Accept in Part

SUBMITTER: Truman C. Surbrook, Michigan State University

RECOMMENDATION: Revise the second sentence of the section as follows with the deletions and additions as indicated:

"The ~~minimum~~ feeder-circuit conductor ~~size, before the application of any adjustment or correction factors,~~ shall have an allowable ampacity ~~equal to or greater~~ not less than the noncontinuous load plus 125 percent of the continuous load."

SUBSTANTIATION: The phrase "before the application of any adjustment or correction factors" is particularly confusing to electricians making conductor ampacity selection when adjustment factors are being used. Some apply the adjustment factors to the allowable ampacity found in the appropriate table and then compare it with 100 percent of both continuous load and noncontinuous load, others compare the adjusted allowable ampacity to the sum of 100 percent of the noncontinuous load and 125 percent of the continuous load. By removing the confusing statement, it makes the section clear that the adjusted allowable ampacity of the conductor is not permitted to be less than the sum of 100 percent of the noncontinuous load plus 125 percent of the continuous load.

PANEL ACTION: Accept in Part.

The panel accepts the change of "equal to or greater" to "not less".

The remainder of the proposal is rejected.

PANEL STATEMENT: The text recommended for deletion is necessary for proper application of the section. The second sentence of 215-2(a) establishes the minimum conductor size permitted for a circuit supplying any continuous loads. Actual conductor allowable ampacity (relative to the load current) is determined by applying 310-15 including the adjustment factors. This allows the allowable ampacity calculation to take advantage of higher temperature ratings on conductor insulation.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #4115)

2- 244 - (215-2(a), Exception): Accept in Principle

SUBMITTER: Truman C. Surbrook, Michigan State University

RECOMMENDATION: Revise the Exception as follows:

"Where the assembly, including the overcurrent devices protecting the feeder(s), is listed for operation at 100 percent of its rating, the allowable ampacity of the feeder conductors shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load, and not less than the rating of the overcurrent device."

SUBSTANTIATION: The addition of the word "allowable" ampacity should make it clear that it is the ampacity under the prevailing conditions including the application of adjustment factors if they apply.

The rule for sizing conductors when the overcurrent device is listed for 100 percent operation and one that is not such listed can lead to widely different conductor sized for the same identical load. At least in the case where the overcurrent device is listed for 100 percent operation, the minimum allowable ampacity of the conductor should not be permitted to be less than the rating of the overcurrent device. The following example illustrates the point.

Example: If a feeder supplies a continuous load of 130 amperes and the overcurrent device and enclosure are listed for operation at 100 percent of its rating then the overcurrent device is permitted to be rated at 150 amperes. In this case the conductor is permitted to be sized based upon an allowable ampacity not less than 100 percent of the continuous load. If copper conductors are used with 75°C insulation and terminations, the maximum conductor size required would be AWG #1 which is listed in Table 310-16 as 130 amperes. If the overcurrent device had not been listed for 100 percent operation, the minimum overcurrent device rating for this load would have been 175 amperes and the minimum conductor size would have been AWG #2/0. This seems to be a wide difference in minimum conductor size for the same identical load simply because one overcurrent device is rated for 100 percent operation and the other is not.

PANEL ACTION: Accept in Principle.

Revise the exception in the existing Code to read as follows:

Exception: Where the assembly, including the overcurrent devices protecting the feeder(s), is listed for operation at 100 percent of its rating, the allowable ampacity of the feeder conductors shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load. In no case shall the ampacity be less than the rating of the overcurrent device."

PANEL STATEMENT: The panel has accepted the submitter's recommendation relative to the use of "allowable" in the exception. The submitter's wording can be interpreted to be permissive relative to the minimum sizing compared to the overcurrent device. As such, the panel has revised the exception to accomplish the objective using clearer language.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #689)

2- 245 - (215-2(d) (New)): Reject
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 4 for action in Article 225. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add a new paragraph (d) to read as follows:
(d) Feeder conductors covered by Article 225 shall have an ampacity not less than (1) 100-amperes 3-wire single-phase or 60-(70)- amperes 4-wire three-phase where supplying a one-family dwelling; (2) 60-amperes 3-wire single-phase or 30 (40) -amperes 4-wire three-phase where supplying an individual dwelling unit of a two-family or multifamily dwelling. The ampacity for a neutral conductor shall be permitted to be determined in accordance with Section 220-22. Conductor ratings specified in Table 310-15(b)(6) shall be permitted.
(ampacity figures in parentheses are alternate choices)
SUBSTANTIATION: Specific minimum ampacities for feeder conductors covered in Article 225 and supplying a dwelling unit do not appear to be covered in the Code. Section 230-42(b) in effect, requires minimum service conductor rating of 100 amperes 3-wire for a one-family dwelling and 60-amperes for dwelling units of two-family or multi-family dwellings.
Sections 225-39(c) and (d) requires a minimum disconnecting means rating of 100-amperes 3-wire for a one-family dwelling, and 60-amperes for units of two-family or multifamily dwellings as correlation with Section 230-79. Feeder conductors should also correlate with Section 225-39.
A 60-ampere 3-phase 4-wire 208y/120-volt system can supply a volt-ampere load midway between that of 120/240-volt and 208y/120-volt single-phase systems. Three-phase 4-wire systems for dwellings do not appear to be prohibited by the code.
PANEL ACTION: Reject.
PANEL STATEMENT: Code-Making Panel 2 does not agree that it is necessary to establish a minimum rating for feeders supplying a dwelling unit. The panel requests that the Technical Correlating Committee refer this proposal to Code-Making Panel 4 for action since this is under the scope of Article 225.

(Log #690)

2- 247 - (215-4(a)): Accept
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Feeders with Common Neutral. ~~Feeders containing a common neutral shall be permitted to supply two~~ Two or three sets of 3-wire feeders, or two sets of 4-wire or 5-wire feeders shall be permitted to utilize a common neutral.
SUBSTANTIATION: Editorial. Present wording indicates feeders supplying feeders. Branch circuits may be supplied.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #691)

2- 248 - (215-5): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise last sentence to read as follows:
Such a diagram shall show the area in square feet of the building or other structure supplied by each feeder, the total ~~connected~~ computed load before applying demand factors... (remainder unchanged).
SUBSTANTIATION: Editorial. All loads are not connected loads, per se, such as those based on square foot area, or assigned to specific type circuits, or number of outlets. Connected loads are still computed and would be included.
PANEL ACTION: Reject.
PANEL STATEMENT: The use of the term "connected load" is consistent with the usage of the term elsewhere in the code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1747)

2- 249 - (215-5): Reject
SUBMITTER: Jamie McNamara, Hastings, MN
RECOMMENDATION: Revise as follows:
215-5. Diagrams of Feeders. If required by the authority having jurisdiction, a diagram showing feeder details shall be provided prior to the installation of the feeders. Such a diagram shall show the area in square feet of the building or other structure supplied by each feeder, the total connected load before applying demand factors, the demand factors used, the computed load after applying demand factors, and the size and type of conductors to be used. If required by the authority having jurisdiction, the computed load after apply the demand factors and the date the computation was done, shall be posted at the point were the feeder receives its supply.
SUBSTANTIATION: In cases were the AHJ requires these diagrams/calculations the information is readily known and available at the original time of installation. This requires very little work to post this at the panelboard were the feeder originates when you already have the information. This is valuable information for people to know, This information is often lost or not available shortly after installation, the date the calculation was done is also pertinent information AHJ is often apprehensive about requiring a diagram of a feeder due to the time and expense involved in doing one. This information is needed to make a safe decision as to the adequacy of the existing system.
PANEL ACTION: Reject.
PANEL STATEMENT: The authority having jurisdiction can already require that this information be posted without changes in the Code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #692)

2- 250 - (215-8): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Means of Identifying Conductor with the Higher Voltage to Ground. On a 4-wire delta-connected ~~secondary~~ system where the midpoint of one phase is grounded ~~to supply lighting and similar loads~~ the phase conductor having the higher voltage to ground shall be ~~identified~~ distinguished from the other phase conductors by a continuous outer finish that is orange in color along its entire length ~~or by tagging or other effective means~~ except that a conductor larger than No. 6 shall be permitted to be identified at the time of installation by a permanent distinctive orange marking that shall encircle the conductor insulation. Such identification shall be provided ~~placed~~ at each ~~point where a connection is made~~ conductor termination, at each junction point except conduit bodies that do not contain splices or unused hubs, and at intervals not exceeding 6 ft (1.83 m), but not less than one such intermediate marking, where installed in a wireway, auxiliary gutter, or cable tray. Such identification shall be provided ~~placed~~ in accordance with the above at each point where the grounded conductor is also present.

SUBSTANTIATION: This section permits field marking for conductors regardless of size which does not conform to field marking for grounded or grounding conductors. Are the safety considerations any less? Present wording infers that other phase conductors are not to be orange but requires an interpretation of intent since it is not specifically prohibited. The word "secondary" may be inferred as an on-site transformer, whereas the source of the feeder may be a service or generator. The word "system" is encompassing.

Proposal 5-20 in the 1998 ROP provided for marking that encircles the grounded conductor, the substantiation for which is applicable for all field marking.

Junction points such as pull boxes, and conductors in wire-ways, auxiliary gutters, and cable trays are amenable to future connections and marking at installation prior to later connections would be desirable. Conduit bodies with no splices or unused hubs are less likely tap points.

PANEL ACTION: Reject.

PANEL STATEMENT: The requirement to identify the high-leg of a feeder is based on specific connection issues to equipment. Requirements to identify the grounded and grounding conductors are based on much more extensive concerns. Applying the grounded conductor rules to the high-leg marking is not substantiated by the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #1501)

2- 251 - (215-8): Reject

SUBMITTER: Larry D. Wendt, State of Idaho / Rep. I.A.E.I.

RECOMMENDATION: Revise text as follows:

215-8. Means of Identifying Conductor with the Higher Voltage to Ground. On a 4-wire, delta-connected secondary where the midpoint of one phase winding is grounded to supply lighting and similar loads, the phase conductor having the higher voltage to ground shall be identified by an outer finish that is orange in color or by tagging or other effective means. Such identification shall be placed at each point where a connection is made if the grounded conductor is also present. See Section 110-15.

SUBSTANTIATION: Means of identifying conductor with the higher voltage to ground is a requirement that should be in Section 110-15 for requirements for electrical installations where it would apply to all types of installations instead of this location. It would also streamline and simplify the code for easier usage.

Please coordinate with proposals on Sections 110-15, 210-4(d), 230-56, 384-3(e), and 384-3(f).

PANEL ACTION: Reject.

PANEL STATEMENT: The cross-reference from 215-8 back to the proposed section is unnecessary since the two items would be identical.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #4416)

2- 252 - (215-10): Reject

NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 4 for information.

SUBMITTER: Charles Meeker, Electro-Test, Inc.

RECOMMENDATION: Revise text to read as follows:

215.10. Ground-Fault Protection of Equipment. ~~Each f~~Feeder disconnect(s) ~~rated 1000 amperes or more and installed on solidly grounded wye electrical systems of more than 150 volts to ground, but not exceeding 600 volts phase to phase,~~ shall be provided with ground-fault protection of equipment in accordance with the provisions of Section 230.95.

SUBSTANTIATION: There are two reasons for proposing these changes.

1. The deleted words are redundant and unnecessary.
2. To eliminate conflict between proposed changes to 230-95.

The intent of the change is based on the hazards of arcing ground-faults which are determined by total system capacity, and not the size of an individual disconnect rating. Therefore, it is the equipment rating of 1000 amperes or greater that should be used to determine the need for ground-fault protection. For example, the number of individual disconnecting means, as allowed by 230-71, does not reduce the potential hazard to person or equipment of arcing ground-faults, if the rating of the equipment is still 1000 amperes or greater.

PANEL ACTION: Reject.

PANEL STATEMENT: The text in 215-10 is necessary for the application of ground fault protection on feeders. Should revisions be made to 230-95, Code-Making Panel 2 will review those and act accordingly.

(Log #439)

2- 253 - (215-12 (New)): Reject

SUBMITTER: Glenn W. Zieseniss, Crown Point, IN

RECOMMENDATION: Add a new section stating the following:

215-XX. Access to Occupants. Each occupant shall have access to the occupant's supply disconnecting means as described in Article 225, Section 35.

SUBSTANTIATION: Section 240-24(b) addresses Overcurrent (OC) devices accessible to occupant(s). This new 215-xx would address a feeder disconnecting means, which may or may not be an OC device. If the feeder disconnecting means is located in another portion of a small, 3 or 4 unit apartment building (even if the owner of the building lives in one unit), he/she will not be available 24 hours a day every day of the year(s). The occupant needs access to the disconnecting means as per 225-35 as if it were in another building or structure.

By referring to the 225-35 section, this reduces the amount of words in the NEC.

PANEL ACTION: Reject.

PANEL STATEMENT: This requirement is addressed in Sections 225-35 and 240-24. It is not necessary to restate this in Article 215.

ARTICLE 220 — BRANCH-CIRCUIT, FEEDER, AND SERVICE CALCULATIONS

(Log #453)

2- 254 - (220): Accept

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION:

1. In Section 220-3(b)(8)(a), replace "5 ft (1.52 m)" with "1.5 m (5 ft)".
2. In Section 220-3(b)(8)(b), replace "1 ft (305 mm)" with "300 mm (1 ft)".
3. In Section 220-3(c)(1), replace "500 ft^2 (46.5 m^2)" with "46.5 m^2 (500 ft^2)".
4. In Section 220-12(b), replace "2 ft (610 mm)" with "600 mm (2 ft)".
5. In Section 220-30(b)(2), replace "3 volt-amperes per square foot (0.093 m^2)" with "33 volt-amperes/m^2 or 3 volt-amperes/ft^2".
6. In Section 220-31 2nd paragraph, replace "3 volt-amperes/ft2 (0.093 m^2)" with "33 volt-amperes/m^2 or 3 volt-amperes/ft^2".
7. In Section 220-31(2), replace "3 volt-amperes/ft^2 (0.093 m^2)" with "33 volt-amperes/m^2 or 3 volt-amperes/ft^2".
8. In Section 220-32(c)(2), replace "3 volt-amperes/ft^2 (0.093 m^2)" with "33 volt-amperes/m^2 or 3 volt-amperes/ft^2".

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show the SI units as the preferred and the inch-pound units immediately following in parenthesis. The inch-pound numbers are not shown in parenthesis for items 5 through 8 since they are not a direct conversion. Separate loads for these items are given based on square meters and square feet

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BROWN: The use of "hard Conversions" should be reevaluated. The proposed metric measurements do not correlate with the respective English measurements as used in such documents as model building codes, and standards such as ANSI A117.1. The Technical Correlating Committee should correlate all of these metric changes in the NEC with those dimensions already accepted throughout the industry. Using the proposed dimensions and factors, it is possible to calculate a load that will be 2 percent higher then is now required.
COMMENT ON AFFIRMATIVE:
BECKER: Consideration should be given to using a metric load that is less than the 1 in.-pound load, to encourage trades people to use the SI units. In this case, 32 volt-amperes would be approximately 1 percent less than the soft conversion of 32.58 volt-amperes, compared to 33 volt-amperes being 2.3 percent greater.

(Log #3821)

2- 255 - (220): Reject
SUBMITTER: Philip Morgans, Riviera Electric
RECOMMENDATION: Section 220 should have two sections that cover standard and optional load calculations for apartment buildings including house loads.
SUBSTANTIATION: It is unclear about how to calculate loads for apartment buildings in regard to standard vs. optional calculation.
PANEL ACTION: Reject.
PANEL STATEMENT: No proposed text was provided in accordance with 4-3.3 of the Regulations Governing Committee Projects.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3837)

2- 256 - (220, Appendix D): Reject
SUBMITTER: Bill Kolson, Riviera Electric
RECOMMENDATION: Revise text to read:
"This change would allow users of the code, quick and easy reference to the examples ~~without having to leave the article to fix them~~ by having them located within the article they pertain to. This would greatly simplify the usage of Article 220 and would eliminate the need to reference code users to Appendix D.
SUBSTANTIATION: All of the example calculations for one family and multiple dwelling are located currently in Appendix D. When working these calculations using Article 220, it would be more time saving for the electrician to have these examples contained in the article they pertain to rather than having to flip to the back of the code book to use them.
PANEL ACTION: Reject.
PANEL STATEMENT: Appendix D contains examples, not mandatory code. The NEC Style Manual indicates that explanatory materials are to be in an Annex.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3840)

2- 257 - (220): Reject
SUBMITTER: Dean Hauck, Riviera Electric
RECOMMENDATION: The NEC should include a section in the code book that lists formulas that would be used in the field. Such as ohm's law, voltage drop, containers, capacitors, inductance etc. (using a perforated page would allow testing agencies to remove these for testing purposes). Having these formulas would help the electricians in the field.
SUBSTANTIATION: It is difficult to remember all these formulas, so having a section at lists all formulas for calculations would save a lot of time and money for our employers, not to mention correct calculations for safety and correct operation of electrical systems.
PANEL ACTION: Reject.
PANEL STATEMENT: This is a design or engineering consideration as outlined in Section 90-1(c) and is not appropriate in the Code. In addition, this proposal does not conform to 4-3.3 of the Regulations Governing Committee Projects.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1467)

2- 258 - (220-1 Exception No. 2 (New)): Reject
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 4 for information.
SUBMITTER: William M. Lewis, Eli Lilly and Co.
RECOMMENDATION: Change the exception to Exception No. 1 and add Exception No. 2 to read:
Exception No. 2: Outdoor feeders over 600 volts as covered in Article 225, Part C.
SUBSTANTIATION: New proposals for Article 225 created by a task group to address over 600 volt issues in the code, if accepted, will make this new exception necessary.
This proposal was developed by the Task Group based on the Task Group's review and discussion of the current requirements of Articles 225, 230, 100, 110, 240, and 250. This proposal is one of 14 which makes up the Task Group's response to a recommendation by a TCC task group on usability in 1995. In considering the needed proposals, emphasis was placed on including in the NEC, practices which are recognized in the electrical industry as necessary for safe installation of over 600 volt systems. This is to provide guidance and direction for installation of these facilities that have not historically been included in the NEC.
The Task Group participants consisted of William M. Lewis (CMP 4); committee chair; Carl J. Fredericks (CMP 10); Tom Adams (CMP 4); John Beck (Chairman CMP 4); Mark Sumrall (CMP 4); Barry Hornberger, (CMP 13); William T. Beutler, P.E.; William Long, NEMA.
Interested persons (nonparticipants): Robert J. Pollock (CMP 4 and TCC); Merton Bunker (NFPA); Mark Earley (NFPA).
PANEL ACTION: Reject.
PANEL STATEMENT: The panel questions adding an exception to remove calculations for over 600 volt feeders from the scope of Article 220. Should specific rules for calculating loads over 600 volts be necessary, the appropriate placement is in Article 220.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
ROCHE: Even though there is already one exception to the concept of all load calculations being in Article 200, I agree that the proper place for guidance for calculating loads for over 600 volt feeders should be in Article 220 instead of Article 225. Rules could be developed for all circuits over 600 volts, not just outside circuits. With this concept in mind, I suggest that the rules incorporated by CMP 4 action on Proposal 4-40b be moved into a new Part E of Article 220. Part E would be titled "E. Method of Sizing Conductors for Circuits Over 600 Volts".
This would also require coordination with CMP 4 actions on Proposals 4-4, 4-7, 4-7(a), 4-39, and 4-40(b).

(Log #3826)

2- 259 - (220-2(b)): Accept in Principle
SUBMITTER: Fred Deffenbaugh, Riviera Electric
RECOMMENDATION: Add text:
"It is permitted to drop a fraction of an ampere of less than 0.5."
SUBSTANTIATION: Except where computations result in a fraction of an ampere 0.5 or larger, such fractions shall be permitted to be dropped. (This is not clear).
PANEL ACTION: Accept in Principle.
Revise existing Section 220-2(b) to read as follows:
"Where computations result in a fraction of an ampere that is less than 0.5, such fractions shall be permitted to be dropped."
PANEL STATEMENT: The revised text meets the intent of the submitter and provides clarity.

(Log #4426)

2- 260 - (220-2(b)(8)): Accept in Principle
SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Add a new sentence as follows:
"The length used for the computation shall be based on the portion that contains receptacle outlets.
SUBSTANTIATION: Multioutlet assemblies are commonly installed in department stores and office buildings as free standing, vertical "power poles". The multioutlet assemblies are commercially available as listed products with one or more receptacles located near the end intended to be supported from the floor. The entire length of the assembly may be 20 or 30 feet but the portion containing receptacles is typically less than 1 foot. The load is typically a cash register or office equipment. Presently one would have to use the entire length of the assembly (the majority of which contains no receptacles and therefore has no load) to determine the load computation. This application could be similar to installing a free standing conduit drop having a threaded "FS Type" Box, containing a receptacle, located near the floor. The computation in this case would only be 180 volt-amperes. See also the definition for Multioutlet Assembly in Article 100.
PANEL ACTION: Accept in Principle.
Add a new second sentence to the opening paragraph of existing Section 220-3(b)(8) to read as follows:
"For the purposes of this section, the computation shall be permitted to be based on the portion that contains receptacle outlets."
PANEL STATEMENT: The revised wording meets the intent of the submitter and provides clarity.

AFFIRMATIVE: 12

(Log #4402)

2- 261 - (220-2(c) (New)): Reject
SUBMITTER: Richard W. Becker, Engineered Electrical Systems, Inc.
RECOMMENDATION: Add a paragraph to read:
(c) Load Calculations. Calculations shall be in units of kVA. Except where the computations result in a fraction of a kVA 0.05 or larger, such fractions shall be permitted to be dropped.
SUBSTANTIATION: This proposal deals with "significant digits". Calculations using Volt-Amperes are cumbersome and difficult to interpret. When kVA is rounded to one decimal point, loads less than 40 VA are rounded down and 50 VA and greater are rounded up. Statistically, the rounding results in an insignificant difference and makes the information much easier to process.
PANEL ACTION: Reject.
PANEL STATEMENT: This is an engineering consideration. There are other methods used to calculate loads, and the panel does not agree that units of kVA should be mandated.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #452)

2- 262 - (220-3(a)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise the first sentence of Section 220-3(a) to read as follows:
"A unit load of not less than that specified in Table 220-3(a) for occupancies specified therein shall constitute the minimum lighting load. ~~for each square foot (0.093 m^2) of floor area.~~"
SUBSTANTIATION: Deleting the material noted in the proposal eliminates the need to revise it to the metric format. Also, the deleted material is not necessary since Table 220-3(a) includes the proper reference to square foot or square meter.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1444)

2- 263 - (220-3(a)): Reject
SUBMITTER: Barry F. Tower, Patten, ME
RECOMMENDATION: Keep the first sentence as is.
Change the second sentence to read as follows:
"The floor area for each floor including finished basements and unfinished basements adaptable for future use shall be computed from the outside dimensions of the building, dwelling unit, or other area involved."
Keep the third sentence as is.
SUBSTANTIATION: The purpose of this proposal is to clarify what is already the intent of the "code". A previous CMP 2 has already indicated that unfinished basements must be included in the square footage calculations if they are adaptable for future use. Please see the 1995 NEC ROP 2-405. The actual wording change that I am proposing is that I have inserted the following ten words into that existing sentence: "including finished basements and unfinished basements adaptable for future use."
Including the basement or not including the basement when calculating square footage can make a tremendous difference (It can be twice as much). Something this significant should be clarified.
PANEL ACTION: Reject.
PANEL STATEMENT: The present code requirements are clear in their intent. The second sentence applies to all buildings, the third sentence applies to dwelling units.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1886)

2- 264 - (220-3(a)): Reject
SUBMITTER: Richard D. Thompson, Thompson Assoc.
RECOMMENDATION: Add to: Type of Occupancy; Unit load per square foot (volt-amperes)
Motion Picture and Television Production Soundstages and Approved Production Facilities 35
SUBSTANTIATION: NFPA 140, "Standard for Motion Picture and Television Production Soundstages and Approved Production Facilities" was adopted by the NFPA at their May 1999 annual meeting. In this new standard, Section 3-5 Electrical Requirements, states in 3-5.1 that "Soundstages and approved production facilities shall be provided with a minimum of 35 W/ft^2 (377 $W/m/^2$) dedicated for production lighting and power."
The NFPA Technical Committee that developed NFPA 140 consisted of representatives of the major film and television studios, fire departments, insurance underwriters, and knowledgeable industry personnel. In their deliberations, it was strongly urged to add to this fire code standard a minimum requirement for the electrical power used for set lighting. Typically, lighting fixtures in the 1000, 2000, 5000 and 10,000 watt sized are used in lighting motion picture and television productions. The committee found that many productions were and continue to be filmed in industrial buildings where the installed electrical service is woefully inadequate. Typically, portable generators are needed to augment the existing electrical service. This requirement in NFPA 140 does not preclude the use of portable generators, should the needs of the production exceed this minimum requirement.
It is the intent of this proposal to the 2002 NEC to incorporate this provision from NFPA 140 into the Electrical Code so as to facilitate the knowledge and information of this new requirement such that the AHJ, electrical engineers, building owners and studio operators can comply with this standard.
PANEL ACTION: Reject.
PANEL STATEMENT: NFPA 140, Section 3-5.1 deals with lighting and power requirements for these facilities. NEC Table 220-3(a) only applies to general lighting loads. The submitter's proposal would require the full 35 VA per sq. ft. for lighting only which the panel does not believe is the submitter's intent. The panel questions whether a sound stage is a general lighting load.

(Log #454)

2- 265 - (Table 220-3(a)): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Replace Table 220-3(a) with the following table:

Table 220-3(a) General Lighting Loads by Occupancy

Type of Occupancy	Unit Load Volt-Amperes per Square Meter	Unit Load Volt-Amperes per Square Foot
Armories and auditoriums	11	1
Banks	39[b]	3 1/2[b]
Barber shops and beauty parlors	33	3
Churches	11	1
Clubs	22	2
Court rooms	22	2
Dwelling units[a]	33	3
Garages – commercial (storage)	6	1/2
Hospitals	22	2
Hotels and motels, including apartment houses without provision for cooking by tenants[a]	22	2
Industrial commercial (loft) buildings	22	2
Lodge rooms	17	1 1/2
Office buildings	39[b]	3 1/2[b]
Restaurants	22	2
Schools	33	33
Stores	33	3
Warehouses (storage)	3	1/4
In any of the above occupancies except one-family dwellings and individual dwelling units of two-family and multi-family dwellings:		
Assembly halls and auditoriums	11	1
Halls, corridors, closets, stairways	6	1/2
Storage spaces	3	1/4

[a]See Section 220-3(b)(10).
[b]In addition, a unit load of 1 volt-ampere/ft^2 or 11 volt/amperes/m^2 shall be included for general-purpose receptacle outlets where the actual number of general-purpose receptacle outlets is unknown.

SUBSTANTIATION: The proposed revision is itended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to values of measurement. The inch-pound numbers are not shown in parenthesis since they are not a direct conversion. Separate unit loads are given based on square feet and square meters.
PANEL ACTION: Accept in Principle.
In the proposed table, in the row for "Schools", change the number in the "Volt-Amperes per Square Foot" column from "33" to "3".
In superscript "b" at the bottom of the table, delete the slash between "volt" and "amperes". In addition in "b" reverse the english and the metric units.
PANEL STATEMENT: The revisions to the table are editorial.

(Log #4133)

2- 266 - (Table 220-3(a)): Reject
SUBMITTER: David T. Brender, Cooper Development Assn. Inc.
RECOMMENDATION: In Table 220-3(a), change the Unit Load per Square Foot (Volt-Amperes) for Dwelling Units from 3 to 4-1/2.
SUBSTANTIATION: The current Unit Load per Square Foot for dwelling units has been at 3 in the Code for at least 30 years (1968 NEC). During this period, there has been an explosion of electrical products being used in dwelling units. Where, in the sixties, there might have been one TV, stereo, or hair dryer in a home, there are now multiple appliances throughout the dwelling. Recent research (International Telework Association and Council-report released October 27, 1999) indicates that 19.2 million people, or 10 percent of the workforce, now telecommute, supporting the growing residential use of computers, printers, fax machines, copiers, etc. In fact, 55 percent of all U.S. households now have one or more computers (Parks Associates, Forum99, October 1999), and this is expected to grow further to 75-80 percent within the new 10 years. Many other appliances VCRs, DVDs, room heaters, room air-conditioners, hair dryers, curling irons, exercise equipment, remote telephones, answering machines, etc., have become commonplace in dwellings. Electric chain saws, snow throwers, hedge clippers, edgers, leaf blowers, etc., have also proliferated in usage.
The Code should recognize this dramatic increase in electric requirements by revising the Code to accurately reflect the current and projected simultaneous electricity demands in dwellings. Even the increased value of 4-1/2 volt-amperes per square foot is modest compared to the amount of electrical products currently in use and the anticipated continuing increase in the coming decades. The dwellings being built today need to be able to handle the electrical load for up to 50 years from now.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not considered in his substantiation that utilization equipment manufactured today is more efficient than in the past. For such a change, the panel would need to review actual engineering field measurements to show that 3 VA/sq. ft. is insufficient.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2892)

2- 267 - (220-3(b)): Reject
SUBMITTER: James Maldonado, City of Tempe, AZ/Rep. Central Arizona Chapter IAEI
RECOMMENDATION: Add new subsections (11) to Section 220-3(b) to read as follows:
(8) For purposes of calculations and installation requirements, the following loads and branch circuit requirements may be used where the actual nameplate rating is not available.

	LOAD	CONDUCTOR AMPACITY	SINGLE PHASE NOMINAL VOLTAGE
Electric Clothes Dryer	5000 VA	30 Ampere	(120/240V)
Water heater	4500 VA	30 Ampere	(240V)
Dishwasher	1500VA	20 Ampere	(120V)
Garbage Disposal	720 VA	20 Ampere	(120V)
Evaporative Cooler	1200 VA	20 Ampere	(120V)
Compactor	1500 VA	20 Ampere	(120V)
Wall Mounted Oven or Counter Mounted	6000 VA	30 Ampere	(120/240V)
Cooking Units Range	12000 VA	50 Ampere	(120/240V)
Gas Fire Clothes Dryer	1500 VA	20 Ampere	(120V)
Clothes Washer	1500 VA	20 Ampere	(120V)
Microwave Ovens (Fixed)	1200 VA	20 Ampere	(120V)

NOTE: The above calculations are without appropriate NEC demands, which may be taken where permitted in the NEC. If appliances are installed having higher nameplate ratings than the minimum loads specified above, the conductors shall be increased to the proper size. Where limited storage capacity water heaters are specified, the nameplate rating of the unit(s) shall be used.

SUBSTANTIATION: These loads are necessary to allow for calculating loads prior to having the complete data on equipment that has not been purchased. These loads will allow for most equipment to be installed while having an electrical system that is designed with adequate ampacity. These values do not have to be used if the equipment planned for has already been specified and the values are known. Too many times designers choose values they are familiar with while not completely specifying the equipment being designed for.
PANEL ACTION: Reject.
PANEL STATEMENT: This is a design issue. See Section 90-1(c). It is not possible for the code to anticipate all of the loads of available appliances.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3818)

2- 268 - (220-3(b)): Reject
SUBMITTER: Don Crawford, Riviera Electric
RECOMMENDATION: Delete this section.
SUBSTANTIATION: By deleting this section and only using 220-12(a) as reference this will eliminate duplication and/or duplication unnecessarily. This duplication is confusing and causes uncertainty.
PANEL ACTION: Reject.
PANEL STATEMENT: It is unclear which section the submitter wants to delete. It should be noted that Section 220-12(a) pertains to demand factors for computing feeder and service loads for show windows. Section 220-3(b)(7) is used to compute show window branch circuit loads.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2835)

2- 269 - (220-3(b)(1)): Accept
SUBMITTER: Melvin K. Sanders, Ankeny, IA
RECOMMENDATION: Replace "strap" with "yoke":
(9) Receptacle Outlets. Except as covered in (10), receptacle outlets shall be computed at not less than 180 volt-amperes for each single or for each multiple receptacle on one ~~strap~~ yoke. A single piece of equipment consisting of a multiple receptacle comprised of four or more receptacles shall be computed at not less than 90 volt-amperes per receptacle.
SUBSTANTIATION: To be consistent with the text presently in Definitions Article 100 page 23 for "Receptacle" and as used elsewhere in the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1152)

2- 270 - (220-3(b)(3)): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise text to read:
"Motor Loads. Outlets for motor loads shall be computed based on maximum current ratings in accordance with the requirements in Sections ~~430-22 and 430-24 and Article 440.~~ 430-6(a), (b), (c), and (d), and the rated load current or branch-circuit selection current as covered in Section 440-2 for hermetic refrigerant motor-compressors."
SUBSTANTIATION: Sections 430-22 and 430-24 do not relate directly to load computations, but conductor ampacity, which is not the same, but separate considerations. While it is common to include the largest motor factor (25 percent) and continuous load factor (125 percent) to simplify calculations for panelboard, feeder, and service loads, those factors are technically for conductor ampacities, not load computations.
This section infers motor supply conductor ampacity constitutes the computed load which is misleading and incorrect.
If the requirements of Section 430-22(b) for a continuous duty motor for varying duty to have supply conductors of 200 percent of the motor nameplate current rating is used for load calculation there would be a phantom load increase of 100 percent for the branch circuit load. Section 220-14 for feeders and services does not reference Section 430-22 even though they may supply only a single branch circuit for such a motor.
The present reference to Article 440 is not specific; Code users should be directed to explicit sections that apply.
PANEL ACTION: Accept in Principle in Part.
Revise 220-3(b)(3) in the existing code by replacing "Article 440" with "Section 440-6".
The panel rejects the remainder of the proposal.

PANEL STATEMENT: The panel accepts in principle the part of the recommendation referencing a specific section in Article 440. The proper reference is 440-6. The panel rejects the remainder of the proposal because the references make it clear what rules to use. It is the intent of the panel to use the same rules for motor conductor calculations as load calculations.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #693)

2- 271 - (220-3(b)(6)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(6) Sign and Outline Lighting Each branch circuit specified in Section 600-5(a) for ~~Sign~~ sign and outline lighting outlets shall be computed at not less than 1200 volt-amperes. ~~for each branch circuit specified in Section 600-5(a).~~
SUBSTANTIATION: Editorial. Section 600-5(a) allows one or more outlets on the sign circuit. Present wording can be interpreted as applying the minimum load to each outlet or the sum total of outlets. Proposal clearly assigns the load to the circuit.
PANEL ACTION: Reject.
PANEL STATEMENT: The present text is clear, and states specifically that the computed load is a minimum of 1200 va for each branch circuit specified in 600-5(a).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #694)

2- 272 - (220-3(c)(1), (2)): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(1) Dwelling Units. General lighting ~~Loads~~ loads for structural additions to an existing dwelling unit or for a previously unwired portion of an existing dwelling unit ~~Either of which exceed 500 ft^2 (46.5m^2),~~ shall be computed in accordance with ~~(b)~~ (a). Loads for new circuits or extended circuits for other than general lighting in previously wired dwelling units shall be computed in accordance with ~~either (a) or~~ (b).
(2) Other than Dwelling Units. Loads for new circuits or extended circuits in other than dwelling units shall be computed in accordance with either (a) or (b), as applicable.
SUBSTANTIATION: The first sentence of (1) appears intended to apply to general lighting loads since the reference to (b) is apparently an oversight carried over from the 1996 code where (b) was titled Lighting Load for Listed (Specific) occupancies, which is now (a). Without such distinction, the addition or unwired portions are equally covered by the last sentence.
The present reference to (b) doesn't allow Table 220-3(a) to be used.
The present wording allows up to 500 sq ft to be wired without a load computation; at 3va/sq ft this could be a normally computed load of 1500 va. This exemption doesn't apply for the last sentence of (1) if (a) is selected, nor for (2) where (a) is selected. This is inconsistent and doesn't make sense.
If the intent is to apply a distinction between general lighting and other loads the reference to (a) should be deleted in the second sentence as that covers "other loads". If the intent is to permit either (a) or (b) the first sentence should be deleted as it is then superfluous and contradictory.
Present wording of (2) literally allows either (a) (general lighting) or (b) (other loads) to be used for computation without distinction of the type of load supplied.
PANEL ACTION: Accept in Principle in Part.
Revise exsiting section 220-3(c)(1) to read as follows:
"(1) Dwelling Units.
a. Loads for structural additions to an existing dwelling unit or for a previously unwired portion of an existing dwelling unit, either of which exceeds 46.5m2 (500 ft.^{2}), shall be computed in accordance with 220-3(a) and (b).
b. Loads for new circuits or extended circuits in previously wired dwelling units shall be computed in accordance with either 220-3 (a) or (b), as applicable."
The panel rejects the deletion of "Either of which exceed 500 ft2".
The panel accepts the suggested change in (2) of the proposal.
PANEL STATEMENT: The revised wording meets the intent of the submitter and provides clarity. New additions need to comply with both (a) and (b). No substantiation was given for deleting the 500 ft^2 exclusion.

(Log #2162)

2- 273 - (220-4(c)): Accept
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
Range Loads. It shall be permissible ~~acceptable~~ to apply demand factors for range loads in accordance with Table 220-19, including Note 4.
SUBSTANTIATION: Acceptable is not the proper word for a permissive rule. "Shall be permitted and shall be permissible indicate allowed optional or alternate methods." [NEC Style Manual 3.2.5.5 Voltage]; therefore, permissible should be used in this section.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1748)

2- 274 - (220-5 (New)): Reject
SUBMITTER: Jamie McNamara, Hastings, MN
RECOMMENDATION: Add new text to read as follows:
220-5. Diagrams of service(s). If required by the authority having jurisdiction, a diagram showing service details shall be provided prior to the installation of the service. Such a diagram shall show the area in square feet of the building or other structure supplied by each service, the total connected load before applying demand factors, the demand factors used, the computed load after applying demand factors, and the size and type of conductors to be used.
SUBSTANTIATION: There is a requirement for feeders in article 215-5 that is similar to this one but limited to feeders by the scope of article 215-1. Article 215 covers the installation requirements, overcurrent protection requirements, minimum size, and ampacity of conductors for feeders supplying branch-circuit loads as computed in accordance with Article 220. This requirement would allow the authority having jurisdiction to require a diagram of the service (load calculation) as is currently the case for feeders only. There are a lot of buildings that have a service and branch circuits only and no feeder's as in most dwellings and small commercial buildings and the requirements in 215-5 can not be applied. Please see other proposal on 230-5 and 215-5.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirement for a diagram would not be appropriate in Article 220.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #455)

2- 275 - (220-12(a)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise Section 220-12(a) to read as follows:
"(a) Show Windows. For show-window lighting, a load of not less than 660 volt-amperes/linear meter or 200 volt-amperes/linear foot shall be included for ~~each linear foot (305 mm) of~~ a show window, measured horizontally along its base.
FPN: See Section 220-3(b)(7) for branch circuits supplying show windows."
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement.

The inch-pound numbers are not shown in parenthesis since they are not a direct conversion. Separate loads are given based on linear meters and linear feet.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3763)

2- 276 - (220-12(b)): Accept
NOTE: The Technical Correlating Committee directs that the panel clarify the action on the proposal, specifying where the new sentence is to be located. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Michael S. O'Boyle, Lightolier, Inc./Rep. American Lighting Assn.
RECOMMENDATION: Add last sentence from 1996 NEC 410-102 and relocate to Part A:
"Track Lighting. For track lighting in other than dwelling units or guest rooms of hotels or motels, an additional load of 150 volt-amperes shall be included for every 2 ft (610 mm) of lighting track or fraction thereof. Where multicircuit track is installed the load shall be considered to be divided equally between the track circuits."
SUBSTANTIATION: This load calculation requirement was relocated to Section 220-12 from Section 410-102 during the 1999 code cycle. The 1996 Section 410-102 requirement addressed both single circuit and multicircuit lighting track. Using that rule, 12 ft of single circuit lighting track would be considered a 900 VA load, each circuit of a 12 ft two-circuit lighting track would be considered a 450 VA load and each circuit of a 12 ft triple-circuit lighting track would be considered a 300 VA load. Presently, Section 220-12 does not address multicircuit lighting track. A98 NEC-ROP and A98 NEC-ROC do not reveal any substantiated reason for deleting the multicircuit calculation provision. Because separate branch circuits may supply a multicircuit lighting track, provisions should be given to separately calculate the load of each track circuit. Also, because the rule is associated with both branch circuits and feeders, it should appear in 220, Part A.
NOTE: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1153)

2- 277 - (220-14): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise text to read:
Motors. Motor loads shall be computed based on maximum current ratings in accordance with Sections ~~430-24, 430-25, and 430-26.~~ 430-6(a), (b), (c), and (d), and the rated load current or branch-circuit selection current as covered in Section 440-2 for hermetic refrigerant motor-compressors.
SUBSTANTIATION: Sections 430-24, 430-25 and 430-26 do not relate directly to load computations, but conductor ampacity, which is not the same, but separate considerations. This section infers the 25 percent increase for motor supply conductors constitute part of the load, which is misleading and incorrect. Section 430-22(b) should also apply to service and feeder conductors where they supply a motor (no other load) since they see the same heating effects as the branch-circuit portion of the supply conductors. Section 430-26 is deleted as that is a separate section which stands alone, again relating to ampacity, but does not specifically affect computed load. Section 440-2 is referenced as rated load or branch-circuit selection current appears to be the constituted load, as inferred by Sections 440-7, 440-33, and 440-34.
PANEL ACTION: Accept in Principle in Part.
At the end of existing Section 220-14, add "and 440-6 for hermetic refrigerant motor compressors."
The panel rejects the remainder of the proposal.
PANEL STATEMENT: The panel accepts in principle the part of the recommendation referencing a specific section in Article 440. The proper reference is 440-6. The panel rejects the remainder of the proposal because the references make it clear what rules to use. It is the intent of the panel to use the same rules for motor conductor calculations as load calculations.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #695)

2- 278 - (220-15, Exception): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Exception: Where reduced loading of the conductors results from units operating on duty-cycle, intermittently, or from all units not operating at ~~one~~ the same time, the authority having jurisdiction may grant permission for feeder and service conductors to have an ampacity less than 100 percent, provided the conductors have an ampacity sufficient for the load so determined.
SUBSTANTIATION: Editorial. Since service conductors would see the same reduced loading in addition to any other diversity, they should be included. Though service conductors would be computed based on feeder reduced load (normally), the text is a precise statement requiring 100 percent computation and the exception doesn't address the service conductors.
PANEL ACTION: Accept in Part.
The panel accepts the proposal, with the exception of the insertion of the word "sufficient".
PANEL STATEMENT: The word "sufficient" is not necessary, and is not in compliance with 2.2.1 of the NEC Style Manual.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3239)

2- 279 - (220-16(a)): Reject
SUBMITTER: Edward J. Fox, Jr., Orange County Bldg Div., FL
RECOMMENDATION: Reference to 1996 NEC Article 220-4(b) which has been rewritten, the following should be added at the end of the existing paragraph in 220-16(a):
220-16(a): There shall be a maximum or two duplex receptacles installed on each of the two required small appliance receptacle branch circuits for counter tops in the kitchen.
SUBSTANTIATION: If an electrical contractor wires a residence and does so with the minimum code as is stated in the 1996 NEC, and the 1999 NEC, he would only be required to have two circuits for small appliances in the kitchen area and be in compliance.
With the many different appliances available today, when the customer plugs in a coffee maker, a microwave, a griddle, a toaster, and etc., and all on the same circuit; that circuit breaker will trip due to an overloaded circuit. We feel that this could be unsafe because what the owner might do to correct this problem. Why create an unsafe condition that could be avoided and also have room for expansion later if needed.
The above article provides a higher degree of safety and flexibility for the consumers.
By providing fewer receptacles per circuit, there is less of a chance of any overload or the use of extension cords.
This proposal is very exact as to the requirements of this article.
By adding the loads of typical kitchen equipment it is very apparent that two outlets per circuit provides the additional capacity needed.
By providing a better electrical system up front, the citizens are not impacted by additional cost later due to adding more circuits to handle an ever increasing demand.
People entertain more and spend more time in the kitchen area and have a greater demand for kitchen related equipment.
PANEL ACTION: Reject.
PANEL STATEMENT: Insufficient substantiation has been provided to show that the current requirements are inadequate.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2857)

2- 280 - (220-16(c) (New)): Reject
SUBMITTER: Bill F. Neitzel, Madison, WI
RECOMMENDATION: Add new subsection:
(c) Bathroom Circuit Load. A load of not less than 1500 volt-amperes shall be included for each 2-wire bathroom branch circuit installed as required by Section 210-11(c)(3). This load shall be permitted to be included with the general lighting load and subjected to the demand factors provided in Table 220-11.
SUBSTANTIATION: The recognition of the loads associated with "bathroom accessories" has prompted Article 210-11 to address these loads with a 20-ampere branch circuit. These loads are substantial enough to warrant being addressed in Article 220. With the increase in the number of bathrooms found in residences, there is also increased loading on services and feeders.
PANEL ACTION: Reject.
PANEL STATEMENT: Insufficient substantiation has been provided to show that the current requirements are inadequate. The load for bathrooms is taken into consideration in Table 220-3(a). The requirement for the 20 ampere circuit for the bathroom does not add any additional load to the feeder or service.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3819)

2- 281 - (220-18): Reject
SUBMITTER: Denise Cribbs, Riviera Electric
RECOMMENDATION: Revise text to read as follows:
"The load for household electric clothes dryers in a dwelling unit shall be 5000 watts (VA) or the nameplate rating whichever is larger for each dryer unless using optional calculation (220-30)."
SUBSTANTIATION: In 220-18 it states to use 5 kw or nameplate rating whichever is greater with no reference optional calculation. Then if you go to 220-30 for optional calculation it tells you to use nameplate rating so which code do you go by?
PANEL ACTION: Reject.
PANEL STATEMENT: Article 220, Part B and Part C are stand-alone sections and should be considered separately. See section 220-30(a).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4167)

2- 282 - (Table 220-18): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise the table as follows:

Table 220-18. Demand Factors for Household Electric Clothes Dryers

Number of Dryers	Demand Factor
1-4	100%
5	85%
6	75%
7	65%
8	60%
9	55%
10	50%
11	47%
12-22	[47 - (Number of dryers over 11)]%
23	35%
24-42	[35- 0.5(Number of dryers over 23)]%
43 and over	25%

SUBSTANTIATION: Applying the existing table to installations involving 1 through 42 electric clothes dryers results in no fewer than 14 different connected load combinations where a marginal increase of an additional 5 kW clothes dryer results in either no change (one instance) or an actual reduction (13 instances) in the calculated load. In other words, out of the first 42 possible dryer connections, fully one third of them result in a paradoxical load calculation, one in which you reduce, in absolute terms, your calculated load by adding to the connected load. We might entertain this anomaly if correcting it required hopeless complexity. It doesn't. The proposed table has fewer lines than the one it replaces, and every additional dryer produces an increase in load. Over all, the new table stays right with the basic parameters of the existing table, generally running slightly over the old numbers (in the direction of safety). There are a few instances where it computes slightly below the old values, but not significantly.
The table below shows the paradoxical points in the existing table with asterisks, together with all the possible combinations together with how many kilowatts at which each dryer combination would calculate (based on 5 kW dryers). The worst case shortage is less than 1 kW. In every case, those "shortages" are actually phantoms, because they always occur for the dryer combination just below the point in the old table where you start getting free dryers (additional connected load = lower calculated load).
CMP 2 should take this modest step to produce a better, more coherent and defensible Code. This proposal, along with the one from the Massachusetts Electrical Code Advisory Committee on Table 220-36, essentially rid Article 220 of tables that force users into paradoxical load calculations. They would join Table 220-11, which never had this problem since its inception in the 1950s, and Table 530-19(a), which got rid of its paradoxical calculations in 1990 by this submitter's proposal.

Number of Clothes Dryers	Table 220-18 Demand Factor		Proposal Demand Factor

2- 285 - (Table 220-19 Notes): Accept in Principle
SUBMITTER: Donald R. Cook, Southern Section, IAEI
RECOMMENDATION: Revise text to read as follows:

Notes:

1) Over 12 kW through 27 kW ranges all of same rating. For ranges individually rated more than 12 kW but more than 27 kW, the Maximum demand of Column C shall be increased 5 percent for each additional kilowatt of rating or major fraction thereof by which the rating of individual ranges exceed 12 kW.

2) Over 8 3/4 through 27 kW ranges of unequal ratings. For ranges individually rated more than 8 3/4 kW and of different ratings, but none exceeding 27 kW, an average value of rating shall be computed by adding together the ratings of all ranges to obtain the total connected load (using 12 kW for any range rated less than 12 kW) and dividing by the total number of ranges. Then the maximum demand in Column C shall be increased 5 percent for each kilowatt or major fraction thereof by which this average value exceeds 12 kW.

3) Over 1 3/4 kW through 8 kW. In lieu of the method provided in Column C, it shall be permissible to add the nameplate ratings of all household cooking appliances rated more than 8 3/4 kW and multiply the sum by the demand factors specified in Column A or B for the given number of appliances. Where the rating of cooking appliances for that column and the results added together.

4) Branch-Circuit Load. It shall be permissible to compute the branch-circuit load for one range in accordance with Table 220-19. The branch-circuit load for a counter-mounted cooking unit and not more than two wall-mounted ovens, all supplied from a single branch circuit and located in the same room, shall be computed by adding the nameplate rating of the individual appliance and treating this total as equivalent to one range.

5) This table also applies to household cooking appliances rated over 1 3/4 kW and used in instructional programs.

FPN No. 1: See Table 220-20 for commercial cooking equipment.

FPN No. 2: See the examples in Appendix D.

SUBSTANTIATION: To realign the notes to match new Table 220-19.
PANEL ACTION: Accept in Principle.
Revise the existing code to read as follows:

"Notes: 1. Over 12 kW through 27 kW ranges all of same rating. For ranges individually rated more than 12 kW but not more than 27 kW, the maximum demand in Column C shall be increased 5 percent for each additional kilowatt of rating or major fraction thereof by which the rating of individual ranges exceeds 12 kW.

2. Over 8 3/4 kW through 27 kW ranges of unequal ratings. For ranges individually rated more than 8 3/4 kW and of different ratings, but none exceeding 27 kW, an average value of rating shall be computed by adding together the ratings of all ranges to obtain the total connected load (using 12 kW for any range rated less than 12 kW) and dividing by the total number of ranges. Then the maximum demand in Column C shall be increased 5 percent for each kilowatt or major fraction thereof by which this average value exceeds 12 kW.

3. Over 1 3/4 kW through 8 3/4 kW. In lieu of the method provided in Column C, it shall be permissible to add the nameplate ratings of all household cooking appliances rated more than 1 3/4 kW but not more than 8 3/4 kW and multiply the sum by the demand factors specified in Column A or B for the given number of appliances. Where the rating of cooking appliances falls under both Column A and Column B, the

demand factors for each column shall be applied to the appliances for that column, and the results added together.
4. Branch-Circuit Load. It shall be permissible to compute the branch-circuit load for one range in accordance with Table 220-19. The branch-circuit load for one wall-mounted oven or one counter-mounted cooking unit shall be the nameplate rating of the appliance. The branch-circuit load for a counter-mounted cooking unit and not more than two wall-mounted ovens, all supplied from a single branch circuit and located in the same room, shall be computed by adding the nameplate rating of the individual appliances and treating this total as equivalent to one range.
5. This table also applies to household cooking appliances rated over 1 3/4 kW and used in instructional programs.
FPN No. 1: See Table 220-20 for commercial cooking equipment.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #609)

2- 287 - (220-19, FPN): Accept in Principle
SUBMITTER: Rick Stringfield, Westinghouse Savannah River Co.
RECOMMENDATION: Remove FPN referring to Example D5(a) and change to a parenthetical statement after the second sentence of the section. Should read:
Where two or more single-phase ranges are supplied by a 3-phase, 4-wire feeder or service, the total load shall be completed on the basis of twice the maximum number connected between any two phases. (See Example D5(a) in Appendix D)
SUBSTANTIATION: Promote understanding. As written, FPN appears to refer to entire section when, in fact, example mentioned only covers 2 or more ranges supplied by 3-phase, 4-wire feeder. Change still maintains code standards and language.
PANEL ACTION: Accept in Principle.
In the existing code, move the third sentence to become the second sentence. Move the current second sentence into a new second paragraph. The fine print note remains unchanged.
PANEL STATEMENT: The revised wording meets the intent of the submitter and provides clarity.

(Log #13)

2- 288 - (220-22): Accept in Principle
NOTE: The following proposal consists of Comment 2-162 on Proposal N/A in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE.
SUBMITTER: Edwin C. Denham, Denham Consulting Engineers Inc.
RECOMMENDATION: Rewrite the last sentence to read as follows:
There shall be no reduction of:
(a) The neutral capacity for that portion of the load that consists of nonlinear loads,
(b) The grounded conductor of a 3-wire circuit which consists of 2-phase wires and the neutral wire, where the supply is from a 4-wire, 3-phase, wye-connected system.
SUBSTANTIATION: The present sentence is a "run-on" sentence, and is unclear unless read by a textual scholar. The sentence should be diagramed as submitted or broken into two separate sentences which would add additional text to an already cumbersome article. Some code officials are reading this text as justification of no deration of any neutral in a commercial project etc.
PANEL ACTION: Accept in Principle.
Rewrite the last sentence of the proposed wording into two sentences to read as follows:
"There shall be no reduction of the neutral capacity for that portion of the load that consists of nonlinear loads supplied from a 4-wire, wye-connected, 3-phase system. There shall be no reduction in the capacity of the grounded conductor of a 3-wire circuit consisting of two phase wires and the neutral of a 4-wire, 3-phase, wye-connected system."
PANEL STATEMENT: These are two separate requirements. The wording has been revised to reflect this intent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4071)

2- 289 - (220-30): Reject
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./ Rep. Edison Electric Inst./Electric Light & Power Group
RECOMMENDATION: This is a companion proposal to change Appendix D, Example No. D2(c).
Change paragraph (c) of 220.30 as follows:
(c) Heating and Air-Conditioning Load. Include the largest of the following ~~six~~ five selections (load in kVA).
(1) 100 percent of the nameplate rating(s) of the air conditioning and cooling including heat pump compressors.
~~(2) 100 percent of the nameplate ratings of the heat pump compressors and supplemental heating unless the controller prevents the compressor and supplemental heating from operating at the same time.~~
(2) ~~(3)~~ 100 percent of the nameplate rating(s) of electric thermal storage and other heating systems where the usual load is expected to be continuous at the full nameplate value. Systems qualifying under this selection shall not be calculated under any other selection in (c).
(3) ~~(4)~~ 65 percent of the nameplate rating(s) of the total central electric space heating including heat pump compressors. If the heat pump compressor is prevented from operating at the same time as the supplementary heat, it does not need to be added to the supplementary heat for the total central space heat load. ~~, including integral supplemental heating in heat pumps where the controller prevents the compressor and supplemental heating from operating at the same time.~~

(4) ~~(5)~~ 65 percent of the nameplate rating(s) of electric space heating if less than four separately controlled units.
(5) ~~(6)~~ 40 percent of the nameplate rating(s) of electric space heating if four or more separately controlled units.
SUBSTANTIATION: In the 1999 NEC a major change was made in calculations without adequate technical substantiation. This change impacts load calculations for single family dwellings with heat pumps when the compressor and supplemental heating is operating at the same time (normal installation) by counting the central space heat at 100 percent rather than at 65 percent as had been done by the Optional Method since the 1971 NEC. This change was made with no historical load data to justify the change. It significantly increases the main panel size and service entrance conductors on many homes and apartments thus increasing the cost with no improvements in safety. Also, the 1999 calculations are very erratic depending on whether or not the heat pump can be on at the same time as the supplementary heat. Based on the NFPA 70 A98 ROP Proposal 2-319 was rejected because it did not further clarify the present wording. See the NFPA 70 A98 ROC for Comments 2-164 and 2-165 that were accepted in principle as editorial revision to enhance clarity. In Proposal 2-319, the submitter stated that "These changes have no impact on the result of the calculation, only on the format of this section". In reality the example for the Optional Calculation using 220-30 in the 1996 and 1999 NEC is identical except for counting the central electric space heating at 100 percent in the 1999 NEC!

Numerous load surveys have been submitted by various utility companies throughout the years to verify the diversified demand of electric heat. Going back to the 1971 NEC and following codes as well, the key statement was, "Use the larger of the air conditioning load or the diversified demand of the heating load." Using 100 percent for the air conditioning and cooling, including heat pump compressors (from 1971 to 1996) meant that a heat pump could be used for cooling with or without supplemental electric heat and that the summer load could thus be greater than the winter load. Central Electric Space Heating, which was calculated at 65 percent, could include a heat pump compressor as well as integral supplemental heat, i.e., "strip" or electric resistance heat. All of the authors writing books on calculations have included resistance heat at 65 percent. A heat pump is more efficient (lower demand, higher heat output) than straight resistance heat. Also, heat pump systems are designed to turn off the heat pump if the outdoor temperature drops too low preventing continuous operation of the heat pump and the full backup resistance heat. Therefore the diversified demand for a residence would be less if the heat pump and strip heat were on at the same time.

This is exactly opposite to the 1999 changes!! Appendix D Example No. 2(c) of the 1996 NEC added the heat pump load of 5.76 kVA and the 15 kVA and multiplied the total by 65 percent for a total of 13.49 kVA. However, example D2(c) of the 1999 NEC uses a total of 20.76 kVA. The statement that "If supplementary heat is not on at the same time as heat pump, heat pump kVA need not be added to total." would mean that one would use 65 percent of 15 kVA which would be 9.75 kVA. It is reasonable to assume that the winter heat diversified demand is based on the heat loss of the home with a particular thermostat setting. If more electric heat is installed than needed (or it is not divided into two or more stages) then it will just cycle more often, but essentially have the same electrical demand. However, look at the differences in calculations for the 1999 NEC when using a 5 kW heat pump and various amounts of supplemental heat.

Assume: Heat Pump plus Supplemental Diversified Demand		
Supplemental Heat		Heat Only
1971-96 NEC	1999 NEC	
	5 + 15 = 20 kVA	
13.0 kVA	20.0 kVA	
		15 kVA
9.75 kVA	9.75 kVA	
		20 kVA
13.0 kVA	13.0 kVA	
	5 + 20 = 25 kVA	
16.25 kVA	25 kVA	
		20 kVA
13.0 kVA	13 kVA	
		25 kVA
16.25 kVA	16.25 kVA	

Thus, based on the 1999 NEC if one uses a 25 kVA central electric heating system with a heat pump, the load is 25 kVA, but if one uses 5 kVA of supplemental heat to replace the heat pump, then the diversified demand drops to 16.25 kVA. If one has 20 kVA of supplemental heat the demand is 13 kVA, but if a 5 kW heat pump is added, the demand jumps to 25 kVA. If one has a 15 kVA system calculated at 9.75 kVA, the demand more than doubles to 20 kVA if a 5 kVA heat pump is added. The 25 kVA heat pump system could actually have a lower demand than the 25 kVA supplemental heat only system that is calculated at 16.25 kVA!!

Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The current text is a clarification of the technical substantiation from previous cycles. A change in the current text would require new substantiating data.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
MOORE: The Panel Statement is in error. The current 1999 text clearly was not a clarification of the technical substantiation from previous cycles. This was adequately shown in the substantiation (the same central space heating load for 25 kW can range from 16.25 kW to 25 kW). The current text in the 1999 NEC was a major change without any substantiation. If the substantiation of the 1971 NEC (1. 40 percent of the nameplate ratings of electric space heating for 4 or more separately controlled units; 2. 65 percent of nameplate ratings of electric space heating if less than 4 separately controlled units; and 3. 65 percent of the name plate rating of central electric space heating) was sufficient to use, then it is adequate to justify 65 percent for any type of electric space heating installation. This calculation is for the feeder or service to the dwelling, not a branch circuit. Therefore, it should be obvious that a combination central space heating installation with a heat pump and supplemental heat on at the same time will have a lower demand than a central resistance heat system. The 2002 NEC should revert back to what was in the 1996 NEC if the Panel cannot clarify without making unsubstantiated technical changes.

(Log #14)

2- 290 - (220-30(a)): Accept in Part
NOTE: The following proposal consists of Comment 2-166 on Proposal 2-319 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 2-319 was:
Revise Section 220-30. Optional Calculation -- Dwelling Unit, as shown.
(a) Feeder and Service Load. For a dwelling unit having the total connected load served by a single 3-wire, 120/240-volt or 208Y/120-volt set of service-entrance or feeder conductors with an ampacity of 100 or greater, it shall be permissible to compute the feeder and service loads in accordance with Table 220-30 for the loads in (b) and (c) instead of the method specified in Part B of this article. Feeder and service-entrance conductors whose demand load is determined by this optional calculation shall be permitted to have the neutral load determined by Section 220-22.
(b) General Loads. The loads identified in Table 220-30 as "other load" and as "remainder of other load" shall include the following:
(1) 1500 volt-amperes for each 2-wire, 20-ampere small appliance branch circuit and each laundry branch circuit specified in Section 220-16.
(2) 3 volt-amperes per sq ft (0.093 sq m) for general lighting and general-use receptacles.
(3) The nameplate rating of all appliances that are fastened in place, permanently connected, or located to be on a specific circuit, ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers, and water heaters.
(4) The nameplate ampere or kVA rating of all motors and of all low-power-factor loads.
(c) Other Loads. Include the largest of the following five selections in Table 220-30.
(1) 100 percent of the nameplate rating(s) of the air conditioning and cooling. including

(2) Heat pump compressors and supplemental heating unless the controller prevents both the compressor and supplemental heating from operating at the same time.

(3) 100 percent of the nameplate ratings of electric thermal storage and other heating systems where the usual load is expected to be continuous at the full nameplate value. Systems qualifying under this selection shall not be figured under any other selection in this table.

(4) 65 percent of the nameplate rating(s) of the central electric space heating, including integral supplemental heating in heat pumps where the controller prevents both the compressor and supplemental heating from operating at the same time.

(5) 65 percent of the nameplate rating(s) of electric space heating if less than four separately controlled units.

(6) 40 percent of the nameplate rating(s) of electric space heating of four or more separately controlled units.

Table 220-30. Optional Calculation for Dwelling Unit Load in kVA

100 percent of the first 10kVA of all other load.
40 percent of the remainder of all other load.

SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Accept in Principle in part (first sentence) revised.

(a) Feeder and Service Load. For a dwelling unit having the total connected load served by a 3-wire, 120/240-volt or 208Y/120-volt set of service ~~entrance~~ or feeder conductors with an ampacity of 100 or greater, or a 4-wire 208Y/120-volt set of service or feeder conductors with an ampacity of 60 or greater, it shall be permissible to compute the service and feeder loads in accordance with Table 220-30 ~~for the loads in (b) and (c)~~ instead of the method specified in Part B of this article.

SUBSTANTIATION: To apply provisions of this section to 4-wire 3-phase systems with a volt-ampere capacity substantially equal to the systems indicated and also to apply the provisions to supply (service) conductors which are not service-entrance conductors, per the Fine Print Note to definition of service-entrance conductors, underground system in Article 100.
PANEL ACTION: Accept in Part.
The panel accepts the deletion of the word "entrance", and rejects the remainder of the proposal.
PANEL STATEMENT: Insufficient substantiation has been provided to extend the optional method to 3-phase services.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4439)

2- 291 - (220-30(a)): Reject
SUBMITTER: George T. Anderson, Antioch, CA
RECOMMENDATION: Revise text to read as follows:

(a) Feeder and Service Load. For a dwelling unit having the total connected load served by a single 3-wire, 120/240-volt 208Y/120-volt set of service entrance or feeder conductors with an ampacity of 200 or greater.

SUBSTANTIATION: Today's technology and optional appliances have increased our need for extra circuits:
1. Electronic equipment performs "cleaner" on its own circuit.
2. Audio equipment as above.
3. Spas of 2 pole 40 to 60 amperes.
4. Landscape and "garden" lighting.
5. Future automotive recharging.

PANEL ACTION: Reject.
PANEL STATEMENT: Insufficient substantiation has been provided to justify a change in the minimum ampacity of the conductors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1445)

2- 292 - (220-30(b)(2)): Accept in Principle
SUBMITTER: Barry F. Tower, Patten, ME
RECOMMENDATION: Keep the sentence as is.
Add the following two sentences to read as follows:
"The floor area for each floor including finished basements and unfinished basements adaptable for future use shall be computed from the outside dimensions of the dwelling unit. The computed floor area shall not include open porches, garages, or unused or unfinished spaces not adaptable for future use."

SUBSTANTIATION: The purpose of this proposal is to clarify what is already the intent of the "code". A previous CMP 2 has already indicated that unfinished basements must be included in the square footage calculations if they are adaptable for future use. Please see the 1995 NEC ROP 2-405.

It should be stated here as well as in 220-3(a). Since this is an "optional" method of calculating loads for dwelling units, it should be able to stand alone without requiring a person to go back to 220-3(a) and find out the meaning of a square foot. These optional calculations (part C) are the most widely used for dwelling units.

I am actually proposing two changes: 1) Adding this square-footage statement to this part of the "code" so that it can stand alone, and 2) I have inserted ten words into the sentence that is not currently in 220-3(a) as follows: "including finished basements and unfinished basements adaptable for future use". I have also submitted a proposal on 220-3(a) to add those same ten words, thus making them similar to each other.

Including the basement or not including the basement when calculating square footage can make a tremendous difference (it can be twice as much). Something this significant should be clarified.
PANEL ACTION: Accept in Principle.
Add a second and third sentence to the existing code text to read as follows:
"The floor area for each floor shall be computed from the outside dimensions of the dwelling unit. The computed floor area shall not include open porches, garages, or unused or unfinished spaces not adaptable for future use."
PANEL STATEMENT: The revised text is extracted from Section 220-3(a). This will provide clarity for this optional calculated method pertaining strictly to dwelling units.

(Log #3898)

2- 293 - (220-30(c)(2)): Reject
SUBMITTER: Leonard L. Johnson, Dept. of Insp, Licenses & Permits, Howard Cnty, MD
RECOMMENDATION: Revise text to read as follows:

(2) 100 percent of the nameplate rating(s) of the heat pump compressors and 65 percent of the supplemental heating unless the controller prevents the compressor and supplemental heating from operating at the same time.

SUBSTANTIATION: If the supplemental heat is interlocked so it will not operate at the same time as the compressor a 65 percent demand is allowed as stated in 220-30(c)(4). If the system is connected so the compressor will operate at the same time as the supplemental heat the only additional load [above that stated in 220-30(c)(4)] that would be added to the service or feeder is the compressor load. 100 percent of the compressor load is the only additional load that could be justified. Note: If 100 percent of the supplemental heat is required in 220-30(c)(2) than 100 percent of the heat should be required in 220-30(c)(4).
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action on Proposal 2-289.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #CP210)

2- 294a - (220-31): Accept
SUBMITTER: Technical Committee on National ECMP 2
RECOMMENDATION: Revise Section 220-31 to read as follows:
"220-31. Optional Calculations for Additional Loads in an Existing Dwelling Unit. This section shall be permitted to be used to determine if the existing service or feeder is of sufficient capacity to serve additional loads. Where the dwelling unit is served by a 120/240-volt or 208Y/120-volt, 3-wire service, it shall be permissible to compute the total load in accordance with (a) or (b).

(a) Where Additional Air-Conditioning Equipment or Electric Space-Heating Equipment is not to be Installed. The following formula shall be used for existing and additional new loads.

Load (kVa) Percent of Load

First 8 kVa of load at 100
Remainder of load at 40

Load calculations shall include:

(1) General lighting and general-use receptacles at 33 volt-amperes/m2 or 3 volt-amperes/ft2 as determined by Section 220-3(a).

(2) 1500 volt-amperes for each 2-wire, 20-ampere small-appliance branch circuit and each laundry branch circuit specified in Section 220-16.

(3) Household range(s), wall-mounted oven(s) and counter-mounted cooking unit(s).

(4) All other appliances that are permanently connected, fastened in place, or connected to a dedicated circuit, at nameplate rating.

(b) Where Additional Air-Conditioning Equipment or Electric Space-Heating Equipment is to be Installed. The following formula shall be used for existing and additional new loads. The larger connected load of air-conditioning or space-heating, but not both, shall be used.

Air-conditioning equipment	100%
Central electric space-heating	100%
Less than four separately controlled space-heating units	100%
First 8 kVa of all other loads	100%
Remainder of all other loads	40%

Other loads shall include:

(1) General lighting and general-use receptacles at 33 volt-amperes/m2 or 3 volt-amperes/ft2 as determined by Section 220-3(a).

(2) 1500 volt-amperes for each 2-wire, 20-ampere small-appliance branch circuit and each laundry branch circuit specified in Section 220-16.

(3) Household range(s), wall-mounted oven(s) and counter-mounted cooking unit(s).

(4) All other appliances that are permanently connected, fastened in place, or connected to a dedicated circuit, including four or more separately controlled space-heating units, at nameplate rating."

SUBSTANTIATION: The entire section has been revised in order to provide clarity.
PANEL ACTION: Accept.

(Log #697)

2- 294 - (220-31): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise first paragraph to read as follows:

For an existing dwelling unit presently being served by an existing 3-wire 120/240 volt, or 3- or 4-wire 208y/120 volt ~~3-wire~~ service, it shall be permissible to compute load calculations as follows:.

SUBSTANTIATION: Three-phase 4-wire systems are not explicitly prohibited by code and should be included.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 2-290.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #705)

2- 295 - (220-31(1) through (5)): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

(1) 1500 volt-amperes for each 2-wire, 20-ampere small-appliance branch circuit and each laundry branch circuit specified in Section 220-16.

(2) ~~Lighting~~ General lighting and ~~portable appliances~~ general-use receptacles at 3 volt-amperes/ft^2 (0.093m2)

(3) The nameplate rating of all appliances that are fastened in place, permanently connected, or located to be on a specific circuit, ~~Household~~ range(s), ~~or~~ wall-mounted oven(s) ~~and~~ counter-mounted cooking unit(s), clothes dryers, and water heaters.

(4) ~~All other appliances fastened in place, including four~~ Four or more separately controlled space-heating units, at nameplate ratings.

(5) The nameplate ampere or kVA rating of all motors and of all low power-factor loads.

SUBSTANTIATION: Editorial. Present (1) assigns a 1500 volt-ampere load to all 20-ampere appliance circuits, including appliances fastened in place, permanently connected, etc., not just small appliances and laundry circuits. This is not required elsewhere in the code, and may be inappropriate. Proposed (1) and (3) correlate with the second paragraph.

Present (2) appears intended to apply to general lighting and general-use receptacles as indicated in (b)(2).

Present (3) is not specific whether nameplate ratings as specified in (b) (3) is intended or whether demand factors of Table 220-19 may be used, which would permit a double demand factor. The proposal is more comprehensive.

Proposed (5) covers motors such as pool or spa pumps, etc., which may not be considered appliances, per se and clarifies that such loads (existing or to be added) are included in the 40 percent demand. Application of the demand factor can be critical in determine whether a service is adequate to add a spa or pool pump motor. Section (b)(5) makes it clear that the section permits the 40 percent demand to apply to motors not covered by (b)(3).

PANEL ACTION: Accept in Principle in Part.
The panel accepts the concept of the proposal in principle, however, rejects the proposed wording "(5)".
PANEL STATEMENT: See panel action and statement on Proposal 2-294a.

The proposed (5) is rejected because it is already covered by (4).

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #699)

2- 296 - (220-32(a), (c)): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

(a) Feeder and Service Load. It shall be permissible to compute the load of a feeder and ~~or~~ service ~~load~~ that supplies more than one dwelling unit of a multifamily dwelling in accordance with Table 220-32 instead of Part B of this article where all the following conditions are met.

(1) No change.

(2) No change

Exception: No change

(3) Each dwelling unit is equipped with either electric space heating or air conditioning, or both. Feeders and service ~~entrance~~ conductors whose demand load is determined by this optional calculation shall be permitted to have the neutral load determined by Section 220-20.

Add new paragraph:

Where dwelling units that do not comply with (1), (2), and (3) are also supplied, that portion of the feeder and service load shall be computed in accordance with Part B of this article.

(c) ~~Connected~~ Computed Loads. The ~~connected~~ computed load to which the demand factors of Table 220-32 apply shall include the following (remainder unchanged).

SUBSTANTIATION: One must infer this section is intended to apply where more than one unit is supplied by the same service or feeder. However, it does not literally exclude application to individual services/feeders for each unit, as permitted by Section 230-2(b)(1).

In (a)(3) there does not appear to be a valid reason to limit neutral load determination to only service-entrance conductors and not include service-laterals and service-drops; demand loads also affect these conductors.

The proposed new paragraph would clarify that this section may apply where some units do not comply with conditions (1), (2) and (3). It may be interpreted by present wording that this is not permitted.

In (c) the loads of (1) and (2) are not "connected" loads but computed loads. A computed load may encompass connected and computed loads.

PANEL ACTION: Accept in Principle in Part.
In the proposal, change (a) to read as follows:
"(a) Feeder or Service Load. It shall be permissible to compute the load of a feeder or service that supplies more than two dwelling units of a multifamily dwelling...".
Revise the second sentence of proposed (3) to read as follows:
"(3) Feeder and Service conductors whose demand...".
The panel rejects the remainder of the proposal.
PANEL STATEMENT: The revisions will correct the discrepancies pointed out by the submitter. The proposed new paragraph is unnecessary as it is already implied. The panel does not accept the revision to (3)(c) as "connected load" is consistent with other parts of the article.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #698)

2- 297 - (220-32(c)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise 220-32(c) to read as follows:
The ~~connected~~ computed load to which the demand factors of Table 220-32 apply shall include the following:.
(remainder unchanged)
SUBSTANTIATION: Editorial. The loads assigned to small appliance branch circuits, laundry receptacle circuits, general-use receptacle circuits, sign circuits, etc., are not "connected" loads. These circuits have a code-assigned computed load. Nameplate ratings of other utilization equipment which is connected would be included since they are also "computed."
PANEL ACTION: Reject.
PANEL STATEMENT: The use of the term "connected" is consistent with wording elsewhere in the code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #700)

2- 298 - (220-33): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Optional Calculation Two Dwelling Units. Where ~~two~~ dwelling units of a two-family dwelling are supplied by a ~~single~~ common service or feeder and the computed load undr Part B of this article exceeds that for three identical units computed under Section 220-32, the lesser of the two loads shall be permitted to be used.
SUBSTANTIATION: Editorial Clarification. "Two dwelling units" is not definitive; it also covers two one-family dwellings. The definition of dwelling unit does not specify the number of families. Proposal is based on assumption that a two-family dwelling is intended. A single common service that supplies each unit of a two-family dwelling directly by branch circuits should be included.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 220-33 is intended to apply either to a two-family dwelling, or two dwelling units of a multifamily dwelling, not just a two-family dwelling.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #701)

2- 299 - (220-34): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Optional Method-Schools. The calculation of a feeder ~~or~~ and service which supplies the total load for a school~~s~~ building(s) shall be permitted in accordance with Table 220-34 in lieu of Part B of this article where ~~equipped with~~ the feeder or service supplies electric space heating or air conditioning or both, and other loads such as power and lighting. The ~~connected~~ computed load to which the demand factors shall apply include ~~all of the exterior and interior lighting, power, water heating, cooking, other loads, and~~ the larger of the air-conditioning or space heating and all other loads supplied.
Feeders and service~~s entrance conductors~~ whose demand load is dertermined by this optional calculation shall be permitted to have the neutral load determined by Section 220-22. Where the building or structure load is calculated by this optional method a feeder~~s~~ within the building or structure that does not supply the total load shall have an ampacity as determined in Part B of this article; however, the ampacity of an individual feeder shall not be required to be larger than the ampacity for the feeder or service supply conductors as calculated by this section. ~~entire building.~~
For the purposes of this section, total load shall not include load supplied by a feeder or service of a different class.
This section shall not apply to portable classroom buildings.
Table 220-34 Optional Method - Demand Factors for Feeders and services - ~~Entrance Conductors~~
(remainder unchanged)
SUBSTANTIATION: The word "or" between feeder and service can literally suggest a choice of one or the other but not both. Present literal wording of the first sentence indicates a feeder (singular) for schools, which may be comprised of multiple buildings. Revised wording is clear to permit application to one feeder for multiple buildings or separate feeders for each.
This section is not clear whether the feeder or service is intended to supply the total load, as is specified or inferred by similar sections concerning optional calculations, which usually involve diversity. Present wording specifies the school must be "equipped" with electric space heating and/or air conditioning, not that such load must be supplied by the feeder or service being calculated. A feeder or service of one class (e.g. 208y/120 volt 3-phase) supplying the loads indicated, except with no heating or cooling load would qualify if the building is equipped with an air conditioning system supplied by a different class of feeder or service (e.g., 460-volt 3-phase).
"Connected" is changed to "computed" since some loads such as general lighting and general-use receptacles may be computed as unit loads. Such loads and connected loads are "computed".
The word "service" in the first sentence includes service-equipment, service-entrance, service-drop, and service-lateral conductors, all of which relate to the calculation. The second paragraph limits Section 220-22 to service-entrance conductors which doesn't correlate with that section which uses the encompassing word "service".
"All other loads suplied" obviates the need for listing specific loads, and includes interior or exterior loads. Air conditioning equipment is frequently located other than within a building, such as on the roof or in a side yard, which the literal present wording does not include.
"Feeders within the building" appears intended to apply to feeders derived from the service or feeder supply conductors to the building and which supply only a portion of the total load. The proposal attempts to make that clearer. The ampacity of such feeders is not "permitted" by Part B but required (Sections 220-1, 220-10).
The proposed third paragraph would permit application of this section to feeders or services of different classes which do not supply the total load but would otherwise qualify
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal does not improve clarity.

AFFIRMATIVE: 12

(Log #456)

2- 300 - (Table 220-34): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Replace Table 220-34 with the following table:

Table 220-34. Optional Method — Demand Factors for Feeders and Service-Entrance Conductors for Schools

Connected Load (VA/m^2)	Connected Load (VA/ft^2)	Demand Factor (Percent)
The first 33 VA m^2 at	The first 3 VA/ft^2 at	100
Plus,		
Over 33 to 220 VA m^2 at	Over 3 to 20 VA ft^2 at	75
Plus,		
Remainder over 220 VA m^2 at	Remainder over 20 VA/ft^2 at	25

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to values of measurement. The inch-pound numbers are not shown in parenthesis since they are not a direct conversion. Separate connected loads are given based on square feet and square meters.
PANEL ACTION: Accept in Principle.
In the table, insert slashes after "VA" in 4 places. In addition, add the word "plus" in two places as it is shown in the first column.
PANEL STATEMENT: The panel accepts the proposal with editorial revisions.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #419)

2- 301 - (220-35): Reject
SUBMITTER: Jack D. Echols, Baltes/Valentino California, Inc.
RECOMMENDATION: Add to 220-35:
"When adding load to a generator, the weekly log of generator peak loads may be used in lieu of a high kw demand provided the load is established at 125 percent of peak similar to the high kw demand value. Loads shall be determined during full load testing procedures and recorded as called for by 700-4(d) and 700-4(e) and certified by the building owner by a competent representative or building official."
SUBSTANTIATION: Problem: The local authority has no legal means to permit adding loads to an existing generator except by interpretation, something many of them are reluctant to use.
PANEL ACTION: Reject.
PANEL STATEMENT: The appropriate sections of Chapter 7 are clear in their application and should be used. The recommendation could create a conflict with the basic requirement of 700-5(a) that requires the generator to have capacity to supply all emergency loads simultaneously.

(Log #4279)

2- 302 - (220-35, Exception): Reject
SUBMITTER: Stan Price, Electric League of the Pacific Northwest
RECOMMENDATION: Section 220-35.
Paragraph 1, Exception.
Add a second paragraph as follows:
"Loads that do not vary with time or that can be operated at their maximum load, such as motors driving mechanical equipment or lighting systems, shall be permitted to be measured instantaneously."
SUBSTANTIATION: Loads that do not vary with time or that can be operated at their maximum load, such as motors driving mechanical equipment or lighting systems, do not benefit from recordings lasting 30 days.
Motor driven equipment generally is designed to a calculated maximum design horsepower, is then equipped with the next higher standard motor horsepower rating above the maximum design requirement, and then applied in applications that are safely below the maximum design number. The NEC requires that the Nameplate rating of the motor be used for load calculations. In general practice the measured load for many of these units will be 60 percent - 70 percent of nameplate rating. This difference is cumulative throughout the electrical system and results in a calculated number that is approximately 50 percent higher that actual. Prudent engineering adds a margin of safety on top of this number which then results in a system design that is approaching twice the
actual demand load. The purpose of electrical calculations is to accurately predict the peak demand. A summation of actual demand provides the most accurate information that can be obtained.
Lighting loads are an example of an existing load that can be effectively isolated for purposes of measurement. If an entire lighting system can be operated independent of all other loads, the instantaneous measurement provides the best available information on this portion of the total load and eliminates the need to count and document hundreds of individual light fixtures.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not understand how this would apply to a typical office building or retail business due to the nature of the equipment and appliances involved.

(Log #619)

2- 303 - (220-35(1), Exception): Reject
SUBMITTER: Bruce Fairweather, Electrical Safety Inc.
RECOMMENDATION: Sixth line. after the words "ammeter or", delete the term "power meter".
SUBSTANTIATION: Many electricians use the utility billing demand data to determine existing loading. Unless there is power factor correction the use of a power meter is not going to provide the detail required for determining existing loads.
The electric utility tariff details the rolling average demand time used for billing. Normally I have found industrial plants on fifteen minute rolling averages and commercial users on thirty minute averages. From a billing demand perspective there isn't much difference in these kilowatt over time measurements. Where we all miss the boat is where there is a large amount of inductive load (rarely do we find a problem due to capacitance)and a corresponding low power factor. Most power meters, like utility demand meters measure KW. In my years in the utility business it was not unusual to have a service burn down due to overload although the demand meter was registering a KW in range of the amperage of the service conductors. This was a major problem with small grocery stores that continued to add refrigeration units to their electric plant. Come summer their demand diversity became non-exsistant. Coupled with an already low power factor it was not unusual to find that a 50 KW billing demand was actual.
PANEL ACTION: Reject.
PANEL STATEMENT: There are many types of devices that can be employed to achieve the end results. The term "power meters" includes kVA meters.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

(Log #702)

2- 304 - (220-36): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Optional Calculation ~~New~~ restaurants. Calculation of a service ~~load~~ or feeder load, where the service or feeder serves the total load for a ~~new~~ restaurant shall be permitted in accordance with Table 220-36 in lieu of Part B of this article.
The overload protection of the service ~~entrance~~ conductors shall be in accordance with Sections 230-90 and 240-3.
Feeder conductors shall not be required to be of greater ampacity than the service ~~entrance~~ conductors.
Service ~~entrance~~ or feeder conductors whose demand load is determined by this optional calculation shall be permitted to have the neutral load determined by Section 220-22.
Table 220-36 Optional Method-Demand Factors for Service ~~Entrance~~ and Feeder Conductors for ~~New~~ Restaurants
(remainder of table unchanged)
Note: Add all electrical loads, including both electric space heating and air conditioning ~~cooling~~ loads to compute the total connected computed load.
SUBSTANTIATION: There doesn't seem to be a safety reason to limit this section to new restaurants. It should be just as applicable for existing restaurants where remodeling/rewiring takes place.
Electrical wiring doesn't discern any difference.
The first sentence refers to service load, which includes service-drops, service laterals, and service equipment, then three ensuing paragraphs are limited to specific types of service conductors. There is a pertinent relationship to these other designated types of service conductors. Section 230-90 relates overload protection to (ALL) service conductors.
There is no text which clearly identifies specific type heating and cooling loads specified in the table note and an inference is required. Specificity would be helpful to code users.
PANEL ACTION: Accept in Part.
The panel accepts the deletion of the word "entrance" in 4 places.
The panel accepts the revision of "service load or feeder" to "service or feeder load".
The panel rejects the remainder of the proposal.
PANEL STATEMENT: Insufficient substantiation has been provided to justify extending the optional method to rewiring existing restaurants. The panel rejects the revision to the "Note" because all heating and cooling loads must be included.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:

(Log #4168)

2- 305 - (Table 220-36): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise the title and the body of the table to read as follows. (Table shown below)
SUBSTANTIATION: It isn't often that an improvement in technical accuracy can be combined with an increase in simplicity and usability. This proposal provides just that. By simply carrying out the calculations in the corresponding proposal submitted in the 1999 cycle ahead of time for the user, the relevant load calculations can be done with a single multiplication, as given in the revised table. Even the original proposal submitters agree that the methodology in the original proposal was technically accurate and fairly represented their data plots presented to the panel.
This user-friendly proposal involves only four break points instead of six, and completely avoids the paradoxical sizing problem that has caused seminar and application questions across the country. Remember, the reason for going to six rows in the 1996 NEC was to avoid problems involved when the paradoxical load problem crossed standard switch sizes. The problem remains in the 1999 NEC, where a 324 kVA would require an 80% demand factor (720A on a 208Y/120V system), but a 326 kVA similar restaurant saves 86A on its feeder calculation by adding the additional load. This proposal is a much simpler approach that avoids the problem entirely.
The panel objected to the lack of substantiation for this table in the previous comment period. By that logic, Table 220-36 shouldn't be in the Code, since the data supporting this table is the identical data that the restaurant group and EPRI used in the original submittal. For clarity on this point please find enclosed the data as plotted by EPRI as part of the original submittal for the 1996 cycle, with various test plots analyzed on the margins of the calculation cut points. This methodology fits the data curves just as well as the original 1996 NRA/EPRI/EEI proposal, with no paradoxical results on feeder calculations. This revised table has been in the Massachusetts Electrical Code ever since without any reported objections.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel accepts the submitter's revision in addition to the revisions made in Proposal 2-304.

Table 220.36. Optional Method—Permitted Load Calculations for Service-Entrance and Feeder Conductors for New Restaurants

Total Connected Load (kVA)	All Electric Restaurant Calculated Loads (kVA)	Not All Electric Restaurant Calculated Loads (kVA)
0 – 200	80%	100%
201 – 325	10% (amount over 200) + 160.0	50% (amount over 200) + 200.0
326 – 800	50% (amount over 325) + 172.5	45% (amount over 325) + 262.5
Over 800	50% (amount over 800) + 410.0	20% (amount over 800) + 476.3

(The note remains as in the 1999 NEC without change.)

(Log #703)

2- 307 - (220-40(b)): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(b) Other than Dwelling Unit. For each farm building or load ~~supplied by~~ where a service or feeder is installed to supply two or more separate branch circuits, the load for feeders and services ~~service entrance conductors and service equipment~~ shall be computed in accordance with demand factors not less than indicated in Table 220-40.
(FPN): No change.
SUBSTANTIATION: Editorial. The present wording infers the supply to a farm building may be two or more branch circuits. Section 225-8(a) limits such supply to one branch circuit, with 6 exceptions. If application of any exception involves a separate service there could be two or more branch circuits, but supplied by different services, and the table demand factors shouldn't be applicable.
This section does not literally apply to service-laterals and service drops. The proposed word "service" encompasses all such supply conductors and service equipment.
PANEL ACTION: Accept in Principle.
Revise the existing code text to read as follows:
"(b) Other Than Dwelling Unit. Where a feeder or service supplies a farm building or other load having two or more separate branch circuits, the load for feeders, service conductors, and service equipment...".
PANEL STATEMENT: The revised wording meets the intent of the submitter and provides clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #704)

2- 308 - (220-41): Accept
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise first sentence to read as follows:
Where supplied by a common service ~~The~~ the total load of the farm for service ~~entrance~~ conductors and service equipment shall be computed in accordance with the farm dwelling unit load and demand factors specified in Table 220-41.
SUBSTANTIATION: Editorial. This section appears intended to apply where dwelling unit and farm loads are supplied by a common service, but not where separate services are provided. The computed load should also apply to service-lateral and service drop conductors.
PANEL ACTION: Accept.

ARTICLE 225 — OUTSIDE BRANCH CIRCUITS AND FEEDERS

(Log #515)

4- 2 - (225): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Section 225-4, replace "10 ft (3.05 m)" with "3.0 m (10 ft)".
2. In Section 225-6(a)(1), replace "50 ft (15.2 m)" with "15 m (50 ft)".
3. In Section 225-6(b), replace "40 ft (12.2 m)" with "12 m (40 ft)".
4. In Section 225-7(c), replace "3 ft (914 mm)" with "900 mm (3 ft)".
5. In Section 225-14(c), replace "4 in. (102 mm)" with "100 mm (4 in.)".
6. In Section 225-14(d), replace "1 ft (305 mm)" with "300 mm (1 ft)".
7. In Section 225-14(d)(1), replace "30 in. (762 mm)" with "750 mm (30 in.)".
8. In Section 225-14(d)(2), replace "24 in. (610 mm)" with "600 mm (24 in.)" and replace "30 in. (762 mm)" with "750 mm (30 in.)".
9. In Section 225-18, replace "10 ft (3.05 m)" with "3.0 m (10 ft)"; "12 ft (3.66 m)" with "3.7 m (12 ft)"; "15 ft (4.57 m)" with "4.5 m (15 ft)"; and "18 ft (5.49 m)" with "5.5 m (18 ft)".
10. In Section 225-19(a), replace "8 ft (2.44 m)" with "2.5 m (8 ft)" and replace "3 ft (914 mm)" with "900 mm (3 ft)".
11. In Section 225-19(a) Exception No. 2, replace "4 in. (102 mm)" with "100 mm (4 in.)"; "12 in. (305 mm)" with "300 mm (12 in.)"; and "3 ft (914 mm)" with "900 mm (3 ft)".
12. In Section 225-19(a) Exception No. 3, replace "18 in. (457 mm)" with "450 mm (18 in.)"; "6 ft (1.83 m)" with "1.8 m (6 ft)"; and "4 ft (1.22 m)" with "1.2 m (4 ft)".
13. In Section 225-19(a) Exception No. 4, replace "3 ft (914 mm)" with "900 mm (3 ft)".
14. In Sections 225-19(b), (c) and (d), replace "3 ft (914 mm)" with "900 mm (3 ft)" throughout.
15. In Section 225-19(e), replace "50 ft (15.2 m)" with "15 m (50 ft)"; "6 ft (1.83 m)" with "1.8 m (6 ft)"; and "8 ft (2.44 m)" with "2.5 m (8 ft)".
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #351)

4- 3 - (225-1): Reject
SUBMITTER: Kenneth W. Birringer, University of Michigan/Rep. Univ. of Michigan Facilities Planning and Design
RECOMMENDATION: Revise to read as follows:
"This article covers requirements for outside branch circuits and feeders run on or between buildings, structures, or poles on the premises or on a multi-building campus-style complex; and electric ... or poles."
SUBSTANTIATION: With the exception of a few sections, the NEC is based on a model of a single utility service supplying a single premises. This proposed change combined with two others provides means by which the Authority Having Jurisdiction can apply the NEC with consistency to non-utility, inter-building power distribution systems at multi-building campus-style complexes including universities and industrial complexes.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no evidence that the existing wording has caused confusion in the application of the Code rules. The concept is already covered by the scope of Article 225.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #CP407)

4- 3a - (225-2): Accept
SUBMITTER: CMP 4
RECOMMENDATION: Add "Table 225-2 Other Articles" above the existing list of articles.
Amend the existing text to read: "225-2. Other Articles. Application of other articles, including additional requirements to specific cases of equipment and conductors, are shown in Table 225-2."
SUBSTANTIATION: To conform with the NFPA NEC Style Manual.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1468)

4- 4 - (225-3): Accept in Principle
SUBMITTER: William M. Lewis, Eli Lilly and Co.
RECOMMENDATION: Change 225-3 to read:
3. Sizing of Outdoor Conductors
a. 600 volt nominal or less
The sizing of conductors for outdoor branch circuits shall be based on load as determined by Section 220-3. The sizing of conductors for outdoor feeders shall be based on load as determined by Part B of Article 220.
b. Over 600 volts nominal
The sizing of conductors for outdoor branch circuits shall be based on load as determined by Section 220-3.
Sizing of conductors for outdoor feeders shall be determined by Section 225-49 (New).
SUBSTANTIATION: This proposal must be considered in concert with companion proposals to add Sections 225-48 and 225-49. It has long been the practice at utilities and at supervised installations to size feeder conductors based on connected transformer capacity and load characteristics. This proposal addresses these accepted practices.
This proposal was developed by the Task Group based on the Task Group's review and discussion of the current requirements of Articles 225, 230, 100, 110, 240, and 250. This proposal is one of 14 which makes up the Task Group's response to a recommendation by a Task Group on usability in 1995. In considering the needed proposals, emphasis was placed on including in the NEC, practices which are recognized in the electrical industry as necessary for safe installation of over 600 volt systems. This is to provide guidance and direction for installation of these facilities which have not historically been included in the NEC.
The Task Group participants consisted of William M. Lewis (CMP 4); committee chair; Carl J. Fredericks (CMP 10); Tom Adams (CMP 4); John Beck (Chairman CMP 4); Mark Sumrall (CMP 4); Barry Hornberger (CMP 13); William T. Beutler, P.E.; William Long, NEMA.
Interested persons (nonparticipants): Robert J. Pollock (CMP 4 and TCC); Merton Bunker (NFPA); Mark Earley (NFPA)
PANEL ACTION: Accept in Principle.
Change title of Section 225-3 to read:
"Calculation of Loads 600 Volts Nominal or Less."
Retain the existing wording of this section.
PANEL STATEMENT: The change in title clearly identifies that Section 225-3 applies only to calculating loads for systems 600 volts or less. Calculation of loads for systems over 600 volts has been incorporated into Part C (III) of Article 225.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2800)

4- 5 - (225-3(b)): Reject
SUBMITTER: George Ritchie, City of Phoenix, AZ
RECOMMENDATION: Revise text to read:
"Feeder conductors shall have an ampacity not less than required to supply the load as computed in Parts B, C, and D of Article 220."
SUBSTANTIATION: This would allow the same optional calculations and method for computing farm loads as is already allowed by Article 215-2(a). Currently the NEC does not allow "outside" feeders the same latitude as feeders covered in Article 215 with regard to load calculations.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing text of 220-10 adequately addresses the submitter's concern.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #708)

4- 6 - (225-4 and Exception No. 2 (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Conductor Covering. Where within 10 ft (3.05 m) of any building or structure other than supporting poles or towers, open individual (aerial) conductors shall be insulated ~~or covered.~~ Conductors ~~in cables or raceways,~~ except Type MI cable, shall be of the rubber-covered type or thermoplastic type, and, in wet locations, shall comply with Section 310-8. ~~Conductors for festoon lighting shall be of the rubber-covered or thermoplastic type.~~
Exception No. 1: No change.
Exception No. 2: Bare conductors shall be permitted in accordance with Section 411-5(c).
SUBSTANTIATION: There is no code table which references open single "covered" conductor data for temperature rating, sunlight resistance, wet location, dimension, material, etc., and they are apparently not a listed product. This creates a problem with Sections 110-2, 110-3, 110-11, 240-3, 310-8, 310-11, raceway fill tables, etc. I believe "covered" conductors in the past applied to one individually encased in asphaltic-impregnated material and commonly referred to as "weatherproof", when the majority of insulated conductors was Type R. This type conductor was widely used for overhead distribution but is seldom used tody, and may not even be available. If a covered conductor does not provide insulating qualities why should it be an optional choice for insulation?
Deletion of "in cables or raceways" removes a limitation of insulation type and wet location requirements and implies the requriements to the open individual conductors and also festoon conductors (open or cables) which are not literally covered. It becomes a general requirement which makes the last sentence superfluous.
Exception No. 2 removes a conflict With Section 411-5(c).
PANEL ACTION: Reject.
PANEL STATEMENT: There are ampacities provisions for covered conductors in Table 310-21 and Section 310-15(b)(3). Covered conductors are used for installations over 600 volts. The conductors described in the proposed exception are not branch circuit conductors per the Article 100 definition, therefore are not covered in Article 225.

(Log #1051)

4- 8 - (225-6): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise 225-6(a) as follows:
(1) For 600 volts, nominal, or less, ~~No. 10~~ 10 AWG copper or ~~No. 8~~ 8 AWG aluminum for spans up to 50 ft (15.2 m) in length and ~~No. 8~~ 8 AWG copper or ~~No. 6~~ 6 AWG aluminum for a longer span, unless supported by a messenger wire
(2) For over 600 volts, nominal, ~~No. 6~~ 6 AWG copper or ~~No. 4~~ 4 AWG aluminum where open individual conductors and ~~No. 8~~ 8 AWG copper or ~~No. 6~~ 6 AWG aluminum where in cable
225-6(b) - change "No. 12" to "12 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #15)

4- 9 - (225-8): Reject
NOTE: The following proposal consists of Comment 4-4 on Proposal 4-10a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 4-10a was:
Revise Section 225-8 to read as follows:
225-8. More than One Building or Other Structure.
(a) Number of Supplies. Where more than one building or other structure is on the same property and under single management, each building or other structure served shall be supplied by one feeder or branch circuit. For the purpose of this section a multiwire branch circuit shall be considered a single circuit.
Exception No. 1: For fire pumps.
Exception No. 2: For emergency, legally required standby, optional standby, or parallel power production systems.
Exception No. 3: By special permission, in multiple-occupancy buildings where there is no available space for supply equipment accessible to all occupants.
Exception No. 4: Where the capacity requirements are in excess of 2000 amperes at a supply voltage of 600 volts or less, or by special permission.
Exception No. 5: By special permission, for a single building or other structure sufficiently large to make two or more supplies necessary.
Exception No. 6: For different characteristics, such as for different voltages, frequencies, or phases, or for different uses, such as for different rate schedules.
Exception No. 7: For large capacity multibuilding industrial installations under single management, where it is ensured that the disconnecting can be accomplished by establishing and maintaining safe switching procedures.
(b) Disconnecting Means. Means shall be provided for disconnecting all ungrounded conductors supplying or passing through the building or structure.
(c) Location. The disconnecting means shall be installed either inside or outside of the building or structure served or where the conductors pass through the building or structure. The disconnecting means shall be at a readily accessible location nearest the point of entrance of the conductors.
Exception No. 1: For large capacity multibuilding industrial installations under single management, where it is ensured that the disconnecting can be accomplished by establishing and maintaining safe switching procedures, the disconnecting means shall be permitted to be located elsewhere on the premises.
Exception No. 2: Buildings or other structures qualifying under the provisions of Article 685.
Exception No. 3: Poles or groups of poles used as lighting standards where disconnecting means are remote.
(d) Maximum Number of Disconnects.
(1) General. The disconnecting means for each supply permitted by (a) above shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be no more than six disconnects per supply grouped in any one location.
Exception: For the purpose of this section, disconnecting means used solely for the control circuit of the ground-fault protection system, installed as part of the listed equipment, shall not be considered a supply disconnecting means.
(2) Single-Pole Units. Two or three single-pole switches or breakers, capable of individual operation, shall be permitted on multiwire circuits, one pole for each ungrounded conductor, as one multipole disconnect, provided they are equipped with "handle ties" or a "master handle" to disconnect all conductors of the supply with no more than six operations of the hand.
(e) Grouping of Disconnects.
(1) General. The two to six disconnects as permitted in (d) above shall be grouped. Each disconnect shall be marked to indicate the load served.
Exception: One of the two to six disconnecting means permitted in (d) above, where used only for a water pump also intended to provide fire protection, shall be permitted to be located remote from the other disconnecting means.
(2) Additional Disconnecting Means. The one or more additional disconnecting means for fire pumps or for emergency, legally required standby, or optional standby supplies permitted by (a) above shall be installed sufficiently remote from the one to six disconnecting means for normal supply to minimize the possibility of simultaneous interruption of supply.
(3) Access to Occupants. In a multiple-occupancy building, each occupant shall have access to the occupant's supply disconnecting means.
Exception: In a multiple-occupancy building where electric supply and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the disconnecting means supplying more than one occupancy shall be permitted to be accessible to authorized management personnel only.
(f) Suitable for Service Equipment. The disconnecting means specified in (b) above shall be suitable for use as service equipment.
Exception: For garages and outbuildings on residential property, a snap switch or a set of 3-way or 4-way snap switches suitable for use on branch circuits shall be permitted as the disconnecting means.
(g) Identification. Where a building or structure is supplied by more than one feeder or branch circuit, or by any combination of branch circuits, feeders, and services, a permanent plaque or directory shall be installed at each feeder and branch circuit disconnect location denoting all other services, feeders, and branch circuits supplying that building or structure and the area served by each. See Section 230-2(b).
Exception No. 1: A plaque or directory shall not be required for large capacity multibuilding industrial installations under single management, where it is ensured that disconnection can be accomplished by establishing and maintaining safe switching procedures.
Exception No. 2: This identification shall not be required for branch circuits installed from a dwelling unit to a second building or structure.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Accept in principle revised as follows:
~~More than~~ One or More Buildings or Other Structures. ~~Where more than one building or other structure is on the same property and under single management, each~~ Each building or other structure served shall be supplied by not more than one feeder or one branch circuit. For the purpose of this section, a multiwire branch circuit shall be considered a single circuit.
SUBSTANTIATION: The requirements of this section do not apply where there is only one building or structure supplied from a remote service such as pedestal type or unit substation, nor where a second building is supplied from one under a different management such as a leased or rented second building.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's concerns are covered in the panel's actions on Proposals 4-18 and 4-17a. The panel reaffirms that the concept of single management means the responsible party for the electrical supply system and does not agree that multiple leases or tenants conflicts with the term "single management."

4- 11 - (225-18): Reject
SUBMITTER: Robert E. Molde, Northern States Power Co./Rep. Wisconsin Utilities Assn.
RECOMMENDATION: Add new text as follows:
225-18. Clearance from Ground. The vertical clearances of all branch circuit and feeder conductors shall be based on conductor temperature of 60°F (15°C), no wind, with final unloaded sag in the wire, conductor, or cable. Overhead spans of open conductors and open multiconductor cables of not more than 600 volts, nominal, shall conform to the following:.
SUBSTANTIATION: It is clear that the clearance requirements for this section is shared with Rule 230-24 Clearances for Service Drop Conductors. The conditions under which measurements are based should be stated in 225-18 as they are in 230-24. To promote consistency within the code, the above wording should be added to eliminate any confusion when installing and tensioning outside branch circuits or feeders.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed text is not enforceable. The similar wording has been removed from Section 230-24, see panel action on Proposal 4-68a.

AFFIRMATIVE: 11

(Log #CP411)

4- 11a - (225-19(d)): Accept
NOTE: The Technical Correlating Committee understands that the metric values are those accepted in Proposal 4-2.
SUBMITTER: CMP 4
RECOMMENDATION: In Section 225-19(d) amend as follows:
"(D) Final Spans. Final spans of feeders or branch circuits shall comply with (1), (2) and (3).
(1) Clearance From Windows. Final spans to the building they supply or from which they are fed shall be permitted to be attached to the building, but they shall be kept not less than 3 ft (914 mm) from windows that are designed to be opened, doors, porches, balconies, ladders, stairs, fire escapes, or similar locations.
Exception: Conductors run above the top level of a window shall be permitted to be less than the 3 ft (914 mm) requirement above.
(2) Vertical Clearance. The vertical clearance of final spans above, or within 3 ft (914 mm) measured horizontally of, platforms, projections, or surfaces from which they might be reached shall be maintained in accordance with Section 225-18.
(3). Building Openings. The overhead branch-circuit and feeder conductors shall not be installed beneath openings through which materials may be moved, such as openings in farm and commercial buildings, and shall not be installed where they will obstruct entrance to these building openings."
Delete the existing Fine Print Note.
SUBSTANTIATION: The panel action is to comply with the NFPA NEC Style Manual. The deletion of the FPN is a result of the panel's action on Proposals 4-44 and 4-45.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2912)

4- 12 - (225-19(d)): Reject
SUBMITTER: Donald A. Ganiere, Ottawa, IL
RECOMMENDATION: Delete text as follows:
(d) Final Spans. Final spans of feeders or branch circuits to a building they supply or from which they are fed shall be permitted to be attached to the building, but they shall be kept not less than 3 ft (914 mm) from windows ~~that are designed to be opened~~, doors, porches, balconies, ladders, stairs, fire escapes, or similar locations. Vertical clearance of final spans above, or within 3 ft (914 mm) measured horizontally of, platforms, projections, or surfaces from which they might be reached shall be maintained in accordance with Section 225-18.
SUBSTANTIATION: Windows are used for fire department access whether they are designed to open or not. Fire departments need clear access to windows for victim rescue, building ventilation, and application of fire streams. Conductors are permitted to be installed in locations that unduly interfere with fire department operations by the existing code wording. Keeping conductors at least 3 ft away from all windows will increase fire fighter safety and will make the placement of ladders for emergency rescue and fire fighting faster.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its position that this section does not apply to fixed glass assemblies. There has been no technical substantiation provided to conclusively support that the placement of the final spans within three feet of windows, which are designed not to be opened, is unsafe.

COMMENT ON AFFIRMATIVE:
SUMRALL: I agree with the Panel's Action and statement on this proposal. Over the course of 4 days we, the Panel, addressed 37 such proposals from this submitter. I kept the time expended on this submitter's proposals. Six hours and forty-seven minutes were expended to debate the concerns this submitter asked us to consider. 24.4 percent of all our issues came from this one submitter. Several times, 15 to 25 minutes were used to debate superfluous, smirching proposals.

(Log #707)

4- 14 - (225-22): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Raceways on Exterior Surfaces of Building or Other Structures.
Raceways, boxes, fittings, and other enclosures in wet locations on exterior surfaces of buildings or other structures shall be raintight and arranged to drain.
SUBSTANTIATION: Raceways on exterior surfaces may be in a damp location rather than wet, per Article 100 definitions of damp and wet locations. Exposed to weather and unprotected will normally be a wet location. The inference is that boxes and fittings are required to be raintight to assure the raintight requirement for raceways. The proposal would correlate with Section 370-15 which requires boxes, conduit bodies, and other fittings to be listed for use, where in wet locations, but does not apply that requirement for damp locations. The proposal would correlate with that section. Other structures are included to apply the requirements to other than buildings.
PANEL ACTION: Accept in Principle in Part.
The panel accepts the addition of the words "or Other Structures" to the title and text of the section.
The panel rejects the remainder of the proposed wording.
PANEL STATEMENT: Acceptance of the change to the title and text clarifies the application of this section. It is not necessary to reiterate the requirements of Article 370 for boxes and fittings installed in wet locations.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #120)

4- 15 - (225-26): Reject
NOTE: It was the action of the Technical Correlating Committee that this Proposal be reconsidered for correlation with the action on Proposal 3-132. This action will be considered by the Panel as a Public Comment.
NOTE: The following proposal consists of Comment 4-34 on Proposal 4-44d in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 4-44d was:
Delete the exception in its entirety.
SUBMITTER: Melvin K. Sanders, TECo., Inc.
RECOMMENDATION: CMP 3 Task Group supports the Panel Action of CMP 4 to delete the present Exception.
SUBSTANTIATION: It is the position of CMP 3 Task Group Raymond W. Weber, Richard P. Owen and Melvin K. Sanders, Secretary, on ROP 4-44(d) that it is within the purview of CMP 4 to determine the support requirements for wiring methods in Article 225.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel affirms its position that there are applications under the purview of Article 305 where the support of temporary branch circuits or feeders by vegetation is appropriate.

(Log #121)

4- 16 - (225-26): Accept in Principle
NOTE: It was the action of the Technical Correlating Committee that this Proposal be reconsidered for correlation with the action on Proposal 3-132. This action will be considered by the Panel as a Public Comment.
NOTE: The following proposal consists of Comment 4-35 on Proposal 4-44d in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 4-44d was:
Delete the exception in its entirety.
SUBMITTER: James T. Pauley, Square D Co.
RECOMMENDATION: The Panel should reject the proposal and keep the exception.
SUBSTANTIATION: The Panel Statement makes note that Article 305 does not provide a variation to the rule. Article 305 never needed a rule to state this because 225-26 had the exception. By deleting the exception the panel has removed the entire permission for this practice without any justification. It is common to run temporary wiring through vegetation and the panel should keep the exception.
PANEL ACTION: Accept in Principle.
Revise this section to read:
"225.26. Vegetation as Support.Vegetation, such as trees, shall be permitted only for the support of temporary wiring, as covered in Article 305."
PANEL STATEMENT: The revised wording incorporates the exception into the main requirement. The panel intends that vegetation be used for support of only temporary branch circuits and feeders.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
SUMRALL: In the era of temporary this and temporary that, many exceptions to the reference of Chapter 3 are extended beyond the time tables. This will eventually cause 90-1 to become ineffective for the Authority Having Jurisdiction and cause injury to wandering children and uninformed adults.

(Log #1488)

4- 17 - (225-26, Exception): Reject
NOTE: It was the action of the Technical Correlating Committee that this Proposal be reconsidered for correlation with the action on Proposal 3-132. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Craig Schumann, Dept. of Energy
RECOMMENDATION: The exception should be deleted in that there is nothing in Article 305 that discusses vegetation.
SUBSTANTIATION: There is nothing in Article 305 that discusses vegetation.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel affirms its position that there are applications under the purview of Article 305 where the installation of temporary branch circuits or feeders in vegetation is appropriate.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #CP402)

4- 17a - (225-30): Accept
SUBMITTER: CMP 4
RECOMMENDATION: Modify Section 225-30 to read:
"Where more than one building or other structure is on the same property and under single management, each additional building or other structure served, that is on the load side of the service disconnecting means, shall be supplied by one feeder or branch circuit unless permitted in (a) through (e). For the purpose of this section, a multiwire branch circuit shall be considered a single circuit."
SUBSTANTIATION: The panel's action clarifies that assemblies such as service pedestals, substations, or similar equipment are considered to be structures. Structures are an assembly of parts or components arranged in a logical form or manner for a useful purpose. This action also clarifies that this section is applicable to buildings or other structures supplied by circuits on the load side of the service disconnecting means.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #711)

4- 18 - (225 Part B, and 225-30): Reject
NOTE: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Part B. ~~More than~~ One or More Buildings or Other Structures.
Number of Supplies. ~~Where more than one building or structure is on the same property and under single management each~~ Each building or structure served, other than a service or meter pedestal, unit substation, or the like, shall be supplied by one feeder or branch circuit unless otherwise permitted in (a) through (e) below. For the purpose of this section a multiwire branch circuit shall be considered a single circuit.
SUBSTANTIATION: The requirements of this section do not apply where there is only one building or structure on the property, nor where a second building is supplied from one under different management, such as a leased second building, nor where one of the buildings is on different property. The requirement for single management and same property do not appear to be relevant to electrical safety if other pertinent code rules are observed, and such considerations may be better left to other codes and regulations.
In Comment 4-4 in the 1998 ROC, the panel indicated service pedestals and structures. Literally true perhaps, but not in the context of apparent intent of this section. They would be electrically served, but if the supply is service conductors, not served by one feeder or branch circuit.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel actions on Proposals 4-9 and 4-17a address the submitter's concerns. The panel clarifies through its action that Part A covers a single structure and Part B covers multiple structures, including service pedestals and similar electrical equipment. The submitter's concerns are adequately covered by the existing text in Part B of Article 225.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4398)

4- 19 - (225-30(a)(6) (New)): Reject
SUBMITTER: Monte R. Ewing, State of Wisconsin
RECOMMENDATION: Add new paragraph (6) to read as follows:
(6) Multi-occupancy buildings or structures related in use to multi-family dwellings shall be permitted to have one set of branch circuit conductors installed from a dwelling unit to the second building or structure's occupied space.
SUBSTANTIATION: This has always been common practice for individual dwelling branch circuits to be installed to the matching detached garage stall in compliance with NEC 210-25. The present language in 225-30 does not provide for this common wiring method. The provision in 225-30(b)(1) would only apply when there is no common place on the building where the tenant disconnects could be grouped. With detached garages that is almost never the problem. The problem to avoid is multiple branch circuits and disconnects all being grouped at one place rather than one per tenant space similar to service conductors NEC 230-40 Exception No. 1. The provision to install individual branch circuit conductors to respective detached garage units has been incorporated into the State of Wisconsin Electrical Code and I feel that it needs to be addressed in the National Electrical Code.
PANEL ACTION: Reject.
PANEL STATEMENT: To permit this application without limitation on the number of branch circuits to a building or structure raises concerns over the location of multiple individual disconnecting means. The submitter's proposed language implies that the disconnecting means will be located in the individual spaces in the detached structure. This type of installation could pose a problem for emergency personnel where it is necessary to disconnect all power.

(Log #4169)

4- 21 - (225-30(e)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
"Additional feeders or branch circuits shall be permitted to supply large capacity multibuilding industrial or institutional installations under single management where documented safe switching procedures are established and maintained for disconnection."
SUBSTANTIATION: The new 1999 NEC rule allows multiple supplies on a far broader range of buildings and structures that was ever properly substantiated, the only limitation being safe switching procedures as interpreted by the authority having jurisdiction. The concept in the original proposal simply involved expanding industrial to industrial plus institutional, which was appropriate. The 1999 NEC is far too broad given the multiplicity of jurisdictions subject to the NEC. Note that the use of this language to justify additional sources of supply [new Section 225-30(e)] is a new concept that goes beyond the traditional allowance for remote switching (to be in Section 225-32 Exception No. 2). This limitation has been in the Massachusetts Electrical Code for ten months with no reported objections.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient technical substantiation to disallow or not permit applications of these requirements wherever documented safe switching procedures are established and maintained.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3937)

4- 22 - (225-30(f)): Reject
SUBMITTER: William F. Laidler, South Shore Voc Tech School
RECOMMENDATION: Add a new paragraph (f) to read as follows:
(f) One and Two Family Dwellings. For one and two family dwellings additional feeders or branch circuits shall be permitted to supply other buildings (such as garages and outbuildings) on the property. Where such installations comply with Section 250-32(a) and do not exceed six branch circuits the documented safe switching procedures of Section 225-30(e) need not be established.
SUBSTANTIATION: The present wording is commonly interpreted to restrict multiple branch circuits from supplying out buildings on residential property such as garages and sheds. Section 250-32(a) recognizes the practice of one or more branch circuits supplying a second building without regard to type of occupancy. Under these situations if only one branch circuit supplies a structure and has provisions for equipment grounding a grounding electrode is not required. For residential properties it is very common to add branch circuits to such structures over a period of time. Limiting this practice (without reported safety issues) would be economically restrictive.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not substantiated that the existing Code text has had a limiting effect for these types of structures. The installation of a feeder with subsequent redistribution is a commonly used option. The panel intends that there be a limit on the number of branch circuits to a detached building or structure.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #CP404)

4- 22a - (225-31 and 225-32): Accept
NOTE: The Technical Correlating Committee directs that the word "utilized" be changed to "used" in accordance with the NEC Style Manual.
SUBMITTER: CMP 4
RECOMMENDATION: Combine Sections 225-31 and 225-32. The revised text incorporates the accepted actions in Proposals 4-24, 4-25, and 4-27.
Revise text to read:
"225-31. Disconnecting Means. Means shall be provided to disconnect all ungrounded conductors that supply or pass through a building or structure in accordance with (1) and (2).
(1) Readily Accessible Location. The branch circuit or feeder disconnecting means shall be installed at a readily accessible location in accordance with (a) or (b).
(a) Outside. Where the branch circuit or feeder disconnecting means is installed outside a building or structure it shall be on or within sight of the building or structure supplied.
(b) Inside. Where the branch circuit or feeder disconnecting means is installed inside, it shall be nearest the point of entrance of the supply conductors.
(2) Conductors Considered Outside. For the purposes of this section, the requirements of Section 230-6 shall be permitted to be used."
Modify Exception No. 1 (Proposal 4-25), maintain existing Exceptions Nos. 2-4, and add new Exception No. 5 (Proposal 4-27).
SUBSTANTIATION: The proposed wording provides clarity, resolves concerns relative to the location of disconnects and resolves the issue that conductors considered outside of a building per 230-6 do not require a disconnect.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
CARRICK: This Panel's intent for outside locations was that the disconnect should be within sight of the building and within 50 ft. It was thought that the definition of "within sight of" would specify the 50 ft limit; however, the definition in Article 100 is for two pieces of equipment. A building is usually not considered a piece of equipment. This proposal would be acceptable if the words "and within 50 ft" were added after "within sight".

(Log #2054)

4- 23 - (225-31, Exception): Accept in Principle
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Add an Exception to read as follows:
Exception: Where the ungrounded conductors comply with Section 230-6.
SUBSTANTIATION: Fire pump feeders or services that pass under or through a building should not have disconnects or overcurrent protection installed in the feeder or service where large complexes need these requirements.
Emergency power circuits should have this same exception.
By allowing the exception requirements in section 225-32 does not allow exception to 225-31.
The compliance to Article 695-4 will be complied with out having a conflict since this article does not exempt Article 225.
See also Section 695-4(b) for only supervised systems.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel action on Proposal 4-22a adequately address the submitter's concerns.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1818)

4- 24 - (225-32): Accept in Principle
NOTE: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal as it relates to Proposal 4-22a. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Brad Spencer, Burgess & Niple, Ltd.
RECOMMENDATION: Revise to read as follows:
The disconnecting means shall be installed either ~~inside or~~ outside of the building or structure served or where conductors pass through the building or structure or inside nearest the point of entrance of the conductors. The disconnecting means shall be at a readily accessible location ~~nearest the point of entrance of the conductors.~~ For the purposes of this section, the requirements in Section 230-6 shall be permitted to be utilized.
SUBSTANTIATION: The existing text leads one to conclude that the disconnecting means, if installed outside, must be located nearest the point of entrance of the conductors. Situations sometimes arise in which the best location for the outdoor disconnecting means is not necessarily nearest the best point of entrance of the conductors. For example, one may want to place a disconnecting means on the front of a structure but run the conductors along the outside of the structure and enter from another side. The current wording unnecessarily restricts the designer or installer from doing this. Furthermore, the proposed change to the text will make it similar to Article 230, Section 70(a) which deals with the location of service equipment disconnecting means.
PANEL ACTION: Accept in Principle.
Amend the proposal to read:
"The disconnecting means shall be installed at a readily accessible location either outside of the building or structure or inside nearest the point of entrance of the conductors. For the purposes of this section, the requirements of Section 230-6 shall be permitted to be utilized."
PANEL STATEMENT: The panel agrees in principle with the submitter's proposed text and has reworded it to enhance clarity.

4- 25 - (225-32 Exception No. 1): Accept
NOTE: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal as it relates to Proposal 4-22a. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add the following underlined text.
Exception No. 1: For installations under single management, where documented safe switching procedures are established and maintained for disconnection, and where the installation is monitored by qualified individuals, the disconnecting means shall be permitted to be located elsewhere on the premises.

SUBSTANTIATION: The exception was modified in the last code cycle to include any facility that could establish safe switching procedures. Prior to this change, only industrial facilities enjoyed this benefit, mainly due to its having a staff of qualified individuals that were familiar with the installation and could ensure that safe switching procedures were followed. Unfortunately it does not appear that same criteria carried over from the previous code. Generally speaking, for a facility to qualify for this exception prior to the 1999 NEC, it would have had a staff of qualified individuals. Presently there is no requirement for a qualified staff, which could quite easily lead to unsafe switching procedures or none at all. To assure safe switching procedures it is crucial for a qualified individual to be on staff at all times, otherwise there is no mechanism to assure that any procedure could be followed by an individual not familiar with the installation.
PANEL ACTION: Accept.

(Log #4170)

4- 26 - (225-32 Exception No. 1): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
"For large capacity multibuilding industrial or institutional installations under single management where documented safe switching procedures are established and maintained for disconnection, the disconnecting means shall be permitted to be located elsewhere on the premises."
SUBSTANTIATION: The major 1999 NEC expansion of the rule allows multiple supplies on a far broader range of buildings and structures that was ever properly substantiated, the only limitation being safe switching procedures as interpreted by the AHJ. The concept in the original proposal simply involved expanding industrial to industrial plus institutional, which was appropriate. The 1999 NEC is far too broad given the multiplicity of jurisdictions subject to the NEC. It potentially reaches a single-family house with a detached garage, which is rather far afield from the limitation to "large capacity multibuilding industrial," a limitation that had been in the Code since it first appeared in the 1984 edition. This limitation has been in the Massachusetts Electrical Code for ten months with no reported objections.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient technical substantiation to disallow or not permit applications of these requirements wherever documented safe switching procedures are established and maintained.

4- 27 - (225-32 Exception No. 5 (New)): Accept
NOTE: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal as it relates to Proposal 4-22a. This action will be considered by the Panel as a Public Comment.
SUBMITTER: C. John Beck, Pacific Gas & Electric Co.
RECOMMENDATION: Add new Exception No. 5 to 1999 NEC Section 225-32, to read as follows:
Exception No. 5: For outdoor emergency, legally required standby, or optional standby generator sets, the disconnecting means, when listed as suitable for use as service equipment, shall be permitted to be located at the generator set.
SUBSTANTIATION: A98 ROC Comment 4-14 was held in accordance with Section 3-4.6.2.2 NFPA Regulations Governing Committee Projects. The Technical Correlating Committee requested that a Task Group of members of Panels 4 and 15 review this issue and develop an agreed upon proposal for the 2002 NEC Development Cycle. The above proposal was developed by the Task Group based on the Task Group's review and discussion of the current requirements of Article 225 regarding location and suitability for use as service equipment, NEC Section 225-32, the original Comment 4-14 (NFPA 70-A98 ROC), and the State of Wisconsin documentation (as submitted by Mr. Bey to NFPA). The above proposal is the Task Group's response to Comment 4-14 (NFPA 70 - A98 ROC), identifies and addresses the issues raised by both Mr. Bey and the state of Wisconsin, maintains consistency with the current requirements of Article 225, and fulfills the direction of the Technical Correlating Committee. The proposal recognizes the need to permit a disconnecting means to be located at an outdoor generator set and establishes the requirement for that installation.
The Task Group participants consisted of:
Tom Adams (CMP 4); Peter Amos (CMP 15); John Beck (Chairman CMP 4 & Task Group Chair); Bob Duncan (Chairman, CMP 15); John Kovacik (CMP 15); Bill Lewis (CMP 4); and, Mark Sumrall (CMP 4).

(Log #16)

15- 3 - (225-34(b)): Accept in Principle in Part
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 4 for information.
NOTE: The following proposal consists of Comment 4-14 on Proposal 4-10a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 4-10a was:
Revise Section 225-8 to read as follows:
225-8. More than One Building or Other Structure.
(a) Number of Supplies. Where more than one building or other structure is on the same property and under single management, each building or other structure served shall be supplied by one feeder or branch circuit. For the purpose of this section a multiwire branch circuit shall be considered a single circuit.
Exception No. 1: For fire pumps.
Exception No. 2: For emergency, legally required standby, optional standby, or parallel power production systems.
Exception No. 3: By special permission, in multiple-occupancy buildings where there is no available space for supply equipment accessible to all occupants.
Exception No. 4: Where the capacity requirements are in excess of 2000 amperes at a supply voltage of 600 volts or less, or by special permission.
Exception No. 5: By special permission, for a single building or other structure sufficiently large to make two or more supplies necessary.
Exception No. 6: For different characteristics, such as for different voltages, frequencies, or phases, or for different uses, such as for different rate schedules.
Exception No. 7: For large capacity multibuilding industrial installations under single management, where it is ensured that the disconnecting can be accomplished by establishing and maintaining safe switching procedures.
(b) Disconnecting Means. Means shall be provided for disconnecting all ungrounded conductors supplying or passing through the building or structure.
(c) Location. The disconnecting means shall be installed either inside or outside of the building or structure served or where the

conductors pass through the building or structure. The disconnecting means shall be at a readily accessible location nearest the point of entrance of the conductors.

Exception No. 1: For large capacity multibuilding industrial installations under single management, where it is ensured that the disconnecting can be accomplished by establishing and maintaining safe switching procedures, the disconnecting means shall be permitted to be located elsewhere on the premises.

Exception No. 2: Buildings or other structures qualifying under the provisions of Article 685.

Exception No. 3: Poles or groups of poles used as lighting standards where disconnecting means are remote.

(d) Maximum Number of Disconnects.

(1) General. The disconnecting means for each supply permitted by (a) above shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be no more than six disconnects per supply grouped in any one location.

Exception: For the purpose of this section, disconnecting means used solely for the control circuit of the ground-fault protection system, installed as part of the listed equipment, shall not be considered a supply disconnecting means.

(2) Single-Pole Units. Two or three single-pole switches or breakers, capable of individual operation, shall be permitted on multiwire circuits, one pole for each ungrounded conductor, as one multipole disconnect, provided they are equipped with "handle ties" or a "master handle" to disconnect all conductors of the supply with no more than six operations of the hand.

(e) Grouping of Disconnects.

(1) General. The two to six disconnects as permitted in (d) above shall be grouped. Each disconnect shall be marked to indicate the load served.

Exception: One of the two to six disconnecting means permitted in (d) above, where used only for a water pump also intended to provide fire protection, shall be permitted to be located remote from the other disconnecting means.

(2) Additional Disconnecting Means. The one or more additional disconnecting means for fire pumps or for emergency, legally required standby, or optional standby supplies permitted by (a) above shall be installed sufficiently remote from the one to six disconnecting means for normal supply to minimize the possibility of simultaneous interruption of supply.

(3) Access to Occupants. In a multiple-occupancy building, each occupant shall have access to the occupant's supply disconnecting means.

Exception: In a multiple-occupancy building where electric supply and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the disconnecting means supplying more than one occupancy shall be permitted to be accessible to authorized management personnel only.

(f) Suitable for Service Equipment. The disconnecting means specified in (b) above shall be suitable for use as service equipment.

Exception: For garages and outbuildings on residential property, a snap switch or a set of 3-way or 4-way snap switches suitable for use on branch circuits shall be permitted as the disconnecting means.

(g) Identification. Where a building or structure is supplied by more than one feeder or branch circuit, or by any combination of branch circuits, feeders, and services, a permanent plaque or directory shall be installed at each feeder and branch circuit disconnect location denoting all other services, feeders, and branch circuits supplying that building or structure and the area served by each. See Section 230-2(b).

Exception No. 1: A plaque or directory shall not be required for large capacity multibuilding industrial installations under single management, where it is ensured that disconnection can be accomplished by establishing and maintaining safe switching procedures.

Exception No. 2: This identification shall not be required for branch circuits installed from a dwelling unit to a second building or structure.

SUBMITTER: Lawrence A. Bey, Onan Corp.

RECOMMENDATION: Add new text to read:

Exception No. 4: Outdoor emergency and legally required standby generator sets where disconnecting means are located at the generator set.

SUBSTANTIATION: Where emergency and standby generators are outdoors and have circuit breakers at the generator, an additional disconnecting means nearest the point of entrance of the conductors introduces a single point of failure. Standard practice for the reliability of a simple system is to feed a distribution panel or automatic transfer switch directly from the generator. Most outdoor generator sets are located close to the building they serve, typically within 25 feet. Refer to the letter from the State of Wisconsin, Safety and Building Division.

NOTE: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept in Principle in Part.

Add new text to 225-32 read:

Exception No. 5: For outdoor emergency, legally required standby, or optional standby generator sets, the disconnecting means when listed as being suitable for use as service equipment, shall be permitted to be located at the generator set.

PANEL STATEMENT: The panel agrees with the revised text as developed by the joint CMP 4 and CMP 15 task group. The revised text meets the intent of the submitter. The intent of the exception is to permit the disconnect to be located at the generator provided that the location is readily accessible nearest the point of entrance of the conductors.

The part rejected is the location of the code. The requirement belongs in 225-32 not 225-34.

(Log #3147)

4- 29 - (225-36): Reject

SUBMITTER: Michael Krumnauer, Vasso, MI

RECOMMENDATION: Add to the end of the first section:

"Where the supply conductors are not protected on the supply end with overcurrent protection meeting the requirements of Section 240-3."

SUBSTANTIATION: There is no need to place a restrictive condition on a disconnect on the load end of a feeder just because it supplies another building.

PANEL ACTION: Reject.

PANEL STATEMENT: Section 225-36 does not require redundant overcurrent protection for the supply conductors at the building disconnecting means. This section only requires a specific listing of the equipment. The term "suitable for use as service equipment" does not imply that overcurrent protection is mandatory.

4- 30 - (225-36): Accept

SUBMITTER: Charles F. Mello, Milwaukie, OR

RECOMMENDATION: Revise as follows:

Where the installation is made in accordance with Section 250-32(b)(2) ~~The~~ the disconnecting means specified in Section 225-31 shall be suitable for use as service equipment.

SUBSTANTIATION: The standard to qualify a disconnecting means as suitable for service equipment has basically three provisions. Fist there must be a barrier between the unfused "service" conductors and the conductors protected by the "service overcurrent protection." This is commonly referred to as separation of unfused with protected conductors or wire. Second, is that provisions are provided for connecting a grounding electrode conductor and third is that provisions are made to bond the grounded circuit conductor to the enclosure and equipment grounding conductors with a "main bonding jumper." When the definition of service was changed in the 1987 code, then the circuit to a second building became a feeder all the way and was no longer a s"ervice." This required many of the requirements from Article 230 to be moved to Article 225 over several code cycles since this circuit was a feeder. In making these revisions and with the confusion on how the old Section 250-24 was written, the requirement to make the disconnect rated as suitable for service equipment had some reason. With the 1999 Section 250-32 clarifying when grounding and bonding is required on the grounded circuit conductor, this section needs to be updated. With regard to what the rated equipment provides: 1) the feeder conductors are in fact not "unfused" like a service since they must be protected as required by the NEC. In addition, the product standards for disconnects (fused switches and enclosed circuit breakers) have a line side lug barrier provided. The ability to install a grounding electrode connection to the enclosure is provided in disconnecting means that are not service equipment rated. Lastly, bonding of the grounded circuit conductor (neutral) is only allowed

in limited case by Section 250-32(b)(2) in the 1999 NEC. Many incorrect installations take place because the main bonding jumper provided with service rated equipment is inadvertently installed because it was supplied. Strict enforcement of this requirement has caused many installations to purchase specially rated equipment that was not really required. For example, an industrial or commercial installation with a feeder going to a MCC in a pump building, the MCC was required to be rated for service equipment even though the feeder was only three phase three wire from a system that was high impedance grounded. Because this was caught in the field, the modification expense and then reevaluation by the testing laboratory delayed the work, caused unneeded expense and did not provide any additional safety. This modification to this section will define when equipment rated as suitable for service entrance is needed and when standard disconnecting means, not rated for service entrance can be utilized.
PANEL ACTION: Accept.

4- 32 - (225-36, Exception): Reject
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Revise as follows:
225-36. Suitable for Service Equipment. The disconnecting means specified in Section 225-31 shall be suitable for use as service equipment.
Exception: For garages and outbuildings at a one-family dwelling ~~on residential property,~~ a snap switch ~~or a set of 3-way or 4-way snap switches~~ suitable for use on branch circuits shall be permitted as the disconnecting means.
SUBSTANTIATION: The term "residential property" is not defined in Article 100, is far too broad and can include large apartment complexes. Some interpret the term to apply to any property where a person may "reside" which includes hotels and motels.
It seems the present permission to use a set of 3-way or 4-way switches for the disconnecting means at a garage or outbuilding violates the concept of disconnection of power at the building for safety where one may be working on an electrical system. The 3-way or 4-way switch at a remote location can accidentally be operated which will energize the system being worked on and create a safety hazard. It should not be necessary to show a body count or history of electric shock incidents to recognize that this change in the code is necessary.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided any accident data to support the elimination of a long standing Code requirement, nor has he provided substatiation for the limitation to one-family dwellings.

(Log #2327)

4- 33 - (225-36 Exception No. 2 (New)): Accept in Principle
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add a new Exception as follows:
Exception No 2: The disconnecting means shall not be required to be configured as service equipment.
SUBSTANTIATION: There is presently much confusion about this section's requirement to be suitable for use as service equipment. Much of it stems from why this requirement exists to how the disconnect(s) to a second building must be installed.
Many manufacturers, designers, and code officials believe this section requires the disconnect(s) at a second building must be installed as if it were a service. In some aspects this is correct, such as the electrodes at the second building, but in many situations this does not make sense. As an example; A 277/480 volt wye electrical service entrance section with a 3000 ampere main switch with Ground Fault Protection (GFP) serves a 1600 amp feeder to a second building disconnect. The disconnect at the second building must be suitable for use as service equipment, but does it mean that it must have GFP (because it must be installed as service equipment) at that second building in spite of 215-10? The installation of GFP at the second building would not seem to be required due to 215-10, but since the equipment must be suitable for use as service equipment, many believe that if it were to have a single main, the main must have GFP because of requirements of 230-95 for services. It also has been argued that the nationally recognized test labs will not label such a piece of equipment to be suitable for use as service equipment without the main having GFP.
Requiring GFP in this example does not seem to provide any additional safety to the electrical system, in fact it may harm the system by nullifying the upstream GFP if it is not installed correctly, or a designer may elect to use the six switch rule to be used. In either case it seems that these two situations may be less desirable than having a single main without GFP.
Is it the intent of the present article to require all disconnects for a second building/structure to have all of the miscellaneous parts required by the manufacturer for a service to be installed, or was it the intent that this equipment was to merely be suitable for use as service equipment so that any and all necessary and or required equipment could easily be added at the time of installation?
The intent of this proposal is to show that the equipment must be suitable for use as service equipment, the disconnecting means is not mandated to have all of the requisite equipment to be used as service equipment. If the proposal is rejected it will show that the intent of this article is to require all of the equipment that falls under it, to be installed as service equipment.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concern has been addressed by the panel's action on Proposal 4-30. The requirement is now required only under the conditons specified by Section 250-32(b)(2).

SUBSTANTIATION: The action is taken to comply with the NFPA NEC Style Manual.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #714)

4- 35 - (225-37): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Identification. Where a building or structure is supplied by more than one feeder or branch circuit ~~has~~ or any combination of feeders, branch circuits, ~~or services passing through it or~~ supplying it, a permanent plaque or directory shall be installed at each feeder or branch-circuit disconnect location specified in Section 225-32 (excluding the exceptions) denoting all other services feeders, or branch circuits supplying that building or structure and the area served by each. See Section 230-2(e).
This section shall not apply to disconnect locations immediately adjacent to each other.
Exception No. 1: No change.
Exception No. 2: This identification shall not be required for ~~branch~~ circuits from a dwelling unit to a second building or structure.
SUBSTANTIATION: Editorial. The first sentence is revised to conform to the clearer wording of the 1996 NEC; two or more branch circuits may not be interpreted as a combination.
Reference to Section 225-32 would clarify the identification plaque is intended for disconnects at the building served (where provided) and not at the locations permitted by the exception for Section 225-32. If those exceptions relieve the requirements for a disconnect at the building served, it appears the safety consideration would also not merit a plaque at these locations. Identification is required by other code rules.
Service conductors (unprotected) are not permitted by Section 230-3 to pass through buildings unless encased in concrete or brick per Section 230-6. This is not a common procedure but if employed does not appear to warrant a disconnect any more than open service conductors passing over the roof or attached to the eaves or side of the building, which would not require the disconnect.
This section appears related to occupant or firefighter awareness of existence and location of multiple power source disconnect means. It is possible and feasible to locate all different supply disconnects at one location since the limitation to six applies to each supply. If so grouped they are readily discernible and there are no remote locations to warrant the plaque requirement. Such disconnects are required to be identified by Section 110-22.
In Exception No. 2, the limitation to branch circuits still applies plaque requirements to feeders, services, or combinations. Many second buildings may have a feeder or service in addition to a branch circuit, such as a 240 volt 2-wire service for a workshop welder. Since the occupant of a dwelling unit is likely to be fully aware of these supplies a plaque does not seem warranted.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed revision does not enhance the clarity of this section and proposes more than editorial changes. The present Code wording adequately addresses the identification requirements.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #CP405)

4- 35a - (225-38): Accept
SUBMITTER: CMP 4
RECOMMENDATION: Modify Section 225-38 by adding the following text:
"225-38. Disconnect Construction. Disconnecting means shall meet the requirements of (a) through (d).
Exception: For garages and outbuildings on residential property, snap switches or sets of 3-way or 4-way snap switches shall be permitted as the disconnecting means"
Delete the existing exception to 225-36.
SUBSTANTIATION: The additional text clarifies that all of the requirements of this section apply to disconnecting means. The relocation of the existing exception places it in a more appropriate section and exempts these devices from the requirements to be indicating and simultaneously open all poles. The wording of the exception has been modified to permit multiple snap switches and multiple sets of three-way or four-way switches as disconnecting means.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #716)

4- 37 - (225-39): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Rating of Disconnect. The ~~feeder or branch circuit~~ building or structure disconnecting means shall have a rating not less than the maximum computed load to be carried, as determined in Article 220. In no case shall the rating be lower than specified in (a), (b), (c), or (d) below.
(a) ~~One Circuit Installation. For installations to supply only limited loads of a single branch circuit, the branch circuit disconnecting means shall have a rating of not less than 15 amperes.~~
Branch circuit Installation. Where the supply conductors consist of one or more branch circuits each disconnect shall have a rating of not less than 15 amperes.
(b) ~~Two Circuit Installations. For installations consisting of not more than two 2-wire branch circuits, the feeder or branch circuit disconnecting means shall have a rating of not less than 30 amperes.~~
Feeder Installations. Where the supply conductors consist of one or more feeders each disconnect shall have a rating of not less than 30-amperes where (1) two or more 2-wire branch circuits are supplied by a 2-wire feeder; (2) more than two 2-wire branch circuits are supplied by a 3-wire feeder; (3) two or more 3-wire branch circuits are supplied by a 3-wire feeder or; (4) two or more 4-wire branch circuits are supplied by a 3-phase, 4-wire feeder.
(c) One Family Dwelling. For, a one-family dwelling the ~~feeder~~ disconnecting means shall have a rating of not less than 100 amperes single-phase 3-wire or 60-amperes 3-phase 4-wire.
(d) ~~All Others. For all other installations, the feeder or branch circuit disconnecting means shall have a rating of not less than 60 amperes.~~
Other Dwelling Units. For an individual dwelling unit of a two-family or multifamily dwelling the disconnecting means shall have an ampere rating of not less than 60 (70) - amperes 3-wire single-phase or 30 (40) - amperes 4-wire three-phase
(ampere figures in parentheses are alternates)

SUBSTANTIATION: The disconnecting means covered in this section apparently refer to the building or structure disconnects of Sections 225-31 through 225-39. Since supply conductors are feeders and/or branch circuits, references to feeder or branch circuit disconnecting means can be confusing and misleading as it applies to the disconnects at the feeder or branch circuit source of supply. A snap switch which disconnects the building wiring branch circuit supply conductors is not a branch circuit disconnecting means any more than a snap switch controlling a lighting fixture. A disconnect which may disconnect the building wiring from a feeder is not a feeder disconnect unless it supplies a feeder.

"Maximum computed" may be technically more correct since "load" can be considered with or without demand factors.

The present (a) refers to one circuit. Section 225-30 indicates more than one branch circuit may constitute supply conductors. "Limited" load is not defined and is somewhat meaningless in this application. All branch circuits supply a limited load, which can vary such as a 15-ampere 120-volt circuit and a 15-ampere 480/277 volt circuit. The intent is not clear whether a limit other than the circuit capacity is intended.

Since "disconnecting means" may consist of six snap switches it may be construed that the aggregate value of their ratings comply, i.e., three 5-ampere rated switches meet the 15-ampere minimum. "Each disconnect" clarifies that sum ratings such as permitted in Section 230-80 do not apply for snap switches.

The present (b) could apply to two separate 2-wire branch circuit supplies (where permitted by Section 225-30) even if their ampacities are less than 30-amperes, and it doesn't apply where there are more than two separate branch circuit supplies. It appears (d) would then apply. This subsection literally applies to a disconnect at the feeder or branch circuit source since the conductors on the line side of the building disconnects are feeders or branch circuits. A 3-wire feeder supplying the two 2-wire 15-ampere branch circuits could be size No. 14 or 12 yet this section requires a 30-ampere disconnecting means.

In (c) provision should be made for 3-phase 4-wire feeders (208y/120 v) which are not prohibited and can accommodate slightly less volt-amperes than a 120/240 volt 3-wire system but more than a 208y/120 volt 3-wire system. Section 220-30 refers to 208 y/120 volts 4-wire feeders.

Present (d) becomes unnecessary with the proposal for (c) which covers minimum disconnecting means ratings for feeders, which tracks the ampacity requirements of Section 215-2. If more than two branch circuit supplies are provided in accordance with Section 225-50, present (d) requires a 60-ampere rated disconnect even if the branch circuits are rated 15-amperes. If a 3-wire feeder supplies two or more 3-wire branch circuits Section 215-2(a) permits a minimum feeder ampacity of 30; this section requires a minimum 60-ampere rated disconnecting means.

The proposal for (d) fills a void not presently covered. Section 230-79(d) requires a minimum 60-ampere rating for service disconnecting means for such dwelling units and seems appropriate for feeders for 3-wire systems. It provides for disconnecting means rating where the system is 3-phase 4-wire.

(See my proposal for Section 230-79).

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed language is adding requirements that have not been adequately substantiated. The existing text is clear in stating the requirements for the rating of the disconnecting means.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #3855)

4- 38 - (225-41 (New)): Reject

NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 10 for information.

SUBMITTER: J. Philip Simmons, Olympia, WA

RECOMMENDATION: Move the text of existing Section 240-13 to become a new Section 225-41 as follows:

225-41. Ground-Fault Protection of Equipment. Ground-fault protection of equipment shall be provided in accordance with the provisions of Section 230-95 for solidly grounded wye electrical systems of more than 150 volts to ground, but not exceeding 600 volts phase-to-phase for each individual device used as a building or structure main disconnecting means rated 1000 amperes or more.

Exception No. 1: The provisions of this section shall not apply to a disconnecting means for a continuous industrial process where a nonorderly shutdown will introduce additional or increased hazards.

Exception No. 2: The provisions of this section shall not apply to fire pumps.

Exception No. 3: The provisions of this section shall not apply if the disconnecting means is protected on the supply side by service or feeder ground-fault protection.

SUBSTANTIATION: Part B of Article 225 deals with disconnecting means for buildings and structures on the premises that are supplied from a service in another building or structure. The requirements for ground fault protection of equipment in Section 240-13 for building disconnecting means should be located here in Article 225 where the other requirements for building or structure disconnecting means are located. This should improve the structure of the code and make the code more "user friendly."

PANEL ACTION: Reject.

PANEL STATEMENT: CMP 4 believes that this requirement is appropriately located in Section 240-13. This action is referred to CMP 10 for review.

(Log #1469)

4- 39 - (225-48): Accept in Principle

NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 1 for information.

SUBMITTER: William M. Lewis, Eli Lilly and Co.

RECOMMENDATION: Add new section to read:

225-48 Supervised Installations.

For the purposes of Part C, the term supervised installation is defined as the portions of a facility where all of the following conditions are met:

1. Conditions of design, and installation are provided under engineering supervision.
2. Qualified persons provide maintenance, monitoring and servicing of the system.
3. The premises has at least one service that is more than 600 volts nominal.

SUBSTANTIATION: Existing load calculations as covered in Section 220 are impractical for outdoor feeders over 600 volts.

This proposal must be considered in concert with companion proposals to add Sections 225-49, 225-3, and Exception No. 2 to 220-1. It has long been the practice at utilities and at supervised installations to size feeder conductors based on connected transformer capacity and load characteristics. This proposal addresses these accepted practices.

This proposal was developed by the Task Group based on the Task Group's review and discussion of the current requirements of Articles 225, 230, 100, 110, 240, and 250. This proposal is one of 14 which makes up the Task Group's response to a recommendation by a TCC task group on usability in 1995. In considering the needed proposals, emphasis was placed on including in the NEC, practices which are recognized in the electrical industry as necessary for safe installation of over 600 volts systems. This is to provide guidance and direction for installation of these facilities which have not historically been included in the NEC.

The Task Group participants consisted of William M. Lewis (CMP 4); committee chair; Carl J. Fredericks (CMP 10); Tom Adams (CMP 4); John Beck (Chairman CMP 4); Mark Sumrall (CMP 4); Barry Hornberger, (CMP 13); William T. Beutler, P.E.; William Long, NEMA.

Interested persons (nonparticipants): Robert J. Pollock (CMP 4 and TCC); Merton Bunker (NFPA); Mark Earley (NFPA).

PANEL ACTION: Accept in Principle.

Modify the proposed section to read:

"225-48 Supervised Installations.

For the purposes of Part C, the term supervised installation is defined as the portions of a facility where all of the following conditions are met:

1. Conditions of design, and installation are provided under engineering supervision.
2. Qualified persons <u>with documented training and experience in over 600 volt systems,</u> provide maintenance, monitoring and servicing of the system.

~~3. The premises has at least one service that is more than 600 volts nominal. "~~

PANEL STATEMENT: Working on systems over 600 volt requires special qualifications and training. The modification to (2) is made to emphasize that point. Paragraph (3) is deleted as superfluous because it is located in Part C of Article 225. The panel refers their action on modifying the definition of qualified person to CMP 1 as the definition (as accepted in Proposal 1-178) needs to be expanded to better cover over 600 volt installations.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
ZINNANTE: I oppose the proposal as written. The NEC as stated in Article 90 is not intended as a design specification. I always thought that the locator state codes and ordinances as well as the Authority Having Jurisdiction determined who was qualified to perform electrical maintenance, monitoring and servicing. No where in the code do we define what a journeyman electrician or an apprentice electrician is and what documentation is required to distinguish them. Why should the NEC now start inserting these requirements. The assumption by the Code is that the person installing, servicing and monitoring, by definition is qualified.
COMMENT ON AFFIRMATIVE:
CARRICK: This definition should be placed in the over 600 volt section of Article 100.
SUMRALL: I applaud the Panel's decision to include a definition of the term "qualified" in this section, for installations over 600 vac. 90-1 specifically spells out the primary purpose of the NEC, and that is "THE PRACTICAL SAFEGUARDING OF PERSONS AND PROPERTY." By adapting this proposal, the Panel reaffirms 90-1 is still upheld as the high standard of the electrical industry. Over the past 12 months, thousands of dollars have been spent on medical, rehabilitation and funeral expenses. Though the NEC cannot regulate human error, it can continue to be a well-intentioned document to provide guidance in a fast and ever-changing industry.

(Log #1470)

4- 40 - (225-49): Accept in Principle
SUBMITTER: William M. Lewis, Eli Lilly and Co.
RECOMMENDATION: Add a new Section 225-49 to read as shown:
225-49. Sizing of conductors for outdoor feeders.
Sizing of conductors for outdoor feeders shall be sized in accordance with A or B below:
A. The sizing of conductors for outdoor feeders supplying only other feeders shall be based on the following:
1. Each segment of feeders beyond the service equipment shall be based on the total of the nameplate ratings of the transformers supplied by that segment of feeders.
2. The sizing of conductors for outdoor feeders supplying a combination of feeders, utilization equipment or other loads shall be based on the total of the nameplate ratings of the transformers supplied by that segment of feeders plus the maximum rating of the other equipment.
B. For supervised installations as defined in Section 225-48, conductor sizing shall be permitted to be determined by qualified persons using the requirements of this Code or under engineering supervision.
SUBSTANTIATION: This proposal must be considered in concert with companion proposals to add Sections 225-48, 225-3, and Exception No. 2 to 220-1. It has long been the practice at utilities and at supervised installations to size feeder conductors based on connected transformer capacity and load characteristics. This proposal addresses these accepted practices.
This proposal was developed by the Task Group based on the Task Group's review and discussion of the current requirements of Articles 225, 230, 100, 110, 240, and 250. This proposal is one of 14 which makes up the Task Group's response to a recommendation by a TCC task group on usability in 1995. In considering the needed proposals, emphasis was placed on including in the NEC, practices which are recognized in the electrical industry as necessary for safe installation of over 600 volt systems. This is to provide guidance and direction for installation of these facilities which have not historically been included in the NEC.

NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 2 for inclusion of the material in Articles 210 and 215 to cover over 600 volt branch circuits, feeders, and supervised installations, in general. This action will be considered by the Panel as a Public Comment.
SUBMITTER: CMP 4
RECOMMENDATION: Add the following text at the beginning of Part C and renumber accordingly in the present order.
"PART C. Over 600 Volts
225-50. Proposal 4-39 as modified.
225-51 Sizing of Outdoor Circuits.
Outdoor circuit conductors shall be sized in accordance with (A), (B) or (C):
(A) Sizing of Conductors for Outdoor Branch Circuits. The ampacity of branch circuit conductors shall not be less than 125 percent of the designed potential load of utilization equipment that will be operated simultaneously.
(B) Sizing of Conductors for Outdoor Feeders.
The ampacity of outdoor feeder conductors shall be in accordance with the following:
(1) The ampacity of feeders supplying only transformers shall not be less than the sum of the nameplate ratings of the transformers supplied by the feeder.
(2) The ampacity of feeders supplying a combination of transformers and utilization equipment shall be not less than the sum of the nameplate ratings of the transformers and 125 percent of the designed potential load of the utilization equipment that will be operated simultaneously.
(C). Sizing of Conductors in Supervised Installations. For supervised installations as defined in 225-50, branch circuit and feeder conductor sizing shall be permitted to be determined by qualified persons under engineering supervision.
225-52. Ampacities. The ampacity of conductors shall be in accordance with Section 310-15 and Section 310-60 as applicable."
SUBSTANTIATION: This action provides necessary direction for sizing conductors for installations over 600 volts. The concepts of Proposals 4-7 and 4-40 have been incorporated into the panel proposal.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
CARRICK: Conductors used for over 600 volt branch circuits and feeders can be used at 100 percent of their ratings. There is concern that the authority having jurisdiction will try to enforce 225-51 A and B as a minimum even in supervised installations when engineers have determined that conductors smaller than those specified in 225-51 A and B would be suitable. This was not the Panel's intent.

(Log #717)

4- 41 - (225-50): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Warning Signs. Signs with the words "Danger ~~Warning~~ High Voltage-Keep Out" shall be posted in plain view ~~where unauthorized persons might come in contact with live parts~~ for electrical installations covered in Section 110-31.
Or alternatively: WARNING SIGNS. Signs with the words "DANGER HIGH-VOLTAGE KEEP OUT" shall be posted in plain view at entrances to rooms and other guarded locations that contain exposed live parts ~~where~~ forbidding unqualified persons to enter. ~~might come in contact with live parts.~~
SUBSTANTIATION: Editorial. The present wording infers unauthorized persons may have access to rooms, screened or fenced area, etc., where there are live parts. Section 110-31 indicates area

or enclosures for other than metal-enclosed installations (possible live parts) shall deter access by unqualified persons and Section 110-34(c) indicates deterence to areas with live parts. Where building disconnect means as as covered by Sections 225-51 and 225-52 may be inside a building, Sections 110-31(a)(1) and (c) require installations accessible to unauthorized persons to be metal-enclosed, locked, or in a location where access is controlled by a lock.

The word "danger" is proposed in lieu of "warning" to correlate with Sections 110-34(c); 230-203; 490-53; and 490-55.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel's action on Proposal 4-40a has removed this wording from Article 225 as Section 110-34(c) adequately covers the requirement for signage.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #1831)

4- 42 - (225-50): Reject

SUBMITTER: Buster R. Falls, City of Orlando, FL

RECOMMENDATION: Replace "warning" with "danger."

SUBSTANTIATION: Corrects use of term that will be the same throughout the code.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel's action on Proposal 4-40a has removed this wording from Article 225 as Section 110-34(c) adequately covers the requirement for signage.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #3261)

4- 43 - (225-50): Reject

SUBMITTER: Alan Manche, Square D Co.

RECOMMENDATION: Revise the 225-50 with the additions (underlined) as shown. The entire text is shown for clarity, but only those changes shown underlined are part of this proposal.

225.50. Warning Signs. Signs with the <u>following</u> words <u>or equivalent</u>, "WARNING - HIGH VOLTAGE - KEEP OUT" shall be posted in plain view where unauthorized persons might come in contact with live parts."

SUBSTANTIATION: The explicit nature of the present wording is causing field problems in the acceptance of appropriate warning signs or markings. The ANSI Z535 series of standards provides the proper procedure in establishing a hazard sign or marking. ANSI Z535.4 provides the information about what should be contained in a hazard sign or label. This includes a message panel that identifies the hazard, indicates how to avoid the hazard and advises the probable consequence of not avoiding the hazard.

The objective of the NEC wording is to generally convey the basic message requirement to user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would allow a hazard sign to comply with the NEC, but be formated in accordance with Z535.4.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel's action on Proposal 40a has removed this wording from Article 225 as Section 110-34(c) adequately covers the requirement for signage.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #1471)

4- 44 - (225-60): Accept in Principle

SUBMITTER: William M. Lewis, Eli Lilly and Co.

RECOMMENDATION: Add new Section 225-60 as shown:

225-60. Clearances Over Roadways, Walkways, Rail, Water, Open Land.

(a) 22kV Nominal to Ground or Less.

(Table shown below)

(b) Over 22kV Nominal to Ground. Clearances for the above categories shall be increased by 0.4 in. (10 mm) per kV above 22000 volts.

(c) For special cases such as where crossings will be made over lakes, rivers, or areas utilizing large vehicles such as mining operations, specific designs shall be engineered considering the special circumstances and shall be approved by the authority having jurisdiction.

SUBSTANTIATION: The existing NEC does not give clearance requirements for feeders over 600 volts. The proposal addresses this oversight and is in harmony with the NESC.

This proposal was developed by the Task Group based on the Task Group's review and discussion of the current requirements of Articles 225, 230, 100, 110, 240, and 250. This proposal is one of 14 which makes up the Task Group's response to a recommendation by a TCC task group on usability in 1995. In considering the needed proposals, emphasis was placed on including in the NEC, practices which are recognized in the electrical industry as necessary for safe installation of over 600 volt systems. This is to provide guidance and direction for installation of these facilities which have not historically been included in the NEC.

The Task Group participants consisted of William M. Lewis (CMP 4); committee chair; Carl J. Fredericks (CMP 10); Tom Adams (CMP 4); John Beck (Chairman CMP 4); Mark Sumrall (CMP 4); Barry Hornberger, (CMP 13); William T. Beutler, P.E.; William Long, NEMA

Interested persons (nonparticipants): Robert J. Pollock (CMP 4 and TCC); Merton Bunker (NFPA); Mark Earley (NFPA)

PANEL ACTION: Accept in Principle.

Amend the proposed text and table as follows:

"(a) 22kVNominal to Ground or Less. The clearances over roadways, walkways, rail, water and open land for conductors and live parts up to 22kV nominal to ground or less shall be not less than the values shown in Table 225-60."

After (c) add the following Fine Print Note:

"Fine Print Note: For additional information see National Electrical Safety Code, ANSI C2-1997."

Add these metric values to the proposed table:

13.5 ft-4.1m
14.5 ft-4.4m
17 ft-5.2m
18.5 ft-5.6m
26.5 ft-8.1m

PANEL STATEMENT: The panel's action complies with the NFPA NEC Style Manual and the FPN has been added to provide additional guidance.

(Log #1472)

4- 45 - (225-61): Accept in Principle
SUBMITTER: William M. Lewis, Eli Lilly and Co.
RECOMMENDATION: Add new Section 225-61 to read as shown:
225-61. Clearances Over Buildings and Other Structures.
(a) 22kV nominal to ground or less.

Clearance of Conductors or Live Parts From:	Horizontal	Vertical
Building Walls, Projections, and Windows	7.5 ft	
Balconies, Catwalks, and Similar Areas Accessible to People	7.5 ft	13.5 ft
Over or Under Roofs or Projections Not Readily Accessible to People		12.5 ft
Over Roofs Accessible to Vehicles But Not Trucks		13.5 ft
Over Roofs Accessible to Trucks		18.5 ft
Other Structures	7.5 ft	

(b) Over 22kV Nominal to Ground. Clearances for the above categories shall be increased by 0.4 inches per kV above 22000 volts.
SUBSTANTIATION: The existing NEC does not give clearance requirements for feeders over 600 volts. The proposal addresses this oversight and is in harmony with the NESC.
This proposal was developed by the Task Group based on the Task Group's review and discussion of the current requirements of Articles 225, 230, 100, 110, 240, and 250. This proposal is one of 14 which makes up the Task Group's response to a recommendation by a TCC task group on usability in 1995. In considering the needed proposals, emphasis was placed on including in the NEC, practices which are recognized in the electrical industry as necessary for safe installation of over 600 volt systems. This is to provide guidance and direction for installation of these facilities which have not historically been included in the NEC.
The Task Group participants consisted of William M. Lewis (CMP 4); committee chair; Carl J. Fredericks (CMP 10); Tom Adams (CMP 4); John Beck (Chairman CMP 4); Mark Sumrall (CMP 4); Barry Hornberger, (CMP 13); William T. Beutler, P.E.; William Long, NEMA.
Interested persons (nonparticipants): Robert J. Pollock (CMP 4 and TCC); Merton Bunker (NFPA); Mark Earley (NFPA)
PANEL ACTION: Accept in Principle.
Add the following to the proposed text:
(a) 22kV Nominal to Ground or Less. The clearances over buildings and other structures for conductors and live parts up to 22 kV nominal to ground or less shall be not less than the values shown in Table 225-61.
After (b) add the following Fine Print Note:
Fine Print Note: For additional information see National Electrical Safety Code, ANSI C2-1997
Add these metric values to the proposed table:
7.5 ft.-2.3m
12.5ft.-3.8m
13.5 ft.-4.1m
18.5ft.-5.6m

ARTICLE 230 — SERVICES

(Log #516)

4- 46 - (230): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Sections 230-6(1) and (2), replace "2 in. (50.8 mm)" with "50 mm (2 in.)" throughout.
2. In Section 230-9 first paragraph and the Exception, replace "3 ft (914 mm)" with "900 mm (3 ft)" throughout.
3. In Section 230-24, replace "60°F (15°C)" with "15°C (60°F)".
4. In Section 230-24(a), replace "8 ft (2.44 m)" with "2.5 m (8 ft)" and replace "3 ft (914 mm)" with "900 mm (3 ft)".
5. In Section 230-24(a) Exception No. 2, replace "4 in. (102 mm)" with "100 mm (4 in.)"; "12 in. (305 mm)" with "300 mm (12 in.)"; and "3 ft (914 mm)" with "900 mm (3 ft)".
6. In Section 230-24(a) Exception No. 3, replace "18 in. (457 mm)" with "450 mm (18 in.)"; "6 ft (1.83 m)" with "1.8 m (6 ft)"; and "4 ft (1.22 m)" with "1.2 m (4 ft)".
7. In Section 230-24(a) Exception No. 4, replace "3 ft (914 mm)" with "900 mm (3 ft)".
8. In Section 230-24(b), replace "10 ft (3.05 m)" with "3.0 m (10 ft)"; "12 ft (3.66 m)" with "3.7 m (12 ft)"; "15 ft (4.57 m)" with "4.5 m (15 ft)"; "12-ft (3.66-m)" with "3.7 m (12 ft)"; and "18 ft (5.49 m)" with "5.5 m (18 ft)".
9. In Section 230-26, replace "10 ft (3.05 m)" with "3.0 m (10 ft)".
10. In Section 230-43(15), replace "6 ft (1.83 m)" with "1.8 m (6 ft)" throughout.
11. In Section 230-50(b) and its Exception, replace "10 ft (3.05 m)" with "3.0 m (10 ft)" throughout.
12. In Section 230-51(a), replace "12 in. (305 mm)" with "300 mm (12 in.)" and replace "30 in. (762 mm)" with "750 mm (30 in.)".
13. In Section 230-51(b), replace "15 ft (4.57 m)" with "4.5 m (15 ft) and replace "2 in. (50.8 mm)" with "50 mm (2 in.)".
14. In Section 230-54(c) Exception, replace "24 in. (610 mm)" with "600 mm (24 in.)".
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following.
PANEL ACTION: Accept.

4- 46a - (230-2(a)(4)): Accept
NOTE: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. There is presently no definition for "Standby Systems." This action will be considered by the Panel as a Public Comment.
SUBMITTER: CMP 4
RECOMMENDATION: Amend the text in 230-2(a)(4) to read: "(4) Standby systems."
SUBSTANTIATION: The panel's action clarifies that a standby system is permissible. This action eliminates the confusion with Article 702 requirements.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #718)

4- 47 - (230-2(a)(4)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete: ~~(4) Optional standby systems.~~
SUBSTANTIATION: The permission for an additional service to supply optional standby systems seems counter to Section 702-2, which per Section 90-3 modifies the general rules of Chapters 1 through 4. The word "intended" in Section 702-2 and in other Code sections conveys a quasi-mandatory intent.
PANEL ACTION: Reject.

PANEL STATEMENT: The panel's action on Proposal 4-46a clarifies their position on the submitter's concern.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1022)

4- 48 - (230-2(a)(6) (New)): Reject
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 16 for information.
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Add a new section 230-2(a)(6) as follows:
(6) High-power, network-powered broadband communications systems.
SUBSTANTIATION: This is a companion proposal to the proposal for Article 831, High-Power, Network-Powered Broadband Communications Systems, and is necessary to allow high-power, network-powered broadband communications systems as an additional service.
PANEL ACTION: Reject.
PANEL STATEMENT: The referenced Article 831 has not been accepted by CMP 16. CMP 4 refers this to CMP 16 for information.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

(Log #2431)

4- 49 - (230-2(b)(2)): Reject
SUBMITTER: Dennis Kaunzner, City of Sierra-Vista, AZ
RECOMMENDATION: Revise text to read as follows:
"A single building or other structure sufficiently large to make two or more services necessary <u>at two locations of the building without being grouped providing the services can be tripped by a remote means outside the building.</u>"
SUBSTANTIATION: In cases of a mall it should be permissible to have two services because of distances but it should not be allowed to have two locations with 6 disconnects each in a locked room several hundred feet apart for the fire department to shut down in emergencies. Many fires start in the equipment rooms to begin with. Many power companies require a disconnecting means on the outside of the building.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided technical substantiation to require the remote tripping as proposed.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2489)

4- 50 - (230-2(b)(2)): Reject
SUBMITTER: Lynn Adams, Escambia County, FL
RECOMMENDATION: Revise as follows:
230-2(b)(2) A single building or other structure sufficiently large to make two or more services necessary. <u>Each service shall be limited to the adjacent area of the building.</u>
SUBSTANTIATION: If multiple services are installed, a danger exists when circuit extensions are made into other areas of the building. Section 230-2(e) requires that the areas served be identified. This proposal would prevent the intermingling of circuits in the middle area between the two services.
PANEL ACTION: Reject.
PANEL STATEMENT: There are instances where it is necessary to have circuits supplied from multiple services in the same area of a building such as circuits supplied from an emergency service or different voltage characteristics. Acceptance of this proposal could lead to conflicts with other parts of Section 230-2.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2430)

4- 51 - (230-2(c)(1), (2), (3)): Reject
SUBMITTER: Dennis Kaunzner, City of Sierra-Vista, AZ
RECOMMENDATION: At the end of each requirement add:
"<u>When the services are grouped in one location.</u>"
SUBSTANTIATION: Right now there is a conflict between 230-2(b)(2) and the above section. We just had a mall built and there were two services of 3500 amps a piece, the engineer argued that they could have two services in different locations because of the capacity of the service and did not need special permission to put them in different locations. My feelings are that if this were the case they should at least be in the same location.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no conflict between Section 230-2(b)(2) and 230-2(c).
The submitter has not provided any documentation that the current wording has created problems in the field.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2490)

4- 52 - (230-2(d)): Reject
SUBMITTER: Lynn Adams, Escambia County, FL
RECOMMENDATION: Revise as follows:
(d) Different Characteristics. Additional services shall be permitted for different voltages, frequencies, or phases, or for different uses, such as for different rate schedules. <u>The services shall be in sight from one another.</u>
SUBSTANTIATION: This would add to safety by making all sources of power apparent to any servicing or emergency personnel. Using the defined term "in sight from" allows for separate equipment locations, but ensures they can be opened promptly.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 230-2(e) provides the necessary provisions for safety where multiple services are not wiithin sight from each other. No substantiation has been provided to indicate that the current wording has created problems in the field.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1749)

4- 53 - (230-5 (New)): Reject
SUBMITTER: Jamie McNamara, Hastings, MN
RECOMMENDATION: Add new text to read as follows:
230-5. Diagrams of Service. If required by the authority having jurisdiction, a diagram showing service details shall be provided prior to the installation of the service. Such a diagram shall show the area in square feet of the building or other structure supplied by each service, the total connected load before applying demand factors, the demand factors used, the computed load after applying demand factors, and the size and type of conductors to be used. The diagram shall be done so the service is in complice with article 220.
SUBSTANTIATION: The current requirement for a diagram of a feeder is in 215-5 and is limited to feeders only (see scope 215-1). This would expand the requirement to include services, when the authority having jurisdiction thought it was necessary. There are a lot of building that do not have a feeder in them (most smaller buildings). The current text will not allow the authority having jurisdiction to require a diagram of the service (load calculation per article 220). It may be appropriate to put this requirement in article 220-5 so it would not be needed in 215-5 and 230-5 please see other proposal on 220-5 and 215-5.
PANEL ACTION: Reject.
PANEL STATEMENT: Article 220 requires load calculations. It is the prerogative of the authority having jurisdiction to require the proposed diagram showing the load calculations. The proposal is unenforceable as changes to building systems invalidate the initial diagram. The submitter is referenced to Article 80-Administration and Enforcement.

(Log #4101)

4- 56 - (230-6(3)): Accept in Principle
SUBMITTER: Robert E. Molde, Northern States Power Co./Rep. Wisconsin Utilities Assn.
RECOMMENDATION: Revise as follows:
(3) Conductors and equipment ~~Where~~ installed in ~~a transformer~~ fire resistant vault conforming to the requirements of Article 450, Part C.
SUBSTANTIATION: There is a need to clarify the intent of a vault is for fire resistance whether a transformer is present or not. A vault meeting the fire resistance requirements of 450 Part C shall be considered outside the building.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concerns are addressed by the panel's action on Proposal 4-55.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #719)

4- 57 - (230-7): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Other Conductors in Raceway or Cable. ~~Conductors other than service~~ Service conductors shall not be contained ~~installed~~ in ~~the same service~~ a raceway, cable, auxiliary gutter, or cablebus assembly that contains other than service conductors, or service conductors of a different class.
Exceptions No. 1 and 2 No change.
SUBSTANTIATION: Editorial. For consistency other enclosures permitted for service conductors should be included. Code users may install conductors in a raceway but do not install them in a cable. Service cable may be interpreted as covering Type SE but not other cables permitted as service conductors. Literal wording does not prohibit 120/240 volt single phase and 480-volt three-phase sets of service conductors in the same raceway; both sets are service conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is more than editorial in nature. Auxiliary gutters are used to supplement the wiring space of service equipment and the intermixing of conductors is inevitable in that space. The submitter has provided no technical substantiation to apply this requirement to cablebus.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

(Log #2808)

4- 58 - (230-7 Exception No. 3 (New)): Reject
SUBMITTER: Bud Swathwood, Bud Swathwood Consulting
RECOMMENDATION: Add an Exception No. 3 to read:
Exception No. 3: In auxiliary gutters, when used as supplemental wiring spaces for service equipment and the conditions of Sections 374-1 and 374-2 are met. The service conductors when used in this wiring method shall be identified.
SUBSTANTIATION: There are those who feel that the auxiliary gutters are raceways and therefore cannot contain "other" conductors (with SE conductors). Auxiliary gutters was added to Section 300-3 as a wiring method because the panel (admitted) that auxiliary gutters, by definition, are NOT raceways. Manufacturers have available A.Gs as a supplement to their equipment for added ring space. Wireway manufactures market A.Gs. for additional wiring space. There is, in my opinion, no hazard by using this method of wiring. No more than having SE conductors installed in the "gutter" space in load centers, switchboards, etc. with branch circuits and feeders.
PANEL ACTION: Reject.
PANEL STATEMENT: In accordance with the definition of raceways in Article 100, auxiliary gutters are not raceways and the exception is not necessary.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #CP413)

4- 58a - (230-8): Accept
SUBMITTER: CMP 4
RECOMMENDATION: In Section 230-8 amend the reference to Section 300-5 by adding (g). The correct reference is 300-5(g).
SUBSTANTIATION: This change is made to comply with the NFPA NEC Style Manual.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1188)

4- 59 - (230-8): Reject
SUBMITTER: Earl Dean, Town of Manchester, CT
RECOMMENDATION: Deleted text:
230-8. Raceway Seal. Where a service raceway enters a building or structure from an underground distribution system, it shall be sealed. (delete: in accordance with Section 300-5.) Spare or unused raceways shall also be sealed. Sealants shall be identified for use with the cable insulation, shield, or other components.
SUBSTANTIATION: The way it is currently written requires the reader to search out Section 300-5. It is a long section of which only a single sentence applies: "(g) Raceway Seals. Conduits or raceways through which moisture may contact energized live parts shall be sealed or plugged at either or both ends."
If the intent is to require the sealing of all UG service raceways, then it would be easier and plainer to simply state so in Article 230.
If the intent is to require the sealing of only those UG service raceways that may cause a moisture problem, then add the verbiage in Article 230.

As it stands now, I, as a building official, cannot require the sealing of service raceways until there is evidence of a moisture problem; akin to closing the barn door after the cows have run off.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel disagrees that it is necessary to seal all service raceways. The reference to 300-5 provides the necessary guidance where it is required to seal service raceways. See panel action on Proposal 4-58a

(Log #CP415)

4- 59a - (230-9): Accept
NOTE: The Technical Correlating Committee understands that the metric values are those accepted in Proposal 4-46.
SUBMITTER: CMP 4
RECOMMENDATION: In Section 230-9 revise as follows:
"230-9. Clearance from Building Openings. Service conductors and final spans shall comply with (A), (B) and (C).
(A) Clearance From Windows. Service conductors installed as open conductors or multiconductor cable without an overall outer jacket shall have a clearance of not less than 3 ft (914 mm) from windows that are designed to be opened, doors, porches, balconies, ladders, stairs, fire escapes, or similar locations.
Exception: Conductors run above the top level of a window shall be permitted to be less than the 3 ft (914 mm) requirement above.
(B) Vertical Clearance. The vertical clearance of final spans above, or within 3 ft (914 mm) measured horizontally of, platforms, projections, or surfaces from which they might be reached shall be maintained in accordance with Section 230-24(b).
(C) Building Openings. Overhead service conductors shall not be installed beneath openings through which materials may be moved, such as openings in farm and commercial buildings, and shall not be installed where they will obstruct entrance to these building openings."
SUBSTANTIATION: The panel action complies with the NFPA NEC Style Manual.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2913)

4- 60 - (230-9): Reject
SUBMITTER: Donald A. Ganiere, Ottawa, IL
RECOMMENDATION: Delete text as follows:
Service conductors installed as open conductors or multiconductor cable without an overall outer jacket shall have a clearance of not less than 3 ft (914 mm) from windows ~~that are designed to be opened~~, doors, porches, balconies, ladders, stairs, fire escapes, or similar locations. Vertical clearance of final spans above, or within 3 ft (914 mm) measured horizontally of, platforms, projections, or surfaces from which they might be reached shall be maintained in accordance with Section 230-24(b).
SUBSTANTIATION: Windows are used for fire department access whether they are designed to open or not. Fire departments need clear access to windows for victim rescue, building ventilation, and application of fire streams. Conductors are permitted to be installed in locations that unduly interfere with fire department operations by the existing code wording. Keeping conductors at least 3 ft away from all windows will increase fire fighter safety and will make the placement of ladders for emergency rescue and fire fighting faster.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms its position that this section does not apply to fixed glass assemblies. There has been no technical substantiation provided to conclusively support that the placement of the final spans within three feet of windows, which are designed not to be opened, is unsafe.

(Log #4102)

4- 61 - (230-9): Reject
SUBMITTER: Robert E. Molde, Northern States Power Co./Rep. Wisconsin Utilities Assn.
RECOMMENDATION: Revise as follows:
230-9. Clearance from Building Openings. <u>The service head or similar fitting shall be located such that the</u> ~~S~~service conductors installed as open conductors...
Move this newly worded requirement to Article 230-54(h).
SUBSTANTIATION: The location of the attachment point at the building is a crucial factor in determining whether the service conductors have the required clearance. Emphasis is needed to alert the installer of the service head or similar fixture of the importance of their action in achieving the required clearance.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing text adequately covers the submitter's concerns. The panel's primary concern is that this proposal would limit the applicability of this section to service conductors that are not installed by the utility. The current language in Sections 230-9 and 230-54 does provide the appropriate clearance requirements for service conductors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3927)

4- 62 - (230-10): Reject
SUBMITTER: Charles J. Palmieri, Palmieri Assoc.
RECOMMENDATION: Add new text:
230-10 Diagrams of Service Entrance Conductors.
If required by the authority having jurisdiction, a diagram showing feeder details shall be provided prior to the installation of the service entrance conductors. Such a diagram shall show the area in square feet of the building or other structure supplied by each feeder, the total connected load before applying demand factors,the demand factors used, the computed load after applying demand factors, and the size and type of conductors to be used.
SUBSTANTIATION: I'm not certain where within this section such a proposed requirement should be placed but I find it curious that an inspector may request feeder diagrams in Section 215-5, and there is no similar requirement in Article 230 for Service Entrance Conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: Article 220 requires load calculations. It is the prerogative of the authority having jurisdiction to require the proposed diagram showing the load calculations. The proposal is unenforceable as changes to building systems invalidate the initial diagram. The submitter is referenced to Article 80 Administration and Enforcement.

4- 63a - (230-22): Accept
SUBMITTER: CMP 4
RECOMMENDATION: Revise Section 230-22 to read. Individual conductors shall be insulated or covered.
Existing exception is to remain.
SUBSTANTIATION: This action clarifies that it is permissible to use covered conductors. The use of covered conductors is appropriate, particularly in installations over 600 volts.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #720)

4- 64 - (230-22): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Insulation ~~or Covering.~~ Individual conductors shall be insulated ~~or covered~~ with an extruded thermoplastic or thermosetting insulating material.
Exception: No change.
SUBSTANTIATION: Article 100 definition of covered conductor indicates the covering is not insulation. This section indicates an insulating material is required for "covered" conductors. The sentence basically states "conductors shall be insulated or covered with insulation" which is inane.
I recollect a commonly used individual covered conductor widely used by utilities for service-drops, commonly called "weatherproof" wire, but seldom if ever used today. Individual "covered" conductors are noticeable by their absence from code tables and do not appear to be a listed type conductor.
(see my proposal for Article 100 Conductor - Covered)
PANEL ACTION: Reject.
PANEL STATEMENT: There are installations, particularly over 600 volts, where the use of covered conductors is appropriate.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11COMMENT ON AFFIRMATIVE:
SUMRALL: Not more than 3 months ago, we installed a covered conductor. We used the existing NEC to justify and propose the use of this conductor, and guess what, there was nothing inane about the installation.

(Log #1185)

4- 65 - (230-23(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add new text:
"Where continuous load(s) or motor load(s) is supplied, the minimum conductor ampacity shall be in accordance with the provisions of Section 230-42."
SUBSTANTIATION: The provisions of Section 230-42 should be applicable to service-drop conductors which carry the same load as service-entrance conductors. The reference in Section 230-42 to adjustment factor can be applicable where service-drop conductors consist of multiconductor cable with or without an outer covering and there are more than three current-carrying conductors. (See my proposal for Section 230-42).
PANEL ACTION: Reject.
PANEL STATEMENT: The provisions of Articles 220 and 430 adequately cover the computation of motor loads.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3401)

4- 68 - (230-23(d) (New)): Reject
SUBMITTER: Donald W. Zipse, West Chester, PA
RECOMMENDATION: It is suggested that a new paragraph be added after 230-23(c) or the panel should accept the concept and generate their own words.
230-23(d) Direct Utility Connection, Customer Option. The aerial service conductors can consist of one, two or three insulated phase conductors, and an insulated identified conductor (neutral), and a messenger that also serves as a grounding conductor to be used as an equipment grounding conductor, which originates at the service transformer.
Underground service conductors can consist of one, two or three insulated phase conductors, and an insulated identified conductor (neutral), and a grounding conductor to be used as an equipment grounding conductor, which originates at the service transformer.
SUBSTANTIATION: Please note that this is an option for the informed customer to make, not a requirement. Granted there is no probation against doing this, except the concept is foreign to the authority having jurisdiction and it is very doubtful if the authority having jurisdiction would approve such an installation. Therefore, this allowance must be placed in the NEC to permit protection against stray, uncontrolled primary neutral current flow over metallic piping such as water, gas, etc. and the earth.
There are laws such as Ohm's Law and Kirchoff's Laws. Now there is Zipse's Law - Zipse's Law:
"In order to have and maintain a safe electrical installation:
All continuously, flowing current shall be contained within an insulated conductor or if a bare conductor, the conductor shall be installed on insulators, insulated from earth, except at one place within the system and only one place can the neutral be connected to earth.

A system is defined as the conductors between transformers or after the last transformer."

Approximately 25 years ago, what is now Code Making Panel 19 made mandatory the connection of trailers using 4 or 5 wire systems. The panel recognized the hazards associated with multiple connection of the neutral conductor, identified conductor to earth/ground. Two (2) or three (3) phase conductors, and insulated neutral conductor and a bare ground conductor were required.

One or two Code cycles later another Code Making Panel made mandatory the connection of Marinas using 4 or 5 wire systems thus eliminating the hazardous condition of stray, uncontrolled flow of current over metallic conducting paths and water.

It was not until the 1996 edition of the NEC that Code Making Panel No. 5, saw clear to make ranges and dryers wiring mandatory using 4 or 5 wire systems with an insulated and isolated neutral/identified conductor and a separate equipment ground/earth conductor.

It makes sense then that the high voltage electrical systems under the control of the NEC and Code Marking Panel No. 5 would follow the same logic, that the neutral/identified conductor would be insulated and connected to earth at only one place in order to eliminate hazardous flow of uncontrolled stray current. (Proposals have been submitted to CMP #5). It has been reported that persons in showers and swimming pools and dairy cows have received electric shocks from this stray uncontrolled flow of neutral return current flowing uncontrolled over the earth, metallic piping and other conductive surfaces.

Are the members of the Code Making Panel aware that the primary neutral return current from the primary side of the transformers used for services is directly connected to the secondary side neutral at the utility's transformer?

This allows primary neutral current to flow over the interior metallic water piping, uncontrolled, not within an insulated conductor. Does any member of this panel condone the flow of uncontrolled primary neutral current over interior metallic piping, over the earth flowing uncontrolled, shocking persons in swimming pools, showers, and dairy cows? After the panel members recognize this hazard I am sure they will agree and seek a solution.

If and when the public is informed of the dangers associated with multiple neutral to ground/earth connections that result in hazardous uncontrolled flow of stray current over the earth, interior water and gas piping systems and other conducting paths that result in electric shocks to the inhabitants, law suits will probably follow.

The object of this proposal is to prevent the uncontrolled flow of continuous current over the earth by allowing the service neutral to be insulated and to require a separate ground conductor to originate at the service transformer. This is the same requirement that now exists for marinas and mobile homes, ranges and dryers. Why should the building be exempt?

Yes, today the utilities do not supply an insulated, separate neutral, (yet). Someone has to be first and why not the NFPA's NEC? This is the case of the chicken and the egg, which came first?

The grounding conductor would be connected again to earth at the service entrance and any other places that would be desirable.

The basic substantiation is Ohm's Law and Kirchoff's Laws. Kirchoff states, "The algebraic sum of the currents toward any point in a network is zero." Thus with the identified conductor (neutral) connected to earth at more than one place, at the service to each and every house served from the transformer and at the transformer, uncontrolled current can and will flow over the earth. No matter what the resistance is to the earth and the resistance of the messenger serving also as the neutral and the ground, a proportion of the return current will flow uncontrolled over the earth. (Ohm's Law).

Two technical papers are available on the web. They explain in detail the problem with multiple connection to earth of the neutral conductor. One is subtitled, "The Shocking Showers" and the other is subtitled, "The Shocking Swimming Pool". They can be found at:

www.mikeholt.com/Newsletters/8-16-99.doc and at www.mikeholt.com/Newsletters/8-17-99.doc.

All continuous current flow however, must be contained within insulated conductors. The rejection of this proposal could indicate this panel condones and approves of the uncontrolled flow of current over the earth, which I am sure you do not.

By approving this proposal, you are opening the way to improve the use of electrical energy safely by making the first step to preventing uncontrolled flow of continuous current over the earth.

PANEL ACTION: Reject.

PANEL STATEMENT: The AHJ and the building owner have no control over the grounding of the service drop supplied by the utility or the methods and materials used. Regardless, if the neutral is insulated the effect that the submitter desires is negated by the bonding jumper required at the service equipment.

4- 69 - (230-24(a) Exception No. 5 (New)): Reject

SUBMITTER: Charles K. Eldridge, Indianapolis, IN

RECOMMENDATION: Add a new Exception No. 5 to read:

230-24. Clearances. The vertical clearances of all service-drop conductors shall be based on conductor temperature of 60°F (15°C), no wind, with final unloaded sag in the wire, conductor, or cable.

Service-drop conductors shall not be readily accessible and shall comply with (a) through (d) for services not over 600 volts, nominal.

(a) Above Roofs. Conductors shall have a vertical clearance of not less than 8 ft (2.44 m) above the roof surface. The vertical clearance above the roof level shall be maintained for a distance of not less than 3 ft (914 mm) in all directions from the edge of the roof.

Exception No. 5: Where the voltage between conductors does not exceed 600, the roof has a slope of 4 in. (102 mm) in 12 in. (305 mm), or greater, and the service drop is Messenger Supported Wiring as defined in Article 321, a reduction in clearance above only the overhanging portion of the roof to not less than 36 in. (915 mm) shall be permitted if (1) not more than 6 ft (1.83 m) of service-drop conductors, 4 ft (1.22 m) horizontally, pass above the roof overhang, and (2) they are terminated at a through-the-roof raceway or approved support.

SUBSTANTIATION: This change would permit the now wide spread practice (the National Electrical Safety Code®, Rule 234C3d(1) Exception No. 1, permits this installation now) of allowing a 480 volt service drop to hit a through the roof raceway with proper clearance. In addition to the general restrictions given in Exception No. 3, I have increased safety by adding the general restrictions in Exception No. 2.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not adequately defined whether the proposed text is applicable to open conductors or cables. Reducing the clearance for this level of voltage is considered to be a reduction in the present level of safety. The panel does not concur that this is permitted by the NESC.

(Log #122)

3- 3 - (230-25, 305): Accept in Principle
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 4 for information.
NOTE: The following proposal consists of Comment 4-49 on Proposal 4-77 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 4-77 was:
Add the following new section under Article 230:
230-25. Vegetation. Vegetation such as trees shall not be used for support of overhead service drop conductors.
Exception: For temporary wiring in accordance with Article 305.
SUBMITTER: Melvin K. Sanders, TECo., Inc.
RECOMMENDATION: CMP 3 Task Group accepts the Panel Action to Accept in Part Proposal 4-77 such that the rule will be: "Section 230-25. Vegetation. Vegetation such as trees shall not be used for support of overhead service drop conductors." and to exclude the proposed Exception.
SUBSTANTIATION: It is the position of CMP 03 Task Group Raymond W. Weber, Richard P. Owen and Melvin K. Sanders, Secretary, on ROP 4-77 that it is within the purview of CMP 04 to determine the support requirements for wiring methods in Article 230.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Section 305-4 requires compliance with the provisions of Article 230 for services used for a temporary installation. Panel 4 has jurisdiction over the support requirements for service conductors and should make the determination on whether or not to relax support requirements for a temporary service. CMP 3's position is that vegetation shall not be used as a support means.

(Log #721)

4- 71 - (230-28): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add:
Service masts shall be installed in a manner that will permit the minimum clearances specified in Section 230-24 for service-drop conductors.
SUBSTANTIATION: The proposed requirement is inferred where service-drops are covered by the code. Many exempt utility-owned and installed service do not conform to Section 230-24. There is no requirement to provide mast installation which allows conformance with Section 230-24 in such cases. Since the majority of service drops are exempted from Section 230-24 by Section 90-2, the proposal would enhance the likelihood of conformance with Section 230-24.
PANEL ACTION: Reject.
PANEL STATEMENT: In order to meet the clearance requirements of this section, installers must coordinate the installation of the mast with the serving utility. Additional language is not necessary to assure compliance.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4067)

4- 72 - (230-28): Reject
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./Rep. Edison Electric Inst./Electric Light & Power Group
RECOMMENDATION: Add a sentence at the end of 230-28:
230-28. Service Masts as Supports. Where a service mast is used for the support of service-drop conductors, it shall be of adequate strength or be supported by braces or guys to withstand safely the strain imposed by the service drop. Where raceway-type service masts are used, all raceway fittings shall be identified for use with service masts. Only power service-drop conductors shall be permitted to be attached to a service mast. Only one service drop shall be attached to a raceway-type service mast.
SUBSTANTIATION: This change ensures that proper loading is applied to raceway-type masts.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided technical substantiation to limit the number of service drops permitted to be attached to a single mast.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1670)

4- 73 - (230-28, Exception): Reject
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 16 for information.
SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions
RECOMMENDATION: Add the following exception at the end of Section 230-28:
Exception: Communications and community antenna television (CATV) service drops shall be permitted to be attached to a service mast that is listed for the purpose of accepting multiple attachments.
SUBSTANTIATION: The present general prohibition regarding the attachment of communications and CATV service drops to the power service mast is excessive. Where the service mast is designed and listed for the attachment of multiple service drops, a single mast for all attachments should be permitted. Listing will ensure that the mast itself, as well as the installation hardware and methods, are adequate to withstand the total combined load. Also, listing will provide a verification method to the authority having jurisdiction. It is unnecessarily costly to the building owner and aesthetically unslightly when two service masts must be provided, one for power and another for communications and CATV services.
This proposal attempts to find a reasonable and safe alternative to the main rule by permitting communications and CATV attachments to power service masts that are listed for such application. Listing will help ensure the safety of attached power and communications conductors on a single mast, as well as address the personnel safety concerns raised by CMP 4 in previous Code cycles. It should be noted that the communications and CATV craft personnel are trained to work in close proximity to power conductors. Section 800-10(a)(4) permits a minimum separation of 12 inches between power-service drops and communications drops at their point of attachment to the building, provided that the nongrounded power conductors are insulated and that a clearance of 40 inches between the two services is maintained at the pole.

Section 820-10(f)(1) permits separations of as little as 4 inches where cables of the two systems are attached to buildings.

This proposal seeks relief from the present prohibition on communications and CATV attachments to a power service mast in a way that is both safe and cost effective.

Note that companion proposals for a new Section 800-10(c) and a revised Section 820-10(c) have been submitted. These companion proposals would permit communications and CATV service drop attachments to a power service mast in accordance with the proposed Section 230-28, Exception.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel does not believe that the listing of the product will adequately address the personnel safety issues that are created by the co-mingling of the different systems on a common mast. Issues such as loading can be addressed by the proposed listing, however personnel safety can not be assured regardless of the listing criteria.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

YOUNG: Personnel safety is important, but the code does not impose any limitations or restrictions on the installation of different systems today. A listed mast could well be safer by identifying where and how the systems are attached.

COMMENT ON AFFIRMATIVE:

HUGHES: I strongly support the panel action to reject this proposal. While the suggested listing requirement might address loading requirements, attachment methods, etc., it would still ignore the safety concerns of many installers and service electricians. Documented proof is available that multiple attachments have caused injury to service electricians. This possibility will not be eliminated with listing. Also contrary to the submitter's belief, not all CATV personnel have adequate training to work around live conductors.

The submitter also raises the question of unnecessary cost to the building owner. While cost should not be a controlling factor but rather safety, the installing electrician would have to bear increased cost as well as any increased liability.

SUMRALL: The continuing battle, of telecommunication companies, to attach another service drop to the electrical mast, is only driven by the profits that will be realized by these entities. As stated in the Panel Statement, listing will do absolutely nothing for the safety concerns that are raised each and every time this proposal or one like it is brought before the CMP, the Technical Correlating Committee, or the NFPA floor. These companies seek only greater profit margins and claim aesthetics as one of the substantiation concerns. During the last cycle, an appeals board met to discuss the merits of a similar proposal and agreed with the CMP, 90-1 is the driving force for the NEC. The NEC should not be concerned with minimal costs, but rather the practical safeguarding of persons and property.

(Log #3152)

4- 74 - (230-30): Reject

SUBMITTER: Andrew J. Mayville, Escanaba, MI

RECOMMENDATION: Add the following new section and renumber the present sections of Part C. Make title of section Underground Supply. Article reads as follows:

Underground service conductors from a building or other structure (such as a pole) on which a meter is installed shall be considered service lateral conductors and installed accordingly.

SUBSTANTIATION: It is common to run conductors underground from a metering point, such as on a farm, underground to out buildings. In this case the underground conductors should be considered to be service lateral conductors just like overhead conductors under similar circumstances are to be considered service drop conductors.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not provided technical substantiation to treat these conductors as service lateral conductors. The panel intends that the requirements of Part D apply to the conductors on the load side of terminal box, meter or other enclosure.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #1184)

4- 75 - (230-31(a)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Add text to read:

"The ampacity of service-lateral conductors before the application of any adjustment or correction factors shall not be less than the sum of the noncontinuous load(s), plus 125 percent of the continuous load(s) or the ampacity specified for motor supply conductors in Part B of Article 430 and Part D of Article 440, whichever is greater.

Exception: The correction factors for temperatures below 26°C (78°F) shall be permitted in determining the initial conductor ampacity."

SUBSTANTIATION: Loads as computed in Article 220 do not specify any load increase, per se, for continuous load or motor load. Requirements for those type loads specify an increase in conductor ampacity, which is not the same as load. Those requirements are in Articles 210, 215, 230, and 430 which cover branch circuits, feeders, and service-entrance conductors, and "conductors" (not specific) for motors, which could apply but is easily overlooked as applying to service-laterals. Required ampacity increases should apply to service-laterals as it does to service-entrance conductors in Section 230-42(a)(1)(2).

Application of this section does not correlate with Section 215-2 for continuous load nor Section 430-24, and can lead to disparity of ampacity ratings for conductors supplying the same load.

The proposed exception allows for increased ampacity where underground temperatures are deemed to be less than 26°C.

See my proposals for Sections 210-19(a) and 215-2(a).

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not demonstrated that the existing requirement for sizing service lateral conductors has proven to be inadequate. These conductors generally do not terminate in enclosures that require conductors to be sized at 125 percent.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #CP419)

4- 75a - (230-31(c)): Accept

SUBMITTER: CMP 4

RECOMMENDATION: Remove the fine print note from Section 230-31(c).

SUBSTANTIATION: The fine print note does not enhance the usability of this section.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #3794)

4- 76 - (230-33 (New)): Accept in Principle

SUBMITTER: John I. Williamson, Minnesota Board of Electricity

RECOMMENDATION: Create a new section in Part C (Underground Service Lateral Conductors) similar to Section 230-46 for Service-Entrance Conductors as follows:

230.33. Spliced Conductors. Service-lateral conductors shall be permitted to be spliced or tapped by clamped or bolted connections. Splices shall be made in enclosures or, if directly buried, with a listed underground splice kit. Splices of conductors shall be made in accordance with Sections 110.14, 300.5(e), 300.13, and 300.15.

SUBSTANTIATION: There is no prohibition in the code from splicing service-lateral conductors, consequently it is assumed that it is permissible to do so. The usability of the code would be improved if the code included a section that specifically permitted service-lateral conductors to be spliced.

PANEL ACTION: Accept in Principle.

Revise as follows:

"230.33. Spliced Conductors. Service-lateral conductors shall be permitted to be spliced or tapped ~~by clamped or bolted connections. Splices shall be made in enclosures or, if directly buried, with a listed underground splice kit. Splices of conductors shall be made~~ in accordance with Sections 110.14, 300.5(e), 300.13, and 300.15."

PANEL STATEMENT: The panel's action adequately addresses the submitter's concern. See panel action on Proposal 4-96.

4- 77 - (230-40): Accept in Principle
SUBMITTER: Junior L. Owings, Rep. Oregon Chapter Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text as follows:
230-40. Number of Service-Entrance Conductor Sets. Each service drop or lateral shall supply only one set of service-entrance conductors.
Exception No. 1: Buildings with one or more than one occupancy shall be permitted to have one set of service-entrance conductors for each ~~class~~ different characteristic of service run to each occupancy or group of occupancies.
Exception No. 2: Where two to six service disconnecting means in separate enclosures are grouped at one location and supply separate loads from one service drop or lateral, one set of service-entrance conductors shall be permitted to supply each or several such service equipment enclosures.
Exception No. 3: A single-family dwelling unit and a separate structure shall be permitted to have one set of service-entrance conductors run to each from a single service drop or lateral.
Exception No. 4: A two-family dwelling or a multifamily dwelling shall be permitted to have one set of service-entrance conductors installed to supply the circuits covered in Section 210-25.
Exception No. 5: One set of service-entrance conductors connected to the supply side of the normal service disconnecting means shall be permitted to supply each or several systems covered by Section 230-82(4).
SUBSTANTIATION: The present Code language does not specify what "class" means, however, 230-2(d) does specify "different characteristics."
PANEL ACTION: Accept in Principle.
Revise Exception No. 1 to read:
"Exception No. 1: A building with one or more than one occupancy shall be permitted to have one set of service-entrance conductors for each ~~class service of different characteristics, as defined in Section 230-2(d), run to each occupancy or group of occupancies.~~"
PANEL STATEMENT: The change to the proposed language enhances the clarity of the exception. This change also incorporates the language of Proposal 4-80.

(Log #2250)

4- 78 - (230 Part D): Reject
SUBMITTER: Michael G. Zeuger, LDA Co.
RECOMMENDATION: I feel a section should be added to service entrance conductors. All services entrance conductors shall be derated 80 percent with no exceptions.
SUBSTANTIATION: Due to a growing amount of nonlinear loads in commercial and institutional buildings.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no techncial substantiation to apply this requirement to all service entrance conductors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1042)

4- 79 - (230-40 Exception No. 1): Reject
SUBMITTER: William Barnett, City of Gresham, OR
RECOMMENDATION: Delete Exception No. 1.
SUBSTANTIATION: Exception No. 1 is in direct conflict with Part F of Article 230. While 230-40 specifically addresses service-entrance conductors, Exception No. 1 in fact allows an unlimited number of service disconnects and unfused conductors throughout a building with more than one occupancy. A 40-unit apartment building or a 3-story building with a different retail tenant on each floor is a single occupancy building by Uniform Building Code definition. "Buildings with one or more than one occupancy" is a vague and undefined term that covers all existing and future buildings, with or without area or occupancy separations. Section 230-40 Exception No. 1 is subject to broad interpretation and nullifies Sections 230-2, 230-70(a), 230-71(a), and 230-72(a). The National Electrical Code does not define "occupancy", "mixed-occupancy", or "multi-occupancy". The NEC repeatedly refers to NFPA 101-1997 and this standard uses the UBC definition of "occupancy". Code Making Panel No. 1 has refused to accept the UBC definition of "occupancy". While it is necessary to have alternate methods to achieve compliance with the intent of the codes, Exception No. 1 lessens uniformity, compliance and is potentially hazardous for firefighters and building occupants.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation is incorrect. Section 230-40 Exception 1 does not conflict with Part F. Exception No. 1 permits multiple sets of service entrance conductors to be supplied by a single service and Section 230-71(a) specifically addresses the location of the disconnecting means. The multiple sets of service entrance conductors are required to comply with the requirements of Section 230-70(a) and it is not permitted to run conductors without overcurrent protection through the interior of the building. The use of this exception has practical application for buildings with more than one occupancy and the submitter has not provided documentation to indicate that this language has resulted in decreased safety of the installation.

SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise as follows:
Exception No. 1: ~~Buildings~~ A building with one or more than one...
(Remainder Unchanged).
SUBSTANTIATION: Buildings (plural) literally indicates more than one structure. The proposal would include one structure with one or more occupancy, or a separate structure(s) with one or more occupancy which may be on the same property. Proposal is editorial.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4171)

4- 81 - (230-40 Exception No. 1): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
"By special permission, where there is no available space for service equipment accessible to all the occupants, buildings with more than one occupancy shall be permitted to have one set of service entrance conductors for each class of service run to each occupancy or group of occupancies."
SUBSTANTIATION: The continuing rejection of any limits on the existing exception is unbelievable. On the literal text of the present NEC, it is permitted to group six of seven service disconnects for a seven family dwelling at one point. Then, one can run a set of service conductors around the outside of the building to a remote location and spot the seventh disconnect. In fact, the service conductors need not run outside the building; they could be run in a wall as long as there was two inches of concrete encasement.
Section 230-2 does not apply, since there is only one service. Therefore, it is not even necessary to provide a directory at either disconnect location to inform the fire service of the remote, still energized disconnect. If this does not justify an outright prohibition, surely it justifies a requirement for special permission. This rule has been in the Massachusetts Code for over ten years now, and it is working well. In truly extenuating circumstances, special permission is granted, usually upon the condition of reciprocal labeling.

The 1999 change, expanding this allowance to each class of service, makes this proposal even more critical. Under the 1996 NEC a ten-family apartment house might have 60 service disconnects. If there are two classes of service, now there could be 120 disconnects.

Prior panel statements about (effectively) Section 90-4 are, frankly, irresponsible. Good inspectors loathe code rules that effectively force them in to inventing the Code through that process. Only the bad inspectors welcome this chance to show how powerful they are. In all the electrical seminars I have been part of across the nation, I have never found any support for they way this rule can be applied, and with the new change it's worse than ever. The inspector needs a forthright statement that clearly shows that special discretion is expected in these cases.

PANEL ACTION: Reject.

PANEL STATEMENT: The use of this exception has practical application for buildings with more than one occupancy and the submitter has not provided documentation to indicate that this language has resulted in decreased safety of the installation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

COMMENT ON AFFIRMATIVE:

SUMRALL: Since the State of Massachusetts elected to utilized 90-4 for the adoption of this exception into their Electrical Code, it would appear not all inspectors need a "forthright statement" to grant special permission for this type of installation. This most learned seminar instructor, I hope, is not rejecting the idea of the Authority Having Jurisdiction does not already have the tools to use discretion in these cases, because they do have that ability. This is the only proposal for this section, so therefore the problem might not be as widespread as the submitter thinks.

(Log #722)

4- 82 - (230-40 Exception No. 5): Accept

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

Exception No. 5: One set of service-entrance conductors connected to the supply side of the normal service disconnecting means shall be permitted to supply each or several systems covered by Section 230-82 (4) or (5).

SUBSTANTIATION: Editorial. Section 230-82(5) covers systems permitted to be connected to the supply side of the normal service disconnecting means by conductors which may be considered service conductors.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #723)

4- 83 - (230-41, Exception (New)): Accept in Principle in Part

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Add a new paragraph (e) to the exception to read as follows:

(e) Bare copper used in an auxiliary gutter or in a cablebus assembly.

SUBSTANTIATION: Editorial. These are permitted wiring methods in Section 230-40, but since they are not considered raceways bare grounded conductors are not permitted, for no other apparent good reason.

PANEL ACTION: Accept in Principle in Part.

Amend the proposed text to read:

"(e) Bare conductors used in an auxiliary gutter".

Do not accept the proposed language to permit bare grounded conductors in cablebus.

PANEL STATEMENT: The panel disagrees that this proposal constitutes an editorial change only. The panel is capable of judging whether a proposed change is editorial. Section 365-3(a) requires that all current carrying conductors in cablebus be insulated. Section 374-7 permits the use of bare conductors in an auxiliary gutter and does not restrict this permission to copper conductors only. Conductors in auxiliary gutters may be wire or busbar.

(Log #17)

4- 84 - (230-42(a)): Reject

NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 2 and 11 for information.

NOTE: The following proposal consists of Comment 4-64 on Proposal 4-96 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 4-96 was:

Revise as follows:

230-42. Size and Rating.

(a) General. Service-entrance conductors shall be of sufficient size to carry the loads as computed in Article 220.

(1) Ampacity. Ampacity shall be determined from Section 310-15.

Exception: The maximum allowable current of approved busways shall be that value for which the busway has been listed or labeled.

(2) Continuous and Noncontinuous Loads. Where service entrance conductors supply continuous loads or any combination of continuous and noncontinuous loads, the minimum service entrance conductor size, without the application of any adjustment or correction factors, shall have an allowable ampacity equal to or greater than the noncontinuous load plus 125 percent of the continuous load.

Exception: Where the assembly, including any overcurrent devices, is listed for operation at 100 percent of their rating, neither the ampere rating of the overcurrent device nor the ampacity of the branch circuit conductors shall be less than the sum of the continuous load plus the noncontinuous load.

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Accept in principle, revise Panel Action as follows:

(a) General. ~~The ampacity of the service entrance conductors, before the application of any adjustment or correction factors shall not be less than items 1 or 2 below. Loads are to be determined in accordance with Article 220. Ampacity shall be determined from Section 310-15. 1) The sum of the noncontinuous load, if the service entrance conductors terminate in an overcurrent device that is listed for operation at 100 percent of its rating.~~ Service-entrance conductors shall have an ampacity not less than the maximum load to be served. Where service-entrance conductors supply continuous load or any combination of continuous, noncontinuous load, and motor load, the minimum service-entrance conductor size, before the application of any adjustment or correction factors, shall have an allowable ampacity equal to or greater than the noncontinuous load plus 125 percent of the continuous load, plus the ampacity specified in Section 430-24 for motor loads.

Exception No. 1: Where the assembly, including the overcurrent protective device(s) for the service-entrance conductors are listed for 100 percent of their rating, the ampere rating of the overcurrent protective device(s) shall not be less than the sum of the continuous load plus the noncontinuous load, plus the motor load, and the ampacity of the service-entrance conductors shall not be less than the continuous load plus the noncontinuous load, plus the ampacity specified in Section 430-24 for motor loads.

SUBSTANTIATION: Although a fully loaded motor operating for 3 hours or more meets the definition of continuous load, this does not appear to be the intent of the Code. The revision would be more comprehensive for Code users (user friendly) and correlate with a similar requirement of Section 430-24. Although a fully loaded motor operating for 3 hours or more meets the definition of continuous load, this does not appear to be the intent of the Code and is not addressed in this section. The proposed revision would be more comprehensive for Code users and "user friendly". Panel revision item (a)(2) is incorrect as pointed out by Mr. Young and has left out inclusion of "assembly" which is generally necessary for a 100 percent continuous load rating. Busway current rating is covered in Article 364.

PANEL ACTION: Reject.

PANEL STATEMENT: The requirements of Articles 220, 430 and 440 adequately cover the requirements for calculating the loads described in the proposal. Panel 4 does not have jurisdiction over the rules for computing loads. See panel action on Proposal 4-87.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #4116)

4- 85 - (230-42(a)): Reject
SUBMITTER: Truman C. Surbrook, Michigan State University
RECOMMENDATION: Revise the first sentence of the section as follows with the deletions and additions as indicated:
"The ~~ampacity of the~~ service-entrance conductors ~~before the application of any adjustment or correction factors~~ shall have an allowable ampacity not ~~be~~ less than as determined in either (1) or (2)."
SUBSTANTIATION: The phrase "before the application of any adjustment or correction factors" is particularly confusing to electricians making conductor ampacity selection when adjustment factors are being used. Some apply the adjustment factors to the allowable ampacity found in the appropriate table and then compare it with 100 percent of both continuous load and noncontinuous load, others compare the adjusted allowable ampacity to the sum of 100 percent of the noncontinuous load and 125 percent of the continuous load. By removing the confusing statement, it makes the section clear that the adjusted allowable ampacity of the conductor is not permitted to be less than the sum of 100 percent of the noncontinuous load plus 125 percent of the continuous load.
PANEL ACTION: Reject.
PANEL STATEMENT: The current language contained in 230-42(a) provides the correct sizing requirements. The ampacity of the conductors is determined by calculating the continuous and noncontinuous loads before the application of any adjustment or correction factors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4118)

4- 86 - (230-42(a)): Reject
SUBMITTER: Truman C. Surbrook, Michigan State University
RECOMMENDATION: In the first line add the word allowable before ampacity. The section will then read "The allowable ampacity of the service-entrance conductors..."
SUBSTANTIATION: The addition of the word allowable should make it clear that the ampacity of the service entrance conductors is the value determined in the appropriate allowable ampacity table with any appropriate adjustment factors applied.
PANEL ACTION: Reject.
PANEL STATEMENT: Addition of this language does not add clarity to this section. In fact it may cause confusion that only the tables of Article 310-15(b) are permitted to be used.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1186)

4- 87 - (230-42(a)(1), (2)): Reject
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 2 and 11 for information.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise text to read:
(1) The sum of the noncontinuous load(s), plus 125 percent of the continuous load(s) or the ampacity specified for motor supply conductors in Part B of Article 430 or Part D of Article 440, whichever is greater.
(2) The sum of the noncontinuous load(s) ~~plus~~ and the continuous load(s), plus the ampacity specified for motor supply conductors in Part B of Article 430 and Part D of Article 440, if the service-entrance conductors terminate ~~in an overcurrent device~~ at an assembly with or without an integral overcurrent device(s) where ~~both the overcurrent device and its~~ the assembly ~~are~~ is listed for continuous operation at 100 percent of ~~their~~ its rating.
Exception: Boxes or other enclosures which contain only spliced or tapped conductors in accordance with Section 230-46 shall not be required to be listed for continuous operation.
SUBSTANTIATION: The panel statement for Comment 1-174 in the 1998 ROC indicated motor loads continuing for 3 hours or more are not excluded from the definition of continuous load. This may be literally correct but not in harmony with Article 430 and 440 and common practice which only applies the 25 percent ampacity increase (125 percent factor) to the largest motor (regardless of operating time). If motors operating for 3 hours or more are deemed continuous load, this section (1) requires each motor supply conductor to be computed at 125 percent ampacity. If the motor(s) operate for less than 3 hours no factor is required by this section, which conflicts with Article 430 which requires the general 25 percent ampacity increase regardless of operating time. The 25 percent factor for motor supply conductors as I understand it, is not for a phantom load but provides for temporary motor overload and the general maximum rating for motor overload devices. The proposed revision for (1) would allow the continuous load factor to apply to the motor conductor ampacity factor or vice-versa, whichever is larger.
The proposal for (2) is revised to permit deletion of the 125 percent factor for continuous loads where conductors are terminated at an assembly without integral overcurrent devices, such as a nonfusible switch listed for continuous operation at 100 percent of rating. Present wording disallows a 100 percent ampacity rating of supply side conductors for such a switch or a meter socket. (Literally conductors don't terminate in an overcurrent device.) Again, the required ampacity for motor supply conductors in Article 430 is a given, and should be provided for the largest supplied motor, whether operated for less than 3 hours or more than 3 hours. [See my proposal for Section 215-2(a)].
PANEL ACTION: Reject.
PANEL STATEMENT: The requirements of Articles 220, 430 and 440 adequately cover the requirements for calculating the loads described in the proposal. Panel 4 does not have jurisdiction over the rules for computing loads.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3142)

4- 88 - (230-42(a)(2)): Reject
SUBMITTER: Nathan Kay, Frankenmuth, MI
RECOMMENDATION: Delete the entire Paragraph (2).
SUBSTANTIATION: Conductors are now required to be sized at 125 percent of the continuous load. Why does it matter if the overcurrent device is rated to operate at only 100 percent of the continuous load? In addition, this section deals with wire sizing, not overcurrent device ratings.
PANEL ACTION: Reject.
PANEL STATEMENT: The sizing of the conductors and the limitations on the overcurrent device are indeed interrelated. The existing language is necessary to properly match the conductor size to the service equipment terminations (loads and termination temperature ratings shall be considered).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4117)

4- 89 - (230-42(a)(2)): Reject
SUBMITTER: Truman C. Surbrook, Michigan State University
RECOMMENDATION: Revise paragraph (2) as follows:
"The sum of the noncontinuous load plus the continuous load and not less than the rating of the overcurrent device if the service-entrance conductors terminate in an overcurrent device where both the overcurrent device and its assembly are listed for operation at 100 percent of their rating."
SUBSTANTIATION: The rule for sizing conductors when the overcurrent device is listed for 100 percent operation and one that is not such listed can lead to widely different conductors sized for the same identical load. At least in the case where the overcurrent device is listed for 100 percent operation, the minimum allowable ampacity of the conductor should not be permitted to be less than the rating of the overcurrent device. The following example illustrates the point.
Example: If a set of service entrance conductors supplies a continuous load of 130 amperes and the overcurrent device and enclosure are listed for operation at 100 percent of its rating then the overcurrent device is permitted to be rated at 150 amperes. In this case the conductor is permitted to be sized based upon an allowable ampacity not less than 100 percent of the continuous load. If copper conductors are used with 75°C insulation and terminations, the maximum conductor size required would be AWG #1 which is listed in Table 310-16 as 130 amperes. If the overcurrent

device had not been listed for 100 percent operation, the minimum overcurrent device rating for this load would have been 175 amperes and the minimum conductor size would have been AWG #2/0. This seems to be a wide difference in minimum conductor size for the same identical load simply because one overcurrent device is rated for 100 percent operation and the other is not.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided any technical substantiation to justify requiring the conductor to have ampacity not less than the rating of the overcurrent device. This is permitted by Section 230-90(a) Exception No. 2.

RECOMMENDATION: Add:
Application of Note 3 to Article 310 Ampacity Tables of 0 to 2000 volts shall be permitted.
SUBSTANTIATION: Editorial. To provide correlation with Note 3 where conductor ampacity and service/feeder ratings may differ. This is done in Section 230-90(a).
PANEL ACTION: Reject.
PANEL STATEMENT: This added reference is not necessary since the general requirements of Section 230-42(a) refer to Section 310-15.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4172)

4- 91 - (230-42(b)): Accept in Principle in Part
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise by replacing the entire subsection as follows:
(b) Ungrounded Conductors. The ampacity of the ungrounded conductors shall be not less than the load to be carried, determined in accordance with Article 220. In no case shall the ampacity or the conductor sizes be lower than as specified in (1), (2), (3), or (4).
(1) One-Circuit Installation. For installations that supply only limited loads of a single branch circuit, the conductor(s) shall be not smaller than No. 12 copper or No. 10 aluminum or copper-clad aluminum. The service conductors shall not be smaller than the branch-circuit conductors.
(2) Limited-Circuit Installations. For installations consisting of not more than two 2-wire branch circuits, or by special permission for other installations limited by demand or by the source of supply, the conductors shall be not smaller than No. 8 copper or No. 6 aluminum or copper-clad aluminum.
(3) One-Family Dwelling. For a one-family dwelling, the conductors shall have an ampacity of not less than 100 amperes, 3-wire.
(4) All Others. For all other installations, the conductors shall have an ampacity of not less than 60 amperes.
SUBSTANTIATION: This proposal restores the conditions and allowances that were in the 1996 NEC, edited as positive text instead of using exceptions. The 1999 panel action changing this requirement to a cross reference to the disconnecting means thresholds in Section 230-79 introduced major changes without a shred of technical substantiation, and caused major confusion as well. For example, the minimum size on a single circuit was always No. 12. However, Sec. 230-79(a) sets the minimum disconnecting means for such circuits at 15A, which now allows a No. 14 for the first time. Similarly, the two-circuit installation used to be No. 8 minimum; now the rule goes over to the 30A disconnect size, which allows for a No. 10 instead. The former exception allowing a No. 8 for general use on limited demand situations by special permission was deleted outright.
The major area of confusion concerns the present phrase "the minimum rating of the disconnecting means." Suppose you have a calculated load of 237A. You still install 237A minimum conductors, subject to allowances elsewhere in the Code for continuous loads, etc. The fact that the switch might be 400A with 250A fuses, because those are standard sizes, doesn't mean you have to cable to the 400A switch size. Nevertheless, I have found in doing seminars across the country that many people think they do have to cable to the switch size.
This proposal puts everything in the 1996 provisions, except as modified for the 100A house rule, back on the table. CMP 4 should retain this format. If it chooses to remove any element, then it should provide the technical justification for doing so.
PANEL ACTION: Accept in Principle in Part.
The panel has modified Section 230-42(b) to read:
"230-42(b) Specific Installations. In addition to the requirements of 230-42(a), the minimum ampacity for ungrounded conductors for specific installations shall not be less than the rating of the service disconnecting means specified in 230-79(a) through (d)."
The remainder of the proposal is rejected.
PANEL STATEMENT: The panel has modified 230-42(b) to address the submitter's concern over clarity.
The panel reaffirms that the use of conductor ampacities based on 310-15 is not a reduction in the safety of the installation. The overcurrent protection required by Section 230-90 adequately protects the conductor. This action eliminated the confusion between Sections 230-42(b) and 230-79 in the 1996 NEC.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #372)

4- 93 - (230-43(6), (15), (16)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete:
~~(6) Electrical nonmetallic tubing.~~
Add to (15): and limited to a single length.
Add to (16): where limited to a single length not over 6 ft (1.83m) long.
SUBSTANTIATION: Section 331-3(1)(a) indicates ENT is permitted for exposed work in a building where not subject to physical damage. The FPN for this section indicates extreme (not defined) cold may cause susceptibility to damage. Section 331-4(7) indicates ENT is not permitted in exposed wet locations except indoors as specified in Section 331-3(7). This suggests that ENT may not be suitable as a service raceway on the outside of a building in a cold climate.
The substantiation for Proposal 4-99 in the 1986 TCR which reintroduced flexible conduit indicated it was to provide for short lengths necessary to facilitate difficult raceway routing around obstructions and reduce the need for conduit bodies. Present wording does not indicate this purpose and does not limit the number of separate 6 ft or less sections which may be interposed in the service raceway. Such latitude obviates the normal use of nonflexible raceway bends and conduit bodies even where there are no obstructions, which did not seem to be the intent of the proposal.
Present (16) provides no limit on the length of LTFNMC if supported in accordance with Section 351-23(a). If the prime reason for flexible raceway is as stated in the substantiation for Proposal 4-99, it should also apply to LTFNMC.
PANEL ACTION: Reject.

PANEL STATEMENT: Although not appropriate for use in outdoor cold climates, there is no need to completely eliminate the use of ENT installed in accordance with Article 331, as a service wiring method. Additionally there is no technical substantiation to limit items (15) and (16) to a single six foot length.

(Log #405)

4- 94 - (230-46): Accept in Principle
SUBMITTER: Amos D. Lowrance, Jr., City of Chattanooga, TN
RECOMMENDATION: Revise 230-46 to read as follows:
Spliced Conductors. Service-entrance conductors shall be permitted to be spliced or tapped by crimped, exothermic clamped or bolted connections. Splices shall be made in enclosures or, if directly buried, with a listed underground splice kit. Splices or conductors shall be made in accordance with Sections 110-14, 300-5(e), 300-13 and 300-15.
SUBSTANTIATION: Presently, the code only permits clamped or bolted connections disregarding the traditional means of exothermic and crimped connections which practice has taught to be a superior method of taping or splicing.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concerns are addressed by the panel's action on Proposal 4-96.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1482)

4- 95 - (230-46): Accept in Principle
SUBMITTER: Larry T. Smith, Nat'l Electrical Seminars
RECOMMENDATION: Revise to read as follows:
Service-entrance conductors shall be permitted to be spliced <u>with irreversible compression connectors or</u> tapped by clamped or bolted connections. Splices shall be made in enclosures or, if directly buried, with a listed underground splice kit. Splices of conductors shall be made in accordance with Sections 110-14, 300-5(e), 300-13, and 300-15.
SUBSTANTIATION: History ignored will repeat itself, and split-bolt connections have a history of failure.
We need to listen to the people who are actually doing the work. Ask an assembly of one hundred electricians this question: "How many of you have seen a split-bolt splice go bad?" Usually ninety hands will go up. I have asked this question in seminar after seminar and gotten the same result; ninety to ninety-five percent of those in attendance will attest to having had to repair a bad split-bolt splice.
Clamped or bolted connectors, if properly installed, are a good product. It's with the proper installation that we have difficulty. Service conductor splices must have the reliability of irreversible compression connectors.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concerns are addressed by the panel's action on Proposal 4-96.

COMMENT ON AFFIRMATIVE:
SUMRALL: The submitter in his substantiation asked an assembly of electricians if they have "seen a split-bolt splice go bad," however he did not address if a follow-up question, such as "How many have been properly trained to install a split bolt splice?" In recent history, I have seen two failures of split bolt connections, The Root Cause Failure Analyses in both cases were the result of untrained or poorly trained personnel doing the installation.

(Log #2814)

4- 96 - (230-46): Accept in Principle
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 1 and 3 for information.
SUBMITTER: John E. Staires, Tulsa Code Seminars/Rep. Oklahoma Chapter IAEI
RECOMMENDATION: Remove the wording:
"~~splices shall be made in enclosures or, if directly buried, with a listed underground splice kit.~~"
Insert the wording:
"<u>splices shall be made in enclosures or, if directly buried, shall be permitted to be spliced with a listed underground splice kit.</u>"
SUBSTANTIATION: The above referenced sentence contains literal wording which would require directly buried service entrance conductors to be spliced with a listed underground splice kit. The requirement for the splicing of directly buried service entrance conductors are in the next sentence of Section 230-46 by reference to Sections 110-14, 300-5(e), 300-13 and 300-15. As presently written, Section 230-46 would literally preclude the splicing of directly buried conductors in an enclosure such as a junction box.
PANEL ACTION: Accept in Principle.
Modify Section 230-46 to read:
"Service-entrance conductors shall be permitted to be spliced or tapped ~~by clamped or bolted connections. Splices shall be made in enclosures or, if directly buried, with a listed underground splice kit. Splices of conductors shall be made~~ in accordance with Sections 110-14, 300-5(e), 300-13, and 300-15."
PANEL STATEMENT: The panel's action addresses the submitter's concern and adds clarity to this section.

(Log #4012)

4- 97 - (230-50(a)(3)): Accept
SUBMITTER: Christopher Pharo, Rep. IBEW
RECOMMENDATION: This proposal is to revise (3) to read as follows:
Section 230-50(a)(3) Schedule 80 rigid nonmetallic conduit.
SUBSTANTIATION: There is always confusion when it comes to the installation of nonmetallic conduit. Most people do not realize that every day, typical, nonmetallic conduit is not approved for areas subject to physical damage. The only way one can know this is to carry the UL white book around. By removing the phrase "suitable for the location" and placing "Schedule 80" before the text "rigid nonmetallic conduit", this code section would effectively eliminate any chance of a misapplication of the product.
This type of specific reference to the use of Schedule 80 is made in Section 300-5(d) and Section 336-6(b). These articles specifically refer to Schedule 80 rigid nonmetallic conduit as an alternate wiring method in areas subject to physical damage. This was also done so as to prevent the misuse of Schedule 40 rigid nonmetallic conduit.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #725)

4- 98 - (230-51): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Mounting Supports. Cables or individual open service-<u>entrance</u>

conductors shall be supported as specified in (a) or (b) ~~or (c).~~

(a) Service Cables. Type SE Service-entrance cables and Type MC and Type MI cables used as service-entrance conductors shall be supported by straps or other approved means within 12 in. (305 mm) of every service head, gooseneck, or connection to a raceway or enclosure and at intervals not exceeding 30 in. (762 mm).

(b) Delete.

~~(c)~~ (b) Individual Open Conductors. Individual open service-entrance conductors shall be installed in accordance with ~~Table 230-51(c)~~ applicable provisions of Article 320. Where exposed to the weather, the conductors shall be mounted on insulators or on insulating supports attached to racks, brackets, or other approved means. Where not exposed to the weather, the conductors shall be supported on glass or porcelain knobs. The minimum separation between conductors and the surface wired over shall not be less than 2 in. (50.8 mm).

Delete Table 230-51(c).

SUBSTANTIATION: Since this section is in Part D Service-Entrance Conductors and not all service cables are service-entrance cable, per Article 338, the proper designation should be applied to the specific conductors used.

Panel 7 in response to Comment 7-48 of the 1998 ROC stated that Section 250-51(a) does not apply to support requirements for Type MI cable. Panel 4 in their response to Proposal 4-94 in the 1995 ROP stated they intended this section to apply to all cables used as service-entrance conductors. With different panel opinions consistent interpretation is difficult, and clarification is warranted. Section 334-10(e) indicates this section applies to Type MC cable.

Other (than Type SE) cables indicated by Section 230-43 as suitable for service-entrance conductors are Type MC and MI. Articles 330 and 334 do not have specific restrictions against contact with buildings. What other cables does the present (b) apply to?

Section 300-2 specifies Chapter 3 wiring methods to be used. Article 320 covers open wiring on insulators, which is permitted by Section 230-43(1); the FPN for Section 320-13 refers to this article. Since Article 320 has more comprehensive requirements, limits installation to industrial and agricultural occupancies, and not over 600 volts, has more detailed and limited support requirements, and general protection requirements, the differences between Article 320 and this section indicates this section covers a wiring method that is difficult to identify. While this method of service-entrance conductor installation may be outmoded and seldom used, the reference to Article 320 would provide clarification.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter is incorrect that service cables means only Type SE cable. Section 230-43 permits other cable types. Section 320-2 refers to and defers to Article 225 and other Code sections. Therefore the requirements of Table 230-51(c) are applicable where open conductors are installed as service conductors.

(Log #726)

4- 101 - (230-54(g)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

(g) Arranged that Water will not Enter Service Raceway or Equipment. Service-drop conductors and service-entrance conductors shall be arranged ~~so that~~ to minimize the likelihood of water ~~will not enter~~ entry into service raceways, service cables, or equipment.

SUBSTANTIATION: Present wording is an absolute type of requirement. Cables permitted by Section 230-43 should be included. It is difficult to prevent water entry into flexible metal conduit and Type MC cable.

PANEL ACTION: Reject.

PANEL STATEMENT: The existing wording of this section adequately covers the submitter's concern and provides appropriate requirements for installation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #727)

4- 102 - (230-56): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

Service Conductor with the Higher Voltage to Ground. On a 4-wire delta-connected service where the midpoint of one phase is grounded, the service conductor with the highest voltage to ground shall be distinguished from the other phase conductors by a continuous outer finish that is orange in color along its entire length, ~~durably and permanently marked by an outer finish that is orange in color or by other effective means~~ except that a conductor that is larger than No. 6 shall be permitted to be identified at the time of installation by a durable and permanent distinctive orange marking that shall encircle the conductor insulation. Such identification shall be provided at each termination ~~or~~ and junction point except a conduit body that does not contain splices or unused hubs.

(FPN): Junction point includes auxiliary gutters that supplement wiring spaces at service disconnecting means.

Table 230-51(c). Supports and Clearances for Individual Open Service Conductors

Maximum Volts	Maximum Distance Between Supports		Minimum Clearances			
			Between Conductors		From Surface	
	(m)	(ft)	(mm)	(in.)	(mm)	(in.)
600	2.7	9	150	6	50	2
600	4.5	15	300	12	50	2
300	1.4	4 1/2	75	3	50	2
600*	1.4*	4 1/2*	65*	2 1/2*	25*	1*

~~Note: For SI units: 1 in. = 25.4 mm; 1 ft = 0.3048 m~~

*Where not exposed to weather

SUBSTANTIATION: The proposal word "distinguished" would specifically prevent orange insulation on other phase conductors, which seems to be the intent. Present wording permits No. 6 or smaller conductor identification only at termination and junction points. Insulated grounded and grounding conductors No. 6 and smaller must have continuous color identification.

A basic requirement to provide marking that encircles the insulated (grounded) conductor was established by Proposal 5-20 in the 1998 ROP the substantiation for which is applicable to this section. Section 200-6 does not provided for "other effective means" (whatever that means to different persons). The requirement for this section should be no less specific.

Service conductors run through a conduit body without splices or hubs do not appear to warrant this identification since the need to know the higher voltage at this junction point seems minimal.

The fine print note would clarify that an auxiliary gutter containing service conductors looped between service disconnects is a junction point.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed wording does not provide additional safety. The existing wording provides the necessary requirements.

(Log #1983)

4- 104 - (230-62(c) (New)): Reject

SUBMITTER: John M. O'Connor, North American Technologies, Inc.

RECOMMENDATION: Add new Section 230-62(c) to read as follows:

(c) Meter Sockets. Meter sockets shall be effectively closed by a closure which is integral to the meter socket enclosure when a meter is not installed in the socket.

SUBSTANTIATION: The enclosure of a meter socket is UL listed only when a meter is installed in a socket. The service which is energized without a meter being installed does not meet Section 111-27 Guarding of Live Parts. In many instances meters are bypassed, often by noncode approved means, in order to provide temporary power on construction jobsites. The protection of these live parts may or may not exist, depending on the installer and when or if a meter is installed.

These hazardous situations are occurring at new homes, offices, construction sites and at temporary classrooms (which are usually located on school playgrounds) while they are waiting to have meters installed. Utility deregulation may also cause increased incidence of these situations.

The addition of an integral closure to a meter socket would protect workers, children and others from a potentially dangerous situation, one that is preventable. Listed metering assemblies with integral socket closures are already commercially available.

Note: This is a companion proposal to my proposal on Section 373-4(b).

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter's concerns are adequately covered by the requirements of Section 110-27 and 230-62. The panel also disagrees that the meter socket is only listed where the meter is in place. Underwriters Laboratories Standard 414 lists the sockets without the meter installed.

4- 106 - (230-64 (New)): Reject

NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 14 for comment.

SUBMITTER: David A. Kerr, Jr., Friendsville, PA

RECOMMENDATION: Add a new Section 230-64 to read as follows:

Separation from Gas Meters and Tanks. Electric meters and equipment, in general, are sources of ignition and shall be located three ft from gas meters, five ft from portable LP gas tanks and ten ft from hose-filled LP gas tanks. See Section 501-3 and NFPA 54, 2.7.2(c), sources of ignition, and NFPA 58, 3-2.2.2 Table d.

SUBSTANTIATION: These important separation requirements need to be spelled out in Article 230 because service equipment and meters are most likely to have a location conflict with gas equipment.

PANEL ACTION: Reject.

PANEL STATEMENT: The determination of whether a specific location is hazardous (classified) is outside the scope of CMP 4. This proposal has provided no technical substantiation that there is a safety issue. CMP 4 refers this action to CMP 14 for information.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

COMMENT ON AFFIRMATIVE:

BECK: The proponent makes some broad assumptions and draws conclusion the Panel did not agree with. Electric meters and metering equipment are not sources of ignition. It is not correct to arbitrarily consider all electrical equipment, devices, or apparatus to be automatically considered sources of ignition. In addition to the

equipment itself and its operation, the equipment, device or apparatus must be considered within the context of the environment and conditions in which it is installed or placed to be considered as a source of ignition. National Electrical Code (NEC) Section 501-3 provides "guidance" for the determination of when a Class I Division 1 or Division 2 location may exist and provides reference to and applicability of NEC Section 500-7. Applying NEC Section 501-3 may require the installation of explosion proof, purged and pressurized enclosures, which would be an extreme and technically unsubstantiated requirement for residential installations especially those located in outdoor locations. Under NEC Section 500-7(a) you must have a gas or vapor concentration that, under normal operating conditions, can be ignitable. Most outdoor locations even when gas and electric meters are in close proximity or adjacent to one another do not necessarily meet that criteria. For example natural gas has a specific gravity of about 0.65 and an UFL of 14 percent and LFL of 4 percent. The actual determination of Class and Division for any location must be made by a knowledgeable person or representative of the Authority Having Jurisdiction, and no attempt should be made for a blanket application of a particular classification for all locations. The real issue here is application of NEC working space requirements. The NEC, as currently written, provides the reasonable guidance and requirements for use by such knowledgeable persons for classifying locations and provided for the proper working clearances as required by the NEC. The determination for application of the requirements of any other NFPA document may or may not, in fact, be appropriate and should be made by the appropriate knowledgeable person based on the site specific installation situation and conditions.

(Log #2564)

4- 107 - (230-70 and Part F): Accept in Principle in Part
SUBMITTER: Richard E. Loyd, Perryville, AR
RECOMMENDATION: Revise as follows:

F. Service Equipment — Disconnecting Means.

230-70. General. A means shall be provided to disconnect all conductors in a building or other structure from the service-entrance conductors. The service overcurrent device and ground fault protection where required shall be an integral part of the service disconnecting means or shall be located immediately adjacent thereto.

(a) Location. The service disconnect(s)~~ing means.~~ Overcurrent device, and ground-fault protection where required shall be installed at a readily accessible location either in sight outside of a building or structure, or inside nearest the point of entrance of the service conductors.

(1) Service disconnecting means shall not be installed in bathrooms.

(2) A switch or button located in accordance with (a) used to operate a shunt trip main disconnecting means located elsewhere shall not be permitted as the disconnecting means.

(b) Manually or Power Operable. The service disconnecting means for ungrounded service conductors shall consist of either

(1) a manually operable switch or circuit breaker equipped with a handle or other suitable operating means or

(2) a power-operated switch or circuit breaker provided the switch or circuit breaker can be opened by hand in the event of a power supply failure.

(c) Suitable for Use. Each service disconnecting means shall be suitable for the prevailing conditions. Service equipment installed in hazardous (classified) locations shall comply with the requirements of Articles 500 through 517.

(d) Simultaneous Opening of Poles. Each service disconnect shall simultaneously disconnect all ungrounded service conductors that it controls from the premises wiring system.

(e) Indicating. The service disconnecting means shall plainly indicate whether it is in the open or closed position.

~~(b)~~ (f) Marking. Each service disconnect shall be permanently marked to identify it as a service disconnect.

230-71. Maximum Number of Disconnects.

(a) General. The service disconnecting means for each service permitted by Section 230-2, or for each set of service-entrance conductors permitted by Section 230-40, Exception Nos 1 or 3, shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be no more than six disconnects per service grouped in any one location. For the purpose of this section, disconnecting means used solely for power monitoring equipment or the control circuit of the ground-fault protection system, installed as part of the listed equipment, shall not be considered a service disconnecting means.

(b) Single-Pole Units. Two or three single-pole switches or breakers, capable of individual operation, shall be permitted on multiwire circuits, one pole for each ungrounded conductor, as one multipole disconnect, provided they are equipped with handle ties or a master handle to disconnect all conductors of the service with no more than six operations of the hand.

FPN: See Section 384-16(a) for service equipment in panelboards, and see Section 430-95 for service equipment in motor control centers.

230-72. Grouping of Disconnects.

(a) General. The two to six disconnects as permitted in Section 230-71 shall be grouped. Each disconnect shall be marked to indicate the load served.

Exception: One of the two to six service disconnecting means permitted in Section 230-71, where used only for a water pump also intended to provide fire protection, shall be permitted to be located remote from the other disconnecting means.

(b) Additional Service Disconnecting Means. The one or more additional service disconnecting means for fire pumps, for legally required standby, or for optional standby services permitted by Section 230-2 shall be installed sufficiently remote from the one to six service disconnecting means for normal service to minimize the possibility of simultaneous interruption of supply.

(c) Access to Occupants. In a multiple-occupancy building, each occupant shall have access to the occupant's service disconnecting means.

Exception: In a multiple-occupancy building where electric service and electrical maintenance are provided by the building management and where these are under the continuous building management supervision, the service disconnecting means supplying more than one occupancy shall be permitted to be accessible to authorized management personnel only.

~~230-74. Simultaneous Opening of Poles. Each service disconnect shall simultaneously disconnect all ungrounded service conductors that it controls from the premises wiring system.~~

230-75. Disconnection of Grounded Conductor. Where the service disconnecting means does not disconnect the grounded conductor from the premises wiring, other means shall be provided for this purpose in the service equipment. A terminal or bus to which all grounded conductors can be attached by means of pressure connectors shall be permitted for this purpose.

In a multisection switchboard, disconnects for the grounded conductor shall be permitted to be in any section of the switchboard, provided any such switchboard section is marked.

~~230-76. Manually or Power Operable. The service disconnecting means for ungrounded service conductors shall consist of either (1) a manually operable switch or circuit breaker equipped with a handle or other suitable operating means or (2) a power operated switch or circuit breaker provided the switch or circuit breaker can be opened by hand in the event of a power supply failure.~~

~~230-77. Indicating. The service disconnecting means shall plainly indicate whether it is in the open or closed position.~~

230-79. Rating of Service Disconnecting Means. The service disconnecting means shall have a rating not less than the load to be carried, determined in accordance with Article 220. In no case shall the rating be lower than specified in (a), (b), (c), or (d).

(a) One-Circuit Installation. For installations to supply only limited loads of a single branch circuit, the service disconnecting means shall have a rating of not less than 15 amperes.

(b) Two-Circuit Installations. For installations consisting of not more than two 2-wire branch circuits, the service disconnecting means shall have a rating of not less than 30 amperes.

(c) One-Family Dwelling. For a one-family dwelling, the service disconnecting means shall have a rating of not less than 100 amperes, 3-wire.

(d) All Others. For all other installations, the service disconnecting means shall have a rating of not less than 60 amperes.

230-80. Combined Rating of Disconnects. Where the service disconnecting means consists of more than one switch or circuit breaker, as permitted by Section 230-71, the combined ratings of all the switches or circuit breakers used shall not be less than the rating required by Section 230-79.

230-81. Connection to Terminals. The service conductors shall be connected to the service disconnecting means by pressure connectors, clamps, or other approved means. Connections that depend on solder shall not be used.

230-82. Equipment Connected to the Supply Side of Service Disconnect. Only the following equipment shall be permitted to be connected to the supply side of the service disconnecting means:

1. Cable limiters or other current-limiting devices.
2. Meters nominally rated not in excess of 600 volts, provided all metal housings and service enclosures are grounded in accordance with Article 250.

3. Instrument transformers (current and voltage), high impedance shunts, surge-protective devices identified for use on the supply side of the service disconnect, load management devices, and surge arresters.
4. Taps used only to supply load management devices, circuits for stand-by power systems, fire pump equipment, and fire and sprinkler alarms, if provided with service equipment and installed in accordance with requirements for service-entrance conductors.
5. Solar photovoltaic systems or interconnected electric power production sources (See Articles 690 or 705 as applicable.)
6. Control circuits for power-operable service disconnecting means, if suitable overcurrent protection and disconnecting means are provided.
7. Ground-fault protection systems where installed as part of listed equipment, if suitable overcurrent protection and disconnecting means are provided.

SUBSTANTIATION: Some plans examiners inspectors and engineers are interpreting Section 230-76(2) as permitting a shunt trip button (switch) to be located in accordance with Section 230-70(a). This is permitting a very dangerous situation as it allows service entrance conductors inside the building without overcurrent protection. Recently I was involved with a case which resulted in a laborer being killed in Little Rock, Arkansas. The engineer had specified a shunt-trip switch to be located outside at the point of entrance. The service disconnect was located approximately 170 feet inside the building fed with overhead 3000 amp busduct. The laborer while repairing a sheetrock fireblock drilled into the busduct. His last words were "the electrician said there was nothing hot he could touch". The arcing continued until the substation approximately 1/4 mile away tripped out. The plans examiner and inspector had approved the installation based on Section 230-76(2).

I did a survey at several IAEI section meetings and found other inspectors are interpreting the NEC to permit this method of installation. I feel rearrangement of Article 230 Part F will stop this misinterpretation of Article 230.

PANEL ACTION: Accept in Principle in Part.

The panel accepts in principle the concept of outside disconnecting means being within sight of the building or structure served and the issue of not permitting remote control actuators as the service disconnecting means.

The panel rejects the remainder of the proposal.

PANEL STATEMENT: The panel accepts in principle the concept of outside disconnecting means being within sight of the building or structure served and the issue of not permitting remote control actuators as the service disconnecting means. The panel's action on Proposal 4-107a has addressed these issues.

The panel rejects the remainder of the proposal as there is insufficient substantiation to warrant the proposed changes.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #CP422)

4- 107a - (230-70(a)): Accept

SUBMITTER: CMP 4

RECOMMENDATION: Revise existing Section 230-70(a) to read:

"230-70. General. Means shall be provided to disconnect all conductors in a building or other structure from the service-entrance conductors.

(A) Location. The service disconnecting means shall be installed in accordance with (1), (2), and (3):

(1) Readily Accessible Location. The service disconnecting means shall be installed at a readily accessible location in accordance with (a) or (b).

(a) Outside. Service disconnecting means installed outside a building or structure shall comply with (1) or (2):

(1) The service disconnecting means shall be permitted on or within sight of the building or structure served.

(2) Where the service disconnecting means is not within sight of the building or structure served, a feeder disconnecting means for the building or structure supplied shall be installed in accordance with Part B of Article 225.

(b) Inside. Where the service disconnecting means is installed inside, it shall be nearest the point of entrance of the service conductors.

(2) Bathrooms. Service disconnecting means shall not be installed in bathrooms.

(3) Remote Control. Where a remote control device(s) is used to actuate the service disconnecting means, the service disconnecting means shall be located in accordance with (1) above."

The current sections (b) and (c) remain.

SUBSTANTIATION: The panel has addressed specific issues that have been raised relative to the location of service and building disconnecting means. Additionally, the panel's action on remote control actuators clarifies that they are not recognized as the required service disconnecting means.

PANEL ACTION: Accept.

(Log #1778)

4- 108 - (230-70(a)): Accept in Principle

SUBMITTER: Terry L. Carlson, Nebraska State Electrical Board

RECOMMENDATION: Revise as follows:

(a) Location. The service disconnecting means shall be located at a readily accessible location either inside or outside of a building or structure nearest the point of entrance of the service conductors. Service disconnecting means shall not be installed in bathrooms.

SUBSTANTIATION: The intent of Section 230-70(a) and Section 225-32 are identical in that both provide the required location of a building or structure disconnecting means. The intent is based on electrical safety, and that safety depends on the ability of the building occupant to have ready access to the building disconnect in the event of an emergency.

However, even though the intent of each Section is the same, safety for the occupant, the language in both conflict with each other. Section 225-32 requires that the disconnect in a second building be located either inside or outside of the building nearest the point of entrance of the service conductors. Therefore, regardless of whether the disconnect is located inside or outside, according to Section 225-32 it still must be located nearest the point of entrance of the service conductors.

But, Section 230-70(a) allows the building disconnect for a single building or structure to be located either inside nearest the point of entrance of the service conductors or outside of, and off of, the building at any location the designer or installer chooses, as long as it is readily accessible. A disconnect located 500 feet from the building in an open field may be considered 'readily accessible' by some designers, however it is not in the best interest of electrical safety or the building occupant. This is not consistent with the safety requirements of Section 225-32.

Whether a disconnecting means is for multiple buildings as covered in Section 225-32 or for a single building fed with a service as covered in 230-70(a), the location requirement for each should be the same. This can be accomplished by this proposal. It will both streamline the NEC for consistent building disconnect requirements and also enhance electrical safety for building occupants.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The submitter's concern relative to the location of the disconnecting means has been clarified by the panel's action on Proposal 4-107a.

(Log #2893)

4- 110 - (230-70(a)): Reject
SUBMITTER: James Maldonado, City of Tempe, AZ/Rep. Central Arizona Chapter IAEI
RECOMMENDATION: Revise Section 230-70(a) to read as follows:
(a) Location. The service disconnecting means shall be installed at a readily accessible location either outside of a building or structure, or inside nearest the point of entrance of the service conductors. The service disconnecting means shall be installed adjacent to and accessible from the same working area as the utility meter.
SUBSTANTIATION: This requirement was added at the request of our fire departments, in order to have a disconenct available for emergencies, either on the outside of a building or within a dedicated room with one hour separation, as requried in Proposal #11. At the present time fire departments have to pull the meter under load or wait for the utility to arrive to disconect, if the disconnect is within the area of the fire.
PANEL ACTION: Reject.
PANEL STATEMENT: The location of the service disconnecting means is not relevent to the location of the meter. There are metering arrangements that would make this location impractical.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2894)

4- 111 - (230-70(a)): Reject
SUBMITTER: James Maldonado, City of Tempe, AZ/Rep. Central Arizona Chapter IAEI
RECOMMENDATION: Revise 230-70(a) to read as follows:
(a) Location. The service disconnecting means shall be installed at a readily accessible location either outside of a building or structure, or inside nearest the point of entrance of the service conductors.
All service disconnecting means located inside a building shall be enclosed within a room or space separated from the rest of the building by not less than a one-hour fire resistive occupancy separation.
SUBSTANTIATION: This code proposal was adopted by the Maricopa Association of Governments for the last 3 code cycles. There have been many cases when service entrance sections have been installed within a building. Because of high AIC availability in many cases, faults within this equipment have created costly fires. Faults have been created while servicing or working on SES equipment. These faults have in some cases burned for over 30 minutes until the utility was able to disconnect. We require that a one hour fire separation be installed that separates the service entrance section from any other spaces within a building. This separation enclosure is to be constructed in accordance with the applicable building code in effect within the jurisdiction. This type of installation has limited many fires to small areas in fires documented by the City of Phoenix.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no technical substantiation provided to require a one hour fire-rated room or enclosure in a residential structure.

(Log #3240)

4- 112 - (230-70(a)): Reject
SUBMITTER: Edward J. Fox, Jr., Orange County Bldg Div., FL
RECOMMENDATION: 230-70(a): The service disconnecting means for residential services shall be installed on the outside of the building.
SUBSTANTIATION: If the electrical service is on the interior of a building, then firemen and emergency people would not be able to shut power off safely in the case of emergency.
The above article provides a higher degree of safety and flexibility for the consumers.
To safely remove power in case of emergency reason's, such as fire, tree down or storm damage items. This could be accomplishing quickly and easily because a person would not have to go into a building to find the service disconnect switch. This would help save lives and property due to fire when the fireman has to shut power off.
Power could be locked off or disconnected quickly and easily if needed in case of emergency.
It would allow power to be shut off quickly and easily in time of an emergency, such as fire and would allow fireman access to fight fires and thusly save more structures.
In times of emergency, such as during lightning storms, which frequent Florida, fires spring up very easily, less damage will be done to structures if power can be shut off quickly when firemen arrive to fight fires.
PANEL ACTION: Reject.
PANEL STATEMENT: The historical precedence of locating the service disconnecting means inside a building or structure has not resulted in a reduction of safety. There are locations where locating the equipment inside is necessary.

(Log #4090)

4- 113 - (230-70(a)): Reject
SUBMITTER: Leonard F. Devine, Jr., W. Palm Beach County Bldg & Zoning, FL
RECOMMENDATION: Add new text to read as follows:
(a) Location. The service disconnecting means shall be installed at a readily accessible location either outside of a building or structure or inside nearest the point of entrance of the service conductors. If the service disconnecting means is located at a point that is not accessible and available for servicing, and disconnecting in case of emergencies, there shall be a shunt trip switch installed on the exterior of the building or structure. The shunt trip switch, when installed should be between six (6) feet and six feet seven inches (6 ft 7 in.) above finish grade. A sign constructed of a permanent material with no less than 1-1/2 in. high letters designating "Shunt Trip — Main Disconnect" shall be located on the exterior of the building or structure, and approximately one foot (1) above and one foot (1) to one side of the shunt trip mechanism.
SUBSTANTIATION: This new text is needed to provide firefighters with a means to turn off the power to a building or structure much quicker and safer in some cases.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no technical substantiation provided to require a remote actuator for the service disconnecting means.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4173)

4- 114 - (230-70(a)): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc. /Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise the first paragraph as follows:
"The service disconnecting means shall be installed at a readily accessible location either outside and attached to or immediately adjacent to the building or structure served, or inside nearest the point of entrance of the service conductors."
SUBSTANTIATION: A service disconnect in a metering pedestal would not be located at a building or structure, and therefore the multiple buildings or structures provisions in Section 225-8 wouldn't apply. The service disconnect could indeed be remote from the building. The consistent position of CMP 4, however, has always been that the metering pedestal is a structure.
This doesn't agree with the BOCA definition of "structure", which is "a combination of materials assembled at a fixed location to give support or shelter, such as a building, framework, retaining wall, tent, reviewing stand, platform, bin, fences over six feet high, sign, flagpole, recreational tramway, mast for radio antenna, or the like." A metering pedestal supported on a pole would, collectively constitute a structure, true enough. However, a self-contained, single-entity item like a metering pedestal alone, wouldn't be a "combination of materials assembled at a fixed location," and therefore wouldn't qualify, except under the most tortured interpretation of the definition.

PANEL ACTION: Accept in Principle.
The panel accepts in principle the concept of establishing a proximity for the service disconnecting means.
PANEL STATEMENT: Without a defined distance for the term "immediately adjacent" the panel has embraced the concept of "within sight" per the definiton of that term in Article 100. See the panel's action on Proposal 4-107a.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1777)

4- 115 - (230-70(d) (New)): Reject
SUBMITTER: Terry L. Carlson, Nebraska State Electrical Board
RECOMMENDATION: New subsection: (d) Mounting Height. Each service disconnecting means shall be installed so the bottom of the enclosure containing the disconnecting means is not less than 610 mm (2 ft) above finished grade or working platform.
Exception: Service disconnecting means located within floor mounted switch gear enclosures.
SUBSTANTIATION: There is currently no reference to the minimum mounting height of normal service disconnecting means other than for mobile home service equipment. Inspectors in the field find service disconnects mounted so low to the floor or finished grade that it is impossible to inspect them or for electricians to service them without getting down on their knees or lower to open the equipment enclosure.
The exception is for large floor mounted switch gear where it is common to locate the main disconnect in the lower part of the enclosure. The need for a minimum height requirement has existed for many years and this proposal will accomplish it.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no technical substantiation to mandate a minimum clearance. Additionally this proposal raises an equipment design consideration that is outside the scope of the NEC.

4- 117 - (230-71(a)): Accept
NOTE: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 4-118. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) General. The service disconnecting means for each service permitted by Section 230-2, or for each set of service-entrance conductors permitted by Section 230-40, Exception Nos. 1, ~~or~~ 3, 4, or 5 shall consist of not more than six switches or sets of circuit breakers or a combination of not more than six switches and sets of circuit breakers, mounted in a single enclosure, in a group of enclosures, or in or on a switchboard. There shall be no more than six sets of disconnects per service grouped in any one location. For the purpose of this section disconnecting means used solely for power monitoring, or the control circuit of the ground-fault protection system or power-operable service disconnecting means, installed as part of the listed equipment, shall not be considered a service disconnecting means.
SUBSTANTIATION: Editorial. the conductors permitted by Exceptions No. 4 and 5 appear to have been overlooked. These conductors must terminate in service equipment and should be included. Since (b) permits single-pole circuit breakers with a handle tie, each individual breaker may be considered as one of six. The word "sets" would clarify they are considered one unit. The reference to a combination would clarify that all sets do not have to be either switches or circuit breakers.
Disconnects for control circuits of power-operable service disconnecting means are a reasonable inclusion with ground-fault and power monitoring equipment, otherwise they are not exempted from the rule.
PANEL ACTION: Accept.

NOTE: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 4-117. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Brian E. Rock, Hubbell Inc.
RECOMMENDATION: Revise as follows:
230-71. Maximum Number of Disconnects.
(a) General. The service disconnecting means for each service permitted by Section 230-2, or for each set of service-entrance conductors permitted by Section 230-40, Exception Nos. 1 or 3, shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be no more than six disconnects per service grouped in any one location. For the purpose of this section, disconnecting means used solely for power monitoring equipment, transient voltage surge suppression, or the control circuit of the ground-fault protection system, installed as part of the listed equipment, shall not be considered a service disconnecting means.
SUBSTANTIATION: Section 230-71(a) mandates that maximum number of disconnects not exceed six for each service; each disconnect, typically a circuit breaker overcurrent device, constitutes 1/6 of the total number of overcurrent devices; 1/6 equals 16.67 percent, more than 10 percent. Section 384-14(a) defines a lighting and appliance branch-circuit panelboard as having more than 10 percent of its overcurrent devices protecting lighting and appliance branch circuits. Section 230-79(d) mandates that a service disconnect not be rated less than 60 amperes. By contrast, Section 384-14(a) defines a lighting and appliance branch circuit as having overcurrent protection limited to 30 amperes maximum.
When a transient voltage surge suppressor is provided at the service entrance, there have been misinterpretations treating the TVSS as a branch circuit carrying a continuous load. Transient voltage surge protection (TVSS) is wired across each of the ungrounded, grounded and grounding conductors, with no outputs for load. In other words, transient voltage surge suppressors provide this protection in parallel, not "downstream" in series, with their single set of connection wire leads.
The TVSS normally sit across the conductors, with no conduction whatsoever. When a transient voltage surge appears, the TVSS clamps and a surge current flows for nanoseconds-to-microseconds duration (billionths of a second to millionths of a second) between the ungrounded, grounded and grounding lines, thereby providing transient voltage surge protection to the entire service. This conducted surge current is of such short duration that the wire lead conductors of the TVSS experience no temperature rise whatsoever, never even remotely approaching the thermal limits associated with the steady-state ampacity rating of that conductor size. As such, TVSSs do not constitute loads and do not require individual overcurrent thermal protection. The TVSSs are protected against excessive surge current and internal failures by internal protection devices as required by UL Standard UL 1449 to which the TVSSs are Listed. Short circuit protection is provided by the main circuit breaker or fuse to the electrical service. The UL Listing Report explicitly states "they are intended to be installed on the load side of the main Overcurrent Protection."
When misclassified as a branch circuit, there have been conflicts regarding the proper ampere rating of overcurrent protection required for the TVSS on its own disconnect. As indicated by the

UL Report, the main overcurrent protections rating, whatever it may be, is adequate and therefore safe. The selection of conductor size for the integral wire leads of the TVSS has absolutely no bearing on the temperature capacity nor any bearing on the ampere rating of the circuit breaker or fuse; conductor size selection relates solely to the transient voltage clamping characteristics and to manufacturing coordination of components internal to the TVSS.

Discrete service equipment panels having only one main disconnecting means would require the TVSS to be tapped off the one set of feeder conductors (load side) in accordance with NEC Section 240-21(b)(1). Servicing a tapped-in TVSS would necessitate disconnecting the electrical service to the entire feeder, resulting in consequential downtime.

Since NEC Section 230-71 allows up to a total of six service disconnects, spare capacity in the same service equipment panelboard for additional disconnects allows one further option; adding a separate main circuit breaker dedicated as a disconnect solely for a TVSS. A dedicated disconnect would allow the TVSS to be served unenergized without disconnecting any of the feeders from the other four main circuit breakers, thereby avoiding any downtime to ongoing operations. However, NEC Section 230-79(d), the service disconnect (main circuit breaker) would have to have a minimum rating of 60 amperes. Until such time that NEC Section 230-71(a), last sentence, is modified to also include transient surge suppression protection, NEC Section 230-79(d)s 60 ampere minimum has been and may continue to be incorrectly misinterpreted to preclude the use of a lower ampere main circuit breaker with a TVSS.

PANEL ACTION: Accept.

4- 119 - (230-71(a), FPN (New)): Reject
SUBMITTER: David A. Kerr, Jr., Friendsville, PA
RECOMMENDATION: Add a fine print note to 230-71(a) to read as follows:

FPN: See Sections 384-14, 384-15, 384-16 for restrictions on branch circuit breakers.

SUBSTANTIATION: Very few people seem to realize that most 15-30 ampere branch circuits require main protection. This needs a cross reference.
PANEL ACTION: Reject.
PANEL STATEMENT: The addition of the fine print note does not add to the clarity of this section. Users of the Code are required to follow the applicable rules of Article 384.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #435)

4- 120 - (230-71(a), Exception (New)): Accept in Principle
SUBMITTER: Abel S. Lampa, T&M Assoc.
RECOMMENDATION: Add an exception to 230-71(a) to read as follows:

Exception: For the purpose of this section, disconnecting means used solely for the control circuit of ground fault protection system, installed as part of the listed equipment and (transient voltage suppression system equipment) (TVSS) shall not be considered a service disconnecting means.

SUBSTANTIATION: The ability for emergency personnel to disconnect electric loads quickly during an emergency situation appears to be the reason why a limit was placed on the number of disconnects allowed (6). However, a TVSS does not feed a load, it is a sensor. Therefore, the TVSS would not need to be shut down during an emergency.

Based on the above, it is suggested that the section be modified to allow a TVSS connection in addition to six (6) disconnects. This revision will result in significant cost savings to building owners in numerous situations, and should not compromise safety.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concerns are addressed by the panel's action on Proposal 4-118.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #729)

4- 121 - (230-72(b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

(b) ~~Additional Service~~ Disconnecting Means for Additional Services. The one or more additional service ~~disconnecting means~~ disconnects for fire pumps, emergency, legally required standby, ~~or optional standby~~ systems ~~services~~ permitted by the exceptions for Section 230-2 to be served by an additional service(s), shall be installed sufficiently remote from the one to six service disconnects ~~disconnecting means~~ for the normal service to minimize the probability of simultaneous interruption of supply.

SUBSTANTIATION: Emergency systems were mistakenly removed from this section by panel action on Proposal 4-156 in the 1998 ROP apparently due to confusion that this section applies to additional disconnecting means for taps on the supply side of the normal service disconnect. In the heading the word “additional” may be construed as applying to “service” or “service disconnecting means”, which are different and may be confusing. However, the text reference to Section 230-2 clearly indicates service is intended since that section does not relate to taps ahead of the service disconnecting means. Deletion of “emergency” removes the application of the requirement to disconnects for an additional emergency service. The “one or more additional” phrase is superfluous and may add to the confusion, and is covered by Section 230-71. Since disconnecting means is defined as a group of devices and may consist of six devices per group, the word “disconnects” may be more technically correct and clear.

Optional standby systems is deleted since Section 702-2 indicates on-site generated power is to be used.
PANEL ACTION: Reject.
PANEL STATEMENT: The action by CMP 15 in the 1996 NEC to remove taps ahead of the service disconnecting means as a method of providing emergency power is the substantiation offered by the proposer in his Proposal 4-157 in the 1998 ROP, therefore the panel maintains that the inclusion of the term “emergency” is not appropriate.

(Log #4174)

4- 122 - (230-72(c) Exception No. 2 (New)): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Add a second Exception as follows:

Exception No. 2: In a multiple occupancy building where each occupant has grouped, readily accessible means to disconnect all ungrounded conductors within that occupancy with no more than six motions of the hand, the service disconnecting means shall be permitted to be accessible to authorized management personnel only.

SUBSTANTIATION: Relief is needed. Consider an underground service to a package store on the first floor and basement, with an apartment upstairs. Does anyone seriously believe the package store owner is going to allow the apartment tenant access to his basement on a 24-hour basis? The other exception doesn't apply since there is no “continuous building management supervision.” The present requirements are not realistic for many of these small occupancies. The result is anarchy, as jurisdiction by jurisdiction the rule is avoided or unenforced in many different ways. The submitted wording is working well in Massachusetts as a part of its electrical code. Everyone is playing on a level playing field, applying a workable, consistent rule.

The last time the panel rejected this substantiation, it said every occupant had a legitimate need for access for the purposes of continuity and control. They would have that in their own panels under the provision of this proposal, and they would have it far more quickly at hand. This proposal strikes a more realistic balance between the prerogatives of the building ownership and the rights of the various tenancies.
PANEL ACTION: Accept in Principle.
Change the word “motions” to “operations” in the proposed new text.

Add the following to the proposed text:

The rating of the individual branch circuit overcurrent devices shall comply with 230-92.

PANEL STATEMENT: The panel's action harmonizes the proposed language with that of 230-71(b) relative to the use of the word “operation”, and correlates with Section 230-92.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
SUMRALL: The submitter continues to submit the same proposal cycle after cycle. In his substantiation he cites a basement of a package store as the reasons building management will not allow access to a tenant of a various class. I am from a location where basements will fill up with water at 5 1/2 ft below the ground level. The alternative is to put the services in a different location, accessible to the various tenants. The State of Massachusetts, by adopting this exception, embraced 90-4, the very same section, the submitter says in Proposal 4-81 is "irresponsible."

Perception, without the facts, is truth. Fact, during the past two cycles this submitter is the only person that feels the playing field needs to be leveled. Fact, during the past two cycles this Panel has rejected the very same proposal it now accepts. Fact, this submitter called the result of this CMP's work an "anarchy."

Truth, there is nothing wrong with the present wording of this section. If this were not so, this Panel would have had more proposals to change the present code. Truth, the only playing field that is not level is that in Massachusetts, compared to the rest of the world. If this were not so, this Panel would have had more proposals to see the wording changed. Fact, the work of this CMP is indeed a privilege to work on, and with colleagues of all disciplines, to learn and share experiences, and to make a better Code. But in so doing, we at times must endure the repeated assault of certain individuals that have other alternatives to making a better code.

(Log #CP423)

4- 122a - (230-75): Accept

NOTE: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
SUBMITTER: CMP 4
RECOMMENDATION: Remove the existing second paragraph of Section 230-75.
SUBSTANTIATION: The issue addressed in the second paragraph is a product standard issue and does not need to be restated in the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
YOUNG: This paragraph is deleted with the substantiation that this is covered in product standards and does not need to be in the code. This is incorrect. This paragraph was added in the 1990 NEC and one of the problems being addressed was the interpretation of "service equipment" meaning the switchoard section containing the service disconnect. The product standard allowed the disconnect for the grounded conductor to be in other sections prior to that code change, but these interpretations would not allow it to be in other sections because of the wording in the first paragraph. This problem would be reintroduced if this paragraph is deleted.

The other problem is that if the second paragraph is deleted there would no longer be a requirement for marking the switchoard section where the disconnect is located and this could be removed from the product standards.

The intent of the code-making panel is that the grounded conductor disconnect can be located in any section of a multisection switchboard, and that this section should be identified by marking. Deleting this paragraph confuses the intent of the code-making panel and will result in reintroducing the problems that existed prior to the 1990 NEC.

(Log #730)

4- 123 - (230-75): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise last paragraph to read as follows:

In a multisection switchboard or motor control center, disconnects for the grounded conductor shall be permitted in any section of the switchboard or motor control center provided any such ~~switchboard~~ section other than the service disconnecting means enclosure is marked to indicate the location of the disconnect.

SUBSTANTIATION: Motor control centers may contain service equipment, and since they are covered in Article 430 may not be equated with switchboards even if similarly constructed. Purpose of the marking should be indicated, and such marking does not seem necessary where the grounded conductor disconnect is in the service disconnecting means section.
PANEL ACTION: Reject.
PANEL STATEMENT: The second paragraph of Section 230-75 has been removed. See panel action and comment on Proposal 4-122a.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #731)

4- 124 - (230-79(b), (c), (d)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

(b) ~~Two Circuit Installation~~ Specified Circuits. ~~For installations consisting of not more than two 2-wire branch circuits the~~ The service disconnecting means shall have a rating of not less than 30-amperes to supply; (1) two or more 2-wire circuits supplied by a 2-wire service; (2) more than two 2-wire circuits supplied by a 3-wire service; (3) two or more 3-wire circuits supplied by a 3-wire service or; (4) two or more 4-wire circuits supplied by a three-phase 4-wire service.

(c) ~~One Family~~ Dwelling Units. For a one family dwelling, the service disconnecting means shall have a rating of not less than 100-amperes 3-wire single phase or 60-amperes 4-wire three phase. For an individual dwelling unit of a two-family or multifamily dwelling the service disconnecting means shall have a rating of not less than 60-amperes 3-wire single-phase or 30 (40) amperes 4-wire three phase (Figure 40 is alternate)

~~(d) All Others. For all other installations the service disconnecting means shall have a rating of not less than 60 amperes.~~

SUBSTANTIATION: The proposal for (b) tracks Section 215-2 for feeders and is more specific and comprehensive than present wording. Present wording requires a minimum 30-ampere disconnecting means for a 3-wire service supplying two 2-wire branch circuits, but if a single 3-wire circuit is supplied per (a) the disconnecting means could be rated 15-amperes. A disconnecting means for a 3-wire service which supplies two 15-ampere 3-wire circuits, for example, is not covered and falls under the requirement of (d) which requires a minimum 60-ampere rating, likewise for a 4-wire three phase disconnecting means supplying two 15-ampere 4-wire circuits.

Present wording of (c) suggests a 4-wire three phase service is not permitted. A 60-ampere 208y/120-volt 4-wire service can supply 21600 volt-amperes compared to 20800 volt-amperes of a 208y/120 volt 3-wire single-phase service. Though (d) may be construed to permit a 60-ampere disconnecting means where a 100-ampere 3-wire rating per (c) is not provided, the text is not clear. The proposal for two-family and multifamily dwellings is similar in vein; present (d) requires a minimum 60-ampere rating which can supply 12480 volt-amperes at 208y/120-volt 3-wire single-phase, compared to a 30-ampere rating at 208y/120-volt three phase which can supply 10800 volt-amperes or at 480 volts three phase, 14400 volt-amperes.

The present 60-ampere minimum seems arbitrary and doesn't appear to take into account voltage and number of phases whereby the volt-ampere capacity can greatly vary.

Under the present wording of this section where a minimum 60-ampere disconnecting means is required, it can result in service-entrance conductors larger than necessary for the load. For example, a 60-ampere disconnect which supplies two branch circuits for 7-1/2 HP 460 volt three phase motors. No. 10 copper service-entrance conductors have ampacity suitable for the load. If nontime-delay fuses are used for OC devices the service OC device could be rated 40-amperes. This fuse rating requires a 60-ampere switch, which also satisfies (d). However, Section 230-42(b) requires the service-entrance conductor ampacity to be at least 60-amperes. For other installations requiring a 60-ampere rating per (d) but where a lower rated OC device is sufficient for the load, the same condition can exist. For circuit breakers used as the service disconnect it is difficult to provide the required 60-ampere rating with lower overcurrent trip rating, which may be suitable for the load. The requirement of (d) in effect, also mandates a service-entrance ampacity and OC device rating of 60-amperes.
PANEL ACTION: Reject.

PANEL STATEMENT: The current requirements of the Code provide the minimum specifications for safe service installations. The current Code does not prohibit a 3-phase, 4-wire service to a dwelling provided it has the same capacity as the 100 ampere, 3-wire rated disconnect.

4- 125 - (230-79(c)): Reject
SUBMITTER: George T. Anderson, Antioch, CA
RECOMMENDATION: Revise as follows:
(c) One-Family Dwelling. For a one-family dwelling, the service disconnecting means shall have a rating of not less than 200 amperes, 3-wire.
SUBSTANTIATION: Todays technology and optional appliances have increased our needs for extra circuits:
1. Electronic equipment performs "cleaner" on its own circuit.
2. Audio equipment as above.
3. Spas at 2 pole 40 to 60 amperes.
4. Landscape and "garden" lighting.
5. Future automotive recharging.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided technical substantiation to increase the minimum rating of the disconnecting means.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
SUMRALL: During the last cycle a subcommittee convened to submit the changes the 1999 code now has as the rule. The mentioning of electronic equipment was noted and discussed. However, the technical substantiation was not available and therefore the current installation practices were utilized. Articles 210, 220 and 680 all refer to Chapter 2 for calculating loads. The submitter might be better equipped to submit technical data for their consideration, than to this CMP.

(Log #3263)

4- 126 - (230-82): Accept
NOTE: The Technical Correlating Committee directs the Panel to reword "in accordance with Article 250" to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Alan Manche, Square D Co.
RECOMMENDATION: Revise NEC 230-82 with the deletion (strike-through) as shown. The entire text of 230-82 is shown for clarity, but only those changes shown as strike-through are part of this proposal.
230-82. Equipment Connected to the Supply Side of Service Disconnect. Only the following equipment shall be permitted to be connected to the supply side of the service disconnecting means:
1. Cable limiters or other current-limiting devices
2. Meters nominally rated not in excess of 600 volts, provided all metal housings and service enclosures are grounded in accordance with Article 250
3. Instrument transformers (current and voltage), high-impedance shunts, ~~surge-protective devices identified for use on the supply side of the service disconnect,~~ load management devices, and surge arresters.
SUBSTANTIATION: The NEC only addresses the installation of surge arresters presently. I am not aware of any surge protection device that is "identified for use on the supply side of the service disconnect" that is not presently covered as a Surge Arrester in Article 280. The problem with the present language is that it is leading intallers to assume that devices other than surge arresters (i.e. TVSS devices) are OK on the line side of the service disconnect. Since there are no devices other than surge arresters that can be installed in this manner, the confusing wording should be removed.
PANEL ACTION: Accept.

(Log #4065)

4- 127 - (230-82): Accept in Principle
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 15 for information.
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./Rep. Edison Electric Inst./Electric Light & Power Group
RECOMMENDATION: Revise as follows:
230-82. Equipment Connected to the Supply Side of Service Disconnect. Only the following equipment shall be permitted to be connected to the supply side of the service disconnecting means:
1. Cable limiters or other current-limiting devices.
2. Meters nominally rated not in excess of 600 volts, provided all metal housings and service enclosures are grounded in accordance with Article 250.
3. Instrument transformers (current and voltage), high-impedance shunts, surge-protective devices identified for use on the supply side of the service disconnect, load management devices, and surge arresters.
4. Taps used only to supply load management devices, circuits for standby power systems, fire pump equipment, and fire and sprinkler alarms, if provided with service equipment and installed in accordance with requirements for service-entrance conductors.
5. Solar photovoltaic systems or interconnected electric power production sources. (See Articles 690 or 705 as applicable.)
6. Control circuits for power-operable service disconnecting means, if suitable overcurrent protection and disconnecting means are provided.
7. Ground-fault protection systems where installed as part of listed equipment, if suitable overcurrent protection and disconnecting means are provided.
8. Standby power system transfer equipment that is listed and labeled as service disconnect and grouped with the service overcurrent device. (See Articles 100, 250, and 700 through 702 as applicable)
SUBSTANTIATION: This change is necessary to clarify the intent for the main service equipment function when transfer equipment is installed on the supply side for standby power. For example, some transfer switches are manufactured, listed and labeled "suitable for use as service equipment" and contain only a disconnecting device along with necessary grounding provisions for service equipment. Although, the listing agency qualifies the equipment in this manner, they do indicate the installation shall meet national and local requirements. The practice typically recognized as the local requirement is that service equipment needs to be comprised of a switch and fuse or circuit breaker to meet the necessary disconnecting and protective function at the load end of service conductors. The service equipment could contain these devices in one enclosure or within adjacent enclosures. In outdoor high voltage stations, the devices are grouped within the same switchyard.
This change will mitigate installation arrangements in conflict with the requirements of authorities having jurisdiction of the electric supply and National Electrical Code.
PANEL ACTION: Accept in Principle.
Revise the text of item 8 to read:
"8. Transfer equipment installed in accordance with Sections 700-6, 701-7 and 702-6."
PANEL STATEMENT: The proposed language has been added to permit transfer switches to be connected ahead of the service disconnecting means. The panel does not intend that transfer switches become the service disconnecting means unless identified and installed for that purpose. This change correlates with the changes made by CMP 15 to Sections 700-6, 701-7 and 702-6. It is recommended to the Technical Correlating Committee that this action be referred to CMP 15 for information.

4- 128 - (230-82(2)): Accept
NOTE: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. The Technical Correlating Committee directs the Panel to reword "in accordance with Article 250" to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Timothy M. Croushore, Allegheny Power Service Corp./Rep. Edison Electric Inst./Electric Light and Power Group
RECOMMENDATION: Revise the current (2) to read as follows:
Meters, meter sockets, or meter disconnect switches, normally rated not in excess of 600 volts, provided all metal housings and service enclosures are grounded in accordance with Article 250.

SUBSTANTIATION: This change will add meter sockets and meter disconnect switches to the list of equipment permitted ahead of the service disconnecting means. Meter sockets are commonly placed ahead of the service disconnecting means in almost every location to facilitate the installation of electric metering. Meter disconnects are commonly used ahead of meter sockets on 480Y/277 volt services with self-contained metering. Self-contained metering does not have external potential or current transformers. These meter disconnects are required by the serving electric utility to de-energize the meter socket during meter installation or replacement. Electric utilities will often refer to this type of metering as "cold sequence."
PANEL ACTION: Accept.

(Log #3909)

4- 131 - (230-82(4)(a) (New)): Accept in Principle
SUBMITTER: Ronald E. Gnotke, Rep. Minnesota Board of Electricity
RECOMMENDATION: Add new Section 230-82(4)(a) to read as follows:
(a) A transfer switch or disconnecting means, listed as suitable for use as service equipment, with or without overcurrent protection, shall be permitted at the distribution point or service point supplying one or more buildings or structures under single management or ownership. Transfer switches without overcurrent protection, shall not be installed in or on buildings or structures, but are permitted to be installed adjacent to these structures providing the working space between the transfer switch and the building or structure complies with the minimum requirements of Section 110-34.
Where a parallel path is not created with the grounded conductor, the bonding requirements of 250-28 shall apply to both the transfer switch and the service disconnecting means in the building. Agricultural buildings and structures shall comply with the requirements of Section 547-8.
SUBSTANTIATION: When 1996 NEC Section 230-83 was deleted in the 1999 NEC, some authorities having jurisdiction would only allow unfused transfer switches to be installed on agricultural building sites as indicated in Section 547-8(a). There are many other residential sites with small acreages and commercial installations that would be better served by allowing or clarifying this code change. Where the transfer switch without overcurrent protection ahead of or an integral part of the switch, is away from the building or structure, it would appear that there is not greater safety hazard present with this switch than there is with a CT enclosure, connection cabinet, meter socket or other unprotected piece of equipment. If interrupting ratings or available fault current is an issue, consider limiting the size of the transfer switch without overcurrent protection to 800 or 1000 amps maximum.
By locating these switches according to Table 110-34(a), distances from the building would not be left to field interpretation.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concerns are addressed by the panel's action on Proposal 4-127.

4- 132 - (230-82(5)): Accept
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 3 for information. The Technical Correlating Committee directs the Panel to reword "(See Articles 690, 691, or 705 as applicable.)" to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Kenneth Krastins, Plug Power, Inc.
RECOMMENDATION: Revise Section 230-82(5) to read as follows:
"Solar photovoltaic systems, fuel cell systems, or interconnected electric power production sources (See Articles 690, 691, or 705 as applicable.)
SUBSTANTIATION: This proposal is submitted to provide correlation for a new Article 691.
An important goal of building codes is to permit to the fullest extent possible, the use of modern methods, devices and technological improvements while protecting the health, safety, and welfare of the end user and general public. While new technology may offer many worthwhile benefits, appropriate regulations are needed to allow safe adoption of the technology and prevent misapplication. The fuel cell represents just such an emerging technology. Fuel cells provide a means, via an electrochemical process, of converting a fuel gas (such as natural gas, propane, etc.) into electrical energy that may then be used to power a building or residential dwelling. Fuel cells are virtually pollution free, very quiet when compared to other means of electric power generation, and can operate at high efficiency levels using very abundant and cheap fuels such as natural gas and LP gas.
There is growing interest in small, clean and quiet independent power generating units. The installation of fuel cell electrical generating systems used at residential and light commercial establishments is imminent. Recent advances in fuel cell technologies and more economical means of production will foster widespread acceptance of small distributed electrical generating units (under 50 kW) for single family home use and medium size units (51 kW to 250 kW) for multifamily units and small commercial buildings.

The interest in other clean forms of distributed generation is demonstrated by the adoption of the NEC Article 690, Solar Photovoltaic Systems. The direct interpretation of this article and its application deals specifically with solar photovoltaic electrical generating systems. It has been suggested that this article can also adequately cover other forms of distributed generation including fuel cell systems. However, since much of the language in Article 690 is specific to photovoltaic systems and rather complex to accommodate the interconnection requirements of the many sub-systems in photovoltaic systems, application of this article to fuel cells will be cumbersome.

Much of the information in Article 690 could apply to small and medium size electrical generating systems in general. Likewise, Article 705, Interconnected Electrical Power Production Sources, and Article 490, Equipment Over 600 Volts, Nominal, apply mainly to the large utility grid parallel independent electrical generating units. For example, Article 705-12, (b), (1) stipulates, "The aggregate of non-utility sources of electricity has a capacity in excess of 100k W, or the service is above 1000 volts." Leaving the interpretation of Article 690 and other articles up to the local inspector to determine the requirements for fuel cell systems will be problematic and could hinder the use of this beneficial technology. While the combination of these existing articles and others may adequately address fuel cells, it is clearly advantageous to users of the National Electrical Code, to have an article which specifically articulates the electrical installation requirements of fuel cell systems.

This being stated, Article 690, Solar Photovoltaic Systems, does offer a good basis for the creation of a Fuel Cell Systems article. A description of and substantiation for the individual topics to be covered in the proposed article follows. Where appropriate, comparisons are made within the following detailed substantiation between this proposed fuel cell article and the extant Photovoltaic Article 690. Sections of the Photovoltaic article that do not appear at all in the proposed article are also discussed and distinguished in bold, italicized text.

Additional Changes – Revised wording is recommended for section 230-82 (5), the exception to section 705-3, and section 705-30 to include language to cover fuel cell systems, similar to what is currently included for solar photovoltaic systems.

Members of Plug Power, Inc. and DTE Energy Technologies drafted the original version of the proposed fuel cell article. The proposed article began to be referred to as 691 because of its similarity and relationship to Article 690. It is recognized that the number ultimately assigned to the article may be different from 691.

The article was then circulated, reviewed, and revised internally at Plug Power. Subsequently, an e-mail notification was forwarded on September 13, 1999 to the members of three different groups advising them of the existence of the proposed article and inviting them to request a copy for review and comment. The three different groups notified were

- The members of the IEEE Standards Coordinating Committee (SCC) 21 currently involved in the development of a national standard (P1547) to cover interconnection of distributed resources with electrical power systems
- The members of the technical working group involved in the development of Standard Interconnection Requirements (SIR) for New York State which have since been submitted to the NYS Public Service Commission
- The Codes & Standards Working Group of the US Fuel Cell Council

All totaled, these groups include over 200 individuals. Presentations concerning the proposed article were given by Plug Power at both the September 27, 1999 meeting of the IEEE-SCC21 committee in Arlington, Virginia and the October 8, 1999 Power Quality Workshop (Interconnect-3) sponsored by the US Fuel Cell Council in Phoenix, Arizona. Those individuals who requested a copy of the draft article as a result of the e-mail notification or the presentations were sent one for review. After comments were received, they were negotiated and incorporated in the proposed article currently being submitted. Substantial changes have been made to the proposed article since its original inception, but the input generously provided by the individuals of the groups listed above has served to help develop a much better article as a result.

PANEL ACTION: Accept.
PANEL STATEMENT: This action is based on acceptance of the proposed Article 691.

(Log #1982)

4- 133 - (230-83 (New)): Reject
SUBMITTER: John M. O'Connor, North American Technologies, Inc.
RECOMMENDATION: Add new Section 230-83 to read as follows:
230-83. Meter Socket Bypass/Jumper Means. Meter sockets shall be bypassed or jumpered only by a full rated listed bypass or jumper. The bypass/jumper shall be enclosed by a listed method which prevents access to live parts.
SUBSTANTIATION: The enclosure of a meter socket is UL listed only when a meter is installed in a socket. The service which is energized without a meter being installed does not meet Section 111-27 Guarding of Live Parts. In many instances meters are bypassed, often by noncode approved means, in order to provide temporary power on construction jobsites. The protection of these live parts may or may not exist, depending on the installer and when or if a meter is installed.

These hazardous situations are occurring at new homes, offices, construction sites and at temporary classrooms (which are usually located on school playgrounds) while they are waiting to have meters installed. Utility deregulation may also cause increased incidence of these situations.

The addition of an integral closure to a meter socket would protect workers, children and others from a potentially dangerous situation, one that is preventable. Listed metering assemblies with integral socket closures are already commercially available.

Note: This is a companion proposal to my proposal on Section 373-4(b).
PANEL ACTION: Reject.
PANEL STATEMENT: The use of bypass mechanisms is not an installation issue. This is a maintenance and service issue and the proposed language is unenforceable.

4- 134 - (230-83 (New)): Reject
SUBMITTER: John M. O'Connor, North American Technologies, Inc.
RECOMMENDATION: Add a new section to read as follows:
"Meter sockets shall be bypassed or jumpered only by a full rated Listed bypass or jumper. The bypass/jumper shall be enclosed by a Listed method which prevents access to live parts."
SUBSTANTIATION: In many instances meters are bypassed, often by non-code approved means, in order to provide temporary power on construction jobsites and power to homes and businesses until a meter is installed. If a bypass switch is used this can be done safely. However, most times it is jumpered in an unsafe manner which can be dangerous to the individual doing the work and is a shock hazard to others if not properly protected. Removal of nonListed jumpers can also be hazardous to the meter installer when it is time for the meter to be installed. With the advent of utility deregulation, there will be increased occurrences of jumepring and hazardous situations. By requiring Listed bypass/jumpers and integral covers, the industry will be safer for workers and users.

Listed metering assemblies with safe bypass means and integral covers are already commercially available.
PANEL ACTION: Reject.
PANEL STATEMENT: The use of bypass mechanisms is not an installation issue. This is a maintenance and service issue and the proposed language is unenforceable.

4- 135 - (230-83): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Restore 1996 NEC Section 230-83 to the 2002 NEC, in the following edited form:
230-83. Transfer Equipment.
Transfer equipment, including transfer switches and all permanent wiring arrangements that contemplate a transfer of power between on-site sources and service conductors, shall operate such that all ungrounded conductors of one source of supply are disconnected before any ungrounded conductors of the second source ~~are~~ can be connected.

Exception No. 1: Where manual equipment identified for the purpose or suitable automatic equipment is utilized, two or more sources shall be permitted to be connected in parallel through transfer equipment.

Exception No. 2: ~~Where~~ Parallel operation ~~is~~ shall be permitted ~~used and~~ where suitable automatic or manual control equipment is provided .

SUBSTANTIATION: This section was removed by a panel proposal with essentially no substantiation. It took up about one inch of space in the ROP and most of use read over it, which is probably why there weren't any comments. I tried to convince some CMP 4 members to push for a panel comment to restore it during the ROC meetings, but no deal. Contrary to the panel statement, there are larger issues here than the product standard issue about contact overlap. It needs to be restored because until and unless the scope of Article 702 changes, this material is all that stands as enforceable language between a homeowner's power inlet for his cord-connected generator and a utility line crew repairing an outage.

I had used the phrase "including transfer equipment" as a key point in arguing that the scope of this section extended beyond just transfer equipment. Then I insisted the owner show how one system had to be off if the other were on. The final result, invariably, was an agreement to go get a manual transfer switch. Time after time this was in the context of the owner showing me how he was willing to turn everything off except this circuit and that circuit. "The main breaker; you mean I have to turn that off too?" went the response, "OK, I'll be sure and remember to do that." Sure.

This proposal updates the main rule to clearly address these arrangements. It also makes an editorial change in the last exception to make it more positive and use a complete sentence format.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The submitter's concerns have been addressed by the panel's action on Proposal 4-127.

4- 135a - (230-90): Accept

NOTE: The Technical Correlating Committee directs the Panel to reword Exception No. 3 "in accordance with Article 220" to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.

SUBMITTER: CMP 4

RECOMMENDATION: Revise 230-90 as follows:

"230-90. Where Required. Each ungrounded service conductor shall have overload protection.

(a) Ungrounded Conductor. Such protection shall be provided by an overcurrent device in series with each ungrounded service conductor that has a rating or setting not higher than the allowable ampacity of the conductor. A set of fuses shall be considered all the fuses required to protect all the ungrounded conductors of a circuit. Single-pole circuit breakers, grouped in accordance with Section 230-71(b), shall be considered as one protective device.

Exception No. 1: For motor-starting currents, ratings that conform with Sections 430-52, 430-62, and 430-63 shall be permitted.

Exception No. 2: Fuses and circuit breakers with a rating or setting that conform with Section 240-3(b) or (c) and Section 240-6 shall be permitted.

Exception No. 3: Two to six circuit breakers or sets of fuses shall be permitted as the overcurrent device to provide the overload protection. The sum of the ratings of the circuit breakers or fuses shall be permitted to exceed the ampacity of the service conductors, provided the calculated load in accordance with Article 220 does not exceed the ampacity of the service conductors.

Exception No. 4: Overload protection for fire pump supply conductors shall conform with Section 695-4(b)(1).

Exception No. 5: Overload protection for 120/240-volt, 3-wire, single-phase dwelling services shall be permitted in accordance with the requirements of Section 310-15(b)(6).

~~FPN: See Standard for the Installation of Centrifugal Fire Pumps, NFPA 20-1996.~~

(b) Not in Grounded Conductor. No overcurrent device shall be inserted in a grounded service conductor except a circuit breaker that simultaneously opens all conductors of the circuit."

SUBSTANTIATION: The changes that have been made are editorial and to comply with the NFPA NEC Style Manual. The fine print note is deleted as NFPA 20 is referenced in Article 695, therefore it is not necessary to repeat it in Article 230.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #2920)

4- 136 - (230-90): Reject

SUBMITTER: Joseph A. Tedesco, Boston, MA

RECOMMENDATION: Change the word "overload" to "overcurrent" so that it reads "230-90 Where Required. Each ungrounded service conductor shall have overcurrent protection".

SUBSTANTIATION: The current requirement is often met by limiting the load at the service equipment. No short-circuit protection is provided for the service entrance conductors. This proposed wording would require short-circuit protection where the service entrance conductors receive their source of supply, but would still allow overload protection at the service entrance equipment by limiting the load. Limiters, as allowed by 230-82(1), are available to provide this short-circuit protection.

PANEL ACTION: Reject.

PANEL STATEMENT: The intent of this section is to reasonably and practically address the safety issues of conductors connected and energized by utility provided conductors. Adding cable limiters is not technically justified in all instances. There is no technical justification to require the installation of load limiters by changing "overload" to "overcurrent'.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #2477)

4- 137 - (230-90(a) Exception No. 3): Reject

SUBMITTER: William Eder, Chicago Switchboard Co.

RECOMMENDATION: Revise as follows:

... The sum of the ratings of the circuit breakers or fuses shall not be permitted to exceed 125 percent of the ampacity of the service conductors when these overcurrent devices are rated at 80 percent and not exceed 100 percent of service conductors when rated at 100 percent.

SUBSTANTIATION: Loading in buildings is constantly growing and what may work now for overcurrent protection will not in the future - this is safety insured and not overload service conductors after future growth.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not provided technical substantiation to justify the proposed change. Providing extra capacity is a design consideration.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

(Log #2921)

4- 139 - (230-91(a) (New)): Reject
SUBMITTER: Joseph A. Tedesco, Boston, MA
RECOMMENDATION: Add a new paragraph as follows:
(a) Residential Occupancies. Service entrance conductors for residential occupancies shall be protected against overcurrents before the conductors enter the structure.
SUBSTANTIATION: Fires cause by unprotected service entrance cables continue to take lives and cause property damage. Several utilities already require this proposed protection. Outdoor, weatherproof fused disconnects or circuit breakers could be locked as long as the branch circuit devices, per Section 230-92, were accessible and of a smaller size than the outdoor main. Therefore, this proposal should not cause any problems, and will definitely save lives and property.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided adequate technical substantiation to require overcurrent protection, other than overload protection, for residential service conductors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #406)

4- 140 - (230-92): Reject
SUBMITTER: Amos D. Lowrance, Jr., City of Chattanooga, TN
RECOMMENDATION: Revise 230-92 to read as follows:
Locked Service Overcurrent Devices. In a multiple-occupancy building, where the device overcurrent devices are locked or sealed, or not readily accessible to the occupant, branch-circuit overcurrent devices shall be installed on the load side, shall be mounted in a readily accessible location and shall be of lower ampere rating than the service overcurrent device.
SUBSTANTIATION: The code as currently written requires a reduction in size of the overcurrent service any time the service disconnection means is locked, even on a single-family dwelling. This would require that any tab be removed that would permit locking the outside disconnect or that the inside overcurrent devices be smaller than the main.
PANEL ACTION: Reject.
PANEL STATEMENT: This requirement is only applicable where the overcurrent device(s) is actually locked or sealed, not where the potential of locking exists.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #734)

4- 141 - (230-92): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Locked Service Overcurrent Device. Where the service overcurrent device(s) is locked or sealed, or otherwise not ~~readily~~ accessible to ~~the~~ an occupant for whom access is not requisite, branch-circuit overcurrent devices shall be installed on the load side, shall be mounted in a readily accessible location and shall be of a lower ampere rating than the service overcurrent device(s) from which they are supplied.
FPN: See Section 240-24(b).
SUBSTANTIATION: "Locked or sealed" appears to be equated with "not readily accessible". This section uses not readily accessible (location) instead of accessible which relates to locks or other effective means. Overcurrent devices which are not readily accessible conflicts with Section 230-70(a) where the disconnecting means is a fused switch or circuit breaker. Section 240-24(a) generally does not permit not readily accessible overcurrent devices. Section 380-8(a) generally does not permit (fused) switches and circuit breakers to be not readily accessible.
This section does not correlate with other sections where fused switches and circuit breakers are permitted or required to be locked, but are considered readily accessible. For example Sections 110-26, 110-31, 110-34(c), 240-24(b).
Branch-circuit overcurrent devices which are also locked can be readily accessible but would not be accessible to those without a key.
Since service overcurrent devices may consist of six sets with different ampere ratings, the proposal would clarify the rating relationship.
The FPN would be helpful to Code users as Section 240-24(b) relates to this section and also covers feeder overcurrent devices.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's proposal does not accurately reflect the current wording of this requirement. The panel is unclear of the submitter's intent.

(Log #3378)

4- 142 - (230-92): Reject
SUBMITTER: Dale P. Missey, Mesa, AZ
RECOMMENDATION: Revise 230-92 to read:
230-92. Locked Service Overcurrent Devices. Where the service overcurrent devices are locked or sealed, or not readily accessible to the occupant, branch-circuit overcurrent devices shall be installed on the load side, shall be mounted in a readily accessible location, and shall be selectively coordinated with the service overcurrent device.
SUBSTANTIATION: The intent of the existing phrase "of lower ampere rating than" is to assure that an overcurrent on a branch circuit will open only the branch circuit overcurrent device and not the service overcurrent device, so that the occupant can reenergize the circuit after finding and fixing the problem. This is especially important for occupants that utilize in-home life support systems. Unfortunately, just because the service overcurrent device is larger than the branch device, it doesn't mean that the two will selectively coordinate. This proposal clarifies the intent by requiring that the two devices are selectively coordinated. Both fuses and circuit breakers are available to meet this proposed requirement.
PANEL ACTION: Reject.
PANEL STATEMENT: Selective coordination is a design consideration.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1507)

4- 143 - (230-95): Reject
SUBMITTER: Junior L. Owings, Rep. Oregon Chapter Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text as follows:
230-95. Ground-Fault Protection of Equipment. Ground-fault protection of equipment shall be provided for solidly grounded wye electrical services of more than 150 volts to ground, but not exceeding 600 volts phase-to-phase for ~~each~~ service ~~disconnect~~ equipment rated 1000 amperes or more.
~~The rating of the service disconnect shall be considered to be the rating of the largest fuse that can be installed or the highest continuous current trip setting for which the actual overcurrent device installed in a circuit breaker is rated or can be adjusted.~~
Definition. Solidly grounded means that the grounded conductor is grounded without inserting any resistor or impedance device.
Exception No. 1: The ground-fault protection provisions of this section shall not apply to a service disconnect for a continuous industrial process where a nonorderly shutdown will introduce additional or increased hazards.
Exception No. 2: The ground-fault protection provisions of this section shall not apply to fire pumps.
(a) Setting. The ground-fault protection system shall operate to cause the service disconnect to open all ungrounded conductors of the faulted circuit. The maximum setting of the ground-fault protection shall be 1200 amperes, and the maximum time delay shall be one second for ground-fault currents equal to or greater than 3000 amperes.
(b) Fuses. If a switch and fuse combination is used, the fuses employed shall be capable of interrupting any current higher than the interrupting capacity of the switch during a time when the ground-fault protective system will not cause the switch to open.
(c) Performance Testing. The ground-fault protection system shall be performance tested when first installed on site. The test shall be conducted in accordance with instructions that shall be provided with the equipment. A written record of this test shall be made and shall be available to the authority having jurisdiction.
FPN No. 1: Ground-fault protection that functions to open the service disconnect will afford no protection from faults on the line

side of the protective element. It serves only to limit damage to conductors and equipment on the load side in the event of an arcing ground fault on the load side of the protective element.

FPN No. 2: This added protective equipment at the service equipment may make it necessary to review the overall wiring system for proper selective overcurrent protection coordination. Additional installations of ground-fault protective equipment may be needed on feeders and branch circuits where maximum continuity of electrical service is necessary.

FPN No. 3: Where ground-fault protection is provided for the service disconnect and interconnection is made with another supply system by a transfer device, means or devices may be needed to ensure proper ground-fault sensing by the ground-fault protection equipment.

SUBSTANTIATION: The hazards of equipment damage from ground faults are based on total system capacity, not disconnect ratings, therefore the protection for the hazard should be based on system capacity, which is related to equipment rating. The number of service disconnecting means as allowed by 230-71, does not reduce the potential hazard. The section as written works fine for when there is a single main disconnect which is related to the overall equipment rating. The problem arises when multiple disconnects (up to six) are installed each with ratings below 1000 amps. A 4000 amp switchboard with six 800 amp main service disconnects has the same potential to burn down from an arcing ground fault as the same 4000 amp switchboard with a single 4000 amp main disconnect.

In addition, since the ground fault protection would now be based on the rating of the service equipment, defining the disconnect rating is no longer necessary. This also removes the potential conflict and confusion that has come from application of Section 240-6(c).

PANEL ACTION: Reject.

PANEL STATEMENT: The original study for including this requirement in the Code was based on the rating of the overcurrent device installed in the disconnecting means and not the total rating of the service. The statement in the submitter's substantiation relative to the similar effects of multiple disconnecting means is not accurate, was not supported by the original study, and in fact the subdivision of the disconnecting means is desirable to minimize the impact of ground faults.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #2559)

4- 144 - (230-95, FPN No. 3): Reject

SUBMITTER: Joseph C. Warren, Joseph C. Warren Electrical Consulting Services

RECOMMENDATION: Revise as follows:

FPN No. 3: Where ground-fault protection is provided for the service disconnect and interconnection is made with another supply system by a transfer device, a 4-pole transfer switch should be used on this 3-phase 4-wire system to isolate the neutral completely from the generator windings under normal power conditions to stop false tripping of ground-fault protection, and having current flowing back on neutral taking a path through ground-fault sensor and not sensed as fault current.

SUBSTANTIATION: In my experience in the installation of 480/277 volt 3-phase systems where a 3-pole transfer switch is used, if a phase leg develops a ground fault, this current travels back on the neutral and takes a path through the ground-fault sensor and is not sensed as fault current. In addition to this problem, under normal conditions when no ground-fault exists, neutral current due to normal load unbalance on phase legs divides at common neutral connection in automatic transfer switch with some current flowing toward the generator and returning to service main on a metal conduit indicating falsely that a ground-fault exists and takes out ground-fault protection. A four pole transfer switch always eliminates this condition and gives a definitive method of installation.

PANEL ACTION: Reject.

PANEL STATEMENT: The present wording of the fine print note adequately covers the topic of interconnected system concerns. The proposed text could be construed as a mandatory requirement in an advisory statement.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #1159)

4- 145 - (230-95 Exception No. 3 (New)): Reject

SUBMITTER: James A. Erickson, Boltswitch, Inc.

RECOMMENDATION: Add a new Exception No. 3 to read:

Exception No. 3: The ground-fault protection provisions shall not be required on the service disconnect if all sub-main devices are contained within the same switchboard and all are equipped with ground-fault protection. This allowance shall not be intended to require ground-fault protection on loads identified in Exceptions No. 1 and No. 2.

SUBSTANTIATION: Service disconnect devices that are designed to interrupt ground fault circuits can and do usually require maintenance after the device trips under fault conditions. This is understood and allowed by design standards. When a service disconnect requires maintenance, a utility shutdown is generally required. Consequently, when a service disconnect interrupts under ground fault conditions, the building management is faced with the choice of either lengthy delays (and costs) for a utility shutdown to perform maintenance or re-energize the system without proper maintenance. Unfortunately, the second option is usually selected.

The addition of Exception No. 3 would allow for a service disconnect to be placed directly ahead of any device equipped with ground fault protection. This would allow for proper maintenance without the delays and costs of a utility shutdown.

Also, Exception No. 3 would allow for ground fault protection to be installed solely on sub-main switches, which would provide an additional benefit of isolating a ground fault induced outage to only a portion of the facility. The unexpected outage would be less catastrophic, and the fault would be easier to locate.

Also, Exception No. 3 would allow for ground fault protection to be installed on sub-main switches without relying on coordinated trip settings or the cost and complexity of zone interlocking.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed exception reduces the level of protection for the main bus of the service equipment. The submitter has not provided technical substantiation to justify using downstream GFP protection as a substitute for protection for the entire bus.

4- 146 - (230-96 (New)): Reject

NOTE: The Technical Correlating Committee notes that Code-Making Panel 2 rejected Proposal 2-119 that relates to this proposal. It is also the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 2 for information.

SUBMITTER: William H. King, Jr., U.S. Consumer Product Safety Comm.

RECOMMENDATION: Add new Section 230-96 as follows:

230-96. Replacement of Service Equipment in Dwelling Units. When service equipment in dwelling units is replaced, each existing 125-volt, single-phase, 15- and 20-ampere lighting and appliance branch circuit shall be individually protected by an arc-fault circuit interrupter.

FPN: See Section 210-12(c). (Editorial note: Section 210-12(c) is a proposed new paragraph, submitted separately to the CMP for Article 210, to complement this proposed new Section 230-XX. For information purposes, proposed new Section 210-12(c) reads as follows: Lighting and Appliance Branch Circuits. Each existing 125-volt, single-phase, 15- and 20-ampere lighting and appliance branch circuit shall be individually protected by an arc-fault circuit-interrupter when the service equipment is replaced.)

SUBSTANTIATION: According to a study conducted by the U.S. Consumer Product Safety Commission (CPSC), "Residential Electrical Distribution System Fires", Smith & McCoskrie, 1987, fires originating in branch circuit wiring predominately occurred in dwellings over 20 years old, with the highest rates of fires occurring in dwellings over 40 years old. Older dwellings are frequently upgraded with replacement service equipment to accommodate an increase in the service rating to supply additional appliance and equipment loads. However, often times, the existing lighting and appliance branch circuits in dwelling units are not replaced when the service is upgraded, due to the increased cost, and/or the inability to evaluate the remaining life expectancy of the branch circuit conductors. The branch circuit conductors are frequently located in concealed spaces surrounded with thermal insulation, and may be in a deteriorated condition at the time the service is

upgraded. This proposal is intended to remedy this situation with the addition of arc-fault circuit interruption (AFCI) protection against fire hazard conditions for the existing branch circuit conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is outside the scope of CMP 4. CMP 4 directs the Technical Correlating Committee to refer this to CMP 2 and CMP 10 for review.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2922)

4- 147 - (230-96 (New)): Reject
SUBMITTER: Joseph A. Tedesco, Boston, MA
RECOMMENDATION: Add a new Section 230-96 in the 2002 NEC as shown below:
230-96. Large Services. Where the size of the service is large enough so that three or more cables per phase are utilized, and are connected together at both the point where they receive their supply and at the service entrance equipment, current-limiting cable limiters shall be installed on both ends of each cable to provide both short-circuit protection and isolation of a faulted cable.
SUBSTANTIATION: This proposal provides for service entrance conductor protection for those large services that require three or more cables per phase. Because of their large size, these services can produce tremendous amounts of available short-circuit current. Without this requirement, there is only minimal protection provided on the line side of the transformer. Many utilities already have similar requirements for these limiters on large services. Because of the very high available short-circuit currents, the available arc flash energy is also extremely high. Because of their current-limiting properties, current-limiting cable limiters can limit this arc flash energy. Workers will still need to wear appropriate PPE, but the hazard level will be greatly reduced.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided technical substantiation to require this type of protection. In a three conductor per phase installation, where cable limiters have been installed, the isolation of one cable would cause the remaining two cables in that phase to continue operation with inadequate overload protection. This method of installation is permitted by Article 240 and is a design consideration.

(Log #3262)

4- 148 - (230-203): Reject
SUBMITTER: Alan Manche, Square D Co.
RECOMMENDATION: Revise the 230-203 with the additions (underlined) as shown. The entire text is shown for clarity, but only those changes shown underlined are part of this proposal.
230-203. Warning Signs. Signs with the <u>following</u> words <u>or equivalent</u>, "DANGER - HIGH VOLTAGE - KEEP OUT" shall be posted in plain view where unauthorized persons might come in contact with energized parts.
SUBSTANTIATION: The explicit nature of the present wording is causing field problems in the acceptance of appropriate warning signs or markings. The ANSI Z535 series of standards provides the proper procedure in establishing a hazard sign or marking. ANSI Z535.4 provides the information about what should be contained in a hazard sign or label. This includes a message panel that identifies the hazard, indicates how to avoid the hazard and advises the probable consequence of not avoiding the hazard.
The objective of the NEC wording is to generally convey the basic message requirement to user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would allow a hazard sign to comply with the NEC, but be formated in accordance with Z535.4.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's concerns have been addressed by the panel's action on Proposal 4-147a.

(Log #1473)

4- 150 - (230-212): Accept in Principle
SUBMITTER: William M. Lewis, Eli Lilly and Co.
RECOMMENDATION: Change Section 230-212 to read:
230-212 ~~Services~~ Over 15,000 Volts. Where the voltage exceeds 15,000 volts, between conductors ~~they shall enter either~~ <u>which enter a building, they shall terminate in a</u> metal-enclosed switchgear <u>compartment</u> or a transformer vault conforming to the requirements of Sections 450-41 through 450-48.
SUBSTANTIATION: Many services over 15000 volts do not enter a building but terminate in an outdoor substation. The proposed wording remedies this oversight.
This proposal was developed by the Task Group based on the Task Group's review and discussion of the current requirements of Articles 225, 230, 100, 110, 240, and 250. This proposal is one of 14 which makes up the Task Group's response to a recommendation by a TCC task group on usability in 1995. In considering the needed proposals, emphasis was placed on including in the NEC, practices which are recognized in the electrical industry as necessary for safe installation of over 600 volt systems. This is to provide guidance and direction for installation of these facilities which have not historically been included in the NEC.
The Task Group participants consisted of William M. Lewis (CMP 4); committee chair; Carl J. Fredericks (CMP 10); Tom Adams (CMP 4); John Beck (Chairman CMP 4); Mark Sumrall (CMP 4); Barry Hornberger, (CMP 13); William T. Beutler, P.E.; William Long, NEMA.
Interested persons (nonparticipants): Robert J. Pollock (CMP 4 and TCC); Merton Bunker (NFPA); Mark Earley (NFPA)
PANEL ACTION: Accept in Principle.
Amend the proposed language to read:
"230-212 ~~Services~~ Over 15,000 Volts. Where the voltage exceeds 15,000 volts, between conductors ~~they shall enter either~~ <u>which enter a building, they shall terminate in a</u> metal-enclosed switchgear <u>compartment</u> or a transformer vault conforming to the requirements of Sections 450-41 through 450-48."
PANEL STATEMENT: The modification to the proposed text clarifies that the conductors are permitted to terminate in any vault that meets the requirements of Article 450, Part C.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
LEWIS: The Panel Action is appropriate and clarifies the intent of Section 230-212. I notice, however, that there is an inconsistency with 230-212, and 450-21, and 450-24, and 450-25. 450-21(b) requires only that specific transformers be installed in a fire resistant room. The term "Fire Resistant" for this section is defined as construction having a minimum fire rating of one hour. 450-21(c), 450-24, and 450-25 then specify that the three hour fire rated room (part C) will be required only if the voltage rating is greater than 35,000 Volts.

By requiring that services over 15,000 Volts which enter a building and terminate in other than metal enclosed switchgear, be in a three hour vault; the panel is requiring more restrictive rules on services, than on feeders between 15,000 Volts and 35,000 Volts. Since there is no difference in protection methods for feeders and services at this voltage level, I question the justification for the difference.

This comment is offered to highlight the inconsistency and to give the public an opportunity to suggest corrective measures if it has created a problem; or to provide justification for the difference.

7. In Section 240-21(b)(4) replace "35 ft (10.67 m)" with "11 m (35 ft)"
8. In Section 240-21(b)(4) replace "100 ft (30.5 m)" with "30 m (100 ft)"
9. In Section 240-21(b)(4) replace "30 ft (9.14 m)" with "9.0 m (30 ft)"
10. In Section 240-21(c)(2) replace in subdivision title and text "10 ft (3.05 m)" with "3.0 m (10 ft)"
11. In Section 240-21(c)(3) replace in subdivision title and text "25 ft (7.62 m)" with "7.5 m (25 ft)"
12. In Section 240-92(b)(1)(a) replace "50 ft (15.24 m)" with "15 m (50 ft)"
13. In Section 240-92(b)(1)(b) replace "75 ft (22.86 m)" with "23 m (75 ft)"
14. In Section 240-92(b)(1)(c) replace "75 ft (22.86 m)" with "23 m (75 ft)"
SUBSTANTIATION: The proposed revisions are intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units.
PANEL ACTION: Accept in Principle.
In Item 1, change "No. 18" to "18 AWG".
In Item 2, change "No. 16" to "16 AWG.
In Item 3., change "3.0 m" to "3 m".
In Item 9., change "9.0 m" to "9 m".
In Item 10., change "3.0 m" to "3 m".
PANEL STATEMENT: The change from "No." to "AWG" is to provide consistency with the action taken on proposal 10-2. The deletion of the extra precision in the conversion shown in Items 3, 9, and 10 is made to avoid implying undue precision in the conversion to a smaller length in metric units.

10- 3b - (240-2, Other Article Referenced): Accept
SUBMITTER: CMP 10
RECOMMENDATION: Move existing 240-2 to 240-3, delete existing title and add new title "Other Articles."
Delete second paragraph of section 240-3(e) and relocate to section 240-2 as a definition titled "Tap conductor".
Delete section 240-11 and relocate to section 240-2 as definition titled "Current limiting overcurrent protective device".
Delete section 240-91 and relocate to section 240-2 as definition titled "Supervised Industrial Installations".
Delete last paragraph of section 240-12 and relocate to section 240-2 as definition titled "Coordination".
Move existing 240-3 to 240-4.
Move existing 240-4 to 240-5.
Revise as follows:
240-1 No change
"240-2 Definitions
Coordination. The proper localization of a fault condition to restrict outages to the equipment affected, accomplished by the choice of selective fault-protective devices.
Current-Limiting Overcurrent Protective Device. A current-limiting overcurrent protective device is a device that, when interrupting currents in its current-limiting range, will reduce the current flowing in the faulted circuit to a magnitude substantially less than that obtainable in the same circuit if the device were replaced with a solid conductor having comparable impedance.
Supervised Industrial Installation. For the purposes of Part H, supervised industrial installation is defined as the industrial portions of a facility where all of the following conditions are met:
1. Conditions of maintenance and engineering supervision ensure that only qualified persons will monitor and service the system.
2. The premises wiring system has 2500 kVA or greater of load used in industrial process(es), manufacturing activities, or both, as calculated in accordance with Article 220.
3. The premises has at least one service that is more than 150 volts to ground and more than 300 volts phase-to-phase.
This definition shall not apply to those installations in buildings used by the industrial facility for offices, warehouses, garages, machine shops, and recreational facilities that are not an integral part of the industrial plant, substation, or control center.
Tap Conductors. As used in this article, a tap conductor is defined as a conductor, other than a service conductor that has overcurrent protection ahead of its point of supply, that exceeds the value permitted for similar conductors that are protected as described elsewhere in this section."
240-3 Other Articles (Add existing text of section 240-2).
240-4 (relocate existing section 240-3).
240-5 (relocate existing section 240-4).

SUBSTANTIATION: The proposed changes are in conformance with the NEC style manual. This change provides for a more user friendly format of Article 240.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1053)

10- 2 - (240-2): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise Article 240 as follows:
240-3(d) - change:
"No. 14" to "14 AWG"
"No. 12" to "12 AWG" in two places
"No. 10" to "10 AWG" in two places
240-4(b)(1) - change:
"No. 18" to "18 AWG"
"No. 16" to "16 AWG"
240-4(b)(2) - change:
"No. 18" to "18 AWG"
"No. 16" to "16 AWG"
"No. 14" to "14 AWG" in two places
"No. 12" to "12 AWG" in two places
240-4(b)(3) - change "No. 16" to "16 AWG"
240-21(b)(4)(g) - change "No. 6 copper or No. 4 aluminum" to "6 AWG copper or 4 AWG aluminum".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
PANEL STATEMENT: No clarity is added for U.S. and some other locations, where the meaning of "No. 14" and "14 AWG" are universally known and interchangeable; further, the Code is generally consistent in listing "xx AWG" in the tables and "No. xx" in the text. However, this proposal adds considerable clarity for international locations that might accept the NEC, where common U.S. trade sizes are less well known.
The panel suggests that the Technical Correlating Committee ensures that all final actions on similar proposals are consistent throughout the Code.

(Log #CP1005)

10- 3a - (240-2 (New)): Accept
NOTE: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposals 4-54 and 4-55. The Technical Correlating Committee directs the panel to clarify the location of the new definition. This action will be considered by the Panel as a Public Comment.
The Technical Correlating Committee directs that this proposal be forwarded to Code-Making Panel 4 for information.
SUBMITTER: CMP 10
RECOMMENDATION: Add the following definition to 240-2:
"Conductors Considered Outside the Building. In addition to outdoor conductors," (Add existing text from Section 230-6 of the existing code).
SUBSTANTIATION: This definition clarifies the panel's intent in recognizing a long-standing practice.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BORTHICK: I am opposed to the panel action.
Existing 240-21(b)(5) permits feeder conductors to be tapped without restriction to the length of the tap conductors and without restriction to the minimum tap conductor size. These two parameters can have significant effect on circuit impedance. Without careful consideration of these factors a short-circuit near the extreme end of the tap might reduce the fault-current in the circuit to a level that the feeder overcurrent protective device might not operate quickly enough to prevent damage to the tap conductor or at the very least its insulation. Another possible scenario is that the tap conductor could melt in two before the overcurrent protective device could open thus "clearing the fault" and the overcurrent protective device would not open at all leaving the severed tap conductors energized.
A generic example to illustrate this might be a 200 amp 480 volt three-phase feeder run to a junction box where numerous taps are made. The available fault-current at the junction or "tap" box is 24000 amps. A three-phase tap is made here, using #12 AWG copper. The tap conductors immediately exit the building and are run on the building surface for 160 feet and terminate at a 20 amp overcurrent protective device that protects the tap conductors against overload. If a short-circuit occurs at 150 feet from the tap box the available fault current is roughly 1100 amps. How long will the feeder overcurrent protective device take to open at only 550 percent of its rating? At least a few seconds longer than it would take for the #12 copper to melt. Also, if the tap conductors are attached to a combustible surface the heat generated at the fault might also be of sufficient duration and intensity to ignite these combustibles.
The existing 240-21(b)(5) is sufficiently unrestrictive to cause concern for its general application.
The panel's acceptance of the proposal further broadens the permitted installations. It is conceivable that many traditional branch circuits that have been safely protected against overcurrent by installation of overcurrent protective devices at their supply, will now become taps protected from overload by virtue of being installed per the criteria of 230-6.
COMMENT ON AFFIRMATIVE:
DOLLARD: I am voting affirmative to the panel action to accept proposal 10-3a. My comments are as follows:
"The panel statement explains that defining "Conductors Considered Outside the Building" in Article 240 is necessary to recognize a long-standing practice. I agree with the Panel's intent to allow some flexibility to outside tap conductors at the point they enter a building or structure. However, applying this definition globally throughout Article 240, may result in confusion, installations and interpretations that are not the intent of the Panel on this proposal. The words "outside", "outdoors" and "outdoor" occur in Sections 240-21(b), 240-21(c) and 240-92(c). The need for this definition arises from the use of these words in the associated tap rules. With the acceptance of this new definition to Article 240 the words "outside", "outdoor" and "outdoors" as used in existing text will be interpreted in a very different manner. Acceptance of this proposal will permit "Service Equivalent Taps" as described in proposal 10-68 in the ROP for the 1999 code cycle. The Panel rejected this proposal and noted in the panel statement the confusion that could occur in the application and enforcement of such a change.
I believe that the Panel's intention can be met with the following changes:
240-21(b)(5) Outside Taps of Unlimited Length. Where the conductors are located outdoors <u>or enter a building or structure from the outdoors in accordance with Condition No. 1 or Condition No. 2 of Section 230-6,</u> except at the point of <u>load</u> termination, and comply with all of the following conditions.
240-21(c)(4) Outside Secondary Conductors. Where the conductors are located outdoors <u>or enter a building or structure from the outdoors in accordance with Condition No. 1 or Condition No. 2 of Section 230-6,</u> except at the point of <u>load</u> termination, and comply with all of the following conditions.
240-92(c)(3) The tap conductors are installed outdoors <u>or enter a building or structure form the outdoors in accordance with Condition No. 1 or Condition No. 2 of Section 230-6,</u> except at the point of <u>load</u> termination."

(Log #737)

10- 4 - (240-3): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Protection of Conductors. ~~Conductors~~ Circuit conductors, other than flexible cords and cables, and fixture wires shall be protected against overcurrent in accordance with their ampacities as specified in Section 310-15 unless otherwise permitted or required in (a) through (g) below:
Exception: Grounded conductors shall not be required to have overcurrent protection.
(a) No change.
(b) Devices Rated 800 Amperes or Less. ~~The next~~ A higher ~~standard~~ overcurrent device rating or setting (above the ampacity of the conductor being protected) shall be permitted to be used provided all the following conditions are met:
(1) No change.
(2) No change.
(3) The ~~next~~ higher ~~standard~~ rating or setting selected does not exceed the next higher standard rating and 800 amperes.
(c) Devices Rated Over 800 Amperes. Where the overcurrent device ~~is rated~~ rating or setting is over 800 amperes, the ampacity of the conductors shall be ~~equal to or greater~~ not less than the rating or setting of the overcurrent device. ~~as defined in Section 240-6.~~
(d) Small Conductors. Unless specifically permitted otherwise in (e) through (g) blow, the overcurrent protection shall not exceed 15 amperes for No. 14, 20 amperes for No. 12, and 30 amperes for No. 10, copper, or 15 amperes for No. 12 and 25 amperes for No. 10 aluminum or copper-clad aluminum, except where ambient temperatures of 21-25°C permit an increase in ampacity the provisions of Section 240-3(b) shall apply.
(e) Tap Conductors. Tap conductors shall be considered ~~permitted~~ to be protected against overcurrent in accordance with Sections 210-19 (c) and (d), 240-21; 364-11; and 430-53(d).
(remainder unchanged)
(f) Transformer Secondary Conductors. Conductors connected to a transformer secondary in accordance with Section 240-21(c) shall be ~~permitted~~ considered to ~~have~~ be protected against overcurrent. ~~protection located as specified in Section 240-21(c).~~
(g) Overcurrent Protection for Specific Conductors. Application. ~~Overcurrent protection for the specific conductors~~ Conductors shall be ~~permitted~~ considered to be protected against overcurrent where installed in conformance with requirements for specific applications as referenced in the list below:
(Existing list unchanged)
Add to list:

Battery Circuit Conductors	Article 480 Section 480-3
Electrolytic Cell Conductors	Article 668 Section 668-30(d)

SUBSTANTIATION: The first paragraph should include flexible cables since their ampacities are covered in Article 400, not Section 310-15. Flexible cords and fixture wires are indicated, even though indirectly excluded by the FPN for Section 310-1. The limiting word "circuit" and the proposed exception would exclude grounding and bonding conductors, and grounded conductors which are literally included in the rule. The exception would correlate with Sections 230-90(b) and 240-22, and where an overcurrent device such as a multiple circuit breaker does supply a grounded conductor as permitted, the overcurrent element for the grounded conductor, whether or not a reduced-in-size neutral, would not have to comply with this section. The exception reflects present accepted practice.
The present wording of (b) implies that only the next higher standard rating shall be permitted and that seems to be the impression of some code users. If the allowable ampacity of a conductor is determined to be 180 amperes why should a rating of 190 amperes not be permitted? The revised wording would correlate with the FPN for Section 240-6(b), is reasonable and practical. Since a setting may be different from rating, per the exception for Section 240-6(b) it should be included.
Proposal for (c) is editorial.
The present (d) limits overcurrent protection to 15, 20, 25 or 30 amperes even after the correction factor for ambient temperature of 21-25°C permits an ampacity that is higher, and effectively negates the provisions of Section 240-3(b). The small ampacity increase permitted for lower ambient temperatures that may prevail, such as underground, in northern climes, or in controlled temperature environments may not be of great consequence but could matter in border line installations.
In (e), (f), and (g) I believe "considered to be" is more technically accurate based on the premise that overcurrent (overload, short-circuit, ground-fault) protection is literally only provided where the overcurrent device is located at the point of supply and rated in accordance with the conductor ampacity. Many sections where these conditions are not met refer to "overcurrent device" or "overload protection" to indicate overcurrent protection is not literally provided. Section 210-19(c) should logically be included.
The present (f) only relates to location of overcurrent protection (devices) but does not affect the basic ampacity requirements of the first paragraph of this section.
The list in (f) should include Section 668-30(d) which is applicable, and Section 480-3 if my proposal for that section is accepted.
PANEL ACTION: Accept in Part.
The panel accepts the insertion of "(c) and" in Item (e) of the proposal.
The panel rejects the remainder of the proposal.
PANEL STATEMENT: The panel does not consider that the qualifier "circuit" on conductors is necessary.
The addition of "and cables" would modify protection requirements of type AC, MI, MC, etc. cables.
The exception is a duplication of the material in 240-22, and is in conflict with section 430-36.
No technical substantiation was provided for the proposed changes to (b) and (c). The present text is easy to read and enforceable without change.
In proposed (d), adding "otherwise" does nothing except add another word. The added sentence is too permissive in a bracketed area, and would allow larger than a 15, 20, 25, or 30 ampere overcurrent device to be used. The present text is practical, enforceable, and easy to read.
In proposed (e), the panel does not agree that "considered" is more technically correct, and the word is not permitted by the NEC Style Manual.
The panel approves the addition of "(c) and" to proposed (e).
The proposed change to (f) does not improve clarity. The panel does not agree that "considered" is more technically correct, and the word is not permitted by the NEC Style Manual.
The proposed change to (g) does not improve clarity. The panel does not agree that "considered" is more technically correct, and the word is not permitted by the NEC Style Manual.
The additions to the list have no specific provisions for overcurrent protection in the referenced sections.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2247)

10- 5 - (240-3(b)): Reject
SUBMITTER: Steven R. Musial, II, Pittsburgh, PA
RECOMMENDATION: Revise text as follows:
240-3(b) "The next higher standard overcurrent device rating (at or above the ampacity of the conductors being protected) shall be...".
SUBSTANTIATION: Several conductor sizes listed in Table 310-16 have rated ampacities that match the standard size fuses and circuit breakers that are commonly manufactured per Article 240-6 (e.g., No. 3 AWG Cu, THW rated at 100 amperes).
PANEL ACTION: Reject.
PANEL STATEMENT: Protection of the conductors at the ampacity of the conductors is in conformance with 240-3. Section 240-3(b) addresses overcurrent protection at a value above the conductor ampacity.
The present text of this section meets the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #309)

10- 6 - (240-3(c)): Reject
SUBMITTER: Sonny D. Nordhoff, Noblesville, IN
RECOMMENDATION: Revise 240-3(c) to read as follows:
Where the overcurrent device is rated over 800 amps, the ampacity of the conductors it protects shall be equal to, or greater than the rating of the overcurrent device as defined in Section 240-6.
Exception No. 1: Where the ampacity of the conductors is no more than 60 amps or less, than the rating of the O.C.P., it shall be permitted to increase to that higher O.C.P.
SUBSTANTIATION: When installing a 1200 amp service, three 500 kcmil conductors come up short by only 60 amps short of the rating of 1200 amps. It is my understanding that section 240-3(c) is in place because of the large jumps between standard size fuses over 800 amps. The 60 amp increase is not too much in my eyes but I am just an electrician, not an authority having jurisdiction.

PANEL ACTION: Reject.
PANEL STATEMENT: There is a lack of technical substantiation for making this a general rule. No technical information has been provided to show whether the conductors could be damaged due to the increase of resistive heat.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
ELDRIDGE: This proposal should have been Accept in Principle. Chance as follows to allow for all ranges of ampacities. "Where the overcurrent device is rated over 800 amperes, the ampacity of the conductors it protects shall be equal to or greater than not less than 95% of the rating of the overcurrent device as defined in Section 240-6" This satisfies the submitter's concerns.
By making this change, a 1600-ampere service could be wired with four sets of 500 kcmil, Cu., 75 degrees C wire. This was done for years without any problems and no problems have been encountered for the existing 800 amperes or less, as permitted now in Section 240-3(b). Of course, all the other code provisions would have to be followed.
FREDERICKS: I'm voting against the panel action. I agree the original proposal was flawed because it is too specific, but it raises a good concept that should have been accepted in principle. The panel should have voted to accept in principle per the motion made in the panel meeting.
The motion would have allowed, for devices above 800 amperes, the next higher available size of overcurrent device to be used, where the next higher size was no more than 5 percent above the allowable conductor ampacity.
Below 800 amperes, the NEC already allows conductors to be protected at the next standard device rating, effectively allowing these conductors to be protected and up to 18 percent above their allowable ampacity. This practice has proven successful in many thousands of NEC installations and in years of practice. This successful practice is with conductors that are smaller and heat more quickly than those above 800 amperes. Also, the overcurrent protective device is smaller and more sensitive to the wire size below 800 amperes.
It would seem that, if anything, there would be more technical merit in restricting the smaller devices and conductor, but again long successful practice and experience supports the exiting latitude given in 240-3.
There is no technical reason to disallow the modest 5 percent allowance for conductors above 800 amperes, as proposed in the motion.

(Log #1772)

10- 7 - (240-3(e)): Reject
SUBMITTER: Richard E. Loyd, Perryville, AR
RECOMMENDATION: Revise to read as follows:
(e) Tap Conductors. Tap conductors shall be permitted to be protected against overcurrent in accordance with Sections 210-19(d), 240-21, 364-11, 364-12, and 430-53(d).
As used in this article, a tap conductor is defined as a conductor, ~~other than a service conductor~~ that has overcurrent protection ahead of its point of supply, that exceeds the value permitted for similar conductors that are protected as described elsewhere in this section.
SUBSTANTIATION: This paragraph as written in the 1999 NEC was being misinterpreted and the proposed phrase to be deleted neither added to the definition or clarified its intent. Service conductors are protected against overload and not overcurrent.
PANEL ACTION: Reject.
PANEL STATEMENT: The phrase "other than a service conductor" is needed in the definition to avoid confusion and misapplication. Some service conductors are protected against overcurrent when, for example, cable limiters are used.

10- 10 - (240-3(e)): Accept
Note: The Technical Correlating Committee understands that this revision occurs in the relocated definition in Proposal 10-3b.
SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Insert a comma after the words "service conductor" in the second sentence as follows:
As used in this article, a tap conductor is defined as a conductor, other than a service conductor, that has overcurrent protection ahead of its point of supply, that exceeds the value permitted for similar conductors that are protected as described elsewhere in this section.
SUBSTANTIATION: A service conductor does not have overcurrent protection ahead of its point of supply and should be "separated" from the rest of the sentence. This will clarify that it is the tap conductor that has overcurrent protection ahead of its point of supply, and not the service conductor.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4176)

10- 11 - (240-3(e)): Accept
Note: The Technical Correlating Committee understands that this revision occurs in the relocated definition in Proposal 10-3b.
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise by adding a comma after "service conductor" and deleting the comma after "point of supply" as follows:
As used in this article, a tap conductor is defined as a conductor, other than a service conductor, that has overcurrent protection ahead of its point of supply, that exceeds the value permitted for similar conductors that are protected as described elsewhere in this section.
SUBSTANTIATION: Service conductors don't customarily have overcurrent protection ahead of their point of supply. The misplaced comma effectively groups the concept of "overcurrent protection ahead of its point of supply" with service conductors, which is wrong, and not with values permitted for similar conductors, as intended.
PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1162)

10- 12 - (240-3(f)): Reject
SUBMITTER: Charles K. Eldridge, Indianapolis, IN
RECOMMENDATION: Revise text to read:

(f) Transformer Secondary Conductors. Single-phase (other than 2-wire) and multiphase (other than delta-delta, 3-wire; ungrounded 3-wire wye; or high resistance grounded wye) transformer secondary conductors shall not be considered to be protected by the primary overcurrent protective device. Conductors supplied by (1) the secondary side of a single-phase transformer having a 2-wire (single-voltage) secondary, (2) ~~or~~ a three-phase, delta-delta connected transformer having a 3-wire (single-voltage) secondary, or (3) a 3-phase, 3-wire ungrounded wye transformer, or (4) a 3-phase high resistance grounded wye transformer shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, provided this protection is in accordance with Section 450-3 and does not exceed the value determined by multiplying the secondary conductor ampacity by the secondary to primary transformer voltage ratio.

SUBSTANTIATION: This was a good and technically correct proposal when submitted for the 1999 Code cycle. Mr. Krupesh-Kumar K. Parikh, General Electric Company, has considered the technical problems concerning the issues surrounding this proposal and is correct in his conclusions.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.
PANEL STATEMENT: This proposal is technically sound but proper application may require engineering supervision. For example, the secondary conductors may have to be sized at 125-150 percent or more of the transformer secondary full-load current rating in order to be protected against overload by the primary overcurrent protective device.

Proper application is best restricted to Part H, Supervised Industrial Installations. See panel action and statement on proposal 10-71.

10- 14 - (240-4): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

Protection of Flexible Cords, Flexible Cables, and Fixture Wires. Flexible cords and cables, including tinsel cord and extension cords, and fixture wires shall be protected ~~against overcurrent~~ by overcurrent devices in accordance with either (a) or (b).

(a) Flexible cord and cable shall be protected by an overcurrent device in accordance with its ampacity as specified in Tables 400-5(A) and (B). (remainder of (a) unchanged)

(b) Branch Circuit Overcurrent Device. Flexible cord and fixture wire shall be considered to be protected against overcurrent where supplied by a branch circuit in accordance with ~~one of the methods described below~~ (1), (2), or (3).

(1) Supply Cord of Listed Appliances or Portable Lamps. Where flexible cord or tinsel cord is approved for and used with a specific appliance or portable lamp ~~it shall be permitted to be~~ and supplied by a branch circuit of Article 210 in accordance with the following: (remainder unchanged)

(2) Fixture Wire. Fixture wire ~~shall be permitted to be tapped~~ where used as tap conductors for connecting a lighting fixture(s) to the branch circuit conductors of a branch circuit of Article 210 in accordance with the following: (remainder unchanged)

(3) Extension Cord Sets. Flexible cord used in listed extension cord sets, or in extension cords made with separately listed and installed components ~~shall be permitted to be~~ where supplied by a branch circuit of Article 210 in accordance with the following:

20-ampere circuits- No. 16 and larger.

(c) Permanently Connected. Where permitted elsewhere in this code to be permanently connected as feeder or branch-circuit conductors, flexible cords and cables shall be permitted to be protected in accordance with applicable provisions of Section 240-3.

SUBSTANTIATION: Flexible cords should be noted because of the reference to Table 400-5(B) which covers such conductors. The fixture wire of (b)(2) should be limited to use as fixture tap conductors otherwise Sections 725-23 Exception and 760-23 Exception permits application to No. 18 and 16 fixture wires used for Class 1 and NPLFA circuits. The option of using (b) does not provide true "overcurrent" protection, as defined in Article 100, and may or may not even provide short-circuit or ground-fault protection. The proposed overcurrent "device" does not infer overcurrent protection is necessarily provided.

Fixture wire should be noted in the first paragraph of (a) as it is covered in (b).

Section 240-3 does not apply to flexible cords, and where they are permitted to be permanently connected as branch circuit or feeder conductors for temporary wiring, motors, cranes and hoists, elevators, floating buildings, etc., they must be protected in accordance with (a) of this section since they are not covered by (b). Where such cords have adequate ampacity, none of the subsections of Section 240-3 relating to overcurrent protection apply. If a flexible cord for a material handling magnet is permanently connected to a branch circuit with short-circuit protection only, per Section 240-3(a), it is likely the cord conductors would have to be "oversize" to comply with (a) of this section. A cord supplying a wet pit submersible motor rated 12 amperes could have an ampacity of 15, but if the circuit overcurrent device exceeds 15 amperes (e.g. 30 amperes) the cord would have to be increased in size to comply with (a) of this section. Is anyone requiring this?

Section 610-12(b) may be considered as modifying (a) of this section by virtue of Section 90-3 since it is not in permissive form, but Articles 364, 422, 430, 553, 610, 620 do not appear to have any modifications of this section.

PANEL ACTION: Reject.
PANEL STATEMENT: No justification was provided for adding flexible cables.

The proposed changes to (a) and (b) do not improve clarity.

The proposed item (c) is redundant with section 240-4(a).

(Log #3442)

10- 15 - (240-4(b)): Reject
SUBMITTER: Randall Kirkman, Energy, IL
RECOMMENDATION: Delete (1) and (3). Renumber existing (2) as new (1).

SUBSTANTIATION: The new requirement for AFCI protection for bedroom circuits is a step in the right direction in the pursuit of reducing electrically caused fires in residences. Fires caused by shorts in small cords and by overloaded cords will be greatly reduced in years to come as more and more new homes are built. Unfortunately, there are literally millions of existing homes that will not have the extra protection offered by AFCIs.

What are we as an industry going to do to protect the public that lives in existing homes? There is one major step that we can take. That needed step is to require protection of small cords at their ampacity. This can be accomplished economically by the manufacturer of the small appliance or the manufacturer of the extension cord. Agreed, this will not cover the hundreds of millions of appliances and extension cords that are currently in use, but, with limited life, these appliances and extension cords will be replaced

much sooner than the existing homes will be replaced. This gives us the means to reduce fires for the millions of existing homes.

How do we know that protecting small cords at their ampacity will reduce the amount of electrical fires? UL did a study for the U.S. Consumer Product Safety Commission (CPSC-C-94-1112). Following are quotes from that study.

Page (ix) "The technologies, as exemplified by the devices analyzed, demonstrated a capability of detecting and/or responding to certain types of abnormal conditions involving over temperature and/or overcurrent and showing that supplementary protection technology can contribute to a reduction in the likelihood of an electrically caused fire."

Page 18 "Supplementary protective devices are intended to be installed between the receptacle and the plug of an appliance. These devices provide fused-down customized overcurrent protection for certain loads and/or provide sensitivity to high temperatures that might develop at a plug or receptacle."

Page 136 "Abnormal conditions that involve normal load current levels but that do not involve arcing or current to ground (e.g., high resistance series faults, usage of undersized conductors, etc.) will not be detected by arc-fault detectors, fault interrupters, or overcurrent protection until and unless such conditions lead to overcurrent, ground faults and/or arcing faults. Supplementary protection devices can potentially address such conditions."

What about AFCIs. Won't they protect the small cords? As explained above, AFCIs won't generally be used in the millions of existing homes and therefore offer no protection for those homes. In addition, the same UL study as mentioned above makes the following statements with regard to the various protection techniques, including AFCIs.

Page x "It was determined that no single product or technology in the examined state of development would provide protection against all electrical ignition scenarios likely to be encountered in residential wiring systems."

Page 136 "From the previous discussion, it is evident that no single product or technology in the examined state of development was found to provide protection against all electrical overheating mechanisms, as shown in Figure 4, that might directly or indirectly lead to ignition."

In addition, UL 1669, the Standard for Safety for Arc-Fault Circuit Interrupters, makes it clear that AFCIs are not intended to open for all potential ignition-causing conditions. For example, the minimum current at which an AFCI is tested to open under the "point contact" test is 75 amperes (56.5.3). The value is set so high because the AFCI cannot trip out during the "Unwanted" Tripping Test. This proposal, if accepted, would therefore add a degree of safety above and beyond that provided by AFCIs for those current levels below which the AFCI is not required to open. It is a great combination to reduce electrically caused fires in new homes.

What kind of history do supplementary devices have as far as protection is concerned? Have they ever been required? Supplementary devices have never been required to protect small conductors in the United States. However, they have been required for many years in England, where they have an exemplary record.

Don't the branch circuit overcurrent devices in the panel provide protection? No, a 20 ampere fuse or circuit breaker is simply not designed to protect a number 18 copper conductor. Both devices can do an excellent job protecting a number 12 copper conductor, but neither can react to conductor overloads, which are less than the rating of the fuse or circuit breaker. Again, refer to the UL study for the CPSC.

Page 129 "Since present branch-circuit devices are only intended to protect properly sized wire against damage from overcurrent, they may not protect undersized conductors or high resistance series faults under overcurrent conditions."

In summary, this proposal will take advantage of a technology identified in the UL study that, if combined with AFCIs, will dramatically reduce the number of electrically caused fires in new homes. And because AFCIs won't find their way into most existing homes, this proposal will become the primary means to reduce the number of electrically caused fires in those homes.

PANEL ACTION: Reject.

PANEL STATEMENT: Section 240-4(b)(1) deals with the supply cords of listed appliances or portable lamps. These are the cords to dedicated loads of known ampacity. The proposal does not substantiate a problem with these cords. With respect to extension cord sets, section 240-4(b)(3), there have been major changes in the labeling and construction of these cords. Thus, 16 AWG and larger wire may be protected on 20-ampere circuits. Again, the proposal does not substantiate a problem with these cords.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2

EXPLANATION OF NEGATIVE:

DOLLARD: I am voting Negative to the panel action to reject proposal 10-15. My reasons are as follows:

I believe the submitter did substantiate that a problem exists in both appliance cords and extension cords. This substantiation is similar to the ones given in proposals 2-128 and 2-129 of the ROP stage in the 1999 code cycle, which resulted in a requirement for AFCI protection.

In the substantiations for proposals 2-128 and 2-129 in the 1999 code cycle numbers of fires are attributed to appliances, appliance cords, and extenstion cords. These staggering statistics demand that steps be taken to attempt to eliminate these potential fire hazards.

The steps that need to be taken are not within the scope of the NEC.

It is the appliance manufacturers and listing agencies that should evaluate appliance cords and extension cords. Appliance cords and extension cords should be tested and sized to allow the branch circuit overcurrent protective device to operate in the event of an overcurrent.

These two subdivisions should be deleted. These requirements belong in product standards not the NEC.

It is the job of the authority having jurisdiction to inspect the installation of conductors and equipment on an electrical installation. When was the last time a job was failed by an authority having jurisdiction because an appliance cord or extension cord set was undersized?

Appliance and extension cord manufacturers are sizing conductors according to the minimum requirements of the NEC as listed in 240-4. These conductors cause staggering numbers of fires. The scope of the NEC is the practical safeguarding of persons and property from hazards arising from the use of electricity. The scope of the NEC demands that this issue be addressed.

OCKULY: I vote negative on the panel action. The proposer did, in fact, supply compelling substantiation that problems exist with the use of supply cords and extension cord sets applied using Exceptions No. 1 and No. 3 in Section 240-4(b). The two exceptions are realistically outside the scope of the NEC and unenforceable! These cord sets are installed after the wiring installation has been "final inspected" by the Authority Having Jurisdiction.

Documentation has been supplied by the manufacturers of AFCI devices that fully two-thirds of dwelling fires occur in "zones" two and three. These zones, Zone 2 the cord set, and Zone 3 the utilization equipment, are beyond the premises hard wired system. Removal of Exceptions No. 1 and No. 3 from Section 240-4(b) would require the product standards to deal with the proper overcurrent protection of supply cords and extension cords. Further, addressing the flexible cord overcurrent protection issues in the product standards provides increased safety for existing dwellings when new cord sets and equipment are installed in older homes. It is difficult to understand why some provisions such as AFCIs are accepted in some articles of the NEC and the code chooses to ignore the similar fire and safety issues allowed by Exceptions No. 1 and No. 3 in this section.

(Log #3843)

10- 16 - (240-6 and 430-152): Reject

SUBMITTER: Brian Rahl, Riviera Electric

RECOMMENDATION: Relocation of text.

When looking for fuse and circuit breaker sizes for motor calculations which are in Section 240-6, should be listed for ease and convenience in two separate locations as sub-notes, 430-52 Rating or Setting for Individual Motor Circuits, and 430-152 Maximum Rating or Setting of Motor Branch-Circuit Short-Circuit and Ground-Fault Protective Devices.

SUBSTANTIATION: In Section 430-152, Maximum Rating or Setting of Motor Branch-Circuit Short-Circuit and Ground-Fault Protective Devices, Section 430-52, Rating or Setting for Individual Motor Circuits, and Section 240-6, Standard Ampere Rating Fuses and Fixed Trip Circuit Breakers.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not provided substantiation or a signature for this proposal. This proposal does not meet the requirements 4-3.3 of the Regulations Governing Committee Projects concerning content of proposals.

The submitter's intent is to relocate the standard sizes of overcurrent devices to Section 430-52 and Table 430-152. This section belongs in Article 240. Adding text to Article 430 is not

within the Scope of Panel 10. Section 90-1(c) states that the NEC is not intended as a design specification nor an instruction manual for untrained persons, users of Article 430 must also be aware of all other requirements of this code.

(Log #3867)

10- 18 - (240-6(a)): Accept
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Make the following revision to this section:
Additional ~~The~~ standard ampere ratings for fuses shall be ~~considered~~ 1, 3, 6, 10, and 601.
SUBSTANTIATION: Editorial correction.
PANEL ACTION: Accept.
The panel requests that the proposed revised sentence be placed as the second sentence of the existing code paragraph.
By doing this, the last sentence of this paragraph in the existing code will be deleted.
PANEL STATEMENT: The revised placement of sentences in the paragraph provides greater clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #407)

10- 19 - (240-6(b)): Reject
SUBMITTER: Amos D. Lowrance, Jr., City of Chattanooga, TN
RECOMMENDATION: Revise 240-6(b) to read as follows:
Adjustable-Trip Circuit Breakers. The rating of adjustable-trip circuit breakers having external means for adjusting the current setting (log-time pickup setting), not meeting the requirements of (c), shall be the maximum setting possible. A permanent label shall be placed on or adjacent to the breaker indicating the wire type and size feeding the overcurrent device.
SUBSTANTIATION: The idea behind this is to show at the area of adjustment the size of wire feeding the overcurrent device. This will help prevent the oversizing of the overcurrent device by the electrician.
PANEL ACTION: Reject.
PANEL STATEMENT: An adjustable trip circuit breaker, not meeting the requirements of (c), must be wired for the maximum circuit breaker setting. Since it is being wired as a conventional fixed-circuit-breaker, no additional marking is needed.
The substantiation is somewhat confusing since the application of 240-6(b) is with the protection of wire on the load side of the overcurrent device.

10- 21 - (240-11): Reject
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
A current-limiting overcurrent protective device is a device that, when interrupting currents in its current-limiting range, will reduce the current ~~flowing~~ in the faulted circuit...
SUBSTANTIATION: The use of "flowing" is redundant and not needed. Current is defined as the flow of electrons; therefore, it is more proper simply to say "current." The word current is used over 350 times in the code without the use of the words flow or flowing.
PANEL ACTION: Reject.
PANEL STATEMENT: Removal of the word "flowing" may cause confusion. Current-limiting devices, when operating within their current-limiting range, reduce current flowing, not the prospective short-circuit current available at the location of the fault.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3439)

10- 22 - (240-12): Reject
SUBMITTER: Diane L. Ricotta, Ft. Worth, TX
RECOMMENDATION: Revise this section to read:
240-12. Electrical System Coordination. Where an orderly shutdown is required to minimize the hazard(s) to personnel and equipment, the overcurrent protective devices shall be selectively coordinated for all values of overload and available short-circuit current. Under overload conditions, monitoring systems are permitted to cause the condition to go to alarm, allowing corrective action or an orderly shutdown, thereby minimizing personnel hazard and equipment damage.
For the purposes of this section, selective coordination is defined as the proper localization of a fault condition to restrict outages to the equipment affected, accomplished by the choice of selective fault-protective devices.
Remove the existing FPN as it is incorporated into the first paragraph.
SUBSTANTIATION: Current wording permits selective coordination for short circuit conditions and monitoring systems for overload conditions. It does not require selective coordination even though a blackout could result in hazards to both people and equipment. Proposed wording mandates selective coordination where required to minimize hazards to personnel and equipment and allows monitoring systems for overload conditions. Minor changes were made to the definition to clean up the grammar.
PANEL ACTION: Reject.
PANEL STATEMENT: There is confusion between the requirements of the first sentence and the second sentence. Furthermore, the present code language contains the phrase "shall be permitted" and it is considered that this phrase is required. The present FPN does provide explanatory material and it should not be moved into the main text.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2EXPLANATION OF NEGATIVE:
DOLLARD: I am voting Negative to the panel action to reject proposal 10-22. My reasons are as follows:

"The present text of Section 240-12 permits coordination, "Where an orderly shutdown is required to minimize the hazard(s) to personnel and equipment."

If an orderly shutdown is required to minimize the hazard(s) to personnel and equipment, then there should be a minimum requirement to provide for an orderly shutdown."

OCKULY: I vote negative on the panel action. I disagree with the panel statement that there is confusion between the requirements of the first sentence and the second sentence of the proposal. The second sentence of the proposal does not modify or conflict with the first sentence. It simply states that system coordination is sometimes achieved under overload conditions by means of monitoring systems. It does not provide an exception to the need for system coordination under overload conditions. The proposal is correct and covers a missing part of supplying a fully coordinated system. As presently written, Section 240-12 does not include requirements for coordination over the full range of an overcurrent protective device's time verus current characteristics including overload, short-circuit, or ground fault. The section only addresses short-circuit.

The potential dangers inherent in a noncoordinated system are every bit as serious if the system overcurrent protective devices cascade out due to overload or ground fault as well as short-circuit.

The international wiring code, specifically IEC 60364, is in the process of considering the need and requirement for coordination in Clause 539.1, discrimination (coordination) between overcurrent protective devices. The NEC should lead in this field. As such, the proposal should be accepted.

(Log #3856)

10- 23 - (240-13): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 4 for information.

SUBMITTER: J. Philip Simmons, Olympia, WA

RECOMMENDATION: Delete this section and add these requirements to become a new Section 225-41. A companion proposal has been submitted for Section 225-41.

SUBSTANTIATION: Part B of Article 225 deals with disconnecting means for buildings and structures on the premises that are supplied from a service in another building or structure. Section 240-13, which covers equipment ground fault protection requirements for building disconnecting means should be located where the other requirements for building or structure disconnecting means are located.

This should improve the structure of the Code and made the Code more "user friendly."

PANEL ACTION: Reject.

PANEL STATEMENT: The general requirements for ground fault protection of equipment belong in Article 240 dealing with overcurrent protection.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

MUNSON: I agree with the submitter, moving this section to Article 225 will make the code more user friendly. As the code moves into the international arena, it must be easily understood. Associating similar requirements just makes good sense and helps with understanding.

OCKULY: I vote negative on the panel action. I agree with the submitter's proposal. Section 240-13 is redundant and should be removed from the NEC. Ground fault protection of equipment is already covered in numerous sections, including 215-10, 230-95, 426-28, 427-22, 517-17, 690-5 and 700-26.

(Log #4417)

10- 24 - (240-13): Reject

SUBMITTER: Charles Meeker, Electro-Test, Inc.

RECOMMENDATION: Revise text as follows:

240-13. Ground-Fault Protection of Equipment. Ground-fault protection of equipment shall be provided in accordance with the provisions of Section 230-95 for solidly grounded wye electrical systems ~~of more than 150 volts to ground, but not exceeding 600 volts phase-to-phase~~ for each individual device used as a building or structure main disconnecting means. ~~rated 1000 amperes or more.~~

SUBSTANTIATION: There are two reasons for proposing these changes.

1. The deleted words are redundant and unnecessary.
2. To eliminate conflict between proposed changes to 230-95.

The intent of the change is based on the hazards of arcing ground-faults which are determined by total system capacity, and not the size of an individual disconnect rating. Therefore, it is the equipment rating of 1000 amperes or greater that should be used to determine the need for ground-fault protection. For example, the number of individual disconnecting means, as allowed by 230-71, does not reduce the potential hazard to person or equipment of arcing ground-faults, if the rating of the equipment is still 1000 amperes or greater.

PANEL ACTION: Reject.

PANEL STATEMENT: Ground-fault protection of equipment on solidly grounded wye electrical systems rated 1000 amperes or more operating at 480Y/277 volts and 600Y/346 volts was first required in the 1971 Code because of the unusually high number of burndowns reported on these types of systems.

Historically, systems lower than 150 volts to ground do not present the same problems. Also, disconnecting means rated less than 1000 amperes and associated overcurrent devices provide an alternate form of protection.

Ground-fault protection of services will not protect the conductors on the supply side of the service disconnecting means, but is designed to provide protection from line-to-ground faults that occur on the load side of the ground-fault protective device.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #2329)

10- 25 - (240-13(4) (New)): Reject

SUBMITTER: Mark Ptashkin, City of Phoenix, AZ

RECOMMENDATION: Add the following to this section.

(4) Data processing facilities that fall under the scope of Article 645.

SUBSTANTIATION: It has been argued that the loss of power presents the same financial risks to these facilities as it does to industrial facilities. A building owner may wish to preserve the data or the continued operation of the equipment at all costs to the equipment. In other words they would be willing to sacrifice elements of the system to assure its operation, but in so doing, may endanger the well being of occupants in the facility.

Several sections of the code do not require GFP, these include emergency systems, legally required systems, fire pumps, and many areas of hospitals. All of these share a common thread, the activation of the GFP may introduce additional hazards to the welfare of people should they operate. The NEC does not wish to jeopardize the safety of individuals for the continuity of operation of a system that does not provide support for the safety of individuals, or that if it were provided, would endanger individuals through its operation.

The reason for this proposal is to clarify that GFP should be provided in all cases, except where the installation of such equipment would impose an additional hazard to the safety of individuals.

PANEL ACTION: Reject.

PANEL STATEMENT: Loss of power is a financial risk that can be abated by the use of UPS systems and standby generators. The proposal equates financial risk that may be associated with the loss of data with risks associated with loss of power in industrial processes which may include personnel hazards.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #3091)

10- 26 - (240-20(b)): Accept

SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)

RECOMMENDATION: Revise the text in item (b) as follows:

(b) Circuit Breaker as Overcurrent Device. Circuit breakers shall open all ungrounded conductors of the circuit both manually and automatically ~~unless otherwise permitted in (1), (2), or (3)~~.

Exception: Individual single-pole circuit breakers, with or without approved handle ties, shall be permitted as the protection for each ungrounded conductor of multiwire branch circuits that serve only single-phase, line-to-neutral loads except where limited by Section 210-4(b).

~~(1) Except where limited by Section 210-4(b), individual single-pole circuit breakers, with or without approved handle ties, shall be permitted as the protection for each ungrounded conductor of multiwire branch circuits that serve only single-phase, line-to-neutral loads.~~

~~(2) In grounded systems, individual single-pole circuit breakers with approved handle ties shall be permitted as the protection for each ungrounded conductor of line-to-line connected loads for single phase circuits for 3-wire, direct current circuits.~~

~~(3) For line-to-line loads in 4-wire, 3-phase systems or 5-wire, 2-phase systems having a grounded neutral and no conductor operating at a voltage greater than permitted in Section 210-6, individual single-pole circuit breakers with approved handle ties shall be permitted as the protection for each ungrounded conductor.~~

SUBSTANTIATION: The main clause of 240-20(b) in the present Code states that circuit breakers shall open all ungrounded conductors of the circuit unless otherwise permitted in (1), (2), or (3). The implication of the main clause is that circuit breakers are common trip. This is certainly the interpretation of the NFPA National Electrical Code Handbook which states "Section-20(b) requires that if a circuit breaker is used, it must open all ungrounded conductors of the circuit when it trips or is manually operated." The proposed language "Circuit breakers shall open all ungrounded conductors of the circuit both manually and automatically" clarifies this situation.

Many users of circuit breakers are unaware that handle ties do not cause the circuit breaker to serve as a common trip mechanism, but rather that they allow for common switching only. This is clarified in the Handbook that states, "handle tie mechanism circuit breakers are permitted as a substitute for internal common trip mechanism circuit breakers only for limited applications." These limited applications are Exceptions (1), (2), and (3) in the present Code.

This proposal includes removing the permitted areas (2) and (3). These permitted areas deal with the protection of line to line loads, in grounded systems, by individual single-pole circuit breakers with approved handle-ties. With these circuit breakers, and for this type of load, an overcurrent could be removed by the tripping of one of the individual circuit breakers. Under these circumstances, voltage would still be present on the deenergized load. Removal of these two permitted areas would cause circuit breaker users to use common trip circuit breakers for line to line loads in grounded systems. These circuit breakers are commonly available with the same physical size as handle-tied individual single-pole circuit breakers. In fact, the common-trip-breakers are frequently difficult to distinguish from the non-common-trip breakers because both types can be equipped with handle-ties. In both cases the ties are associated with the manual switching operation of all poles. The advantage of the common trip circuit breaker would be the removal of both current and voltage at the load.

The proposal maintains permitted area (1), which has been rewritten as an exception to the main clause 240-20(b). This exception deals with the protection of line to neutral loads. In this case, an overcurrent in one of the load circuits could be removed by the tripping of one individual single-pole circuit breaker. The significant point is that voltage would also be removed from that particular deenergized load.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9

NEGATIVE: 3

EXPLANATION OF NEGATIVE:

ELDRIDGE: This proposal should have been: Accept in Part, in Principle. Add the words as follows:

"Circuit breakers shall simultaneously open all ungrounded conductors of the circuit by means of a common trip mechanism unless otherwise permitted in (1), (2), or (3)."

Common trip is used in the UL product standard and is recognized in the industry. The remaining portion shall remain unchanged, as the substantiation has presented no documented problems with handle ties. This is the same as trying to require common trip fuses.

This proposal has been presented with no substantiation other than to delete the two subsections to "provide better protection and to follow the National Fire Protection Association handbook." If protection was the problem, why allow fuses to be used since they cannot be common trip. Circuit breakers with approved handle ties must be used on a grounded system. Is this any different than the way fuses are used with the same system? The ONLY reason for the handle ties is to provide for common switching, the same as in the realm of safe fusing practices.

The question of safety was raised in the panel discussions. The failure of a load to continue to operate is not sufficient to determine that a circuit is dead and is a violation of all safety rules that I know of with or without common-trip breakers or fuses. It is not reasonable to assume a circuit is dead without testing for the presence of voltage.

I understand the cost of common trip circuit breakers is not much more than single pole breakers, cost is not the problem; however, I have found that the cost of common trip circuit breakers is 15 percent to 30 percent over single pole circuit breakers without handle ties. It appears that this may be an attempt by the circuit breaker manufacturers to sell a more expensive product. Deleting (2) and (3) will require all line-to-line loads to have the more expensive "common trip" circuit breakers. In dwelling units this will include all 240-volt circuits.

MUNSON: The purpose of the handle tie is to achieve full manual disconnection of a load during servicing or shut down. If normal, safe operation of an appliance or piece of utilization equipment requires protection with a circuit breaker that automatically interrupts all ungrounded lines by means of internal common trip construction, then such requirement should be a required marking on the appliance or part of the manufacturer's installation literature.

OCKULY: I vote negative on the panel action. Single-pole circuit breakers with approved tie handles have been used safely for decades. The submitter has provided no evidence or substantiation of a problem. This proposal would remove from the code a long-standing safe installation method of using single-pole circuit breakers with or without approved tie handles on single-phase line-to-line circuits.

Acceptance of this proposal also would create significant problems where a single-pole CB with an approved tie handle must be replaced. The proposal would require replacing not only the defective CB but, also the perfectly good companion CB connected by the tie handle. For some installations, it would be difficult and sometimes impossible to find a replacement two-pole common trip CB to replace the defective single-pole unit.

The NEC permitted two single-pole circuit breakers without tie handles from the 1960's through the 1993 NEC. The 1996 NEC introduced "approved tie handles" to address the issue of common disconnecting of the circuit.

The long, safe history of applying single-pole circuit breakers (even without handle ties) speaks for itself. There is no justification to require common trip CBs on single-phase line-to-line circuits.

COMMENT ON AFFIRMATIVE:

KIMBLIN: The expectation, for multipole circuit breakers, is that the poles not only switch together under manual operation, but that the poles open together due to the presence of overcurrents in any individual pole. Handle-ties indeed ensure the simultaneous switching of all poles, but do not ensure the opening of all poles in the presence of overloads and short circuits. The present proposal permits the continued use of handle-tied circuit breakers on line to neutral loads. Here, operation of a single pole interrupts the load current and also removes voltage from that load. However, the proposal does not permit the continued use of handle-tied circuit breakers on line to line connected loads. Here, operation of a single pole interrupts the load current but does not necessarily remove voltage from the load. It is noted that the titles, identified in Panel Proposal 10-26a, will not be needed if Proposal 10-26 is accepted.

(Log #CP1002)

10- 26a - (240-20(b)(1), (2), (3)): Accept

Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 10-26. This action will be considered by the Panel as a Public Comment.

SUBMITTER: CMP 10

RECOMMENDATION: Revise 240-20 to read as follows:

"240-20. Ungrounded Conductors

(b) Circuit Breaker as Overcurrent Device. Circuit breakers shall open all ungrounded conductors of the circuit unless otherwise permitted in (1), (2), or (3).

(1) Line-to-Neutral Single Phase Loads. Except where limited by Section 210-4(b), individucal single-pole circuit breakers, with or without approved handle ties, shall be permitted as the protection for each ungrounded conductor of multiwire branch circuits that serve only single-phase, line-to-neutral loads.

(2) Line-to-Line Loads. In grounded systems, individual single-pole circuit breakers with approved handle ties shall be permitted as the protection for each ungrounded conductor for line-to-line connected loads for single-phase circuits or 3-wire, direct-current circuits.

(3) Line-to-line Loads in Polyphase Systems. For line-to-line loads in 4-wire, 3-phase systems or 5-wire, 2-phase systems having a grounded neutral and no conductor operating at a voltage greater than permitted in Section 210-6, individual single-pole circuit

breakers with approed handle ties shall be permitted as the protection for each ungrounded conductor."
SUBSTANTIATION: The proposed change is to provide titles to these second level subdivisions as required by 2.1.5.2 of the NEC Style Manual.
PANEL ACTION: Accept.

(Log #628)

10- 28 - (240-21(b)(3)b): Reject
SUBMITTER: Vohn N. Peeler, Faith, NC
RECOMMENDATION: Delete existing Section 240-21(b)(3)b and replace with new wording as listed below:
The ampacity of the conductors supplied by the transformer secondary shall not be less than the following: Divide the rating of the overcurrent device protecting the feeder by 3. Multiply this number by the ratio of primary to secondary voltage to find the required ampacity.
SUBSTANTIATION: While I believe the current wording is correct, I also believe that it is difficult to interpret and easy to misapply. I have been teaching the NEC and other electrical courses for many years. I am currently using a textbook written by a well-known code expert. I am convinced that the code expert has misapplied this section. Here is the basic example:
The feeder OCPD is rated 600 amps.
The transformer is 480V primary and 240V secondary.
The tap conductor to the primary side of the transformer is found this way: 1/3(600A) = 200A
The secondary tap conductor is found this way: (1/3)(600A)(.5)= 100A.
I believe it is intended that the ampacity of the secondary tap conductor should be 400A.
If code experts have trouble interpreting this section, then rewording is needed to give the rest a chance.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter acknowledges that the present wording is correct. It is unnecessary to add specific instructions.

(Log #2330)

10- 29 - (240-21(b)(5)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Change this section as follows, add underlined text and delete strike through text.
"Where the conductors are ~~located outdoors,~~ routed outside a building, except at the ~~point~~ points of termination, and comply with all of the following conditions."
SUBSTANTIATION: This editorial change would permit the feeders to be located under a building as is permitted by 230-6 for service conductors. It seems that the articles intent was to permit any length of unprotected conductor provided it was routed outside of the building.
The change from point to points would allow both ends of a tap to be in the same building provided that they immediately exit and then terminate nearest the point of entry. This change should not have a negative impact on safety, in fact it should in most cases have a shorter length of unprotected conductor in the building than the 10 or 25 ft tap rules.
PANEL ACTION: Reject.
PANEL STATEMENT: Changing the word "point" to "points" implies multiple points of termination and could allow overcurrent protection in excess of the original tap conductor rating, thereby, creating a safety concern.
Section 240-21(b)(5) deals with outside taps. In order to avoid tapping a tap, the proposal would require protection of the incoming tap at its ampacity per 240-21(b)(5)(b). However, the second point of entry would require exactly the same protection. This means that the first incoming outside tap could be overloaded.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
BORTHICK: I agree with the panel action to reject this proposal.
Allowing tap conductors of unlimited length without size restriction removes any maximum limit on circuit (feeder) impedance. With no tap limitations a short-circuit or ground-fault in the tap conductors might not deliver sufficient current to operate the feeder overcurrent protective device quickly enough to prevent damage to the tap conductors or combustibles surrounding them. To permit multiple entry and exit points of these tap conductors allows even more length of these "unprotected conductors" inside a building where persons are in closer proximity.

(Log #4062)

10- 30 - (240-21(b)(5)): Reject
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./Rep. Edison Electric Inst.
RECOMMENDATION: Revise text as follows:
(5) Outside Taps of Unlimited Length. Where the conductors are located outdoors, except at the point of termination, and comply with all of the following conditions.
a. The conductors are suitably protected from physical damage.
b. ~~The conductors terminate at a single circuit breaker or a single set of fuses that will limit the load to the ampacity of the conductors. This single overcurrent device shall be permitted to supply any number of additional overcurrent devices on its load side.~~ The conductors supply a building or other structure in conformance with the requirements of Article 225.
c. The overcurrent device for the conductors is either an integral part of ~~b~~ the disconnecting means specified in Part B of Article 225 or ~~shall be~~ located immediately adjacent thereto.
d. ~~The disconnecting means for the conductors are installed at a readily accessible location either outside of a building or structure, or inside nearest the point of entrance of the conductors.~~ The overcurrent protection complies with Section 230-90.
SUBSTANTIATION: Article 225 recognizes buildings served by a feeder. Part B of Article 225 specifies the required disconnecting means for the building or structure. Whether a building is supplied by a service per Article 230 or a feeder per Article 225, the conductors are protected from overload if such protection complies with 230-90. There is no technical justification to treat the building feeder conductor overcurrent protection differently than that required for service conductors in 230-90. Both must be sized to carry the computed load. This is particularly true recognizing that the feeder conductors have short circuit protection on their supply side. For example, when the ownership of the feeder supply conductors change due to a relocation of the service point as frequently occurs, present 240-21(b)(5) in many instances would require the unnecessary installation of a single main overcurrent device to protect the same tap conductors that are adequately protected by conformance with the requirements of 230-90. Section 225-33 permits the supply feeder to terminate in up to six disconnect switches. This proposal resolves the apparent conflict between the requirements of 225-33 and 240-21(b)(5).
PANEL ACTION: Reject.
PANEL STATEMENT: Addressing first of all Article 225, here the feeder conductors are protected, at their ampacity, at their source. If the feeder conductors were taps, then they would have to be installed in accordance with 240-21(b). In particular, they would need to terminate in a single overcurrent device as per 240-21(b)(5)(b). With respect to 230-90, the service conductors (the conductors from the service point to the service disconnecting means) are indeed protected, at their ampacity, by up to six overcurrent devices. However, these six overcurrent devices are not necessarily sized to protect the utility conductors, of unlimited length, which lead to the service point. Outside feeder tap

conductors fall under the jurisdiction of the Code, and it is necessary to protect these conductors at their ampacity, even though the overcurrent protective device is at the load end of the conductors. A single overload protective device is necessary to ensure overload protection of this tap. With respect to the equipment, changes associated with a change of ownership, this change is also associated with a change of safety-responsibility. A single overcurrent device is mandated unless the plant falls under Part H of Article 240, Supervised Industrial Installations.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
ELDRIDGE: Proposal 10-30 should have been accepted. Addressing the panel statement, the tap feeder conductors are sized to carry the load and protected at their load end, the same as all taps. Short circuit and ground fault protection is provided at the source of the feeder. The tap conductors would be protected better if the overcurrent protection were in multiple overcurrent devices instead of a single overcurrent device because of the diversity. Overload, short circuit or a ground fault on the load side of the smaller overcurrent device would have lesser effect on the tap conductors than if it were on the load side of a single, larger overcurrent device. The panel statement does not respond to these facts in its assertion that a single overcurrent device is necessary.
A change in ownership associated with the sale of a utility installation to a customer would not change the safety of the former service conductors, now classified as tap conductors.
The following information was sent to Stanley D. Kahn, who was chairman of CMP 10 at the time, on February 23, 1996. It was the outcome of a CMP 4 Task Group established at the direction of the Correlating Committee as the result of action on the part of Panel 10, which was considered outside its scope.
The following was CMP 4's unanimous Task Group Response to CMP 10:
"1. Substantiation referencing utility practices has no bearing on dictating changes to the requirements of the number of disconnects allowed for a feeder.
2. The number of disconnects referenced in Proposal 10-60 (this was Proposal 10-60 for the 1996 cycle) would be compatible with the requirements for a feeder found in Article 225. Six Disconnects installed at a location, in a single enclosure or in separate enclosures grouped together, would constitute a safe installation."
Copies of this was sent to Harold Ware, Don Strassburg (Task Group Chair), Mark Earley, and John Troglia.
Service conductors are permitted to be protected by up to six disconnecting means and there is no justification why feeders, which supply a building or other structure, should not be allowed the same measure of protection.
This has presented a problem of lack of coordination between Article 225 and 240 that will continue if not addressed this code cycle. Since there is a conflict between these two articles, the TCC should help resolve this issue.
FREDERICKS: I'm voting against the panel action on this proposal, which should have been accepted.
The panel should consider that installations with from two to six grouped disconnects are presently allowed for feeders in Article 225, and for transformer secondary protection in Article 450. The panel statement gave no justification for its claim that a single overcurrent device is required to limit the load at the end of the tap conductors and that this same effect could not be accomplished with up to six grouped overcurrent devices. Indeed, Articles 225 and 450 recognize this method of protection, so this panel action results in a lack of correlation with these articles.
MUNSON: The proposal should be Accepted in Principle. The panel statement correctly identifies the problem. In Article 230, the six handles are permitted to allow for an orderly shutdown in the case of emergency. The six sets of overcurrent devices do not protect the utility. In Article 240, we are dealing with two issues, the orderly shutdown in the case of an emergency and secondly, ensuring that the tap does not become overloaded by future additions that increase the number of "handles" past six or that increase the total load above the ampacity of the tap. The panel should Accept this proposal in Principle, and require identification of the uniqueness of the construction; only six "handles" permitted and the maximum total load for the tap.
COMMENT ON AFFIRMATIVE:
BORTHICK: I agree with the panel action to reject this proposal: 240-21(b) general statement allows conductors to be tapped to a feeder. Each of the proposed changes is to allow up to five additional taps to be tapped to the tap. The second sentence of 240-21 specifically prohibits this.

(Log #2111)

10- 31 - (240-21(b)(5)b): Reject
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Revise the text in 240-21(b)(5)b as follows:
b. The conductors, if smaller than 250 kcmil, terminate at a single circuit breaker or a single set of fuses that will limit the load to the ampacity of the conductors. This single overcurrent device shall be permitted to supply any number of additional overcurrent devices on its load side. For conductors larger than 250 kcmil, the overcurrent device shall be permitted to consist of not more than six circuit breakers or six sets of fuses grouped in one location.
SUBSTANTIATION: The overcurrent device referenced here is providing overload, not short circuit protection. There is no valid overcurrent-protection reason to limit the number of devices used to provide this protection, at least for larger circuits. The time-honored NEC limit of six devices, based on disconnection reasons, is proposed here. One comment made against similar proposals for the 1999 NEC was that there was no limit on the size of the conductors allowed to be terminated with six disconnects; this proposal addresses that comment.
PANEL ACTION: Reject.
PANEL STATEMENT: No justification has been presented for dealing in a different manner with feeder tap conductors smaller than 250 kcmil and feeder tap conductors larger than 250 kcmil. A single overcurrent device should be used in both cases. Also, see panel action and statement on proposal 10-30.

(Log #2916)

10- 33 - (240-21(c)): Reject
SUBMITTER: Arthur J. Carlson, City of Pocatello, ID
RECOMMENDATION: Revise text to read:
(c) Transformer Secondary Conductors. Conductors shall be permitted to be connected to a transformer secondary, ~~without overcurrent protection at the secondary,~~ as permitted in (1) through (4).
SUBSTANTIATION: 240-21(c) is about transformer secondary wiring with and without over current protection.
PANEL ACTION: Reject.
PANEL STATEMENT: Conductors attached to a transformer secondary are not required to have an overcurrent device(s) at that location where the provisions in (1) through (4) are followed. Therefore, the present wording is appropriate.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3286)

10- 34 - (240-21(c)): Accept
SUBMITTER: James T. Pauley, Square D Co.
RECOMMENDATION: In 240-21(c), main paragraph revise "(4)" to be "(6)".
In 240-21(c)(3), revise the title as follows: (3) Industrial Installation Secondary Conductors Not Over 25 ft Long.
Add a new (6) to 240-21(c) to read as follows:
(6) Secondary Conductors Not Over 25 ft Long. Where the length of secondary conductor does not exceed 25 ft and complies with all of the following.
(a) The secondary conductors shall have an ampacity that, when multiplied by the ratio of the secondary-to-primary voltage, is at least one-third of the rating of the overcurrent device protecting the primary of the transformer.
(b) The secondary conductors terminate in a single circuit breaker or set of fuses that will limit the load current to not more than the conductor ampacity that is permitted by Section 310-15.
(c) The secondary conductors are suitably protected from physical damage.
SUBSTANTIATION: The objective of this proposal is to solve a long-time problem of "How do I get a 25' secondary on a transformer?" The Code has allowed a 25' secondary by applying the rules in 240-21(b)(3) and making the primary conductors "fully protected" to allow the full 25' on the secondary. The problem with using this rule is two fold. First, the rule is actually for a transformer circuit that is "tapped" to a feeder. In many cases, the circuit is not tapped to a feeder, but it is a direct connection to the feeder overcurrent device. Secondly, getting the user of the NEC to sort through the rule to get to a simple 25' tap is a complex task. The AHJ must "liberally" interpret the "tap" concept to allow it to be applied to a transformer primary directly connected to a feeder OCP.
The new (6) is based on three key rules from 240-21(c)(3)...items b, d and e. The 25' secondary would have to terminate in a single OCP to limit the load and would also have to comply with the 1/3 rule when multiplied by the secondary-to-primary voltage ratio.
The revisions proposed for 240-21(c) and 240-21(c)(3) are really editorial changes to correlate with the new item (6). The recommended title change in (c)(3) would allow the user to easily distinguish the more liberal "industrial installation" rule from the general proposed 25' tap rule.
This proposal will simplify something that is permitted today, but takes considerable explaining to get there.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3936)

10- 35 - (240-21(c)): Reject
SUBMITTER: William F. Laidler, Town of Hanover, MA
RECOMMENDATION: Delete the existing 240-21(c)(2) Transformer Secondary Conductors Not Over 10 ft Long.
Renumber existing 240-21(c)(3) as (2) and strike the restrictive wording "For industrial installations only" to read as follows:
(2) Secondary Conductors Not Over 25 ft (7.62 m) Long. ~~For industrial installations only,~~ where the length of the secondary conductors do not exceed 25 ft (7.62 m) and complies with all of the following:
Add the FPN from the deleted 240-21(c)(2) where it's still relevant to this section.
FPN: For overcurrent protection requirements for lighting and appliance branch-circuit panelboards, see Sections 384-16(a) and (e).
Renumber the remaining sections of 240-21(c) accordingly.
SUBSTANTIATION: As the current Code reads, the maximum length of transformer secondary conductors for other than industrial installations is limited to ten feet (total conductor length). There are many installations in non industrial locations where these conductors are installed without overcurrent protection at their point of supply and exceed the restrictive limitation of 10 feet. In short, the 25 foot rule has been used extensively without a rash of failures.
With the requirement of most equipment in least amount of space it is becoming quite common to install elevated transformers if the secondary conductor installations conform with the requirements of (c)(3) 25 foot rule so to say than whether industrial or commercial the minimum safety requirements are met.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not agree with the need for deleting the restriction "for industrial installations only." For general use as a 25 foot tap rule, more restrictions must be imposed, such as a requirement for the conductors to be enclosed in a raceway.

10- 37 - (240-21(c)(4)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Revise the current paragraph as follows, add underlined text and delete strike through text.
"Where the conductors are ~~located outdoors,~~ routed outside a building, except at the ~~point~~ points of termination, and comply with all of the following conditions."
Add the following part (e):
(e) The secondary conductors immediately exit the building.
SUBSTANTIATION: This editorial change would permit the feeders to be located under a building as is permitted by 230-6 for service conductors. It seems that the articles intent was to permit any length of unprotected conductor provided it was routed outside of the building. Currently the article suggests that conductors are to be outdoors, underground conductors would not be permitted.
The change from point to points would allow both ends of the secondary conductor to be in the same building provided that they immediately exit and then terminate nearest the point of entry. As presently worded the transformer must be located outside the building. Placing the transformer inside a building should have little if any additional hazard to the structure and in fact may improve service continuity. This change should not have a negative impact on safety, in fact it should in most cases have a shorter length of unprotected conductor in the building than the 10 or 25 ft tap rules.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 10-29. In addition, the proposal, as written, could allow multiple-tapping of the original tap conductors, subjecting them to overload.

SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./Rep. Edison Electric Inst.
RECOMMENDATION: Revise text as follows:
(4) Outside Secondary Conductors. Where the conductors are located outdoors, except at the point of termination, and comply with all of the following conditions:
a. The conductors are suitably protected from physical damage.
b. ~~The conductors terminate at a single circuit breaker or a single set of fuses that will limit the load to the ampacity of the conductors. This single overcurrent device shall be permitted to supply any number of additional overcurrent devices on its load side.~~ The conductors supply a building or other structure in conformance with the requirements of Article 225.
c. The overcurrent device for the conductors is either an integral part of ~~b~~ the disconnecting means specified in Part B of Article 225 or ~~shall be~~ located immediately adjacent thereto.
d. ~~The disconnecting means for the conductors are installed at a readily accessible location either outside of a building or structure, or inside nearest the point of entrance of the conductors.~~ The overcurrent protection complies with Section 230-90.
SUBSTANTIATION: Article 225 recognizes buildings served by a feeder. Part B of Article 225 specifies the required disconnecting means for the building or structure. Whether a building is supplied by a service per Article 230 or a feeder per Article 225, the conductors are protected from overload if such protection complies with 230-90. There is no technical justification to treat the building feeder conductor overcurrent protection differently than that required for service conductors in 230-90. Both must be sized to carry the computed load. This is particularly true recognizing that the feeder conductors have short circuit protection on their supply side. For example, when the ownership of the secondary conductors change due to a relocation of the service point to the primary side of the transformer, as frequently occurs, present 240-21(c)(4) in many instances would require the unnecessary installation of a single main overcurrent device to protect the same conductors that are adequately protected by conformance with the requirements of 230-90. Section 225-33 permits the supply feeder to terminate in up to six disconnect switches. This proposal resolves the apparent conflict between the requirements of 225-33 and 240-21(c)(4).
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 10-30.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
ELDRIDGE: Proposal 10-39 should have been accepted. Addressing the panel statement, the tap feeder conductors are sized to carry the load and protected at their load end, the same as all taps. Short circuit and ground fault protection is provided at the source of the feeder. The tap conductors would be protected better if the overcurrent protection were in multiple overcurrent devices instead of a single overcurrent device because of the diversity. Overload, short circuit or a ground fault on the load side of the smaller overcurrent device would have lesser effect on the tap conductors than if it were on the load side of a single, larger overcurrent device. The panel statement does not respond to these facts in its assertion that a single overcurrent device is necessary.
A change in ownership associated with the sale of a utility installation to a customer would not change the safety of the former service conductors, now classified as tap conductors.
The following information was sent to Stanley D. Kahn, who was chairman of CMP 10 at the time, on February 23, 1996. It was the outcome of a CMP 4 Task Group established at the direction of the Correlating Committee as the result of action on the part of Panel 10, which was considered outside its scope.
The following was CMP 4's unanimous Task Group Response to CMP 10:
"1. Substantiation referencing utility practices has no bearing on dictating changes to the requirements of the number of disconnects allowed for a feeder.
2. The number of disconnects referenced in Proposal 10-60 (this was Proposal 10-60 for the 1996 cycle) would be compatible with the requirements for a feeder found in Article 225. Six Disconnects installed at a location, in a single enclosure or in separate enclosures grouped together, would constitute a safe installation."
Copies of this were sent to Harold Ware, Don Strassburg (Task Group Chair), Mark Earley, and John Troglia.
Service conductors are permitted to be protected by up to six disconnecting means and there is no justification why feeders, which supply a building or other structure, should not be allowed the same measure of protection.
This has presented a problem of lack of coordination between Article 225 and 240 that will continue if not addressed this code cycle. Since there is a conflict between these two articles, the TCC should help resolve this issue.

FREDERICKS: This proposal should have been accepted in principle, see my Explanation of Negative Vote on Proposal 10-30.
MUNSON: See my Explanation of Negative on Proposal 10-30.

(Log #2294)

10- 40 - (240-21(c)(4)(b)): Reject
SUBMITTER: Dann M. Strube, Lanesville, IN
RECOMMENDATION: Delete existing text and insert new text to read:
"The conductors terminate in an overcurrent device that will limit the load to the ampacity of the conductors. The overcurrent device shall be permitted to consist of not more than six circuit breakers or sets of fuses grouped in one location."
SUBSTANTIATION: Other sections allowing six disconnects:
225-33 More than one building or structure
230-71 Services
240-92(b)(2) from your own panel guys!
240-92(c) from your own panel guys!
450-3(a) and (b) Transformers.
The general membership voted for six at the 1998 meeting. The NEC should be responsive to the needs of the industry and this section is not.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 10-30.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
ELDRIDGE: This proposal should have been Accept in Principle. See my Explanation of Negative Vote on Proposal 10-39.

MUNSON: See my Explanation of Negative Vote on Proposal 10-30.

(Log #738)

10- 41 - (240-24(a)(3), (b)): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a)(3) For overcurrent devices, as described in Section 225-40~~. and 230-92.~~
(b) Occupancy. Each occupant shall have ready access to all overcurrent devices protecting the conductors supplying that occupancy. Where electric service and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the service, overcurrent devices, feeder and branch circuit overcurrent devices supplying more than one occupancy shall be permitted to be accessible to only authorized management personnel in the following:
(1) In multiple occupancy buildings.
(2) For guest rooms of hotels and motels that are intended for transient occupancy.
SUBSTANTIATION: Although Section 230-92 refers to readily accessible the substance appears related to accessible. (See my proposal for that section).
It seems reasonable to include branch circuit overcurrent devices. Branch circuit panelboards serving more than one occupancy are commonly installed in hallways of hotels and motels and locked (not accessible) This section does not permit such locking.
PANEL ACTION: Accept in Principle in Part.
1. The panel accepts the principle of allowing restricted access to the overcurrent devices supplying the guest rooms of hotels and motels.
2. The remainder of the proposal is rejected.
PANEL STATEMENT: 1. See panel action and statement on Proposal 10-41a.
2. The reference to Section 230-92 is necessary to allow tenants accessiblity to their branch circuits. Adding "and branch circuit" would be in conflict with Section 230-92.

10- 41a - (240-24(b)): Accept
SUBMITTER: CMP 10
RECOMMENDATION: Revise as follows:
(b) Occupancy. Each occupant shall have ready access to all overcurrent devices protecting the conductors supplying that occupancy.
Exception No. 1: Where electric service and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the service overcurrent devices and feeder overcurrent devices supplying more than one occupancy shall be permitted to be accessible to only authorized management personnel in the following:
1. In multiple occupancy buildings.
2. For guest rooms of hotels and motel that are intended for transient occupancy.
Exception No. 2: Where electric service and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the branch circuit overcurrent devices supplying any guest rooms shall be permitted to be accessible to only authorized management personnel for guest rooms of hotels and motels that are intended for transient occupancy.
SUBSTANTIATION: It is important to permit restricted access to the branch circuit overcurrent protective devices in hotels and motels from tampering by unauthorized personnel.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4177)

10- 42 - (240-24(b), Exception): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 4-122. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Add an exception at the end of the subsection after all listed items, as follows:
Exception to all of Section 240-24(b): In a multiple occupancy building where each occupant has grouped, readily accessible means to disconnect all ungrounded conductors within that occupancy with no more than six motions of the hand, the overcurrent devices protecting the source of supply to that occupancy shall be permitted to be accessible to authorized management personnel only.
SUBSTANTIATION: There is no existing permission to shelter these feeder overcurrent protective devices from access by the occupancy they protect. Unless favorable action is taken here, the permission to allow this very practical, workable installation will remain absent. There will not be confusion because this wording exactly correlates with wording sent to CMP 4 under a companion proposal on the same topic.
Relief is needed. Consider an underground service to a package store on the first floor and basement, with an apartment upstairs. Does anyone seriously believe the package store owner is going to allow the apartment tenant access to his basement on a 24-hour basis? The other exception doesn't apply since there is no "continuous building management supervision." The present requirements are not realistic for many of these small occupancies. The result is anarchy, as jurisdiction by jurisdiction the rule is avoided or unen-forced in many different ways. The submitted wording is working well in Massachusetts as a part of its electrical code. Everyone is playing on a level playing field, applying a workable, consistent rule.
In the last cycle, the Panel rejected this on the basis that it would deprive the occupant of access to the overcurrent device protecting the premises. The same is true of service devices, and yet we allow them to be inaccessible if downstream devices are accessible. This concept has been extended on the load side of the service into separate buildings (Sec. 225-40). Although each of these provisions allow for smaller sized branch devices, the fact is that the parent device could trip on overload, and the tenant would have no access to reset it. This proposal is a very modest extension of this well-established concept.
PANEL ACTION: Reject.

PANEL STATEMENT: Other provisions can be made, such as building a separate room in the basement or moving the service equipment outside the building. Acceptance of this proposal would create an unsafe situation for the occupants.

10- 44 - (240-24(e)): Reject
SUBMITTER: Warren Kohm, Briner Electric
RECOMMENDATION: Revise as follows:
240-24. Location in or on Premises.
(3) Not Located in Bathrooms. ~~In dwelling units and guest rooms of hotels and motels,~~ Overcurrent devices, other than supplementary overcurrent protection, shall not be located in bathrooms as defined in Article 100.
SUBSTANTIATION: Overcurrent devices should not be allowed in bathrooms regardless of the type of occupancy. Many bathrooms have locks on the doors that can only be unlocked from the inside. When the bathroom is occupied and the door is locked, the overcurrent devices are no longer readily accessible to the other building occupants.
PANEL ACTION: Reject.
PANEL STATEMENT: A primary reason for not locating overcurrent devices in the bathrooms of dwelling units and guest rooms of hotels and motels is due to environmental conditions and the occupant's proximity to multiple grounded surfaces. It is not a question of access because, generally, a locked door would be associated with the presence of a person, within the bathroom, who could provide access. It is noted that a ban on overcurrent devices in all bathrooms would be extremely restrictive. For example, bathrooms within commercial buildings and recreational areas are usually of large size, and trained personnel would usually interact with panelboards in those areas.

10- 44a - (240-30(a), (b)): Accept
SUBMITTER: CMP 10
RECOMMENDATION: Revise 240-30 to read as follows:
"240-30. General
(a) Protection from Physical Damage. Overcurrent devices shall be protected from physical damage by one of the following:
(1) Installation in enclosures, cabinets, cutout boxes, or equipment assemblies
(2) Mounting on open-type switchboards, panelboards, or control boards that are in rooms or enclosures free from dampness and easily ignitable material, and are accessible only to qualified personnel
(b) Operating Handle. The operating handle of a circuit breaker shall be permitted to be accessible without opening a door or cover."
SUBSTANTIATION: The proposed change is to provide titles to second level subdivisions as required by 2.1.5.2 of the NEC Style Manual.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3795)

10- 45 - (240-33): Reject
SUBMITTER: John I. Williamson, Minnesota Board of Electricity
RECOMMENDATION: Modify the wording in this section as follows:
Vertical Position. Enclosures for overcurrent devices shall be mounted in a vertical position. Circuit breaker enclosures shall be permitted to be installed horizontally where the circuit breaker is installed in accordance with Section 240-81. Enclosures for overcurrent devices shall not be mounted in a face-up position. Listed busway plug-in units shall be permitted to be mounted in orientations corresponding to the busway mounting position.
SUBSTANTIATION: The change in the 1999 NEC that permitted horizontal mounting of overcurrent device enclosures has been interpreted to mean that such enclosures are permitted to be installed in a face-up position. Installing such enclosures in a face-up position increases the risk of physical damage or contamination by foreign materials.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided any substantiation indicating an existing problem or hazard that needs to be corrected.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4178)

10- 46 - (240-33): Accept in Part
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
Enclosures for overcurrent devices shall be mounted in a vertical position unless that is shown to be impracticable. Circuit breaker enclosures ~~shall be permitted to be installed~~ mounted horizontally ~~where the circuit breaker is installed in accordance~~ shall comply with Section 240-81. Listed busway plug-in units shall be permitted to be mounted in orientations corresponding to the busway mounting position.
SUBSTANTIATION: In the process of removing exceptions, CMP 10 completely, and apparently inadvertently, discarded the practicability threshold for mounting circuit breakers horizontally which had been in the NEC for over 70 years. This proposal restores that principle, while retaining the rest of the 1999 changes. Since the second sentence is enforceable independently, and applies to any circuit breaker mounting position, CMP 10 should consider accepting this proposal in principle and removing that sentence. The Section 240-81 reference was added by CMP 4 in the 1984 cycle as part of an editorial change without any specific substantiation. Should CMP 10 elect to retain the reference, the wording in this proposal is in better form.
PANEL ACTION: Accept in Part.
1. The panel accepts the proposed addition of the wording "unless that is shown to be impracticable".
2. The panel rejects the remainder of the proposal.
PANEL STATEMENT: 1. The Panel agrees with the submitter.
2. The present wording is clear and the proposed changes do not provide additional clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #739)

10- 47 - (240-40): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Disconnecting Means for Fuses. ~~A~~ An approved disconnecting means shall be provided on the supply side of all fuses in circuits of over 150 volts to ground and cartridge fuses in circuits of any voltage where accessible to other than qualified persons, so that each individual set of fuses, ~~circuit containing fuses~~ can be independently and simultaneously disconnected from the source of power.
(remainder unchanged)
SUBSTANTIATION: Editorial. The phrase "individual circuit" per definition limits application of the rule to fuses for a circuit which supplies only a single utilization equipment.
In the absence of other pertinent rules which may specify simultaneous opening of all conductors of the circuit, or specific type of disconnecting means, the present wording would allow single-pole disconnects for each fuse of a two or three wire circuit. A requirement for "approved" and "simultaneously" would preclude use of terminals, or wire connectors, which are devices by which conductors can be disconnected, per definition of disconnecting means.
PANEL ACTION: Reject.
PANEL STATEMENT: No substantiation has been provided to insert the word "approved." A circuit is all the circuit conductors including the grounded and grounding conductors. When a circuit is disconnected, all ungrounded circuit conductors shall be disconnected. The word "simultaneously" should not be added as some circuit configurations may require a specific sequence of disconnecting to facilitate orderly shutdown.

(Log #311)

10- 48 - (240-81): Reject
SUBMITTER: Paul Hesselroth, Washington State Dept. of Labor & Industries, Electrical Section
RECOMMENDATION: Add new third paragraph to 240-81 to read as follows:
The line side conductors shall terminate at the top or "on" position of the circuit breaker.
SUBSTANTIATION: This has been a common industry practice for some time in the name of safety. This is not addressed in the National Electrical Code that I am aware of. Manufacturers and installers can and do at times install line side conductors on the bottom of a circuit breaker. When this is done, it can create a safety concern because the electricians may assume the line side is on the top.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 240-81 deals with indications of the "On" and "Off" positions. It does not, and should not, deal with the installation of line conductors. Many circuit breakers are capable of being "reverse fed", with the line conductors being connected to the base of the circuit breaker. This provides flexibility to the user. The submitter has not provided any technical substantiation for this change.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1878)

10- 49 - (240-83(a)): Reject
SUBMITTER: David A. Kerr, Jr., Friendsville, PA
RECOMMENDATION: Revise to read as follows:
(a) Durable and Visible. Circuit breakers shall be marked in white with their ampere rating in a manner that will be durable and visible after installation.
SUBSTANTIATION: I find black-on-black breakers very difficult to read. Judging by the number of misapplied breakers I find, other people have the same problem. Visibly marked wires would be a good idea also.
PANEL ACTION: Reject.
PANEL STATEMENT: The code demands that the ampere rating be durable and visible after installation. A demand that circuit breakers be marked in white would not necessarily improve visibility since many circuit breakers are made from white molding material. This is a certifier's issue rather than a code issue.

(Log #230)

10- 50 - (240-83(c)): Accept in Principle
NOTE: The following proposal consists of Comment 10-80 on Proposal 10-110 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 10-110 was:
Add new Exception:
Exception: A circuit breaker shall be permitted to be used on a circuit having an available fault current greater than its marked interrupting rating if protected on the line side by a suitable current-limiting device selected under engineering supervision. This additional series combination rating including identification of the up stream current-limiting device shall be permitted to be field marked on the end use equipment.
SUBMITTER: George W. Farrell, Carey, IL
RECOMMENDATION: Continue to accept this proposal.
SUBSTANTIATION: This proposal is required for the situation where the available fault current has increased beyond the interrupting rating of an airframe circuit breaker.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See Panel Action and Substantiation on Proposal 10-67.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
KIMBLIN: The impact of this proposal is to permit series ratings to be determined under engineering supervision for load side circuit breakers that are "passive" for the first 1/2 cycle of a fault and with no test or third party evaluation. This added method of determining series ratings is in addition to the present method of testing. We are not aware of a calculation method that will determine, in practice, the suitability of a series rating for each of the conditions for which tests are applied under industry standards. Furthermore, we are concerned that the estimates for series-rating suitability will not take into account the characteristics of the circuit breakers located downstream from the supposedly "passive" circuit breakers. In series ratings we are dealing with a systems issue where the downstream circuit breakers are underrated relative to the available fault current. Safety is of paramount importance, and this safety can only be assured by rigorous testing of the series combinations.
ZAPLATOSCH: Substantiation has not been submitted that demonstrates that a safe series combination can be selected solely based on the performance characteristics of the two (or more) series devices. When a manufacturer identifies a series combination for their listed equipment, the suitability of the host equipment is also considered. For this reason, the circuit breaker-series connected information published in the Recognized Component Directory of Underwriters Laboratories is not intended to be used in field applications to determine proper coordination and protection of load side circuit breakers. Testing may be necessary to determine the suitability of such series combinations. This is especially true as the determination of a suitable series combination of overcurrent devices must include an evaluation of the host equipment, not only a calculation of the performance characteristics of the two (or

more) series connected devices. The full system of overcurrent devices, host equipment and connections must be reviewed, and perhaps tested, to determine the suitability of the system for use on a circuit with an available fault current greater than the marked rating of the overcurrent protective device(s). Determination of the need for tests and the method to conduct the tests must be in accordance with established safety standards.
COMMENT ON AFFIRMATIVE:
ELDRIDGE: See my Comment on Affirmative Vote on Proposal 10-67.
FREDERICKS: See my Comment on Affirmative Vote on Proposal 10-67.

(Log #231)

10- 51 - (240-83(c)): Accept in Principle in Part
NOTE: The following proposal consists of Comment 10-81 on Proposal 10-110 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 10-50 (Log #230)].
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: The proposal should be accepted in principle. Delete the fine print note and revise as follows:
A circuit breaker shall be permitted to be used on a circuit having an available fault current greater than its marked interrupting rating if protected on the supply side by a suitable current-limiting device selected under engineering supervision. Where the desired combination of overcurrent protective devices has not been included in appropriate published material by a qualified testing laboratory, the engineering process shall include appropriate engineering representation from the manufacturer of the circuit breaker. A written record of this participation shall be made available to the Authority Having Jurisdiction upon request. This additional series combination rating, including identification of the upstream current-limiting device, shall be field marked on the end use equipment.

SUBSTANTIATION: The problem with the fine print note is that you really can't know whether or not a circuit breaker is passive and for how long unless you put it on a bench and test it. On the other hand, the proposal submitter is addressing a very genuine problem. We simply cannot be expected to upgrade our entire installed plant every time the available fault changes.
This comment is an attempt to bridge that gap, by first acknowledging the recognized component publications that have many combinations in them that have already been tested. If that doesn't work, then the next step would be to make sure the manufacturer is in the loop. Whether they would dare speculate is another question; some might try for the full upgrade by hanging tough on the suitability of the existing breakers. Its a very difficult call. I think something like this just might create enough of a market that there would be genuine cooperation.
PANEL ACTION: Accept in Principle in Part.
1. The panel accepts in principle the first three sentences, and the last sentence of the recommendation.
2. The panel rejects the remainder of the proposal.
PANEL STATEMENT: 1. See panel action and statement on Proposals 10-67 and 10-69.
2. The requirement for a written record is at the discretion of the authority having jurisdiction.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
DEATON: Although the validity of the "up-over-down" method for determining the proper engineering of series ratings for equipment combinations was demonstrated, the opportunity for abuse and misapplication is significant. Power air circuit breakers are larger, more expensive types of equipment where testing of series ratings has often been justified, and these breakers are typically repaired, not replaced, to correct deficiencies found during maintenance. Molded-case circuit breakers must be replaced when found to be defective. Molded-case circuit breakers, particularly the smaller frame sizes are relatively inexpensive devices where testing combinations is harder to justify and the incentive to use engineered combinations would be much greater. Replacement of an older, passive unit with a newer, interchangeable, nonpassive breaker is very likely to occur, even if personnel ensure that the replacement breaker has the same continuous and interrupting ratings as the unit being discarded.
KIMBLIN: See my Explanation of Negative Vote on Proposal 10-50.
ZAPLATOSCH: See my Explanation of Negative Vote on Proposal 10-51.

10- 52 - (240-83(c)): Reject
NOTE: The following proposal consists of Comment 10-82 on Proposal 10-110 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 10-50 (Log #230)].
SUBMITTER: James T. Pauley, Square D Co.
RECOMMENDATION: The proposal should be rejected.
SUBSTANTIATION: The proposal is not technically feasible. If the circuit breaker manufacturers had an acceptable method of using some engineering method to determine the series rating, it would already be in use. In fact, the testing required by the product standard is the only acceptable method today. If the manufacturer has the series rating as a permitted combination it will exist on the labeling or markings of the product. The proposed FPN provides absolutely no useful guidance in determining the applicability of a series rating. The concept of passivity cannot be determined without a very detailed understanding of the circuit breaker and its interaction with other devices. This is what the testing program accomplishes.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action on Proposal 10-67 where the panel agrees this can be done.

(Log #3058)

10- 53 - (240-83(c)): Reject
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Recognizing that CMP 10 has a held issue on their docket relative to "engineered series ratings," this proposal is to recommend that the concept outlined in held Proposal 10-110 from the 1998 Report on Proposals not be added to the 2002 NEC.
SUBSTANTIATION: Proposal 10-110, as modified by the Panel, and the associated eight comments, was held by the NEC Technical Correlating Committee. This proposal, as modified by the Panel, reads:

"A circuit breaker shall be permitted to be used on a circuit having an available fault current greater than its marked interrupting rating if protected on the supply side by a suitable current-limiting device selected under engineering supervision. This additional series combination rating, including identification of the upstream current-limiting device, shall be permitted to be field marked on the end use equipment."

This proposal was held for further study by the TCC. The reason was that a new Section 240-86 was being added through an entirely separate proposal, Proposal 10-114, which conflicted with the requirements of Proposal 10-110. NEMA had consistently opposed this proposal throughout the Code cycle, and the present proposal is aimed at maintaining that opposition when Proposal 10-110 is reconsidered in the NEC 2002 cycle.

Part of the problem of "determining series ratings under engineering supervision" is captured in the January 1999 EC&M Magazine article "Don't Be Felled By Higher Fault Currents" that was written by Mr. Vince Saporita in support of the 1999 NEC Code Proposal. Here, in the concluding paragraph, we read: "If the AHJ will allow it (under either a local amendment or under Section 90-4), you may be able to use this approach. Just be sure you only apply it to suitable equipment. For example, don't apply it to modern MCCBs or you may create a significant hazard. Properly applied, however, this method may be what allows an overall improvement in a plant electrical system to be economically viable."

During the past Code cycle, UL and NEMA took consistent exception to the concept of "series ratings under engineering supervision" precisely because the concept could only be applied to "suitable equipment," and that "significant hazards" would result from any misjudgment. In particular, under high current fault conditions, the vast majority of molded case circuit breakers open during the first half cycle. They are designed to be active rather than passive.

The EC&M magazine article distinguishes between air frame circuit breakers (UL 1066 and ANSI power circuit breakers) and molded case circuit breakers (UL 489). It is certainly true that a power circuit breaker might be passive during the first fault current half cycle whereas a molded case is highly unlikely to be passive. However, even in the case of power circuit breakers, such breakers are typically applied upstream from molded case circuit breakers, and it would therefore be dangerous to consider a series rating, under engineering supervision, for the power breaker alone. The whole system needs to be considered. Here, as already stated, the downstream molded case circuit breakers are highly unlikely to be passive since they are deliberately designed to open during the first half cycle.

In more detail, since 1970, only tested combinations have been considered suitable under UL 489 and the NEC. The reason is that series ratings cannot reliably be selected by "engineering judgment" because of a number of factors. The major factor is the dynamic behavior of the circuit breaker nearest the fault. The contacts of virtually all molded case circuit breakers open during the first 1/2 cycle of a short circuit, though in a number of cases, the circuit breaker will not clear the circuit immediately. With contacts open, this circuit breaker is taking some of the energy of interruption that would otherwise go to the device on its supply side, causing that device to open and protect the circuit. Also included in tested series ratings are tests in the enclosure to determine that interaction with the enclosure does not occur. Further, there are tests at low fault conditions that would determine that the combination clears the circuit safely below the threshold of current limitation of the supply side device. These many factors covered by testing cannot be determined by "engineering judgment.

NEMA shares Mr. Saporita's concern that personnel "should not be felled by higher currents." For safety, system upgrades with associated fault currents that exceed the downstream breaker ratings, require extremely careful evaluation. In general, downstream molded case circuit breakers are involved, and these circuit breakers are active during the first current half cycle. Any engineering supervision calculation would need to predict the behavior of these molded case circuit breakers at the maximum available fault current and at intermediate fault current levels. Such calculations are unreliable and hence unsafe, and experience has shown direct testing to be the only safe evaluation method.

(Log #3155)

10- 54 - (240-83(c)): Reject
SUBMITTER: George D. Gregory, Square D Company
RECOMMENDATION: This proposal is to reject the 1999 NEC cycle Proposal 10-100 (see NEC A98 ROP, page 229), as modified by the Panel (see NEC A98 ROC, page 179), which was held for further study.

The Panel recommendation in the ROC, which I propose to be rejected, reads as follows:

"A circuit breaker shall be permitted to be used on a circuit having an available fault current greater than its marked interrupting rating if protected on its supply side by a suitable current-limiting device selected under engineering supervision. Where the desired combination of overcurrent protective devices has not been included in appropriate published material by a qualified testing laboratory, the engineering process shall include appropriate engineering representation from the manufacturer of the circuit breaker. A written record of this participation shall be made available to the Authority Having Jurisdiction upon request. This additional series combination rating, including identification of the upstream current-limiting device, shall be field marked on the end use equipment."

SUBSTANTIATION: Although it is clear that any new wording must be in harmony with other wording in the NEC as the TCC pointed out, the reasons to reject this proposal are technical.

The primary reason to reject the proposal is that there is no known method of calculation that will determine whether an overcurrent protective device will protect another overcurrent protective device above its interrupting rating. A series of tests (not just a single test) have been shown to be necessary.

A second reason to reject the proposal is related to the substantiation. This proposal is intended to address installations for which the supplying service has been upgraded such that the prospective fault current becomes greater than the circuit breaker's interrupting rating. Even if calculations could show protection for an individual circuit breaker at the higher prospective fault current, can they show that the entire installation is protected including conductors and equipment on the load side of the circuit breaker? If the added current limiting device provides that protection, all is well. However, such protection is already covered in the NEC and no additions are necessary. This proposal does not address protection of the system and must be considered incomplete until it does.

Addressing the proposal to calculate protection for a circuit breaker, any evaluation method must consider the following points:

Dynamic Behavior.

Dynamic behavior begins when the contacts separate, not when clearing occurs. Even for larger circuit breakers that may take several electrical cycles to clear, contact opening may occur considerably earlier. In order to predict protection, an engineer will need to understand the contact arrangement, operating

mechanism and trip device behavior under conditions above its interrupting rating. Testing is necessary.

Intermediate Current Levels.

Current-limiting devices have a threshold of current limitation, above which they exhibit specific current limiting capabilities. Below that level, operation will be slower and will not exhibit the degree of limitation that is seen at higher currents. The threshold is generally somewhere above 20 times the continuous current rating. For a 2000 ampere fuse, its threshold is somewhere above 40,000 amperes. If the interrupting rating of the circuit breaker is below 40,000 amperes it may not be protected, in this case. Series rating and fused circuit breaker test programs carefully test this lower current condition. Does engineering supervision have the tools or training to address this point?

Equipment Tests.

Peak current, let through I^2t and rate of current rise seen in a series device test with a fault current above the interrupting rating of the load side circuit breaker are frequently greater than are seen in tests of the individual circuit breaker at its rating. Listed equipment containing the circuit breaker is also tested at its short-circuit current rating with the circuit breaker installed. Listed equipment in which series ratings are applied is tested at the higher ratings at which the series will be applied. If the calculated series rating is above the equipment rating, how will engineering supervision know that the equipment is suitable?

The Up-Over-Down method may have some merit in determining protection by a fuse used above its threshold of current-limitation and when the load it is protecting is passive. However, circuit breakers are active devices under fault conditions. Also, the Up-Over-Down method is only useful at highest fault levels above the threshold of limitation of the fuse.

To the knowledge of the proposer, there are no other methods available to engineering supervision to evaluate whether protection is provided. It is for that reason that an enormous amount of testing is done to establish third party recognized, tested series ratings. That work is done at great expense and effort of circuit breaker manufacturers. If there were a simpler method, manufacturers would surely use it.

As related to larger circuit breakers protecting electrical systems, ANSI C37.13 recommends in Paragraph 10.8 that cascade ratings not be applied.

(Log #3640)

10- 55 - (240-83(c)): Reject
SUBMITTER: Jim Brozer, Acton, MA
RECOMMENDATION: Add the following as the second sentence in 240-83(c):
"The marking for a multi-pole circuit breaker shall include both its single-pole and multi-pole interrupting ratings."
SUBSTANTIATION: The importance of single-pole interrupting ratings has recently been uncovered, thanks in part to the ground breaking IEEE article "Single-Pole Short-Circuit Interruption of Molded-Case Circuit Breakers" by George Gregory of Square D. Based upon that article, it is critical that multi-pole circuit breakers be marked with their single-pole interrupting ratings so that they can be properly applied. There are few issues with low voltage power circuit breakers because they are tested at 87 percent of their multi-pole rating, but it is very easy to misapply molded case circuit breakers on several types of systems.

These are systems that can impose full line-to-line voltage across only one pole. With a corner grounded delta system, it takes only one fault to ground to have full line-to-line voltage on one pole (assumes a 2-pole circuit breaker). On resistance-grounded and ungrounded systems, the first fault to ground produces very little current, so little in fact, that it does not open the overcurrent device. Thus, the facility can continue to run, giving time for the maintenance crew to find and fix the problem. However, if another phase goes to ground, it becomes a phase-to-phase fault. Without the intentional impedance of the resistance grounded system or the system impedance of the ungrounded system, the actual fault can be quite high. If the faults are at different levels of the distribution system, one circuit breaker may be asked to clear the fault with the full system voltage across only one pole. This becomes critical because the standard for molded case circuit breakers (UL 489) tests for full voltage across one pole for only the minimum short circuit tests. For example, 3-pole, 480 volt molded case circuit breakers, up through 800 amperes, are tested at only 8,660 amperes with full voltage across one pole. A 600 ampere 3-pole molded case circuit breaker could have a 100,000 ampere 3-pole interrupting rating, but its single pole rating would be 8,660 amperes when used on a resistance grounded system. See Table 7.1.7.2 from UL 489.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.
PANEL STATEMENT: Marking a single pole interrupting rating on a multi-pole, molded case, circuit breaker is not required for proper application. For corner grounded delta systems, 240-85 requires "1 phase-3 phase" to be marked on two-pole circuit breakers used for this application. For impedence grounded wye systems, 250-36 requires ground detection systems. No problems are known to exist in applying circuit breakers on center point grounded systems.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
DEATON: The need for marking interrupting ratings on circuit breakers is clear and has long been required in the NEC. Since multi-pole circuit breakers may be applied on circuits where short-circuit currents may appear on either a single pole or more than one pole of such multi-pole breakers. Depending on the design of a particular circuit breaker, its interrupting rating may vary significantly for single-pole short-circuit currents versus multi-pole short-circuit currents. Labeling is needed to enable proper application of multi-pole circuit breakers.

(Log #3844)

10- 56 - (240-83(c) and (d)): Reject
SUBMITTER: Al Fitzgerald, Riviera Electric
RECOMMENDATION: Revise text as follows:
(c) Circuit breakers having an interrupting rating of <u>5000 amperes</u> shall have its interrupting shown on (location) of the circuit breaker.
(d) Every circuit breaker having an interrupting rating <u>other than</u> 5000 amperes...etc.
SUBSTANTIATION: Paragraph needs an inclusive statement for circuit breakers of 5000 amperes or needs an additional paragraph.
PANEL ACTION: Reject.
PANEL STATEMENT: Any circuit breaker that has no marked interrupting rating is automatically rated for 5000 amperes RMS symmetrical by ANSI/UL 489. This adequately distinguishes it from higher rated circuit breakers which, indeed, need to be marked.

10- 57 - (240-83(c), Exception): Reject
NOTE: The following proposal consists of Comment 10-83 on Proposal 10-110 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 10-50 (Log #230)].
SUBMITTER: Jerome W. Seigel, West Hartford, CT
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: This proposal does NOT provide any technical substantiation that this method will provide an increase in safety that the submitter claims. In fact the adoption of this method of analytically determining the series ratings may in fact be a great reduction in safety and compromise the Code.

The only justification seems to be monetary, i.e. "causing an excessive waste of dollars and resources."

Also the new proposed Fine Print Note that the Panel has added to the proposal in response to the last paragraph of the substantiation may in fact introduce an additional trap since it implies that the only real consideration has to be the "the first 1/2 cycle". This assumes a lot and is furthermost from the truth.

The problem of this type of analytical approach is that the engineer has to analyze an infinite number of variables and would require and need to make use of a greater amount of information from manufacturers of both the fuses and circuit breakers than is presently or may ever be available.

The engineer can NOT stop at the first 1/2 cycle but must look at a whole host of other conditions. The use of the first 1/2 cycle is quite limited to, for the location in the system under consideration, where the fault levels for all cases is above the threshold value of the fuse in consideration. There is much more to the problem. The engineer would have to look at all locations in the system, at all types of faults as well as at all fault levels and durations. If the fault lasts longer than the first 1/2 cycle because the fuse has not cleared this presumably lower level fault that is lower than the fuse threshold value and the circuit breaker does try to now clear the fault that is higher than its own rating, what is going to happen?

There is a very large gray area due to the fact that the fault level can be anywhere from a minor overload up to whatever the available fault current is at whatever point in the system the fault occurs. This is the major problem of an "engineered" approach in place of a "Tested and Listed System."

The vote and "Comment on Affirmative" by Mr. Eldridge has in its last paragraph information attributed to Mr. Ockly that is not recorded in the proposal itself. Also I do not understand the reference to "the relative age of a circuit breaker" as this has little to do with the problem.

The engineered approach of course assumes that the engineer involved has the experience, knowledge, and background to realize the scope of the task and the areas to be addressed. Unfortunately, not all engineers are "qualified" in this important area that the proposal is addressing and have the necessary background and knowledge to analyze this major area of safety. As a result the NEC could then be allowing the use of approaches that could end up further compromising the safety of the electrical system instead of increasing it.

10- 58 - (240-83(c), Exception): Accept in Principle

NOTE: The following proposal consists of Comment 10-85 on Proposal 10-110 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 10-50 (Log #230)].

SUBMITTER: Morton L. Mullins, Chemical Manufacturers Assn.
RECOMMENDATION: Continue to accept the original proposal in principle.
SUBSTANTIATION: CMA agrees with Eldridge's and Fredericks' Comment on Affirmative.

There is a need to safely provide for existing equipment that has its interrupting rating exceeded by a system change. For equipment where the older "up, over, and down" calculations are no longer considered applicable, it is felt that the manufacturers should provide updated guidance, rather than force the user to buy new equipment. The users should also have access to guidance that would allow a broader mixing of devices than is available from existing listed series combinations.

The following additional comments are from Fredericks' comment on affirmative vote:

There are a large number of existing and potential applications that are not covered by a tested series rating, and the users could very much benefit from consistent and technically credible direction from the manufacturers on how to properly engineer these applications.

It is troubling to see representatives from the "breaker community" of NEMA present a fundamentally different technical position than the representatives from the "fuse community" do on this issue.

A huge number of successful self-engineered series applications exist, albeit generally with older design downstream breakers with relatively low interrupting ratings. It is difficult to believe that the manufacturers could not provide engineering guidance that would lead to safe self-engineered series ratings, at least for those devices that will remain passive for 1/2 cycle or less of a specified amount of i^2t.

The calculation of the i^2t seen by the downstream device is inherently conservative if it does not include the impedance of that device, which is generally very difficult for users to obtain.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Proposal 10-67.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
DEATON: See my Explanation of Negative Vote on Proposal 10-51.
KIMBLIN: See my Explanation of Negative Vote on Proposal 10-50.
ZAPLATOSCH: Substantiation has not been submitted that demonstrates that a safe series combination can be selected solely based on the performance characteristics of the two (or more) series devices. When a manufacturer identifies a series combination for their listed equipment, the suitability of the host equipment is also considered. For this reason, the circuit breaker-series connected information published in the Recognized Component Directory of Underwriters Laboratories is not intended to be used in field applications to determine proper coordination and protection of load side circuit breakers. Testing may be necessary to determine the suitability of such series combinations. This is especially true as the determination of a suitable series combination of overcurrent devices must include an evaluation of the host equipment, not only a calculation of the performance characteristics of the two (or more) series connected devices. The full system of overcurrent devices, host equipment and connections must be reviewed, and perhaps tested, to determine the suitability of the system for use on a circuit with an available fault current greater than the marked rating of the overcurrent protective device(s). Determination of the need for tests and the method to conduct the tests must be in accordance with established safety standards.
COMMENT ON AFFIRMATIVE:
ELDRIDGE: See my Comment on Affirmative Vote on Proposal 10-67.
FREDERICKS: See my Comment on Affirmative Vote on Proposal 10-67

(Log #235)

10- 59 - (240-83(c), Exception): Reject

NOTE: The following proposal consists of Comment 10-86 on Proposal 10-110 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 10-50 (Log #230)].

SUBMITTER: John W. Young, Siemens Energy & Automation, Inc.
RECOMMENDATION: Reject proposal.
SUBSTANTIATION: The substantiation notes that all possible series combinations are not cataloged by circuit breaker manufacturers. It is incorrect to assume that because a combination does not appear on the list that it has not been tested. Combinations that do not pass the tests are also not published. Essentially, circuit breaker manufacturers have tested every possible combination and the lists include those devices that pass. Any combinations that are "engineered" that are not on the manufacturers' lists will probably be a combination that the manufacturer has shown to be a combination that will not pass the tests.

The substantiation goes on to note that this would allow a current limiting device to be installed ahead of existing equipment that would have to be changed to comply with increased available currents. This approach would allow equipment to be installed at

current levels higher than the short circuit rating of the equipment. A current limiting device does not automatically protect equipment such as panelboards.

In his comment, Mr. Eldridge notes that the article by Mr. DiMarco stated that "if" the downstream device is passive and "if" its withstand current is known that fuse characteristics could be used. These are two large "ifs". Circuit breakers are dynamic devices intended to interrupt the circuit as circuit breaker manufacturers have repeatedly noted. They are not intended to be passive devices. The last sentence quoted from the article, which was not underlined, is the key in that it states "However, if the downstream device is active and capable of developing dynamic impedance concurrently with the fuse, then analytical fuse selection is in question."

Mr. Fredericks' comments that "...users could very much benefit from consistent and technically credible direction from the manufacturers on how to properly engineer these applications." Circuit breaker manufacturers have provided consistent and technically credible direction, i.e., that a series rating was only valid when supported by tests and cannot be engineered. If it were possible to "engineer" a combination, the breaker manufacturers would take this route rather than testing the combinations and doing follow-up testing of the combinations.

Mr. Fredericks further notes that it is troubling for the "breaker community" of NEMA to present a fundamentally different technical position than the representatives from the "fuse community". He is correct, but it should be noted the community most familiar with circuit breakers and their capabilities is the "breaker community". The concern should be that the "fuse community" presents a fundamentally different approach than the "breaker community."

Finally, Mr. Fredericks notes that "it is difficult to believe that the manufacturers could not provide engineering guidance that would lead to self-engineered series ratings, at least for those devices that will remain passive for 1/2 cycle or less of a specified amount of I^2t." The engineering guidance he requests is that a series rating is only valid when supported by tests.

NOTE: The following proposal consists of Comment 10-87 on Proposal 10-110 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 10-50 (Log #230)].

SUBMITTER: Larry Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: It should be noted that the engineers who designed the circuit breaker, and have the most knowledge about it, may have already determined that it could not be used in a series rating application, and that is why it does not appear in the lists of series ratings. It should be further noted that few, if any, breakers are passive in a high fault situation, and this is not information available to application engineers. No clarification is provided regarding who may engineer the series combination or by what method. No method of determining what circuit breakers are passive is given. The impact of this proposal is to permit series ratings to be determined under engineering supervision with no test or third party evaluation, in addition to the present method of determining series ratings by tests which are witnessed by a third party Circuit breaker manufacturers have found by tests that calculated methods do not accurately anticipate protection unless the protected devices are fully passive during the fuse melting period or supply side circuit breaker unlatching period. However, tests to determine whether a device is "passive" relative to a given supply side fuse or circuit breaker would be roughly as extensive as the series test and would most generally indicate that the circuit breaker is not passive. It does not seem prudent to permit evaluation under "engineering supervision" without tests and with guidelines as loose as those proposed.

(Log #3728)

10- 63 - (240-83(d)): Accept
SUBMITTER: Wayne A. Lilly, Bridgewater, VA
RECOMMENDATION: Add a new second sentence to Section 240-83(d) and revise the first sentence so the section will read as follows:
(d) Used as Switches. Circuit breakers used as switches in 120-volt and 277-volt fluorescent lighting circuits shall be listed and shall be marked "SWD" or HID." Circuit breakers used as switches in high intensity discharge lighting circuits shall be listed and shall be marked as "HID."
SUBSTANTIATION: Circuit breakers with the "SWD" marking used with 120-volt and 277-volt fluorescent lighting perform well for switching duty. However, there have been reports at International Association of Electrical Inspector chapter meetings of circuit breakers being used as switches failing where they are used with HID fixtures. There are currently circuit breakers listed as suitable for HID use. The new language proposed here is intended to solve the problem of circuit breaker failure when used as switches with HID lighting by requiring that the circuit breaker be listed and marked "HID."
"HID" and "SWD" listed and marked circuit breakers are both tested for switching duty. "HID" circuit breakers are tested with a more severe power factor than "SWD" circuit breakers. Because "HID" circuit breakers are tested at a more severe power factor and for switching duty they would be suitable for use on fluorescent lighting circuits.
PANEL ACTION: Accept.
The panel accepts the proposal with the editoral request that quotation marks be placed on both sides of the word "HID" in the first sentence of the proposed wording.
PANEL STATEMENT: The correction is editorial.

(Log #2898)

10- 64 - (240-83(f) (New)): Reject
SUBMITTER: Scott McComber, McComber Electric
RECOMMENDATION: Add new paragraph (f) to read as follows:
(f) Heat Activated Indicators. Circuit breakers shall be equipped with heat activated indicators.
SUBSTANTIATION: As electrical contractors, we've seen numerous electrical panel fires started by dangerously overheated circuit breakers. Over 39,000 structure fires annually are caused by a building's own electrical distribution system, of which overcurrent devices are included. Electrical distribution equipment fires ranked: fifth in number of home structure fires; fourth in home fire deaths; seventh in home fire injuries; and second in direct property damage.
Source, NFPA, 5/99 U.S. Fire Problem Report.
Monitoring circuit breakers for dangerous overheating, whether part of the service, or branch circuit equipment can be economically accomplished by adhering heat activated temperature indicators to the breaker's face, or other regions of the circuit breaker (product literature submitted). Periodic visual inspections of the breakers can then be implemented to help reveal dangerous overheating, thereby drastically minimizing the potential for electrical equipment fires.
Arc Fault Circuit Interrupters do not address overheating circuit breakers, and periodic infrared scans are costly, require special skills and equipment, and the distribution equipment must be properly loaded.
Heat activated indicators require no special tools or skills to implement, and constantly monitor the breaker under all load conditions. Once the indicator's rated temperature is reached, the indicator changes permanently to visually reveal the overheated circuit breaker.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation does not present information on the number of fires that are supposed to be caused by overheated circuit breakers. Further, this code change would apply to all circuit breakers, many of which are already subjected to periodic inspection; for example to NEMA AB-4 or NETA. Finally, the panel, while rejecting the proposal, certainly encourages routine circuit breaker inspection.

(Log #3090)

10- 65 - (240-85): Accept
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Revise the second paragraph of 240-85 as follows:
A circuit breaker with a slash rating, such as 120/240V or 480Y/277V, shall be permitted to be applied in a solidly grounded circuit where the nominal voltage of any conductor to ground does not exceed the lower of the two values of the circuit breaker's voltage rating and the nominal voltage between any two conductors does not exceed the higher value of the circuit breaker's voltage rating.
SUBSTANTIATION: The intention of this proposal is to clarify that slash-rated circuit breakers must be applied on solidly grounded systems.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3639)

10- 66 - (240-85): Accept in Principle
Note: The Technical Correlating Committee directs the panel to reconsider the action relative to the inclusion of a recommendation in the Fine Print Note to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Jim Brozer, Acton, MA
RECOMMENDATION: Add a new third paragraph to read:
"On corner grounded delta systems, resistance grounded wye systems, ungrounded systems and center point grounded delta systems, multi-pole circuit breakers shall be applied so that their three-pole interrupting rating is not exceeded by the available 3 phase bolted fault current and so that their single-pole interrupting rating is not exceeded by the available phase-to-phase bolted fault current."
SUBSTANTIATION: This new third paragraph is needed to assure that 2 and 3 pole circuit breakers are applied within their ratings on systems where full line-to-line voltage can easily appear across only one pole of the circuit breaker. For example, the first fault to ground on a 480 volt corner grounded delta system could put 480V across only one pole of a two-pole circuit breaker. That breaker needs to be able to safely open the available line-to-line short-circuit current at 480 volts with just one pole. On a 480 volt resistance grounded system, the first fault to ground from any phase will result in a very small amount of current flow at 277 volts, not enough current to open the overcurrent device. That's the advantage of this type of system – it allows the plant to continue to run. The problem occurs if a second phase goes to ground before the first ground fault is found and fixed. A second ground fault may require the circuit breaker to clear the now phase-to-phase 480V fault with only one pole. Section 250-36 requires ground detectors to be installed on the system. This helps the maintenance crew realize that the first fault occurred. Very disciplined facilities find and fix the fault within one shift. The fault may persist for months at less disciplined locations. It is a real safety concern when the second fault occurs and the single-pole interrupting rating is not adequate.
Table 7.1.7.2 of UL 489 lists the single-pole interrupting ratings under the "Individual" column. This table shows, for example, that the single-pole (Individual) interrupting rating for a 1000 ampere, 3-pole, 480 volt, molded case circuit breaker, is 12,120 amperes. The 3-pole rating may be 65,000 amperes, or 100,000 amperes, but the single-pole rating 12,120 amperes. It is independent of the 3-pole rating.
Low Voltage Power Circuit Breakers (LVPCB) are tested at 87 percent of their 3-pole interrupting rating. Since the maximum phase-to-phase fault is 87 percent of a 3-phase bolted fault, any LVPCB that is applied within its 3-pole rating, will automatically be applied properly within its single-pole rating.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle.
Insert a Fine Print Note at the end of the existing code Section 240-85 to read as follows:
"FPN: Application of circuit breakers on systems other than solidly grounded wye, particularly on corner grounded delta systems, should consider the individual pole interrupting capability."

PANEL STATEMENT: The submitter's concern is addressed in the informational Fine Print Note. Sections 110-9 and 110-10 provide the requirements for interrupting rating. Also, see the panel action and statement on proposal 10-55.

EXPLANATION OF NEGATIVE:
KIMBLIN: The single pole interrupting capability is a standards performance issue. This Fine Print Note does not belong in the Code.

(Log #2885)

10- 67 - (240-86): Accept
NOTE: The Technical Correlating Committee directs the panel to reconsider the proposal relative to the use of permissive language in the first sentence. This action will be considered by the Panel as a Public Comment.
SUBMITTER: George J. Ockuly, Cooper Bussmann
RECOMMENDATION: Revise text to read as follows:
240-86 Series Ratings. A circuit breaker may be used on a circuit having an available fault current higher than its marked interrupting rating by being connected on the load-side of an acceptable overcurrent protective device having the higher rating, under conditions specified in (a) or (b), and (c).
(a) Selected Under Engineering Supervision. The line-side current-limiting device is selected under engineering supervision for load-side circuit breakers, which are passive during the first 1/2 cycle of a fault. This additional series combination rating, including identification of the upstream current-limiting device, shall be field marked on the end use equipment.
(b) Tested Combinations. The combination of line-side overcurrent device and load-side circuit breaker(s) is tested and marked on the end use equipment, such as switchboards and panelboards.
(c) Motor contribution [no change from exisiting (b)].
SUBSTANTIATION: All possible permutations of series rated combinations are not cataloged or identified by circuit breaker equipment manufacturers. This proposal permits a series combination to be engineered for specific installations. There is a major problem in existing installations where fault currents have increased beyond the circuit breakers original interrupting rating thereby causing an unsafe condition.
The proposal will permit a current-limiting device to be installed ahead of the circuit breaker(s) to obtain an increased series interrupting rating thus improving overall safety. Without this provision large amounts of otherwise serviceable equipment must be removed and scrapped causing an excessive waste of dollars and resources.
Suitable systems can be engineered when the circuit breaker is passive during the first 1/2 cycle of a fault. PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
DEATON: See my Explanation of Negative Vote on Proposal 10-51.
KIMBLIN: See my Explanation of Negative Vote on Proposal 10-50.
ZAPLATOSCH: The proposal should be rejected. The substantiation has not demonstrated that a safe series combination can be selected based only on the performance characteristics of the two series devices. The operation of both devices throughout the range of fault currents are needed to determine that a combination of the devices is likely to operate in a safe manner. It is not possible to determine in the field how long the downstream device remains passive under dynamic high fault current conditions to assure that it does not function at current levels above its short circuit rating. This proposal assumes that the down stream device is passive for the first 1/2 cycle.
In addition, the proposal only addresses the series combination of the two overcurrent devices. When a manufacturer identifies a series combination for their listed equipment, the suitability of the host equipment is also considered.
COMMENT ON AFFIRMATIVE:
DOLLARD: I am voting affirmative to the panel action to accept proposal 10-67. My reasons are as follows:
"In existing installations where the available short circuit current has increased to a value above the rating of the existing equipment, a very dangerous situation awaits all of those persons who service and maintain the equipment.
Presently, the owner of such an installation has only one option. Remove and scrap his/her equipment and replace it with new series rated equipment. This will represent a large financial investment to the owner of such a facility. Acceptance of this proposal will provide a cost effective option for providing the necessary level of protection.
Safety of persons is the primary purpose of the NEC. The safety of all of those persons who service and maintain the equipment will suffer if this cost prevents the owner from making the necessary changes."
ELDRIDGE: The IEEE Recommended Practice for Applying Low-Voltage Circuit Breakers Used in Industrial and Commercial Power Systems was approved by the IEEE Standards Board on February 10, 1997. In Chapter 4, Specific Applications, of that standard in Section 4-4, Selection Approach for Electrical Ratings, paragraph (d) states:
In cases where increases in available short-circuit current necessitates a system upgrade, a second approach shown in Figure 4-4, may be used for retrofitting existing older systems where a recognized series rating is not available. A line-side current-limiting circuit breaker or fuses, which limits peak current and let-through energy, may be added, only if the existing load side breakers do not exhibit dynamic impedance within the first half cycle. The distribution of short-circuit energy is shifted away from the slower, load-side circuit breaker to the higher speed current-limiting device. The downstream circuit breaker is then subject to no more short-circuit energy than its ratings.
In the March/April 1994 issue of the IAEI News, an article was written by NEMA concerning series ratings. On the second page of the article, in the section labeled Testing vs. Up-Over-and-Down and Up-And-Over, a sentence says: "While the concept seems plausible and was valid with some breaker designs twenty or thirty years ago, it is not a viable concept today with most breaker designs."
In the May/June 1993 IEEE Transactions on Industry Applications, an article was written by Bernie DiMarco and Steven R. Hansen titled Interplay of Energies in Circuit Breaker and Fuse combinations. In Part V of the article titled Fuse-Breaker Series Combinations and subsection "Are Analytical Methods Appropriate? the first paragraph says:
"If the downstream device is passive, that is, it does not react to the fault current and its "withstand current" is known, then fuse let-through characteristics can be used for fuse selections. Likewise, if the downstream device is active but remains passive during fuse clearing time, then fuse let-through characteristics can be used for fuse selections. However, if the downstream device is active and capable of developing dynamic impedance concurrently with the fuse, then analytical fuse selection is in question."
Mr. Ockuly's proposal is very nearly identical to the IEEE standard. Mr. Ockuly said the same thing in his proposal and in the panel meeting that the above referenced articles are saying. It would seem to me that a NRTL could test an older circuit breaker to provide data to an engineer that would allow a series rated circuit to be designed IF the circuit breaker is passive in the first half cycle of the fault.
This is an acceptable method for protecting some older circuit breakers under engineering supervision.
FREDERICKS: I agree in principle with the substantiation of the proposal and with the panel action, but I believe more restrictive text, such as was proposed in 10-69, would have been beneficial to help prevent misapplications that could occur even under engineering supervision.
It is not universally appreciated that current-limiting fuse operation may take longer than one half cycle, and further, data on interruption time for current-limiting fuse operation vs. prospective current is not readily available from most manufacturers. Nor is data on contact parting time vs. current for most circuit breakers.
Also, as pointed out by others, there is a need to consider all currents above the nominal rating of the breaker, at the full range of possible fault power factors and closing angles, and not just the maximum possible current at 15 percent power factor and maximum offset.

(Log #1782)

10- 68 - (240-86(b)(1)): Accept
SUBMITTER: Noel Williams, Noel Williams Consulting
RECOMMENDATION: Add the word "and" to the end of the first condition and remove the period.
SUBSTANTIATION: Both conditions are required to prohibit the use of series ratings. The punctuation and sentence structure are not clear as written. As an alternative, the wording of (b) could be changed to "Series Ratings shall not be used where both (1) and (2) below are true."
PANEL ACTION: Accept.
PANEL STATEMENT: The submitter's intent is met by the errata in the first printing of the 1999 NEC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2112)

10- 69 - (240-86(c)): Accept in Principle
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Add a new paragraph 240-86(c) to read as follows:
(c) Engineered Ratings. Series ratings and applications may be made under conditions of engineering supervision. In these cases, one of the following conditions must apply:
(1) Test data exists to validate the series combination, or
(2) Both the protected and protecting device manufacturers have given their written approval of the series combination.
FPN: Calculations made per the "up, over, and down" method are not generally a reliable method of engineering series ratings.
Where nonlisted series ratings are applied in accordance with this paragraph, the additional series combination interrupting rating, including identification of the upstream current-limiting device, must be marked on the end use equipment, such as switchboards and panelboards.
SUBSTANTIATION: In some cases, system fault currents increase above the interrupting ratings of existing equipment. This proposal provides a framework that in some cases will allow for the safe protection of the existing equipment without requiring its replacement, which could be cost-prohibitive.
Suitable systems can be engineered, where under all conditions:
(1) The protected device remains passive while the current-limiting device is operating.
(2) The protected device can withstand the current let through by the current limiting device.
There are other cases where manufacturer's data exists to validate a series rating, but for some reason a listed rating does not exist.
In these cases, the manufacturer's data can be safely applied under conditions of engineering supervision.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Proposal 10-67. Short circuit let-through using the up-over-and-down method produce realiable results when applied on systems and circuits that are totally passive or remain passive for 1/2 cycle or longer. Consulation with the breaker manufacturer or the appropriate testing laboratory may be needed to determine the level of passivity.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2113)

10- 71 - (240-92(a) and (d) (New)): Accept in Part
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Modify 240-92(a) as follows:
(a) Feeder and Branch-Circuit Conductors. Feeder and branch-circuit conductors shall be protected at the point the conductors receive their supply, as permitted in Section 240-21, or as otherwise permitted in (b), ~~or~~ (c), or (d).
Add a new paragraph (d) to read:
(d) Protection by Primary Overcurrent Device. Conductors supplied by the secondary side of a transformer shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, provided the primary device time-current protection characteristic, multiplied by the maximum effective primary-to-secondary transformer voltage ratio, effectively protects the secondary conductors.
The following maximum per-unit ratios apply for some common transformer connections. (A higher number implies less primary protection.)
Delta Primary, Grounded Wye Secondary: 1.73
Single Phase Primary, Center-Tapped Secondary: 2.00
Delta Primary, Delta or Wye High-Resistance Grounded or Ungrounded 3-wire Secondary: 1.00
SUBSTANTIATION: This proposal recognizes safe overcurrent protection installations where a device in series with a transformer primary is used to protect secondary conductors. The ratios given in the proposal are recognized in numerous industry standards and references, including IEEE Standard C37.91. A response to similar proposals for the 1999 NEC was that this material should only be applied under engineering supervision, in Article 240 Part H. This proposal complies with that wish.
Further descriptive detail and substantiation follows:
The following examples will generally discuss per-unit currents, or transformers with a 1:1 line-line voltage ratio, but keep in mind that the same general principles apply for any voltage ratio.
For per-unit currents, or for transformers with a 1:1 line-line voltage ratio, the highest primary-to-secondary current ratio can be considered as n:1.
If n is equal to 1, a secondary fault or overload of a given amount will always produce that much current (or more) in at least one primary conductor. In these instances, the secondary conductors can be protected against both short-circuit and overload (where required) by the primary overcurrent device. This of course depends on the rating of the primary device and the sizing of the secondary conductors. For example, if a delta-delta transformer has a primary device sized at 125 percent of the transformer rating, the secondary conductors must also be sized at least at 125 percent of the transformer rating, if they are to be protected against overload by the primary device.
Common connections with a 1:1 worst case current ratio are:
1. Single-phase, with 2-wire (single voltage) secondary.
2. Delta-delta with 3-wire (single voltage) secondary. This includes delta-delta transformers with ungrounded, corner-grounded, or high-resistance grounded (by means of a zig-zag or other grounding transformer) secondaries.

3. Delta-wye with 3-wire loads and either ungrounded or high-resistance grounded neutral.

Those above three connections are those now provided for by this proposal. The first two are recognized by 240-21(c) of the 1999 NEC, and the first connection has been recognized in the NEC for many years.

Most commonly-used low-voltage connections will have more than a 1:1 worst-case current ratio, considering the ratio of secondary to primary per-unit currents. For example, if this ratio is 2:1, a secondary overcurrent of a given amount could produce only half that amount of current on the primary, and in general, it would be impractical to provide overload protection to the secondary conductors with a primary overcurrent device. However, in many cases, the primary device can still effectively protect the secondary conductors against short circuit.

Common connections with more than a 1:1 worst-case current ratio are:

1. Single-phase primary, single-phase 3-wire secondary (for example 480-120/240 volt. A 1:1 line-line voltage ratio example would be 240-120/240 volts). The worst case current ratio for this connection is 2:1, for a phase-neutral fault or unbalanced secondary load from line-to-neutral.

2. Three-phase delta-wye with solidly grounded neutral (for example 480-208Y/120. A 1:1 line-line voltage ratio example would be 208-208Y/120): The worst-case ratio for this connection is 1.732:1, for a phase-neutral fault, or for an unbalanced phase-neutral secondary load on a 4-wire system.

3. Three-phase, delta-delta, with 4-wire midpoint-grounded secondary (for example 480-240/120 delta. A 1:1 line-line voltage ratio example would be 240-240/120 delta). The worst-case ratio for this connection is 2:1, for phase-neutral fault, or for an unbalanced phase-neutral secondary load.

These three connections represent the great majority of transformers used for low voltage service, and it is not generally practical to provide overload protection for secondary conductors on these transformers with a primary device. This is probably one reason for the fairly widespread but not completely accurate belief that primary devices do not properly sense secondary currents and cannot protect secondary conductors.

For further reference on this subject, the interested reader can refer to any one of a number of industry references on the subject. One good reference is IEEE/ANSI standard C37.91, which contains figures presenting the same information discussed above.

PANEL ACTION: Accept in Part.

The panel accepts (a) and the first paragraph of (d) of the proposal, and rejects the remainder of the proposal beginning with "The following maximum...".

PANEL STATEMENT: The additional proposed text is not necessary. 90-1(c) states that the code is not intended as an instruction manual.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

DOLLARD: I am voting negative to the panel action to accept in part proposal 10-71. My reasons are as follows:

"The proposed text is not user friendly. While this proposal is to "Part H. Supervised Industrial Installations" the user of the Code must be able to read and understand all parts of this code. In order to determine if "effective" protection has been provided, an inspector or installer must make the required calculation. This new text would require that the inspector or installer multiply the primary device time current characteristic by the effective primary to secondary transformer ratio.

I have had the opportunity to discuss this proposed change with inspectors, contractors and engineers. I am not convinced that the user of this code book will understand what this really means.

This new text is written by, and directed towards, engineers in supervised industrial installations.

Good code should be practical, easy to read and enforceable."

COMMENT ON AFFIRMATIVE:

FREDERICKS: I agree with the panel action, but some wording changes could have helped improve the clarity of the code text. The following would improve the clarity of the first paragraph of (d):

Conductors supplied by the secondary side of a transformer shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, where the primary protection has been determined to effectively protect the secondary conductors. The primary device time-vs-current protection characteristic shall be multiplied by the maximum effective primary-to-secondary transformer voltage ratio in making this determination.

Also, I believe the originally proposed text on maximum per-unit ratios of common transformer connections should have been retained. Even though the code is not intended as an instruction manual, I believe that small amounts of explanatory material should be considered acceptable when they relate to complex considerations such as this.

(Log #2114)

10- 72 - (240-92(b)(1)): Accept

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: Delete the length limitations in 240-92(b)(1) (b) and (c), as follows:

b. The ~~length of the secondary conductors does not exceed 75 ft (22.86 m) and the~~ conductors are protected by a differential relay with a trip setting equal to or less than the conductor ampacity.

c. The conductors shall be considered to be protected ~~if the length of the secondary conductors does not exceed 75 ft (22.86 m) and~~ if calculations, made under engineering supervision, determine that the system overcurrent devices will protect the conductors within recognized time vs. current limits for all short-circuit and ground-fault conditions.

SUBSTANTIATION: The supporting material and comments found in the ROP and ROC produced during the development of the 1999 NEC did not substantiate a technical reason to support a length limitation under (b) and (c).

Differential protection, as covered by (b) does not depend on the length of the protected conductors. Also, calculations made under engineering supervision, as covered by (c), may determine that the system overcurrent devices will adequately protect the conductors, even through they are longer than 75 ft.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

DOLLARD: I am voting negative to the panel action to accept proposal 10-72. My reasons are as follows:

"The length limitations were considered necessary in the 1999 cycle. The present limitations should remain in place. I do not believe that in the course of one cycle there is sufficient data to support the removal of all limitations on conductor length."

(Log #30)

10- 73 - (240-92(b)(1)a and b): Accept in Principle in Part

NOTE: The following proposal consists of Comment 10-95 on Proposal 10-115c in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 10-115c was:

Add a new Section 240-92 covering feeder and branch-circuit protection for supervised industrial installations in new Part H to read as follows:

240-92. Location in Circuit. An overcurrent device shall be connected in each ungrounded circuit conductor as follows:

(a) Feeder and Branch-Circuit Conductors. Feeder and branch-circuit conductors shall be protected at the point the conductors receive their supply, as permitted in Section 240-21, or as otherwise permitted in (b) or (c) below.

(b) Transformer Secondary Conductors of Separately Derived Systems. Conductors shall be permitted to be connected to a transformer secondary of a separately derived system, without overcurrent protection at the connection, where the conditions are met in (1), (2), and (3) below:

(1) Short Circuit and Ground Fault Protection. The conductors shall be protected from short-circuit and ground-fault conditions by complying with one of the following conditions:

a. The length of the secondary conductors does not exceed 50ft (l5.24 m) and the transformer primary overcurrent device has a rating or setting that does not exceed 150% of the value determined by multiplying the secondary conductor ampacity by the secondary-to-primary transformer voltage ratio.

b. The length of the secondary conductors does not exceed 75 ft. (22.86 m) and are protected by a differential relay with a trip setting equal to or less than the conductor ampacity.

c. The conductors shall be considered to be protected, if the length of the secondary conductors does not exceed 75 ft. (22.86 m) and if calculations, made under engineering supervision, determine that the system overcurrent devices will protect the conductors within recognized time vs. current limits for all short-circuit and ground-fault conditions.

(2) Overload Protection. The conductors shall be protected against overload conditions by complying with one of the following:

a. The conductors terminate in a single overcurrent device which will limit the load to the conductor ampacity.

b. The sum of the overcurrent devices at the conductor termination, limits the load to the conductor ampacity. The overcurrent devices shall consist of not more than six circuit breakers or sets of fuses, mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be no more than six overcurrent devices grouped in any one location.

c. Overcurrent relaying is connected (with current transformer(s), if needed) to sense all of the secondary conductor current and limit the load to the conductor ampacity by opening upstream or downstream devices

d. Conductors shall be considered to be protected if calculations made under engineering supervision determine that the system overcurrent devices will protect the conductors from overload conditions.

(3) Physical Protection. The secondary conductors shall be suitably protected from physical damage.

(c) Outside Feeder Taps. Outside conductors shall be permitted to be tapped to a feeder or to be connected at a transformer secondary, without overcurrent protection at the tap or connection, where all the following conditions are met:

(1) The conductors are suitably protected from physical damage.

(2) The sum of the overcurrent devices at the conductor termination limits the load to the conductor ampacity. The overcurrent devices shall consist of not more than six circuit breakers or sets of fuses mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be no more than six overcurrent devices grouped in any one location.

(3) The tap conductors are installed outdoors, except at the point of termination.

(4) The overcurrent device for the conductors is an integral part of a disconnecting means or shall be located immediately adjacent there to.

(5) The disconnecting means for the conductors are installed at a readily accessible location either outside of a building or structure, or inside nearest the point of entrance of the conductors.

SUBMITTER: T. Neil Thorla, New Carlisle, IN

RECOMMENDATION: Accept Proposal 10-115c in principle with the revised text for 240-92(b)(1)a and b as follows:

a. The length of the secondary conductors does not exceed ~~50 ft (22.86 m)~~ 100 ft (30.48 m) and the transformer primary overcurrent device has a rating or setting that does not exceed 150 percent of the value determined by multiplying the secondary conductor ampacity by the secondary-to-primary voltage ratio.

b. The length of the secondary conductors does not exceed ~~75 ft (22.86 m)~~ 100 ft (30.48 m) and ~~are~~ the entire length of the secondary conductors ~~are~~ is protected by ~~a~~ differential relay protection with a trip setting ~~equal to or less than~~ not exceeding the conductor ampacity.

SUBSTANTIATION: The Panel has already accepted the concept that conductor lengths of up to 100 ft can be protected by an overcurrent device set at 300 percent of the ampacity of the conductors in 240-21(e). As explained in the substantiation for this proposal, the worst case condition for transformer secondary conductors is a line-to-neutral fault on the secondary conductors for which the primary conductors see only 50 percent of the fault current as compared to the corresponding line-to-line fault. An overcurrent device set at 150 percent, seeing 50 percent of the fault current, equates to an overcurrent setting of 300 percent of the conductor ampacity. Increasing the length to 100 ft makes this section technically consistent with other sections of this Article.

Please refer to the example presented in my companion comments on 240-92(b)(1)c. Case 2 of this example represents one of the most challenging overcurrent protection situations, since it uses the free air rating of the conductors, unrestrained by termination temperature ratings, resulting in the smallest possible size conductors operating at their highest possible temperature (90°C). Furthermore, the spacing of these cables makes the inductive reactance relatively large, leading to lower prospective fault currents and longer primary overcurrent operating times. Figure 1 shows the single line diagram for this example. Using the equations from this example, Table 1 shows the secondary conductor temperature rise for phase-to-phase and phase-to-ground faults, with primary overcurrent protection set at 150 percent. Note that the conductor temperature rise is very low for lengths up to 500 ft. Table 2 shows the effect of transformer impedance on conductor temperature rise with a 100 ft length for the secondary conductors. Even for an impedance of 10 percent, more than twice the standard impedance for this size transformer, the conductor temperature rise is well below the allowable short circuit temperature rise of the conductors. Curve 1 shows the generic Type E fuse curve, and the conductor short circuit I^2t curves. This example shows that even in an extreme case, the 100 ft conductor length, with 150 percent primary overcurrent, is quite conservative.

The remaining proposed changes are editorial to better convey intent, and to agree with C-1(e) of the NEC Style Manual.

NOMENCLATURE

(Log #31)

10- 74 - (240-92(b)(1)c): Accept

NOTE: The following proposal consists of Comment 10-96 on Proposal 10-115c in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 10-50 (Log #30)].

SUBMITTER: T. Neil Thorla, New Carlisle, IN

RECOMMENDATION: Accept Proposal 110-115c in principle with the revised text for 240-92(b)(1)c as follows:

c. The conductors shall be considered to be protected~~, if the length of the secondary conductors does not exceed 75 ft (22.86 m) and~~ if calculations, made under engineering supervision, determine that the system overcurrent devices will protect the conductors within recognized time vs. current limits for all short-circuit and ground fault conditions.

SUBSTANTIATION: The Panel is to be commended for their effort to correct the problems with the existing Code language. Many inspectors are ignoring the "be permitted" portion of the "shall be permitted" language of 240-21(d) and (j), and turning a permissive statement into a mandatory rule. The problem with 240-21 is that it does not contain a mandatory rule for transformer secondary conductors, and the permissive statement is an alternate to nothing. The two Panel members who voted negative on this proposal referred to existing Code "rules". According to the NEC Style Manual "shall be permitted" language does not constitute a rule, but rather a permissive statement. Although it may not be obvious, this proposal actually imposes length restrictions on transformer secondary conductors where none currently exist due to the lack of mandatory language.

With the Panel's proposed wording, the maximum secondary conductor length possible would be 75 ft. This length seems somewhat arbitrary, and could still be too short where the transformer is located outdoors at grade level and the equipment room is on the second or third floor, which frequently occurs in industrial facilities.

The engineering equations and skills required to determine if a 75 ft conductor length is acceptable vs. a 50 ft length are exactly the same equations and skills that are required to determine if a 100 ft (or any other length) conductor is acceptable. There is no reason to restrict the length if engineering calculations are made. Length is not the only parameter that controls the prospective fault current of a faulted conductor. Conductor resistance is controlled primarily by length and cross-sectional area, with frequency playing a secondary role effect due to skin effect. Conductor inductive reactance is a function of length, shape of cross section, conductor spacing, frequency, and permeability of nearby materials. Furthermore, different insulation types have different maximum allowable short circuit temperatures, typically ranging from 150-250°C. The engineer should be able to tradeoff one parameter vs. another to design an acceptable system. It makes no sense to put a limit on one parameter, while leaving the other parameters unrestricted.

The following example illustrates how a fault at the end of a 100 ft secondary conductor length would result in a lower conductor temperature rise than for a 50 ft length for the same transformer and supply system. The example illustrates the installation of a 500 hp adjustable speed motor drive. This drive receives its power from a 660 kVA, 13.8 kV/460V transformer. It is preferred to use a mineral oil filled transformer located outdoors, which will require a 100 ft cable run as illustrated in Case 1. A less desirable alternate, due to space and cooling restrictions, is to use a silicone fluid filled transformer located indoors to limit the cable run to 50 ft, as illustrated in Case 2.

Figure 1 shows the fault current and conductor temperature rise calculations for both cases. Figure 2 shows the calculations for conductor impedance. In all cases the conductor temperature rise for the 100 ft length of cable of Case 1 is lower than the corresponding value for the 50 ft length in Case 2. The highest temperature rise of 41°C in Case 2 is still well within the worst case limits for modern cable insulations.

The Panel may argue that this is not a typical example, and this is indeed correct. This example was selected to be near worst case as far as conductor fault temperature is concerned, to show that even a 100 ft limitation is extremely conservative. The following is a brief comparison of this example versus a more typical example:

1) The transformer impedance of 6 percent, while typical for drive transformers, is higher than standard for this size transformer. This higher impedance reduces prospective fault current and results in additional conductor temperature rise due to longer fuse clearing times.

2) Drive transformers are typically ungrounded or high resistance grounded. The grounded wye secondary leads to the worst case overcurrent protection case for a phase-to-ground fault.

3) The cable is sized for a 90°C operating temperature. In the typical case, the cable would be sized for a 75°C operating temperature due to termination temperature limitations. This results in a smaller cable size which causes a higher temperature rise for the same current value. It also results in higher cable impedance which has the effect as explained in 1) above. The 90°C vs. 75°C also results in 15°C less temperature margin between operating and short circuit temperature.

4) Case 2 results in the smallest possible cable size. Cable was sized based on the 90°C column of Table 310-17. It would be possible to use cable sized in this manner, if the equipment construction was such that the cable does not act as a heat sink. In the more typical case of UL listed equipment, even if the terminations were rated for 90°C, the listing is based on ampacities from Table 310-16, which result in larger conductor sizes. The maintained spacing of Case 2 also results in greatly increased conductor inductive reactance, which has the effect as explained in 1) above.

5) The fuse clearing curves assume that no load exists before the fault, in which case the conductors would not be at maximum operating temperature at the time of the fault,

If the conductors were carrying rated load prior to the fault, the melting time portion of the fuse total clearing time would be shorter. In either event, the conductor fault temperature will be slightly lower than what is predicted in this analysis.

(Log #3134)

10- 75 - (240-92(d) (New)): Reject

SUBMITTER: Christopher Henry, Fluor Daniel

RECOMMENDATION: Add the following:

(d) Conductors from Battery Terminals. Where conductors are protected from physical damage, overcurrent protection for battery feeder conductors shall be located no farther than 10 ft from battery terminals.

SUBSTANTIATION: For battery installations, there is a physical problem with providing overcurrent protection at the point the conductors receive their supply (battery terminals). In most installations, there will always be several feet of electrically unprotected cable. Many industrial UPS manufacturers provide the overcurrent protection as an integral part of the UPS cabinet. It is common industry practice to locate the battery rack next to the cabinet and connect directly together (without an external overcurrent device). The length of electrically unprotected cable for this application might reach 5 to 10 feet. The above recommendation provides a clear and reasonable requirement for industrial battery installations.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed length is arbitrary and there has been no consideration given to the potentially hazardous conditions around batteries. Sufficient information has not been provided to substantiate any particular length.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #580)

10- 77 - (240-100(a)): Accept
SUBMITTER: James T. Dollard, Jr., IBEW Local Union 98
RECOMMENDATION: Revise to read as follows:
240-100. Feeders and Branch Circuits.
(a) Feeder and branch-circuit conductors shall have overcurrent protection in each ungrounded conductor located at the point where the conductor receives its supply, or at ~~a~~ an alternate location in the circuit ~~determined~~ when designed under engineering supervision that includes but is not limited to considering the appropriate fault studies and time current coordination analysis of the protective devices and the conductor damage curves. The overcurrent protection shall be permitted to be provided by one of the following.
SUBSTANTIATION: This proposal is the work of a Task Group assigned to recommend specific actions for proposal 13-43 and Comments 13-46, 13-47, 13-48 to the 1999 NEC. The Task Group consisted of the following members of CMP 10 and CMP 13.
Chair, Jim Dollard CMP 10, John Brezan CMP 10, Carl Fredericks CMP 10, Clive Kimblin CMP 10, Charles Blizard CMP 10, Charles Eldridge CMP 10, Don Johnson CMP 10, Vince Saporita CMP 10, George Gregory CMP 10, Jim Carroll CMP 13, Bill Brunner CMP 13, Barry Hornberger CMP 13.
This additional text is proposed by the Task Group with the intent of giving some guidance to the design of a premises wiring distribution system by an engineer under "engineering supervision". This will also give a minimum outline for the inspector.
The intent is not to limit the engineer to a minimum outline but to allow him/her the flexibility to consider all factors which might affect the system. This language makes it clear that a properly engineered system may provide adequate protection without providing overcurrent protection in each ungrounded conductor located at the point where the conductor receives its supply.
The Task Group believes the over 600-volt feeder or branch circuit will be protected from short circuits and ground faults where properly engineered by an engineer who looks at the whole distribution system on the premises. Smaller tap conductors from larger feeder conductors may be adequately protected from short circuits and ground faults even though the tap conductors are not protected from overload at the point the tap conductors receive their supply. The tap conductors may be adequately protected from overload by the use of overcurrent protection provided at the load end of the tap conductors.
The words "when designed" (under engineering supervision) should be substituted for "determined" (under engineering supervision) because the word designed is more forceful in ensuring that the particular installation has been actively reviewed. This wording will also make it clearer that it is in the design phase that engineering supervision takes place. This is important when the general rule of placing the overcurrent protection at the point where the conductor receives its supply is no longer being followed.
The Panel is proposing that the words "engineering supervision" be qualified by the words "that includes but is not limited to considering the appropriate fault studies and time current coordination analysis of the protective devices and the conductor damage curves". Here the objective is to provide an inspector with additional information relative to judging the adequacy of the engineering supervision.
When departing from the code requirement that the overcurrent protection be provided at the point where the conductor receives its supply and applying engineering supervision as permitted, the installer shall provide adequate engineering supervision. As a guideline for an inspector, that supervision should include appropriate fault studies and time current coordination analysis of the protective devices and the conductor damage curves. However, additional factors might have to be considered depending on the particular installation. This is why the words "that includes but is not limited to" have been added to this section. Ultimately the engineers involved bear the responsibility.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1464)

10- 78 - (240-100(a)): Reject
SUBMITTER: William M. Lewis, Eli Lilly and Co.
RECOMMENDATION: Revise the text as follows:
(a) Feeder and branch-circuit conductors shall have short-circuit protection in each ungrounded conductor located at the point where the conductor receives its supply or at a location in the circuit determined under engineering supervision. For supervised installations as defined in Section 225-48, where 240-101(b) does not apply, the location of the short circuit protection may be as allowed in Section 240-92, except length limitations from 240-92 are doubled for circuits of from 2400 to 5000 volts phase-to-phase, and quadrupled for circuits greater than 5000 volts phase-to-phase. The overcurrent protection shall be permitted to be provided by one of the following.
SUBSTANTIATION: Two changes are proposed here:
1. Correction of the 1999 NEC change from requiring "short-circuit" to requiring "overcurrent" protection in this section. Historically, the Code has required short circuit protection of these conductors, and this wording is consistent with the rating and setting requirements given in 240-101. The term "overcurrent" is a more general term which includes both short circuit protection and overload protection. As such it does not specifically imply fault clearing capability. Overload protection does not require fault clearing capability. Short Circuit protection does imply fault clearing capability.
2. To provide specific tap allowances and restrictions for supervised installations above 600 volts. Similar tap allowances and restrictions are provided in Article 240 Part H of the 1999 NEC for supervised industrial installations up to 600 volts.
The only difference vs. the low-voltage 240-92 allowances that is proposed here is to increase the allowable lengths based on the circuit voltage. The allowances proposed here are conservative, and intended to be the minimum that would reasonably allow for the increased scale of the larger high-voltage systems. Since the fault-energy limiting effect of an impedance is reduced by an increase in the voltage squared, the technically-justifiable tap lengths are much greater than those proposed here.
For reference, the proposed wording of Section 225-48 is:
225-48 Supervised Installations.
For the purposes of Part C, the term supervised installation is defined as the portions of a facility where all of the following conditions are met.
1. Conditions of design, and installation are provided under engineering supervision.
2. Qualified persons provide maintenance, monitoring and servicing of the system.
3. The premises wiring system has 2500 kVA or greater of load as calculated in accordance with Article 220.
4. The premises has at least one service that is more than 600 volts nominal.
This proposal was developed by the Task Group based on the Task Group's review and discussion of the current requirements of Articles 225, 230, 100, 110, 240, and 250. This proposal is one of 14 which makes up the Task Group's response to a recommendation by a TCC task group on usability in 1995. In considering the needed proposals, emphasis was placed on including in the NEC, practices which are recognized by utilities as necessary for safe installation of over 600 volt systems; and may not be familiar to inspectors who rely on the NEC for direction.
The Task Group participants consisted of William M. Lewis, (CMP 4), committee chair; Carl J. Fredericks (CMP 10); Tom Adams (CMP 4); John Beck (Chairman CMP 4); Mark Sumrall (CMP 4); Barry Hornberger, (CMP 13); William T. Beutler, P.E. William Long, NEMA
Interested persons (nonparticipants): Robert J. Pollock (CMP 4 and TCC); Merton Bunker (NFPA); Mark Earley (NFPA).
PANEL ACTION: Reject.
PANEL STATEMENT: The panel's decision is that "overcurrent" is the correct term for this section. It is understood that overload

protection may be provided in circuits above 600 volts via load limitation. The panel does not agree that any length limitations should be imposed on the designing engineer. See panel action on Proposal 10-77.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3264)

10- 79 - (240-100(a)): Reject
SUBMITTER: Alan Manche, Square D Co.
RECOMMENDATION: Revise NEC 240-100(a) with the deletion (strike through) as shown. The entire text of 240-100(a) is shown for clarity, but only the change shown strike through is part of this proposal.

240-100. Feeders and Branch Circuits.

(a) Feeder and branch-circuit conductors shall have overcurrent protection in each ungrounded conductor located at the point where the conductor receives its supply ~~or at a location in the circuit determined under engineering supervision~~.

SUBSTANTIATION: The requirement in 240-100(a) states the feeder and branch-circuit conductors shall have "overcurrent protection." Locating the protection at any other location than where the conductor receives its supply does not afford the "overcurrent" protection as defined in Article 100. The definition in Article 100 states, "Overcurrent. Any current in excess of the rated current of equipment or the ampacity of a conductor. It may result from overload, short circuit, or ground fault."

The intent of Ted Stutheit Comment 10-97 (1999 ROC) has been completely missed by allowing overcurrent protection devices to be placed at locations in the circuit other than where the conductor receives its supply. Placement of the overcurrent device in any location other than at the supply of the conductors can result in the loss of short circuit, ground fault, and overload protection of the unprotected portion of the conductors located on the line side of the protection device. The panel appears to "believe" that a system can be installed safely but provided no substantiation of current practice or restrictions to support reducing the safety requirements in the 240-100.

Deregulation is moving the maintenance and control of high voltage equipment into the hands of owners other than utilities and heavy industry. These owners are looking to the public service sector such as product manufacturers and local electrical contractors for assistance with their high voltage electrical system. Utilities and heavy industry that once serviced nearly all of the high voltage equipment is no longer the norm.

The panel also deems the application issues Over 600V systems as "unique." This should place additional safety concern on such systems instead of just being dismissed to "Engineering Supervision." Those performing the "Engineering Supervision" must have a set of safety rules by which they operate or the panel has just reduced the level of safety to the public. These governing safety rules need to be introduced into the NEC for high voltage.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and submitter's substantiation on Proposal 10-77.

(Log #3758)

10- 80 - (240-100(a)): Accept in Part
SUBMITTER: Timothy M. Croushore, Allegheny Power Service Corp.
RECOMMENDATION: Please reword the existing Section 240-100(a) to read as follows:

240-100. Feeders and Branch Circuits.

(a) Location and Type of Protection. Feeder and branch-circuit conductors shall have short circuit protection in each ungrounded conductor located at the point where the conductor receives its supply or at a location in the circuit determined under engineering supervision. The short circuit protection shall be permitted to be provided by one of the following.

SUBSTANTIATION: The changes identified in this proposal would add a title to the section and revert back to the 1996 NEC concept of short circuit protection for high voltage feeders and branch circuits.

As the section currently reads in the 1999 NEC, the installer would have to provide overcurrent protection which would include short circuit protection, overload protection and ground fault protection at the point where each conductor receives its supply. Providing overload protection and ground fault protection at this point is not always feasible in a high voltage electric system. High voltage fuses as permitted in (2) of 240-100 will not provide adequate overload protection for all high voltage cables. Overload protection in this application is best applied at the load overcurrent protective device rather than at the cable supply source.

Fuses for ungrounded high voltage circuits or high impedance grounded circuits cannot provide ground fault protection. Rather, overcurrent relays and current transformers are necessary to provide this protection when necessary. The main issue at the electric supply source is short circuit protection. This section should be changed back to the concept in the 1996 NEC so only short circuit protection is required at the point where the conductor receives its supply.
PANEL ACTION: Accept in Part.
The panel accepts the proposed subsection title, "Location and Type of Protection.", and rejects the remainder of the proposal.
PANEL STATEMENT: The panel accepts the subsection title which is in conformance with the NEC Style Manual. See panel action on Proposal 10-77 and panel action and statement on Proposal 10-78.

10- 81 - (240-100(a)(1)): Accept

NOTE: The Technical Correlating Committee directs the panel to reconsider the proposal relative to the use of permissive language in the second sentence. This action will be considered by the Panel as a Public Comment.

SUBMITTER: William M. Lewis, Eli Lilly and Co.
RECOMMENDATION: Revise the text as follows:

(1) Overcurrent Relays and Current Transformers. Circuit breakers used for overcurrent protection of 3-phase circuits shall have a minimum of three overcurrent relay <u>elements</u> operated from three current transformers. <u>The separate overcurrent relay elements (or protective functions) may be part of a single electronic protective relay unit.</u>

On 3-phase, 3-wire circuits, an overcurrent relay <u>element</u> in the residual circuit of the current transformers shall be permitted to replace one of the phase relay <u>elements.</u>

An overcurrent relay <u>element</u>, operated from a current transformer that links all phases of a 3-phase, 3-wire circuit, shall be permitted to replace the residual relay <u>element</u> and one of the phase-conductor current transformers. Where the neutral is not regrounded on the load side of the circuit as permitted in Section 250-184(b), the current transformer shall be permitted to link all 3-phase conductors and the grounded circuit conductor (neutral).

SUBSTANTIATION: This change is intended to recognize present-technology multifunction electronic overcurrent relays. These types of devices provide equal or better protection to the single-function relays that were previously the norm.

This proposal was developed by the Task Group based on the Task Group's review and discussion of the current requirements of Articles 225, 230, 100, 110, 240, and 250. This proposal is one of 14 which makes up the Task Group's response to a recommendation by a TCC task group on usability in 1995. In considering the needed proposals, emphasis was placed on including in the NEC, practices which are recognized in the electrical industry as necessary for safe installation of over 600 volt systems. This is to provide guidance and direction for installation of these facilities which have not historically been included in the NEC.

The Task Group participants consisted of William M. Lewis (CMP 4); committee chair; Carl J. Fredericks (CMP 10); Tom Adams (CMP 4); John Beck (Chairman CMP 4); Mark Sumrall (CMP 4); Barry Hornberger, (CMP 13); William T. Beutler, P.E.; William Long, NEMA.

Interested persons (nonparticipants): Robert J. Pollock (CMP 4 and TCC); Merton Bunker (NFPA); Mark Earley (NFPA)
PANEL ACTION: Accept.

10- 82 - (240-101(a), FPN (New)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Insert a new Fine Print Note as follows:
FPN: The minimum trip setting of an electronically actuated fuse is the minimum amount of current that will cause the device to open. It is equivalent to the long-time trip element setting of a circuit breaker.
SUBSTANTIATION: While giving a seminar, several people came up to me and asked if the word "minimum," in the context of a Code section that supposedly sets the maximum values for overcurrent protection, were a misprint. It seems to suggest that the six-times parameter, which is a maximum ceiling for circuit breakers, is only the minimum floor for these devices. Although the manufacturers understand how the term is used, it is counterintuitive. After discussing this with a manufacturer, who didn't want the Code to change to the point where he would have to relabel his products, we hit on the idea of a fine print note. Based on the way the question resonated at the seminar, I think there is likely to be quite a bit of confusion on this point, and the note will put it to rest.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not agree with the submitter's definition. This information is presently available in the manufacturer's documentation. This is design information that does not belong in the code.

(Log #3779)

10- 83 - (240-102): Reject
SUBMITTER: Behzad Eghtesady, City of Los Angeles, CA
RECOMMENDATION: Where an orderly shutdown is required to minimize hazard(s) to personnel and equipment in an ungrounded system, a means shall be provided to protect the system from destructive transient over voltage(s) due to ground fault(s) based on the following conditions:
(1) Coordinated short-circuit protection.
(2) Impedance grounded system.
(3) Overload indication based on monitoring systems or devices.
(4) Cables with 133 percent insulation level.

For the purpose of this section, coordination is defined as properly localizing a fault condition to restrict outages to the equipment affected, accomplished by a choice of selective fault-protective devices.

Impedance grounding of a system shall be accomplished through the use of either a derived or readily available neutral. Due to complexity of such installations, they shall be done under supervision of a registered professional engineer.

FPN: The monitoring system may cause the condition to go to alarm, allowing corrective action or an orderly shutdown, thereby minimizing personnel hazard and equipment damage.
SUBSTANTIATION: Currently, there is no equivalent requirement for a high voltage system as there is for low voltage system as specified in section 240-12. This new requirement will produce an equivalent protection for high voltage systems that are similar to what is currently offered in the code for low voltage installations. Furthermore, majority of plant failures in high voltage systems are contributed to the overvoltage and their build up in ungrounded systems due to ground faults. This overvoltage can easily reach six to eight times the phase voltage due to restriking ground faults. Since such an installation would require detail engineering analysis, it would be prudent that such a work to be done under supervision of a professional registered engineer.

This new requirement will establish a safe and reliable installation with minimal cost. Lack of such protection will continue to create a wiring system that fails often and cause dangerous operating conditions for the employees or occupants of plants, beside any economic loss.
PANEL ACTION: Reject.
PANEL STATEMENT: Part I of Article 240 deals with overcurrent not with overvoltage protection. The panel does not agree that impedance grounding should be required for such systems. The proposal would not add flexibility to code users other than what is already provided by the panel's acceptance of proposal 10-77. See panel action and submitter's substantiation on Proposal 10-77.

SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Section 250-30(a)(3)(b), replace "5 ft (1.52 m)" with "1.5 m (5 ft)".
2. In Section 250-50, replace "5 ft (1.52 m)" with "1.5 m (5 ft)".
3. In Section 250-50(a), replace "10 ft (3.05 m)" with "3.0 m (10 ft)".
4. In Section 250-50(c), replace "2 in. (50.8 mm)" with "50 mm (2 in.)".
5. In Section 250-50(c) in 2 locations, replace "20 ft (6.1 m)" with "6.0 m (20 ft)".
6. In Section 250-50(c), replace "1/2-in. (12.7 mm)" with "12.7 mm (1/2 in.)".
7. In Section 250-50(d), replace "2 1/2 ft (762 mm)" with "750 mm (30 in.)".
8. In Section 250-50(d), replace "20 ft (6.1 m)" with "6.0 m (20 ft)".
9. In Section 250-52, replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
10. In Section 250-52(c), replace "8 ft (2.44 m)" with "2.5 m (8 ft)".
11. In Section 250-52(c)(2) in 2 locations, replace "5/8 in. (15.87 mm)" with "15.87 mm (5/8 in.)".
12. In Section 250-52(c)(2), replace "1/2 in. (12.7 mm)" with "12.7 mm (1/2 in.)".
13. In Section 250-52(c)(3) in 2 locations, replace "8 ft (2.44 m)" with "2.5 m (8 ft)".
14. In Section 250-52(c)(3), replace "21/2 ft (762 mm)" with "750 mm (30 in.)".
15. In Section 250-52(d), replace "2 ft^2 (0.2 m^2)" with "0.2 m^2 (2 ft^2)".
16. In Section 250-52(d), replace "1/4 in. (6.35 mm)" with "6.35 mm (1/4in.)".
17. In Section 250-52(d), replace "0.06 in. (1.52 mm)" with "1.52 mm (0.06 in.)".
18. In Section 250-52(d), replace "2 1/2 ft (762 mm)" with "750 mm (30 in.)".
19. In Section 250-56, replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
20. In Section 250-56, FPN, replace "8 ft (2.44 m)" with "2.5 m (8 ft)".
21. In Section 250-56, FPN, replace " 6 ft (1.83 m)" with "1.8 m (6 ft)".
22. In Section 250-64(a), replace "18 in. (457 mm)" with "450 mm (18 in.)".
23. In Section 250-80, Exception, replace "18 in. (457 mm)" with "450 mm (18 in.)".
24. In Section 250-86, Exception No. 1(b), replace "25 ft (7.62 m)" with "7.5 m (25 ft).
25. In Section 250-86, Exception No. 3, replace "18 in. (457 mm)" with "450 mm (18 in.)".
26. In Section 250-92(b), FPN No. 1, replace "6 in. (152 mm)" with "(150 mm (6 in.)".
27. In Section 250-102(e), replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
28. In Section 250-106, FPN No. 2, replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
29. In Section 250-106, FPN No. 2, replace "3 ft (0.92 m)" with "900 mm (3 ft)".
30. In Section 250-110(1), replace "8 ft (2.44 m)" with "2.5 m (8 ft)".
31. In Section 250-110(1), replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

32. In Section 250-110(1), Exception No. 2, replace "8 ft (2.44 m)" with "2.5 m (8 ft)".
33. In Section 250-118(6)(c), replace "6 ft (1.83 m)" with "1.8 m (6 ft)".

34. In Section 250-118(7)(d), replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
35. In Section 250-118(8)(b), replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
36. In Section 250-184(a), Exception No. 2 FPN, replace "10 ft (3.05 m)" with "3.0 m (10 ft)".
37. In Section 250-188(e), replace "20 ft (6.1 m)" with "6.0 m (20 ft)".

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show the SI units as the preferred and inch-pound units immediately following in parenthesis. A soft conversion was used for product related items such as ground rods.
PANEL ACTION: Accept.
PANEL STATEMENT: Editorially, add hard conversions where ever necessary to CMP 5 proposals in all revised or altered accepted text.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
COMMENT ON AFFIRMATIVE:
RAPPAPORT: I agree with the change to metric but I do not agree with some of the specifics. Distances less than 0.1 meters (100 mm) would normally be measured with a ruler and it is appropriate to state the distance in millimeters. A distance of 0.5 meter (500 mm) would be measured with a tape and should be given in meters. I, therefore, suggest that distances of 0.5 meters and longer be stated in meters and distances less than 0.5 meters be stated in millimeters. The conversions of small numbers should also take into account the tolerance (not given) of the inch values. For example, 5/8 in. is translated to 15.87 mm. If the tolerance on the 5/8 in. is 1/64 in., then the millimeter value would be 16.27 mm. It would seem that for item 11, for example, the new rod diameter should be given as "16 mm (5/8 in)". Similar arguments can be given for item 16: "6.5 mm (1/4 in.)" and for item 17: "1.5 mm (0.6 in.)".

(Log #2815)

5- 55 - (250): Reject
SUBMITTER: Joseph Kenning, St. Cloud, MN
RECOMMENDATION: Grounding system is very important, but should be noncurrent carrying system. To correct this issue, 110 volts should be retransformed to fully balance the coil. Transformers should never be bonded to earth, to stop alternating electrical magnetic field.
SUBSTANTIATION: I have provided a video that describes the serious problems of grounding system. My system has been in operation for 14 years and is open for review.
When this system is hooked up right it is safer and more fire proof.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no specific recommendation made by the submitter in the proposal. Section 4.3.3(c) of the Regulations Governing Committee Projects requires proposals to include proposed text, including the wording to be added, revised (and/or) revise, or deleted

5- 56 - (250-2): Reject
SUBMITTER: Thomas E. Trainor, City of San Diego, CA
RECOMMENDATION: Add a new Section 250.2 Definitions, to define technical terms used in Article 250. The proposed new section would read as follows:
250.2. Definitions.
Fault Current Path. An electrically conductive path from the point of a ground fault on a wiring system to the grounded conductor at the service. The path may consist of any combination of equipment grounding conductors, metallic raceways, metallic cable sheaths, electrical equipment, and any other electrically conductive material such as metal water and gas piping, steel framing members, stucco mesh, metal ducting, reinforcing steel, phone or TV cables, and the earth itself.
Effective Fault Current Path. An electrically conductive path from the point of a ground fault on a wiring system to the grounded conductor at the service designed and intended to carry current under fault conditions. An effective fault current path is created by effectively bonding together all of the electrically conductive materials that are likely to be energized by the wiring system. Effective bonding is accomplished through the use of equipment grounding conductors, bonding jumpers or bonding conductors, approved metallic raceways, connectors and couplings, approved metallic sheathed cable and cable fittings, and other approved devices. A ground fault path is effective when it is an intentionally constructed, permanent, low impedance circuit that will safely carry fault current at a level which is at least four times the trip setting of the related overcurrent device.
Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the earth or some electrically conductive material which is connected to earth.
SUBSTANTIATION: The term Fault Current Path is a new technical term used in the 1999 NEC. The term Effective Fault Current Path is a new technical term proposed for the 2000 NEC. The term Ground Fault is not defined in Article 100 and requires a definition to describe why a fault current path is required.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation has not indicated that there is a need to define these terms. The panel does not agree with the submitter's definitions.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
MELLO: This proposal should be accepted in principle. The terms identified for definition are either in use or proposed for use. The incorrect understanding of "bonding" is a direct result of not understanding the terms used around "ground faults." The starting point of understanding the issues of "grounding" and "bonding" must be from having defined terms. I agree with the panel's comment on not accpeting the definitions as proposed, and that there is not technical substantiation provided for the four times rating, but the principle is correct and the panel should act to find wording that is acceptable to the majority. The submitter's substantiation for having the definitions is adequate and correct.
JOHNSTON: This proposal should be Accept in Principle. Adding definitions to define some of the critical performance based terms used in Article 250 can add to the increased understanding of the purposes of grounding and bonding and promote a more user friendly Article 250. I do concur with the Panel's Statement that the Panel does not agree with the submitter's definitions. I do feel as though there is a strong need for these definitions and terms in the beginning of Article 250. The definitions and terms submitted in the proposal may need to be reworded a bit by the Panel. This proposal would further clarify the performance requirement to enhance not only usability but promote a better understanding and grasp of the critical fundamentals in this section.

(Log #4089)

5- 57 - (250-2): Reject

SUBMITTER: Thomas E. Trainor, City of San Diego, CA

RECOMMENDATION: Amend Section 250.2 to read as follows:

250.2. General Requirements for Grounding and Bonding. The following general requirements identify what grounding and bonding of electrical systems are required to accomplish. The prescriptive methods contained in Article 250 shall be followed to comply with the performance requirements of this section.

(a) Grounded Systems.

(1) Electrical System Grounding. Electrical systems that are required to be grounded or are optionally grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher voltage lines and that will stabilize the voltage to earth during normal operation.

(2) Grounding of Electrical Equipment. Conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth so as to limit the voltage to ground on these materials.

(3) Bonding of Electrical Equipment. Conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the supply system grounded conductor in a manner that establishes an effective fault current path.

(4) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials, such as metal water piping, metal gas piping, and structural steel members, that are likely to become energized shall be connected together and to the supply system grounded conductor in a manner that establishes an effective fault current path.

(5) Creating an Effective Fault Current Path. Electrical equipment and wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low impedance circuit capable of safely carrying fault current at a level which is at least four times the trip setting of the related overcurrent device from any point on the wiring system where a fault may occur to the grounded conductor at the service. The earth shall not be used as the sole equipment grounding conductor or fault current path.

(b) Ungrounded Systems.

(1) Grounding of Electrical Equipment. Conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth in a manner that will limit the voltage imposed by lightning or unintentional contact with higher voltage lines and limit the voltage to ground on these materials created by capacitance.

(2) Bonding of Electrical Equipment. Conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the supply system grounded equipment in a manner that facilitates the use of ground fault detection devices.

(3) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials, such as metal water piping, metal gas piping, and structural steel members, that are likely to become energized shall be connected together and to the supply system grounded equipment in a manner that facilitates the use of ground fault detection devices.

(4) Ground Fault Detection Devices. Electrical equipment, wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low impedance circuit from any point on the wiring system where a fault may occur to the grounded service equipment to facilitate the use of ground fault detection devices. The earth shall not be used as the sole equipment grounding conductor or fault current path.

FPN: See Figure 250.2 for information on the organization of Article 250.

Figure 250.2. Grounding.

SUBSTANTIATION: The revision of Section 250-2 for the 1999 NEC originated with the NFPA Usability Task Group. The intent was not identify general performance requirements for grounding and bonding to clarify what needs to be accomplished in order to have a safely "grounded" installation. The proposal was editorial in nature, consisting of the information previously contained in old Section 250-51 and the Fine Print Notes to old 250-1. The requirements for ungrounded systems were intentionally omitted because a rewrite would require more than editorial changes. The assumption was that the panel would take appropriate action on these requirements. Unfortunately, some of the comments accepted results in a negative impact on the usability of this Section.

The following are examples, in support of this proposed revision for the 2002 NEC, to show how the amended text is more accurate and makes the Section more easily read and understood.

Example 1. Section 250-2(b) it titled "Grounding of Electrical Equipment" but only the first sentence deals with grounding. Both the second and third sentences describe how equipment must be bonded to form a fault current path. This is not "grounding" and it is inaccurate to describe it as such. The fault current path connects equipment to the grounded service conductor while grounding connects equipment to earth. Although these paths are typically the same from the point where a fault occurs to the service, they separate at the service and perform two radically different functions. The connection to the grounded service conductor is part of the "fault current path" which completes a low impedance circuit allowing a high level of fault current to return to the serving transformer and force an overcurrent device to operate. The connection to earth is an effort to protect electrical equipment from damage by lightning or high voltage. Combining these two requirements in a section entitled "grounding" is inaccurate, confusing to the user and serves to foster the ongoing confusion regarding the purposes of grounding and bonding.

The intent of the original Usability proposal was to clearly identify and differentiate between these two functions. This proposal separates the requirements for grounding and bonding as was originally intended and states them in a clear and accurate manner.

Example 2. The third sentence of Section 250-2(b) deals with ungrounded systems and requires equipment to "be connected together in a manner that establishes an effective path for fault current". Unfortunately, it is impossible to establish an effective path for fault current on an ungrounded system since there is no path for fault current to return to the serving transformer. Connecting equipment together and to the earth will provide some protection from lightning but it will not create a path for fault current. In point of fact, the first fault to metal equipment on an ungrounded circuit causes no change in the operation of the circuit. No current flows because there is no path for it to return to the source. No circuit - No current. However, a faulted circuit poses a potential hazard to equipment and personnel since a second fault can create a low impedance connection between the ungrounded conductors of the system. The only protection against ground faults on an ungrounded system is the use of ground fault detection devices. These devices can sound an alarm or shut down circuits when a fault is sensed.

This proposal more accurately described what grounding and bonding are intended to accomplish on ungrounded systems.

Example 3. Section 250-2(c) also requires electrically conductive materials on an ungrounded system to "be connected together in a manner that establishes an effective path for fault current".

The comments above apply equally to this path. No Circuit - No Current.

Example 4. Section 250-2(d) deals with "performance of the fault current path". The first issue is that this is anew technical term which is undefined in the NEC. A definition is being submitted in a separate proposal. The second issue is which fault current path? From a point where a fault occurs, there may be multiple "fault current paths". Many of them are paths that we do not want fault current to flow on, such as across stucco mesh to earth or along metal air ducts to the heating equipment. There is no way to eliminate all of the potential paths for fault current. In order for the performance requirement to be meaningful, it needs to be clear that it applies to the fault current path that we designed to carry fault current. The designed path is the one that must be a permanent part of the circuit and of low impedance to safely carry fault current and force an overcurrent device to operate. The only effective way to eliminate the fire and electrocution hazards associated with fault current is to turn off the circuit as soon as possible after a fault occurs. The overcurrent device will do this if, and only if, an effective fault current path exists.

This proposal makes it clear that electrical installations have to be made in a manner that creates an effective fault current path. This also creates another technical term which is undefined in the NEC. A definition of "effective fault current path" is submitted as a separate proposal.

In summary, this proposal (and the separate proposal for definitions) continues the work started by the original Usability Task Group. It clearly separates the performance requirements

for grounding and bonding on grounded systems because they are different. It provides different performance requirements grounding and bonding of grounded and ungrounded systems as they operate differently. It provides clearer, more measurable performance standards for the fault current path which is critical to the safe operation of electrical circuits. These proposed changes are intended to make the section easier to read, use, and enforce.
PANEL ACTION: Reject.
PANEL STATEMENT: The additional wording does not add clarity to requirements as written. There is no justification for the four times rating. There is no substantiation for the additional requirements in 250-2(b).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
JOHNSTON: This proposal should be Accept in Principle and in Part. I agree with the submitter's proposal to clarify this section. The nature and spirit of the proposal are well intended and are continuing in the direction of further expanding on the performance aspect of Article 250. In (a) (1) change "or are optionally grounded" to "or other electrical systems specified in Section 250-21 that are grounded by choice". In (b)(2) that facilitates the operation of ground fault detection devices if utilized. Ground detectors are not a requirement of the NEC for ungrounded systems at the present other than as specified in Section 250-21(3)(d). The proposal would clarify some of the performance issues associated with an ungrounded system. This proposal would possibly need rewording and a companion proposal in Section 250-21 that requires ground fault detection systems for ungrounded systems. Many of the more recent ungrounded systems do have some form of ground detection system installed for monitoring, but it still only appears as a FPN in Section 250-21. I agree with the submitter's intent to remove ungrounded systems from this section or add a new subsection and locate the requirements for ungrounded systems in the new section. Both systems do require an effective path for fault current, but the separation and info on the specific performance requirements of the fault current path for each system can use clarification in this section. I concur with the Panel's conclusion that the four times rating of the device has no substantiation with it to warrant the new wording in the Code.
MELLO: The proposal should be accepted in principle. The substantiation provides clear statements on how the present wording makes no sense. To apply common peformance criteria to grounded systems where a ground fault will have a high current and should be cleared by overcurrent protection to an ungrounded system only creates confusion. The concept to separate the requirements for grounding and for bondng and also to separate grounded and ungrounded systems goes a long way to resolve the confusion. I agree with the panel's action on rejecting the four times overcurrent device rating as that was not technically substantiated.

(Log #4289)

5- 58 - (250-2): Reject
SUBMITTER: Charles F. Mello, Milwaukie, OR
RECOMMENDATION: Revise text to read as follows:
The following general requirements identify what grounding and bonding of electrical systems are required to accomplish. The prescriptive methods contained in Article 250 shall be followed to comply with the performance requirements of this section.
(a) Grounding of Electrical Systems. Electrical systems that are required to be grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher voltage lines and that will stabilize the voltage to earth during normal operation.
(b) Bonding and Grounding of Electrical Equipment. Conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be bonded together and connected to earth so as to limit the voltage to ground on these materials. Where the electrical system is required to be grounded, these materials shall be connected together and to the supply system grounded conductor as specified by this article in a manner that establishes an effective path for fault current. Where the electrical system is not solidly grounded, these materials shall be connected bonded together to form an electrically continuous path in ~~a manner that establishes an effective path for fault current.~~
(c) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials, such as metal water piping, metal gas piping, and structural steel members, that are likely to become energized shall be bonded as specified by this article to the supply system grounded conductor in a manner that establishes an effective path for fault current or, in the case of an ungrounded electrical system, to the electrical system grounded equipment~~, in a manner that establishes an effect path for fault current~~.
SUBSTANTIATION: The present wording misuses the term grounding in paragraph (b) when it is actually the bonding of the noncurrent carrying parts that provide for the fault current path. In addition, the fault current path for ground fault current only makes sense for grounded systems and does not make sense for an ungrounded system. This revision of the text will clarify the purposes of grounding and bonding separately as well as when combined.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed text does not add clarity. The new wording could suggest that even grounded equipment electrically connected together may require additional bonding. Even systems that are not solidly grounded do require effective path for fault currents.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
MELLO: The proposal should be accepted in principle. In paragraph (b), the word "connected" and the word "in" in the last sentence should be deleted as editorial changes. The present code text is not clear and was substantiated to be incorrect so some clarity is needed. The panel comment itself indicates confusion on what "grounding" and "bonding" are for. If equipment is electrically connected together, then it is bonded as long as that electrical connection is adequate to carry the ground fault current likely to be imposed. When this electrically connected equipment gets to the service or souce of a separately derived system, then the connection to the grounding electrode is what makes it "grounded".
RAPPAPORT: This proposal should be "Accept in Principle". The proposal introduces the purpose of bonding which has been missing. It identifies, but not clearly, the difference between "system grounding" and "equipment grounding". In order to emphasize the differences in (a) and (b), subsection titles should be changed to "System Grounding" and "Equipment Bonding and Grounding", respectively. The proposal incorrectly refers to "fault current" which also includes line-to-line faults. "Fault current" should be changed to "ground fault current" which is the intended condition.
WHITE: This proposal should be accepted in principle. The words "connected" and "in" in the last sentence of proposed 250-2(b) should be deleted. The concept of bonding of electrical equipment is not presently covered in 250-2. I think this concept is an important part of the performance requirements that the panel has tried to establish in this section. I think this proposal accurately clarifies the difference between grounding and bonding and the purposes of each and therefore does add needed clarity to this section.

(Log #741)

5- 59 - (250-2(a), (d)): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Grounding of Electrical Systems. Electrical systems ~~required~~ to be grounded shall be ... (remainder unchanged)
Add to first paragraph of (d):
This requirement shall not be construed as requiring an equipment grounding conductor or equipment bonding jumper larger than the largest ungrounded associated circuit conductor.
SUBSTANTIATION: The provisions of (a) should also apply to systems grounded by choice. The requirements of (d) and the FPN for Table 250-122 may be inferred as requiring a grounding conductor larger than the largest conductor where the overcurrent device rating exceeds the circuit conductor ampacity.

PANEL ACTION: Accept in Principle in Part.
The panel accepts in principle the deletion of the words "required to be" to Section 250-2(a). The panel rejects the proposed revision to Section 250-2(d).
PANEL STATEMENT: See panel action on Proposal 5-60 for the accepted text of 250-2(a). Section 250-2(d) provides fault current path performance requirements. The proposed requirements in 250-2(d) are redundant because the sizing requirements for equipment bonding jumpers and equipment grounding conductors are covered in Section 250-102(c) and (d) and Section 250-122 respectively.

5- 60 - (250-2(a)): Accept
SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Revise Section 250-2(a) as follows:
(a) Grounding of Electrical Systems. Electrical systems that are ~~required to be~~ grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher voltage lines and that will stabilize the voltage to earth during normal operation.
SUBSTANTIATION: The requirements for how to ground a system should be followed whether the system is grounded by choice or requirement.
PANEL ACTION: Accept.

(Log #2589)

5- 61 - (250-2(b)): Accept in Principle
SUBMITTER: Donald R. Cook, Southern Section, IAEI
RECOMMENDATION: Revise Section 250-2(b) to read as follows:
(b) Grounding of Electrical Equipment. Noncurrent-carrying ~~C~~conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth so as to limit the voltage to ground on these materials. Where the electrical system is required to be grounded, these materials shall be connected together and to the supply system grounded conductor as specified by this article. Where the electrical system is not solidly grounded, these materials shall be connected together in a manner that establishes an effective path for fault current.
SUBSTANTIATION: The current wording of the first sentence of this section requires all conductive materials, such as conduits, cabinets, etc. to be connected to earth. The wording also includes normal current carrying conductive materials forming a part of the equipment. Taken literally, this wording includes items such as busbars. Including the phrase noncurrent-carrying limits the sentence to noncurrent-carrying conductive parts.
PANEL ACTION: Accept in Principle.
Revise Section 250-2(b) to read as follows:
(b) Grounding of Electrical Equipment. Noncurrent-carrying ~~C~~conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth so as to limit the voltage to ground on these materials. Where the electrical system is ~~required to be~~ grounded, these materials shall be connected together and to the supply system grounded conductor as specified by this article. Where the electrical system is not solidly grounded, these materials shall be connected together in a manner that establishes an effective path for fault current.
PANEL STATEMENT: The phrase "required to be" was removed beacuse the panel intends 250-2(b) to cover all grounded systems, whether they are required to be grounded or permitted to be grounded.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
RAPPAPORT: I agree with the deletion of "required to be" but I am concerned with the addition of "Noncurrent - carrying". The proposed wording is technically correct but the previous wording was also correct. The substantiation that the present wording includes current carrying conductors is not correct because the present wording refers to materials "enclosing electrical conductors". I am concerned that someone out there will try to find some ulterior motive for the CMP change in wording.

5- 64 - (250-2(c)): Accept in Principle
SUBMITTER: Richard E. Loyd, Perryville, AR
RECOMMENDATION: Revise to read as follows:
(c) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials, such as metal water piping, metal gas piping, and structural steel members, ~~that are likely to become energized~~ shall be bonded as specified by this article to the supply system grounded conductor or, in the case of an ungrounded electrical system, to the electrical system grounded equipment, in a manner that establishes an effective path for fault current.
SUBSTANTIATION: Bonding is generally required and when it is only required where likely to become energized it is so stated. In this general requirement the allowance is inappropriate.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel believes that the submitter's intent is met by the action on Proposal 5-65. The panel believes the words "likely to become energized" are important in both Sections 250-2(c) and in 250-104.

EXPLANATION OF NEGATIVE:
WHITE: This proposal should be rejected. See my Explanation of Negative Vote on Proposal 5-65.

(Log #4180)

5- 65 - (250-2(c)): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Delete the comma that follows "and structural steel members."
SUBSTANTIATION: In reference to Section 250-104, water pipe bonding and gas pipe bonding occur whether or not they are connected to electrical equipment that might energize them. The gas pipe bonding rule, for example, applies equally to gas-fired equipment that has no electrical connection whatsoever. Structural steel members, however, are only bonded if they "may become energized." Therefore this comma, which I'll have to take responsibility for as part of my comment that put this in the code, introduces a technical error. The "likely to become energized" phrase should only tie to structural steel and not to the other two items.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
MELLO: The proposal would possibly create a performance requirement that is beyond the intent of the panel. The panel has typically intended that the general requirement is that water and gas piping that is likely to become energized be bonded as well as the building steel. Section 250-104 provides the specifics of prescriptive requirements for water, gas and structural steel. What this proposal could do is to require multiple bonds be installed for example in a building plumbed in plastic where many short sections of copper or metal water pipes are stubbed out, even if these metal pipes were far from any possible enegizing source.
