WHITE: It has always been the intent of the panel that the qualifying phrase "that are likely to become energized" applies to interior metal piping in reference to bonding. I think the submitter is incorrect in stating that structural steel is the only item it should apply to. In light of the panel's action on Proposal 5-229 and based on the wording in 250-104(c), I think this proposal should be rejected.

(Log #3868)

5- 66 - (250-2(d)): Reject
SUBMITTER: J. Philip Simmons, Simmons Electrical Services
RECOMMENDATION: Revise text to read as follows:
(d) Effective ~~Performance of~~ Fault Current Path. The fault current path shall be permanent and electrically continuous, shall be capable of safely carrying the maximum fault likely to be imposed on it, and shall have sufficiently low impedance to facilitate the operation of overcurrent devices under fault conditions.
The earth shall not be used as the sole equipment grounding conductor or fault current path.
SUBSTANTIATION: The text came from Section 250-51 of the 1996 NEC where the title of the section was "Effective Grounding Path." This section was quoted by many as containing the fundamentals of effective grounding. Incorporating the word "Effective" in the title of the section will aid the instructor and student in conveying the true meaning of the section.
Sorry, this is as technical as I can get in the Substantiation!
PANEL ACTION: Reject.
PANEL STATEMENT: The word "performance" more clearly identifies the content of this section.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #2764)

5- 67 - (250-3-Neutral (New)): Reject
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 1 for comment.
SUBMITTER: Joseph A. Tedesco, Nat'l Technology Transfer, Inc
RECOMMENDATION: Add definition as follows:
Neutral. A grounded conductor having the same voltage to each ungrounded conductor of the same 3-wire, or 4-wire circuit.
SUBSTANTIATION: Here is a start, although I realize not all neutrals are grounded. The term should be defined in the NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not agree with the submitter's definition. CMP 5 refers this proposal to CMP 1 for comment.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3892)

5- 68 - (250-4): Accept
NOTE: The Technical Correlating Committee directs the Panel to reconsider this Proposal and format this section to be consistent with similar sections in other articles. The Technical Correlating Committee directs the panel to relocate this Section to 250-3. This action will be considered by the Panel as a Public Comment.
SUBMITTER: J. Philip Simmons, Simmons Electrical Services
RECOMMENDATION: 250-4. Application of Other Articles. Change this section become a Fine Print Note.
SUBSTANTIATION: Since this section reads, "In other articles applying to particular cases of installation of conductors and equipment, there are requirements that are in addition to those of this article or are modifications of them" it does not contain a requirement but is information only. As such, it needs to be changed to be a fine print note in conformance with Section 90-5(c).
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
COMMENT ON AFFIRMATIVE:
DOBROWSKY: This section should be relocated to Section 250-3 as encouraged by 2.4.1 of the NEC Style Manual. Consistency throughout all articles to the extent possible will increase usability.

(Log #2167)

5- 69 - (250-6(a) and (b)): Accept in Principle
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
250-6(a) The grounding of electrical systems, circuit conductors, surge arresters, and conductive noncurrent-carrying materials and equipment shall be installed and arranged in a manner that will prevent an objectionable ~~flow of~~ current over the grounding conductors or grounding paths.

250-6(b) If the use of multiple grounding connections results in an objectionable ~~flow of~~ current, one or more of the following alterations shall be permitted,...
SUBSTANTIATION: The use of "flow of" is redundant and not needed. Current is defined as the flow of electrons; therefore, it is more proper simply to say "current." The word current is used over 350 times in the code without the use of words flow or flowing.
PANEL ACTION: Accept in Principle.
The Panel accepts the proposal and in addition deletes the word "an" before the word objectionable in both 250-6(a) and 250-6(b).
PANEL STATEMENT: This revision corrects the grammar of the text.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #2176)

5- 70 - (250-6(b)(4)): Accept
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
(4) Take other suitable remedial and approved action. ~~satisfactory to the authority having jurisdiction.~~
SUBSTANTIATION: "Approved" is defined in Article 100 of the NEC as "acceptable to the authority having jurisdiction" which is the same as "satisfactory to the authority having jurisdiction."
"Standard terms have been established through accepted use or by definition and are to be used..." [NEC Style Manual 3.2.4 Standard Terms]. "Approved" is listed as one of the standard terms in Annex B of the NEC Style Manual and defined in the NEC; therefore, "approved" should be used in place of its definition.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #740)

5- 71 - (250-8 and Exception (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise first sentence:
Wire type ~~Grounding~~ grounding conductors and bonding jumpers shall be connected by exothermic welding, listed pressure connectors, listed clamps, or other listed means.
Add:
Exception: Machine screws shall be permitted for solid No. 10 and smaller conductors, where used for no other purpose.
SUBSTANTIATION: Equipment grounding conductors may be raceways, cable armor, cable tray, cablebus framework, etc. Screws/bolts are used in many applications for bonding/grounding continuity such as receptacles, switch yokes, box covers, faceplates, cabletray and cablebus framework, etc., where there is direct metal-to-metal contact, and are indicated in Sections 250-28(a); 250-102(a); 250-126(1); 250-148(a); 250-136(a); 370-40(d); 410-58(b)(3); 550-11(c)(4); 551-55(c),(2)(3); 551-56(b) Exception; 552-56(c)(2)(3), and inferred by 250-98. While some of these may be covered by listing, all are not. A common grounding or bonding connection in boxes is by a machine screw in a tapped hole covered by Section 370-40(d).
PANEL ACTION: Reject.
PANEL STATEMENT: Machine screws are used to secure conductor pressure connectors. Section 250-8 also covers connectors other than the wire type such as conduit grounding hubs.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #742)

5- 72 - (250-20): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise first paragraph:
Alternating-current Circuits and Systems to be Grounded. Alternating-current circuits and systems shall be grounded as provided in (a), (b), (c), or (d). Other circuits and systems shall be permitted to be grounded, and where grounding is provided the provisions of this article shall apply.
Revise (c): Alternating Current Systems of 1kV and Over. Alternating current systems supplying mobile or portable equipment shall be grounded as specified in Section 250-188. Where supplying other than mobile or portable equipment such systems shall be permitted to be grounded. ~~Where such systems are grounded, they shall comply with the applicable provisions of this article.~~
SUBSTANTIATION: Editorial. Many requirements of this article apply only where grounding is "required" presumably by code. Where grounding is done by choice, it should comply with minimum standards for safety. The first sentence of (c) requires grounding of mobile equipment systems, the second sentence states other than portable (i.e. mobile) systems are permitted to be grounded, which is confusing.
If this proposal is accepted the last sentence of (c) becomes redundant.
PANEL ACTION: Accept in Principle.
Revise first paragraph:
"Alternating-Current Circuits and Systems to Be Grounded. Alternating-current circuits and systems shall be grounded as provided for in (a), (b), (c), or (d). Other circuits and systems shall be permitted to be grounded. If such systems are grounded, they shall comply with the applicable provisions of this article.
Revise (c): Alternating Current Systems of 1kV and Over. Alternating current systems supplying mobile or portable equipment shall be grounded as specified in Section 250-188. Where supplying other than mobile or portable equipment, such systems shall be permitted to be grounded." ~~Where such systems are grounded, they shall comply with the applicable provisions of this article.~~
PANEL STATEMENT: The panel found errors of missing text in the recommended text. The panel made those editorial corrections to match the 1999 NEC. The panel agrees with the submitter to move the last sentence in 250-20(c).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3752)

5- 73 - (250-20(b)(1)): Reject
SUBMITTER: George O. Stiles, Stiles Electric Service/Rep. IAEI
RECOMMENDATION: Revise text to read as follows:
"Where the system can be grounded so that the maximum voltage to ground on the ungrounded conductors does not exceed ~~150 volts~~ suggested replacement 480 volts or maximum phase voltage."
SUBSTANTIATION: Many of the systems listed in 250-26 and 250-20 FPN produce voltages that exceed 150 volts to ground.
The 1899 code and many succeeding codes did not recognize system grounding, only requirement grounding to protect from lightning damage. For many years only neutrals were considered groundable. Grounding other than neutrals is a relatively new concept and the code needs to be adjusted accordingly. Coordination between National Electric Code and National Electric Safety Code will be enhanced by this revision.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter provided no substantiation to mandate grounding of systems that were previously permitted to be grounded.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3869)

5- 74 - (250-20(b)(4) (New)): Reject
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Add new text to read as follows:
(4) Where the grounded system conductor is uninsulated in accordance with the exceptions to Sections 230.22, 230.30, and 230.41.
SUBSTANTIATION: It appears that this requirement in the 1996 NEC for when an electrical system is required to be grounded was inadvertently omitted during the processing of the 1999 NEC. See Section 250-5(b)(4) of the 1996 NEC.
PANEL ACTION: Reject.

PANEL STATEMENT: The following statement appeared in the 1998 NEC ROP, Proposal 5-57:
"This statement is redundant. Section 250-5(b) discusses the requirements for grounding AC premises wiring systems at 50 to 1000 volts. This section begins by stating that where a grounded service conductor is uninsulated as per Sections 230-22, 230-30 and 230-41. If it is a grounded service conductor, it must be supplied from a grounded system." The panel concludes this was intended action.

(Log #3355)

5- 75 - (250-20(c)): Accept in Principle
SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Delete the last sentence of Section 250-20(c).
SUBSTANTIATION: This concept is already covered by Section 90-3. The sentence is vague and does not provide sufficient detail to be enforceable.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 5-72.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3356)

5- 76 - (250-20(d)): Accept
SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Revise Section 250-20(d) as follows:
(d) Separately Derived Systems. ~~If required to be grounded as in (a) or (b),~~ Sseparately derived systems, as covered in (a) or (b), shall be grounded as specified in Section 250-30.
SUBSTANTIATION: Whether the system is grounded by choice or requirement should have no effect on how the grounding is accomplished. If a system is grounded it functions as a grounded system and should be installed according to the requirements.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #743)

5- 77 - (250-20(d), FPN No. 1): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 1 for comment on the comment on the affirmative vote.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
FPN No. 1: An alternating-current power source such as an on-site generator is not a separately derived system if ~~the neutral~~ there is a solid~~ly interconnected to a service-supplied neutral~~ interconnection between a conductor of the alternate power source and a conductor of another system.
or alternatively:
See Article 100 for definition of a separately derived system.
SUBSTANTIATION: Editorial. This section relates to separately derived systems. The fine print note is an example of, or defines what is not a separately derived system and is limited since it does not address a 2-wire generator or 3-phase 3-wire generator with a solidly interconnected conductor which is not a neutral. It also does not address a generator solidly interconnected to a nonservice transformer secondary.
PANEL ACTION: Reject.
PANEL STATEMENT: The present FPN is an example only. The FPN was not intended to be all inclusive.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
COMMENT ON AFFIRMATIVE:
DOBROWSKY: This proposal should be shared with CMP-1 for information. The submitter's substantiation identifies a possible flaw in the definition of a separately derived system. If two or more separately derived systems are interconnected (such as in parallel) they would literally not be considered separately derived according to the definition. This in effect removes all other requirements that are applicable to separately derived systems. See also the substantiation for Proposal 5-162.

(Log #2459)

5- 78 - (250-21): Reject
SUBMITTER: Dann M. Strube, Lanesville, IN
RECOMMENDATION: The following systems covered by Section 250-20(b) of 50 volts...
SUBSTANTIATION: To make it clear that Section 250-21 modifies Section 250-20(b) but does not prohibit other systems for operating ungrounded.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not believe the additional cross reference adds clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3158)

5- 79 - (250-21(4)): Accept
SUBMITTER: Robert R. Sallaz, City of Munroe Falls, OH
RECOMMENDATION: Delete Subsection (4) from 250-21.
~~(4) Isolated systems as permitted or required in Articles 517 and 668.~~
SUBSTANTIATION: Section 250-22 clearly states that isolated circuits SHALL NOT BE GROUNDED in (2) Health Care Facilities per Article 517 and (3) Electrolytic Cells per Article 668. Current 250-21(4) states "Ac systems 50 to 1000 volts shall be permitted to be grounded in isolated systems as permitted or required in Articles 517 and 668." A direct violation of 250-22.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 4
EXPLANATION OF NEGATIVE:
BRENDER: Articles 517 and 668 contain provisions that govern circumstances and methods under which certain systems are allowed to be grounded, or not. Reference to those Sections within Section 5-21(4) is an aid to the user. The submitter is incorrect that Section 250-21(4) is a direct violation of 250-22.
DOBROWSKY: The proposal should be rejected. System grounding requirements are required, permitted, or not permitted depending on specific circumstances, as provided in each article.
JOHNSTON: The proposal should be Accept in Principle and the wording in Section 250-21(4) to read:
"Systems as permitted by Section 668-30(a)."
Section 250-22 deals with circuits as compared to 250-21 which deals with systems. Some rules in 668 are permissive while others are mandatory regarding system or circuit grounding. I feel that deleting Section 250-21(4) completely will leave a void in this section.
MELLO: There is no conflict between Sections 250-21(4) and 250-22 as one deals with systems and the other deals with circuits. The provisions in Section 250-21(4) are a good pointer that there are permissive and restrictive aspects in Articles 517 and 668 dealing with grounding that modifies the requirements in Section 250-21. The proposal should be accepted in principle and a more clear reference to Section 668-30(a) provided.

(Log #744)

5- 80 - (250-22(4), (5) (New)): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add:
(4) Lighting Systems. Circuits as provided in Articles 411 and 680.
(5) A rectifier-derived dc system supplied by direct electrical connection to an ac supply system source.

SUBSTANTIATION: Editorial. Circuits for low-voltage lighting systems and low-voltage underwater pool lighting are also required to be ungrounded. A rectifier-derived system with direct electrical between the dc and ac sides without an isolating transformer should be required to be ungrounded. A ground on the dc side in effect provides a ground for the ac supply circuit either directly or through the rectifying device(s), dependent upon the type and configuration of the rectifier.
PANEL ACTION: Accept in Principle in Part.
The panel accepts in part No. 4 to read as follows: "(4) Lighting Systems. Secondary circuits as provided in 411-5(a)."
The panel rejects the remainder of the proposal.
PANEL STATEMENT: The panel added "secondary" for clarity and removed the reference to Article 680 since the submitter did not provide a specific reference. The submitter provided inadequate substantiation for item number 5.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3357)

5- 81 - (250-24(a)): Accept
SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Revise to read:
(a) System Grounding Connections. A premises wiring system ~~that is~~ supplied by ~~an~~ a grounded ac service ~~that is grounded~~ shall have ~~at each service~~ a grounding electrode conductor connected to the ~~grounding electrode(s) required by Part C of this article. The grounding electrode conductor shall be connected to the~~ grounded service conductor, at each service, in accordance with (1) through (5).
SUBSTANTIATION: The grounding electrode requirements are covered in Part C of Article 250. See also 250-24(c). Sections or portions of sections should not be redundantly repeated. All grounding electrode requirements should be in one part and sections of that part should be referenced were appropriate. Editorial changes were made to improve readability.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
JOHNSTON: I disagree with the submitter's substantiation that sections or portions of sections should not be redundantly repeated. The existing reference to Part C continues to add clarity and provides for better user friendliness in this section. Accept adding "at each service" in the last sentence.
MELLO: The panel action should be Accept in Part. The part to accept is the additional words in the last sentence, "at each service." The remainder should be rejected. Part C does not ever require that a grounding electrode conductor be installed to a service. It only establishes the grounding electrode system and how to install, size, protect and terminate the grounding electrode conductor on the grounding electrode. In fact, in Part C there are references back to Section 250-24 where it is established that a grounding electrode conductor is required. Deleting this text is not redundant and could have the effect of removing a very citical requirement for a safe system.

(Log #1508)

5- 82 - (250-24(a), Exception (New)): Reject
SUBMITTER: Junior L. Owings, Rep. Oregon Chapter Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text as follows:
250-24. Grounding Service-Supplied Alternating-Current Systems.
(a) System Grounding Connections. A premises wiring system that is supplied by an ac service that is grounded shall have at each service a grounding electrode conductor connected to the grounding electrode(s) required by Part C of this article. The grounding electrode conductor shall be connected to the grounded service conductor in accordance with (1) through (5).
Exception: When the electric utility has installed a ground fault protection system ahead of the customer's service equipment, no bonding or electrical connection from the grounding electrode system shall be made to the grounded service conductor on the load side of the utility ground fault sensing device. The neutral or grounded service conductor, however, shall be grounded on the line side of the first ground fault sensor in a manner otherwise required at the customer's service equipment. The grounding electrode conductor shall be run to an equipment grounding bus or terminal at the service equipment as long as the equipment grounding conductor and the grounded neutral conductor are not connected to each other at this point. The on-site ground fault test required by Section 230-95 shall not be performed prior to the above installation requirements. Warning signs shall be installed. This exception is restricted to this type of system only.
(1) General. The connection shall be made at any accessible point from the load end of the service drop or service lateral to and including the terminal or bus to which the grounded service conductor is connected at the service disconnecting means.
FPN: See definition of Service Drop and Service Lateral in Article 100; see also Section 230-21 for overhead supply.
SUBSTANTIATION: When ground fault protection is installed by the serving utility, additional grounding and bonding of the grounded conductor downstream of the serving utility ground fault sensor defeats the ground fault protection. This type of installation is becoming more common with larger utility services from spot or full networks where protection of the collector bus and, service lateral and service entrance conductors is necessary. This exception provides the correct installation so the utility system is not affected and also provides the requirements for the alternate termination points for the grounding and bonding conductors for the service.
PANEL ACTION: Reject.
PANEL STATEMENT: Utility protection schemes are subject to change based on the needs of the utility system. With the passage of time, if the utility did modify its protection scheme, the chances of anyone knowing that the premise wiring would then need modification would be slim to none. This situation could result in a system that would provide no protection at all. Other solutions are available to overcome this problem without requiring unusual premise wiring arrangements. In addition, the on-site ground fault test required by 230-95(c) only applies to ground fault protection systems installed on the premise wiring system.

(Log #1054)

5- 87 - (250-24(b)(2)): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise Article 250 as follows:
250-24(b)(2) - change "No. 1/0" to "1/0 AWG"
250-30(a)(1), Exception No. 2 - change "No. 14 copper or No. 12 aluminum" to "14 AWG copper or 12 AWG aluminum"
250-36(b) - change "No. 8 copper or No. 6 aluminum" to "8 AWG copper or 6 AWG aluminum"
250-50(a)(2), last paragraph - change "No. 6 copper wire or No. 4 aluminum wire" to "6 AWG copper wire or 4 AWG aluminum wire"
250-50(c) - change "No. 4" to "4 AWG"
250-50(d) - change "No. 2" to "2 AWG"
250-64(b) - change:
"No. 4" to "4 AWG"
"No. 6" to "6 AWG" in two places
250-66(a) - change "No. 6" to "6 AWG" and "No. 4" to "4 AWG"
250-66(b) - change "No. 4" to "4 AWG"
250-92(b), FPN No. 1 - change "No. 6" to "6 AWG"
250-102(d) - change "No. 14" to "14 AWG"
250-119(a) - change "No. 6" to "6 AWG" in two places
250-120(c) - change "No. 6" to "6 AWG" in two places
250-122(e) - change "No. 18" to "18 AWG"
250-140(2) - change "No. 10 copper or No. 8 aluminum" to "10 AWG copper or 8 AWG aluminum"
250-166(a) - change "No. 8 copper or No. 6 aluminum" to "8 AWG copper or 6 AWG aluminum"
250-166(b) - change "No. 8 copper or no. 6 aluminum" to "8 AWG copper or 6 AWG aluminum"
250-166(c) - change No. 6 copper wire or No. 4 aluminum wire" to "6 AWG copper or 4 AWG aluminum"
250-166(d) - change "No. 4" to "4 AWG"
250-178 - change "No. 12 copper or No. 10 aluminum" to "12 AWG copper or 10 AWG aluminum"
250-190 - change "No. 6 copper or No. 4 aluminum" to "6 AWG copper or 4 AWG aluminum".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
COMMENT ON AFFIRMATIVE:
DOBROSKY: The AWG designation should also be added to the NEC Style Manual.

(Log #745)

5- 88 - (250-24(d)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise last sentence:
The grounding electrode conductor shall be connected to a metal enclosure of the service conductors or the nonflexible metal service raceway at any accessible point from the load end of the service-drop or service-lateral to the service disconnecting means. Where the service consists of more than one disconnect as permitted in Section 230-40 Exception No. 2, a single point of connection shall be permitted.
SUBSTANTIATION: Editorial. Nonflexible metal service raceways are proposed as a suitable connection point. The definition of enclosure and opinions of some do not equate raceways with enclosures. The last sentence of the proposal is to clarify that multiple connections are not required.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that the proposed wording does not add clarity to the section. The panel does not agree with the substantiation.

AFFIRMATIVE: 17

(Log #432)

5- 90 - (250-28 Exception No. 3 (New)): Reject
SUBMITTER: Patricia Ballard, Framatome Connectors U.S.A. Inc.
RECOMMENDATION: Add an exception to 250-28 to read as follows:
Exception No. 3: It shall be permitted to splice the main bonding jumper by means or irreversible compression-type connectors listed for the purpose.
SUBSTANTIATION: • Compression connectors that are listed for grounding, have been used for many decades with a good time proven history.
• The grounding electrode conductor has been allowed to be spliced (see Sections 250-64(c) and 250-70 for several code cycles), and so should the bonding jumpers.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no technical substantiation provided for splicing wire type main bonding jumpers. The main bonding jumper performs a different function than the grounding electrode conductor. Bus bar splices are acceptable for the main bonding jumper.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #1509)

5- 91 - (250-28 Exception No. 3 (New)): Reject
SUBMITTER: Junior L. Owings, Rep. Oregon Chapter Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Add the following text:
250-28. Main Bonding Jumper. For a grounded system, an unspliced main bonding jumper shall be used to connect the equipment grounding conductor(s) and the service-disconnect enclosure to the grounded conductor of the system within the enclosure for each service disconnect.
Exception No. 1: Where more than one service disconnecting means is located in an assembly listed for use as service equipment, an unspliced main bonding jumper shall bond the grounded conductor(s) to the assembly enclosure.
Exception No. 2: Impedance grounded neutral systems shall be permitted to be connected as provided in Sections 250-36 and 250-186.
Exception No. 3: When the electric utility has installed a ground fault protection system ahead of the customer's service equipment and if the operation of the ground fault system relies on the absence of the main bonding jumper at the service equipment but includes an otherwise satisfactory main bonding jumper as a part of its sensing device, the main bonding jumper shall not be installed at the service equipment which would otherwise bond the grounded service conductor to the equipment ground. The on-site ground fault test required by Section 230-95 shall not be performed prior to the above installation requirements. Warning signs shall be installed. This exception is restricted to this type of system only.
(a) Material. Main bonding jumpers shall be of copper or other corrosion-resistant material. A main bonding jumper shall be a wire, bus, screw, or similar suitable conductor.
(b) Construction. Where a main bonding jumper is a screw only, the screw shall be identified with a green finish that shall be visible with the screw installed.
(c) Attachment. Main bonding jumpers shall be attached in the manner specified by the applicable provisions of Section 250-8.
(d) Size. The main bonding jumper shall not be smaller than the sizes shown in Table 250-66 for grounding electrode conductors. Where the service-entrance phase conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the bonding jumper shall have an area that is not less than 12 1/2 percent of the area of the largest phase conductor except that where the phase conductors and the bonding jumper are of different materials (copper or aluminum), the minimum size of the bonding jumper shall be based on the assumed use of phase conductors of the same material as the bonding jumper and with an ampacity equivalent to that of the installed phase conductors.
Exception No. 2: Impedance grounded neutral systems shall be permitted to be connected as provided in Sections 250-36 and 250-186.
SUBSTANTIATION: When ground fault protection is installed by the serving utility, additional grounding and bonding of the grounded conductor downstream of the serving utility ground fault sensor defeats the ground fault protection. This type of installation is becoming more common with larger utility services from spot or full networks where protection of the collector bus and, service lateral and service entrance conductors is necessary. This exception provides the correct installation so the utility system is not affected and also provides the requirements for the alternate termination points for the grounding and bonding conductors for the service.
PANEL ACTION: Reject.
PANEL STATEMENT: Utility protection schemes are subject to change based on the needs of the utility system. With the passage of time, if the utility did modify its protection scheme, the chances of anyone knowing that the premise wiring would then need modification would be slim to none. This situation could result in a system that would provide no protection at all. Other solutions are available to overcome this problem without requiring unusual premise wiring arrangements. In addition, the on-site ground fault test required by 230-95(c) only applies to ground fault protection systems installed on the premise wiring system.

5- 92 - (250-28 Exception No. 3 (New)): Reject
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Add new Exception No. 3:
Exception No. 3: It shall be permitted to splice the main bonding jumper by means of irreversible compression-type connectors listed for the purpose or by exothermic welding process.
SUBSTANTIATION: Compression connectors that are listed for grounding have been used for many decades with a good time-proven history.
The grounding electrode conductor has been allowed to be spliced [see Articles 250-64(c) and 250-70 for several code cycles], and so should the bonding jumping.
PANEL ACTION: Reject.
PANEL STATEMENT: See action and statement on Proposal 5-90.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
STEINMAN: Equipment bonding jumpers are presently allowed to be spliced. The function of a main bonding jumper is the same as the function of an equipment bonding jumper. The panel provided no technical reason for rejecting the splicing of a main bonding jumper.

(Log #2333)

5- 93 - (250-30 Exception No. 3 (New)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add a new Exception to read as follows:
Exception No. 3: For objectionable currents encountered in paralleled separately derived systems, the bonding jumper may be located at the paralleling switch gear.
SUBSTANTIATION: In systems that use parallel Uninteruptable Power Supplies (UPS) or systems that use parallel generators, there seems to be a problem with "circulating currents". The manufacturers of the systems state that if the bonding jumper is placed at the first overcurrent device (which in the case of a UPS is at the UPS unit per U.L. 1778) will create objectionable current and cause problems with their systems operation. If in fact this is the case then this proposal should be accepted.
One potential problem would be if the UPS units or generators were located remotely from the paralleling gear.
This proposal should help clarify if this would be an acceptable exception.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has failed to submit a history of documented problems with this proposal.

5- 94 - (250-30(3), Exception): Reject
SUBMITTER: Bud Swathwood, Bud Swathwood Consulting
RECOMMENDATION: Add the words "visible" between "is" and "the connection" to read in part:
"the grounding electrode is exposed and visible the connection shall..."
SUBSTANTIATION: This will clarify the interior metal water pipe must be visible so that any disconnection can be detected.
PANEL ACTION: Reject.
PANEL STATEMENT: Exposed as defined in Article 100 is the intent of the panel. The submitter has not provided any substantiation for this change.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #696)

5- 95 - (250-30(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Grounded systems. A separately derived ac system that is grounded shall comply with (1) through (4).
Exception No. 1: No change.
Exception No. 2: Separately derived systems supplied by a portable or vehicle mounted generator shall be permitted in accordance with Section 250-34.
(1) Bonding Jumper. A bonding jumper sized in compliance with Sections 250-28(a) through (d) that is sized for the derived phase conductors shall be used to connect the equipment grounding conductors to the derived grounded conductor. Except as permitted by Section 250-24(a)(4), this connection shall be made at any point on the separately derived system from the source to the first system disconnecting means or overcurrent device(s), ~~or it shall be made at the source of a~~ Where the separately derived system ~~that~~ has no disconnecting means or overcurrent device(s) or directly supplies multiple circuits the bonding connection shall be made at the source of the separately derived system and the sum of the area of the largest ungrounded phase conductor of each circuit shall be used to determine the size of the bonding jumper. ~~The point of connection shall be the same as the grounding electrode conductor as required in Section 250-30(a)(2).~~
Exception No. 1: Where a single set of derived conductors supply the total load ~~A~~ a bonding jumper at both the source and the first disconnecting means shall be permitted where doing so does not establish a parallel path for the grounded circuit conductor. Where a grounded conductor is bonded at the first disconnect/overcurrent device ~~used in this manner,~~ it shall not be required to be larger than the largest ungrounded conductor if of the same material or adjusted in size in accordance with the equivalent size columns of Table 250-66. For the purposes of this exception, connection through earth is not considered as providing a parallel path.
(Exception No. 2 - no change)
(2) Grounding Electrode Conductor. A grounding electrode conductor, sized in accordance with Section 250-66 for the derived phase conductors, shall be used to connect the grounded conductor of the derived system to the grounding electrode as specified in (3). Where multiple sets of circuit conductors are directly supplied the equivalent area of the largest derived phase conductor shall be considered as the sum of the largest ungrounded phase conductor of each circuit.
(remainder unchanged)
SUBSTANTIATION: Editorial. This section is straightforward and clear where the conductors supplied by the separately derived system are a single set and the disc/overcurrent devices are a single set or grouped together. However, there is no prohibition of multiple sets of conductors tapped to the system source. For transformers requiring secondary overcurrent protection there could be six sets of conductors. For transformer not requiring secondary ovrcurrent protection, and generators protected by inherent design there is no specified limit on the number of sets of conductors that may be tapped to the source, with disconnect/overcurrent devices located per tap rules. With multiple sets of conductors and disconnect/overcurrent devices, which is the "first"? Is bonding permitted at only one, or at each of the disconnect/overcurrent devices? What are the sizing requirements for the bonding jumpers and grounding conductor for such multiple sets? There are no specifics indicated and interpretations may vary.
Exception No. 1 does not specify a minimum grounded conductor size for fault current where the grounded conductor is bonded at the source or the first disconnecting means, but not at both locations, if the source is a transformer. Section 445-5 covers this for generator sources.
Since this section (1) mandates the point of connection for the bonding jumper it determines the point of connection of the grounding electrode conductor by virtue of (a)(2) and the last sentence of that section for the point of connection of the grounding electrode conductor is superfluous.
Where multiple tapped circuits and disconnect/overcurrent devices are installed, the provisions for dual bonding and bonding at the disconnect/overcurrent device is eliminated. With multiple and scattered bonding points, it is virtually impossible to avoid parallel return paths, especially in an occupancy where metal raceways, cables, piping, building steel, and equipment are in electrical contact.
The proposal does not eliminate dual bonding points where only one circuit is supplied. It does eliminate a bonding point at one disconnect/overcurrent device from being the connection point of the grounding electrode conductor where multiple sets of circuit conductors and disconnect/overcurrent devices are taped to the source. This is not presently prohibited.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that this proposal is not editorial. The substantiation does not clearly identify the reasons for the specific changes. The panel finds this proposal unclear and confusing.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3360)

5- 96 - (250-30(a), Exception): Accept
SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Revise as follows:
Exception for (a), (b), and (c): Where a separately derived system originates in listed equipment suitable for use as service equipment ~~also used as service equipment~~, the grounding electrode used for the service or feeder ~~equipment~~ shall be permitted as the grounding electrode for the separately derived system provided the grounding electrode conductor from the service or feeder ~~equipment~~ to the grounding electrode is of sufficient size for the separately derived system. Where the equipment ground bus internal to the service equipment is not smaller than the required grounding electrode conductor, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.
SUBSTANTIATION: Frequently for campus style distribution systems the supply conductors to a building are feeders. This provision should also be acceptable for those applications installed according to Part B of Article 225.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel understands that this exception is to be placed after 250-30(a)(3)(c).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
MELLO: The word "equipment" that was deleted in 2 places after the inserted words "or feeder" needs to be left in. A grounding electrode and grounding electrode conductor does not go to a "service" or "feeder" circuit, but goes to the equipment served by the service or feeder circuit. In fact, the last part of the first sentence implies the grounding electrode conductor connects to the "service" or "feeder" wiring and not necessarily the equipment. Since this is an exception, this could

lead someone to believe the connection point on the grounding electrode conductor could be in locations other than the service equipment of feeder equipment, which is contrary to other sections. The substantiation provided by the submitter is very adequate to add the words "or feeder", but no substantiation was provided for deleting the word "equipment" in these two locations and change the meaning of this exception.

RAPPAPORT: This proposal should be "Accept in Principle" with the word "equipment" retained. The grounding electrode conductor is connected to equipment, not to a conductor (current carrying) such as a service or a feeder.

(Log #747)

5- 97 - (250-30(a) Exception No. 2 (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add an exception to read as follows:

Exception No. 2: Where the separately derived system power source is a portable or vehicle-mounted generator, the provisions of Section 250-34 shall be permitted.

SUBSTANTIATION: Editorial. To provide correlation with Section 250-34. That section permits a grounding electrode other than those which shall be indicated in (a)(3). It has been my impression that a "shall" provision is not negated by a permitted provision unless it is an exception.
PANEL ACTION: Reject.
PANEL STATEMENT: This proposal is not editorial. The panel does not agree that this section needs an exception.

(Log #4181)

5- 98 - (250-30(a)(1)): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise by changing the internal reference from "250-24(a)(4)" to "250-24(a)(3)"
SUBSTANTIATION: This proposal addresses Section 250-30(a)(1) and (2). These NEC paragraphs were revised in an attempt to correct reference errors with respect to provisions in Section 250-24 in the prior Code [1996 NEC 250-23]. First, (a)(1) now only refers to Section 250-24(a)(4) [1996 NEC 250-23(a) Exception No. 5] instead of referring to both this section and Section 250-24(a)(3) [250-23(a) Exception No. 4] as before. Second, (a)(2) now refers to both of those provisions in Section 250-24(a), instead of only Section 250-24(a)(3) as before. The 1999 NEC change, to which this proposal responds, corrects one error (in a 1993 NEC change), but creates a new error.

In referencing former Exception No. 5 [1999 NEC: 250-24(a)(4)], the intent was to recognize that on large systems the grounding electrode conductor connection must be made so as to prevent desensitizing ground-fault detection relays. In some cases this may best be arranged if that connection is made to the equipment grounding bus.

Unfortunately, this 1993 code change was made in old subsection (a) [1999 NEC: 250-30(a)(1)] dealing with the main bonding jumper location, instead of (b) [1999 NEC 250-30(a)(2)] that contains rules on the location of the grounding electrode conductor connection. The 1999 NEC change did correct that error, and Section 250-30(a)(2) is now correct.

Section 250-30(a)(1) now refers to Section 250-24(a)(4), however, a provision that has nothing to do with the location of the bonding jumper. Before the 1999 change, the equivalent material referred (in part since 1993 and exclusively before that) to what is now Section 250-24(a)(3) on double-ended services. It did so going back to the 1975 NEC (resulting from a NEMA proposal), in order to accommodate selective ground-fault protection of equipment (GFPE) schemes that are available to permit dual-source systems to operate with maximum service continuity. Under these systems, a ground fault only disables half the loads, with the other side remaining operable.

The 1999 NEC inadvertently and with no substantiation effectively disallows placing the bonding jumper at the downstream center tie point in cases where separately derived systems are arranged in a double-ended design. Although Sec. 250-30(a)(2) now allows for the grounding electrode conductor to be connected at such a point, the bonding jumper must be connected at the same point in order to avoid parallel current over enclosures. Further, if the bonding jumper is connected at another location, the selective GFPE arrangements won't work correctly. This proposal corrects the error and allows our major industrial users to continue using a design that has been in the NEC for a quarter century.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #4290)

5- 99 - (250-30(a)(1)): Reject
SUBMITTER: Charles F. Mello, Milwaukie, OR
RECOMMENDATION: Revise text to read as follows:

(1) Main Bonding Jumper. A main bonding jumper in compliance with Sections 250.28(a) through (d), that is sized for the derived phase conductors, shall be used to connect the equipment grounding conductors of the separately derived system to the grounded conductor. Except as permitted by Section 250.24(a)(4), this connection shall be made at any point on the separately derived system from the source to the first system disconnecting means or overcurrent device, or it shall be made at the source of a separately derived system that has no disconnecting means or overcurrent devices. The point of connection shall be the same as the grounding electrode conductor as required in Section 250.30(a)(2).

SUBSTANTIATION: This revision incorporates the revised definition of "main bonding jumper" that was submitted under a separate proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no substantiation for this change. The submitter has not provided evidence that the term "bonding jumper" is not clear.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
MELLO: The term "bonding jumper" is used to identify many things in Article 250, which creates confusion. Primarily it is used in various forms as that conductor or electrical connection to ensure the electrical continuity of noncurrent carrying metallic parts and to be adequate to carry any ground fault current likely to be imposed on it. A "bonding jumper" used to connect the current carrying grounded conductor (neutral) to the equipment grounding conductors and metal enclosure is rightfully called the "main bonding jumper". With the change in the 1987 NEC for the definition of the term "service", the terms used that are limited to "services" only must be revisited. Any purposeful connection or bonding between the grounded circuit conductor and the equipment grounding conductors should be called a main bonding jumper with all the same size, installation, termination and other requirements already being duplicated.

(Log #CP502)

5- 99a - (250-30(a)(1) Exception No. 1): Accept
SUBMITTER: CMP 5
RECOMMENDATION: Change the last sentence from "is not considered" to "shall not be considered."
SUBSTANTIATION: This change is needed for compliance with the NEC Style Manual Section 3.1.

(Log #2292)

5- 100 - (250-30(a)(2)): Reject
SUBMITTER: Dann M. Strube, Lanesville, IN
RECOMMENDATION: Add a new paragraph as follows:
"Where the source of the separately derived system is located outside the building and the grounding electrode connection is made at the source, at least one additional grounding connection shall be made from the grounded conductor to a grounding electrode, either at the source or elsewhere outside the building."
SUBSTANTIATION: This change brings the requirement for services found in Section 250-24(a)(2) to outdoor derived systems.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed text is confusing and it is unclear as to the submitter's intent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3448)

5- 101 - (250-30(a)(3) (New)): Accept in Principle
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Add a new section (3)(d) to read:
(3)(d) It shall be permissible to connect the grounded electrode conductor of a separately derived system to a continuous grounding electrode conductor which is connected to an effectively grounded metal water pipe within 5 ft (1.52 m) from the point of entrance into the building and extending through the building. All connections shall be made at an accessible location and either by an irreversible crimp, listed for the purpose, or by exothermic weld. The continuous grounding electrode conductor shall not be smaller than 3/0 copper or 250 kcmil aluminum. The grounding electrode conductor of the separately derived system must still comply with Sections 250-28(a) through (d).
SUBSTANTIATION: In a high-rise building or a large manufacturing facility where there is no effectively grounded structural metal members it is not practical to run an individual grounding electrode conductor form every separately derived system transformer back to the effectively grounded metal water pipe within 5 ft (1.52 m) of the entrance of the metal piping into the building. The same result can be accomplished by grounding each separately derived system back to a common grounding electrode conductor that is connected to the effectively grounded metal water pipe.
PANEL ACTION: Accept in Principle.
Add a new paragraph to Section 250-30(a)(2), placed before the exception, to read as follows:
"It shall be permissible to connect the grounding electrode conductor of a separately derived system to a continuous grounding electrode conductor which is connected to the building grounding electrode system and extended through the building. All connections shall be made at an accessible location by an irreversible compression connector listed for the purpose, listed connections to copper busbars not less than 6 mm x 50 mm (1/4 in. x 2 in.), or by the exothermic welding process. This continuous grounding electrode conductor shall not be smaller than 3/0 AWG copper or 250 kcmil aluminum. This continuous grounding electrode conductor and the grounding electrode conductor(s) of each separately derived system shall comply with 250-64(a) through (e)."
PANEL STATEMENT: This proposal provides an alternate solution to where effectively grounded building steel or effectively grounded water pipe are not near the location of separately derived systems, with equal and effective safety. This solution will reduce the excessive lengths of individual grounding electrode conductors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
RAPPAPORT: I agree with the need for this method for high rise buildings and large manufacturing facilities. I am concerned that this provision will be misused in smaller facilities. I would suggest that there be specific proposals, with justification, as to what constitutes a high rise building and what constitutes a large facility. Perhaps the provisions of this proposal should be reworded to be limited to buildings of more than three floors (?) or length or width greater than three hundred feet (?).
COMMENT ON AFFIRMATIVE:
DOBROWSKY: I agree with he concept of extending a grounding electrode conductor but this new language includes some additional restrictions. Grounding electrode conductors are presently allowed to be spliced according to Section 250-50 and 250-64(c). The 3/0 AWG copper or 250 kcmil aluminum minimum conductor size and accessible splice location requirements are excessive in many situations. This provision should also be expanded to include structures.

(Log #2301)

5- 102 - (250-30(a)(3)(a)): Reject
SUBMITTER: Paul E. Guidry, Fluor Daniel, Inc./Rep. Associated Buildings and Contractors, Inc.
RECOMMENDATION: Revise text to read as follows:
"An effectively grounded structural metal member of the structure or a copper bus bar installed around the inside perimeter of the building that serves in place of the metal frame of the building or structure where effectively grounded."
SUBSTANTIATION: There are several manufacturers of modular, premanufactured steel frame substation buildings that contain MCCs and switchgear, typically the equipment is rated 480 V to 35 kV. The buildings are usually installed in supervised industrial facilities. Some manufacturers install a continuous copper bus bar mounted to the interior wall and routed around the building perimeter which is used to bond all equipment enclosures. The bus bar is also used as a grounding electrode to ground small lighting and power transformer neutrals. This installation would violate Section 250-30(a)(2) and (3) as presently found in the 1999 edition of the NEC even though the installation meets the intent of the Code and is safe.
PANEL ACTION: Reject.
PANEL STATEMENT: This connection method is not equivalent to a grounding electrode. A busbar is permitted to be a grounding electrode conductor according to Section 250-64(c).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #4008)

5- 103 - (250-30(a)(3)b, Exception): Reject
SUBMITTER: Christopher Pharo, Rep. IBEW
RECOMMENDATION: This proposal is to delete all the wording in the Exception.
Section 250.30(a)(3)(b) Exception: In industrial and commercial buildings where conditions of maintenance and supervision ensure that only qualified persons will service the installation and the entire length of the interior metal water piping that is being used for the grounding electrode is exposed, the connection shall be permitted at any point on the water pipe system.
SUBSTANTIATION: This proposal allows the use of the metal water pipe in high rise buildings to carry all available fault back to the earth. I have concerns with this practice.
First, it is rare that one electrical contractor is awarded every tenant fit-out in a high rise structure. The changes of every electrical contractor finding the correct metal water pipe to ground each separately derived system is in question. Who would be the qualified persons on the site to guide the electrician?
Secondly, the phrase "where conditions of maintenance and supervision ensure that only qualified persons will service the installation" is not realistic and to think it does exist is wishful thinking. Most of the maintenance personnel in today's high rise buildings are light bulb changers and toilet fixers, i.e., basic handymen. Adding to this problem is the fact that, in today's climate, building owners change frequently thus eliminating any persons with any practical experience on the system. If I could further muddy the water, imagine the people on the maintenance staff looking for and accepting higher paying jobs. Maintenance personnel change jobs as often, if not more than, other sectors of society. This would deplete the building staff of any "tenured qualified personnel".
Finally, the metal water piping system installed during the initial construction changes frequently. In as little as 3, 5, or 10 years later, tenants move in/out or they may want an upgrade, changing

what was originally roughed in. However, this path for an electrical fault to ground is blessed and approved. Plumbers often substitute PVC or some other metal pipe (i.e., steel or brass in lieu of copper) for the original when it comes time to repair, alter, or add to the water system. This creates either no continuity to ground or one with increased impedance. Will this trip the circuit breaker under a fault? Probably, but hopefully my family or friends will not be the unfortunate statistic that may sway the panels vote.

Building steel is everywhere. With today's technological advances and products, it seems foolish to rely on a ground (in essence a conductor) that can be changed by others not familiar with the hazards of electricity.

PANEL ACTION: Reject.

PANEL STATEMENT: The effectively grounded water pipe is not intended to carry fault current. There are many instances where the conditions of maintenance and supervision do ensure that only qualified persons service the installation. There are many buildings and structures, constructed of wood or masonry, that do not have building steel.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

BRENDER: I agree with the submitter, that there is no way to ensure the electrical continuity of water piping, even in industrial and commercial buildings, and especially following initial construction. The proposal, if adopted, will ensure an electrically-continuous grounding electrode system, and will enhance safety.

(Log #2590)

5- 104 - (250-30(a)(3)(d) (New)): Accept in Principle

SUBMITTER: Donald R. Cook, Southern Section, IAEI

RECOMMENDATION: Add a new Section (3)(d) to read as follows:

(3)(d) It shall be permissible to connect the grounded electrode conductor of a separately derived system to a continuous grounding electrode conductor which is connected to an effectively grounded metal water pipe within 5 ft (1.52 m) from the point of entrance into the building and extending through the building. All connections shall be made at an accessible location and either by an irreversible crimp, listed for the purpose, or by exothermic weld. The continuous grounding electrode conductor shall not be smaller than 3/0 copper or 250 kcmil aluminum. The grounding electrode conductor of the separately derived system must still comply with Sections 250-28(a) through (d).

SUBSTANTIATION: In a high-rise building or a large manufacturing facility where there is no effectively grounded structural metal members it is not practical to run an individual grounding electrode conductor from every separately derived system transformer back to the effectively grounded metal water pipe within 5 ft (1.52 m) of the entrance of the metal piping into the building. The same result can be accomplished by grounding each separately derived system back to a common grounding electrode conductor that is connected to the effectively grounded metal water pipe.

PANEL ACTION: Accept in Principle.

(Log #4291)

5- 106 - (250-30(a)(5) (New)): Reject

SUBMITTER: Charles F. Mello, Milwaukie, OR

RECOMMENDATION: Add new text to read as follows:

(5) Equipment Bonding Jumper Size. The bonding jumper run with the derived phase conductors from the source of a separately derived system to the first disconnecting means shall be sized in accordance with Sections 250.28(a) through (d) based on the size of the derived phase conductors.

SUBSTANTIATION: The bonding or grounding conductor that is installed between the source of a separately derived system such as a transformer and the first disconnecting means is not specifically defined by a name and there are not clear requirements for the size. Some individuals consider this strictly as an equipment grounding conductor sized per Section 250-122. Others consider it like a bonding jumper sized per Table 250-66. This conductor may have to carry a ground fault current for some time until the short circuit and ground fault protection on the primary of the source is able to operate. By defining what this conductor is and providing requirements for sizing, this issue in the Code is clarified. By using the same sizing criteria as for the main bonding jumper for the derived system, the conductor sizing is adequate to perform its intended function.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed wording does not add clarity. The proposed term may be misunderstood to require an additional conductor.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NEGATIVE: 3

EXPLANATION OF NEGATIVE:

JOHNSTON: I agree with the submitter that a problem exists in the field. This change would clarify any confusion. I disagree with the Panel's Statement that the wording does not add clarity to this section. By accepting this proposal, it would be clear how to accomplish the sizing of this conductor and add a proper term for this conductor.

MELLO: Section 250-96 specifically and other sections already establish that some sort of conductor must be installed between any two pieces of equipment to ensure continuity of metallic path and to carry the fault current that might be imposed. The conductor that provides "bonding" between the separately derived source (transformer, generator or converter), and the enclosure, which could be a metal raceway, on the secondary is not specifically defined and therefore there is confusion on how to size it. Some people believe this conductor is an equipment grounding conductor with size based on Table 250-122, but there is not an overcurrent device ahead for sizing to ensure this conductor has the proper withstand capacity for the secondary ground fault current. Others believe this conductor is a "bonding conductor" and should be sized similar to a bonding conductor on the line side of a service. This argument has more credibility because the derived phase conductors can be used and reference to Section 250-103(c) so adequate withstand is provided. This proposal attempts to resolve the issue by defining the conductor as an equipment bonding jumper and specifically requires the size to follow similar rules as the bonding conductor on the line side of a service. No additional conductor is intended nor specified, all this proposal said was that this conductor is to be sized this way.

RAPPAPORT: I agree with the submitter that sizing of this conductor is open to various interpretations. This proposal clarifies the requirement.

5- 108 - (250-32): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
~~Two~~ One or more Buildings or Structures Supplied from a ~~common~~ remote service or separately derived system.
(a) Grounding Electrode. Where ~~two or more buildings or structures are supplied from a common ac service by~~ a feeder(s) or branch circuit(s) is supplied from a remote ac service(s) or remote stand-alone separately derived ac system(s), The grounding electrodes ~~required~~ specified in Part C of this article at each building or structure served shall be connected in the manner specified in ~~either~~ (b) ~~or (c).~~ Where there are no existing grounding electrodes, ~~the~~ a grounding electrode~~(s)~~ system that complies with Part C of this article shall be installed.
Exception: A grounding electrode at separate buildings or structures served shall not be required where only one branch circuit supplies the building or structure and the branch circuit includes an equipment grounding conductor. ~~for grounding the noncurrent carrying parts of all equipment.~~
(b) ~~Grounded System.~~ Grounding and Bonding Connections. ~~For a grounded system at~~ At the separate building or structure served, the connection to the grounding electrode and grounding ~~or~~ and bonding ~~of equipment, structures, or frames required to be grounded or bonded~~ shall comply with ~~either (1) or (2)~~ the following:
~~(1) Equipment Grounding Conductor.~~ An equipment grounding conductor as described in Section 250-118 shall be run with the supply conductors and connected to the building or structure disconnecting means and to the grounding electrode(s). The equipment grounding conductor shall be used for grounding ~~or~~ and bonding of metal piping, equipment, structures, ~~or~~ and frames ~~required~~ to be grounded or bonded. Any installed grounded conductor shall not be connected to the equipment grounding conductor or to the grounding electrode(s) at the building or structure served.
(2) Delete.
Add:
Exception: The equipment grounding conductor shall not be required where all the following conditions are met: (1) the grounded circuit conductor run with the supply to the building or structure is connected to the building or structure disconnecting means and to the grounding electrode(s) and used for grounding and bonding of metal piping, equipment, structures, and frames; (2) there are no other continuous metallic paths bonded to the grounding system of the building or structure served and other grounding electrode systems, (3) conductors on the supply side of the building or structure disconnecting means are not provided with ground-fault protection of equipment or personnel; (4) the grounded conductor size is not smaller than shown in Table 250-122 for equipment grounding conductors; (5) the supply to the building or structure consists of not more than one feeder or branch circuit.
(c) Delete.
SUBSTANTIATION: Present wording of this section does not apply to a separate building supplied by a service located in another building that does not supply any circuits in that building. For example, a building with a 1Ø and 3Ø service where the 3Ø service only supplies a circuit to the second building and is not "common" to both, whereas if the 1Ø service supplies both buildings it would be "common". It also does not apply to circuits supplied by stand-alone separately derived systems such as generators or solar photovoltaic systems since these are not services. If an outdoor service pedestal or substation supplies only one building this section only applies if they are considered as structures and contain equipment supplied by a branch circuit or feeder.
Grounding electrodes in (a) are indicated as required by Part C whereas the first sentence of Section 250-50 indicates there is no requirement to provide electrodes, but only specifies types, if available.
Specifying the purpose of the equipment grounding conductor in the exception for (a) is superfluous as that is indicated elsewhere in this section. It also literally indicates it is for grounding of "all" equipment which includes that which is completely nonelectrical.
Removal of reference to grounded systems in (b) would allow application to ungrounded systems also and make (c) unnecessary since the requirement for an equipment grounding conductor would then clearly apply, which is not covered by (c).
The phrase "required to be grounded or bonded" implies the requirements do not apply where such grounding and bonding is done by choice and not code-required.
In the present (b)(2) "where an equipment grounding conductor is not run with the supply to the building or structure" indicates a condition, but not literally a requirement or permission to omit the equipment grounding conductor of (1), nor does such wording modify mandatory requirements of other sections requiring an equipment grounding conductor.
The proposed exception for (b) refers to no "other" continuous metallic paths, so as not to exclude or conflict with the use of the grounded conductor for grounding, which does provide just such a path. Since a branch circuit may be supplied from a feeder which has GFCI protection and supplies other branch circuits, the reference to ground-fault protection is revised to include GFCI type.
Grounded conductor minimum size is specified to correlate with requirements for equipment grounding conductor size. The limitation to one supply circuit is to plainly state what in essence is already implied by the requirement that there be no continuous metallic paths (other than the regrounded grounded conductor) between grounding electrode systems in other buildings. Any additional supply circuit whether grounding is provided by an equipment grounding conductor or grounded conductor, provides such a parallel grounding path for grounded conductor current.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal submitted does not improve the clarity of this section. The term equipment as defined in Article 100 indicates that it is connected with an electrical installation.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #4292)

5- 110 - (250-32(a)): Reject
SUBMITTER: Charles F. Mello, Milwaukie, OR
RECOMMENDATION: Revise text to read as follows:
(a) Grounding Electrode. Where two or more buildings or structures are supplied from a common ac service by a feeder(s) or branch circuit(s), the grounding electrode(s) that are present and required in Part C of this article at each building or structure shall be connected in the manner specified in (b) or (c). Where there are no ~~existing~~ grounding electrodes present, then made grounding electrode(s) ~~required~~ identified in Part C of this article shall be installed as required in Part C of this Article.
SUBSTANTIATION: The present wording is not clear in that it could be interpreted that all of the grounding electrodes identified in Sections 250-50 and 250-52 must be installed and connected together. The revised text makes it clear in the first part that those electrodes as defined in Section 250-50 and 250-52 that are present are to be utilized. The second part clarifies that if no electrodes are available them made electrodes identified in Part C need to be installed to meet the requirements of Part C.
PANEL ACTION: Reject.
PANEL STATEMENT: The revised text does not add clarity. The panel disagrees that this could be intepretated to require all grounding electrodes identified in Sections 250-50 and 250-52 be installed.

(Log #4182)

5- 113 - (250-32(a), Exception): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
"A grounding electrode at separate buildings or structures shall not be required where ~~only one branch circuit supplies the building or structure and~~ no branch circuits originate at that building or structure. The branch circuit(s) shall includes an equipment grounding conductor for grounding the noncurrent-carrying parts of all equipment."
SUBSTANTIATION: This rewrite differs from the 1999 NEC in that a second building fed with branch circuits from another can be wired without a grounding electrode if there is none available. The 1996 NEC, without any technical substantiation, removed the prior provision that an electrode had to be provided only if the second building itself supplied the multiple branch circuits (i.e., was supplied with a feeder.) In its rejection of this proposal in the 1999 cycle, the panel reiterated the intent while continuing to omit any technical substantiation for the 1996 change. The 1993 wording assured that a suitable enclosure (usually a panelboard) was available to make the connection. This proposal restores that allowance in those cases where there are multiple branch circuits, but they originate in the first building. This is very common in dwellings with detached garages. Note that if a qualified grounding electrode is available, however, it must be used. That was required in the 1993 NEC and would be unchanged under this proposed revision.
PANEL ACTION: Reject.
PANEL STATEMENT: It is the panel's intent that this exception shall only apply to a building or structure that is supplied by one branch circuit that contains an equipment grounding conductor.

(Log #1788)

5- 115 - (250-32(b)(2)): Accept in Principle
SUBMITTER: Noel Williams, Noel Williams Consulting
RECOMMENDATION: Add the following to the end of the subsection:
"The size of the grounded conductor shall not be less than given in Table 250-122 based on the rating of the overcurrent device protecting the branch circuit or feeder. The grounded conductor shall not be required to be larger than the largest ungrounded supply conductor."

SUBSTANTIATION: The minimum sizing requirement for the grounded conductor was omitted when this rule was rewritten in the 1999 NEC. This omission was apparently inadvertent and should be corrected to be sure that the grounded conductor can function as a fault return path.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The action and statement on Proposal 5-117 meets the submitters intent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #2290)

5- 116 - (250-32(b)(2)): Accept in Principle
SUBMITTER: Dann M. Strube, Lanesville, IN
RECOMMENDATION: Add a new second paragraph as follows:
"Where an equipment grounding conductor described in Section 250-118 is not run with the supply circuit conductors, the size of the AC system ground conductor on the supply side of the disconnecting means shall not be smaller than the size specified in Table 250-122 for equipment grounding."
SUBSTANTIATION: This rule was found in the 1996 NEC but was not included when Article 250 was revised. This requirement insures that the grounded conductor is of adequate size to carry ground fault currents.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 5-117.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3871)

5- 117 - (250-32(b)(2)): Accept in Principle
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Add new text to read as follows:
"The size of the grounded conductor shall be not smaller than required by Section 220.22 or as required by Section 250.122."
SUBSTANTIATION: It appears that the sizing requirement for the grounded conductor that serves as both the equipment grounding conductor and as the grounded system conductor was inadvertently omitted from this section during the processing of the 1999 NEC. The sizing requirements are essential to the user and enforcer of the NEC.
The size of the grounded conductor needs to be not smaller than required for a feeder as calculated in accordance with Section 220-22 and in addition must no to be smaller than required for equipment grounding conductors by Section 250-122.
PANEL ACTION: Accept in Principle.
Add a new last sentence to read as follows:
"The size of the grounded conductor shall not be smaller than the larger of
(1) that required by 220.22, or
(2) that required by 250.122."
PANEL STATEMENT: Section 220-22 is the minimum sizing criteria for feeder neutral conductors. Where the grounded conductor also serves as an equipment grounding conductor, that conductor must additionally meet the minimum sizing of 250-122. The panel concludes that this meets the submitters intent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:

(Log #3872)

5- 118 - (250-32(c) (New)): Reject
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Add new text to read as follows:
(c) Bonding Means for Other Systems. An accessible means external to enclosures for connecting intersystem bonding and grounding conductors shall be provided at the building or structure disconnecting means by at least one of the following means that is effectively grounded:
1. Exposed nonflexible metallic raceways
2. Exposed metal enclosure for the building or structure disconnecting means
3. Exposed grounding electrode conductor
4. One or more grounding electrodes
5. External bonding conductor of copper or other corrosion-resistant material
FPN No. 1: A No. 6 copper conductor with one end bonded to the disconnecting means and with 6 in. (152 mm) or more of the other end made accessible on the outside wall is an example of the approved means covered in (c)(5).
FPN No. 2: See Sections 800.40, 810.21, and 820.40 for bonding and grounding requirements for communications circuits, radio and television equipment, and CATV circuits.
SUBSTANTIATION: The requirement for providing an accessible means for intersystem bonding needs to be added to this section that covers grounding requirements for more than one building or structure supplied by a common service.
A similar requirement is found in Section 250-92(b) but relates to services only.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed text is already covered in 250-92(b). The panel intends to keep all the requirements for intersystem bonding in Section 250-92(b).

SUBSTANTIATION: This is a corresponding proposal to one submitted to revise the definition of a Grounding Electrode Conductor in Article 100. The term grounding electrode conductor should be used consistently where circuits or systems are connected to a grounding electrode.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement in Proposal 5-123.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #4293)

5- 125 - (250-32(f)): Accept in Principle in Part
SUBMITTER: Charles F. Mello, Milwaukie, OR
RECOMMENDATION: Revise text to read as follows:
(f) Grounding Conductor. The size of the grounding electrode conductor, from the connection point enclosure at the building or structure served, to the grounding electrode(s) shall not be less than given in Section ~~Table~~ 250-122~~66~~, and shall not be required to be larger than the largest ungrounded supply conductor. The installation shall comply with Part C of this article.
SUBSTANTIATION: Adding the word "electrode" properly identifies this conductor as defined in Article 100. The use of other terms for the same thing only creates confusion. The purpose of this conductor is the same as at a service, to provide a connection to earth through the grounding electrode to establish an earth potential reference for noncurrent carrying enclosures and for lightning protection. The difference with a service is that the ampacity of the feeder may be smaller than minimum 60 or 100 amps as required for a service. Since the purpose of the conductor is the same as for a service, the sizing on this conductor for a second building should be that same as for a service. In addition, by referencing the table only, the allowance for maximum size conductors for certain electrodes is not provided for. For the case where a small feeder or branch circuit is installed, the last part of the first sentence provides that this conductor need not be larger than the largest feeder or branch circuit ungrounded conductor which is not a change from the present requirement. By requiring the use of Section 250-122, as is presently set, larger feeders are having very large grounding conductors installed to grounding electrodes. For example, a 1600 amp feeder would have to have 4/0 copper "grounding conductor" where the 1600 amp service only requires a 3/0 copper grounding electrode conductor. Larger feeders only increase the difference.
PANEL ACTION: Accept in Principle in Part.
PANEL STATEMENT: See panel action and statement in Proposal 5-123. The proposed addition of the phrase " from the connection point enclosure at the building or structure served" does not add clarity.

5- 126 - (250-34): Reject
SUBMITTER: Charles F. Mello, Milwaukie, OR
RECOMMENDATION: Revise text to read as follows:
"Portable and vehicle mounted generators grounded and bonded under the provisions of this section shall not be used to serve fixed premises wiring systems, including connection with a flexible cord assembly. Portable and vehicle mounted generators serving utilization equipment shall comply with (a), (b), and (c) below:"
SUBSTANTIATION: Due to the need for standby power, particularly in residences, numerous installations of portable or vehicle mounted generators are being made. The installation of the generator serving fixed premises wiring should be in accordance with Article 445 and other parts of the Code. It is not clear to many installers that this section was not intended to cover using a portable generator to serve temporary power to a building or structure. Since many are connected with a portable cord, the

fixed premises wiring is being considered as if it were a piece of utilization equipment. Most of these generators have an internal bond between the neutral and the frame to meet the requirements of this section and to provide the protection intended when directly supplying utilization equipment. Without a proper grounding electrode installed to earth and with the possibility of grounding the premises wiring neutral downstream of the neutral disconnect link in violation of Section 250-24(a)(5) presents several safety concerns. The added text as an introductory statement clarifies when the grounding and bonding provisions allowed by this section are permitted.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed text is too broad and could be interpreted to prevent presently accepted and safe practices.

Note: The Technical Correlating Committee directs the Code-Making Panel to reconsider the use of the words "grounded conductor" in 250-34(c) relative to two-wire generators.
This action will be considered by the Panel as a public comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(c) Grounded Conductor Bonding. A system conductor that is required to be grounded by Section 250-~~26~~ 20 shall be bonded to the generator frame by a conductor sized in accordance with

Section 250-102(c) where the generator is a component of a separately derived system.

FPN No. 1: For grounding of portable or vehicle-mounted generators supplying fixed wiring systems see Section 250-~~20(d)~~ 30.

FPN No. 2: For grounding of portable or vehicle mounted dc generators see Part H of this article.

SUBSTANTIATION: Editorial. Subsection (b)(4) requires compliance with Section 250-30(a)(1) (minimum No. 8 copper), but where the generator supply conductors are smaller than No. 8 it may be perceived that a direct bonding of such conductor is acceptable. If this is the intent specific wording to that effect is needed.

Vehicle-mounted generators covered by this section should be included in the present FPN. Proposed FPN No. 2 would correlate with Part H which doesn't have any provision stating "shall not be required to be grounded". Reference to Sections 250-26 and 250-20(d) relate to ac systems which infer this section was never intended to apply to dc systems.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel concludes that this proposal is not editorial. The substantiation does not clearly identify the reasons for the specific changes. The references in the recommendation are incorrect.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

(Log #4295)

5- 134 - (250-36(g) (New)): Accept

SUBMITTER: Charles F. Mello, Milwaukie, OR

RECOMMENDATION: Add new text to read as follows:

(g) Equipment Bonding Jumper Size. The equipment bonding jumper shall be sized by (1) or (2) below.

(1) Where the grounding electrode conductor connection is to the grounded side of the grounding impedance, the equipment bonding jumper shall be sized per Section 250.66 based on the size of the service entrance conductors for a service or the derived phase conductors for a separately derived system.

(2) Where the grounding electrode conductor is located at the equipment with the equipment grounding conductors, the equipment bonding jumper shall be sized the same as the neutral conductor in Section 250.36(b).

SUBSTANTIATION: Under the present Code, the equipment bonding jumper is sized like a main bonding jumper. Because the grounding impedance limits the current to a very low value, the equipment bonding jumper is being oversized for the need. It is already recognized that the neutral, which is in series with the equipment bonding jumper on the line side of the grounding impedance, need not be sized any larger than required to carry the rated current of the impedance and not smaller than No. 8 AWG copper. For example, a 4000 amp derived system will require an equipment bonding jumper of 750 kcmil copper to the grounding impedance that has a No. 8 or No. 6 copper conductor from the other side of the impedance back to the source transformer. The expected current flow in high impedance grounded systems is typically 10 amps or less and may go up to 50 amps per the IEEE definitions. This revised text provides for the correct sizing of the equipment bonding jumper with consideration for where the connection of grounding electrode conductor for the system is located.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

(Log #CP503)

5- 134a - (250-50): Accept

SUBMITTER: CMP 5

RECOMMENDATION: Replace the text of the Section 250-50 with the following:

250-50 Grounding Electrode System.

If available on the premises at each building or structure served, each item in 250-52(a)(1)~~(a)~~ through (a)(6) ~~(d), and any made electrodes in accordance with Sections 250-52(c) and (d),~~ shall be bonded together to form the grounding electrode system. Where none of these ~~the~~ electrodes ~~specified in Section 250-50~~ is available, one or more of the electrodes specified in 250-52(a)(4)~~(b)~~ through (a)(7)~~(d)~~ shall be used.

SUBSTANTIATION: This is one of three companion proposals to rearrange the 1999 NEC Sections 250-50 and 250-52 to add clarity to these sections and to make the application more user friendly. The new section is made up of parts of the first paragraphs from the 1999 NEC Section 250-50 and Section 250-52 to establish the requirements for a grounding electrode system. The references within the text were revised to correlate with the correct references in the new section. Editorial changes were made as shown for clarity.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

(Log #750)

5- 135 - (250-50): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise last sentence of first paragraph:

The bonding jumper(s) shall be installed in accordance with Sections 250-64(a), (b), (c), and (e), and 250-66, and shall be connected in the manner specified in Section 250-70.

Revise (a)(2): Supplemental Electrode Required. A metal underground water pipe shall be supplemented by an additional electrode of a type specified in Sections 250-50 or 250-52. Where the supplemental electrode is a made electrode of the rod, pipe, or plate type, it shall comply with Section 250-56. The supplemental electrode shall ~~be permitted to~~ be bonded to one or more of the following: (1) the grounding electrode conductor;

(2) the grounded service-entrance conductor; (3) the nonflexible metal service raceway (4) ~~or~~ any grounded service enclosure. Except for connections to concrete-encased, driven, or buried electrodes, the points of attachment of the bonding jumper shall be accessible.

~~Exception:~~ The supplemental electrode shall be permitted to be bonded to the interior metal water piping that is a metallically continuous extension of the underground metal water pipe at any convenient point as covered in Section 250-50 Exception.

(remainder unchanged).

SUBSTANTIATION: The bonding jumper should comply with Section 250-64(c) since in case of loss of another grounding electrode such as a metal underground water pipe the bonding jumper may become a grounding electrode conductor, in effect. Why apply grounding electrode conductor requirements of Section 250-64(a), (b), and (e) but not (c)?

"Permitted to be" in (a)(2) does not invoke any requirement and the exception does not except any requirement.

Points of attachment should be specified as it is for bonding jumpers of other sections and grounding electrode conductors.

The exception does not appear to except a specific requirement of the rule. "Interior metal water piping" is not specific that it is the grounding electrode and can include isolated or independent systems in industrial processes. While such systems may be bonded in accordance with Section 250-104, it appears the intent is meant to cover piping extended from the metal underground piping.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel notes that the text shown as existing does not match the NEC. The first sentence of Section 250-50(a)(2) already requires that the underground water pipe be supplemented by an additional electrode and adequately covers the bonding points. The remainder of the changes do not add clarity to the Code. Adding 250-64(c) is too broad a change without supplying the panel with significantly better substantiation.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

(Log #1789)

5- 136 - (250-50): Reject

SUBMITTER: Noel Williams, Noel Williams Consulting

RECOMMENDATION: Add the following to the end of the second paragraph:

"A grounding electrode conductor connecting to multiple made electrodes as permitted in Section 250-52(c) or (d) shall be sized according to Table 250-66. "

SUBSTANTIATION: According to the present rule, the conductor to a single rod, pipe, or plate electrode need not be larger than No. 6 copper (or No 4 aluminum). For a group of made electrodes, the largest conductor required for any electrode in the group is also No. 6 copper. Even where many such electrodes are used as a grounding electrode system, the largest is still No. 6. Therefore, where multiple made electrodes are used to increase the overall contact area, the conductor is not required to be increased under the present rule. This is inconsistent with the reasoning behind Section 250-66(a). The rule as written is not a problem when applied to concrete-encased electrodes or ground rings, because even where multiple connections are made they are all made to the same electrode(s).

PANEL ACTION: Reject.

PANEL STATEMENT: The panels intent is to permit the specified size of grounding electrode conductors when connected to single or multiple made electrodes.

5- 139 - (250-50): Reject

SUBMITTER: Richard Shanker, Shanker Electric

RECOMMENDATION: I recommend that water pipe ground size wire be no. 6 in residential home for 200 amp services.

SUBSTANTIATION: None.

PANEL ACTION: Reject.

PANEL STATEMENT: There is no specific recommendation made by the submitter in the proposal. Section 4.3.3(c) of the Regulations Governing Committee Projects requires proposals to include proposed text, including the wording to be added, revised (and/or) revise, or deleted. Also, this proposal does not contain a substantiation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

(Log #1936)

5- 140 - (250-50): Reject

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI

RECOMMENDATION: Revise as follows:

Interior metal water piping located more than ~~5 ft (1.52 m)~~ 10 ft (3.04 m) from the point of entrance to the building shall not be used as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system.

SUBSTANTIATION: Where water piping enters the building in a finished wall, as in a building using slab type construction, an increase to 10 feet would allow the ground connection to be made above the finished ceiling. If the 5 foot rule is enforced and an access panel is provided in the middle of a living room or office wall, it will likely be done away with after the inspection is done. If access to the connection is important, this revision would better assure that this need is met. The 5 foot seems to be an arbitrary number to make the connection as close as practical.

PANEL ACTION: Reject.

PANEL STATEMENT: A length in excess of five feet will increase the probability of impacting the integrity of the grounding electrode.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NEGATIVE: 3

EXPLANATION OF NEGATIVE:
BOKSINER: The submitter's substantiation is plausible. If there are situations where the constraint to 5 ft creates a possibility of future maintenance problems, an increase to 10 ft is justified.
DOBROWSKY: The submitter has valid substantiation. Allowing the connection to be 10 ft (3 m) away from the point of entrance but in an accessible location, such as above a suspended ceiling, should be acceptable.
JOHNSTON: The proposal addresses installation concerns that can become a hardship in meeting this requirement. While there are many ways to accomplish the connection within the first 5 ft of entry to the building, there are occasions where the distance of 10 ft is more practical and does not affect the overall safety, especially if the piping were concealed for the first 10 ft after entry into the building or structure.
COMMENT ON AFFIRMATIVE:
RAPPAPORT: The submitter's substantiation is reasonable but globally changing the 5 ft rule to 10 ft for all applications is not reasonable for the reasons given in the panel statement. A carefully worded limiting exception might provide the relief for special conditions that the submitter is looking for.

(Log #2496)

5- 141 - (250-50): Reject
SUBMITTER: Andre R. Cartal, Bldg Dept., Princeton Borough, NJ
RECOMMENDATION: Revise first sentence as follows:
If installed or present on the premises at each building or structure served, each item (a) through (d), and any made electrodes in accordance with Section 250-52(c) and (d) shall be bonded together to form the grounding system.
SUBSTANTIATION: While this change may seem draconian in nature, it is desperately needed if the NEC is going to provide provisions for grounding systems that reflect the protection needed for year 2000 electrical and communication premises wiring. Consider that made electrodes (Circa 1920) become the electrodes of choice because one of the most effective electrodes, the concrete-encased, is not utilized due to lack of any planning or, worse yet, the problem of enforcement because of the present provision that the electrodes be "available on the premises". The only method that will work is to eliminate this "cop-out" and then designers will make provisions that effective electrodes are made available.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms the use of the term "where available" as the preferred text. An electrode may be present but is not available. No substantiation has been provided for changing the term available to the term present.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
BOKSINER: This proposal would require the availability of concrete-encased electrodes where such electrodes exist. This would significantly improve the grounding electrode system in many installations. If such a requirement were adopted in the NEC, provisions to attach to the concrete-encased electrode would be made prior to building construction at very low cost. Thus, this proposal should be accepted.
MELLO: The issue presented here is real. I cannot agree with the Panel Statement that the term "where available" is the preferred text. The whole concept of using the metal water pipe, effectively grounded structural steel and the concrete encased electrode is based on one or more of these being installed as part of the construction of the building or structure. The word "available" is not enforceable and per the NEC Style Manual for 2000 is to be avoided. This situation is an excellent example of why the word "available" is not enforceable. The Panel Action on other proposals not to allow connection to metal water pipe electrodes at greater than 5 ft (substantiation was to make the pipe "available"), could now be construed to mean that if the first 5 ft of water pipe is in the wall that was covered before the electrician got to the site, and is no longer "available", that the water pipe does not need to be used. Also, if the effectively grounded building steel just happens to have the fire proofing applied before the electrician arrives, then it is not "available" so it does not have to be used. All the work and IEEE papers written by H. G. Ufer confirm that where steel reinforcing bars are installed in the foundation or footing, this electrode provides the best grounding electrode in both terms of low resistance and longevity. If the Panel follows this line of logic of availability, then no matter what is built will have two ground rods as the sole earth reference which will meet the Code because it was inconvenience or lack of coordination with other trades made the more superior electrodes "not available". The substantiation was correct; the word "available" is a "cop out" used by many. Numerous jurisdictions in the Western United States have had to write local amendments or ordinances requiring the use of the concrete encased electrode when rebar is used in the footing or foundation to get by this cop out. The NEC needs to recognize this and not start down the path with unenforceable language and permitting this kind of loophole.
I invite every electrical inspector in the United States to submit a comment on this proposal with substantiation and suggestions for enforceable language so that it is clear and unequivocally understood that the concrete encased electrode where used in the construction of the building is to be used as a grounding electrode for the electrical system.
COMMENT ON AFFIRMATIVE:
RAPPAPORT: The National Electrical Code, Section 90-1(a), indicates that the Code provides for safety but not necessarily an "efficient, convenient, or adequate" system. It may be desirable but it is not within the mandate of the Code to require that a grounding electrode that is present, but not available, be connected as part of the grounding electrode system.

(Log #2836)

5- 142 - (250-50): Reject
SUBMITTER: Melvin K. Sanders, Ankeny, IA
RECOMMENDATION: Insert the following text: "…<u>for the largest conductor required if run singly to the electrode,</u>…":
250-50. Grounding Electrode System. If available on the premises at each building or structure served, each item (a) through (d), and any made electrodes in accordance with Sections 250-52(c) and (d), shall be bonded together to form the grounding electrode system. The bonding jumper(s) shall be installed in accordance with Sections 250-64(a), (b), and (e), shall be sized in accordance with Section 250-66 <u>for the largest conductor required if run singly to the electrode,</u> and shall be connected in the manner specified in Section 250-70.
An unspliced grounding electrode conductor shall be permitted to be run to any convenient grounding electrode available in the grounding electrode system or to one or more grounding electrode(s) individually. It shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it.
SUBSTANTIATION: Text no longer provides guidance on minimum size grounding electrode bonding jumpers as it did in 1996 Edition and earlier. It is now possible to go from the grounded conductor terminal at the service disconnect with a #3/0 AWG to a metallic water pipe or effectively grounded building steel, from there to a made electrode with a #6 AWG, from there to a concrete encased electrode with a #4 AWG and from there to a ground ring encircling the building with a #2 AWG.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that the added text does not add clarity to the section. The panels intent is to permit the specified size of grounding electrode conductors when connected to a single electrode.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
COMMENT ON AFFIRMATIVE:
DOBROWSKY: The Panel Statement may appear to conflict with the Panel Statement for Proposal 5-136.

(Log #3315)

5- 143 - (250-50): Reject
SUBMITTER: Kenneth E. Isman, Nat'l Fire Sprinkler Assn.
RECOMMENDATION: Add a new paragraph to Section 250-50 as follows:
<u>"Interior piping for a water-based fire protection system shall not be used as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system."</u>

SUBSTANTIATION: Use of the fire sprinkler system piping, or other fire protection system piping, for grounding is bad practice and dangerous design. Removal of valves from the system for maintenance and repair such as alarm valves and check valves close to the point of entrance into the building is common enough to cause problems. Sprinkler fitters touching the pipe under these conditions could be electrocuted.

Some electrical contractors are assuming that the fire protection system piping continues to be metallic, even underground. This is no longer a valid assumption as there are a number of nonmetallic pipe and tube products now listed for underground service.

Another concern of the fire sprinkler industry with respect to this issue is the enhanced corrosion that may effect pipe, sprinklers and other attached components due to stray currents.

The NFPA Automatic Sprinkler committee agreed with the concept of this proposal while putting together the 1996 edition of NFPA 13, but thought that the issue was not within the scope of that document. They believed that the issue should be addressed by the NEC. See Proposal 13-27 of the Annual 1996 ROP for more details.

In addition, Section 8-3.5 of NFPA 24 agrees with this proposal. Failure to accept this proposal in some form allows a conflict between two different NFPA documents to continue.

PANEL ACTION: Reject.

PANEL STATEMENT: The recommended text starts with interior piping which can not be a "grounding electrode." The submitter appears to be referring to bonding. Bonding of all interior metal equipment frames and structures, including all metallic piping systems, is mandatory to provide an equipotential reference and thereby reduce shock and fire hazards.

"The intentional bonding of all the utilities in a building creates an equipotential ground plane that minimizes the voltage differential between the different systems under both normal and abnormal operating conditions. The result is an environment safer from the hazards of electrocution and fire. {excerpt from January/February, 2000, NFPA Journal, Grounding, Bonding and Sprinklers by John Caloggero}"

(Log #3911)

5- 144 - (250-50): Accept in Principle

SUBMITTER: Charles F. Mello, Milwaukie, OR

RECOMMENDATION: Revise this section as follows:

250.50. Grounding Electrodes.

(a) Grounding Electrodes. The following shall be defined as grounding electrodes suitable for use to form the grounding electrode system;

(1) Metal Underground Water Pipe. A metal underground water pipe in direct contact with the earth for 10 ft (3.05 m) or more including any metal well casing effectively bonded to the pipe. The metal water pipe shall be electrically continuous, or made electrically continuous by bonding around insulating points or sections or insulating pipe, to the point of connection of the grounding electrode conductor and the bonding conductors. The water pipe electrode shall be considered an electrode upon entering the building for a distance not to exceed 5 ft (1.52 m). Interior metal water piping located more than 5 ft (1.52 m) from the point of entrance to the building shall not be used as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system.

Exception: In industrial and commercial buildings where conditions of maintenance and supervision ensure that only qualified persons will service the installation and the entire length of the interior metal water pipe that is being used for the electrode is exposed.

(2) Metal Frame of the Building or Structure. The metal frame of the building or structure, where effectively grounded.

(3) Concrete-Encased Electrode. An electrode encased by at least 2 in. (50.8 mm) of concrete, located within and near the bottom of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 20 ft (6.1 m) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 1/2-in. (12.7-mm) diameter, or consisting of at least 20 ft (6.1 m) of bare copper conductor not smaller than No. 4 AWG. Reinforcing bars shall be permitted to be bonded together by the usual steel tie wires or other effective means.

(4) Ground Ring. A ground ring encircling the building or structure, in direct contact with the earth consisting of at least 20 ft (6.1 m) of bare copper conductor not smaller than No. 2 AWG.

(5) Rod and Pipe Electrodes. Rod and pipe electrodes shall not be less than 8 ft (2.44 m) in length and shall consist of the following materials.

(a) Electrodes of pipe or conduit shall not be smaller than 3/4 in. trade size and, where of iron or steel, shall have the outer surface galvanized or otherwise metal-coated for corrosion protection.

(b) Electrodes of rods of iron or steel shall be at lest 5/8 in. (15.87 mm) in diameter. Stainless steel rods less than 5/8 in. (15.87 mm) in diameter, nonferrous rods, or their equivalent shall be listed and shall not be less than 1/2 in. (12.7 mm) in diameter.

(6) Plate Electrodes. Each plate electrode shall expose not less than 2 ft2 (0.186 m2) of surface to exterior soil. Electrodes of iron or steel plates shall be at least 1/4 in. (6.35 mm) in thickness. Electrodes of nonferrous metal shall be at least 0.06 in. (1.52 mm) in thickness.

(7) Other Local Metal Underground Systems or Structures. Other local metal underground systems or structures such as piping systems and underground tanks.

(b) Electrodes Not Permitted for Grounding. The following shall not be used as ground electrodes.

(1) Metal Underground Gas Piping System. A metal underground gas piping system shall not be used as a grounding electrode.

(2) Aluminum Electrodes. Aluminum electrodes shall not be permitted.

SUBSTANTIATION: The present code has the grounding electrodes defined along with several requirements for the installation. The grounding ring in the 1999 NEC Section 250-50(d) is really a made electrode and does not fit with others that are available from the building construction and not necessarily purposefully installed as an electrode. This then is confusing with the other "made electrodes" being defined in Section 250-52. The revised text in this proposal along with the revised proposal for 250-52 will define all the electrodes here and the installation issues in 250-52.

PANEL ACTION: Accept in Principle.

COMMENT ON AFFIRMATIVE:

BRENDER: I agree with the Panel vote to Accept in Principle, but I disagree with the inclusion of the Exception under 250-50(a)(1). See my comments in response to Proposal 5-103. My opinion is that the proposal should have been accepted in principle, with 250-5(a)(1), Exception deleted.

(Log #4475)

5- 145 - (250-50): Reject

SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors

RECOMMENDATION: Revise the fourth paragraph to read as follows:

"Interior metal water piping located more than ~~5 ft (1.52m)~~ 10 ft (3.04m) from the point of entrance to the building shall not be used as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system."

SUBSTANTIATION: Where water piping enters the building in a finished wall, as in a building using slab type construction, an increase to 10 ft would allow the ground connection to be made above the finished ceiling. If the 5 ft rule is enforced and an access panel is provided in the middle of a living room or office wall, it will likely be done away with after the inspection is done. If access to the connection is important, this revision would

better assure that this need is met. The 5 ft seems to be an arbitrary number to make the connection as close as practical.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 5-140.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
BOKSINER: See my Explanation of Negative Vote on Proposal 5-140.
DOBROWSKY: See my Explanation of Negative Vote on Proposal 5-140.
JOHNSTON: The proposal addresses installation concerns that can become a hardship in meeting this requirement. While there are many ways to accomplish the connection within the first 5 ft of entry to the building, there are occasions where the distance of 10 ft is more practical and does not affect the overall safety, especially if the piping were concealed for the first 10 ft after entry into the building or structure.
COMMENT ON AFFIRMATIVE:
RAPPAPORT: See my Affirmative Comment on Proposal 5-140.

(Log #751)

5- 146 - (250-50, Exception and (a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Exception: The interior metal water piping shall be permitted as a conductor to interconnect electrodes in ~~In~~ industrial and commercial buildings or structures where all of the following conditions are met: (1) maintenance and supervision ensure that only qualified persons will service the installation and, (2) the entire length of the interior metal water pipe that is being used for the conductor is exposed and (3) the metal water pipe is a metallically continuous extension of a metal underground water pipe as specified in (a) below.
Revise last paragraph of (a)(2): Where the required supplementary electrode specified above is a made electrode as in Section 250-52(c) or (d), that portion of the bonding jumper that is the sole connection to the supplementary grounding electrode shall not be required to be larger than No. 6 copper wire or No. 4 aluminum wire.
SUBSTANTIATION: Editorial. The exception is revised to sentence form, includes structures other than buildings, and adds a proviso that the water piping be an extension of the underground water piping system. Piping systems may exist in systems and processes which are isolated from potable water supply systems. While such systems are required to be bonded in accordance with Section 250-104, the present wording permits their use as a conductor between electrodes. If it is intended that this exception apply to metal water piping that is connected to the underground water pipe electrode, it should be stated.
The proposal for (a)(2) is to clearly distinguish the electrode of this section from the supplementary electrode of Section 250-54.
PANEL ACTION: Reject.
PANEL STATEMENT: This proposal is not editorial and does not add clarity.

(Log #4184)

5- 147 - (250-50, Exception): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise the Exception to the fourth paragraph as follows:
"In industrial and commercial buildings where conditions of maintenance and supervision ensure that only qualified persons will service the installation and the entire length, other than short sections passing directly through partitions, of the interior metal water pipe that is being used for the conductor is exposed."
SUBSTANTIATION: This revision adds the words "other than short sections passing directly through partitions" to the exception. This is necessary because at present, even a single 5-inch wall penetration in a 200-foot run kills the exception. Although CMP 5 rejected this wording, they did say that such a short penetration would not be considered to render the run unexposed. Unfortunately the only ones who will know that are those few that read the ROC. The text must be changed to incorporate the panel's understanding of intent.
The need is even more compelling now, because separately derived systems are no longer permitted to use local water piping as an electrode unless it complies with this exception (or the connection is within 5 ft of the building entrance). In the case of a high-rise building with all vertical passages through floors fire-stopped, the water risers would never be exposed over their entire length.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See Proposal 5-162a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16

EXPLANATION OF NEGATIVE:
DOBROWSKY: The proposal should be accepted in part. The words "or structures" should be incorporated into the exception.

(Log #4183)

5- 148 - (250-50 Exception No. 1): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Identify the present exception as Exception No. 2 and add a new Exception No. 1 to follow the first paragraph as follows:
Exception No. 1: Where located on the premises and within 200 ft (61.0 m) of a new building or structure directly supplied by a well, and where none of the items (a) through (d) below are available, metallic well casings in direct contact with the earth for 10 ft (3.05 m) or more shall be included in the grounding electrode system.
SUBSTANTIATION: Over the past few years, evidence has been steadily accumulating that many soils, including granitic soils with relatively high annual water budgets, are poorly conductive. Ground rod resistance measurements frequently come in with higher resistance's than those being measured in the ongoing grounding electrode study in the Nevada desert near Las Vegas.
Five years ago I was involved in a grounding study in Heath, Mass. where the ground rod resistance exceeded 800 ohms, and the well casing resistance was below 20 ohms. In another study witnessed by the Paul Revere Chapter, IAEI, 10 ground rods were deployed in parallel in a broadly dispersed pattern in Westminster, Mass. The net resistance turned out to be 320 ohms. These extreme results are common in many areas of the country, and it is time reexamine the reluctance to modify this section of the Code. One reason for opposing this type of rule by CMP 5 has been concerns about voltage drop on long runs of grounding electrode conductors. The resistance of 200 feet of No. 4 copper wire is on the order of 0.06 ohms. This, added to typical well casing resistance's, obviously pales in significance when compared to typical ground rod re-si stances in poor soils. Under these extreme conditions, this will be true even after factoring in the high skin effects involved in lightning strokes.
This proposal only affects new buildings where a path to the well casing would probably be available. Other electrodes such as concrete-encased electrodes, could be substituted if necessary. With their greater depth and surface area well casings are far superior to ground rods.
The phrase "directly supplied by a well" in the first clause of the proposed exception addresses the practicality of this requirement with respect to additional structures being erected subsequent to the establishment of service during the construction of the principal building, where the trench to the well would be open as a matter of course. Additional buildings on a property, although sequentially served, would be unlikely to be directly served by the well. This provides a logical basis for practicability, since a trench would usually be opened for such water service. Should a direct water lateral be extended to such a building or structure, then the rule should be applied.
The Advisory Committee did discuss reducing the allowable distance from 200 ft to 100 ft due to a concern about potential differences between a remote electrode during fault conditions and conductive surfaces at the building. That concern is both true and beside the point. A conventional high resistance made

electrode as noted in the preceding substantiation (800W or more), if subjected to a typical 13.8 kV utility cross (8k V to ground), will pass about 10A. The result is a very steep step-potential gradient in the vicinity of the electrode, and almost the full voltage relative to pure ground elsewhere at the building. Furthermore, such a small current won't trip a utility protective device. On the other hand, a No. 4 conductor run 200 ft to a well casing with a 25W resistance (frequently a high number) will pass 320A. The short-time rating of No. 4 (based on 1A/42.25 cm for 5 sec.) is 988A. This amount of current will normally trip utility protective devices. In addition, the voltage drop on the conductor (E=IR) would be approximately (320A x 0.062W = 20V). This is a very substantial, perhaps lifesaving, improvement.

This proposal is a companion one to one for Section 250-66, which contains the other half of this initiative on well casings. These rules have been in place in Massachusetts for ten months now, and seem to be working quite smoothly given that this is a major initiative undertaken on a state level.

PANEL ACTION: Reject.

PANEL STATEMENT: As proposed, this is not an exception since there is no prohibition to connecting a metallic well casing to the grounding electrode system. See Section 250-52(b). Therefore, the well casing could be connected to the grounding electrode system, but not as a required to be connected electrode.

The substantiation refers only to a utility cross fault. Direct lightning strikes and induced current due to near lightning strikes could be prevalent and are not considered. The high inductance of 100 or 200 feet of conductor would present a high inductive reactance to a steep front lightning strike. There is, therefore, no justification for permitting this method as a primary grounding electrode.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

(Log #2109)

5- 149 - (250-50 Exception No. 2 (New)): Accept in Principle

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: Add a new Exception No. 2 to read as follows:

"Where an additional electrode(s) is used to supplement the equipment grounding conductor, in accordance with 250-54, it shall not be required to be bonded to the other electrodes in Part C of this Article."

Identify the existing Exception as No. 1.

SUBSTANTIATION: Many manufacturers of computer controlled machines require that an electrode, typically a ground rod, be installed at the machine location and be connected to the machine frame. Denoting EMI, RF and "noise" as reasons for the "ground" they will not honor their warranty unless the additional electrode is installed. Whether necessary or not, the supplemental electrode is actually connected to the other electrodes required by Part C through the equipment grounding conductor that is run with the machine supply conductors. This connection should not be required to be sized per Table 250-66. Electrodes are installed at medium voltage motors to address touch and step potentials without this additional bonding. There is no intent to allow an isolated electrode.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See action on Proposal 5-172. The panel believes that this action meets the intent of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

BRENDER: Supplementary electrodes installed in connection with CNC machines are covered by Section 250-54. There is no requirement under 250-54 that the supplementary electrode be bonded to the grounding electrode system, although to do so is good engineering practice.

The proposal does not add clarity. The substantiation submitted does not justify this change, and present code language, especially under 250-54, already addresses the submitter's concerns.

Note: Supporting material available for review upon request at NFPA headquarters.

DOBROWSKY: Adding the exception is still necessary. The first sentence of Section 250-50 (including the proposed new wording) requires that all of the available described electrodes to be bonded together. The second sentence provides the sizing requirements according to Section 250-66. Without the exception it appears that Section 250-50 and 250-54 still have opposing requirements.

(Log #1885)

5- 150 - (250-50(a)): Reject

SUBMITTER: David A. Kerr, Jr., Friendsville, PA

RECOMMENDATION: Delete "~~including any metal well casing effectively bonded to the pipe)~~". Create new (b) Any metal well casing. Reletter (b) through (d) accordingly.

SUBSTANTIATION: Important code requirements should be spelled out fully not left to the vagaries of confused parenthetical remarks. Steel well casings are routinely left ungrounded and unbonded. 250-112(l) and (m) clearly require pump and casing grounding for safety. We need an equally clear requirement for system grounding using the well casing.

PANEL ACTION: Reject.

PANEL STATEMENT: This creates a new requirement that metal well casing must be used, and not just when it is effectively bonded to metal water pipe, without technical substantiation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

(Log #1913)

5- 151 - (250-50(a)): Reject

SUBMITTER: Michael J. Johnston, Int'l Assn. of Electrical Inspectors

RECOMMENDATION: Revise text to read as follows:

(a) Metal Underground Water Pipe. A metal underground water pipe in direct contact with the earth at a depth below the earth's surface of not less than 2 1/2 ft (762 mm), and in direct contact with the earth for a length of 10 ft (3.05 m) or more (including any metal well casing effectively bonded to the pipe) and electrically continuous (or made electrically continuous by bonding around insulating joints or sections or insulating pipe) to the points of connection of the grounding electrode conductor and the bonding conductors.

SUBSTANTIATION: This section presently requires that the pipe be in direct contact with the earth but does not specify depth. The pipe could be scratched into the surface of the earth and still literally be in compliance with the existing wording but would not in most cases be an "effectively grounded" metal water pipe. Historically the utilities water lines have been required to be continuous and at specified depths which accomplished the effective connection to the earth. There were clarifications added in the 1999 NEC to require the minimum depth of the plate electrode at 2-1/2 ft and the grounding ring and horizontal ground rod installations are acceptable at 2-1/2 ft. This change to require a minimum depth of an effectively grounded metal water pipe would be consistent with these other depth requirements for electrodes and eliminate the gray area and questionable effectively grounded metal water piping systems. The wording may need to be adjusted.

PANEL ACTION: Reject.

PANEL STATEMENT: There is no technical substantiation provided for the proposed depth requirement. Water pipes have been used as a grounding electrode for many years without a depth requirement with no incidents cited.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

(Log #2452)

5- 152 - (250-50(a)): Reject

SUBMITTER: Stanley T. Fletcher, City of St. Louis, MO

RECOMMENDATION: Delete text as follows:

(a) ~~Metal underground water pipe. A metal underground water pipe in direct contact with the earth for 10 ft (3.05 m) or more.~~

SUBSTANTIATION: Due to the safety hazard to Water Meter Repair Workers in our city and other cities across our nation, we are making an official request to strike Section 250-50 paragraph a "metal underground water pipe" from being used as a grounding electrode. Instead of allowing the grounding to water pipe, which has caused our Water Meter Repair Workers to be shocked, the grounding should be accomplished by use of a grounding rod.

Our Meter Repair Workers have either been shocked or narrowly avoided it by being warned by sparking at the locations within the past 3 or 4 years.

In these examples our Water Repair Workers could have been seriously injured. We need your help in eliminating this safety hazard. The grounded conductor or neutral that has a defective connection allows neutral current to be carried on the grounding conductor back to the source awaiting an unsuspecting Water Meter Repair Worker. It is unintentional and unpredictable when a connection fails causing neutral current on the water system. This has caused many plumbers and water workers to be shocked. Even though a bonding jumper may be present this only divides the current still allowing a shock hazard on the water meter and piping system.

As mentioned in the article in the July, 1998, issue of the AWWA Journal, a Water Worker somewhere in our country is the victim of a serious shock incident due to grounding once a day.

In summation, the Electrical Code, which is intended to promote safety, now permits a hazardous situation to continue. Please put yourselves in the shoes of the Water Service Worker and rectify this by taking the necessary action to have the requested portion of Section 250-50 paragraph (a) removed from the code. As it now stands the electrical code permits a dangerous condition to perpetuate.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: Effectively grounded metal water piping has been, and continues to be, one of the most available and utilized electrodes in practice today. The water pipe workers must follow safe work practices to work on all water pipes.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

SCHIFF: The American Water Works Association (AWWA) has consistently resisted the National Electrical Code requirement that utilized underground water pipe as an electrical ground electrode. Grounding to underground water pipe often results in a shock hazard to water utility personnel and contributes to corrosion of the pipelines.

The NEC took a step in the right direction when it called for a "supplemental" electrode in case the water pipe electrode was inadequate. However, the "supplemental" electrode should be "primary", rather than a back-up device. Although there is a requirement to check that the supplemental electrode has a resistance lower than 25 ohms, this is rarely performed. This can result in liability should the water pipe ground be replaced with nonmetallic pipe, especially in older buildings without the supplemental electrode.

If a ten ft long, underground water pipe ground is acceptable to the NEC, so should an equivalent rod paid for and installed by the electrical supplier or contractor, without reliance on the water pipe.

AWWA has no objection to using interior metal water pipe should to part of the grounding system.

AWWA hopes to enlist support of NFPA/NEC in accomplishing these ends in the future.

Note: Supporting material available upon request for review at NFPA headquarters.

(Log #3314)

5- 153 - (250-50(a)): Reject

SUBMITTER: Kenneth E. Isman, Nat'l Fire Sprinkler Assn.

RECOMMENDATION: Add the following to Section 250-50(a) as follows:

"... and the bonding conductors <u>as long as the underground water pipe is not a private fire service main or a portion of a water-based fire protection system.</u>"

SUBSTANTIATION: Use of the fire sprinkler system piping, or other fire protection system piping, for grounding is bad practice and dangerous design. Removal of valves from the system for maintenance and repair such as alarm valves and check valves close to the point of entrance into the building is common enough to cause problems. Sprinkler fitters touching the pipe under these conditions could be electrocuted.

Some electrical contractors are assuming that the fire protection system piping continues to be metallic, even underground. This is no longer a valid assumption as there are a number of nonmetallic pipe and tube products now listed for underground service.

Another concern of the fire sprinkler industry with respect to this issue is the enhanced corrosion that may effect pipe, sprinklers and other attached components due to stray currents.

The NFPA Automatic Sprinkler committee agreed with the concept of this proposal while putting together the 1996 edition of NFPA 13, but thought that the issue was not within the scope of that document. They believed that the issue should be addressed by the NEC. See Proposal 13-27 of the Annual 1996 ROP for more details..

In addition, Section 8-3.5 of NFPA 24 agrees with this proposal. Failure to accept this proposal in some form allows a conflict between two different NFPA documents to continue.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel concludes that the following statement applies:

"The intentional bonding of all the utilities in a building creates an equipotential ground plane that minimizes the voltage differential between the different systems under both normal and abnormal operating conditions. The result is an environment safer from the hazards of electrocution and fire. {excerpt from January/February, 2000, NFPA Journal, Grounding, Bonding and Sprinklers by John Caloggero}"

AFFIRMATIVE: 17

(Log #4185)

5- 156 - (250-50(a)(2)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
(2) ~~Supplemental~~ Reserve Electrode Required. A metal underground water pipe shall be supplemented by an additional electrode, for reserve purposes, of a type specified in Sections 250-50 or 250-52. Where the ~~supplemental~~ reserve electrode is a made electrode of the rod, pipe, or plate type, it shall comply with Section 250-56 with the metal water pipe assumed to be unavailable. The ~~supplemental~~ reserve electrode shall be permitted to be bonded to the grounding electrode conductor, the grounded service-entrance conductor, the nonflexible grounded service raceway, or any grounded service enclosure.
SUBSTANTIATION: Section 250-56 allows a qualified water pipe to supplement a made electrode if the initial resistance exceeds 25 ohms. The panel intended that the additional electrode independently qualify under the 25 ohm rule and where necessary an additional made electrode must be provided. A very common interpretation, however, is that you never need more than one made electrode because Section 250-56 allows you to look back at the water pipe and use that to, in turn supplement the made electrode. That interpretation stands the panel intent on its head.
This rule went into the NEC because water suppliers commonly change water laterals from copper or iron to plastic. If the water pipe is the only electrode, with nothing in reserve, then the building completely loses its local ground reference. Unfortunately the word "supplemental" was used instead of "reserve."
"Supplemental" implies the necessity of use due to a deficiency on the part of that being supplemented. Some take supplemental vitamins, for example. Nothing could be further from the case here. As long as the water pipe is functioning and properly connected, it needs no supplementation. A made electrode under these conditions is a mouse helping to carry the burden of an elephant. The only use for these additional electrodes occurs when the water pipe is removed, and then they had better be as good as if they were the only electrodes ever installed. This proposal uses better terminology that won't continue the former confusion, and combines it with a change in the text that precludes the erroneous interpretations.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that the term reserve in place of supplemental does not have a generally accepted meaning and would not improve the understanding of this section. The additional wording does not add clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BRENDER: This proposal addresses a circular argument apparently made by some that the required electrode (water pipe) can be considered "supplementary" to a "Made Electrode" under 250-52, thus negating the desired requirement of 25 ohms under 250-56.
I believe this proposal should have been accepted in principle, with the words "with the metal water pipe assumed to be unavailable" added to the second sentence. The wording of the first paragraph of 250-50(a)(2) would then be as follows:
(2) Supplemental Electrode Required. A metal underground water pipe shall be supplemented by an additional electrode of a type specified in Sections 250-50 or 250-52. Where the supplemental electrode is a made electrode of the rod, pipe, or plate type, it shall comply with Section 250-56 with the metal water pipe assumed to be unavailable. The supplemental electrode shall be permitted to be bonded to the grounding electrode conductor, the grounded service-entrance conductor, the nonflexible grounded service raceway, or any grounded service enclosure.

(Log #1879)

5- 157 - (250-50(b)): Reject
SUBMITTER: David A. Kerr, Jr., Friendsville, PA
RECOMMENDATION: Revise to read as follows:
(b) The metal frame of the building or structure~~, where effectively grounded~~ shall be grounded. In cases where the metal frame may be isolated from ground it shall be bonded and at least one other required or supplemental electrode shall be used.
FPN: Most steel frames are effectively grounded.
SUBSTANTIATION: (b) leaves too much to the imagination. Metal frames should be assumed to be grounded unless proven otherwise.
PANEL ACTION: Reject.
PANEL STATEMENT: This section lists grounding electrodes. There is no technical substantiation to warrant this change. The panel concludes that it would be improper to assume that metal frames are effectively grounded in most cases.

(Log #2303)

5- 158 - (250-50(b)): Reject
SUBMITTER: Paul E. Guidry, Fluor Daniel, Inc.
RECOMMENDATION: Revise text to read as follows:
"The metal frame of the building or structure, or a copper bus bar installed around the inside perimeter of the building that serves in place of the metal frame of the building or structure, where effectively grounded."
SUBSTANTIATION: There are several manufacturers of modular, premanufactured steel frame substation buildings that contain MCCs and switchgear, typically the equipment is rated 480 V to 35 kV. The buildings are usually installed in supervised, industrial facilities. Some manufacturers install a continuous copper bus bar mounted to the interior wall and routed around the building perimeter which is used to bond all equipment enclosures. The bus bar is also used as a grounding electrode to ground small lighting and power transformer neutrals. This installation would violate Section 250-(a)(2) and (3) as presently found in the 1999 Edition of the NEC even though the installation meets the intent of the Code and is safe.
PANEL ACTION: Reject.
PANEL STATEMENT: The interior copper busbar in this case cannot serve as the grounding electrode but may serve as the grounding electrode conductor. See definition of "Grounded, Effectively" in Article 100.

5- 159 - (250-50(c)): Reject
SUBMITTER: Gordon D. Brindley, Marion County Building Dept., FL/Rep. N. Florida Div. I.A.E.I.
RECOMMENDATION: Revise 250-50(c) to read as follows:
(c) An electrode encased by at least 2 in. (50.8 mm) of concrete located within and near the bottom of a concrete foundation or footing, that is in direct contact with the earth, consisting of at least 20 ft (6.1 m) of one ~~or more~~ contentious length of bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 1/2-in. (12.7 mm) diameter, or at least 20 ft (6.1 m) of bare copper conductor, not smaller than #4. This reinforcing ~~bars~~ bar shall be permitted to be bonded together with other reinforcing bars in the foundation or footing by the usual steel tie wires or other effective means.
SUBSTANTIATION: The Marion County Electrical Division has made numerous Grounding electrode resistance test with an A. W. Sperry, Model 4102 Analog Earth Resistance Tester; While testing the concrete encased electrodes in different areas of the county, with many different types of soil, we found when the 20 ft of rebar was installed in two, three or four pieces, the lowest resistance reading we were able to get was 38 ohms.
When we required this bar to be one contentious 20 ft length, tied off to the other footer steel, the highest reading we recorded was 3.7 ohms.
We feel this is adequate substantiation, when getting a good grounding system on any structure is of prime essence.
Also, this can be done without any additional cost to the user; and you are not dependent on how tight each wire-tie is made up on numerous pieces of rebar steel.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel has knowledge of test data that varies substantially with the findings in this proposal. The panel finds this substantiation to be inadequate and lacking in detail. Such detail includes:

1.) the secureness of the ties
2.) method of testing
3.) curing time of concrete
4.) conductivity of the soil
5.) time of the year
6.) soil temperature and moisture level.

5- 160 - (250-50(c)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise text to read:
"Concrete-Encased Electrodes. An electrode encased by at least 2 in. (50.8 mm) of concrete <u>for a distance of at 20 ft (6.1 m),</u> located within and near the bottom of a concrete foundation or footing...". (remainder unchanged)
SUBSTANTIATION: Present wording does not prohibit a number of short re-bars (such as five 4 ft lengths or ten 2 ft lengths) side-by-side or 20 ft of copper in short loops or coiled similar to wood pole butt grounds used by some utilities. During the 70's when this type electrode was tested by various agencies, I don't believe this type of installation incorporated in a few square feet of footing was contemplated.
Common perception seems to be that a linear length is intended. Subsection (d) infers a coiled electrode is not suitable due to the word "encircling". For services on poles, service pedestals, traffic controllers, and the like, where the foundation/footing comprises only a few square feet, such side-by-side re-bar or coiled copper offers an economic advantage which may deter the use of a ground ring which requires trenching and larger gauge copper, and is likely not to provide the low resistance usually associated with encased electrodes.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed text is unclear and the panel cannot determine the submitters intent.

Note: The sequence no. 5-161 was not used.

(Log #749)

5- 162 - (250-51 (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add new Section 250-51 to read as follows:
250-51 Grounding Alternate Power Sources.
(a) Other than Separately Derived Systems. Where a premises wiring system is supplied by an alternate power source located on the premises, such as a battery, a solar photovoltaic system, a generator, a transformer or converter windings, and that has a direct electric circuit conductor connection to a circuit conductor originating in another system, such systems, if grounded as required or permitted Section 250-20 and 250-162, shall be grounded in accordance with (b), (c), and (d) below.
(b) Alternating-Current systems. Where the alternate power source connection is to a conductor that has a direct electrical connection to a service-supplied system, the service grounding system shall be used for grounding the alternate power source system. Where the alternate power source connection is to a conductor of a system that does not have a direct electrical connection to a service-supplied system, such as the secondary of an isolating type transformer, a bonding jumper sized in accordance with Section 250-28, based on the largest derived phase conductor(s) of either system shall be used to connect the equipment grounding conductor(s) of the systems to the grounded conductor associated with the largest derived phase conductor(s). This connection shall be made at any point from the system source to the first disconnecting means or overcurrent device, or it shall be made at the source of a system that has no disconnecting means or overcurrent device. A grounding electrode conductor sized in accordance with Table 250-66 for the largest derived phase conductor(s) of either system shall be used to connect the grounded conductor to the grounding electrode conductor as specified in Section 250-30(a) and (b). Neutral conductors which must carry ground-fault current shall not be smaller than the size specified in Table 250-66 for grounding electrode conductors, based on the largest derived phase conductors of the system.
(c) Direct Current Systems. Where the alternate power source connection is to a conductor supplied by a service, the service grounding system shall be used for grounding the alternate power source system. Where the alternate power source connection is to a conductor supplied by a source located on the premises a bonding jumper sized in accordance with Section 250-166(a) and (b) shall be used to connect the equipment grounding conductors of the systems to the largest grounded conductor of the systems. This connection shall be made at the system source of the first system disconnecting means or overcurrent device. A grounding electrode conductor sized in accordance with Section 250-166 shall be used to connect the grounded conductor to the grounding electrode as described in Section 250-30(a)(3). This connection shall be made at the same point where the bonding jumper is installed. Neutral conductors which must carry ground-fault current shall not be smaller than the largest ungrounded conductor of the systems.
(d) Grounding Methods. In all other respects grounding methods shall comply with applicable requirements prescribed in other parts of this code.
SUBSTANTIATION: A standby alternate power source such as a generator with a solid direct conductor connection to a conductor of a transformer secondary, (commonly a neutral) may be utilized to provide for peak power loads or service outages that de-energize the transformer. Neither of these power sources meet the definition of separately derived system due to such interconnection, and Section 250-30 doesn't apply. If such an alternate power source has a direct conductor connection to a service-grounded system individual grounding is not required, and in fact is prohibited by Section 250-141(b), on the assumption that effective grounding is accomplished. However, if the interconnected conductors are derived from sources not defined as separately derived systems, the grounding requirements of Section 250-20 appear to require or permit individual grounding of each system source. However, there are no specifics for grounding and bonding conductors size, point of connection, etc., as there are for services and other systems.
The proposal provides grounding requirements where neither system is a "separately derived" system. Single point bonding and grounding is specified to minimize undesirable current paths. The requirements are based on the largest capacity system. Generator kVA for example, could be smaller than transformer kVA where used to augment a transformer derived system for temporary peak power loads or to supply limited critical loads during service outages. I did not address largest system consideration where an alternate power source has a direct connection to a service-supplied conductor as the service kVA capacity is usually greater than the alternate standby power source.
PANEL ACTION: Reject.
PANEL STATEMENT: The systems the submitter is discussing are already in the present code. Refer to the definition of "Separately Derived System" in Article 100.

5- 162a - (250-52): Accept
SUBMITTER: CMP 5
RECOMMENDATION: Replace the text of the 1999 NEC Section 250-52 with the following:
250-52 <u>Grounding Electrodes.</u>
<u>(a) Electrodes Permitted for Grounding.</u>
<u>(1)</u> ~~(a)~~ Metal Underground Water Pipe. A metal underground water pipe in direct contact with the earth for 10 ft (3.05 m) or more (including any metal well casing effectively bonded to the pipe) and electrically continuous (or made electrically continuous by bonding around insulating joints or sections or insulating pipe) to the points of connection of the grounding electrode conductor and the bonding conductors. Interior metal water piping located more than 5 ft (1.52 m) from the point of entrance to the building shall not be used as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system.
Exception: In industrial and commercial buildings where conditions of maintenance and supervision ensure that only qualified persons will service the installation and the entire length

other than short sections passing perpendicular through walls, floors or ceilings of the interior metal water pipe that is being used for the conductor is exposed.

(2) ((b) Metal Frame of the Building or Structure. The metal frame of the building or structure, where effectively grounded.

(3) (c) Concrete-Encased Electrode. An electrode encased by at least 2 in. (50.8 mm) of concrete, located within and near the bottom of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 20 ft (6.1 m) of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than _-in. (12.7-mm) diameter, or consisting of at least 20 ft (6.1 m) of bare copper conductor not smaller than ~~No. 4~~ 4 AWG. Reinforcing bars shall be permitted to be bonded together by the usual steel tie wires or other effective means.

(4) ~~(d)~~ Ground Ring. A ground ring encircling the building or structure, in direct contact with the earth consisting of at least 20 ft (6.1 m) of bare copper conductor not smaller than No. 2 2 AWG.

(5) ~~(c)~~ Rod and Pipe Electrodes. Rod and pipe electrodes shall not be less than 8 ft (2.44 m) in length, and shall consist of the following materials. ~~and shall be installed in the following manner.~~

a ~~1.~~ Electrodes of pipe or conduit shall not be smaller than _ in. trade size and, where of iron or steel, shall have the outer surface galvanized or otherwise metal-coated for corrosion protection.

b ~~2.~~ Electrodes of rods of iron or steel shall be at least 5/8 in. (15.87 mm) in diameter. Stainless steel rods less than 5/8 in. (15.87 mm) in diameter, nonferrous rods, or their equivalent shall be listed and shall not be less than _ in. (12.7 mm) in diameter.

(6) ~~(d)~~ Plate Electrodes. Each plate electrode shall expose not less than 2 ft2 (0.186 m2) of surface to exterior soil. Electrodes of iron or steel plates shall be at least _ in. (6.35 mm) in thickness. Electrodes of nonferrous metal shall be at least 0.06 in. (1.52 mm) in thickness.

7 ~~(b)~~ Other Local Metal Underground Systems or Structures. Other local metal underground systems or structures such as piping systems and underground tanks.

(b) Electrodes not Permitted for Grounding.

The following shall not be used as grounding electrodes:

(1) ~~(a)~~ Metal Underground Gas Piping System. ~~A metal underground gas piping system shall not be used as a grounding electrode.~~

(2) ~~(e)~~ Aluminum Electrodes. ~~Aluminum electrodes shall not be permitted~~.

SUBSTANTIATION: This is one of three companion proposals to rearrange the 1999 NEC Sections 250-50 and 250-52 to add clarity to these sections and to make their application more user friendly. The new section is made up of parts of the 1999 NEC Section 250-50 and Section 250-52 to provide a definition or description of each of the acceptable grounding electrodes and identify each of the electrodes that are not acceptable for grounding. All modified text, except as shown in Section 250-52(a)(1) exception, are editorial changes that were made for clarity. The accepted text from Proposal 5-147 was added into 250-52(a)(1) exception of this proposal to provide a clear understanding of how the proposed section will read based on panel actions affecting these sections in the 1999 NEC.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3912)

5- 164 - (250-52): Accept in Principle
SUBMITTER: Charles F. Mello, Milwaukie, OR
RECOMMENDATION: Revise this section as follows:

250.52. Grounding Electrode System Installation.

(a) Grounding Electrode System. If available on the premises at each building or structure served, each item in Section 250.50(a)(1) to (6) shall be bonded together to form the grounding electrode system. Where none of the electrodes specified in Section 250.50(a)(1) through 250.50(a)(3) is available, one or more of the electrodes specified in 250.50(a)(4) through 250.50(a)(7) shall be used.

(b) Made Electrodes. Where practicable, made electrodes as defined in Section 250.50(a)(4) through 250.50(a)(7) shall be embedded below permanent moisture level. Made electrodes shall be free from nonconductive coatings such as paint or enamel.

(c) Electrode Spacing. Where more than one electrode is used, each electrode of one grounding system (including that used for air terminals) shall not be less than 6 ft (1.83 m) from any other electrode of another grounding system. Two or more grounding electrodes that are effectively bonded together shall be considered a single grounding electrode system.

(d) Electrode Bonding Jumper. The bonding jumper(s) used to connect grounding electrodes together to form the grounding electrode system shall be installed in accordance with Sections 250.64(a), (b), and (e), shall be sized in accordance with Section 250.66 including the exceptions, and shall be connected in the manner specified in Section 250.70.

(e) Grounding Electrode Conductor Connection. A grounding electrode conductor shall be e permitted to be run to any convenient grounding electrode available in the grounding electrode system or to one or more grounding electrode(s) individually. It shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it. The grounding electrode conductor shall be unspliced or spliced by means of irreversible compression-type connectors listed for the purpose or by the exothermic welding process.

FPN: See Sections 547.8 and 547.9 for special grounding and bonding requirements for agricultural buildings.

(f) Metal Underground Water Pipe. When used as a grounding electrode, metal underground water pipe shall meet the following requirements.

(1) Continuity. Continuity of the grounding path or the bonding connection to interior piping shall not rely on water meters or filtering devices and similar equipment.

(2) Supplemental Electrode Required. A metal underground water pipe shall be supplemented by an additional electrode of a type specified in Sections 250.50(a)(2) through 250.50(a)(7). Where the supplemental electrode is a made electrode of the rod, pipe, or plate type, it shall comply with Section 250.56. The supplemental electrode shall be permitted to be bonded to the grounding electrode conductor, the grounded service-entrance conductor, the nonflexible grounded service raceway, or any grounded service enclosure.

Exception: The supplemental electrode shall be permitted to be bonded to the interior metal water piping at any convenient point as covered in Section 250.50(a)(1), Exception.

(3) Supplemental Electrode Bonding Connection Size. Where the supplemental electrode is a made electrode as in Section 250.50(a)(5) or (6), that portion of the bonding jumper that is the sole connection to the supplemental grounding electrode shall not be required to be larger than No. 6 copper wire or No. 4 aluminum wire.

(g) Grounding Ring. The grounding ring shall be buried at a depth below the earth's surface of not less than 2 1/2 ft (762 mm).

(h) Rod and Pipe Electrodes. The electrode shall be installed such that at lest 8 ft (2.44 m) of length is in contact with the soil. It shall be driven to a depth of not less than 8 ft (2.44 m) except that, where rock bottom is encountered, the electrode shall be driven at an oblique angle not to exceed 45 degrees from the vertical or shall be buried in a trench that is at least 2 1/2 ft (762 mm) deep.

The upper end of the electrode shall be flush with or below ground level unless that aboveground end and the grounding electrode conductor attachment are protected against physical damage as specified in Section 250.10.

(i) Plate Electrodes. Plate electrodes shall be installed not less than 2 1/2 ft (762 mm) below the surface of the earth.

SUBSTANTIATION: The present code mixes the definitions of what is a grounding electrode with many installation requirements. Also the separation of electrodes between Section 250-50 and 250-52 is confusing indicating a preference that may not really exist. By separating what the electrodes are in Section 250-50 as done in another proposal, and all the installation requirements in 250-52 as proposed here will clarify what is an electrode and what are all the installation requirements needed to form a grounding electrode system.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The panel concludes that Proposals 5-134a and 5-171a meet the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BRENDER: The Panel has chosen to reorganize portions of 250-50 into a new Section 250-53, an action with which I can concur notwithstanding the changes in Proposals 5-103 and 5-156. These Panel Proposals are 5-134a, 5-162, and 5-171a.

However, if Proposals 5-134a, 5-162 and 5-171a do not pass, this Proposal must be considered on its own merits. This submission (5-164) omits a number of words that materially affect the requirements for a ground ring and omit the prohibition of aluminum electrodes, with no technical substantiation given that would justify such material changes.

Specifically, in this proposal, Section 250-52(d) omitted the words "consisting of at least 20 ft (6.1 m) of bare copper conductor not smaller than No. 2". Omission of the required minimum length will materially affect resistance to ground, without any technical justification for this change.

Further, this proposal omits currently numbered Section 250-52(e). Aluminum Electrodes, without any substantiation. Aluminum is not suitable for burial in earth as an electrode, is not corrosion-resistant, and for that reason has not been allowed as an electrode.

My vote to accept Proposals 5-103 and 5-156 are not intended to be negated by the vote on this proposal.

See also comments regarding Proposals 5-103 and 5-156.

(Log #3313)

5- 165 - (250-52(a)): Reject
SUBMITTER: Kenneth E. Isman, Nat'l Fire Sprinkler Assn.
RECOMMENDATION: Revise Section 250-52(a) to read as follows:

(a) Metal Underground Gas Piping and Water Based Fire Protection Piping Systems. ~~A m~~Metal underground gas piping systems and water based fire protection piping systems shall not be used as a grounding electrode.

SUBSTANTIATION: Use of the fire sprinkler system piping, or other fire protection system piping, from grounding is bad practice and dangerous design. Removal of valves from the system for maintenance and repair such as alarm valves and check valves close to the point of entrance into the building is common enough to cause problems. Sprinkler fitters touching the pipe under these conditions could be electrocuted.

Some electrical contractors are assuming that the fire protection system piping continues to be metallic, even underground. This is no longer a valid assumption as there are a number of nonmetallic pipe and tube products now listed for underground service.

Another concern of the fire sprinkler industry with respect to this issue is the enhanced corrosion that may effect pipe, sprinklers and other attached components due to stray currents.

The NFPA Automatic Sprinkler committee agreed with the concept of this proposal while putting together the 1996 edition of NFPA 13, but thought that the issue was not within the scope of that document. They believed that the issue should be addressed by the NEC. See Proposal 13-27 of the Annual 1996 ROP for more details.

In addition, Section 8-3.5 of NFPA 24 agrees with this proposal. Failure to accept this proposal in some form allows a conflict between two different NFPA documents to continue.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that the following statement applies:

"The intentional bonding of all the utilities in a building creates an equipotential ground plane that minimizes the voltage differential between the different systems under both normal and abnormal operating conditions. The result is an environment safer from the hazards of electrocution and fire. {excerpt from January/February, 2000, NFPA Journal, Grounding, Bonding and Sprinklers by John Caloggero}"

(Log #378)

5- 169 - (250-52(c)(3)): Reject
SUBMITTER: Joseph J. Chickey, Middle Atlantic Inspections Inc./Rep. Local 375 IBEW Allentown, PA
RECOMMENDATION: Revise as follows:
The electrode shall be installed such that at least eight ft (2.44 m) of length is in contact with the soil. It shall be driven to a depth of not less than eight ft (2.44 m), except that where rock bottom is encountered the electrode shall be driven at an oblique angle not to exceed 45 degrees from the vertical or shall be buried in a trench at least 2 1/2 ft (762 mm) deep. The upper end of the electrode shall be flush with or below ground level, and shall be protected with an orange colored plastic or rubber safety cap.
Delete ~~Unless the above ground end and the grounding electrode conductor attachment are protected against physical damage as specified in Section 250-10.~~
SUBSTANTIATION: A ground rod extending above the ground level can be a dangerous tripping hazard, and can cause a serious injury if fallen on.
On new construction, the proper grade level is not always available, and the electrician usually will have to guess. This also creates a problem for the inspector, who may have to guess. Even on existing ground rod installations, the ground level may change through the years, due to erosion, exposing the ground rod several inches above the ground.
In my opinion, an orange safety cap on the upper end of the ground rod would provide easy identification of the ground rod, and protect people and property such as lawn mowers, and other lawn equipment.
PANEL ACTION: Reject.
PANEL STATEMENT: The concerns of the submitter are already covered by safe work practices and work rules such as OSHA.

SUBMITTER: CMP 5
RECOMMENDATION: Add a new Section 250-53 to read as follows:
250-53. Grounding Electrode System Installation.
FPN: See Sections 547-8 and 547-9 for special grounding and bonding requirements for agricultural buildings.
(a) Rod, Pipe and Plate Electrodes. Where practicable, rod, pipe and plate ~~made~~ electrodes shall be embedded below permanent moisture level. Rod, pipe and plate ~~made~~ electrodes shall be free from nonconductive coatings such as paint or enamel.
(b) Electrode Spacing. Where more than one electrode is used, each electrode of one grounding system (including that used for air terminals) shall not be less than 6 ft (1.83 m) from any other electrode of another grounding system. Two or more grounding electrodes that are effectively bonded together shall be considered a single grounding electrode system.
(c) Bonding Jumper. The bonding jumper(s) used to connect the grounding electrodes together to form the grounding electrode system shall be installed in accordance with Sections 250-64(a), (b), and (e), shall be sized in accordance with Section 250-66, and shall be connected in the manner specified in Section 250-70.
(d) Grounding Electrode Conductor.
(1) Connection. ~~An unspliced~~ grounding electrode conductor shall be permitted to be run to any convenient grounding electrode available in the grounding electrode system or to one or more grounding electrode(s) individually.
(2) Sizing. It shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it.
(3) Splicing. The grounding electrode conductor shall be unspliced or spliced by means of irreversible compression-type connectors listed for the purpose or by the exothermic welding process.
(e) Metal Underground Water Pipe. When used as a grounding electrode, metal underground water pipe shall meet the following requirements.
(1) Continuity. Continuity of the grounding path or the bonding connection to interior piping shall not rely on water meters or filtering devices and similar equipment.
(2) Supplemental Electrode Required. A metal underground water pipe shall be supplemented by an additional electrode of a type specified in ~~Sections 250-50 or 250-52~~Section 250-52(a)(2) through (a)(7). Where the supplemental electrode is a ~~made electrode of the~~ rod, pipe, or plate type, it shall comply with Section 250-56. The supplemental electrode shall be permitted to be bonded to the grounding electrode conductor, the grounded service-entrance conductor, the nonflexible grounded service raceway, or any grounded service enclosure.
Exception: The supplemental electrode shall be permitted to be bonded to the interior metal water piping at any convenient point as covered in Section ~~250-50~~ 250-52(a)(1), Exception.
(f) Supplemental Electrode Bonding Connection Size. Where the supplemental electrode is a rod, pipe or plate ~~made~~ electrode ~~as in Section 250-52(c) or (d),~~ that portion of the bonding jumper that is the sole connection to the supplemental grounding electrode shall not be required to be larger than No. 6 copper wire or No. 4 aluminum wire.
(g) Ground Ring. The ground ring shall be buried at a depth below the earth's surface of not less than 2 1/2 ft (762 mm).
(h) Rod and Pipe Electrodes. The electrode shall be installed

such that at least 8 ft (2.44 m) of length is in contact with the soil. It shall be driven to a depth of not less than 8 ft (2.44 m) except that, where rock bottom is encountered, the electrode shall be driven at an oblique angle not to exceed 45 degrees from the vertical or shall be buried in a trench that is at least 2 1/2 ft (762 mm) deep. The upper end of the electrode shall be flush with or below ground level unless the aboveground end and the grounding electrode conductor attachment are protected against physical damage as specified in Section 250-10.

(i) Plate Electrode. Plate electrodes shall be installed not less than 2 1/2 ft (762 mm) below the surface of the earth.

SUBSTANTIATION: This is one of three companion proposals to rearrange the 1999 NEC Sections 250-50 and 250-52 to add clarity to these sections and to make the application more user friendly. The new section is made up of parts of the 1999 NEC Section 250-50 and Section 250-52 to establish the requirements for installing the electrodes to form a grounding electrode system. The references within the text were revised to correlate with the correct references in the new section. Editorial changes were made as shown for clarity.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

COMMENT ON AFFIRMATIVE:

BRENDER: The Panel has chosen to reorganize portions of 250-50 and 250-52 into a new Section 250-53, an action with which I can concur with certain editorial changes. Agreement with this proposal is contingent on adoption of Proposals 5-162a and 5-134a.

My vote to accept Proposals 5-103 and 5-156 are not intended to be negated by the vote on this proposal.

See also comments regarding Proposal 5-103 and 5-156.

(Log #752)

5- 172 - (250-54): Accept

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

Supplemental Grounding Electrodes. Supplemental grounding electrodes shall be permitted to be connected to the equipment grounding conductors specified in Section 250-118 and shall not be required to comply with the electrode bonding requirements of Section 250-50 or the resistance requirements of Section 250-56, but the earth shall not be used as the sole equipment grounding conductor.

SUBSTANTIATION: Section 250-50 literally covers the electrode of this section if it is available on the premises (each item (a) through (d) and any made electrodes). It appears the intent is not to require GEC, bonding, and resistance rules, although not specifically excluded.

PANEL ACTION: Accept.

Editorially, change supplemental to supplementary in two places to match existing Code text.

PANEL STATEMENT:

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

BRENDER: This proposal is similar to Proposal 5-149. The proposal does not add clarity. The substantiation submitted does not justify this change, and present Code language, especially under 250-54, already addresses the submitter's concerns.

(Log #CP506)

5- 172a - (250-56, 250-60, and 250-66(c)): Accept

SUBMITTER: CMP 5

RECOMMENDATION: Remove the word "made" as pertaining to electrodes in the following sections and editorially edit for clarity as indicated below:

250-56 Title to "Resistance of ~~Made~~ Rod, Pipe and Plate Electrodes

250-60. Use of Air Terminals

Air terminal conductors and driven pipes, rods, or ~~other made~~ plate electrodes used for grounding air terminals shall not be used in lieu of the ~~made~~ grounding electrodes required by Section ~~250-52~~ 250-50 for grounding wiring systems and equipment. This provision shall not prohibit the required bonding together of grounding electrodes of different systems

250-66(a) Connections to ~~Made~~ Rod, Pipe or Plate Electrodes. Where the grounding electrode conductor is connected to ~~made~~ rod, pipe or plate electrodes as permitted in Section ~~250-52(c) or (d)~~250-52(a)(5) or 250-52(a)(6), that portion of the conductor that is the sole connection to the grounding electrode shall not be required to be larger than No. 6 copper wire or No. 4 aluminum wire.

250-166(c) Connected to ~~Made~~ Rod, Pipe or Plate Electrodes. Where connected to ~~made~~ rod, pipe or plate electrodes as in Section ~~250-52(c) or (d)~~250-52(a)(5) or 250-52(a)(6), that portion of the grounding electrode conductor that is the sole connection to the grounding electrode shall not be required to be larger than No. 6 copper wire or No. 4 aluminum wire.

If the 2002 NEC is printed with Appendix E, then make the additional changes also:

In Appendix E1 subpart C, replace the word "made" with "Rod, Pipe and Plate" in two locations.

In Appendix E2 subpart H, replace the word "made" with "Rod, Pipe and Plate" in two locations.

SUBSTANTIATION: To provide correlation with the changes to Sections 250-50 and 250-52 in the 1999 NEC, the word "made" become undefined. The revised text in this proposal provides corrected terms. The references within the text were revised to correlate with the correct references in the new section. Editorial changes were made as shown for clarity.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

(Log #1790)

5- 173 - (250-56): Accept

Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.

SUBMITTER: Noel Williams, Noel Williams Consulting

RECOMMENDATION: Revise first sentence to read as follows:

"A single electrode consisting of a rod, pipe, or plate that does not have a resistance to ground of 25 ohms or less shall be augmented by one additional electrode of any of the types specified by Sections 250-50(b), (c), or (d) or Section 250-52."

SUBSTANTIATION: This change is intended to break the circular reference that currently exists between Sections 250-50, 52, and 56. The current language requires the water pipe to be supplemented by another electrode. If the other electrode is a rod, pipe, or plate with a resistance over 25 ohms to ground, it must be supplemented, but may be supplemented by the water pipe. However, the electrode that supplements a water pipe should be capable of functioning as the sole electrode in the event that the metal underground water piping is replaced with plastic or otherwise lost.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

COMMENT ON AFFIRMATIVE:

DOBROWSKY: The section references are incorrect based on the action on Proposal 5-162a. Change "Section 250-50(b), (c), or (d) or Section 250-52" to "250-52(a)(2) through (a)(7)".

(Log #3830)

5- 174 - (250-56): Reject

SUBMITTER: Nicholas Williams, Riviera Electric

RECOMMENDATION: Revise text to read as follows:

"Resistance of Made Electrodes. Two or more electrodes consisting of rod, pipe, or plate shall be any of the specified in Sections 250.50 or 250.52. The rod pipe or plate electrodes are installed to meet the requirements of this section. They shall not be less than 6 ft (1.83 m) apart.

SUBSTANTIATION: Resistance of made electrodes - a single electrode consisting of a rod, pipe, or plate that does not have a resistance to ground of 25 ohms or less shall be augmented by one additional electrode of any of the types specified in Section 250-50 or 250-52.
PANEL ACTION: Reject.
PANEL STATEMENT: The code now allows a single rod, pipe or plate electrode as long as the resistance is 25 ohms or less. This change requires two electrodes without technical substantiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #753)

5- 175 - (250-64(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add to first paragraph:
Grounding electrode conductors shall not be installed in a raceway, auxiliary gutter, or cable tray containing other conductors, except a grounding electrode conductor may pass through the space perpendicular to the long dimension of auxiliary gutters or wireways.
SUBSTANTIATION: This is an alternative to my other proposal for this section. It would resolve potential problems associated with comingling a GEC with other conductors. Since separate installation is the general practice even though not required, this is not a hardship proposal. It would lessen the possibility of mis, flashover, and damage to equipment due to lightning surges or contact with other system wiring.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no substantiation that "co-mingling" a grounding electrode conductor with other conductors presents a hazard.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #754)

5- 176 - (250-64(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add after first paragraph:
Where an insulated grounding electrode conductor is installed in a raceway, auxiliary gutter, or cable tray containing other conductors it shall have a continuous outer finish that is either green or green with one or more yellow stripes, except that a grounding electrode conductor that is larger than No. 6 shall be permitted to be identified at the time of installation by one of the following:
a. Stripping not less than 4 in. (101.6 mm) of the insulation or encircling the insulation with a durable and permanent distinct green marking at each termination, and at each junction point except conduit bodies that do not contain splices or unused hubs.
b. Encircling the insulation with a durable and permanent distinct green marking at intervals not exceeding 6 ft (1.83 m) with not less than one such marking, where installed in a wireway, auxiliary gutter, or cable tray.
SUBSTANTIATION: There is no code requirement for identification of a grounding electrode conductor and probably no need where installed as an open conductor or in a dedicated conduit or tubing and readily recognized, as is the case for most installations by common practice. However, there is no prohibition against installation in a raceway, gutter, or cable tray with other conductors. Where installed with other conductors and accessible at pull and junction points in tubular raceways, wireways, gutters, or cable trays, and not identified, a voltage/continuity test cannot readily distinguish it from a grounded circuit conductor or an equipment grounding conductor. Since such installation is not the norm, an electrician may not even consider that it is a grounding electrode conductor. There are many conditions where installation with other conductors may be a viable option.
See Proposal 5-20 in the 1998 ROP for substantiation for marking to encircle the insulation.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no code requirement for identification of a grounding electrode conductor. No problem has been cited to warrant a change.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #1401)

5- 177 - (250-64(b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add new wording to read as follows:
Underground installations shall be installed to meet the minimum cover requirements of Table 300-5, except where the conductor rises for termination or transition to above-ground installation.
SUBSTANTIATION: It may be perceived that Table 300-5 includes or does not include grounding electrode conductors since they are not circuit conductors. While burial depth may not relate to safety from shock, it does relate to physical damage potential. If Table 300-5 is intended to apply, the proposal would clarify this.
PANEL ACTION: Reject.
PANEL STATEMENT: CMP 5 concluded, and confirmed from discussions with CMP-3, that the reference to Table 300-5 was not intended to apply to this application.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #1791)

5- 178 - (250-64(c), Exception): Reject
SUBMITTER: Noel Williams, Noel Williams Consulting
RECOMMENDATION: Revise the Exception to read as follows:
"Busbars used as grounding electrode conductors shall be permitted to have splices."
SUBSTANTIATION: Although the wording of this exception was improved in the 1999 NEC, the present wording of the exception is still somewhat misleading and has been interpreted by many persons and in some texts as permitting busbars to be used to make splices in other types of conductors. This proposal will clarify that it's only the busbars that can be spliced.
PANEL ACTION: Reject.
PANEL STATEMENT: The title of this section is "Grounding Electrode Installation." The exception to 250-64(c) already permits busbars to have splices.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3890)

5- 179 - (250-64(e)): Reject
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Revise this section and add the appropriate portions of text from Section 250-92(a)(3) as follows:
(e) Enclosures for Grounding Electrode and Grounding Conductors. Metal enclosures for grounding electrode and grounding conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode, and shall be securely fastened to the ground clamp or fitting. Metal enclosures for the grounding electrode conductor or grounding conductor such as raceways, boxes, and enclosures that are not physically continuous from cabinet or equipment to the grounding electrode shall be made electrically continuous by bonding each end to the grounding electrode conductor or grounding conductor.
Where a raceway is used as protection for a grounding conductor, the installation shall comply with the requirements of the appropriate raceway article.

SUBSTANTIATION: This proposal intends to move the sentence on installation requirements for protecting the grounding electrode conductor from Section 250-92(a)(3) to Section 250-64 where the remainder of the requirements are found. This should improve the organization of Article 250 and the user-friendliness without changing any requirements.
In addition, the phrase "and grounding" is added as the grounding electrode conductor at services and separately derived systems is called the "grounding conductor" at additional buildings or structures that are supplied from a common service.
A coordinating proposal to delete the sentence from Section 250-92(a)(3) has been made.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 5-123.

(Log #4356)

5- 188 - (Table 250-66 Note): Reject
SUBMITTER: Marty Kumm, Board of Electricity, State of Minnesota
RECOMMENDATION: Revise text to read as follows:
Notes:
~~1. Where multiple sets of service-entrance conductors are used as permitted in Section 230-40, Exception No. 2, the equivalent size of the largest service-entrance conductor shall be determined by the largest sum of the areas of the corresponding conductors of each set.~~
~~2.~~ 1. Where there are no service-entrance conductors, the grounding electrode conductor size shall be determined by the equivalent size of the largest service-entrance conductor required for the load to be served.
SUBSTANTIATION: It would be just as safe to allow a separate electrode conductor run from each service disconnect based on the size of the service entrance conductors to that disconnect. We do not require anything different than other exceptions to Section 230-40, why should Exception No. 2 be treated any differently?
PANEL ACTION: Reject.
PANEL STATEMENT: The existing language in Note 1 permits the concept proposed by the submitter. Where one or more of the sets consist of parallel conductors, then the equivalent sum of the conductor areas for a set will determine the appropriate grounding electrode conductor size for that set.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #2059)

5- 189 - (Table 250-66 Note 1 and 2): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Move Notes 1 and 2 into positive text as follows:
(a) Multiple sets of service-entrance conductors. Where multiple sets of service-entrance conductors are used as permitted in Section 230-40, Exception No. 2, the equivalent size of the largest service-entrance conductor shall be determined by the largest sum of the areas of the corresponding conductors of each set.
(b) No service-entrance conductors. Where there are no service-entrance conductors, the grounding electrode conductor size shall be determined by the equivalent size of the largest service-entrance conductor required for the load to be served.
Remaining notes to remain as is with subscripts.
Renumber the existing paragraphs (a) through (c) to (c) through (e).
Change the GENERAL paragraph of 250-66 as follows:
250-66. Size of Alternating-Current Grounding Electrode Conductors. The size if the grounding electrode conductor of a grounded or ungrounded ac system shall not be less than given in Table 250-66, ~~except~~ or as permitted in (a) through ~~(c)~~ (e).
SUBSTANTIATION: This will move the mandatory text of the NOTES into positive language as required by the NEC style manual.
Also make the NEC more user friendly.
No intent changes were intended.
PANEL ACTION: Reject.
PANEL STATEMENT: Notes to this table are mandatory text and in positive language already. The panel concludes that the notes are located in accordance with Section 2.3 of the NEC Style Manual.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
RAPPAPORT: The Panel is technically correct that Notes are mandatory. I wonder how many users of the Code recognize that Notes are mandatory and FPNs are not. Moving the notes into positive text in the body of the section will emphasize the fact that they are mandatory without actually changing any of the rules. I believe that this proposal is in the direction of making the Code more user friendly by removing any doubt as to whether notes are mandatory or not.

(Log #4186)

5- 190 - (250-66(d)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Add a new subsection (d) as follows:
(d) Connections to Well Casings. Where connected to a metal well casing as provided in the exception to the first paragraph of Section 250-50, that portion of a grounding electrode conductor that is the sole connection to the well casing shall not be smaller than No. 4 copper wire. That portion of an existing grounding electrode conductor that is the sole connection to a metal well casing shall not be required to be larger than No. 4.
SUBSTANTIATION: This is a companion proposal to a proposal that adds a mandatory exception to Section 250-50, first paragraph, requiring the use of metallic well casings as grounding electrodes (where available during new construction) if the only alternative would be a made electrode. It sets a minimum size of No. 4, which is commonly available and the appropriate size for a 200A service. It is larger than required for smaller services, but considering the potential distances involved that is a reasonable tradeoff. On the other hand, if the service is ever increased above 200A, the second sentence will preclude the necessity of reopening the trench. Experience shows that the overwhelming majority of existing grounding electrode conductors that are now running to well casings are No. 4, so this language should minimize problems with existing services if and when they are increased.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no technical substantiation for not increasing the size of the grounding electrode conductor if the service increases above 200 amperes.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #756)

5- 191 - (250-68): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Grounding Electrode Conductor and Bonding Jumper Connection to Grounding Electrodes.
(a) Accessibility. The connection of a grounding electrode conductor or bonding jumper to a grounding electrode shall be accessible.

Exception: No change.
(b) Effective Grounding Path. The connection of a grounding electrode conductor or bonding jumper shall be made in a manner that will ensure a permanent and effective grounding path.
(remainder unchanged).
SUBSTANTIATION: Editorial. A bonding jumper connection warrants the same requirements as a grounding electrode conductor as it may serve the same function. For example a supplementary electrode of Section 250-50(a)(2) may in effect become the grounding electrode conductor upon loss of a metal underground water pipe as an electrode.
PANEL ACTION: Accept in Principle.
Revise to read as follows:
"250-68. Grounding Electrode Conductor and Bonding Jumper Connection to Grounding Electrodes.
(a) Accessibility. The connection of a grounding electrode conductor or bonding jumper to a grounding electrode shall be accessible".
Exception: No change.
"(b) Effective Grounding Path. The connection of a grounding electrode conductor or bonding jumper to a grounding electrode shall be made in a manner that will ensure a permanent and effective grounding path."
(remainder unchanged).
PANEL STATEMENT: The connections of the bonding jumper that connects all the grounding electrodes together are required to be accessible unless they are the type referred to in the exception. The proposal adds clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
COMMENT ON AFFIRMATIVE:
DOBROWSKY: The term "bonding jumper" should also be inserted after "grounding electrode conductor" in Section 250-66(a) to provide sizing correlation for bonding jumpers connected to electrodes as revised in new Section 250-53.

(Log #757)

5- 192 - (250-70): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Grounding and Bonding Conductor Connection to Electrodes.
The grounding or bonding conductor shall be connected to the grounding electrode by exothermic welding, listed lugs, listed pressure connectors, listed clamps, or other listed means. Connections depending on solder shall not be used. Ground clamps shall be listed for the material of the grounding electrode and, where used on pipe, rod, or other buried electrode, shall also be listed for direct soil burial or concrete embedment. Not more than one conductor shall be connected to the grounding electrode by a single clamp or fitting unless the clamp or fitting is listed for multiple conductors. One of the following methods shall be used.
(1) No change.
~~(2) A pipe fitting, pipe plug, or other approved device screwed into a pipe or pipe fitting~~
(3) No change
(4) No change.
SUBSTANTIATION: Bonding conductors indicated in Sections 250-50; 250-50(a); 250-68 and other sections which require or permit bonding connections to electrodes should be included. Section 250-102(b) applies this section for a specific type (equipment bonding jumpers), which should apply for other type bonding jumpers also. Listing should be required for concrete-embedded clamps also which UL covers.
I for one, have not seen a pipe plug connection to an electrode. A pipe plug, tee, or other fitting is normally a component of a pipe electrode, not a listed connecting device. Present wording does not allow pipe fittings which are welded or soldered.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no technical substantiation to delete item No. 2. The panel does not agree with the submitter that an approved connecting device is necessarily a listed device. See Article 100 for the definition for approved. The proposed additional wording would add confusion. There is a common listing for both direct burial and concrete embedment.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #2255)

5- 193 - (250-80 Exception No. 1): Reject
SUBMITTER: Paul F. Furman, Rep. IBEW Local 697
RECOMMENDATION: Revise text as follows:
A metal elbow that is installed in an underground installation of rigid nonmetallic conduit and is isolated from possible contact by a minimum cover of 18 in. (457 mm) and/or is not accessible to any part of the elbow shall not be required to be grounded.
SUBSTANTIATION: If the elbow is isolated from contact by 18 inches of ground, then an elbow that is not accessible should also be applied to the exception for not grounding. As stated in Section 250-80, Exception No. 1.
PANEL ACTION: Reject.
PANEL STATEMENT: The exception is limited to underground installations. Using the term "accessible" (as defined in Article 100) could cause confusion.

(Log #3887)

5- 200 - (250-92(b)): Reject
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Delete the second full paragraph as indicated below:
(b) Bonding to Other Systems. An accessible means external to enclosures for connecting intersystem bonding and grounding conductors shall be provided at the service by at least one of the following means.
1. Exposed nonflexible metallic service raceways
2. Exposed grounding electrode conductor
3. Approved means for the external connection of a copper or other corrosion-resistant bonding or grounding conductor to the service raceway or equipment
~~For the purposes of providing an accessible means for intersystem bonding, the disconnecting means at a separate building or structure as permitted in Section 250-32 and the disconnecting means at a mobile home as permitted in Section 550-23(a) shall be considered the service equipment.~~
SUBSTANTIATION: This text needs to be deleted to coordinate with requirements being added to Section 250-32 in another proposal for external intersystem bonding means for more than one building or structure supplied by a common service.
Deleting this text will also remove the confusing reference to the disconnecting means at a separate building or manufactured home being "service equipment" when in actuality, the supply conductors are no doubt feeders and not service conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 5-118.

5- 201 - (250-92(b), FPN No. 1): Reject
SUBMITTER: Vincent Metallo, Sr., Baltimore County, MD
RECOMMENDATION: Delete the following text:
~~FPN No. 1: A No. 6 copper conductor with one end bonded to the service raceway or equipment and with 6 in. (152 m) or more of the other end made accessible on the outside wall is an example of the approved means covered in (b)(3).~~
SUBSTANTIATION: A No. 6 copper conductor with one end connected to the neutral (grounded) bar and the other end open laying in the earth next to, in most cases, the grounded meter can be dangerous. An open main neutral, loose connection on a main neutral, lightning strikes, ground faults on the line and load side and even normal return currents set up by a parallel path. This conductor cannot be defined as a bonding jumper as the open end bonds nothing and is not a grounded electrode conductor because it is not hooked to an electrode. Connection to this grounded wire is not enforceable by 90-2(b)(4).
PANEL ACTION: Reject.
PANEL STATEMENT: The fine print note is a useful example of intersystem bonding. The bonding conductor would be at the same potential as nearby grounded metal parts. There is no substantiation that has shown that this has been a hazard.

5- 205 - (250-97, Exceptions (a) and (d)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Delete: ~~(a) Threaded couplings and connectors for cables with metal sheaths.~~
Revise: (d) ~~(Listed Fittings.~~ Fitting listed as suitable for the purpose.
SUBSTANTIATION: Editorial. "Couplings" are generally associated with raceways. I don't believe I have seen couplings for metal sheath cable. There are in-line splicing devices for Type MI cable but these are not designated as couplings. Wording appears to permit "snap-in" type connectors which may not be approved for over 250 volt circuits, and which conflicts with (c) which requires a locknut connection. Listed fittings in (d) would cover snap-in cable connectors if they are listed for such use.
While "listed fittings" is inferred to mean suitable for over 250 volts it literally includes fittings which are merely listed. Section 250-118 differentiates flexible metal conduit that is "listed" and listed for the purpose.
PANEL ACTION: Reject.
PANEL STATEMENT: This proposal is not editorial. Listed fittings are acceptable. Section 300-15(a) specifies "fittings and connectors shall be used only with the specific wiring methods for which they are designed and listed." There is no technical substantiation to remove item (a) of the exception.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #1165)

5- 209 - (250-102(c)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise text to read:
"Size-Equipment Bonding Jumper on Supply Side of Service Overcurrent Device(s). The bonding jumper shall not be smaller than the sizes shown in Table 250-66 for grounding electrode conductors. Where the service-entrance or service-lateral phase conductors are larger than 1100 kcmil copper or 1750 kcmil aluminum, the bonding jumper shall have an area not less than 12 1/2 percent of the area of the largest phase conductor except that, where the phase conductor and the bonding jumper are of different materials (copper or aluminum), the minimum size of the bonding jumper shall be based on the assumed use of phase conductors of the same material as the bonding jumper and with an ampacity ~~equivalent to~~ not less than that of the installed phase conductors. Where the service-entrance or service-lateral conductors are paralleled in two or more raceways or cables, the equipment bonding jumper, where routed with the raceways or cables, shall be run in parallel. The size of the bonding jumper for each raceway or cable shall be based on the size of the service-entrance or service-lateral conductors in each raceway or cable.
A single common continuous equipment bonding jumper shall be permitted to bond two or more raceways or cables where the bonding jumper is sized in accordance with the total kcmil area of the largest phase conductor."
SUBSTANTIATION: Edit. Since the definition of Service encompasses service drops, service-entrance conductors, service lateral conductors and service equipment, a bonding jumper on the supply side could be indicating a location ahead of the service point, where the "service" begins. Subsection (c) specifies a specific component of a service (overcurrent devices).
This section does not appear to address equipment bonding jumper size for service-laterals.
Present wording may infer each raceway or cable requires an individual bonding jumper, especially in view of Subsection (d) which specifically addresses a common jumper for load side bonding. Lack of specificity in this section suggests it does not apply to supply side bonding. The proposal would clarify this.
The word "equivalent" may be perceived as requiring an ampacity which is the same; ampacities of copper and aluminum conductors may not have "same" values and "not less than" removes any such perception without changing intent.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is not editorial and does not add clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #2332)

5- 210 - (250-102(c)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Revise section title to the following:
250-102(c) Size-Equipment Bonding Jumper on Supply Side of Service and on the Secondary Side of Separately Derived Systems.
SUBSTANTIATION: It is not clear as to what the size the equipment bonding jumper installed on the secondary side of a separately derived system with no over current device is to be. It has been argued that conductors on the secondary side of a transformer are feeders and thus the conductor is an equipment ground and must be sized per Table 250-122. The other argument is that the conductors do not have short circuit and ground fault protection at the point they receive their supply, thus this conductor must be sized in the same manner as the bonding jumper for the transformer and 250-66.
It would seem more appropriate for the equipment bond be sized to Table 250-66. This conductor when used to ground the exposed metal housings of the equipment (instead of the using the grounded conductor per 250-142) must carry the same current as the bonding jumper. In a majority of cases this would result in a smaller conductor.
PANEL ACTION: Reject.
PANEL STATEMENT: The present title accurately reflects the contents and the intent of this section.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #760)

5- 211 - (250-102(d)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Size-Equipment Bonding Jumper on Load Side of Service. The equipment bonding jumper on the load side of the service overcurrent devices shall be sized, as a minimum, in accordance with the sizes listed in Table 250-122, but shall not be required to be larger than the largest ungrounded circuit conductor ~~supplying the equipment~~ in that portion of the circuit where the bonding is provided, and shall not be smaller than No. 14.
(remainder unchanged).
SUBSTANTIATION: Editorial. There is no code prohibition of one conductor of a circuit being "oversize" and where overcurrent devices are rated higher than conductor ampacities such as for motors, welders, etc., the bonding jumper should be commensurate with the largest conductor. Grounded conductors should be excluded as they are literally included as a circuit conductor, and may be smaller than ungrounded conductors, or in some cases larger, such as a common neutral for feeders or to compensate for harmonic currents.
Common wisdom seems to be that bonding jumpers run with tap conductors do not require a size larger than the tap conductors, however, in a literal sense a feeder supplying tap conductors is also supplying the equipment. The proposal is an attempt to clarify bonding jumper size for such tap conductors or other portions of circuit conductors where the size is reduced. (See my proposal for Section 250-122(a)).
PANEL ACTION: Reject.
PANEL STATEMENT: This proposal is not editorial. The proposal does not provide clarification.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #2906)

5- 212 - (250-102(e)): Accept
SUBMITTER: Mark R. Hilbert, Wolfeboro, NH
RECOMMENDATION: Add a new sentence after the current second sentence. This sentence would read:
"An equipment bonding jumper longer than six ft shall be permitted at utility pole locations for the purposes of bonding or grounding of isolated sections of metal raceways or elbows installed in a run of rigid nonmetallic conduit."
SUBSTANTIATION: In many locations service lateral conduits are not owned by the utility company at the time of installation and are subject to the rules of the National Electrical Code as well as policies of the serving utility. Often these isolated sections of metal raceways are left ungrounded or not bonded. In many cases the serving utility mandates a metal elbow and/or a ten foot section of metal raceway at the pole. The serving utility then installs the bell end of a section of nonmetallic raceway over the end of the metallic raceway left by the electrician. Therefore, there is no practical way for an internal bonding jumper to exit the lateral conduit. Acceptance of this proposal would allow the electrician to bond the isolated section of raceway or elbow, that is not 18 in. below grade, with a proper size conductor and leave a coil to be run up the pole and attached to the grounded conductor at the top of the pole by the utility company. This would assure that isolated sections of metal raceways or metal elbows are bonded to the grounded conductor resulting in a safer and more compliant installation.
PANEL ACTION: Accept.
PANEL STATEMENT:
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 5

EXPLANATION OF NEGATIVE:
JOHNSTON: The installation covered in the proposal is under the scope of the electric utility in 90-2(b)(5). Bonding requirements for isolated sections of metal raceways containing service conductors or other conductors is already covered in Section 250-92 for installations that fall within the scope of the NEC.
MELLO: This requirement really belongs to the utility and that is not covered under the NEC. Therefore, this proposal should be rejected. There is no method to ensure this proposed bonding wire is ever connected as the inspection would be beyond the NEC and the electrical inspector. This would add a burden on the installers that is unnecessary. As for feeders where the pole is not supplying the service, the provisons of Section 250-86 already would require the exposed metal raceway to be bonded by an approved means and this would be inspected by the electrical inspector to the NEC.
RAPPAPORT: I am in agreement that it is desirable to provide a means of grounding isolated sections of metal raceways. I am concerned as to how this would be accomplished. I would not want to see a ground rod driven near the raceway for the purpose of grounding. This proposal is too broad in scope.
TOOMER: This is the responsibility of the utility company. The possibility of the coil of wire being present when the utility is ready to connect service conductors is unlikely. The liability and responsibility being placed upon the contractor is too great without their ability to control the scheduling of the utility.
WHITE: This proposal should be rejected. This proposal would regulate and impose requirements upon the serving utility. The NEC does not control the installation requirements of the serving utility. The inclusion or acceptance of this proposal will not resolve the submitter's concern, but will create conflict in the field. The submitter's concern must be addressed by the appropriate entity that regulates the utility practices and the NESC installation requirements not via the NEC. Ultimately, it remains an issue for the utility, to either connect or not connect the bonding jumper.
COMMENT ON AFFIRMATIVE:
DOBROWSKY: The word "utility" should be deleted in the proposed sentence. The same situation could occur at poles other than those owned by a utility.

(Log #761)

5- 213 - (250-104): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete present wording and substitute:
Bonding of Metal Piping Systems and Exposed Structural Steel to Alternating Current Systems.
(a) Metal Piping. The interior metal piping system(s) shall be bonded in accordance with (1) through (5) below. The bonding jumper(s) shall be installed in accordance with Section 250-64(a), (b), (c) and (e). The points of attachment of the bonding jumpers shall be accessible.
FPN: Bonding all metal ducts within the building or structure will provide additional safety.
(1) Services. Where service equipment is located at the building or structure served, the interior metal piping system(s) shall be bonded to the metal service equipment enclosure, the grounded nonflexible service raceway or, if the grounding electrode conductor is sized in accordance with Table 250-66, to the grounding electrode or the grounding electrode conductor. The bonding jumper(s) shall be sized in accordance with Table 250-66.
(2) Buildings of Multiple Occupancy. In buildings of multiple occupancy where a service is installed at the building and the electrical supply to an occupancy consists of a branch circuit(s) or feeder(s), the interior metal piping system(s) of each occupancy shall be bonded in accordance with (a) above, or to the metal disconnecting means for that occupancy, or to the equipment grounding conductor run with the supply conductors. The bonding jumper(s) shall be sized in accordance with Table 250-66 based on the size of the largest ungrounded supply circuit conductor.
(3) One or More Buildings or Structures Supplied from a Remote Service Equipment. Where one or more buildings or structures is supplied by a branch circuit(s) or feeder(s) from a remote service equipment, the interior metal piping system(s) of each building or structure shall be bonded as specified in (2) above.
(4) Separately Derived Systems. Where there is a permanently installed separately derived system at the building or structure served, that requires a grounding electrode conductor connection to a grounding electrode, the interior metal piping system(s) shall be bonded to the same point on the separately derived system where the system grounding electrode conductor is connected or, if the grounding electrode conductor is sized in accordance with Table 250-66, to the grounding electrode or grounding electrode conductor. The bonding jumper(s) shall be sized in accordance with Table 250-66.
Exception for (a)(1), (2), and (4): In industrial or commercial buildings or structures the bonding jumper(s) specified in (1), (2), and (4) above shall not be required where the interior metal piping system(s) is a metallically continuous extension of a metal underground water piping system used as a grounding electrode for the service(s) or separately derived system(s), if the entire length of the metal piping system(s) is exposed and conditions of maintenance and supervision ensure that only qualified persons will service the installation(s).
(5) Metal Gas Piping. The point of connection of the bonding jumper to a metal gas piping system shall be on the supply side of any equipment shutoff valves.
(b) Structural Steel. Exposed structural steel that is interconnected to form a building or structure frame that is not intentionally grounded, and may become energized, shall be bonded in accordance with requirements for interior metal piping systems prescribed in (a) above, as applicable.
SUBSTANTIATION: Alternating-current systems is added to the heading since Section 250-160 indicates this section applies to dc systems unless specifically intended for ac systems. There is no specific intent indicated for all the requirements, some of which may be suitable for dc but not all. For example, bonding of metal piping and structural steel to a grounded dc service conductor would be in most instances, a violation of Section 250-164. If the panel feels specific similar bonding requirements are needed for dc systems, I'm sure they can be produced.
All metal piping systems, whether for water or other fluids, gas, steam, air, etc. are likely to be electrically interconnected by contact with metal building framing, piping connections at equipment such as water heaters, boilers, and other equipment to which more than one piping system is connected, and by interconnection provided by equipment grounding conductors for equipment connected to piping systems such as electric valves, motors, etc. Any such piping systems can become part of a fault current return path. The conductivity of any piping system may equal or exceed that of water piping due to type of material, size, type of joints, etc., but (a)(2), (3) and (c) permit different bonding jumper sizes. An equipment grounding conductor may be more prone to failure since it doesn't have to be without splice or a minimum No. 8 in raceway or armor.
The proposal in effect, requires a minimum No. 8 copper or No. 6 aluminum regardless of the supply system, whether service, feeder, or branch circuit or the rating of the supply circuit. The bonding jumpers sized per Table 250-122 are inconsistent with sizes for Table 250-66, and (c) permits Table 250-122 for bonding to a service. Some branch circuit and feeder supply conductors may have ampacity and fault current values that equal or exceed some services.
An equipment grounding conductor run with tap conductor to equipment that may energize piping could be smaller than the sizes given in Table 250-122.
Section 250-64(c) should be included in (a) to ensure greater reliability of unspliced conductors. The omission allows separate discontinuous bonding jumpers from the first pipe bonding connection to other piping systems, which if connected at different points on the piping allows the piping to become part of the bonding path. Where the equipping grounding conductor is used for bonding and run between electrical equipment connected to different piping systems the possibility for loss of bonding is increased.
Present (a)(1) permits the bonding jumper (minimum No. 8 per Table 250-166) to be bonded to the grounded service conductor. If the ungrounded service conductors are No. 14 as permitted by Sections 230-42(b) and 230-79(a) the minimum No. 8 bonding conductor size is negated, since Section 230-42(c) would allow a grounded service conductor to be No. 14. The same applies to present (d). "Where of sufficient size" is replaced with reference to Table 250-66 since the intent may not be clear to many code users. Smaller sizes permitted for made electrodes may be deemed "sufficient".
The present (a)(2) appears to be an expedient accommodation to avoid requirements to bond isolated piping to the service and infers such individual bonding is not required if the piping is not metallically isolated from the other occupancies. Does it also infer that a metallically continuous piping to all occupancies does

not have to be bonded even if supplied by a nonmetallic underground system? Even if a metallically continuous piping system is bonded at the service but run through different occupancies, the transient nature of some occupancies and alterations due to different occupant needs do not assure a metallically continuous system. "Disconnecting means" is proposed in lieu of "panelboards" in (a)(2) since a disconnect is generally required but not a panelboard. In (a)(3) "disconnecting means" is used.

In (a)(4) separately derived systems are distinguished from portable sources or those covered by Section 250-30(a)(2) Exception.

The present (b) is inadequate as there are no specifics re: sizes, installation, or accessible points of attachment.

For (d) the reference to proposed (a) covers the requirements and avoids duplication, in addition to providing for bonding where the supply is other than a service.

The fine print note for (a) is revised from the present fine print note to include metal ducts for dust, fibers, fumes, etc. which would also provide additional safety, since they may be as conductive as ducts for air.

The exception is proposed since it appears bonding the interior metal water piping is required even where the grounding electrode conductors are connected to the first 5 ft of a metal underground piping system used as a grounding electrode.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal does not add clarity. The substantiation does not identify a problem. Additionally, see panel action and statement on Proposal 5-229. The panel does not agree with the proposed focus on AC systems only. The panel affirms that this section could apply to both AC and DC systems. Refer to Section 250-160.

SUBMITTER: Junior L. Owings, Rep. Oregon Chapter Int'l Assn. of Electrical Inspectors

RECOMMENDATION: Revise text as follows:

250-104. Bonding of Piping Systems and Exposed Structural Steel.

(a) Metal Water Piping. The interior metal water piping system shall be bonded as required in (1), (2), (3), or (4) of this section. The bonding jumper shall be installed in accordance with Section 250-64(a), (b), and (e). The points of attachment of the bonding jumper(s) shall be accessible.

(1) General. The interior metal water piping system shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper shall be sized in accordance with Table 250-66 except as permitted in (2) and (3).

(2) Buildings of Multiple Occupancy. In buildings of multiple occupancy, where the interior metal water piping system for the individual occupancies is metallically isolated from all other occupancies by use of nonmetallic water piping, the interior metal water piping system for each occupancy shall be permitted to be bonded to the equipment grounding terminal of the panelboard or switchboard enclosure (other than service equipment) supplying that occupancy. The bonding jumper shall be sized in accordance with Table 250-122.

(3) Multiple Buildings or Structures Supplied from a Common Service. The interior metal water piping system shall be bonded to the building or structure disconnecting means enclosure where located at the building or structure, or to the equipment grounding conductor run with the supply conductors, or to the one or more grounding electrodes used. The bonding jumper shall be sized in accordance with Section 250-122 based on the rating or setting of the largest overcurrent device protecting the feeder(s) or branch circuit(s) that supply the building.

(4) Separately Derived Systems. The grounded conductor of the separately derived system shall be bonded to the nearest available point of the interior metal water piping system in the area served by the separately derived system. This connection shall be made at the same point on the separately derived system where the grounding electrode conductor is connected. The bonding jumper shall be sized in accordance with Table 250-66.

x(b) Metal Gas Piping. Each aboveground portion of a gas piping system upstream from the equipment shutoff valve shall be electrically continuous and bonded to the grounding electrode system. <u>The size of the bonding conductor shall be based on Table 250-122 for the largest branch circuit that may energize the gas piping system. Where there is no equipment likely to energize the gas piping system, the bonding conductor size shall be based on Table 250-66.</u>

(c) Other Metal Piping. Interior metal piping that may become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper shall be sized in accordance with Table 250-122 using the rating of the circuit that may energize the piping.

The equipment grounding conductor for the circuit that may energize the piping shall be permitted to serve as the bonding means.

FPN: Bonding all piping and metal air ducts within the premises will provide additional safety.

(d) Structural Steel. Exposed interior structural steel that is interconnected to form a steel building frame and is not intentionally grounded and may become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper shall be sized in accordance with Table 250-66 and installed in accordance with Sections 250-64(a), (b), and (e). The points of attachment of the bonding jumpers shall be accessible.

SUBSTANTIATION: The present Code rule is unenforceable. The additional language gives guidance on bonding conductor size for gas piping under both conditions of being likely to be energized and where not likely to be energized.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and statement on Proposal 5-229.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #4287)

5- 217 - (250-104(a)): Accept in Part
SUBMITTER: Charles F. Mello, Milwaukie, OR
RECOMMENDATION: Revise text as follows:
250-104. Bonding of Piping Systems and Exposed Structural Steel.
(a) Metal Water Piping. Where the metal water pipe is not used as a grounding electrode. The interior metal water piping systems shall be bonded as required in (1), (2), (3), or (4) of this section. The bonding jumper shall be installed in accordance with Section 250.64(a), (b), and (e). The points of attachment of the bonding jumper(s) shall be accessible.
(1) General. The interior metal water piping system shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper shall be sized in accordance with Table 250.66 except as permitted in (2) and (3).
(2) Buildings of Multiple Occupancy. In buildings of multiple occupancy, where the interior metal water piping system for the individual occupancies is metallically isolated from all other occupancies by use of nonmetallic water piping, the interior metal water piping system for each occupancy shall be permitted to be bonded to the equipment grounding terminal of the panelboard or switchboard enclosure (other than service equipment) supplying that occupancy. The bonding jumper shall be sized in accordance with Table 250.122.
(3) Multiple Buildings or Structures Supplied from a Common Service. The interior metal water piping system shall be bonded to the building or structure disconnecting means enclosure where located at the building or structure, or to the equipment grounding conductor run with the supply conductors, or to the one or more grounding electrodes used. The bonding jumper shall be sized in accordance with Section 250.66 ~~250-122~~ based on the ~~rating or setting of the largest overcurrent device protecting the feeder(s) or branch circuit(s) size~~ of the feeder or branch circuit conductors that supply the building. The bonding jumper shall not be required to be larger than the largest ungrounded feeder or branch circuit conductor supplying the building.
SUBSTANTIATION: (1) This section has been interpreted by some jurisdictions to require an additional bonding jumper to the interior metal water piping even when it is being used as the grounding electrode per Section 250-50 or Section 250-30. The bonding should only be necessary when there is not an existing connection to the water pipe for the service or a separately derived system.
(2) In a second building supplied from a common service, the purpose of the interior metal water pipe bonding is the same as in the first building at the service. To be consistent, Section 250-66 should be used for both locations. Since there is the possibility of a smaller feeder or branch circuit to the second building, by not requiring the bonding conductor to be larger than the largest ungrounded feeder or branch circuit conductor meets the intent of the present rule to not require a larger conductor than necessary.
PANEL ACTION: Accept in Part.
Revise the text in 250-104(a)(3) as follows:
(3) Multiple Buildings or Structures Supplied from a Common Service. The ~~interior~~ metal water piping system(s) installed in or attached to a building or structure shall be bonded to the building or structure disconnecting means enclosure where located at the building or structure, or to the equipment grounding conductor run with the supply conductors, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with Section 250.66 ~~250-122~~ based on the ~~rating or setting of the largest overcurrent device protecting the feeder(s) or branch circuit(s)~~ size of the feeder or branch circuit conductors that supply the building. The bonding jumper shall not be required to be larger than the largest ungrounded feeder or branch circuit conductor supplying the building.
PANEL STATEMENT: The panel does not agree with the proposed first sentence in 250-104(a) because it does not add clarity. The panel accepts all other proposed changes to Section 250-104(a)(3). Additional changes from Proposal 5-221 were included here.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
DOBROWSKY: No substantiation has been provided to increase the size of the bonding jumper. A conductor (equipment grounding or grounded) sized according to Section 250-122 that is run to the building or structure is the ultimate connection point of the bonding jumper. The additional last sentence is not helpful in many situations because the equipment grounding conductor is usually considerably smaller (based on Table 250-122) than the ungrounded branch circuit or feeder conductors.

(Log #400)

5- 218 - (250-104(a), Exception (New)): Reject
SUBMITTER: Steve Canaday, Dept. of Labor and Industries, WA
RECOMMENDATION: Add an exception to 250-104(a) to read as follows:
Exception: Where the water piping system entering a one or two family dwelling is nonmetallic or is less than 10 ft of metallic piping in contact with earth, the size of bonding jumper may be sized from Table 250-122.
SUBSTANTIATION: Due to the ever-increasing use of underground nonmetallic piping systems entering one and two family dwellings, the need to bond as per Table 250-66 is relieved and does not provide a path to interrupt the current of the fault. This exception to permit the bonding of interior metal water from Table 250-122, based on the largest circuit likely to energize the piping system, should interrupt the circuit safely.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel intends to reference Table 250-66 since there is nothing to prohibit the nonmetallic system from being replaced with a metallic system.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

(Log #1914)

5- 219 - (250-104(a)(1)): Accept
SUBMITTER: Michael J. Johnston, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read as follows:
(1) General. ~~The interior~~ Metal water piping system(s) installed in or attached to a building or structure shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with Table 250-66 except as permitted in (2) and (3).
SUBSTANTIATION: The existing wording in Section 250-104 (a)(1) can be taken literally to mean only one interior metal water piping system is required to be bonded as required in this section. By changing the word system to system(s), it is clear that all water piping systems fall under the same requirement. By changing the first sentence to state Metal water piping systems installed in or attached to a building or structure will provide the additional clarification needed to address situations such as where water piping is installed on a wall on the exterior of a building or on the roof, which is also the exterior of a building. This change will eliminate any question about whether or not the bonding requirement applies to water piping systems installed as stated in this substantiation. It also will increase safety for workers or service personnel that may be exposed to an accidentally energized portion of an exterior metal water piping system, which may not have been bonded due to literal interpretation. By changing the word bonding jumper to bonding jumper(s) in the second sentence, it is clear that all bonding jumpers shall be installed as stated in this section.

PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
COMMENT ON AFFIRMATIVE:
DOBROWSKY: In general I support the concept of bonding water piping systems to the "equipment grounding system". I am concerned about the interpretations of what constitutes a water piping system(s) and about extending the requirement to all exterior piping.

(Log #1915)

5- 220 - (250-104(a)(2)): Accept
SUBMITTER: Michael J. Johnston, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read as follows:
(2) Buildings of Multiple Occupancy. In buildings of multiple occupancy, where the ~~interior~~ metal water piping system(s) installed in or attached to a building or structure, for the individual occupancies is metallically isolated form all other occcupancies by use of nonmetallic water piping, the ~~interior~~ metal water piping system(s) for each occupancy shall be permitted to bonded to the equipment grounding terminal of the panelboard or switchboard enclosure (other than service equipment) supplying that occupancy. The bonding jumper shall be sized in accordance with Table 250-122.
SUBSTANTIATION: The existing wording in Section 250-104 (a)(2) can be taken literally to mean only one interior metal water piping system is required to be bonded as required in this section. By changing the words system to system(s), it is clear that all water piping systems fall under the same requirement. By changing the first sentence to state Metal water piping system(s) installed in or attached to a building or structure will provide the additional clarification needed to address situations such as where water piping is installed on a wall on the exterior of a building or on the roof, which is also the exterior of a building. This change will eliminate any question about whether or not the bonding requirement applies to water piping systems installed as stated in this substantiation. It also will increase safety for workers or service personnel that may be exposed to an accidentally energized portion of an exterior metal water piping system, which may not have been bonded due to literal interpretation. By changing the words bonding jumper to bonding jumper(s) in the second sentence, it is clear that all bonding jumpers shall be installed as stated in this section.

(Log #1917)

5- 222 - (250-104(a)(4)): Accept in Principle
SUBMITTER: Michael J. Johnston, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read as follows:
(4) Separately Derived Systems. The grounded conductor(s) of ~~the~~ separately derived system(s) shall be bonded to the nearest available point of the interior metal water piping system(s) in the area served by the separately derived system(s). This connection shall be made at the same point on the separately derived system(s) where the grounding electrode conductor is connected. The bonding jumper(s) shall be sized in accordance with Table 250-66.
SUBSTANTIATION: The existing wording in Section 250-104 (a) (4) should be revised as proposed because actually more than one separately derived system operating at different voltage levels could serve the same area served as the water piping system(s). Also Section 250-104 (a) (4) can be taken literally to mean only one interior metal water piping system is required to be bonded as required in this section. By changing the word system to system(s), it is clear that all water piping systems fall under the same requirement. It also will increase safety for workers or service personnel who may be exposed to and accidentally energized portion of an interior or exterior metal water piping system, which may not have been bonded due to literal interpretation. By changing the word bonding jumper to bonding jumper(s) in the third sentence, it should clarify that all bonding jumper(s) shall be sized as stated in this section.
PANEL ACTION: Accept in Principle.
Revise text in Section 250-104(a)(4) to read as follows:
(4) Separately Derived Systems. The grounded conductor of ~~the~~each separately derived system shall be bonded to the nearest available point of the interior metal water piping system(s) in the area served by ~~the~~ eachseparately derived system. This connection shall be made at the same point on the separately derived system where the grounding electrode conductor is connected. ~~The~~Eachbonding jumper shall be sized in accordance with Table 250-66.
PANEL STATEMENT: The text was revised for clarity.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #2108)

5- 223 - (250-104(a)(4), Exception (New)): Reject
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Add a new Exception to read as follows:
"A bonding jumper shall not be required where the metal frame of a building or structure is used as the grounding electrode for the separately derived system and the interior metal water piping in the area served by the separately derived system, is attached to or supported from the metal frame by conductive means."

SUBSTANTIATION: In the 1996 NEC bonding was required only when the separately derived system was grounded using a made electrode. Transformers have been commonly installed throughout industrial and commercial occupancies for many years without this additional bonding requirement with no evidence of problem. No substantiation was provided to add this requirement. It can also be interpreted that metal sprinkler piping is also required to be bonded to the grounded conductor of the separately derived system since it is interior metal water piping.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not agree that the mere metallic support of a pipe to a structure is adequate to accomplish bonding as defined in Article 100. See also Section 250-8.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
DOBROWSKY: This proposal should be accepted.
Scenario No. 1. Building 1 (a metal-framed building) is supplied by a 120/240 volt single phase service. The service is grounded to a metal underground water pipe and the effectively grounded metal building frame. There are several feeder supplied 120/240-volt panelboards located throughout the building. No additional bonding is required at each feeder supplied panelboard or in the areas served by them.
Scenario No. 2. Building 2 (a metal-framed building) is supplied by a 240 volt 3-phase, 4-wire, delta service. The service is grounded to a metal underground water pipe and the effectively grounded metal building frame. There are several 120/240-volt transformer supplied panelboards located throughout the building. The transformer secondaries are grounded to the effectively grounded metal frame of the building. In this scenario each transformer must also be bonded to the nearest point of the interior water piping system(s). This requirement appears to apply even though the water piping and metal building frame are bonded together through the service grounding electrode conductor. If the Authority Having Jurisdiction considers the metal sprinkler piping to be "interior water piping" it would have to be bonded also. These bonding jumpers may need to be of considerable length to reach the piping systems. Any utilization equipment that is connected to water piping (a source of potential energization) is required to have an equipment grounding conductor run with the circuit conductors.
The concept of bonding grounded secondary conductors (of separately derived systems) to "local" interior metal water piping was added to the 1996 NEC. I confirmed (with the 1996 NEC CMP 5 Chair) that this was only necessary and required if electrodes <u>other than</u> a metal underground water pipe or the metal frame of a building or structure were used.
The proposed exception could be revised and improved as follows:
Exception: A separate bonding jumper shall not be required where the effectively grounded metal frame of a building or structure, used as the grounding electrode for separate systems, is bonded to the interior metal water piping.

(Log #1676)

5- 224 - (250-104(b)): Reject
SUBMITTER: Terry L. Carlson, Nebraska State Electrical Board
RECOMMENDATION: Revise text.
Add the following new sentence to the end of the current text in (b) to read as follows:
(b) Where the metal gas piping system is electrically continuous with the equipment, the equipment grounding conductor connected to the equipment and sized in accordance with Table 250-122 shall be considered as the required bonding connection.
SUBSTANTIATION: Gas piping connected to and electrically continuous with the equipment is bonded by the equipment grounding conductor connected to the equipment. The equipment the gas piping is connected to is the most likely source that will energize the piping system. Therefore, the equipment grounding conductor sized with Table 250-122 and bonded to the equipment does effectively bond the gas piping system.
There is no need to install a redundant bonding jumper to the piping system unless the gas piping system contains a nonmetallic union between the piping system and the equipment. In such a case a bonding jumper must be installed between the equipment the gas piping is connected to and the supply side of the nonmetallic union with a bonding jumper sized in accordance with 250-122.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 5-229.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #1783)

5- 225 - (250-104(b)): Reject
SUBMITTER: Noel Williams, Noel Williams Consulting
RECOMMENDATION: Delete the superscript x and revise the rule to read as follows:
"Metal Gas Piping. Each aboveground portion of a gas piping system upstream from the equipment shutoff valve shall be bonded to the grounding electrode system. The bonding conductor shall be sized in accordance with Table 250-122 using the rating of the circuit which may energize the piping. Where the circuit that may energize the piping cannot be identified, the bonding conductor shall be a minimum of No. 8 copper or No. 6 aluminum or copper clad aluminum."
SUBSTANTIATION: 1. The current rule was extracted from a standard that addresses the installation of the gas piping. The NEC has no jurisdiction over such installations and electrical personnel cannot be responsible for the electrical continuity of such systems any more than they can be responsible for the continuity of a water, waste, drain, process, or sprinkler piping system.
2. The current rule provides no information as to how the bonding conductor is to be sized. Based on the panel actions for the 1999 NEC, the apparent intent of the panel was to maintain the sizing requirements from similar requirements of previous codes. Since gas piping was previously covered as "other metal piping," and no substantiation was given for any other sizing requirement, the same sizing requirement should be retained. However, since the TCC removed any sizing information from this rule based on the fact that the equipment or circuit that might energize the piping may not be readily identifiable, a minimum size is proposed that corresponds to the minimum size bonding jumper used for equipotential bonding in other rules of the code.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 5-229.

5- 278 - (250-104(b)): Reject
SUBMITTER: Richard P. Owen, City of St. Paul, MN
RECOMMENDATION: Add text as follows:
(b) Metal Gas Piping. Each aboveground portion of a gas piping system upstream from the equipment shutoff valve shall be electrically continuous and bonded to the grounding electrode system. This bonding conductor shall be sized in accordance with Table 250-66.
SUBSTANTIATION: The sizing of the bonding conductor was not specified in the 1999 NEC, and led to confusion and arguments on the job. Since a gas pipe could be connected to several different pieces of equipment in a large building, rather than attempting to determine the largest feeder or circuit to use Table 250-122, I think enforcement would be easier and less confusing to use Table 250-66. Since the bonding conductor can usually be fairly short between the GEC system and some portion of the gas piping, the cost to the consumer should be fairly negligible.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 5-229.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3810)

5- 234 - (250-104(b)): Reject
SUBMITTER: Douglas Hansen, Codecheck
RECOMMENDATION: Add the following sentence at the end of 250.104(b):
"Bonding conductors shall be sized per table 250.122 for the largest overcurrent device of the conductor capable of energizing the piping."
SUBSTANTIATION: Energized gas piping has caused at least 2 fatalities in our area. Bonding of gas piping reduces shock hazards. The 1999 code requires bonding beyond simply that supplied by the equipment grounding conductor of the equipment that may energize the piping. Since a separate conductor is now required, the code should provide guidelines for sizing that conductor.
PANEL ACTION: Reject.

5- 235 - (250-104(b)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Insert the word "fuel" ahead of "gas" in both the title and the rule. Add the following sentence at the end:
"The bonding conductor shall be sized in accordance with Table 250-66."
SUBSTANTIATION: It goes without saying that this new provision in the NEC cries out for clarification with respect to the sizing of the bonding conductor required, and this proposal does just that. Although this is extracted material, NFPA 54 says that this conductor has to be installed per NEC rules, and the NEC Committee does have the authority to set a minimum size. The TCC objection to the panel action during the last comment period has been widely misunderstood. The objection isn't to setting a size; it is to making a technical change in a NFPA 54 requirement. NFPA 54 requires the connection upstream of the equipment shutoff valve. The panel action in the comment period attempted to extend the rules in Section 250-104(c) to this connection. A Section 250-104(c) connection usually occurs through the equipment grounding conductor connection to equipment, and that, in turn, usually occurs on the downstream side of the equipment shutoff valve in the case of gas equipment. The TCC reversed the panel action because it introduced a technical conflict with NFPA 54.

In fact, both connections need to be made. Section 250-104(b) is an entirely separate rule, and it addresses fuel gas piping systems uniquely because they have a fundamental difference from most other piping systems in that they contain highly flammable material. Both sides of the equipment shutoff valve need to be bonded to the same ultimate grounding reference. Only in that way can we be sure that opening the service union won't draw an ignition-capable arc.

With it thus understood that there will be an independent connection to the gas piping system, the remaining question is how to size the connection. Table 250-66 is the only logical choice. It corresponds to requirements for similarly extensive piping systems and structures [water piping, Section 250-104(a) and structural steel §250-104(d)]. It's practical in that one conductor can be run to both systems. Furthermore, even if you want to run a conductor based on Table 250-122, anything smaller than No. 6 ends up in a raceway anyhow. The Table 250-66 approach is technically consistent and practical for field installers.

The word "fuel" needs to be added because although the context within NFPA 54 is clear, it isn't at all clear outside that document. There are many other gas piping systems that only require a Section 250-104(c) bond.
PANEL ACTION: Reject.

(Log #1918)

5- 238 - (250-104(c)): Accept
SUBMITTER: Michael J. Johnston, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read as follows:

(c) Other Metal Piping Systems. ~~Interior~~ Metal piping system(s) installed in or attached to a building or structure that may become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with Table 250-122 using the rating of the circuit that may energize the piping system(s).

The equipment grounding conductor for the circuit that may energize the piping shall be permitted to serve as the bonding means.

SUBSTANTIATION: The existing wording in Section 250-104 (c) can be taken literally to mean only one interior metal piping system is required to be bonded as required in this section. By changing the word system to systems(s), it is clear that all interior metal piping systems fall under the same requirement. By changing the first sentence to state Metal piping system(s) installed in or attached to a building or structure will provide the additional clarification needed to address situations such as where other metal piping systems are installed on a wall on the exterior of a building or on the roof, which is also the exterior of a building. This change will eliminate any question about whether or not the bonding requirement applies to other metal piping systems installed as stated in this substantiation. It also will increase safety for workers or service personnel who may be exposed to an accidentally energized portion of an interior or exterior metal piping system, which may not have been bonded due to literal interpretation. By changing the words bonding jumper to bonding jumper(s) in the last sentence of the second paragraph it should clarify it is clear that all bonding jumpers shall be sized as stated in this section.
PANEL ACTION: Accept.

(Log #1047)

5- 239 - (250-104(d)): Reject
SUBMITTER: Arthur Buxbaum, City of San Diego, CA
RECOMMENDATION: Revise text to read:

(d) Structural Steel. Exposed interior structural steel that is interconnected to form a steel building frame or structure and is not intentionally grounded and may become energized shall ~~be bonded~~ have all metal surfaces within 30 in. (732 mm) bonded together and, to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper shall be sized in accordance with Table 250-66 and installed in accordance with Sections 250-64(a), (b), and (e). The points of attachment of the bonding jumpers shall be accessible.

SUBSTANTIATION: In the course of two fatal accident investigations, it would appear that if this new wording and intent was in place, the fatalities might not have occurred. The issue appears when electrical power or lighting is installed and/or mounted on metal structures. When other metal surfaces such as benches, tables and the like, are within reach, the problem may become fatal. These separated metal units each then present a different potential to ground if a voltage is accidentally applied to the metal. This difference in potential allows an electrical flow of power to occur. A person in contact with the different objects is then subjected to an electrical current flow through their body, their body acting as a conductor between these separated parts, this can be damaging and/or fatal depending on circumstances at the time of the incident. In the two fatalities such was the case. The change of wording to bond the various metal parts together now places all the reachable parts at the same (equal) potential and a flow of current is then limited to the amounts of resistive values between the parts and/or a person.

The rule of electrical flow is an equation with the higher resistance causing the lesser flow. Body resistance is generally higher than the bonded parts. The bonding of these parts together results in generally a lesser resistance, generally not enough to be fatal to the average person in contact with them. Incidents involving metal patio covers and other metallic structures would also benefit. While there would still be the slight hazard of a possible electrical shock, it would not be fatal.

I have provided pictures that demonstrate the condition that caused the fatality. Note the current flow melting the base of the legs. Note the proximity of the bench. If these were bonded, the flow through the body would cause a slight shock and not a fatality. This type of structure is in common use throughout the country. This similar condition of separated metallic parts has been known to cause problems in animal shelters. We cannot totally prevent accidents, but we must learn from them.

Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: In order to revise the text of this section adequately, the panel encourages the submitter to provide the following information as a comment:

1.) Additional technical details surrounding this reported incident.
2.) The technical basis for the distance of 30 inches and how it should be measured and from what reference point.
3.) What mitigations were implemented as a result of the investigation?
4.) Was the existing installation in compliance with the NEC?
5.) What edition of the NEC was used at the time of installation?
6.) Were there any modifications made to the NEC?

Additionally, the panel can not determine if the proposed text will mitigate the hazard cited in the proposal.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BRENDER: I believe this Proposal should be Accepted in Principle, with certain editorial changes.

The submitter identifies a potential hazard and cites two fatal accidents that can be addressed with this Proposal, although I believe the wording can be improved as follows:

(d) Structural ~~Steel~~ Metal. Exposed interior structural ~~steel~~ metal that is interconnected to form a ~~steel~~ building frame, and any ancillary part located within 30 in. (0.732 m), thereof ~~and~~ that is not intentionally grounded and may become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to one or more grounding electrodes used. The bonding jumper shall be sized in accordance with Table 250-66 and installed in accordance with Sections 250-64(a), (b) and (e). The points of attachment of the bonding jumpers shall be accessible.

It should be noted that bus shelters of the type the submitter identifies are frequently made of structural aluminum. See also Proposal 5-240.
COMMENT ON AFFIRMATIVE:
JOHNSTON: I concur with the submitter's concern because of the potential of shock hazard that can exist in these situations. However the recommended solution would be difficult to enforce and requiring all metal objects within 30 in. of the steel is impractical. Also many of these types of structures are installed or exist in a dedicated right of way and may not be covered by the NEC. I agree with the Panel in seeking additional information on this subject.

(Log #1919)

5- 240 - (250-104(d)): Accept
SUBMITTER: Michael J. Johnston, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read as follows:
(d) Structural Steel. Exposed ~~interior~~ structural steel that is interconnected to form a steel building frame and is not intentionally grounded and may become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper(s), shall be sized in accordance with Table 250-66 and installed in accordance with Sections 250-64(a), (b) and (e). The points of attachment of the bonding jumper(s) shall be accessible.
SUBSTANTIATION: The existing wording in Section 250-104(d) can be taken literally to mean only exposed interior metal structural steel is required to be bonded as required in this section. By eliminating the word interior to it should clarify that all exposed structural steel that is interconnected to form a building frame and is not intentionally grounded, fall under the same requirement. Isolated portions of exposed exterior building steel could become energized and would be a potential shock and fire hazard. By changing the first sentence to state "Exposed structural steel that is interconnected to form a building frame and is not intentionally grounded" will provide the additional clarification needed to address situations such as where structural steel is installed on the exterior of a building. Often times isolated sections of building steel are interconnected to form a frame that makes up a portion of the building but is not necessarily common to or connected to the larger portion of the structural steel frame. This change will eliminate any question about whether or not the bonding requirement applies to the exposed structural steel frames of buildings or isolated sections of exposed structural steel frames that are likely to become energized installed as stated in this substantiation. It also will increase safety for workers or service personnel who may be exposed to and accidentally energized portion of an isolated exposed structural steel frame of a building, whether interior or exterior, which may not have been bonded due to literal interpretation. By changing the words bonding jumper to bonding jumper(s) in the second sentence, it is clear that all bonding jumpers shall be installed as stated in this section.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
DOBROWSKY: Expanding this requirement to include exterior structural steel increases the complications in this section. Any conductive object is "capable of", "may", or "can", in theory, become energized. Interior structural steel can usually be bonded to one of the acceptable locations, within a building, without much difficulty. Exterior structural steel may be used for buildings that are not even supplied by an electrical circuit or may not have a service or grounding electrode. How does one determine if it "may" become energized.

(Log #290)

5- 241 - (250-104(e) (New)): Reject
SUBMITTER: Gordon D. Brindley, Marion County Building Dept., FL/Rep. North Florida Division IAEI
RECOMMENDATION: Change heading: Bonding of Piping Systems and ~~exposed structural~~ Steel Framing.
Add a new paragraph (e) to read:
(e) Interior steel framing that is interconnected to form a portion of a building frame and is not intentionally grounded, that may become energized, shall be bonded to the service equipment enclosure, the grounding electrode conductor where of sufficient size, or to one or more grounding electrodes used. The bonding jumper shall be sized in accordance with Table 250-122, using the rating of the circuit that may energize the metal framing. The equipment grounding conductor for the largest circuit that may energize the metal framing, shall be permitted to serve as the bonding means.
SUBSTANTIATION: As you are aware, due to the high cost of lumber, especially in states that have of theirs shipped in from out of state, we are having many more residential and commercial structures built, that are using metal stud wall framing, that are not necessarily considered, STRUCTURAL, as listed in paragraph (d) of this article; many of these wall are exposed within the attics, and can become energized by the circuits that are within these metal framed walls.
We have had two recent cases: One was due to a homeowner, installing a large picture frame on a bedroom wall, he used 2 in. metal screws that entered a NM Cable running down the channel of a 2 x 4 metal stud, this energized the frame wall, and his wife received an extreme shock when she opened a metal medicine cabinet that was attached to another part of this wall section.
Second was caused by a tradesman installing the metal end of a towel bar, using a 2 1/4 in. screw, which also entered the electric dryer circuit cable, the homeowner was shocked while touching the washing machine and the towel bar, at the same time.
This can be remedied by simply attaching a bonding jumper from the equipment ground of the largest circuit within this wall section, or by installing one metal box on that circuit, and grounding the metal box.
Very cost effective, especially when you might save a life.
PANEL ACTION: Reject.
PANEL STATEMENT: Where nails or screws are likely to penetrate nonmetallic-sheathed cable or electrical nonmetallic tubing, protection is required by Section 300-4.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BRENDER: The submitter has identified a potential hazard and cites two accidents to support this Proposal. Bonding of the metal interior wall framing can be accomplished with as little as a properly bonded metal outlet box in such a wall section in lieu of nonconductive box. Existing Section 300-4(b)(2) does not adequately address this situation. The proposal enhances safety and should be adopted.

(Log #2458)

5- 242 - (250-104(l)): Reject
SUBMITTER: Dann M. Strube, Lanesville, IN
RECOMMENDATION: Delete the entire subsection and renumber others as needed.
SUBSTANTIATION: Section 250-104(c) provides adequate coverage for the bonding of gas pipes for safety. The electrical industry is not responsible for electrical continuity of gas pipes.
PANEL ACTION: Reject.
PANEL STATEMENT: The Code section the submitter references does not exist. See panel action on Proposal 5-229 which may meet the submitters concerns.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #2838)

5- 243 - (250-106): Reject
SUBMITTER: Melvin K. Sanders, Ankeny, IA
RECOMMENDATION: Revise by adding the following to the end of the sentence:
"…unless separated from them by no less than 6 ft (1.83 m)…"The lightning protection system ground terminals shall be bonded to the building or structure grounding electrode system unless separated from them by no less than 6 ft (1.83 m)."
SUBSTANTIATION: The information that a 6 ft (1.83 m) separation may be sufficient is found in FPN No. 2. The style language of Section 90-5(c) makes it non-enforceable.
Presently, the mandatory language style of Section 90-5(a) as it pertains to Section 250-106 main text requires air terminals and building or structure grounding electrode systems to be bonded no matter how far apart they may be. The frequency of a lightning stroke makes long lengths of cross-bonding conductors useless and may contribute to electronic equipment damage. I refer you to the discussion in Chapter 4 of the IEEE 1999-1100 Standard (Emerald Book).
PANEL ACTION: Reject.
PANEL STATEMENT: Section 250-106 refers to bonding the ground terminals of the lightning protection system to the

grounding electrode system. Fine Print Note No. 2 refers to additional bonding as required by NFPA 780, Lightning Protection Code. Therefore the proposed change is not correct.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #762)

5- 244 - (250-112(i)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
~~Power-Limited,~~ Class 2, Class 3, ~~Remote Control and Signaling circuits,~~ and Power-Limited Fire Alarm Circuits. Where not located in a hazardous (classified) location, as covered by Articles 500 through 517, noncurrent-carrying metal parts of equipment and enclosures, supplied by ~~Class 1,~~ Class 2, ~~and~~ Class 3 or by power-limited fire alarm circuits, using nonmetallic wiring methods, shall only be required to be grounded where the system ~~grounding~~ is grounded. required by Part B of this article.
SUBSTANTIATION: This section does not correlate with Section 250-10. "Remote control and signaling" is superfluous, and does not cover Class 2 lighting systems. Class 1 and fire alarm circuits may operate at up to 600 volts with no power limitation; should ungrounded equipment be permitted? Class 1 power-limited systems commonly supply damper motors for HVAC systems; Section 430-142 requires grounding if supplied by metal-enclosed wiring; Section 430-144 requires grounding of controllers for such motors.
Grounding should be required where the system is grounded by choice; the result is the same as where required by the code.
This section is an example of why many code users consider Article 250 to be one of the most confusing.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirements for special occupancies are covered in Chapter 5. The panel concludes that repeating the requirement here is unnecessary. The circuits to be grounded are adequately covered in Part B of Article 250. The recommended text does not add to the clarity of this section. There is no substantiation for deleting Class 1 circuits or adding additional conditions for using nonmetallic wiring methods only.

(Log #2818)

5- 247 - (250-114): Reject
SUBMITTER: Frank Martucci, Fort Lee, NJ
RECOMMENDATION: After existing text, "exposed noncurrent-carrying metal parts of cord and plug-connected equipment likely to become energized shall be" ...add: REDUNDANTLY grounded.
(a) Two grounding conductors shall be installed in cord and cord sets with the branch circuit conductors supplying the unfixed equipment.
(b) Component Grounding poles. Cord connectors and attachment plugs shall be provided with two separate wiring sites at the existing grounding pole. Cord female connectors, and male attachment plugs shall be designed so that only the grounding pole can be wired with two conductors.
SUBSTANTIATION: This proposal will correct the design defects in existing line and extension cords that cause thousands of electrocutions and fiery deaths each and every year. Ralph Nader accused the medical profession of accidentally electrocuting 5000 patients a year with electrical equipment and covering up the deaths.
The U.S. National Institute for Occupational Safety and Health estimates 700 Americans are electrocuted on the job each year.
The Consumer Product Safety Commission estimates 600 persons lose their lives each year by electrocution in and around the home. And each year, hundreds of thousands of fires of electrical origin result in many more deaths, as well as billions of dollars of property damage.
Yet, despite these horrific statistics, not a single attempt has ever been made by government agencies, or the National Fire Protection Association, to investigate and correct the design defects in the electrical grounding system responsible for them.
For the past 13 years, I have been trying to convince the National Fire Protection Association that electrocutions, and fatal, destructive, fires, of electrical origin, alluded to by the U.S. Consumer Product Protection Agency, are caused by serious defects in the design of our cord and plug connected grounding system.
Yet, despite my admonitions regarding these life threatening hazards, cord components continue to be sold at hardware stores without any warning tags or instructions; warnings that 4 of 6 ways to wire this product to the white, black, and green cord conductors can cause an electrocution or fiery death.
And, to further compound the chances of fatal wiring errors are the molded extension cords now flooding the market without any color coding whatsoever.
The most insidious nature of the present cord and plug connected grounding system is that a reversal of the white and green wires will operate an appliance properly. They are both grounded conductors.
However, the wiring error will cause current to flow through a hundred feet, or so, of the flexible metal raceways that lace the space inside the walls and ceilings of practically every dwelling, and tenement, in our nation; literally converting rooms into electric ovens.
Massive current from a heater, for example, will cause the lengthy raceway and up to sixteen outlet box connections to overheat enough to cause “unseen”, and undetectable, fire inside walls of dwellings. Tests I’ve made with heater current disclosed flexible raceway temperatures of 150 degrees in open air. The temperatures could be considerably higher inside insulated sealed walls. And, any poorly made, or rusted out, grounding connector may cause arcing sufficient enough to cause immediate ignition.
Tenements, and older dwellings, converted to electricity prior to the adoption of the equipment grounding system are extremely vulnerable to fires inside walls because they lack the approved grounding connectors now in use. There was no need to fasten armored cable securely in those days because the only purpose for armored cable was to protect conductors from damage and to contain, and dissipate, heat. It never occurred to electricians that at some future date the armor would be permitted to carry current.
Since practically every dwelling in our nation uses metal raceways as the equipment grounding conductor it is imperative to prevent massive current, such as from heaters, dryers, and air conditioners, to flow through them for extended periods of time.
Two wire redundancy together with a slight, no cost, change in existing components will prevent a reversal of the white and green conductors from causing deadly fires inside walls, and also correct the many design defects, and cord violations, that cause electrocutions.

If the system I propose is adopted by our nation, a homeowner no longer will be playing 4 bullet "Russian Roulette" with their family because it is impossible to wire the cord and plug grounding system so as to cause an electrocution or fiery death.

However, despite my many proposals during the past 13 years, the National Fire Protection Association still remains unconvinced of the deadly fires that incinerate entire families within seconds, and cause billions of dollars of property damage each year, are "unseen" fires that originate, and rage inside walls.

Therefore, the carnage will continue until, hopefully, new members of the NFPA will see the danger as I do.

We're talking about fires within walls that rage, undetected by occupants, sprinkler systems, or smoke alarms until its too late. "Unseen" fires that superheat the interior of walls until they flashover and consume occupants and their procession within seconds.

Case in point is an article in the January 5, 1994 issue of the Bergen Record that reported a firefighter, (name deleted), was incinerated by a sudden inferno while searching for survivors. His buddy said a "flashover" from superheated walls caused temperatures to rise from 100 degrees to 2000 degrees within seconds. Everything in the room became incinerated within seconds.

Rutherford Fire Chief (name deleted), explained that the interior of walls create a large area where "unseen" fires can develop and build up heat due to lack of ventilation. It makes for the ideal conditions for a flashover.

The January 15, 1995 issue of the Bergen Record reported that a house fire in Burbank, IL killed 6 children and one adult despite working smoke alarms. The report stated a smoke alarm was still blaring when firefighters arrived.

The October 9, 1995 issue of the New York Post reported that 31 year old hero firefighter (name deleted) was incinerated when the room he was standing in suddenly flashed over.

The March 22, 1998 mysterious fire that killed 11 students in Pennsylvania could also have been caused by "unseen", and undetectable, raging fires inside the cabin walls that flashed over and incinerated them within seconds.

And during a two week period of the 1998-9 Christmas season, fast moving fires in the New York Metropolitan area caused 8 deaths, several injuries, and millions of dollars of property damage. Fire officials blamed heaters that ignited combustible material.

I say heater "current" and not heater "heat" is responsible for all fast moving, inferno, type fires.

A fire that demonstrates how wrong the NFPA is concerning the cause of fires is an inferno that killed nine members of a man's family while he was talking to his wife on the phone. He heard his wife scream in agony at the same time the smoke alarm went off. Orange fire officials blamed the tragedy on a heater placed too close to a blanket. And a spokesperson for the National Fire Protection Association also informed an investigative reporter that "most heater related deaths are caused by heaters placed too close to combustible material."

Nothing could be further from the truth. In the first place, I found it impossible to get tissue paper to burn while draped around two types of electric heaters turned on for three hours. Try the experiment and see for yourself.

We are also led to believe that cigarettes, halogen lamps, or candles are also reasons for fast moving fires that caused fatalities and total destruction of property.

This is simply not true. If working smoke alarms are sensitive enough to blare when toasters are used, they most certainly will warn occupants in ample time to escape if a blanket, drape, paper, or chair is on fire inside a room.

Fires that start inside rooms can be easily detected and extinguished by occupants. while serving on the fire brigade in Francis Delafield Hospital, every fire responded to was extinguished and occupants were able to walk away unharmed.

It's the fires that start inside walls that kill and destroy property. But how can a fire start inside a wall? Walls are sealed from floor to ceiling. A fire, originating in a room, would have to rage for a half hour or more before it burnt itself into a wall, during which time smoke alarms and occupants would have detected the fire in ample time to extinguish it or escape.

And people can't smoke, use heaters, play with matches, or toss lit cigarettes inside the walls of dwellings. So it's obvious that the electrical system, prone to overheating, and arcing, is to blame for flashover, fireball, and inferno type fires that kill and destroy property.

And the cause of fires inside the walls are the design defects in line and extension cords together with an ill-conceived grounding system adopted and installed in practically every building in our nation.

According to the original National Electric Code document, devised under the influence of insurance compancies, the grounding conductor should only be copper, copper clad, or aluminum (Article 250-95 in the original code.).

Instead, electrical safety has been severely compromised with exceptions to the original code whereby inappropriate corrosive metal raceways are permitted to be used as the equipment grounding conductor.

The exception also violates the intent of the code that mandates all conductors must terminate in splice boxes to contain any heat or sparking from poorly made connections.

Because practically all buildings in our nation use the metal raceways as the grounding conductor, it behooves NEMA and the NFPA to prevent wiring errors from causing massive current to cause them to overheat and cause raging fires inside the walls.

No family should become incinerated because a plug is inadvertently wired with reversed green and white conductors. Or die because a replacement plug was not properly installed on one of the violation extension cords now flooding the market with similarly colored conductors. The white, green, and black conductors are now all black, all yellow, all gray or all brown.

My proposal provides a standard that will make all line and extension cords fire-proof, and also electrocution-proof, by eliminating or ameliorating the potentially hazardous defects in their design. And even though all conductors are similarly colored.

The standard requires no physical changes except to provide a no cost second wiring site only at the ground pole of cord components.

The extra conductor in all cords is the only cost, a small price to pay to eliminate the following design defects:

1ST DESIGN DEFECT: This defect defies conventional wisdom and practice. Instead of the redundancy resorted to by every other federal agency whenever lives are at stake, the protective equipment grounding conductor used on practically all electrical devices has been reduced up to 66%.

This increases the chances of shock or electrocution from loss of grounding or injury due to line drop shock. My proposal, will prevent loss of grounding and voltage drop.

2ND DESIGN DEFECT: This defect results from sizing cord, and cordset, equipment grounding conductors the same as the circuit conductors (3#18, 3#16, 3#14, etc). The equipment grounding conductor must, at all times, assure that it will withstand fault currents for the length of time it takes fuses, or circuit breakers, to clear a fault. A 20 ampere circuit breaker, for example, can cause spike currents that could burn open the equipment grounding conductor, instead of the circuit conductor, leaving the metal exposed parts of an appliance energized.

Two equipment grounding conductors in all cords, regardless of wire size, will assure that the circuit conductors will always burn open first during massive ground faults.

3RD DESIGN DEFECT: This cord design defect permits miswired devices to operate safely until they are plugged into an outlet, or extension cord, with reversed polarity. The drill in figure 1 operates safely when used with a properly wired outlet, or extension cord, even though improperly wired with reversed green and white conductors.

However, the moment the drill is plugged into an outlet, or extension cord, wired with reversed polarity, the case of the drill becomes energized with a full 120 volt potential, figure 2.

Figure 3 illustrates how my electrocution-proof grounding system will correct this "Russian Roulette" type hazard. The two grounding conductors needed to correct the two previous design defects will make possible a wiring scheme that absolutely prevents miswired cords from causing shock or electrocution regardless of whether, or not, a wall outlet, or extension cord remains wired with reversed polarity.

If all cord components, and device terminals, are designed according to the specification in my proposal, there is no possible way to miswire a cord without at least one of the three grounded conductors (two green and one white) attached to the grounding pole of components and exposed metal parts of electrical devices or extension cords.

Acceptance of my proposal will eliminate the cord design defect that permits wiring errors to shock or electrocute.

4TH DESIGN DEFECT: No provision is provided in existing cords to activate branch circuit ground fault current interrupters when miswiring energizes the exposed metal parts of electrical devices. A ground fault causing current to flow through people cannot trip circuit breakers or blow fuses.

Accepting my proposal will assure that an equipment grounding conductor is ALWAYS attached to the metal exposed parts of electrical devices, despite wiring errors, thereby providing the necessary impedance required to activate branch circuit ground fault current interrupters.

In fact, adoption of my proposal will convert branch circuit ground fault current interrupters into people GFCIs. See how the second grounded conductor in figure 3 prevents shock, or electrocution, by providing the low resistance path required to activate branch circuit ground fault devices.

5TH DESIGN DEFECT: No provision is provided in existing cords to prevent miswiring from causing current to flow through metal raceways. A heater, or extension cord, miswired with reversed green and white conductors, can cause raceway heating, or arcing, at metal raceway connections sufficient enough to cause "unseen" raging fires inside walls.

If my proposal is accepted, the second grounding conductor will shunt any metal raceway current back to the proper circuit conductor.

Figure A illustrates how heater current flows through metal raceways when a line cord, or extension cord, is miswired with reversed green and white conductors.

Figure B illustrates how my proposal will prevent current flow through raceways.

At the New Orleans annual meeting a member ridiculed my A and B figures so I am also submitting figures C and D. They depict, in diagram form, how current flowing through metal raceways can be automatically shunted back to the white circuit conductor.

The second grounding conductor, in conjunction with electrocution-proof and fire-proof cord components, will shunt raceway current to the proper circuit conductor.

Current flowing through raceways, instead of the white conductor, cause the ground poles of all downstream outlets to become energized, a hazard also eliminated by the second ground conductor and the properly designed cord components I propose.

6TH DESIGN DEFECT: Molded cords have similarly colored branch circuit conductors instead of the usual black and white ones, a violation of the National Electrical Code. Without color coding, there is no way to prevent replacement components from being wired with reversed polarity. Even manufacturers are shipping extension cords with reversed polarity. I can corroborate this by producing such an extension cord purchased at a local hardware store.

Figure 2 illustrates how extension cords, or wall outlets, wired with reversed polarity, will cause shock, or electrocution, if used with devices, or another extension cord, inadvertently wired with reversed green and white conductors.

Figure 3 illustrates how a second grounding conductor, together with electrocution-proof components will prevent electrocution from this type of wiring hazard.

Accepting my proposal will permit the SAFE repair of molded cords even if all conductors are colored the same.

7TH DESIGN DEFECT: Providing only one equipment grounding conductor for up to 6 extension outlets. Accepting my proposal will ameliorate this defect.

8th DESIGN DEFECT: Molded cord components cannot be examined or repaired at the strain relief. Accepting my proposal true assurance that the protective equipment grounding conductors will never open prior to the circuit conductors.

9th DESIGN DEFECT: The lack of wiring safeguards. Experienced electricians, including myself, have admitted catching themselves wiring outlets and cords improperly. It is unconscionable to permit a grounding system whereby an electrical worker could be responsible for an electrocution or fiery death.

If four of six ways to wire an attachment plug can cause an electrocution, or fiery death, it becomes imperative that they be designed to at least assure the proper attachment of the equipment grounding conductor.

My proposal will absolutely assure that the grounding pole of cord components will be attached to a grounded conductor regardless of any amount of wiring errors.

It will also assure that the ground poles of cord components are always wired with two green conductors. A green and white, green and black, or black and white conductor attached to the ground pole clamp will be immediately noticed and corrected.

Conclusion: Thousands of our citizens suffer fiery deaths, electrocutions, and serious, shock induced, injuries, because of the above mentioned design defects in all cords.

Design defects that caused an 8 fold increase in electrocutions on construction sites, despite the use of extensive written assured grounding programs by well supervised, and qualified, personnel. Without the assured grounding program, the loss of life and serious injuries would have been considerably higher.

Millions of homeowners, other workers, and patients, exposed to the same defectively designed cords, do not have this mandated assured grounding program and remain unprotected. Therefore, it behooves NEMA and NFPA to adopt my self monitoring electrocution-proof and fire-proof grounding system.

My proposal, if adopted by our nation, will provide true assured grounding for every man, woman, and child, in every area of our nation, without the need for, costly, ineffective, testing programs.

No one should needlessly suffer fiery deaths, shock, or electrocution in order to save the cost of less than two cups of coffee.

Note: Supporting material is available for review at NFPA Headquarters

PANEL ACTION: Reject.

PANEL STATEMENT: The panel has again reviewed the submitter's substantiation and reaffirms its previous statements on this subject . The panel concludes that the substantiation fails to provide convincing evidence that the mentioned fires and associated casualties were the result of miswired extension cords or that the proposed methods of redundant grounding would have prevented these occurrences from taking place.

This proposal would completely eliminate the present method of grounding cord-and-plug connected equipment and would mandate the implementation of an equipment grounding system utilizing two grounding conductors. If adopted this proposal would necessitate the manufacture of special hardware including new 4-conductor cords with redundant grounding conductors, and new plugs and connectors that can terminate these 4-conductor cords.

The panel recognizes that redundancy can enhance the reliability of some systems under some conditions. However, redundancy is not the only effective means of achieving enhanced protection against electric shock. Other effective methods which are now required or permitted, such as ground-fault protection, double insulation, and assured equipment grounding conductor connections have all attributed to a decline in accidental electrocutions in recent years despite the increased use of electrical devices.

(Log #3241)

5- 251 - (250-118): Reject
SUBMITTER: Edward J. Fox, Jr., Orange County Bldg Div., FL
RECOMMENDATION: 250-118: An equipment grounding conductor shall be provided in all electrical raceway systems to insure electrical continuity and shall have the capacity to conduct safely any fault current likely to be imposed.
SUBSTANTIATION: Metal raceways are approved by the NEC to act as the equipment grounding conductor path, installation practices today cannot assure that all connections are made properly. Therefore, grounding continuity cannot be assured for a grounding path.
Further, underground metal raceways deteriorate over a period of years, and therefore you have lost your grounding continuity.
The above articles provide a higher degree of safety and flexibility for the consumers.
When a coupling or fitting becomes loose, whether it is a poor installation or over a period of time fittings become loose, the grounding path is interrupted and you no longer have a safe grounding path to divert a fault.
With the grounding conductor added you always have a grounding path to divert a fault situation.
Technical merit is that it will protect lives better in a fault situation. There have been cases with old electrical systems where only the conduit is the grounding path and it has deteriorated due to metal conduit and corrosive influences have eaten the metal and you have NO grounding path.
When a person has a claim due to electrical shock, where no grounding path was, insurance, hospital bills, and more, cost will rise.
PANEL ACTION: Reject.
PANEL STATEMENT: Insufficient substantiation has been provided to require an equipment grounding conductor in all metal raceways. Metal raceways listed in Section 250-118 have safely been used as an equipment grounding conductor for many years.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
BRENDER: Copper Development Association recommends and suggests that a separate, continuous, copper equipment grounding conductor always be utilized as the most reliable grounding path, irrespective of the conduit type or material.
Numerous recognized sources have agreed with the submitter's statement that grounding continuity cannot be assured utilizing solely the conduit as the equipment grounding conductor. Indeed, several other proposals within this Code cycle, such as 5-262 and 5-263, highlight the potential hazards associated with the use of the conduit as a ground path without an associated copper grounding conductor.
Adoption of this proposal will enhance safety, and help assure a low impedance continuous grounding path.
RAPPAPORT: The Panel comment has indicated that insufficient substantiation has been provided. In fact, there has been an abundance of substantiation from the previous two Code cycles. In the A95 ROP (for 1996), there were five proposals related to the use of conduit as and equipment grounding conductor. In the A98 ROP (for 1999), the IAEI Central Arizona Chapter cited five specific cases in the Phoenix area and twelve cases cited by Factory Mutual. In addition, a Factory Mutual report was cited that described hazardous conditions associated with discontinuities in metallic conduit under fault conditions. Yet the Panel has consistently chosen to ignore substantiation from the field which it generally looks for.
There has been adequate substantiation for requiring a supplementary equipment-grounding conductor in all conduit. A large majority of the substantiation is directed at EMT. As a minimum, this proposal should be accepted in principal to require a supplementary equipment-grounding conductor in all EMT.
I am confused, however, as to why this proposal was even considered by CMP 5. The Technical Correlating Committee has directed that the responsibility for determining the suitability of raceways as in equipment-grounding conductor rests with CMP 8. (See Panel Statement 5-185 in A98 ROC). If that is the case, Section 250-118 should delete all of the permissible raceways from that section and refer to the applicable sections in Chapter 3. Otherwise, 250-118 will always be one Code cycle behind the requirements set by CMP 8.
TOOMER: The substantiation provided adequately represents true field conditions and depicts actual results. This proposal will provide a degree of safety that does not, at present, exist. The majority of projects designed by engineers require equipment grounding conductors in all raceways.

(Log #3400)

8- 3 - (250-118): Reject
SUBMITTER: Steve Dupas, James Building Co.
RECOMMENDATION: Add new text to Article 250 to read as follows:
"All raceways are to include a grounding conductor sized in accordance with largest conductor in raceway. Grounding conductor shall be bonded to all enclosures and bonded to equipment grounding bar in panelboard, disconnects, etc.".
SUBSTANTIATION: Rigid conduit, electrical metallic tubing, intermediate metallic tubing are approved as a grounding path, when the coupling is broke, rusted into, or vibrated loose - electrical continuity is not present and provides no protection against shock. I have been electrocuted as have several other electricians that I know, due to the continuity not being present due to vibration, rusy, or broken fittings. The state of Oklahoma requires this and in my opinion it is needed in the code.
PANEL ACTION: Reject.
PANEL STATEMENT: There are metal raceways that, where installed and maintained properly, are suitable as equipment grounding conductors.

(Log #3708)

5- 252 - (250-118): Reject
SUBMITTER: Scott Steck, Chicago, IL
RECOMMENDATION: None.
SUBSTANTIATION: Please consider requiring all conducting wires be encased in metal tubing. This would make grounding available to all shorted wires. It would also increase safety for personnel.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no specific recommendation made by the submitter in the proposal. Section 4.3.3(c) of the Regulations Governing Committee Projects requires proposals to include proposed text, including the wording to be added, revised (and/or) revise, or deleted.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #4288)

5- 253 - (250-118): Reject
SUBMITTER: Charles F. Mello, Milwaukie, OR
RECOMMENDATION: Revise text to read as follows:
"The equipment grounding conductor run with or enclosing the circuit conductors shall be one or more or a combination of the following:
1. A copper or other corrosion-resistant conductor. This conductor shall be solid or stranded; insulated, covered, or bare; and in the form of a wire or a busbar of any shape.
2. Rigid metal conduit.
3. Intermediate metal conduit.
4. Electrical metallic tubing.
~~5. Flexible metal conduit where both the conduit and fittings are listed for grounding.~~
~~6.~~ 5. Listed flexible metal conduit ~~that is not listed for grounding,~~ meeting all the following conditions.
a. The conduit is terminated in fittings listed for grounding.
b. The circuit conductors contained in the conduit are protected by overcurrent devices rated at 20 amperes or less.
c. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ground return path does not exceed 6 ft (1.83 m).
d. The conduit is not installed for flexibility.
~~7.~~ 6. Renumber the remaining sections.
SUBSTANTIATION: Flexible metal conduit is only listed for use up to 6 ft in length as an equipment grounding conductor. The UL Standard 1 for listing of flexible metal conduit limits this length. There are no nationally recognized listed flexible metal conduits listed for use in lengths greater than 6 ft. This section is permitting something that does not exist and causes confusion because listed conduit that is marked might be assumed to be acceptable in lengths greater than 6 ft or in larger sizes when that is not the case.
The change to the renumbered 250-118(5) is to clarify that the conduit is listed and there is no such thing in this standard as "listed for grounding". With the elimination of old 250-118(5) this extra phrase becomes unnecessary.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has provided insufficient substantiation to warrant this change.

(Log #4002)

5- 254 - (250-118(11)): Accept
SUBMITTER: James T. Dollard, Jr., IBEW Local Union 98/Rep. IBEW Eastern Code Advisory Group
RECOMMENDATION: Revise text as follows:
250-118(11). The metallic sheath or the combined metallic sheath and grounding conductors of the smooth or corrugated Type MC cable.
SUBSTANTIATION: The vast majority of Type MC cable in use today is of the interlocking metal tape sheath type. The problem is that the metal jacket of the interlocking metal tape sheath type MC cable is not identified/listed as an equipment grounding conductor. We have seen far too many situations that involved the misuse of Type MC cable where isolated grounding type receptacles or patient care areas in hospitals etc. are wired with this type of cable. There are also problems where the interlocking metal tape sheath type MC cable is spliced in metal junction boxes and a ground tail is not taken to the box to effectively ground it. When questioned on the application of the interlocking metal tape sheath type MC cable in several situations that I have personally been involved with the answer is clear as to where the confusion exists. Engineers, contractors, and installers are having fits with the way the present Code text reads. To quote one engineer, "If the jacket of this type cable (interlocking metal tape sheath MC) is not an approved equipment grounding conductor then why is it in 250-118?" In the following conversation he asked "If this type cable requires an equipment grounding conductor as Type NM does then why is Type NM absent from Section 250-118, it also is made with an equipment grounding conductor?" The answer to this question is that Section 250-118(11) is confusing, and is not at all user friendly.
The present text of this section is as follows:
250-118. Types of Equipment Grounding Conductors.
(11) The metallic sheath or the combined metallic sheath and grounding conductors of Type MC cable.
The permissive language of this statement is widely interpreted by code users to mean that the metallic sheath of all types of MC cable as detailed in 334-1 may be used as an equipment grounding conductor or the combined metallic sheath and grounding conductors of Type MC cable.
The product listing is METAL CLAD CABLE (PJAZ) as found in the UL White or Green books. The product listing separates the three types of MC cable when addressing the application of the outer metal jackets as equipment grounding conductors. The listing groups the smooth and corrugated sheaths together and clearly states that the outer metal jacket of these type cables alone or a combination of the jacket and a SUPPLEMENTAL conductor are approved as an equipment grounding conductor. The listing addresses the interlocking metal tape sheath alone and clearly points out that an equipment grounding conductor is REQUIRED to be installed. The listing does not recognize a combination of the REQUIRED equipment grounding conductor and the interlocked metal tape sheath as an equipment grounding conductor.
Section 110-3(b) of the National Electrical Code clearly states that "Listed or labeled equipment shall be installed and used in accordance with any instructions included in the listing or labeling." There will be those who would argue that the Code addresses this problem and all users of this code should be aware of this requirement. This argument is in direct conflict with the stated purpose of the NEC. "The purpose of this Code is the practical safeguarding of persons and property from hazards arising from the use of electricity." The misuse of the type of cable assembly is resulting in equipment that is not effectively grounded. The jacket of the interlocking metal tape sheath type MC cable will not provide a low impedance fault return path to limit the voltage to ground and facilitate the operation of the OCPD.
An argument to reject this proposal in my opinion is one in favor of ambiguous language that will mislead users of this Code. The product listing is clear. The jacket of the interlocking metal tape sheath is in no case permitted to be used as a ground fault return path.
We need to revise language in the Code which is clearly not easy to use. I urge the Panel to accept this proposal in the name of safety and to make this section more user friendly, practicable, and enforceable.
Submitted with this proposal is a copy of page 62 of the UL White Book which provides the listing information.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
BRENDER: The product standard for type MC cable already addresses the concerns expressed by the proposal. The product standard for Type MC cable requires that the product be marked to indicate that the armor or the armor and supplemental bare

equipment grounding conductor is an acceptable grounding path where such is the case.

If the proposal is accepted the armor, as part of the combined armor and equipment grounding conductor of the interlocked construction, will no longer be eligible for listing as an equipment grounding path. The present language permits the product to be submitted to listing laboratories for listing and, if so approved, marked accordingly.

Copper Development Association recommends and suggests that a separate, continuous, copper equipment grounding conductor always be utilized as the most reliable grounding path. It is not our intent, by this vote, nor do we believe it is the submitter's intent, to have the interlocking sheath of Type MC, when used in conjunction with a copper grounding conductor, not eligible for listing.

However, the proposed language of the submission would make it appear that the interlocking Type MC cable is not permitted even in combination with the enclosed grounding conductor.

HADEEN: The electrical properties of the metallic sheath on Type MC cable are covered by the product standard. The present text is adequate. Substantiation does not demonstrate that there is widespread confusion on how Type MC is terminated and how it complies with the applicable grounding requirements. Product standards and listing requirements address the identification requirements for the products.

STEINMAN: The implication of the proposed wording would imply that the sheath of smooth tube or corrugated tube must always be suitable as an equipment grounding conductor. This is not always the case. The applicable product standards for type MC cable controls the electrical requirements of the metallic sheath. The present wording accurately reflects the grounding characteristics of the sheath of MC cable.

(Log #264)

5- 253a - (250-118(1)): Accept

Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in Mr. Rappaport's Explanation of Negative. This action will be considered by the panel as a public comment.

SUBMITTER: Charles M. Trout, Maron Electric Co.

RECOMMENDATION: Revise Section 250-118(1) to read:

"A copper, aluminum or copper-clad aluminum conductor. This conductor shall be solid or stranded, insulated, covered, or bare; and in the form of a wire or busbar of any shape."

SUBSTANTIATION: As presently written, it appears that only copper conductors may be used as equipment grounding conductors. Sections 250-62 and 250-64 allows aluminum and copper-clad aluminum to be used as grounding electrode conductor material. Section 250-120(b) permits the use of aluminum and copper-clad aluminum to be used as equipment grounding conductors. Table 250-122 permits the use of aluminum and copper-clad aluminum as equipment grounding conductors. These conductor types should be shown in Section 250-118 as permitted types of equipment grounding conductors. If it was the intent of the panel that aluminum and copper-clad aluminum are covered in the terminology "or other corrosion resistant conductor", then they are departing from the customary explanatory language used in other sections and are not helping to make the code user friendly.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

BRENDER: Aluminum is not a corrosion-resistant material; witness its restrictions for use within 18 in. of the ground, in agricultural areas, or in corrosive environments. If the submitter (and the Authority Having Jurisdiction in his area) considers aluminum to be corrosion-resistant, then present Code language covers his situation, and the proposed change is superfluous.

Particularly in industrial environments, where various vapors and moisture may be present, aluminum is a poor choice for grounding conductor. The present Code wording allows the Authority Having Jurisdiction some discretion that would be diminished with this proposal. In discussions with a member of previous Panels, I was informed that the omission of aluminum from Section 250-118(1) by pervious Panels was intentional.

This proposal should have never been rejected.

(Log #1135)

7- 5a - (250-118(11)): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for information.

SUBMITTER: Kenneth Carter, The Control Specialists

RECOMMENDATION: Revise text to read:

"The sheath of smooth metallic- or corrugated metallic- Type MC Cable or the combined metallic sheath and grounding conductors of Type MC Cable".

SUBSTANTIATION: As it is currently written, Section 250-118(11) implies that the metallic sheaths of all types of MC Cable are permitted as equipment grounding conductors. The sheath of type MC cable having an armor of interlocking tape is not permitted as an equipment grounding conductor. This differentiation should be clearly indicated.

PANEL ACTION: Reject.

PANEL STATEMENT: The the proposed wording would imply that the sheath of smooth tube or corrugated tube is always suitable as an equipment grounding conductor. This not always the case. The applicable product standards for Type MC cable controls the electrical requirements of the metallic sheath. The present wording accurately reflects the grounding characteristics of the sheath of Type MC cable.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NEGATIVE: 1

NOT RETURNED: 1 Ensign

EXPLANATION OF NEGATIVE:

STEWART: The substantiation of the submitter is correct. All types of armour used on MC cable is not suitable for use as an equipment grounding conductor. This change would clarify the point.

The word "continuous" should be added between "or" and "corrugated" to make the proposal completely correct.

COMMENT ON AFFIRMATIVE:

TEMBLADOR: I am voting affirmative to support the Panel Action with a comment. See Mr. Hadeen's coment on Proposal 5-254.

Note: The sequence nos. 8-4 and 8-5 were not used.

(Log #763)

8- 6 - (250-118(14)): Accept

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for information.

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

(14) Other electrically continuous metal raceways <u>and auxiliary gutters</u> listed for grounding.

SUBSTANTIATION: Editorial. Metal auxiliary gutters are not indicated in (1) through (13) nor indicated in (14) since they are not considered raceways. While gutters with dual listing as wireways would be included by (14) where designated by use as gutters, they may be considered as not complying as an equipment grounding conductor. Section 374-9(f) doesn't clarify this, merely refers to Article 250.

PANEL ACTION: Accept.

PANEL STATEMENT: Refer this proposal and action to CMP 5 for information.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NOT RETURNED: 1 Corry

(Log #265)

8- 7 - (250-118(2) and (3)): Reject

NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for information.

SUBMITTER: Charles M. Trout, Maron Electric Co.

RECOMMENDATION: After the words, (2) "Rigid Metal Conduit" and (3) "Intermediate Metal Conduit" add the words "where an application of a listed grounding continuity liquid or compound has been applied to all threaded portions of the rigid metal raceway."

SUBSTANTIATION: Other than a separate equipment grounding conductor being run with the circuit or feeder conductors, the metallic raceway may be the best equipment grounding conductor we have. There is, however, the problem of corrosion as recognized in Section 300-6 and the problem of couplings and locknuts not being set up tight enough to carry fault currents. This is not a problem of poor installation by our labor forces or poor inspection by code enforcement personnel. This is an inherent problem relating to the extent possible to tighten up threaded parts. Corrosion with the resulting high resistance connection at threaded joints in the raceway system must be minimized to maintain the ground fault path required by Section 250-2(d). It is highly unlikely that installers will bond around threaded portions of steel raceways to gain the results required by 250-2(c). The integrity of the corrosion protection applied by the manufacturer will be compromised at any threaded portion of the raceway system. Sealing threaded connections by the application of a listed grounding continuity liquid or compound will help to ensure that the ground fault path will be properly maintained. We might take a tip from the plumbing or other pipe trades that realize the extent to which threads can be made up and apply sealing compounds or other means to prevent leaks.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not identified that there are any products available that have been evaluated for use with metal raceways and will meet the intent of this proposal. Factory cut threads are protected against corrosion.

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for information.
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Delete Item ~~(4) Electrical metallic tubing.~~ from the long list of unlisted types of equipment grounding conductors.
SUBSTANTIATION:
Grounding as provided by the EMT system is inadequate in many cases due to the separation, corrosion, loose fittings, thermal expansion, etc. This is due to inadequate code requirements on specific installation requirements causing EMT to move in such a manner that the fittings, couplings, and connectors loosen over time.
There have been many cases of human injuries due to this problem over time and across the country. In the Phoenix metropolitan area, there have been several cases of electrocution. Recently, an electrocution of an eight year old girl occurred, when the conduit came apart while she was playing on it. Another case was an electrocution of an air conditioning service technician who was taking the cover off of an ac unit with the conduit apart.
Additionally, the City of Phoenix Chief Electrical Inspector at the time, personally investigated many fires and injuries due to EMT conduit raceway failures. One such documented electrocution case occurred when a person attempted to turn on a water hose bib at a residence in Phoenix and was electrocuted. This was due to a shorted-grounded evaporative cooler motor and a broken and separated EMT conduit raceway. The metal water line had a plastic bushing which eliminated the electrical grounding continuity. The human body provided the path to ground. Even though a violation occurred, the missing bonding jumper on the isolation bushing on the water line would have no impact if the EMT raceway system was intact.
The Chief Electrical Inspector also investigated another documented serious injury which resulted in hospitalization. This occurred at the remodeling of a building in downtown Phoenix, Arizona. A power tool failed along with a broken EMT conduit raceway causing serious shock injury and near death.
Another injury was reported by a PE Electrical Engineer who personally investigated the accident. This injury took place at a Mall in Mesa, Arizona when a maintenance man came into contact with a broken EMT conduit raceway and was hurt due to a ground fault to the EMT down stream.
These are the injuries which occurred in the greater Phoenix area only. How many more deaths will it take before we take action?
"Fire investigation records of commercial buildings and military facilities show that metal raceways or cables are identified as the ignition source in a number of fires over recent years. Twelve such instances were identified in a Factory Mutual Technical Report, "A Review of Factory Mutual Technical Reports of Losses of Electrical Origin Involving Metal Conduits," by D.M. Karydas, FMRC J.I. 0N0R3.RU, July, 1986. A Shore Fire Management Report, prepared by the Naval Safety Center covering a period from April, 1982 through April, 1987 shows fires at seven U.S. military buildings were related to metallic raceways or cables. Also, the official NFPA investigation report of the tragic MGM fire indicates an arc between flexible aluminum conduit and EMT was the cause of the fire." Additionally, Factory Mutual conducted various studies on this problem and the summaries of their findings are as follows: "1. It was demonstrated that under ground fault conditions, metal conduit discontinuities release high thermal energy, visually manifested as showers of sparks, that is sufficient to ignite directly flammable gases, or pyrolyzate and melt, or even burn metallic parts (conduit fittings, etc.). 2. It was also demonstrated that under internal high-current arcing conditions, both plastic and metallic conduits suffer external wall rupture and the arcing fault releases high thermal energy to the ambient; molten metallic substance may ignite flammable material in the vicinity or at a distance from the immediate electrical fault area. No sustained fire involving conduit material itself was observed under these conditions." (Refer to 1989 TCR proposal 5-210) The panel's rejection statement on this proposal was not substantiated or answered by the panel. This raises the concern as to the technical intelligence of the panel members in response to the technical concerns that Factory Mutual's report states. The concerns to the public for safety are shown by the panel commented statements such as "Proposal would eliminate all raceways as grounding conductors. This would penalize both the good as well as the mediocre installations of wire / cable in conduit. It fails to take into account that if an equipment grounding conductor is in conduit, as recommended, that similar arcing can occur if the careless installer fails to securely attach each end of the equipment grounding conductor which is not visible after installation." Additionally, the concern of the internal arcing due to the differential impedance between the copper wire within the steel conduit raceway can be eliminated by requiring the equipment grounding conductor to be insulated. Presently over ninety percent of installations uses the insulated equipment grounding conductor. The only people who commented on the proposals are those who have an economic interest for maintaining market share and not for safety interest.
Installation(s) exposed on the surface of the roof have come apart during normal use. Also during the re-roofing of a roof, roof workmen, during the removal and installation of roofing material, have become severely shocked when the workman pick up the EMT raceway during the reroofing process. Roofers quite often move or step on the electrical conduits to install the new roofing. During this process, conduit fittings are being broken, pulled apart, or conductors damaged. Other nonelectrical trades are also called upon to perform on a roof are often not aware of the importance of grounding continuity. These persons do not take the necessary precautions to avoid damaging conduit or separating fittings.
Additionally, conduits exposed to the elements become rusted with a limited amount of ground continuity left and when moved or stepped on, they break quite easily.
Needless additional electrocutions and fires can be eliminated by the following minor change in installation requirements. By having an equipment grounding conductor installed within the raceway, the grounded appliance would have an assured means for ground return, thereby protecting the individual from shock hazard or injury. Since the only way that an appliance can remain energized, is when the conductors contained in the raceway remain continuous.
Interior raceways have the same problem as stated above, however, it has been proven everyday that the raceway system has a high impedance path. This proof is constantly shown by the fact that sensitive electronic equipments do not function correctly. Another line of reasoning involves computer grounding. A more solidly grounded conduit system would be less noisy and would help to encourage safe grounding practices for solid state equipment. Section 250-118(4) implies that this raceway system is adequate for grounding.
Section 250-118 is titled "Types of Equipment Grounding Conductors". Article 100 under definitions defines a

"conductor". Nowhere in the definition of a conductor does it states that a raceway or a raceway which contains conductors is a conductor. Under the definitions, EMT is defined as a raceway. Since 250-118 only implies that a conductor can take other forms, it does not make it mandatory that these conductors are adequate as a equipment grounding conductor. If this was true, then the definition of conductor has to be revised to include any shape, any material, and so on.

Research of the standard relating to EMT shows no substantiated testing to confirm that raceways are adequate as an equipment grounding conductor. EMT Conduits have never been tested by UL or any testing laboratory as an equipment grounding conductor and there are no requirements under UL Standard 797 for resistance testing, for current testing, and for short circuit withstand testing of the conduit. In addition, UL Standard 514B does not require short circuit withstand testing for fittings and connectors. Additionally, Dr. C. Brenner, a PE electrical engineer, states that the technical article "Performance Evaluation of Steel Conduit Enclosed Power Systems" (conducted by Georgia Institute of Technology) does not address the real world conditions of broken, loose, or rusted EMT systems. The testing was done in an ideal condition and does not represent actual field application. The paper does not address the safety/hazard issue that exists when an electrical fault occurs and the metal conduit does not have a low conductivity path and a person contacts the conduit. Additionally, the Georgia Institute of Technology testing project is inadequate and does not addresses the issues of the previously mentioned Factory Mutual testing.

There is no guarantee that couplings, fittings and connectors have low impedance at the connection point. Therefore, it can not be assured that they comply with NEC 250-2(d) without a test of every branch circuit or feeder.

Where the EMT conduit is being used as the sole equipment grounding conductor, the ground path is often broken in normal field applications. As a result, equipment or a portion of the raceway may be energized with no equipment grounding to trip the overcurrent device. By installing an equipment grounding conductor within the raceway will help to ensure an effective equipment grounding means (the grounding path remains intact) and will provide additional safety for personnel and property.

GENERAL STATEMENT TO THE PANEL

How much technical substantiation must we, the public, submit before the panel will take action and require an equipment grounding conductor in a raceway or cable which have uncontrolled impedances as used in a real world field application to conduct ground fault current and where the potential exists for people to get killed or shocked. In the past 10 years, people have submitted many code change proposals to require an equipment grounding conductor and they are constantly rejected by the panels. There has been overwhelming support for this change as documented by the TCRs and with substantiation of specific serious problem areas. The panel statements are always stating workmanship problems or design problems. The NEC is supposed to be an international safety standard. How many lives must be lost before the panel will take action?

Additional information was submitted under ROP (1998) 5-272 and 8-157 including the letters referenced above are available from NFPA.

PANEL ACTION: Reject.

PANEL STATEMENT: The substantiation does not warrant the deletion of EMT as an equipment grounding conductor from 250-118. The first paragraph of 250-118 specifies one or a combination of the identified types of equipment grounding conductors.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NOT RETURNED: 1 Corry

(Log #3394)

5- 255 - (250-118(4)): Reject

SUBMITTER: David Yee, Scottsdale, AZ

RECOMMENDATION: Revised and delete item "~~(4) Electrical metallic tubing~~" from the long list of unlisted types of equipment grounding conductors.

SUBSTANTIATION: A. The title of Section 250-118(4) states "type of equipment grounding conductor".

Conductor is defined in Article 100 as follows:

Bare: A conductor having no covering or electrical insulation whatsoever.

Covered: A conductor encased within material of composition of thickness that is not recognized by this Code as electrical insulation.

Insulated: A conductor encased within material of composition and thickness that is recognized by this Code as electrical insulation.

Since the title references conductors, the code section should only reference conductors. Tubing, conduit, raceways, and other similar material should not be referenced as conductors in this section.

B. Grounding as provided by the EMT system is inadequate in many cases due to the separation, corrosion, loose fittings, thermal expansion, etc. This is due to inadequate code requirements on specific installation requirements causing EMT to move in such a manner that the fittings, couplings, and connectors loosen over time.

There have been many cases of human injuries due to this problem over time and across the country. Refer to my earlier submittal under ROP (1998) 5-272.

Installation(s) exposed on the surface of the roof have come apart during normal use. Also during the reroofing of a roof, roof workmen, during the removal and installation of roofing material, have become severely shocked when the workman pick up the EMT raceway during the reroofing process. Roofers quite often move or step on the electrical conduits to install the new roofing. During this process, conduit fittings are being broken, pulled apart, or conductors damaged. Other nonelectrical trades are also called upon to perform on a roof are often not aware of the importance of grounding continuity. These persons do not take the necessary precautions to avoid damaging conduit or separating fittings. Additionally, conduits exposed to the elements become rusted with a limited amount of ground continuity left and when moved or stepped on, they break quite easily.

Needless additional electrocutions and fires can be eliminated by the following minor change in installation requirements. By having an equipment grounding conductor installed within the raceway, the grounded appliance would have an assured means for ground return, thereby protecting the individual from shock hazard or injury. Since the only way that an appliance can remain energized, is when the conductors contained in the raceway remain continuous.

Interior raceways have the same problem as stated above, however, it has been proven everyday that the raceway system has a high impedance path. This proof is constantly shown by the fact that sensitive electronic equipments do not function correctly. Another line of reasoning involves computer grounding. A more solidly grounded conduit system would be less noisy and would help to encourage safe grounding practices for solid state equipment. Section 250-118(4) implies that this raceway system is adequate for grounding.

Where the EMT conduit is being used as the sole equipment grounding conductor, the ground path is often broken in normal field applications. As a result, equipment or a portion of the raceway may be energized with no equipment grounding to trip the overcurrent device. By installing an equipment grounding conductor within the raceway will help to ensure an effective equipment grounding means (the grounding path remains intact) and will provide additional safety for personnel and property.

Note: Additional information was submitted under ROP (1998) 5-272 and 8-157 including the letters referenced are available from NFPA.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel recognizes the extensive work involved in gathering information related to accidents involving conduits and tubing used as the equipment grounding path. However, it is clear that the incidents reported involved improper installations of the raceway systems or damage to the raceway systems by other trades, in combination with equipment failure. Installation of an internal ground wire is not prohibited. However, field experience has shown that where installed properly, electrical metallic tubing can effectively serve as the grounding path in accordance with Section 250-2(d). Also, in recent years, requirements for listed conduit and tubing fittings have been significantly strengthened. Each raceway/fitting interface is now subjected to the same ground current test as required for grounding and bonding equipment.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16

NEGATIVE: 1

EXPLANATION OF NEGATIVE:
BOKSINER: There are many instances where the NEC requirements are intended to increase the reliability of the grounding path. Such considerations apply to this case. If field experience indicates problems indicated by the submitter then this proposal should be accepted.
COMMENT ON AFFIRMATIVE:
JOHNSTON: I agree with the Panel Action to reject the proposal, but do not totally concur with all of the Panel Statement. Electrical metallic tubing is a proven and effective grounding conductor where installed and maintained correctly. The proposal, as submitted, is too broad in scope, however the submitter identified some situations where it is advisable to have an equipment grounding conductor installed inside the tubing for safety reasons. Damage to EMT on rooftops, resulting in separation of sections of the raceway are real even where the initial installation was done correctly.
RAPPAPORT: When installed properly and maintained so that it remains electrically continuous, EMT provides an adequate means for containing an electromagnetic field within itself as well as providing a low impedance ground fault current return path. I am, however, concerned with the reliability of connections, either during installation or due to daily abuse. It is for this latter reason that a supplementary equipment-grounding conductor should be installed in all EMT. See my Negative Vote and Comment on Proposal 5-251.

(Log #764)

5- 256 - (250-119): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Identification of Equipment Grounding Conductors. Unless otherwise required elsewhere in this Code, equipment grounding conductors shall be permitted to be bare, ~~covered,~~ or insulated. Individually ~~covered or~~ insulated equipment grounding conductors shall have a continuous outer finish that is green or green with one or more yellow stripes except as otherwise permitted in this section.
(a) Conductors Larger than No. 6. An insulated ~~or covered~~ conductor larger than No. 6 ~~copper or aluminum~~ shall be permitted, at the time of installation, to be permanently identified as an equipment grounding conductor ~~at each end and at every point where the conductor is accessible. Identification shall be accomplished~~ by one of the following:
(1) Stripping not less than 4 in. (101.6 mm) of the insulation; ~~or covering from the entire exposed length;~~
(2) ~~Coloring the exposed insulation or covering green.~~ Encircling the insulation with a permanent distinct green marking;
~~(3) Marking the exposed insulation or covering with green tape or green adhesive labels.~~
Identification as permitted in (1) and (2) above shall be provided at each conductor termination, and at each junction point except conduit bodies that do not contain splices or unused hubs. Identification as permitted in (2) above shall be provided at intervals not exceeding 6 ft (1.83 m), with not less than one such marking, where the conductor is installed in a wireway, auxiliary gutter, or cable tray.
(remainder unchanged).
SUBSTANTIATION: Individually covered conductors are not indicated in code tables re: material covering, temperature rating, dimension, ampacity, etc., and do not appear to be a listed product. (See my proposal for Article 100 Conductor - Covered).
The deletion of "copper or aluminum" is editorial since No. 6 covers all material.
In (a) and (a)(1) "accessible" and "entire length" requires a conductor installed as an open aerial conductor per Articles 225, 320, or 321 to be stripped or colored green for the entire length, which for practical purposes rules out an insulated conductor unless it is green.
Stripping the entire exposed length in boxes or other enclosures is somewhat difficult since some insulation is generally visible at the raceway or cable connections. The word "exposed", per definitions, does not seem appropriate. The proposal would negate the need to strip all visible portions of insulation from conductors in switchboards and other equipment and lessen exposure to a grounded surface.
The proposed (2) tracks the requirement of Section 200-6(b) for grounded conductors, the substantiation for which in Proposal 5-20 of the A98 ROP is valid for grounding conductors; it also negates the need for (3). "Permanent green marking" allows for judgement of efficacy of taping, painting, labels, etc.
The proposal would legitimize and permit insulated overhead aerial conductors larger than No. 6 to have insulation other than green and be marked or stripped at terminations and junction points. Present wording requires stripping or marking the entire length since it is accessible. Section 200-6(b) limits required marking of grounded conductors to terminations, which allows a conductor with other than white insulation to be used in overhead aerial spans.
Passing larger than No. 6 insulated grounding conductors through a conduit body without splices or unused hubs does not appear to warrant identification any more than an "accessible" grounding conductor in a cablebus assembly, for which the proposal would only require identification at terminations and junction points.
Present wording which requires stripping or marking of the entire length or every point where the conductor is accessible tends to result in use of bare conductors where used in a wireway, auxiliary gutter, or cable tray.
Since grounding conductors in cables are usually insulated or bare but not individually covered, the proposal has no effect on such conductors.
PANEL ACTION: Accept in Principle in Part.
Revise Section 250-119(a) only to read as follows:
"(a) Conductors Larger than No. 6. An insulated or covered conductor larger than No. 6 copper or aluminum shall be permitted, at the time of installation, to be permanently identified as an equipment grounding conductor at each end and at every point where the conductor is accessible. Identification shall encircle the conductor and shall be accomplished by one of the following:
1. Stripping the insulation or covering from the entire exposed length
2. Coloring the exposed insulation or covering green
3. Marking the exposed insulation or covering with green tape or green adhesive labels."
PANEL STATEMENT: The panel accepts the need to encircle the conductor with coloring or marking. No substantiation has been included to delete covered. The panel does not agree with the requirement to mark conductors at six foot intervals. The remainder of the recommendation is not accepted because it does not add clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:

(Log #3325)

5- 257 - (250-119(a)): Reject
SUBMITTER: Paul E. Phelan, Rep. New Hampshire Electrical Contractors Assn.
RECOMMENDATION: Revise as follows:
(a) Conductors larger than No. ~~6~~ 10 copper or aluminum shall be permitted, at the time of installation, to be permanently identified...
SUBSTANTIATION: Difficulty in the ready availability of green (or green w/yellow stripe) insulated conductors. Facilitates installation with on-hand materials.
PANEL ACTION: Reject.
PANEL STATEMENT: The lack of availability by some electrical suppliers is not technical substantiation for a change. Suppliers will stock materials where there is a demand for it.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
DOBROWSKY: This proposal should be accepted. Conductors with green insulation in sizes larger than 6 AWG could also be manufactured and stocked. Conductors in size 10 AWG and smaller are most commonly used for branch circuits and are readily available with colored insulation. If termination marking is acceptable and considered safe for 4 AWG and larger why not in sizes 6 AWG and 8 AWG.

(Log #2748)

5- 258 - (250-119(d) (New)): Reject
SUBMITTER: Joseph N. Fiorello, Sr., Fiorello Electric Inc.
RECOMMENDATION: Add new paragraph (d) to read as follows:
(d) Identification of isolated grounding conductors. Isolated grounding conductors shall be permitted to be identified with the provisions of 250-119(a). Isolated grounding conductors shall be identified and readily different from the conductors of the equipment grounding system.
SUBSTANTIATION: Upon inspection of a job the electrician had installed, both IG and equipment grounding conductors but both were identified the same and indistinguishable. This problem should also be addressed in cable assembly situations.
PANEL ACTION: Reject.
PANEL STATEMENT: The different identification is already permitted in Section 250-119. The panel does not agree that the different conductors should be required to be distinguishable.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #765)

5- 259 - (250-120(a)): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Raceway, Cable Trays, Auxiliary Gutters, Cablebus, Cable Armor, or Cable Sheaths. Where it consists of a raceway, cable tray, auxiliary gutter, cablebus framework, cable armor or cable sheath, or where it is a wire ~~within a raceway or cable,~~ it shall be installed in accordance with this code using fittings for joints and terminations approved for use with the type ~~raceway or cable~~ of grounding conductor used. All connections, joints, and fittings shall be made tight. ~~using suitable tools.~~
SUBSTANTIATION: The provisions of this section are applicable to auxiliary gutters and cablebus which are not considered raceways. Grounding conductors not within a raceway or cable such as in a gutter or cablebus or as permitted by Sections 250-134(b) Exceptions No. 1 and 2, and Section 250-138(b) should be included. The tool requirement literally does not permit hand-twisted wire connectors.
PANEL ACTION: Accept in Part.
Revise Section 250-120(a) to read as follows:
"a) Raceway, Cable Trays, Cable Armor, Cablebus, or Cable Sheaths. Where it consists of a raceway, cable tray, cable armor, cablebus framework, or cable sheath or where it is a wire within a raceway or cable, it shall be installed in accordance with the applicable provisions in this Code using fittings for joints and terminations approved for use with the type raceway or cable used. All connections, joints, and fittings shall be made tight using suitable tools."
PANEL STATEMENT: The panel concludes that auxiliary gutters do not belong in this section. The additional recommendations do not add clarity to this section.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #2214)

5- 260 - (250-120(b)): Accept in Principle
Note: The Technical Correlating Committee directs that the first sentence of the Proposal be rewritten to comply with the NEC Style Manual to read as follows: "Equipment grounding conductors of bare or insulated aluminum or copper-clad aluminum shall be permitted."
The Technical Correlating Committee understands that the metric values will be the same as accepted in Proposal 5-54. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Revise 250-120(b) as follows:
Equipment grounding conductors of bare or insulated aluminum or copper-clad aluminum are permitted. Where used these conductors shall not come in direct contact with masonry or the earth or where subject to corrosive conditions. Where terminated outside, these conductors shall not be installed within 18 in. (457 mm) of the earth.
SUBSTANTIATION: Rewrite of Article 250 for the 1999 Code can result in a possible interpretation that can prohibit the well recognized use of aluminum and copper-clad aluminum conductors as equipment grounding conductor.
250-64(a) means that aluminum and copper-clad aluminum conductors shall not be used as grounding electrode conductors where in direct contact with masonry or the earth or where subject to corrosive conditions. Equipment grounding conductors are terminated on to the grounding electrodes.
Equipment grounding conductors of bare or insulated aluminum and copper-clad aluminum conductors are part of cable assemblies suitable for direct burial applications or raceway systems and have been used successfully for many years. Their use has been in accordance with the Code. To prohibit their use now, as a result of the rewrite of Article 250 for better organization of the Code requirements in this article, in these wiring methods might as well mean that insulated phase conductors of these materials are prohibited. Rewriting Article 250 was not intended to change the technical requirements for the permitted use of equipment grounding conductors of bare or insulated aluminum and copper-clad aluminum conductors.
Proposed wording recognizes the permitted use while maintaining the intended installation requirement for the proper use of bare or insulated aluminum or copper-clad aluminum as equipment grounding conductors.
PANEL ACTION: Accept in Principle.
Replace 250-120(b) with the following:
"b) Aluminum and Copper-Clad Aluminum Conductors. Equipment grounding conductors of bare or insulated aluminum or copper-clad aluminum are permitted. Bare conductors shall not come in direct contact with masonry or the earth or where subject to corrosive conditions. Aluminum or copper-clad aluminum conductors shall not be terminated within 18 in. (457 mm) of the earth."
PANEL STATEMENT: The panel concludes that this revision meets the submitter's intent and provides clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BRENDER: There is nothing in the present wording of 250-120(b) that prohibits the use of aluminum if it is used within the restrictions of Section 250-64. The submitter provides no substantiation that there was ever a problem with interpretation of this section. The proposal does not provide clarity. According to one member of the Panel during the last cycle, the wording of this section was considered and deliberated.
Bare aluminum grounding conductors used in direct burial as part of a cable assembly is of undocumented success. One major manufacturer of such assemblies informed me they have no documentation or studies of failure rates of conductor material. The submitter's statement that they have been used successfully for many years is a subjective anecdotal comment, with no substantiation provided.
If aluminum is exposed to moisture, as may occur when a semi-porous jacketing material is used in direct burial, or if an impervious jacket is damaged, as during installation, it will corrode at a relatively fast rate, failing in an open-circuit condition and rendering the ground path ineffective.
This proposal is superfluous, degrades safety and should be rejected.
COMMENT ON AFFIRMATIVE:
DOBROWSKY: A similar issue exists with Section 250-64 that should be corrected also. Only bare conductors and the terminations of covered or insulated conductors should be restricted from corrosive environments or within 18 in. of the earth.
The Panel Action text should be revised to improve clarity and comply with the NEC style manual as follows:
(b) Aluminum and Copper-Clad Aluminum Conductors. Bare, covered, or insulated aluminum or copper-clad aluminum equipment grounding conductors shall be permitted. Bare conductors shall not be located where subject to corrosive conditions or be in direct contact with masonry or the earth. Aluminum or copper-clad aluminum conductors shall not be terminated within 18 in. (450 mm) of the earth.

(Log #4337)

5- 261 - (250-120(b)): Accept in Principle
SUBMITTER: C. David Mercier, Southwire Co.
RECOMMENDATION: Delete:
(b) Aluminum and Copper-Clad Aluminum Conductors. Aluminum and copper-clad aluminum conductors shall be installed in accordance with the restrictions of Section 250-64.
Replace with:
(b) Separate Equipment Grounding Conductors. Where the equipment grounding conductor is a separate equipment grounding conductor as provided for in Sections 250.130(c)(1) and (2) and in Section 250-134(b), Exception No. 2, it shall be installed in accordance with Section 250.64 in regard to restrictions for aluminum and also in regard to protection from physical damage.
SUBSTANTIATION: The 1999 NEC inadvertently, through the rewrite of Article 250, now disallows the use of insulated aluminum conductors used as grounding conductors when in direct contact with the earth based on 250-120(b). This now disallows the use of an insulated aluminum grounding conductor for the feeder to a mobile home, removing a product from the market that has been used successfully for many years.
The 1996 NEC allowed the grounding conductor to be aluminum based on 250-92(c)(2) only disallowing aluminum conductors installed as "a separate equipment grounding conductor as provided in the Exception for Sections 250-50(a) and (b) and in Section 250-57(b), Exception No. 2". The panel statement for Proposal 5-257 in the 1995 NEC Committee Report on Proposals states that "Section 250-92(c)(2) only covers a separate equipment grounding conductor as provided for in the exception to Sections 250-50(a) and (b). It does not pertain to the equipment grounding conductor that is contained in type USE service entrance cable."
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 5-260.

(Log #3618)

5- 262 - (250-120(d) (New)): Reject
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Add a new Section 250-120(d) to read as follows:
(d) Roofs. All raceways installed on roofs with a slope of 4 in. per 12 in. or less shall contain an equipment grounding conductor sized per Table 250-122 and installed with the circuit conductors.
Exception No. 1: Systems which are used with low voltage and communication type systems unless required elsewhere in the Code.
Exception No. 2: As permitted by Section 250-86.
SUBSTANTIATION: When a building needs to have its roof redone permits are not required and no inspections are performed. The roofers too often have no regard for the integrity of the conduit system installed on the roof. The conduit is just moved out of the way as they reroof. Even if they move the conduit back to its original position the conduit has separated from the couplings and connectors. Lengths of conduit are no longer grounded and the conductors are subject to physical damage. Without an approved equipment grounding system personnel are exposed to the possibility of electrical shock.
PANEL ACTION: Reject.
PANEL STATEMENT: The code can not regulate the dismantling of electrical systems or foresee all future renovations. There is lack of technical substantiation for this change.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 5
EXPLANATION OF NEGATIVE:
BRENDER: This submitter, as well as the submitter of Proposal 5-263, have identified a safety hazard that is easily and cheaply rectified. This proposal should be accepted in the interests of safety. Numerous recognized sources have agreed with the submitter's intent that grounding continuity cannot be assured utilizing solely the conduit as the equipment grounding conductor. Indeed, several other proposals within this Code cycle, such as 5-251 and 5-263, highlight the potential hazards associated with the use of the conduit as a ground path without an associated copper grounding conductor. Adoption of this proposal will enhance safety and should be adopted.
JOHNSTON: This proposal should be accepted. Damage to raceways on roofs is not an uncommon occurrence. In addition to the types of incidents cited in the substantiation to the proposal, raceways installed on roofs are often damaged by maintenance personnel or workers of other trades, when performing their tasks. When these workers step on or move the raceways, the electrical and mechanical continuity of the raceways at the connectors and couplings is affected and can leave portion(s) of the raceway system isolated creating potential hazards.
MELLO: This proposal should be accepted. This submitter and several before have provided substantial field evidence of a problem. Code-Making Panel 8 has determined that metal raceways are suitable as equipment grounding conductors with the provision that they are applied correctly and installed correctly. The evidence shows that while the initial installaton may comply with the Code, the long term conditions are such that on rooftops, the raceway does not remain suitable as an equipment grounding conductor. I cannot agree, as proposed elsewhere, to make a blanket requirement to install a separate equipment grounding conductor in all metal raceways. In this limited application on rooftops, some action is needed. The panel statement that there is inadequate technical substantiation is incorrect.
RAPPAPORT: There has been substantial documentation relating to the inadequacy of EMT as an equipment-grounding conductor due to mechanical separation, corrosion, and loose fittings. All of these can and do occur on rooftops. It is time that we recognize that all installations are not performed ideally, that all connections are not made secure, and that traffic on rooftops can and does separate EMT sections. This proposal is necessary for safe roof top installations.
It is interesting to note that CMP 8 has passed this same proposal. In view of the direction given by the Technical Correlating Committee that responsibility for determining the suitability of raceways as an equipment-grounding conductor rests with CMP 8, voting on this proposal is inconsequential. See my Negative Vote and Comment on Proposal 5-251.
TOOMER: This problem does not exist in the electrical industry. If this proposal is accepted, it would help ensure the electrical continuity of the fault and ground path. Although the code does not regulate the dismantling of electrical systems, by accepting this proposal it will result in future personnel safety.

(Log #4302)

5- 263 - (250-120(d) (New)): Reject
SUBMITTER: Glenn Soles, Clark County Building Dept./Rep. So. Nevada Electrical Code Committee
RECOMMENDATION: Add a new Section 250-120(d) to read as follows:
(d) Roofs. All raceways installed on roofs with a slope of 4 in. per 12 in. or less shall contain an equipment grounding conductor sized per Table 250-122 and installed with the circuit conductors.
Exception No. 1: Systems which are used with low voltage and communication type systems unless required elsewhere in the Code.
Exception No. 2: As permitted by Section 250.86.
SUBSTANTIATION: When a building needs to have their roof redone permits are not required and no inspections are performed. The roofers too often have no regard for the integrity of the conduit system installed on the roof. The conduit is just moved out of the way as they reroof. Even if they move the conduit back to its original position the conduit has separated from the couplings and connectors. Lengths of conduit are no longer grounded and the conductors are subject to physical damage. Without an approved equipment grounding system personnel are exposed to the possibility of electrical shock.

PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 5-262.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 4
EXPLANATION OF NEGATIVE:
BRENDER: This submitter, as well as the submitter of Proposal 5-262, have identified a safety hazard that is easily and cheaply rectified. As a building official in Clark County, he has undoubtedly encountered the types of damage to the integrity of conduit systems on roofs he alludes to. Further, owing to the exposure to outdoor conditions, corrosion of EMT or other conduits or joints cannot be precluded.
Numerous recognized sources have agreed with the submitter's intent that grounding continuity cannot be assured utilizing solely the conduit as the equipment grounding conductor. Indeed, several other proposals within this Code cycle, such as 5-251 and 5-263, highlight the potential hazards associated with the use of the conduit as a ground path without an associated copper grounding conductor. Adoption of this proposal will enhance safety and should be adopted.
JOHNSTON: See my Explanation of Negative Vote on Proposal 5-262.
MELLO: See my Explanation of Negative Vote on Proposal 5-262.
RAPPAPORT: See my Explanation of Negative Vote on Proposal 5-262.

(Log #1750)

5- 264 - (250-122): Accept
SUBMITTER: Jamie McNamara, Hastings, MN
RECOMMENDATION: Revise to read as follows:
250-122 (b) Increased in size *Adjustment for Voltage Drop.* **Where ungrounded conductors are increased** *adjusted* **in size** *to compensate for voltage drop*, **equipment grounding conductors, where installed, shall be increased in size** *adjusted* **proportionately according to circular mil area of the ungrounded conductors.**
SUBSTANTIATION: The current text is limited to voltage drop only and is subject to abuse and misinterpretation (e.g. it was done per the plans, not for voltage drop). The manufacturers directions often call for conductor to be increased in size, with no explanation for why the ungrounded conductors size is increased, with no corresponding requirement for the equipment grounding conductor to be increased.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
TOOMER: The submitter did not provide sufficient substantiation.

(Log #2057)

5- 265 - (Table 250-122): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Move the first note at the end of Table 250-122 to the General (a) statement.
to read as follows.
(a) General. Copper, aluminum, or copper-clad aluminum equipment grounding conductors of the wire type shall not be smaller than shown in Table 259-122, but shall not be required to be larger than the circuit conductors supplying the equipment. Where a raceway or a cable armor or sheath is used as the equipment grounding conductor, as provided in Sections 250-118 and 250-134(a), it shall comply with Section 250-2(d).
Where necessary to comply with Section 250-2(d), the equipment grounding conductor shall be sized larger than Table 250-122.
SUBSTANTIATION: The Note at the end of Table 250-122 is a mandatory requirement and should be moved into the General text of 250-122.
PANEL ACTION: Reject.
PANEL STATEMENT: The note to the table is mandatory text and is enforcable already. See reference 2.3 of the NEC Style Manual.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
RAPPAPORT: The Panel is technically correct that Notes are mandatory. I wonder how many users of the Code recognize that Notes are mandatory and FPNs are not. Moving the notes into positive text in the body of the section will emphasize the fact that they are mandatory without actually changing any of the rules. I believe that this proposal is in the direction of making the Code more user friendly by removing any doubt as to whether notes are mandatory or not.

(Log #2239)

5- 266 - (Table 250-122): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Revise Table 250-122 as follows.

Table 250-122. Minimum Size Equipment Grounding Conductors for Grounding Raceway and Equipment

Rating or Setting of Automatic Overcurrent Device in Circuit Ahead of Equipment, Conduit, etc., Not Exceeding (Amperes)	Size (AWG or kcmil)	
	Copper	Aluminum or Copper-Clad Aluminum*
15	14	12
20	12	10
30	10	8
40	10	8
60	10	8
100	8	6
200	6	4
300	4	2
400	3	1
500	2	1/0
600	1	2/0
800	1/0	3/0
1000	2/0	4/0
1200	3/0	250
1600	4/0	~~350~~ 300
2000	250	400
2500	350	~~600~~ 500
3000	400	600
4000	500	~~800~~ 750
5000	700	~~1200~~ 1100
6000	800	~~1200~~ 1300

Note: Where necessary to comply with Section 250-2(d), the equipment grounding conductor shall be sized larger than this table.
***See installation restrictions in Section 250-120.**

SUBSTANTIATION:
Objective of this proposal is to examine the requirement for equipment grounding conductor size for overcurrent devices with rating or setting of 1600 Ampere and higher. Except for a few sizes, this table exhibits a relationship between the sizes of copper and aluminum conductors that is similar to the relationship that exists in Table 310-16. The proposed change is needed to make the entire Table 250-122 to exhibit a relationship between the sizes of copper and aluminum conductors that is similar to the relationship that exists in Table 310-16. Also, the acceptance of this recommendation will facilitate harmonization of requirements in the National Electrical Code (NEC) and Canadian Electrical Code (CEC) for this requirement.

References:

1. **Proposals by Mr. E. C. Soares for Table 250-95 as recorded on pages 69 – 72 of the "Preprint" of the proposed amendments for the 1965 NEC.**
2. **Pages 168 – 173 of Soares' Grounding Electrical Distribution Systems for Safety, 1966.**
3. **Table 250-95 of the 1965 NEC.**
4. **Table 250-95 of the 1968 NEC.**
5. **Pages 217 – 221, Soares' Grounding Electrical Distribution Systems for Safety, 1966.**
6. **Table 16 of the 1998 CEC.**

See Appendix 1 for copies of the above items.

It is not the intent of the submitter to challenge the work done by Mr. Soares, in particular, and many other experts on grounding.

This proposal is based on the following statement found on page 218 of item 5 referenced above. (I believe that same statement exist in the original work published by Mr. Soares in 1966, item 1 referenced above.)

"While Tables XVI and XVII list only copper conductors an aluminum conductor having a conductance equivalent to a given copper conductor will also have an approximately equal short–time current–carrying capacity. This is true because, for equivalent dc conductance, the temperature coefficients, specific heats and densities of copper and aluminum, respectively, are such as to cause their respective melting points to be reached in approximately the same length of time."

Table 16 of the CEC and Table 250-122 of the NEC deals with the same subject. Comparison of the two suggests that the requirements are very similar in these two tables. However, some differences do exist for the equipment grounding conductor size for devices rated at 1600 ampere and larger.

Analysis similar to Table XVI shown on page 220 of item 4 above is performed on the revised table 250-122 shown above in the recommendation. See Appendix II for the results.

Should these three details fail to support the proposed recommendation, then the CMP 5 should consider following alternates:

1. Increases the minimum size of the equipment grounding conductor where required to maintain the relationship.

OC Rating (Ampere)	Size of Copper EGC (AWG or kcmil)	Size of Aluminum or Copper-Clad Aluminum EGC (AWG or kcmil)
1600	~~4/0~~ 250	~~350~~ 400
2000	250	400
2500	~~350~~ 400	600
3000	400	600
4000	~~500~~ 600	~~800~~ 900
5000	~~700~~ 750	1200
6000	800	~~1200~~ 1300

2. Use the proportional increase rule of 1965 NEC to establish the size of the copper conductor for OC devices rated above 1200 Ampere and then establish the nearest matching (or larger) size of the aluminum or copper-clad aluminum conductor from Table 310-16:

OC Rating (Ampere)	Size of Copper EGC (Table 250-122) (AWG or kcmil)	Circularmils	Size of Copper EGC (Circularmils) Proportionally Increased using 1200 Ampere as a reference	Size of Copper EGC (Nearest larger size to match with the proportionally increased size) (AWG or kcmil)	Nearest matching (or larger) size of Aluminum or Copper-Clad Aluminum from Table 310-16 (AWG or kcmil)
1200	3/0	167800	3/0	3/0	250
1600	4/0	211600	223733	250	400
2000	250	250000	279667	300	500
2500	350	350000	349583	350	500
3000	400	400000	419500	500	750
4000	500	500000	559333	600	900
5000	700	700000	699167	700	1200
6000	800	800000	839000	900	1500

(Example: Required Circularmils for 1600 Ampere OC Device = (167800 x 1600/ 1200) = 223733)

Note: Supporting material available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no empirical data to support the submitters assumptions of the short time current carrying capacity of the conductors. Table 310-16 refers to steady state ampacity, where as Table 250-122 is based on fault current. This points out the thermal characteristic differences.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

EXPLANATION OF NEGATIVE:
HADEEN: The submitter's substantiation includes the required technical information to support the change. See Appendix 1, Item 5 (Pages 218 and 219 from Soares' Grounding Electrical Distribution System for Safety, 1966); and Appendix 2, Pages 1 and 2 provided with the substantiation.
STEINMAN: The submitter's substantiation includes the required technical information to support the change. See Appendix I, Item 5 (pages 218 and 219 from Soares' Grounding Electrical Distribution System for Safety, 1996) and Appendix 2, pages 1 and 2 that were provided with the submitter's substantiation.

(Log #766)

5- 267 - (250-122(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) General. Copper, aluminum, or copper-clad aluminum equipment grounding conductors of the wire type shall not be smaller than shown in Table 250-122, but shall not be required to be larger than the largest ungrounded associated circuit conductor (including tap conductors) supplying the equipment, if of the same material or adjusted in size in accordance with the equivalent size columns of Table 250-122 if of different material. ~~Where a raceway or cable armor or sheath is used as the equipment.~~ Equipment grounding conductors, as provided in Section 250-118 ~~and 250-134(a)~~ it shall comply with Section 250-2(d).
SUBSTANTIATION: "Largest" and "ungrounded" should be specified, as all ungrounded conductors of a circuit may not be the same size. A grounded conductor is a circuit conductor and a neutral may be larger than the ungrounded conductors where to compensate for harmonic currents. "Associated" is intended to define that portion of a circuit directly related to grounding conductor size, such as the tap conductor portion. While circuit conductors includes tap conductors it also includes feeder conductors. My impression is that the intent is to limit an equipment grounding conductor in general, to the tap conductor size, but this is not explicitly indicated. Section 90-4 gives responsibility for interpretation of "circuit conductors" to the authority having jurisdiction.
A somewhat plausible interpretaton based on Section 250-2(d) and the FPN for Table 250-12, to require a feeder sized equipment grounding conductor could be made for a (worst case type) tap conductor installation as follows:
No. 12 conductors are tapped to an outside feeder that has overcurrent protection rated 500 amperes, with a 2/0 copper equipment grounding conductor, in accordance with Section 240-21(b)(5). A limited ground fault current of approximately 225-amperes on the tap would likely be seen as an overload by the feeder overcurrent device instead of a ground fault, especially if the feeder is lightly loaded, and time/trip characteristics could preclude instantaneous opening. The fault current could fuse (melt open) the tap supply conductors or the No. 12 grounding conductor. If the EGC fuses first, equipment potential can rise to line voltage and remain energized due to loss of ground. While a 2/0 EGC for the tap conductors would not necessarily cause the feeder overcurrent device to open, it would limit the above ground potential of the equipment and allow fusing of the No. 12 tap conductor, which would likely remove the faulted connection.
Grounding conductors of Section 250-118 other than raceways or cable armor should also be included in the reference to Section 250-2(d) which is not so limited. Reference to Section 250-134(a) is superfluous as that section refers to Section 250-118.
Proposal is intended as clarification of intent.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no technical substantiation to delete the reference to raceways, cable armor or sheaths used as equipment grounding conductors. The proposed text does not add any clarity.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #767)

5- 269 - (250-122(e), (f)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(e) Flexible Cord and Fixture Wire. Equipment grounding conductors that are part of flexible cords or used with fixture wires in accordance with section 240-4 shall be copper, not smaller than No. 18 and not smaller than the largest flexible cord conductors or fixture wire. ~~circuit conductors.~~
(f) Conductors in Parallel. Where conductors are run in parallel in multiple raceways or cables as permitted in Section 310-4, the equipment grounding conductors, where used, shall be run in parallel in each raceway or cable. One of the following methods shall be used to ~~ensure~~ determine the minimum size of the equipment grounding conductors. ~~are protected.~~
SUBSTANTIATION: Editorial. No smaller than No. 18 copper does not explicitly require copper. While the cord and fixture wires will normally be copper if intended to be mandatory it should be explicit. (A No. 12 aluminum could be used with fixture conductors). "Circuit" conductors in (a) evidently refers to feeder or branch circuit conductors. Proposal clarifies that branch-circuit conductors are not intended. While flexible cords covered in Section 240-4 will normally have the same size conductors, individual fixture wire could be various sizes and the grounding conductors should relate to the largest sized used.
"Protected" implies overcurrent protection. The code doesn't require overcurrent protection for grounding conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is not editorial. The substantiation is insufficient for the changes proposed. The proposed text does not add clarity.

(Log #2820)

5- 270 - (250-122(e)): Reject
SUBMITTER: Frank Martucci, Fort Lee, NJ
RECOMMENDATION: After existing text add:
(1) Flexible cords, and cordsets, shall be redundantly grounded with two conductors whenever the equipment grounding conductor is sized smaller than shown in table 250-122.
SUBSTANTIATION: Ralph Nader accused the medical profession of accidentally electrocuting 5000 patients a year with electrical equipment and covering up the deaths.
Frank Mayhew, in a micro-shock overview, stated that 1200 patients are electrocuted each year with currents as little as 20 microamperes.

The U.S. National Institute for Occupational Safety and Health estimates 700 Americans are electrocuted on the job each year.

OSHA also reported 109 deaths in one year on construction sites, and many serious injuries due to shocks as little as 3 milliamperes.

The Consumer Product Safety Commission estimates 600 persons lose their lives each year by electrocution in and around the home.

Yet despite thousands of electric shocks that cause injuries, and electrocutions, each and every year, the grounding system still remains without the redundancy every other responsible engineer resorts to whenever lives are at stake.

For the past thirteen years I have urged the members of the NFPA to adopt a cord and plug grounding system that provides the necessary two conductor redundancy required to correct the design defects in cords that cause micro and machro shock.

Instead of redundancy, and despite the above horrific statistics, the members of the NFPA are content to continue protecting our men, women, and children with equipment grounding conductors sized up to 66 percent less than required by table 250-122.

The original code document, developed under the influence of insurance companies, distinctly states the equipment grounding conductors shall be sized according to table 250-122. This means a No. 12 equipment grounding conductor shall be used in all cord and cordsets when used on a 20 ampere circuit.

Therefore, it is irresponsible to permit a No. 18, 7 ampacity conductor grounding conductor to be used on a 20 ampere branch circuit. And especially branch circuits protected by circuit breakers instead of fuses.

And we're talking about cords subjected to much use and abuse, not conductors that are protected inside walls.

If we must reduce the size of the grounding conductor No. 18 then install a second No. 18 conductor to prevent the loss of grounding responsible for electrocutions, and line drop responsible for the milliampere shocks that cause serious injuries.

The same two conductors, together with electrocution-proof components will make our grounding system electrocution-proof and fire-proof. See substantiation I submitted for Section 250-114.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and statement on Proposal 5-247.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

(Log #1707)

5- 271 - (250-122(f)(1) and (2)): Reject

SUBMITTER: Kenneth W. Birringer, University of Michigan

RECOMMENDATION: Revise text as follows:

(1) Each parallel equipment grounding conductor <u>where not in combination with other types of equipment grounding conductors listed in Section 250-118</u> shall be sized on the basis of the ampere rating of the overcurrent device protecting the circuit conductors in the raceway or cable in accordance with Table 250-122.

(2) <u>Where in combination with other types of equipment grounding conductors, each parallel equipment grounding conductor shall be permitted to be sized in accordance with Table 250-122 on the basis of the ampere rating of the overcurrent device divided by the number of sets of parallel conductors.</u>

(3) (Former Paragraph No. 2)

SUBSTANTIATION: Where conductors are run in parallel in multiple raceways and the raceways are approved as equipment grounding conductors, any equipment grounding conductors within the raceways are extra and not required. Therefore, sizing them on the basis of the full ampere rating of the overcurrent device protecting the circuit conductors in accordance with Table 250-122 is unnecessarily costly and discourages the use of supplemental equipment grounding conductors within the raceways.

PANEL ACTION: Reject.

PANEL STATEMENT: The installation of a wire type grounding conductor in a raceway that otherwise qualifies as an equipment grounding conductor is optional. The panel intends that all required and optional installations shall be completed in accordance with the NEC.

There is no substantiation that equal and effective minimum safety is still maintained. The main rule is referring to equipment grounding conductors installed in parallel and does not intend to offer relief when installed in metallic wiring methods specified in Section 250-118. In the proposed changes to (2), no substantiation provided as to the adequate capacity to clear a fault based on the use of the equation provided in the new language.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

(Log #3132)

5- 272 - (250-122(f)(1), Exception (New)): Reject

SUBMITTER: W. E. "Buck" Black, WE Black

RECOMMENDATION: It is suggested that the following exception be added, following 250-122(f)(1):

"Exception: When enlarging an existing feeder circuit by adding one or more parallel runs, all new equipment ground cables shall be sized according to 250-122(f)(1). The existing equipment ground conductors can remain as originally sized if the sum of the cross sections of all ground conductors both old and new is at least 200 percent of the single ground conductor required per Table 250-122. If new ground cables are sized larger than required by Table 250-122, only the cross section shown in the table will be allowed for the 200 percent cross section calculation."

SUBSTANTIATION: Section 250-122(f)(1) places overly conservative restraints on equipment grounding conductors when upgrading large paralleled conductor feeders installed in conduit. The required upsizing of the equipment grounding conductors often results in a replacement of the phase conductors and occasional abandonment of existing conduit due to exceeding the 40 percent fill rule. The requirement for a full size ground conductor in every conduit is belt and suspenders conservative and fails to take into account the dual grounding effectiveness of any individual grounding conductor in a large multiple paralleled run.

The physics behind the safe sizing of equipment grounding conductors is based on two factors:

a) Sufficiently low impedance to develop large fault current flow

b) Sufficient I^2T capability to conduct the fault current without overheating or melting.

The sizing of the equipment grounding conductor in Table 250-122 is based on the use of a single equipment ground conductor. That is, one ground conductor of the indicated size should safely conduct fault current of sufficient magnitude and duration for the circuit overcurrent device to operate. Should the ground conductor be severed or burned in two, all equipment grounding will be lost. If the equipment ground conductor were to come into electrical contact with a phase conductor at mid span in a conduit, fault current would flow from the point of contact back toward the source of the feeder and no flow would occur toward the load. All fault current flow will be through a single cross section of the particular ground cable. With loss of this single ground, the load will lose all grounding and no longer be safe to touch.

Now consider a load served by paralleled conductors, installed in conduit with an equipment ground in each conduit. Just for purposes of tangible example, assume that three paralleled runs constitute this feeder. If a single ground cable is now severed or burned in two, equipment grounding will not be lost since two cables continue to maintain ground. If an equipment ground conductor were to come into electrical contact with a phase conductor at mid span in one conduit, fault current will flow from the point of contact back toward the source of the feeder <u>as well as toward the grounded load.</u> The point of contact is effectively grounded by two cross sections of ground cable at any mid conduit fault in a paralleled feeder circuit. This dual effectiveness was never taken into account when 250-122(f)(1) was drawn up. It was instead based on the conservative Table 250-122, which is predicated on the use of only one equipment ground cable.

The requirement for a full sized ground in every conduit of a paralleled run poses no hardship on new work; it is only when upsizing an existing run that relief should be considered.

The 200 percent requirement will assure that sufficient size and quantity of ground cables are installed such that complete loss or burnout of any one cable will still leave at least 100 percent of the required grounding cross section. This requirement will assure the two-way fault drain (toward the source as well as the grounded equipment) previously described.

PANEL ACTION: Reject.
PANEL STATEMENT: The Code is not retroactive. It is the panel's intent that if an existing feeder is enlarged, it becomes a new feeder. There is no assurance that a fault will only occur in the midspan of the original raceway or cable. An enlarged feeder circuit shall comply with the latest edition of the NEC.

AFFIRMATIVE: 17

(Log #1751)

5- 273 - (250-122(g)): Reject
SUBMITTER: Jamie McNamara, Hastings, MN
RECOMMENDATION: Added new text to read as follows:
(g) Transformers and converters. Where the current that may be imposed on an equipment grounding conductor is supplied through a transformer, converter or the like that changes the voltage. The size of the equipment grounding conductor on the secondary side ahead of any secondary side overcurrent protection device, shall have its minimum size determined by multiplying the secondary equipment grounding conductors overcurrent protection device rating ahead of equipment by the secondary to primary voltage ratio.
SUBSTANTIATION: When the current must pass through a transformer, converter, VFD, UPS or the like that changes the voltage the current also changes and the equipment grounding conductor should be adjusted in size to compensate for this change in current. An example is a 45 kva transformer 480 primary 120/208 secondary with 60 amps overcurrent protection on primary wired with three # 6 and one # 10 equipment grounding conductor, the secondary appears to be acceptable to wire with four 1/0 and one # 10 equipment grounding conductor to a 150 amp overcurrent device. The 60 amp overcurrent protection device on primary is protecting the # 10 on the secondary during a ground fault, but the current on the secondary is 480 / 208 = 2.3 times as much current as is on the primary, a #10 equipment grounding conductor is good for 60 amps times 2.3 equals 138 amps minimum equipment grounding conductor on the secondary or a # 6 pertaining to table 250-122 for 138 amps . Or the current on the primary is (208 / 480 = .433...) .4333 of the secondary. The equipment grounding conductor should be a # 6 good for 200 amps times .4333 = maximum primary overcurrent protection device rating of 86.66 amps.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: No substantiation for the proposed additional requirements which are already addressed in Article 250. Equipment grounding conductor sizing for both primary and secondary circuits of transformers or converters are already required to be sized appropriately by other sections of Article 250.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
MELLO: The Panel Statement is not correct. The conductor that provides "bonding" between the separately derived source (transformer, generator or convertor), and the enclosure with the first disconnecting means is not defined. Some believe this conductor is an equipment grounding conductor with size based on Table 250-122 but there is not overcurrent device ahead to size so this conductor has the proper withstand capacity for the secondary ground fault current. Others believe this conductor is a bonding conductor and should be sized similar to a bonding conductor on the line side of a service. This argument has more credibility because the derived phase conductors can be used and reference to Section 250-103(c) so adequate withstand is provided. This proposal attempts to resolve the issue by defining the conductor as an equipment grounding conductor but specifically requires the size to be increased from that determined from the primary overcurrent device proportionately by the ratio of the current values between the primary and the secondary.

(Log #768)

5- 274 - (250-130(c)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Nongrounding Receptacle Replacement or Branch Circuit Extensions. The equipment grounding conductor of a grounding-type receptacle or a branch circuit extension, or for short sections of metal raceways or enclosures used to provide support or protection of cable assemblies shall be permitted to be connected to any of the following:.
(Remainder unchanged).
SUBSTANTIATION: While these short sections are not required to be grounded, if grounding is desired the provision of Exception No. 1 for Section 250-134(b) doesn't apply since this section doesn't relate to short sections not involved with grounding of receptacles or extensions. Likewise, Section 250-132 doesn't appear to cover short sections for support or protection but rather appears to cover extensions or additions for wiring systems that do not provide an equipment ground.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation is insufficient for the changes proposed. The proposed text does not add clarity. The proposed text is not appropriate for the Section 250-130(c).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:

(Log #769)

5- 275 - (250-132): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Short Sections of Raceways. Isolated sections of metal raceway or cable armor ~~where required~~ to be grounded, shall be grounded in accordance with Section 250-134.
SUBSTANTIATION: Under circumstances where grounding is not required, but done by choice, code rules should be mandated for safety. Otherwise the lack of requirements for size, type identification connections, and manner of installation could result in potential hazard. Optional grounding should meet minimum standards.
PANEL ACTION: Accept in Principle.
Revise to read as follows:
"250-132. Short Sections of Raceway.
If isolated sections of metal raceway or cable armor are grounded, they shall be grounded in accordance with Section 250-134."
PANEL STATEMENT: The panel concludes this action meets the submitter's intent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
TOOMER: The intent of the code, as written, meets the intent of the submitter.

(Log #2306)

5- 276 - (250-134(b)): Reject
SUBMITTER: Paul E. Guidry, Fluor Daniel, Inc.
RECOMMENDATION: Revise text to read as follows:
"By an equipment grounding conductor contained within the same raceway, cable, cord, or if direct buried, in the same trench.
(FPN) The equipment grounding conductor must be kept in close proximity to the phase conductors to keep the impedance as low as possible. For further information see IEEE Recommended Practice for Grounding of Industrial and Commercial Power Systems, ANSI/IEEE Standard 142-1991."
SUBSTANTIATION: The existing terminology "... or otherwise run with the circuit conductors" is too vague. The present wording of this Section has been interpreted to permit the installation of a large duct bank with only one equipment grounding conductor for the entire duct bank thus eliminating the need to install separate equipment grounding conductors in each PVC conduit. This installation was understood to be

acceptable based on the premise that this was "otherwise run with the circuit conductors". The impedance could get too great between the circuit conductors and the equipment grounding conductor and could possibly prevent proper operation of the overcurrent protection device when installed in this manner. Adding this clarification would align this section with Section 300-3(b).
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed language does not improve clarity or cover all applications. Section 250-122(f) addresses the situation as described by the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3899)

5- 277 - (250-140): Reject
SUBMITTER: Douglas Hansen, Codecheck
RECOMMENDATION: Delete item 3 in the list of conditions allowing the frames of appliances to connect to the grounded conductor.
SUBSTANTIATION: This section contradicts Section 338-3(b) and is commonly used to justify uses of other wiring methods (such as nonmetallic sheathed cable) in the same application (using a bare grounded conductor to ground the frame of appliances). There is no longer any need for this item to be included in the code.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 250-140 is applicable to existing range and dryer circuits and item (3) should remain as this was allowable in previous editions of the Code. It allows existing wiring in this manner to remain unchanged if it exists in a manner specified in item (3) of the section.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3429)

5- 279 - (250-142(b)): Reject
SUBMITTER: Tom Baker, TB Training
RECOMMENDATION: Revise text to read as follows:
"(b) Load-Side Equipment. Except as permitted in Sections 250-30(a)(1) and 250-32(b), a grounded circuit conductor shall not be used for grounding noncurrent-carrying metal parts of equipment on the load side of the service disconnecting means or on the load side of a separately derived system disconnecting means or the overcurrent devices for a separately derived system not having a main disconnecting means.
Exception No. 1: The frames of ranges, wall-mounted ovens, counter-mounted cooking units, and clothes dryers under the conditions permitted for existing installations by Section 250-140 shall be permitted to be grounded by a grounded circuit conductor.
Exception No. 2: It shall be permissible to ground meter sockets ~~enclosures~~ by connection to the grounded circuit conductor on the load-side of the service disconnect if:
(a) No service ground-fault protection is installed, and
(b) All meter sockets ~~enclosures~~ are located near the service disconnecting means, and...".
SUBSTANTIATION: For the 1999 NEC, the title of Article 373 and Scope in 373-1 was changed to Cabinets, Cutout Boxes, and Meter Socket Enclosures, adding Meter Sockets.
Article 250-142(b) Load-Side Equipment, Exception No. 2(b) refers to meter enclosures.
The term meter socket is used 6 times in the 1999 NEC. The term meter enclosure is used twice in Article 250.
The terms in Article 250 should be consistent with other sections of the NEC. This proposal is to change meter enclosures to meter sockets.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "meter enclosures" includes more than just meter sockets.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #4188)

5- 280 - (250-142(b) Exception No. 4): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Insert an additional Exception No. 4 as follows:
Exception No. 4: A grounded neutral conductor derived from the supply system shall be connected to the pressure vessel containing the electrodes of an electrode-type boiler operating over 600 volts in accordance with Section 490-72(e)(1). All exposed noncurrent-carrying metal parts of the boiler and exposed grounded structures or equipment shall be bonded to the pressure vessel or to the derived neutral conductor, in accordance with Section 490-74.
SUBSTANTIATION: This is, in effect, former Section 250-61(b) Exception No. 4 in the 1996 NEC. It has been editorially modified to use a complete sentence structure in accordance with current style manual requirements. CMP 5 removed this exception in the 1999 cycle because Section 90-3 accomplished the same ends; its subject matter fell into Chapter 7 and therefore modified this section anyway. The panel lost track of the fact that CMP 13 relocated these requirements into Chapter 4, as part of the new Article 490. The result is a new direct conflict in the NEC that needs appropriate correlation.
PANEL ACTION: Accept in Principle.
Add a new Exception No. 4 to Section 250-142(b) to read as follows:
"Exception No. 4. Electrode-type boilers operating at over 600 volts shall be grounded as required in Sections 490-72(e)(1) and 490-74."
PANEL STATEMENT: The panel concludes that this action meets the intent of the submitter.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #636)

5- 281 - (250-146): Reject
SUBMITTER: Jack Wells, Pass & Seymour/Legrand
RECOMMENDATION: Relocate Section 250-146 without change to proposed new Article 420 as Section 420-9.
420-10~~250-146.~~ Connecting Receptacle Grounding Terminal to Box. An equipment bonding jumper shall be used to connect the grounding terminal of a grounding-type receptacle to a grounded box unless grounded as in (a) through (d).
(a) Surface Mounted Box. Where the box is mounted on or at the surface, direct metal-to-metal contact between the device yoke and the box shall be permitted to ground the receptacle to the box. This provision shall not apply to cover-mounted receptacles unless the box and cover combination are listed as providing satisfactory ground continuity between the box and the receptacle.
(b) Contact Devices or Yokes. Contact devices or yokes designed and listed for the purpose shall be permitted in conjunction with the supporting screws to establish the grounding circuit between the device yoke and flush-type boxes.
(c) Floor Boxes. Floor boxes designed for and listed as providing satisfactory ground continuity between the box and the device shall be permitted.
(d) Isolated Receptacles. Where required for the reduction of electrical noise (electromagnetic interference) on the grounding circuit, a receptacle in which the grounding terminal is purposely insulated from the receptacle mounting means shall be permitted. The receptacle grounding terminal shall be grounded by an insulated equipment grounding conductor run with the circuit conductors. This grounding conductor shall be permitted to pass through one or more panelboards without connection to the panel board grounding terminal as permitted in Section 384-20, Exception, so as to terminate within the same building or structure directly at an equipment grounding conductor terminal of the applicable derived system or service.
FPN: Use of an isolated equipment grounding conductor does not relieve the requirement for grounding the raceway system and outlet box.
SUBSTANTIATION: This is a general installation requirement. It is more in line with the scope of proposed Article 420 than the scope of Article 210. Over many code cycles the general installation and construction requirements for receptacles, attachment plugs and cord connectors have been adopted in various sections of the Code. The intent of this proposal is to locate the general installation requirements for receptacles and

cord connectors to the new Article 420. New Article 420 covers requirements for installation, mounting, grounding and non-interchangeability. This proposal brings the related requirements into a single article thereby making it easier for the code user to locate them.

The Task Group recognizes that by moving this requirement, the application is expanded from receptacles mounted adjacent to wet bars to a general requirement wherever receptacles are mounted in work surfaces or countertops. The task group believes a safety hazard exists wherever receptacles are mounted face up because foreign materials are likely to enter the receptacle and come in contact with current carrying parts.

The proposal was developed by a Task Group of CMP 18 appointed by the chairman to consider separating 1999 NEC Article 410 into two articles, one covering fixtures and the other covering receptacles, attachment plugs and cord connectors. This Task Group was appointed in response to Proposal 18-55 for the revision of the 1996 NEC.

PANEL ACTION: Reject.

PANEL STATEMENT: If the proposed Article 420 is accepted and inserted into the 2002 NEC, then this new article should refer to Section 250-146 for grounding requirements. There are requirements in Section 250-146 that properly belong in Article 250 and not in Article 420. Premises wiring grounding is a comprehensive system that incorporates equipment and installation grounding requirements. Separating the rules will make it more difficult for the user to understand and implement all the requirements.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

(Log #3011)

5- 282 - (250-146(a)): Accept

SUBMITTER: Robert H. Keis, Dover, DE

RECOMMENDATION: Delete the words "or at" in the first sentence. Sentence would then read as follows:

Where the box is mounted on ~~or at~~ the surface, direct metal to metal contact between the device yoke and box shall be permitted..." (balance of paragraph to remain as is).

SUBSTANTIATION: Mr. Hartwell's argument in the original proposal for the 1999 edition is incorrect concerning the contact between an old-work box and the device. He stated also, "There is no dispute that some installation practices result in questionable continuity. That is why we have electrical inspections (at least for now, and that is the premise of the entire code)." When "old work" boxes are installed in walls of any type, the box support fittings seat against the finish wall. The screw hole is recessed behind this box support. In order for the wall plate to properly seat against the wall surface the "plaster ears" must be removed from the receptacle. This is the point where Mr. Hartwell states the contact surface is the same with old and new work. This is not so. The only contact surface is at the screw itself, which is a very small part of the device.

Now the real problem. Apparently Mr. Hartwell and the panel both believe that everything that is installed is going to be inspected. Let's be real. Some areas don't have electrical inspection. Some building codes don't require inspection or permits until a certain financial point is reached. Some areas require inspection, if a permit is obtained, but the electrician, homeowner or whoever says, I can do this and no one will know. Even without inspection the jobs usually are put in by code, but many, many times I have installed old work boxes as Mr. Hartwell described and then went back later and found that the walls have been covered with many things, such as paneling, wallpaper, in the kitchen and bathrooms the walls have been covered with ceramic tile. What happens to the metal to metal contact now? It would really be naive to think that someone is going to install bonding jumpers at this point in time. This can happen days or months after the box was cut into the wall. There could even be a new owner. Do you really believe that whoever installed the paneling or the ceramic tile is going to call the electric inspector to look at work that has nothing to do with electricity, except to possibly set up an electrocution or fire hazard? This is a very serious electrical hazard just waiting to kill someone.

PANEL ACTION: Accept.

(Log #4010)

5- 283 - (250-146(a)): Accept in Principle

SUBMITTER: Christopher Pharo, Rep. IBEW

RECOMMENDATION: This proposal is delete the wording "or at".

"Section 250.146(a) Surface Mounted Box. Where the box is mounted on ~~or at~~ the surface, direct metal to metal contact between the...".

SUBSTANTIATION: A box installed during the rough in phase of a project is sometimes not flush with the GWB. The boxes must be installed perfectly, usually with a factory made mounting bracket, in order to be totally flush. However, if multiple ganged receptacles are required, then the installer must adapt to the field conditions. This is usually done by directly fastening the box to the stud with self-tapping screws. Most installers would rather "err" in keeping the box behind the surface of the GWB rather than risk having the box extend out beyond the surface of the GWB. Another problem would be the use of 5/8 in. GWB. Tile rings come in either 1/2 in. or 3/4 in. not 5/8 in. This is close enough on some jobs but what people seem to forget is that the threaded 6/32 in. bolt in conjunction with the direct metal to metal contact between the yoke of the receptacle and the box itself is a "green wire".

It can be argued that the electrician should not rely on the box as the ground in these instances. I agree, but how in the world can an inspector be asked to pass any future project without dismantling every receptacle in question to make sure that if it does not conform, then it must have a green pigtail to the box. In today's competitive world it seems unfair to place this burden on the inspectors whom already have their work cut out for them. Simply by deleting these two words, "or at", this code section can be enforced quickly and fairly.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The panel concludes that Proposal 5-282 meets the intent of the submitter.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #771)

5- 290 - (250-162): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add to the first paragraph:
In all other respects grounding methods shall comply with applicable requirements prescribed in other parts of this code.
Revise (a) Exception No. 2: A rectifier-derived dc system supplied from an ac system complying with Section 250-20, where there is electrical isolation between the supply conductors and the derived system conductors, shall not be required to be grounded. Where there is a direct electrical connection between the ac system and the dc system, the derived dc system shall not be grounded.
SUBSTANTIATION: Since Part H doesn't specifically indicate other requirements covered in Part B which may be applicable for dc systems, the proposal would clarify that some of those requirements do apply, such as Sections 250-50; 250-56; 250-64; 250-68; 250-70, etc.
If Exception No. 2 is not used, a rectifier without an isolating transformer, if grounded, in effect provides a ground for the supply system, if ungrounded, or a short-circuit or second ground on a grounded supply conductor if the supply system is grounded, dependent on which dc conductor is grounded.
It is somewhat puzzling that such dc systems regardless of capacity or extent may be ungrounded while grounding is apparently required for dc generators regardless of capacity and 3-wire dc systems regardless of voltage or capacity. Such rectifier systems should supply various equipment in unlimited areas, without a ground detector, in contrast to Exception No. 1 which applies to other systems.

PANEL ACTION: Reject.
PANEL STATEMENT: The submitter is repeating the concept from the 90-3 unnecessarily. The submitter has not provided adequate substantiation.

(Log #772)

5- 291 - (250-166(f) (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add new paragraph (f) to read as follows:

(f) Class 1, Class 2, and Class 3 Separtely Derived Systems. A separately derived system that supplies a Class 1, Class 2, or Class 3 circuit(s) shall not be required to have a grounding electrode conductor connection to a grounding electrode where all of the following conditions are met:

(1) The power source is rated not more than 1000 volt-amperes.

(2) The power source is a rectifier and the enclosure is grounded by one of the means specified in Section 250-118, or a stand-alone solar photovoltaic system.

(3) The conductor to be grounded is bonded to the rectifier enclosure or the solar photovoltaic power source disconnecting means by a jumper not smaller than the largest derived circuit conductor and not smaller than No. 14 copper or No. 12 aluminum or copper-clad aluminum.

SUBSTANTIATION: While some of these systems especially Class 2 and 3 may be exempt from grounding by (a), where they are grounded by choice or where the voltage is over 50 as indicated in (a), Table 11(b) of Chapter 9, and as required by Section 690-41, it appears a grounding electrode conductor sized in accorance with (b) connected to an electrode per (c), (d), or (e), or Section 690-47 is required.

There does not appear to be any present provision for such dc circuits as provided for ac circuits in the exception for Secton 250-30(2).

(See my proposal for Section 250-162(a), Exception No. 2).
PANEL ACTION: Reject.
PANEL STATEMENT: The panel concludes that repeating the requirement here is unnecessary. The recommended text does not add to the clarity of this section. The proposed new (f) is not appropriate for Section 250-166 titled "Size of Direct-Current Grounding Electrode Conductor."
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #773)

5- 292 - (250-168): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

Direct-Current Bonding Jumper. For grounded dc systems, an unspliced bonding jumper shall be used to connect the equipment grounding conductor(s) to the grounded conductor of the system. The point of connection shall be the same as the grounding electrode conductor as required in Section 250-164. The ~~the~~ size of the bonding jumper shall not be smaller than the system grounding electrode conductor specified in Section 250-166 (a) and (b).

SUBSTANTIATION: Which bonding jumper is referenced? A "main" bonding jumper must be inferred since specifics are lacking. Section 250-28 applies to ac systems, and Section 250-30(a)(1) does not apply. Since a main bonding jumper is a critical componet of a fault return path, a reduction in size per Section 250-166(c) and (d) should not be included, just as it is not included for ac system main bonding jumpers per Section 250-28(d).
PANEL ACTION: Reject.
PANEL STATEMENT: The recommended text is not clear and suggested wording is confusing. There is no substantiation for the bonding jumper to be unspliced.

5- 293 - (250-169): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

Ungrounded Direct-Current ~~Separately Derived~~ Systems. Except as permitted in Section 250-34 for portable and vehicle-mounted generators, an ungrounded separately derived system supplied from a stand-alone power source such as an engine-generator set, and ungrounded individual services supplied from an off-premises supply station shall have a grounding electrode conductor connected to an electrode that complies with Part C, to provide for grounding of metal enclosures, raceways, cables, and exposed noncurrent-carrying metal parts of equipment. The grounding electrode conductor connection shall be to the metal enclosure, or nonflexible metal raceway at any point on the separately derived system from the source to the first system disconnecting means or overcurrent device ~~or it shall be made at the source of a~~ Where the separately derived system ~~that~~ has no disconnecting means or overcurrent device, or directly supplies multiple circuits the connection ~~it~~ shall be made at the source of the separately derived system. Where multiple circuits are directly supplied the equivalent area of the largest conductor shall be considered as the sum of the areas of the largest conductor of each circuit.

For services the grounding electrode conductor connection shall be made to the metal enclosure of the service conductors or to the nonflexible metal service raceway at any convenient point from the load end of the service drop or service-lateral to the service disconnecting means. Where a service consists of more than a single disconnect, as permitted in Section 230-40, Exception No. 2, a single point of connection shall be permitted. The size of the grounding electrode conductor shall be in accordance with Section 250-166.

SUBSTANTIATION: Part H has substantially incorporated requirements for dc system grounding electrode conductors and grounding electrodes, except ungrounded services do not appear to be specifically covered. Section 250-24(d) relates to ac services and Section 250-32(c) does not apply to services.

Nonflexible metal service raceways are proposed as a suitable connection point. One connection point is indicated as acceptable for multiple disconnects since required service bonding will provide adequate grounding.

Where separately derived systems directly supply multiple circuits, there is a question of how to size the grounding electrode conductor; should it be based on the largest conductor of any one circuit or the aggregate area of the largest conductors of each circuit?

(See substantiation for my proposal for Section 250-30(a)(1) for separately derived systems.)
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed wording is unclear and confusing. The panel is not clear as to the intent of the submitter.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #775)

5- 294 - (250-184): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

(a) ~~Neutral~~ Grounded Conductor. The minimum insulation level for ~~neutral~~ grounded conductors of solidly grounded systems shall be 600 volts.

Exception No. 1: Bare copper conductors shall be permitted to be used for the ~~neutral~~ grounded conductor of service entrances, service-laterals, and ~~the neutral of~~ direct-buried portions of feeders.

Exception No. 2: Bare conductors shall be permitted for ~~the neutral of~~ overhead portions of spans installed outdoors, in accordance with Sections 225-4 and 230-22 Exception.

~~FPN: See Section 225-4 for conductor covering where within 10 ft (3.05 m) of any building or other structure.~~

(b) Multiple Grounding. The ~~neutral~~ grounded conductor of a solidly grounded system shall be permitted to be grounded at more than one point for:
(1) Services
(2) Direct-buried portions of feeders employing a ~~bare~~ copper ~~neutral~~ conductor.
(3) Overhead aerial portions installed outdoors.
(c) ~~Neutral~~ Grounding Conductor. The ~~neutral~~ grounding conductor shall be permitted to be a bare conductor if isolated from phase conductors and protected from physical damage.
SUBSTANTIATION: There doesn't seem to be a safety reason to limit this section to neutral which excludes its use where the service and distribution system is 2-wire, such as in mobile home parks, recreational vehicle parks, etc., where transformation is to single-phase low-voltage utilization values.
If the neutral (grounded) conductor of service entrances can be bare, why not service laterals?
The limitation of Exception No. 2 to neutrals would not permit a bare grounded conductor of a 2-wire system as a service-drop conductor since it is not specifically permitted, as required to invoke the exception for Section 225-4.
In (b)(2) the bare copper restriction precludes multiple grounding of insulated conductors, using approved splicing methods. The condition of a bare conductor does not seem pertinent.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation does not support the recommendation. Grounded conductors are usually neutral conductors, but in this section the grounded conductor is always a neutral. The section should remain as presently worded.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17

(Log #3413)

5- 295 - (250-184): Reject
SUBMITTER: Donald W. Zipse, West Chester, PA
RECOMMENDATION: Completely rewrite 250-184 as follows:
250-184. Solidly Grounded Neutral Systems.
(a) Neutral Conductor Insulation Rating. The minimum insulation level for neutral/identified conductors of solidly grounded systems shall be 600 volts.
Exception No. 1: Bare conductors shall be permitted to be used outdoors for the service entrances where the equipment is station type equipment located outdoors. The equipment grounding conductor or direct-buried portions of feeders may be bare conductor.
FPN: See Section 225-4 for conductor covering where within 10 ft (3.05 m) of any building or other structure.
(b) Grounding. The neutral/identified conductor of a solidly grounded neutral system above 1 kV and over (high voltage) shall be grounded at one location only, preferably at the source transformer or generator.
(3) The neutral/identified conductor shall be insulated and isolated from earth except at one location.
(4) A separate bare equipment grounding conductor shall be installed and run with the phase conductors and the insulated neutral/identified conductor and shall extend into the customer's property along with the insulated phase and insulated neutral/identified conductor(s).
(c) Utility Source. The interface between the utility source and the customer's property shall have:
(2) A neutral isolator/blocker device installed between the utility's multiple neutral grounded conductor and the customer's isolated and insulated neutral/identified conductor. Such neutral blocking device shall be listed by Underwriters Laboratories as per 250-2(d).
(3) A separate bare equipment grounding conductor shall be installed and run with the phase conductors and extending into the customer's property.
(d) Neutral/Identified Conductor. The neutral/identified conductor shall be an insulated conductor. The neutral/identified conductor shall have sufficient ampacity for the load imposed on the conductor, but not less than unbalanced ampacity of the phase conductors. The neutral/identified conductor shall be designed to carry unbalanced phase current continuously.
(e) Equipment Grounding Conductor.
(2) The equipment grounding conductor may be bare and shall have sufficient ampacity for the load imposed on the conductor, but not less than 20 percent of the ampacity of the phase conductors.
(3) The equipment grounding conductor shall be connected to each transformer and to the transformers' grounding electrode and at other additional locations by connection to existing ground electrodes.
(4) The equipment grounding conductor shall have at least one grounding electrode installed and connected to the equipment grounding conductor every 400 m and the maximum distance between any two adjacent electrodes shall not be more than 400 meters.
(5) The equipment grounding conductor shall be available for fault current duty only and the equipment grounding conductor shall not carry or conduct continuous current.
(6) In a multiple grounded shielded cable system there shall be, if required, a separate insulated neutral/identified conductor. The equipment grounding shield shall be grounded at each cable joint which is exposed to personnel contact.
SUBSTANTIATION: 250-184 is shown in its complete form for the ease of reading and understanding by the panel members. This will allow them to see how the individual proposals modifying 250-184 fit together.
There are such laws such Ohm's Law and Kirchoff's Laws. Now there is Zipse's Law — Zipse's Law:
"In order to have and maintain a safe electrical installation:
All continuously, flowing current shall be contained within an insulated conductor or if a bare conductor, the conductor shall be installed on insulators, insulated from earth, except at one place within the system and only one place can the neutral be connected to earth.
A system is defined as the conductors between transformers or after the last transformer."
Approximately 25 years ago, what is now Code Making Panel 19 made mandatory the connection of trailers using 4 or 5 wire systems. The panel recognized the hazards associated with multiple connection of the neutral conductor, identified conductor to earth/ground. Two (2) or three (3) phase conductors, and insulated neutral conductor and a bare ground conductor were required.
One or two Code cycles later another Code Making Panel made mandatory the connection of Marinas using 4 or 5 wire systems thus eliminating the hazardous condition of stray, uncontrolled flow of current over metallic conducting paths and water.
It was not until the 1996 edition of the NEC that this panel, Code Making Panel No. 5, saw clear to make ranges and dryers wiring mandatory using 4 or 5 wire systems with an insulated and isolated neutral/identified conductor and a separate equipment ground/earth conductor.
It makes sense then that the high voltage electrical systems under the control of the NEC and Code Making Panel No. 5 would follow the same logic, that the neutral/identified conductor would be insulated and connected to earth at only one place in order to eliminate hazardous flow of uncontrolled stray current. It has been reported that persons in showers and swimming pools and dairy cows have received electric shock from this stray uncontrolled flow of neutral return current flowing uncontrolled over the earth, metallic piping and other conductive surfaces.
If and when the public is informed of the dangers associated with multiple neutral to ground/earth connections that result in hazardous uncontrolled flow of stray current over the earth, interior water and gas piping systems and other conducting paths that result in electric shocks to the inhabitants, law suits will probably follow.
PANEL ACTION: Reject.
PANEL STATEMENT: This proposal calls for changes that would isolate the grounded conductor of the premises wiring system from the equipment grounding system. During fault and/or lightning disturbances, premises equipment with cases and frames referenced to the equipment grounding conductor will be subject to potentially damaging high voltage as a result of ground potential rise.
The substantiation cites elimination of stray current. The panel does not agree that the proposed arrangement will accomplish this. Stray current could still enter the premises system through the equipment grounding conductor proposed to be run to the source. Control of stray current can be accomplished by other means without subjecting premises wiring to the referenced hazards.
The submitter has not provided adequate substantiation for the proposed major changes in this section. Although the 4 or 5 wire systems are required for trailers and marinas, they are not required for other residential occupancies nor are they required for any commercial or industrial occupancy. The submitter has not substantiated reasons for requiring the 5 wire system for systems of 1 KV and over which are typically industrial facilities.

The following represent some of the areas where substantiation is lacking.

1) A neutral conductor of a grounded system is required to be identified by 200-2. There is no substantiation for the use of the term "neutral/identified".

2) There is no substantiation of why bare conductors can only be used at outdoor station type equipment.

3) There is no substantiation for permitting aluminum for a neutral conductor that was not previously permitted.

4) The neutral conductor is specified to be grounded in one location only. This requirement cannot be met for a service supplied directly from a utility high voltage system without an isolation transformer.

5) A neutral isolator/blocker cannot be provided unless the system is a separately derived system. There is no alternative given for a service supplied directly from the utility without a transformer.

6) There is no substantiation for requiring the neutral conductor to be insulated.

7) The equipment grounding conductor is specified to have "sufficient ampacity for the load imposed on the conductor". An equipment grounding conductor is not intended to carry load current.

8) The requirement for the equipment grounding conductor to have an ampacity not less than 20 percent of the phase conductor ampacity is not consistent with Table 250-122 with no substantiation.

9) There is no substantiation of why connection of the equipment grounding conductor to "additional" locations can only be to existing electrodes. If there are no existing grounding electrodes, is the equipment grounding conductor not grounded at other locations?

10) There is no substantiation for requiring the equipment grounding conductor to be connected to a grounding electrode at least every 400 meters.

11) A shielded cable is not specified as to when it is required.

12) There is no substantiation of why the equipment ground shield is to be grounded at each cable joint exposed to personnel contact.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
DOBROWSKY: The proposal should be accepted in principle. The term "identified" can be deleted because it doesn't add clarity and is unnecessary. Bare neutral conductors are intended to be allowed only where they do not establish another "path" through the earth. Restricting neutral grounding to only one location can be accomplished within the scope of the NEC. Normal current should be restricted to those conductors that are insulated or isolated from the earth and other non-intended conductive paths.

(Log #3402)

5- 296 - (250-184(a)): Reject
SUBMITTER: Donald W. Zipse, West Chester, PA
RECOMMENDATION: Delete 250-184(a) and replace with:

250-184. Solidly Grounded Neutral Systems.

(a) Neutral Conductor Insulation Rating. The minimum insulation level for neutral/identified conductors of solidly grounded systems shall be 600 volts.

SUBSTANTIATION: This is one of a series of proposals dealing with the potential for unsafe conditions resulting from the flow of stray, uncontrolled current over the earth, metallic piping such as metallic water piping, metallic gas piping, metallic process lines, etc., and building steel, and other conductive paths, including earth. They are submitted individually so that each proposal can be voted on separately and the panel not be forced to vote on the total changes as one proposal.

It would appear to be shear folly for the NEC, Code Making Panel No. 5 to copy the NESC when there are flaws in that code. Other countries such as the European Community countries do not allow stray uncontrolled current to flow continuously of the earth that can and has resulted in electric shocks to not only cows, but humans also.

There are two technical papers with details of this problem on the web at location: www.mikeholt.com/Newsletters/8-16-99.doc and at www.mikeholt.com/Newsletters/8-17-99.doc.

5- 298 - (250-184(b)): Accept

NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 4, 10, and 13 for information.

SUBMITTER: William M. Lewis, Eli Lilly and Co.
RECOMMENDATION: Change 250-184(b) to read:

(b) Multiple Grounding. The neutral of a solidly grounded neutral system shall be permitted to be grounded at more than one point and shall include the following:

1. Transformers supplying feeder taps or services to a building or other structure;
2. Underground portions of feeders where the neutral is exposed;
3. Overhead portion installed outdoors.

SUBSTANTIATION: Technically a feeder tap installed or owned by an independent operator of an overhead distribution system is not a service unless that operator is classified as a utility. The need for a multiple ground at this type installation is still valid. This proposal was developed by the Task Group based on the Task Group's review and discussion of the current requirements of Articles 225, 230, 100, 110, 240, and 250. This proposal is one of 14 which makes up the Task Group's response to a recommendation by a TCC task group on usability in 1995. In considering the needed proposals, emphasis was placed on including in the NEC, practices which are recognized in the electrical industry as necessary for safe installation of over 600 volt systems. This is to provide guidance and direction for installation of these facilities which have not historically been included in the NEC.

The Task Group participants consisted of William M. Lewis (CMP 4); committee chair; Carl J. Fredericks (CMP 10); Tom Adams (CMP 4); John Beck (Chairman CMP 4); Mark Sumrall

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

BRENDER: It would be a mistake to adopt practices from the NESC into the NEC. The NESC applies to utilities only, and normally utilities would correct a phase imbalance of 10 percent or greater. Individual utility customers, of the type that would be governed by the National Electrical Code would not necessarily do so. Very simply, customers behave differently than utilities.

Further, most utilities usually order a 1/3 neutral per phase, which adds up to a full size neutral per circuit. Sometimes, owing to the nature of their systems, multiple paths may exist from a fault back to a source. Only under careful engineering supervision, which utilities are capable of, would they consider a smaller neutral.

I personally have encountered many technically-unsophisticated end users who have leased or purchased a facility served at distribution voltages over 1kV, and they do not have the trained personnel of a utility company to operate their high voltage internal systems, nor even an awareness of the level of training and supervision required.

Irrespective of the NESC, there is no substantiation presented that a 20 percent neutral is safe or adequate for customer systems. It is clear from the proposal's wording on 400 m spacing between grounding electrodes that the submitter had utility companies in mind. There is no reason whatsoever for the National Electrical Code to adopt utility practices to public-at-large facilities. This proposal diminishes safety.

DOBROWSKY: See my Explanation of Negative Vote on Proposal 5-295.

5- 309 - (250-186): Accept
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 4, 10, and 13 for information.
SUBMITTER: William M. Lewis, Eli Lilly and Co.
RECOMMENDATION: Change Section 250-186 to read:
250-186. Impedance Grounded Neutral Systems.
Impedance grounded neutral systems <u>in which a grounding impedance, usually a resistor, limits the ground-fault current, shall be permitted where all of the following conditions are met.</u>
<u>(1) The conditions of maintenance and supervision ensure that only qualified persons will service the installation.</u>
<u>(2) Ground detectors are installed on the system.</u>
<u>(3) Line-to-neutral loads are not served.</u>
Impedance grounded neutral systems shall comply with the provisions of (a) through (d).
(a) Location. The grounding impedance shall be inserted in the grounding conductor between the grounding electrode of the supply system and the neutral point of the supply transformer or generator.
(b) Identified and Insulated. Where the neutral conductor of an impedance grounded neutral system is used, it shall be identified, as well as fully insulated with the same insulation as the phase conductors.
(c) System Neutral Connection. The system neutral shall not be connected to ground, except through the neutral grounding impedance.
(d) Equipment Grounding Conductors. Equipment grounding conductors shall be permitted to be bare and shall be <u>electrically</u> connected to the ground bus and grounding electrode conductor ~~at the service-entrance equipment or the disconnecting means for a separately derived system and extended to the system ground.~~

SUBSTANTIATION: Section 250-36 sets forth some rules for 480 to 1000 volt high impedance grounded systems. These requirements are also valid for over 600 volt systems and are brought forward to this section. Common practice for a medium voltage, impedance grounded system is to extend a grounding electrode conductor with the phase conductors for connection of equipment grounds. The requirement that the connection be made at the service disconnect is not a valid requirement.

This above proposal was developed by the Task Group based on the Task Group's review and discussion of the current requirements of Article 225, 230, 100, 110, 240, and 250. This proposal is one of 14 which makes up the Task Group's response to a recommendation by a TCC task group on usability in 1995. In considering the needed proposals, emphasis was placed on including in the NEC, practices which are recognized in the electrical industry as necessary for safe installation of over 600 volt systems. This is to provide guidance and direction for installation of these facilities which have not historically been included in the NEC.

The Task Group participants consisted of William M. Lewis (CMP 4); committee chair; Carl J. Fredericks (CMP 10); Tom Adams (CMP 4); John Beck (Chairman CMP 4); Mark Sumrall (CMP 4); Barry Hornberger, (CMP 13); William T. Beutler, P.E.; William Long, NEMA.

Interested persons (nonparticipants): Robert J. Pollock (CMP 4 and TCC); Merton Bunker (NFPA); Mark Earley (NFPA)

AFFIRMATIVE: 17

(Log #4189)

5- 310 - (250-186): Reject

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Revise as follows:

Add the following sentence at the end of Section 250-186, and then add a new subsection (e), as follows:

Low-impedance grounded neutral systems shall additionally comply with (e) where equipment grounding conductors run separately from the associated phase conductors.

(e) Low-Impedance Grounded Neutral Systems. Where the electrical system is provided with relay protection such that ground faults will be cleared as rapidly as possible but, in any case, within 10 seconds, equipment grounding conductors shall be permitted to be run separately from the phase conductors. The grounding impedance shall be monitored, and in the event it shorts or opens, the system shall be disconnected or an alarm shall be provided at a constantly attended point. The equipment grounding return path shall meet the requirements of Section 250-2(d) without reliance on the existence of the grounding impedance in the circuit.

SUBSTANTIATION: This proposal responds to technical aspects of low-impedance grounded medium-voltage systems. These systems use grounding impedances to limit destructive fault current energy, rather than to prevent disorderly shutdowns as in the case of high-impedance grounded systems. This means that instead of remaining on line with supervised alarms until an orderly shutdown can be arranged, they trip open quickly, functioning essentially as grounded systems in terms of automatic fault clearing. The proposal parameter of ten seconds is based on the typical grounding resistor rating

On the other hand, these do have an impedance. in their neutral connections, which means that fault clearing depends on a relay which need not see large values of fault current in order to respond. At these low levels of fault current (on the order of a few hundred amperes), the impact of increased reactance due to separation of the grounding and phase conductors is minimal. The impedance of the reactance is several orders of magnitude above the reactance due to circuit separation, and therefore the impact of separating those conductors can be disregarded. Suppose the conductor separation causes increases the return impedance by 0.01 ohm. The clearing time for a relay monitoring a 20 ohm impedance won't vary because the total circuit impedance went from 20.41 ohms, for example, to 20.42 ohms. Literal enforcement of the present requirement is costly, impractical, and accomplishes nothing.

This is fundamentally different from high-impedance grounded systems. Although equipment grounding conductors on high-impedance grounded systems normally carry even lower values of fault current, as noted they stay on line until a shutdown can be arranged, and during this period they are essentially functioning as ungrounded systems. If a second fault occurs on a different phase during this period, the result is a short circuit that must be cleared immediately, often through inverse-time devices. Now, as in low-voltage grounded systems, the lowest possible impedance becomes critical.

For this reason, the proposed separation allowance is restricted to low-impedance grounded systems. Such an allowance is inappropriate for ungrounded systems and high-impedance grounded systems, and must never be considered for solidly grounded systems. However, for low-impedance grounded systems, it is both practical, safe, and widely done.

This is an even more conservative version of the original proposal as rejected during the previous comment period. The gravamen of the panel objection was that if the grounding impedance became shorted or grounded, the system would function as grounded or ungrounded, respectively, and would need to comply with protective requirements accordingly. This version addresses that concern. Actually, the equipment grounding return path on these systems is excellent. These systems, when properly installed, have phenomenally low return impedances, and the grounding conductors will maintain continuity and conduct safely any currents likely to be imposed even with the resistance out of the circuit or with the resistance short-circuited. It's just that they are so well engineered that running individual return conductors is pointless.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel reaffirms its position that routing of an equipment grounding conductor separately from the phase conductors will reduce the fault currents and increase the clearing time. This proposal places no restrictions on the length and the spacing of the equipment grounding conductor from the phase conductors. Low impedance grounded systems are permitted provided that all the applicable requirements contained in the NEC are followed.

ARTICLE 280 — SURGE ARRESTERS

(Log #3681)

5- 312 - (280-11): Reject
SUBMITTER: Leonard F. Devine, Jr., W. Palm Beach County Bldg & Zoning, FL
RECOMMENDATION: Add the following text:
280-11. Location.
Surge arresters, listed and labeled, by a nationally recognized testing laboratory, shall be installed v on all services. Surge arresters shall be permitted to be located indoors or outdoors. Surge arresters shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.
SUBSTANTIATION: The reason for adding this requirement is because of all the damage that results from lightning strikes, especially with all the new electronic equipment being installed. It is felt that with a minimal investment, many dollars may be saved by installing surge protection.
PANEL ACTION: Reject.
PANEL STATEMENT: The installation of a surge arrester is not prohibited. There is no substantiation to require surge arresters on all installations. The Code can require listing, but does not require listing by a nationally recognized testing laboratory. Installation of surge arresters as proposed at service level would not necessarily protect electronic equipment.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 16

(Log #2257)

5- 313 - (280-20 (New)): Reject
SUBMITTER: Charles J. Kovarik, Baltimore, MD
RECOMMENDATION: Add the following:
280-20. Where Required. A surge arrestor, selected per 280-4, shall be installed on the service entrance or feeder conductors for individual dwelling units as permitted under this article.
SUBSTANTIATION: My experience in 12 years of investigating fires due to electrical causes includes a disproportionate number of residential fires from surge-induced failures, particularly of electronic-based appliances. The use of surge arrestors as proposed is a cost-effective means of reducing such losses, which will otherwise continue to increase with many new electronic-based products emerging each year. Nondwelling applications do not have the same potential for such losses.
PANEL ACTION: Reject.
PANEL STATEMENT: The installation of a surge arrester is not prohibited. There is no substantiation to require surge arresters on all dwelling unit installations. Installation of surge arresters as proposed at service level may not necessarily protect electronic equipment in all cases.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: Alan Manche, Square D Co.
RECOMMENDATION: Add a new Article 285 as follows:
Article 285 - Transient Voltage Surge Suppressors (TVSS)
I. General.
285-1. Scope. This article covers general requirements, installation requirements, and connection requirements for Transient Voltage Surge Suppressors (TVSS) installed on premises wiring systems.
285-2. Definition. A Transient Voltage Surge Suppressor is a protective device for limiting transient voltages by diverting or limiting surge current, and it also prevents continued flow of follow current while remaining capable of repeating these functions.
285-3. Uses Not Permitted. The use of a TVSS shall not be permitted on the following:
1) Circuits exceeding 600 volts.
2) Ungrounded electrical system as permitted in Section 250-21.
3) Where the rating of the TVSS is less than the maximum continuous phase-to-ground power frequency voltage available at the point of application.
FPN No. 1: For further information on Transient Voltage Surge Suppressors, see NEMA LS-1. The selection of a properly rated Transient Voltage Surge Suppressor is based on criteria such as maximum continuous operating voltage, the magnitude and duration of overvoltages at the suppressor location as affected by phase-to-ground faults, system grounding techniques, and switching surges..
285-4. Number Required. Where used at a point on a circuit, the TVSS shall be connected to each ungrounded conductor.
285-5. Listing. A TVSS shall be a listed device.
285-6. Short Circuit Current Rating. The TVSS shall be marked with a short circuit current rating and shall not be installed at a point on the system where the available fault current is in excess of that rating.
II. Installation.
285-11. Location. TVSS shall be permitted to be located indoors or outdoors and shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.
285-12. Routing of Connections. The conductors used to connect the Transient Voltage Surge Suppressor shall not be any longer than necessary and shall avoid unnecessary bends.
285-21. Connection of the TVSS. Where a TVSS is installed, the following shall apply:
(A)Location.
(1) Service Supplied Building or Structure. The TVSS shall be connected on the load side of a service disconnect overcurrent device required in 230-91.
(2) Feeder Supplied Building or Structure. The TVSS shall be connected on the load side of the first overcurrent device at the building or structure.

Exception to 1 and 2: Where the TVSS is also Listed as a Surge Arrester, the connection shall be as permitted by Article 280.

(3) Separately Derived System. The TVSS shall be connected on the load side of the first overcurrent device in a separately derived system.

(B) Conductor Size. Line and ground connecting conductors shall not be smaller than No. 14 copper or No. 12 aluminum.

(C) Connection Between Conductors. A transient voltage surge suppressor shall be permitted to be connected between any two conductors - ungrounded conductor(s), grounded conductor, grounding conductor. The grounded conductor and the grounding conductor shall be interconnected only by the normal operation of the TVSS during a surge.

285-25. Grounding. Transient voltage surge suppressor grounding connections shall be made as specified in Article 250 unless otherwise noted in this article. Grounding conductors shall not be run in metal enclosures unless bonded to both ends of such enclosure.

SUBSTANTIATION: The Transient Voltage Surge Suppressor has become a common component of the electrical distribution system in North America. Unfortunately, the NEC presently does not recognize the installation of a TVSS, which has unique performance and safety concerns in comparison to a Surge Arrester in Article 280. Manufacturers of TVSS products reference Articles 250 and 280 as part of their installation instructions, but installers, and inspectors find nothing in the NEC recognizing a TVSS. This new proposed Article 285 is intended to address the unique safety concerns of TVSS products. It is recognized that some of the material is the same as that in Article 280, but a separate article is strongly recommended because there are differences between surge arresters and there is presently confusion generated among users between an arrester and a TVSS.

Transient Voltage Surge Suppressors (TVSS) are being installed in residential, commercial, and industrial facilities in order to protect sensitive electronic equipment. TVSS products function similar to surge arresters, however, in order to provide protection for electronic equipment, TVSS devices begin to operate (i.e. - conduct electricity), much closer to the system operating voltage than a typical surge arrester. The NEC does not recognize or address the unique safety implications associated with the TVSS operating characteristics and the UL 1449 safety standard. Surge arresters are evaluated using a variety of IEEE standards, not UL 1449. TVSS products are tested at much lower surge current levels compared to surge arresters, therefore the NEC needs to include the additional safety requirements specific to TVSS devices.

The UL 1449 Safety Standard evaluates products with a maximum rating of 600V and assumes the TVSS is installed on the load side of the service disconnect and its overcurrent protection. The NEC must require that a TVSS be installed on the load side of a service disconnect's overcurrent protection device in order to preserve the safety requirements found in UL 1449. The overcurrent protection is necessary to protect the conductors and electrical equipment if the TVSS is subjected to a system over-voltage. The over-voltage can send the TVSS directly into conduction, as properly designed, but if the overvoltage continues for a period of time beyond its designed capabilities it can cause the TVSS to fail shorted.

The following is the specific substantiation for each Section:

285-1 - This scope is specific to TVSS devices and parallels that for Article 280.

285-2 - This definition is based on the definition contained in UL 1449.

285-3 (1) is from the scope of UL1449.

285-3 (2) is a recognized condition that must be addressed. The modes of protection for TVSS devices are line-to-line (L-L) and line-to-ground (L-G). No reference to ground exists on an ungrounded system allowing the operating voltage to fluctuate. ANSI / IEEE 242-1996 is an industry accepted standard on the Protection and Coordination of Industrial and Commercial Power Systems. A review of ungrounded systems is found in Chapter 7 on page 277 starting with Section 7.25. In reference to IEEE 242, the electrical system in an ungrounded configuration can be subjected to severe overvoltages to ground, as high as 6 to 8 times the normal system operating voltage, when a fault condition arises. TVSS devices will go directly into conduction mode as a result of these extreme overvoltages. Once again, this ungrounded operating condition subjects the TVSS to extreme overvoltages for a long duration causing thermal damage and device failure.

285-3 (3) parallels the limitation specified in Section 280-4(a) for surge arresters.

285-4 - This is a parallel requirement to Article 280 to indicate that the TVSS (where used) must be connected to each ungrounded conductor. Without this requirement, the TVSS will not accomplish the intended objective of protection.

285-5 - Because of the possible failure modes and the wide variety of types of TVSS devices, it is important that the product be evaluated to a recognized standard. Since the AHJ cannot determine compliance of the product in the field the listing requirement is necessary. UL 1449 - Transient Voltage Surge Suppressors would be the appropriate standard for this evaluation and it is noted that the standard includes the evaluation of a TVSS in accordance with the NEC as part of the standard's scope. This requirement is parallel to that in 280-4(a) for Surge Arresters on <1000 volt systems.

285-6 - TVSS products must also have a short circuit current rating. Understanding that short circuit current ratings are usually addressed in section 110-10, this is a unique marking requirement for TVSS devices not currently required for surge arresters. Because this has been one of the key areas of misapplication of TVSS devices, it is important to point out the limitation in the article. The common technology, Metal-Oxide Varister(MOV), employed by TVSS products make a direct line-to-line or line-to-ground connection in order to conduct current through the components during an over-voltage condition. A common mode of failure for an MOV is to establish a direct short between conductors. The available fault current may follow the conduction path under this shorted condition. The TVSS may incur thermal damage and fail in an unsafe manner if it does not have the appropriate short circuit current ratings for the system on which it is employed.

285-11 - Parallels Section 280-11.

285-12 - Parallels Section 280-12.

285-21 - The location requirement in Part A specifically address where the TVSS can be installed in the electrical system on a building or structure or on a separately derived system. Exposure to externally high level surge sources is not just found at the service but on feeders to other buildings or structures. These location requirements are exempt if the device has been tested to the surge current levels of an arrester. The requirement also addresses the necessity of overcurrent protection for the TVSS on a separately derived system. An arcing fault in the TVSS, using number 12 conductors, is not going to be detected by the transformer primary protection.

280-25 - Parallels Section 280-25.

PANEL ACTION: Accept in Principle.

Article 285 – Transient Voltage Surge Suppressors: TVSS ~~–1~~I. General

285.1 Scope. This article covers general requirements, installation requirements, and connection requirements for ~~T~~transient ~~V~~voltage ~~S~~surge ~~S~~suppressors (TVSS) installed on premises wiring systems.

285.2 Definition. A ~~T~~transient ~~V~~voltage ~~S~~surge ~~S~~uppressor (TVSS) is a protective device for limiting transient voltages by diverting or limiting surge current, and it also prevents continued flow of follow current while remaining capable of repeating these functions.

285.3 Uses Not Permitted. ~~The use of a~~ A TVSS shall not be ~~permitted~~ used ~~on~~ in the following:

(1) Circuits exceeding 600 volts.

(2) Ungrounded electrical systems as permitted in Section 250-21.

~~(3) Where the rating of the TVSS is less than the maximum continuous phase-to-ground power frequency voltage available at the point of application.~~

FPN ~~No. 1~~: For further information on ~~Transient Voltage Surge Suppressors~~TVSS's, see Standard for Low Voltage Surge Suppression Devices NEMA LS 1 – 1992 ~~NEMA LS 1~~. The selection of a properly rated TVSS ~~Transient Voltage Surge Suppressor~~ is based on criteria such as maximum continuous operating voltage, the magnitude and duration of overvoltages at the suppressor location as affected by phase-to-ground faults, system grounding techniques, and switching surges.

285.4 Number Required. Where used at a point on a circuit, the TVSS shall be connected to each ungrounded conductor.

285.5 Listing. A TVSS ~~transient voltage surge suppressor~~ shall be a listed device.

285.6 Short Circuit Current Rating. The TVSS ~~transient voltage surge suppressor~~ shall ~~be marked with a short circuit current rating and shall~~ not be installed at a point on the system where the available fault current is in excess of the marked ~~that~~ rating.

II. Installation

285.11 Location. TVSS's ~~Transient voltage surge suppressors~~ shall be permitted to be located indoors or outdoors and shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.

285.12 Routing of Connections. The conductors used to connect the TVSS to the line or bus and to ground shall not be any longer than necessary and shall avoid unnecessary bends.

III. Connecting Transient Voltage Surge Suppressors

285.21 Connection ~~of the TVSS~~. ~~Where a TVSS is installed the following shall apply.~~ A TVSS shall be connected as follows:

(A) Location.

(1) Service Supplied Building or Structure. The ~~TVSS~~ transient voltage surge suppressor shall be connected on the load side of a service disconnect overcurrent device required in 230-91.

(2) Feeder Supplied Building or Structure. The ~~TVSS~~ transient voltage surge suppressor shall be connected on the load side of the first overcurrent device at the building or structure.

Exception to 1 and 2: Where the TVSS is also ~~L~~listed as a ~~S~~surge ~~A~~arrester, the connection shall be as permitted by Article 280.

(3) Separately Derived System. The TVSS shall be connected on the load side of the first overcurrent device in a separately derived system.

(B) Conductor Size. Line and ground connecting conductors shall not be smaller than No. 14 copper or No. 12 aluminum.

(C) Connection Between Conductors. A TVSS ~~transient voltage surge suppressor~~ shall be permitted to be connected between any two conductors – ungrounded conductor(s), grounded conductor, grounding conductor. The grounded conductor and the grounding conductor shall be interconnected only by the normal operation of the TVSS during a surge.

285.25 Grounding. Except as indicated in this Article, TVSS ~~transient voltage surge suppressor~~ grounding connections shall be made as specified in article 250. ~~unless otherwise noted in this article.~~ Grounding conductors shall not be run in metal enclosures unless bonded to both ends of such enclosure.

PANEL STATEMENT: In Section 285.3, the third item was deleted because it was a "use not permitted." All other changes were editorial.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 17

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

DIAZ: This proposal requires all Transient Voltage Surge Suppressors, (TVSS), have short circuit current ratings. The product standard defines permanently connected TVSS as either "one port" devices or "two port" devices. A "one port" device is connected across the line(s), neutral and ground, and has no load connection. Therefore, this device would not carry fault current and subsequently does not have a short circuit rating. A "two port" device has line and load connections and will carry fault current. Such devices are required to be subjected to a withstand test and are required to be marked with a short circuit withstand rating. Section 285-6 of this proposal should be revised to indicate that only "two port" devices having line and load connections shall be marked with a short circuit rating.

Note: Supporting material available for review upon request at NFPA headquarters.

COMMENT ON AFFIRMATIVE:

DOBROWSKY: The third item in Section 285-3 should not be deleted. A TVSS should not be permitted where the voltage rating is less than the line to ground voltage.

ARTICLE 300 — WIRING METHODS

Note from the TCC: Renumbering/Relocation of Chapter 3 Articles: As part of the effort to provide common numbering and arrangement of the raceway and wire/cable articles in Chapter 3, the majority of Articles in Chapter 3 will receive new article numbers at the end of the processing of the NEC. This effort is in conjunction with the efforts of CMP 7 and CMP 8 to provide common format and numbering within the majority of articles under their jurisdiction.

The Technical Correlating Committee is responsible for the placement and numbering of Articles. A study has been completed by the Usability Task Group recommending a new numbering system. That recommendation has been reviewed and accepted by the Technical Correlating Committee. The numbering shown in the following chart will be used.

All comments on proposals in this ROP should be made to the existing Article and NOT the new Article numbers. Staff will make the changes to the new Article numbers before printing the 2002 NEC.

In addition to the renumbering, each renumbered Article will have a note after the title indicating the previous article number for that material. Also, a new informative annex will be added to provide a cross-reference of the renumbered Articles from the 1999 NEC to the 2002 NEC.

(Log #1151a)

3- 4 - (300): Reject
SUBMITTER: Don R. Fowlkes, City of Chattanooga, TN
RECOMMENDATION: Possible wording:
"Somewhere in Article 210 or 300 needs heading "Complete Wiring System".
SUBSTANTIATION: Before an electrical wiring system can be considered complete, it must form proper connections between the power source and the final outlet and/or load.
As an inspector, I am required to refer to a code reference to disapprove any code violation. At present, there is no code reference stating when wiring is incomplete (namely branch circuits). It would help the inspectors to be able to cite a code reference when wiring is not complete. Any wording to this effect would be very helpful.
PANEL ACTION: Reject.
PANEL STATEMENT: This proposal doesn't comply with Section 4-3.3 (c) of the NFPA Regulations Governing Committee Projects by providing specific Code text and suggested location within the Code for the change.

3- 5 - (300): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Section 300-4(a)(1) replace "11/4 in. (31.8 mm)" with "32 mm (1 1/4 in.)"
2. In Section 300-4(a)(1) replace "1/16 in. (1.59 mm)" with "1.6 mm (1/16 in.)"
3. In Section 300-4(a)(2) replace "1/16 in. (1.59 mm)" with "1.6 mm (1/16 in.)"
4. In Section 300-4(b)(2) replace "1/16 in. (1.59 mm)" with "1.6 mm (1/16 in.)"
5. In Section 300-4(d) replace "11/4 in. (31.8 mm)" with "32 mm (1 1/4 in.)"
6. In Section 300-4(d) replace "1/16 in. (1.59 mm)" with "1.6 mm (1/16 in.)"
7. In Section 300-4(e) replace "1/16 in. (1.59 mm)" with "1.6 mm (1/16 in.)"
8. In Section 300-4(e) replace "11/4 in. (31.8 mm)" with "32 mm (1 1/4 in.)"
9. In Section 300-5(d) replace "8 ft (2.44 m)" with "2.5 m (8 ft)"
10. In Section 300-5(d), first paragraph, replace "18 in. (457 mm)" with "450 mm (18 in.)"
11. In Section 300-5(d), second paragraph, replace "18 in. (457 mm)" with "450 mm (18 in.)"
12. In Section 300-5(d) replace "12 in. (305 mm)" with "300 mm (12 in.)"
13. In Section 300-6(c) replace 1/4-in. (6.35-mm)" with "6 mm (1/4 in.)"
14. In Section 300-14 replace "6 in. (152 mm)" with "150 mm (6 in.)"
15. In Section 300-14 replace "8 in. (203 mm)" with "200 mm (8 in.)"
16. In Section 300-14 replace "3 in. (76.2 mm)" with "75 mm (3 in.)"
17. In Section 300-21 FPN, replace "24 in. (610 mm)" with "600 mm (24 in.)"
18. In Section 300-22(b) replace "4 ft. (1.22 m)" with "1.2 m (4 ft.)"
19. In Section 300-22(c)(1) Ex. replace "6 ft. (1.83 m)" with "1.8 m (6 ft.)"
20. In Section 300-39 replace "1 in. (25.4 mm)" with "25 mm (1 in.)"
21. In Section 300-50(a)(2) replace "3 in. (76 mm) with "75 mm (3 in.)"
22. In Section 300-50(b) replace "8 ft (2.44 m)" with "2.5 m (8 ft)"
23. In Table 300-50 Ex. No. 1 replace "24 in. (610 mm)" with "600 mm (24 in.)"
24. In Table 300-50 Ex. No. 2 replace "6 in. (152 mm) for each 2 in. (50.8 mm)" with
" 150 mm (6 in.) for each 50 mm (2 in.) "
25. In Table 300-50 Ex. No. 3 replace "4 in. (102 mm)" with "100 mm (4 in.)"
26. In Table 300-50 Ex. No. 3 replace "6 in. (152 mm)" with "150 mm (6 in.)"
27. In Table 300-50 Ex. No. 5 replace "18 in. (457 mm)" with "450 mm (18 in.)"
28. In Table 300-50 Ex. No. 6 replace "2 in. (50.8 mm)" with "50 mm (2 in.) "

SUBSTANTIATION: The proposed revisions are intended to comply with the NFPA No. 1M Manual of Style, Section 4.1 with respect to the placement of units.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3062)

3- 6 - (300-1(c) (New)): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 8 for information.
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Add a new section to read:
(c) Trade Sizes and Metric Designators. Trade Sizes and Metric Designators for conduit, tubing and associated fittings and accessories are designated as follows:

Table 300-1(c). Trade Sizes and Metric Designator

Trade Size	Metric Designator
3/8	12
1/2	16
3/4	21
1	27
1 1/4	35
1 1/2	41
2	53
2 1/2	63
3	78
3 1/2	91
4	103
5	129
6	155

Note: The Trade Sizes and Metric Designators are for identification purposes only and do not relate to actual dimensions.

SUBSTANTIATION: This information has previously appeared in various Code articles and appropriately belongs in this General section. Fittings and other accessory items for a particular product are designated the same so compatibility is assured. This is a companion proposal to others, which delete the FPNs in various articles, thus eliminating a lot of redundant text.
PANEL ACTION: Accept in Principle.
The Panel revises the proposal to read as follows:
"(c) Metric Designators and Trade Sizes. Metric Designators and Trade Sizes for conduit, tubing, and associated fittings and accessories are designated in Table 300-1(c) :
Table 300-1(c). Metric Designator and Trade Sizes"
(Reverse the two columns so that Metric Designators is the first column)
Change from note to FPN to read as follows: "FPN: The Metric Designators and Trade Sizes are for identification purposes only and are not actual dimensions."

PANEL STATEMENT: The changes include the reversing of the order of Metric Designators and Trade Sizes to utilize the same format of the TCC for metrics and changing the existing note to a Fine Print Note for clarity. Also adding a comma after tubing to provide for proper grouping.

(Log #777)

3- 7 - (300-2(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Voltage. Except as otherwise permitted in this code ~~Wiring~~ wiring methods specified in Chapter 3 shall be used for voltages 600-volts, nominal, or less...
(Remainder unchanged).
SUBSTANTIATION: Editorial. Wiring methods not covered by Chapter 3 are apparently sanctioned in Articles 225, 430, 551, 552, 555, 610, 620, 645, 650, 660, 668, 669, 690, 725, 760, etc. Even though most are outside Chapters 1 through 4, they are numerous enough to warrant notation.
PANEL ACTION: Reject.
PANEL STATEMENT: This is adequately covered by 300-1(a) and the last sentence of 300-2(a).

(Log #778)

3- 8 - (300-3): Accept in Principle in Part
Note: The Technical Correlating Committee directs that the panel review this Proposal relative to the action on Proposal 3-11. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Single Conductors. Except as otherwise permitted in this code ~~Single~~ single conductors ~~specified in Table 310-13~~ shall only be installed where part of a recognized wiring method of Chapter 3.
(b) Conductors of the Same Circuit. Where the wiring method is a raceway, auxiliary gutter, cable tray, cablebus, multiconductor cable or cord, or direct-burial, single conductors, ~~All~~ all conductors of the same circuit and, where used, ~~the grounded conductor and~~ all equipment grounding or bonding conductors shall be contained within the same raceway, auxiliary gutter, cable tray, trench, cablebus, cable, or cord, unless otherwise permitted in accordance with (1) through (4).
(1) No change.
(2) Grounding and Bonding conductors. Equipment grounding conductors shall be permitted to be installed outside a raceway or cable assembly where in accordance with the provisions of Section 250-130(c) for certain existing installations or in accordance with Section 250-134 (b) for dc circuits. Where permitted elsewhere in this code other grounding and bonding conductors shall be permitted to be run separately from the circuit conductors. ~~Equipment bonding conductors shall be permitted to be installed on the outside of raceways in accordance with Section 250-102(e).~~
(3) Delete.
(4) No change.
(c)(1) No change to text.
(c)(1) FPN No. 1: See Section 725-26(b) for Class 1 circuit conductors and Section 725-54(a)(1) for Class 2 and Class 3 circuit conductors.
FPN No. 2: See Section 230-7 for service conductors.
SUBSTANTIATION: "Part of a recognized wiring method" is open to interpretation, i.e., (1) the conductors must be an integral component of a raceway, cablebus, gutter, cabletray, etc. installation or open single conductors may be used where extended from or connected to (part of) the Chapter 3 wiring method. It appears the former is intended, as Section 310-13 also refers to Chapter 3 wiring methods. Single conductors appear to be permitted by other articles where not part of a Chapter 3 wiring method, e.g., Sections 110-34(c); 225-6; 230-21; 300-5(i); 300-20(b); 305-4(b), Exception; 426-42; 427-47. Single open conductors are commonly used as open aerial spans, in transformer vaults, battery room, etc. not covered by Articles 320, 321, or 324. It seems this general requirement should also apply to conductors in the other ampacity tables of Article 310.
The provisions of (b) imply that conductors must utilize one of the wiring methods indicated. It does not provide for wiring whereby single-conductor Type MI cable or flexible cable of Table 400-5(b) is used, nor Article 320 or 324. Sections (b)(3) and 330-16 do not specifically alter or modify the basic requirements of (b). The proposal applies the requirements to multiconductor cables and includes cablebus which is not considered a raceway.
Reference to the grounded conductor is superfluous, since where used it is a circuit conductor. Bonding conductors should be included in (b) since equipment bonding jumpers are only permitted outside a raceway if 6 ft or less in length. Since the last sentence of (b)(2) covers equipment bonding jumpers, the proposal includes coverage of other grounding/bonding conductors such as the grounding electrode conductor (Section 250-64) bonding jumpers between electrodes (Section 250-50) bonding conductors for interior piping (Section 250-104), and separate grounding conductors of Sections 250-32(f) and 250-138(b).
Since (b)(3) is an "otherwise permitted" subsection to the basic rule of (b) it infers that conductors of the same circuit may be run in different raceways or cables if enclosed in nonmagnetic metal such as brass or aluminum, or nonmetallic sheath. Such separation of conductors appears to be permitted only by the exception for (b)(1) which is limited to paralleled conductors, nonmetallic raceways, and underground installation. The reference to Section 300-20(b) reinforces this view since it deals with single conductors (one or paralleled). Single conductor Type MI cable is adequately covered in Article 330.
Fine print notes are modified to include other pertinent sections that may modify (c)(1).
PANEL ACTION: Accept in Principle in Part.
Accept the addition of the phrase "and Bonding" to the title of (b)(2) to read as follows:
"(2) Grounding and Bonding Conductors".
Accept the addition of "and bonding conductors" to the third line of the existing text in Section 300-3(b) to read as follows:
"(b) Conductors of the Same Circuit. All conductors of the same circuit and, where used, the grounded conductor, all equipment grounding conductors and bonding conductors shall be contained within the same raceway, auxiliary gutter, cable tray, trench, cable, or cord, unless otherwise permitted in accordance with (1) through (4)."
The committee rejects the remainder of the proposal.
PANEL STATEMENT: The addition of the phrase to the title of (b)(2) was accepted since the text does deal with both grounding and bonding conductors and should be appropriately labeled. The "or bonding conductors" was changed to "and bonding conductors" and added to the third line of the existing text since bonding conductors are also covered in (2) of the existing text.
The suggested change to (a) is too vague and doesn't comply with Section 4-1 of the NEC Style Manual to improve clarity by referencing specific sections of the Code.
The additional text suggested for (b) is already stated at the end of the existing sentence in (b) and makes the sentence more complex than necessary.
The suggested sentence added to (b)(2) is too vague and doesn't comply with Section 4-1 of the NEC Style Manual to improve clarity by referencing specific sections of the Code. The existing sentence dealing with bonding conductors has a specific reference to Section 250-102(e) that more appropriately complies with the style manual.
The additional reference suggested to (c)(1), FPN is unnecessary since the requirements for conductor insulation are located in Section 725-26(b) and may send the wrong message to the user of the Code since the general rule in Section 725-54(a)(1) is to not allow insulation to act as a separation between voltage systems.
The added FPN referencing Section 230-7 is not adding clarity and does not comply with Section 4-1 of the NEC Style Manual. Additional references are not necessary and tend to be less user friendly.

(Log #2790)

3- 9 - (300-3(3)): Reject
SUBMITTER: Jonathan DaBoi Saravia, E. Freetown, MA
RECOMMENDATION: In the first sentence add the word paralleled as the first word.
SUBSTANTIATION: This section permits conductors of the same circuit contained in nonferrous or other nonmagnetic wiring methods to be in separate raceways. I believe the intent was to make an exception for parallel conductors contained in nonferrous or other nonmagnetic wiring methods, but that is not how this section currently reads. The word parallel must appear in this section to clarify the intent.
PANEL ACTION: Reject.
PANEL STATEMENT: This section applies not only to paralleled conductors but also to single conductors run in nonmagnetic wiring methods. Single conductors with a nonmetallic sheath that are not run in parallel can be installed in a trench with entry into a magnetic metal enclosure requiring compliance with Section 300-20(b).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2591)

3- 10 - (300-3(b)): Accept in Part
SUBMITTER: Donald R. Cook, Southern Section, IAEI
RECOMMENDATION: Revise Section 300-3(b) to read as follows:

(b) Conductors of the Same Circuit. All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors shall be contained within the same raceway, auxiliary gutter, cable tray, trench, cable, or cord, unless otherwise permitted in accordance with (1) through (4).

Where permitted in (1) through (4), conductors in wiring methods with a nonmetallic or other nonmagnetic sheath shall comply with the provisions of Section 300-20(b).

(1) Paralleled Installations. Conductors shall be permitted to be run in parallel in accordance with the provisions of Section 310-4. ~~The requirement to run all circuit conductors within the same raceway, auxiliary gutter, cable tray, trench, cable, or cord shall apply separately to each portion of the paralleled installation, and the equipment grounding conductors shall comply with the provisions of Section 250-122.~~ Conductors installed in nonmetallic raceways run underground shall be permitted to be arranged as isolated phase installations in accordance with Section 300-5(I), Exception No. 2. Parallel runs in cable tray shall comply with the provisions of Section 318-8(d).

~~Exception: Conductors installed in nonmetallic raceways run underground shall be permitted to be arranged as isolated phase installations. The raceways shall be installed in close proximity and the conductors shall comply with the provisions of Section 300-20(b).~~

(2) Grounding and Bonding Conductors. Equipment grounding conductors shall be permitted to be installed outside a raceway or cable assembly where in accordance with the provisions of Section 250-130(c) for certain existing installations, or in accordance with Section 250-134(b), Exception No. 2, for dc circuits. Equipment bonding conductors shall be permitted to be installed on the outside of raceways in accordance with Section 250-102(e).

(3) ~~Nonferrous Wiring Methods.~~ MI Cable. ~~Conductors in wiring methods with a nonmetallic or other nonmagnetic sheath shall, where in different raceways, auxiliary gutters cable trays, trenches, cables, or cords, comply with the provisions of Section 300-20(b).~~ Conductors in single-conductor Type MI cable with a nonmagnetic sheath shall comply with the provisions of Section 330-16.

(4) Enclosures. Where an auxiliary gutter runs between a column-width panelboard and a pull box, and the pull box includes neutral terminations, the neutral conductors of circuits supplied from the panelboard shall be permitted to originate in the pull box.

SUBSTANTIATION: The action of Comment 3-17 of the 1998 ROC was to accept in principle. Part of the substantiation made by the submitter of the comment, as found on page 260 of the ROC, follows:

"This comment is an attempt to rescue the baby from the bath water. It restructures the section to minimize, but not eliminate exceptions, in accordance with my views expressed in the comment on Proposal 3-10. It does so without making changes in the technical content."

Comment 3-17 was made on Proposal 3-12. Proposal 3-12 sought to remove the Exceptions in 300-3(b) and to make them positive text. The panel rejected the proposal and referenced the statement in Proposal 3-10 as their panel statement. The panel statement in 3-10 is "The panel believes that the intent of the relocated exception was changed without sufficient substantiation. The directive received from the Correlating Committee to incorporate exceptions into the main text needs to be addressed by a task force with sufficient time to address all of the concerns and coordinate all of the revisions as well as provide for the balloting process to be completed."

The general rule, as given in 300-3(b), is "All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors shall be contained within the same raceway, auxiliary gutter, cable tray, trench, cable, or cord, unless otherwise permitted in accordance with (1) through (4)." This language means that (1) through (4) are permissions to deviate from the general rule. However, the second sentence in item (1), as written, establishes installation criteria for paralleled conductors. These conditions did not appear in the 1996 NEC or in Proposal 3-10. The 1996 NEC made a simple reference to Section 310-4. This installation criteria should not be located here. If the panel or the submitter of Comment 3-17 feel this language is critical, a proposal should be made to include the language in 310-4. Additionally, the reference to Section 250-112 I contained in 310-4 and need not be restated here.

Taken in relation to the general statement in 300-3(b), item number (3) is a permission to not have "All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors" "be contained within the same raceway, auxiliary gutter, cable tray, trench, cable, or cord." The second sentence in (3) is essentially the same as found in the 1996 NEC. The first sentence, however, seems not to correlate with the provisions of the 1996 NEC. This sentence appears to introduce new permissions which did not have the benefit of public review as they were made at the comment stage rather than the proposal stage. Taken as a permission, this sentence makes it possible to expand the use of single conductors for beyond that found in the 1996 NEC. The permission, as found in the 1999 NEC, permits all nonmetallic and nonmagnetic cables, cords, etc., to have a conductor from one nonmetallic or nonmagnetic cable, cord, etc. and a conductor from another nonmetallic or nonmagnetic cable, cord, etc. for as many nonmetallic or nonmagnetic cable, cord, etc. as wanted to make a circuit. For example, there are four (4) type NM-B cables operating at 120-volts in the same nonmagnetic box. It is now possible to take an ungrounded conductor from one cable, an ungrounded conductor from another cable, a neutral from another cable, and an equipment grounding conductor from another cable to form a multiwire branch-circuit. This permission was not granted in the 1996 NEC. Part of the proposed revisions in (3) seek to restore the 1996 position on is issue.

The 1999 language in the first sentence in (3) would be applicable to all installations where single conductors were employed and magnetic metals were located between the single conductors. For that reason, this requirement is better located ahead of items (1) through (4) and made to apply to each of the items rather than only one. By locating it ahead of the permissions, it is not a permission to expand the use of single conductors but a statement of fact.

This proposal seeks to restore the permissions given in the 1996 NEC while not introducing new material or making changes which have not had the benefit of public review. It also seeks to delete some language found in the 1999 edition which was not found in 1996 edition.
PANEL ACTION: Accept in Part.
PANEL STATEMENT: See panel action and panel statement on Proposal 3-11.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3449)

3- 11 - (300-3(b)): Accept in Principle

Note: The Technical Correlating Committee directs that the panel review this Proposal relative to the action on Proposal 3-8. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors

RECOMMENDATION: Revise Section 300-3(b) to read as follows:

(b) Conductors of the Same Circuit. All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors shall be contained within the same raceway, auxiliary gutter, cable tray, trench, cable, or cord, unless otherwise permitted in accordance with (1) through (4).

Where permitted in (1) through (4), conductors in wiring methods with a nonmetallic or other nonmagnetic sheath shall comply with the provisions of Section 300-20(b).

(1) Paralleled Installations. Conductors shall be permitted to be run in parallel in accordance with the provisions of Section 310-4. ~~The requirement to run all circuit conductors within the same raceway, auxilliary gutter, cable tray, trench, cable, or cord shall apply separately to each portion of the paralleled installation, and the equipment grounding conductors shall comply with the provisions of Section 250-122.~~ Conductors installed in nonmetallic raceways run underground shall be permitted to be arranged as isolated phase installations in accordance with Section 300-5(I), Exception No. 2. Parallel runs in cable tray shall comply with the provisions of Section 318-8(d).

~~Exception: Conductors installed in nonmetallic raceways run underground shall be permitted to be arranged as isolated phase installations. The raceways shall be installed in close proximity and the conductors shall comply with the provisions of Section 300-20(b).~~

(2) Grounding and Bonding Conductors. Equipment grounding conductors shall be permitted to be installed outside a raceway or cable assembly where in accordance with the provisions of Section 250-130(c) for certain existing installations, or in accordance with Section 250-134(b), Exception No. 2, for dc circuits. Equipment bonding conductors shall be permitted to be installed on the outside of raceways in accordance with Section 250-102(e).

(3) ~~Nonferrous Wiring Methods.~~ MI Cable. ~~Conductors in wiring methods with a nonmetallic or other nonmagnetic sheath shall, where run in different raceways, auxilliary gutters, cable trays, trenches, cables, or cords, comply with the provisions of Section 300-20(b).~~ Conductors in single-conductor Type MI cable with a nonmagnetic sheath shall comply with the provisions of Section 330-16.

(4) Enclosures. Where an auxilliary gutter runs between a column-width panelboard and a pull box, and the pull box includes neutral terminations, the neutral conductors of circuits supplied from the panelboard shall be permitted to originate in the pull box.

SUBSTANTIATION: The action of Comment 3-17 of the 1998 ROC was to accept in principal. Part of the substantiation made by the submitter of the comment, as found on page 260 of the ROC, follows. "This comment is an attempt to rescue the baby from the bath water. It restructures the section to minimize, but not eliminate exceptions, in accordance with my views expressed in the comment on proposal 3-10. It does so without making changes in the technical content."

Comment 3-17 was made on Proposal 3-12. Proposal 3-12 sought to remove the Exceptions in 300-3(b) and to make them positive text. The Panel rejected the proposal and referenced the statement in Proposal 3-10 as their Panel Statement. That Panel Statement 3-10 is "The panel believes that the intent of the relocated exception was changed without sufficient substantiation. The directive received from the Correlating Committee to incorporate exceptions into the main text needs to be addressed by a task force with sufficient time to address all of the concerns and coordinate all of the revisions as well as provide for the balloting process to be completed."

The general rule, as given in 300-3(b), is "All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors shall be contained within the same raceway, auxilliary gutter, cable tray, trench, cable, or cord, unless otherwise permitted in accordance with (1) through (4)." This language means that (1) through (4) are permissions to deviate from the general rule. However, the second sentence in item (1), as written, establishes installation criteria for paralleled conductors. These conditions did not appear in the 1996 NEC or in Proposal 3-10. The 1996 NEC made a simple reference to Section 310-4. This installation criteria should not be located here. If the panel or the submitter of Comment 3-17 feel this language is critical a proposal should be made to include the language in 310-4. Additionally, the reference to Section 250-112 I contained in 310-4 and need not be restated here.

Taken in relation to the general statement in 300-3(b), item number (3) is a permission to not have "All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors" " be contained within the same raceway, auxiliary gutter, cable tray, trench, cable, or cord." The second sentence in (3) is essentially the same as found in the 1996 NEC. The first sentence, however, seems not to correlate with the provisions of the 1996 NEC. This sentence appears to introduce new permissions which did not have the benefit of public review as they were made at the comment stage rather than the proposal stage. Taken as a permission, this sentence makes it possible to expand the use of single conductors for beyond that found in the 1996 NEC. The permission, as found in the 1999 NEC, permits all nonmetallic and nonmagnetic cables, cords, etc, to have a conductor from one nonmetallic or nonmagnetic cable, cord, etc. and a conductor from another nonmetallic or nonmagnetic cable, cord, etc. for as many nonmetallic or nonmagnetic cable, cord, etc. as wanted to make a circuit. For example, there are four (4) type NM-B cables operating at 120-volts in the same nonmagnetic box. It is now possible to take an ungrounded conductor from one cable, an ungrounded conductor from another cable, a neutral from another cable, and an equipment grounding conductor from another cable to form a multiwire branch-circuit. This permission was not granted in the 1996 NEC. Part of the proposed revisions in (3) seek to restore the 1996 position on this issue.

The 1999 language in the first sentence in (3) would be applicable to all installations where single conductors were employed and magnetic metals were located between the single conductors. For that reason, this requirement is better located ahead of items (1) through (4) and made to apply to each of the items rather than only one. By locating it ahead of the permissions, it is not a permission to expand the use of single conductors but a statement of fact.

This proposal seeks to restore the permissions given in the 1996 NEC while not introducing new material or making changes which have not had the benefit of public review. It also seeks to delete some language found in the 1999 edition which was not found in 1996 edition.

PANEL ACTION: Accept in Part.

Modify 300-3(b) to read as follows:

"(b) Conductors of the Same Circuit. All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors shall be contained within the same raceway, auxiliary gutter, cable tray, trench, cable, or cord, unless otherwise permitted in accordance with (1) through (4).

Where permitted in (1) through (4), conductors in wiring methods with a nonmetallic sheath or other nonmagnetic sheath shall comply with the provisions of Section 300-20(b).

(2) Grounding and Bonding Conductors. Equipment grounding conductors shall be permitted to be installed outside a raceway or cable assembly where in accordance with the provisions of Section 250-130(c) for certain existing installations, or in accordance with Section 250-134(b), Exception No. 2, for dc circuits. Equipment bonding conductors shall be permitted to be installed on the outside of raceways in accordance with Section 250-102(e)."

The panel reject the balance of the proposal.

PANEL STATEMENT: The proposed addition of the sentence in (b) was moved from existing (3) and should remain as it is presently located in the Code since (3) only deals with installations in nonferrous wiring methods. By placing it in the beginning of the section, it implies that ferrous raceways do not have to comply with Section 300-20 when, in fact, they do.

The exception to Section 300-3(b)(1) is an exception to the general rule as stated in (1) and should remain an exception. The directive from the TCC to the Code Making Panels for the 1999 NEC cycle was to convert any mandatory exceptions into positive text since these mandatory exceptions were a requirement anyway. A true exception to the general rule should remain as an exception since it is more easily identified as being an exception.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

COMMENT ON AFFIRMATIVE:
KREINER: The panel action modifies text in 300-3(b) to include the statement: "Where permitted in (1) through (4), conductors in wiring methods with a nonmetallic sheath or other nonmagnetic sheath shall comply with the provisions of Section 300-20(b)." The panel statement says: "The proposed addition of the sentence in (b) was moved from existing (3) and should remain as it is presently located in the Code since (3) only deals with installations in nonferrous wiring methods. By placing it in the beginning of the section, it implies that ferrous raceways do not have to comply with Section 300-20 when, in fact, they do." The panel statement clearly indicates the panel did no want this sentence included in 300-3(b). It should either be struck out in the panel action or eliminated.

(Log #3734)

3- 12 - (300-3(b)): Accept in Part
SUBMITTER: Wayne A. Lilly, Bridgewater, VA
RECOMMENDATION: Revise Section 300-3(b) to read as follows:
(b) Conductors of the Same Circuit. All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors shall be contained within the same raceway, auxiliary gutter, cable tray, trench, cable, or cord, unless otherwise permitted in accordance with (1) through (4). Where permitted in (1) through (4), conductors in wiring methods with a nonmetallic or other nonmagnetic sheath shall comply with the provisions of Section 300-20(b).
(1) Paralleled Installations. Conductors shall be permitted to be run in parallel in accordance with the provisions of Section 310-4. ~~The requirement to run all circuit conductors within the same raceway, auxiliary gutter, cable tray, trench, cable, or cord shall apply separately to each portion of the paralleled installation, and the equipment grounding conductors shall comply with the provisions of Section 250-122.~~ Conductors installed in nonmetallic raceways run underground shall be permitted to be arranged as isolated phase installations in accordance with Section 300-5(I), Exception No. 2. Parallel runs in cable tray shall comply with the provisions of Section 318-8(d).
~~Exception: Conductors installed in nonmetallic raceways run underground shall be permitted to be arranged as isolated phase installations. The raceways shall be installed in close proximity and the conductors shall comply with the provisions of Section 300-20(b).~~
(2) Grounding and Bonding Conductors. Equipment grounding conductors shall be permitted to be installed outside a raceway or cable assembly where in accordance with the provisions of Section 250-130(c) for certain existing installations, or in accordance with Section 250-134(b), Exception No. 2, for dc circuits. Equipment bonding conductors shall be permitted to be installed on the outside of raceways in accordance with Section 250-102(e).
(3) ~~Nonferrous Wiring Methods.~~ MI Cable. ~~Conductors in wiring methods with a nonmetallic or other nonmagnetic sheath shall, where in different raceways, auxiliary gutters cable trays, trenches, cables, or cords, comply with the provisions of Section 300-20(b).~~ Conductors in single-conductor Type MI cable with a nonmagnetic sheath shall comply with the provisions of Section 330-16.
(4) Enclosures. Where an auxiliary gutter runs between a column-width panelboard and a pull box, and the pull box includes neutral terminations, the neutral conductors of circuits supplied from the panelboard shall be permitted to originate in the pull box.
SUBSTANTIATION: The action of Comment 3-17 of the 1998 ROC was to accept in principal. Part of the substantiation made by the submitter of the comment, as found on page 260 of the ROC, follows. "This comment is an attempt to rescue the baby from the bath water. It restructures the section to minimize, but not eliminate exceptions, in accordance with my views expressed in the comment on proposal 3-10. It does so without making changes in the technical content."
Comment 3-17 was made on Proposal 3-12. Proposal 3-12 sought to remove the Exceptions in 300-3(b) and to make them positive text. The Panel rejected the proposal and referenced the statement in Proposal 3-10 as their Panel Statement. That Panel Statement 3-10 is "The panel believes that the intent of the relocated exception was changed without sufficient substantiation. The directive received from the Correlating Committee to incorporate exceptions into the main text needs to be addressed by a task force with sufficient time to address all of the concerns and coordinate all of the revisions as well as provide for the balloting process to be completed."
The general rule, as given in 300-3(b), is "All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors shall be contained within the same raceway, auxilliary gutter, cable tray, trench, cable, or cord, unless otherwise permitted in accordance with (1) through (4)." This language means that (1) through (4) are permissions to deviate from the general rule. However, the second sentence in item (1), as written, establishes installation criteria for paralleled conductors. These conditions did not appear in the 1996 NEC or in Proposal 3-10. The 1996 NEC made a simple reference to Section 310-4. This installation criteria should not be located here. If the panel or the submitter of Comment 3-17 feel this language is critical a proposal should be made to include the language in 310-4. Additionally, the reference to Section 250-112 I contained in 310-4 and need not be restated here.
The Exception following (1) can be made into positive text by incorporating it into (1). This proposal seeks to do so by adding a new last sentence to (1).
Taken in relation to the general statement in 300-3(b), item number (3) is a permission to not have "All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors" " be contained within the same raceway, auxiliary gutter, cable tray, trench, cable, or cord." The second sentence in (3) is essentially the same as found in the 1996 NEC. The first sentence, however, seems not to correlate with the provisions of the 1996 NEC. This sentence appears to introduce new permissions which did not have the benefit of public review as they were made at the comment stage rather than the proposal stage. Taken as a permission, this sentence makes it possible to expand the use of single conductors for beyond that found in the 1996 NEC. The permission, as found in the 1999 NEC, permits all nonmetallic and nonmagnetic cables, cords, etc, to have a conductor from one nonmetallic or nonmagnetic cable, cord, etc. and a conductor from another nonmetallic or nonmagnetic cable, cord, etc. for as many nonmetallic or nonmagnetic cable, cord, etc. as wanted to make a circuit. For example, there are four (4) type NM-B cables operating at 120-volts in the same nonmagnetic box. It is now possible to take an ungrounded conductor from one cable, an ungrounded conductor from another cable, a neutral from another cable, and an equipment grounding conductor from another cable to form a multiwire branch-circuit. This permission was not granted in the 1996 NEC. Part of the proposed revisions in (3) seek to restore the 1996 position on this issue.
The 1999 language in the first sentence in (3) would be applicable to all installations where single conductors were employed and magnetic metals were located between the single conductors. For that reason, this requirement is better located ahead of items (1) through (4) and made to apply to each of the items rather than only one. By locating it ahead of the permissions, it is not a permission to expand the use of single conductors but a statement of fact.
This proposal seeks to restore the permissions given in the 1996 NEC while not introducing new material or making changes which have not had the benefit of public review. It also seeks to delete some language found in the 1999 edition which was not found in 1996 edition.

3- 13 - (300-3(b)(3)): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the actions on Proposals 7-126 and 7-126a. It was also the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 7 for information. This action will be considered by the Panel as a Public Comment.
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Revise text to read as follows:
(3) Nonferrous Wiring Methods. Conductors in wiring methods with a nonmetallic or other nonmagnetic sheath shall, where run in different raceways, auxiliary gutters, cable trays, trenches, cables, or cords, shall comply with the provisions of

Section 300.20(b). Conductors in single-conductor Type MI cable with a nonmagnetic sheath shall comply with the provisions of Section 330.16.
SUBSTANTIATION: Editorial correction.
PANEL ACTION: Accept in Principle.
Revise text to read as follows:
"(3) Nonferrous Wiring Methods. Conductors in wiring methods with a nonmetallic or other nonmagnetic sheath , where run in different raceways, auxiliary gutters, cable trays, trenches, cables, or cords, shall comply with the provisions of Section 300.20(b). Conductors in single-conductor Type MI cable with a nonmagnetic sheath shall comply with the provisions of Section 330.16."
PANEL STATEMENT: The change meets the submitter's intent and places the "shall" in the correct location.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4433)

3- 14 - (300-3(c)(1)): Reject
SUBMITTER: William Mattson, Lawrence Berkley Lab
RECOMMENDATION: Revise text to read as follows:
300.3(c)(1) 600 Volts, Nominal, or Less. Conductors of circuits rated 600 volts, nominal, or less, ac circuits, and dc circuits shall be permitted to occupy the same equipment wiring enclosure, cable, or raceway. All conductors shall have an insulation rating equal to ~~at least the maximum circuit voltage applied~~ the highest insulation rating of any conductor within the enclosure, cable, or raceway, up to 600 volts.
SUBSTANTIATION: To avoid limitations created when combining conductors in enclosures, cables or raceways, with maximum insulation ratings less than 600 volts, with conductors rated at 600 volts.
PANEL ACTION: Reject.
PANEL STATEMENT: There are installations where the maximum voltage levels are 240 volts for all of the power circuits enclosed in the raceway but the Class 1 control circuits that are functionally associated as allowed by Section 725-26(b) may be power-limited to a maximum of 1000 VA with a maximum 30 volts. This change would require all conductor insulation to be rated for 600 volts if any conductor in the raceway is rated for 600 volts and this would be overly restrictive for no technical reason. The maximum voltage of any circuit in the raceway should determine the insulation rating of the other conductors, not the insulation ratings of the other conductors.

(Log #1821)

3- 15 - (300-3(c)(1), FPN): Reject
SUBMITTER: Joseph A. Tedesco, Nat'l Technology Transfer, Inc.
RECOMMENDATION: Relocate the existing fine print note to follow the first sentence, and change it to become a rule as follows:
"Section 725-54(a)(1) restricts Class 2 and Class 3 circuit conductors from being installed in the same enclosure, cable, or raceway."
SUBSTANTIATION: The current reference continues to be ignored always by installers! The words in the section will make it very clear that there are restrictions. I had a student in Ohio almost faint when I mentioned this rule, which was not properly enforced at the local level by the authority having jurisdiction.
PANEL ACTION: Reject.
PANEL STATEMENT: The Fine Print Note provides information to alert the user of the Code to look in Section 725-54 when dealing with Class 2 and Class 3 conductors. Section 90-3 already states that Chapter 7 can supplement or modify the general rules in Chapters 1 through 4. The FPN provides enough information to warn the user of the existence of a variation of the general rule and should not be placed into Article 300 as another mandatory reference.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #411)

3- 16 - (300-4): Reject
SUBMITTER: Russell A. Jones, Charlottesville, VA
RECOMMENDATION: Add new second sentence to main paragraph:
A router or any other power tool, shall not be used to cut through sheetrock or any other material, that has been placed over an electrical box containing electrical wires, to access the box.
SUBSTANTIATION: The wires are being nicked or cut through. Where only the wire insulation has been cut through applying electrical tape does not in my opinion comply with "a workmanlike installation". What about the small nicks that aren't noticed? Splicing wire onto the wires that have been badly nicked or cut through, does not in my opinion comply with "At least 6 in. of free conductor - for splices etc." (not as splices), or "a workman like installation". I've yet to see a sheetrocker using a router, nick or cut a wire or wires, in less than one out of fifty or so work boxes.
PANEL ACTION: Reject.
PANEL STATEMENT: The tools used by another building trade to cut sheet rock around outlet boxes cannot be limited or eliminated by the NEC. Section 300-4 addresses protection against physical damage of conductors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
CASPARRO: Although I agree with the Panel Statement that tools used by another building trade to cut sheet rock around outlet boxes cannot be limited or eliminated by the NEC, the effects of wires being nicked and cut is becoming a serious problem and needs to be addressed. Blank plates can be mounted over the outlet boxes before the sheet rock is installed, but this now becomes an added expense for the electrical contractor.

(Log #4438)

3- 17 - (300-4(2), Exception): Reject
SUBMITTER: Thomas Royer
RECOMMENDATION: Revise the Exception to read as follows:
Exception: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, ~~rigid nonmetallic conduit,~~ or electrical metallic tubing.
SUBSTANTIATION: Using PVC conduits in notches subjects the conductors to sheet rock screws from screw guns. The plastic should be protected in the notches.
PANEL ACTION: Reject.
PANEL STATEMENT: The section referenced should be 300-4(A)(2). The submitter had not provided technical substantiation for his proposal.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
CASPARRO: According to the Fact Finding Report File #E7330 Project 93ME50090 supplied with the 2002 Proposals, rigid nonmetallic conduit suffered considerable damage from nails and screws. For example a total of 25 tests were done with drywell screws. The screws penetrated the interior of the conduit 15 times or 60 percent. Of 25 tests done with drywall screws / drill point, the screw penetrated the interior of the conduit 18 times or 72 percent. These percentages are much too high, thereby jeopardizing the safety of the conductors.
Based on Panel Action on Proposal 3-31, it seems consistent to accept the submitter's proposal.
GRUBER: I agree with Mr. Casparro's negative comment.

(Log #1408)

3- 18 - (300-4(a)(1)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise first sentence to read:
(1) Bored Holes. In both exposed and concealed locations where a cable or raceway-type wiring method is installed through bored or punched holes in ~~joists, rafters or~~ wood or metal framing members, holes shall be bored or punched so that ~~the~~ no edge of the hole is ~~not~~ less than 1 1/4 in. (31.8mm) from the nearest edge of the ~~wood~~ framing member.
(Remainder unchanged).

SUBSTANTIATION: This section does not specifically cover punched holes in metal framing members and may be perceived as not covering bored holes in metal members. Cables and raceways are commonly run through bored or punched holes in metal framing members and subject to penetration by wall cover screws and other fasteners. The protection required by subsection (b)(1) appears related to sharp edges. Sections 333-7(a), 334-10(a)(1), and 336-9 require protection for cables run through metal members.

"Framing members" renders "joists" and "rafters" superfluous since it covers those specific members and all others regardless of designation.

Wording should be explicit enough to prevent the 12 in. measurement being made to the hole edge farthest from the nearest edge of the framing member, which is apparently the intent. As presently worded, this is not specifically prohibited.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 300-4(A) relates specifically to cables and raceways through wood members. Parentheses (B) relates to metal framing members.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 2

EXPLANATION OF NEGATIVE:
CASPARRO: See my Explanation of Negative Vote on Proposal 3-17.
GRUBER: I agree with Mr. Casparro's negative comment.

(Log #4031)

3- 21 - (300-4(a)(1), Exception and FPN (New)): Reject
SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l
RECOMMENDATION: Add an Exception and a Fine Print Note to read as follows:
Exception: A plate or bushing of 1/32 in (0.8 mm) thickness with a minimum hardness of 45 on the 45-N scale shall be permitted.
FPN: One way to determine applicable requirements for steel hardness is to refer to the Standard Hardness Conversion Tables for Metals (ASTM E140-97).
SUBSTANTIATION: Steel plates of 1/16 in. thickness cause bulging on drywall. The above described plates (1/32 in. thickness) prevent screws and nails from penetrating into the cable and maintain the safety of technicians and occupants.
PANEL ACTION: Reject.
PANEL STATEMENT: Twisted and imperfect studs, electrical boxes with raised nail brackets designed to be installed on the edge of a stud, plumbing pipes, and many other construction related items can cause bulges in drywall, but a properly installed steel nail plate that is 1/16th inch in thickness would not create an unnecessary bulge in the drywall. The submitter had not provided any technical substantiation for this proposal.

(Log #3242)

3- 25 - (300-4(b)(1)): Reject
SUBMITTER: Ronald G. Nickson, Nat'l Multi Housing Council
RECOMMENDATION: Revise text to read as follows:
(b) Nonmetallic-Sheathed Cables and Electrical Nonmetallic Tubing Through metal Framing Members.
(1) Nonmetallic-Sheathed Cable. In both exposed and concealed locations where nonmetallic-sheathed cables pass through either factory or field punched, cut, or drilled slots or holes in metal members, the cable shall be protected by listed bushings or grommets covering all metal edges and securely fastened in the opening prior to installation of the cable.
SUBSTANTIATION: This proposal was originally developed by the Task Group on Nonmetallic-Sheathed Cable based on their review of appropriate uses for Nonmetallic-Sheathed Cable. This review indicates that the critical issue in the safe use of Nonmetallic-Sheathed Cable in metal framing members (typical steel studs) is protection of the cable during installation. This includes the pulling of the cable through openings in the studs and the normal movement (adjustment or straightening) of the studs after the cable is in place.
Section 300.4(b)(1) presently identifies the minimum construction standards for bushings used to protect Nonmetallic-Sheathed Cable. A safety standard exists (UL Standard for Safety 635) which provides testing and listing requirements for bushings intended to be used for this purpose. The standard includes acceptable types of materials for such bushings and pull test to assure that the bushings remain in place during the installation of cables. The task group believes that a requirement for listing is necessary to assure that bushings used for the protection of Nonmetallic-Sheathed Cable will perform effectively.
The recommendation for the deletion of the term "grommet" is based on a review of common definitions of the term which nearly all refer to a "a metal eyelet" or opening for a rope. The definition of the term busing includes "a lining of an opening for one or more electrical wires to pass through". Use of the term "busing" is also consistent with the Safety Standard which uses the term "stud bushing" to describe bushings intended to meet the requirements of Section 300.4.
NMHC is submitting this proposal to forward the work of the Task Group on Nonmetallic Sheathing to Panel 7.
PANEL ACTION: Reject.

The definition of the term bushing includes "a lining of an opening for one or more electrical wires to pass through". Use of the term "bushing" is also consistent with the Safety Standard which uses the term "stud bushing" to describe bushings intended to meet the requirements of Section 300.4.
NMHC is submitting this proposal to forward the work of the Task Group on Nonmetallic Sheathing to Panel 3.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter states that UL 635 provides testing and listing standards for bushings intended for use in factory or field punched steel studs. UL 635 covers the listing of bushings and accessories for insulated bushings for protection of cables, cords, and insulated conductors where routed through internal or external walls of electrical equipment. It also covers the use of insulated bushings for providing strain relief and protection for flexible cords and single conductors in electrical equipment. It specifically states that it does not cover bushings used in conjunction with rigid or flexible conduit, conduit fittings, electrical metallic tubing, armored cable, or non-metallic sheathed cable.

3- 26 - (300-4(b)(2), Exception and FPN (New)): Reject
SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l
RECOMMENDATION: Add an Exception and a Fine Print Note to read as follows:
Exception: A plate or bushing of 1/32 in (0.8 mm) thickness with a minimum hardness of 45 on the 45-N scale shall be permitted.
FPN: One way to determine applicable requirements for steel hardness is to refer to the Standard Hardness Conversion Tables for Metals (ASTM E140-97).
SUBSTANTIATION: Steel plates of 1/16 in. thickness cause bulging on drywall. The above described plates (1/32 in. thickness) prevent screws and nails from penetrating into the cable and maintain the safety of technicians and occupants.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 3-21.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4190)

3- 27 - (300-4(d)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Delete this subsection.
SUBSTANTIATION: This is a companion proposal to one made for Section 336-9 to include this provision for nonmetallic sheathed cables. Taken together, both proposals transfer this restriction to the type of cable for which it is appropriate. There have been many studies done that well demonstrate that armored cables roll out of the way of a penetrating nail or screw. In fact, it is much more difficult to damage an armored cable assembly than it is a rigid steel raceway, whether EMT or even rigid or intermediate steel conduit, and certainly more difficult than rigid nonmetallic conduit. CMP 3 should revisit the technical merits of this requirement.
In the last cycle, CMP 3 rejected a similar proposal by effectively reiterating that due to unsubstantiated "statements from the field" CMP 3 would continue to refuse to be confused by objective information in the fact finding studies. This code rule is an economic benefit for a special interest masquerading as a safety requirement, and as such it discredits the process. If this subsection is removed, then CMP 7 will write appropriate

protection rules within its articles, rules that should reasonably differ according to the different cable constructions.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter did not provide technical substantiation for this proposal. Also the field comments were not substantiated.
This subsection should remain in Section 300-4 since it covers more than just cable systems and also provides the user of the Code with a single location with which to deal with conductor protection in both cables and raceways.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
ANDREWS: The first two sentences of the Panel Statement are confusing. The last paragraph of the submitter's substantiation included the charge that similar proposal in the 1999 cycle was rejected due to "unsubstantiated statements from the field." In the Panel discussion it was noted that proper substantiation had been submitted in past cycles, and it was considered unnecessary to repeat them again when the proposal itself was basically unchanged. Unfortunately, the second sentence of the Panel Statement indicates the submitter's claim was true, when the exact opposite is the case. The word "not" in the second sentence should be removed.
BEILE: The panel statement is wrong by including the sentence, "Also the field comments were not substantiated." Field reports were substantiated by former Code-Making Panel 3 members.

(Log #4034)

3- 30 - (300-4(d) Exception No. 3): Accept
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 19 for information.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete Exception No. 3.
SUBSTANTIATION: This exception came into the 1990 code based on the premise that factory supervision and tests negated the need for the rule. A nail or screw for nonconductive wall covering, cabinets, etc., which penetrates insulation and only contacts an ungrounded conductor is not likely to be detected by a dielectric test or continuity test to ground or grounded conductor, where the wiring method is nonmetallic such as NM, ENMT, NMRC, etc. Are the factory supervision and tests more effective than a qualified inspector requiring proper clearance or protection?
This section is intended to provide protection also against future installation of nails or screws by occupants. If spaced or protected in accordance with the rule there may be protection, but a past dielectric or continuity test offers no such protection. If such tests are suitable in lieu of spacing or protection, they should be an option for all installations. In my opinion, this exception provides a lesser level of safety for occupants of mobile homes and recreational vehicles.
PANEL ACTION: Accept.

3- 31 - (300-4(d) Exception No. 4 (New)): Reject
SUBMITTER: George A. Straniero, AFC Cable Systems, Inc.
RECOMMENDATION: Add an Exception No. 4 to read as follows:
"Interlocked steel armored MC and AC cables not exceeding four conductors no larger than 10 AWG."
SUBSTANTIATION: A similar proposal was submitted for the 1999 code. It is being resubmitted for consideration by the panel for the 2002 code. The substantiation for the proposal is fact-finding report that demonstrates the ability of steel armored cables to resist nail penetrator. In fact, the report shows that steel armored cables resist nail penetration equal to or better than wiring methods currently accepted from the requirements of 300-4(d). The proposal was not accepted last cycle based on nondocumented beliefs. The proposal should be accepted based on the documented performance I have submitted.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The fact finding report shows that these cables receive varying amounts of sheath damage and\or penetrations which would appear to justify the requirement, rather than justifying its elimination. Enforcement of this proposal would be difficult, since there is no external marking on the AC & MC cables indicating whether the sheath is aluminum or steel, the AHJ would then have to determine the sheathing type under often adverse conditions.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4458)

3- 35 - (300-4(g), 370-15(c)): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 1 for information.
SUBMITTER: David E. Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
RECOMMENDATION: Add new text to read as follows:
"Equipment located within 78 in. vertically from streets, alleys, parking lots, or sidewalks, where access by the general public is not restricted by physical barriers, shall be considered "subject to severe mechanical damage."
SUBSTANTIATION: The CMP and Correlating Committee have accepted the concept that equipment subject to severe mechanical damage does require protection in order to fulfill the mandate of 90-1(a). So many of these installations are damaged, whether casually, spitefully, or accidentally. Every member of the committee is likely to come upon on instance of what I'm talking about while walking no more than a mile in just about any neighborhood. Installers should be put on notice that this should be treated like any other instance where sever mechanical damage required suitable protection I doubt the committee would want to change the wording to say, "some cases where equipment is subject to sever mechanical damage it require protection but other such equipment does not." This is not an instance where an NEIS is likely to be of help; it's not clearly a 110-12 issue. The rule should reflect the reality that most of these are at risk, rather than an implicit base assumption that they are not. It's burdensome for a Code official to have to make the call. "This one is at risk, that one really isn't." I've heard again and again from inspectors that a uniform rule would be easier to enforce and therefore ultimately safer.
PANEL ACTION: Reject.
PANEL STATEMENT: Article 300 deals with wiring methods and Section 300-4 specifically deals with protection of conductors where installed as or in a wiring method. The proposal covers a very wide concept of protection of all electrical equipment and may be more appropriately covered in Article 110 for Requirements for Electrical Installations. However, Sections 110-3(a)(1), 110-3(a)(2), 110-3(a)(8), 110-26(f)(2), and 110-27(b) already seem to apply to those situations where electrical equipment may be subjected to damage of any kind. Locating electrical equipment in streets, alleys, parking lots, or sidewalks that are accessible to the general public would not necessarily mean that electrical equipment is subject to severe mechanical damage. This should remain a judgement call by the authority having jurisdiction based upon the actual installation in accordance with Section 110-2.

AFFIRMATIVE: 11

(Log #4017)

3- 37 - (300-5): Reject
SUBMITTER: Christopher Pharo, Rep. IBEW
RECOMMENDATION: Revise text to read as follows:
300-5(d), second paragraph:
"Service laterals, feeders, and branch circuits that are not encased in concrete and that are buried 18 in. or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 12 in. above the underground installation."
SUBSTANTIATION: Feeders and branch circuits can also be placed below grade for various reasons. Why would the NEC single out feeders? It may be said that service laterals are not equipped with stringent overcurrent/short circuit protection that the NEC mandates. These feeder and branch circuits, in most cases, are not protected by GFCI device so the same hazard of electrocution is still very much present.
I do not think the NEC singled out only feeders, the previous code proposal probably addressed feeders only. This code change would increase safety in and around the public and private sector.
PANEL ACTION: Reject.

CASPARRO: See my Explanation of Negative Vote on Proposal 3-45.

(Log #780)

3- 38 - (Table 300-5): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise column 5 heading:
Class 2 circuits and Circuits for Control of Irrigation ~~and~~ or Landscape Lighting, Limited to Not More than 30 Volts, and Installed with Type UF or other Identified Cable or in Raceway.
SUBSTANTIATION: This column does not provide for Class 2 circuits unless they are used for irrigation control and landscape lighting (both required?). There does not seem to be a specific reference in Article 725 which allows column 5 to be used.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 725-3 states that compliance with Article 300 is not necessary, unless specifically referenced within Article 725. Due to its power limitations, a Class 2 circuit will not initiate a fire and provides acceptable protection from a shock hazard. Since it is not considered to be a shock hazard, compliance with the minimum cover requirements in Table 300-5 is not a safety issue. A person can certainly use the Table but the minimum requirements in Table 300-5 should not be mandatory. Placing the requested text into the Table would require a change for Article 725 and then would become mandatory without any potential safety problem.

(Log #1269)

3- 39 - (Table 300-5): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: 1) Revise the table heading as follows:

Table 300-5. Minimum Cover Requirements, 0 to 600 Volts, Nominal, Burial in mm (inches) ~~inches~~ (Cover is defined as the shortest distance in mm (inches) ~~inches~~ measured between a point on the top surface of any direct-buried conductor, cable, conduit, or other raceway and the top surface of finished grade, concrete, or similar cover.)

2) Split Table 300-5 Column 1 as follows:

mm	Inches
600	24
450	18
0	0
450	24
600	24
450	18
450	18

3) Split Table 300-5 Column 2 as follows:

mm	Inches
150	6
150	6
0	0
100	4
600	24
450	18
450	18

4) Split Table 300-5 Column 3 as follows:

mm	Inches
450	18
300	12
0	0
100	4
600	24
450	18
450	18

5) Split Table 300-5 Column 4 as follows:

mm	Inches
300	12
50	6
0 (in raceway only)	0 (in raceway only)
150 (direct burial)	
100 mm (in raceway)	6 (direct burial)
4 (in raceway)	
600	24
300	12
450	18

6) Split Table 300-5 Column 5 as follows:

mm	Inches
150	6
50	6
0 (in raceway only)	0 (in raceway only)
150 (direct burial)	6 (direct burial)
100 mm (in raceway)	4 (in raceway)
600	24
450	18
450	18

7) Delete Note 1 to Notes to Table 300-5. Renumber existing notes accordingly.

8) Revise existing Note 2 to read as follows:

Raceways approved for burial only where concrete encased shall require concrete envelope not less than 50 mm (2 in.) ~~2 in.~~ thick.

9) Revise existing Note 3 to read as follows:

Where solid rock prevents compliance with the cover depths specified in this table, the wiring shall be installed in metal or nonmetallic raceway permitted for direct burial. The raceways shall be covered by a minimum of 50 mm (2 in.) ~~2 in.~~ of concrete extending down to rock.

SUBSTANTIATION: The proposed revisions are intended to comply with the NFPA No. 1M Manual of Style, Section 4.1 with respect to the placement of units The existing Table 300-5 columns have been split into two columns, one for burial depth in mm, the other for burial depth in inches. NFPA editorial staff may format the information in the most suitable format for inclusion in Table 300-5.

PANEL ACTION: Accept in Principle.

Modify the table heading to read as follows: "Table 300-5. Minimum Cover Requirements, 0 to 600 Volts, Nominal, Burial in mm (inches) (Cover is defined as the shortest distance in mm (inches) measured between a point on the top surface of any direct-buried conductor, cable, conduit, or other raceway and the top surface of finished grade, concrete, or similar cover.)"

2) Split Table 300-5 Column 1 as follows:

mm	Inches
600	24
450	18
0	0 (in raceway only)
450	18
600	24
450	18
450	18

3) Split Table 300-5 Column 2 as follows:

mm	Inches
150	6
150	6
0	0
100	4
600	24
450	18
450	18

4) Split Table 300-5 Column 3 as follows:

mm	Inches
450	18
300	12
0	0
100	4
600	24
450	18
450	18

5) Split Table 300-5 Column 4 as follows:

mm	Inches
300	12
50	6
0 (in raceway only)	0 (in raceway only)
150 (direct burial)	6 (direct burial)
100 mm (in raceway)	4 (in raceway)
600	24
300	12
450	18

6) Split Table 300-5 Column 5 as follows:

mm	Inches
150	6
50	6
0 (in raceway only)	0 (in raceway only)
150 (direct burial)	6 (direct burial)
100 mm (in raceway)	4 (in raceway)
600	24
450	18
450	18

7) Delete Note 1 to Notes to Table 300-5. Renumber existing notes accordingly.

8) Revise existing Note 2 to read as follows:

"Raceways approved for burial only where concrete encased shall require concrete envelope not less than 50 mm (2 in.) thick."

9) Revise existing Note 5 to read as follows:

"Where solid rock prevents compliance with the cover depths specified in this table, the wiring shall be installed in metal or nonmetallic raceway permitted for direct burial. The raceways shall be covered by a minimum of 50 mm (2 in.) of concrete extending down to rock."

PANEL STATEMENT: The items changed were strictly editorial.

The changes include:

In item 2) in the proposal recommendation, insert "(in raceway only)" after both 0 (zeros) in the 4th line down and replace "24" with "18" in the 5th line down.

In item 5), place "6 (direct burial)" opposite "150 (direct burial)" and place "4 (direct burial)' opposite "100', delete the " mm" before "(in raceway).

In item 9), replace Note 3 with Note 5 in the proposal recommendation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1403)

3- 40 - (Table 300-5): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: In the first row, under column 4, under the Figure 12, add (direct burial or in Col. 3 raceway).
SUBSTANTIATION: The 12 in. cover requirement even where conductors are installed in rigid metal conduit, requires these specific branch circuits to be at a greater depth than column 2 which would otherwise apply to non-GFCI protected circuits with higher voltage and overcurrent protection. The proposal clarifies that where installed in Column 3 raceway, the burial depth can be reduced.
PANEL ACTION: Reject.
PANEL STATEMENT: The Table already allows residential branch circuits rated at 120 volts or less with GFCI protection and a maximum overcurrent protection of 20 amperes or less to be installed in direct burial nonmetallic raceways at a burial depth of 12 inches rather than 18 inches or direct burial cables or conductors at 12 inches rather than 24 inches. The proposal recommendation does not seem to provide clarification.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2959)

3- 41 - (300-5(a)(1) (New)): Reject
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Add new text to read as follows:
(1) Raceways, used as a means of wire management, need not be listed when used with cables suitable for direct burial. The nonlisted raceway and direct burial cables shall be installed with the sufficient cover per Column 1 of Table 300-5.
SUBSTANTIATION: Cables suitable for direct burial are often sleeved in various raceways for design reasons. If such cable is installed with the sufficient cover for direct burial, then the characteristics of the raceway need not be evaluated. Other rules of the Code that apply to raceways generally may apply. See Section 300-5(h).
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal uses substantiation of design reasons. The design reasons are not known. There is no definition of the term "wire management" and does not comply with the NEC Style Manual. A sleeve used in this application should consist of a listed conduit. Non listed products could contain internal defects that could damage the conductors and have not been tested for the suitability of the application. Also, the panel is concerned about the potential of adding future circuits to this installation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
FORSBERG: The panel stated that the raceway was required to be listed. A panel proposal should have been developed stating so. There continues to be listed direct burial cable being installed in nonlisted raceways.

(Log #2839)

3- 36 - (300-5(b)): Reject
SUBMITTER: Melvin K. Sanders, Ankeny, IA
RECOMMENDATION: Revise as follows:
"~~Service laterals~~ Conductors that are not encased in concrete or protected by ground-fault circuit-interrupters (GFCI) and that are buried 18 in. (457 mm) or more below grade shall have their location identified by a warning ribbon that is ~~placed in the trench~~ located at least 12 in. (305 mm) above the underground installation."
SUBSTANTIATION: All direct-buried conductors should be marked to help minimize dig-in accidents and to additionally recognize that a GFCI may be substituted for the marker.
"Trench" is deleted as the same problem exists with drilled holes. Equipment is available that can drill multiple holes in one setting so a marker tape can be pulled through the upper one.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel understands that this is referenced to 300-5(d). The substantiation is not thorough enough to address all of the concerns of the panel. These concerns include such things as:
A method of installing a tape above bored holes, GFCI requirement, burial depths less than 18". The panel is concerned about the elimination of the service lateral requirement. Also, does the proposal address only direct burial conductors and not cables?
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
CASPARRO: The intent of the submitter's proposal is the protection of the conductors. GFCI protection is for personnel only.

(Log #781)

3- 42 - (300-5(c)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete this section.
SUBSTANTIATION: This section appears totally related to design, not safety. Cables suitable for direct-burial outside a building or embedded in a concrete slab, or under an exterior slab for a driveway, patio, parking lot, etc. do not require raceways. The literal wording requires a raceway to be extended beyond perimeter walls even if cable is installed wholly within building perimeter.
PANEL ACTION: Reject.
PANEL STATEMENT: Table 300-5, Column 1 already requires a raceway where installing direct burial conductors or cables under a building. Installing direct burial cables or conductors either in the concrete slab of a building or under the concrete slab of a building and any movement or shift of the building slab or foundation may cause damage to the conductors. Damaged conductors and any ensuing leakage current that could occur into or through the concrete would be a hazard. Enclosing these cables or conductors under the slab of a building is more than a design consideration. This section does not apply to raceways that originate and terminate in the same building.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
CASPARRO: I agree with the last sentence of the substantiation of the submitter. The literal wording of (300-5(c)) does seem to require that a raceway run underground must extend beyond the outside walls of the building. The last sentence of the Panel Statement should become part of (300-5(c)).

(Log #285)

3- 43 - (300-5(d)): Reject
SUBMITTER: Larry T. Smith, Nat'l Electrical Seminars
RECOMMENDATION: Revise the second paragraph to read:
"Service laterals that are not encased in concrete and that are buried 18 in. (457 mm) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 12 in. (305 mm) above the ~~underground installation~~ service lateral. Horizontally bored service laterals shall be exempt from this requirement."
SUBSTANTIATION: How is the installer to provide a warning ribbon above a service lateral that is being horizontally bored under a roadway, or parking lot, or street intersection? The nature of horizontal boring is used in those areas where trenching is impractical. At present, the only way to comply with this paragraph is to bore a second hole above the service lateral for the warning ribbon. The new wording will exempt horizontally bored services from the requirement of a warning ribbon.
The words underground installation are vague; if the warning ribbon is to be placed at least twelve inches above the service lateral, it should just say so.
PANEL ACTION: Reject.
PANEL STATEMENT: Present language only addresses trenching and not boring, thus boring is already excluded from the ribbon requirement.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #532)

3- 44 - (300-5(d)): Reject
SUBMITTER: John M. Vargo, City of Lorain, OH
RECOMMENDATION: Delete text:
~~In no case shall the protection be required to exceed 18 in. (457 mm) below finished grade.~~
SUBSTANTIATION: This sentence contradicts Table 300-5's requirement in column 1 that direct buried cables or conductors must be buried a minimum of 24 inches in all locations not specified below.
PANEL ACTION: Reject.
PANEL STATEMENT: The 18 in in the first paragraph of 300-(5) is for vertical protection. It has nothing to do with cover requirements which is in Table 300-5. This sentence requires protection of the direct burial conductors from a depth of a least 18 inches below grade and up to 8 feet above grade. This sentence makes it clear that this protection does not have to be provided below 18 inches from grade. For example, a raceway sleeve could be installed for the direct burial conductors at 18 inches below grade and would not be required to start at the 24 inch depth of the direct burial conductors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

(Log #1894)

3- 45 - (300-5(d)): Reject
SUBMITTER: Paul Casparro, Scranton Electricians JATC/Rep. Scranton Electricians JATC (IBEW-NECA)
RECOMMENDATION: Revise second paragraph to read as follows:
Service laterals, feeders, and branch circuits that are not encased in concrete and that are buried 18 in. (457 mm) or more below grade shall have their location identified by a warning ribbon that is placed in the trench or at least 12 in. (305 mm) above the underground installation.
SUBSTANTIATION: It has been my experience recently that even though there as built drawings, underground installations tend to get dug up accidentally without a warning ribbon. This proves to be costly for the owner, not to mention a safety hazard. For the sake of safety a warning ribbon should be placed over all underground installations not encased in concrete.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 3-36.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
CASPARRO: Warning ribbon or tape was added for the 1999 code to reduce the risk of an accident or electrocution during excavation near underground service lateral conductors and to correlate the NEC with Utility Company practices. This requirement did not extend to feeders and branch circuits because those circuits contain short circuit protection. It is the submitter's intent to protect feeders and branch circuits from unnecessary damage due to excavation for renovations or new construction. These damages impose an additional expense to the contractor.
This proposal should be accepted.

(Log #2900)

3- 46 - (300-5(d)): Reject
SUBMITTER: James H. Maxfield, Dover, NH
RECOMMENDATION: Revise second paragraph as follows:
Service laterals or underground service entrance conductors that are not encased in concrete...
SUBSTANTIATION: Where meter enclosures are installed between the street main and the point of entrance to a building. currently there is no language to require the installation of warning ribbon above the underground service entrance conductors. The added language would reduce the likelihood of an accident when working near underground service entrance conductors which do not contain short circuit protection.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement for proposal 3-36. Refer to the definition of " Service lateral" and " Service entrance conductors" as found in Article 100.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
CASPARRO: I believe the submitter's intent is correct to protect not only service laterals but also underground service entrance conductors.
Conductors on the utility side of the service point are not covered by the NEC. Most utilities are now requiring warning tape in their trenches. Why not bring the tape all the way to the meter and service equipment and eliminate any unnecessary damage to these conductors.
GRUBER: I agree with Mr. Casparro's negative comment.

(Log #2960)

3- 47 - (300-5(d)): Accept
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Revise text to read as follows:
"Where the enclosure or raceway is subject to physical damage, the conductors shall be installed in rigid metal conduit, intermediate metal conduit, Schedule 80 rigid nonmetallic conduit, or equivalent.
Conductors or cables used in enclosures or raceways in underground installations shall be listed for wet locations."
SUBSTANTIATION: This proposal revises the aforementioned section to protect the conductors and cables from corrosions due to condensation or water they may accumulate in the raceways. This is a normal practice but needs to be defined in the code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4191)

3- 48 - (300-5(d)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
"Service laterals and underground service entrance conductors that are not encased in concrete and that are buried 18 in. (457 mm) or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 12 in. (305 mm) above the underground installation."
SUBSTANTIATION: Underground service entrance conductors present the same exposure as service laterals and should be treated consistently. This was an oversight in the original submittal and should be corrected at this point.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to the definition of " Service lateral" and " Service entrance conductors" as found in Article 100.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
CASPARRO: See my Explanation of Negative Vote on Proposal 3-46.

(Log #782)

3- 49 - (300-5(i)): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Conductors of the Same Circuit. All conductors of the same circuit and, where ~~used~~ provided ~~the grounded conductor and~~ all separate equipment grounding conductors shall be installed in the same raceway or cable. ~~or shall be installed in close proximity in the same trench.~~
Exception No. 1: Conductors in parallel as provided in Section 310-4 shall be permitted in separate raceways or cables provided each phase or polarity, grounded conductor, and separate equipment grounding conductor is contained in ___ each raceway or cable. shall contain all conductors of the same circuit including grounding conductors.
Exception No. 2: Isolated phase, polarity, and grounded conductor installations shall be permitted in nonmetallic

raceways or cables in close proximity where conductors are paralleled as permitted in Section 310-4, and where conditions of Section 300-20 are met.

Exception No. 3: Switch loops shall be permitted to consist of only those conductors connected to the switching device(s) and, where provided, the equipment grounding conductor.

Exception No. 4: Single-conductor Type MI cable with a nonmagnetic sheath shall be permitted where installed in conformance with Section 330-16.

Exception No. 5: Single conductors approved for direct-burial shall be permitted where installed in close proximity in the same trench.

SUBSTANTIATION: Cables should be included in the rule and Exceptions No. 1 and 2 since the reasons for grouping raceways applies to cables. The phrase "or shall be installed in close proximity in the same trench" is apparently intended for installations covered in Exceptions No. 2 and 5, but literally voids the basic requirement if the raceways are so installed.

Including "grounded conductor" is superfluous as it is a circuit conductor.

Exception No. 1 is revised for clarity. Polarity is included to cover dc circuits as past panel comments have indicated intent to require grouping for dc conductors.

Switch loops are not presently exempted from including a grounded conductor; Type MI cable is not presently exempted from the rule.

PANEL ACTION: Accept in Part.

Accept the addition of "cable" in the text of both the main Section and the two exceptions with the words "nonmetallic-sheathed" added to cables in Exception No. 2..

Accept the addition of "polarity, and grounded conductor" in Exception No. 2.

Reject the remainder of the proposed changes.

The section should read as follows:

"(i) Conductors of the Same Circuit. All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors shall be installed in the same raceway or cable or shall be installed in close proximity in the same trench.

Exception No. 1: Conductors in parallel in raceways shall be permitted, but each raceway or cable shall contain all conductors of the same circuit including grounding conductors.

Exception No. 2: Isolated phase, polarity, and grounded conductor installations shall be permitted in nonmetallic raceways or nonmetallic-sheathed cables in close proximity where conductors are paralleled as permitted in Section 310-4, and where the conditions of Section 300-20 are met."

PANEL STATEMENT: Cable was added to the section and two exceptions since the same requirements should apply to cables as applies to raceways. The addition of polarity and grounded conductors to the second exception recognizes that dc and grounded conductors should also be permitted where installed in either nonmetallic conduit or nonmetallic-sheathed cable.

The change to delete the grounded conductor in the base section would make it less clear that the grounded conductor must be included where it is actually used in the circuit. The word "separate" was not accepted since Section 250-122 already requires equipment grounding conductors, whether one or more is installed, to be in the same raceway or cable as the circuit conductors. The phrase "or shall be installed in close proximity in the same trench" was left in the base section since the installation could be in a raceway, a cable, or a trench.

The reference to Section 310-4 in the proposed changes in the first exception is an unnecessary reference since conductors in parallel already must comply with Section 310-4. Section 4.1 of the NEC Style Manual discourages unnecessary use of references unless clarity is improved.

The proposed Exception No. 3 is not necessary since switch loops are already part of the circuit and as long as both the power down and the switched leg back up are installed in the raceway or cable, the cancellation of the lines of flux surrounding the individual conductors will occur. If an equipment grounding conductor is pulled with the switch loop, it must also be included in the same raceway, cable, or trench.

The proposed Exception No. 4 is not necessary. Section 300-1 states that Article 300 covers wiring methods for all wiring installations unless modified by other articles. Section 330-16 already specifically covers single conductor MI cables installations.

The proposed Exception No. 5 is not necessary since the text is already covered in the base section by the phrase "or shall be installed in close proximity in the same trench." Deleting text from the base section and adding the text into an exception does not promote usability of the Code.

The grounded conductor is not part of the circuit conductors in all cases and is not superfluous. As an example see 250-24(b) for clarity.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #2961)

3- 50 - (300-5(j) (New)): Reject

SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions

RECOMMENDATION: Add new text to read as follows:

(j) Directional Boring. Cables or conduit or other raceways shall be listed for the use with directional boring equipment.

SUBSTANTIATION: This proposal adds a new section to address cables and raceways used with directional boring equipment. Currently nonlisted and listed raceways are being used with directional boring equipment that have resulted in failures in the field. Continuous reeled raceways have "necked down", reducing the cross sectional area due to the pulling. Raceway joints have separated or loosened underground which have damaged cables during pulling and/or has allowed excessive moisture into the raceway. This new section will require cables and raceways to be evaluated for the use with directional boring equipment.

PANEL ACTION: Reject.

PANEL STATEMENT: This item should be numbered 300-5(k) instead of 300-5(j). This is specific to a certain application and the requirement is broad based for all products. Continuous reel raceways that neck down are the result of pulling and may not be only related to directional boring equipment.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

CASPARRO: The submitter's intent is correct to use listed cables, conduit or other raceways with directional boring equipment.

FORSBERG: The panel should not ignore directional boring practices. Unapproved joints will separate when pulled with directional boring equipment.

(Log #4328)

3- 51 - (300-5(j), FPN): Accept

SUBMITTER: Leo F. Martin, Martin Electrical & Technical Training Services

RECOMMENDATION: In the second line of the FPN revise expansion joint to read: "expansion fitting."

SUBSTANTIATION: To correlate with the definition of the term Fitting in Article 100 since the prime reason is mechanical, the term fitting should be used.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #1774)

3- 52 - (300-6): Reject

SUBMITTER: Richard E. Loyd, Perryville, AR

RECOMMENDATION: Delete existing text and replace with the following:

300-6. Protection Against Corrosion and Degradation. Raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, fittings, supports, and support hardware shall be of materials suitable for the environment in which they are to be installed.

(a) General. Ferrous Metal Raceways. ~~Ferrous~~ Raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, metal elbows, couplings, fittings, supports and support hardware shall be protected against corrosion inside and outside by a suitable corrosion-resistant coating. The threads at joints shall be permitted to be coated with an electrically conductive compound.

(1) Where protected from corrosion solely by enamel, they shall not be used outdoors or in wet locations as described in (c). Where boxes or cabinets have an approved system of organic coatings and are marked "Raintight," Rainproof," or "Outdoor Type," they shall be permitted outdoors.

(2) In Concrete or in Direct Contact with the Earth. Ferrous or nonferrous metal raceways, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, fittings, supports, and support hardware shall be permitted to be installed in concrete or in direct contact with the earth, or in areas subject to severe corrosive influences where made of material judged suitable for the condition, or where provided with corrosion protection approved for the condition.

(b) Nonmetallic raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing cabinets, ~~metal~~ elbows, couplings, fittings, supports, and support hardware shall be suitably protected against corrosion and degradation.

(1) Exposed to Sunlight. Where exposed to sunlight or other forms of ultraviolet degradation they shall utilize materials or coatings approved for the installation and shall be listed sunlight resistant.

(2) Exposed to Chemical Degradation. Where subject to chemical solvent vapors, ~~airborne or~~ splash or immersion exposure they shall utilize materials or coatings ~~be~~ suitable for the installation.

(c) Indoor Wet Locations. In indoor wet locations, and in locations where walls are frequently washed or where there are surfaces of absorbent materials, such as damp paper or wood, the entire wiring system, where installed exposed, including all boxes, fittings, conduits, and cable used therewith, shall be mounted so that there is at least a 1/4-in. (6.35 mm) airspace between it and the wall or supporting surface.

Exception: Nonmetallic raceways, boxes, and fittings shall be permitted to be installed without the airspace on a concrete, masonry, tile, or similar surface.

(d) Supporting hardware. All supports, bolts, straps, screws, etc., shall be of corrosion-resistant materials or protected against corrosion by corrosion-resistant materials.

FPN: In general, areas where salts, acids and alkali chemicals are manufactured, processed, handled ~~and~~ or stored may present such corrosive conditions, particularly when wet or damp. Severe corrosive conditions may also be present in portions of water and wastewater treatment plants, pulp and paper plants, petrochemical operations, primary metals production facilities, direct burial applications in corrosive soils, food processing areas subject to frequent washdowns, installations immediately adjacent to a seashore and swimming pool areas; and areas where chemical deicers are used.

SUBSTANTIATION: Article 300 covers the general requirements for all wiring methods and Section 300-6 as stated only covers metal wiring methods and yet references nonmetallic wiring methods. Many corrosion and degradation issues need to be clearly addressed in Article 300. I believe this proposal does that.

PANEL ACTION: Reject.

PANEL STATEMENT: This rewrite has added confusion and put an increased amount of restrictions on the nonmetallic products currently used without substantiation.

Nonmetallic products do not corrode or "degrade" due to mold and fungus. In fact, these products have an indefinite life span for these environments.

Exposure to sunlight, corrosion, and temperature are all addressed in each of the individual non metallic raceway articles.

This proposal does not clearly indicate changes to the existing text.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

GRUBER: See my Explanation of Negative Vote on Proposal 3-53.

(Log #3167)

3- 53 - (300-6): Reject

SUBMITTER: Tim Andrassy, Steel Tube Inst.

RECOMMENDATION: Revise this section to read:

300-6. Protection Against Corrosion, Chemical Exposure, Sunlight Degradation, and Temperature Extremes. ~~Metal~~ rRaceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, fittings, supports, and support hardware shall be ~~of materials~~ suitable for the environment in which they are to be installed.

(a) ~~General.~~ Ferrous metal raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, metal elbows, couplings, fittings, supports, and support hardware shall be ~~suitably~~ protected against corrosion inside and outside (except threads at joints) by an approved corrosion resistant coating ~~of approved corrosion resistant material such as zinc, cadmium, or enamel.~~ Threads at joints shall be permitted to be coated with an identified electrically conductive compound.

Exception: Stainless steel is not required to have protective coating(s).

(1) Protected from Corrosion Solely by Enamel. Where protected from corrosion solely by enamel, they shall not be used outdoors or in wet locations as described in (d~~c~~). Where boxes or cabinets have an approved system of organic coatings and are marked "Raintight," "Rainproof," or "Outdoor Type," they shall be permitted outdoors.

~~Exception: Threads at joints shall be permitted to be coated with an identified electrically conductive compound.~~

(2 ~~b~~) In Concrete or in Direct Contact with the Earth. Ferrous or ~~nonferrous~~ metal raceways, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, fittings, supports, and support hardware shall be permitted to be installed in concrete or in direct contact with the earth, or in areas subject to severe corrosive influences where made of materials ~~judged~~ approved as suitable for the condition, or where provided with corrosion protection approved for the condition.

(b) Non-ferrous metal raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, nipples, fittings, and support hardware shall be protected by an approved corrosion resistant material or coating where embedded or encased in concrete or where in direct contact with soil.

(c) Nonmetallic raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, fittings, supports, and support hardware shall be made of material approved as suitable for the condition, and shall comply with 1, 2, and 3 as applicable to the specific installation.

(1) Exposed to Sunlight. Where exposed to sunlight or other forms of ultraviolet degradation materials or coatings approved for the installation shall be utilized and shall be listed as sunlight resistant.

(2) Chemical Exposure. Where subject to chemical solvent vapors, or splash or immersion exposure, materials or coatings approved for the specific reagent shall be utilized.

(3) Temperature Extremes. Where exposed to environments having extreme temperatures the material shall not be used beyond its listed temperature limitations to protect against cracking, or sagging and melting.

(d~~c~~) Indoor Wet Locations. In addition to (a), (b), or (c), as applicable, ~~I~~ in ~~portions of dairies, laundries, canneries, and other~~ indoor wet locations, and in locations where walls are frequently washed or where there are surfaces of absorbent materials, such as damp paper or wood, the entire wiring system, where installed exposed, including all boxes, fittings, conduits, and cable used therewith, shall be mounted so that there is at least a 1/4-in. (6.35-mm) airspace between it and the wall or supporting surface.

~~Exception: Nonmetallic raceways, boxes, and fittings shall be permitted to be installed without the airspace on a concrete, masonry, tile, or similar surface.~~

(e) Supporting hardware. All supports, bolts, straps, screws, etc., shall be of corrosion-resistant materials or protected against corrosion by corrosion-resistant materials.

FPN: In general,the following are locations where severe corrosive influences may be present, ~~corrosion concerns might need to be evaluated,~~ particularly when expected to be wet or

damp: (1) areas where salts, acids and alkali chemicals are manufactured, processed, handled or ~~and~~ stored, (2) portions of water and wastewater treatment plants, (3) pulp and paper plants, (4) petrochemical operations, (5) primary metals production facilities, (6) direct burial applications in corrosive soils (generally less than 2000 ohms/centimeter), (7) food processing areas subject to frequent washdowns, (8) ~~may present such corrosive conditions, particularly when wet or damp. Severe corrosive conditions may also be present in portions of meatpacking plants, tanneries, glue houses, and some stables;~~ installations immediately adjacent to a seashore and swimming pool areas; and (9) areas where chemical deicers are used.~~; and storage cellars or rooms for hides, casings, fertilizer, salt and bulk chemicals.~~

SUBSTANTIATION: This article has been rewritten for clarity and to provide guidance for the full variety of products available and updated locations. Section (b) has been added to include requirements from the listing. Chemical exposure has been added to cover those materials subject to other than corrosion from some environments. The exception to (d) has been deleted. Discussion at CMP 3 have indicated that mold and fungus can degrade nonmetallics without this air space.

PANEL ACTION: Reject.

PANEL STATEMENT: The substantiation for the rewrite of this section is "for clarity and to provide guidance for the full variety of products available and updated locations". Instead this rewrite has added confusion and put an increased amount of restrictions on the nonmetallic products currently used without substantiation.

The removal of the exception for nonmetallic raceways, boxes, and fittings without an airspace is not substantiated. Nonmetallic products do not corrode or "degrade" due to mold and fungus. In fact, these products have an indefinite life span for these environments.

Exposure to sunlight, corrosion, and temperature are all addressed in each of the individual non metallic raceway articles.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

CASPARRO: This proposal should be accepted in part. Accept everything but deletion of the FPN. Safeguarding against deterioration of plastic is just as important as safeguarding against corrosion of metal. Plastics are not resistant to all chemicals and the Code should recognize this. The language is very similar to that proposed by the Chemical Manufacturers Association for Article 344 of the 1999 NEC. Nonmetallic producers did not object. It is better to put all these type requirements into one Section of the Code.

GRUBER: This proposal should be accepted in part.

The part not accepted is deletion of the exception to (d) Indoor Locations.

In response to the Panel comment:

The text regarding nonmetallic raceways, etc. requires only that they be made of:

(a) "material approved as suitable for the condition"

(b) The "exposed to sunlight" and "temperature extremes" is not new language. It can be found in the nonmetallic raceway articles.

(c) The "chemical exposure" text is not overly restrictive since it does not require a specific reagent, it only requires approval. This is an appropriate requirement because nonmetallics should not be used where they will be exposed to chemicals which would either degrade or deteriorate them.

Corrosion requirements for all the conduits are contained to some extent in the specific raceway articles. However, this rewrite pulls the variety of concerns into one location. If the text is not needed for nonmetallics, then perhaps 300-6 should be deleted and the language in each specific wiring method article would govern in all cases.

Rather than "adding confusion", the proposed text clarified the various requirements.

(Log #266)

3- 54 - (300-6(a)): Reject

SUBMITTER: Charles M. Trout, Maron Electric Co.

RECOMMENDATION: In the first sentence, delete the parenthesis and the words (except threads at joints). In the Exception, delete the words "permitted to be" so that the Exception shall now read:

"Threads at joints shall be coated with an identified electrically conductive compound."

SUBSTANTIATION: The problems of corrosion at threaded joints in metal raceways and the resulting high resistance connections have been well documented. In order to comply with the intent of Section 300-6 relative to protection against corrosion, the words "(except at threaded joints)" must be deleted. The importance of the application of a listed electrically conductive sealing compound cannot be ignored. The manufacturers applied corrosion resistance coating will be compromised at any threaded location. The resultant high resistance connection will prevent the installation from being in conformance with Section 250-2(d) and the integrity of the ground fault path will be severely diminished.

PANEL ACTION: Reject.

PANEL STATEMENT: The substantiation does not provide technical documentation to support this proposal. The exception in the proposal has a mandatory requirement. The submitter has not provided the technical substantiation of corrosion at conduit joints to require all threads to have an additional coating.. Ferrous raceways (those that contain iron) often have a factory applied corrosion protection and include the threads at the end of the raceways and the coupling. A field-applied enamel coating is allowed only indoors and in occupancies not subject to severe corrosive influences. The existing exception in the 1999 NEC is permissive in allowing an identified electrically conductive compound to be applied for field threaded raceways. The proposed change makes "identified electrically conductive compounds" on all threads mandatory. The subject of this section is corrosion.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

COMMENT ON AFFIRMATIVE:

BEILE: In the panel statement, there are two misstatements.

1. In the third line, the word "often" should be stricken. All steel conduit threads have factory applied corrosion protection.

2. In the fourth line, "field applied enamel" is not allowed on threads.

CASPARRO: I believe the submitter raises some valid concerns. The real concern was not with all threads, but rather with field cut threads, whereby corrosion protection is removed in the threading process and not replaced. The submitter proposed an electrically conductive compound but neglected to address the corrosion protection issue, which is what (300-6(a)) covers. The submitter was present at the Panel meeting and agreed to resubmit his proposal at the comment stage addressing these concerns.

GRUBER: The Panel Statement should have the word "often" deleted form the third sentence. "...Ferrous raceways (those that contain iron) ~~often~~ have a factory applied corrosion protection and ...".

All factory threads have a factory applied corrosion protection on them.

Also, a field-applied enamel coating is not permitted to be applied to threads.

(Log #607)

3- 55 - (300-6(a)(1) (New)): Accept in Principle

SUBMITTER: Mario L. Mumfrey, Cincinnati, OH

RECOMMENDATION: Add a new 300-6(a)(1) to read as follows:

Conduits, Raceways or Cables entering a building or structure through which moisture may contact energized live parts shall be sealed at point(s) of entry with a sealant identified and approved for such use.

FPN: This would now include all service entrance installations, not just underground.

SUBSTANTIATION: There is no clear language presently that requires sealing point(s) of entry of services into a building other than for Section 300-5(g) FPN as it relates to Section 230-8. By adding this new paragraph it may now prevent moisture and corrosion occurring in all SE equipment for all service applications. Some jurisdictions are enforcing the use of sealants under practical safeguarding, others are not.

We need this new wording for uniformity and compliance.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and panel statement on Proposal 3-61.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4120)

3- 57 - (300-6(c)): Accept
SUBMITTER: Truman C. Surbrook, Michigan State University
RECOMMENDATION: In the first line delete the word "dairies" and replace with the words dairy processing facilities so the section will read as follows:
"In portions of ~~dairies~~ dairy processing facilities, laundries, canneries,...".
SUBSTANTIATION: The reference needs to be change to avoid confusion with agricultural dairy farms which is covered in 547.4(b).
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1167)

3- 58 - (300-6(c), Exception): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise text to read:
Exception: Raceways and cables with a final outer nonmetallic jacket, nonmetallic raceways, boxes, and fittings shall be permitted to be installed without the airspace on a concrete, masonry, tile, or similar surface.
SUBSTANTIATION: Edit. Raceways and cables with a PVC jacket seem to be suitable as much as nonmetallic raceways. Deletion of commas after the words "raceway" and "boxes" will clearly indicate they are modified by the word "nonmetallic" and not segregated by the commas.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter had provided no technical substantiation for this proposal.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4121)

3- 59 - (300-6(c), Exception): Reject
SUBMITTER: Truman C. Surbrook, Michigan State University
RECOMMENDATION: Add a reference to agricultural buildings as permitted in 547-4(b) as follows:
Exception: Nonmetallic raceways, boxes, and fittings shall be permitted to be installed without the air space on a concrete, masonry, tile, or similar surface, and as permitted in 547.4(b) for agricultural buildings.
SUBSTANTIATION: This section must also recognize the special requirements in agricultural buildings where leaving the 1/4 in. air space creates another hazard of conductor and raceway exposure to damage.
PANEL ACTION: Reject.
PANEL STATEMENT: This proposal adds an unnecessary reference. Section 90-3 states that Chapters 5, 6, and 7 supplement or modify the requirements in Chapters 1 through 4. This proposed reference to Section 547-4(b) is not necessary in accordance with Section 4.1 of the 1999 NEC Style Manual.

(Log #1192)

3- 60 - (300-7(a) (New)): Accept in Principle
SUBMITTER: David A. Williams, Delta Twp Lansing, MI/Rep. IAEI
RECOMMENDATION: Add new text to 300-7(a) to read as follows:
(a) Sealing. Condensation in a raceway shall be limited by sealing the raceway where it is exposed to widely different temperatures.
SUBSTANTIATION: The present wording of this code section only applies to indoor raceway systems as in walk-in coolers. Walk-in coolers for beverages would be about 35°F and the room temperature of about 68°F, would have a temperature difference of 33°F. In areas of the country that are subject to very cold temperatures this is a problem with raceways entering buildings. The outside temperature could be below zero, creating a temperature difference in excess of 70°F. It is a problem that could easily be accomplished with nonhardening material such as Duct Seal placed into the raceway opening. I have seen load centers in homes that have a thick layer of frost on the panel cover due to the condensation freezing. Branch circuit overcurrent devices have had to be replaced long before normal due to the corrosion damage from the condensation entering the panel through the raceway. I believe this is a valid code change that does not increase the cost of the installation dramatically.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and panel statement on Proposal 3-61.

(Log #4397)

3- 61 - (300-7(a)): Accept in Principle
Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Monte R. Ewing, State of Wisconsin
RECOMMENDATION: Add new text to read as follows:
"Where portions of raceways are subjected to different temperatures, as in cold storage areas of buildings or where passing from a building interior to the exterior, the raceway shall be sealed to prevent the circulation of warm air to a colder section of the raceway."

SUBSTANTIATION: The present code implies that the interior of a raceway needs to be sealed to prevent condensation damage however, the present wording does not address the problems where raceways enter or leave a building to connect to metering equipment, rooftop equipment, or exterior equipment in general. In these cases a dew point is forming within the raceways causing the equipment inside and out (depending on the time of year) to fill with moisture and sometimes frost. This problem has been addressed by code in the State of Wisconsin and I feel that this problem needs to be addressed by the National Electrical Code.
PANEL ACTION: Accept in Principle.
Revise the text to read as follows:
"Where portions of a raceway or sleeving for cables are subjected to different temperatures and where condensation is known to be a problem, as in cold storage areas of buildings or where passing from the interior to the exterior of a building, the raceway or sleeving for cables shall be sealed to prevent the circulation of warm air to a colder section of the raceway or cable. The sealant used shall be approved for such use and the seal shall not be required to be an explosionproof seal."
PANEL STATEMENT: The major problems appear to be concerning raceways or sleeving for cables that enter a building from outside where there is a difference of temperature and where there is a known condensation problem. Not all areas of the country nor all interior building applications would require this sealing. The last sentence was added to make it clear that an approved sealant must be used that would not have deleterious effects on the conductor insulation. The last sentence also makes it clear that explosionproof seals are not necessary.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
BEILE: This proposal should be rejected. While I agree with the situation the submitter described in his substantiation can be a problem, the revised language accepted by the panel is too restrictive. The panel notes in its Panel Statement that "not all areas of the country nor all interior building applicatons would require this sealing." The present wording, however, could be interpreted to mean that the sealing is always required. More appropriate text would be as follows:
"Where portions of a raceway or sleeving for cables are known to be subjected to different temperatures and where condensation is known to be a problem, as in cold storage areas of buildings or where passing from the interior to the exterior of a building, the raceway or sleeving for cables shall be filled with approved material to prevent the circulation of warm air to a colder section of the raceway or cable. An expolsionproof seal shall not be required to be installed for this purpose."
FORSBERG: The requirement is vague and would basically require that all raceways be sealed. The language used was not the language agreed on by the task group assigned during the meeting.
GRUBER: This proposal should be rejected.
Certainly the situation the submitter described in his substantiation could be a problem, the revised language accepted by the Panel is too restrictive. The Panel notes in its Panel Statement that "not all areas of the country nor all interior building applications would require this sealing." The present wording, however, could be interpreted to mean that the sealing is always required. More appropriate text would be as follows:
"Where portions of a raceway or sleeving for cables are known to be subjected to different temperatures and where condensation is known to be a problem, as in cold storage areas of buildings or where passing from the interior to the exterior of a building, the raceway or sleeving for cables be filled with approved material to prevent the circulation of warm air to a colder section of the raceway or cable. An explosionproof seal shall not be required to be installed for this purpose."

(Log #3928)

3- 62 - (300-7(a), FPN (New)): Reject
SUBMITTER: Charles J. Palmieri, Palmieri Assoc.
RECOMMENDATION: Add a new Fine Print Note as indicated.
300.7(a) Sealing. Where portions of an interior raceway system are exposed to widely different temperatures, as in refrigerating or cold-storage plants, circulation of air from a warmer to a colder section through the raceway shall be prevented.
FPN: This section is not intended to require the use of a listed conduit seal fitting, unless so specified elsewhere in this code.
SUBSTANTIATION: Some authorities are interpreting this section so to require and explosion proof fitting in areas that only require a compound or other suitable means to block the transmission of air to areas of different ambient temperatures.
PANEL ACTION: Reject.
PANEL STATEMENT: Nowhere in this section does the phrase "conduit sealing fitting" occur and the section does not detail the method used to prevent the unwanted air circulation. The fine print note is not necessary to clarify the intent of this Section.

(Log #377)

3- 63 - (300-7(b)): Accept
SUBMITTER: Michael W. Rogers, Corey Electrical Engineering, Inc.
RECOMMENDATION: 1. Change paragraph title: (b) ~~Expansion Joints.~~ Expansion Fittings.
2. Change paragraph text: Raceways shall be provided with expansion ~~joints~~ fittings where necessary to compensate for thermal expansion and contraction.
SUBSTANTIATION: The term "Expansion Joint" usually refers to an architectural item that is built into a structure to allow for expansion and contraction, and/or vibration isolation. The term "Expansion Fitting" is used in 347-9 to describe a necessary conduit fitting used for compensating for thermal expansion and contraction. Other references in the code do not use the term "Expansion Joint" for anything other than an architectural reference.
PANEL ACTION: Accept.

(Log #3144)

3- 65 - (300-9): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 1 for possible inclusion in Article 100. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Kylene Abram, Germfosk, MI
RECOMMENDATION: Move the description of the first floor in Section 336.5(a)(1) to the new Section of 300.9.
SUBSTANTIATION: The description of what is the first floor of a building is a general requirement that is used in more than just locations where nonmetallic-sheathed cable is installed and therefore should be located in Article 300. For example, the definition of first floor is also used in Section 331.3(a) Fine Print Note.
PANEL ACTION: Reject.
PANEL STATEMENT: Based upon the scope statement in Article 100, definitions that are used in two or more articles or apply to two or more articles should be located in Article 100 and not in Article 300.
This proposal should be sent by the TCC to Panel 1 for action.
Section 336-5(a)(1) clearly states the definition of first floor is for the purposes of Article 336.

(Log #CP304)

3- 66a - (300-11(a)): Accept
SUBMITTER: CMP 3
RECOMMENDATION: Revise the existing text to add headings in (a) and (b) as follows:
"300-11. Securing and Supporting
(a) Secured in Place. Raceways, cable assemblies, boxes, cabinets, and fittings shall be securely fastened in place. Support wires that do not provide secure support shall not be permitted as the sole support. Support wires and associated fittings that provide secure support and that are installed in addition to the ceiling grid support wires, shall be permitted as the sole support. Where independent support wires are used, they shall be secured at both ends. Cables and raceways shall not be supported by ceiling grids.
(1) Fire Rated Assemblies. Wiring located within the cavity of a fire-rated floor–ceiling or roof–ceiling assembly shall not be secured to, or supported by, the ceiling assembly, including the ceiling support wires. An independent means of secure support shall be provided. Where independent support wires are used, they shall be distinguishable by color, tagging, or other effective means from those that are part of the fire-rated design.
Exception: The ceiling support system shall be permitted to support wiring and equipment that have been tested as part of the fire-rated assembly.
FPN: One method of determining fire rating is testing in accordance with Standard Methods of Tests of Fire Endurance of Building Construction and Materials, NFPA 251-1995.
(2) Non Fire Rated Assemblies. Wiring located within the cavity of a nonfire-rated floor–ceiling or roof–ceiling assembly shall not be secured to, or supported by, the ceiling assembly, ..."
SUBSTANTIATION: The panel added headings to conform with the 1999 NEC Style Manual.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #783)

3- 67 - (300-11(a), (b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Secured in Place. Raceways, cable assemblies, auxiliary gutters, cable trays, cablebus, boxes, cabinets, ~~and~~ fittings, and other electric equipment shall be securely fastened in place, except as otherwise permitted or required elsewhere in this Code.
(remainder unchanged)
(b) Raceways and Cables Used as Means of Support. Raceways or cables shall only be used as a means of support for other raceways, cables, conductors, or nonelectric equipment under the following conditions.
(1) Where the raceway or means of support is identified for the purpose or
(2) Where the raceway or cable contains power supply conductors for electrically controlled equipment and is used to support Class 2 circuit conductors or cables that are solely for the purpose of connection to the equipment control circuits.
(3) ~~Where the raceway is used to support boxes or conduit bodies in accordance with Section 370-23 or to support fixtures in accordance with Section 410-16(f).~~ Where an approved raceway mast is used for termination and support of outdoor aerial conductors.
(4) Where the raceway is used to support a bonding jumper installed in accordance with Section 250-102(e).
SUBSTANTIATION: Additional proposed items for (a) would be more inclusive and the last portion would correlate with Sections 347-9; 350-18, Exceptions; 351-8, Exceptions; 333-7(b); 334-10(b); 336-18, Exception No. 1; 348-13, Exception No. 2; etc., where movement or fishing without support is permitted.
In (b) cables such as Type AC, MC, MI, etc. are not presently included and seem to be as suitable as flexible conduit as a support for Class 2 conductors. Conductors (single) are added to the rule to preclude grounding electrode conductors, electrode bonding jumpers, piping system bonding jumpers, and the like. Not prohibiting (single) conductors is at odds with the concept of the rule and while not a literal violation violates the spirit of the rule.
Present (3) is deleted as unnecessary and superfluous as it relates to support of electrical equipment whereas the rule prohibits support of nonelectric equipment.
The proposed (3) and (4) are for correlation with other Code sections which permit such movement.
PANEL ACTION: Reject.
PANEL STATEMENT: The cables shall not be used to support for other cables or raceways. The submitter did not properly underline proposed new text.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4192)

3- 68 - (300-11(a)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
1. Delete the second sentence in Section 300-11(a) which reads "Support wires and associated fittings that provide secure support and that are installed in addition to the ceiling grid support wires shall be permitted as the sole support."
2. Revise Section 300-11(a)(2) to read as follows:
(2) Nonfire-Rated Assemblies. Branch-circuit wiring associated with equipment that is located within, supported by, or secured to a suspended ceiling that is not an integral portion of a fire-rated floor/ceiling or roof/ceiling assembly shall be permitted to be supported by the ceiling support wires.
3. Delete Section 300-11(a)(2) Exception.
SUBSTANTIATION: The Committee believes installing additional support wires is unnecessary based on the successful experience with the 1996 state rule which allowed this practice in non-rated assemblies. The NEC exception is one that would never be practicable. The proposal does, however, trade some additional restrictions on wiring on support wires off against the allowance to use existing support wires. It does this by going back to the old principle that the only legitimate use for this support method is for branch circuit wiring to supply equipment such as lighting troffers and tele-power poles that are directly connected to the ceiling.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel re-affirms its position that an independent means of support shall be provided for all wiring, not just branch circuit wiring, in both fire-rated and nonfire rated floor/ceiling or roof/ceiling assemblies.
Support wires installed in addition to the ceiling grid support wires is one means to comply with this requirement. The panel believes the exception is merely an option for installers who may choose to evaluate the entire fire-rated or non fire-rated assembly, including all associated wiring.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
CASPARRO: CMP-3 has worked hard over a number of code cycles to get (300-11(a)) to where it is. By rejecting this proposal, the Panel has retained a necessary, viable, safe and widely used alternative. The submitter provided no technical substantiation to warrant proposed change.

(Log #4364)

3- 69 - (300-11(a)): Reject
SUBMITTER: Ed Stubbs, City of Atlanta, GA
RECOMMENDATION: 330.11. Securing and Supporting. (Add to text)
(a) Secured in Place. (Add to last sentence) Fixtures installed in a ceiling grid shall comply with Section 410.16(c). Track lighting on a ceiling grid shall comply with Section 410.101(d).
SUBSTANTIATION: We all know that the sole purpose of a suspended grid ceiling was get away from structured ceilings and be able to install different type of fixtures of unlimited types. Well, when it was designed, lay in tiles an fixtures where designed to be installed with it. It was not designed to support raceways, cables and boxes. As 300-11 states, "Cables and raceways shall not be supported to the grid." It did not include fixtures. Another item that is supported by the grid is heating and air registers.
Section 410-16(c) does require that the fixture be supported to the grid by screws, chips, rivets, etc., and it doesn't refer you back to 300-11 as an exception. Contractors are having great difficulty in securing a fixture to a separate supporting wire with a high structured ceiling and grid ceiling over 6 ft between them. How do they know where to hang there support wires when the grid is not there? When the grid is installed, they can't get to the high structured ceiling without removing part of the grid assembly and get a lift in between. Now they may damage the grid trying to replace removed sections. Who is responsible now for the weakening of the grid? The same is for track lights. How can they be secured in place on a independent support wire. Where do you attach the wire on the track and how do you install the lay in tile if the track goes down the center of a tile? I believe this section should be added to relive the contractor of impossible odds of securing the fixture in a fire rated and nonfire rated ceiling.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel interprets the submitter's intent to address 300-11, not 330-11. The proposal adds an unnecessary reference. The language is already present in Section 410-16(c) and 410-101(d) which addresses the submitter's concerns. This section is not intended to provide support requirements for lighting fixtures or track lighting.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1147)

3- 71 - (300-11(b)): Reject
SUBMITTER: Larry T. Smith, Nat'l Electrical Seminars
RECOMMENDATION: Revise text to read:
(b) Raceways Used as Means of Support. Raceways shall not be ~~only be~~ used as a means of support for other raceways, except as otherwise permitted in this Code. Raceways shall be permitted for the support of cables, or nonelectric equipment under the following conditions:
~~1. Where the raceways or means of support is identified for the purpose; or~~
1. ~~2.~~ Where the raceway contains power supply conductors for electrically controlled equipment and is used to support Class 2 circuit conductors or cables that are solely for the purpose of connection to the equipment control circuits; or 2.~~3.~~ Where the raceway is used to support boxes or conduit bodies in accordance with Section 370-23 or to support fixtures in accordance with Section 410-16(f).
SUBSTANTIATION: Section 300-11(b)(1) is completely misleading; there are no raceways identified for the purpose of supporting other raceways. As it is presently written, we are led to the conclusion that there might be a raceway listed for the purpose of supporting other raceways, and only after exhaustive reading of the UL General Information Directory for Electrical Equipment would we conclude that there are none. Every time I explain this in a seminar, participants shake their heads and mumble, 'Aw, not another one of those Code things'.
This is leading to misinterpretation and considerable misapplication in the field. A percentage of installers look at one inch rigid steel conduit, and assume that it just has to be identified for the purpose of supporting at least one other conduit; the existence of back to back support clamps fuels the confusion.
A case can be made for the use of a short section of raceway used to support other raceways, or nonelectrical equipment. Metal conduit used to enclose electrical conductors is metal piping — not electrical raceway. This practice could presumably continue.
PANEL ACTION: Reject.
PANEL STATEMENT: This section allows raceways as defined in Article 100 to provide support for other raceways, if the manufacturer has submitted it to a testing laboratory and had it identified as acceptable to support other raceways. The other part of this sentence deals with means of support that may be identified as a support mechanism for more than one raceway. The Code should not prevent a manufacturer from submitting a raceway or a support fitting for testing as a means of support for other raceways. The suggested text "except as otherwise permitted in this Code" is too vague and not in compliance with Section 4.1.1 of the 1999 NEC Style Manual.

3- 75 - (300-11(c) (New)): Reject
SUBMITTER: Bruce Fairweather, Electrical Safety Inc.
RECOMMENDATION: New text:
(c) Electrical conduits, cables and conductors shall not be supported or attached in any way to piping of liquid or gas delivery systems, waste product systems, or ductwork of environmental air systems.
SUBSTANTIATION: This is my second submission on this topic. The panel's comment to my 1999 Code proposal was that the intent of the paragraph was sufficient enough to preclude the use of specific wording.
From what I witness in the field on a day to day basis, the panel's intent is not recognized by many electricians. As long as I continue to find NM cable tie-wrapped to gas lines feeding boilers, hot air furnaces, and hot water heaters, or clamped to the exterior of environmental air supply and return ducts, or to sanitary drains then the panel's "intent" is esoteric and worse, unenforceable. Again, I suggest the inclusion of specific wording.
PANEL ACTION: Reject.
PANEL STATEMENT: The wording in the proposal is too restrictive. CMP 3 does not endorse using other systems as a support mechanism. However, there are conditions where associated wiring systems may only be supported by the other systems such as HVAC systems, Boiler systems, fire sprinkler control valves, etc..

(Log #3644)

3- 78 - (300-14): Reject
SUBMITTER: William E. Slater, Granger, IN
RECOMMENDATION: Revise 300-14 to read as follows:
300-14. Length of Free Conductors at Outlets, Junctions, and Switch Points. Where the opening to an outlet, junction or switch box is less than 8 in. (203 mm) in any dimension, each conductor shall be long enough to extend at least 3 in. (76.2 mm) outside the opening.
SUBSTANTIATION: The present requirement of at least 6 in. (152 mm) of free conductor, measured from the point in the box where it emerges from its raceway or sable sheath, is not practical for all box depths. Article 370-24 permits device boxes as shallow as 15/16 in. Some device boxes are as deep as 3-1/2 in. When a 15/16 in. deep box is used and 6 in. of free conductor extends from the back of the box, 5-1/16 in. of conductor extends outside of the box. When a 3-1/2 in. deep box is used and 6 in. of free conductor extends from the back of the box, only 2-1/2 in. of conductor extends outside of the box. This dimension is in conflict with the 3 in. minimum dimension required in the last sentence of the present wording. This proposal will eliminate this conflict and also provide 3 in. of free conductor, regardless of the box depth.
PANEL ACTION: Reject.
PANEL STATEMENT: The 6 inch measurement requirement is necessary to cover all aspects of make-up wire at outlet, junction, and switch points. The submitter's comment that only 2 1/2 inches of conductor would be available using a 3 1/2 inch box would be a violation of the Code since at least 3 inches must be available in accordance with the last sentence. Where using a 15/16 inch deep box, there must be a fixture shroud or some other method applied to allow the conductors to enter and terminate in the box. See Sections 370-16(a) and (b).
The submitter is also not covering in his proposed change the required length of free conductors for boxes where one of the box dimensions exceeds 8 inches.

(Log #2962)

3- 79 - (300-14 Exceptions No. 1 and No. 2 (New)): Reject
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Revise text to read as follows:
Exception No. 1: Conductors that are not spliced or terminated at the outlet, junction, or switch point.
Exception No. 2: Conductors that are spliced within a conduit body.
SUBSTANTIATION: This proposal allows splices to occur within conduit bodies without the required length of conductors. When splices do occur in conduit bodies the excessive conductor length may overfill the conduit body.
PANEL ACTION: Reject.
PANEL STATEMENT: A conduit body that contains splices does need extra room for the splicing devices plus the extra conductor length necessary to allow the conductor to be stripped and terminated so an exception is not warranted. Section 370-16(c)(2) provides requirements for sizing of conduit bodies where used for splicing, tapping, or connecting devices within the conduit body. The cubic inch capacity is marked on the conduit body and the maximum number of conductors is computed in accordance with Section 370-16(b) and the accompanying table. The splicing, tapping, or connecting of devices may necessitate the use of a larger conduit body with reducers on either or both ends to allow the extra room necessary for the splice or tap to occur.

(Log #1752)

3- 80 - (300-15): Reject
SUBMITTER: Jamie McNamara, Hastings, MN
RECOMMENDATION: Revise to read as follows:
300-15. Boxes, Conduit Bodies, or Fittings — Where Required
(a) Box or Conduit Body. Where the wiring method is conduit, electrical metallic tubing, Type AC cable, Type MC cable, Type MI cable, nonmetallic-sheathed cable, or other cables and cords, a box or conduit body complying with Article 370 shall be installed at each conductor splice point, outlet, switch point, junction point, or pull point, unless otherwise permitted in (b) through (n). A box shall be installed at each outlet and switch point for concealed knob-and-tube wiring.
SUBSTANTIATION: To clarify that in general cords need box's or conduit body's at splice points.
PANEL ACTION: Reject.
PANEL STATEMENT: Flexible cord splicing is already covered very specifically in Section 400-9 and, if the splice is made correctly, a box or conduit body is not necessary.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4193)

3- 81 - (300-15): Accept in Principle in Part
Note: It was the action of the Technical Correlating Committee that this Proposal be correlated with the action on Proposal 3-84. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
300-15. Boxes, Conduit Bodies, or Fittings — Where Required.
~~(a) Box or Conduit Body.~~ Where the wiring method is raceway or multiconductor cable, conduit, electrical metallic tubing, or Type AC cable, Type MC cable, Type MI cable, nonmetallic-sheathed cable, or other cables, a box or conduit body complying with Article 370 shall be installed at each conductor splice point, outlet, switch point, junction point, or pull point, unless otherwise permitted in (~~b~~ a) through (~~n~~ m) below. A box shall be installed at each outlet and switch point for concealed knob-and-tube wiring. Fittings and connectors shall be used only with the specific wiring methods for which they are designed and listed.
(a) Wiring Methods With Interior Access. A box or conduit body shall not be required for splice, junction, switch, pull, and outlet points in wiring methods with removable covers, including busways, header-ducts, multioutlet assemblies, auxiliary gutters, and some surface raceways. The covers shall be accessible after installation.
(b) Equipment. An integral junction box or wiring compartment as part of approved equipment shall be permitted in lieu of a box.
(c) Protection. A box or conduit body shall not be required where cables enter or exit from conduit or tubing that is used to provide cable support or protection against physical damage. A fitting shall be provided on the end(s) of the conduit or tubing to protect the cable from abrasion.
(d) Type MI Cable. A box or conduit body shall not be required where accessible fittings are used for straight-through splices in mineral-insulated metal-sheathed cable.
(e) Integral Enclosure. A wiring device with integral enclosure identified for the use, having brackets that securely fasten the device to walls or ceilings of conventional on-site frame construction, for use with nonmetallic-sheathed cable, shall be permitted in lieu of a box or conduit body.
(FPN): See Sections 336-18, Exception No. 2; 545-10; 550-10(j); and 551-47(e), Exception No. 1.
(f) Fitting. A fitting identified for the use shall be permitted in lieu of a box or conduit body where no conductors are spliced or terminated within the fitting. The fitting shall be accessible after

installation. ~~and not containing spliced or terminated conductors.~~

(g) Direct-Buried Conductors. A box or conduit body shall not be required for ~~As permitted in Section 300-5(e) for~~ splices and taps in direct-buried conductors and cables made in accordance with Section 300-5(e).

(h) Insulated Devices. A box or conduit body shall not be required ~~As permitted in Section 336-21~~ for insulated devices supplied by nonmetallic-sheathed cable in accordance with the provisions of Section 336-21.

(i) Enclosures. A box or conduit body shall not be required where a splice, switch, or pull point is in a cabinet or cutout box, or in an enclosure for a switch or overcurrent device as covered in ~~As permitted in~~ Section 373-8 ~~Exception, for switches and overcurrent devices, and~~ or in a motor controller as covered in Section 430-10(a), ~~for motor controllers.~~ or in a switchboard or motor control center.

(j) Fixtures. A box or conduit body shall not be required where a fixture is used as a raceway in accordance with one of the exceptions to Section 410-31. ~~As permitted in Section 410-31 where a fixture is used as a raceway.~~

(k) Embedded. A box or conduit body shall not be required for splices where conductors are embedded as covered in Sections 424-40; 424-41(d); 426-22(b); 426-24(a); and 427-19(a).

~~(l) Manufactured Wiring System. Where manufactured wiring systems in accordance with Article 604 are used.~~

~~(m)~~ (l) Closed Loop. A box shall not be required with a closed-loop power distribution system where a device identified and listed as suitable for installation without a box is used. ~~with a closed-loop power distribution system.~~

~~(n)~~ (m) Manholes. A box or conduit body shall not be required for splice, junction, and pull points conductors in manholes and other electric enclosures intended for personnel entry where accessible ~~only~~ to qualified persons only. The installation shall comply with the provisions of Part D of Article 370.

SUBSTANTIATION: This is a largely editorial rewrite that corrects many errors and conflicts in the 1999 NEC. Point by point specific substantiation follows:

1. Since the two subsections (a) and (b) (of the 1996 NEC) can be combined, the litany of wiring methods at the opening is more confusing than helpful. The basic rule is to provide a box or conduit body for raceways and multiconductor cables, and that is how the rule should begin.
2. The stand-alone sentence on suitable fittings and connectors has been included in the main rule to allow ease of citation and to retain the format of a series of modifications to the principal rule contained within the paragraph.
3. The content of former subsection (a) has been retained as a new (a) in this comment. Given the revised structure, all that is necessary is to recast the exception as a rule. There is a very minor technical change in that the present exception covers splices and this comment adds other uses. This reflects widespread practice in the industry, with surface metal raceways listed and routinely used with receptacles, lampholders, etc. In fact the existing exception expressly includes multioutlet assemblies, for which the revised wording would be essential. The suggested wording also mentions busways because they routinely use splice connection points that don't involve boxes.
4. The equipment rule in (b) includes the wording now in the Code in order to clarify that this is in lieu of a box, but would also apply to transformer enclosures and the like. The wording also correlates with the wording in Section 370-23(f) Exception No. 2, which is important.
5. The remaining sections have a few words added in order to make them complete sentences. This is more appropriate for stand-alone rules, particularly because the number of subsections involved in this case make for a substantial distance between the parent provisions and subsequent specific requirements.
6. The rules with section references have been editorially reformatted to use a parallel construction so as to be less confusing to the reader, and as required in the current style manual. In each case the sentence opens with the subject matter ("… not required for splices and taps …"; "… not required for insulated devices", etc.) and then closes with the section reference.
7. In (g) the word "direct" was added to provide better correlation with the actual requirement.
8. In (i) the original proposal has been broadened to cover other enclosures for which a requirement for a box has never been required as a practical matter, including cabinets and cutout boxes, (includes panelboards — see definition) switchboards and motor control centers. The reference in Article 373 has been corrected.
9. In (j) the suggested text references the exceptions and not the rule in Section 410-31. This is more technically correct because it is only the exceptions that permit what this rule seeks to permit.
10. I have suggested deleting (l) from the original proposal because, by virtue of Section 90-3, it is unnecessary to correlate requirements in Chapter 6 in this article. There are many other special provisions that could be brought forward; it is far better to simply stay in the first four chapters of the Code where correlation is critical. This is also reflected in the new style manual.
11. I am suggesting restricting the permission in manholes to splice, junction, and pull functions. If a light were installed in a manhole, for example, it should be on a box just like anywhere else. The permission should go directly to the unique function of the manhole as a large pull box that one has the ability to step into. In addition, I have taken material from the new manhole provisions in Article 370 for correlation, along with providing the appropriate reference.

PANEL ACTION: Accept in Principle in Part.

Delete "raceway or multiconductor cable" and "electrical metallic" in the proposal.

Insert the last two sentence before (a) as the first two paragraphs at the beginning of the Section.

In the proposal in (a), change the word "including" to "such as"

In (e), FPN, make the correction for 550-10(i) from (j) in the proposal and add 552-48(e), Exception No. 1.

In (f), change the word "no" to "not" and insert it after "are" and before "spliced"

In (g) and (h), Add the words "As permitted in Section 300-5(e)" and "As permitted in Section 336-21" at the beginning of the sentence.

In (i), change "as covered in" to "as permitted in" in the second line. Delete "switchboard or" in the last line.

In (m), delete "splice, junction, and pull points" in the first line and replace "and other electric enclosures intended for personnel entry" with "except where connecting to electrical equipment."

The changed proposal reads as follows:

"300-15. Boxes, Conduit Bodies, or Fittings - Where Required. A box shall be installed at each outlet and switch point for concealed knob-and-tube wiring.

Fittings and connectors shall be used only with the specific wiring methods for which they are designed and listed.

Where the wiring method is conduit, tubing, Type AC cable, Type MC cable, Type MI cable, nonmetallic-sheathed cable, or other cables, a box or conduit body complying with Article 370 shall be installed at each conductor splice point, outlet point, switch point, junction point, termination point or pull point, unless otherwise permitted in (a) through (m).

(a) Wiring Methods With Interior Access. A box or conduit body shall not be required for each splice, junction, switch, pull, termination, or outlet points in wiring methods with removable covers, such as wireways, multioutlet assemblies, auxiliary gutters, and surface raceways. The covers shall be accessible after installation.

(b) Equipment. An integral junction box or wiring compartment as part of approved equipment shall be permitted in lieu of a box.

(c) Protection. A box or conduit body shall not be required where cables enter or exit from conduit or tubing that is used to provide cable support or protection against physical damage. A fitting shall be provided on the end(s) of the conduit or tubing to protect the cable from abrasion.

(d) Type MI Cable. A box or conduit body shall not be required where accessible fittings are used for straight-through splices in mineral-insulated metal-sheathed cable.

(e) Integral Enclosure. A wiring device with integral enclosure identified for the use, having brackets that securely fasten the device to walls or ceilings of conventional on-site frame construction, for use with nonmetallic-sheathed cable, shall be permitted in lieu of a box or conduit body.

FPN: See Sections 336-18, Exception No. 2; 545-10; 550-10(i); 551-47(e), Exception No. 1; and 552-48, Exception No. 1.

(f) Fitting. A fitting identified for the use shall be permitted in lieu of a box or conduit body where conductors are not spliced or terminated within the fitting. The fitting shall be accessible after installation.

(g) Direct-Buried Conductors. As permitted in Section 300-5(e), a box or conduit body shall not be required for splices and taps in direct-buried conductors and cables.

(h) Insulated Devices. As permitted in Section 336-21, a box or conduit body shall not be required for insulated devices supplied by nonmetallic-sheathed cable.

(i) Enclosures. A box or conduit body shall not be required where a splice, switch, terminal or pull point is in a cabinet or cutout box, in an enclosure for a switch or overcurrent device as permitted in Section 373-8, in a motor controller as permitted in Section 430-10(a), or in a motor control center.

(j) Fixtures. A box or conduit body shall not be required where a fixture is used as a raceway as permitted in the exceptions to Section 410-31.

(k) Embedded. A box or conduit body shall not be required for splices where conductors are embedded as permitted in Sections 424-40, 424-41(d), 426-22(b),426-24(a), and 427-19(a).

(l) Closed Loop. A box shall not be required with a closed-loop power distribution system where a device identified and listed as suitable for installation without a box is used.

(m) Manholes. Where accessible only to qualified persons, a box or conduit body shall not be required for conductors in manholes, except where connecting to electrical equipment. The installation shall comply with the provisions of Part D of Article 370."

PANEL STATEMENT: Based upon the definition of a "raceway", not all raceway wiring methods would require a box or conduit body for a splice point. There is no reason to insert "multiconductor cable" since even single conductor cables, such as MI cable must have a junction box for splicing purposes. By removing "electrical metallic", this section now covers EMT, ENT, and flexible metallic tubing. This came from Proposal 3-82.

The last two sentences were moved to be the first two and made into separate paragraphs so that permission to go to (a) through (m) immediately precedes the text it addresses.

The submitter did a nice job of rewriting the text into complete sentences.

The change in (a) was to provide a list of examples of wiring methods with interior access, such as wireways, multioutlet assemblies, auxiliary gutters, and surface raceways.

The change in (e), FPN was a correction in the proposal reference from 550-10(j) to 550-10(i). The added reference to 552-48(e), Exception No. 1 was needed since it wasn't added when Article 552 was added to the Code.

The remainder of the changes in (f) through (l) were strictly editorial changes.

The change in (m) using the phrase "except where connecting to electrical equipment," was an attempt to clarify that boxes are only necessary in manholes where there is electrical equipment such as lights, receptacles, and switches.

The phrase "termination point" was inserted where necessary in the text to ensure that live conductors that are capped for future use are also enclosed in a box or conduit body.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2189)

3- 82 - (300-15(a)): Accept in Principle
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
Where the wiring method is conduit, ~~electrical metallic~~ tubing, Type AC cable,...
SUBSTANTIATION: As originally written this subsection does not include electrical nonmetallic tubing or flexible metallic tubing. Both of these raceway methods require boxes or conduit bodies. See Sections 331-12 and 349-17. By deleting "electrical metallic" all types of tubing are included. This is similar to using the general term "conduit" to include all types of conduit.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and panel statement on Proposal 3-81.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

(Log #3012)

3- 83 - (300-15(a)): Accept in Principle
SUBMITTER: Robert H. Keis, Dover, DE
RECOMMENDATION: Insert the words "termination point" into the required locations or points where a box is required.
300-15. Boxes, Conduit Bodies, or Fittings—Where Required.
(a) Box or Conduit Body. Where the wiring method is conduit, electrical metallic tubing, Type AC cable, Type MC cable, Type MI cable, nonmetallic-sheathed cable, or other cables, a box or conduit body complying with Article 370 shall be installed at each conductor splice point, outlet, switch point, junction point, termination point, or pull point, unless otherwise permitted in (b) through (n). A box shall be installed at each outlet and switch point for concealed knob-and-tube wiring.
SUBSTANTIATION: The argument has come up recently about just taping the ends of an abandoned, but usable cable and leaving the cable end buried in a wall or laying in a ceiling. Nowhere in the code can I find a requirement that abandoned cables need to be removed and a lot of times that would be needless expense. Often cables are discontinued for one reason or another and may or could be utilized again in the future. This will settle a long standing argument. We tell the electrician when he violates the code to "read the words." He did just that, and that is reason for this proposal. The words aren't there!
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Proposal 3-81. However, truly abandoned wires should not remain energized or connected to a possible source of potential.

(Log #2773)

3- 85 - (300-15(m)): Reject
SUBMITTER: Gregory P. Bierals, Electrical Design Inst.
RECOMMENDATION: Add new text as follows:
Flexible Cord. Where conductors are spliced in accordance with Section 400-9, no box or conduit body shall be required.
SUBSTANTIATION: No box or conduit is necessary where flexible cord conductors are properly spliced in accordance with Section 110-14(b).
PANEL ACTION: Reject.
PANEL STATEMENT: The requirement for flexible cords are in Article 400, in particular Section 400-9, and are not needed here. Section 300-1(a) already addresses the submitter's recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #785)

3- 86 - (300-16(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) A box or terminal fitting having a separately bushed hole for each conductor shall be used wherever a change is made from cablebus, busway, conduit, electrical metallic tubing...
(remainder unchanged).
SUBSTANTIATION: This section does not cover transitions to open wiring from cablebus or busways with bus stubs, which are not uncommon in switchgear or transformer rooms where open wiring may be permitted, or at service drops.
PANEL ACTION: Reject.
PANEL STATEMENT: Thie proposal is adequately covered by 364-8 and 365-7.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #786)

3- 87 - (300-16(b)): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(b) Bushing. A bushing shall be permitted in lieu of a box or terminal described in (a) where the conductors emerge from a raceway ~~or conduit~~ and enter or terminate at equipment, such as open switchboards, unenclosed control equipment, or where a raceway terminates under an open bottom switchboard or motor control center, within a pole supporting a lighting fixture(s) or sign(s), or at a location accessible to qualified persons only, such as a room or vault, fenced enclosure and similar locations, used primarily for the containment of batteries, transformers, switchboards, and other electrical distribution equipment.
SUBSTANTIATION: Editorial. Since a bushing is a terminal fitting, the fitting it may be used in lieu of should be noted. "Or conduit" is redundant.
Though it may be considered unnecessary to make a laundry list of all permitted (or common) uses, it would be helpful to Code users to indicate some of the more common uses where a bushing is, in practice, used at transitions to open conductors to allow for a more or less straight conductor emergence which is less stressful to conductor insulation, especially for large conductors and high-voltage conductors. The limited scope of the present wording may suggest the additional uses indicated are not permitted.
PANEL ACTION: Accept in Part.
The panel accepts the following to read:
"(b) Bushing. A bushing shall be permitted in lieu of a box or terminal where the conductors emerge from a raceway."
The remainder of the existing text to remain as is.
PANEL STATEMENT: The submitter is correct that a laundry list of applications is not necessary and certainly would not cover all of the possibilities. Information such as this would be better applied in the Handbook if anyone felt the need to include additional examples. The use of the word "conduit" is redundant and the panel agreed with the deletion.

AFFIRMATIVE: 11

(Log #124)

8- 9 - (300-18, Exceptions No. 4 and 5-(New)): Reject
NOTE: The following proposal consists of Comment 8-2 on Proposal 3-125 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 3-125 was:
Add:
Exception No. 4: Preassembled cable in nonmetallic conduit in accordance with Article 343.
Add:
Exception No. 5: Busway assemblies in accordance with Article 364.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: To correlate with the Panel Action on Proposal 8-5a, the Technical Correlating Committee directs that Exception No. 3 be revised to read as follows: "Exception No. 3: Prewired assemblies shall be permitted where indicated in Article 315." The Technical Correlating Committee directs Code-Making Panel 8 to add specific language to Article 315 recognizing flexible metal conduit and flexible metallic tubing as prewired assemblies. This action will be considered by Panel 8 as a Public Comment.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal's intent was to correct 300-18 of the 1996 NEC by adding both NUCC as a pre-wired assembly and pre-wired Busways. Panel 3 revised 300-18(a) to read "Pre-wired raceway assemblies shall be permitted only where specifically permitted in the Code for the applicable wiring method".
Article 315 (344) will not be adopted by Panel 8 (See Panel action and statement on 8-84) . Articles 343 and 364 will stand alone. 350-10(a)(5) allows Flexible Metal Conduit and Section 349-10(a) Exception 2 allows Flexible Metal Tubing to be pre-assembled.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2190)

3- 90 - (300-18(c); 343-11; 345-11; 346-11; 347-14; 348-12; 351-10; 351-30 (New)): Reject
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Add a new Section 300-18(c) to read as follows:
Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) in conduit or tubing between pull points (for example, conduit

bodies and boxes).

The following paragraph will replace these sections:
343-11; 345-11; 346-11; 347-14; 348-12; 351-10; 351-30

Bends — Number in One Run. The number of bends in one run shall comply with 300-18(c).

SUBSTANTIATION: This rule appears in every conduit and tubing article except one. The NEC Style Manual 4.1.1 states, "Use references to other NEC rules to avoid repeating a requirement." Therefore, to avoid repetition of this rule it should appear once in Article 300 Wiring Methods and be referenced by all other articles.
PANEL ACTION: Reject.
PANEL STATEMENT: It is important to have this rule in each of the raceway articles. The submitter has not avoided repetition by this proposal since there is still a reference to go back to proposed Section 300-18(c) in each one of the raceway articles. These rules should remain in each article for simple ease of use and user friendliness.

SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

(a) Conductors Grouped Together. Where conductors carrying alternating current are installed in metal enclosures, ~~or~~ metal raceways, or contained in metal-armored cables, they shall be arranged to avoid heating the surrounding metal by induction. To accomplish this all circuit ~~phase~~ conductors and where used, ~~the grounded conductor and~~ all wire-type equipment grounding conductors shall be grouped together in the same raceway, cable, or approved enclosure.

Exception No. 1: No change.
Exception No. 2: No change.
Exception No. 3: Paralleled conductors shall be permitted in accordance with Section 310-4.
Exception No. 4: Single-conductor Type MI cable with a copper sheath shall be permitted in accordance with Section 330-16.
Exception No. 5: Grounded conductors supplied by a column-type panelboard using an auxiliary gutter and pull box with neutral terminations shall be permitted to terminate in the pullbox.

(b) Individual Conductors. Where a single conductor carrying alternating current passes through metal with magnetic properties, the magnetic effect shall be minimized by (1) cutting slots in the metal between the individual holes through which the individual conductors pass, or (2) passing all the conductors in the circuit through an insulating wall sufficiently large for all the conductors of the circuit.

Exception: In the case of circuits supplying vacuum or electric-discharge lighting systems for signs, or x-ray apparatus, the currents carried by the conductors are so small that the heating effect can be ignored where these conductors are placed in metal enclosures or pass through metal.

FPN: Because aluminum is not a magnetic metal, there will not be heating due to hysteresis; however, ~~induced~~ currents ~~will be present~~ can be induced. They will not be of sufficient magnitude to require ~~grouping of conductors or~~ special treatment in passing conductors through aluminum wall sections.
SUBSTANTIATION: Metal armored cables should be included, they can be misued in a manner to cause induction heating. For example, two 2-conductor cables can provide a 4-wire circuit; three 2-wire cables with same-phase conductors in each cable can provide a paralleled 3-wire circuit. Inclusion of cables would reinforce requirements of Sections 300-3(b) and 310-4 and cover single-conductor Type MI cable with a steel sheath.

"Circuit" conductor covers grounded conductors; "wire-type" grounding conductor is specific. "Grouped together" should be more specific; using the code as a guide for interpretation "grouped" as used in Sections 225-34(a); 230-72(a); and 330-16 is applied to separate enclosures and cables.

Proposed Exceptions No. 3, 4, and 5 would provide correlation and allow for installations not literally permitted by present wording.

"Approved enclosure" would cover installations in auxiliary gutters, cablebus, etc., which are not deemed "raceways".

The FPN phrase "grouping of conductors" may suggest the rule of (a) need not apply if the raceway is aluminum, although it is not an exception. This would conflict with Sections 300-3(b) and 310-4, Exception No. 2. Section 300-3(b)(3) requires compliance with (b) where passing through magnetic metal and doesn't modify the general requirements of Section 300-3(b) which doesn't differ for nonmagnetic enclosure.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirement in the proposal singling out metal armored cable should not be in the NEC as it is in cable standards. The installer has no control over the placement of the conductors in the cable.

The proposed change to delete phase conductors and grounded conductors from the text was not accepted since these are very specific terms and help the user in identifying exactly which conductors must be grouped.

The proposed addition of "wire-type" is unnecessary since only equipment grounding conductors of the wire type would need to be grouped with the other conductors.

The proposed addition in the last sentence of the phrase "in the same raceway, cable, or approved enclosure" is redundant since it is also stated in the first sentence of the existing text.

Proposed Exception No. 3 and Exception No. 4 are unnecessary since this information is already covered in Sections 300-3(b)(1) and (b)(3) plus referenced in Section 330-16 back to Section 300-20(b) for single conductor MI cable.

Proposed Exception No. 5 is unnecessary since it is already covered in Section 300-3(b)(4). These column-type metal panelboards have been tested and listed with the auxiliary gutter and pullbox and can be considered as one complete piece of equipment.

The Panel disagrees with the submitter's statement that without these three exceptions, the installations of concern would not be permitted.

The FPN is very clear in its message involving aluminum and induced currents. Deleting the information on grouping of conductors through aluminum wall sections makes the FPN less clear and defeats the purpose of the FPN which is to provide clarity.

AFFIRMATIVE: 11

(Log #4349)

3- 93 - (300-21, FPN): Accept in Part
SUBMITTER: Lawrence Brown, Nat'l Assn. of Home Builders
RECOMMENDATION: Revise text to read as follows:
FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Model building codes also contain restrictions on membrane penetrations on opposite sides of a fire resistance rated wall assembly. An example is the 24-in. (610-mm) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. This separation may depend on a specified horizontal dimension, fireblocking, or the incorporation of listed products. Assistance in complying with Section 300.21 can be found in these building codes, fire resistance directories and product listings.
SUBSTANTIATION: Not only do the fire-resistance directories have specific requirements for the assemblies they have tested, the model building codes also have specific requirements. Please note the following Section 711.32 of the 2000 IBC. There are other alternative methods to achieve the ends of containing the spread of fire and the products of combustion besides a 24-in. separation. The use of solid fireblocking and listed products to provide necessary separation are also recognized. This information should also be included in the FPN to better inform the user.
ICC Section: 711.3.2 Membrane Penetrations. Membrane penetrations shall comply with Section 711.3.1. Where walls are required to have a minimum 1 hour fire resistance rating, recessed light fixtures shall be so installed such that the required fire resistance will not be reduced.
Exceptions:
1. Steel electrical boxes that do not exceed 16 square inches (0.0103 m^2) in area provided the total area of such openings does not exceed 100 square inches (0.0645 m^2) for any 100 square feet (9.29 m^2) of wall area. Outlet boxes on opposite sides of the wall shall be separated as follows:
1.1 By a horizontal distance of not less than 24 inches (610 mm), or
1.2 By a horizontal distance of not less than the depth of the wall cavity when the wall cavity is filled with cellulose loose-fill or mineral fiber insulation, or
1.3 By solid fire blocking in accordance with Section R602.81, or
1.4 By other listed materials and methods
2. Membrane penetrations for listed electrical outlet boxes of any materials are permitted provided such boxes have been tested for use in fire resistance-rated assemblies and are installed in accordance with the instructions included in the listing.
3. The annular space created by the penetration of a fire sprinkler provided it is covered by a metal escutcheon plate.
PANEL ACTION: Accept in Part.
The panel accepts the following to read:" FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire resistance rated wall assembly. An example is the 610 mm (24 in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with Section 300.21 can be found in building codes, fire resistance directories and product listings."
PANEL STATEMENT: The deleted sentence was not accepted because it contains terminology that may introduce more questions than clarification.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3170)

3- 95 - (300-22(b)): Accept in Principle
NOTE: The Technical Correlating Committee directs that the panel clarify the Panel Action on this Proposal considering the comments on voting and the Panel Action on 3-98. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION: Revise the first sentence to read:
(b) Ducts or Plenums Used for Environmental Air. Only wiring methods without an overall nonmetallic covering and consisting of Type MI cable, Type MC cable employing a smooth or corrugated impervious metal sheath, electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, or rigid metal conduit shall be installed in ducts or plenums specifically fabricated to transport environmental air.
SUBSTANTIATION: Section 300-22(b) as currently written does not permit nonmetallics in these environmental air spaces. This proposal is to clarify that fact relative to a new rigid conduit product and does not affect any of the currently permitted products. The current text permits the use of "rigid metal conduit". Recent changes have been made to UL Safety Standard 6 "Rigid Metal Conduit", which now allows the listing of a metal conduit with a PVC coating as an alternative to metal conduit with galvanizing. If this change is not made in 300-22(b), this new type of conduit could be used in ducts or plenums, which was not the original intent. The 1999 UL Electrical Construction Equipment Directory (Green Book) states that, "Conduit with nonmetallic coatings has not been evaluated for use in ducts, plenums, or other environmental air spaces in accordance with Section 200-33 of the National Electrical Code."
PANEL ACTION: Accept in Principle.
Revise the first sentence to read:
"(b) Ducts or Plenums Used for Environmental Air. Only wiring methods without an overall nonmetallic covering and consisting of Type MI cable, Type MC cable employing a smooth or corrugated impervious metal sheath, electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, or rigid metal conduit shall be installed in ducts or plenums specifically fabricated to transport environmental air."
PANEL STATEMENT: The deletion was strictly editorial. In the proposer's substantiation, the reference in the UL Electrical Construction Equipment Directory should be Section 300-22, not 200-33.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
FORSBERG: The panel rejected similar text per Proposal 3-98 by the panel substantiation: "The substantiation covered only rigid metal conduit. There was no substantiation to include other products with over all nonmetallic covering." This panel substantiation also applies for Proposal 3-95. There are currently cables used with nonmetallic covers per Articles 725, 770, and 800.
COMMENT ON AFFIRMATIVE:
CASPARRO: The submitter's substantiation, which states that UL has not evaluated nonmetallic coatings for use in ducts, plenums, or other environmental air spaces, makes this proposal acceptable.
GRUBER: This proposal should be "Accept" not "Accept in Principle".
The Panel accepted the exact language from the proposal. The Panel's editorial comment about an incorrect Code reference (300-22 not 200-33) refers to the submitter's substantiation, not the proposal itself and therefore should only be a Panel comment regarding the substantiation.
KREINER: The first "and" in the second line of the Panel Action should be deleted since that was the reason for the Accept in Principle.

(Log #2060)

3- 96 - (300-22(c) Exception No. 2): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Add an Exception to read as follows:
Exception No. 2: This section shall not apply to supervised industrial installations for semiconductor clean room facilities as defined by Section 240-91.
SUBSTANTIATION: Many Authorities Having Jurisdiction are unsure if this section should apply to semiconductor fabrication plants.
Semiconductor clean rooms are similar to Article 645 except that they have much more safety sensing devices and can not be interrupted during the process stage. See also NFPA 318.
To install the wiring methods in raceways only limits the ability to change the fabrication tools so that production can be maintained in as short of time as possible.
As defined in the Mechanical codes this room is somewhat like a plenum.
As defined in the electrical code this room is not a plenum but air moves around the room through the fabrication tools the same as data processing equipment.
The building Code states this fabrication area is a single conditioned environment.
The room is also separated from the rest of the building the same as if NFPA 75 was used in the design of this area.
A hardship is being placed on the technology industry because some Inspectors do not under stand that this room must change with the new technology being developed at a rapid pace.
Using section 300-22(c) impedes this process due to all the other combustible products being install in this OTHER SPACE.
Exhaust ducts up to 36 inches made out of plastic type materials.
Tubing used for gas sensing is combustible.
Cold water pipes used for the air handlers are insulated with pvc materials.
I hope the Panel will give this request serious consideration.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The definition for a supervised industrial installation in Section 240-91 only applies to Part H of Article 240 for special permission for overcurrent protection for feeders and branch circuits in large industrial installations used exclusively for manufacturing and process control activities. The submitter needs to provide much more technical documentation showing the containment of products of combustion within a limited area, types of filtering, fire protection techniques used in these areas, fan and electrical equipment shutdown during a fire emergency, and similar information that would allow deviation from the standard requirements found in Section 300-22(c).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2930)

3- 97 - (300-22(c)(1)): Reject
SUBMITTER: Timothy Arendt, City of Chicago
RECOMMENDATION: Revise text to read as follows:
"..., Type AC cable, ~~or other factory assembled multiconductor control or power cable that is specifically listed for the use,~~ or...".
SUBSTANTIATION: There is growing concern nationwide regarding combustible or limited combustible material used in this space. In Chicago survey has revealed that dangerous accumulations of cables does not exist due to the raceway requirement.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The supporting material does not back-up the submitter's proposal to deny the use of specifically listed plenum cable in this other space for environmental air. These cables have been tested and listed based upon low smoke producing characteristics. There has been no technical documentation submitted to indicate that permission to use this cable in an other space for environmental air should be rescinded.
The supporting material indicates that the NFPA Committee for NFPA 90A has recommended that an exception be inserted in NFPA 90A to allow the plenum cable for computer equipment and communications equipment in spaces for environmental air only where the cable is connected to equipment that is actually operational and to not allow cables in these areas not connected to operating equipment. This was turned down on the floor at the NFPA meeting, appealed to the Standards Council, and turned down by the Standards Council.
The second part of the supporting material submitted deals with research on duct mounted smoke detectors that would apply to Section 300-22(b) covering fabricated ductwork, not 300-22(c) covering other space used for environmental air.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3169)

3- 98 - (300-22(c)(1)): Reject
SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION: Revise the last sentence in 300-22(c)(1) to read:
Other type cables and conductors shall be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers; <u>overall nonmetallic coverings shall not be permitted.</u>
SUBSTANTIATION: Section 300-22(c)(1) as currently written does not permit nonmetallics in these environmental air spaces. This proposal is to clarify that fact relative to a new rigid conduit product and does not affect any of the currently permitted products. The current text permits the use of "rigid metal conduit". Recent changes have been made to UL Safety Standard 6 "Rigid Metal Conduit", which now allows the listing of a metal conduit with a PVC coating as an alternative to metal conduit with galvanizing. If this change is not made in 300-22(b), this new type of conduit could be used in ducts or plenums, which was not the original intent. The 1999 UL Electrical Construction Equipment Directory (Green Book) states that, "Conduit with nonmetallic coatings has not been evaluated for use in ducts, plenums, or other environmental air spaces in accordance with Section 200-33 of the National Electrical Code."
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation covered only coated rigid metal conduit. There was no substantiation to include other products with over all nonmetallic covering.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
CASPARRO: In light of the action taken by CMP-3 on Proposal 3-99 on Section 300-22(c)(1) Exception, it would seem appropriate for consistency to accept the proposal.
GRUBER: I agree with Mr. Casparro's negative comment.

(Log #2500)

3- 99 - (300-22(c)(1), Exception): Accept
SUBMITTER: Andre R. Cartal, Bldg Dept., Princeton Borough, N
RECOMMENDATION: Delete the exception.
SUBSTANTIATION: The accommodation of a specific wiring method in this location should be removed. The use of liquidtight flexible metal conduit in single lengths of not over 6 feet but with no limit on the number of single lengths permitted has to be in conflict with the basic intent of this section, especially so since the section prohibits the use of MC cable with a nonmetallic covering.
For example, we could have 100 fixtures fed by 6 foot LTFMC fixture whips for a total of 600 feet of this product and that would be in compliance but if we had 2 feet of MC cable with a nonmetallic covering we would be in violation.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
CASPARRO: Removal of what could potentially be unlimited lengths of up to 6 ft pieces of sealtite is a positive step for getting toxic substances from other spaces used for environmental air. The submitter and CMP-3 should be commended for this proposal.

(Log #4134)

3- 100 - (300-22(e)): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 16 for information.

SUBMITTER: Marcelo M. Hirschler, GBH Int'l, Inc./Rep. Plenum Cable Assn.

RECOMMENDATION: Add new text to read as follows:

300.22. Wiring in Ducts, Plenums, and Other Air-Handling Spaces. The provisions of this section apply to the installation and uses of electric wiring and equipment in ducts, plenums, and other air-handling spaces.

FPN: See Article 424, Part F, Duct Heaters.

(e) Abandoned cables, not intended for future use, shall not be permitted to remain.

SUBSTANTIATION: There is a significant amount of information indicating that the amount of cables installed in plenums, and other air-handling spaces, is increasing rapidly. An understanding of cabling practices indicates that the most common way in which cable installation is carried out is by disconnecting existing cable and leaving it abandoned in place, while introducing the cable needed to perform the additional functions. This creates an increased fuel load in plenums and other air-handling spaces, which is best controlled. There is, as yet, no indication that the additional cable in plenums causes an added fire hazard, and the fire record of cables in concealed spaces, both above ceilings and below floors, remains excellent. In fact, plenum cables, which meet the fire test requirements of NFPA 262, have been shown to have extremely good fire performance and to spread flame only very slowly, if at all. However, this type of preventive measure is worthwhile.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter's own substantiation states there is no indication that the additional cables in plenums caused an added fire hazard and that the fire record of cables in plenums is excellent. Requiring abandoned cables to be removed that are not intended for future use would be almost impossible to enforce. Many cables are installed for future use and cables are often swapped at patch panels to provide a very effective method of moving a computer or a piece of telecommunications equipment without having to pull a new cable.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

ABSTENTION: 1

COMMENT ON AFFIRMATIVE:

CASPARRO: I'm not sure this proposal belongs in Chapter 3. The proposal submitted seems intended to address low voltage type wiring. The literal wording of the proposal appears to broaden the scope of the proposal to include cable assemblies. The provisions of Chapter 3 may be modified by Chapters 5, 6, and 7, as indicated in 90-3. Chapter 8 is independent of the other Chapters except where specifically referenced therein. I feel the concerns of the submitter can and will be addressed by other code panels.

EXPLANATION OF ABSTENTION:

FORSBERG: The Society of Plastic Industries could not come to agreement on this proposal.

(Log #1832)

3- 101 - (300-23): Reject

SUBMITTER: Dan Ward, City of Orlando, FL

RECOMMENDATION: Add a new sentence:

"See Sections 640-5, 725-5, 760-5, 770-7, 800-5, 820-5 and 830-6 for the same requirement.

SUBSTANTIATION: This sentence will make the code easier to use, without adding a fine print note. It belongs here because the rules are ignored.

PANEL ACTION: Reject.

PANEL STATEMENT: This rule applies generally. Mandatory replication of section is not necessary for the safe application of this code.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #789)

3- 102 - (300-37): Accept in Part

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

Aboveground Wiring Methods. Aboveground conductors shall be installed in rigid metal conduit, in intermediate metal conduit, in electrical metallic tubing, in rigid nonmetallic conduit, in auxiliary gutters, in cable trays, as busways, as cablebus, in other identified raceways, or as open runs of metal-clad cable suitable for the use and purpose. In locations accessible to qualified persons only, open runs of Type MV cable and bare conductors, including busbars, shall also be permitted where securely supported on insulators.

SUBSTANTIATION: Since auxiliary gutters are not considered raceways, the mandatory requirements of this section excludes their use. Bare busbars is somewhat redundant since they are bare conductors. Requirements for support seem warranted since Article 320 only applies to 600 volt or less systems. Section 300-11(a) reference to cable assemblies does not appear to include individual open conductors.

PANEL ACTION: Accept in Part.

Revise the text to read as follows:

"Aboveground Wiring Methods. Aboveground conductors shall be installed in rigid metal conduit, in intermediate metal conduit, in electrical metallic tubing, in rigid nonmetallic conduit, in auxiliary gutters, in cable trays, as busways, as cablebus, in other identified raceways, or as open runs of metal-clad cable suitable for the use and purpose."

The panel rejects the remainder of the proposal.

PANEL STATEMENT: The existing text covering both bare conductors and bare busbars makes it very clear that this section applies to both. The suggested change does not clarify the issue but actually obscures it somewhat. The submitter is correct that Article 320 would not apply, but Article 110, Part C does apply. The additional text for securing bare conductors and bare busbars is not necessary since it is already covered in Section 110-36.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

ANDREWS: This proposal should be rejected. The submitter proposed to add some words to this section. The only part accepted was to add the words "in auxiliary gutters" in the first sentence. The Panel accepted that the words could be added to the permitted wiring methods for any voltages above 600 volts since it was permitted for those 600 volts and below. However, there are no gutter products listed for use with systems over 600 volts.

The energy level of a fault or shout-circuit at the higher voltages are greatly different from those occurring at 600 volts and less. The response time of overcurrent protection and the magnetic stresses on equipment are different at the higher levels.

Review of the UL listing for wireways, auxiliary gutters, and associated fittings, (category ZOYX, page 117 of the UL "White Book", General Information for Electrical Equipment, 1999), shows UL870 Standard correlates Articles 362, 374, and 645. Upon double checking through Don Nissen of Underwriters Laboratories, UL Standard 870 shows listings for 600 volts and below. In order to comply with the second sentence of Section 300-2(a), UL would have to show a specific listing showing compliance with an appropriate NEC Article. Since Article 374 does not specifically mention auxiliary gutter use for over 600 volts, UL does not have any basis to list equipment for that use.

(Log #2044)

3- 103 - (300-37): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 8 for comment on application of the subject wiring methods over 600 volts. It was also the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 7 and 11 for information. The Technical Correlating Committee notes that the Recommendation of this Proposal deletes some wiring methods without substantiation.

SUBMITTER: Gregory P. Bierals, Electrical Design Inst.

RECOMMENDATION: Revise text to read as follows:

"Aboveground conductors shall be installed in rigid metal conduit, intermediate metal conduit, EMT, in rigid nonmetallic conduit, in flexible metal conduit and liquidtight flexible metallic conduit at motor connections in lengths up to 6 ft."

SUBSTANTIATION: To correlate with Sections 430-123 and 430-145(b).

PANEL ACTION: Reject.

PANEL STATEMENT: The permission to use this wiring method for over 600 volt applications is very limited. To insert it within Section 300-37 would seem to be an invitation to misread and misapply it. If the user is installing a motor with a voltage in excess of 600 volts, then Part K of Article 430 should be read and the requirements specifically adhered to, especially Section 430-123.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #4194)

3- 104 - (300-37): Reject

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee

RECOMMENDATION: Revise as follows:

"Aboveground conductors shall be installed in rigid metal conduit, in intermediate metal conduit, in electrical metallic tubing, in rigid nonmetallic conduit, in cable trays, as busways, as cablebus, in other identified raceways, or as open runs of metal-clad cable suitable for the use and purpose. Where rigid nonmetallic conduit is used, it shall be Schedule 80 or it shall be suitably encased in not less than 2 in. (50.8 mm) of concrete. In locations accessible to qualified persons only, open runs of Type MV cables, bare conductors, and bare busbars shall also be permitted. Busbars shall be permitted to be either copper or aluminum."

SUBSTANTIATION: The Advisory Committee believes that if rigid nonmetallic conduit is used for above grade use above 600V, the Code should require a small safety margin beyond what it requires for similar use for 600V and below. This proposal allows rigid nonmetallic conduit for this purpose, but asks for Schedule 80 (or concrete encasement otherwise) when so employed.

PANEL ACTION: Reject.

PANEL STATEMENT: There has been no technical substantiation provided to disallow the use of Schedule 40 PVC in above ground use or to require concrete encasement. Section 347-2 allows its use for underground installations without the added protection. Section 347-3(c) does not allow PVC where subject to physical abuse, unless specifically identified for such use.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #791)

3- 105 - (300-37, Exception (New)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Add an exception to read as follows:

Exception: Flexible metal conduit, liquidtight flexible metal conduit, and liquidtight flexible nonmetallic conduit shall be permitted in accordance with Section 430-123 for motors and Section 600-32(a) for electric signs and outline lighting.

SUBSTANTIATION: Editorial. Many code users may not be ware of UL listing which "identifies" these raceways, along with the referenced sections, as suitable, since Articles 350 and 351 do not address such over 600 volt use for flexible metal conduit and liquidtight flexible metal conduit.

PANEL ACTION: Reject.

PANEL STATEMENT: The permission to use this wiring method for over 600 volt applications is very limited. To insert it within Section 300-37 would seem to be an invitation to misread and misapply it. If the user is installing a motor with a voltage in excess of 600 volts, then Part K of Article 430 should be read and the requirements specifically adhered to, especially Section 430-123. If the user of the Code is installing an electric sign or outline lighting, then Article 600 can certainly modify the requirements in Section 300-37. The submitter is incorrect in implying that liquidtight flexible nonmetallic conduit is acceptable for use with motors over 600 volts. The listing only allows this use for signs and Section 430-123 further backs that up.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #2215)

3- 106 - (300-39): Reject

SUBMITTER: Ravindra H. Ganatra, Alcan Cable

RECOMMENDATION: Revise the first two sentences to read:

Open runs of braid-covered insulated conductors shall have a ~~flame retardant~~ flame tested braid. If the conductors used do not have this protection, a ~~flame retardant~~ listed saturant shall be applied to the braid covering after installation.

SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.

[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]

A "listed" saturant for the purpose could be evaluated for not only its capability to meet an applicable flame test requirement but other physical and electrical properties that may be necessary for this application.

PANEL ACTION: Reject.

PANEL STATEMENT: Panel 3 does not have jurisdiction over the specific technical issues of conductors and whether the braid is called flame-retardant or flame tested. This whole issue falls under the jurisdiction of Panel 6 and should be decided first by Panel 6. The word "listed" should not be added to saturant without some qualification as to the type of listed saturant. Is it a listed flame-tested saturant or listed flame-retardant saturant or is a listed saturant without any further explanation acceptable? The submitter should submit the technical substantiation to Panel 6 for this change.

The term "flame retardant" is used throughout the Code as a means of expressing to the user that the material resists ignition or the spread of flames, albeit the test methods are often not defined. The term "flame tested" would be similarly undefined, but can be understood to mean a test which does not necessarily measure the ability of a material to resist ignition or flame propagation. Some articles of the NEC offer information regarding the tests deemed appropriate for the required level of resistance to ignition or flame propagation. Others rely on the product standards to provide such information. The panel suggests that specific proposals be made wherever the generic reference to "flame retardant" is not sufficient.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #3217)

3- 107 - (300-50): Reject
SUBMITTER: Allen L. Wadkins, Murray State Univ.
RECOMMENDATION: Add new text to read as follows:
Underground installations of conductors of 600 volts, or more, direct buried or in a raceway shall have an insulated conductor laid in some ditch line for locating purposes. The insulated conductor shall be terminated at each end of underground installation at a readily accessible location, to where a locating device may easily be connected.
SUBSTANTIATION: Underground high voltage lines have always been a difficult task to locate. Most locator equipment manufacturers do not recommend connecting to a conductor of 600 volts or more, for several reasons, mainly safety. Also, many h.v. faults and cables are unaccessible without a shutdown. The second means of locating is to connect the locator transmitter to the ground of the shielded cable which is very unreliable being that the locator indicates a signal on the ground and scatters the signal in the ground.
PANEL ACTION: Reject.
PANEL STATEMENT: Other detection methods exist that are tested and reliable. Utility companies and private locator companies have been locating underground cables and conductors for many years with a great deal of effectiveness. Locating the locator line after the system has been buried for a period of time would also be difficult. If the system is bored or vibrated into place then the locator line would also have to be installed. Section 90-1(b) states that the Code contains provisions considered necessary for safety and free from hazard. This is not a safety issue. The panel considered that the submitter intended his proposal to read "over 600 volts, Nominal" instead of "600 volts, or more".

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1271)

3- 108 - (Table 300-50): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise the table heading as follows:
1) Table 300-50. Minimum Cover Requirements (Cover is defined as the shortest distance in mm (inches) ~~inches~~ measured between a point on the top surface of any direct-buried conductor, cable, conduit, or other raceway and the top surface of finished grade, concrete, or similar cover.)
2) Split Table 300-50 Columns 2, 3 & 4 (Direct Buried Cables, Rigid Nonmetallic Conduit Approved for Direct Burial and Rigid Metal Conduit Intermediate Metal Conduit) as follows:

Direct Buried Cables		Rigid Nonmetallic Conduit Approved for Direct		Rigid Metal Conduit and Intermediate Metal Conduit	
mm	Inches	mm	Inches	mm	Inches
750	30	450	18	150	6
900	36	600	24	150	6
1000	42	750	30	150	6

Revise the note below the Table as follows:

~~Note: For SI units, 1 in. = 25.4 mm.~~
*** Listed by a qualified testing agency as suitable for direct burial without encasement. All other nonmetallic systems shall require ~~2 in. (50.8 mm)~~ 50 mm (2 in) of concrete or equivalent above conduit in addition to above depth.**

SUBSTANTIATION: The proposed revisions are intended to comply with the NFPA No. 1M Manual of Style, Section 4.1 with respect to the placement of units The existing Table 300-50 columns for the appropriate wiring methods have been split into two columns, one for burial depth in mm, the other for burial depth in inches. NFPA editorial staff may format the information in the most suitable format for inclusion in Table 300-50
PANEL ACTION: Accept in Principle.
Insert "Burial" and asterisk in title to column 3.
PANEL STATEMENT: The panel understands that the remainder of the table will remain as is. Editorial correction indicating the addition of the word "Burial" and asterik in the third column.

3- 109 - (Table 300-50): Accept in Principle
Note: The Technical Correlating Committee directs the Panel to clarify the action on this Proposal. The relationship of the Exceptions to the Table Columns is not clear. The Technical Correlating Committee also directs the Code-Making Panel to revise the title of the table to move the definition of "cover" into a Table Note. This action will be considered by the Panel as a Public Comment
SUBMITTER: Melvin K. Sanders, Ankeny, IA
RECOMMENDATION: Revise Table 300-50 as shown. (Leave the present text located above and below the table as in the 1999 Edition of the NEC.)

Circuit Voltage	Buried Direct-Cables	Rigid Nonmetallic Conduit Approved for Direct Burial*	Rigid Metal Conduit and Intermediate Metal Conduit					
			All locations not otherwise specified	In trench below 2-in. thick concrete or equivalent	Under a building	Under minimum of 4-in. thick concrete exterior slab with no vehicular traffic and the slab extending not less than 6 in. beyond the underground installation	Under streets, highways, roads, alleys, driveways, and parking lots	In or under airport runways, including adjacent areas where trespassing prohibited
Over 600 V through 22 kV	30	18	6	6	0	4	24	18
Over 22 kV through 40 kV	36	24	6	6	0	4	24	18

SUBSTANTIATION: To be consistent with Table 300-5, and acknowledge that burial depths for airport locations are to be 18-inches minimum due to FAA regulations.
PANEL ACTION: Accept in Principle.
Revise table as follows:

Table 300-50. Minimum Cover Requirements (Cover is defined as the shortest distance in inches measured between a point on the top surface of any direct-buried conductor, cable, conduit, or other raceway and the top surface of finished grade, concrete, or similar cover.)

(1) Circuit Voltage	(2) Buried Direct-Cables	(3) Rigid Nonmetallic Conduit Approved for Direct Burial and not Under a Building*	(4) Rigid Metal Conduit and Intermediate Metal Conduit				
			(5) All locations not otherwise specified	(6) Under a building (including rigid nonmetallic conduit approved for direct burial)	(7) Under minimum of 4-in. thick concrete exterior slab with no vehicular traffic and the slab extending not less than 6-in. beyond the underground installation (including rigid nonmetallic conduit approved for direct burial)	(8) Under streets, highways, roads, alleys, driveways, and parking lots	(9) In or unde airport runways, including adjacent a where trespassing prohibited
Over 600 V through 22 kV	30	18	6	0	0	24	18
Over 22 kV through 40 kV	36	24	6	0	0	24	18
Over 40 kV	42	30	6	0	0	24	18

Note: For SI units, 1 in. = 25.4 mm.
*** Listed by a qualified testing agency as suitable for direct burial without encasement. All other nonmetallic systems shall require 2 in. (50.8 mm) of concrete or equivalent above conduit in addition to above depth.**

(8) *Exception No. 1: Areas subject to vehicular traffic, such as thoroughfares or commercial parking areas, shall have a minimum cover of 24 in. (610 mm).*

(2)(3) *Exception No. 2: The minimum cover requirements for other than rigid metal conduit and intermediate metal conduit shall be permitted to be reduced 6 in. (152 mm) for each 2 in. (50.8 mm) of concrete or equivalent protection placed in the trench over the underground installation.*

(3)(6)(7) ~~*Exception No. 3: The minimum cover requirements shall not apply to conduits or other raceways that are located under a building or exterior concrete slab not less than 4 in. (102 mm) in thickness and extending not less than 6 in. (152 mm) beyond the underground installation. A warning ribbon or other effective means suitable for the conditions shall be placed above the underground installation.*~~

(3)(6)(7) Exception No. 3: The minimum cover requirements for conduits shall not apply if the installation meets either one of the following conditions. A warning ribbon or other effective means suitable for the conditions shall be placed above the underground installation.

1. The minimum cover requirements shall not apply to conduits or other raceways that are located under a building; or

2. The minimum cover requirements shall not apply to conduits or other raceways that are located under an exterior concrete slab not less than 4 in. (102 mm) in thickness and extending not less than 6 in. (152 mm) beyond the underground installation.

Exception No. 4: Lesser depths shall be permitted where cables and conductors rise for terminations or splices or where access is otherwise required.

(2) Exception No. 5: In or under airport runways, including adjacent defined areas where trespass is prohibited, cable shall be permitted to be buried not less than 18 in. (457 mm) deep and without raceways, concrete enclosement, or equivalent.

(9) Exception No. 6: In or under airport runways, including adjacent defined areas where trespass is prohibited, conduit shall be permitted to be buried not less than 18 in. (457 mm) deep and without concrete enclosement or equivalent.

Exception No. 7: Raceways installed in solid rock shall be permitted to be buried at lesser depth where covered by 2 in. (50.8 mm) of concrete, which shall be permitted to extend to the rock surface.

PANEL STATEMENT: The panel has met the submitter's intent and has provided some revisions to include information from some of the six existing exceptions to this table. The panel also added the 40Kv row which was missing in the original proposal.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

CASPARRO: Pending review of final document.

(Log #610)

3- 110 - (300-50(c)): Reject
SUBMITTER: Rick Stringfield, Westinghouse Savannah River Co.
RECOMMENDATION: Change second sentence of this section to read:
The taps and splices shall be watertight and protected from mechanical damage and shall be made in accordance with Section 110-14(b).
SUBSTANTIATION: Maintain consistency with rulings set forth in 300-5(e).
PANEL ACTION: Reject.
PANEL STATEMENT: The requirement is redundant since it is already addressed in 110-14(b) and 300-5(e).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #790)

3- 111 - (300-50(e)): Accept in Principle
Note: The Technical Correlating Committee directs the Panel to confirm the Technical Correlating Committee's assumption that the Panel intends that 300-50(e) remain as presently written in the 1999 NEC. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Raceway Seal. Where a raceway ~~enters~~ from an underground system ~~the end~~ terminates within a building or at an enclosure the end shall be sealed with an identified compound so as to ~~prevent~~ minimize the entrance of moisture or gases. ~~or it shall be arranged to prevent moisture from contacting live parts.~~
SUBSTANTIATION: A raceway terminating at an enclosure outside a building should be included since it may have live parts or allow gases to pass into connecting raceways. The word "minimize" is more realistic than "prevent". Explosion-prooof seals do not necessarily prevent passage of gases. The alternative "or arranged to prevent moisture from contacting live parts" voids the requirement of a seal for gases. Section 300-5(g) does not indicate an alternative to sealing and doesn't limit sealing to raceway ends within a building. Requirements in different sections ostensibly for the same safety reasons should correlate, for the benefit of code users.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and panel statement on proposal 3-61. It is applicable because Part A is general and would apply.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
FORSBERG: See my Explanation of Negative Vote on Proposal 3-61.
GRUBER: See my Explanation of Negative Vote on Proposal 3-61.
PACE: The words "or it shall be arranged to prevent moisture from contacting live parts" should not be deleted. The substantiation states, "The alternative or arranged to prevent moisture from contacting live parts" voids the requirement of a seal for gases". 300-50(e) does not require seals exclusively, but offers seals as one alternative and the arrangement as another. Proper arrangement of raceways is an effective method of protection from moisture contacting live parts. The words "or arranged to prevent moisture from contacting live parts" should be left as they currently exist in the text. The substantiation also makes reference to 300-5(g), which talks about "conduits or raceways through which moisture may contact energized live parts shall be scaled or plugged at either or both ends". I agree with this statement and recognize this situation is different from that of 300-50(e) where the arrangement is such that contact is prevented. Both are correct for the specific situation they address, and they are not in conflict with each other.

ARTICLE 305 — TEMPORARY WIRING

(Log #2095)

3- 112 - (305): Reject
NOTE: The Technical Correlating Committee advises that article placement is the responsibility of the Technical Correlating Committee and accepts the Panel Action.
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Move Article 305 to Chapter 7 such as New Article 710 which is now vacated.
SUBSTANTIATION: The problem leaving Article 305 here is that it appears to be in conflict with Section 90-3.
Section 90-3 states the arrangement of the Code.
Chapters 1 through 4 apply generally; chapters 5,6, and 7 apply to special occupancies, special equipment, or other special conditions.
Article 305 would fall under special conditions and does not apply generally to wiring methods.
Article 305 amends Chapters 1 through 4.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel has accepted a TCC proposal to relocate Article 305 to a new Article 527. See panel statement on Proposal 3-141.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #793)

3- 113 - (305-1, FPN (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add a fine print note to read as follows:
FPN: It is not the intent of this article to prohibit suitable permanent type wiring methods permitted elsewhere in this code.
SUBSTANTIATION: Editorial. See panel statements for Proposals 3-154 and 3-156 in the 1998 ROP: "It is not the intent of this article to prohibit wiring methods which are elsewhere permitted by the code". Many code users may not be aware of this. In Proposal 3-142 of the 1995 ROP, the panel indicated permanent wiring methods need not be removed per (d) which infers they are not considered as temporary wiring. The proposal merely clarifies that permanent type wiring methods may be used but are subject to the time constraints of Section 305-3.
PANEL ACTION: Reject.
PANEL STATEMENT: The Panel disagrees that the proposed FPN would add clarity to the Scope of Article 305. Section 305-2 already states that "Except as specifically modified in this article, all other requirements of this Code for permanent wiring shall apply to temporary wiring installations."
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2766)

3- 114 - (305-1-Temporary Wiring (New)): Reject
SUBMITTER: Joseph A. Tedesco, Nat'l Technology Transfer, Inc
RECOMMENDATION: Add definition to read as follows:
Temporary Wiring. Approved wiring for power and lighting during a period of construction, remodeling, maintenance, repair, or demolition and decorative lighting, carnival power and lighting, and similar purposes.
SUBSTANTIATION: Seems like this definition belongs in the NEC. I found this in NFPA 1, 1997 edition of the Fire Prevention Code.
PANEL ACTION: Reject.
PANEL STATEMENT: The scope and time constraints for temporary wiring methods in Article 305 primarily cover the information found in the proposed definition so a further definition is not necessary. Carnivals, fairs, and similar functions are covered in Article 525 which can supplement or modify any of the Chapters 1-4 requirements so the reference to carnivals in the proposed definition is also unnecessary.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2062)

3- 115 - (305-2, Exception (New)): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Add a new Exception to read as follows:
Exception: Where Temporary Power is supplied during construction for Industrial installations Article 220 shall not apply to the feeder load calculations and the service load capacity shall be continuously monitored.
SUBSTANTIATION: Since the load calculation for sizing feeders are not exempted in this Article many inspectors are not allowing additional loads be connected if the Code load exceeds the capacity the feeder or service.
It appears that the only requirement that must be met is that overcurrent protection be provided to protect the equipment or conductors.
During construction the load on the Temporary Service or Feeder is constantly changing or a lock-out tag-out system is employed, since the contractor can not afford to have the Electrical Power fail.
This Section as written does not give any relief to exceeding Article 220 requirements.
The panel should clarify this Section if the intent is to allow additional loads beyond the requirements Article 220.
Granted the Service shall not be overloaded but are installed with a single main, but if it is not then monitoring should be a must.
These projects may be under construction for longer than 90 days.
Section 305-4 does not help in resolving this issue.
PANEL ACTION: Reject.
PANEL STATEMENT: It is not the intent of Article 305 to allow temporary overloading of services or feeders. The proposal does not state the maximum potential load on a monitored system, only that it be monitored. Section 230-42 provides the maximum permitted ampacity on the service entrance conductors as the load determined by Article 220. Section 230-90(a) further states that the ungrounded service conductors shall be protected by an overcurrent protection device in series with each ungrounded service conductor having a rating or setting not higher than the allowable ampacity of the conductor, with some exceptions. The exceptions allow a higher rating or setting of overcurrent protection device under very significant conditions but never allows the calculated load to be higher than the allowable or actual ampacity of the conductor.

(Log #2768)

3- 116 - (305-2(a)(1)): Reject
SUBMITTER: Joseph A. Tedesco, Nat'l Technology Transfer, Inc.
RECOMMENDATION: Add new text:
"Each branch circuit that supplies receptacles or fixed equipment shall contain a separate equipment grounding conductor where run as an open conductor."
SUBSTANTIATION: This was found in NFPA 241, 1996 edition, Standard for Safeguarding Construction, Alterations, and Demolition Operations. This rule should be added as per Section 90-3 and added to Appendix A.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 305-2(a) already states that the temporary installation must comply with all permanent wiring method requirements unless modified by Article 305. That would include compliance with Article 250. Open wiring has been restricted in use by the 1999 Code as covered in Section 305-4(c), second paragraph, to a very limited application. Messenger supported wiring must comply with Article 250, and specifically with Section 250-86 for connection to the messenger. Additional text is not required to cover grounding requirements for temporary wiring. This should have been submitted to Section 305-4(c) covering branch circuits.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2770)

3- 118 - (305-2(a)(3)): Reject
SUBMITTER: Joseph A. Tedesco, Nat'l Technology Transfer, Inc.
RECOMMENDATION: Add new text as follows:
No extension cords or other temporary wiring shall be permitted within 25 ft of any stored consumer fireworks.
SUBSTANTIATION: See NFPA 1124, 1998 edition. This rule should be mentioned in the 2002 NEC as an extract.
PANEL ACTION: Reject.
PANEL STATEMENT: There doesn't seem to be any technical substantiation to restrict the use of extension cords or temporary wiring from around fireworks. Obviously, arcs and sparks should be minimized but any other restrictions should not be of concern.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #359)

3- 119 - (305-2(c) (New)): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 15 for action in Chapter 5. The Technical Correlating Committee notes that by the action on Proposal 15-147, Article 702 will now apply to optional stand-by systems that utilize portable generators.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add:
(c) GENERATORS. Where temporary power is provided by a portable or vehicle-mounted generator(s) and is connected to the permanent wiring system, a suitable means of transfer shall be provided to prevent the inadvertent interconnection of normal and temporary power sources. Where a motor base inlet type of plug is used to receive power from the generator, all circuit conductors, including the grounded conductor, attached to the inlet plug shall be disconnected while normal power is supplied. The generator(s) shall have an adequate capacity and rating for the supply of all equipment to be operated at one time. The installation shall comply with other applicable provisions of this code.
SUBSTANTIATION: The use of portable generators connected to permanent wiring at services, panelboards, switches, etc., is common as a means to provide temporary power. They are commonly connected to permanent wiring by a flexible cord with permanent connection or by a cord connector body and motor base inlet type of plug on the permanent wiring equipment.
This type of installation is different from the portable and vehicle mounted generators described in the grounding requirements of Section 250-34 and is not covered by Article 702 which relates to permanent installations. There doesn't seem to be specific code requirements to fully cover this type of installation.
The reference to inadvertent interconnection would not prohibit deliberate interconnection of grounded conductors where Code requirements are met. Such interconnection was tacitly approved by Section 230-83 in the 1996 NEC.
The requirement for disconnection of all conductors from an inlet plug complies with Section 410-56(g) and prevents a backfeed potential from the normal system.
While many of these type installations are made by unqualified persons or without the benefit of inspection, the proposal provides guidelines for safety.

PANEL ACTION: Accept in Principle.
In the second sentence of the recommendation, change "motor base" type to "flanged" type inlet of plug.
Revise (c) to read as follows:
"(c) Generators. Where temporary power is provided by a portable or vehicle-mounted generator(s) and is connected to the permanent wiring system, a suitable means of transfer or isolation shall be provided to prevent the inadvertent interconnection of normal and temporary power sources. Where a flanged inlet type of plug is used to receive power from the generator, all circuit conductors, including the grounded conductor, where provided, attached to the inlet plug, shall be disconnected while normal power is supplied. The generator(s) shall have an adequate capacity and rating for the supply of all equipment to be operated at the same time."
PANEL STATEMENT: Industry terminology uses the flanged inlet to describe the type of unit used for connection of cord caps into a system. On smaller portable generators there may not be a grounded conductor. Therefore CMP-3 has added the term "where provided".

(Log #792)

3- 120 - (305-2(c) (New)): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 15 for action in Chapter 5. The Technical Correlating Committee notes that by the action on Proposal 15-147, Article 702 will now apply to optional stand-by systems that utilize portable generators.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add new paragraph (c) to read as follows:
(c) Generators. Where temporary power is provided by a portable or vehicle-mounted generator(s), and is connected to the permanent wiring system, a suitable means of transfer shall be provided to prevent the inadvertent interconnection of normal and temporary power sources. Where a motor base inlet type of plug is used to receive power from the generator, all circuit conductors, including the grounded conductor, attached to the inlet plug shall be disconnected while normal power is supplied. The generator(s) shall have adequate capacity and rating for the supply of all equipment to be operated at the same time. The installation shall comply with other applicable provisions of this code.
SUBSTANTIATION: The use of portable generators connected to permanent wiring at switches, panelboards, services, etc., is common as a means to provide temporary power. They are usually connected to permanent wiring by a flexible cord with permanent type connections or by a cord connector body and motor base inlet type of plug on the permanent wiring equipment. This type of installation is different than the portable and vehicle-mounted generators described in the grounding requirements of Section 250-34 and is not covered by Article 702 which relates to permanent installations. There doesn't seem to be specific code requirements to fully cover this type installation.
The reference to inadvertent interconnection would not prohibit deliberate interconnection of grounded conductors where code requirements are met. Such interconnection was tacitly approved by Section 230-83 in the 1996 NEC.
The requirement for disconnection of all conductors from an inlet plug would be in compliance with Section 410-56(g) and prevent a backfeed potential to a grounded conductor prong or blade from the normal system.
While many of these type installations are made by unqualified persons, or without the benefit of inspection, the proposal provides guidelines for safety.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and panel statement on Proposal 3-119.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2061)

3- 121 - (305-2(c) (New)): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Add a new section to read as follows:
(c) Load Calculations. Temporary power used for construction purposes shall not be required to comply with Article 220 where the service has a single main service disconnecting means and all feeder overcurrent devices comply with Article 240.
SUBSTANTIATION: Where the service entrance equipment is installed for construction purposes complying with the load calculations of Article 220 will cause the installation of many additional temporary services to be installed. This is caused by the requirement to test many pieces of electrical equipment which is run on and off during the testing cycles for each of the many loads. Relief must be given for large complex electrical installations.
Since the service and feeders are protected as required by Article 240 no electrical shock or fire hazard can occur during this stage. If the overcurrent device trips safety is assured and alerts the installing contractor to tag and lock out loads so that the testing can continue for other equipment or remove the load.
PANEL ACTION: Reject.
PANEL STATEMENT: It is not the intent of Article 305 to allow temporary overloading of services or feeders. Minimum calculations must be provided based upon the usage of the particular services or feeders for the site. These circuits could be installed for temporary heating units at a site or some other known load. Section 230-42 provides the maximum permitted ampacity on the service entrance conductors as the load determined by Article 220. Section 215-2(a) also uses Article 220 for calculating the load on a feeder. Conditions at many sites are not necessarily going to be the best to begin with and to knowingly allow overloads would not be a safe practice.

(Log #3776)

3- 123 - (305-3(b)): Reject
SUBMITTER: Ellis A. Schmidt, Schmidts' Tree Farm/Rep. Nat'l Christmas Tree Assn.
RECOMMENDATION: Revise text to read as follows:
305.3(b) 90 Days. Temporary electrical power and lighting installations shall be permitted for a period not to exceed 90 days. ~~for~~ Christmas decorative lighting and similar ~~purposes.~~ seasonal lighting shall be considered as festoon lighting.
SUBSTANTIATION: In the 1993 and previous codes, lighting at Christmas tree lots was treated as festoon lighting. The 1996 code required drastic changes to the wiring systems allowed. The 1999 code allowed some relief but still considers Christmas decorative lighting as temporary lighting under Section 305.3(b). The section requires conductors be supported at intervals not greater than 10 ft and that lamp guards be used. In contrast, festoon lighting requires support at a maximum of 40 ft and does not require lamp guards.
To the best of our knowledge, there were no problems with lighting at Christmas tree lots or other seasonal installations when they were considered as festoon lighting. Outdoor cafes and

automobile lots operate as festoon lighting and it seems consistent to allow seasonal lighting to be installed and operate unde the same code requirements.
PANEL ACTION: Reject.
PANEL STATEMENT: The scope of Article 305 very clearly indicates that the provisions required in Article 305 may be of a class less than would be required for a permanent installation but the provisions for a permanent installation could be utilized in the case of festoon lighting for Christmas tree lots. Section 225-6 would apply to this type of lighting. The festoon lighting used on Christmas tree lots would not be considered to be the Christmas decorative lighting referred to in Section 305-3(b).

3- 124 - (305-3(b)): Accept in Principle
Note: The Technical Correlating Committee directs the Panel to review this Proposal in light of the Scope of Article 305. This action will be considered by the Panel as a Public Comment. In addition, the Technical Correlating Committee directs that this Proposal be forwarded to Code-Making Panels 2 and 18 for information.
SUBMITTER: Monte R. Ewing, State of Wisconsin
RECOMMENDATION: Revise text to read as follows:
"90 Days. Temporary electrical power and lighting installations shall be permitted for a period not to exceed 90 days for Christmas decorative lighting and similar purposes where not provided with arc-fault circuit-interrupter protection."
SUBSTANTIATION: Fire inspectors are having a loosing battle trying to limit the use of Christmas lighting in retail establishments to 90 days. Some of these uses never get removed for inspection, they merely unplug the lighting string and call it disconnected. Since we can't get rid of it I feel that this is a possible safe alternative to a 90-day code that is too difficult to enforce.
PANEL ACTION: Accept in Principle.
Change the proposed added phrase to "unless provided with arc-fault circuit-interrupter protection." To read as follows:
"Temporary electrical power and lighting installations shall be permitted for a period not to exceed 90 days for holiday decorative lighting and similar purposes, unless provided with arc-fault circuit-interrupter protection."
PANEL STATEMENT: The amended text provides a more positive text than the one in the proposal.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
CASPARRO: This proposal should be rejected.
Section 305-3(b) limits the use of temporary wiring to a period not to exceed 90 days. Section 305-3(d) requires removal of all temporary wiring upon completion of the purpose for which the wiring was installed. The submitter has not provided any technical substantiation as to the use of arc-fault circuit interrupters for this application. The Panel discussion referenced how would inspectors police the holiday lights to be taken down. The Panel discussion referenced how would inspectors police the holiday lights to be taken down. I'm wondering how are they going to police the holiday lights to be protected by arc fault?
KREINER: Adoption of this proposal aimed at allowing seasonal products to be installed for periods exceeding 90 days, was recommended to address the unenforceable nature of these installations. While, if properly employed, are fault circuit interrupters (AFCIs) would certainly make the products safer, it is unlkely there would be sufficient motivation to employ these devices. These devices would add considerable expense to the product or the installation. Since many commercial and residential installations already transcent the 90 day limit without adverse consequences and the proposed change doesn't address the enforceability of the Code requiement, what would motivate the consumer to spend considerable more to AFCI protect the product?
UL 588 - The Standard for Christmas-Tree and Decorative-Lighting Outfits, specifically restricts use of these products to 90 days through a marking on the product or the packaging for the product. Requirements in the Standard, although beefed up to address the length of installation misuse of these products, were developed with the temporary use of the product as a fundamental premise. Therefore, no Listed products exist that have been evaluated for long term product use.
Employing the AFCI protector would certainly begin to address the potential fire hazard associated with the product misuse. However, shock hazard has not been adequately addressed if we make long term installation a normal use. The verbiage of the propoal leads users to believe that employing an AFCI protector somehow eliminates any safety concerns with product misuse.
Lastly, the proposed verbiage is too general to be effective. Five diffenent AFCI configurations have either been developed or theorized. Branch/feeder AFCIs are installed at the origin of the circuit and are intended to protect branch/feeder circuit wiring and additionally provide limited protection for branch circuit extension wiring. Outlet circuit AFCIs are installed at the outlet and are intended to protect cord sets and power supply cords connected to that outlet. Combination AFCIs are intended to protect branch/feeder circuit and extension wiring. Cord AFCIs would plug into a receptacle outlet and would only protect the power supply cord connected to it. Portable AFCIs would plug into a receptacle and would provide multiple outlets intended to protect cord sets plugged into them. To adequately protect seasonal cord sets, an AFCI product designed to protect extension wiring would need to be employed and therfore specified in the code.

(Log #2487)

3- 125 - (305-3(d)): Reject
SUBMITTER: James M. Imlah, City of Hillsboro, OR
RECOMMENDATION: Revise as follows:
(d) Removal. All temporary electrical wiring shall be removed in its entirety, immediately upon competition of construction or purpose for which the wiring was installed.
SUBSTANTIATION: Temporary wiring methods can be of lesser rating than would be normally used for occupancies operating conditions. There are possible hazards from unqualified individuals who may attempt to use, repair, or make adaptations to existing temporary wiring methods. There have been times when the temporary has been used at a later time for normal wiring when it is not suitable for the conditions. If temporary wiring is not removed in its entirety, others may attempt to use it again, not knowing if it is a safe and intact system which can create additional hazards to person(s) or property from fire or shock hazards.
PANEL ACTION: Reject.
PANEL STATEMENT: The extra text being suggested is not necessary since the existing text already requires removal of temporary wiring, not just disconnection.

(Log #4195)

3- 126 - (305-4(b)): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
"Feeders shall be protected as provided in Article 240. They shall originate in an approved distribution center. Conductors shall be permitted within cable assemblies, or within multiconductor cords or cables of a type identified in Table 400-4 for hard usage or extra-hard usage. For the purpose of this section, Type NM and Type NMC cables shall be permitted to be used in any dwelling, building, or structure without any height limitation."
SUBSTANTIATION: When the allowance for single conductors was removed from this subsection and the one following after the construction site electrocution, the intent was clear, no single conductors. However, the final language of this section differs from Section 305-4(c) in that it literally does allow single conductor cord if of the hard or extra-hard usage type. This does not appear to have been the intent. It is becoming a major issue in exhibition halls which must abide by these provisions via Section 518-3(b).
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4196)

3- 129 - (305-4(c)): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
(c) Branch Circuits. All branch circuits shall originate in an approved power outlet or panelboard. Conductors shall be permitted within cable assemblies, or within multiconductor cord or cable of a type identified in Table 400-4 for hard usage or extra-hard usage. All conductors shall be protected as provided in Article 240. For the purposes of this section, Type NM and Type NMC cables shall be permitted to be used in any dwelling, building, or structure without any height limitation.
Exception: Branch circuits installed for the purposes specified in Sections 305-3(b) or (c) shall be permitted to be run as single insulated conductors. Where the wiring is installed in accordance with Section 305-3(b), the voltage to ground shall not exceed 150 volts, the wiring shall not be subject to physical damage, and the conductors shall be supported on insulators at intervals of not more than 10 ft (3.05 m); or, for festoon lighting, the conductors shall be arranged so that excessive strain is not transmitted to the lampholders.

SUBSTANTIATION: This is an exception to the general rule requiring multiconductor cable assemblies. That's what it is, a seasonal use exception for certain circuits under certain conditions, along with the emergencies and tests allowance folded in. The original proposal used the exception format. When the panel changed the typeface (and essentially nothing else) they created what we now have: an orphaned, uncitable second paragraph in conflict with the first paragraph. This is a perfect example of the get rid of exceptions movement run amok.
PANEL ACTION: Accept.
PANEL STATEMENT: Section 3.1.4 of the Style Manual states that while exceptions should be used sparingly, they should be used to convey alternatives or differences to a basic Code rule. In addition, the Style Manual states that exceptions need to be evaluated by the CMP to see if the principle is expressed more clearly as an exception to the rule. The panel believes that the requirement in this Section can best be conveyed by an exception.

(Log #2873)

3- 130 - (305-4(d)): Reject
SUBMITTER: Patrick Trujillo, Wrangler Electric
RECOMMENDATION: Delete the following text:
Receptacles shall not be connected to the same ungrounded conductor of multiwire circuits that supply temporary lighting.
Add the following text:
Multiwire branch circuits cannot supply lighting and receptacle loads.

SUBSTANTIATION: Multiwire branch circuits shall be provided with a means to disconnect simultaneously all ungrounded conductors at the power outlet or panelboard where the branch circuit originated. This article would cause lighting loss if an outlet load tripped the breaker.
PANEL ACTION: Reject.
PANEL STATEMENT: The effects of this proposed change would be to require individual (non multi-wire) branch circuits to all lighting and receptacle loads but would allow receptacle loads on the same circuit as the lighting loads. Multiwire branch circuits are all right as long as the receptacles are connected to the other overcurrent protection device on the multiwire branch circuit. If the receptacle circuit is overloaded (the load least likely to be a fixed known load), at least lighting, and thus safety, won't be compromised. The requirement for a simultaneous disconnect is applicable to dwelling use only per 210-4(b).

AFFIRMATIVE: 11

(Log #794)

3- 131 - (305-4(g), (i)): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(g) Splices. ~~On construction sites a~~ A box or other enclosure shall not be required for splices or junction connections where the circuit conductors are multi-conductor flexible cord or cable assemblies other than metal-armored type. See Sections 110-14(b) and 400-9. A box, conduit body, or terminal fitting having a separately bushed hole for each conductor shall be used wherever a change is made ~~to~~ from a conduit or tubing system or a metal sheathed cable system to a different wiring method.
(i) Termination(s) ~~at Devices.~~ Flexible cords and cables entering enclosures ~~containing devices requiring termination~~ shall be secured to the ~~box~~ enclosure with fittings designed for the purpose.
SUBSTANTIATION: A construction site is probably more hazardous and conducive to physical damage than Christmas decorative lighting sites and other temporary wiring areas, but present wording does not exempt the box requirement for such other sites. Enclosure other than boxes may be used for splices and should be included.
The box exemption should not include metal-armored cable assemblies where grounding continuity is involved. A requirement for a box or other enclosure would then invoke the requirements of (i). The last sentence of (g) is revised for clarity.
Present wording of (i) appears to exempt securement to a box or other enclosure which contains no devices (assuming the intent is not to include wire connectors as devices). While the requirement would relieve strain on conductors terminating at receptacles, switches, circuit breakers, etc., the same strain relief should be provided at conductor splice terminations. This would correlate with Section 400-10.

PANEL ACTION: Accept in Principle in Part.

Revise first sentence of the proposal to read as follows:
"On construction sites, a box shall not be required for splices or junction connections where the circuit conductors are multiconductor cord or cable assemblies provided the equipment grounding continuity is maintained with or without the box."
The remainder of the proposal is rejected.
PANEL STATEMENT: The panel disagrees with the submitter's substantiation that all locations where temporary wiring is used should not require a box for splices where the equipment grounding continuity is maintained. The panel believes that the inclusion of the term "enclosure" is unnecessary. The panel accepts in principle a revision to the third sentence to clarify that the exception for the requirement for a box does not apply to metal armored type cable assemblies. The panel accepts the editorial revisions to the fourth sentence but rejects the revisions to paragraph (i). The panel does not believe that adequate technical substantiation has been provided to warrant changing this requirement.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2147)

3- 132 - (305-4(j)): Reject
Note: The Technical Correlating Committee directs that this Proposal be sent to Code-Making Panel 4 for information. The Technical Correlating Committee notes that the responsibility for support of temporary wiring is under the purview of Code-Making Panel 3. From the Panel Statement, Code-Making Panel 3 would appear to disagree with allowing temporary wiring to be supported to vegetation. Presently, Code-Making Panel 4 does allow vegetation to be used for an outside feeder or branch circuit, where that circuit is installed for Article 305 applications. The Technical Correlating Committee encourages public comment on this issue and directs that Code-Making Panel 3 arrive at a determination as to acceptance of vegetation for support of temporary wiring after reviewing the Public Comments. Should the final determination of Code-Making Panel 3 be that vegetation is not permitted, the Technical Correlating Committee will direct that Code-Making Panel 4 take action to delete the permission in 225-26.
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Add the following sentence to this section:
"The support may be attached either to vegetation such as trees, or to temporary or permanent structures which are structurally sound."
SUBSTANTIATION: Section 225-56, exception; allows attaching to vegetation "in accordance with Article 305", however, there is no permission for attaching to vegetation in Article 305. This proposal rectifies that situation. Attaching temporary circuits to trees is a common practice and is often the safest installation of other alternatives.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes the submitter's Code reference should be to Section 225-26, Exception. The panel disagrees that vegetation should be permitted as a support means for overhead cables assemblies or flexible cords and cables. The panel is unaware of any current provisions in Article 305 which prohibit the attachment to temporary or permanent structures provided the provisions of Section 305-4(j) are met. This section just addresses the support of cable assemblies and flexible cords to protect them from physical damage. In some cases supporting them to vegetation may actually be more harmful to the cable. For example, in areas where there are high wind capabilities, attaching the cables or cords to vegetation may subject them to insulation and jacket damage.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
PACE: I agree with the Panel in that 305-4(j) does not prohibit use of vegetation provided the provisions of 305-4(j) are met. I also feel the reference to 305 in 225-26, Exception, should be removed.

(Log #795)

3- 133 - (305-4(j), Exception (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add an exception to read as follows:
Exception: Flexible cords approved for hard usage shall be permitted to be run on the ground or floor where they are not likely to be damaged and where there is no available structure to provide support, or where they are suitably protected against damage.
SUBSTANTIATION: This proposal simply reflects the real world use, and provides for the period when there is no available structure to provide support or where no actual structure is erected. It allows for judgement and is in line with the panel statement for Comment 3-149 in the 1998 ROC that the text of Section 305-4(h) does not prohibit cords run on the floor provided they are adequately protected. It would be helpful to Code users to be aware of that. Protection can be afforded by location or physical means. Section 525-13(f) doesn't prohibit flexible cords run on the ground and only requires physical protection where accessible to the public.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no restriction on the use of hard usage flexible cords where they are not likely to be damaged so the exception is not necessary. If they are temporarily run on the floor and not subject to physical abuse, they are supported by the floor and no further support is necessary.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
CASPARRO: Section 305-4(h) requires that flexible cords and cables be protected from physical damage. I disagree with the Panel Statement that cords can be supported by the floor. It is difficult to understand how laying conductors on the floor would not be subjected to physical damage. OSHA 1926.405(a)(2)(ii)(B) prohibits branch circuit conductors from being installed on the floor.

(Log #1447)

3- 134 - (305-4(k) (New)): Reject
Note: See the Technical Correlating Committee action on Proposal 3-132.
SUBMITTER: Barry F. Tower, Patten, ME
RECOMMENDATION: Add the following new section:
(k) Outdoor Support. Vegetation such as trees shall be permitted to be used for support of temporary overhead service drop conductors and feeders.
SUBSTANTIATION: This proposal is to make legal a long standing practice in the industry of using existing trees as support in order to get the cables off from the ground. It would be an unnecessary expense to require us to set utility poles for temporary work. This provision is already in the exception of Section 225-26, and it should be here to avoid a conflict.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and panel statement on Proposal 3-132.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2819)

3- 135 - (305-6): Reject
SUBMITTER: Frank Martucci, Fort Lee, NJ
RECOMMENDATION: Add:
(c) Electrocution-proof cord and plug grounding system. Receptacles of all voltages shall be protected in accordance with (1) and (2).
(1) Cords and cordsets shall be redundantly grounded, with two insulated copper conductors. The grounding conductors shall be installed in cords and cordsets with the branch circuit conductors supplying the unfixed equipment. Attachment plugs and connector bodies shall be hospital grade type.
(2) Grounding poles. Cord connectors, attachment plug, and the internal terminals of multiple outlet boxes shall be provided with two separate wiring sites at the grounding pole. The cord connectors, attachment plugs, and internal wiring terminals shall be designed so that only the grounding pole can be wired with two conductors.

This proposal is related to proposals 250-114 and 410-58 seeking the adoption of an electrocution-proof and fire-proof cord and plug connected grounding system for all areas of our nation.
SUBSTANTIATION: The April 1995 issue of the IBEW Journal reported that 106 workers were electrocuted on construction sites in 1992.
They died despite the use of GFCIs and elaborate assured grounding programs adopted by our nation in the late 1970's. It was mandated by OSHA because 70 workers died on construction sites during a period from 1970 to 1975.
The program, despite the use of qualified and well supervised personnel, failed miserably in its attempt to reduce, or eliminate, the average of 14 electrocutions that occurred each year during that period. Instead the annual rate of electrocutions has increased 8 fold, from 14 deaths to 109.
The article went on to state that painful shock, from as little as 3 milliamperes, has also caused many indirect serious injuries.
The construction workers will continue to die, or suffer serious indirect injury from shock, unless NEMA and the NFPA corrects the hazardous design defects in all line and extension cords. (See section/paragraph 305-6(a)).
The program failed because no amount of testing can assure a single, undersized, grounding conductor will not fail even hours of testing.
ONLY TWO CONDUCTOR REDUNDANCY CAN ASSURE THE GROUNDING CONDUCTOR WILL NOT OPEN PRIOR TO THE CIRCUIT CONDUCTORS.
And no GFCI or testing program can assure against line drop or provide the compensation required in the code for line drop.
ONLY TWO CONDUCTOR GROUNDING REDUNDANCY WILL PROVIDE THE NECESSARY COMPENSATION TO PREVENT THE LINE DROP RESPONSIBLE FOR THE 3 MILLIAMPERE SHOCKS ALLUDED TO BY OSHA.
And using qualified, and well supervised personnel, is no assurance that wiring errors cannot be made. A patient was electrocuted March 15, 1956 by qualified personnel.
A qualified electrician, his qualified supervisor, a qualified electrical inspector, a qualified factory worker, and his qualified supervisor, all contributed to the electrocution.
Many times, I have caught myself wiring cords improperly. And I've repaired many line and extension cords with used components where the green paint, identifying the grounding terminal, was rusted, or worn out.
To prevent any further electrocutions, especially after dealing with the homicide division, I immediately replaced three conductor cords with four conductor cords to provide an electrocution-proof grounding system for all patients.
Here is an excellent opportunity to try out an electrocution-proof grounding system on a small scale. Contractors will welcome a fool-proof method of providing safety without the costly testing program and the use of GFCIs.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel finds the technical substantiation to support such a major change to be inadequate.
Redundant (two conductor) grounding does not make a cord and plug system "electrocution-proof".
The submitter provides no evidence that the cause of the mentioned electrocutions are related to wiring or grounding problems involving cord and plug sets or connected equipment. Other causes such as personnel error or other kinds of equipment could have been the cause.
Redundancy of grounding conductors is not the only effective way to achieve enhanced protection against electric shock. Use of GFCIs, double insulation, and assured equipment grounding programs are other ways.
GFCI protection provides protection even if the equipment grounding conductor is lost in the branch circuit or at the equipment. Redundancy of grounding conductors will not make GFCI's trip faster, or at a lesser current value.
The construction requirements of flexible cord are not within the jurisdiction of CMP-3. Article 400 is under the jurisdiction of CMP-6.

3- 136 - (305-6(a)): Reject
SUBMITTER: Tim Quigley, Rome Electric Corp.
RECOMMENDATION: Revise second sentence text as follows:
"If a receptacle(s) ... shall be provided by the user."
SUBSTANTIATION: On large construction projects when temporary power is removed by an electrical contractor under the owners request they expect us to provide the ground-fault circuit-interrupter protection.
PANEL ACTION: Reject.
PANEL STATEMENT: It is not the purview of CMP-3 to dictate who provides the GFCI protection, only that the protection shall be provided.
The last sentence of this section allows cord sets or devices incorporating GFCI protection and identified for portable use.
There are many times where power has been switched from temporary to permanent power and portable devices must be used since trying to GFCI protect all permanently installed devices during the remainder of construction, remodel, or repair would be extremely difficult.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3326)

3- 137 - (305-6(a)): Reject
SUBMITTER: Edward A. Schiff, Technology Research Corp.
RECOMMENDATION: Revise 1st sentence of 305-6(a) to read as follows:
(a) Receptacle Outlets. All 125-volt 250 volts or less, single phase, 15-, 20-, and 30-ampere receptacle outlets that are not a part of the permanent wiring of the building or structure and that are in use by personnel shall have approved ground-fault circuit interrupter protection for personnel with open neutral protection.
SUBSTANTIATION: The same hazard exists on 250 volt applications. Although the available power at most new construction sites is 125-volt, this article applies to remodeling, maintenance, and repair, where 250 volt power is frequently utilized. UL listed products are available from multiple manufacturers for 250 volt applications.
The addition of the word approved will eliminate the use of nontested/certified field constructed units (often made by nonqualified personnel). Although the majority of inspectors do not want these units, some feel the lack of clarity of the code allows for them. This also matches the wording in Part 1926 Subpart K of OSHA's construction appendix on safety and health regulations.
The clarification on providing open neutral protection matches with UL standard 943A requirement for portable GFCIs. If the input neutral opens due to a broken conductor or loose connection (an event which occurs in temporary wiring situations), the protective device circuitry would not receive power and therefore would not operate to provide protection from shock or electrocution. Open neutral protection consists of the opening of the line contacts of the protective device, thus interrupting the output potential, unless the circuit interrupter has sufficient input power to provide shock hazard protection. Since this article deals with temporary wiring, clearly defining this requirement will eliminate any ambiguity in the interpretation of this safety requirement.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 305-6(b) already requires receptacles other than 15-, 20-, and 30-amp, 125-volt receptacles, to be either protected by GFCIs or by a written assured equipment grounding conductor program. This would include those receptacles that are being operated at 250-volts so it is not necessary to add this requirement to (a). It is not necessary to require approval of GFCI protection devices since Section 110-2 already requires approval of all electrical conductors and equipment. The open neutral protection should stay as a product standard requirement since UL 943A only requires this protection for portable GFCIs and the technology may only be able to apply to portable devices.
The submitter did not provide data to support such a substantial change.

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

ANDREWS: This proposal should be rejected. Although the use of the assured equipment grounding conductor program (AEGCP) is dwindling, there are still some applications in industry where the program is justified for 125 volt, 15-, 20-, and 30-ampere receptacle outlets that are not part of the permanent wiring of a building and are used for temporary wiring purposes. One example is use in classified hazardous areas.

There was no substantiation provided by the submitter to prove that the program is inadequate when performed properly. And, there was no documentation to prove that the program was not being properly performed.

PACE: The Panel does not provide proper substantiation to delete this exception. A proven safety record for one method of protection does not subsequently disprove the safety record of another. In industrial establishments, reliability of electrical circuits is a very critical part of safely operating the facility. Thus, both safety and reliability must be maximized. Nuisance trips of GFCI circuits can create additional safety hazards. Examples of this are loss of power to magnetic-based drill operations where loss of power would cause the drill(s) to fall, loss of power to confined-space entry lighting and associated life protective monitoring equipment, and loss of power to other forms of lighting used for the safe egress for personnel. These require the highest degree of reliability to ensure personnel safety.

This exception was originally included to allow industrial establishments the choice, under controlled conditions, of using the assured equipment grounding conductor program (AEGCP), in order to maximize reliability without compromising safety. OSHA 29CFR1926.404 and NEC 305-6 recognize the AEGCP as an acceptable method of personnel protection and therefore Exception 2, under NEC 305-6(a) should be retained.

The issues surfaced here involve enforcement of the rule, not the validity of the rule itself. No matter how many examples there are of violation, lack of compliance with the AEGCP requirements and lack of enforcement of the requirements does not change the fact that if done correctly, the AEGCP is effective in providing protection for personnel. The GFCI method is also not affective in protecting personnel if its requirements are not enforced. If the requirements of the AEGCP are not being enforced, certainly the authority having jurisdiction should make adjustments necessary to ensure protection for personnel, just as they should for any other safety concern. This alternative should not be removed as an approved method for those who apply and administer the AEGCP correctly.

COMMENT ON AFFIRMATIVE:

CASPARRO: This was a proposal submitted by CMP-3 at the proposal stage. It was overwhelmingly supported by CMP-3 at the Panel Meeting.

I believe the Panel recognized that the removal of this exception was long overdue. As indicated in the Panel substantiation, the sufficient availability and proven safety record of GFCI protection eliminates the need for this exception.

(Log #4006)

3- 139 - (305-6(a) Exception No. 2): Reject

SUBMITTER: Robert B. Alexander, Fluor Daniel

RECOMMENDATION: Delete: "In industrial establishments only,"

SUBSTANTIATION: The origin of the Assured Equipment Grounding Conductor Program (AEGCP) is OSHA 29CFR1926.404(b)(1)(iii) which is a construction safety document; but, under the current wording of 2-2.4.3, [because of the current wording of 305(6)(a) Exception No. 2] the original beneficiaries of AEGCP, are now excluded.

This situation was caused by the combination of two unrelated proposals to the 1996 NEC, for the parallel Section 305-6(b) to (1) [3-151] expand the benefits of ground fault protection in temporary wiring and (2) [3-160] eliminate AEGCP altogether. While CMP 3 stated they accepted the second proposal "in principle" they actually rejected it because they left AEGCP in the NEC.

It was the broad consensus of the 70E Technical Committee that AEGCP is a safe and effective system. Any user capable of implementing the program should be permitted to use it.

Additional Substantiation:

Note in my affirmative comment to the original ballot circulation to Comment 70E-5, I agreed that 70E could not properly contradict the NEC. However, as I also pointed out in the comment, a motion to specifically reject the substantiation statement; "It was the broad consensus of the 70E Technical Committee that AEGCP is a safe and effective system." failed for lack of a second. My affirmative comment was intentionally included in the original circulation of the ballot to allow any other committee member to route this. I further note that none did.

I have had the opportunity to visit four construction sites as a consultant since the initial 70E issue arose. I intended to ask three questions: (1) Do you use GFCI or AEGCP? (2) If GFCI, do you test them regularly? (3) Do you have a record of those tests? I never needed to ask question 3, since not one site regularly tested their GFCIs. All four sites used 42 circuit GFCI panels. Two sites had a single panel, one had two the other had four. I found one panel wired improperly, and it was repaired immediately. I found two GFCIs that didn't work properly and they were replaced.

While requiring testing is certainly enforceable through 110-3(b), most users are simply unaware of product standards. And there is still no requirement to document it even if they do test regularly.

I believe both systems are functionally safe. Any user capable of appropriate installation and maintenance should be allowed to use either or both systems.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: Over the course of the past several Code cycles, CMP 3 has reaffirmed its position that GFCI protection affords a higher level of protection for all workers. OSHA inspection & citation data clearly indicates the many problems associated with the lack of implementation of the ASEGCP. This exception was added only for industrial establishments because it was understood that they have better control over and better implementation of this program at their facilities than is commonly encountered on construction sites.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

AFFIRMATIVE: 11

COMMENT ON AFFIRMATIVE:

CASPARRO: The attempt to remove "In Industrial Establishments Only," from this exception would have been a major step backwards for worker safety. It would have opened up the door for assured tape color change for temporary wiring.

(Log #2821)

3- 140 - (305-6(a) Exception No. 3 (New)): Reject
SUBMITTER: Frank Martucci, Fort Lee, NJ
RECOMMENDATION: Add: Exception No. 3. In all industrial establishments, a self monitoring, redundantly grounded, electrocution-proof, grounding system shall be permitted to be utilized for all outlets.

This proposal is related to proposals 250-114 and 410-58 seeking the adoption of an electrocution-proof and fireproof and plug connected grounding system for all areas of our nation.
SUBSTANTIATION:

The April 1995 issue of the IBEW Journal reported that 106 workers were electrocuted on construction sites in 1992. They died despite the use of GFCIs and elaborate assured grounding programs adopted by our nation in the late 1970's. It was mandated by OSHA because 70 workers died on construction sites during a period from 1970 to 1975. The program, despite the use of qualified and well supervised personnel, failed miserably in its attempt to reduce, or eliminate, the average of 14 electrocutions that occurred each year during that period. Instead the annual rate of electrocutions has increased 8 fold, from 14 deaths to 109. The article went on to state that painful shock, from as little as 3 milliamperes, has also caused many indirect serious injuries. The construction workers will continue to die, or suffer serious indirect injury from shock, unless NEMA and NFPA corrects the hazardous design defects in all line and extension cords. The adoption of my proposal will prevent the many electrocutions and serious injuries that occur in all in other workplaces each year without the need for ineffective assured grounding programs or GFCIs. No amount of testing can assure the integrity of the grounding conductor, especially undersized ones. Only redundancy, resorted to by every responsible engineer whenever lives are at stake, can provide true grounding assurance. And only a second grounding conductor can prevent the line drop that is causing the 3 milliampere shocks responsible for serious injuries in the workplace. And the 109 deaths are proof that even qualified and well supervised personnel can make mistakes. Mistakes caused the electrocution of a patient on my watch on March 15, 1956. A qualified, well supervised, electrician, installed an outlet with reversed black and white conductors. The patient died because a qualified, and well supervised, factory worker, wired a replacement plug on a Bovie surgical unit with reversed green and white conductors.

The patient died because a qualified electrical inspector inspected and Okayed the installation.

The patient died because qualified personnel in the Underwriters Laboratories approved a grounding system for our nation whereby 4 or 6 ways to wire cord components can electrocute or cause fiery deaths.

My proposal will prevent shock, or electrocutions due to wiring errors.

My proposal, if adopted by our nation, will also eliminate the 600 electrocutions that occur in homes, as reported in the same IBEW Journal. And my cord standard will also reduce, or eliminate, the 5000 covered up electrocutions that occur in hospitals each year, as reported by Ralph Nader in the June 18, 1986 issue of the Star.

It will minimize, or eliminate, relying on, after the fact, GFCIs with tripping currents that can cause serious, indirect, injuries, and possible cardiac arrest.

The proposal provides a standard that will make all line and extension cords electrocution-proof, and fire-proof, by correcting their hazardous design defects.

The standard requires no physical component changes except to provide a second, no cost, wiring site at the gorund pole.

The extra conductor in all cords is the only cost, a small price to pay to eliminate the following design defects:

1ST DESIGN DEFECT: This defect defies conventional wisdom and practice. Instead of the redundancy resorted to by every other federal agency whenever lives are at stake, the protective equipment grounding conductor used on practically all electrical devices has been reduced almost 66%.

This reduction is a clear violation of the electrical code itself. Table 250-122 distinctly states that equipment grounding shall be provided with a No. 12, 20 ampacity, copper conductor for 20 ampere branch circuits, not the No. 18, 7 ampacity, conductor that powers practically all electrical devices. Reduction of copper size, and durability, increases the chances of protective grounding loss.

Compounding the chances of a discontinuous, or missing grounding path, is the extensive use of lengthy, interconnected, extension cords with protective equipment grounding conductors also sized less than required in table 250-122(a) of the NEC.

The same design defect can cause a voltage drop in the protective equipment grounding conductor, during minor ground faults, insufficient enough to trip GFCIs but painful enough to cause the indirect serious injuries on construction sites as mentioned above.

Compounding the chances of line drop is the total lack of compensation for voltage drop as required in article 250-122(b) of the NEC. Even properly sized equipment grounding conductors may require such adjustment. The assured grounding programs do not address this major cause of serious injury from painful shock.

Two grounding conductors will provide the compensation required to prevent equipment grounding voltage drop in lengthy, interconnected, extension cords. Only two conductor grounding redundancy will provide the grounding assurance OSHA is seeking. Qualified personnel and existing cords cannot compensate for line drop in lengthy extension cords.

2ND DESIGN DEFECT: This defect results from sizing cord, and cordset, equipment grounding conductors the same as the circuit conductors (3#18, 3#16, 3#14, etc). The equipment grounding conductor must, at all times, assure that it will withstand fault currents for the length of time it takes fuses or circuit breakers to clear a fault. A 20 ampere circuit breaker, for example, can cause spite currents that could burn open the equipment grounding conductor, instead of the circuit conductor, leaving the metal exposed parts of an appliance energized.

Two equipment grounding conductors in all cords, regardless of wire size, will assure that the circuit conductors will always burn open first during massive ground faults.

3RD DESIGN DEFECT: This cord design defect permits miswired devices to operate safely until they are plugged into an outlet, or extension cord, with reversed polarity.

The drill in figure 1 operates safely when used with a properly wired outlet, or extension cord, even though improperly wired with reversed green and white conductors.

However, the moment the drill is plugged into an outlet, or extension cord, wired with reversed polarity, the case of the drill becomes energized with a full 120 volt potential, figure 2.

Figure 3 illustrates how my electrocution-proof grounding system will correct this "Russian Roulette" type hazard even though the outlet remains improperly wired.

The two grounding conductors needed to correct the two pervious design defects will make possible a wiring scheme that absolutely prevents miswired cords from causing shock or electrocution regardless of whether, or not, a wall outlet, or extension cord remains wired with reversed polarity.

If all cord components, and device terminals, are designed according to the specification in my proposal, there is no possible way to miswire a cord without at least one of the three grounded conductors (two green and one white) attached to the grounding pole of components and exposed metal parts of electrical devices or extension cords.

Acceptance of my proposal will eliminate the cord design defect that permits wiring errors to shock or electrocute.

4TH DESIGN DEFECT: No provision is provided in existing cords to activate branch circuit ground fault current interrupters when miswiring energizes the metal parts of electrical devices. A ground fault causing current to flow through people cannot trip circuit breakers or blow fuses.

Accepting my proposal will assure that an equipment grounding conductor is ALWAYS attached to the metal exposed parts of electrical devices, despite wiring errors, to provide the necessary impedance required to activate branch circuit ground fault current interrupters.

The adoption of my proposal will convert branch circuit ground fault current interrupters into people GFCIs whenever miswiring causes metal parts of electrical devices to become energized; a much safer method since workers need not sustain the severe shock required to trip people GFCIs; shock that can cause serious indirect injuries or electrocution. See how the second grounded conductor in figure 3 prevents shock, or electrocution, providing the low resistance path required to activate branch circuit ground fault devices.

5TH DESIGN DEFECT: No provision is provided in existing cords to prevent miswiring from causing metal raceways to carry current. A heater, or extension cord, miswired with reversed green and white conductors, can cause raceway heating, or arcing, at metal raceway connections sufficient enough to cause "unseen" raging fires inside walls; fires that cannot be detected by

smoke alarms until too late to save occupants; fires that flashover into rooms and consume workers, or firemen, within seconds.

If my proposal is accepted, the second grounding conductor will prevent raging "unseen" fires inside of walls by shunting metal raceway current back to the proper circuit conductor.

Current flowing through metal raceways, instead of the white conductor, causes the ground poles of all downstream outlets to become energized, a hazard also eliminated by the second grounding conductor and the properly designed cord components I propose.

6TH DESIGN DEFECT: Molded cords have similarly colored branch circuit conductors instead of the usual black and white ones, a violation of the National Electrical Code. When they are damaged, and require component replacements, there is no way to prevent them from being wired with reversed polarity. Even manufacturers, despite inspection by qualified personnel, are shipping extension cords with reversed polarity. I can corroborate this by producing such an extension cord, inadvertently wired with reversed green and white conductors.

Accepting my proposal will permit the SAFE repair of molded cords even if all conductors are colored the same.

7TH DESIGN DEFECT: Providing only one equipment grounding conductor for up to 6 extension outlets. Accepting my proposal will ameliorate this defect.

8TH DESIGN DEFECT: Molded cord components cannot be examined or repaired at the strain relief. Accepting my proposal will provide true assurance that the protective equipment grounding conductors will never open prior to the circuit conductors.

9TH DESIGN DEFECT: The lack of wiring safeguards. Experienced electricians, including myself, have admitted catching themselves wiring outlets and cords improperly. If four of six ways to wire an attachment plug can cause an immediate or future "Russian Roulette" type of electrocution, it becomes imperative that they be designed to at least assure the proper attachment of the equipment grounding conductor.

Accepting my proposal will absolutely assure that the grounding pole of cord components and the internal wiring terminals of electrical devices always has a grounded conductor attached to it regardless of any amount of wiring errors.

It will also assure that the ground pole of cord components are always wired with two green conductors. A green and white, green and black, or black and white conductor attached to the ground pole clamp will be immediately noticed and corrected.

Conclusion: 109 workers were electrocuted on construction sites during 1992. Many other workers were seriously injured from currents as small as 3 milliamperes. And they could also become seriously injured from the .5 milliamperes required to trip GFCIs. They died, or were seriously injured, despite extensive assured grounding programs initiated by OSHA and conducted by well supervised, qualified workers.

They will continue to die, or become seriously injured, unless the above 9 design defects in cords are corrected. This proposal relates only to extension cords as they represent the greatest hazard to workers, especially when interconnected.

NOTE: Supporting material is available upon request at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: No definition or equipment specification is provided to completely describe the term "self monitoring, redundantly grounded, electrocution-proof grounding system".

A double redundant ground does not make a cord set "electrocution-proof ". Receptacle cord caps are very well marked to indicate which conductors must be terminated on each terminal. But, adding an additional equipment grounding conductor to terminate at the cap will not keep someone from wiring the cap wrong if they are not paying attention to the installation.

The submitter does not break down the deaths as they relate to cord and plug sets versus other causes.

The requirement in this proposal for providing redundant grounding in all cords used for all outlets in an industrial facility would not assure that any damage to the equipment grounding system in the cord and plug would not involve both equipment grounding conductors.

ARTICLE 310 — CONDUCTORS FOR GENERAL WIRING

(Log #1677)

6- 4 - (310): Reject

SUBMITTER: Terry L. Carlson, Nebraska State Electrical Board

RECOMMENDATION: Article 310, Conductors For General Wiring

New: Article 310, Part A

New: Article 310, Part B

Add the following "A. General Requirements" after the title to Article 310 as follows:

Article 310 - Conductors for General Wiring

A. General Requirements

Add the following "B. Conduit Fill Tables" at the end of the current Article 310 as follows:

B. Conduit Fill Tables

Move the "Conduit and Tubing Fill Tables for Conductors and Fixture Wires of the Same Size" from Appendix C to new Part B of Article 310 as follows:

B. Conduit Fill Tables

Conduit and Tubing Fill Tables for Conductors and Fixture Wires of the Same Size.

SUBSTANTIATION: It is common knowledge in the industry that the Appendix to the Code is for informational purposes only, and it is not part of the Code requirements.

Conduit fill tables should be part of the requirements of the Code, and not located as an informational recommendation in the Code appendix.

PANEL ACTION: Reject.

PANEL STATEMENT: Conduit fill requirements are defined in Chapter 9, which is an enforceable part of the Code in accordance with 90-3. Conduit fill tables in Appendix C are based on these requirements for specific set of design requirements. Other design possibilities, where an equipment grounding conductor may be bare, are not covered by Appendix C.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

Note: The sequence nos. 6-5 and 6-6 have been moved to follow 6-222.

(Log #1058)

6- 7 - (310-3): Accept

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Revise Article 310 as follows:

310-3 - change "No. 8" to "8 AWG"

310-4 - change "No. 1/0" to "1/0 AWG"

310-4, Exception No. 2 - change "No. 1/0" to "1/0 AWG"

310-4, Exception No. 3 - change "No. 1/0" to "1/0 AWG"

310-4, Exception No. 4 - change "No. 2" to "2 AWG"

Table 310-13, Note 4 - change "Nos. 14-12" to "14-12 AWG"

310-14 - change:

"No. 8, 10, and 12" to "8, 10, and 12 AWG"

"No. 8" to "8 AWG"

SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Accept.

PANEL STATEMENT: The panel does not have knowledge of the phrase "specifically authorized for use with the SI system of units in North America" in substantiation. The panel also recognizes that the present industry practice is to use AWG or kcmil designators.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #800)

6- 8 - (310-4): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Conductors in Parallel. Aluminum, copper-clad aluminum, or copper conductors of size No. 1/0 and larger, comprising each phase of ac circuits, each polarity of dc circuits, and each neutral or grounded circuit conductor shall be permitted to be connected in parallel (electrically joined at both ends to form the equivalent of a single conductor).
Exception No. 1 through 3: No change.
Exception No. 4: Under engineering supervision, grounded neutral conductors ~~in sizes No. 2 and larger~~ shall be permitted to be run in parallel ~~for~~ with an existing ~~installation~~ No. 2 or No. 1 neutral conductor of a three-phase 4-wire wye-connected circuit where overheating of the existing neutral occurs due to high content of triplen harmonic currents.
FPN: Delete.
The parallel conductors ~~in~~ comprising each phase, polarity, neutral, or grounded conductor shall:
(1) No change.
(2) No change.
(3) No change.
(4) No change.
(5) No change.
(6) Be interconnected at the point of connection of tap conductors at each load supply point except as otherwise permitted in Section 450-6(a)(4)(b) for transformer secondary ties.
Where run in separate raceways, ~~or~~ cables, auxiliary gutters, cablebus, cable trays or other enclosures, the raceways, ~~or~~ cables, auxiliary gutters, cablebus framework, cable trays, or other enclosures for alternating-current circuits shall have the same physical characteristics. (remainder - no change)
SUBSTANTIATION: The word "phase" infers alternating-current to many. The word "polarity" should not be confusing to trained persons, as the proposed first paragraph states "polarity of dc circuits". Many of the requirements of this section should be clearly indicated to apply to dc circuits. Direct-current circuits are amenable to paralleling (see Articles 668, 669, e.g.)
The word "equivalent" is editorial; two or more conductors don't literally make one conductor.
Exception No. 4 is revised to avoid any confusion that existing No. 1/0 or larger conductors need engineering supervision in order to parallel another No. 1/0 or larger conductor. Present wording permits this exception to apply to single-phase and dc circuits (or any circuit). I believe it was intended to apply to three-phase 4-wire wye-connected circuits. The fine print note is incorporated into the rule as a condition, since it is presently information which doesn't impose a condition for utilizing Exception No. 4.
Condition (6) is proposed since there is no similar requirement in this section. Where paralleled conductors are run in wireways and auxiliary gutters, or raceways or cables with intermediate pull or junction boxes (common to all runs or in each individual run) it is easy to tap one set of paralleled conductors and upset current balance of the paralleled conductors. Section 450-6(a)(4)(a) has a similar requirement for paralleled tie conductors.
The requirement for physical characteristics should be extended to other metal enclosures where inductive reactance may be a factor, which are not encompassed by "raceways or cables". Additionally, there does not seem to be a reason not to limit this requirement to ac circuits. Section 300-20 is limited to alternating-current.
PANEL ACTION: Reject.
PANEL STATEMENT: The present text of 310-4 is adequate. Paralleling of conductors is permitted for both ac and dc circuits. Word "form" in "....to form a single conductor" is self explanatory that two or more conductors do not make one conductor.

(Log #2191)

6- 10 - (310-4): Accept in Principle
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise fifth paragraph as follows:
Where conductors are used in parallel, space in enclosures shall comply with applicable provisions of Articles 370 and 373. ~~be given consideration (see Articles 370 and 373).~~
SUBSTANTIATION: The paragraph, as originally written is unenforceable. The NEC Style Manual 3.2.1 states, "The NEC shall not contain references or requirements that are unenforceable or vague," and the word "consideration" is listed as a "possibly unenforceable term." It is rewritten to be enforceable. It is also rewritten to remove the reference which should have been a fine print note the way it was written.
PANEL ACTION: Accept in Principle.
Delete the fifth paragraph.
PANEL STATEMENT: Delete the fifth paragraph because it is a redundant reference.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2334)

6- 11 - (310-4 Exception No. 5 (New)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add the following Exception:
Exception No. 5: For non-linear loads, only on 3 phase wye systems, grounded conductors smaller than 1/0 shall be permitted to run in parallel when run to the following equipment/systems, provided the ampacity of a single conductor will not be exceeded if one or more of the parallel conductors become inadvertently disconnected.
(a) Branch circuits to modular furniture/office systems.
(b) Transformer secondaries.
SUBSTANTIATION: Substantiation for (a)
(a) There are a number of office furniture manufacturers that produce systems utilizing parallel grounded conductors. An example of this would be on a 20 ampere circuit, the manufacturer has run 2 No. 12 conductors for the grounded conductor of the multiwire circuit. These manufacturers are doing this to address the possibility of harmonics that may be encountered in the office environment. Presently this section will not permit this installation even though the single conductor is fully sized for the code loads. This article is in fact penalizing designers, manufacturers and installers for providing a superior system.
Substantiation for (b)
(b) A designer is not permitted to run multiple grounded conductors in parallel (sizes smaller than 1/0) from transformers were harmonics are present. This is true even if a single conductor is sized to carry the calculated load per chapter 2 of the NEC. Again we are penalizing the designers by not allowing this installation. It is permissible for the designer to increase the size of the conductors to address the non-linear loads, but not double the conductors. The NEC is not supposed to be a design manual, but here it seems to be mandating a particular design.
PANEL ACTION: Reject.

PANEL STATEMENT: Size requirement for conductors in parallel is a well established fact in the Code. It is not permissible to increase the size of the grounded conductors to address the non-linear loads by simply adding the conductors if they are smaller than the permissible size for the purpose.

6- 15 - (310-8(b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(b) ~~Dry and~~ Damp Locations. Insulated conductors and cable used in ~~dry and~~ damp locations shall be Types FEP, FEPB, ~~MTW,~~ PFA, RH, RHH, ~~RHW, RHW-2,~~ SA, THHN, ~~THW, THW-2, THHW, THHW-2, THWN, THWN-2, TW,~~ XHH, ~~XHHW, XHHW-2,~~ Z, or ZW, or of a type listed for use in wet locations.
SUBSTANTIATION: Editorial. (a) specifies conductors for dry locations, (b) also covers dry locations and limits conductor types to fewer than would be permitted by (a). In lieu of specifying wet location types such as fixture wires which are suitable for dry or damp locations, the added phrase would include those types, including Type UF which is not noted as suitable.
PANEL ACTION: Reject.
PANEL STATEMENT: The Code does not prohibit the listed conductors in a dry location. The panel does not agree with the proposed editorial change.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3102)

6- 16 - (310-8(b)): Accept
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Delete reference to Type RH insulated conductors.
310-8(b) Dry and Damp Locations. Insulated conductors and cables used in dry and damp locations shall be Types FEP, FEPB, MTW, PFA, ~~RH,~~ RHH, RHW, RHW-2, SA, THHN, THW, THW-2, THHW, THHW-2, THWN, THWN-2, TW, XHH, XHHW, XHHW-2, Z, or ZW.
SUBSTANTIATION: Underwriters Laboratories canvassed subscribers of Thermoset-Insulated Wires and Cables, UL 44. It was determined that Type RH insulated conductor is no longer being produced.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2593)

6- 17 - (310-8(d)): Reject
SUBMITTER: Donald R. Cook, Southern Section, IAEI
RECOMMENDATION: Revise text to read as follows:
(d) Locations Exposed to Direct Sunlight. Insulated conductors and cables over 5 ft used where exposed to direct rays of the sun shall be of a type listed or marked "sunlight resistant."
SUBSTANTIATION: There have been no problems with insulated conductors under 5 ft. Only on insulated conductors of longer lengths. This also would eliminate the problem of conductors in a service cable and conduits when the insulated conductor exits the weather head.
PANEL ACTION: Reject.
PANEL STATEMENT: Sunlight deterioration is not a function of exposed cable length.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1

EXPLANATION OF NEGATIVE:
BURNS: The statement given by CMP-6, "Sunlight deterioration is not a function of exposed cable length", is a correct statement. However the Panel's action should be to accept one of these proposals. UL has two different test procedures for sunlight resistance of wire and cable, a 300 hour test and a 720 hour test. Each of these tests use carbon arcs and water spray around the specimen to determine if the insulation of the conductor maintains 85 percent, 80 percent of its original values, respectively, to obtain a sunlight resistance rating. Thus, there exist two standards for one to achieve a sunlight resistance rating. Time-honored tradition concludes that insulated conductors having a carbon black base insulation do not deteriorate when exposed to sunlight. Thus allowing the portion of a wire or cable, comprising a drip loop, to be exposed to sunlight, should be permitted.
COMMENT ON AFFIRMATIVE:
GANATRA: See my Comment on Affirmative on Proposal 6-14a.

(Log #4077)

6- 18 - (310-8(d)): Reject
SUBMITTER: C. David Mercier, Southwire Co.
RECOMMENDATION: Revise text to read as follows:
(d) Locations Exposed to Direct Sunlight. Insulated conductors and cables used where exposed to direct rays of the sun shall be
1. Types MI, SE, USE, PLTC, or ITC;
2. Flexible cords and cables marked with "W";
3. Cables with an overall metallic covering; or
4. Conductors and cables listed or marked "sunlight resistant".
SUBSTANTIATION: The addition of 310-8(d) to the 1999 Code has caused much confusion over which conductors are listed and which conductors must be marked for use exposed to direct sunlight. Also many people have interpreted 310-8(d) as requiring all conductors and cables exposed to direct sunlight to be marked. This proposal uses the same format as used in 310-8(c) to help determine which insulated conductors and cables meet the requirements for locations exposed to direct sunlight.
PANEL ACTION: Reject.
PANEL STATEMENT: The list proposed in the recommendation does not include all products that may be sunlight resistant. The panel action on Proposal 6-14a clarifies the listing and marking requirements for products exposed to sunlight.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

(Log #385)

6- 20 - (310-8(d), Exception (New)): Reject
SUBMITTER: Anthony E. Jarosz, Premier Elec./Rep. Local 292, IBEW
RECOMMENDATION: Add an exception to 310-8(d) to read as follows:
Exception: Where used for temporary wiring in accordance with Article 305 in this code.
SUBSTANTIATION: When running NM-B cable for temporary heaters, I was made to wrap the cable with poly and duct tape. I personally don't think the insulation of the sheath and of the conductor will break down if exposed to direct sunlight for 90 days.
PANEL ACTION: Reject.
PANEL STATEMENT: Type NM Cable is not permitted to be used outdoors for temporary wiring in accordance with Article 305. This proposal is forwarded to Panel 7 because it deals with specific applications of Type NM cable for temporary wiring in Article 305.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1926)

6- 21 - (310-8(d), Exception (New)): Reject
SUBMITTER: W. Creighton Schwan, Hayward, CA
RECOMMENDATION: Add a new exception to read as follows:
Exception: Drip loops extended from a cable or raceway to service drop conductors.
SUBSTANTIATION: The "what if" approach of the Panel in response to Comment 6-7 on Proposal 6-18 on page 299 of the 1998 ROC is no way to write code. It has been noted that white insulation may be difficult to make sunlight resistant. So what? These drip loops are short, well separated in open air, and in the case of the white wire, could be bare.
PANEL ACTION: Reject.
PANEL STATEMENT: Sunlight deterioration is not a function of exposed cable length.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
GANATRA: See my Comment on Affirmative on Proposal 6-14a.

(Log #4197)

6- 22 - (310-8(d), Exception (New)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Add an Exception as follows:
Exception: For drip loops installed to comply with Section 230-54(f), or for similar drip loops formed in branch-circuit or feeder conductors, conductors extending not more than 3 ft (914 mm) from a cable sheath or from a raceway shall not be required to be sunlight resistant.
SUBSTANTIATION: The blanket prohibition against nonsunlight-resistant conductors threatens to make raceway-type service entrances obsolete, unless, perhaps, they are on the north side of a building. Although UL has revised its guide card restrictions on SE cable to give relief where that is the wiring method, they cannot provide relief for building wire generally. Wire manufacturers will be reluctant to reformulate and retest entire product lines for the sake of a few feet of wire coming out of a weatherhead. This is particularly true for small conductors that usually aren't uniformly black with colored tape applied afterwards.
For example, a 60A service might well have a No. 6 grounded circuit conductor (neutral or otherwise), and that conductor would need to be entirely white. Although white wires can be made sunlight resistant, it is much more difficult and expensive than black wire, and therefore we aren't likely to see much of it. Relief is needed for installers. The general rule is appropriate, however, for long lengths of conductors exposed to sunlight, such as outdoor installations of single conductors in cable tray or open wiring on insulators.
PANEL ACTION: Reject.
PANEL STATEMENT: Sunlight deterioration is not a function of exposed cable length.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BURNS: See my Explanation of Negative Vote on Proposal 6-17 (Log #2593).
COMMENT ON AFFIRMATIVE:

(Log #1815)

6- 23 - (310-10): Reject
SUBMITTER: James Tente, Tente Electric
RECOMMENDATION: Revise as follows:
No conductor shall be used in such a manner that its operating temperature will exceed that designated for the type of insulated conductor involved. In no case shall conductors be associated together in a raceway in such a way with respect to type of circuit, the wiring method employed, or the number of conductors that the limiting temperature of any conductor is exceeded.
SUBSTANTIATION: Some confusion has arisen as to whether or not this section applies to conductors installed in gutters of panelboards.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirement is not limited to conductors in raceways.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3718)

6- 24 - (310-10 and 310-16): Reject
SUBMITTER: Jerry M. Turner, Asarco, Inc.
RECOMMENDATION: In Table 310.16, change the heading "Correction Factors" to read: "Correction Factors - See Section 310.10."
and
In the first paragraph of Section 310.10 FPN, change the text to read:
(1) Ambient temperature - ambient temperature may vary along the conductor length as well as from time to time. As a minimum, the ambient temperature shall be regarded as the average of annual extreme maximum temperatures for the location.
SUBSTANTIATION: There is need for the National Electrical Code to clarify the meaning of ambient temperature as it relates to the sizing electrical conductors. The various engineers, electricians, electrical supervisors, contractors, vendors, and others who use the Code to size conductors often lack sufficient familiarity with the Code and either ignore or misunderstand ambient correction factors. While many simply read directly from Table 310.16, there are relatively few locations in the United States having an ambient temperature that remains consistently below 30°C. Accordingly, conductors are being undersized.
This proposal would clarify the need to use the ambient correction factors, and would establish minimum ambient temperature values for each geographical location based on local weather conditions.
The recommended minimum standard, the average of annual extreme maximum temperatures, is a condition analogous to the three-hour definition of continuous load. That average would be close to the maximum three-hour maximum temperature that could be reasonably expected. Its value remains consistent over time, and it is more reasonable than the use of an all-time record high temperature.
PANEL ACTION: Reject.
PANEL STATEMENT: The cross reference is redundant. The proposed change to 310-10(1) specifies a method for the determination of ambient temperatures for a given location. Regardless of its validity, the proposed method is a specific design criterion and as such is beyond the scope of the NEC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4064)

6- 25 - (310-11(a)(1)): Accept in Principle
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./Rep. Edison Electric Inst.
RECOMMENDATION: Revise text to read as follows:
(1) The maximum rated voltage for which the conductor was listed or, if above 600 volts, the maximum rated voltage at which the conductor was tested according to applicable industry standards.
SUBSTANTIATION: When the premise owner changes their service from secondary rate to primary rate by purchasing the cable and transformer from the utility and accepts service at a voltage above 600 volts, the addition to this rule will permit the owner to continue to use the cable and transformer, which are in all likelihood not listed but tested in accordance with applicable industry standards.
PANEL ACTION: Accept in Principle.
Revise text to read as follows:
"(1) The maximum rated voltage."
PANEL STATEMENT: This change would accomplish the intent of the proposal in a more direct way. The tested voltage in many cases is higher than the rated voltage. This panel action does not change the requirements for listed products.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
POST: I vote to reject; I am not comfortable accepting equipment that is not listed or labeled.

(Log #4105)

6- 26 - (310-11(a)(1)): Accept in Principle
SUBMITTER: Robert E. Molde, Northern States Power Co./Rep. Wisconsin Utilities Assn.
RECOMMENDATION: Revise text to read as follows:
(1) The maximum rated voltage for which the conductor was listed or the maximum rated voltage at which the conductor was tested according to applicable industry standards.
SUBSTANTIATION: When the premise owner changes their service from secondary rate to primary rate by purchasing the cable and transformer from the utility and accepts service at a voltage above 600 volts, the addition to this rule will permit the owner to continue to use the cable and transformer, which are in all likelihood not listed but tested in accordance with applicable industry standards.

(Log #2823)

6- 34 - (310-11(d), FPN): Accept in Principle
SUBMITTER: Ravindra H. Ganatra, Alcan Cable /Rep. CANENA Tech Harmonization Subcomm. For Bldg Wire and Cable Products
RECOMMENDATION: Revise the FPN to 310-11(d) as follows:
FPN: Examples of these markings include but are not limited to <u>markings suitable for limited smoke, sunlight resistant, etc.</u> <u>~~"LS" for limited smoke and markings such as "sunlight resistant."~~</u>
SUBSTANTIATION: This proposal is submitted on behalf of the THSC - Building Wire and Cable Product Standards, of Council of Harmonization of Electrotechnical Standardization of North America (CANENA).
Abbreviation LS has been found to represent different requirements in different national product standards in North America. In Mexico, "LS" is used to indicate compliance with requirements associated with marking for low smoke. In the US, "LS" marking has been used to indicate compliance with requirements associated with marking for limited smoke. However, the requirements in Mexico and the US are different. Further, requirements for "ST1" marking used in Canada are similar to limited smoke marking used in the US.
Thus, removal of the abbreviation in the Code will facilitate harmonization of marking requirements in the product standards.
The proposal does not recommend any change in the test method or performance requirements for a product being evaluated for limited smoke marking.
PANEL ACTION: Accept in Principle.
Add the following text to 310-11 (d).
"These markings include, but are not limited to, markings for limited smoke, sunlight resistance, etc."
Delete FPN.
PANEL STATEMENT: The panel is implementing a requirement of the NEC Style Manual to delete FPNs and make them Code text.

6- 35 - (310-12(c)): Accept in Principle
NOTE: The Technical Correlating Committee directs the panel to revise the Exception to form a complete sentence in accordance with the Style Manual. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Richard E. Loyd, Perryville, AR
RECOMMENDATION: Revise as follows:
(c) Ungrounded Conductors. Conductors that are intended for use as ungrounded conductors, whether used as a single conductor or in multiconductor cables, shall be finished to be clearly distinguishable from grounded and grounding conductors. Ungrounded conductors shall be distinguished by colors other than white, ~~natural gray,~~ or green; or by a combination of color plus distinguishing marking. Distinguishing markings shall also be in a color other than white ~~natural gray,~~ or green, and shall consist of a stripe or stripes or a regularly spaced seris of identical marks. Distinguishing markings shall not conflict in any manner with the surface markings required by Section 310-11(b)(1).
Exception: As permitted by Section 200-7.

SUBSTANTIATION: This term is undefined. The past Chairman of CMP 5 and others with historical data as to where this term originally came from all relate to products or product manufacturing process that has not been used for the past 35 to 50 years. Since it is a term that was used to define a product no longer made it should be deleted to eliminate the confusion that continues to exist in the industry.

There are many shades of white and many shades of black. How does one determine if gray is a shade of black or white? Different manufactures use various shades of each color and often two or three different manufactures wire will be installed on the same job site. The continued use of the term causes confusion and is or could be a safety issue that might result in life threatening shock hazard.

PANEL ACTION: Accept in Principle.

Revise as follows:

(c) Ungrounded Conductors. Conductors that are intended for use as ungrounded conductors, whether used as a single conductor or in multiconductor cables, shall be finished to be clearly distinguishable from grounded and grounding conductors. Distinguishing markings shall not conflict in any manner with the surface markings required by Section 310-11(b)(1).

Exception: As permitted by Section 200-7.

PANEL STATEMENT: Panel action, without making a determination on removal of "natural", satisfies the submitter's recommendation. Specific requirements for the identification of grounded and grounding conductors are specified in Article 250.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #4296)

6- 36 - (310-12(c)): Accept in Principle

SUBMITTER: Charles F. Mello, Milwaukie, OR

RECOMMENDATION: Revise text to read as follows:

(c) Ungrounded Conductors. Conductors that are intended for use as ungrounded conductors, whether used as single conductors or in multiconductor cables, shall be finished to be clearly distinguishable from grounded and grounding conductors. Ungrounded conductors shall be distinguished by colors other than white, ~~natural~~ gray, or green; or by a combination of color plus distinguishing marking. Distinguishing markings shall also be in a color other than white, ~~natural~~ gray, or green, and shall consist of a stripe or stripes or a regularly spaced series of identical marks. Distinguishing markings shall not conflict in any manner with the surface markings required by Section 310-11(b)(1).

Exception: As permitted by Section 200-7.

SUBSTANTIATION: Delete the word natural since the color natural gray is not defined and in fact does not exist as a specified color for wire insulation. This proposal goes with the definition of gray within a specified range of color per the Munsell color system as used by industry for wire color coding. The definition of the gray is provided in another proposal.

PANEL ACTION: Accept in Principle.

6- 41 - (Table 310-13): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Add SI units for insulation thicknesses using the following conversion table.
Under "Thickness of Insulation" add a new column entitled "mm" between "AWG or kcmil" and "Mils" and insert the SI equivalents for the insulation thickness based on the table submitted.
Change insulation thickness value in Superscript Note 4 for Type RHH #14-12 AWG in Tables 310-13 as follows:
Change "45 mils" to "1.14 mm (45 mil)".
Change insulation thickness value in Superscript Note 9 for Type USE 213-500 kcmil in Table 310-13 as follows: Change "80 mils" to "2.03 mm (80 mils)".

Conversion Table for Insulation Thickness Values in Tables 310-13, -62, -63 and -64 of 1999 NEC

mm	Mils	mm	Mils	mm	Mils	mm	Mils	mm	Mils
		2.67	105	5.33	210	8.00	315	10.67	420
0.36	14	2.79	110	5.46	215	8.13	320	10.80	425

2.54	100	5.21	205	7.87	310	10.54	415	13.21	520

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
A "soft" conversion is necessary to conform o U.S. industry practice and applicable product standards.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2027)

6- 42 - (Table 310-13): Accept
SUBMITTER: Siegfried A. Schauffele, Superior Essex
RECOMMENDATION: For types FEP or FEPB change the description of the outer covering to:
"Glass or other suitable braid material."
SUBSTANTIATION: Asbestos coverings are no longer in use for types FEP or FEPB, and are not included in UL Standard 83 for these types. [See related proposal to 310-11(b)(3)(d)].
PANEL ACTION: Accept.
PANEL STATEMENT: This change should be for size range 6 to 2.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2240)

6- 44 - (Table 310-13): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: In Table 310-13: change the phrase "flame-retardant" (or "flame retardant") to "flame tested" in thirteen (13) places in column titled "Insulation," in four (4) places in column titled "Outer Covering," and in one (1) place in "Note 9."
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.
[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
PANEL ACTION: Reject.
PANEL STATEMENT: Cables are listed for their flame retardant properties and some of their applications are referenced in the Code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
GANATRA: See my Explanation of Negative Vote on Proposal 6-3.

(Log #3103)

6- 45 - (Table 310-13): Accept in Principle
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Delete reference to Type RH insulated conductors from table.
~~Thermoset RH75°C Dry and damp locations 167°F~~
SUBSTANTIATION: Underwriters Laboratories canvassed subscribers of Thermoset-Insulated Wires and Cables, UL 44. It was determined that Type RH insulated conductor is no longer being produced.
PANEL ACTION: Accept in Principle.
In addition to the recommendation, the following changes shall be made:
Line one shall be deleted and 10 changed to 14-10 on the second line in column 6. Superscript four shall be removed and the remaining superscripts shall be appropriately renumbered.
PANEL STATEMENT: The 30 mil wall thickness associated with 14-12 only applied to RH. The superscript change is an editorial clarification.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4430)

6- 46 - (Table 310-13): Reject
SUBMITTER: Joel Sandler, Lera Electric/Rep. IBEW Local 595
RECOMMENDATION: Designate suffix to indicate which type of wire is sunlight resistant/add to Table 310-13.
SUBSTANTIATION: The only way to know if wire is sunlight resistant is to look at sample or call supplier and ask/adding suffix to wire and table will rectify this lack of information.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirement is adequately covered under 310-8(d).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2803)

6- 47 - (310-14): Accept in Principle
SUBMITTER: Terry L. Carlson, Nebraska State Electrical Board
RECOMMENDATION: Revise text to include Type RH, RHH, and RHW conductor insulation in those required to be made of an AA-8000 series electrical grade aluminum alloy conductor material.
SUBSTANTIATION: Present language requires that Type XHHW, THW, THHW, THWN, THHN, service-entrance Type SE Style U (flat) and SE Style R (round) be made of AA-8000 series aluminum.
Underground Service Entrance (USE) cable must be terminated outside of a building according to NEC Section 338-2. However, dual rated USE cable is available as USE / RH, RHH, RHW. The dual rating of RH, RHH, and RHW allows it to be used and terminated inside of a building. Therefore, the requirement for AA-8000 series aluminum alloy should apply to Type RH, RHH, and RHW as used in dual rated Type USE cable. Dual rated Type USE / RH, RHH, RHW cable is currently available made from the 1350 series aluminum which does not meet the safety standard of AA-8000 series. Revising the text of Section 310-14 to include Type RH, RHH and RHW will require the dual rated Type USE / RH, RHH, RHW aluminum conductors to be made from AA-8000 series aluminum.
PANEL ACTION: Accept in Principle.
Delete "RH" from the recommendation.
PANEL STATEMENT: RH is being deleted from the Code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #18)

6- 48 - (310-15(a)): Reject
NOTE: The following proposal consists of Comment 6-32 on Proposal 6-52 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 6-52 was:

Add the following sentence at the end of the first paragraph in Section 310-15(a):
"Select the ampacity table by using the matrix tables 310-15A through D." Add the following four tables:

Table 310-15A Selection Matrix for Ampacity Tables -- 0-2000 Volts Above Ground

Application	Table 310					Table B-310*			
	16	17	18	19	NT3	1	2	3	4
Not more than 3 current carrying conductors rated 60-90° in raceway or cable	x

SUBSTANTIATION: The following tables have been revised to remove references to Appendix B in accordance with comments from the Technical Correlating Committee. The proposed table format has also been revised to provide additional clarity.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed recommendation does not add to the usability of the various ampacity tables.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
PETTIGREW: I disagree with the Panel Statement. Providing cross-reference tables will add to the usability of the NEC. These tables would assist users in selecting the correct ampacity table. The number of ampacity tables included in the mandatory portion of the NEC has increased and so has the probability of error. The goal of the Code panels should be to reduce the margin of error in using the NEC.

(Log #19)

6- 49 - (310-15(a)): Reject
NOTE: The following proposal consists of Comment 6-33 on Proposal 6-52 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 6-52 was:
(See Proposal 6-48 (Log #18)
SUBMITTER: Craig M. Wellman, Newark, DE
RECOMMENDATION: Relocate the portions of the tables deleted by the Technical Correlating Committee to Appendix B. The new Appendix B tables will then be as shown following.

Table B-310-15(b)(2)A Selection of Ampacity Tables — 0-2000 Volts Above Ground

AFFIRMATIVE: 11

(Log #2063)

6- 51 - (310-15(a), Exception (New)): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Add an Exception to read as follows:
Exception "xx": Where Nonmetallic Sheathed Cables are installed in a one-family dwelling unit are bundled longer than 24 in. (610 mm) and not installed in a raceway need not comply with the derating factors of Table 310-15(b)(2)(a).
SUBSTANTIATION: Nonmetallic Sheathed Cables including Type SE cables bundled together for lengths longer than 24 inches have been tested by UL and found to not exceed the temperature rating of the conductors.
These tests where conducted during a product LISTING for a manufacture and this information was not made available for this submittal. The manufacture is still trying to obtain this test report.
Over 40 No. 14 Type NM cables each drawing 12.5 amperes where included in this test and the termperture of the conductors was well below the 90 degree requirement of type NM-B cables.
This information will be forwarded if UL will release this data.
Also due to the high diversity in dwelling units it is very unlikely that more than 4 cables bundled will be carrying the required maximum current.
Cables installed in raceways shall not be included in this exception because tests have shown that the conductors do exceed the conductor temperatures even in short raceway runs.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel can only act on data submitted with the proposal. No data was submitted with this proposal.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

(Log #4436)

6- 52 - (310-15(a)(1)): Reject
SUBMITTER: Vinson Owyoung
RECOMMENDATION: Revise text to read as follows:
"Ampacities for conductors shall be permitted to be determined by tables or under <u>electrical</u> engineering supervision, as provided in (b) and (c)."
SUBSTANTIATION: There are all kinds of engineers, for electrical work you should specify electrical in this section.
PANEL ACTION: Reject.
PANEL STATEMENT: Heat transfer technology is not limited to electrical engineering.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #803)

6- 53 - (310-15(a)(2) and Exception): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(2) Selection of Ampacity. Where more than one calculated or tabulated ampacity could apply for <u>the length of</u> a given <u>set of</u> circuit <u>conductors,</u> the lowest value shall be used.
Exception: Where two different ampacities apply to adjacent portions of a <u>given set of</u> circuit <u>conductors,</u> the higher ampacity shall be permitted to be used beyond the point of transition, a distance ~~equal to~~ <u>not more than</u> 10 ft (3.05 m) or 10 percent of the circuit <u>conductor</u> length figured at the highest ampacity, whichever is less.
SUBSTANTIATION: Editorial. Circuit conductors include those designated as service, feeder, branch circuit, and tap. Literal wording of this section and the exception results in more than apparently intended.
For example, a given circuit length includes a feeder and tap conductors connected to it, (definition of feeder includes tap conductors up to the final branch-circuit overcurrent device). The rule indicates a feeder with an ampacity of 400, to which a set of 20-ampere rated No. 12 conductors are tapped, in accordance with Section 240-21(b)(5), would have an ampacity of 20 assigned to the entire assembly of conductors.
Conversely, the present exception literally permits the opposite; the higher rated ampacity (400) could be applied to 10 ft or 10 percent of the No. 12 conductors.
The proposed phrase "given set of circuit conductors" is intended to provide distinguishment of feeder, branch circuit, and tap conductor portions of circuits.
If this proposal is accepted, Section 310-60(b)(1) should be revisited.
PANEL ACTION: Reject.
PANEL STATEMENT: Regardless of the nature of the circuit, this section deals with the requirements for the selection of ampacity, either tabulated or calculated, that need to be followed.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3138)

6- 56 - (310-15(a)(2), Exception): Reject
SUBMITTER: Joel Norton, RR 1 Box 1662
RECOMMENDATION: Delete the exception to 310-15(a)(2).
SUBSTANTIATION: Testing has shown that the conductor ampacity can be determined using the 90°C column right up to a panelboard within a few inches of a termination rated at a lower temperature. This 10 foot or 10 percent rule is no longer needed.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter provided no test data to substantiate the recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #797)

6- 57 - (310-15(b), Table 310-15(b)(6)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
For dwelling units, conductors and cables, as listed in Table 310-15(b)(6), shall be permitted as 120/240 volt, 3-wire, single-phase service-entrance conductors, service lateral conductors, and feeder conductors that serve as the main power feeder to a dwelling unit. ~~and are installed in raceway or cable with or without an equipment grounding conductor.~~
(remainder of text unchanged)
Add:
FPN No. 1: See Section 310-8(c) for conductors in wet locations.
FPN No. 2: See Section 338-3 for Type SE cable use as a feeder.
Revise Table 310-15(b)(6) Conductor and Cable Types and Sizes for 120/240-volt, 3-wire, Single-phase Dwelling Services and Feeders. Conductor Types, RH, RHH, RHW, RHW-2, THHN, THHW, THW, THW-2, THWN, THWN-2, XHHW, XHHW-2, cable types SE, USE, USE-2, MC with conductors rated not less than 75°C (167°F) and MI.
SUBSTANTIATION: Editorial. Type SE, USE, and USE-2 indicated in the table are not conductor types, per se, but cable types. Type MC and MI cables are suitable for service and feeder conductors and should be included for this application.
The portion proposed to be deleted seems irrelevant to the provisions of this section. All cables and raceways are not suitable for services or feeders, and the wording suggests an equipment grounding conductor is optional. Those provisions are adequately covered in other Code sections. When the panel added the phrase "with or without an equipment grounding conductor" in the revision for Proposal 6-83 in the 1989 ROP no reason was given.
The proposal would clarify that other pertinent code sections re: wiring methods, grounding, insulation type in wet locations, are not modified by this section, and that only usually required wire sizes are modified. A modifying section may be seen to modify all that is noted.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal does not clarify the issue.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
ZIMNOCH: Section 334-3(1) permits Type MC cable for services already. Inclusion of Type MC in Table 310-15(b)(6) coordinates it permitted uses as done for Type SE and USE.

(Log #4421)

6- 58 - (310-15(b)): Reject
SUBMITTER: Craig M. Wellman, Newark, DE
RECOMMENDATION: Revise paragraph as marked:
"(b) Tables. Ampacities for conductors rated 0-2000 volts shall be as specified in the Allowable Ampacity Tables 310-15(b) and 310-16 through 310-19..."
Insert new table as follows:

Table 310-15(b) Selection of Ampacity Tables 0-2000 Volts Abov Ground Except as Noted

Not more than 3 current carrying conductors rated 60-90°C in raceway or cable, above ground, directly buried or in electrical ducts	310-16
Single insulated conductors rated 60-90°C in free air	310-17
Three single insulated conductors rated 150-250°C in raceway or cable	310-18
Single insulated conductors rated 150-250°C in free air	310-19
Two or three single insulated conductors supported on a messenger	310-20
Multiconductor cables in cable trays – See Section 318-11(a) for details	310-16 and 310-
Single insulated conductor cables in cable trays – See Section 318-11(b) for details	310-17 and 310-
120/240 volt, single phase, dwelling service and feeders	310-16 to 310-19 Note 3

For adjustment factors on more than 3 current carrying conductors in a raceway or cable see Table 310- Note 8

SUBSTANTIATION: Finding the correct table consistently is difficult. The proposed change will reduce code application errors by improving usability of the code.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed recommendation does not add to the usability of the various ampacity tables.

PETTIGREW: See my Explanation of Negative Vote on Proposal 6-48.

(Log #2915)

6- 59 - (310-15(b)(2)): Reject
SUBMITTER: Donald A. Ganiere, Ottawa, IL
RECOMMENDATION: Add text as follows:
a. More than Three Current-Carrying Conductors in a Raceway or Cable. Where the number of current-carrying conductors in a raceway or cable exceeds three, or where single conductors or multiconductor cables are stacked or bundled longer than 24 in. (610 mm) without maintaining spacing and are not installed in raceways, the allowable ampacity of each current-carrying conductor shall be reduced as shown in Table 310-15(b)(2)(a).
SUBSTANTIATION: The addition of the words "current-carrying" will make it clear that the size of the equipment grounding conductor does not have to be adjusted when there are multiple current-carrying conductors in the raceway or cable. Some inspectors are requiring that the equipment grounding conductor be increased in size along with the current-carrying conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: This requirement does not deal with the sizing of equipment grounding conductors. Size of the equipment grounding conductors is established in accordance with Article 250 for a given application.

(Log #4198)

6- 61 - (Table 310-15(b)(2)(a): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:

Number of Current-Carrying Conductors	Percent of Values in Tables 310-16, 310-17, 310-18, 310-19, as Adjusted for Ambient Temperature if Necessary
4 through 6	80
7 through 24	70
25 through 42	60
43 and above	50

(FPN): Overheating may occur where continuous, fully loaded conductor diversity is less than 50 percent and the number of current-carrying conductors exceeds nine. See Section 310-10.
SUBSTANTIATION: Electricians are not installing conductors so as not to energize them, or load them to only half of their normal ampacity. From the 1993 NEC forward the NEC has effectively disallowed any raceway fill with 10 or more conductors. The data on which the panel relied does not translate well into real world experience. A circuit is never 100 percent loaded for continuous periods due to listing restrictions on overcurrent protective devices. Because conductor heating is proportional to the current squared, a very small reduction from maximum current values produces a great reduction in heating. This is why no loss experience has ever been produced stemming from the 50 or more years the 1984 language was in the Code.
CMP 6 should reconsider this issue. By this proposal the Advisory Committee advises CMP 6 that after four code cycles in which the State of Massachusetts has retained in this location the traditional derating factors now exiled into NEC Appendix B-310-11, we have yet to hear of a single failure related to mutual conductor heating in an installation that complied with the traditional factors. Section 310-10 adequately addressees those bizarre instances where a problem could be demonstrated.
PANEL ACTION: Reject.
PANEL STATEMENT: User is not restricted from using information in Appendix B under engineering supervision. Table 310-15(b)(2)(a) is applicable for conditions where no diversity is established while the information provided in Appendix B is utilized for conditions where diversity is established under engineering supervision.

(Log #3298)

6- 67 - (310-15(b)(2)(a) Exception No. 5 (New)): Accept in Principle in Part
SUBMITTER: George W. Flach, Nat'l Armored Cable Mfrs' Assn.
RECOMMENDATION: Add a new Exception to read:
Exception No. 5: Adjustment factors shall not apply to Type AC cable or to Type MC cable having interlocked armor without an overall outer jacket where:
a. each cable has not more than three current-carrying conductors,
b. the conductors are No. 12 copper, and
c. not more than 20 current carrying conductors are bundled, stacked, or supported on "bridle rings".

A 60 percent adjustment factor shall be applied where the current-carrying conductors in these cables that are stacked or bundled longer than 24 in. (610 mm) without maintaining spacing exceeds 20.
SUBSTANTIATION: This proposal is similar to Proposal ROP 6-90/ROC 6-68. The proposal has been altered to address the panel's comments concerning jacketed cables (jacketed cables have been specifically excluded) and to address the issue of conductor size (the size has been limited to No. 12 which is represented by the test report).
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle in Part.
Delete "having interlocked armor". Change "24 in. (610 mm)" to "600 mm (24 in.)". Change "No. 12" to "12 AWG".
PANEL STATEMENT: Type MC cable can be manufactured using interlocked or continuous armor. The second change was made to correlate with panel action on Proposal 6-27. The third change was made to correlate with panel action on Proposal 6-7.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
POST: I vote to reject. I am not convinced that bundling 20 current carrying conductors together will not cause excessive heating.

(Log #3299)

6- 68 - (310-15(b)(2)(a) Exception No. 5 (New)): Reject
SUBMITTER: George W. Flach, Nat'l Armored Cable Mfrs' Assn.
RECOMMENDATION: Add a new Exception No. 5 to read:
Exception No. 5: Derating factors shall not apply to Type AC Armored Cable or non-jacketed interlocked Type MC Metal Clad Cables in air containing no more than three current-carrying conductors where bundled, stacked, or supported on "bridle rings" and where the total number of current-carrying conductors does not exceed twenty. A 60 percent derating factor shall apply to Type AC or non-jacketed Type MC cables containing twenty-one conductors or more.
SUBSTANTIATION: This proposal is similar to Proposal ROP 6-90/ROC 6-68. The proposal has been altered to address the panel's comments concerning jacketed cables. Jacketed cables have been specifically excluded from the proposal. The report I have provided addresses No. 12 only; however, the report is intended to demonstrate that the rate of heat dissipation for metal jacketed cables do not require the same derating as nonmetallic jacketed constructions. The exception should apply to all sizes. It should not be necessary to test every other size and number of conductors in order to apply the exception.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The report referenced in the substantiation addresses only 12 AWG conductor. Extrapolation cannot be made to other conductor sizes without additional information.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3342)

6- 69 - (310-15(b)(2)(a) Exception No. 5 (New)): Reject
SUBMITTER: Michael R. Puckett, Puckett Engineering
RECOMMENDATION: Add an exception to read as follows:
Exception No. 5: Derating factors may not apply for up to 30 current-carrying conductors installed in wireways, under provisions of Section 362-5.
SUBSTANTIATION: Section 362-5 waives the derating requirement of 310-15(b)(2)(a). The proposed text addition is similar to Exception No. 2 for conductors installed in cable trays.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is redundant. The exception is covered under 362-5 and 374-6(a).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3397)

6- 70 - (310-15(b)(2)(a) Exception No. 5 (New)): Reject
SUBMITTER: Darrell Lombardi, Center Greenlake
RECOMMENDATION: Add a new Exception to read as follows:
Exception No. 5: Where heating load conductors and cooling load conductors are contained in the same raceway only the heating current carrying conductors or the cooling current carrying conductors shall be counted as current carrying conductors, whichever is larger, for purposes of applying adjustment factors.
SUBSTANTIATION: Heating and cooling load conductors are counted together when determining the adjustment factor for conductors in a raceway. Only one group of conductors will be current carrying depending on the temperature of the area being heated or cooled. The larger number of conductors in a group should be the only conductors counted when determining the adjustment factor.
PANEL ACTION: Reject.
PANEL STATEMENT: This recommendation would be redundant. Load diversity for noncoincidental loads as suggested in the recommendation is covered in the Code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4199)

6- 71 - (310-15(b)(2)a Exception No. 5 (New)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Add a new exception No. 5 as follows:
Exception No. 5: Derating factors shall not apply where 30 or fewer current-carrying conductors occupy no more than 20 percent of the interior cross sectional area of Underfloor Raceways, Article 354; Cellular Metal Floor Raceways, Article 356; and Cellular Concrete Floor Raceways, Article 358.
SUBSTANTIATION: For good reason, these raceway articles forbid the reinsulation of conductors at abandoned outlets. However, the present Code builds in a powerful economic incentive to violate these rules. This is because Note 8(a) complicates the simple solution to the problem. If this proposal is accepted, it will be a simple matter to use one pair of conductors for each outlet, spliced in a header duct of some kind. Then if an outlet is to be abandoned, the pair of wires can be simply withdrawn with a pull wire left in place for the future. Although this can be done now, the literal effect of Note 8(a) would be to require oversized conductors on many runs, which needlessly discourages the practice. In fact, with generally small loads split up over many pairs of wires, or even a large load using only one pair of wires in a group, there is no problem. These raceways are large in area and well embedded in an excellent "heat sink" medium. Massachusetts has made this exception for the last seven editions of the Code without incident.
This wording, in comparison to that submitted in 1990 (Proposal 6-112), adds restrictions comparable to metal wireways. This will provide a more technically correct basis for the existing rule in terms of preventing overheating. If these installations overheat, then the wireways would also. The panel objected to this substantiation in the previous cycle based on a lack of calculations. Let's try common sense instead. One of these metal raceways embedded in a concrete floor would be very unlikely to cause a problem for the enclosed conductors based on standard usage patterns and similarities with other raceways of comparable cross section.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's substantiation is not related to the recommendation. No data or calculation was given in the substantiation to support the technical change in the derating factor.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4396)

6- 72 - (310-15(b)(2)a Exception No. 5 (New)): Reject
SUBMITTER: Monte R. Ewing, State of Wisconsin
RECOMMENDATION: Add a new Exception to read as follows:
Exception No. 5: The derating factors shown above do not apply to branch circuits supplying an individual dwelling unit.
SUBSTANTIATION: This exception has been incorporated into the State of Wisconsin Electrical Code for many years now. Because of the individual dwelling unit's load diversity and circuit design requirements from Article 220 Wisconsin does not see a need for additional derating. There has been no documented problems of overloading caused from bunding of the dwelling unit branch circuits to justify derating of these conductors. After more than 15 years of this exception being in the Wisconsin Code I feel it should be addressed in the National Electrical Code.
PANEL ACTION: Reject.
PANEL STATEMENT: No data, calculations, or testing was submitted to support the recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
KOMASSA: I agree with the submitter that having over 15 years of time honored experience without any overloads throughout the entire State of Winconsin is a sufficient reason to accept the proposed change.

(Log #2594)

6- 73 - (310-15(b)(2)(a) Exceptions No. 5 and No. 6 (New)): Reject
SUBMITTER: Donald R. Cook, Southern Section, IAEI
RECOMMENDATION: Add a new Exception No. 5 and No. 6 to Section 310-15(b)(2)(a). The new Exceptions are to read as follows:
Exception No. 5: For conductors installed in metallic wireways.
Exception No. 6: For conductors installed in sheet metal auxiliary gutters.
SUBSTANTIATION: The derating of conductor ampacity for metal wireways and sheet metal auxiliary gutters is not applied the same as it is for other raceways. Sections 362-5, 374-5(a), and 374-6(a) provide conditions which would permit no ampacity derating. It is important that the Code user be alerted that Table 310-15(b)(2)(a) does not apply to all wireway and sheet metal auxiliary gutter installations.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is redundant. The exception is covered under 362-5 and 374-6(a).

SUBMITTER: Wayne A. Lilly, Bridgewater, VA
RECOMMENDATION: Add new Exception No. 5 and No. 6 to Section 310.15(b)(2)(a). The new Exceptions are to read as follows:
Exception No. 5: For conductors installed in metallic wireways, the provisions of Section 362.5 shall apply.
Exception No. 6: For conductors installed in sheet metal auxiliary gutters, the provisions of Sections 374.5(a) and 374.6(a) shall apply.
SUBSTANTIATION: The derating of conductor ampacity for metal wireways and sheet metal auxiliary gutters is not applied the same as it is for other raceways. Sections 362.5, 374.5(a), and 374.6(a) provide conditions which would permit no ampacity derating. It is important that the Code user be alerted that Table 310.15(b)(2)(a) does not apply to all wireway and sheet metal auxiliary gutter installations.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is redundant. The exception is covered under 362-5 and 374-6(a).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #805)

6- 76 - (310-15(b)(3)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(3) Where bare or covered circuit conductors ~~are used~~ contained in a raceway, cable, auxiliary gutter, cable tray, cablebus, or direct-buried, in close proximity with insulated conductors, ~~their allowable ampacities shall be limited to those permitted for the adjacent insulated conductors.~~ they shall be considered to have insulation equal to the lowest insulation temperature rating of the adjacent insulated conductors, for the purpose of determining their allowable ampacity.
Exception: Uninsulated conductors of Type SE cable shall be considered to have the same ampacity as the insulated conductors.
SUBSTANTIATION: The phrase "insulated conductors" would apply this section to a bare grounded conductor used with insulated ungrounded conductors in an aerial span between poles or bare spans between poles where insulated conductors in raceway or cable are tapped to them and run down the pole, or they are tapped by insulated conductors for signs or fixtures. This section does not correlate with Table 310-21 and doesn't consider open single conductor spans where spacing and air renders this section somewhat irrelevant. The ampacity determined is more reasonably applied where bare conductors are run with circuit conductors as indicated in the proposal, which covers wiring methods used for perhaps the most common use of bare conductors aside from aerial wiring (services).
In accordance with present literal wording, a bare service neutral which is double the circular mil area of the largest insulated phase conductor, to compensate for harmonic currents, the allowable ampacity is limited to that of the insulated phase conductors.
Present wording does not address the size or material of bare conductors but allows an ampacity of the insulated conductors regardless of size or material of the bare or insulated conductors.
With no code tables indicating the ampacity of bare conductors in raceways or cables, the average code user cannot readily determine what the ampacity is for a particular size, in comparison to insulated conductors. This can be helped by assuming an insulation temperature rating.
The exception would correlate with UL listing which considers an uninsulated conductor of Type SE cable to have the same ampacity as the insulated conductors even where it is a smaller size.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed wording does not add any clarification to the existing requirement. It would limit the requirement to branch circuits only.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1526)

6- 77 - (310-15(b)(4)a): Reject
SUBMITTER: James A. Popma, Engineering Design Assoc., Inc.
RECOMMENDATION: Revise to read as follows:
(a) A neutral conductor that carries only the unbalanced current from other conductors of the same multi-wire branch circuit shall not be required to be counted when applying the provisions of Section 310-15(b)(2)(a).
SUBSTANTIATION: I know of contractors who are not counting the neutral of a 120V 2-wire circuit (when derating because of multiple conductors in the same raceway). I think the above change would help clarify their misunderstanding.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed wording does not add any clarification to the existing requirement. It would limit the requirement to branch circuits only. Multi-wire usage does not change the unbalanced current concept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

(Log #3415)

6- 79 - (310-15(b)(4)(c)): Reject
SUBMITTER: Nicholas T. Abbatiello, Spencerport, NY
RECOMMENDATION: Add the following sentence at the end:
"An additional adjustment factor shall be required where conductors, which are part of an overall assembly with an outer covering or sheath impeding heat flow, are installed in a raceway. Such assemblies shall include Power and Tray Cables (Type TC) installed within raceways such as conduits, tubing, wireways, etc."
SUBSTANTIATION: In many instances Variable Frequency Drives, which produce nonlinear currents, are being used for motor speed control. In order to maintain reflected waves within acceptable boundaries, many manufacturers specify that shielded type TC cable assemblies be used. As long as the type TC cable is placed in open trays according to the specific rule there is no problem. However, many cables are being installed within raceways, which are enclosed and restrict the free flow of air around the cable jacket causing the conductors to run at higher than normal temperatures even if only an 80 percent factor is applied. A second factor application would afford some additional protection against possible overheating. There is no empirical data to substantiate this at this time, but the requiring of an additional factor would not be unduly restrictive until evaluation and experience data is obtained which either substantiates or refutes the need.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter did not provide any data to substantiate the recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

(Log #348)

6- 80 - (310-15(b)(5)a (New)): Reject
SUBMITTER: Robert Reed, Wood County Building Dept., OH
RECOMMENDATION: Add a new 310-15(b)(5)(a) to read as follows:
On a 4-wire, 3-phase wye circuit where the major portion of the load consists of nonlinear loads, harmonic currents can be present in the equipment grounding conductor also. See 310-15(b)(4)(c) and 310-4 (FPN).
SUBSTANTIATION: Awareness of the problems range from power company lines to burnt up neutral and expensive equipment. Also, the grounding conductors are sized to trip overcurrent devices, not to carry current from nonlinear loads.
PANEL ACTION: Reject.
PANEL STATEMENT: 310-15(b)(4) adequately addresses the situation relative to the harmonic current source described in the recommendation. The equipment grounding conductor must be sized in accordance with Article 250.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

(Log #364)

6- 81 - (310-15(b)(6)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise second sentence:
For application of this section, the main power feeder shall be the feeder(s) between the main disconnect and the lighting and appliance branch-circuit panelboard(s), and the feeder conductors to a dwelling unit shall not be required to ~~be larger than~~ have an ampere rating higher than their service-entrance conductors.
SUBSTANTIATION: Editorial. Where aluminum main power feeder conductors are required to have a (ampere) rating equal to copper service-entrance conductors, the feeder conductors should be larger than the service-entrance conductors. Present wording suggests No. 4 aluminum feeder conductors, for example, may have the same rating as No. 4 copper service-entrance conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: Present Code wording does not lead to the interpretation included in the substantiation provided by the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

(Log #436)

6- 82 - (310-15(b)(6)): Accept
SUBMITTER: Mike Theisen, St. Cloud, MN
RECOMMENDATION: Break up the compound sentence into two sentences to read as follows:
For application of this section, the main power feeder shall be the feeder(s) between the main disconnect and the lighting and appliance branch-circuit panelboard(s) ~~and t~~ The feeder conductors to a dwelling unit shall not be required to be larger than their service-entrance conductors.
SUBSTANTIATION: When two sentences are used, the section is easier to read and understand the first time through. One sentence describes the "main power feeder" and the second sentence deals with the limitation on the required size of the feeder.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3677)

6- 83 - (310-15(b)(6)): Reject
SUBMITTER: Leonard F. Devine, Jr., W. Palm Beach County Bldg & Zoning, FL
RECOMMENDATION: Revise text to read as follows:
(6) 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. For dwelling units, and detached residential garages, conductors, as listed in Table 310-15(b)(6), shall be permitted as 120/240-volt, 3-wire, single-phase service-entrance conductors, service lateral conductors, and feeder conductors that serve as the main power feeder to a dwelling unit, or detached residential garage, and are installed in raceway or cable with or without an equipment grounding conductor. For application of this section, the main power feeder shall be the feeder(s) between the main disconnect and the lighting and appliance branch-circuit panelboard(s), and the feeder conductors to a dwelling unit or detached residential garage shall not be required to be larger than their service-entrance conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of Sections 215.2, 220.22, and 230.42 are met.

SUBSTANTIATION: By adding this text, it would put the garage in the same category as the dwelling. If the garage is attached to the dwelling and you had a panel located in the garage you would allow one to derate the feeder.
PANEL ACTION: Reject.
PANEL STATEMENT: A detached residential garage may include a workshop and thus would not provide the diversity similar to a dwelling unit.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3908)

6- 84 - (310-15(b)(6)): Accept
SUBMITTER: Ronald E. Gnotke, Rep. Minnesota Board of Electricity
RECOMMENDATION: Revise text to read as follows:
310.15(b)(6) SE Cable from Article 338.4(a) installed as an indoor feeder shall comply with Parts A and B of Article 336, except Section 336.26. The grounded conductor shall be permitted to be smaller, than the ungrounded conductors, provided the requirements of Section 215.2, 220.22, and 230.42 are met.
SUBSTANTIATION: Recommend that the underlined sentence be added to Section 310.15(b)(6) to eliminate confusion in the field being created by Section 336.26 which requires that indoor installations of SE cable be restricted to the ampacity rating of 60°C, which conflicts with the first part of this paragraph.
PANEL ACTION: Accept.
PANEL STATEMENT: Panel recognizes that the submitter is not recommending deletion of the text of 310-15(b)(6) not shown in the proposal. Also, if Panel 7 accepts a similar proposal, then it is not necessary to accept this proposal.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
ZIMNOCH: Type SE cable is constructed from the same insulation and jacket materials as other wire types. Where imbedded in thermal insulation (fiberglass, rock wool, styrofoam, etc.) type SE cables are subjected to the same thermal degradation and rules of physics as other wire and cable types. There is no reason type SE should be subjected to less-stringent requirements.

(Log #4200)

6- 85 - (310-15(b)(6)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
(6) 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. For dwelling units, conductors, as listed in Table 310-15(b)(6), shall be permitted as 120/240-volt, 3-wire, single-phase service-entrance conductors, service lateral conductors, and feeder conductors that serve as ~~the main~~ a principal power feeder to a dwelling unit and are installed in raceway or cable with or without an equipment grounding conductor. For application of this section, ~~the main~~ a principal power feeder shall be ~~the~~ a feeder~~(s)~~ that supplies not less than 40 percent of the line-to-neutral load of a dwelling unit. ~~between the main disconnect and the lighting and appliance branch-circuit panelboard(s), and~~ The feeder conductors to a dwelling unit shall not be required to be larger than their service-entrance conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of Sections 215-2, 220-22, and 230-42 are met.
SUBSTANTIATION: The wording of this section in the 1999 NEC is schizophrenic. It describes "the" main power feeder (emphasis on the singular) as being the "feeder(s)" to the lighting and appliance branch-circuit "panelboard(s)" (emphasis on the possible plural). Many, if not the majority of, dwelling unit 400A services are wired with two 200A panels. Which one is the main one? After three cycles of service on CMP 9 I can assure CMP 6 that almost invariably both panels would have enough small line-to-neutral circuits to qualify as lighting and appliance branch-circuit panelboards, so the distinction in the present Code is one without a difference. This proposal is a constructive attempt to provide more effective language that is consistent with the prior panel intent. The 40 percent parameter should be large enough to assure diversity and yet small enough that the load across two panels need not be balanced exactly.
PANEL ACTION: Reject.
PANEL STATEMENT: The present wording adequately describes the requirement.

COMMENT ON AFFIRMATIVE:
GANATRA: See my Comment on Affirmative on Proposal 6-91.

(Log #2441)

6- 90 - (310-15(b)(7)): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 7 for information.
SUBMITTER: Joseph A. Ross, Ross Electrical Assessments
RECOMMENDATION: Delete Section 310-15(b)(7).
SUBSTANTIATION: Section 310-15(b)(7) first appeared as Note 5 in the 1959 NEC and has remained, essentially, the same since. Section 310-15(b) addresses ampacities for conductors rated 0 to 2000 volts as specified in the Allowable Ampacity Tables 310-16 through 310-19 and Ampacity Tables 310-20 and 310-21 as modified by (b)(1) through (b)(7).
Subsection (b)(7) is not "user friendly" and in its present location offers very little, if anything, to the provisions for determining the allowable ampacities of conductors. The text of subsection (b)(7) relates more to the provisions of Section 330-15 (Terminal Seals) and is better suited and should be relocated to be included in Section 330-15. See companion proposal for the relocation of the text of (b)(7) to Section 330-15.
PANEL ACTION: Accept in Principle.
Panel 6 accepts this recommendation provided that the text of 310-15(b)(7) in its entirety is relocated to Article 330.
PANEL STATEMENT: The relocation of text is appropriate because it deals with installation and uses of Type MI Cable. This text modifies the general requirements for ampacity in Article 310 for specific installation criteria for Type MI Cables.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
GANATRA: See my Comment on Affirmative on Proposal 6-91.

(Log #4306)

6- 91 - (310-15(b)(7)): Accept in Principle in Part
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 1 and 7 for information.
SUBMITTER: L. James Milne, BICCGeneral
RECOMMENDATION: Revise text to read as follows:
(7) Mineral-Insulated, Metal-Sheathed Cable. The temperature limitations on which the ampacities of mineral-insulated, metal-sheathed cable are based shall be determined by the insulating materials used in the end seal. ~~Termination fittings incorporating unimpregnated, organic, insulating materials shall be limited to 90°C (194°F) operation.~~ <u>The conductor temperature at the termination shall not exceed the listed temperature rating of the end seal termination. When mineral insulated cable is bundled in accordance with Section 330-16, ampacities from either Table 310-16 or 310-17 can be used providing the temperature limit of the cable's end termination is not exceeded.</u>
SUBSTANTIATION: This section, essentially unchanged through the 1999 edition, has been in the National Electrical Code since MI cable made its first appearance in the 1953 edition. The substantiating fact finding study performed by Underwriters Laboratories on January 15, 1951 states "The end terminations limit the cable to use in dry locations at 85°C. The end terminations also limit the cable to use in wet locations at 60°C. The cable itself, exclusive of the end terminations, is rated 250°C". Since this inclusion, the temperature rating of the standard terminations has been raised to 90°C, reflecting advances in the materials used in the terminations. This proposal recommends elimination of any reference to the actual temperature limit since, depending on components used, the end seal termination could have a higher or lower temperature limit." The study further states "No long time aging tests were considered necessary to determine the effects a temperature of 250°C would have on the physical properties of the magnesium oxide since this material is produced under a temperature of 1450° to 1500°C. ...Reference to technical literature indicates that up to a temperature of 232°C (450°F) oxidation of copper is not considered a problem. Oxidation above this temperature becomes more serious but at 250°C (482°F) it is generally considered as a superficial tarnish. For these reasons no long time tests on the copper at 250°C were included in the investigation." The relevant page of the fact finding study has been submitted with this proposal.

Since its recognition in the 1953 NEC, there have been literally thousands of installations of single conductor mineral insulated cable sized in accordance with Table 310-17, or its equivalent from the past. The cables have always been bundled, each bundle containing one of each phase conductors and, when required, a neutral. When parallel runs have been necessary, the same bundling has been applied with 2.15 cable diameters between bundles which is consistent with Section 318-11(b)(4).

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept in Principle in Part.

Revise text to read as follows:

"(7) Mineral-Insulated, Metal-Sheathed Cable. The temperature limitations on which the ampacities of mineral-insulated, metal-sheathed cable are based shall be determined by the insulating materials used in the end seal fitting. The conductor temperature at the termination shall not exceed the listed temperature rating of the end seal fitting. When mineral insulated cable is bundled in accordance with 330-16, ampacities from applicable ampacity tables can be used in accordance with 110-14 provided the temperature limit of the cable's end seal fitting is not exceeded."

PANEL STATEMENT: The panel accepts the deleted text in the recommendation. Panel modified the proposed new text to include permitted applications of MI Cables in accordance with various ampacity tables, including tables 310-16 and 310-17. The Panel changed "end seal terminations" to "end seal fittings" and included a reference to 110-14 for added clarity. This proposal is forwarded to Panel 7 in addition to proposal 6-90.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

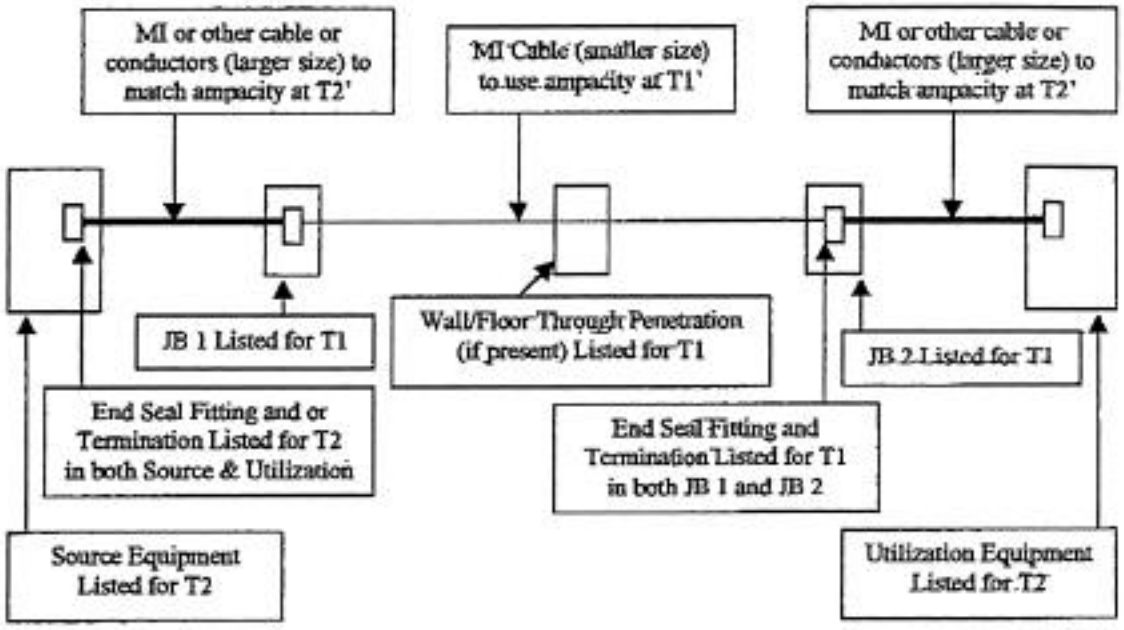
COMMENT ON AFFIRMATIVE:

GANATRA: We believe that the schematic [1] I have provided provides an explanation of the actions by CMP 6, in particular, and by CMP 7 on Proposals, 6-88, 6-89, 6-90, 6-92, 6-93, 6-94, 6-106, 6-113, and 7-82, 7-83, 7-86, and 7-88 for 2002 NEC. Panel Actions by CMP 6 and CMP 7 should be reviewed to avoid an erroneous interpretation that can create confusion regarding the use of excellent thermal properties of MI Cable. Also, at the same time compliance with the requirements of 110-14 shall not be compromised. (See Proposal 1-227).



Ampacity of MI Cable or permitted arrangement of MI Cable (single conductor) between JB 1 and JB 2.

Ampacity shall not exceed, after permitted derating the corresponding ampacity at T1 to comply with the listing requirement of terminations in JB 1 or JB 2 and associated MI Cable End Seal Fittings and any wall or floor through penetrating products, if present, in accordance with 110-14.

Ampacity of MI Cable or permitted arrangement of MI Cable (single conductor) or other conductors or cables between source and JB 1 and JB 2 and utilization:

Ampacity of connected conductors, after permitted derating shall not exceed the corresponding values in Table 310-16 to comply with the requirements of 110-14.

[1] The above schematic is based on "Wire Temperature Termination Requirements Can Be Your Terminator If You Don't Know All the Rules" by Jim Pauley - Square D Company (August 1995 Publication 1001H09301R7/95)

(Log #1987)

6- 92 - (310-15(c)): Reject
SUBMITTER: John E. Conley, Stratford, CT
RECOMMENDATION: Substitute "scientific" for "conductor" in the second line.
SUBSTANTIATION: See the substantiation for proposal on "Ampacity" definitions. The word conductor is redundant because ampacities apply only for conductors by definition.
PANEL ACTION: Reject.
PANEL STATEMENT: Ampacity values provided in the tables (which utilize ampacities versus allowable ampacities) are no less or no more scientific than the calculated ampacity in accordance with 310-15(c). Substantiation, provided with the proposed definition in Proposal 1-101, does not provide any evidence of the problem with the use of ampacity values provided in various tables (which utilize ampacities versus allowable ampacities) or calculated in accordance with 310-15(c).

(Log #806)

6- 96 - (Table 310-16): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise ampacity figures for No. 14, 12, and 10 conductors to values shown in the 1978 code.
SUBSTANTIATION: Table 310-16 ampacities for No. 14, 12, and 10 conductors were revised in the 1981 code with an obelisk note indicating load current rating and overcurrent protection shall not exceed 15, 20, and 30-amperes, respectively for copper, and 15 and 25-amperes, respectively, for aluminum (now Section 240-3(d)). The apparent benefit or result was to allow the increased ampacities to offset derating factors while maintaining previous allowable load currents. Higher ampacities only for derating purposes are not provided for other conductor sizes, and if these smaller sizes of conductors are only suitable for lower currents as limited by Section 240-3(d) without any derating, how can they be suitable for the same current where derating is required?

Proposal 6-81 in the 1986 TCR resulted in the addition of "unless otherwise specifically permitted elsewhere in this code" to the note presumably to allow for higher overcurrent protection ratings, such as permitted for motors. Article 430 is not "specific" relating to these conductor sizes, but indirect, by requiring minimum conductor ampacity and maximum overcurrent device ratings. "Specifically permitted" appears to apply only to sections such as 240-3(a); 240-21; 460-8; and 668-30(d); Article 630 and the like.

Proposal is based on the premise that overcurrent protection (overload, short-circuit, ground-fault) protection is technically only achieved where the overcurrent device is located at the point of supply for conductors.

No. 14 copper supply conductors to a building, supplied from an outside panelboard and with overcurrent protection rated at 15 amperes could supply a 15-ampere load; the same conductors tapped from an outside feeder or transformer secondary (any rating) without overcurrent protection at the tap, could terminate at a single overcurrent device rated 20-amperes and supply a 20-ampere load, an increase of 33-1/2 percent (the No. 14 conductors are a feeder size not governed by Section 215-21(a)). This scenario could be applied to similar installations where the higher ampacity is permitted.

The added hazards of conductors without overcurrent protection at their point of supply is exacerbated where higher ampacities are also permitted without length restrictions or conductor size/ampacity ratios.

The present Section 240-3(d) in effect negates any slight ampacity increase permitted by an ambient temperature of 21°-25°C. The small increases, whereby Section 240-3(b) could be used, is in conflict with Section 240-3(d). Those could be critical factors in borderline installations underground or in controlled temperature environments judged to be 21°C - 25°C.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter did not provide any data or technical information to substantiate a change in the existing requirement.

6- 97 - (Table 310-16): Reject
SUBMITTER: William J. Tipton, I.B.E.W. Local 575
RECOMMENDATION: Return Table 310-16 to its 1996 format.
SUBSTANTIATION: In the 1996 Code the obelisk (†) beside the ampacities rating for 14, 12, and 10 was referenced at the bottom of page where most people read the information. In the 1999 Code the use of an asterisk and only an article reference at the bottom of the page, and even the reference is not specific it should read 240-3D, some people will not look it up and therefore conductors will not be properly protected.
PANEL ACTION: Reject.
PANEL STATEMENT: The present Code has the requirements in the correct location.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

(Log #1710)

6- 98 - (Table 310-16): Reject
SUBMITTER: Ray C. Mullin, Ray C. Mullin Books
RECOMMENDATION: In the 75°C column, change the ampacity of 500 kcmil from ~~380~~ amperes to 400 amperes.
SUBSTANTIATION: Some inspectors have been accepting 500 kcmil copper conductors as 400 ampere conductors for years. For example, a 1,200 ampere service would consist of three 500 kcmil copper conductors per phase...a 1,600 ampere service would consist of four 500 kcmil copper conductors per phase.
In Table 310-16:

Conductor Size	Circular Mils	Ampacity	Comments
3	52,620	100	
3/0	167,800	200	2X the ampacity of a No. 3 and 3≠X the circular mil area.
500 kcmil	500,000	380	Not quite 4X the ampacity of a No. 3 and approximately 10X the circular mil area.

Because of the great load diversity in services and feeders, I sincerely believe that changing the allowable ampacity of a 500 kcmil from 380 to 400 would not compromise the current carrying ability of a service or feeder.
The multiple of 400 would make it extremely easy to determine conductor sizes for 1,200, 1,600, 2,000, and larger ampere rated services.
A precedent is already in place in Section 310-15(b)(6) for single-phase, residential services.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter did not provide any data to substantiate the recommendation.

(Log #2442)

6- 106 - (Table 310-17): Reject
SUBMITTER: Joseph A. Ross, Ross Electrical Assessments
RECOMMENDATION: Delete "MI" from the 90°C (copper) column of Table 310-17.
SUBSTANTIATION: According to the provisions of Section 330-16, "Where single conductor (Type MI) cables are used, all phase conductors and, where used, the neutral conductor shall be grouped together to minimize induced voltage on the sheath." Though it is common practice to space polymeric single-conductor cables, it is not acceptable to space Type MI/MS single-conductor cables. They must be grouped (i.e., without spacing); and, according to the provisions of Section 330-12(1), they shall be "securely supported at intervals not exceeding 6 ft by straps, staples, hangers, or similar fittings." Grouped and securely supported every 6 ft do not qualify a single conductor in free air.
As MI presently appears in Table 310-17 would tend to lead users of the Code to believe that Type MI single-conductor cable can be run in free air without being grouped or supported and used at the Table 310-17 ampacities. Type MI cable is presently listed in the 90°C (copper) column of Table 310-16, and rightfully so.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirements for grouping and other installation limitations are addressed in the Code. This proposal should be forwarded Panel 7 for reference only. See panel action on Proposal 6-91 for further information.

(Log #21)

6- 110 - (Table 310-20): Accept in Principle
NOTE: The following proposal consists of Comment 6-54 on Proposal 6-50 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 6-50 was:
The Technical Correlating Committee has agreed that this proposal be submitted to the Panel as a public proposal.
Revise as follows:
310-15. Ampacities for Conductors Rated 0–2000 Volts.
(a) General.

(1) Tables or Engineering Supervision. Ampacities for conductors shall be permitted to be determined by tables or under engineering supervision, as provided in (b) and (c) below.

(FPN No. 1): Ampacities provided by this section do not take voltage drop into consideration. See Section 210-19(a), FPN No. 4, for branch circuits and Section 215-2(b), FPN No. 2, for feeders.

(FPN No. 2): For the allowable ampacities of Type MTW wire, see Table 11 in the Electrical Standard for Industrial Machinery, NFPA 79-1994.

(2) Selection of Ampacity. Where more than one calculated or tabulated ampacity could apply for a given circuit length, the lowest value shall be used.

Exception: Where two different ampacities apply to adjacent portions of a circuit, the higher ampacity shall be permitted to be used beyond the point of transition, a distance equal to 10 ft (3.05 m) or 10 percent of the circuit length figured at the higher ampacity, whichever is less.

(FPN): See Section 110-14(c) for conductor temperature limitations due to termination provisions.

(b) Tables. Ampacities for conductors rated 0 to 2000 volts shall be as specified in the Allowable Ampacity Tables 310-16 through 310-19 as modified by (1) through (7) below.

(FPN): Tables 310-16 through 310-19 are application tables for use in determining conductor sizes on loads calculated in accordance with Article 220. Allowable ampacities result from consideration of one or more of the following:

1. Temperature compatibility with connected equipment, especially at the connection points
2. Coordination with circuit and system overcurrent protection
3. Compliance with the requirements of product listings or certifications. See Section 110-3(b)
4. Preservation of the safety benefits of established industry practices and standardized procedures

(1) General. For explanation of type letters used in tables and for recognized sizes of conductors for the various conductor insulations, see Section 310-13. For installation requirements, see Sections 310-1 through 310-10 and the various articles of this Code. For flexible cords, see Tables 400-4, 400-5(A), and 400-5(B).

(2) Adjustment Factors.

a. More than Three Current-Carrying Conductors in a Raceway or Cable. Where the number of current-carrying conductors in a raceway or cable exceeds three, or where single conductors or multiconductor cables are stacked or bundled longer than 24 in. (610 mm) without maintaining spacing and are not installed in raceways, the allowable ampacity of each conductor shall be reduced as shown in Table 310-15(b)(2).

Table 310-15(b)(2). Adjustment Factors for More than Three Current-Carrying Conductors in a Raceway or Cable.

Number of Current-Carrying Conductors	Percent of Values in Tables 310-16 through 310-19 as Adjusted for Ambient Temperature if Necessary
4 through 6	80
7 through 9	70
10 through 20	50
21 through 30	45
31 through 40	40
41 and above	35

(FPN): See Appendix B, Table B-310-11, for adjustment factors for more than three current-carrying conductors in a raceway or cable with load diversity.

Exception No. 1: Where conductors of different systems, as provided in Section 300-3, are installed in a common raceway or cable, the derating factors shown in Table 310-20 shall apply to the number of power and lighting (Articles 210, 215, 220, and 230) conductors only.

Exception No. 2: For conductors installed in cable trays, the provisions of Section 318-11 shall apply.

Exception No. 3: Derating factors shall not apply to conductors in nipples having a length not exceeding 24 in. (610 mm).

Exception No. 4: Derating factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit, or rigid nonmetallic conduit having a length not exceeding 10 ft (3.05 m) and the number of conductors does not exceed four.

b. More than One Conduit, Tube, or Raceway. Spacing between conduits, tubing, or raceways shall be maintained.

(3) Bare or Covered Conductors. Where bare or covered conductors are used with insulated conductors, their allowable ampacities shall be limited to those permitted for the adjacent insulated conductors.

(4) Neutral Conductor.

a. A neutral conductor that carries only the unbalanced current from other conductors of the same circuit ~~need not~~ shall not be required to be counted when applying the provisions of Section 310-15(b)(2). [minor editorial rewording]

b. In a 3-wire circuit consisting of two phase wires and the neutral of a 4-wire, 3-phase wye-connected system, a common conductor carries approximately the same current as the line-to-neutral load currents of the other conductors and shall be counted when applying the provisions of Section 310-15(b)(2).

c. On a 4-wire, 3-phase wye circuit where the major portion of the load consists of nonlinear loads, harmonic currents are present in the neutral conductor; the neutral shall therefore be considered a current-carrying conductor. [minor rewording for editorial clarity]

(5) Grounding or Bonding Conductor. A grounding or bonding conductor shall not be counted when applying the provisions of Section 310-15(b)(2).

(6) 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. For dwelling units, conductors, as listed in Table 310-15(b)(6), shall be permitted as 120/240-volt, 3-wire, single-phase service-entrance conductors, service lateral conductors, and feeder conductors that serve as the main power feeder to a dwelling unit and are installed in raceway or cable with or without an equipment grounding conductor. For purposes of this section, the feeder conductors to a dwelling unit shall not be required to be larger than its service-entrance conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of Sections 215-2, 220-22, and 230-42 are met.

Table 310-15(b)(6). Conductor Types and Sizes for 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. RH-RHH-RHW-THHW-THW-THWN-THHN-XHHW-USE

Copper AWG	Aluminum or Copper-Clad Aluminum AWG	Service or Feeder Rating Amperes
4	2	100
3	1	110
2	1/0	125
1	2/0	150
1/0	3/0	175
2/0	4/0	200
3/0	250 kcmil	225
4/0	300 kcmil	250
250 kcmil	350 kcmil	300
350 kcmil	500 kcmil	350
400 kcmil	600 kcmil	400

(7) Mineral-Insulated, Metal-Sheathed Cable. The temperature limitations on which the ampacities of mineral-insulated, metal-sheathed cable are based ~~is~~ shall be determined by the insulating materials used in the end seal. Termination fittings incorporating unimpregnated, organic, insulating materials ~~are~~ shall be limited to 90°C (194°F) operation. [minor editorial rewording]

(c) Engineering Supervision. Under engineering supervision, conductor ampacities shall be permitted to be calculated by means of the following general formula:

$$I = \sqrt{\frac{TC - (TA + DELTA\ \ TD)}{RDC(1 + YC)RCA}}$$

Where:
TC = Conductor temperature in degrees C
TA = Ambient temperature in degrees C
DELTA TD = Dielectric loss temperature rise
RDC = DC resistance of conductor at temperature TC
YC = Component ac resistance resulting from skin effect and proximity effect
RCA = Effective thermal resistance between conductor and surrounding ambient

(FPN): See Appendix B for examples of formula applications

TABLES 310-16 THROUGH 310-19 HERE
to be inserted here

The only modifications to the tables are as follows:

1. Remove the text after the obelisk note at the bottom of Table 310-16 and 310-17 and replace with "See Section 240-3". Apply the obelisk symbol to the #14, #12 and #10 in both Column 1 and Column 8 in Table 310-16 and 17. The proposal for 240-3 would place the overcurrent limitations presently in the obelisk to all #14, #12 and #10 conductors except as permitted in the balance of Section 240-3.

2. Remove the obelisk symbol on all of the conductor insulations in Tables 310-16 and 310-17. The rational for this change is that the rule needs to be applicable to all of the insulation types for #14, #12 and #10. Attempting to spare a few insulations like ZW-2, SA, SIS and TBS is leading to more confusion than help.

310-60. Conductors Rated 2001–35,000 Volts.

(a) Definitions

Electrical Ducts: As used in Article 310, electrical ducts shall include any of the electrical conduits recognized in Chapter 3 as suitable for use underground; and other raceways round in cross section, listed for underground use, embedded in earth or concrete.

Thermal Resistivity: As used in this Code, refers to the heat transfer capability through a substance by conduction. It is the reciprocal of thermal conductivity and is designated Rho and expressed in the units °C-cm/watt.

TABLES 310-61 THROUGH 310-64 TO BE INSERTED HERE
THESE TABLES ARE NOT MODIFIED

(b) Ampacities of Conductors Rated 2,001-35,000 volts. Ampacities for solid dielectric-insulated conductors shall be permitted to be determined by tables or under engineering supervision, as provided in (c) and (d) below.

(1) Selection of Ampacity. Where more than one calculated or tabulated ampacity could apply for a given circuit length, the lowest value shall be used.

Exception: Where two different ampacities apply to adjacent portions of a circuit, the higher ampacity shall be permitted to be used beyond the point of transition, a distance equal to 10 ft (3.05 m) or 10 percent of the circuit length figured at the higher ampacity, whichever is less.

(FPN): See Section 110-40 ~~110-14(c)~~ for conductor temperature limitations due to termination provisions.

(c) Tables. Ampacities for conductors rated 2,001 to 35,000 volts shall be as specified in the Allowable Ampacity Tables 310-67 ~~310-69~~ through 310-86. Ampacities at ambient temperatures other than those shown in the tables shall be determined by the formula in (4) below.

(FPN No. 1): For ampacities calculated in accordance with Section 310-15(a), reference IEEE/ICEA "Power Cable Ampacities," Vol. I and II (IPCEA Pub. No. P-46-426) and the "References" therein for availability of all factors and constants.

(FPN No. 2): Ampacities provided by this section do not take voltage drop into consideration. See Section 210-19(a), FPN No. 4, for branch circuits and Section 215-2(b), FPN No. 2, for feeders.

(1) Grounded Shields. Ampacities shown in Tables 310-69, 310-70, 310-81, and 310-82 are for cable with shields grounded at one point only. Where shields are grounded at more than one point, ampacities shall be adjusted to take into consideration the heating due to shield currents.

(2) Burial Depth of Underground Circuits. Where the burial depth of direct burial or electrical duct bank circuits is modified from the values shown in a figure or table, ampacities shall be permitted to be modified as indicated in a. and b. below.

a. Where burial depths are increased in part(s) of an electrical duct run, no decrease in ampacity of the conductors is needed, provided the total length of parts of the duct run increased in depth to avoid obstructions is less than 25 percent of the total run length.

b. Where burial depths are deeper than shown in a specific underground ampacity table or figure, an ampacity derating factor of 6 percent per increased ft (305 mm) of depth for all values of Rho ~~can~~ shall be permitted ~~to be utilized~~. [editorial change]

No rating change is needed where the burial depth is decreased.

(3) Electrical Ducts in Figure 310-60 ~~310-1~~.

~~Spacings between electrical ducts (raceways) as shown in Figure 310-1 shall be permitted to be less than as specified in Figure 310-1, where ducts (raceways) enter equipment enclosures from underground, without reducing the ampacity of conductors contained within such ducts (raceways).~~ [remove this text and reword as shown below. The term (raceway) is not needed since the definition of electrical duct is provided in 310-60(a) - editorial only]

At locations where electrical ducts enter equipment enclosures from underground, spacing between such ducts, as shown in Figure 310-60, shall be permitted to be reduced without requiring the ampacity of conductors therein to be reduced.

(4) Ambients Not in Tables. Ampacities at ambient temperatures other than those shown in the tables shall be determined by means of the following formula:

$$I_2 = I_1 \sqrt{\frac{TC - TA_2 - DELTA\ \ TD}{TC - TA_1 - DELTA\ \ TD}}$$

Where:

I_1 = Ampacity from tables at ambient TA_1

I_2 = Ampacity at desired ambient TA_2

TC = Conductor temperature in degrees C

TA_1 = Surrounding ambient from tables in degrees C

TA_2 = Desired ambient in degrees C

DELTA TD = Dielectric loss temperature rise

(FPN): For ampacities calculated in accordance with the above formula, reference IEEE/ICEA "Power Cable Ampacities," Vol. I and II (IPCEA Pub. No. P-46-426) and the "References" therein for availability of all factors and constants.

(d) Engineering Supervision. Under engineering supervision, conductor ampacities shall be permitted to be calculated by means of the following general formula:

$$I = \sqrt{\frac{TC - (TA + DELTA\ \ TD)}{RDC(1 + YC)RCA}}$$

Where:

TC = Conductor temperature in degrees C

TA = Ambient temperature in degrees C

DELTA TD = Dielectric loss temperature rise

RDC = DC resistance of conductor at temperature TC

YC = Component ac resistance resulting from skin effect and proximity effect

RCA = Effective thermal resistance between conductor and surrounding ambient

(FPN): See Appendix B for examples of formula applications

Figure 310-1	Figure 310-60

SUBMITTER: Bob Macfarlane, McLean, VA
RECOMMENDATION: Add title "Ambient Temperature Adjustment Factors" between the two tables contained in referenced table.
SUBSTANTIATION: A title before the second table would alert users that there are actually two tables in Table 310-20. Presently, the tables are run together. There are already titles before the second tables found in Tables 310-16 through 310-19, so this change would make the format consistent. The proposed title is consistent with my recommended revision of the title "Correction Factors" between the two tables contained in each Table 310-16 through 310-19.
PANEL ACTION: Accept in Principle.
In the recommendation, replace "Ambient Temperature Adjustment Factors" with "Correction Factors".
PANEL STATEMENT: The portion of the heading addressed in the recommendation for Table 310-20 should match the similar portion of the heading for Tables 310-16 through 310-19.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3108)

6- 111 - (Table 310-20): Accept
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Delete Type RH from the second and fourth columns of the table heading.
SUBSTANTIATION: Underwriters Laboratories canvassed subscribers of Thermoset-Insulated Wires and Cables, UL 44. It was determined that Type RH insulated conductor is no longer being produced.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3139)

6- 112 - (Table 310-20): Accept in Principle
SUBMITTER: Jeff Palovich, Flint, MI
RECOMMENDATION: In the title of the table insert the word <u>one</u> before the word two so it reads as follows:
"Ampacity of <u>One,</u> Two or Three..."
SUBSTANTIATION: This table should also apply to duplex cable as well as triplex and quadraplex.
PANEL ACTION: Accept in Principle.
Change title to read as follows:
"Table 310-20. Ampacities of Insulated Conductors, Rated 0 Through 2000 Volts, Not More than Three Single Current-Carrying Conductors Supported on a Messenger, Based on Ambient Air Temperature of 40°C (104°F)"
PANEL STATEMENT: This revision better meets the intent of submitter and is more consistent with other ampacity table titles.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4201)

6- 113 - (Table 310-20): Accept
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 7-88. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Insert "MI" into the 90°C copper column.
SUBSTANTIATION: Section 321-3(a) expressly allows Type MI cable on a messenger. This table looks like the appropriate place to cover the ampacity of this wiring system, but there needs to be an express reference that installers can point to in order to achieve consistency of enforcement.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
GANATRA: See my Comment on Affirmative on Proposal 6-91.

(Log #CP601)

6- 113a - (Table 310-21): Accept
SUBMITTER: CMP 6
RECOMMENDATION: Reverse the order of inch-pound and SI units for the wind velocity.
SUBSTANTIATION: See substantiation for Proposal 6-27.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #808)

6- 114 - (Table 310-21): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise heading:
Ampacities of Bare ~~Covered~~ Conductors <u>in Free Air,</u> Based on 40°C (104°F) Ambient, 80°C (176°F) Total Conductor Temperature, 2 ft/sec (610 mm/sec.) wind velocity.
Delete all references to covered conductors in the table.
SUBSTANTIATION: It is assumed this table applies to single conductors in free air, although not specified. The code does not indicate a temperature rating of covered conductors nor any data relative to material covering, sunlight resistance, wet location use, etc. A covered conductor (per definition) does not appear to be a listed product. It is somewhat puzzling that a covered conductor is higher ampere rated than a bare conductor of the same size and material. A covering, (presumed to be nonmetallic) does not normally have greater heat-dissipating qualities than a bare conductor.
PANEL ACTION: Accept in Principle.
Add "or covered" in the first line of the recommendation.
PANEL STATEMENT: Typically, the covering provides circuit protection from momentary contacts with other conductors or trees and corrosion resistance in certain environments. Covered conductors are to be installed on insulators.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3153)

6- 115 - (Table 310-22): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with Table 310-16. This proposal will be referred to Code Making Panel 7 for information. This action will be considered by the Panel as a Public Comment.
SUBMITTER: John Lewellyn, Montrose, MI
RECOMMENDATION: Move Table B-310-3 to Section 310-15 as new Table 310-22.
SUBSTANTIATION: The table for determination of ampacity of large size multiconductor cables needs to be in Section 310-15 so it is available for use. Electrical contractors are experiencing installations on a frequent basis where they are installing large size multiconductor cables. They need a table available for this purpose, and inspectors need a table readily available to use to determine if the ampacity has been selected properly. This table is referenced in a fine print note in Section 318-11.
PANEL ACTION: Accept in Principle.
Replace the existing note below the existing Table B-310-3 with "See 240-3(d)" and delete all of the existing asterisks. Delete wire

sizes 18,16, and 14 from column 10. Add asterisks to columns number 1 and 10 for wire sizes 14,12, and 10.
PANEL STATEMENT: See panel action on Proposal 6-6. The panel desires that the new Tables 310-21 and 310-22 in the same format as Tables 310-16 and 310-17.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1240)

6- 116 - (Figure 310-60): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Change dimensions in Figure 310-60 to read as follows:
~~7.5 in.~~ 190 mm (7.5 in.)
~~11.5 in. x 11.5 in.~~ 290 x 290 mm (11.5 in. x 11.5 in.)
~~19 in. x 19 in.~~ 475 x 475 mm (19 in. x 19 in.)
~~19. in. x 27 in~~ 475 x 675 mm (19 in. x 27 in.)
~~27 in. x 27 in.~~ 675 x 675 mm (27 in. x 27 in.)
~~27 in. x 11.5 in.~~ 675 x 290 mm (27 in. x 11.5 in.)
~~27 in. x 19 in.~~ 675 x 475 mm (27 in. x 19 in.)
~~24 in.~~ 600 mm (24 in.)
Change dimensions in Note 1 in Figure 310-60 to read as follows:
Note 1: ~~30 in.~~ 750 mm (30 in.)
Note 1: ~~36 in.~~ 900 mm (36 in.)
Delete Note 2 in Figure 310-60.
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept.

(Log #3619)

6- 121 - (Table 310-61): Reject
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Add an additional type of conductor to this Table 310-61.

Table 310-61. Conductor Application and Insulation

Trade Name	Type Letter	Maximum Operating Temperature	Application Provision	Insulation	Outer Covering
Gas Tube and Ignition Cable	GTO**	105°C	Dry or wet locations rated 2001 volts and higher	Thermoplastic	None or Jacket sheath

**Type GTO cable shall be restricted to a maximum ampacity of 300 milliamperes where installed for the secondary circuit conductors as required by Section 600-23(d).

Rest of section to remain as stated now in this table.
SUBSTANTIATION: Problem: Article 600 refers to a GTO Type of cable that has no reference in Article 310 and no one really knows what this conductor is.
Substantiation: This Type conductor which is a high voltage application cable is and has been used by the Sign industry for many years.
This Conductor is and has been listed by NRTLs for many years under UL Standard 814. The Code has never defined Type GTO cable in Article 310 leaving confusion within the inspection community.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 6-40.

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.

A "soft" conversion is necessary to conform to U.S. industry practice and applicable product standards.

PANEL ACTION: Accept.

(Log #587)

6- 125 - (Table 310-64 Note 3 (New)): Reject

SUBMITTER: Raafat Mounib, Al-Hejailan Consultants

RECOMMENDATION: New text to read as follows:

173 Percent Insulation Level. Cables in this category shall be permitted to be applied where the clearing time requirements of the 133 percent level category cannot be met, and yet there is adequate assurance that the faulted section will be de-energized in time exceeding (one) hour.

SUBSTANTIATION: Cable Strength:

173% IL (Percent Insulation Level): Generally used in refineries or in critical areas, where it is required to operate cable longer than one hour continuously with one phase conductor grounded. These types of cables (173% IL) are available now and have been used in success in Ras-tanura Refinery (biggest refinery in Saudi Arabia) since May 1996.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter did not provide any technical substantiation for the recommendation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

FRIEDMAN: The proposal should have been Accepted in Principle.

Some suggested wording that would address the submitter's concern is:

"173 Percent Insulation Level. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons will service the installation, cables in this category shall be permitted to be applied in situations where the clearing time requirements of the 133 percent level category cannot be met, and yet there is adequate assurance that the faulted section will be de-energized in an orderly shutdown. Also, they shall be permitted to be used where additional insulation strength over the 133 percent level category is desirable."

The revised text specifically address the submitter's concern regarding the need of continuous process industries such as petrochemical plants and pulp and paper facilities to continue to operate with one phase conductor grounded until an orderly shutdown can be accomplished, which may take more than one hour. The 173 percent insulation level has been defined in ICEA standards for many years.

ZIMNOCH: Cables with a 173 percent insulation level have been produced and used in the US and abroad in the past for industrial customers. They are used on ungrounded delta systems where the time to de-energize a grounded section is indefinite. Their use is also recommended for resonant grounded systems. This level is also used when an increased level of confidence (insulation thickness) is desired.

ICEA and AEIC currently recognize 173 percent insulation level.

COMMENT ON AFFIRMATIVE:

GANATRA: I am voting to support Panel action to reject this proposal with following the comment. The proposal has a possible application in industrial establishments and it could be accepted. Suggested wording could be: "173 Percent Insulation Level. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons

will service the installation, cables in this category shall be permitted to be applied in situations where the clearing time requirements of the 133 percent level category cannot be met, and yet there is adequate assurance that the faulted section will be de-energized in an orderly shutdown."

Appropriate thickness values should be added to the applicable tables.

The revised text could address the submitter's concern regarding the need of continuous processes in industrial facilities such as petrochemical plants and pulp and paper facilities to continue to operate with one phase conductor grounded until an orderly shutdown can be accomplished, which may take more than one hour. The 173 percent insulation level has been defined in ICEA standards for many years.

ARTICLE 318 — CABLE TRAYS

(Log #1276)

8- 11 - (318): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise as follows:
Article 318 - Cable Trays
318 - 3 (b) (1) (a) Single conductor cable shall be No. 1/0 or larger and shall be of a type listed and marked on the surface for use in cable trays. Where Nos. 1/0 through 4/0 single conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be ~~9 in. (229 mm).~~ 230 mm (9 in.). Where exposed to direct rays of the sun, cables shall be identified as being sunlight resistant.
318 - 6 (a) Complete System. Cable trays shall be installed as a complete system. Field bends or modifications shall be made so that the electrical continuity of the cable tray system and support for the cables shall be maintained. Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment. The system shall provide for the support of the cables in accordance with their corresponding articles.
Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceways or to equipment where the conductors are terminated, the support distance between cable trays or between the cable tray and the equipment shall not exceed ~~6 ft (1.83 m).~~1.8 m (6 ft). The conductors shall be secured to the cable tray(s) at the transition and they shall be protected, by guarding or by location, from physical damage.
A bonding jumper sized in accordance with Section 250-102 shall connect the two sections of cable tray, or the cable tray and the raceway or equipment. Bonding shall be in accordance with Section 250-96.
318 - 6 (j) Raceways, Cables, and Outlet Boxes Supported from Cable Trays. In industrial facilities where conditions of maintenance and supervision ensure only qualified persons will service the installation and where cable trays are designed to support the load, raceways, cables, and outlet boxes shall be permitted to be supported from cable trays. For raceway terminating at the tray, a listed cable tray clamp or adapter shall be used and no nearby support, such as a support within ~~3 ft (914 mm)~~ 900 mm (3 ft), shall be required.
For raceway or cable running parallel to, but under or beside, a tray, support shall be in accordance with the requirements of the appropriate raceway or cable article.
For outlet boxes located under or beside a tray, support shall be in accordance with the requirements of Article 370.
318 - 9 (b) Multiconductor Control and/or Signal Cables Only. Where a ladder or ventilated trough cable tray, having a usable inside depth of ~~6 in. (152 mm)~~150 mm (6 in.) or less, contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray. A depth of ~~6 in. (152 mm)~~150 mm (6 in.) shall be used to compute the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than ~~6 in. (152 mm)~~150 mm (6 in.).
318 - 9 (d) Solid Bottom Cable Tray - Multiconductor Control and/or Signal Cables Only. Where a solid bottom cable tray, having a usable inside depth of ~~6 in. (152 mm)~~150 mm (6 in.) or less, contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray. A depth of ~~6 in. (152 mm)~~150 mm (6 in.) shall be used to compute the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than ~~6 in. (152 mm)~~150 mm (6 in.).
318 - 10 (b) Ventilated Channel Cable Trays. Where 75 mm (3 in.) ~~3 in. (76 mm)~~, 100 mm (4 in.) ~~4 in. (102 mm)~~, or 150 mm (6 in.) ~~6 in. (152 mm)~~ wide ventilated channel cable trays contain single conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.
318 - 11 (a) (2) Where cable trays are continuously covered for more than 1.8 m (6 ft) ~~6 ft (1.83 m)~~ with solid unventilated covers, not over 95 percent of the allowable ampacities of Tables 310-16 and 310-18 shall be permitted for multiconductor cables.
318 - 11 (b) (1) Where installed according to the requirements of Section 318-10, the ampacities for 600 kcmil and larger single conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Tables 310-17 and 310-19. Where cable trays are continuously covered for more than 1.8 m (6 ft)~~6 ft (1.83 m)~~ with solid unventilated covers, the ampacities for 600 kcmil and larger cables shall not exceed 70 percent of the allowable ampacities in Tables 310-17 and 310-19.
318 - 11 (b) (2) Where installed according to the requirements of Section 318-10, the ampacities for No. 1/0 through 500 kcmil single conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Tables 310-17 and 310-19. Where cable trays are continuously covered for more than 1.8 m (6 ft)~~6 ft (1.83 m)~~ with solid unventilated covers, the ampacities for No. 1/0 through 500 kcmil cables shall not exceed 60 percent of the allowable ampacities in Tables 310-17 and 310-19.
318 - 13 (a) (1) Where cable trays are continuously covered for more than 1.8 m (6 ft)~~6 ft (1.83 m)~~ with solid unventilated covers, not more than 95 percent of the allowable ampacities of Tables 310-75 and 310-76 shall be permitted for multiconductor cables.
318 - 13 (b) (1) The ampacities for Nos. 1/0 and larger single conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Tables 310-69 and 310-70. Where the cable trays are covered for more than 1.8 m (6 ft)~~6 ft (1.83 m)~~ with solid unventilated covers, the ampacities for Nos. 1/0 and larger single conductor cables shall not exceed 70 percent of the allowable ampacities in Tables 310-69 and 310-70.
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis.
In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised.
In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel directs staff to correct 230 mm to 225 mm in the second sentence of the proposal. This reflects the hard conversion value for 9 inches in the directive from the NEC TCC. This value also reflects the use of 225 mm in product standards.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 2
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
LINDSAY: I acknowledge the incentive to "metricate" the National Electrical Code is so that it will be more user friendly in other countries and for harmonization with other international standards. However, I do not think it is necessary to make the transition for the 2002 cycle. I vote negative to the proposals developed by the Metrication Task Group, primarily for the following reasons:
Usability - In consideration of the end users of the code, such as inspectors, electricians, technicians, and contractors, I think these proposals will make the NEC less user friendly than if the

metrication issues were left as they currently exist in the code. The vast majority of these users do not need the SI units, and certainly do not want them to replace the English units that they will continue to use. I would suggest that these individuals would be close to unanimous in their desire to leave the code in its current form relative to metrication issues.

Enforcement - Enforcement of the different measurements or sizes will certainly present problems. Even though the Metrication Task Group and Code Making Panel members agree that either of the units of measurement is acceptable, the authority having jurisdiction may decide that one is preferable to the other.

Urgency - I do not share the same sense of urgency for adoption of SI units that the Metrication Task Group proposes. I do not think any harm would result if reviewed for a code cycle or two.

LOYD: I agree with Mr. Lindsay's negative comment. In addition, although I support the international use of the NEC, the addition of metric first with in./lb. units in parentheses will apparently not be the only version of the Code that NFPA will have to print. For example, Mexico will not accept dual measurements; it will accept metric only.

The Federal Government has also backed off rom its mandate that all federal construction projects have to be in metric.

UL's written policy on metrication states that for U.S. based standards, the base unit is in.-pounds with SI units in soft converson in parentheses. The installation code that governs the installation of these products should reflect the units of measurement shown in the product standards.

If this proposal is accepted, the same in.-pound unit could be expressed in different metric conversions leading to confusion. The Task Group on metrication allows soft conversions for dimensions where safety issues would be a factor or where industry policy so dictates. Other dimensions are being converted using hard metric. As a result, a 10 ft unit will be expressed either as 3m (10 ft) or 3.05m (10 ft).

(Log #2936)

8- 12 - (318-1): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: After the words, "solid bottom", insert the words "single rail, wire mesh".

New wording should read:

"solid bottom center rail, wire basket, and other structures."

SUBSTANTIATION: Single rail and wire basket are new types of cable tray manufactured and used for many applications. They should be added for completeness.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided technical substantiation to support the addition of these types of cable trays. There are issues such as cable tray fill, support (318-6(j)) and types of wiring systems permitted that are not addressed in the proposal.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry
COMMENT ON AFFIRMATIVE:
GRIFFITH: The two types of cable tray the submitter proposes to add to 318-1 are widely used overseas and are appearing with increasing frequency in the U.S. (see photos provided for multiple examples.) Rules for application are, therefore, needed in the code and the panel is urged to recognize these systems should reasonable support and a basis to do so be provided during the comment period.

Note: Supporting material is available for review at NFPA Headquarters.

(Log #2449)

8- 13 - (318-2-Cable Tray Systems): Reject
SUBMITTER: John A. Hoffman, Centre Region Code Admin.
RECOMMENDATION: Revise as follows:

A unit or assembly of units or sections and associated fittings forming a rigid structure system used to securely fasten or support conductors, cables, and raceways.

SUBSTANTIATION: This change reflects that cable tray systems are not limited to support of cables and raceways. Cable tray systems are also permitted to support conductors when installed in accordance with 318-3(b)(1).
PANEL ACTION: Reject.
PANEL STATEMENT: The present definition adequately describes the types of wiring methods that are permitted to be supported by a cable tray. Cable trays are permitted to support single conductors only within industrial establishments.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1840)

8- 14 - (318-3): Accept in Principle
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise 318-2 as follows:

318-3. Uses Permitted. Cable tray installations shall not be limited to industrial establishments.

Where exposed to direct rays of the sun, conductors and cables shall be identified as being sunlight resistant.

(a) Wiring Methods. (No change)

(b) In Industrial Establishments. The wiring methods in Section 318-3(a) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons will service the installed cable tray system ~~any of~~ the cables in (1) and (2) shall also be permitted to be installed in ladder, ventilated trough, or ventilated channel cable trays.

(1) Single Conductors. Single conductors ~~cables~~ shall be permitted to be installed in accordance with the following.

(a) Single conductor cable shall be No. 1/0 or larger and shall be of a type listed and marked on the surface for use in cable trays. Where Nos. 1/0 through 4/0 single conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 9 in. (229 mm). ~~Where exposed to direct rays of the sun, cables shall be identified as being sunlight resistant.~~

(b) Welding cables shall comply with the provisions of Article 630, Part D.

(c) Single conductors used as equipment grounding conductors shall insulated, covered, or bare and they shall be No. 4 or larger.

~~(2) Multiconductor. Multiconductor cables, Type MV (Article 326) where exposed to direct rays of sun, shall be identified as being sunlight resistant.~~

Medium Voltage. Single and multiconductor Type MV cable. Single conductors shall be installed in accordance with 318-3(b)(1).

SUBSTANTIATION: The requirement that conductors or cables exposed to the sun must be identified as sunlight resistant is not limited to just industrial establishments; it applies regardless of the type of occupancy.

To clarify that in addition to the cables listed in 318-3(a), single conductors (600V and 2000V) and Type MV (5000V and higher) single conductors and multiconductor cables can also be installed in cable tray in industrial establishments.
PANEL ACTION: Accept in Principle.
Revise 318-3 as follows:

"318-3. Uses Permitted. Cable tray installations shall not be limited to industrial establishments.

Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant.

(a) Wiring Methods. (No change)

(b) In Industrial Establishments. The wiring methods in Section 318-3(a) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons will service the installed cable tray system any of the cables in (1) and (2) shall be permitted to be installed in ladder, ventilated trough, or ventilated channel cable trays.

(1) Single Conductors. Single conductor cables shall be permitted to be installed in accordance with the following.

(a) Single conductor cable shall be No. 1/0 or larger and shall be of a type listed and marked on the surface for use in cable trays. Where Nos. 1/0 through 4/0 single conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 9 in. (229 mm).

(b) Welding cables shall comply with the provisions of Article 630, Part D.

(c) Single conductors used as equipment grounding conductors shall insulated, covered, or bare and they shall be No. 4 or larger.

(2)Medium Voltage. Single and multiconductor medium voltage cables shall be Type MV Cable (Article 326). Single conductors shall be installed in accordance with 318-3(b)(1)."
PANEL STATEMENT: The panel agrees with the intent of the submitter's proposal. The text was revised to enhance clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2297)

8- 15 - (318-3): Accept in Principle in Part
SUBMITTER: William T. Fiske, I T S North America/Rep. Intertek Testing Services , ETL SEMKO
RECOMMENDATION: Revise text to read as follows:
"~~Cable tray installations shall not be limited to industrial establishments.~~ Cable tray installations shall be permitted to be used for feeder circuits, branch circuits, communications circuits, control circuits and signaling circuits."
SUBSTANTIATION: The existing language, "not...limited to industrial establishments," is confusing. The reader is left in doubt as to what, if any, limitations do exist. Section 318-4, as written, does not clarify the Panel's intent for Section 318-3. Should permit all circuits, with specific exclusions in Section 318-4.
PANEL ACTION: Accept in Principle in Part.
The Panel does not accept the deletion of the first sentence of 318-3.
Revise 318-3 by adding a new sentence so the section reads as follows:
"318-3. Uses Permitted. Cable tray shall be permitted to be used as a support system for services, feeders, branch circuits, communications circuits, control circuits, and signaling circuits. Cable tray installations shall not be limited to industrial establishments."
PANEL STATEMENT: It is important to retain the existing sentence. This sentence serves to clarify the permitted use of cable tray by removing the misconception that cable tray is limited to industrial establishments only.
The word "services" is added to the proposed new sentence because cable tray may be used for services.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1212)

8- 16 - (Table 318-3): Accept
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise the reference for power limited tray cable from 725-71(e) to 725-71(f).
SUBSTANTIATION: If my proposal to establish a new section 725-71(b) is accepted, a new section is added and the sections will be renumbered including section 725-71(e). The new section creates two new cable types, Type CL3P-50 and Type CL2P-50. This proposal correlates section 318-3 with those proposed changes.
PANEL ACTION: Accept.
PANEL STATEMENT: Staff is advised to make the editorial correction if Panel 16 accepts the proposal to establish a new section.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1841)

8- 17 - (318-3(a)): Reject
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Add a paragraph at the end of 318-3(a):
"Single conductors or multiconductor cables that comply with the requirements for both Type MV and Type MC, and are identified as Type MV or MC and for use in cable tray shall also be permitted to be installed in cable tray."
SUBSTANTIATION: Sections 326-1 and 334-1 both authorize single and multiconductor constructions. Section 334-21(b) authorizes the use of Type MC cable as open runs of cable. If a construction marked "Type MV or MC" can be used as open wiring, it should also be permitted in cable tray in the same occupancies.
PANEL ACTION: Reject.
PANEL STATEMENT: The language of this proposal would permit Type MV cable to be used in cable tray installations in all occupancies. Because of the increased hazards associated with the higher operating voltages of Type MV cable it is limited to those industrial establishments identified in 318-3(b).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2963)

8- 18 - (318-3(a)): Accept
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: The following is the revised listed of acceptable wiring methods for cable tray:
(a) Wiring Methods. The following shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections:

	Article	Section
Armored cable		333
Communication Raceways		800
Electrical metallic tubing		348
Electrical nonmetallic tubing		331
Fire alarm cables		760
Flexible metal conduit		350
Flexible metallic tubing		349
Instrumentation tray cable		727
Intermediate metal conduit		345
Liquidtight flexible metal conduit and liquidtight flexible nonmetallic conduit		351
Metal-clad cable		334
Mineral-insulated, metal-sheathed cable		330
Multiconductor service-entrance cable		338
Multiconductor underground feeder and branch-circuit cable		339
Multipurpose and communications cables		800
Nonmetallic-sheathed cable		336
Power and control tray cable		340
Power-limited tray cable	725-61(c) and 725-71(e)	
Optical fiber cables		770
Optical Fiber Raceways		770
Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays		
Rigid metal conduit		346
Rigid nonmetallic conduit		347

SUBSTANTIATION: Optical Fiber/Communication Raceways are listed raceways used in plenum, riser and general purpose areas of a building. These listed raceways are commonly used in cable trays. Optical Fiber/Communication Raceways are use to separate the Optical Fiber Cable and/or Telecommunications Cable from the other wiring methods found in the cable tray. These raceways are made of the same materials as the cable jacket and are used as a cable management system.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2335)

8- 19 - (318-3(a)(1)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add the following to 318-3:
318-3(a)(1). Data Processing Facilities. In data processing facilities, telephone switching facilities and other similar occupancies, single conductors of systems rated 50 volts or less, shall per permitted to be installed in accordance with 318-3(b)(1).
SUBSTANTIATION: It has become common to see very large low voltage systems in these types of facilities. Systems are being designed in excess of 4000 amps at 48 volts dc. The interconnections of equipment has become increasingly more and more difficult as the complexities of the systems increase.
These facilities usually have maintenance staff that serve the multiple facilities and are familiar with the equipment. These facilities are much the same as an industrial facility, the main difference is that they do not produce products.
PANEL ACTION: Reject.
PANEL STATEMENT: The phrase data processing facilities, telephone switching facilities, and other similar occupancies are not clearly understood and are too broad. There should be specific requirements for the competency level of the maintenance personnel. Where determined to be an industrial facility by the AHJ, the referenced facilities may be permitted to use section 318-3(b)(1) where the required conditions of supervision and maintenance are provided.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2298)

8- 20 - (318-3(b)): Reject
SUBMITTER: William T. Fiske, I T S North America/Rep. Intertek Testing Services , ETL SEMKO
RECOMMENDATION: Revise text to read as follows:
"~~The wiring methods in Section 318-3(a) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles.~~ In industrial establishments only, where conditions of maintenance and service ensure that only qualified persons will service the installed cable tray system...".
SUBSTANTIATION: The first sentence is redundant to Section 318-3(a), adding neither additional information nor clarification.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel disagrees with the substantiation. The proposed deleted language is intended to clarify the permitted wiring methods for use in industrial establishments. Section 318-3 is clearly divided into industrial establishments and all others. To maintain that clear distinction, it is appropriate to maintain the proposed deleted language.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2943)

8- 21 - (318-3(b)): Accept
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: Revise text to read as follows:
(b) In Industrial Establishments. The wiring methods in Section 318-3(a) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons will service the installed cable tray system, any of the cables in (1) and (2) shall be permitted to be installed in ladder, ventilated trough, <u>solid bottom,</u> or ventilated channel cable trays.
SUBSTANTIATION: Cables are installed within solid metal enclosures every day i.e., conduit and wireway. There is no reason to exclude solid bottom tray from containing these cables as long as they are being installed by qualified individuals in industrial establishments and the fill requirements are consistent with the conservative numbers used for conduit and wireway.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
LOYD: The submitter provided no substantiation for adding solid bottom tray to this section, which permits the use of single conductors in cable tray. I am concerned that hot spots may develop in the conductors lying on solid bottom cable tray. I believe it is appropriate for the panel to require technical support for this change.

(Log #4092)

8- 22 - (318-3(b), Exception (New)): Reject
SUBMITTER: L. James Milne, BICCGeneral
RECOMMENDATION: Add the following exception:
(b) In Industrial Establishments. The wiring methods in Section 318-3(a) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons will service the installed cable tray system, any of the cables in (1) and (2) shall be permitted to be installed in ladder, ventilated trough, or ventilated channel cable trays.
<u>Exception: Single conductor Type MI cable is not restricted to use in industrial establishments.</u>
SUBSTANTIATION: For sizes larger than #4 AWG, mineral insulated cable is only available in single conductor configurations. Single conductor mineral insulated cable has been installed in cable tray for some time in commercial and industrial installations across the country. The Underwriters Laboratories Building Materials Directory includes cable tray as an option for installing 2 hour fire resistive mineral insulated cables which includes single conductor cable. These cables are used almost exclusively in commercial and institutional properties for emergency feeders.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: Single conductor Type MI cable is currently permitted by 318-3(a) in other than industrial establishments under the conditions described in Article 330.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1059)

8- 23 - (318-3(b)(1)a): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise Article 318 as follows:
318-3(b)(1)(a) - change "No. 1/0 or larger" to "1/0 AWG or larger" and "Where Nos. 1/0 through 4/0 single" to "Where 1/0 through 4/0 AWG single"
318-3(b)(1)(c) - change "No. 4 or larger" to "4 AWG or larger"
318-8(e) - change "Nos. 1/0 through 4/0" to "1/0 through 4/0 AWG"
318-9(a)(1) - change "No. 4/0 or larger" to "4/0 AWG or larger"
318-9(a)(2) - change "No. 4/0" to "4/0 AWG"
318-9(a)(3) - change "No. 4/0" to "4/0 AWG" in four places
Table 318-9, footnote b - change "Nos. 4/0" to "4/0 AWG"
318-9(c)(1) - change "No. 4/0" to "4/0 AWG"
318-9(c)(2) - change "No. 4/0" to "4/0 AWG"
318-9(c)(3) - change "No. 4/0" to "4/0 AWG" in four places
318-10(a)(4) - change "Nos. 1/0 through 4/0" to "1/0 through 4/0 AWG"
318-11(b)(2) - change "No. 1/0" to "1/0 AWG" in two places.
318-11(b)(3) - change "Nos. 1/0" to "1/0 AWG"
318-11(b)(4) - change "Nos. 1/0" to "1/0 AWG"
318-13(b)(1) - change "Nos. 1/0" to "1/0 AWG" in two places
318-13(b)(2) - change "Nos. 1/0" to "1/0 AWG"
318-13(b)(3) - change "Nos. 1/0" to "1/0 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.

(Log #2296)

8- 27 - (318-4): Reject
SUBMITTER: William T. Fiske, I T S North America/Rep. Intertek Testing Services , ETL SEMKO
RECOMMENDATION: Revise text to read as follows:
318-4 Uses Not Permitted.
(a) Hoistways. Cable tray systems shall not be used in hoistways.
(b) Subject to Damage. Cable tray systems shall not be used where subject to severe physical damage.
(c) Dwellings. Cable tray systems shall not be used in dwellings.
(d) Health Care Facilities. Cable tray systems shall not be used in health care facilities where prohibited by provisions of Article 517.
(e) Spaces Used for Environmental Air. Cable tray systems shall not be used in environmental air spaces.
Exception: Cable tray systems shall be permitted to be used as permitted by provisions of Section 300-22 to support wiring methods permitted for use in such spaces.
SUBSTANTIATION: The language of Sections 318-3 and 318-4 taken together, do not make it clear where cable tray can and cannot be used. Required wiring methods in Sections 517-10(b)(2), 517-30(c)(3) and 517-61(a) and (b), effectively exclude cable tray, and readers of Section 318 should be made aware of those exclusions. Given that dwellings are not staffed by persons even remotely qualified, dwelling spaces should also be excluded.
PANEL ACTION: Reject.
PANEL STATEMENT: Cable tray systems are structural systems utilized to securely fasten or support cables and raceways. Where the cable tray is installed in accordance with 318-3(a), cable tray is permitted to be used in a dwelling .
Cable tray may be used with the wiring methods given in the referenced sections. Section 318-3(d) adequately addresses the issue of cable tray use in hazardous (classified) locations.

8- 28 - (318-5(e), FPN (New)): Accept in Principle
NOTE:The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: After 318-5(e), insert the following fine print note:
FPN: For information concerning the selection and application of metal cable trays, refer to NEMA-VEI metal cable tray systems, 1998.
SUBSTANTIATION: This standard is an industry resource in the selection of cable trays including dimensions, finish, and load rating. This document has been harmonized with CSA standards.
PANEL ACTION: Accept in Principle.
Locate the proposed FPN in Section 318-1 and amend it to read:
"For further information on cable trays, see NEMA-VE 1,1998 Metal Cable Tray Systems; NEMA-VE 2, 1996, Metal Cable Tray Installation Guidelines; and NEMA-FG 1,1998, Nonmetallic Cable Tray Systems."
PANEL STATEMENT: As Section 90-1(c) states that the NEC is not a design manual, reference to selection of cable trays is not appropriate. The FPN has been placed after Section 318-1 to correspond with the article scope. The panel wishes to point out that CSA Standards support CEC requirements and not the NEC. As such, the panel does not support that portion of the substantiation. Two other standards were added to the FPN to provide more comprehensive information.

(Log #2216)

8- 29 - (318-5(f)): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested."
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.
[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
PANEL ACTION: Reject.
PANEL STATEMENT: The phrase "flame-tested" does not convey the requirement that the material contain flame-retardant properties.

(Log #2864)

8- 31 - (318-5(g) (New)): Accept in Principle
SUBMITTER: Richard E. Loyd, Perryville, AR
RECOMMENDATION: Add text to read as follows:
318-5(f) Identification and Suitability. Cable Tray(s) and their associated fittings shall be suitable for the conditions of use and location and identified for its intended use.
SUBSTANTIATION: Cable tray is manufactured in many forms. From a simple hanger or wire mesh to a substantial steel rigid support system. It can designed and manufactured to support a specific type system, or to support all wiring methods and single power conductors as listed in Section 318-3 in all environments or specific environments.
To assure a safe support system it is necessary that all types of cable tray be identified for its intended use and be suitable for the location and the conditions for which it may be used
PANEL ACTION: Accept in Principle.
Add a new sentence to Section 318-3 to read as follows:
Cable trays and their associated fittings shall be identified for the intended use.
"Staff is advised that the Panel Action on proposal 8-15 added a new second sentence to 318-3 and this Panel Action adds a new third sentence".
PANEL STATEMENT: Section 318-3 deals with permitted uses for cable tray. Section 318-5 deals with construction specifications. The proposed text deals with the use of cable tray and belongs in 318-3. The revised wording meets the submitter's intent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #1168)

8- 32 - (318-6(a)): Accept
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise the first sentence of the second paragraph to read:
"Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the ~~support~~ distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 6 ft (1.83 m)."
SUBSTANTIATION: Edit. The proposed wording clearly separates the raceways from the modifying phrase "where the conductors are terminated". This section apparently relates to nonsupport of conductors but present wording appears to literally address distance between supports for cable trays, raceways, and equipment.
Three installations are noted: tray to tray, tray to raceway, and tray to equipment (equipment being perceived as not including tray or raceway). However, the 6 ft limitation is only designated for two installations and thereby doesn't address the tray to raceway installation.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
LOYD: The submitter provided no technical support for permitting cables to extend up to six feet out of the cable tray before entering a raceway. He only states he felt it was intended by the panel to extend this permission. I feel cables should be supported at all times and although a bonding conductor between the cable tray and the raceway is required, I cannot envision this to be a safe, neat and workmanlike installation.
COMMENT ON AFFIRMATIVE:
GRIFFITH: The submitter's recommended revision to the first sentence of the second paragraph should read, "where cable trays support individual conductors or cables and where the conductors or cables pass from one cable tray...".
Although I agree with the submitter's revision as proposed, it is believed that this sentence, which was new in the last revision of the code, should have always applied to cables as well as individual conductors. The practice involving up to 6 foot cable tray discontinuities is universally applied to cables, as well as individual conductors.

(Log #1166)

8- 33 - (318-6(j)): Reject
Note:The Technical Correlating Committee directs that the panel clarify the last sentence of the Panel Statement relative to the action taken on Proposal 8-34. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise text to read:
"Raceways, Cables, and ~~Outlet~~ Boxes Supported from Cable Trays. In industrial facilities where conditions of maintenance and supervision assure only qualified persons will service the installation and where cable trays are designed to support the load, raceways, cables, ~~and outlet~~ boxes, and conduit bodies shall be permitted to be supported by cable trays. For ~~raceway~~ rigid metal conduit, intermediate metal conduit, and electrical metallic tubing terminating at, and secured to the tray with a listed tray clamp or adapter, ~~shall be used and no nearby support, such as a~~

~~support within 3 ft (914 mm) shall be required~~ fastening of the raceway shall be permitted to be increased to a distance of 5 ft (1.52 m) from the termination.

For raceway or cable running parallel to, but under or beside a cable tray, support shall be in accordance with the requirements of the appropriate raceway or cable article.

For ~~outlet~~ boxes and conduit bodies located under or beside a tray, support shall be in accordance with the requirements of Article 370."

SUBSTANTIATION: Edit. Many in the trade loosely refer to all boxes as "outlet" boxes and EMT as "conduit" or "thin-wall conduit". While intent may be understood, it is not technically correct in a Code sense. Some boxes are designated as "pull", "junction", or "device" boxes, as indicated by Article 370. Specific limitation to "outlet" boxes suggests boxes for other uses and conduit bodies are not permitted to be supported. If a reference to cable tray support is deemed necessary, other use boxes and conduit bodies should be included.

The reference to "nearby" and "such as 3 ft" is vague; does this intend to include nonrequirement of fastening at 5 ft as permitted by Sections 348-13 Exception No. 1, 345-12(a), and 346-12(a)? The reference to 3 ft suggests RMC, IMC, RNMC, and EMT were the raceways contemplated since other raceways have different support/fastening intervals from terminations. If the 3 ft or 5 ft interval is not required where does the measurement for the first support start? Additionally, the word "support" is not the same as "fastened in place" used in raceway articles. Section 347-8 and Table 347-8 require fastening and support at 3 ft intervals for 1/2 to 1 in. RNMC which is the same fastening distance from terminations; this section appears to negate that requirement.

The proposal would require adherence to the 3 ft interval from terminations for fastening RNMC and correlate with the 5 ft interval permitted for RMC, IMC, and EMT if listed cable tray clamps or adapters are used, and allow other raceway articles to govern fastening/support requirements for flexible conduit, wireways, busways, etc.

PANEL ACTION: Reject.

PANEL STATEMENT: It is not appropriate to limit the requirement of this section to metal raceways. Where the raceway is attached to the cable tray with the appropriate fitting, it is intended that the support of the raceway be accomplished in accordance with the respective raceway article.

There is no technical substantiation to remove the word outlet prior to boxes as this will expand the permission to all boxes, including cutout boxes.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NOT RETURNED: 1 Corry

COMMENT ON AFFIRMATIVE:

BERMAN: Panel Action should have been Accept in Part, based on action taken on Proposal 8-34. The Panel Statement regarding the submitter's proposal to remove the word "outlet" is incorrect, as this same deletion of text was clearly accepted in Proposal 8-34, with the statement that the proposed text clarifies the requirement.

(Log #2595)

8- 34 - (318-6(j)): Accept in Principle

Note: The Technical Correlating Committee directs the panel to confirm the action on this Proposal relative to the position of the panel stated in the panel statement on Proposal 3-33. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Donald R. Cook, Southern Section, IAEI

RECOMMENDATION: Delete the word outlet from Section 318-6(j) so the Section read as follows:

(j) Raceways, Cables, and ~~Outlet~~ Boxes Supported from Cable Trays. In industrial facilities where conditions of maintenance and supervision ensure only qualified persons will service the installation and where cable trays are designed to support the load, raceways, cables and ~~outlet~~ boxes shall be permitted to be supported from cable trays. For raceway terminating at the tray, a listed cable tray clamp or adaptor shall be used and no nearby support, such as a support within 3 ft (914 mm), shall be required. For raceway or cable running parallel to, but under or beside, a tray, support shall be in accordance with the requirements of the appropriate raceway or cable article.

For ~~outlet~~ boxes located under or beside a tray, support shall be in accordance with the requirements of Article 370.

SUBSTANTIATION: Cable tray is a support system. If designed to support the load there is no reason to restrict its use to the support of "outlet boxes" only. Tray should be allowed to support all boxes. These would include not just outlet boxes but such boxes as pull and junction.

PANEL ACTION: Accept in Principle.

In the title of this Section delete the word "outlet" and after "boxes" add "and conduit bodies."

Delete the word "outlet" in the first sentence and reword it to read: "boxes and conduit bodies as covered in Section 370-1."

In the last sentence of this section delete the word "outlet" and change it to read "boxes and conduit bodies..."

In the last sentence change the reference to Section 370-23.

PANEL STATEMENT: The amended text meets the intent of the submitter and clarifies the requirement.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NEGATIVE: 1

NOT RETURNED: 1 Corry

EXPLANATION OF NEGATIVE:

LOYD: The panel action should have been to reject. While it is true cable tray is a support system, it is only designed to support wiring methods linearly with the weight distribution on the bottom of the tray and not on the sides.

No technical substantiation was provided to permit cable tray to support large boxes of unlimited dimensions.

This change will now permit a cabinet or junction box weighing several hundred pounds to be attached directly to the sidewall of the cable tray. The stress during cable pulling which could easily damage the cable tray was not considered.

(Log #3736)

8- 35 - (318-6(j)): Accept in Principle

SUBMITTER: Wayne A. Lilly, Bridgewater, VA

RECOMMENDATION: Delete the word "outlet" from Section 318-6(j) so the section reads as follows:

(j) Raceways, Cables, and ~~Outlet~~ Boxes Supported from Cable Trays. In industrial facilities where conditions of maintenance and supervision ensure only qualified persons will service the installation and where cable trays are designed to support the load, raceways, cables, and ~~outlet~~ boxes shall be permitted to be supported from cable trays. For raceway terminating at the tray, a listed cable tray clamp or adapter shall be used and no nearby support, such as a support within 3 ft (914 mm), shall be required.

For raceway or cable running parallel to, but under or beside, a tray, support shall be in accordance with the requirements of the appropriate raceway or cable article.

For ~~outlet~~ boxes located under or beside a tray, support shall be in accordance with the requirements of Article 370.

SUBSTANTIATION: Cable tray is a support system. If designed to support the load there is no reason to restrict their use to the support of "outlet boxes" only. Tray should be allowed to support all boxes. These would include not just outlet boxes but such boxes as pull and junction.

PANEL ACTION: Accept in Principle.

NOT RETURNED: 1 Corry

(Log #809)

8- 40 - (318-8(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Cable Splices. For other than metal-armored cables ~~Cable~~ splices made an insulated by approved methods shall be permitted without a box or fitting ~~to be~~ if located within a cable tray provided they are accessible and do not project above the side rails, except that splices for equipment grounding conductors shall not be required to be insulated.
SUBSTANTIATION: Editorial. It appears the intent is to permit splices in nonmetallic-covered cables without a box or fitting, but wording is not specific. This should be limited to nonmetallic jacketed cables to preserve grounding integrity of cables such as Type AC, MC, and MI. Equipment grounding conductors normally need not be insulated at splices.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient technical substantiation to only allow splices in nonmetallic cables. Approved splices are permitted in any of the wiring methods permitted by Section 318-3. The existing text does not prohibit uninsulated splices in equipment grounding conductors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

NOT RETURNED: 1 Corry

(Log #2944)

8- 41 - (Table 318-9(e)): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: Revise Table 318-9(e) to include allowable cable fill area for multiconductor cables in solid bottom channel cables trays. Also revise Table 318-9(e) to include fill areas for 2 in. and 8 in. channel cable tray.
SUBSTANTIATION: Two inch and 8 in. channel cable tray are two widely available sizes that have been overlooked in previous NEC proposals. Due to continued inquiries by the industry, adding the 2 in. and 8 in. sizes would increase the available options for installing small amounts of cables while building on previously proven installation practices.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient technical substantiation to support the inclusion of the new sizes. More information is necessary to determine the safe proposed fill allowances.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
GRIFFITH: Although the submitter did not use the correct format for these proposals, as a group they all proposed revisions that would provide fill rules for multi-conductor cables installed in 2 in. and 8 in. ventilated channel cable tray, as well as 2 in. through 8 in. solid bottom channel cable tray. Solid bottom channel is being applied in all these sizes as is the ventilated channel in sizes 2 in. and 8 in. It is believed the submitter's proposal provides fill rules for all these channel types and sizes when using multi-conductor cables consistent with the way installations are being designed and installed, and the history of successful use for these practices is of an equivalent weight to that available when cable tray was first recognized as a wiring method some years ago. In addition, it is believed that the adequacy of the fill limits is self-evident as compared to accepted fill practices for other raceway systems discussed in the submitter's substantiation.

(Log #2945)

8- 42 - (318-9(f) (New)): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: Add new text to read as follows:
(f) Solid Channel Cable Trays. Where solid channel cable trays contain multiconductor cables of any type, the following shall apply.
SUBSTANTIATION: Solid channel cable trays have been available for years but have been overlooked in previous NEC revisions. Taking into account the success of solid bottom cable tray applications there appears to be insufficient argument for the continued exclusion of solid channel cable tray in the National Electrical Code.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 4-3.3 of the Regulations Governing Committee Projects requires each proposal to include the proposed text of the Proposal, including the wording to be added, revised, (and how revised), or deleted. This proposal is incomplete in the wording it proposes.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

(Log #2946)

8- 43 - (318-9(f)(1) (New)): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: Add new text to read as follows:
(1) Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 3 of Table 318-9(e).
SUBSTANTIATION: In keeping with the conservative nature of the area fill values for multiconductor cables in ventilated channel cable tray, the values depicted in Column 3 of the proposed Table 318-9(e) were based on the 53 percent area fill values used for installing one conductor in conduit raceway found in Chapter 9 of the NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 4-3.3 of the Regulations Governing Committee Projects requires each proposal to include the proposed text of the Proposal, including the wording to be added, revised, (and how revised), or deleted. This proposal is incomplete in the wording it proposes.
No substantiation was provided to indicate on what basis and how the proposed values were determined other than an arbitrary selection of 53%.
Table 318-9(e) was not revised. See panel action and statement on Proposal 8-41.

NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
GRIFFITH: See my Explanation of Negative Vote on Comment 8-41.

(Log #2947)

8- 44 - (318-9(f)(2) (New)): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: Add new text to read as follows:
(2) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 4 of Table 318-9(e).
SUBSTANTIATION: In keeping with the conservative nature of the area fill values for multiconductor cables in ventilated channel cable tray, the values depicted in Column 4 of the proposed Table 318-9(e) were based on the 31 percent area fill values used for installing two conductors in conduit raceway found in Chapter 9 of the NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 4-3.3 of the Regulations Governing Committee Projects requires each proposal to include the proposed text of the Proposal, including the wording to be added, revised, (and how revised), or deleted. This proposal is incomplete in the wording it proposes.
No substantiation was provided to indicate on what basis and how the proposed values were determined other than an arbitrary selection of 31%.
Table 318-9(e) was not revised. See panel action and statement on Proposal 8-41.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
GRIFFITH: See my Explanation of Negative Vote on Comment 8-41.

(Log #2954)

8- 45 - (Table 318-10): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: Add Columns 3 and 4 for Solid Bottom Tray Cable.
(Table shown below)
SUBSTANTIATION: Column 3 and 4 are based on the extremely conservative 20 percent area fill requirement for metal wireway. If these cables can be installed in an enclosed metal wireway, there is little argument to exclude their use in an open system such as solid bottom cable tray as long as it is being installed by qualified individuals in industrial establishments.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient technical substantiation to support the inclusion of solid bottom cable tray. More information is necessary to determine the safe proposed fill allowances.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

(Log #2948)

8- 46 - (318-10(b)): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: Revise text to read as follows:
(b) Ventilated Channel Cable Trays. Where 2 in. (51 mm), 3-in. (76-mm), 4-in. (102-mm), 6-in. (152-mm), or 8 in. (204 mm) wide ventilated channel cable trays contain single conductor cables, the sum of the diameters of tall single conductors shall not exceed the inside width of the channel.
SUBSTANTIATION: Two inch and 8 in. Channel Cable Tray are two widely available sizes that have been overlooked in previous NEC proposals. Due to continued inquiries by the industry, adding the 2-in and 8-in. sizes would increase the available options for installing small amounts of cables while building on previously proven installation practices.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient technical substantiation to support the inclusion of the new sizes. Since this proposal relates to cable tray fill, it is necessary to correlate it with the additional information requested by the panel in its statement on Proposal 8-41.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
GRIFFITH: Although the submitter did not use the correct format for these proposals, as a group they all propose revisions that would provide fill rules for single conductor cables installed in 2 in. and 8 in. ventilated channel cable tray, as well as Table 318-10 sizes of solid bottom cable tray. Solid bottom cable tray is being applied in all these sizes as is the ventilated channel in sizes 2 in. and 8 in. It is believed the submitter's proposal provides fill rules for all these channel/tray types and sizes when using individual conductors consistent with the way installations are being designed and installed, and the history of successful use for these practices is of an equivalent weight to that available when cable tray was first recognized as a wiring method some years ago. In addition, it is believed that the adequacy of the fill limits is self-evident as compared to accepted fill practices for other raceway systems discussed in the submitter's substantiation.

(Log #2949)

8- 47 - (318-10(c) (New)): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: Add new text to read as follows:
(c) Solid Bottom Cable Trays. Where solid bottom cable trays contain single conductor cables, the maximum number of single conductors shall conform to the following:
SUBSTANTIATION: Single conductors are installed within solid metal enclosures every day i.e., conduit and wireway. There is no reason to exclude solid bottom tray from containing single conductor cables as long as they are being installed by qualified individuals in industrial establishments and the fill requirements are consistent with the conservative numbers used for conduit and wireway.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 4-3.3 of the Regulations Governing Committee Projects requires each proposal to include the proposed text of the Proposal, including the wording to be added, revised, (and how revised), or deleted. This proposal is incomplete in the wording it proposes.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
GRIFFITH: See my Explanation of Negative Vote on Proposal 8-46.

(Log #2950)

8- 48 - (318-10(c)(1) (New)): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: Add new text to read as follows:
(1) Where all of the cables are 1000 kcmil or larger, the sum of the diameters of all single conductor cables shall not exceed 90 percent of the cable tray width, and the cables shall be installed in a single layer.
SUBSTANTIATION: Single conductor cables installed in the above manner equates to approximately 30 percent fill in a 3 in. deep cable tray. This figure is equivalent to the fill area for conduit raceway which is fully enclosed. Based on this conservative figure, there is no reason to exclude these cables from solid bottom cable tray.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 4-3.3 of the Regulations Governing Committee Projects requires each proposal to include the proposed text of the Proposal, including the wording to be added, revised, (and how revised), or deleted. This proposal is incomplete in the wording it proposes.
No substantiation was provided to indicate on what basis and how the proposed values were determined other than an arbitrary selection of 30%.
See panel action and statement on Proposal 8-47.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
GRIFFITH: See my Explanation of Negative Vote on Proposal 8-46.

(Log #2951)

8- 49 - (318-10(c)(2)): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: Add new text to read as follows:
(2) Where all of the cables are from 250 kcmil up to 1000 kcmil the sum of the cross-sectional areas of all single conductor cables shall not exceed the maximum allowable cable fill area in Column 3 of Table 318-10, for the appropriate cable tray width.

Table 318-10. Allowable Cable Fill Area for Single Conductor Cables in Ladder, ~~or~~ Ventilated Trough, or Solid Bottom Cable Trays for Cables Rated 2000 Volts or Less.

	Maximum Allowable Fill Area for Single Conductor Cables			
	Ladder or Ventilated Trough CableTrays Section 318-10(a)		Solid Bottom Cable Trays Section 318-10(c)	
Inside Width of Cable Tray (in.)	Column 1 Applicable for Section 318-10(a)(2) only (in.^{2})	Column 2 Applicable for Section 318-10(a)(3) only (in.^{2})	Column 3 Applicable for Section 318-10(c)(2) only (in.^{2})	Column 4 Applicable fo Section 318-10(c)(3) onl (in.^{2})
6	6.5	6.5-(1.1 Sd)[b]	3.5	3.5-(1.1 Sd)[b]
9	9.5	9.5-(1.1 Sd)	5.5	5.5-(1.1 Sd)
12	13.0	13.0-(1.1 Sd)	7.0	7.0-(1.1 Sd)
18	19.5	19.5-(1.1 Sd)	11.0	11.0-(1.1 Sd)
24	26.0	26.0-(1.1 Sd)	14.5	14.5-(1.1 Sd)
30	32.5	32.5-(1.1 Sd)	18.0	18.0-(1.1 Sd)
36	39.0	39.0-(1.1 Sd)	21.5	21.5-(1.1 Sd)

SUBSTANTIATION: Column 3 of the proposed Table 318-10 is based on 20 percent area fill accepted for conductor area fill in fully enclosed wireway (Article 362). Based on this conservative standpoint and the proven track record of wireway, an open system such as cable tray should be entirely acceptable.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 4-3.3 of the Regulations Governing Committee Projects requires each proposal to include the proposed text of the Proposal, including the wording to be added, revised, (and how revised), or deleted. This proposal is incomplete in the wording it proposes.
No substantiation was provided to indicate on what basis and how the proposed values were determined other than an arbitrary selection of 20%.
Table 318-10 was not revised. See panel action and statement on Proposal 8-45.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
GRIFFITH: See my Explanation of Negative Vote on Proposal 8-46.

(Log #2952)

8- 50 - (318-10(c)(3) (New)): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: Add new text to read as follows:
(3) Where 1000 kcmil or larger single conductor cables are installed in the same cable tray with single conductor cables smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 318-10, for the appropriate cable tray width.
SUBSTANTIATION: Refer to Column 3 for an explanation on the computation in column 4. Column 3 is based on 20 percent area fill for a 3 in. deep cable tray. Twenty percent area fill is currently used for area fill for wireway (Article 362).
PANEL ACTION: Reject.
PANEL STATEMENT: Section 4-3.3 of the Regulations Governing Committee Projects requires each proposal to include the proposed text of the Proposal, including the wording to be added, revised, (and how revised), or deleted. This proposal is incomplete in the wording it proposes.
No substantiation was provided to indicate on what basis and how the proposed values were determined other than an arbitrary selection of 20%.
Table 318-10 was not revised. See panel action and statement on Proposal 8-45.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
GRIFFITH: See my Explanation of Negative Vote on Proposal 8-46.

(Log #2953)

8- 51 - (318-10(c)(4) (New)): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: Add new text to read as follows:
(4) Where any of the single conductor cables are Nos. 1/0 through 4/0, the sum of the diameters of all single conductor cables shall not exceed 90 percent of the cable tray width, and the cables shall be installed in a single layer.
SUBSTANTIATION: Putting 1/0 through 4/0 single conductor cables in a single layer into a 3 in. deep ladder cable tray as is called out in Section 318-10(a)(4) gives you an area fill of 12 to 16 percent. This is less than the 20 percent fill used for metal wireways that are fully enclosed (Article 362). Based on the extremely conservative loading resulting from using only 90 percent of the cable tray width, adding single conductors to solid bottom tray poses no harm.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 4-3.3 of the Regulations Governing Committee Projects requires each proposal to include the proposed text of the Proposal, including the wording to be added, revised, (and how revised), or deleted. This proposal is incomplete in the wording it proposes. See panel action and statement on Proposal 8-47.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
GRIFFITH: See my Explanation of Negative Vote on Proposal 8-46.

(Log #1771)

8- 52 - (318-11(a)): Accept
SUBMITTER: Richard E. Loyd, Perryville, AR
RECOMMENDATION: Revise as follows:
(a) Multiconductor Cables. The allowable ampacity of multiconductor cables, nominally rated 2000 volts or less, installed according to the requirements of Section 318-9, shall be as given in Tables 310-16 and 310-18, subject to the provisions of (1), (2), and (3), and Section 310-15(a)(2).
SUBSTANTIATION: This reference is needed to make it clear that where the conductors leave the tray they are often placed in raceways and terminated on motors or equipment with lower ampacity allowances. To permit the higher ampacities of the tables without consideration of the terminations and other wiring methods is a safety issue that can result in fire or shock hazard.
PANEL ACTION: Accept.
Delete the word "and" from between (2) and (3) in the proposed text.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2941)

8- 53 - (318-11(a)(3)): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: In the last sentence of this section, change the words "Section 310-15(c)" to "Table B-310-3 in Appendix B".
Delete the FPN. Last line of this section should read ", in accordance with Table B-310-3 in Appendix B."
SUBSTANTIATION: Section 310-15(c) provides a general formula for ampacity but refers to Appendix B for Examples of formula applications. Reference to Table B-310-3 provides a direct reference to correct table. This change returns this section to the 1990 NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 310-15(c) is a rule which requires engineering supervision. 310-15(c) references Appendix B as a FPN. FPN and Appendixes are for information only. See 90-3 and Appendix B.
Mandatory requirements are not permitted to make mandatory references to information contained in an appendix.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1770)

8- 54 - (318-11(b)): Accept
SUBMITTER: Richard E. Loyd, Perryville, AR
RECOMMENDATION: Revise to read as follows:
(b) Single Conductor Cables. The allowable ampacity of single conductor cables, shall be as permitted by Section 310-15(a)(2). The derating factors of Section 310-15(b)(2)(a), shall not apply to the ampacity of cables in cable trays. The ampacity of single conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following.
SUBSTANTIATION: This reference is needed to make it clear that where the conductors leave the tray they are often placed in raceways and terminated on motors or equipment with lower ampacity allowances. To permit the higher ampacities of the tables without consideration of the terminations and other wiring methods is a safety issue that can result in fire or shock hazard.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3388)

8- 55 - (318-11(b), FPN (New)): Accept in Principle
SUBMITTER: Will Dockham, Gilmanton Iron Works, NH
RECOMMENDATION: Add the following Fine Print Note after Section 318-11(b).
FPN: See Section 110-14(c) for conductor temperature limitations due to termination provisions.
SUBSTANTIATION: I have seen numerous incidence where engineers and electricians have applied the ampacities provided for in Section 318-11(b) to the complete circuit, including the equipment that is supplied by the cables installed in the cable tray. This usually results in a violation to Section 110-14(c), because the equipment connected to the cables installed in the cable tray have termination temperature limitations based on the ampacities in Table 310-16. I believe that a FPN referencing Section 110-14(c) will significantly reduce these violations.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's intent has been accomplished by the panel's action on Proposal 8-54.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3141)

8- 56 - (318-14 (New)): Accept in Principle
SUBMITTER: Marcus Howard, Flint, MI
RECOMMENDATION: There should be a new section added, 318-14, dealing with support requirements for cable trays as follows:
Cable trays shall be supported at intervals in accordance with manufacturing listing.
SUBSTANTIATION: Presently there aren't any support requirements for cable trays and it can be installed with spacing inconsistent with manufacturer's listings.
PANEL ACTION: Accept in Principle.
Add a new second paragraph to Section 318-6(c):
"Cable trays shall be supported at intervals in accordance with the installation instructions."
PANEL STATEMENT: The panel agrees with the submitter's intent and the proposed language is more appropriately located in Section 318-6(c). Also, listing is not a requirement, see panel action on Proposal 8-31.

ARTICLE 320 — OPEN WIRING ON INSULATORS

(Log #459)

7- 3 - (320): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 320-6(a) - revise as follows:
"Supports shall be installed as follows:
(1) Within 150 mm (6 in.) ~~6 in. (152 mm)~~ from a tap or splice
(2) Within 300 mm (12 in.) ~~12 in. (305 mm)~~ of a dead-end connection to a lampholder or receptacle
(3) At intervals not exceeding 1.4 m (4 1/2 ft) ~~4 1/2 ft (1.37 m)~~ and at closer intervals sufficient to provide adequate support where likely to be disturbed"
320-6(b) - revise as follows:
"Supports for conductors No. 8 or larger installed across open spaces shall be permitted up to 4.5 m (15 ft) ~~15 ft (4.57 m)~~ apart if noncombustible, nonabsorbent insulating spacers are used at least every 1.4 m (4 1/2 ft) ~~4 1/2 ft (1.37 m)~~ to maintain at least 65 mm (2 1/2 in.) ~~2 1/2 in. (64 mm)~~ between conductors."
In the second paragraph, change "6 in. (152 mm)" to "150 mm (6 in.)"
320-6(c) - change "30 ft (9.1 m)" to "9 m (30 ft)"
320-10 - revise second sentence as follows:
"The tubing shall be in continuous lengths not exceeding 4.5 m (15 ft) ~~15 ft (4.57 m)~~ and secured to the surface by straps at intervals not exceeding 1.4 m (4 1/2 ft) ~~4 1/2 ft (1.37 m).~~"
320-12 - change "2 in. (50.8 mm)" to "50 mm (2 in.)"
320-14 - revise as follows:
"Conductors within 2.1 m (7 ft) ~~7 ft (2.13 m)~~ from the floor shall be considered exposed to physical damage. Where open conductors cross ceiling joists and wall studs and are exposed to physical damage, they shall be protected by one of the following methods:
(1) Guard strips not less than 25 mm (1 in.) ~~1 in. (25.4 mm)~~ nominal in thickness and at least as high as the insulating supports, placed on each side of and close to the wiring
(2) A substantial running board at least 13 mm (1/2 in.) ~~1/2 in. (12.7 mm)~~ thick in back of the conductors with side protections. Running boards shall extend at least 25 mm (1 in.) ~~1 in. (25.4 mm)~~ outside the conductors, but not more than 50 mm (2 in.) ~~2 in. (50.8 mm)~~, and the protecting sides shall be at least 50 mm (2 in.) ~~2 in. (50.8 mm)~~ high and at least 25 mm (1 in.) ~~1 in. (25.4 mm)~~ nominal in thickness
(3) Boxing made as above and furnished with a cover kept at least 25 mm (1 in.) ~~1 in. (25.4 mm)~~ away from the conductors within. Where protecting vertical conductors on side walls, the boxing shall be closed at the top and the holes through which the conductors pass shall be bushed."
320-15(a) -revise second sentence as follows:
"Where run through bored holes, conductors in the joists and in studs or rafters to a height of not less than 2.1 m (7 ft) ~~7 ft (2.13 m)~~ above the floor or floor joists shall be protected by substantial running boards extending not less than 25 mm (1 in.) ~~1 in. (25.4 mm)~~ on each side of the conductors."
320-15(b) Exception - change "3 ft (914 mm)" to "900 mm (3 ft)".
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-3a.

(Log #CP703)

7- 3a - (320): Accept
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: CMP 7
RECOMMENDATION: Rewrite Article 320 to comply with NEC Style Manual.

ARTICLE 320 -- Open Wiring on Insulators

I General

320-1. Scope. This article covers the use, installation, and construction specifications of open wiring on insulators.
320-2. Definition.
Open Wiring on Insulators. An exposed wiring method using cleats, knobs, tubes, and flexible tubing for the protection and support of single insulated conductors run in or on buildings.

II. Installation

320-10. Uses Permitted. Open wiring on insulators shall be permitted only for industrial or agricultural establishments on systems of 600 volts, nominal, or less, as follows:
(1) Indoors or outdoors
(2) In wet or dry locations
(3) Where subject to corrosive vapors
(4) For services
320-12 Uses Not Permitted. Open wiring on insulators shall not be installed where concealed by the building structure.
320-15 Exposed Work.
(a) Dry locations. In dry locations, where not exposed to severe physical damage, conductors shall be permitted to be separately enclosed in flexible nonmetallic tubing. The tubing shall be in continuous lengths not exceeding 4.5 m (15 ft) and secured to the surface by straps at intervals not exceeding 1.4 m (4 1/2 ft).

(b) Entering Spaces Subject to Dampness, Wetness, or Corrosive Vapors. Conductors entering or leaving locations subject to dampness, wetness, or corrosive vapors shall have drip loops formed on them and shall then pass upward and inward from the outside of the buildings, or from the damp, wet, or corrosive location, through noncombustible, nonabsorbent insulating tubes.

FPN: See 230-52 for individual conductors entering buildings or other structures.

(c) Exposed to Physical Damage. Conductors within 2.1 m (7 ft) from the floor shall be considered exposed to physical damage. Where open conductors cross ceiling joists and wall studs and are exposed to physical damage, they shall be protected by one of the following methods:

(1) Guard strips not less than 25 mm (1 in.) nominal in thickness and at least as high as the insulating supports, placed on each side of and close to the wiring

(2) A substantial running board at least 13 mm (1/2 in.) thick in back of the conductors with side protections. Running boards shall extend at least 25 mm (1 in.) outside the conductors, but not more than 50 mm (2 in.), and the protecting sides shall be at least 50 mm (2 in.) high and at least 25 mm (1 in.) nominal in thickness

(3) Boxing made as above and furnished with a cover kept at least 25 mm (1 in.) away from the conductors within. Where protecting vertical conductors on side walls, the boxing shall be closed at the top and the holes through which the conductors pass shall be bushed.

(4) Rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing, in which case the rules of Articles 345, 346, 347, or 348 shall apply; or by metal piping, in which case the conductors shall be encased in continuous lengths of approved flexible tubing.

320-17. Through or Parallel to Framing Members. Open conductors shall be separated from contact with walls, floors, wood cross members, or partitions through which they pass by tubes or bushings of noncombustible, nonabsorbent insulating material. Where the bushing is shorter than the hole, a waterproof sleeve of noninductive material shall be inserted in the hole and an insulating bushing slipped into the sleeve at each end in such a manner as to keep the conductors absolutely out of contact with the sleeve. Each conductor shall be carried through a separate tube or sleeve.

FPN: See 310-10 for temperature limitation of conductors.

320-19. Clearances. Open conductors shall be separated at least 50 mm (2 in.) from metal raceways, piping, or other conducting material, and from any exposed lighting, power, or signaling conductor, or shall be separated therefrom by a continuous and firmly fixed nonconductor in addition to the insulation of the conductor. Where any insulating tube is used, it shall be secured at the ends. Where practicable, conductors shall pass over rather than under any piping subject to leakage or accumulations of moisture.

320-23. In Accessible Attics. Conductors in unfinished attics and roof spaces shall comply with (a) or (b).

(a) Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the side of or through bored holes in floor joists, studs, or rafters. Where run through bored holes, conductors in the joists and in studs or rafters to a height of not less than 2.1 m (7 ft) above the floor or floor joists shall be protected by substantial running boards extending not less than 25 mm (1 in.) on each side of the conductors. Running boards shall be securely fastened in place. Running boards and guard strips shall not be required for conductors installed along the sides of joists, studs, or rafters.

(b) Not Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the sides of or through bored holes in floor joists, studs, or rafters.

Exception: In buildings completed before the wiring is installed, attic and roof spaces that are not accessible by stairway or permanent ladder and have headroom at all points less than 900 mm (3 ft), the wiring shall be permitted to be installed on the edges of rafters or joists facing the attic or roof space.

320-30. Securing and Supporting.

(a) Conductor Sizes Smaller than 8 AWG. Conductors smaller than 8 AWG shall be rigidly supported on noncombustible, nonabsorbent insulating materials and shall not contact any other objects. Supports shall be installed as follows:

(1) Within 150 mm (6 in.) from a tap or splice.

(2) Within 300 mm (12 in.) of a dead-end connection to a lampholder or receptacle.

(3) At intervals not exceeding 1.4 m (4 1/2 ft) and at closer intervals sufficient to provide adequate support where likely to be disturbed.

(b) Conductor Sizes 8 AWG and Larger. Supports for conductors 8 AWG or larger installed across open spaces shall be permitted up to 4.5 m (15 ft) apart if noncombustible, nonabsorbent insulating spacers are used at least every 1.4 m (4 1/2 ft) to maintain at least 65 mm (2 1/2 in.) between conductors.

Where not likely to be disturbed in buildings of mill construction, 8 AWG and larger conductors shall be permitted to be run across open spaces if supported from each wood cross member on approved insulators maintaining 150 mm (6 in.) between conductors.

(c) Industrial Establishments. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons will service the system, conductors of sizes 250 kcmil and larger shall be permitted to be run across open spaces where supported at intervals up to 9.0 m (30 ft) apart.

(d) Mounting of Conductor Supports. Where nails are used to mount knobs, they shall not be smaller than tenpenny. Where screws are used to mount knobs, or where nails or screws are used to mount cleats, they shall be of a length sufficient to penetrate the wood to a depth equal to at least one-half the height of the knob and the full thickness of the cleat. Cushion washers shall be used with nails.

(e) Tie Wires. 8 AWG or larger conductors supported on solid knobs shall be securely tied thereto by tie wires having an insulation equivalent to that of the conductor.

320-42. Devices. Surface-type snap switches shall be mounted in accordance with 380-10(a), and boxes shall not be required. Other type switches shall be installed in accordance with 380-4

III. Construction specifications

320-104. Conductors. Conductors shall be of a type specified by Article 310.

SUBSTANTIATION: This revision to Article 320 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with the usability effort. Specific proposals addressed by this revision include 7-3, 7-4, 7-5, 7-7, 7-8, 7-9, 7-11, 7-13, and 7-14.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #1375)

7- 4 - (320): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise text to read as follows:

Article 320 — Open Wiring on Insulators

I. General

~~320-1.~~ 320-2. Definition.

Open wiring on insulators. ~~is an~~ An exposed wiring method using cleats, knobs, tubes, and flexible tubing for the protection and support of single insulated conductors run in or on buildings, and not concealed by the building structure.

~~320-2.~~ 320-3. Other Articles.

Open wiring on insulators shall comply with this article and also with the applicable provisions of other articles in this Code, especially Articles 225 and 300.

II. Installation

~~320-3.~~ 320-10. Uses Permitted.

(1) Open Wiring. Open wiring on insulators shall be permitted on systems of 600 volts, nominal, or less, only for industrial or agricultural establishments, indoors or outdoors, in wet or dry locations, where subject to corrosive vapors, and for services.

~~320-10. Flexible Nonmetallic Tubing~~

(2) ~~(a)~~ Dry Locations. In dry locations, where not exposed to severe physical damage, conductors shall be permitted to be separately enclosed in flexible nonmetallic tubing. The tubing shall be in continuous lengths not exceeding 15 ft (4.57 m) and secured to the surface by straps at intervals not exceeding 4 1/2 ft (1.37 m).

(3) ~~320-13.~~ (b) Entering Spaces Subject to Dampness, Wetness, or Corrosive Vapors.

Conductors entering or leaving locations subject to dampness, wetness, or corrosive vapors shall have drip loops formed on them and shall then pass upward and inward from the outside of

the buildings, or from the damp, wet, or corrosive location, through noncombustible, nonabsorbent insulating tubes.

FPN: See Section 230-52 for individual conductors entering buildings or other structures.

~~320-14.~~ 320-15. Exposed Work. ~~Protection from Physical Damage~~

Conductors within 7 ft (2.13 m) from the floor shall be considered exposed to physical damage. Where open conductors cross ceiling joists and wall studs and are exposed to physical damage, they shall be protected by one of the following methods:

1. Guard strips not less than 1 in. (25.4 mm) nominal in thickness and at least as high as the insulating supports, placed on each side of and close to the wiring.

2. A substantial running board at least 1/2 in. (12.7 mm) thick in back of the conductors with side protections. Running boards shall extend at least 1 in. (25.4 mm) outside the conductors, but not more than 2 in. (50.8 mm), and the protecting sides shall be at least 2 in. (50.8 mm) high and at least 1 in. (25.4 mm) nominal in thickness.

3. Boxing made as above and furnished with a cover kept at least 1 in. (25.4 mm) away from the conductors within. Where protecting vertical conductors on side walls, the boxing shall be closed at the top and the holes through which the conductors pass shall be bushed.

4. Rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing, in which case the rules of Articles 345, 346, 347, or 348 shall apply; or by metal piping, in which case the conductors shall be encased in continuous lengths of approved flexible tubing.

~~320-11.~~ 320-17. ~~Through Walls, Floors, Wood Cross Members, etc~~ Through or Parallel to Framing Members. Open conductors shall be separated from contact with walls, floors, wood cross members, or partitions through which they pass by tubes or bushings of noncombustible, nonabsorbent insulating material. Where the bushing is shorter than the hole, a waterproof sleeve of noninductive material shall be inserted in the hole and an insulating bushing slipped into the sleeve at each end in such a manner as to keep the conductors absolutely out of contact with the sleeve. Each conductor shall be carried through a separate tube or sleeve.

FPN: See Section 310-10 for temperature limitation of conductors.

~~320-12.~~ 320-19. ~~Clearance from Piping, Exposed Conductors, etc.~~ Clearances. Open conductors shall be separated at least 2 in. (50.8 mm) from metal raceways, piping, or other conducting material, and from any exposed lighting, power, or signaling conductor, or shall be separated therefrom by a continuous and firmly fixed nonconductor in addition to the insulation of the conductor. Where any insulating tube is used, it shall be secured at the ends. Where practicable, conductors shall pass over rather than under any piping subject to leakage or accumulations of moisture.

~~320-15.~~ 320-23. ~~Unfinished Attics and Roof Spaces~~

In Accesible Attics. Conductors in unfinished attics and roof spaces shall comply with (a) or (b).

(a) Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the side of or through bored holes in floor joists, studs, or rafters. Where run through bored holes, conductors in the joists and in studs or rafters to a height of not less than 7 ft (2.13 m) above the floor or floor joists shall be protected by substantial running boards extending not less than 1 in. (25.4 mm) on each side of the conductors. Running boards shall be securely fastened in place. Running boards and guard strips shall not be required for conductors installed along the sides of joists, studs, or rafters.

(b) Not Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the sides of or through bored holes in floor joists, studs, or rafters.

Exception: In buildings completed before the wiring is installed, attic and roof spaces that are not accessible by stairway or permanent ladder and have headroom at all points less than 3 ft (914 mm), the wiring shall be permitted to be installed on the edges of rafters or joists facing the attic or roof space.

~~320-6.~~ 320-30. ~~Conductor Supports~~ Securing and Supporting.

(a) Conductor Sizes Smaller than No. 8. Conductors smaller than No. 8 shall be rigidly supported on noncombustible, nonabsorbent insulating materials and shall not contact any other objects.

Supports shall be installed as follows:

1. Within 6 in. (152 mm) from a tap or splice

2. Within 12 in. (305 mm) of a dead-end connection to a lampholder or receptacle

3. At intervals not exceeding 4 1/2 ft (1.37 m) and at closer intervals sufficient to provide adequate support where likely to be disturbed

(b) Conductor Sizes No. 8 and Larger. Supports for conductors No. 8 or larger installed across open spaces shall be permitted up to 15 ft (4.57 m) apart if noncombustible, nonabsorbent insulating spacers are used at least every 4 1/2 ft (1.37 m) to maintain at least 2 1/2 in. (64 mm) between conductors. Where not likely to be disturbed in buildings of mill construction, No. 8 and larger conductors shall be permitted to be run across open spaces if supported from each wood cross member on approved insulators maintaining 6 in. (152 mm) between conductors.

(c) Industrial Establishments. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons will service the system, conductors of sizes 250 kcmil and larger shall be permitted to be run across open spaces where supported on intervals up to 30 ft (9.1 m) apart.

~~320-7.~~ (d) Mounting of Conductor Supports. Where nails are used to mount knobs, they shall not be smaller than tenpenny. Where screws are used to mount knobs, or where nails or screws are used to mount cleats, they shall be of a length sufficient to penetrate the wood to a depth equal to at least one-half the height of the knob and the full thickness of the cleat. Cushion washers shall be used with nails.

~~320-8.~~ (e) Tie Wires. No. 8 or larger conductors supported on solid knobs shall be securely tied thereto by tie wires having an insulation equivalent to that of the conductor.

~~320-16. Switches~~ 320-42. Devices. Surface-type snap switches shall be mounted in accordance with Section 380-10(a), and boxes shall not be required. Other type switches shall be installed in accordance with Section 380-4.

~~320-5(b)~~ 320-80. Ampacity. The ampacity shall comply with Section 310-15.

III. Construction Specifications

~~320-5 Conductors.~~ 320-104. Conductors

~~(a) Type.~~ Conductors shall be of a type specified by Article 310.

SUBSTANTIATION: The proposed article re-write was developed as part of a larger effort by the NEC Usability Committee to re-format existing raceway, cable and wiring articles. The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as stated in the NEC Style Manual 2.4.1. It is hoped that the parallel code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.

To the extent that this was possible in this article, this has been done. It is not the intent or purpose of this re-write to change the actual intent of the existing article requirements. The only new material in this proposal is the proposed new article scope which has been added to conform with the NEC Style Manual 2.2.1

A companion proposal has also been submitted which re-structures the article to a greater degree by splitting existing Code requirements into new sections to better adhere to the new article format. In some cases this is done with an alternate article re-write while in other cases, individual proposals have been submitted. These proposals are also intended to further enhance the structure and format of the article but in some cases existing code text requirements had to be revised or altered to meet the re-formatting needs. For this reason the proposals are separate which will allow the Code Making Panels to individually consider each proposal.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-3a.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #271)

7- 5 - (320-1 and 320-2): Accept in Principle

SUBMITTER: Charles M. Trout, Maron Electric Co.

RECOMMENDATION: Revise Section 320-1 and 320-2.

Renumber Section 320-1 Definitions to 320-2 Definitions.

Place the following new text in 320-1:

320-1 Scope. This article covers the use, installation and construction specifications of open wiring on insulators.

Delete present text in Section 320-2. Other Articles and replace with text from renumbered Section 320-1 Definitions.

SUBSTANTIATION: As presently written, Section 320-2 titled "Other Articles" directs compliance with this article. This compliance is more properly shown as being the scope of this article. It is redundant to indicate that compliance with other applicable provisions of this code is required. This information is adequately covered in Section 903. to indicate that compliance with "especially" Articles 225 and 300 is a requirement is not only redundant as to Section 90-3 but appears to place a premium on the value of safety in some instances. The use of the term "especially" indicates an exceptional "degree" of importance being given to particular requirements for safety or conversely indicates a lack of importance to some safety requirements. The National Electrical Code should not apply degrees of safety to its requirements.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-3a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1169)

7- 6 - (320-1): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise the Open Wiring on Insulators to read:
"Open Wiring on Insulators" is an exposed wiring method using cleats, tubes, and flexible tubing for the protection and support of single (~~insulated~~) (circuit) conductors run in or on buildings and not concealed by the building structure." (alternate choices are in parenthesis)
SUBSTANTIATION: Clarification. This section indicates all conductors including grounded conductors and equipment grounding conductors are insulated. Section 320-5(a) indicates conductors shall be a type covered in Article 310. Section 310-2(a) Exception and 310-12(b) indicates bare conductors are permitted for grounded and grounding conductors. Proposal allows the panel to clarify the intent.
PANEL ACTION: Reject.
PANEL STATEMENT: The phase conductors and grounded conductor are required to be insulated. The equipment grounding conductor is covered by 250-119.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1307)

7- 7 - (320-1): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Add 320-1 (New) as follows:
320-1. Scope. This article covers the use, installation, and construction specifications of open wiring on insulators.
Renumber existing Sections accordingly.
SUBSTANTIATION: NEC Style Manual Section 2.2.1 requires that each Article contain a Scope.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-3a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1308)

7- 8 - (320-2): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Delete 320-2.
SUBSTANTIATION: Section 90-3 adequately covers this requirement. NEC Style Manual, Section 4.1 requires that references not be provided if the material is already covered by Section 90-3. Also, Section 4.4.1 prohibits referencing an entire Article.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-3a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1414)

7- 9 - (320-2): Accept in Principle
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Delete 320-2 in its entirety.
SUBSTANTIATION: The 1999 National Electrical Code Style Manual 4.1 states "Do not use a reference if the requirement is already covered by 90.3". 4.1.1 of the Style Manual stipulates that "References shall not be made to an entire article...unless additional conditions are specified."
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-3a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #812)

7- 10 - (320-3): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Uses Permitted. Open wiring on insulators shall be permitted on systems of 600 volts, nominal, or less, only for industrial or agricultural establishments (excluding farm dwelling units), indoors or outdoors, in wet or dry locations, where subject to corrosive vapors, and services.
SUBSTANTIATION: Editorial. The text doesn't indicate whether dwelling units are intended to be included as part of agricultural establishments, such as a farm house or dwelling units provided for transient farm workers. This wiring method doesn't appear suitable for such use.
PANEL ACTION: Reject.
PANEL STATEMENT: The term agricultural establishments does not include dwelling units. The term applies to those buildings used expressly for agricultural purposes and the term dwelling is defined in Article 100.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1309)

7- 11 - (320-3): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise existing 320-3 (320-10 New) to convert text to a list.
~~320-3.~~ 320-10. Uses Permitted. Open wiring on insulators shall be permitted only for industrial or agricultural establishments on systems of 600 volts, nominal, or less as follows:
(1) indoors or outdoors
(2) in wet or dry locations
(3) where subject to corrosive vapors
(4) ~~and~~for services.
SUBSTANTIATION: NEC Style Manual Section 3.3.2 requires that where possible lists or tables be used to present requirements, rather than long text descriptions.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-3a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #3722)

7- 12 - (320-3): Reject
SUBMITTER: Barry Bauman, Alliante Energy/Rep. Alliant Energy/Rep. American Society of Agricultural Engineers
RECOMMENDATION: Revise text to read as follows:
"Open wiring on insulators shall be permitted on systems of 600 volts, nominal, or less, only for industrial ~~or agricultural~~ establishments, indoors or outdoors, in wet or dry locations, where subject to corrosive vapors, and for services."
SUBSTANTIATION: Open wiring on insulators is not appropriate in the interior of modern agricultural buildings. It is being used to avoid more appropriate wiring methods such as UF cable and nonmetallic conduit.
A similar proposal is being submitted for 547-4(a).
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided technical substantiation to demonstrate that the use of this wiring method is not appropriate.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1310)

7- 13 - (320-4): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Add a new Section 320-4 (320-12 New) as follows:
320-4. Uses Not Permitted. Open wiring on insulators shall not be installed where concealed by the building structure.
Delete the last phrase in 320-1 (320-2 New) which reads "and not concealed by the building structure."
SUBSTANTIATION: Requirement relocated from the last sentence of the definition and restated as a complete sentence. This requirement is more appropriate under Uses Not Permitted rather than as part of the Definition.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-3a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1311)

7- 14 - (320-5(b)): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Delete 320-5(b) (320-80 New) in its entirety.
SUBSTANTIATION: Section 90-3 adequately covers this requirement. The NEC Style Manual Section 4.1 states "Do not use a reference if the requirement is already covered by 90-3.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-3a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1060)

7- 15 - (320-6(a)): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise Article 320 as follows:
320-6(a) - change "No. 8" to "8 AWG" in two places
320-6(b) - change "No. 8" to "8 AWG" in two places
320-8 - change "No. 8" to "8 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #272)

7- 16 - (320-6(c)): Reject
SUBMITTER: Charles M. Trout, Maron Electric Co.
RECOMMENDATION: Delete Section 320-6(c) entirely.
SUBSTANTIATION: There is absolutely no reason for any "Industrial Establishment" to operate at a lessor degree of safety than any other installation. The practical safeguarding of persons and property from hazards arising from the use of electricity is no less important because of the industrial establishment location of the installation. To operate under the subterfuge that "conditions of maintenance and supervision ensures that only qualified persons will service the system", appears to be nothing more than a cover-up for a system of self-certification. There is nothing in these Code provisions that indicates what are the "conditions of maintenance and supervision", who ensures that "only qualified persons will service the system", who determines the "qualifications" of the persons that will service the system. The burden on the authority having jurisdiction will be impossible. How often must the continued employment of these "qualified" persons be monitored? Are the installations made in other occupancies more stringent because they are not maintained? Are the requirements of the Code a result of a study of how well maintained the installations are going to be? If a change in management policy dictates removal of these "qualified persons", who bears the responsibility for revisions to bring the installation into compliance with the code.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided substantiation of any problems with supporting conductors in accordance with 320-6(c).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #811)

7- 17 - (320-14): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Protection from Physical Damage. Conductors ~~within~~ less than 7 ft (2.13 m) ~~from~~ above the floor or grade shall be considered exposed to physical damage.
(remainder unchanged)
SUBSTANTIATION: Editorial. Since this wiring method may be used outdoors or in buildings where there are no floors, grade should be included.
PANEL ACTION: Reject.
PANEL STATEMENT: The addition of the new wording does not enhance the clarity of this section. The use of the term grade could cause confusion due to multiple interpretations of the term.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
NOT RETURNED: 1 Ensign
EXPLANATION OF NEGATIVE:
TRAINOR: It would seem that the submitter is correct in noting that open wiring on insulators can be used outdoors and that the present requirement appears to address indoor installations only. I recommend that this proposal be accepted.

ARTICLE 321 — MESSENGER SUPPORTED WIRING

(Log #CP704)

7- 17a - (321): Accept

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: CMP 7

RECOMMENDATION: Rewrite Article 321 to comply with NEC Style Manual.

321 -- Messenger Supported Wiring

I General

321-1. Scope. This article covers the use, installation, and construction specifications for Messenger Supported Wiring.

321-2. Definition.

Messenger Supported Wiring. An exposed wiring support system using a messenger wire to support insulated conductors by any one of the following:

(1) A messenger with rings and saddles for conductor support.

(2) A messenger with a field-installed lashing material for conductor support.

(3) Factory-assembled aerial cable.

(4) Multiplex cables utilizing a bare conductor, factory assembled and twisted with one or more insulated conductors, such as duplex, triplex, or quadruplex type of construction.

II Installation

321-10. Uses Permitted.

(a) Cable Types. The following shall be permitted to be installed in messenger supported wiring under the conditions described in the article or section referenced for each:

Article	Section
Metal-clad cable	334
Mineral-insulated, metal-sheathed cable	330
Multiconductor service-entrance cable	338
Multiconductor underground feeder and branch-circuit cable	339
Other factory-assembled, multiconductor control, signal, or power cables that are identified for the use	
Power and control tray cable	340
Power-limited tray cable	725-61(c) and 725-71(e)

(b) In Industrial Establishments. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons will service the installed messenger supported wiring, the following shall be permitted:

(1) Any of the conductor types shown in Table 310-13 or Table 310-62

(2) MV cable

Where exposed to weather, conductors shall be listed for use in wet locations. Where exposed to direct rays of the sun, conductors or cables shall be sunlight resistant.

(c) Hazardous (Classified) Locations. Messenger supported wiring shall be permitted to be used in hazardous (classified) locations where the contained cables are permitted for such use in 501-4, 502-4, 503-3, and 504-20.

321-12. Uses Not Permitted. Messenger supported wiring shall not be used in hoistways or where subject to severe physical damage.

321-30. Messenger Support. The messenger shall be supported at dead ends and at intermediate locations so as to eliminate tension on the conductors. The conductors shall not be permitted to come into contact with the messenger supports or any structural members, walls, or pipes.

.321-56. Conductor Splices and Taps. Conductor splices and taps made and insulated by approved methods shall be permitted in messenger supported wiring.

321-60. Grounding. The messenger shall be grounded as required by 250-80 and 250-86 for enclosure grounding.

SUBSTANTIATION: This revision to Article 321 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with the usability effort. Specific proposals addressed by this revision include 7-18, 7-19, 7-20, 7-21, 7-22, and 7-27.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #1376)

7- 18 - (321): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise Article as Follows:

Article 321 — Messenger Supported Wiring

~~321-1.~~ 321-2 Definition. Messenger supported wiring is an exposed wiring support system using a messenger wire to support insulated conductors by any one of the following:

1. A messenger with rings and saddles for conductor support

2. A messenger with a field-installed lashing material for conductor support

3. Factory-assembled aerial cable

4. Multiplex cables utilizing a bare conductor, factory assembled and twisted with one or more insulated conductors, such as duplex, triplex, or quadruplex type of construction

~~321-2.~~ 321-3 Other Articles. Messenger supported wiring shall comply with this article and also with the applicable provisions of other articles in this Code, especially Articles 225 and 300.

~~321-3.~~ 321-10 Uses Permitted.

(a) Cable Types. The following shall be permitted to be installed in messenger supported wiring under the conditions described in the article or section referenced for each:

Article	Section
Metal-clad cable	334
Mineral-insulated, metal-sheathed cable	330
Multiconductor service-entrance cable	338
Multiconductor underground feeder and branch-circuit cable	339
Other factory-assembled, multiconductor control, signal, or power cables that are identified for the use	
Power and control tray cable	340
Power-limited tray cable	725-61(c) and 725-71(e)

(b) In Industrial Establishments. In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons will service the installed messenger supported wiring, the following shall be permitted:

1. Any of the conductor types shown in Table 310-13 or Table 310-62

2. MV Cable. Where exposed to weather, conductors shall be listed for use in wet locations. Where exposed to direct rays of the sun, conductors or cables shall be sunlight resistant.

(c) Hazardous (Classified) Locations. Messenger supported wiring shall be permitted to be used in hazardous (classified) locations where the contained cables are permitted for such use in Sections 501-4, 502-4, 503-3, and 504-20.

~~321-4.~~ 321-12 Uses Not Permitted. Messenger supported wiring shall not be used in hoistways or where subject to severe physical damage.

~~321-6.~~ 321-30 Messenger Support. The messenger shall be supported at dead ends and at intermediate locations so as to eliminate tension on the conductors. The conductors shall not be permitted to come into contact with the messenger supports or any structural members, walls, or pipes.

~~321-8.~~ 321-56 Conductor Splices and Taps. Conductor splices and taps made and insulated by approved methods shall be permitted in messenger supported wiring.

~~321-7.~~ 321-60 Grounding. The messenger shall be grounded as required by Sections 250-80 and 250-86 for enclosure grounding.

~~321-5.~~ 321-80 Ampacity. The ampacity shall be determined by Section 310-15.

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering cable and wiring.

A uniform format is proposed to achieve consistency across all of the cable and wiring articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for cable and wiring not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-17a.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #270)

7- 19 - (321-1 and 321-2): Accept in Principle
SUBMITTER: Charles M. Trout, Maron Electric Co.
RECOMMENDATION: Delete all the present text in Section 321-2. Other Articles and retitle to Section 321.2. Definitions.
Relocate the present text of Section 321-1. Definitions to retitled Section 321-2. Definitions.
Retitle Section 321-1. Scope and insert the following text:
"This article covers the use, installation and construction specifications of messenger supported wiring."
SUBSTANTIATION: As presently written, Section 321-2 titled "Other Articles" directs compliance with this article. This compliance is more properly shown as being the scope of this article. It is redundant to indicate that compliance with other applicable provisions of this code is required. This information is adequately covered in Section 90-3. To indicate that compliance with "especially" Articles 225 and 300 is a requirement, is not only redundant as to Section 90-3 but appears to place a premium on the value of safety in these articles. The use of the term "especially" indicates an exceptional degree of importance being given to particular requirements or conversely indicates a lack of importance to some safety requirements. The National Electrical Code should not apply degrees of safety to its requirements.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-17a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1312)

7- 20 - (321-1): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Add new text to read:
321-1. Scope. This article covers the use, installation, and construction specifications for Messenger Supported Wiring.
Renumber existing Sections accordingly.
SUBSTANTIATION: NEC Style Manual requires that each article contain a statement of scope and that the scope statement be the first section of the article. See 2.2.1 and 2.2.2.2.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-17a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1313)

7- 21 - (321-2): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Delete this section.
SUBSTANTIATION: Section 90-3 adequately covers this requirement. NEC Style Manual, Section 4.1, requires that references not be provided if the material is already covered by Section 90-3. Also Section 4.1.1 prohibits referencing an entire Article.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-17a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1415)

7- 22 - (321-2): Accept in Principle
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Delete 321-2 in its entirety.
SUBSTANTIATION: The 1999 National Electrical Code Style Manual 4.1 states "Do not use a reference if the requirement is already covered by 90.3". 4.1.1 of the Style Manual stipulates that "References shall not be made to an entire article...unless additional conditions are specified."
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-17a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1213)

7- 23 - (Table 321-3): Accept
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 16 for information.
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise the reference for power limited tray cable from 725-71(e) to 725-71(f).
SUBSTANTIATION: If my proposal to establish a new section 725-71(b) is accepted, a new section is added and the sections will be renumbered including section 725-71(e). The new section creates two new cable types, Type CL3P-50 and Type CL2P-50. This proposal correlates section 321-3 with those proposed changes.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel accepts the proposal contingent upon acceptance of the referenced proposal by CMP 16. CMP 7 refers this action to the Technical Correlating Committee for correlation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
ABSTENTION: 1
NOT RETURNED: 1 Ensign
EXPLANATION OF ABSTENTION:
HALL: No industry consenses with the Society of the Plastics Industry could be reached on this proposal. Due to this, I am abstaining.

(Log #269)

7- 24 - (321-3(b)): Reject
SUBMITTER: Charles M. Trout, Maron Electric Co.
RECOMMENDATION: Delete Section 321-3(b) In "Industrial Establishments" in its entirety.
SUBSTANTIATION: There is absolutely no reason for any "Industrial Establishment" to operate at a lesser degree of safety than any other installation. To operate under the subterfuge that "conditions" of maintenance and supervision ensures that only qualified persons will service the installed messenger supported wiring is nothing more than a cover-up for self certification. There is nothing in these or any other Code provisions that indicates what are the "conditions of maintenance and supervision", who ensures that "only qualified persons will service the installed messenger supported wiring", who determines the "qualifications" of these people. The burden on the authority having jurisdiction will be impossible. How often must the continued employment of these "qualified" be monitored. Are the requirements for installation in other occupancies more stringent because of the quality of maintenance? Are the requirements of the code a result of a study of how well-maintained the installations are going to be? If a change in management policy dictates removal of these "qualified persons", who bears the responsibility for revisions necessary to bring the installation into compliance with the code.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided substantiation of any problems with supporting conductors in accordance with 321-3(b).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #813)

7- 25 - (321-3(b), Exception (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add an exception to read as follows:
Exception: Where permitted elsewhere in this code, bare equipment grounding conductors and bare grounded circuit conductors shall be permitted.
SUBSTANTIATION: Editorial. Bare conductors are not indicated in Tables 310-13 or 310-62, nor listed for wet locations or sunlight resistance. Section 321-1(4) indicates a bare conductor, as does Section 250-184(a) Exception No. 2.
PANEL ACTION: Reject.
PANEL STATEMENT: Grounded conductors are required to be insulated except as permitted in Article 230. The reference for equipment grounding conductors is not necessary as they are addressed by 250-119.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1843)

7- 26 - (321-4): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Delete the word "severe" in the second line.
SUBSTANTIATION: There is no distinction between "physical damage" and "severe physical damage" in the code; messenger supported wiring should not be subjected to physical damage.
Section 3.2.5.4 of the 1999 National Electrical Code Style Manual also shows "protection against physical damage".
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1314)

7- 27 - (321-5): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Delete 321-5 (321-80 New) in its entirety.
SUBSTANTIATION: Section 90-3 adequately covers this requirement. The NEC Style Manual Section 4.1 states "Do not use a reference if the requirement is already covered by 90-3.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-17a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #814)

7- 28 - (321-8): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Except where conductors are components of Type MC or Type MI cable, ~~Conductor~~ conductor splices and taps made an insulated by approved methods shall be permitted in messenger supported wiring without a box or conduit body, except that splices for equipment grounding conductors shall not be required to be insulated.
SUBSTANTIATION: The inferred intent is that a box or conduit body is not required for splices or taps. If that perception is correct, it should be clearly stated. However, Type MC and MI cables should be excluded to prevent conductor damage and maintain grounding paths. Equipment grounding conductors normally need not be insulated at splices.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing text adequately addresses the splicing of messenger supported wiring using approved methods.

ARTICLE 324 — CONCEALED KNOB-AND-TUBE WIRING

(Log #460)

7- 29 - (324): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 324-6 - revise second sentence as follows:
"Supports shall be installed as follows:
(1) Within 150 mm (6 in.) ~~6 in. (152 mm)~~ of each side of each tap or splice
(2) At intervals not exceeding 1.4 m (4 1/2 ft) ~~4 1/2 ft (1.37 m)~"~~
324-8(a) - revise as follows:
"A clearance of not less than 75 mm (3 in.) ~~3 in. (76 mm)~~ shall be maintained between conductors and a clearance of not less than 25 mm (1 in.) ~~1 in. (25.4 mm)~~ between the conductor and the surface over which it passes."
324-9 - change "3 in. (76 mm)" to "75 mm (3 in.)"
324-11(a) - revise second sentence as follows:
"Where run through bored holes, conductors in the joists and in studs or rafters to a height of not less than 2.1 m (7 ft) ~~7 ft (2.13 m)~~ above the floor or floor joists shall be protected by substantial running boards extending not less than 25 mm (1 in.) ~~1 in. (25.4 mm)~~ on each side of the conductors."
324-11(b) Exception - change "3 ft (914 mm)" to "900 mm (3 ft)"
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-29a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #CP705)

7- 29a - (324): Accept
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: CMP 7
RECOMMENDATION: Rewrite Article 324 to comply with NEC Style Manual.

ARTICLE 324 -- Concealed Knob-and-Tube Wiring

I General

324-1. Scope. This article covers the use, installation, and construction specifications of Concealed Knob-and-Tube Wiring.
324-2. Definition.
Concealed Knob-and-Tube Wiring. A wiring method using knobs, tubes, and flexible nonmetallic tubing for the protection and support of single insulated conductors.

II Installation

324-10. Uses Permitted. Concealed knob-and-tube wiring shall be permitted to be installed in the hollow spaces of walls and ceilings or in unfinished attics and roof spaces as provided in 324-23 only as follows:
(1) For extensions of existing installations
(2) Elsewhere by special permission
324-12. Uses Not Permitted. Concealed knob-and-tube wiring shall not be used in following:
(1) Commercial garages
(2) Theaters and similar locations
(3) Motion picture studios
(4) Hazardous (classified) locations
(5) Hollow spaces of walls, ceilings, and attics where such spaces are insulated by loose, rolled, or foamed-in-place insulating material that envelops the conductors
324-17. Through or Parallel to Framing Members. Conductors shall comply with 320-11 where passing through holes in structural members. Where passing through wood cross members in plastered partitions, conductors shall be protected by noncombustible, nonabsorbent, insulating tubes extending not less than 75 mm (3 in.) beyond the wood member
324-19. Clearances.
(a) General. A clearance of not less than 75 mm (3 in.) shall be maintained between conductors and a clearance of not less than 25 mm (1 in.) between the conductor and the surface over which it passes.

(b) Limited Conductor Space. Where space is too limited to provide these minimum clearances, such as at meters, panelboards, outlets, and switch points, the individual conductors shall be enclosed in flexible nonmetallic tubing, which shall be continuous in length between the last support and the enclosure or terminal point.

(c) Clearance from Piping, Exposed Conductors, etc. Conductors shall comply with 320-19 for clearances from other exposed conductors, piping, etc.

324-23. In Accessible Attics. Conductors in unfinished attics and roof spaces shall comply with (a) or (b).

FPN: See 310-10 for temperature limitation of conductors.

(a) Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the side of or through bored holes in floor joists, studs, or rafters. Where run through bored holes, conductors in the joists and in studs or rafters to a height of not less than 2.1 m (7 ft.) above the floor or floor joists shall be protected by substantial running boards extending not less than 25 mm (1 in.) on each side of the conductors. Running boards shall be securely fastened in place. Running boards and guard strips shall not be required where conductors are installed along the sides of joists, studs, or rafters.

(b) Not Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the sides of or through bored holes in floor joists, studs, or rafters.

Exception: In buildings completed before the wiring is installed, attic and roof spaces that are not accessible by stairway or permanent ladder and have headroom at all points less than 900 mm (3 ft.), the wiring shall be permitted to be installed on the edges of rafters or joists facing the attic or roof space.

324-30 Securing and Supporting.

(a) Supporting. Conductors shall be rigidly supported on noncombustible, nonabsorbent insulating materials and shall not contact any other objects. Supports shall be installed as follows:

(1) Within 150 mm (6 in.) of each side of each tap or splice and

(2) At intervals not exceeding 1.4 m (4 1/2 ft)

Where it is impracticable to provide supports, conductors shall be permitted to be fished through hollow spaces in dry locations, provided each conductor is individually enclosed in flexible nonmetallic tubing that is in continuous lengths between supports, between boxes, or between a support and a box.

(b) Securing. Where solid knobs are used, conductors shall be securely tied thereto by tie wires having insulation equivalent to that of the conductor.

324-42. Devices. Switches shall comply with 380-4 and 380-10(b).

324-56. Splices and Taps. Splices shall be soldered unless approved splicing devices are used. In-line or strain splices shall not be used.

III Construction Specifications

324-104. Conductors. Conductors shall be of a type specified by Article 310.

SUBSTANTIATION: This revision to Article 324 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with the usability effort. Specific proposals addressed by this revision include 7-29, 7-30, 7-31, 7-32, 7-33, 7-34, 7-35, 7-36, and 7-38.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #1377)

7- 30 - (324): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise text to read as follows:

Article 324 — Concealed Knob-and-Tube Wiring

I. General

~~324-1.~~ 324-2. Definition. Concealed knob-and-tube wiring. ~~is a~~ A wiring method using knobs, tubes, and flexible nonmetallic tubing for the protection and support of single insulated conductors.

~~324-2.~~ 324-3. Other Articles. Concealed knob-and-tube wiring shall comply with this article and also with the applicable provisions of other articles in this Code, especially Article 300.

II. Installation

~~324-3.~~ 324-10. Uses Permitted. Concealed knob-and-tube wiring shall be permitted to be installed in the hollow spaces of walls and ceilings or in unfinished attics and roof spaces as provided in Section ~~324-11~~ 324-23 only as follows:

1. For extensions of existing installations, or

2. Elsewhere by special permission.

~~324-4.~~ 324-12. Uses Not Permitted. Concealed knob-and-tube wiring shall not be used in commercial garages, theaters and similar locations, motion picture studios, hazardous (classified) locations, or in the hollow spaces of walls, ceilings, and attics where such spaces are insulated by loose, rolled, or foamed-in-place insulating material that envelops the conductors.

~~324-9. Through Walls, Floors, Wood Cross Members, etc.~~

324-17 Through or Parlallel to Framing Members. Conductors shall comply with Section ~~320-11~~ 320-17 (New) where passing through holes in structural members. Where passing through wood cross members in plastered partitions, conductors shall be protected by noncombustible, nonabsorbent, insulating tubes extending not less than 3 in. (76 mm) beyond the wood member.

~~324-8.~~ 324-19. ~~Conductor~~ Clearances.

(a) General. A clearance of not less than 3 in. (76mm) shall be maintained between conductors and a clearance of not less than 1 in. (25.4 mm) between the conductor and the surface over which it passes.

(b) Limited Conductor Space. Where space is too limited to provide these minimum clearances, such as at meters, panelboards, outlets, and switch points, the individual conductors shall be enclosed in flexible nonmetallic tubing, which shall be continuous in length between the last support and the enclosure or terminal point.

~~324-10.~~ (c) Clearance from Piping, Exposed Conductors, etc. Conductors shall comply with Section 320~~-12~~-19 for clearances from other exposed conductors, piping, etc.

~~324-11. Unfinished Attics and Roof Spaces.~~

324-23. In Accessible Attics. Conductors in unfinished attics and roof spaces shall comply with (a) or (b).

FPN: See Section 310-10 for temperature limitation of conductors.

(a) Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the side of or through bored holes in floor joists, studs, or rafters. Where run through bored holes, conductors in the joists and in studs or rafters to a height of not less than 7 ft (2.13 m) above the floor or floor joists shall be protected by substantial running boards extending not less than 1 in. (25.4 mm) on each side of the conductors. Running boards shall be securely fastened in place. Running boards and guard strips shall not be required where conductors are installed along the sides of joists, studs, or rafters.

(b) Not Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the sides of or through bored holes in floor joists, studs, or rafters.

Exception: In buildings completed before the wiring is installed, attic and roof spaces that are not accessible by stairway or permanent ladder and have headroom at all points less than 3 ft (914 mm), the wiring shall be permitted to be installed on the edges of rafters or joists facing the attic or roof space.

~~324-6. Conductor Supports.~~

324-30. Securing and Supporting.

(a) Supporting. Conductors shall be rigidly supported on noncombustible, nonabsorbent insulating materials and shall not contact any other objects. Supports shall be installed ~~as follows~~:

1. within 6 in. (152 mm) of each side of each tap or splice, and

2. at intervals not exceeding 4 1/2 ft (1.37 m).

Where it is impracticable to provide supports, conductors shall be permitted to be fished through hollow spaces in dry locations, provided each conductor is individually enclosed in flexible nonmetallic tubing that is in continuous lengths between supports, between boxes, or between a support and a box.

~~324-7. Tie Wires~~ (b) Securing. Where solid knobs are used, conductors shall be securely tied thereto by tie wires having insulation equivalent to that of the conductor.

~~324-13.~~ 324-40. Boxes and Fittings, Outlet boxes shall comply with Article 370.

~~324-14 Switches.~~ 324-42. Devices. Switches shall comply with Sections 380-4 and 380-10(b).

~~324-12.Splices.~~ 324-56. Splices and Taps. Splices shall be soldered unless approved splicing devices are used. In-line or strain splices shall not be used.

~~324-5(b)~~ 324-80. Ampacity. The ampacity shall comply with Section 310-15.

III. Construction Specifications

~~324-5.~~ 324-104. Conductors.

~~(a) Type.~~Conductors shall be of a type specified by Article 310.

SUBSTANTIATION: The proposed article re-write was developed as part of a larger effort by the NEC Usability Committee to re-format existing raceway, cable and wiring articles. The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as stated in the NEC Style Manual 2.4.1. It is hoped that the parallel code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.

To the extent that this was possible in this article, this has been done. It is not the intent or purpose of this re-write to change the actual intent of the existing article requirements. The only new material in this proposal is the proposed new article scope which has been added to conform with the NEC Style Manual 2.2.1

A companion proposal has also been submitted which re-structures the article to a greater degree by splitting existing Code requirements into new sections to better adhere to the new article format. In some cases this is done with an alternate article re-write while in other cases, individual proposals have been submitted. These proposals are also intended to further enhance the structure and format of the article but in some cases existing code text requirements had to be revised or altered to meet the re-formatting needs. For this reason the proposals are separate which will allow the Code Making Panels to individually consider each proposal.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-29a.

ARTICLE 325 — INTEGRATED GAS SPACER CABLE: TYPE IGS

(Log #CP706)

7- 39a - (325): Accept
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: CMP 7
RECOMMENDATION: Rewrite Article 325 to comply with NEC Style Manual.

ARTICLE 325 -- Integrated Gas Spacer Cable: Type IGS

I General

325-1. Scope. This article covers the use, installation, and construction specifications for Integrated Gas Spacer Cable, Type IGS.

325-2. Definition.
Integrated Gas Spacer Cable, Type IGS. A factory assembly of one or more conductors, each individually insulated and enclosed in a loose fit, nonmetallic flexible conduit as an integrated gas spacer cable rated 0 through 600 volts.

II Installation

325-10. Uses Permitted. Type IGS cable shall be permitted for use underground, including direct burial in the earth, as:
(1) Service-entrance conductors.
(2) Feeder or branch-circuit conductors.

325-12. Uses Not Permitted. Type IGS cable shall not be used as interior wiring or be exposed in contact with buildings.

325-24. Bending Radius. Where the coilable nonmetallic conduit and cable is bent for installation purposes or is flexed or bent during shipment or installation, the radii of bends measured to the inside of the bend shall not be less than specified in Table 325-24.

Table 325-24. Minimum Radii of Bends

Conduit Metric Designator	Conduit Trade Size	Minimum Radii mm	in
53	2	600	24
78	3	900	35
103	4	1150	45

325-26. Bends. A run of Type IGS cable between pull boxes or terminations shall not contain more than the equivalent of four quarter bends (360 degrees total), including those bends located immediately at the pull box or terminations.

325-40. Fittings. Terminations and splices for Type IGS cable shall be identified as a type that is suitable for maintaining the gas pressure within the conduit. A valve and cap shall be provided for each length of the cable and conduit to check the gas pressure or to inject gas into the conduit.

325-80. Ampacity. The ampacity of Type IGS cable shall not exceed values shown in Table 325-80.

Table 325-80. Ampacity of Type IGS Cable

Size (kcmil)	Amperes	Size (kcmil)	Amperes
250	119	2500	376
500	168	3000	412
750	206	3250	429
1000	238	3500	445
1250	266	3750	461
1500	292	4000	476
1750	344	4250	491
2000	336	4500	505
2250	357	4750	519

III. Construction Specifications

325-104. Conductors. The conductors shall be solid aluminum rods, laid parallel, consisting of one to nineteen 12.7 mm (1/2 in) diameter rods. The minimum conductor size shall be 250 kcmil and the maximum size shall be 4750 kcmil.

325-112. Insulation. The insulation shall be dry kraft paper tapes and a pressurized sulfur hexafluoride gas (SF6), both approved for electrical use. The nominal gas pressure shall be 138 kPa gauge (20 pounds per square inch gauge). The thickness of the paper spacer shall be as specified in Table 325-112.

Table 325-112. Paper Spacer Thickness

	Thickness	
Size (kcmil)	mm	in.
250–1000	1.02	0.040
1250–4750	1.52	0.060

325-116. Conduit. The conduit shall be a medium density polyethylene identified as suitable for use with natural gas rated pipe in metric designator 53, 78, or 103 (trade size 2, 3, or 4). The percent fill dimensions for the conduit are shown in Table 325-116.
The size of the conduit permitted for each conductor size shall be calculated for a percent fill not to exceed those found in Table 1, Chapter 9.

Table 325-116. Conduit Dimensions

Conduit Metric Designator	Conduit Trade Size	Actual Outside Diameter		Actual Inside Diameter	
		mm	In.	mm	in.
53	2	60	2.375	49.46	1,947
78	3	89	3.500	73.30	2.886
103	4	114	4.500	94.23	3.710

325-120. Marking. The cable shall be marked in accordance with 310-11(a), 310-11(b)(1), and 310-11(d).
SUBSTANTIATION: This revision to Article 325 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with the usability effort. Specific proposals addressed by this revision include 7-40, 7-41, 7-42, 7-43, 7-44, 7-45, 7-46, 7-47, 7-48, 7-49, 7-50, and 7-51.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1378)

7- 40 - (325): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise text to read as follows:

ARTICLE 325 -- Integrated Gas Spacer Cable: Type IGS

~~A.~~ I. General

325-1 325-2. Definition. Type IGS cable is a factory assembly of one or more conductors, each individually insulated and enclosed in a loose fit, nonmetallic flexible conduit as an integrated gas spacer cable rated 0 through 600 volts.

~~325-2~~ 325-3 . Other Articles. Type IGS cable shall comply with this article and also with the applicable provisions of other articles in this Code.

~~B.~~ II. Installation

~~325-3~~ 325-10. Uses Permitted. Type IGS cable shall be permitted for use underground, including direct burial in the earth, as service-entrance conductors, or as feeder or branch-circuit conductors.

~~325-4~~ 325-12. Uses Not Permitted. Type IGS cable shall not be used as interior wiring or be exposed in contact with buildings.

~~325-11~~ 325-24. Bending Radius. Where the coilable nonmetallic conduit and cable is bent for installation purposes or is flexed or bent during shipment or installation, the radii of bends measured to the inside of the bend shall not be less than specified in Table ~~325-11~~ 325-24.

Table ~~325-11~~ 325-24. Minimum Radii of Bends

Conduit Trade Size (in.)	Minimum Radii In.	Mm
2	24	~~610~~
3	35	~~889~~
4	45	~~1143~~

~~325-12~~ 325-26. Bends. A run of Type IGS cable between pull boxes or terminations shall not contain more than the equivalent of four quarter bends (360 degrees total), including those bends located immediately at the pull box or terminations.

~~325-13~~ 325-40. Fittings. Terminations and splices for Type IGS cable shall be identified as a type that is suitable for maintaining the gas pressure within the conduit. A valve and cap shall be provided for each length of the cable and conduit to check the gas pressure or to inject gas into the conduit.

325-14 325-80. Ampacity. The ampacity of Type IGS cable and conduit shall not exceed values shown in Table ~~325-14~~ 325-80 for single conductor or multiconductor cable.

Table ~~325-14~~ 325-80. Ampacity of Type IGS Cable

Size (kcmil)	Amperes	Size (kcmil)	Amperes
250	119	2500	376
500	168	3000	412
750	206	3250	429
1000	238	3500	445
1250	266	3750	461
1500	292	4000	476
1750	344	4250	491
2000	336	4500	505
2250	357	4750	519

~~C.~~ III. Construction Specifications

~~325-20~~ 325-100. Conductors. The conductors shall be solid aluminum rods, laid parallel, consisting of one to nineteen 1/2-in. (12.7-mm) diameter rods.

The minimum conductor size shall be 250 kcmil and the maximum size shall be 4750 kcmil.

~~325-21~~ 325-112. Insulation. The insulation shall be dry kraft paper tapes and a pressurized sulfur hexafluoride gas (SF6), both approved for electrical use. The nominal gas pressure shall be 20 pounds per square inch gauge (psig) (138 kPa gauge).

The thickness of the paper spacer shall be as specified in Table ~~325-21~~ 325-112.

Table ~~325-21~~. 325-112. Paper Spacer Thickness

Size (kcmil)	Thickness in.	mm
250–1000	0.040	1.02
1250–4750	0.060	1.52

~~325-22.~~ 325-116. Conduit. The conduit shall be a medium density polyethylene identified as suitable for use with natural gas rated pipe in 2-in., 3-in., or 4-in. trade size. The percent fill dimensions for the conduit are shown in Table ~~325-22.~~ 325-116.

The size of the conduit permitted for each conductor size shall be calculated for a percent fill not to exceed those found in Table 1, Chapter 9.

Table ~~325-22.~~ 325-116. Conduit Dimensions

Conduit Trade Size (in.)	Outside Diameter in.	mm	Inside Diameter in.	mm
2	2.375	60	1.947	49.46
3	3.500	89	2.886	73.30
4	4.50	114	3.710	94.23

~~325-24~~ 325-120. Marking. The cable shall be marked in accordance with Sections 310-11(a), 310-11(b)(1), and 310-11(d).
SUBSTANTIATION: The proposed article re-write was developed as part of a larger effort by the NEC Usability Committee to re-format existing raceway, cable and wiring articles. The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as stated in the NEC Style Manual 2.4.1. It is hoped that the parallel code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.

To the extent that this was possible in this article, this has been done. It is not the intent or purpose of this re-write to change the actual intent of the existing article requirements. The only new material in this proposal is the proposed new article scope which has been added to conform with the NEC Style Manual 2.2.1

A companion proposal has also been submitted which re-structures the article to a greater degree by splitting existing Code requirements into new sections to better adhere to the new article format. In some cases this is done with an alternate article re-write while in other cases, individual proposals have been

submitted. These proposals are also intended to further enhance the structure and format of the article but in some cases existing code text requirements had to be revised or altered to meet the re-formatting needs. For this reason the proposals are separate which will allow the Code Making Panels to individually consider each proposal.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-39a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #273)

7- 41 - (325-1 and 325-2): Accept in Principle
SUBMITTER: Charles M. Trout, Maron Electric Co.
RECOMMENDATION: Delete the present text in Section 325-2. Other Articles and retitle Section 325-2. Definitions.
Relocate the present text of Section 325-1. Definitions to retitled Section 325-2. Definitions.
Retitle Section 325-1. Scope and insert the following text:
"This article covers the use, installation, and construction specifications of integrated gas spacer cable."
SUBSTANTIATION: As presently written, Section 325-2 title Other Articles directs compliance with this article. This requirement for compliance is more properly shown as being the scope of this article. It is redundant to indicate that compliance with other articles of this code is required. This information is adequately covered in Section 90-3.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-39a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1321)

7- 42 - (325-1): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Add new text to read:
325-1. Scope. This article covers the use, installation, and construction specifications for Integrated Gas Spacer Cable.
Renumber existing Sections accordingly.
SUBSTANTIATION: NEC Style Manual requires that each article contain a statement of scope and that the scope statement be the first section of the article. See 2.2.1 and 2.2.2.2.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-39a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1320)

7- 43 - (325-1-Integrated Gas Spacer Cable (Type IGS)): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise 325-1 (325-2. New) definition as follows:
Integrated Gas Spacer Cable (Type IGS). ~~Type IGS cable is a~~ A factory assembly of one or more conductors, each individually insulated and enclosed in a loose fit, nonmetallic flexible conduit as an integrated gas spacer cable rated 0 through 600 volts.
SUBSTANTIATION: The Definition has been editorially revised to match the sentence structure of the other cable and wiring articles which contain a "definition" of the covered cable or wiring article. It is not intended that this change be other than editorial to provide a similar format where the definition follows a standard sentence structure where ever possible.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-39a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1323)

7- 44 - (325-2): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Delete this section.
SUBSTANTIATION: Section 90-3 adequately covers this requirement. NEC Style Manual, Section 4.1, requires that references not be provided if the material is already covered by Section 90-3. Also Section 4.1.1 prohibits referencing an entire Article.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-39a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1417)

7- 45 - (325-2): Accept in Principle
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Delete 325-2 in its entirety.
SUBSTANTIATION: 1999 National Electrical Code Style Manual:
Section 4.1 states "Do not use a reference if the requirement is already covered by 90.3."
Section 4.1.1 stipulates that "References shall not be made to an entire article... unless additional conditions are specified.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-39a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1324)

7- 46 - (325-3): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise existing 325-3 (325-10 New) to convert text to a list.
~~325-3.~~ 325-10. Uses Permitted. Type IGS cable shall be permitted for use underground, including direct burial in the earth as:
(1) service-entrance conductors
(2) feeder or branch-circuit conductors.
SUBSTANTIATION: NEC Style Manual Section 3.3.2 requires that where possible lists or tables be used to present requirements, rather than long text descriptions.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-39a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #462)

7- 47 - (Table 325-11): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise Table 325-11 as follows:

Table 325-11. Minimum Radii of Bends

Metric Designator	~~Conduit~~ Trade Size ~~(in.)~~	Minimum Radii mm	Minimum Radii in.
53	2	600 ~~610~~	24
78	3	900 ~~889~~	35
103	4	1150 ~~1143~~	45

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-39a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1322)

7- 48 - (325-14): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise 325-14 to read :
"The ampacity of Type IGS cable ~~and conduit~~ shall not exceed the values shown in Table 325-14 ~~for single conductor or multiconductor cable~~."
SUBSTANTIATION: Type IGS cable is defined in 325-1 as one or more conductors enclosed in a conduit so the ampacity is for the complete IGS cable and it is not necessary to repeat "for single or multiconductor cable".
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-39a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #461)

7- 49 - (325-20, 21, and 22): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 325-20 - revise as follows:
"The conductors shall be solid aluminum rods, laid parallel, consisting of one to nineteen 12.7 mm (1/2 in.) ~~1/2 in. (12.7 mm)~~ diameter rods."
Table 325-21 - reverse the position of the last two columns.
325-22 - revise the first sentence as follows:
"The conduit shall be a medium density polyethylene identified as suitable for use with natural gas rated pipe in metric designator 53, 78, or 103 (trade size 2, 3, or 4). ~~2 in., 3 in., or 4 in. trade size.~~"
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
The SI units are not rounded in Section 325-20 and Table 325-21 since the diameter of the aluminum rod and the paper spacer thickness are product specific and safety related.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-39a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #463)

7- 50 - (325-21): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise the second sentence as follows:
"The nominal gas pressure shall be 138 kPa (20 pounds per square inch gauge (psig) ~~20 pounds per square inch gauge (psig) (138 kPa gauge).~~"
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
The SI unit is not rounded since the dimension shown is product related.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-39a.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #464)

7- 51 - (Table 325-22): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise Table 325-22 as follows.
(Table shown below)

Table 325-22. Conduit Dimensions

Metric Designator	~~Conduit~~ Trade Size ~~(in.)~~	*Actual Outside Diameter* mm	*Actual Outside Diameter* in.	Actual Inside Diameter mm	Actual Inside Diameter in.
53	2	60	2.375	49.46	1.947
78	3	89	3.500	73.30	2.886
103	4	114	4.500	94.23	3.710

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI unit as the preferred unit and the inch-pound units immediately following in parenthesis.
The SI units are not rounded since the conduit dimensions require a soft conversion because of wire fill calculations.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-39a.

ARTICLE 326 — MEDIUM VOLTAGE CABLE: TYPE MV

(Log #CP707)

7- 52a - (326): Accept
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: CMP 7
RECOMMENDATION: Rewrite Article 326 to comply with NEC Style Manual.
ARTICLE 326 -- Medium Voltage Cable: Type MV
I General
326-1. Scope. This article covers the use, installation, and construction specifications for Medium Voltage Cable, Type MV.
326-2. Definition.
Medium Voltage Cable, Type MV. A single or multiconductor solid dielectric insulated cable rated 2001 volts or higher.
II Installation
326-10. Uses Permitted. Type MV cables shall be permitted for use on power systems rated up to 35,000 volts, nominal:
(1) In wet or dry locations
(2) In raceways
(3) In cable trays as specified in 318-3(b)(1)
(4) Direct buried in accordance with 300-50
(5) In messenger supported wiring
326-12. Uses Not Permitted. Type MV cable shall not be used unless identified for the use:
(1) Where exposed to direct sunlight
(2) In cable trays
326-80. Ampacity. The ampacity of Type MV cable shall be determined in accordance with 310-60. The ampacity of Type MV cable installed in cable tray shall be determined in accordance with 318-13.
III Construction Specifications
326-100. Construction. Type MV cables shall have copper, aluminum, or copper-clad aluminum conductors and shall be constructed in accordance with Article 310.
SUBSTANTIATION: This revision to Article 326 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with the usability effort. Specific proposals addressed by this revision include 7-53, 7-54, 7-55, 7-56, 7-58, 7-59, 7-60, 7-61, 7-62, and 7-63.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1379)

7- 53 - (326): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise text to read as follows:
Article 326 — Medium Voltage Cable: Type MV
I. General.
~~326-1.~~ 326-2. Definition.
Medium Voltage Cable (Type MV). ~~cable is a~~ A single or multiconductor solid dielectric insulated cable rated 2001 volts or higher.
~~326-2.~~ 326-3. Other Articles.
In addition to the provisions of this article, Type MV cable shall comply with the applicable provisions of this Code, especially those of Articles 300, 305, 310, 318, and 490.
II. Installation.
~~326-3.~~ 326-10. Uses Permitted. Type MV cables shall be permitted for use on power systems rated up to 35,000 volts, nominal, in wet or dry locations, in raceways, in cable trays as specified in Section 318-3(b)(1) or directly buried in accordance with Section 300-50, and in messenger supported wiring.
~~326-4.~~ 326-12. Uses Not Permitted. Type MV cable shall not be used unless identified for the use (1) where exposed to direct sunlight, and (2) in cable trays.
~~326-6.~~ 326-80. Ampacity. The ampacity of Type MV cable shall be in accordance with Section 310-60.
Exception: The ampacity of Type MV cable installed in cable tray shall be in accordance with Section 318-13.
III. Construction Specifications.
~~326-5.~~ 326-100. Construction. Type MV cables shall have copper, aluminum, or copper-clad aluminum conductors and shall be constructed in accordance with Article 310.
~~326-7.~~ 326-120. Marking. Medium voltage cable shall be marked as required in Section 310-11.
SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering cable and wiring.
A uniform format is proposed to achieve consistency across all of the cable and wiring articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as stated in the NEC Style Manual 2.4.1. It is hoped that the parallel code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.
For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for cable and wiring not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-52a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #268)

7- 54 - (326-1 and 326-2): Accept in Principle
SUBMITTER: Charles M. Trout, Maron Electric Co.
RECOMMENDATION: Delete all of the present text in Section 326-2 "Other Articles" and retitle Section 326-2 "Definitions."
Relocate the present text of Section 326-1 "Definition" to retitled Section 326-2 "Definitions."
Retitle Section 326-1 "Scope" and insert the following text:
"This article covers the use, installation, and construction medium voltage cable: Type MV."
SUBSTANTIATION: As presently written, Section 326-2 titled Other Articles directs compliance with this article. This compliance is more properly shown as being the scope of this article. It is redundant to indicate that compliance with other applicable provisions of this code is required. This information is adequately covered in Section 90-3. To indicate that compliance with "especially" Articles 300, 305, 310, 318, and 490 is

a requirement, is not only redundant to Section 90-3 but appears to place a premium on the value of safety in these articles. The National Electrical Code Style Manual in Part B. References in paragraph B.2(b) discourages cross-references to an entire article unless a reference to one or more sections would not be sufficiently complete. The use of the term "especially" indicates an exceptional degree of importance being given to particular requirements or conversely indicates a lack of importance to some safety requirements.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-52a.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #817)

7- 57 - (326-3): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Type MV cables shall be permitted for use on power systems rated up to 35,000 volts, nominal, in wet or dry locations, in approved raceways, in cablebus assemblies, in auxiliary gutters, in cable trays as specified in Section 318-3(b)(1), as open wiring in accordance with Section 310-7(b), as open wiring in accordance with Article 225 and Section 300-37, ~~or~~ directly buried in accordance with Section 310-7(b), and in messenger supported wiring in accordance with Section 321-3(b).
SUBSTANTIATION: Editorial. Approved raceways should be specified as all are not approved (listed) for over 600 volts. If wiring methods are to be listed they should be inclusive.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 326-3 is not intended to be an all inclusive list of uses permitted, but a list of common applications for the wiring method. Uses not permitted are specifically covered in Section 326-4 and the wiring methods proposed by the submitter are not excluded.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
NOT RETURNED: 1 Ensign
EXPLANATION OF NEGATIVE:
TRAINOR: I do not agree with the Panel Statement. Section 110-8 reads, "Only wiring methods recognized as suitable are included in this Code. The recognized methods of wiring shall be permitted to be installed in any type of building or occupancy, except as otherwise provided in this Code."
Restrictions on the use of wiring methods can be placed in either "Uses Permitted" or "Uses Not Permitted." In uses not permitted, the restriction is generally a specific prohibition. If the wiring method is permitted for any use except those specifically prohibited in uses not permitted, then there should be no entry in uses permitted. Section 300-2 states that the wiring methods specified in Chapter 3 shall be used for voltages of 600 volts, nominal, unless otherwise limited and that they shall be permitted for voltages over 600 volts, nominal only where specifically permitted elsewhere in the Code. Type MV Cable is used on circuits with voltages ranging from 2,000 V to 35,000 V. The present wording of 326-3 allows MV cable to be used "in raceways" with no limitation. This would allow it to be installed in Electrical Nonmetallic Tubing which is clearly not acceptable.
Because MV cable is used at over 600 V, it's permitted uses with other wiring methods must be limited to those which are also identified for use at voltages up to 35,000 V. I agree with the bulk of the submitter's proposal. I believe that the Uses Permitted for Type MV Cable should be very specific and should read something like the following:
(1) In raceways identified for the voltage of the circuit
(2) In cablebus assemblies
(3) In cable trays in accordance with 318-3(b), 318-6(f), 318-12 and 318-13
(4) as open wiring in accordance with Article 225 and Section 300-37
(5) directly buried in accordance with 300-50 and 310-7
(6) in messenger supported wiring in accordance with 321-3(b)
I did not find a reference to over 600 V for Auxiliary Gutters although they are typically used in such systems.

(Log #1327)

7- 58 - (326-3): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise existing 326-3 (326-10 New) to convert text to a list.
~~326-3.~~ 326-10. Uses Permitted
Type MV cables shall be permitted for use on power systems rated up to 35,000 volts, nominal~~,~~:
(1) In ~~in~~ wet or dry locations~~,~~
(2) In ~~in~~ raceways~~,~~
(3) In ~~in~~ cable trays as specified in ~~Section~~ 318-3(b)(1)
(4) Direct ~~or directly~~ buried in accordance with ~~Section~~ 300-50
(5) In ~~and in~~ messenger supported wiring.
SUBSTANTIATION: NEC Style Manual Section 3.3.2 requires that where possible lists or tables be used to present requirements, rather than long text descriptions. The word "Section" was deleted in accordance with the NEC Style Manual requirement in 4.1.2.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-52a.

ARTICLE 328 — FLAT CONDUCTOR CABLE: TYPE FCC

(Log #CP708)

7- 63a - (328): Accept
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
The Technical Correlating Committee directs the Panel to reconsider Section 328-12 to be consistent with the other cable articles. See Proposals 7-89a, 7-128a, 7-247, and 7-265a. This action will be considered by the Panel as a Public Comment.
SUBMITTER: CMP 7
RECOMMENDATION: Rewrite Article 328 to comply with NEC Style Manual.

ARTICLE 328 -- Flat Conductor Cable: Type FCC

I General

328-1. Scope. This article covers a field-installed wiring system for branch circuits incorporating Type FCC cable and associated accessories as defined by the article. The wiring system is designed for installation under carpet squares.
328-2. Definitions.
Type FCC Cable. Three or more flat copper conductors placed edge-to-edge and separated and enclosed within an insulating assembly.
FCC System. A complete wiring system for branch circuits that is designed for installation under carpet squares. The FCC system includes Type FCC cable and associated shielding, connectors, terminators, adapters, boxes, and receptacles.
Cable Connector. A connector designed to join Type FCC cables without using a junction box.
Insulating End. An insulator designed to electrically insulate the end of a Type FCC cable.
Top Shield. A grounded metal shield covering under-carpet components of the FCC system for the purposes of providing protection against physical damage.
Bottom Shield. A protective layer that is installed between the floor and Type FCC flat conductor cable to protect the cable from physical damage and may or may not be incorporated as an integral part of the cable.
Transition Assembly. An assembly to facilitate connection of the FCC system to other wiring systems, incorporating (1) a means of electrical interconnection, and (2) a suitable box or covering for providing electrical safety and protection against physical damage.
Metal Shield Connections. Means of connection designed to electrically and mechanically connect a metal shield to another metal shield, to a receptacle housing or self-contained device, or to a transition assembly.

II Installation

328-10. Uses Permitted.
(a) Branch Circuits. Use of FCC systems shall be permitted both for general-purpose and appliance branch circuits and for individual branch circuits.
(b) Branch-Circuit Ratings.
(1) Voltage. Voltage between ungrounded conductors shall not exceed 300 volts. Voltage between ungrounded conductors and the grounded conductor shall not exceed 150 volts.
(2) Current. General-purpose and appliance branch circuits shall have ratings not exceeding 20 amperes. Individual branch circuits shall have ratings not exceeding 30 amperes
(c) Floors. Use of FCC systems shall be permitted on hard, sound, smooth, continuous floor surfaces made of concrete, ceramic, or composition flooring, wood, and similar materials.
(d) Walls. Use of FCC systems shall be permitted on wall surfaces in surface metal raceways.
(e) Damp Locations. Use of FCC systems in damp locations shall be permitted.
(f) Heated Floors. Materials used for floors heated in excess of 30ºC (86ºF) shall be identified as suitable for use at these temperatures.
(g) System Height Any portion of an FCC system with a height above floor level exceeding 2.3 mm (0.090 in.) shall be tapered or feathered at the edges to floor level.
(h) Coverings. Floor-mounted Type FCC cable, cable connectors, and insulating ends shall be covered with carpet squares not larger than 914 mm (36 in.) square. Those carpet squares that are adhered to the floor shall be attached with release-type adhesives.
(I) Corrosion Resistance. Metal components of the system shall be either corrosion resistant, coated with corrosion-resistant materials, or insulated from contact with corrosive substances.
(j) Metal-Shield Connectors. Metal shields shall be connected to each other and to boxes, receptacle housings, self-contained devices, and transition assemblies using metal-shield connectors
328-12. Uses Not Permitted. FCC systems shall not be used in the following:
(1) Outdoors or in wet locations
(2) Where subject to corrosive vapors
(3) In any hazardous (classified) location
(4) In residential, school, and hospital buildings
.
328-18. Crossings. Crossings of more than two Type FCC cable runs shall not be permitted at any one point. Crossings of a Type FCC cable over or under a flat communications or signal cable shall be permitted. In each case, a grounded layer of metal shielding shall separate the two cables, and crossings of more than two flat cables shall not be permitted at any one point.
328-30. Securing and Supporting. All FCC system components shall be firmly anchored to the floor or wall using an adhesive or mechanical anchoring system identified for this use. Floors shall be prepared to ensure adherence of the FCC system to the floor until the carpet squares are placed.

328-40. Boxes and Fittings.
(a) Cable Connections and Insulating Ends. All Type FCC cable connections shall use connectors identified for their use, installed such that electrical continuity, insulation, and sealing against dampness and liquid spillage are provided. All bare cable ends shall be insulated and sealed against dampness and liquid spillage using listed insulating ends.
(b) Polarization of Connections. All receptacles and connections shall be constructed and installed so as to maintain proper polarization of the system.
(c) Shields.
(1) Top Shield. A metal top shield shall be installed over all floor-mounted Type FCC cable, connectors, and insulating ends. The top shield shall completely cover all cable runs, corners, connectors, and ends.
(2) Bottom Shield. A bottom shield shall be installed beneath all Type FCC cable, connectors, and insulating ends.
(d) Connection to Other Systems. Power feed, grounding connection, and shield system connection between the FCC system and other wiring systems shall be accomplished in a transition assembly identified for this use.
328-42 Devices.
(a) Receptacles. All receptacles, receptacle housings, and self-contained devices used with the FCC system shall be identified for this use and shall be connected to the Type FCC cable and metal shields. Connection from any grounding conductor of the Type FCC cable shall be made to the shield system at each receptacle.
(b) Receptacles and Housings. Receptacle housings and self-contained devices designed either for floor mounting or for in- or on-wall mounting shall be permitted for use with the FCC system. Receptacle housings and self-contained devices shall incorporate means for facilitating entry and termination of Type FCC cable and for electrically connecting the housing or device with the metal shield. Receptacles and self-contained devices shall comply with 210-7. Power and communications outlets installed together in common housing shall be permitted in accordance with 800-52(a)(2), Exception No. 1.
328-56. Splices And Taps.
(a) FCC Systems Alterations. Alterations to FCC systems shall be permitted. New cable connectors shall be used at new connection points to make alterations. It shall be permitted to leave unused cable runs and associated cable connectors in place and energized. All cable ends shall be covered with insulating ends.
(b) Transition Assemblies. All transition assemblies shall be identified for their use. Each assembly shall incorporate means for facilitating entry of the Type FCC cable into the assembly, for connecting the Type FCC cable to grounded conductors, and for electrically connecting the assembly to the metal cable shields and to equipment grounding conductors.
328-60. Grounding. All metal shields, boxes, receptacle housings, and self-contained devices shall be electrically continuous to the equipment grounding conductor of the supplying branch circuit. All such electrical connections shall be made with connectors identified for this use. The electrical resistivity of such shield system shall not be more than that of one conductor of the Type FCC cable used in the installation.

III Construction

328-100. Construction.
(a) Type FCC Cable. Type FCC cable shall be listed for use with the FCC system and shall consist of three, four, or five flat copper conductors, one of which shall be an equipment grounding conductor.
(b) Shields.
(1) Materials and Dimensions. All top and bottom shields shall be of designs and materials identified for their use. Top shields shall be metal. Both metallic and nonmetallic materials shall be permitted for bottom shields.
(2) Resistivity. Metal shields shall have cross-sectional areas that provide for electrical resistivity of not more than that of one conductor of the Type FCC cable used in the installation.
.
328-112. Insulation. The insulating material of the cable shall be moisture resistant and flame retardant. All insulating materials in the FCC systems shall be identified for their use.
.
328-120. Markings.
(a) Cable Marking. Type FCC cable shall be clearly and durably marked on both sides at intervals of not more than 610 mm (24 in.) with the information required by 310-11(a) and with the following additional information:
(1) Material of conductors
(2) Maximum temperature rating
(3) Ampacity
(b) Conductor Identification. Conductors shall be clearly and durably identified on both sides throughout their length as specified in 310-12.
SUBSTANTIATION: This revision to Article 328 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with the usability effort. Specific proposals addressed by this revision include 7-64, 7-65, 7-66, 7-67, and 7-68.

7- 64 - (328): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise text to read as follows:
Article 328 -- Flat Conductor Cable: Type FCC
A. I. General
328-1. Scope. This article covers a field-installed wiring system for branch circuits incorporating Type FCC cable and associated

accessories as defined by the article. The wiring system is designed for installation under carpet squares.

328-2. Definitions.

Flat Conductor Cable (Type FCC). ~~Cable Type FCC cable consists of~~ Tthree or more flat copper conductors placed edge-to-edge and separated and enclosed within an insulating assembly.

FCC System. A complete wiring system for branch circuits that is designed for installation under carpet squares. The FCC system includes Type FCC cable and associated shielding, connectors, terminators, adapters, boxes, and receptacles.

Cable Connector. A connector designed to join Type FCC cables without using a junction box.

Insulating End. An insulator designed to electrically insulate the end of a Type FCC cable.

Top Shield. A grounded metal shield covering under-carpet components of the FCC system for the purposes of providing protection against physical damage.

Bottom Shield. A protective layer that is installed between the floor and Type FCC flat conductor cable to protect the cable from physical damage and may or may not be incorporated as an integral part of the cable.

Transition Assembly. An assembly to facilitate connection of the FCC system to other wiring systems, incorporating (1) a means of electrical interconnection, and (2) a suitable box or covering for providing electrical safety and protection against physical damage.

Metal Shield Connections. Means of connection designed to electrically and mechanically connect a metal shield to another metal shield, to a receptacle housing or self-contained device, or to a transition assembly.

328-3. Other Articles. The FCC systems shall conform with the applicable provisions of Articles 210, 220, 240, 250, and 300.

~~B.~~ II. Installation

~~328-4~~. 328-10. Uses Permitted.

(a) Branch Circuits. Use of FCC systems shall be permitted both for general-purpose and appliance branch circuits and for individual branch circuits.

~~328-6~~ (b) Branch-Circuit Ratings.

~~328-6. (b)~~ (1) Current. General-purpose and appliance branch circuits shall have ratings not exceeding 20 amperes. Individual branch circuits shall have ratings not exceeding 30 amperes.

~~328-6. (a)~~ (2) Voltage. Voltage between ungrounded conductors shall not exceed 300 volts. Voltage between ungrounded conductors and the grounded conductor shall not exceed 150 volts

~~(b)~~ (c) Floors. Use of FCC systems shall be permitted on hard, sound, smooth, continuous floor surfaces made of concrete, ceramic, or composition flooring, wood, and similar materials.

~~(c)~~ (d) Walls. Use of FCC systems shall be permitted on wall surfaces in surface metal raceways.

~~(d)~~ (e) Damp Locations. Use of FCC systems in damp locations shall be permitted.

~~(e)~~ (f) Heated Floors. Materials used for floors heated in excess of 30°C (86°F) shall be identified as suitable for use at these temperatures.

~~328-18.~~ (g) System Height. Any portion of an FCC system with a height above floor level exceeding 0.090 in. (2.29 mm) shall be tapered or feathered at the edges to floor level.

~~328-10~~. (h) Coverings. Floor-mounted Type FCC cable, cable connectors, and insulating ends shall be covered with carpet squares not larger than 36 in. (914 mm) square. Those carpet squares that are adhered to the floor shall be attached with release-type adhesives.

~~328-33~~. (i) Corrosion Resistance. Metal components of the system shall be either corrosion resistant, coated with corrosion-resistant materials, or insulated from contact with corrosive substances.

~~328-35 (c).~~ (j) Metal-Shield Connectors. Metal shields shall be connected to each other and to boxes, receptacle housings, self-contained devices, and transition assemblies using metal-shield connectors.

~~328-5~~ 328-12. Uses Not Permitted. FCC systems shall not be used in the following:

1. Outdoors or in wet locations
2. Where subject to corrosive vapors
3. In any hazardous (classified) location
4. In residential, school, and hospital buildings

~~328-17~~. 328-18. Crossings. Crossings of more than two Type FCC cable runs shall not be permitted at any one point. Crossings of a Type FCC cable over or under a flat communications or signal cable shall be permitted. In each case, a grounded layer of metal shielding shall separate the two cables, and crossings of more than two flat cables shall not be permitted at any one point.

~~328-16~~. 328-30. ~~Anchoring~~ Securing and Supporting. All FCC system components shall be firmly anchored to the floor or wall using an adhesive or mechanical anchoring system identified for this use. Floors shall be prepared to ensure adherence of the FCC system to the floor until the carpet squares are placed.

328-40. Boxes and Fittings.

~~328-11.~~ (a) Cable Connections and Insulating Ends.

All Type FCC cable connections shall use connectors identified for their use, installed such that electrical continuity, insulation, and sealing against dampness and liquid spillage are provided. All bare cable ends shall be insulated and sealed against dampness and liquid spillage using listed insulating ends.

~~328-20.~~ (b) Polarization of Connections. All receptacles and connections shall be constructed and installed so as to maintain proper polarization of the system.

~~328-12.~~ (c) Shields.

~~(a)~~ (1) Top Shield. A metal top shield shall be installed over all floor-mounted Type FCC cable, connectors, and insulating ends. The top shield shall completely cover all cable runs, corners, connectors, and ends.

~~(b)~~ (2) Bottom Shield. A bottom shield shall be installed beneath all Type FCC cable, connectors, and insulating ends.

~~328-15~~. (d) Connection to Other Systems. Power feed, grounding connection, and shield system connection between the FCC system and other wiring systems shall be accomplished in a transition assembly identified for this use.

328-42 Devices.

~~328-14~~. (a) Receptacles.

All receptacles, receptacle housings, and self-contained devices used with the FCC system shall be identified for this use and shall be connected to the Type FCC cable and metal shields. Connection from any grounding conductor of the Type FCC cable shall be made to the shield system at each receptacle.

~~328-36~~. (b) Receptacles and Housings. Receptacle housings and self-contained devices designed either for floor mounting or for in- or on-wall mounting shall be permitted for use with the FCC system. Receptacle housings and self-contained devices shall incorporate means for facilitating entry and termination of Type FCC cable and for electrically connecting the housing or device with the metal shield. Receptacles and self-contained devices shall comply with Section 210-7. Power and communications outlets installed together in common housing shall be permitted in accordance with Section 800-52(a)(2), Exception No. 1.

328-56. Splices and Taps.

~~328-19.~~ (a) FCC Systems Alterations. Alterations to FCC systems shall be permitted. New cable connectors shall be used at new connection points to make alterations. It shall be permitted to leave unused cable runs and associated cable connectors in place and energized. All cable ends shall be covered with insulating ends.

~~328-37~~. (b) Transition Assemblies.

All transition assemblies shall be identified for their use. Each assembly shall incorporate means for facilitating entry of the Type FCC cable into the assembly, for connecting the Type FCC cable to grounded conductors, and for electrically connecting the assembly to the metal cable shields and to equipment grounding conductors.

328-60. Grounding.

~~328-13. Enclosure and Shield Connections.~~ All metal shields, boxes, receptacle housings, and self-contained devices shall be electrically continuous to the equipment grounding conductor of the supplying branch circuit. All such electrical connections shall be made with connectors identified for this use. The electrical resistivity of such shield system shall not be more than that of one conductor of the Type FCC cable used in the installation.

~~C.~~ *III. Construction Specifications*

328-100. Construction.

~~328-30~~. (a) Type FCC Cable. Type FCC cable shall be listed for use with the FCC system and shall consist of three, four, or five flat copper conductors, one of which shall be an equipment grounding conductor~~. The insulating material of the cable shall be moisture-resistant and flame-retardant. 328-32. (b) Order.~~ For a 2-wire FCC system with grounding, the grounding conductor shall be central

~~328-35~~. (b) Shields.

~~(a)~~ 1. Materials and Dimensions. All top and bottom shields shall be of designs and materials identified for their use. Top shields shall be metal. Both metallic and nonmetallic materials shall be permitted for bottom shields.

~~(b)~~ 2. Resistivity. Metal shields shall have cross-sectional areas that provide for electrical resistivity of not more than that of one conductor of the Type FCC cable used in the installation.
~~328-34.~~ 328-112. Insulation. The insulating material of the cable shall be moisture resistant and flame retardant. All insulating materials in the FCC systems shall be identified for their use.
~~328-31~~ 328-120. Markings.
(a) Cable Marking. Type FCC cable shall be clearly and durably marked on both sides at intervals of not more than 24 in. (610mm) with the information required by Section 310-11 (a) and with the following additional information:
1. Material of conductors
2. Maximum temperature rating
3. Ampacity
~~328-32~~ (b) Conductor Identification.
~~(a) Colors.~~ Conductors shall be clearly and durably ~~marked~~ identified on both sides throughout their length as specified in Section 310-12.
SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering cable and wiring.
A uniform format is proposed to achieve consistency across all of the cable and wiring articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as stated in the NEC Style Manual 2.4.1. It is hoped that the parallel Code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.
For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for cable and wiring not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-63a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1331)

7- 65 - (328-3): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Delete this section:
~~328-3. Other Articles. The FCC systems shall conform with the applicable provisions of Articles 210, 220, 240, 250, and 300.~~
SUBSTANTIATION: Section 90-3 adequately covers this requirement. NEC Style Manual, Section 4.1 requires that references not be provided if the material is already covered by Section 90-3.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-63a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1418)

7- 66 - (328-3): Accept in Principle
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Delete 328-3 in its entirety.
SUBSTANTIATION: 1999 National Electrical Code Style Manual:
Section 4.1 states "Do not use a reference if the requirement is already covered by 90.3."
Section 4.1.1 stipulates that "References shall not be made to an entire article... unless additional conditions are specified.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-63a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #466)

7- 67 - (328-10): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise the first sentence as follows:
"Floor-mounted Type FCC cable, cable connectors, and insulating ends shall be covered with carpet squares not larger than 914 mm (36 in.) ~~36 in. (914 mm)~~ square."
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
The SI unit is not rounded since the dimension shown is standard industry practice.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-63a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #465)

7- 68 - (328-18 and 31): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 328-18 - revise as follows:
"Any portion of an FCC system with a height above floor level exceeding 2.3 mm (0.090 in.) ~~0.090 in. (2.29 mm)~~ shall be tapered or feathered at the edges to floor level."
328-31 - change "24 in. (610 mm)" to "610 mm (24 in.)"
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
The SI units in Section 328-31 are not rounded since the measurement is product specific and 610 mm may be required to complete the legend, 600 mm may be too short.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-63a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #2217)

7- 69 - (328-30): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested."
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.
[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
PANEL ACTION: Reject.
PANEL STATEMENT: The term "flame-retardant" is used throughout the Code as a means of expressing to the user that the material resists ignition or the spread of flames, albeit the test methods are often not defined. The term "flame tested" is similarly undefined, but can be understood to mean a test which does not necessarily measure the ability of a material to resist

ignition or flame propagation. Some articles of the NEC offer information regarding the tests deemed appropriate for the required level of resistance to ignition or flame propagation. Others rely on the product standard to provide such information. The panel suggests that specific proposals be made wherever the generic reference to "flame retardant" is not sufficient.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign
COMMENT ON AFFIRMATIVE:
STEWART: The panel statement is correct. Changing the words "flame tested" is an undefined term that would lead to improper testing for the intended application.
TEMBLADOR: See Ravi Gantra's comment on Proposal 6-3.

ARTICLE 330 — MINERAL-INSULATED, METAL-SHEATHED CABLE: TYPE MI

(Log #CP709)

7- 69a - (330): Accept
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
The Technical Correlating Committee directs the Panel to move item (11), Uses Permitted, to an appropriate part of the Article. This action will be considered by the Panel as a Public Comment.
SUBMITTER: CMP 7
RECOMMENDATION: Revised Article 330 to conform with NEC Style Manual:
ARTICLE 330 -- Mineral-Insulated, Metal-Sheathed Cable: Type MI
I General
330-1 Scope. This article covers the use, installation, and construction specifications for Mineral- Insulated, Metal-Sheathed Cable, Type MI.
330-2. Definition. Mineral-Insulated, Metal-Sheathed Cable, Type MI. A factory assembly of one or more conductors insulated with a highly compressed refractory mineral insulation and enclosed in a liquidtight and gastight continuous copper or alloy steel sheath.
II Installation
330-10. Uses Permitted. Type MI cable shall be permitted as follows:
(1) For services, feeders, and branch circuits
(2) For power, lighting, control, and signal circuits
(3) In dry, wet, or continuously moist locations; where installed in wet locations, Type MI cable shall comply with 300-6(c)
(4) Indoors or outdoors
(5) Where exposed or concealed
(6) Embedded in plaster, concrete, fill, or other masonry, whether above or below grade
(7) In any hazardous (classified) location
(8) Where exposed to oil and gasoline
(9) Where exposed to corrosive conditions not deteriorating to its sheath
(10) In underground runs where suitably protected against physical damage and corrosive conditions
(11) Where single-conductor cables are used, all phase conductors and, where used, the neutral conductor shall be grouped together to minimize induced voltage on the sheath.
330-12. Uses Not Permitted. Type MI cable shall not be used where exposed to destructive corrosive conditions, unless protected by materials suitable for the conditions.
330-17. Through or parallel to Framing Members. Type MI cable shall comply with 300-4 where installed through studs, joists, rafters, or similar wood members.
330-24. Bending Radius. Bends in Type MI cable shall be made so that the cable will not be damaged. The radius of the inner edge of any bend shall not be less than shown as follows:
(1) Five times the external diameter of the metallic sheath for cable not more than 19 mm (3/4 in.) in external diameter
(2) Ten times the external diameter of the metallic sheath for cable greater than 19 mm (3/4 in.) but not more than 25 mm (1 in.) in external diameter
330-30. Securing and Supporting. Type MI cable shall be supported by one of the following means:
(1) Supported securely at intervals not exceeding 1.8 m (6 ft) by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable
Exception: Where cable is fished, support shall not be required.
(2) Supported in accordance with 318-8(b) where installed in cable trays
330-40. Boxes and Fittings.
(a) Fittings. Fittings used for connecting Type MI cable to boxes, cabinets, or other equipment shall be identified for such use. Where single-conductor cables enter ferrous metal boxes or cabinets, the installation shall comply with 300-20 to prevent inductive heating.
(b) Terminal Seals. Where Type MI cable terminates, a seal shall be provided immediately after stripping to prevent the entrance of moisture into the insulation. The conductors extending beyond the sheath shall be individually provided with an insulating material.
III. Construction Specifications
330-104. Conductors. Type MI cable conductors shall be of solid copper or nickel-clad copper with a resistance corresponding to standard AWG sizes.
330-108. Equipment Grounding. Where the outer sheath is made of copper, it shall provide an adequate path for equipment grounding purposes. Where made of steel, an equipment grounding conductor shall be provided
330-112. Insulation. The conductor insulation in Type MI cable shall be a highly compressed refractory mineral that provides proper spacing for all conductors.
330-116. Sheath. The outer sheath shall be of a continuous construction to provide mechanical protection and moisture seal.
SUBSTANTIATION: This revision to Article 320 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with the usability effort. Specific proposals addressed by this revision include 7-70, 7-71, 7-72, 7-73, 7-79, 7-81, 7-85, and 7-89.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1381)

7- 70 - (330): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise "A. General" to "I. General"
Renumber and revise Section 330-1 as follows:
~~330-1.~~ 330-2. Definition. ~~Type MI mineral-insulated, metal-sheathed cable~~ Mineral-insulated, metal-sheathed cable (Type MI). ~~is a~~ A factory assembly of one or more conductors insulated with a highly compressed refractory mineral insulation and enclosed in a liquidtight and gastight continuous copper or alloy steel sheath.
Renumber "330-2. Other Articles." as "330-3. Other Articles."
Revise "B. Installation" to "II. Installation"
Combine Sections 330-3, 330-10 and 330-16 and revise to read as follows:
~~330-3.~~ 330-10. Uses Permitted. Type MI cable shall be permitted as follows:
(1) For services, feeders, and branch circuits
(2) For power, lighting, control, and signal circuits
(3) In dry, wet, or continuously moist locations;
~~330-10. Wet Locations.~~ ~~Where~~ where installed in wet locations, Type MI cable shall comply with ~~Section~~ 300-6(c).
(4) Indoors or outdoors
(5) Where exposed or concealed
(6) Embedded in plaster, concrete, fill, or other masonry, whether above or below grade
(7) In any hazardous (classified) location
(8) Where exposed to oil and gasoline
(9) Where exposed to corrosive conditions not deteriorating to its sheath
(10) In underground runs where suitably protected against physical damage and corrosive conditions.
~~330-16. Single Conductors.~~
(11) Where single-conductor cables are used, all phase conductors and, where used, the neutral conductor shall be grouped together to minimize induced voltage on the sheath.
(12) Where single-conductor cables enter ferrous enclosures, the installation shall comply with ~~Section~~ 300-20 to prevent heating from induction."
Renumber "330-4. Uses Not Permitted." as "330-12. Uses Not Permitted."

Revise "330-11. Through Joists, Studs, or Rafters." to "330-17. Through or Parallel to Framing Members."
Revise "330-13. Bends." to read as follows:
~~330-13. Bends.~~ 330-24. Bending Radius. Bends in Type MI cable shall be made so ~~as not to damage the cable.~~ that the cable will not be damaged. The radius of the inner edge of any bend shall not be less than shown as follows:
1. Five times the external diameter of the metallic sheath for cable not more than 3/4 in. (19 mm) in external diameter
2. Ten times the external diameter of the metallic sheath for cable greater than 3/4 in. (19 mm) but not more than 1 in. (25.4 mm) in external diameter
Revise "330-12. Supports." to "330-30. Securing and Supporting."
Combine 330-14 and 330-15 and revise to read as follows:
330-40. Boxes and Fittings.
(a) ~~330-14.~~ Fittings. Fittings used for connecting Type MI cable to boxes, cabinets, or other equipment shall be identified for such use. Where single-conductor cables enter ferrous metal boxes or cabinets, the installation shall comply with ~~Section~~ 300-20 to prevent inductive heating.
(b) ~~330-15.~~ Terminal Seals. Where Type MI cable terminates, a seal shall be provided immediately after stripping to prevent the entrance of moisture into the insulation. The conductors extending beyond the sheath shall be individually provided with an insulating material."
Revise "C. Construction Specifications" to "III. Construction Specifications"
Renumber "330-20. Conductors." as "330-104. Conductors."
Renumber "330-21. Insulation." as "330-112. Insulation."
Revise "330-22. Outer Sheath." to "330-116. Sheath."
SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering cable and wiring.
A uniform format is proposed to achieve consistency across all of the cable and wiring articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as stated in the NEC Style Manual 2.4.1. It is hoped that the parallel code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.
For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for cable and wiring not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.
PANEL ACTION: Accept in Principle.

NOT RETURNED: 1 Ensign

(Log #1332)

7- 71 - (330-1): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Add a new Section:
330-1. Scope. This article covers the use, installation, and construction specifications for Mineral-Insulated, Metal-Sheathed Cable, Type MI.
Renumber 330-1 to 330-2.
Renumber 330-2 to 330-3.
Renumber 330-3 to 330-4.
Renumber 330-4 to 330-5.
SUBSTANTIATION: NEC Style Manual Section 2.2.1 requires that each article contain a statement of scope and that the scope statement be the first section of the Article.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-69a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1335)

7- 72 - (330-2): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Delete 330-2. Other Articles in its entirety.
SUBSTANTIATION: Section 90-3 adequately covers this requirement. NEC Style Manual, Section 4.1, requires that references not be provided if the material is already covered by Section 90-3. Also Section 4.1.1 prohibits referencing an entire Article.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-69a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1419)

7- 73 - (330-2): Accept in Principle
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Delete 330-2 in its entirety.
SUBSTANTIATION: 1999 National Electrical Code Style Manual:
Section 4.1 states "Do not use a reference if the requirement is already covered by 90.3."
Section 4.1.1 stipulates that "References shall not be made to an entire article... unless additional conditions are specified.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-69a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:

NOT RETURNED: 1 Ensign

(Log #1847)

7- 74 - (330-4): Accept in Principle
Note: The Technical Correlating Committee understands that the Panel Action text modifies 330-12 accepted in Proposal 7-69a.
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise 330-4 to read as follows:
330-4. Uses Not Permitted. Type MI cable shall not be used where exposed to destructive corrosive conditions, unless the metallic sheath is suitable for the conditions or is protected by materials suitable for the conditions.
SUBSTANTIATION: The proposed text is consistent with 334-4 for Type MC cable. There will be situations where the cable may be installed in a corrosive area but the particular corrosive material may not have a harmful effect on the metal covering used.
PANEL ACTION: Accept in Principle.
Revise 330-4 to read:
"Type MI cable shall not be used where exposed to conditions destructive and corrosive to the metallic sheath unless additionally protected by materials suitable for the conditions."
PANEL STATEMENT: The revised wording of the section addresses the concerns of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #467)

7- 79 - (330-12(1) and 330-13): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 330-12(1) - revise as follows:
"(1) Supported securely at intervals not exceeding 1.8 m (6 ft) ~~6 ft (1.83 m)~~ by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable"
330-13 - revise as follows:
"(1) Five times the external diameter of the metallic sheath for cable not more than 19 mm (3/4 in.) ~~3/4 in. (19 mm)~~ in external diameter
(2) Ten times the external diameter of the metallic sheath for cable greater than 19 mm (3/4 in.) ~~3/4 in. (19 mm)~~ but not more than 25 mm (1 in.) ~~1 in. (25.4 mm)~~ in external diameter"
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-69a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

Note: The sequence no. 7-80 was not used.

(Log #819)

7- 81 - (330-14): Accept
Note: The Technical Correlating Committee understands that this action would delete the second sentence of 330-40(a) in Proposal 7-69a.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete the second sentence:
"~~Where single-conductor cables enter ferrous metal boxes or cabinets, the installation shall comply with Section 300-20 to prevent inductive heating.~~"
SUBSTANTIATION: Edit. This section is titled "fittings" Section 330-16 titled "single conductors" contains an identical sentence.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #2419)

7- 82 - (330-15): Accept in Principle in Part
Note: The Technical Correlating Committee understands that the action will be included in 330-40(b) in Proposal 7-69a.
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise to read:
330-15 Terminal Seals. Where Type MI cable terminates, ~~a~~ an end seal termination shall be ~~provided~~ installed immediately after stripping to prevent the entrance of moisture into the insulation. The conductor temperature at the termination shall not exceed the listed temperature rating of the end seal termination. The conductors extending beyond the sheath shall be individually provided with an insulating material.
SUBSTANTIATION: First sentence revised for clarity.
Second sentence added since it specifically applies to the installation and advises that the Listed temperature rating of the end seal termination must not be exceeded. While it is currently 90°C for end seal terminations that incorporate unimpregnated, organic, insulating materials, the listing temperature may be higher or lower than 90°C based on the materials used.
A companion proposal to revise 310-15(b)(7) has been submitted to coordinate with this revision.
PANEL ACTION: Accept in Principle in Part.
Change the word "termination" to "fitting" in the first sentence.
Delete the proposed second sentence.
PANEL STATEMENT: The terminology change is more descriptive for the end seal. The second sentence has been incorporated into new Section 330-80.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign
COMMENT ON AFFIRMATIVE:
STEWART: The change does not adequately cover termination temperature limitations. This needs to be done by referring to Fine Print Note No. 1 in Section 310-15(b).
TEMBLADOR: See my Comment on Affirmative on Proposal 7-88.

(Log #2440)

7- 83 - (330-15): Accept in Principle
SUBMITTER: Joseph A. Ross, Ross Electrical Assessments
RECOMMENDATION: Revise 330-15 as follows:
"Where Type MI cable terminates, a seal shall be provided immediately after stripping to prevent the entrance of moisture into the insulation. Termination fittings incorporating unimpregnated, organic, insulating materials shall be limited to 90°C (194°F) operation. The conductors extending beyond the sheath shall be individually provided with an insulating material."
SUBSTANTIATION: The termination seal that is referenced in Section 330-15 is actually part of the termination end seal that is referenced in Section 310-15(b)(7). See companion proposal that proposes the deletion of Section 310-15(b)(7) and the relocation of its text to Section 330-15.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concerns have been addressed by the panel's action on Proposal 7-88.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign
COMMENT ON AFFIRMATIVE:
TEMBLADOR: See my Comment on Affirmative on Proposal 7-88.

(Log #820)

7- 84 - (330-16): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
Single Conductors. Where single-conductor cables are used, all ac circuit ~~phase~~ conductors ~~and, where used, the neutral conductor~~ shall be grouped together to minimize induced voltage on the sheath. (remainder unchanged)
SUBSTANTIATION: Edit. The requirement should apply specifically to ac as does Section 300-20. While "phase" may imply ac circuits it may also not imply a grounded conductor of a 2-wire circuit. "Circuit conductors" covers all conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing wording adequately covers the grouping requirement for all systems and the proposed wording would place a limitation on the use of this cable to AC systems only.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1334)

7- 85 - (330-16): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Delete the second sentence of 330-16 so that it reads:
"Where single-conductor cables are used, all phase conductors and, where used, the neutral conductor shall be grouped together to minimize induced voltage on the sheath. ~~Where single-conductor cables enter ferrous enclosures, the installation shall comply with Section 300-20 to prevent heating from induction.~~"
SUBSTANTIATION: The second sentence should be deleted since Section 90-3 adequately covers this requirement. NEC Style Manual, Section 4.1, requires that references not be provided if the material is already covered by Section 90-3.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-69a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #4202)

7- 86 - (330-16): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
"Where single-conductor cables are used, all phase conductors and, where used, the neutral conductor shall be grouped together to minimize induced voltage on the sheath. The ampacities in Table 310-20 shall be permitted to apply to this condition. Where single-conductor cables enter ferrous enclosures, the installation shall comply with Section 300-20 to prevent heating from induction."
SUBSTANTIATION: Due in part to the 1996 NEC version of what is now Section 700-9(d), many who hadn't considered Type MI cable previously looked again in the context of installing an electrical circuit protective system. Some of these were quite large, and involve single-conductor cables for that reason. To this day installers and in-spectors are trying to get a handle on how to determine the ampacity of these cables under this condition.
Many manufacturer's representatives suggest Table 310-17. Many inspectors are saying Table 310-16, reasoning that the cable grouping is akin to a cable. This proposal suggests that the truth is somewhere be-tween these two positions. On the one hand, a grouped set of cables can't, for ampacity purposes, qualify as a single conductor in free air. On the other hand, we have the robustness of the insulation with respect to high temperature, and the excellent ability of the copper (or even steel as applicable) sheath to dissipate heat, and the fact that the insulation rating on the cable has to do with the termination seals and not the cable over its length.
Section 321-3(a) expressly recognizes the suitability of Type MI cable for use with messenger-supported wiring, which is the subject of Table 310-20. The ampacities in this table fall between those inTable 310-16 and 310-17. This is a reasonable compromise, especially since Table 310-20 has come out of exile in Appendix B. If CMP 7 has a better table to use, by all means feel free to substitute it for the one in this proposal.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's concerns have been addressed by the panel's action on Proposal 7-88.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign
COMMENT ON AFFIRMATIVE:
TEMBLADOR: See my Comment on Affirmative on Proposal 7-88.

(Log #1850)

7- 87 - (330-20): Accept
Note: The Technical Correlating Committee understands that the action will be included in 330-104 in Proposal 7-69a.
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise 330-20 as follows:
"Type MI cable conductors shall be of solid copper or nickel-clad copper with a resistance corresponding to standard AWG and kcmil sizes."
SUBSTANTIATION: Table 310-13 authorizes Type MI cable in sizes 18 AWG up to 500 kcmil.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #2420)

7- 88 - (330-80 (New)): Accept in Principle
Note: The Technical Correlating Committee understands the entire new proposed Section 330-80 was accepted in addition to the new second paragraph added by the Panel Action.
The Technical Correlating Committee directs that this Proposal be forwarded to Code-Making Panels 1 and 6 for information.
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Add a new Section 330-80 to read as follows:
330-80 Ampacity. The ampacity of Type MI cable shall be determined in accordance with 310-15.
The ampacities for Type MI cable installed in cable tray shall be determined in accordance with 318-11.
Where single Type MI conductors are grouped together in a triangular or square configuration, as required by 330-16, and installed on a messenger or as open runs with a maintained free air space of not less than 2.15 times one conductor diameter (2.15 x O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall not exceed the allowable ampacities of Table 310-17.
SUBSTANTIATION: To incorporate text consistent with that used in other cable articles.
The text in the last paragraph is consistent with 318-11(b)(4) for single conductors installed in a similar configuration in cable tray. The following comparison table shows that the ampacities in Table 310-17 are consistent with the IEEE ampacities for three single conductors triplexed in free air adjusted for 30°C ambient air temperature. The IEEE ampacities for no sun and no wind are appropriate since almost all installations of this type are inside buildings.
Installation methods will limit the temperature of the MI cable end seal termination to a maximum of 90°C as required by Section 310-15(b)(7) or to its listed temperature limit.

Allowable Ampacities of Single-Insulated Copper Conductors 0.6 to 5 kV Unshielded Single Conductor Extruded Dielectric Cable
Triplexed in Free Air

Notes: (1) Based on no sun, wind at 0 ft/sec.
(2) Neher/McGrath formula
(3) Rounded up to next 0 or 5

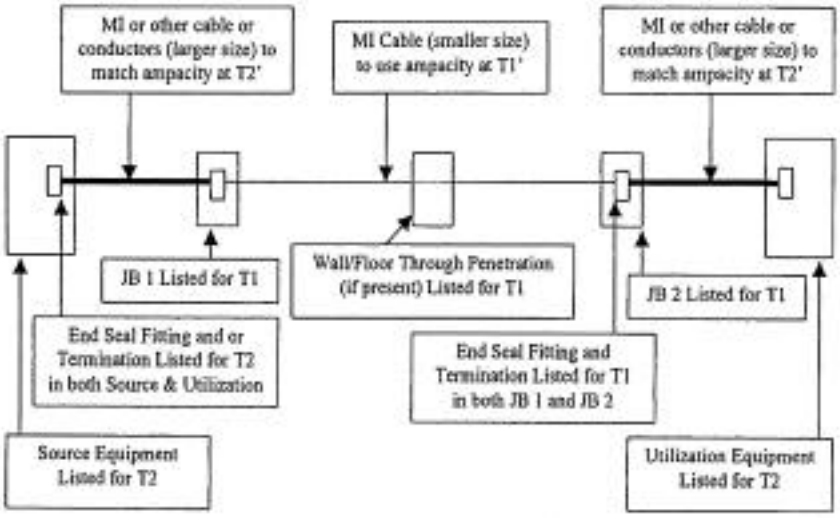
Ambient Temperature Corrections were based on the following Neher/McGrath formula:

$$I' = \sqrt{Tc - Ta' / Tc - Ta} \times 1$$

T_c = maximum conductor temperature used in the tables
T_a = ambient temperature used in the tables
I = ampacity shown in the tables for T_c and T_a
T_a' = new ambient temperature
I' = adjusted ampacity for ambient temperature T_a'

Source: IEEE Standard 835-1994, IEEE Standard Power Cable Ampacity Tables. Section 3.4.1, adjust for changes in ambient temeprature.
PANEL ACTION: Accept in Principle.
Add a new second paragraph to 330-80 to read:
"The conductor temperature at the end seal fitting shall not exceed the listed temperature rating of the end seal fitting."
PANEL STATEMENT: Panel 7 accepts the transfer of Proposal 6-90 from Panel 6. The text relocated from 310-15(b)(7), has been revised to reflect that the ampacity of the cable is independent of the temperature rating of the end seal terminations provided installation methods are utilized to limit the conductor temperature to not exceed the listed temperature rating of the end seal fitting. The new second paragraph has been worded to encompass the range of temperatures for which the end seal fittings may be listed. See panel's rewrite of Article 330 in Proposal 7-69a.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign
COMMENT ON AFFIRMATIVE:
PROPST: I support the panel action and want to confirm that the ampacity described in this proposal does not apply to MI cable used for surface heat tracing as described elsewhere (426 and 427) in the NEC.
STEWART: This proposal does not address sheath temperature. If the single conductor in free air is operating at a 90 degree C conductor temperature, the conductor temperature where the singles are bundled together will be higher than 90 degrees C. What would the maximum sheath temperature be?
TEMBLADOR: We believe that the following schematic[1] provides an explanation of the actions by CMP 6, in particular, and by CMP 7 on Proposals 7-82, 7-83, 7-86, 6-88, 6-89, 6-90, 6-91, 6-92, 6-93, 6-94, 6-106 and 6-113 for 2002 NEC. Panel Actions by CMP 6 and CMP 7 should be reviewed to avoid an erroneous interpretation that can create confusion regarding the use of excellent thermal properties of MI cable. Also, at the same time compliance with the requirements of 110-14 shall not be comprised (See Proposal 1-227).
(Artwork shown on following page)



Amapcity of MI Cable or permitted arrangement of MI Cable (single conductor) between JB 1 an JB 2.

Ampacity shall not exceed, after permitted derating, the corresponding ampacity at T1 to comply with the listing requirement of terminations in JB 1 or JB 2 and associated MI Cable End Seal Fittings and any wall or floor through penetrating products, if present, in accordance with 110-14.

Ampacity of MI Cable or permitted arrangement of MI Cable (single conductor) or other conductors or cables between source and JB 1 an JB 2 and utilization:

Ampacity of connected conductors, after permitted derating, shall not exceed the corresponding values in Table 310-16 to comply with the requirements of 110-14.

1 The above schematic is based on: "Wire Temperature Termination Requirements Can Be Your "Terminator If You Don't Know All the Rules" By Mr. Jim Pauley - Square D Company (August 1995 Publication 0110HO9301R7/95).

(Log #1333)

7- 89 - (330-108 (New)): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Add a new Section:

330-108. Equipment Grounding. Where the outer sheath is made of copper, it shall provide an adequate path for equipment grounding purposes. Where made of steel, an equipment grounding conductor shall be provided.

Delete the second and third sentences of 330-22 (330-116 New).

SUBSTANTIATION: Text relocated from 330-22 (330-116 New) to provide consistency among the wire and cable articles. The phrase "the outer sheath" was added for clarity.

Deleted the phrase "in accordance with Article 250" since Section 90-3 adequately covers this requirement. NEC Style Manual, Section 4.1, requires that references not be provided if the material is already covered by Section 90-3. Also Section 4.1.1 prohibits referencing an entire Article

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-69a.

ARTICLE 331 — ELECTRICAL NONMETALLIC TUBING: TYPE ENT

(Log #1221)

8- 57 - (331): Accept in Principle

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise Article 331 to read as follows

Article 331 Electrical Nonmetallic Tubing: Type ENT

A. General

331-1. Scope. This article covers the use, installation, and construction specifications for Electrical Nonmetallic Tubing (ENT) and associated fittings.

331-2. 331-2. ~~331-1.~~ Definition.

Electrical Nonmetallic Tubing (ENT). A nonmetallic pliable corrugated raceway of circular cross section with integral or associated couplings, connectors, and fittings ~~listed~~ for the installation of electric conductors. ~~It~~ ENT is composed of a material that is resistant to moisture and chemical atmospheres and is flame retardant.

A pliable raceway is a raceway that can be bent by hand with a reasonable force, but without other assistance.

~~Electrical nonmetallic tubing shall be made of material that does not exceed the ignitibility, flammability, smoke generation, and toxicity characteristics of rigid (nonplasticized) polyvinyl chloride.~~

~~331-3.~~ 331-2. ~~Other Articles.~~

Installations for ENT ~~electrical nonmetallic tubing~~ shall comply with ~~the~~ applicable provisions ~~of the applicable sections~~ of Article 300. ~~Where equipment grounding is required by Article 250, a separate equipment grounding conductor shall be installed in the raceway.~~

331-6. Listing Requirements. ENT and associated fittings shall be listed.

B. Installation

331-10.~~331-3.~~ Uses Permitted.

The use of ENT ~~electrical nonmetallic tubing~~ and fittings shall be permitted in the following:

(1) In any building not exceeding three floors above grade

(a) For exposed work, where not subject to physical damage

(b) Concealed within walls, floors, and ceilings

FPN: See Section 336-5(a)(1) for definition of first floor.

(2) In any building exceeding three floors above grade, ENT ~~electrical nonmetallic tubing~~ shall be concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies. The 15-minute finish rated thermal barrier shall be permitted to be used for combustible walls, floors, and ceilings.

FPN: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.

(3) In locations subject to severe corrosive influences as covered in Section 300-6 and where subject to chemicals for which the materials are specifically approved

(4) In concealed, dry, and damp locations not prohibited by Section 331-12 ~~331-4.~~

(5) Above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies, except as permitted in Section 331-10(1)(a) ~~331-3(1)(a).~~

(6) Encased in poured concrete, or embedded in a concrete slab on grade where ENT is placed on sand or approved screenings, provided fittings identified for this purpose are used for connections

(7) For wet locations indoors as permitted in this section or in a concrete slab on or below grade, with fittings listed for the purpose

(8) 1/2 in. through 1 in. as listed manufactured prewired assembly

FPN: Extreme cold may cause some types of nonmetallic conduits to become brittle and, therefore, more susceptible to damage from physical contact.

331-12. ~~331-4.~~ Uses Not Permitted.

ENT ~~Electrical nonmetallic tubing~~ shall not be used in the following:

(1) In hazardous (classified) locations, except as permitted by Section 504-20 and Section 505-15(a)(1)

(2) For the support of fixtures and other equipment

(3) Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise

(4) For conductors whose insulation temperature limitations would exceed those for which the tubing is listed

(5) For direct earth burial

(6) Where the voltage is over 600 volts

(7) In exposed locations, except as permitted by Sections 331-10(1), 331-10(5) and 331-10(7). ~~331-3(1), 331-3(5), and 331-3(7)~~

(8) In theaters and similar locations, except as provided in Articles 518 and 520

(9) Where exposed to the direct rays of the sun, unless identified as sunlight resistant

331-20. ~~331-5.~~ Size.

(a) Minimum. ENT ~~Tubing~~ smaller than 1/2-in. ~~electrical~~ trade size shall not be used.

(b) Maximum. ENT ~~Tubing~~ larger than 2-in. ~~electrical~~ trade size shall not be used.

FPN: Metric trade numerical designations for ENT ~~electrical nonmetallic tubing~~ are 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, and 2 = 53.

331-22. ~~331-6.~~ Number of Conductors ~~in Tubing~~.

The number of conductors or cables ~~in a single tubing~~ shall not exceed that permitted by the percentage fill in Table 1, Chapter 9.

331-24.~~331-9.~~ Bends — How Made.

Bends ~~of electrical nonmetallic tubing~~ shall be made so that the tubing will not be damaged and that the internal diameter of the tubing will not be effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment, and the radius of the curve of the inner edge of such bends shall not be less than shown in Table ~~346-10~~ 346-24.

331-26.~~331-10.~~ Bends — Number in One Run.

There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, e.g., conduit bodies and boxes.

331-28.~~331-7.~~ Trimming.

All cut ends ~~of tubing~~ shall be trimmed inside and outside to remove rough edges.

331-30. Securing and Supporting. ~~331-11. Supports.~~

ENT ~~Electrical nonmetallic tubing~~ shall be installed as a complete system as provided in Article 300 and shall be ~~secured~~ securely fastened in place and supported in accordance with (a) and (b).

(a) Securely Fastened. ENT shall be securely fastened at intervals not exceeding 3 ft (914 mm). ~~or, for horizontal runs, it shall be permitted to be supported by openings in framing members at intervals not exceeding 3 ft (914 mm).~~ In addition, ~~it~~ ENT shall be securely fastened in place within 3 ft (914 mm) of each outlet box, device box, junction box, cabinet, or fitting where it terminates.

Exception: Lengths not exceeding a distance of 6 ft (1.83 m) from a fixture terminal connection for tap connections to lighting fixtures shall be permitted without being secured.

(b) Supports. Horizontal runs of ENT supported by openings in framing members at intervals not exceeding 3 ft (914 mm) and securely fastened within 3 feet (914 mm) of termination points shall be permitted.

331-40. ~~331-12.~~ Boxes and Fittings.

~~Electrical nonmetallic tubing shall be used only with listed fittings.~~

Boxes and fittings shall comply with the applicable provisions of Article 370.

331-46 ~~331-14.~~ Bushings.

Where a tubing enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.

FPN: See Section 300-4(f) for the protection of conductors size No. 4 or larger.

331-48. ~~331-8.~~ Joints.

All joints between lengths of tubing and between tubing and couplings, fittings, and boxes shall be by an approved method.

331-56. ~~331-13.~~ Splices and Taps.

Splices and taps shall be made only in accordance with Section 300-15. ~~junction boxes, outlet boxes, device boxes, or conduit bodies.~~ See Article 370 for rules on the installation and use of boxes and conduit bodies.

331-60. Grounding. Where equipment grounding is required by Article 250, a separate equipment grounding conductor shall be installed in the raceway.

C. Construction Specifications

331-100. Construction. ~~331-15. General~~

ENT ~~Electrical nonmetallic tubing~~ shall be made of material that does not exceed the ignitibility, flammability, smoke generation, and toxicity characteristics of rigid (nonplasticized) polyvinyl chloride.

~~Electrical nonmetallic tubing shall be clearly and durably marked at least every 10 ft (3.05 m) as required in the first sentence of Section 110-21. The type of material shall also be included in the marking. Tubing that has limited smoke-producing characteristics shall be permitted to be identified with the suffix LS. The type, size, and quantity of conductors used in prewired manufactured assemblies shall be identified by means of a printed tag or label attached to each end of the manufactured assembly and either the carton, coil, or reel. The enclosed conductors shall be marked in accordance with Section 310-11.~~

ENT, as a prewired manufactured assembly, shall be provided in continuous lengths capable of being shipped in a coil, reel, or carton without damage.

331-120. Marking.

ENT shall be clearly and durably marked at least every 10 ft (3.05 m) as required in the first sentence of Section 110-21. The type of material shall also be included in the marking. Tubing that has limited smoke-producing characteristics shall be permitted to be identified with the suffix LS.

The type, size, and quantity of conductors used in prewired manufactured assemblies shall be identified by means of a printed tag or label attached to each end of the manufactured assembly and either the carton, coil, or reel. The enclosed conductors shall be marked in accordance with Section 310-11.

SUBSTANTIATION:

The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways of circular cross-section. For the 1999 NEC, a previous Sub-Task Group recommended that all of the circular raceway articles be combined into a single article (Article 344), to present a more uniform approach to the conduit and tubing requirements and to consolidate common requirements.

Review of public comments led the Panel to conclude that the goal of more user friendly code language had not been realized by the proposed Article 344. Furthermore, the Panel requested that a committee be appointed to consider the issue of user friendly code as it relates to the circular raceway articles.

The Sub-Task Group was asked to address such possibilities as revising the rejected 1999 proposal in light of the public comments, developing one or more articles to address the requirements presented in the nine current circular raceway articles, or revising the current nine circular raceway articles using a similar style manual format. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.

A uniform format is proposed to achieve consistency across all of the circular raceways. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. A table that provides the uniform format for each circular raceway has been provided with this proposal. For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for conduit and tubing not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

Explanation of proposed renumbering and editorial changes;

(1) Title Acronym “ENT” added
(2) 331-1 New Scope added to conform with the style manual.
(3) 331-2
  (1) Definition renumbered from Section 331-1 to 331-2.
  (2) “ENT” (two places) and the text “A nonmetallic” added for clarity
  (3) “Electrical Nonmetallic Tubing” capitalized as it is a proper name of a product.
  (4) Listing requirements relocated to new Section 331-6.
  (5) Materials characteristics moved to Section 331-100.
(4) 331-3
(1) Other Articles renumbered from Section 331-2 to 331-3.
(2) Delete product name and replace with acronym “ENT”.
(3) Text revised for clarity.
(4) Grounding requirements moved to 331-60.
(5) 331-6 New section to relocate listing requirements for ENT and associated fittings. Listing requirements for the tubing came from 331-2 (99 NEC) and for the fittings from 331-12 (99 NEC).
(6) 331-10
  (1) Uses Permitted renumbered from Section 331-3 to 331-10.
  (2) Delete product name and replace with acronym “ENT” (two places).
  (3) Correct section references (two places).
(7) 331-12
  (1) Uses Not Permitted renumbered from Section 331-4 to 331-12.
  (2) Delete product name and replace with acronym “ENT”.
  (3) Correct section references.
(8) 331-20
  (1) Size renumbered from Section 331-5 to 331-20.
  (2) Delete product description or product name and replace with acronym “ENT” (three places).
  (3) The word “electrical” was deleted as it added nothing to the clarity of this section (two places).
(9) 331-22
  (1) Number of Conductors renumbered from 331-6 to 331-22.
  (2) Reword section adding reference to cables for clarity.
  (3) Removed the reference to tubing for clarity (two places).
(10) 331-24
  (1) Bends-How Made renumbered from 331-9 to 331-24.
  (2) Delete product name for clarity.
  (3) Corrected section reference.
(11) 331-26 Bends-Number in One Run renumbered from 331-10 to 331-26.
(12) 331-28
  (1) Trimming renumbered from 331-7 to 331-28.
  (2) Delete “ of tubing” for clarity.
(13) 331-30
  (1) Securing and Supporting renumbered from 331-11 to 331-30.
  (2) Title changed from “Supports” to “Securing and Supporting” since section addresses both subjects.
  (3) Deleted product name and replaced with acronym “ENT” (two places)
  (4) Seperated the Section into two parts for clarity.
  (5) Added text for clarity without changing the original requirement.
(14) 331-40
  (1) Boxes and Fittings renumbered from 331-12 to 331-40.
  (2) Listing requirement for fittings moved to 331-6.
(15) 331-46 Bushings renumbered from 331-14 to 331-46
(16) 331-48 Joints renumbered from 331-8 to 331-48.
(17) 331-56
  (1) Splices and Taps renumbered from 331-13 to 331-56.
  (2) Referenced 300-15 and deleted list of products for clarity.
(18) 331-60 New Section for the grounding requirements. Text moved from 331-2 (99 NEC).
(19) 331-100

(1) Construction renumbered and renamed from 331-15 General to 331-100 Construction.
(2) Deleted product name and replaced with acronym "ENT"
(3) Material characteristics moved from 331-1 (99 NEC).
(4) Moved marking requirements to 331-120.

(20) 331-120 New section for marking requirments moved from 331-15 (99 NEC).

The following Section numbers have been assigned unilaterally throughout all 10 raceway articles.	**Common Numbering System for the Circular Raceway Articles**
	Article 3XX, <title>: <acronym>
	Part A. General
3XX - 1	Scope.
3XX - 2	Definitions.
3XX - 3	Other Articles.
3XX - 6	Listing Requirements.
	Part B. Installation
3XX - 10	Uses Permitted.
3XX - 12	Uses Not Permitted.
3XX - 14	Dissimilar Metals.
3XX - 16	Temperature Limits.
3XX - 20	Size.
3XX - 22	Number of Conductors.
3XX - 24	Bends – How Made.
3XX - 26	Bends – Number in One Run.
3XX - 28	Reaming & Threading.
3XX - 28	Trimming.
3XX - 30	Securing and Supporting.
3XX - 40	Boxes and Fittings.
3XX - 42	Coupling and Connectors
3XX - 44	Expansion Fittings
3XX - 46	Bushings.
3XX - 48	Joints.
3XX - 50	Conductor Terms
3XX - 56	Splices and Taps.
3XX - 60	Grounding.
	Part C. Construction Specifications.
3XX - 100	Construction.
3XX - 110	Corrosion Protection.
3XX - 120	Marking.
3XX - 130	Standard Lengths.

PANEL ACTION: Accept in Principle.
Delete proposed Sections 331-3 and 331-40.
Delete the words "or cables" from proposed 331-22.
Delete the second sentence from proposed 331-56

PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP-8 recommends approval of the scope section by the TCC.

Proposed Sections 331-3 ,331-40 and the second sentence of 331-56 are deleted as Section 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.

There was no technical substantiation provided to add the words "or cables" as part of the rewrite of 331-22.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1278)

8- 58 - (331): Accept

Note: The Technical Correlating Committee understands that the action on this Proposal is to be implemented on the sections as revised by the action on Proposal 8-57.

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise as follows:

331-3 (2) FPN

FPN: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of ~~121~~ 120°C (250°F) or an individual temperature of ~~163~~ 160°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.

331-3 (8) Metric Designator 16 through 27 (Trade Size 1/2 through 1) ~~1/2 in. through 1 in.~~ as listed manufactured prewired assembly

331-5 (a) Minimum. Tubing smaller than metric designator 16 (trade size 1/2) ~~1/2 in. electrical trade size~~ shall not be used.

331-5 (b) Maximum. Tubing larger than metric designator 53 (trade size 2) ~~2 in. electrical trade size~~ shall not be used.

FPN: Metric trade numerical designations for electrical nonmetallic tubing are 16 = 1/2 ~~1/2 = 16~~, 21 = 3/4 ~~3/4 = 21~~, 27 = 1 ~~1 = 27~~, 35 = 1 1/4 ~~1 1/4 = 35~~, 41 = 1 1/2 ~~1 1/2 = 41~~, and 53 = 2 ~~2 = 53~~.

331-11

Electrical nonmetallic tubing shall be installed as a complete system as provided in Article 300 and shall be secured at intervals not exceeding 900 mm (3 ft) ~~3 ft (914 mm~~) or, for horizontal runs, it shall be permitted to be supported by openings in framing members at intervals not exceeding 900 mm (3 ft) ~~3 ft (914 mm)~~. In addition, it shall be securely fastened in place within 900 mm (3 ft) 3 ft (914 mm) of each outlet box, device box, junction box, cabinet, or fitting where it terminates.

Exception: Lengths not exceeding a distance of 1.8 m (6 ft) ~~6 ft (1.83 m)~~ from a fixture terminal connection for tap connections to lighting fixtures shall be permitted without being secured.

331-15 Electrical nonmetallic tubing shall be clearly and durably marked at least every 3 m (10 ft) ~~10 ft (3.05 m)~~ as required in the first sentence of Section 110-21. The type of material shall also be included in the marking. Tubing that has limited smoke-producing characteristics shall be permitted to be identified with the suffix LS. The type, size, and quantity of conductors used in prewired manufactured assemblies shall be identified by means of a printed tag or label attached to each end of the manufactured assembly and either the carton, coil, or reel. The enclosed conductors shall be marked in accordance with Section 310-11.

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis.

In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised.

In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.

PANEL ACTION: Accept.

(Log #2181)

8- 59 - (331-1, 331-16 (New)): Accept in Principle
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
A pliable raceway is a raceway that can be bent by hand with a reasonable force, but without other assistance.
~~Electrical nonmetallic tubing shall be made of material that does not exceed the ignitibility, flammability, smoke generation, and toxicity characteristics of rigid (non plasticized) polyvinyl chloride.~~
MOVE TO A NEW ARTICLE
331-16 Material [newly proposed]
Electrical nonmetallic tubing shall be made of material that does not exceed the ignitibility, flammability, smoke generation, and toxicity characteristics of rigid (nonplasticized) polyvinyl chloride.
SUBSTANTIATION: This paragraph is a rule not a definition. It should be moved from 331-1 to Part C. Construction Specifications. This would be consistent with other similar sections of the code, for example 334-22 and 346-16(b). Also, the NEC Style Manual 2.2.2 states, "Definitions shall not contain requirements...".
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-57.

NOT RETURNED: 1 Corry

(Log #2218)

8- 60 - (331-1): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested."
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.
[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
PANEL ACTION: Reject.
PANEL STATEMENT: The phrase "flame-tested" does not convey the requirement that the material contain flame-retardant properties. "Flame-retardant" is an understood and acceptable term in the industry.

NOT RETURNED: 1 Corry
COMMENT ON AFFIRMATIVE:
DOLLINS: See Ganatra's Explanation of Negative Vote on Proposal 6-3.

(Log #821)

8- 61 - (331-2 and Exception (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add:
"Where provided, an equipment bonding jumper shall be installed in accordance with Section 250-102."
Add a new Exception:
Exception: Where equipment, raceways, and enclosures are grounded by connection to the grounded circuit conductor as permitted in Section 250-142, an equipment grounding conductor shall not be required.
SUBSTANTIATION: Where ENT is interposed in a run of metal raceway and is 6 ft or less in length an EBJ on the outside should be permitted to maintain continuity of the equipment grounding conductor (raceways). A grounded circuit conductor is technically not an equipment grounding conductor; this section appears to negate or conflict with Section 250-142.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirements for bonding and equipment grounding are specified in Article 250, and are not under the jurisdiction of CMP 8. The requirements of Article 250 for grounding and bonding apply throughout the Code and it is not necessary to repeat them in Article 331.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1420)

8- 62 - (331-2): Accept in Principle
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise as follows:
331-2. Other Articles. ~~Installations for electrical nonmetallic tubing shall comply with the provisions of the applicable sections of Article 300.~~ Where equipment grounding is required by Article 250, a separate equipment grounding conductor shall be installed in the raceway.
SUBSTANTIATION: 1999 National Electrical Code Style Manual:
Section 4.1 states "Do not use a reference if the requirement is already covered by 90.3."
Section 4.1.1 stipulates that "References shall not be made to an entire article... unless additional conditions are specified.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-57, specifically 331-3.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #375)

8- 63 - (331-3): Reject
SUBMITTER: Jerry Richardson, TFE, Inc.
RECOMMENDATION: Revise to read as follows:
331-3. Uses Permitted. One may use electrical nonmetallic tubing:
(1) In any structure with less than four floors above grade
(a) For exposed work, where physical damage is unlikely OR
(b) Concealed within a wall, floor, or ceiling
FPN: See Section 336-5(a)(1) for definition of first floor.
(2) In any structure that has more than three floors above grade, the walls, floors, and ceilings which conceal tubing must provide a 15-minute finish rating as evidenced in a listing of fire-rated assemblies.
FPN: For wood, the finish rating is the time needed for the stud or joist to rise 121°C, or reach 163°C (325°F) on the plane of the wood nearest the fire. Finish ratings do not apply to membrane ceilings.
(3) In locations where severe corrosives (as covered in Section 300-6) exist, and resistance to the chemical is specifically approved
(4) In concealed, dry, and damp locations not prohibited by Section 331-4
(5) Encased in poured concrete, or embedded in a concrete slab on grade where the tubing is placed on sand or approved screenings, if fittings identified for this purpose are used for connections
(7) For wet locations indoors as permitted in this section or in a concrete slab on or below grade, with fittings listed for the purpose
(8) 1/2 in. through 1 in. as a listed manufactured prewired assembly
FPN: Extreme cold may cause some types of nonmetallic tubing to become brittle and become more easily damaged.
SUBSTANTIATION: The 15-minute finish rating applies whether the surface is combustible or not. If the reader has instruments and ability to understand temperature rise and thermal resistance, Fahrenheit metrics are probably not needed.
PANEL ACTION: Reject.

PANEL STATEMENT: The proposal completelly rewrote Section 331-3 without substantiating all of the changes. 331-3(2) states that the 15 minute finish rating applies to combustible and non combustible walls. The first edition of the NEC inadvertently omitted the term "noncombustible" from 331-3(2) and was noted in the official NFPA NEC errata.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry
COMMENT ON AFFIRMATIVE:
BERMAN: The third sentence of the Panel Statement should have included a reference to the first printing of the 1999 edition of the NEC.

(Log #4094)

8- 64 - (331-3 and 331-4): Reject
SUBMITTER: Marshall A. Klein, Marshall A. Klein & Assoc., Inc./Rep. AvalonBay Communities & Lincoln Property Co.
RECOMMENDATION: Revise text as follows:
331-3. Uses Permitted. The use of electrical nonmetallic tubing and fittings shall be permitted in the following:
(1) One- and two-family dwellings
(2) Multifamily dwellings and other structures, except as prohibited in Section 331-4.
~~(1) In any building not exceeding three floors above grade~~
~~(a) For exposed work, where not subject to physical damage~~
~~(b) Concealed within walls, floors, and ceilings~~
~~FPN: See Section 336-5(a)(1) for definition of first floor.~~
~~(2) In any building exceeding three floors above grade, electrical nonmetallic tubing shall be concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies. The 15-minute finish rated thermal barrier shall be permitted to be used for combustible walls, floors, and ceilings.~~
~~FPN: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.~~
(3) In locations subject to severe corrosive influences as covered in Section 300-6 and where subject to chemicals for which the materials are specifically approved.
(4) In concealed, dry, and damp locations not prohibited by Section 331-4
~~(5) Above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies, except as permitted in Section 331-3(1)(a).~~
(~~6~~ 5) Encased in poured concrete, or embedded in a concrete slab on grade where ENT is placed on sand or approved screenings, provided fittings identified for this purpose are used for connections
(~~7~~ 6) For wet locations indoors as permitted in this section or in a concrete slab on or below grade, with fittings listed for the purpose
(~~8~~ 7) 1/2 in. through 1 in. as listed manufactured prewired assembly
FPN: Extreme cold may cause some types of nonmetallic conduits to become brittle and, therefore, more susceptible to damage from physical contact.
331-4. Uses Not Permitted. Electrical nonmetallic tubing shall not be used in the following:
(1) In any multifamily dwelling or other structure exceeding three floors above grade
For the purpose of this article, the first floor of a building shall be that floor that has 50 percent or more of the exterior wall surface area level with or above finished grade. One additional level that is the first level and not designed for human habitation and used only for vehicle parking, storage, or similar use shall be permitted.
(~~1~~ 2) In hazardous (classified) locations, except as permitted by Section 504-20 and Section 505-15(a)(1)
(~~2~~ 3) For the support of fixtures and other equipment
(~~3~~ 4) Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise
(~~4~~ 5) For conductors whose insulation temperature limitations would exceed those for which the tubing is listed
(~~5~~ 6) For direct earth burial
(~~6~~ 7) Where the voltage is over 600 volts
(~~7~~ 8) In exposed locations, except as permitted by Sections 331-3(1), ~~331-3(5),~~ 331-3(2), and 331-3(~~7~~ 6)
(~~8~~ 9) In theaters and similar locations, except as provided in Articles 518 and 520
(~~9~~ 10) Where exposed to the direct rays of the sun, unless identified as sunlight resistant
SUBSTANTIATION: Article 331 was a new article in the 1984 NEC. In the 1984 NEC Section 331-3 was the same as Section 336-3. In the 1987 NEC Section 331-3 was revised to eliminate the three story limit on the use of ENT.
The use of ENT was recognized by the NEC, and permitted to be used in buildings above 3 stories, as a result of the U.S. Supreme Court case, from 1981-1988, Allied tube & Conduit v. Indian Head, Inc. (which decided that the actions of Allied Tube & Conduit during the 1980 NFPA Annual Meeting were not protected from antitrust liability), NEC-TCR-86-A Code Proposal 8-49, and NEC TCD-86 Comments 8-32 and 8-33.
NEC-TCR-86-A Code Proposal 8-49 used as substantiation the report entitled "The Use of ENMT, Fire Hazard Analysis," by Benjamin/Clarke Associates, Inc., dated 9/85, to accept the use of ENT above three stories when concealed behind a 15 minute finish rated thermal barrier.
In 1998, Sullivan Code Group prepared the report I have submitted entitled, "Type NM Cable Fire Hazard Analysis," based on the same type of analysis that was used by the Benjamin/Clarke Hazard Analysis for ENMT. The results of the Sullivan Report (which is based on cone calorimeter testing by Dr. Fred Mower, Fire Protection Engineering Department, University of MD, and a third party peer review by Dr. Fred Clarke, Benjamin Clarke Associates) concludes that the fire hazard (or lack thereof) of NM Cable is equivalent to ENMT.
Based on the results of this study, and the Panel 7 Committee's reluctance during prior Code cycles to remove the story limit on NM Cable, the Panel 8 Committee should reconsider its acceptance of ENT use in buildings over three stories in height.
By submitting this proposal, we are neither supporting nor opposing the use of ENT above three stories in height. We are only attempting to gain consistency in the NEC, and between Panel Committees, on electrical wiring methods.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter makes it clear that he does not oppose the use of ENT above three stories and provides no new substantiation to identify this use as a hazard.

(Log #2964)

8- 65 - (331-3(2), Exception (New)): Reject
Note: The Technical Correlating Committee directs that this Proposal be referred to the NFPA Toxicity Advisory Committee for comment on the toxicity issues relative to the use of ENT in buildings over three stories. The Technical Correlating Committee directs that Code-Making Panel 8 act on the technical merits of the proposal outside of presumed toxicity issues.
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Revise text to read as follows:
(2) In any building exceeding three floors above grade, electrical nonmetallic tubing shall be concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies. The 15-minute finish rated thermal barrier shall be permitted to be used for combustible walls, floors, and ceilings.
Exception: When a fire sprinkler system(s) is installed in accordance with NFPA 13, Installation of Sprinkler Systems, on all floors, ENT is permitted to be used within walls, floors and ceilings exposed or concealed in buildings exceeding three floors above grade.
FPN: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature of 163°C (325°F)

as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.
SUBSTANTIATION: PVC will not ignite unless exposed to a substantial flame energy. If a fire or flame energy is present, the fire sprinkler system would extinguish or detain the fire to allow the evacuation of the building. PVC will not support combustion on its own. PVC is self extinguishing. In other words, if the flame energy or source is removed or extinguished the PVC material would put itself out.
ENT has been acceptable to be used exposed or concealed in buildings less than three stories since the 1984 NEC. There has not been a single instance where ENT has been identified as having contributed to the spread of fire or smoke, personal injury, or fatality. This is an enviable safety record.
The finish rating requirement was included in the 1987 NEC when the three floor height limitation was deleted from Article 331. This requirement was added to the original proposal by the NFPA Toxicity Advisory Committee as a means to qualify the heat transfer resistance of the material which is used to conceal the ENT. Fire sprinkler systems will reduce the amount of heat transferred by either the concealed wall or exposed materials.
The fire sprinkler systems have proven to give occupants adequate time to exit a building when a fire is present. These systems have saved live's even though room furnishings are ignited, spreading flame and omitting toxic gasses and smoke.
PANEL ACTION: Reject.
PANEL STATEMENT: As stated in the substantiation, the addition of the wording pertaining to finish rating was developed as a result of the NFPA Toxicity Technical Advisory Committee. Until such time as the NFPA Toxicity Technical Advisory Committee deems the use of a sprinkler system to be an acceptable substitute for a 15 minute finish rating, it is necessary to retain the requirement. There was no substantiation provided to demonstrate the safety record of the product as stated by the submitter. The panel directs staff to submit this proposal and panel statement to the NFPA Toxicity Technical Advisory Committee for comment.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
KENDALL: The panel has been instructed by the Technical Correlating Committee to address the use of ENT pertaining to the application without addressing toxicity. The panel continues to use the issue of toxicity as a reason to restrict ENT when used in buildings exceeding three floors.

(Log #2965)

8- 66 - (331-3(5), Exception (New)): Reject
Note: The Technical Correlating Committee directs that this Proposal be referred to the NFPA Toxicity Advisory Committee for comment on the toxicity issues relative to the use of ENT in buildings over three stories. The Technical Correlating Committee directs that Code-Making Panel 8 act on the technical merits of the proposal outside of presumed toxicity issues.
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Revise text to read as follows:
(5) Above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies, except as permitted in Section 331-3(1)(a).
Exception: When a fire sprinkler system(s) is installed in accordance with NFPA 13, Installation of Sprinkler Systems, on all floors, ENT is permitted to be used above suspended ceilings without 15-minute finish rated thermal barrier material.
SUBSTANTIATION: PVC will not ignite unless exposed to a substantial flame energy. If a fire or flame energy is present, the fire sprinkler system would extinguish or detain the fire to allow the evacuation of the building. PVC will not support combustion on its own. PVC is self extinguishing. In other words, if the flame energy or source is removed or extinguished the PVC material would put itself out.
ENT has been acceptable to be used exposed or concealed in buildings less than three stories since the 1984 NEC. There has not been a single instance where ENT has been identified as having contributed to the spread of fire or smoke, personal injury, or fatality. This is an enviable safety record.
The finish rating requirement was included in the 1987 NEC when the three floor height limitation was deleted from Article 331. This requirement was added to the original proposal by the NFPA Toxicity Advisory Committee as a means to qualify the heat transfer resistance of the material which is used to conceal the ENT. Fire sprinkler systems will reduce the amount of heat transferred by either the concealed wall or exposed materials.
The fire sprinkler systems have proven to give occupants adequate time to exit a building when a fire is present. These systems have saved live's even though room furnishings are ignited, spreading flame and omitting toxic gasses and smoke.

KENDALL: The panel has been instructed by the Technical Correlating Committee to address the use of ENT pertaining to the application without addressing toxicity. The panel continues to use the issue of toxicity as a reason to restrict ENT when used in buildings exceeding three floors.

(Log #3171)

8- 67 - (331-4(10) (New)): Accept in Principle
Note: The Technical Correlating Committee understands that this becomes (10) of 331-12 and also modifies 331-10(1)(a) of Proposal 8-57.
SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION: Add a new Use Not Permitted to section 331-4 and number appropriately.
(10) Where subject to physical damage unless identified for such use.
SUBSTANTIATION: This is the same language that appears in Section 347-3(c) of the 1999 NEC®. Section 331-3(1)(a) only covers physical damage where exposed in buildings of three stories or less. Physical characteristics of ENT are less than Sch. 40 and the NEC should be clear relative to physical damage.
PANEL ACTION: Accept in Principle.
Amend the proposal to read:
(10) Where subject to physical damage.
Amend Section 331-3(1)(a) to read:
For exposed work where not prohibited by 331-4.
PANEL STATEMENT: T he submitters proposal to require ENT identified for use where subject to physical damage is not substantiated.
Section 331-3(1)(a) has been amended to eliminate redundant language.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #335)

8- 68 - (331-4(3)): Reject
SUBMITTER: Mike Theisen, St. Cloud, MN
RECOMMENDATION: Reinsert the original first sentence in the 1996 NEC, which must have been inadvertently edited out of the 1999 NEC.
Where subject to ambient temperatures exceeding those for which the tubing is listed.
SUBSTANTIATION: The phrase “ambient temperature” normally indicates more than just a high temperature. In Minnesota and other northern climates, the ambient temperature can be below -20°F for

extended periods of time. At these low temperatures, ENT is very fragile.
PANEL ACTION: Reject.
PANEL STATEMENT: The current language in 331-4(3) was a fine print note in the 1996 NEC. Because the FPN contained mandatory requirements it was made into a Code rule. The language "Where subject to ambient temperatures exceeding those for which the tubing is listed" was applicable to the highest temperature rating of ENT. Therefore, it would not be applicable to problems associated with lower temperature ranges. The FPN following 331-3(8) draws attention of the user to cold weather installations.
The removal of the language from the 1999 NEC was based on Comment 8-155.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3034)

8- 69 - (331-5): Accept in Principle
SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Revise text as follows:
(a) Minimum. ENT ~~Tubing~~ smaller than 1/2 16 ~~-in. electrical trade size~~ shall not be used.
(b) Maximum. ENT ~~Tubing~~ larger than 2 53 ~~-in. electrical trade size~~ shall not be used.
FPN: The Trade Sizes and Metric Designators are for identification purposes only and do not relate to actual dimensions. See 300-1(c).
~~FPN: Metric trade numerical designations for electrical nonmetallic tubing are 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, and 2 = 53.~~
SUBSTANTIATION: To correlate with proposal submitted by NEMA to CMP 3 to add a table showing current trade sizes and metric designators. The table provides universal information throughout the Code. This cuts out a lot of excess language in the Code which is no longer needed. Metric designators for trade sizes have been established for two Code cycles and cover raceways and system components. Also, picks up use of acronym as proposed for the 2002 Code.
PANEL ACTION: Accept in Principle.
The Panel accepts in principle the addition of the new FPN to read as follows:
"FPN: See 300-1(c) for the Metric Designators and Trade Sizes. These are for identification purposes only and do not relate to actual dimensions. "
The panel accepts the deletion of the old FPN. The panel accepts in principle the replacement of "Tubing" with the acronym "ENT" and the deletion of "in. electrical trade size" by action on Proposals 8-57 and 8-58.
PANEL STATEMENT: The acceptance of the changes to the Fine Print Notes are contingent upon an acceptance of Proposal 3-6 by CMP 3. If CMP-3 does not accept Proposal 3-6, the panel directs staff to revert to the existing FPN. The proposed Fine Print Note was revised to comply with Section 4.1.2 of the NEC Style Manual. See panel action on Proposals 8-57 and 8-58.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3068)

8- 70 - (331-9): Accept in Principle
Note: The Technical Correlating Committee understands that this action replaces the accepted text in 331-24 in Proposal 8-57.
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Revise second sentence of this section to read:
Bends shall be permitted to be made manually without auxiliary equipment, and the radius of the curve ~~of the inner edge~~ to the centerline of such bends shall not be less than shown in Table 346-10 using the column "Other Benders."
SUBSTANTIATION: This change is necessary to correlate with the proposal to revise Table 346-10. This text clarifies that measurements are to be made to the centerline and provides radii consistent with other conduits.
PANEL ACTION: Accept in Principle.
Change the word "Benders" to "Bends" in the propsed language.
PANEL STATEMENT: See panel action and statement on Proposal 8-245.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2166)

8- 71 - (331-13): Accept
Note: The Technical Correlating Committee understands that this action replaces the accepted text in 331-56 in Proposal 8-57.
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise to read as follows:
Splices and taps shall be made only in junction boxes, outlet boxes, device boxes, or conduit bodies. ~~See Article 370 for rules on the installation and use of boxes and conduit bodies.~~
FPN: See Article 370 for rules on the installation and use of boxes and conduit bodies.
SUBSTANTIATION: This deleted sentence is an explanatory reference to another NEC rule; therefore, it should be a fine print note. The NEC Style Manual 4.1 states, "Explanatory references shall be in fine print notes.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1061)

8- 72 - (331-14, FPN): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: 331-14, FPN - change "No. 4" to "4 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2824)

8- 73 - (331-15): Accept
Note: The Technical Correlating Committee understands that this action regarding the replacement of the third sentence revises the accepted text in 331-120 in Proposal 8-57.
SUBMITTER: Ravindra H. Ganatra, Alcan Cable /Rep. CANENA Tech Harmonization Subcomm. For Bldg Wire and Cable Products
RECOMMENDATION: Revise 331-15 as follows:
331-15. General. Electrical nonmetallic tubing shall be clearly and durably marked at least every 10 ft (3.05 m) as required in the first sentence of Section 110-21. The type of material shall also be included in the marking. ~~Tubing that has limited smoke producing characteristics shall be permitted to be identified with the suffix LS.~~ Marking for limited smoke shall be permitted on the tubing that has limited smoke-producing characteristics. The type, size, and quantity of conductors used in prewired manufactured assemblies shall be identified by means of a printed tag or label attached to each end of the manufactured assembly and either the carton, coil, or reel. The enclosed conductors shall be marked in accordance with Section 310-11.
ENT, as a prewired manufactured assembly, shall be provided in continuous lengths capable of being shipped in a coil, reel, or carton without damage.
SUBSTANTIATION: This proposal is submitted on behalf of the THSC - Building Wire and Cable Product Standards, of Council of Harmonization of Electrotechnical Standardization of North America (CANENA).
Abbreviation LS has been found to represent different requirements in different national product standards in North America. In Mexico,

"LS" is used to indicate compliance with requirements associated with marking for low smoke. In the US, "LS" marking has been used to indicate compliance with requirements associated with marking for limited smoke. However, the requirements in Mexico and the US are different. Further, requirements for "ST1" marking used in Canada are similar to limited smoke marking used in the US.

Thus, removal of the abbreviation in the Code will facilitate harmonization of marking requirements in the product standards.

Although the section does not deal with wire and cable products, this proposal is made for this section to address the change in h abbreviation for limited smoke marking.

The proposal does not recommend any change in the test method or performance requirements for a product being evaluated for limited smoke marking.

PANEL ACTION: Accept.

ARTICLE 333 — ARMORED CABLE

(Log #CP710)

7- 89a - (333): Accept

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: CMP 7
RECOMMENDATION: Rewrite Article 333 to comply with NEC Style Manual.

ARTICLE 333 -- Armored Cable: Type AC

I General

333-1 Scope. This article covers the use, installation, and construction specifications for Armored Cable, Type AC.

333-2. Definition.

Armored Cable, Type AC. A fabricated assembly of insulated conductors in a flexible metallic enclosure. See 333-100.

II. Installation

333-10. Uses Permitted. Where not subject to physical damage, Type AC cable shall be permitted:
(1) For branch circuits and feeders
(2) In both exposed a concealed work
(3) In cable trays where identified for such use
(4) In dry locations
(5) Embedded in plaster finish on brick or other masonry, except in damp or wet locations
(6) To be run or fished in the air voids of masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness

333-12. Uses Not Permitted. Type AC cable shall not be used:
(1) In theaters and similar locations, except where permitted in
(2) 518-4
(2) In motion picture studios
(3) In hazardous (classified) locations except where permitted in:
  (a) 501-4(b), Exception
  (b) 502-4(b), Exception No. 1
  (c) 504-20
(4) Where exposed to corrosive fumes or vapors
(5) On cranes or hoists, except where permitted in 610-11(c)
(6) In storage battery rooms
(7) In hoistways, or on elevators, or escalators, except where permitted in 620-21
(8) In commercial garages except where permitted in 511-4 and 511-6

333-15. Exposed Work. Exposed runs of cable shall closely follow the surface of the building finish or of running boards. Exposed runs shall also be permitted to be installed on the underside of joists where supported at each joist and located so as not to be subject to physical damage.

333-17. Through or Parallel to Framing Members. Type AC cable shall comply with 300-4 where installed through or parallel to studs, joists, rafters, or similar wood or metal members.

333-23. In Accessible Attics. Type AC cables in accessible attics or roof spaces shall be installed as specified in (a) and (b).

(a) Where Run Across the Top of Floor Joists. Where run across the top of floor joists, or within 2.1 m (7 ft.) of floor or floor joists across the face of rafters or studding, in attics and roof spaces that are accessible, the cable shall be protected by substantial guard strips that are at least as high as the cable. Where this space is not accessible by permanent stairs or ladders, protection shall only be required within 1.8 m (6 ft.) of the nearest edge of the scuttle hole or attic entrance.

(b) Cable Installed Parallel to Framing Members. Where the cable is installed parallel to the sides of rafters, studs, or floor joists, neither guard strips nor running boards shall be required, and the installation shall also comply with 300-4(d).

333-24. Bending Radius. Bends in Type AC cable shall be made so that the cable will not be damaged. The radius of the curve of the inner edge of any bend shall not be less than five times the diameter of the Type AC cable.

333-30. Securing and Supporting. Type AC cable shall be secured by staples, cable ties, straps, hangers, or similar fittings designed and installed so as not to damage the cable at intervals not exceeding 1.4 m (4 1/2 ft) and within 300 mm (12 in.) of every outlet box, junction box, cabinet, or fitting.

(a) Horizontal Runs. Type AC cable installed in other than vertical runs through bored or punched holes in wood or metal framing members, or through notches in wooden framing members and protected by a steel plate at least 1.6 mm (1/16 in.) thick, shall be considered secured where the support intervals do not exceed 1.4 m (4 1/2 ft.) and the armored cable is securely fastened in place by an approved means within 300 mm (12 in.) of each box, cabinet, conduit body, or other armored cable termination.

(b) Unsupported. Type AC cable shall be permitted to be unsupported where the cable is:
(1) Fished between access points, where concealed in finished buildings or structures and supporting is impracticable;
(2) Not more than 600 mm (2 ft.) in length at terminals where flexibility is necessary; or
(3) Not more than 1.8 m (6 ft.) in length from an outlet for connections within an accessible ceiling to lighting fixtures or equipment.

(c) Cable Tray Installations. Type AC cable installed in cable trays shall comply with 318-8(b).

333-40. Boxes and Fittings. At all points where the armor of AC cable terminates, a fitting shall be provided to protect wires from abrasion, unless the design of the outlet boxes or fittings is such as to afford equivalent protection, and, in addition, an insulating bushing or its equivalent protection shall be provided between the conductors and the armor. The connector or clamp by which the Type AC cable is fastened to boxes or cabinets shall be of such design that the insulating bushing or its equivalent will be visible for inspection. Where change is made from Type AC cable to other cable or raceway wiring methods, a box, fitting, or conduit body shall be installed at junction points as required in 300-15.

333-80. Ampacity. The ampacity shall be determined by 310-15.

(a) Thermal Insulation. Armored cable installed in thermal insulation shall have conductors rated at 90ºC (194ºF). The ampacity of cable installed in these applications shall be that of 60ºC (140ºF) conductors

(b) Cable Tray. The ampacity of Type AC cable installed in cable tray shall be determined in accordance with 318-11

III Construction Specifications

333-100. Construction. Type AC cable shall have an armor of flexible metal tape and shall have an internal bonding strip of copper or aluminum in intimate contact with the armor for its entire length.

333-104. Conductors. Insulated conductors shall be of a type listed in Table 310-13 or those identified for use in this cable. In addition, the conductors shall have an overall moisture-resistant and fire-retardant fibrous covering. For Type ACT, a moisture-resistant fibrous covering shall be required only on the individual conductors..

333-108. Equipment Grounding. Type AC cable shall provide an adequate path for equipment grounding as required by 250-2(d).

333-120. Marking. The cable shall be marked in accordance with 310-11, except that Type AC shall have ready identification of the manufacturer by distinctive external markings on the cable sheath throughout its entire length.

SUBSTANTIATION: This revision to Article 333 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with the usability effort. Specific proposals addressed by this revision include 7-90, 7-91, 7-92, 7-93, 7-95, 7-97, 7-98, 7-99, 7-105, and 7-106.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1382)

7- 90 - (333): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise text to read as follows:

Article 333 Armored Cable: Type AC

~~A.~~ I. General.

~~333-1.~~ 333-2. Definition.

Armored Cable (Type AC). ~~cable is a~~ A fabricated assembly of insulated conductors in a flexible metallic enclosure. See Section ~~333-19.~~ 333-100.

~~333-2.~~ 333-3. Other Articles. Type AC cable shall comply with this article and also with the applicable provisions of other articles in this Code, especially Article 300.

~~B.~~ II. Installation.

~~333-3.~~ 333-10. Uses Permitted. Except where otherwise specified in this Code and where not subject to physical damage, Type AC cable shall be permitted for branch circuits and feeders in both exposed and concealed work and in cable trays where identified for such use.

Type AC cable shall be permitted in dry locations and embedded in plaster finish on brick or other masonry, except in damp or wet locations. It shall be permissible to run or fish this cable in the air voids of masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness.

~~333-4.~~ 333-12. Uses Not Permitted. Type AC cable shall not be used where prohibited elsewhere in this Code, including the following:

1. In theaters and similar locations, except as provided in Article 518, Places of Assembly
2. In motion picture studios
3. In any hazardous (classified) location except as permitted by Sections 501-4(b), Exception, 502-4(b), Exception No. 1, and 504-20
4. Where exposed to corrosive fumes or vapors
5. On cranes or hoists, except as provided in Section 610-11(c)
6. In storage battery rooms
7. In hoistways or on elevators, except as provided in Section 620-21
8. In commercial garages where prohibited in Article 511

~~333-11.~~ 333-15. Exposed Work. Exposed runs of cable shall closely follow the surface of the building finish or of running boards. Exposed runs shall also be permitted to be installed on the underside of joists where supported at each joist and located so as not to be subject to physical damage.

~~333-10.~~ 333-17. Through or Parallel to Framing Members. Type AC cable shall comply with Section 300-4 where installed through or parallel to studs, joists, rafters, or similar wood or metal members.

~~333-12.~~ 333-23. In Accessible Attics. Type AC cables in accessible attics or roof spaces shall be installed as specified in (a) and (b).

(a) Where Run Across the Top of Floor Joists. Where run across the top of floor joists, or within 7 ft (2.13 m) of floor or floor joists across the face of rafters or studding, in attics and roof spaces that are accessible, the cable shall be protected by substantial guard strips that are at least as high as the cable. Where this space is not accessible by permanent stairs or ladders, protection shall only be required within 6 ft (1.83 m) of the nearest edge of the scuttle hole or attic entrance.

(b) Cable Installed Parallel to Framing Members. Where the cable is installed parallel to the sides of rafters, studs, or floor joists, neither guard strips nor running boards shall be required, and the installation shall also comply with Section 300-4(d).

~~333-8.~~ 333-24. Bending Radius. ~~All bends~~ Bends in Type AC cable shall be made so that the cable will not be damaged~~, and the~~ The radius of the curve of the inner edge of any bend shall not be less than five times the diameter of the ~~Type AC~~ cable.

~~333-7.~~ 333-30. ~~Support~~ Securing and Supporting. Type AC cable shall be secured by staples, cable ties, straps, hangers, or similar fittings designed and installed so as not to damage the cable at intervals not exceeding 4 1/2 ft (1.37 m) and within 12 in. (305 mm) of every outlet box, junction box, cabinet, or fitting.

(a) Horizontal Runs. Type AC cable installed in other than vertical runs through bored or punched holes in wood or metal framing members, or through notches in wooden framing members and protected by a steel plate at least 1/16 in. (1.59 mm) thick, shall be considered secured where the support intervals do not exceed 4 1/2 ft (1.37 m) and the armored cable is securely fastened in place by an approved means within 12 in. (505 mm) of each box, cabinet, conduit body, or other armored cable termination.

(b) Unsupported. Type AC cable shall be permitted to be unsupported where the cable is

1. Fished between access points, where concealed in finished buildings or structures and supporting is impracticable;
2. Not more than 2 ft (610 mm) in length at terminals where flexibility is necessary; or
3. Not more than 6 ft (1.83 m) in length from an outlet for connections within an accessible ceiling to lighting fixtures or equipment.

(c) Cable Tray Installations. Type AC cable installed in cable trays shall comply with Section 318-8(b).

~~333-9.~~ 333-40. Boxes and Fittings. At all points where the armor of AC cable terminates, a fitting shall be provided to protect wires from abrasion, unless the design of the outlet boxes or fittings is such as to afford equivalent protection, and, in addition, an insulating bushing or its equivalent protection shall be provided between the conductors and the armor. The connector or clamp by which the Type AC cable is fastened to boxes or cabinets shall be of such design that the insulating bushing or its equivalent will be visible for inspection. Where change is made from Type AC cable to other cable or raceway wiring methods, a box, fitting, or conduit body shall be installed at junction points as required in Section 300-15.

333-80. Ampacity. The ampacity shall be determined by Section 310-15.

Armored cable installed in thermal insulation shall have conductors rated at 90°C (194°F). The ampacity of cable installed in these applications shall be that of 60°C (140°F) conductors.

~~C.~~ III. Construction Specifications

~~333-19.~~ 333-100. Construction. Type AC cable shall have an armor of flexible metal tape. The insulated conductors shall be in accordance with Section ~~333-20~~ 333-104. Cables of the AC type shall have an internal bonding strip of copper or aluminum in intimate contact with the armor for its entire length.

~~333-20.~~ 333-104. Conductors. Insulated conductors shall be of a type listed in Table 310-13 or those identified for use in this cable. In addition, the conductors shall have an overall moisture-resistant and fire-retardant fibrous covering. For Type ACT, a moisture-resistant fibrous covering shall be required only on the individual conductors. ~~The ampacity shall be determined by Section 310-15.~~

~~Armored cable installed in thermal insulation shall have conductors rated at 90°C (194°F). The ampacity of cable installed in these applications shall be that of 60°C (140°F) conductors.~~

~~333-21.~~ 333-108. Equipment Grounding. Type AC cable shall provide an adequate path for equipment grounding as required by Section 250-2(d).

~~333-22.~~ 333-120. Marking. The cable shall be marked in accordance with Section 310-11, except that Type AC shall have ready identification of the manufacturer by distinctive external markings on the cable sheath throughout its entire length.

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering cable and wiring.

A uniform format is proposed to achieve consistency across all of the cable and wiring articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as stated in the NEC Style Manual 2.4.1. It is hoped that the parallel Code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for cable and wiring not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

The last three sentences of existing Section 333-20 were relocated to new Section 333-80.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-89a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1336)

7- 91 - (333-1): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Add a new Section 333-1 as follows:
333-1. Scope. This article covers the use, installation, and construction specifications for Armored Cable Type, AC.
Renumber existing 333-1 to 333-2
333-2 to 333-3
333-3 to 333-4
SUBSTANTIATION: NEC Style Manual requires that each article contain a statement of scope and that the scope statement be the first section of the Article. See NEC Style Manual 2.2.1 and 2.2.2.2.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-89a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1338)

7- 92 - (333-2): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Delete Section 333-2 (333-3 New)
~~333-2. Other Articles. Type AC cable shall comply with this article and also with the applicable provisions of other articles in this Code, especially Article 300.~~
SUBSTANTIATION: Section 90-3 adequately covers this requirement. NEC Style Manual, Section 4.1 requires that references not be provided if the material is already covered by Section 90-3.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-89a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1421)

7- 93 - (333-2): Accept in Principle
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Delete 333-2 in its entirety.
SUBSTANTIATION: 1999 National Electrical Code Style Manual:
Section 4.1 states "Do not use a reference if the requirement is already covered by 90.3."
Section 4.1.1 stipulates that "References shall not be made to an entire article... unless additional conditions are specified.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-89a.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #825)

7- 94 - (333-3): Accept
Note: The Technical Correlating Committee understands that this action deletes 333-10(1) in Proposal 7-89a.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise second sentence:
"Type AC cable shall be permitted ~~for branch circuits and feeders~~ in both exposed and concealed work, and in cable trays where identified for such use."
SUBSTANTIATION: Edit. Literal limitation to use as branch circuits and feeders suggests this cable is not suitable for other uses, e.g., control and signal circuits. It has been suggested that the Code must be looked at as a whole, to sometimes define intent. Sections 330-3 and 334-3 specifically indicate Types MI and MC cables are suitable for control and signal circuits, and Section 336-4 does not specify specific cable use. This indicates intent is not to permit use of Type AC cable for other than branch circuits or feeders.
Branch circuits may end at an outlet to which Type AC cable is connected to supply utilization equipment with tap conductors which may not be considered as a branch circuit.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1339)

7- 95 - (333-3): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise existing 333-3 (333-10 New) to convert text to a list and to remove redundant reference to the Code.
~~333-3.~~ 333-10. Uses Permitted. ~~Except where otherwise specified in this Code and~~ Where not subject to physical damage, Type AC cable shall be permitted:
(1) For ~~for~~ branch circuits and feeders
(2) In ~~in~~both exposed and concealed work
(3) In ~~and in~~ cable trays where identified for such use~~. Type AC cable shall be permitted~~
(4) In ~~in~~ dry locations
(5) Embedded ~~embedded~~in plaster finish on brick or other masonry, except in damp or wet locations~~.~~
(6) ~~It shall be permissible to~~ To be run or fished ~~this cable~~ in the air voids of masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness~~.~~
SUBSTANTIATION: NEC Style Manual Section 3.3.2 requires that where possible lists or tables be used to present requirements, rather than long text descriptions.
"Except where otherwise specified in this Code and" was deleted as it applies generally, it is redundant, vague, and unenforceable and Section 90-3 adequately covers this requirement. See NEC Style Manual 4.1.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-89a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #4093)

7- 96 - (333-3 and 333-4): Reject
SUBMITTER: Marshall A. Klein, Marshall A. Klein & Assoc., Inc./Rep. AvalonBay Communities & Lincoln Property Co.
RECOMMENDATION: Revise text to read as follows:
~~333-3. Uses Permitted. Except where otherwise specified in this Code and where not subject to physical damage. Type AC cable shall be permitted for branch circuits and feeders in both exposed and concealed work and in cable trays where identified for such use. Type AC cable shall be permitted in dry locations and embedded in plaster finish on brick or other masonry, except in damp or wet locations. It shall be permissible to run or fish this cable in the air voids of masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness.~~
333.3. Uses Permitted. The use of Type AC shall be permitted in the following:
(1) One- and two-family dwellings
(2) Multifamily dwellings and other structures, except as prohibited in Section 331.4
(3) Cable trays, where the cables are identified for the use.
FPN: See Section 310.10 for temperature limitation of conductors.
33.4. Uses Not Permitted. Type AC cable shall not be used where prohibited elsewhere in this Code, including the following:
(1) In any multifamily dwelling or other structure exceeding three floor above grade.
For the purpose of this article, the first floor of a building shall be that floor that has 50 percent or more of the exterior wall surface area level with or above finished grade. One additional level that is the first level and not designed for human habitation and used only for vehicle parking, storage, or similar use shall be permitted.

(~~1~~ 2) In theaters and similar locations, except as provided in Article 518, Places of Assembly
(~~2~~ 3) In motion picture studios
(~~3~~ 4) In any hazardous (classified) location except as permitted by Sections 501.4(b), Exception, 502.4(b), Exception No. 1, and 504.20.
(~~4~~ 5) Where exposed to corrosive fumes or vapors.
(~~5~~ 6) On cranes or hoists, except as provided in Section 610.11(c)
(~~6~~ 7) In storage battery rooms
(~~7~~ 8) In hoistways or on elevators, except as provided in Section 620.21
(~~8~~ 9) In commercial garages where prohibited in Article 511.

SUBSTANTIATION: The report I submitted, NBSIR 78-1415, Fire Endurance Tests of Residential Walls Containing Branch Circuit Wiring-Preliminary Findings, substantiates that there is no significant different in the performance of different cable types. The two cable types used in this study were Type NM and Type AC. In addition, the Panel 7 Committee has the report from the NEC Task Group on NM cable along with the negative ballot comments. The representative for NEMA on this task group noted in his negative ballot comments for Proposals 336-4 and 336-5 the following (directly quoted from his comments):

C. Question of Flame Retardation

3) Delete statement or revise to read "Potential to be a source of ignition."

Substantiation: Any wiring method can be a potential source of ignition. There was no evidence presented that NM cable presented a higher or lower potential than other wiring methods to be a source of ignition. Many fires are caused by arcing at the termination's which is independent of the wiring method used.

Revise 3rd paragraph as follows: "The issue where Nonmetallic Sheathed Cable fails because of damage or overload and generates an arcing fault is of concern. ~~Some task group members remain convinced that an arcing fault in Nonmetallic Sheathed Cable is more likely to start a fire then a similar fault in most other wiring methods.~~ The task group did not come to agreement on the extent of this hazard or propose new requirements to address it."

Substantiation: There was no substantiation to support such a statement, only speculation.

D, Question of Smoke Density

Revise to read "The Task Group determined that large quantities of exposed Nonmetallic-Sheathed Cable could contribute move to the smoke density of a fire ~~than most other branch circuit wiring methods~~. The actual impact of this on individual fires has not been determined. The typical areas where Nonmetallic-Sheathed Cable would be exposed in large quantities would include dropped or suspended ceilings, or electrical distribution rooms or areas, ~~large attics and basements~~. Smoke density is ~~of serious~~ a concern because it can affect the ability of the occupants to evacuate the building. The Task Group believes that requirements to limit the exposed use of Nonmetallic-Sheathed Cable in any expanding use would address this issue."

Substantiation: The first sentence as revised above is accurate; the original sentence is not. The Task Group had no data comparing NM cable to other wiring methods. NM cable has been used for many years exposed in attics and basements of one- and two-family dwellings as well as multifamily dwellings and other structures not exceeding three floors above grade with no reported problems. Also, what constitutes a large quantity? The term is subject to wide interpretation. The last sentence could construed to mean that exposed use should be limited in all cases.

E. Production of Toxic Products of Combustion

Revise to read "The Task Group agreed that Nonmetallic-Sheathed Cable, like all other wiring methods, produces toxic products of combustion when exposed to flame. The Task Group notes that the use of toxic products of combustion ~~needs to be addressed~~ should be considered in any expanded use of Type NM cable."

Substantiation: All wiring methods except Type MI cable produce toxic products of combustion when exposed to flame. Toxicity research funded by NEMA for New York State indicated that there is no statistically significant difference between the nonmetallic materials used in all wiring methods. Except for the addition of a nonmetallic jacket, the insulated conductors used in NM cable are identical to those used in other wiring methods. In fact, insulated conductors with more nonmetallic materials (thicker insulation) are frequently used in other cable types and wiring methods. Lacking any data, the Task Group does not know if the issue "needs to be addressed", it certainly "should be considered".

Based on the results of the NBS Report comparing Type NM with Type AC and finding no differences in fire characteristics between these cables, the NEC Task Group's Report, and the position of NEMA on the safety of all wiring methods, the Panel 7 Committee should reconsider its acceptance of Type AC use in buildings over three stories in height.

By submission of this proposal, we are neither supporting nor opposing the use of Type AC above three stories in height. We are only attempting to gain consistency in the NEC on electrical wiring methods.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter's proposal has not documented any problems resulting from the current permitted uses for Type AC cable that would support the proposed restrictions on those uses.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12
NEGATIVE: 2
NOT RETURNED: 1 Ensign

EXPLANATION OF NEGATIVE:

RODGERS: I am voting negative on the panel action on this proposal. I believe the panel should have accepted this proposal in principle. In the submitter's substantiation, there is no difference between the characteristics in type NM and AC cable, they should be treated the same.

SCHUMACHER: I am voting negative on the panel action on this proposal. While the submitter admits that this is a frivolous proposal with his last sentence, I agree with his substantiation that if there is no difference between the characteristics in Type NM cable, and type AC cable and they should be treated the same. I believe the panel should have accepted this in principle, because type AC cable should be allowed in any building up to three stories, and not limited to residential.

(Log #1340)

7- 97 - (333-4): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise 333-4 (333-12 New) to read as follows:

333-4. Uses Not Permitted. Type AC cable shall not be used ~~where prohibited elsewhere in this Code, including the following:~~

(1) In theaters and similar locations, except where permitted ~~as provided~~ in 518-4 ~~Article 518, Places of Assembly~~
(2) In motion picture studios
(3) In ~~any~~ hazardous (classified) locations except where ~~as~~ permitted in ~~by Sections~~
(a) 501-4(b), Exception~~,~~
(b) 502-4(b), Exception No. 1~~, and~~
(c) 504-20
(4) Where exposed to corrosive fumes or vapors
(5) On cranes or hoists, except where permitted ~~as provided~~ in ~~Section~~ 610-11(c)
(6) In storage battery rooms
(7) In hoistways, or on elevators or escalators, except where permitted ~~as provided~~ in ~~Section~~ 620-21
(8) In commercial garages except where permitted in 511-4 and 511-6 ~~where prohibited in Article 511.~~

SUBSTANTIATION: The phrase in the first sentence was deleted since 90-3 adequately covers this requirement. NEC Style Manual, Section 4.1, requires that references not be provided if the material is already covered by Section 90-3.

NEC Style Manual Section 4.1.1 prohibits referencing an entire Article unless additional conditions are specified. Referencing parts within Articles is permitted.

Section 4.1.2 states that references shall include only the number of the rule being referenced; the word section, subsection, and paragraph shall not be used.

"As provided" was replaced with "where permitted" to aid in word clarity in accordance with NEC Style Manual Section 3.3.4.

(7) was revised to correctly reference the equipment addressed in 620-21.

(8) was revised to use positive language in accordance with NEC Style Manual Section 3.3.1(4).
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-89a.

NOT RETURNED: 1 Ensign

(Log #468)

7- 98 - (333-7 and 333-12): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 333-7 - revise as follows:
"333-7. Support. Type AC cable shall be secured by staples, cable ties, straps, hangers, or similar fittings designed and installed so as not to damage the cable at intervals not exceeding 1.4 m (4 1/2 ft) ~~4 1/2 ft (1.37 m)~~ and within 300 mm (12 in.) ~~12 in. (305 mm)~~ of every outlet box, junction box, cabinet, or fitting."
333-7(b) - revise as follows:
"(b) Unsupported. Type AC cable shall be permitted to be unsupported where the cable is
(1) Fished between access points, where concealed in finished buildings or structures and supporting is impracticable;
(2) Not more than 600 mm (2 ft) ~~2 ft (610 mm)~~ in length at terminals where flexibility is necessary; or
(3) Not more than 1.8 m (6 ft) ~~6 ft (1.83 m)~~ in length from an outlet for connections within an accessible ceiling to lighting fixtures or equipment."
333-12 - change "7 ft (2.13 m)" to "2.1 m (7 ft)" and change "6 ft (1.83 m)" to "1.8 m (6 ft)".
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-89a.

(Log #469)

7- 99 - (333-7(a)): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 333-7(a) - revise as follows:
"(a) Horizontal Runs. Type AC cable installed in other than vertical runs through bored or punched holes in wood or metal framing members, or through notches in wooden framing members and protected by a steel plate at least 1.59 mm (1/16 in.) ~~1/16 in. (1.59 mm)~~ thick, shall be considered secured where the support intervals do not exceed 1.4 m (4 1/2 ft) ~~4 1/2 ft (1.37 m)~~ and the armored cable is securely fastened in place by an approved means within 300 mm (12 in.) ~~12 in. (505 mm)~~ of each box, cabinet, conduit body, or other armored cable termination."
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
The thickness of the steel plate is not rounded since the dimension shown is standard industry practice.
The "505 mm" is an error and should have been "305 mm".
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-89a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1407)

7- 100 - (333-7(a)): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Horizontal Runs. Type AC cable installed in other than vertical runs through bored or punched holes in wood or metal framing members, or through notches in wooden framing members ~~and protected by a steel plate at least 1/16 in. (1.59mm) thick~~ shall be considered secured where the support intervals do not exceed 4 1/2 ft (1.37mm) and the armored cable is securely fastened in place by an approved means within 12 in. ~~(505mm)~~ (305mm) of each box, cabinet, conduit body, or other armored cable termination.
SUBSTANTIATION: Steel plate protection is presently required regardless of the distance of the hole from the edge of the framing member. Section 333-10 requires compliance with Section 300-4 which relates to physical protection, while this section appears primarily related to support. Uniformity between sections would be user friendly. (See my proposal for Section 300-4(a)(1)).
PANEL ACTION: Accept in Part.
Accept the editorial correction. Reject the remainder of the proposal.
PANEL STATEMENT: The current wording sufficiently covers the requirements for support of horizontal cable installations. The steel plate is essential to holding the cable in place where run through notches.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #822)

7- 101 - (333-7(b)(3)): Accept
Note: The Technical Correlating Committee understands that the action will be included in 333-30(b)(3) in Proposal 7-89a.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
(3) Not more than 6 ft (1.83 m) in length ~~from an outlet~~ for connection within an accessible ceiling to lighting fixtures or other equipment.
SUBSTANTIATION: Edit. Although the outlet can be considered the fixture or equipment it can be construed as an outlet box, conduit body, etc. separate from the fixture or equipment, which would preclude the 6 ft permission where the cable is a continuous run to a panelboard longer than 6 ft but with a support within 6 ft of the fixture. Section (b)(2) does not use the phrase "from an outlet".
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
NOT RETURNED: 1 Ensign
EXPLANATION OF NEGATIVE:
TRAINOR: From the Panel discussion, it appears that the intent was to permit AC cable in a suspended ceiling to be run to a lighting fixture so long as it was supported within 6 ft of the fixture. I concur with the intent. Unfortunately, the wording change accepted will also allow 6 ft of unsupported AC cable from one lighting fixture to another. I do not believe that was the intent of the Panel or the submitter. I recommend that this proposal be rejected. See my comment on Proposal 7-102.

(Log #2907)

7- 102 - (333-7(b)(3)): Accept in Principle
SUBMITTER: Mark R. Hilbert, Wolfeboro, NH
RECOMMENDATION: Add the words: "or from the last point of secure attachment to a structural member or other" after the words "accessible ceiling."
The revised sentence would read: Not more than 6 ft (1.38 m) in length from an outlet for connections within an accessible ceiling or from the last point of secure attachment to a structural member or other, to lighting fixtures or equipment.
SUBSTANTIATION: The revised wording of this sentence would allow for six feet of flexibility for a cable that does not originate at an outlet within the accessible ceiling. For example, it would allow for a cable to be run from a switch within a wall to a light fixture within an accessible ceiling. Currently, there is no language which permits this installation method. However, it is common to see this method in the

field. I am not aware of any problems due to the use of this installation method.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concerns are addressed by the panel's action on Proposal 7-101.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
NOT RETURNED: 1 Ensign
EXPLANATION OF NEGATIVE:
TRAINOR: From the Panel discussion and action on Proposal 7-101, it appears that the intent was to permit AC cable in a suspended ceiling to be run directly to a lighting fixture so long as it was supported within 6 ft of the fixture. This is a significant change from the present requirement which only allows 6 ft of unsupported AC cable where it is installed from an outlet to a fixture. I concur with the intent. Unfortunately, the wording change accepted will also allow 6 ft of unsupported AC cable from one lighting fixture to another. I do not believe that was the intent of the Panel or the submitter. I recommend that this proposal be amended to replace the words "from an outlet" with the words "from the last point of support". The amended text of 333-7(b)(3) would then read:
Not more than 6 ft (1.83 m) in length from the last point of support for connection within an accessible ceiling to lighting fixtures or other equipment. This will permit what the Panel apparently intended. It also permits AC cable from fixture to fixture but requires support of the cable between fixtures.

(Log #823)

7- 103 - (333-9): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise last sentence:
"Where a change is made from Type AC cable to other cable, ~~or~~ raceway, or open wiring methods, a box, fitting, or conduit body shall be installed at junction points as required in Sections 300-15 and 300-16.
SUBSTANTIATION: Edit. Section 300-16 specifically addresses a transition from Type AC cable to open wiring. Inclusion of reference to open wiring transition would make this section more complete.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's proposed text is already covered by Section 300-16 and the cross reference is not necessary.

7- 107a - (334): Accept

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: CMP 7

RECOMMENDATION: Rewrite Article 334 to comply with NEC Style Manual.

ARTICLE 334 -- Metal-Clad Cable: Type MC

I General

334-1. Scope. This article covers the use, installation, and construction specifications of Metal- Clad Cable, Type MC.

334-2. Definition.

Metal Clad Cable, Type MC. A factory assembly of one or more insulated circuit conductors with or without optical fiber members enclosed in an armor of interlocking metal tape, or a smooth or corrugated metallic sheath.

II Installation

334-10. Uses Permitted.

(a) General Uses. Where not subject to physical damage, Type MC cables shall be permitted as follows:

(1) For services, feeders, and branch circuits
(2) For power, lighting, control, and signal circuits
(3) Indoors or outdoors
(4) Where exposed or concealed
(5) Direct buried where identified for such use
(6) In cable tray
(7) In any raceway
(8) As open runs of cable
(9) As aerial cable on a messenger
(10) In hazardous (classified) locations as permitted in Articles 501, 502, 503, 504, and 505
(11) In dry locations and embedded in plaster finish on brick or other masonry except in damp or wet locations
(12) In wet locations where any of the following conditions are met:
(1) The metallic covering is impervious to moisture.
(2) A lead sheath or moisture-impervious jacket is provided under the metal covering.
(3) The insulated conductors under the metallic covering are listed for use in wet locations.

(b) Specific Uses. Type MC cable shall be installed in compliance with Articles 300, 490, 725, and 770-52 as applicable and in accordance with the following:

(1) Cable Tray. Type MC cable installed in cable tray shall comply with Article 318.

(2) Direct Buried. Direct-buried cable shall comply with 300-5 or 300-50, as appropriate.

(3) Installed as Service-Entrance Cable. Type MC cable installed as service-entrance cable shall comply with Article 230.

(4) Installed Outside of Buildings or as Aerial Cable. Type MC cable installed outside of buildings or as aerial cable shall comply with Article 225 and Article 321.

334-12. Uses Not Permitted. Type MC cable shall not be used where exposed to the following destructive corrosive conditions, unless the metallic sheath is suitable for the conditions or is protected by material suitable for the conditions:

(1) Direct burial in the earth
(2) In concrete
(3) Where exposed to cinder fills, strong chlorides, caustic alkalis, or vapors of chlorine or of hydrochloric acids

334-17. Through or Parallel to Framing members. Type MC cable shall comply with 300-4 where installed through or parallel to joists, studs, rafters, or similar wood or metal members

334-23. In Accessible Attics. The installation of Type MC cable in accessible attics or roof spaces shall also comply with 333-12.

334-24. Bending Radius. Bends in Type MC Cable shall be made so that the cable will not be damaged. The radius of the curve of the inner edge of any bend shall not be less than shown in (a) through (c).

(a) Smooth Sheath.

(1) Ten times the external diameter of the metallic sheath for cable not more than 19 mm (3/4 in.) in external diameter
(2) Twelve times the external diameter of the metallic sheath for cable more than 19 mm (3/4 in.) but not more than 38 mm (1 1/2 in.) in external diameter
(3) Fifteen times the external diameter of the metallic sheath for cable more than 38 mm (1 1/2 in.) in external diameter

(b) Interlocked-Type Armor or Corrugated Sheath. Seven times the external diameter of the metallic sheath.

(c) Shielded Conductors. Twelve times the overall diameter of one of the individual conductors or seven times the overall diameter of the multiconductor cable, whichever is greater.

334-30. Securing And Supporting.

(a) Supported Cables. Type MC cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft).

(1) Horizontal Runs. Cables installed in other than vertical runs through bored or punched holes in wood or metal framing members, or through notches in wooden framing members and protected by a steel plate at least 1.6 mm (1/16 in.) thick shall be considered supported and secured where such support does not exceed 1.8 m (6 ft) intervals.

(2) At Terminations. Cables containing four or fewer conductors, sized not larger than 10 AWG shall be secured within 300 mm (12 in.) of every box, cabinet, fitting, or other cable termination.

(b) Unsupported Cables. Type MC cable shall not be required to be supported and secured where the cable is fished between access points, where concealed in finished buildings or structures and supporting is impracticable, or where used in lengths not more than 1.8 m (6 ft) from an outlet for connections within an accessible ceiling to lighting fixture(s) or equipment.

334-40. Boxes and Fittings. Fittings used for connecting Type MC cable to boxes, cabinets, or other equipment shall be listed and identified for such use. Where single-conductor cables enter ferrous metal boxes or cabinets, the installation shall comply with 300-20 to prevent inductive heating.

334-80. Ampacity. The ampacity of Type MC cable shall be in accordance with 310-15 or 310-60.

Exception No. 1: The ampacities for Type MC cable installed in cable tray shall be determined in accordance with 318-11 and 318-13.

Exception No. 2: The ampacities of No. 18 and No. 16 conductors shall be in accordance with Table 402-5.

FPN: See 310-10 for temperature limitation of conductors.

III Construction Specifications

334-104. Conductors. The conductors shall be of copper, aluminum, or copper-clad aluminum, solid or stranded. The minimum conductor size shall be No. 18 copper and No. 12 aluminum or copper-clad aluminum

334-108. Equipment Grounding. Type MC cable shall provide an adequate path for equipment grounding as required by Article 250.

334-112. Insulation. The insulated conductors shall comply with (a) or (b).

(a) 600 Volts. Insulated conductors in sizes 18 and 16 AWG shall be of a type listed in Table 402-3, with a maximum operating temperature not less than 90ºC (194ºF), and as permitted by 725-27. Conductors larger than 16 AWG shall be of a type listed in Table 310-13 or of a type identified for use in Type MC cable.

(b) Over 600 Volts. Insulated conductors shall be of a type listed in Tables 310-61 through 310-64.

334-116. Sheath. The metallic covering shall be one of the following types: smooth metallic sheath, corrugated metallic sheath, interlocking metal tape armor. The metallic sheath shall be continuous and close fitting. Supplemental protection of an outer covering of corrosion-resistant material shall be permitted and shall be required where such protection is needed. The sheath shall not be used as a current-carrying conductor.

FPN: See 300-6 for protection against corrosion.

SUBSTANTIATION: This revision to Article 334 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with the usability effort. Specific proposals addressed by this revision include 7-107, 7-109, 7-110, 7-111, 7-112, 7-113, 7-115, 7-115, 7-127 and 7-128.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1062)

7- 108 - (334): Accept

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Revise Article 334 as follows:

334-10(a) - change “No. 10” to “10 AWG”
334-10(a)(2) - change “No. 10” to “10 AWG”

334-13, Exception No. 2 - change "No. 18 and No 16" to "18 and 16 AWG"
334-20 - change "No. 18 copper and No. 12 aluminum" to "18 AWG copper and 12 AWG aluminum"
334-12(a) - change:
"No. 18 and No. 16" to "18 and 16 AWG"
"No. 16" to "16 AWG".

SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1383)

7- 109 - (334): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise text to read as follows:

Article 334 — Metal-Clad Cable Type MC

~~A.~~ 1. General.

~~334-1.~~ 334-2. Definition.

Metal-Clad Cable (Type MC). ~~cable is a~~ A factory assembly of one or more insulated circuit conductors with or without optical fiber members enclosed in an armor of interlocking metal tape, or a smooth or corrugated metallic sheath.

~~334-2.~~ 334-3. Other Articles. Metal-clad cable shall comply with this article and also with the applicable provisions of other articles in this Code, especially Article 300.

Type MC cable shall be permitted for systems in excess of 600 volts, nominal. See Section 300-2(a).

~~B~~ 1I. Installation.

~~33 3.~~ 334-10. Uses Permitted.

(a) General Uses. Unless specifically prohibited elsewhere in this Code and where not subject to physical damage, Type MC cables shall be permitted as follows:

1. For services, feeders, and branch circuits
2. For power, lighting, control, and signal circuits
3. Indoors or outdoors
4. Where exposed or concealed
5. Direct buried where identified for such use
6. In cable tray
7. In any raceway
8. As open runs of cable
9. As aerial cable on a messenger
10. In hazardous (classified) locations as permitted in Articles 501, 502, 503, 504, and 505
11. In dry locations and embedded in plaster finish on brick or other masonry except in damp or wet locations
12. In wet locations where any of the following conditions are met:
a. The metallic covering is impervious to moisture.
b. A lead sheath or moisture-impervious jacket is provided under the metal covering.
c. The insulated conductors under the metallic covering are listed for use in wet locations.

(b) Specific Uses. ~~334-10. Installation.~~ Type MC cable shall be installed in compliance with Articles 300, 490, 725, and Section 770-52 as applicable and in accordance with the following.

~~(c)~~ 1. Cable Tray. Type MC cable installed in cable tray shall comply with Article 318.

~~(d)~~ 2. Direct Buried. Direct-buried cable shall comply with Sections 300-5 or 300-50, as appropriate.

~~(e)~~ 3. Installed as Service-Entrance Cable. Type MC cable installed as service-entrance cable shall comply with Article 230.

~~(f)~~ 4. Installed Outside of Buildings or as Aerial Cable. Type MC cable installed outside of buildings or as aerial cable shall comply with Article 225 and Article 321.

~~334-4.~~ 334-12. Uses Not Permitted. Type MC cable shall not be used where exposed to destructive corrosive conditions, such as direct burial in the earth, in concrete, or where exposed to cinder fills, strong chlorides, caustic alkalis, or vapors of chlorine or of hydrochloric acids, unless the metallic sheath is suitable for the conditions or is protected by material suitable for the conditions.

~~334-10(g).~~ 334-17. Through or Parallel to Framing Members. ~~Joists, Studs, and Rafters.~~ Type MC cable shall comply with Section 300-4 where installed through or parallel to joists, studs, rafters, or similar wood or metal members.

~~334-10(h).~~ 334-23. In Accessible Attics. The installation of Type MC cable in accessible attics or roof spaces shall also comply with Section 333-12.

~~334-11.~~ 334-24. Bending Radius. ~~All bends~~ Bends in Type MC cable shall be made so that the cable will not be damaged~~, and the~~ The radius of the curve of the inner edge of any bend shall not be less than shown in (a) through (c).

(a) Smooth Sheath.
1. Ten times the external diameter of the metallic sheath for cable not more than 3/4 in. (19 mm) in external diameter
2. Twelve times the external diameter of the metallic sheath for cable more than 3/4 in. (19 mm) but not more than 1 1/2 in. (38 mm) in external diameter
3. Fifteen times the external diameter of the metallic sheath for cable more than 1 1/2 in. (38 mm) in external diameter

(b) Interlocked-Type Armor or Corrugated Sheath. Seven times the external diameter of the metallic sheath.

(c) Shielded Conductors. Twelve times the overall diameter of one of the individual conductors or seven times the overall diameter of the multiconductor cable, whichever is greater.

~~334-10(a)~~ 334-30. Securing and Supporting.

(a) Supported Cables. Type MC cable shall be supported and secured at intervals not exceeding 6 ft (1.83 m). Cables containing four or fewer conductors, sized no larger than No. 10 shall be secured within 12 in. (305 mm) of every box, cabinet, fitting, or other cable termination.

(1) Horizontal Runs. Cables installed in other than vertical runs through bored or punched holes in wood or metal framing members, or through notches in wooden framing members and protected by a steel plate at least 1/16 in. (1.59 mm) thick shall be considered supported and secured where such support does not exceed 6-ft (1.83-m) intervals.

(2) At Terminations. Cables containing four or fewer conductors, sized not larger than No. 10 shall be secured within 12 in. (305 mm) of every box, cabinet, fitting, or other cable termination.

~~334-10(b)~~

(b) Unsupported Cables. Type MC cable shall not be required to be supported and secured where the cable is fished between access points, where concealed in finished buildings or structures and supporting is impracticable, or where used in lengths not more than 6 ft (1.83 m) from an outlet for connections within an accessible ceiling to lighting fixture(s) or equipment.

~~334-12~~ 334-40. Boxes and Fittings. Fittings used for connecting Type MC cable to boxes, cabinets, or other equipment shall be listed and identified for such use. Where single-conductor cables enter ferrous metal boxes or cabinets, the installation shall comply with Section 300-20 to prevent inductive heating.

~~334-13~~ 334-80. Ampacity. The ampacity of Type MC cable shall be in accordance with Sections 310-15 or 310-60.

Exception No. 1: The ampacities for Type MC cable installed in cable tray shall be determined in accordance with Sections 318-11 and 318-13.

Exception No. 2: The ampacities of No. 18 and No. 16 conductors shall be in accordance with Table 402-5.

FPN: See Section 310-10 for temperature limitation of conductors.

~~C.~~ III. Construction Specifications.

~~334-20.~~ 334-104. Conductors. The conductors shall be of copper, aluminum, or copper-clad aluminum, solid or stranded.

The minimum conductor size shall be No. 18 copper and No. 12 aluminum or copper-clad aluminum.

~~334-23.~~ 334-108. Equipment Grounding. Type MC cable shall provide an adequate path for equipment grounding as required by Article 250.

~~334-21.~~ 334-112. Insulation. The insulated conductors shall comply with (a) or (b).

(a) 600 Volts. Insulated conductors in sizes No. 18 and No. 16 shall be of a type listed in Table 402-3, with a maximum operating temperature not less than 90°C (194°F), and as permitted by Section

725-27. Conductors larger than No. 16 shall be of a type listed in Table 310-13 or of a type identified for use in Type MC cable.

(b) Over 600 Volts. Insulated conductors shall be of a type listed in Tables 310-61 through 310-64.

~~334-22.~~ 334-116. ~~Metallic~~ Sheath. The metallic covering shall be one of the following types: smooth metallic sheath, corrugated metallic sheath, interlocking metal tape armor. The metallic sheath shall be continuous and close fitting.

Supplemental protection of an outer covering of corrosion-resistant material shall be permitted and shall be required where such protection is needed. The sheath shall not be used as a current-carrying conductor.

FPN: See Section 300-6 for protection against corrosion.

~~334-24.~~ 334-120. Marking. The cable shall be marked in accordance with Section 310-11.

SUBSTANTIATION: The proposed article re-write was developed as part of a larger effort by the NEC Usability Committee to re-format existing raceway, cable and wiring articles. The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as state in the NEC Style Manual 2.4.1. It is hoped that the parallel code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.

To the extent that this was possible in this article, this has been done. It is not the intent or purpose of this re-write to change the actual intent of the existing article requirements. The only new material in this proposal is the proposed new article scope which has been added to conform with the NEC Style Manual 2.2.1

A companion proposal has also been submitted which re-structures the article to a greater degree by splitting existing Code requirements into new sections to better adhere to the new article format. In some cases this is done with an alternate article re-write while in other cases, individual proposals have been submitted. These proposals are also intended to further enhance the structure and format of the article but in some cases existing code text requirements had to be revised or altered to meet the re-formatting needs. For this reason the proposals are separate which will allow the Code Making Panels to individually consider each proposal.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-107a.

(Log #3297)

7- 114 - (334-3(12)(c)): Reject

SUBMITTER: George W. Flach, Nat'l Armored Cable Mfrs' Assn.

RECOMMENDATION: Revise text to read as follows:

334-3. Uses Permitted.

12. In wet locations where any of the following conditions are met:

(a) The metallic covering is impervious to moisture.

(b) A lead sheath or moisture-impervious jacket is provided under the metal covering.

(c) The insulated conductors under the metallic covering with an overall moisture impervious jacket are listed for use in wet locations.

SUBSTANTIATION: The requirements of 12(a) and 12(b) of 334-3 keep water from entering the cable core. The requirement of 12(c) permits water to enter the cable core of the interlocked armor type MC cable. The section should be revised to require an overall moisture impervious jacket over the metal coverings to prevent water from entering the cable core where it could migrate to conductor terminations.

PANEL ACTION: Reject.

PANEL STATEMENT: There has been no technical substantiation to require an overall jacket when the conductors are rated for wet locations. The present wording of this section sufficiently covers the requirements for Type MC cable in wet locations.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #1345)

7- 115 - (334-4): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Rearrange the text in 334-4 (334-12 New) to read as follows:
334-4. Uses Not Permitted. Type MC cable shall not be used where exposed to the following destructive corrosive conditions ~~, such as~~ unless the metallic sheath is suitable for the conditions or is protected by material suitable for the conditions
(1) Direct ~~direct~~ burial in the earth~~,~~
(2) In ~~in~~ concrete~~, or~~
(3) Where ~~where~~ exposed to cinder fills, strong chlorides, caustic alkalis, or vapors of chlorine or of hydrochloric acids
SUBSTANTIATION: NEC Style Manual Section 3.3.2 requires that if possible, use lists or tables to present requirements, rather than long text descriptions.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-107a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1150)

7- 116 - (334-9(b)): Reject
SUBMITTER: Robert Deyab, II, Kohlage Electric Inc.
RECOMMENDATION: Same language as Section 333-9.
"Boxes and Fittings at all points where the armor of MC cable terminates, a fitting shall be provided to protect wires from abrasion, unless the design of the outlet boxes or fittings is such to afford equivalent protection shall be provided between the conductors and the armor (sheath). The connector or clamp by which the MC cable is fastened to boxes or cabinets shall be of such design that the insulating bushing... or its equivalent will be visible for inspection. Where change is made from Type MC cable to other cable or raceway wiring methods, a box, fitting, or conduit body shall be installed at junction points as required in Section 300-15."
SUBSTANTIATION: It seems to me and several colleagues that this language should appear in text as mandatory. Coils of MC (small gauge #12 and 14) come with antishot bushings from factory, and, most inspectors require these devices of termination!
PANEL ACTION: Reject.
PANEL STATEMENT: Anti-short bushings are not required for Type MC cable in accordance with the listing of the product. The termination fittings approved for use with Type MC cable are designed such that the wires will not come in contact with the cut edge of the armor; the throat of the fitting is small enough to prevent contact with the armor. Type MC termination fittings perform the same function for Type MC cable as Type AC terminations plus the anti-short bushing do for Type AC cable.
While Type AC and Type MC cable with interlocking armor may appear to be similar, the coils of cable referred to are Type AC cable which do require an anti-short bushing and the bushings are supplied by the cable manufacturer with each coil.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign
COMMENT ON AFFIRMATIVE:
TEMBLADOR: We suport the Panel Action. Further, there is a construction difference between Type AC and MC Cable. The conductor assembly in Type MC includes an overall polyester wrap between the armor and the conductors. In addition, listing of a fitting means that the fitting and the armor do not damage the conductors.

(Log #1851)

7- 117 - (334-10): Reject
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise as follows:
Type MC cable shall be installed in compliance with ~~Articles 300, 490, 725,~~ 490-34, 725-B, and ~~Section~~ 770-52 as applicable and in accordance with the following.
Delete (c), (d), (e), (f), and (g).
Renumber (h) as (c) and delete the word "Section" in the last line.
SUBSTANTIATION: Article 300 already applies and it is not necessary to include the reference.
Section 4.1 of the 1999 National Electrical Code Style Manual stipulates "Do not use a reference if the requirement is already covered by 90.3."
1999 National Electrical Code Style Manual:
Section 4.1.1 states that "References shall not be made to an entire article unless additional conditions are specified."
Section 4.1.2 stipulates that "...references shall include only the number of the rule being referenced; the word section, subsection, and paragraph shall not be used."
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's concerns have been addressed by the panel's action on Proposal 7-109.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #471)

7- 118 - (334-10(a)(1)): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 334-10(a)(1) - revise as follows:
"(1) Horizontal Runs. Cables installed in other than vertical runs through bored or punched holes in wood or metal framing members, or through notches in wooden framing members and protected by a steel plate at least 1.59 mm (1/16 in.) ~~1/16 in. (1.59 mm)~~ thick shall be considered supported and secured where such support does not exceed 1.8 m (6 ft) ~~6 ft (1.83 m) intervals.~~"
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
The thickness of the steel plate is not rounded since the dimension shown is standard industry practice.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-107a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1406)

7- 119 - (334-10(a)(1), (b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a)(1) Horizontal Runs. Cables installed in other than vertical runs through bored or punched holes in wood or metal framing members ~~and protected by a steel plate at least 1/16 in. (1.59 mm) thick~~ shall be considered supported and secured where such support does not exceed 6 ft. (1.83m) intervals.
(b) Unsupported Cables. Type MC cable shall not be required to be supported and secured where the cable is fished between access points, where concealed in finished buildings or structures and supporting is impracticable, ~~or where used in lengths not more than 6 ft. (1.83m) from an outlet~~ nor within 12 in. (305 mm) of termination of the initial supply for the connections within an accessible ceiling to a lighting fixture(s) or other equipment.
SUBSTANTIATION: In (a)(1), a protection plate is required regardless of the distance of the hole from the edge of the framing member. Subsection (g) requires compliance with Section 300-4 which relates to physical protection, while this section appears to primarily relate to support. There should be uniformity between requirements.
In (b), the comma after "access points" is deleted as it suggests the following phrase "where concealed in finished buildings..." is a separate condition which stands alone.
The word "outlet" infers a box or point on the wiring system, which may preclude application to a direct unbroken run from a panelboard for example. On the other hand a junction at a fixture may be considered an "outlet" and negates the 12 in. fastening requirement. The intent for fastening requirements for 6 ft. or less cables between fixtures is not clear.

Since the 6 ft. distance is a general support requirement, (b) appears intended to address the 12 in. fastening distance requirement, which the proposal explicitly addresses. If the intent is to exempt the 12 in. fastening requirement for cables, interconnecting fixtures or equipment, the phrase "of the initial supply" can be deleted.

Since fixtures are equipment, by definition, the word "other" is added for clarity.

(See my proposal for Section 300-4(a)(1)).

PANEL ACTION: Reject.

PANEL STATEMENT: The current wording sufficiently covers the requirements for support of horizontal cable installations. The steel plate is essential to holding the cable in place where run through notches.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #2859)

7- 120 - (334-10(a)(1)): Reject

SUBMITTER: Bill F. Neitzel, Madison, WI

RECOMMENDATION: Revise the text of 3340-10(a)(1) to read:

(1) Horizontal Runs. Cables installed in other than vertical runs through bored or punched holes in wood or metal framing members shall be considered supported and secured where such support does not exceed 6 ft (1.83 m) intervals. Cables are required to be protected from damage as required in Section 300-4.

SUBSTANTIATION: Protection of conductors and cables is covered in Section 300-4. The current wording appears to indicate all horizontal runs are required to have nail plate protection regardless of how it is installed. The wording is confusing. Protection of MC in shallow grooves is already covered in 300-4(e).

PANEL ACTION: Reject.

PANEL STATEMENT: The current wording sufficiently covers the requirements for support of horizontal cable installations.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

Log #827)

7- 121 - (334-10(a)(2), (e)): Accept in Part

Note: The Technical Correlating Committee understands that the action deletes 334-30(a)(2) in Proposal 7-107a. In addition, the Technical Correlating Committee directs the Panel to address the Style Manual issues as they relate to the rewrite of 334-30. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Delete (a)(2); revise (e):

"INSTALLED as SERVICE- ~~ENTRANCE CABLE~~ CONDUCTORS. Type MC cable installed as service- ~~entrance cable~~ conductors shall comply with Article 230."

SUBSTANTIATION: Edit. Section (a)(2) is already covered in (a). Service-entrance cable is a specific type cable (Type SE) which Type MI cannot become. Section 334-3 permits installation in a raceway. Where so installed as service-lateral conductors they are service conductors but not service-entrance cable.

PANEL ACTION: Accept in Part.

Accept the deletion of 334-10(a)(2). Reject the remainder of the proposal.

PANEL STATEMENT: The panel accepts the editorial correction. The proposal to change "service entrance cable" to "service conductors" is rejected as this section defines the application of the product and does not redesignate the cable type.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #2908)

7- 122 - (334-10(b)): Accept in Principle in Part

Note: The Technical Correlating Committee understands that the action on this Proposal will be included in 334-30(b) on Proposal 7-107a.

SUBMITTER: Mark R. Hilbert, Wolfeboro, NH

RECOMMENDATION: Delete the word "or" after the word "impracticable."

Add the words: "or from the last point of secure attachment to a structural member or other" after the words "accessible ceiling."

The revised sentence would read: Type MC cable shall not be required to be supported and secured where the cable is fished between access points, where concealed in finished buildings or structures and supporting is impracticable, where used in lengths not more than 6 ft (1.38 m) from an outlet for connections within an accessible ceiling or from the last point of secure attachment to a structural member or other, to lighting fixture(s) or equipment.

SUBSTANTIATION: The revised wording of this sentence would allow for six feet of flexibility for a cable that does not originate at an outlet within the accessible ceiling. For example, it would allow for a cable to be run from a switch within a wall to a light fixture within an accessible ceiling. Currently, there is no language which permits this installation method. However, it is common to see this method in the field. I am not aware of any problems due to the use of this installation method.

PANEL ACTION: Accept in Principle in Part.

Reject the deletion of the word "or".

Revise Section 334-10(b) to read:

"Type MC cable shall not be required to be supported and secured where the cable is fished between access points, where concealed in finished buildings or structures and supporting is impracticable or where used in lengths not more than 6 ft (1.38 m) for connections within an accessible ceiling to lighting fixture(s) or equipment."

PANEL STATEMENT: The panel rejects the deletion of the word "or" as this section is expressing two separate conditions. The panel has accepted in principle the submitter's second concept by deleting the words "from an outlet". This correlates with a change made to Section 333-7(b)(3) by Proposal 7-101.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NEGATIVE: 1

NOT RETURNED: 1 Ensign

EXPLANATION OF NEGATIVE:

TRAINOR: From the panel discussion and similiar action on Proposal 7-101, it appears that the intent was to permit MC cable in a suspended ceiling to be run directly to a lighting fixture so long as it was supported within 6 ft of the fixture. This is a significant change from the present requirement which only allows 6 ft of unsupported MC cable where it is installed from an outlet to a fixture. I concur with the intent. Unfortunately, the wording change accepted will also allow 6 ft of unsupported MC cable from one lighting fixture to another. I do not believe that was the intent of the panel or the submitter. I recommend that this proposal be amended to replace the words "from an outlet" with the words "from the last point of support." The amended text of 334-10(b) would then read: "Where used in lengths not more than 6 ft (1.83m) from the last point of support for connection within an accessible ceiling to lighting fixtures or other equipment." This will permit what the panel apparently intended. It also permits MC cable from fixture to fixture but requires support of the cable between fixtures.

(Log #826)

7- 123 - (334-12): Accept

Note: The Technical Correlating Committee understands that the action on this Proposal deletes the second sentence in 334-40 on Proposal 7-107a.

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Delete second sentence:

"~~Where single-conductor cables enter ferrous metal boxes or cabinets, the installation shall comply with Section 300-20 to prevent inductive heating.~~"

SUBSTANTIATION: Edit. Section 300-3(b) appears to prohibit a single-conductor cable for circuit wiring, whether ac or dc. The UL white book indicates listed cable contains two or more conductors. If single-conductor cable is allowed for dc, under Section 90-4, Section 300-20 doesn't apply.

PANEL ACTION: Accept.

PANEL STATEMENT: The panel does not concur with the submitter's substantiation. The section has been deleted as part of the TCC usability effort.

7- 124 - (334-12): Reject
SUBMITTER: John R. Hartigan, Roseville, MI
RECOMMENDATION: Add new text as follows:
An insulated bushing or equivalent protection shall be provided between the conductors and the armor at all fittings.
SUBSTANTIATION: The armor outer coverings is not always cut with an approved stripping tool. Tools such as "dikes" and "hacksaws" are used also. Even with approved tools there can be sharp edges on the armor. The circuit can be shorted out especially while installing the MC cable into fittings. The installation of the "anti-short" bushings that are already supplied with the rolls of MC cable, and use recommended by the manufacturers would provide insulation for a safer installation.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: Anti-short bushings are not required for Type MC cable in accordance with the listing of the product. The termination fittings approved for use with Type MC cable are designed such that the wires will not come in contact with the cut edge of the armor; the throat of the fitting is small enough to prevent contact with the armor. Type MC termination fittings perform the same function for Type MC cable as Type AC terminations plus the anti-short bushing do for Type AC cable.
While Type AC and Type MC cable with interlocking armor may appear to be similar, the coils of cable referred to are Type AC cable which do require an anti-short bushing and the bushings are supplied by the cable manufacturer with each coil.

7- 124a - (334-12): Reject
SUBMITTER: Alan Chessman, Flag Electric
RECOMMENDATION: Add the following text:
Anti-Shorts shall be used when installing all MC cable.
SUBSTANTIATION: As an apprentice of Local 96 I do not understand why the manufacturer would send out the anti-shorts with the reels of MC cable if they do not intend for using them at all times.
PANEL ACTION: Reject.
PANEL STATEMENT: Anti-short bushings are not required for Type MC cable in accordance with the listing of the product. The termination fittings approved for use with Type MC cable are designed such that the wires will not come in contact with the cut edge of the armor; the throat of the fitting is small enough to prevent contact with the armor. Type MC termination fittings perform the same function for Type MC cable as Type AC terminations plus the anti-short bushing do for Type AC cable.
While Type AC and Type MC cable with interlocking armor may appear to be similar, the coils of cable referred to are Type AC cable which do require an anti-short bushing and the bushings are supplied by the cable manufacturer with each coil.

COMMENT ON AFFIRMATIVE:
TEMBLADOR: See my Comment on Affirmative on Proposal 7-116.

(Log #2421)

7- 125 - (334-13): Accept in Principle
Note: The Technical Correlating Committee understands the entire Proposal was accepted except for Panel's revision to (1) of the Proposal. The Technical Correlating Committee also understands that this revision is to 334-80 of Proposal 7-107a.
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise 334-13 to read as follows:
334-13. Ampacity. The ampacity of Type MC cable shall be determined in accordance with ~~Sections~~ 310-15 or 310-60 for 14 AWG and larger conductors and in accordance with Table 402-5 for 18-16 AWG conductors.
The ampacities for Type MC cable installed in cable tray shall be determined in accordance with 318-11 and 318-13.
~~Exception No. 1: The ampacities for Type MC cables installed in cable tray shall be determined in accordance with Sections 318-11 and 318-13.~~
~~Exception No. 2: The ampacities of No. 18 and No. 16 conductors shall be in accordance with Table 402-5.~~
~~FPN: See Section 310-10 for temperature limitation of conductors.~~
Where single Type MC conductors are grouped together in a triangular or square configuration, as required by 334-14 (New), and installed on a messenger or as open runs with a maintained free air space of not less than 2.15 times one conductor diameter (2.15 x O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall not exceed the allowable ampacities of:
(1) two or three single insulated conductors rated 0 through 2000 volts supported on a messenger in accordance with 310-15(b).
(2) Tables 310-67 and 310-68 for conductors rated over 2000 volts
SUBSTANTIATION: For clarity and to incorporate text consistent with that used in other cable articles. The Exceptions were converted to requirements in accordance with NFPA Manual of Style Section 2.3.5.2.
The word "Section" was deleted in accordance with NEC Style Manual Section 4.1.2.
The FPN was deleted since 90-3 adequately covers this requirement. The 1999 NEC Style Manual Section 4.1 states "Do not use a reference if the requirement is already covered by 90-3."
The text in the last paragraph is consistent with 318-11(b)(4) and 318-13(b)(3) for single conductors installed in similar configurations in cable tray. The following comparison table shows that the ampacities in Table 310-20 are conservative since they are equal to and, in most cases, lower than either the IEEE values or the Table 310-17 values adjusted to 40°C ambient air temperature. Tables 310-67 and 310-68 already specifically address single conductor cables triplexed in air. Table shown on next page.
PANEL ACTION: Accept in Principle.
Revise the proposed item (1) to read:
(1) Table 310-20 for conductors rated 0 through 2000 volts.
PANEL STATEMENT: The direct reference to the specific table enhances the usability of this section.

NOT RETURNED: 1 Ensign

(Log #1852)

7- 126 - (334-14 (New)): Accept
Note: The Technical Correlating Committee directs the Panel to clarify the Panel Action relative to the location and title of the proposed language in Proposal 7-107a. This action will be considered by the Panel as a Public Comment.
The Technical Correlating Committee refers this Proposal to Code-Making Panel 3 for information.
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Add a new 334-14 to read:
"Where single-conductor cables are used, all phase conductors and, where used, the neutral conductor shall be grouped together to minimize induced voltage on the sheath."
SUBSTANTIATION: Single conductor Type MC cables have not been listed or used until recently. This requirement is the same requirement that applies to single conductor Type MI cable in 330-16.
It is not necessary to include the second sentence in 330-16 since it is adequately covered by 90-3 and Section 4.1 of the 1999 National Electrical Code Style Manual stipulates "Do not use a reference if the requirement is already covered by 90.3."
PANEL ACTION: Accept.

ARTICLE 336 — NONMETALLIC-SHEATHED CABLE

(Log #472)

7- 128 - (336): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: 336-6(b) - change "6 in. (152 mm)" to "150 mm (6 in.)"

336-18 - revise second sentence as follows:

"Cable shall be secured in place at intervals not exceeding 1.4 m (4 1/2 ft) ~~4 1/2 ft (1.37 m)~~ and within 300 mm (12 in.) ~~12 in. (305 mm)~~ from every cabinet, box, or fitting."

336-18, Exception No. 2 - revise as follows:

"Exception No. 2: A wiring device identified for the use, without a separate outlet box, incorporating an integral cable clamp shall be permitted where the cable is secured in place at intervals not exceeding 1.4 m (4 1/2 ft) ~~4 1/2 ft (1.37 m)~~ and within 300 mm (12 in.) ~~12 in. (305 mm)~~ from the wiring device wall opening, and there shall be at least a 300 mm (12 in.) ~~12 in. (305 mm)~~ loop of unbroken cable or 150 mm (6 in.) ~~6 in. (152 mm)~~ of a cable end available on the interior side of the finished wall to permit replacement."

336-18, Exception No. 3 - change "4 1/2 ft (1.37 m)" to "1.4 m (4 1/2 ft)"

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.

PANEL ACTION: Accept in Principle.

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

Further, the Technical Correlating Committee directs that the definition in 336-12(a)(1) be moved to 336-2 Definitions to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.

SUBMITTER: CMP 7

RECOMMENDATION: Rewrite Article 336 to comply with NEC Style Manual.

ARTICLE 336 -- Nonmetallic-Sheathed Cable: Types NM, NMC, and NMS

I General

336-1. Scope. This article covers the use, installation, and construction specifications of nonmetallic-sheathed cable.

336-2. Definition.

Nonmetallic-Sheathed Cable. A factory assembly of two or more insulated conductors having an outer sheath of nonmetallic material.

II Installation.

336-10. Uses Permitted. Type NM, Type NMC, and Type NMS cables shall be permitted to be used in the following:

(1) One- and two-family dwellings

(2) Multifamily dwellings and other structures, except as prohibited in 336-5

(3) Cable trays, where the cables are identified for the use

FPN: See 310-10 for temperature limitation of conductors.

(a) Type NM. Type NM cable shall be permitted:

(1) For both exposed and concealed work in normally dry locations

(2) To be installed or fished in air voids in masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness

(b) Type NMC. Type NMC cable shall be permitted:

(1) For both exposed and concealed work in dry, moist, damp, or corrosive locations

(2) In outside and inside walls of masonry block or tile

(3) In a shallow chase in masonry, concrete, or adobe protected against nails or screws by a steel plate at least 1.6 mm (1/16-in.) thick, and covered with plaster, adobe, or similar finish

(c) Type NMS. Type NMS cable shall be permitted:

(1) For both exposed and concealed work in normally dry locations

(2) To be installed or fished in air voids in masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness

(3) To be used as permitted in Article 780

336-12. Uses Not Permitted.

(a) Types NM, NMC, and NMS. Types NM, NMC, and NMS cables shall not be used:

(1) In a multifamily dwelling or other structure exceeding three floors above grade

For the purpose of this article, the first floor of a building shall be that floor that has 50 percent or more of the exterior wall surface area level with or above finished grade. One additional level that is the first level and not designed for human habitation and used only for vehicle parking, storage, or similar use shall be permitted.

(2) As service-entrance cable

(3) In commercial garages having hazardous (classified) locations as defined in 511-3

(4) In theaters and similar locations, except where permitted in 518-4

(5) In motion picture studios

(6) In storage battery rooms

(7) In hoistways or on elevators or escalators.

(8) Embedded in poured cement, concrete, or aggregate

(9) In hazardous (classified) locations, except where permitted in:

(a) 501-4(b), Exception.

(b) 502-4(b), Exception No. 1

(c) 504-20

(10) Types NM and NMS. Types NM and NMS cable shall not be used:

(a) Where exposed to corrosive fumes or vapors

(b) Where embedded in masonry, concrete, adobe, fill, or plaster

(c) In a shallow chase in masonry, concrete, or adobe and covered with plaster, adobe, or similar finish

336-15. Exposed Work. In exposed work, except as provided in 300-11(a), the cable shall be installed as specified in (a) through (c).

(**a) To Follow Surface.** The cable shall closely follow the surface of the building finish or of running boards.

(**b) Protection from Physical Damage.** The cable shall be protected from physical damage where necessary by conduit, electrical metallic tubing, Schedule 80 PVC rigid nonmetallic conduit, pipe, guard strips, listed surface metal or nonmetallic raceway, or other means. Where passing through a floor, the cable shall be enclosed in rigid metal conduit, intermediate metal conduit, electrical metallic tubing, Schedule 80 PVC rigid nonmetallic conduit, listed surface metal or nonmetallic raceway, or other metal pipe extending at least 150 mm (6 in.) above the floor.

(c) In Unfinished Basements. Where the cable is run at angles with joists in unfinished basements, it shall be permissible to secure cables not smaller than two No. 6 or three No. 8 conductors directly to the lower edges of the joists. Smaller cables shall either be run through bored holes in joists or on running boards.

336-17. Through or Parallel to Framing Members. Types NM, NMC, or NMS cable shall comply with 300-4 where installed through or parallel to joists, studs, rafters, or similar wood or metal members.

336-23. In Accessible Attics. The installation of cable in accessible attics or roof spaces shall also comply with 333-12.

336-24. Bending Radius. Bends in Type NM, NMC, and NMS cable shall be made so that the cable will not be damaged. The radius of the curve of the inner edge of any bend during or after installation, shall not be less than five times the diameter of the cable.

336-30. Securing and Supporting. Nonmetallic-sheathed cable shall be secured by staples, cable ties, straps, or similar fittings designed and installed so as not to damage the cable. Cable shall be secured in place at intervals not exceeding 1.4 m (4 1/2 ft.) and within 300 mm (12 in.) from every cabinet, box, or fitting. Flat cables shall not be stapled on edge. Cables run through holes in wood or metal joists, rafters, or studs shall be considered to be supported and secured.

FPN: See 370-17(c) for support where nonmetallic boxes are used.

Exception No. 1: For concealed work in finished buildings or finished panels for prefabricated buildings where such supporting is impracticable, it shall be permissible to fish cable between access points.

Exception No. 2: A wiring device identified for the use, without a separate outlet box, incorporating an integral cable clamp shall be permitted where the cable is secured in place at intervals not exceeding 1.4 m (4 1/2 ft.) and within 300 mm (12 in.) from the wiring device wall opening, and there shall be at least a 300mm (12 in.) loop of unbroken cable or 150 mm (6 in.) of a cable end available on the interior side of the finished wall to permit replacement.

Exception No. 3: Lengths not more than 1.4 m (4 1/2 ft.) from an outlet for connection within an accessible ceiling to lighting fixture(s) or equipment.

336-40. Boxes and fittings.

(a) Boxes of Insulating Material. Nonmetallic outlet boxes shall be permitted as provided in 370-3.

(**b) Devices of Insulating Material.** Switch, outlet, and tap devices of insulating material shall be permitted to be used without boxes in exposed cable wiring and for rewiring in existing buildings where the cable is concealed and fished. Openings in such devices shall form a close fit around the outer covering of the cable and the device shall fully enclose the part of the cable from which any part of the covering has been removed. Where connections to conductors are by binding-screw terminals, there shall be available as many terminals as conductors.

(c) Devices with Integral Enclosures. Wiring devices with integral enclosures identified for such use shall be permitted as provided in 300-15(e).

336-80. Ampacity. The ampacity of Types NM, NMC, and NMS cable shall be determined in accordance with 310-15. The ampacity shall be in accordance with the 60º C (140º F) conductor temperature rating. The 90º C (194º F) rating shall be permitted to be used for ampacity derating purposes provided the final derated ampacity does not exceed that for a 60º C (140º F) rated conductor.

III Construction Specifications

336-100. Construction. The outer cable sheath of nonmetallic-sheathed cable shall be a nonmetallic material.

336-104. Conductors. The insulated power conductors shall be sizes 14 through 2 AWG with copper conductors or sizes 12 through 2 AWG with aluminum or copper-clad aluminum conductors. The signaling conductors shall comply with 780-5.

336-108. Equipment Grounding. In addition to the insulated conductors, the cable shall be permitted to have an insulated or bare conductor for equipment grounding purposes only. Where provided, the grounding conductor shall be sized in accordance with Article 250.

336-112. Insulation. The insulated power conductors shall be one of the types listed in Table 310-13 that is suitable for branch circuit wiring or one that is identified for use in these cables. Conductor insulation shall be rated at 90º C (194º F).

FPN: Types NM, NMC, and NMS cable identified by the markings NM-B, NMC-B, and NMS-B meet this requirement

336-116. Sheath. The outer sheath of nonmetallic-sheathed cable shall comply with:

(1) Type NM. The overall covering shall be flame retardant and moisture resistant.

(2) Type NMC. The overall covering shall be flame retardant, moisture resistant, fungus resistant, and corrosion resistant.

(3) Type NMS. The overall covering shall be flame-retardant and moisture-resistant. The sheath shall be applied so as to separate the power conductors from the communications and signaling conductors. The signaling conductors shall be permitted to be shielded. An optional outer jacket shall be permitted.

FPN: For composite optical cable, see 770-4 and 770-52.

SUBSTANTIATION: This revision to Article 336 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with the usability effort. Specific proposals addressed by this revision include 7-129, 7-132, 7-133, 7-134, 7-142, 7-144, 7-160, 7-175, 7-182 and 7-192.

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #1384)

7- 129 - (336): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise “A. General” to “I. General”

Revise 336-2 as follows:

336-2. Definition.

Nonmetallic-sheathed cable . ~~is a~~ A factory assembly of two or more insulated conductors having an outer sheath of moisture-resistant, flame-retardant, nonmetallic material.

Revise “336-4. Uses Permitted.” to “336-10. Uses Permitted.”

Revise “336-5. Uses Not Permitted.” to “336-12. Uses Not Permitted.”

Revise “B. Installation” to “II. Installation”

Revise 336-6 as follows:

~~336-6. Exposed Work — General~~ to 336-15. Exposed Work. In exposed work, except as provided in Section 300-11(a), the cable shall be installed as specified in (a) through ~~(d)~~ (c).

(a) To Follow Surface. The cable shall closely follow the surface of the building finish or of running boards.

(b) Protection from Physical Damage. The cable shall be protected from physical damage where necessary by conduit, electrical metallic tubing, Schedule 80 PVC rigid nonmetallic conduit, pipe, guard strips, listed surface metal or nonmetallic raceway, or other means. Where passing through a floor, the cable shall be enclosed in rigid metal conduit, intermediate metal conduit, electrical metallic tubing, Schedule 80 PVC rigid nonmetallic conduit, listed surface metal or nonmetallic raceway, or other metal pipe extending at least 6 in. (152 mm) above the floor.

(c) In Unfinished Basements. Where the cable is run at angles with joists in unfinished basements, it shall be permissible to secure cables not smaller than two No. 6 or three No. 8 conductors directly to the lower edges of the joists. Smaller cables shall either be run through bored holes in joists or on running boards.

~~(d) In Accessible Attics. The installation of cable in accessible attics or roof spaces shall also comply with Section 333-12.~~

Revise “336-9. Through or Parallel to Framing Members” to “336-17. Through or Parallel to Framing Members.”

Add a new section: “336-23 In Accessible Attics. The installation of cable in accessible attics or roof spaces shall also comply with Section 333-12.”

Revise “336-16. Bends.” to “336-24. Bending Radius.”

Revise “336-18. Supports.” to “336-30. Securing and Supporting.”

Revise 336-20, 336-21 and 336-25 as follows:

336-40. Boxes and Fittings.

~~336-20.~~ (a) Boxes of Insulating Material

Nonmetallic outlet boxes shall be permitted as provided in Section 370-3.

~~336-21.~~ (b) Devices of Insulating Material.

Switch, outlet, and tap devices of insulating material shall be permitted to be used without boxes in exposed cable wiring and for rewiring in existing buildings where the cable is concealed and fished. Openings in such devices shall form a close fit around the outer covering of the cable and the device shall fully enclose the part of the cable from which any part of the covering has been removed.

Where connections to conductors are by binding-screw terminals, there shall be available as many terminals as conductors.

~~336-25.~~ (c) Devices with Integral Enclosures.

Wiring devices with integral enclosures identified for such use shall be permitted as provided in Section 300-15(e).

Revise “336-26. Ampacity.” to “336-80. Ampacity.”

Revise “C. Construction Specifications” to “III. Construction Specifications”

Revise “336-30. General.” to “336-100. Construction.”

Revise “336-31. Marking.” to “336-120. Marking.”

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering cable and wiring.

A uniform format is proposed to achieve consistency across all of the cable and wiring articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc.

The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as stated in the NEC Style Manual 2.4.1. It is hoped that the parallel Code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for cable and wiring not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-128a.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #3165)

7- 130 - (336): Reject

SUBMITTER: Tim Andrassy, Steel Tube Inst.

RECOMMENDATION: Revise Article so that Sections 336-1 through 336-5 read as follows:

336-1. Scope. This article covers the use, installation, and construction specifications of nonmetallic sheathed cable.

A. General

336-2. Definition

1. Nonmetallic-sheathed cable is a factory assembly of two or more insulated conductors having an outer sheath of moisture-resistant, flame-retardant, nonmetallic material. Where designated NMC, the cable is also fungus and corrosion resistant. Where designated NMS the cable is a factory assembly of insulated power, communications, and signaling conductors enclosed within a common sheath.

2. Types of Construction are defined as detailed in the Table 503 of the International Building Code 2000. Groups are Assembly (A), Business (B), Educational (E), Factory (F), Hazardous (H), Institutional (I), Mercantile (M), Residential (R), Storage (S), Utility (U) and Misc. (U)

336-3. Other Articles. Installations of nonmetallic-sheathed cable shall comply with the other applicable provisions of this Code, especially Articles 300 and 310.

336-4. Uses Permitted. Type NM, Type NMC, and Type NMS cables shall be permitted to be used in the following:

1.Detached ~~O~~one-and two-family dwellings.

2. Multifamily dwellings not exceeding the height and areas permitted in Types II, III, IV, and V construction. ~~and other structures, except as prohibited in Section 336-5.~~

~~3. Cable trays, where the cables are identified for the use~~

3. Structures incidental to the use of residential occupancies.

4. Structures classified as Business or Mercantile, Educational, or Institutional occupancies in the International Building Code 2000 that are permitted to be Types IV or V construction.

5. As temporary wiring in accordance with Article 305.

6. In other structures not prohibited in Section 336-5 or elsewhere in this Code.

~~FPN: See Section 310-10 for temperature limitation of conductors~~

(a) Type NM. Type NM cable shall be permitted for both exposed and concealed work in normally dry locations. It shall be permissible to install or fish Type NM cable in air voids in masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness.

(b) Type NMC. Type NMC cable shall be permitted as follows:

1. For both exposed and concealed work in dry, moist, damp, or corrosive locations

2. In outside and inside walls of masonry block or tile

3. In a shallow chase in masonry, concrete, or adobe protected against nails or screws by a steel plate at least 1/16-in. (1.59-mm) thick, and covered with plaster, adobe, or similar finish

(c) Type NMS. Type NMS cable shall be permitted for both exposed and concealed work in normally dry locations. It shall be permissible to install or fish Type NMS cable in air voids in masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness. Type NMS cable shall be used as permitted in Article 780.

336-5. Uses Not Permitted

(a) Types NM, NMC, and NMS. Types NM, NMC, and NMS cables shall not be used in the following:

1. In structures required to be of Type I construction.

2~~1.~~ In any multifamily dwelling except as permitted in Section 336-4(2).

3. In Business, Mercantile, Educational, or Institutional structures except as permitted in Section 336-4(4).

4~~2~~. As service-entrance cable.

5~~3.~~ In commercial garages having hazardous (classified) locations as provided in Section 511-3.

6. In Places of Assembly except as provided in Section 518-4(b).

7~~4.~~ In theaters, motion picture studios, and similar locations, except as provided in Section 520-5(c).~~except as provided in Article 518, Places of Assembly.~~

~~5. In motion picture studios~~

8~~6.~~ In storage battery rooms.

9~~7.~~ In hoistways.

10~~8.~~ Embedded or encased in poured cement, concrete, or aggregate.

11~~9.~~ In any hazardous (classified) location, except as permitted by Sections 501-4(b), Exception, 502-4(b), Exception, and 504-20.

12. In health care facilities except as permitted in Article 517.

13. As open runs in the cavities created by dropped or suspended ceilings in other than detached one and two-family dwellings, or in other structures where the open run is only a single cable.

(b) Types NM and NMS. Types NM and NMS cable shall not be installed in the following:

1. Where exposed to corrosive fumes or vapors.

2. Where embedded or encased in masonry, concrete, adobe, fill, or plaster.

3. In a shallow chase in masonry, concrete, or adobe and covered with plaster, adobe, or similar finish.

Note: The Scope through Uses Not Permitted has been submitted for revision as one proposal because the full range of changes in these sections is clearer and better correlated that way. Changes to other sections of Article 336 have been submitted separately. If possible Table 503 of the IBC should be included in the Article. NFPA 220 was considered, but is not as complete and not as widely used.

SUBSTANTIATION: 336-2.1 – Clarifying N/M, NMS, and Nonmetallic-Sheathed Cable makes the Article more user friendly. Where this information appears elsewhere in Article 336, proposals to delete have been submitted.

336-2.2 – Reference to types of construction provides a consistent means for identifying area and height of buildings in which Nonmetallic Sheathed Cable is permitted. The International Building Code was recently adopted as a melding of requirements for the three Model Codes. In the past, there was no way to use building types because of differences in the three codes. Now, even if the IBC has not been adopted in a jurisdiction, the height and area are defined in a specific identifiable Table that should not conflict with NFPA 220. It is becoming ever more important to correlate the NEC with the IBC to discourage amendments to the NEC in that document. The ICC members are counting on Panel 7 to clarify Article 336, and this is an important step.

336-4.2 – The Article 336 Task Group that met this summer agreed to use of N/M cable in multi-family Types III, IV, and V construction. For all practical purposes, the referenced Table 503 would limit the number of stories to four, even in Type II; therefore Type II has been included in 336-4. The height of a building remains a concern relative to safe egress of occupants and potential for construction site damages. The building code deems it necessary to limit the number of stories for fire safety. Where more stories are permitted the Table requires Type I noncombustible structures. These hi-rise structures should not have concealed spaces filled with combustibles.

Existing 336-4.3 has been deleted. Article 318 covers cable tray and requires identification of conductors permitted to be used in cable tray. This support method is redundant in Article 336 and as written could be interpreted to override Article 318.

336-4.3 (new) – Structures incidental to residential use should be permitted. Use of the word "incidental" should preclude the concern expressed by some that a building on the property might be used as a repair garage, for example. This item limits the out buildings to being related to residential use such as parking and storage.

336-4.4 (new) – Type V is combustible construction of limited area and Type IV is heavy timber. Numerous jurisdictions already amend the Code to prohibit N/M in "Commercial" work altogether. This rule will cover use of N/M in "Mom & Pop" and other small businesses, while still providing the level of safety desirable in most commercial work. The terms "business" and "mercantile" are proposed because they are used for Table 503 of the IBC, and "commercial" is not defined. "Educational" and "institutional" are limited due to the need to lower risk in these structures. Accepting this Section would eliminate numerous local amendments to the NEC.

FPN: This FPN is proposed to be deleted as it is redundant. Article 310 is specifically noted in Section 336-3.

336-4.5 (new) – To correlate with Article 305.

336-4.6 (new) – To grant permission for structures not specifically covered as Permitted or Not Permitted.

336-5.a.1 – As stated in Uses Permitted substantiation, buildings required to be noncombustible should not have wall and ceiling concealed spaces filled with combustible open power wiring which contains a built-in source of ignition. Besides smoke detection delay in these spaces, sprinklers are not required in many concealed areas. DuPont has presented testing at the 1999 NFPA Symposium that shows some cables can propagate fire even in under-ventilated spaces with explosion possible. Depending on the quantity of conductors, the fire resistance rating could be compromised in the event of a concealed space fire. Type I buildings are frequently very large/very tall and the potential for construction damage is increased.

336-5.a.2 – Completes 336-4.2.

336-5.a.3 – Completes 336-4.5

336-5.a.4 and 5 – Renumbered only.

336-5.a.6 and 7 – Places of Assembly and motion picture studios have been separated to correlate with the appropriate Articles as contained in the Code. This should have been done in earlier editions.

336-5.a.8 and 9 – Renumbered only.

336-5.a.10 – During the 1999 Code cycle, CMP 8 interpreted "embedded" and "encased" to mean different things. This was not supported by a Code proposal, nor was it correlated with the intent of these terms throughout the Code. This proposed change is to ensure N/M cable is neither partially nor completely in concrete.

336-5.a.11 – Renumbered only.

336-5.a.12 – This reference is needed to assure the limitations in Article 517 are appropriately applied.

336-5.a.13 - Although consensus was not reached on the total report, long discussion by the N/M Task Group resulted in a strong feeling by a number of members that N/M in ceiling cavities should be protected. Grid ceilings are considered exposed locations by the NEC. As such, wiring in the cavities is often subjected to abuse by other trades during construction and maintenance. In steel truss construction the cable can be damaged by slag, joints, and edges. This proposal has been written so as to permit single runs of cable, such as to a light fixture, in order not to be overly restrictive. Such application would automatically be self-limiting and should present little hazard. However, bundles of cable are of concern.

336-5.b.2 – Same as item 10 of 336-5.a.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal expands the use of Type NM cable and also places restrictions on existing uses of Type NM cable without any technical substantiation. Mandatory references to other documents does not comply with the NEC Style Manual.

(Log #2219)

7- 131 - (336-2): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested."
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.
[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
PANEL ACTION: Reject.
PANEL STATEMENT: The term "flame-retardant" is used throughout the Code as a means of expressing to the user that the material resists ignition or the spread of flames, albeit the test methods are often not defined. The term "flame tested" is similarly undefined, but can be understood to mean a test which does not necessarily measure the ability of a material to resist ignition or flame propagation. Some articles of the NEC offer information regarding the tests deemed appropriate for the required level of resistance to ignition or flame propagation. Others rely on the product standard to provide such information. The panel suggests that specific proposals be made wherever the generic reference to "flame retardant" is not sufficient.

7- 135 - (336-4 and 336-5): Reject
Note: The Technical Correlating Committee directs that this Proposal be referred to the NFPA Toxicity Advisory Committee for any comments regarding the toxicity of NM Cable in the proposed expanded applications.
The Technical Correlating Committee will direct the NM Cable Task Group to reconvene and review the proposals submitted on expanded NM cable use and develop any appropriate comments.
SUBMITTER: Ronald G. Nickson, Nat'l Multi Housing Council
RECOMMENDATION: Revise text to read as follows:
336-4 Uses Permitted.
(a) Type NM, Type NMC, and Type NMS. Type NM, Type NMC, and Type NMS cables shall be permitted to be used in the following:
(1) One- and two-family dwellings.

(2) Multifamily dwellings ~~and other structures~~ permitted to be of Types III, IV, and V construction except as prohibited in Section 336-5.

(3) Other structures permitted to be of Types III, IV, and V construction except as prohibited in Section 336-5. Cables shall be concealed within walls, floors, or ceilings that provide a thermal barrier of material that has at least a fifteen-minute finish ratings as identified in listings of fire rated assemblies.

FPN No. 1: Building constructions are defined in NFPA 220, Standard on Types of Building Construction, 1998, or the applicable building code or both.

FPN No. 2: See Appendix F for determination of building types (Table 3-1 from NFPA 220).

(4 ~~3~~) Cable trays, where the cables are identified for the use.

FPN: See Section 310-10 for temperature limitations of conductors.

(b) Type NM. Type NM cable shall be permitted for both exposed and concealed work in normally dry locations except as prohibited in (a)(3) above. It shall be permissible to install or fish Type NM cable in air voids in masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness.

(c) Type NMC. Type NMC cable shall be permitted as follows:

1. For both exposed and concealed work in dry, moist, damp, or corrosive locations except as prohibited in (a)(3) above.
2. In outside and inside walls of masonry block or tile.
3. In a shallow chase in masonry, concrete, or adobe protected against nails or screws by a steel plate at least 1/16-in. (1.59-mm) thick, and covered with plaster, adobe, or similar finish.

(d ~~c~~) Type NMS. Type NMS cable shall be permitted for both exposed and concealed work in normally dry locations except as prohibited in (a)(3) above. It shall be permissible to install or fish Type NMS cable in air voids in masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness. Type NMS cable shall be used as permitted in Article 780.

336-5. Uses Not Permitted.

(a) Types NM, NMC, and NMS. Types NM, NMC, and NMS cables shall not be used in the following:

~~(1) In any multifamily dwelling or other structure exceeding three floors above grade. For the purpose of this article, the first floor of a building shall be that floor that has 50 percent from one of the exterior wall surface area level with or above finished grade. One additional level that is the first level and not designed for human habitation and used only for vehicle parking, storage, or similar use shall be permitted.~~

(1) As open runs in dropped or suspended ceilings in other than one- and two-family and multi-family dwellings.

(2) As service-entrance cable.

(3) In commercial garages having hazardous (classified) locations as provided in Section 511-3.

(4) In theaters and similar locations, except as provided in Article 518, Places of Assembly.

(5) In motion picture studios.

(6) In storage battery rooms.

(7) In hoistways.

(8) Embedded in poured cement, concrete, or aggregate.

(9) In any hazardous (classified) locations, except as permitted by Sections 501-4(b), Exception 502-4(b), Exception, and 504-20.

(b) Types NM and NMS. Types NM and NMS cable shall not be installed in the following:

1. Where exposed to corrosive fumes or vapors.
2. Where embedded in masonry, concrete, adobe, fill, or plaster.
3. In a shallow chase in masonry, concrete, or adobe and covered with plaster, adobe, or similar finish.

SUBSTANTIATION: This proposal was developed by the Task Group on Nonmetallic-Sheathed Cable based on their review of appropriate uses for Nonmetallic-Sheathed Cable. The task group noted that their evaluation of Nonmetallic-Sheathed Cable was based on the assumption that the cable would be constructed in accordance with criteria contained in UL Standard for Safety 719. The review of current installation requirements and the development of new requirements were also based on this assumption. The task group noted that all major manufacturers of Nonmetallic-Sheathed Cable presently obtain listing for their cables on voluntary basis so that a requirement for Nonmetallic-Sheathed Cable to be listed is necessary to establish uniform cable construction standards and assure that the installation requirements relate directly to the capability of the cables.

NHMC is submitting this proposal to forward the work of the Task Group on Nonmetallic-Sheathed to Panel 7.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal expands the use of Type NM cable by permitting it to be installed in dwelling units and other structures over 3-floors by the reference to use in Types III, IV and V construction. The submitter has not provided technical substantiation for this expanded use. Additionally in 336-4(a)(3) and 336-5(a)(1) of the proposal, restrictions have been placed on existing uses of Type NM cable without any technical substantiation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NEGATIVE: 2

NOT RETURNED: 1 Ensign

EXPLANATION OF NEGATIVE:

NICKSON: I do not agree with the panel action to reject based on the panel statement that technical substantiation was not included to support the expanded use. The proposal resulted from the work of the Task Group on Nonmetallic Sheathed Cable and was submitted by MNHC to bring the issue to the table. The task group report was included as substantiation and attached to Proposal 7-137.

TRAINOR: The International Association of Electrical Inspectors endorses the work of the Task Group on Nonmetallic-Sheathed Cable. The proposals prepared by the task group are based on a thorough review of the safety issues related to the use of Nonmetallic-Sheathed Cable. The issues reviewed included:

The possibility of physical damage both during and after installation.

The potential for misuse or abuse.

The lack of flame retardant properties.

The generation of smoke and other toxic products of combustion when subjected to flame.

The proposals prepared by the task group establish installation requirements that provide for the safe use of the product when installed in conformance with the requirements. The task group has noted that misuse or abuse of the product is not a code issue. This product, like all others, is designed for a specific use with the expectation that it will be used in the manner intended. The ongoing reluctance to accept expanded uses of Nonmetallic-Sheathed Cable seems to be based on a concern that misuse and abuse is common now and that expanded use will result in more of the same. Although that is possible, this clearly is an enforcement issue and needs to be dealt with at that level.

Clearly Nonmetallic-Sheathed Cable performs its intended function perfectly well when it is properly installed and maintained. There are millions of homes wired with Nonmetallic-Sheathed Cable. The vast majority of these homes have never had a wiring problem of any kind. Nonmetallic-Sheathed Cable has been used in tens of thousands of apartment buildings and continues to function perfectly year after year. For a supposedly fragile wiring method, Nonmetallic-Sheathed Cable has an admirable safety record.

It is also noted that this task group proposal provides more effective safeguards for the use of Nonmetallic-Sheathed Cable in “other structures”. Multifamily dwellings of three floors or less will typically be of wood frame construction, Type V Non-rated or 1 Hour Rated depending on the size of the structure. It seems apparent that the three floor rule was designed to permit Nonmetallic-Sheathed Cable to be used in wood frame construction because it was considered safe in that application. However, the inclusion of the phrase “and other structures” has been a source of controversy for as long as it has been in the code. This phrase presently permits Nonmetallic-Sheathed Cable to be used in “other structures” of any type of construction so long as they do not exceed three floors. The potential for physical damage is mush greater in this application than in wood frame construction. Also it is much more likely that there will be large quantities of exposed Nonmetallic-Sheathed Cable in such structures which could be exposed to flame. This Panel proposal establishes separate and different requirements for other structures. It will effectively limit Nonmetallic-Sheathed Cable to other structures of wood frame construction. It also requires Nonmetallic-Sheathed Cable to be concealed in walls, floors and ceilings which addresses most of the flame retardant and toxic smoke issues by significantly reducing the possible exposure to flame. It prohibits open runs of

Nonmetallic-Sheathed Cable in dropped or suspended ceilings for these same reasons.

This proposal permits the expanded use of Nonmetallic-Sheathed Cable in applications where it has a history of safe and effective use. It also adds appropriate restrictions on the use of Nonmetallic-Sheathed Cable in other structures to maintain a necessary level of safety. The International Association of Electrical Inspectors recommends that this proposal be accepted.

COMMENT ON AFFIRMATIVE:

SCHUMACHER: I believe that this proposal comes as close to a solution to the NM cable problem as anything so far but it still needs a lot of work. The task group on NM cable was making a lot of progress, but didn't have enough time to complete its work. Type NM cable is a wiring system with a specific purpose, and that purpose needs to be defined in this code.

(Log #3300)

7- 136 - (336-4): Reject

SUBMITTER: Frank Ricketti, Deerfield Beach, FL

RECOMMENDATION: Revise as follows:

336-4. Uses Permitted. Type NM, NMC, and Type NMS cables shall be permitted to be used in the following:

1. One- and two-family dwellings.

~~2. Multifamily dwellings and other structures except as prohibited in Section 336-5.~~

3. Cable trays, where the cables are identified for the use.

FPN: See Section 310-10 for temperature limitations of conductors.

SUBSTANTIATION: I attended the Southern Section IAEI meeting in Ft. Lauderdale. They told a story about how the Dallas Cowboys player (name deleted) lost his home to a fire. They said that the fire started when he drove a nail through NM cable when he was trying to hang a picture. We hear about such incidents because it happened to a celebrity. How many other times does this or other type damage occur to NM that we don't hear about? NM is a fragile wiring method that is suitable for one and two family dwellings only because it would limit any potential problems to isolated dwellings and a limited number of occupants.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not provided technical substantiation to place the additional restrictions on Type NM cable.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

(Log #4095)

7- 137 - (336-4 and 336-5): Reject

Note: The Technical Correlating Committee directs that this Proposal be referred to the NFPA Toxicity Advisory Committee for any comments regarding the toxicity of NM Cable in the proposed expanded applications.

The Technical Correlating Committee will direct the NM Cable Task Group to reconvene and review the proposals submitted on expanded NM cable use and develop any appropriate comments.

SUBMITTER: Ronald G. Nickson, Nat'l Multi Housing Council

RECOMMENDATION: Revise text to read as follows:

336-4. Uses Permitted.

(a) Type NM, Type NMC and Type NMS. Type NM, Type NMC, and Type NMS cables shall be permitted to be used in the following:

(1) One and Two Family dwellings.

(2) Multifamily dwellings ~~and other structures~~ permitted to be of Types III, IV, and V construction except as prohibited in Section 336.5.

(3) Other structures permitted to be of Types III, IV, and V construction except as prohibited in Section 336.5. Cables shall be concealed within walls, floors, or ceilings that provide a thermal barrier of material that has at least a fifteen-minute finish rating as identified in listings of fire rated assemblies.

FPN No. 1: Building constructions are defined in NFPA 220, Standard on Types of Building Construction, 1998, or the applicable building code or both.

FPN No. 2: See Appendix F for determination of building types (Table 3-1 from NFPA 220).

(~~3~~ 4) Cable trays, where the cables are identified for the use.

FPN: See Section 310.10 for temperature limitation of conductors.

(b) Type NM. Type NM cable shall be permitted for both exposed and concealed work in normally dry locations except as prohibited in (a)(3) above. It shall be permissible to install or fish Type NM cable in air voids in masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness.

(c) Type NMC. Type NMC cable shall be permitted as follows:

1. For both exposed and concealed work in dry, moist, damp, or corrosive locations except as prohibited in (a)(3) above.

2. In outside and inside walls of masonry block or tile.

3. In a shallow chase in masonry, concrete, or adobe protected against nails or screws by a steel plate at least 1/16-in. (1.59-mm) thick, and covered with plaster, adobe, or similar finish.

(d ~~c~~) Type NMS. Type NMS cable shall be permitted for both exposed and concealed work in normally dry locations except as prohibited in (a)(3) above. It shall be permissible to install or fish Type NMS cable in air voids in masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness. Type NMS cable shall be used as permitted in Article 780.

336.5 Uses Not Permitted

(a) Types NM, NMC, and NMS. Types NM, NMC, and NMS cables shall not be used in the following:

~~(1) In any multifamily dwelling or other structure exceeding three floors above grade. For the purpose of this article, the first floor of a building shall be that floor that has 50 percent or more of the exterior wall surface area level with or above finished grade. One additional level that is the first level and not designed for human habitation and used only for vehicle parking, storage, or similar use shall be permitted.~~

(1) As open runs in dropped or suspended ceilings in other than one- and two-family and multifamily dwellings.

(2) As service-entrance cable.

(3) In commercial garages having hazardous (classified) locations as provided in Section 511.3.

(4) In theaters and similar locations, except as provided in Article 518, Places of Assembly.

(5) In motion picture studios.

(6) In storage battery rooms.

(7) In hoistways.

(8) Embedded in poured cement, concrete, or aggregate.

(9) In any hazardous (classified) location, except as permitted by Sections 501.4(b), Exception 502.4(b), Exception, and 504.20.

(b) Types NM and NMS. Types NM and NMS cable shall not be installed in the following:

1. Where exposed to corrosive fumes or vapors.

2. Where embedded in masonry, concrete, adobe, fill, or plaster.

3. In a shallow chase in masonry, concrete, or adobe and covered with plaster, adobe, or similar finish.

SUBSTANTIATION: This proposal was developed by the Task Group on Nonmetallic-Sheathed Cable based on their review of appropriate uses for Nonmetallic-Sheathed Cable. The task group noted that their evaluation of Nonmetallic-Sheathed Cable was based on the assumption that the cable would be constructed in accordance with the criteria contained in UL Standard for Safety 719. The review of current installation requirements and the development of new requirements were also based on this assumption. The task group notes that all major manufacturers of Nonmetallic-Sheathed Cable presently obtain listing for their cables on voluntary basis so that a requirement for Nonmetallic-Sheathed Cable to be listed is necessary to establish uniform cable construction standards and assure that the installation requirements relate directly to the capability of the cables.

NMHC is submitting this proposal to forward the work of the Task Group on Nonmetallic Sheathing to Panel 7.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: There is concern that the requirements of the use of Type NM cable will now be dependent upon the use of building codes for proper interpretation of types of construction.

The substantiation provided with this proposal does not provide a comparison with the wiring methods that are currently used in the applications for which the expanded use of Type NM cable is being proposed.

The Task Group report, which is the substantiation for the proposal, noted that there are potential hazards involving the use of Type NM cable that have not been adequately reviewed. These include:

1. The compatibility of NM cable with modern building code requirements and construction methods and materials other than wood frame construction.

2. The NFPA Research Foundation's study of Incapacitation and the possible contribution of PVC to this issue.

3. The potential contribution to Electromagnetic Interference which is of particular concern in commercial and industrial applications.

The task group report also states "Of ongoing concern is the behavior of Nonmetallic-Sheathed Cable under fault or overload conditions. The task group disagrees on the extent to which nonmetallic sheathed cable becomes an ignition source under these conditions. Any expanded use of Nonmetallic -sheathed Cable would need to address this issue effectively."

It should be noted that the Task Group Report did not receive consensus support from the members of the Task Group.

The proposed 336-4(a)(3) second sentence and 336-5(a)(1) impose additional restrictions on the use of Type NM cable without sufficient technical substantiation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NEGATIVE: 2

NOT RETURNED: 1 Ensign

EXPLANATION OF NEGATIVE:

NICKSON: The panel action to reject is based on statements taken out of context from the Task Group Report on Nonmetallic Sheathed Cable which are not related to the issue of expanded use of nonmetallic sheathed cable in residential structures.

TRAINOR: See my Explanation of Negative on Proposal 7-135. The International Association of Electrical Inspectors recommends that this proposal be accepted.

COMMENT ON AFFIRMATIVE:

SCHUMACHER: I believe that this proposal comes as close to a solution to the NM cable problem as anything so far but it still needs a lot of work. The task group on NM cable was making a lot of progress, but didn't have enough time to complete its work. Type NM cable is a wiring system with a specific purpose, and that purpose needs to be defined in this code.

(Log #4347)

7- 138 - (336-4 and 336-5): Reject

Note: The Technical Correlating Committee directs that this Proposal be referred to the NFPA Toxicity Advisory Committee for any comments regarding the toxicity of NM Cable in the proposed expanded applications.

The Technical Correlating Committee will direct the NM Cable Task Group to reconvene and review the proposals submitted on expanded NM cable use and develop any appropriate comments.

SUBMITTER: Lawrence Brown, Nat'l Assn. of Home Builders

RECOMMENDATION: Revise text to read as follows:

336.4. Uses Permitted. Type NM, Type NMC, and Type NMS cables shall be permitted to be used ~~in the following:~~ except as prohibited in Section 336.5, and in cable trays, where the cables are identified for the use.

(1) One- and two-family dwellings

~~(2) Multifamily dwellings and other structures, except as prohibited in Section 336-5.~~

~~(3) Cable trays, where the cables are identified for the use~~

(a) No changes to subsection (a)

(b) No changes to subsection (b)

(c) No changes to subsection (c)

* Move FPN to after (c)

FPN: See Section 310.10 for temperature limitations of conductors.

336.6. Uses Not Permitted.

(a) Types NM, NMC, and NMS. Types NM, NMC, and NMS cables shall not be used in the following:

~~(1) In any multifamily dwelling or other structure exceeding three floors above grade.~~

~~For the purpose of this article, the first floor of a building shall that floor that has 50 percent or more of the exterior wall surface area with or above finish grade. One additional level that is the first floor and not designed for human habitation and used only for vehicle parking, storage, or similar use shall be permitted.~~

Renumber existing subparagraphs.

(1) As service-entrance cable

(2) In commercial garages having hazardous (classified) locations as provided in Section 551.3

(3) In theaters and similar locations, except as provided in Article 518, Places of Assembly

(4) In motion picture studios

(5) In storage battery rooms

(6) In hoistways

(7) Embedded in poured cement, concrete, or aggregate

(8) In any hazardous (classified) location, except as permitted by Section 501.4(b), Exception, 502.4(b), Exception, and 504.20.

SUBSTANTIATION: There is no basis or supporting data to limit the Installation of Nonmetallic Sheathed Cable in relationship to the height of a building. With the continuing development of code requirements in all model building codes, the restriction to a height of three floors above grade is no longer necessary. Firestopping is required at all floor/ceiling levels, ceiling/roof levels, and at the top and bottom in concealed horizontal and vertical spaces such as those in stud spaces. This prevents the spread of fire from one floor or fire area to another. The allowable height and area of a building directly relates to the "Type of Construction" and required fire protection mandated by the building codes. Buildings four stories and more above ground level are required to be of noncombustible construction. Buildings with a height of 75 feet or more above fire department access are required to be protected throughout by a fire sprinkler system. In other words, the restriction of Installing Nonmetallic Sheathed Cable in a building in relationship to its height are unfounded. The State of Michigan has exempted this restriction for over 30-years. No data exists for that state that shows a fire or life-safety hazard. It is time to recognize the realities of the built environment and delete this restriction.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal introduces additional restrictions on Type NM cable without sufficient technical substantiation.

See panel action and statement on Proposal 7-137.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

ABSTENTION: 1

NOT RETURNED: 1 Ensign

EXPLANATION OF ABSTENTION:

NICKSON: The panel statement for rejection based on more restrictive provisions does not identify the provisions they feel are more restrictive and give the proponent sufficient information as to why the technical data is not sufficient.

(Log #4373)

7- 139 - (336-4, 336-5): Reject

Note: The Technical Correlating Committee directs that this Proposal be referred to the NFPA Toxicity Advisory Committee for any comments regarding the toxicity of NM Cable in the proposed expanded applications.

The Technical Correlating Committee will direct the NM Cable Task Group to reconvene and review the proposals submitted on expanded NM cable use and develop any appropriate comments.

SUBMITTER: Joseph A. Hertel, Safety and Buildings Div., State of Wisconsin

RECOMMENDATION: Revise text to read as follows:

336.4. Uses Permitted. Type NM, Type NMC, and Type NMS cables shall be permitted to be used in the following:

(1) One-and two-family dwellings

~~(2) Multifamily dwellings and other structures, except as prohibited in Section 336-5.~~ In any building exceeding three floors above grade, nonmetallic-sheathed cable shall be concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies. The 15-minute finish rated thermal barrier shall be permitted to be used for combustible walls, floors, and ceilings.

336.5. Uses Not Permitted.

~~(1) In any multifamily dwelling or other structure exceeding three floors above grade.~~

SUBSTANTIATION: Currently Section 331-3, of the NEC uses this language to recognize the use of Electrical Nonmetallic Tubing in a building of any height. The same rule should apply to nonmetallic-sheathed cables used in a building of any height. To my knowledge there has been no documentation of problems with the use of ENT in these buildings. There is no significant difference in the amount of combustible material in a nonmetallic-sheathed cable or nonmetallic raceway system and therefore no reason to restrict the use of NM cables to buildings of less than three floors.

PANEL ACTION: Reject.

PANEL STATEMENT: The substantiation provided with this proposal does not provide a comparision with the wiring methods that are currently used in the applications for which the expanded use of Type NM cable is being proposed.
See panel action and statement on Proposal 7-137.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
NOT RETURNED: 1 Ensign
EXPLANATION OF NEGATIVE:
NICKSON: The panel references back to the rejection of Proposal 7-137 as justification is insufficient in that the rejection for 7-137 was based on statements taken out of context from the Task Group Report on Nonmetallic Sheathed Cable. The panel has also not provided the proponent with proper guidance as to why the technical data supplied does not provide the comparison of wiring methods and what testing is needed to provide the information the panel needs to act on the proposal.

(Log #25)

7- 140 - (336-4(a),(b)): Reject
NOTE: The following proposal consists of Comment 7-143 on Proposal 7-74 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 7-74 was:
Revise Section 336-4 to read as follows:
336-4. Uses Permitted. Type NM, Type NMC, and Type NMS cables shall be permitted to be used in one- and two-family dwellings, multifamily dwellings, and other associated structures, except as prohibited in Section 336-5. Where installed in cable trays, cables shall be identified for this use.
Each branch-circuit shall serve only one living unit, shall not extend beyond that living unit, and shall originate in a panel located on or within that living unit. Such panel shall serve only that living unit.
(FPN): See Section 310-10 for temperature limitation of conductors.
(a) Type NM. Type NM cable shall be permitted for both exposed and concealed work in normally dry locations. It shall be permissible to install or fish Type NM cable in air voids in masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness.
(b) Type NMC. Type NMC cable shall be permitted:
(1) For both exposed and concealed work in dry, moist, damp, or corrosive locations.
(2) In outside and inside walls of masonry block or tile.
(3) In a shallow chase in masonry, concrete, or adobe protected against nails or screws by a steel plate at least 1/16-in. (1.59-mm) thick, and covered with plaster, adobe, or similar finish.
(c) Type NMS. Type NMS cable shall be permitted for both exposed and concealed work in normally dry locations. It shall be permissible to install or fish Type NMS cable in air voids in masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness. Type NMS cable shall be used as permitted in Article 780.
SUBMITTER: David F. Scarelli, Fairport, NY
RECOMMENDATION: Add new text to read:
336(a) 1, NMS 2, NMSC 3, NMSS
336(b) Conductors:
Insert: Line type Fire Protective Signaling Switch
(FPN): 780-6 (a) Hybrid Cable.
SUBSTANTIATION: John Hall Jr.'s (NFPA Fire Analysis Research Division), "Selections from the U.S. Fire Problem Overview Report through 1992 Leading Causes and Other Patterns and Trends-Homes, Hotels and Motor Homes," states "Annual Property losses at $8.4 Billion, Lives 8,554. There are 996,000 Fires with 41,170 Injuries." Electrical distribution systems are responsible for approximately 10 percent of this loss.
Our communication of this concern with electricians, building maintenance people, the Rochester Fire Marshall's Office and the Rochester Building Code Enforcement Offices disclose that the major cause of NM-Cable destruction is damage at installation (cuts, nails, screws, staples driven in too far, etc.) and occupant circuit breaker abuse. Manufacturers specify the testing of ground fault detectors at least once a month to keep them from fusing together.
A nail driven through an NM-cable causes a milli-amp current to cross-flow around the nail to the return line. Energy is converted by the nail from electrical to thermal. A hot spot is created within the jacket and remains undetected until it burns its way through and ignites the distilled gasses which travels through the wall cavity.
The proposed NMS-cable was tested at the ITEK Laboratories, and witnessed by David F. Scarelli (submitter).
1. The NMS-cable conductors were raised to 90°C and the 150°C and held for 1 hour at each interval respectively. Hi-peak and temporary-overload conditions were thus assimilated. The signal portion of the NMS-cable was not activated. The NMS-cable was returned to its normal cycle with no ill-effects.
2. A roofing nail was driven through the NMS-cable and the voltage raised. When a milli-amp current flow measured, internal glowing occurred with light smoke and corona filling the air. The jacket contained its integrity when the alarm sounded. The power was disconnected. A circuit breaker could not detect this fault since the current flow as below its rating. A fire would have been created.
3. The NMS-cable was then wired through an electrical box and shorted. The voltage was raised, the box began to destruct, and the wire insulations began to melt along with the PVC jacket. The plastics were self-extinguishing and dripped off the conductors to the floor. The power was disconnected. A functional circuit breaker would have opened the circuit, but since there would not have been an alarm with an NM-cable the occupant would have just re-set the circuit breaker. If the occupant did not realize there was an electrical short become irritated and forced the circuit to remain permanently closed. The plastics would then drip off the conductors which would then short out at the staples, ties wall stud and floor joist passage holes igniting the structure all the way back to the power panel. The NMC-cable's alarm system alarmed the occupants and shut down the power. Existing fire protection devices detect fires after they start, not before.
When a fire originates in the other areas specified in the NFPA Report secondary fires are not considered. Electrical boxes in the wall and ceilings are consumed by fire before the 15 minute rated drywall is. The insulations are there-by melted leaving shorted conductors. If the circuit breaker is fused or bashed a secondary fire, through the branch circuit power panel is stopped by the main switch located in the cellar.
The above scenario dictated that the electrical distribution could be credited with an additional 10 to 20 percent of the life and property losses.
The NM-cable is a fine product. It is very low in cost until it meets the distribution houses. The houses squeeze the wire and cable Industry until it cannot afford to raise its costs 1/10 of 1 cent per foot.
The NMS-cable would raise the market price of a house less than .1 percent of its construction cost. It would save the repair and rebuilding due to fire damage up to 100 percent every time that horn sounds. The occupants would be very grateful for the early warning from a safe product.
The NMS-cable would automatically put a fire detector into every electrical box in the Building.
NOTE: The wire and cable industry is well aware of the NMS-cable. They have admitted its MERIT but fear market loss due to the slight cost increase over the current NM-cable. They have attained their market positions by increasing their efficiencies and cutting their profit margins from the copper mines to the shipping dock. If they want to survive, they may have to follow the now ever present American Motto: "Make it Fast-Make it Cheap" syndrome and the next NFPA Report will be a shameful one.
Conclusion: The NM-cable must be modified to contain an integral fire warning system to make it as safe as it can be.
The NMS-cable must be a regulated product before the wire and cable industry will manufacture it. If it is totally rejected, how will we account for the 8,500 of our men, women, and children who will perish to fire each and every year.
Who knows who these people will be?
We wish to bring to the Committees' attention "Regulations Governing Committee Projects" Section 4-2 Evaluation of Emergency Nature paragraphs (c), (d), and (e).
NOTE: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel is not clear on the submitter's intent. The proposal does not provide sufficient information for the panel to incorporate new text.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
NOT RETURNED: 1 Ensign
EXPLANATION OF NEGATIVE:
NICKSON: The panel statement that the intent of the proposal is not clear is insufficient in that the proposal is quite clear in its intent. Additionally, the panel does not give the proponent sufficient guidance on what is not sufficient in the justification.

(Log #1449)

7- 141 - (336-4(a)): Accept
Note: The Technical Correlating Committee understands the action on the Proposal deletes the text "...where such walls...dampness" in 336-10(a)(2) of Proposal 7-128a.
SUBMITTER: Barry F. Tower, Patten, ME
RECOMMENDATION: Delete the last 13 words so that it will read as follows:
(a) Type NM. Type NM cable shall be permitted for both exposed and concealed work in normally dry locations. It shall be permissible to install or fish type NM cable in air voids in masonry block or tile walls.
SUBSTANTIATION: The purpose of this change is to put wording in the positive instead of negative. I have submitted another proposal to put the deleted words into 336-5(b)(4) (Uses Not Permitted) where it should be. The words that I have deleted are as follows: "where such walls are not exposed or subject to excessive moisture or dampness". This part of the sentence should be moved to 336-5(b)(4) (New). I have also submitted another proposal similar to this one for 336-4(c) (Uses permitted for Type NMS). Both of these should be deleted and combined into one new one as I have proposed in 336-5(b)(4)(New) under uses NOT permitted.
PANEL ACTION: Accept.
PANEL STATEMENT:
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:

(Log #1351)

7- 144 - (336-5): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise 336-5 (336-12 New) to read as follows:
336-5. Uses Not Permitted.
(a) Types NM, NMC, and NMS. Types NM, NMC, and NMS cables shall not be used ~~in the following~~:
(1) In a multifamily dwelling or structure exceeding three floors above grade.
For the purpose of this article, the first floor of a building shall be that floor that has 50 percent or more of the exterior wall surface area level with or above finished grade. One additional level that is the first level and not designed for human habitation and used only for vehicle parking, storage, or similar use shall be permitted.
(2) As service-entrance cable
(3) In commercial garages having hazardous (classified) locations as defined ~~provided~~ in ~~Section~~ 511-3
(4) In theaters and similar locations, except where permitted in 518-4 ~~as provided in Article 518, Places of Assembly~~
(5) In motion picture studios
(6) In storage battery rooms
(7) In hoistways, or on elevators or escalators
(8) Embedded in poured cement, concrete, or aggregate
(9) In ~~any~~ hazardous (classified) locations, except where ~~as~~ permitted in ~~by Sections~~
(a) 501-4(b), Exception ~~,~~
(b) 502-4(b), Exception No.1~~, and~~
(c) 504-20
(b) Types NM and NMS. Types NM and NMS cable shall not be used ~~installed~~:
(1) Where exposed to corrosive fumes or vapors
(2) Where embedded in masonry, concrete, adobe, fill, or plaster
(3) In a shallow chase in masonry, concrete, or adobe and covered with plaster, adobe, or similar finish.
SUBSTANTIATION: "As provided" was replaced with "where permitted" to aid in word clarity in accordance with NEC Style Manual Section 3.3.4.
NEC Style Manual Section 4.1.1 prohibits referencing an entire Article unless additional conditions are specified. Referencing parts within Articles is permitted.
(7) was revised to provide consistent text in all the wire and cable articles.
(9)(b) was revised to show the specific reference in 502-4(b).
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-128a.

(Log #3247)

7- 145 - (336-5): Reject
Note: The Technical Correlating Committee directs that this Proposal be referred to the NFPA Toxicity Advisory Committee for any comments regarding the toxicity of NM Cable in the proposed expanded applications.
The Technical Correlating Committee will direct the NM Cable Task Group to reconvene and review the proposals submitted on expanded NM Cable use and develop any appropriate comments.
SUBMITTER: Ronald G. Nickson, Nat'l Multi Housing Council
RECOMMENDATION: Revise text to read as follows:
336-5. Uses Not Permitted.

(a) Types NM, NMC, and NMS. Types NM, NMC, and NMS cables shall not be used in the following:

(1) In any multifamily dwelling or other structure exceeding three floors above grade.

Exception: Type NM, NMC, and NMS, cables shall be permitted in buildings with multifamily dwellings exceeding three floors above grade when the cable is concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-min finish rating as identified in listings of fire rated assemblies. When installed above suspended ceilings, the suspended ceiling shall provide a thermal barrier of material that has at least a 15-min finish rating as identified in listings of fire-rated assemblies.

SUBSTANTIATION: Intent: Approval of this proposal would allow the use of nonmetallic sheathed electrical cable in R-2 occupancies (apartments) exceeding three stories in height.

Substantiation: 1. Nonmetallic-sheathed cable has a long and successful safety record: Nonmetallic-sheathed cabled has been in use since 1928 (70+ years), in communities throughout the country in single family, multifamily, and commercial applications (many being higher than three-stories). If the product were truly unsafe it would be obvious. In these 70+ years no one has ever presented any evidence showing that nonmetallic-sheathed cable is unsuitable for any residential application. Objections to the removal of the three-story limitation have been based only on hypothetical concerns and dated research. No evidence has been presented to demonstrate that there are any "real-world" problems. In contrast, this proposal is fully substantiated based on statistical evidence and quantitative analysis.

2. The three-story limit on the use of NM cable cannot be substantiated based on fire- or fire-safety: The NEC has only limited Type NM cable to buildings not exceeding three-stories since the 1974 edition, and even when the limit was adopted, there was not real evidence of problems with the product.

Some jurisdictions, particularly the State of Michigan and the Commonwealth of Massachusetts, rejected the NEC three-story limit, and thereby, they have never restricted the use of nonmetallic-sheathed cable base on building height. Consequently, nonmetallic-sheathed cable is already in widespread use in buildings exceeding three stories in height, and there have been no reported fire- or life-safety problems reported.

Fire loss data: Fire loss data from the U.S. Fire Administration's National Fire Incident Reporting System (NFIRS) for the period 1993 to 1997 indicates that approximately 1.5 percent of all apartment fires are caused by electrical wiring. This figure includes all wiring methods, not just nonmetallic-sheathed cable. Based on this, it is fairly evident that electrical wiring of any kind is not a big factor affecting overall fire safety in R-2 occupancies regardless of the wiring method used. The possibility of electrical wiring in apartments being a contributing factor in fire has virtually been eliminated in the 1999 NEC by the inclusion in Section 210-2 requirements for arc-fault circuit interrupter(s) in all branch circuits serving dwelling unit bedrooms.

It is also worth noting that the percentage of wiring fires in commercial occupancies, such as assembly and office uses, tends to be more than double that of R-2 uses, even though one would expect these other occupancies to make greater use of supposedly superiors wiring methods such as armored cable and wiring in conduit.

Fire spread through rated assemblies is not a problem: Fire tests sponsored by the U.S. Department of Housing and Urban Development (HUD) concluded that there is "no significant difference" in the fire performance of nonmetallic sheathed versus armored cable with respect to fire spread through rated assemblies. Consequently, arguments proposing that nonmetallic-sheathed cable might increase the chance of fire spread from unit to unit through fire-rated walls are unfounded.

Nonmetallic-sheathed cable does not present an ignition source problem: It has been well documented in recent years that nonmetallic-sheathed cable does not present an ignition source problem. NFPA 921, Guide for Fire and Explosion Investigation, makes it clear that electrical conductors, including nonmetallic-sheathed cable, are not common sources of ignition. Fire data supports this conclusion. See NFPA 921-98, Sections 14-11.4, 14-11.5, A-14.11.4, and Appendix B on referenced publications.

There is no unique fire hazard associated with nonmetallic-sheathed cable versus other acceptable wiring methods: Fire research conducted by the University of Maryland Department of Fire Protection Engineering indicated that there is no particular fire hazard associated with nonmetallic-sheathed cable versus wiring that is installed in electrical nonmetallic tubing (ENT). The research report concluded:

"1) Type NM cable will not decrease the level of life safety within a building of any height when located in ceiling and wall spaces separated from the interior of the building by a 15 minute finish rating (i.e., 1/2 in. thick gypsum wall board), and on this basis should not arbitrarily be limited to three stories in height," and

"2) In terms of building firesafety, these results indicate that Type NM cable, like ENT (which is not limited to three stories by the National Electrical Code), will not contribute to the hazard of fire when the cable is separated from the interior of the building by a 15-minute finish rating."

Consideration that wiring methods employing ENT are not restricted in a building with respect to building height, there is no basis for restricting the use of nonmetallic-sheathed cable since the fire performance of these two products is not substantially different in terms of overall impact on building fire safety.

3. The three-story limit on the use of NM cable cannot be substantiated based on toxicity: All wiring methods except Type MI cable produce toxic products of combustion when exposed to flame. Toxicity research funded by NEMA for New York State indicated that there is no statistically significant difference between the nonmetallic-material used in all wiring methods. Except for the addition of a nonmetallic jacket, the insulated conductors used in NM cable are identical to those used in other wiring methods. In fact, insulated conductors with more nonmetallic material are frequently used in other cable and wiring methods.

Considering that other wiring methods using nonmetallic insulation are not restricted in a building with respect to building height, there is no basis for restricting the use of nonmetallic-sheathed cable since the toxicity performance of these two products is not substantially different in terms of overall impact on building fire safety.

It is also important to note that all buildings affected by removal of the three-story limit on nonmetallic-sheathed cable in R-2 uses will be required by the IBC to be sprinklered throughout. Thereby, fires in occupied spaces will typically be controlled before involving concealed spaces, where wiring will be located, and fires originating in concealed spaces are statistically infrequent.

Conclusion. It is apparent that there is no safety benefit to be gained by limiting the use of nonmetallic-sheathed cable to buildings that are three-stories or less in height. In addition the objections to the expanded use of nonmetallic-sheathed cable have never been supported by any technical justification. The reported problems are based only on hypothetical concerns without any supporting data or research.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel rejects the proposal based on the following responses to the submitter's documentation:

Attachment #1-The Task Group report, which is the substantiation for the proposal, noted that there are potential hazards involving the use of Type NM cable that have not been adequately reviewed. These include:

1. The compatibility of NM cable with modern building code requirements and construction methods and materials other than wood frame construction.

2. The NFPA Research Foundation's study of Incapacitation and the possible contribution of PVC to this issue.

3. The potential contribution to Electromagnetic Interference which is of particular concern in commercial and industrial applications.

The task group report also states "Of ongoing concern is the behavior of Nonmetallic-Sheathed Cable under fault or overload conditions. The task group disagrees on the extent to which nonmetallic-sheathed cable becomes an ignition source under these conditions. Any expanded use of Nonmetallic -sheathed Cable would need to address this issue effectively."

It should be noted that the Task Group Report did not receive consensus support from the members of the Task Group.

Attachment #2-In attachment 2 there are two parts, the first part is a letter with corresponding data covering various types of conduits (Schedule 40, Schedule 80, and Electrical Nonmetallic Tubing). This is not relevant to the use of Type NM cable.

The second item provides toxicity results of PVC without interpreting the data relative to the safety or dangers of the test results.

Attachment #3-A primary stated purpose of the tests was to determine the effect on the fire endurance of a one-hour fire-rated wall due to the installation of NM or AC cable." The fire-rating was reduced in both instances. Various "suppositions" are offered as to the reasons. The report notes in paragraph 4 of the Introduction that the UL test is "a type of ease of ignition test." "It cannot be used for evaluating the effect of electrical wires on the fire resistance of a fire barrier."

Attachment #4-This documentation is addressing two subjects. The first is the likelihood of a staple igniting the insulation on the conductor or the wood to which it was stapled. Table A from Statistical Report on Fire Losses Attributed to Electrical Wiring in Apartments and Other Structures" prepared by Jeffrey M. Shapiro P.E., International Code Consultants was submitted. This table indicates that there were an average of 1759 fixed wiring structure fires in high rise and low rise apartments and in buildings other than homes reported by US fire departments that caused an average of nine civilian deaths from 1993-1997. This data only supports what was contained in the task group's report concerning the other potential hazards involved in the expanded use of Type NM cable. The second part of Attachment 4 basically discusses different types of fire stops which does not provide substantiation for the proposal.

Attachment #5-The test submitted does not provide conclusive data as there are not firm test conditions. The cone calorimeter is not an accepted method of fire testing electrical wire and cable. Wire and cable is tested for flame propagation and, in some cases, for smoke release using actual flame tests on wire and cable products. The cone calorimeter measures heat release, not flame propagation.

Present restrictions for the use of Type NM Cable attest to the fact that it is a safe product provided it is used in accordance with the NEC. Evidence is required by a committee of NFPA responsible for a particular standard or any portion thereof to make a change in the existing requirements. It is not the responsibility of the responsible technical committee to substantiate the existing requirements. Submitter is required to provide the necessary and sufficient technical substantiation for a proposed change.

The Panel does not have any knowledge as to the substantiation used by the Commonwealth of Massachusetts and the State of Michigan in amending the three floor restriction since it first appeared in the NEC.

Fire loss data does not differentiate the specific wiring methods used for Fixed Wiring.

Fire spread of individual products is not compared using test methods applicable to wire and cable products.

Fire Hazard Analysis comparison of Type NM Cable versus wiring in ENT does not compare all other differences in the two wiring methods.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 3

NOT RETURNED: 1 Ensign

EXPLANATION OF NEGATIVE:

NICKSON: Among other things, a portion of the panel action to reject is based on statements taken out of context from the Task Group Report on Nonmetallic Sheathed Cable which are not related to the issue of expanded use of nonmetallic sheathed cable in residential structures.

NUTT: The three-story limit on the use of NM cable cannot be substantiated based on fire-or fire-safety:

The NEC has only limited Type NM cable to buildings not exceeding three-stories since the 1974 edition, and even when the limit was adopted, there was not real evidence of problems with the product. Some jurisdictions, particularly the State of Michigan and the Commonwealth of Massachusetts, rejected the NEC three-story limit, and thereby, they do not restrict the use of nonmetallic-sheathed cable based on building height. Consequently, nonmetallic-sheathed cable is already in widespread use in buildings exceeding three stories in height, and there have been no fire safety problems reported.

Fire loss data from the U.S. Fire Administration's National Fire Incident Reporting System (NFIRS) for the period 1993 to 1997 indicates that approximately 1.5 percent of all apartment fires are caused by electrical wiring. This figure includes all wiring methods, not just nonmetallic-sheathed cable. Based on this, it is fairly evident that electrical wiring of any kind is not a big factor affecting overall fire safety in R-2 occupancies regardless of the wiring method used.

The positive experience of the two states mentioned and the lack of data supporting the restricted use of NM, NMC and NMS compels the elimination of the restriction on NM, NMC, and NM cables.

PROPST: I do not agree with the panel's action to reject this proposal and I do not agree that the panel's substantiation provides adequate justification for the action. I believe that the presentation to the panel along with the two statistical reports provided by Mr. Jeffrey Shapiro ("Statistical Report on Fire Losses Attributed to Electrical Wiring in Apartments and Other Structures" dated January 20, 2000 by Jeff Shapiro, and "Statistical Report Structure Fires in High-Rise and Low-Rise Apartments and in Buildings Other Than Homes, by Equipment Involved" dated January 2000, by Jeff Shapiro) provides more than adequate evidence that a safety problem does not currently exist and that the existing code wording to restrict the use of NM cable is an attempt to address a perceived problem that falls well below accepted levels of risk. I recommend that the panel "accept in principle" Proposal 7-145 with the following modifications presented by Mr. Shapiro during the code panel discussions:

Section 336-5. Uses Not Permitted.

(a) Types NM, NMC and NMS. Types NM, NMC, and NMS cables shall not be used in the following:

(1) In any multifamily dwelling or other structure exceeding three floors above grade.

Exception: Type NM, NMC, and NMS cables shall be permitted in buildings with multifamily dwellings exceeding three floors above grade when in compliance with all of the following:

1. Cables are located in concealed spaces separated from occupiable building areas by materials providing a thermal barrier with a finish rating of not less than 15 minutes, and
2. Cables are located in portions of the building used for residential purposes and do not extend between floors, except within a single dwelling unit.

COMMENT ON AFFIRMATIVE:

FAHRENTHOLD: Code panels, as representatives of NFPA in editing the NEC, must always remember that the purpose of this code is "the practical safeguarding of persons and property from hazards arising from the use of electricity." Safety must remain our goal. The submitter for this proposal states that "nonmetallic sheath cable has a long and successful safety record." He provided us with statistical data from the U.S. Fire Administration's National Fire Incident Reporting System for the periods 1993-1997. This data indicates that there were an average of 1,759 fires attriuted to "fixed wiring" in apartment buildings during that period. The data also states that these fires caused an average of 9 civilian deaths and 74 civilian injuries. The submitter implies that this is an acceptable amount of fires, deaths and injuries. I submit that one (1) fire, one (1) death, or one (1) injury is not acceptable. Our goal should be zero in all three categories. The use of nonmetallic sheath cable should be limited to wood frame structures and any wood frame structure over three floors using nonmetallic sheath cable should have a sprinkler system not only in the exit corridors and stairwells, but also full coverage in the dwelling area. Nonmetallic sheath cable should not be used with metal stud construction in buildings of any height. A wiring system that cannot withstand the extra pinch from a staple driven too far into a wooden stud should not be used with metal stud construction.

SCHUMACHER: Part of the submitter's substantiation is fire loss data indicating that approximately 1.5 percent of all apartment fires are caused by the wiring. This figure includes all wiring methods. What would this figure be if NM cable were allowed in all apartment buildings with no restrictions? While there is no way to answer this question, I think that we need to keep in mind Section 90-1(a) of this code.

(Log #4445)

7- 146 - (336-5): Reject

SUBMITTER: Frants Marvin Jensen, Consolidated Engr Labs

RECOMMENDATION: Delete: "~~in any multifamily dwelling or other structure exceeding 3 floors above grade.~~"

Add: "336.4 (1) of wood frame construction.

SUBSTANTIATION: There is no reason not to allow NM in any with recent reaction. As you know, you can build four floors and a penthouse with wood frame.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not provided any technical substantiation to support changes to uses permitted or uses not permitted.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #4320)

7- 147 - (336-5(a)): Reject
Note: The Technical Correlating Committee directs that this Proposal be referred to the NFPA Toxicity Advisory Committee for any comments regarding the toxicity of NM Cable in the proposed expanded applications.
The Technical Correlating Committee will direct the NM Cable Task Group to reconvene and review the proposals submitted on expanded NM Cable use and develop any appropriate comments.
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./Rep. Edison Electric Inst./EL&P Group
RECOMMENDATION: Delete Section 336-5(a)(1). Renumber (2) through (9) as (1) through (8).
Section 336-5(a) will now read as follows:
336.5. Uses Not Permitted.
(a) Types NM, NMC, and NMS. Types NM, NMC, and NMS shall not be used in the following:
~~(1) In any multifamily dwelling or other structure exceeding three floors above grade.~~
~~For the purpose of this article, the first floor of a building shall be the first floor that has 50 percent or more of the exterior wall surface area level with or above finished grade. One additional level that is the first level and not designed for human habitation and used only for vehicle parking, storage, or similar use shall be permitted.~~
~~(2)~~ (1) As service-entrance cable
~~(3)~~ (2) In commercial garages...Section 511.3.
~~(4-9)~~ to (3-8).
SUBSTANTIATION: This proposal goes a step beyond Proposal 7-77, which EEI submitted for the 1999 NEC. In their published actions and statements in the 1999 ROP, CMP 7 chose not to address the specific issues of Proposal 7-77, but simply reference their action on other proposals. Proposal 7-77 was similar to the Massachusetts Electrical Code where there is no three floor use restriction for Types NM, NMC, and NMS cables. Massachusetts does require that Types NM, NMC, and NMS cables not be permitted to extend vertically into another floor of the building.
This EEI 2002 NEC proposal is more in line with the electrical code in the State of Michigan, which has no height restrictions on the use of Types NM, NMC, and NMS cables. Michigan and Massachusetts have continually amended out the three floor restriction since it fist appeared in the 1975 NEC. This EEI proposal, if accepted, will remove all "number of building floors" or similar types of height restrictions on Types NM, NMC, and NMS cables. It does not affect other "uses permitted" or "uses not permitted."
EEI has closely monitored the considerable activity that has occurred on this topic following the 1998 annual meeting in Cincinnati. This includes the various appeals to the Standards Council by the NMHC, the work of the TCC-CMP 7 Task Group, and the floor action on the ICC Building Codes in St. Louis. After reviewing all that has been said and done. EEI is more convinced than ever that three floor restriction on Types NM, NMC, and NMS cables is totally unjustified, has absolutely no basis on "safety", and represent a major additional expense to the customer. It appears to EEI that this is strictly a business issue and that the NEC, the most widely adopted safety standard in the world, is being used to enhance some Corporate "bottom lines", more than it enhances public safety.
The TCC sent all CMP 7 members all materials and technical reports present to (but not always discussed) by the CMP 7 Task Group assigned to address the Type NM, NMS, and NMC controversy. We hope that the members of CMP 7 seriously consider all of the documented technical reports and test data submitted by the NMHC and others, supporting the removal of the three floor restriction. These technical reports (submitted to the CMP 7 Task Group and included in materials sent to all CMP 7 members at the direction of the TCC), coupled with the 20 plus years of virtually trouble free nonheight restricted use of Types NM, NMC, and NMS cables in the states of Michigan and Massachusetts, is documented proof that height limitations for using Types NM, NMC, and NMS cables in any building or structure cannot be justified and must be removed.
The members of EEI ask the members of CMP 7 to please act on and respond directly to the issues presented in this proposal rather than once again referring us to some other CMP 7 action on what we (EEI) may perceive to be a totally unrelated proposal. EEI hopes that CMP 7 will finally remove this long standing, unfair, unjustified rule and permit Types NM, NMC, and NMS cables to be used as are any of the other approved wiring methods.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not have any knowledge as to the substantiation used by the Commonwealth of Massachusetts and the State of Michigan in amending the three floor restriction since it first appeared in the NEC. The panel refers the submitter to the panel's action and statement on Proposal 7-137.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 2
NOT RETURNED: 1 Ensign
EXPLANATION OF NEGATIVE:
NICKSON: The panel statement for rejection is a misrepresentation of the facts. The Commonwealth of Massachusetts and the State of Michigan never included the three floor restrictions in their codes in the first place. They had not and still have not experienced any problems with nonmetallic wiring and the NEC did not provide a justification for the restriction when it was added to the code in the first place.
The rejection of Proposal 7-137 is based on statements taken out of context from the Task Group Report on Nonmetallic Sheathed Cable which are not related to the issue of expanded use of nonmetallic sheathed cable in residential structures.
NUTT: The three-story limit on the use of NM cable cannot be substantiated based on fire-or fire-safety:
The NEC has only limited Type NM cable to buildings not exceeding three-stories since the 1974 edition, and even when the limit was adopted, there was not real evidence of problems with the product. Some jurisdictions, particularly the State of Michigan and the Commonwealth of Massachusetts, rejected the NEC three-story limit, and thereby, they do not restrict the use of nonmetallic-sheathed cable based on building height. Consequently, nonmetallic-sheathed cable is already in widespread use in buildings exceeding three stories in height, and there have been no fire safety problems reported.
Fire loss data from the U.S. Fire Administration's National Fire Incident Reporting System (NFIRS) for the period 1993 to 1997 indicates that approximately 1.5 percent of all apartment fires are caused by electrical wiring. This figure includes all wiring methods, not just nonmetallic-sheathed cable. Based on this, it is fairly evident that electrical wiring of any kind is not a big factor affecting overall fire safety in R-2 occupancies regardless of the wiring method used.
The positive experience of the two states mentioned and the lack of data supporting the restricted use of NM, NMC and NMS compels the elimination of the restriction on NM, NMC, and NM cables.
This EEI 2002 NEC proposal is more in line with the electrical code in the State of Michigan, which, has no height restrictions on the use of Types NM, NMC, and NMS cables. Michigan and Massachusetts have continually amended out the three floor restriction since it first appeared in the 1975 NEC. <u>This EEI proposal, if accepted, will remove all "number of building floors" or</u> similar types of height restrictions on Types NM, NMC, and NMS cables. It does not affect other <u>"uses permitted" or "uses not permitted".</u>

(Log #1775)

7- 148 - (336-5(a)(1)): Reject
Note: The Technical Correlating Committee directs that this Proposal be referred to the NFPA Toxicity Advisory Committee for any comments regarding the toxicity of NM Cable in the proposed expanded applications.
The Technical Correlating Committee will direct the NM Cable Task Group to reconvene and review the proposals submitted on expanded NM Cable use and develop any appropriate comments.
SUBMITTER: Harold Richmond, City of Sterling Heights, MI/Rep. Reciprocal Electrical Council Inc.
RECOMMENDATION: Deleted text:
(1) In any multifamily dwelling or other structure exceeding three floors above grade. For the purpose of this article, the first floor of a building shall be that floor that has 50 percent or more of the exterior wall surface area level with or above finished grade. One additional level that is the first level and not designed for human habitation and

used only for vehicle parking, storage, or similar use shall be permitted.
SUBSTANTIATION: With the construction of the material as made today there is no reason to limit the use of type NM cable to buildings no more than three floors in above grade. The State of Michigan and local jurisdictions have amended this from the Code for more than three decades with no adverse effects. Studies from some of the larger communities with multiple high rise type buildings show no increase in electrical incidents in buildings using these wiring methods as compared to buildings utilizing other (allowed) wiring methods of the Code. There should be no cause for concern in the addition of smoke or toxins being introduced during a fire, as other wiring methods allowed containing the same conductor insulation, would produce more smoke and or toxins than type NM cables. A properly installed system utilizing type NM cable has been found to be just as safe if not more so than other systems which are allowed by the Code to be installed.
PANEL ACTION: Reject.
PANEL STATEMENT: The Panel does not have any knowledge as to the substantiation used by the Commonwealth of Massachusetts and the State of Michigan in amending the three floor restriction since it first appeared in the NEC. The panel refers the submitter to the panel's action and statement on Proposal 7-137.

7- 151 - (336-5(a)(1), Exception (New)): Reject
Note: The Technical Correlating Committee directs that this Proposal be referred to the NFPA Toxicity Advisory Committee for any comments regarding the toxicity of NM Cable in the proposed expanded applications.
The Technical Correlating Committee will direct the NM Cable Task Group to reconvene and review the proposals submitted on expanded NM Cable use and develop any appropriate comments.
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Add a new Exception as follows:
Exception: Type NM, Type NMC, and Type NMS cables shall be permitted to be used in multifamily dwellings and other buildings, provided that where the building exceeds three floors above grade, the cables do not leave the floor or dwelling unit from which the cables originated.
SUBSTANTIATION: The Committee is aware of the special task group recommendations to extend the use of Type NM cable to buildings and structures permitted to be of Types III, IV, or V construction by the applicable building codes. However, the continued exclusion from Type I and II construction is untenable. This construction presents the lowest risk of fire transmission, and the building codes recognize combustible plumbing and wiring elements within the walls. Other task group initiatives will severely limit or remove the possibility of Type NM cables running exposed in these buildings, and the Advisory Committee doesn't take issue with any of those new restrictions.
All these factors together lead to the following absurd result: The buildings most able to safely contain a nonmetallic wiring system will be unlikely to be allowed to use it, unless this proposal is accepted. This pro-posal contains an additional restriction to ensure that the cables aren't a factor in transmission of fire from floor to floor. As Massachusetts approaches thirty years of experience of allowing this type of use, we hope CMP 7 will see the objections for what they really are: an economic interest masquerading as a safety concern.
PANEL ACTION: Reject.
PANEL STATEMENT: The Panel does not have any knowledge as to the substantiation used by the Commonwealth of Massachusetts and the State of Michigan in amending the three floor restriction since it

first appeared in the NEC. The panel refers the submitter to the panel's action and statement on Proposal 7-137.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
NOT RETURNED: 1 Ensign
EXPLANATION OF NEGATIVE:
NICKSON: The panel statement for rejection is a misrepresentation of the facts. The Commonwealth of Massachusetts and the State of Michigan never included the three floor restrictions in their codes in the first place. They had not and still have not experienced any problems with nonmetallic wiring and the NEC did not provide a justification for the restriction when it was added to the code in the first place.
The rejection of Proposal 7-137 is based on statements taken out of context from the Task Group Report on Nonmetallic Sheathed Cable which are not related to the issue of expanded use of nonmetallic sheathed cable in residential structures.
COMMENT ON AFFIRMATIVE:
SCHUMACHER: I agree with the panel's action on this proposal, Types I and II construction by their nature are designed to limit the flammability of buildings. The installation of a wiring method that will support a flame in an otherwise fireproof assembly is a direct contradiction.

SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION: Revise this section to read:
(c) In Unfinished Basements. Where the cable is run at angles with joists in unfinished basements, ~~it shall be permissible to secure cables not smaller than two No. 6 or three No. 8 conductors directly to the lower edges of the joists. Smaller~~ cables shall be run through bored holes in joists. ~~or on running boards.~~
SUBSTANTIATION: Frequently "unfinished" basements become "finished." Often this is done by the homeowner and without a permit. Running through bored holes at the time of construction provides greater protection from damage when finishing occurs. Even if not ever finished there is less likelihood of damage. It has long been a concern of many that exposed N/M in basements is hazardous. This provides a little more protection.
PANEL ACTION: Reject.

PANEL STATEMENT: No technical substantiation has been provided that there has been problems with securing the larger sizes of Type NM cable to the lower edges of the joists.

(Log #3174)

7- 158 - (336-6(f) (New)): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 3 for information. The Technical Correlating Committee understands that the Panel Action text becomes the new second paragraph of Section 336-17.
SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION: Add a new (f) to read:
(f) Grommets in Metal Studs. Grommets shall be used in metal studs as required in 300-4(b)(1), shall remain in place during the wall finishing process, shall cover the complete opening, and shall be listed for the purpose of cable protection.
SUBSTANTIATION: The 1999 Code change to 300-4(b) was a good start toward solving a common problem. The N/M Task Group considered requiring listing of these grommets, and although consensus was not reached there was considerable support for listing. The primary problem now is grommets (or bushings) popping out with the final straightening of the wall. Section 300-4 only speaks to "prior to installation of the cable."
PANEL ACTION: Accept in Principle.
Add the proposed text as a new second paragraph to 336-9.
Grommets or bushings shall be used in metal studs as required in 300-4(b)(1), shall remain in place during the wall finishing process, shall cover the complete opening, and shall be listed for the purpose of cable protection.
PANEL STATEMENT: The addition of the word "bushing" correlates with Section 300-4. The text is more appropriately located in Section 336-9. CMP-7 refers this to the Technical Correlating Committee for correlation with any changes made CMP-3 to 300-4.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #4204)

7- 159 - (336-9): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
"Types NM, NMC, or NMS cable shall comply with Section 300-4 where installed through ~~or parallel to~~ joists, studs, rafters, or similar wood or metal members.
In both exposed and concealed locations, where the cable is installed parallel to framing members, such as joists, rafters, or studs, the cable shall be secured so that the nearest outside surface of the cable is not less than 1 1/4 inch (31.8 mm) from the nearest edge of the framing member where nails or screws are likely to penetrate. Where this distance cannot be maintained, the cable shall be protected from penetration by nails or screws by a steel plate, sleeve, or equivalent at least 1/16 inch (1.59 mm) thick.
Exception No. 1: For concealed work in finished buildings, or finished panels for prefabricated buildings where such supporting is impracticable, it shall be permitted to fish the cable between access points.
Exception No. 2: For mobile homes and recreational vehicles."
SUBSTANTIATION: This is a companion proposal to one made to delete Section 300-4(d). Taken together, both proposals transfer this restriction to the type of cable for which it is appropriate, namely, Type NM. There have been many studies done that well demonstrate that armored cables roll out of the way of a penetrating nail or screw. In fact, it is much more difficult to damage an armored cable assembly than it is a rigid steel raceway, whether EMT or even rigid or intermediate steel conduit, and certainly more difficult than rigid nonmetallic conduit.
CMP 7 should write appropriate protection rules within its articles, rules that will reasonably differ according to the different cable constructions. There isn't any credible reason to, in effect, say that Type NM cable and Type AC cable have similar resistances to mechanical abuse in one part of the Code, and then say in another part of the Code that their mechanical characteristics warrant dramatically different treatment for similar exposures. Or, if they're really all the same, perhaps the special CMP 7 task group would reconsider its recommended restriction against open runs of Type NM cable above suspended ceilings? Massachusetts has imposed the Section 300-4(d) restrictions on Type NM cables only (and also by extension from requirements within other articles, to Type SE and Type UF cable) for a number of code editions at this point without a single reported failure.
PANEL ACTION: Reject.
PANEL STATEMENT: The location of this requirement in Article 336 is considered necessary to ensure that Type NM cable is protected where installed parallel to framing members.

NOT RETURNED: 1 Ensign

(Log #1346)

7- 160 - (336-16): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise the first sentence of existing 336-16 (336-24 new) as follows:
~~336-16. Bends.~~ 336-24. Bending Radius. Bends in Type NM, NMC, and NMS cable shall be made so~~, and other handling shall be such,~~ that the cable will not be damaged~~, and the~~ The radius of the curve of the inner edge of any bend, during or after installation, shall not be less than five times the diameter of the cable.
SUBSTANTIATION: 1. " and other handlings" was deleted as it does not concern bending. In addition, the phrase "as such" was deleted because it should be followed by an example as required by NEC Style Manual Section 3.3.4. The phrase "during or after installation" was added to use wording consistent with the current requirement in Section 300-34.
2. Other suggested changes are editorial and provide clarity.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-128a.

NOT RETURNED: 1 Ensign

(Log #325)

7- 161 - (336-18): Reject
SUBMITTER: Barry Knispel, Arrow Fastener Co., Inc.
RECOMMENDATION: We are asking to include the following sentence into Section 336-18 Supports (Page 70-250):
"Where staples are used for cable sizes smaller than three No. 8 conductors, they shall be of the insulated type, or listed noninsulated staples driven by staple guns shall be permitted."
Please note that the above sentence has been added into the 1996 Massachusetts Electrical Code book, as well as the 1996 Rhode Island Amendment to the NEC.
SUBSTANTIATION: Inspectors in the field seem to be confused as to allowing staples to be used for installation of nonmetallic cable, and Arrow believes this would clarify the situation.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposer has not provided technical substantiation to change the existing wording. The present text permits the use of approved and listed securing methods that are designed not to damage the cable.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #396)

7- 162 - (336-18): Reject
SUBMITTER: Nick Phillips, Fit Your Budget Electric
RECOMMENDATION: Revise 336-18 to read as follows:
Nonmetallic-sheath cable shall be secured by ~~staples,~~ metal staples or steel staples, cable ties, straps, or similar fittings so designed...

SUBSTANTIATION: First problem, UL approved plastic staples with 2 nail arc being used. This is not a proper means of fire protection. No way to guarantee dead short if overcurrent device fails or etc.

Second, inspectors need this rule reworded. For enforcement and guaranteed fire stop.

PANEL ACTION: Reject.

PANEL STATEMENT: The present wording adequately covers the requirements for securing cables. The submitter has not provided technical substantiation to require the use of metal or steel staples only.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #2285)

7- 163 - (336-18): Reject

SUBMITTER: Terry L. Schneider, Regional Bldg Dept.

RECOMMENDATION: Revise text to read as follows:

336-18 Nonmetallic-sheated cable shall be secured by staples, cables ties, straps, or similar fittings designed and installed so as not to deform the outer sheath of the cable.

SUBSTANTIATION: A large number of fires have occurred nation wide from staples being installed too tight. Wood joists swelling and contracting from humidity changes can gradually cause arcing from eventual failure. Original installation may not appear to be damaged. This should give adequate protection for long term reliability.

PANEL ACTION: Reject.

PANEL STATEMENT: The present wording of this section adequately covers the proper installation of securing methods.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #4205)

7- 164 - (336-18): Reject

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee

RECOMMENDATION: Revise as follows:

"Nonmetallic-sheathed cable shall be secured by staples, cable ties, straps, or similar fittings so designed and installed as to not damage the cable. Where staples are used for cable sizes smaller than three No. 8 conductors, they shall be of the insulated type, or listed noninsulated staples driven by staple guns shall be permitted. Cable shall be secured in place at intervals not exceeding 4 1/2 ft (1.37 m) and within 12 in. (305 mm) from every cabinet, box, or fitting. Flat cables shall not be stapled on edge. For other than within 12 in. (305 mm) of a cable termination at a cabinet, box, or fitting, cables ~~run through holes in wood or metal joists, rafters, or studs,~~ passing through successive holes in adjacent framing members no more than 24 in. (610 mm) apart shall be considered to be secured."

SUBSTANTIATION: The insulated staple rule continues to prevent premature cable failures in Massachusetts, at negligible marginal cost. It is difficult to control the force on a hammer, and the staple insulation adds a time tested margin of safety. Remember, an over driven staple will often not cause a failure for a long time, as the insulation is gradually displaced under the constant pressure. The rule was instituted in Massachusetts only after documented failures under uninsulated staples. Now, however, that there are listed staple guns and staples for use with Type NM cable, we do permit these systems without the insulation.

Although no one is trying to staple NM cable inside of bored joists, etc., limitations need to be imposed on the permission to use stud holes as cable support. The final support adjacent to boxes, etc., should actually prevent cable movement, which will not happen in a bored hole. The rule should only apply where the cable is entrained through a series of holes in closely adjacent framing members.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposer has not provided technical substantiation to change the existing wording. The present text permits the use of approved and listed securing methods that are designed not to damage the cable.

The present wording of 336-18 covers the requirements for securing the cable within 12 inches of termination points. The 4.5 foot securing requirement is adequate and there is no substantiation to reduce the stud spacing to 24".

NOT RETURNED: 1 Ensign

(Log #4386)

7- 166 - (336-18): Reject

SUBMITTER: Malinda Joyce Sampson, Minnesota Electricity Board

RECOMMENDATION: Revise text to read as follows:

"When nonmetallic boxes are used with nonmetallic-sheathed cable, the cable assembly, including the sheath, shall extend into the box no less than 1/4 in. (6.35 mm) through a nonmetallic-sheathed cable knockout opening and shall be secured to the box with an approved cable clamp or strap.

Multiple cable entries shall be permitted through a single cable knockout opening.

When nonmetallic-sheathed cable is run to a single gang, nonmetallic box mounted in walls or ceilings, sized no larger than a nominal 2 1/4 x 4 in., a clamp shall not be required where the cable is fastened within 8 in. (203 mm) of the box (measured along the sheath)."

SUBSTANTIATION: This exception to the requirement for an approved cable clamp at all boxes, now located in Article 370.17, seems to be "hidden" from the other NM, NMC, and NMS requirements, and may be more appropriately located in this section.

PANEL ACTION: Reject.

PANEL STATEMENT: The Fine Print Note to 336-18 provides the necessary cross-reference to 370-17.

(Log #829)

7- 169 - (336-18 Exception No. 3): Accept
Note: The Technical Correlating Committee understands the wording replaces 336-30, Exception No. 3 of Proposal 7-128a.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
Exception No. 3: Lengths not more than 4 1/2 ft (1.37 m) ~~from an outlet~~ for connection within an accessible ceiling to lighting fixture(s) or equipment shall be permitted without a support within 12 in. (305 mm) of termination.
SUBSTANTIATION: Edit. The use of the word "outlet" from which lighting fixtures or equipment is supplied infers a box or other enclosure is necessary, whereas the intent seems to allow the prescribed length from the last support.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
NOT RETURNED: 1 Ensign
EXPLANATION OF NEGATIVE:
TRAINOR: From the Panel discussion and similar action on Proposal 7-101, it appears that the intent was to permit NM cable in a suspended ceiling to be run directly to a lighting fixture so long as it was supported within 4 1/2 ft of the fixture. This is a significant change from the present requirement which only allows 4 1/2 ft of unsupported NM cable where it is installed from an outlet to a fixture. I concur with the intent. Unfortunately, the wording change accepted will also allow 4 1/2 ft of unsupported NM cable from one lighting fixture to another. I do not believe that was the intent of the Panel or the submitter. I recommend that this proposal be amended to replace the words "from an outlet" with the words "from the last point of support". The amended text of 336-18 Exception No. 3 would then read:
"Lengths not more than 4 1/2 ft (1.37 m) from the last point of support for connection within an accessible ceiling to lighting fixture(s) or equipment." This will permit what the Panel apparently intended. It also permits NM cable from fixture to fixture but requires support of the cable between fixtures, I do not believe the additional wording regarding support within 12 ft is needed. The requirement for securing every 4 1/2 ft and within 12 in. of every box is in the same sentence in 336-18 so that the exception already applies to both requirements. I recommend that the Panel Action on this proposal be changed to Accept in Principle in Part.

(Log #2861)

7- 170 - (336-18 Exception No. 3): Reject
SUBMITTER: Bill F. Neitzel, Madison, WI
RECOMMENDATION: Delete the following text:
Section 336-18 ~~Exception No. 3: Lengths not more than 4 1/2 ft (1.37 m) from an outlet for connection within an accessible ceiling to lighting fixture(s) ore equipment.~~
SUBSTANTIATION: This exception is a clear violation of Section 336-6. Accessible ceilings offer little or no protection of NM cables, nor do they provide support within 12 in. of the connectors. These cables are just as susceptible to damage as AC cable indicated in 333-12. Installation of communications and power cables after the fact put these "NM Fixture Whips" in a compromising situation. We have spent many years trying to protect NM.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided substantiation to indicate that this type of installation has resulted in damage to the Type NM cable.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #2862)

7- 171 - (336-18 Exception No. 3): Reject
SUBMITTER: Bill F. Neitzel, Madison, WI
RECOMMENDATION: Add the following text to 336-18 Exception No. 3:
"Exception No. 3: In dwelling units only, lengths not more than 4 1/2 ft (1.37 m) from an outlet..."
SUBSTANTIATION: My understanding is this code exception was implemented for "homeowner projects" so NM could be used as a fixture whip. So be it. NM fixture whips have no place in the commercial setting where communications, HVAC, and other personnel require constant access above suspended ceilings.
This code section also is a violation of Section 336-6 and proper wording needs to be installed in 336-6 if this code exception is allowed to remain.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided substantiation to indicate that this type of installation has resulted in damage to the Type NM cable in other than residential structures.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #2909)

7- 172 - (336-18 Exception No. 3): Accept in Principle
SUBMITTER: Mark R. Hilbert, Wolfeboro, NH
RECOMMENDATION: Add the words: "or from the last point of secure attachment to a structural member or other" after the words "accessible ceiling."
The revised exception would read: Lengths not more than 4-1/2 ft (1.37 m) from an outlet for connection within an accessible ceiling or from the last point of secure attachment to a structural member or other, to lighting fixture(s) or equipment.
SUBSTANTIATION: The revised wording of this sentence would allow for six feet of flexibility for a cable that does not originate at an outlet within the accessible ceiling. For example, it would allow for a cable to be run from a switch within a wall to a light fixture within an accessible ceiling. Currently, there is no language which permits this installation method. However, it is common to see this method in the field. I am not aware of any problems due to the use of this installation method.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concerns have been addressed by the panel's action on Proposal 7-169. The panel notes that the permission in this exception is limited to 4.5 feet.

(Log #3038)

7- 179 - (336-26): Reject

SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit

RECOMMENDATION: Revise 336-26 to read:

The ampacity of Types NM, NMC, and NMS cable shall be that of 60°C (140°F) conductors and shall comply with Section 310-15. The 90°C rating shall not be permitted to be used for ampacity derating purposes. ~~The 90°C (194°F) rating shall be permitted to be used for ampacity derating purposes provided the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor.~~

SUBSTANTIATION: This section should not have been revised in the previous Code. The historical reason for the 90°C rating requirement was because 60°C rated N/M Cable was overheating in thermal (weatherizing) insulation. Bringing it back down to 60°C is a step backward. When Proposal 7-31 was accepted in the 1984 NEC, it was based on data documenting temperature rise. To permit derating from 90°C does not address those situations which required a final ampacity of less than 60°C before Proposal 7-31 was accepted. There is a good chance the use of N/M will be expanded this Code cycle. In addition, use of electrical equipment continues to grow and this safety factor should go back in the Code.

PANEL ACTION: Reject.

PANEL STATEMENT: It is intended that the final ampacity for Type NM cable shall be that of 60 degree C conductors and it is permitted to use the 90 degree C ampacity for application of adjustment or correction factors. See panel action on Proposal 7-177.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13
NEGATIVE: 1
NOT RETURNED: 1 Ensign

EXPLANATION OF NEGATIVE:

STRANIERO: The substantiation submitted with the proposal is correct. When cables are installed in thermal insulation and operated at 60 C ampacity, the heat dissipation is impeded by the thermal insulation causing the actual conductor temperature to rise to 90 C. Allowing the 90 C conductor rating to be used for derating, even when limiting the final value to that of 60 C conductors, will permit bundled cables or cables in high ambient that are installed in thermal insulation to be exposed to temperatures above that for which they are rated.

(Log #4206)

7- 180 - (336-26): Reject

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee

RECOMMENDATION: Revise as follows:

"Type NM, NMC, and NMS cable shall have conductors rated at 90°C (194°F). Where in-stalled in thermal insulation, the ampacity of conductors shall be that of 60°C (140°F) conductors."

SUBSTANTIATION: The 1999 NEC contains a technical error. The NEC does not condition the increased ampacity allowances on the cables being run in open air, as it does with Type AC cable in Section 333-20. This wording incorporates that concept. Studies done by UL and NEMA conclusively demonstrate the severe effect that thermal insulation has on conductor ampacities. See, for example, Proposals 7-131 and 4-97 in the 1987 NEC cycle for the original substantiation.

In its prior rejections of this proposal, CMP 7 seems not to have read it well enough to understand that it really is just what the panel historically seems to want, namely, another restriction on NM cable. This one actually has technical merit.

It does not, however, turn the clock back to 1993, as another proposal presently circulating would do, and make Type NM-B cable start its derating in the 60° column even if run in open air. This leads to some truly remarkable results, well suited to satire. Suppose, for example, you run two 12-2 NM cables for kitchen small appliance branch circuits through the same set of bored holes in attic rafters (no thermal insulation around the cables). Assume the attic design temperature is 110°F, quite conservative in many areas of the country.

What you find is that you have to wire the kitchen circuits with No. 8, because even No. 10 fails to work if you start in the 60°C column [30A x 0.8 x 0.71 = 17A; per Sec. 240-3(b)(1) next higher sized device not allowable.] If, however, you start in the 90°C column, now No. 12 works (30A x 0.8 x 0.87 = 21A.) This result wasn't being enforced when it was in the Code, even in the southwest according to an article at the time in IAEI News. I'd like to meet the inspector who'd insist on 8-2 NM cable in this case, or even 10-2 cable through separate holes (25A x 0.71 = 18A, No. 10 required) in the same attic.

This wording is technically appropriate and it has been in the Massachusetts Code for four cycles of the Code at this point, without any reported problems.

PANEL ACTION: Reject.

PANEL STATEMENT: It is intended that the final ampacity for Type NM cable shall be that of 60 degree C conductors in all installations, and it is permitted to use the 90 degree C ampacity for application of adjustment or correction factors. There has been no technical substantiation provided to indicate that there has been a problem with applying the derating factors to the 90 degree C ampacity where installed in thermal installation. See panel action on Proposal 7-177.

EXPLANATION OF NEGATIVE:

STRANIERO: See my Explanation of Negative Vote on Proposal 7-179.

(Log #1486)

7- 181 - (336-27 (New)): Reject

SUBMITTER: Norman Arendt, City of Chicago,

RECOMMENDATION: Add new section to read as follows:

336-27. Arc-Fault Current Circuit-Interrupter Protection. Arc-fault circuit-interrupter protection shall be installed for concealed Types NM, NMC, and NMS cable.

SUBSTANTIATION: The U.S. Consumer Product Safety Commission "1995 Residential Fire Loss Estimates" identifies the following: 1) 425,500 residential structure fires; 2) 3,695 civilian deaths; 3) 19,125 civilian injuries; 4) $4.4 billion in property loss; 5) material first ignited in 33,800 fires was Electrical Cable Insulation.

Arc-fault circuit-interrupters will detect arcing faults which have been know to cause such fires as referenced in the CPSC Report of Manufacturers test results as well as their advertising shows the positive impact of arc-fault devices on NM cable wiring methods.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The data supplied by the submitter is not accurate in identifying the problems as exclusive to Type NM cable installations. The submitter has not provided substantiation to indicate that this type of protection should be applied only to installations of Type NM cable. Section 210-12 requires this method of protection for specific branch circuits regardless of the wiring method.

7- 182 - (336-30, 336-108, 336-112, 336-116 (New)): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise 336-30 (336-100 New) as follows:

~~336-30.~~ 336-100. ~~General.~~ Construction. ~~Nonmetallic-sheathed cable shall comply with (a) and (b) below.~~

~~(a) Construction.~~ The outer cable sheath of nonmetallic-sheathed cable shall be a nonmetallic material.

~~(1) Type NM. The overall covering shall be flame retardant and moisture resistant.~~

~~(2) Type NMC. The overall covering shall be flame retardant, moisture resistant, fungus resistant, and corrosion resistant.~~

~~(3) Type NMS. Type NMS cable is a factory assembly of insulated power, communications, and signaling conductors enclosed within a common sheath of moisture resistant, flame retardant, nonmetallic material. The sheath shall be applied so as to separate the power conductors from the communications and signaling conductors. The signal conductors shall be permitted to be shielded. An optional outer jacket shall be permitted.~~

~~(FPN): For composite optical cable, see Sections 770-4 and 770-52.~~

~~(b) Conductors. The insulated power conductors shall be one of the types listed in Table 310-13 that is suitable for branch-circuit wiring or one that is identified for use in these cables.~~
~~The power conductors shall be sizes No. 14 through No. 2 with copper conductors or sizes No. 12 through No. 2 with aluminum or copper-clad aluminum conductors.~~
~~The signaling conductors shall comply with Section 780-5.~~
~~In addition to the insulated conductors, the cable shall be permitted to have an insulated or bare conductor for equipment grounding purposes only. Where provided, the grounding conductor shall be sized in accordance with Article 250.~~
~~Conductors shall be rated at 90°C (194°F).~~
~~(FPN): Types NM, NMC, and NMS cable identified by the markings NM-B, NMC-B, and NMS-B meet this requirement.~~

Revise 336-30(b) (336-104 New) as follows:

~~336-30(b)~~ 336-104. Conductors. The power conductors shall be sizes No. 14 through No. 2 with copper conductors or sizes No. 12 through No. 2 with aluminum or copper-clad aluminum conductors. The signaling conductors shall comply with ~~Section~~ 780-5.

Add a new Section 336-108 as follows:

336-108. Equipment Grounding. In addition to the insulated conductors, the cable shall be permitted to have an insulated or bare conductor for equipment grounding purposes only.

Insulated equipment grounding conductors shall be rated at 90°C (194°F).

Add a new Section 336-112 as follows:

336-112. Insulation. The insulated power conductors shall be one of the types listed in Table 310-13 that is suitable for branch-circuit wiring or one that is identified for use in these cables.

Conductors shall be rated at 90°C (194°F).

(FPN): Types NM, NMC, and NMS cable identified by the markings NM-B, NMC-B, and NMS-B meet this requirement.

Add a new Section 336-116 as follows:

336-116. Sheath. The outer sheath of nonmetallic-sheathed cable shall comply with:

(1) Type NM. The overall covering shall be flame retardant and moisture resistant.

(2) Type NMC. The overall covering shall be flame retardant, moisture resistant, fungus resistant, and corrosion resistant.

(3) Type NMS. The overall covering shall be flame retardant and moisture resistant. The sheath shall be applied so as to separate the power conductors from the communications and signaling conductors. The signal conductors shall be permitted to be shielded. An optional outer jacket shall be permitted.

(FPN): For composite optical cable, see ~~Sections~~ 770-4 and 770-52.

SUBSTANTIATION: Present text of Section 336-30 has been divided into five sections (336-100, 336-104, 336-108, 336-112, and 336-116) to provide consistency among the wire and cable articles. A portion of 336-30(a) has been relocated to 336-116. The balance of 336-30(a) is shown as 336-100. One portion of 336-30(b) is shown as 336-104, second portion of 336-30(b) is shown as 336-108, and the remaining portion of 336-30(b) is shown as 336-112. Changes shown are consistent with this division.

In Section 336-30(b) deleted the sentence: "Where provided, the grounding conductor shall be sized in accordance with Article 250." Section 90-3 adequately covers this requirement. NEC Style Manual, Section 4.1 requires that references not be provided if the material is already covered by Section 90-3. Also, Section 4.4.1 prohibits referencing an entire Article.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-128a.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #3244)

7- 183 - (336-30): Reject

SUBMITTER: Ronald G. Nickson, Nat'l Multi Housing Council

RECOMMENDATION: Revise text to read as follows:

336-30. General. Nonmetallic-sheathed cable shall be listed and shall comply with (a) and (b).

No change to remainder of text.

SUBSTANTIATION: This proposal was developed by the Task Group on Nonmetallic-Sheathed Cable based on their review of appropriate uses for Nonmetallic-Sheathed Cable. The task group noted that their evaluation of Nonmetallic-Sheathed Cable was based on the assumption that the cable would be constructed in accordance with criteria contained in UL Standard for Safety 719. The review of current installation requirements and the development of new requirements were also based on this assumption. The task group noted that all major manufacturers of Nonmetallic-Sheathed Cable presently obtain listing for their cables on voluntary basis so that a requirement for Nonmetallic-Sheathed Cable to be listed is necessary to establish uniform cable construction standards and assure that the installation requirements relate directly to the capability of the cables.

NHMC is submitting this proposal to forward the work of the Task Group on Nonmetallic-Sheathed to Panel 7.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: There are a number of methods for conformity assessment and it is not the panel's intent to promote one to the exclusion of the others. Other methods of conformity assessment include:

Company reputation (brand name recognition); Supplier's declaration; Third-party certification; Certification through voluntary inter-laboratory agreements that are not limited to national borders; and private sector agreements on conformity assessment activities (subcontracting and laboratory memorandums of understandings, including company laboratories) that are not limited by national border.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NEGATIVE: 2

NOT RETURNED: 1 Ensign

EXPLANATION OF NEGATIVE:

PROPST: While I generally support the panel's substantiation that a number of means exist for assessing the suitability of a product, I feel that NM cable needs to be addressed separately. The product is widely used by people with a broad range of experience and knowledge from the skilled electrician to the weekend handyman. The product is readily available in almost any hardware store, home center, or discount store. With this exposure, I believe that the consequences associated with the use of products not meeting minimum industry product standards creates safety concern. It was reported in the panel meeting that all of the major cable manufacturer's NM cables are currently listed. If that is the case, then this additional requirement for this specific type of cable would not have a significant impact or burden on the manufacturer or consumer, and would provide some level of assurance that potentially inferior material was not being used by consumers who may not be well educated in the significance of listed products.

TRAINOR: The International Association of Electrical Inspectors endorses the work of the Task Group on Nonmetallic-Sheathed Cable. As noted in the substantiation, this proposal was prepared by that task group for sound and compelling reasons. Objective, third party testing and listing of products is a basic requirement of practically every inspection jurisdiction. This is of extreme benefit to manufacturers. If every inspection jurisdiction adopted its own review process for approving products, the differences between them would make it impossible for manufacturers to produce a product that was uniformly accepted. In addition, listing provides some protection against the liability inherent in manufacturing products. The Panel Statement lists a number of different methods for conformity assessment. These include:

Company reputation (brand name recognition)
Suppliers declaration
Private sector agreements
Third Party Certification
Certification through voluntary inter-laboratory agreements
Private sector agreements

These types of options may exist but, in fact, they are not being used for this product. Inspection jurisdictions seldom accept any option other than listing. When they do, it is usually to assist in the review of a new or one-of-a-kind product. For all wiring methods, listing is the standard requirement for acceptance. Listing certifies to the inspector that the product has been tested to an appropriate standard and will perform safely in its intended use. Manufacturers obviously know this. Every manufacturer of Nonmetallic-Sheathe Cable has

obtained a listing for their product. They know that the alternate "methods for conformity assessment" are not acceptable for their product. At present however, there is nothing to prevent anyone from producing a cable to no standard at all and calling it Nonmetallic-Sheathed Cable. It would undoubtedly cost less than a listed cable. Since listing is not a code requirement, the inspector would have the sole responsibility of deciding whether or not it was acceptable. This is not a situation the inspector wants to be and it's unlikely that reputable manufacturers want an inspector making that call.

It is noted that nearly all of the raceway wiring methods are required to be listed while nearly none of the cable methods have this requirement. This is a serious inconsistency in requirements for products that serve basically the same function. It weakens the credibility of the NEC, leaves manufacturers open to unfair competition and makes the inspector's job more difficult. The International Association of Electrical Inspectors recommends reconsideration of this issue and acceptance of a listing requirement for Nonmetallic-Sheathed Cable.

(Log #4073)

7- 184 - (336-30): Reject
SUBMITTER: Ronald G. Nickson, Nat'l Multi Housing Council
RECOMMENDATION: Revise text to read as follows:

336-30. General. Nonmetallic-sheathed cable shall be listed and shall comply with (a) and (b).

No change to the remainder of text.

SUBSTANTIATION: This proposal was developed by the Task Group on Nonmetallic-Sheathed Cable based on their review of appropriate users for Nonmetallic-Sheathed Cable. The task group noted that their evaluation of Nonmetallic-Sheathed Cable was based on the assumption that the cable would be constructed in accordance with the criteria contained in UL Standard for Safety 719. The review of current installation requirements and the development of new requirements were also based on this assumption. The task group noted that all major manufacturers of Nonmetallic-Sheathed Cable presently obtain listing for their cables on voluntary basis so that a requirement for Nonmetallic-Sheathed Cable to be listed is necessary to establish uniform cable construction standards and assure that the installation requirements relate directly to the capability of the cables.

NHMC is submitting this proposal to forward the word of the Task Group on Nonmetallic-Sheathing to Panel 7.

Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: There are a number of methods for conformity assessment and it is not the panel's intent to promote one to the exclusion of the others. Other methods of conformity assessment include:

Company reputation (brand name recognition); Supplier's declaration; Third-party certification; Certification through voluntary inter-laboratory agreements that are not limited to national borders; and private sector agreements on conformity assessment activities (subcontracting and laboratory memorandums of understandings, including company laboratories) that are not limited by national border.

7- 186 - (336-30(3)): Reject
SUBMITTER: Joseph McKenzie, McKenzie Safety Products, Inc.
RECOMMENDATION: Proposed rewritten text to read as follows:

"Type NMFP cable is a factory assembly of insulated power, communication, and signaling conductors enclosed within a common sheath of moisture resistant, flame retardant, nonmetallic material. The sheath shall be applied so as to incorporate the power conductors and the heat responsive cable assembly within the same cavity."
SUBSTANTIATION: The Safety and Lives of Thousands of People. Our cable assembly will instantaneously signal a heat buildup, a potential fire and shutdown power to bring immediate action before a full blown fire erupts.

Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided a fact-finding report to indicate that the proposed new type of cable provides equivalent safety to that of the existing Type NM cable. Additionally the submitter has not demonstrated that the existing cable requires the proposed modification in construction.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #3177)

7- 187 - (336-30(a)): Reject
SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION: Revise 336-30.a to read:

Nonmetallic-sheathed cable shall comply with (a) and (b).

(a) Construction. The outer cable sheath of Types NM, NMC, and NMS shall be a nonmetallic material and ~~(1) Type NM. The~~ the overall covering shall be flame retardant and moisture resistant.

(1) ~~(2)~~ Type NMC. The overall covering of Type NMC shall also be fungus resistant and corrosion resistant.

(2) ~~(3)~~ Type NMS. ~~Type NMS cable is a factory assembly of insulated power, communications, and signaling conductors enclosed within a common sheath of moisture resistant, flame retardant, nonmetallic material.~~ The sheath of Type NMS shall be applied so as to separate the power conductors from the communications and signaling conductors. The signaling conductors shall be permitted to be shielded. An optional outer jacket shall be permitted.

FPN: For composite optical cable, see Sections 770-4 and 770-52.
SUBSTANTIATION: 336-30.a – These changes make it clear all three types are nonmetallic and are flame retardant and moisture resistant. It consolidates and shortens text.

336-30.a.3 – Part of the deleted first sentence was moved to become a definition for NMS in a related proposal. The changes to the second sentence are editorial only.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed language changes the technical requirements for type NMS cable construction. The proposed text does not improve the clarity of this section.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14

(Log #2220)

7- 188 - (336-30(a)(1), (2), and (3)): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" (or "flame retardant") to "flame tested" in three places [in 336-30(a)(1), (2), and (3)].
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because

the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.

[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]

PANEL ACTION: Reject.

PANEL STATEMENT: The term "flame-retardant" is used throughout the Code as a means of expressing to the user that the material resists ignition or the spread of flames, albeit the test methods are often not defined. The term "flame tested" is similarly undefined, but can be understood to mean a test which does not necessarily measure the ability of a material to resist ignition or flame propagation. Some articles of the NEC offer information regarding the tests deemed appropriate for the required level of resistance to ignition or flame propagation. Others rely on the product standard to provide such information. The panel suggests that specific proposals be made wherever the generic reference to "flame retardant" is not sufficient.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

COMMENT ON AFFIRMATIVE:

STEWART: The panel statement is correct. Changing the words "flame tested" is an undefined term that would lead to improper testing for the intended application.

TEMBLADOR: See comment on Ravi Gantra's Proposal 6-3.

(Log #1064)

7- 189 - (336-30(b)): Accept

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: In the second paragraph change:

"No. 14" to "14 AWG"

"No. 2" to "2 AWG" in two places

"No. 12" to "12 AWG".

SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #2570)

7- 190 - (336-30(b)): Reject

SUBMITTER: Travis Lindsey, Bldg Dept., Clark County, NV

RECOMMENDATION: Revise as follows:

... the power conductors shall be sizes No. ~~14~~ 12 through No. 2 with copper conductors or sizes No. ~~12~~ 10 through No. 2 with aluminum or copper clad aluminum conductors,...

SUBSTANTIATION: A large number of residential fires have been attributed to the fixed wiring systems of buildings. CPSC residential fire loss estimates for 1995 alone indicated 14,640 fires from the fixed wiring of residential structures.

Drawing from experience as a code professional the problem is obvious.

In our jurisdiction we have enacted rules limiting branch circuits to No. 12. We did this because there were problems with heating of conductors, overloaded circuits and tripping related to these conditions. Since enacting these regulations the number of problems have been reduced significantly.

In addition to the factors above, conductors are usually not applied incorrectly. Ambient temperature correction factors are not considered. Attics in most parts of the country are hot enough for prolonged periods during the summer months that application of the correction factors would reduce the current carrying capacity of the No. 14 wire to a very small number. Increased heating occurs when circuits are heavily loaded, and the combined effect of neglecting these factors can be disastrous.

In cases such as single outlet appliance circuits serving refrigerators and similar loads, the circuits have been known to fatigue and deteriorate (oxidize and burn) at connection points, overcurrent devices and receptacles due to the high starting loads and the small wire size.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not documented that the use of No. 14 AWG copper and No. 12 AWG aluminum has been the cause of the problems cited in his substantiation. The Code does not prohibit the use of the proposed conductor sizes. The use of cables with conductors No. 14 AWG copper and No.12 AWG aluminum in accordance with the applicable rules of the Code will result in safe installations.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NEGATIVE: 1

NOT RETURNED: 1 Ensign

EXPLANATION OF NEGATIVE:

STRANIERO: This proposal will enhance safety. Clark County Nevada and other municipalities have high ambient temperatures and derating of conductors is rarely applied. Fire occurrence should be reduced by this proposal.

(Log #3178)

7- 191 - (336-30(b)): Reject

SUBMITTER: Tim Andrassy, Steel Tube Inst.

RECOMMENDATION: Revise 336-30(b) to read:

(b) Conductors and Cable Jacket. Conductors and cable jackets shall comply with the following:

(1) The insulated power conductors shall be one of the types listed in Table 310-13 that is suitable for branch-circuit wiring or one that is identified for use in these cables.

(2) The power conductors shall be sizes No. 14 through No. 2 with copper conductors or sizes No. 12 through No. 2 with aluminum or copper-clad aluminum conductors.

(3) The signaling conductors shall comply with Section 780-5.

(4) In other than detached one and two family dwellings or in one floor structures, the cables shall also be listed as follows:

1. As suitable for use in a vertical run in a shaft or from floor to floor and as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of the Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts, ANSI/UL 1666-1997.

2. For permitted uses other than as riser cable, the cables shall be listed as resistant to the spread of fire.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in the Reference Standard for Electrical Wires, Cables and Flexible Cords, ANSI/UL 1581-1991.

In addition to the insulated conductors, the cable shall be permitted to have an insulated or bare conductor for equipment grounding purposes only. Where provided, the grounding conductor shall be sized in accordance with Section 250-122, comply with ~~Article 250~~ Section 250-122 and comply with Section 250-2(d).

Conductors shall be rated at 90°C (194°F).

~~FPN: Types NM, Nonmetallic Sheathed Cable, and NMS cable identified by the markings NM B, Nonmetallic Sheathed Cable B meet this requirement.~~

SUBSTANTIATION: N/M Cable currently meets the least stringent test for flame retardation. If it is going to be installed from floor to floor and between units of buildings, it should at least be as flame retardant as communications wire and cables. This text is copied from Article 800. The FPN is proposed to be deleted and a separate proposal has been submitted to move this to the "Marking" section as a requirement.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not provided substantiation to document that the use of Type NM cable has resulted in the propagation of flame between floors under the current permitted uses.

(Log #1854)

7- 192 - (336-31): Accept in Principle
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Delete 336-31. Marking. in its entirety.
SUBSTANTIATION: Section 4.1 of the 1999 NEC Style Manual states "Do not use a reference if the requirement is already covered by 90-3." 90-3 states that Chapters 1, 2, 3 and 4 apply generally.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-128a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #3179)

7- 193 - (336-31): Reject
SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION: Revise 336-31 to read:
336-31. Marking.The cable shall be marked in accordance with Sections 110-21 and 310-11. The cable shall also be identified as Type NM-B, NMC-B, or NMS-B to indicate an insulation rating of 90°C (194°F) as required in Section 336-30(d)(2).
SUBSTANTIATION: This information is currently contained in a FPN in Section 336-30(b). It is more appropriate in a marking section and thus assures a means of identifying the 90°C insulation. This is very important when N/M cable is surrounded by thermal insulation. (The FPN was proposed for deletion in a companion proposal.)
PANEL ACTION: Reject.
PANEL STATEMENT: Marking is covered in 310-11. The reference to 110-21 is not necessary as per 90-3 it is applicable. The Fine Print Note adequately conveys the marking designation for 90 degree C conductors. See panel's rewrite of Article 336 in Proposal 7-128a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #3035)

7- 194 - (336-32 (New)): Reject
SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Add a new section titled, "Listed" to read:
Types N/M, NMS, and Nonmetallic-Sheathed Cable shall be listed.
SUBSTANTIATION: Evaluation of the suitability of products assumes they meet certain requirements. Listing is the best way to accomplish this. Other wiring methods in Chapter 8 have listing requirements and cables should also be listed.
We keep hearing "most everyone lists anyway." If so, then there is no reason not to make it a requirement so cable from other countries will also be listed.
PANEL ACTION: Reject.
PANEL STATEMENT: There are a number of methods for conformity assessment and it is not the panel's intent to promote one to the exclusion of the others. Other methods of conformity assessment include:
Company reputation (brand name recognition); Supplier's declaration; Third-party certification; Certification through voluntary inter-laboratory agreements that are not limited to national borders; and private sector agreements on conformity assessment activities (subcontracting and laboratory memorandums of understandings, including company laboratories) that are not limited by national border.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 2
NOT RETURNED: 1 Ensign
EXPLANATION OF NEGATIVE:
GUIDA: This proposal should be accepted. As indicated by the submitter, most, if not all nonmetallic-sheathed cable used is listed. The definition of "Listed" in the NEC states that the listing organization is required to be acceptable to the authority having jurisdiction, and that equipment meets identified standards or has been tested and found suitable for a specified purpose. Many other cables and most raceways in the NEC are required to be listed.
The panel statement indicates that company reputation or a supplier's declaration are acceptable alternatives to listing. It should be noted that Code-Making Panel 1 has rejected similar proposals due to the potential for inconsistent interpretations by authorities having jurisdiction. Listing is based on compliance with recognized product safety standards.
As additional information, the Standard for Nonmetallic-Sheathed Cables, UL 719, requires a thorough construction and performance evaluation for all nonmetallic-sheathed cables. Among others, testing includes flammability, dielectric voltage-withstand, unwinding at low temperatures, pulling through joists, conductor pullout, crushing and abrasion. Nonlisted cables may not have been evaluated for compliance with these requirements, and may not function correctly with listed termination fittings.
TRAINOR: See comments on Proposal 7-183. The International Association of Electrical Inspectors recommends that the action on this proposal be changed to Accept in Principle and the proposed text be placed in a new 336-6 which is the section number in the new parallel numbering format which is reserved for listing requirements. The new section would read as follows:
"336-6. Listing Requirements. Nonmetallic-Sheathed Cable shall be listed."

(Log #3036)

7- 195 - (336-32 (New)): Reject

ARTICLE 338 — SERVICE-ENTRANCE CABLE

(Log #CP713)

7- 195a - (338): Accept

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: CMP 7

RECOMMENDATION: Rewrite Article 338 to comply with NEC Style Manual.

ARTICLE 338 -- Service-Entrance Cable:

Types SE and USE

I General

338-1. Scope. This article covers the use, installation, and construction specifications of service- entrance cable.

338-2. Definition.

Service-Entrance Cable. A single conductor or multiconductor assembly provided with or without an overall covering, primarily used for services, and of the following types:

(a) Type SE. Service-entrance cable having a flame-retardant, moisture-resistant covering.

(b) Type USE. Service-entrance cable, identified for underground use, having a moisture- resistant covering, but not required to have a flame-retardant covering.

Cabled, single-conductor, Type USE constructions recognized for underground use may have a bare copper conductor cabled with the assembly. Type USE single, parallel, or cabled conductor assemblies recognized for underground use may have a bare copper concentric conductor applied. These constructions do not require an outer overall covering.

FPN: See 230-41, Exception, item (b) for directly buried, uninsulated service-entrance conductors.

(c) One Uninsulated Conductor. If Type SE or USE cable consists of two or more conductors, one shall be permitted to be uninsulated.

II Installation

338-10. Uses Permitted.

(a) Service-Entrance Conductors. Service-entrance cable used as service-entrance conductors shall be installed as required by Article 230.

Type USE used for service laterals shall be permitted to emerge above ground outside at terminations in meter bases or other enclosures where protected in accordance with 300-5(d).

(b) Branch Circuits or Feeders.

(1) Grounded Conductor Insulated. Type SE service-entrance cables shall be permitted in interior wiring systems where all of the circuit conductors of the cable are of the rubber-covered or thermoplastic type.

(2) Grounded Conductor Not Insulated. Type SE service-entrance cables without individual insulation on the grounded circuit conductor shall not be used as a branch circuit or as a feeder within a building, except a cable that has a final nonmetallic outer covering and is supplied by alternating current at not over 150 volts to ground shall be permitted as a feeder to supply only other buildings on the same premises.

Type SE service-entrance cable shall be permitted for use where the fully insulated conductors are used for circuit wiring and the uninsulated conductor is used for equipment grounding purposes.

(3) Temperature Limitations. Type SE service-entrance cable used to supply appliances shall not be subject to conductor temperatures in excess of the temperature specified for the type of insulation involved.

(4) Installation Methods for Branch Circuits and Feeders.

(a) Interior Installations. In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Part II of Article 336 and shall comply with the applicable provisions of Article 300.

FPN: See 310-10 for temperature limitation of conductors.

(b) Exterior Installations. In addition to the provisions of this article, service-entrance cable used for feeders or branch circuits, where installed as exterior wiring, shall be installed as required by Article 225. The cable shall be supported in accordance with 336-18, unless used as messenger-supported wiring as allowed by Article 321.

Type USE cable shall be installed outside in accordance with the provisions of Article 339. Where Type USE cable emerges above ground at terminations, it shall be protected in accordance with 300-5(d).

Multiconductor service-entrance cable shall be permitted to be installed as messenger-supported wiring in accordance with Articles 225 and 321.

338-24. Bending Radius. Bends in Type USE and SE cable shall be made so that the cable will not be damaged. The radius of the curve of the inner edge of any bend, during or after installation, shall not be less than five times the diameter of the cable.

III. Construction.

338-120. Marking. Service-entrance cable shall be marked as required in 310-11. Cable with the neutral conductor smaller than the ungrounded conductors shall be so marked.

SUBSTANTIATION: This revision to Article 338 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with the usability effort. Specific proposals addressed by this revision include 7-196, 7-197, 7-198, and 7-210.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #1385)

7- 196 - (338): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Add " I. General" before Section 338-1.

Add " II. Installation" before Section 338-10 (New).

Add " III. Construction Specifications" before Section 338-120 (New).

Revise existing 338-2, 338-3 and 338-4 as follows:

~~338-2.~~ 338-10. Uses Permitted. ~~as Service-Entrance Conductors.~~

(a) Service-Entrance Conductors. Service-entrance cable used as service-entrance conductors shall be installed as required by Article 230.

Type USE used for service laterals shall be permitted to emerge above ground outside at terminations in meter bases or other enclosures where protected in accordance with Section 300-5(d).

~~338-3.~~ (b) ~~Uses Permitted as~~ Branch Circuits or Feeders.

~~(a)~~ (1) Grounded Conductor Insulated. Type SE service-entrance cables shall be permitted in interior wiring systems where all of the circuit conductors of the cable are of the rubber-covered or thermoplastic type.

~~(b)~~ (2) Grounded Conductor Not Insulated. Type SE service-entrance cables without individual insulation on the grounded circuit conductor shall not be used as a branch circuit or as a feeder within a building, except a cable that has a final nonmetallic outer covering and is supplied by alternating current at not over 150 volts to ground shall be permitted as a feeder to supply only other buildings on the same premises.

Type SE service-entrance cable shall be permitted for use where the fully insulated conductors are used for circuit wiring and the uninsulated conductor is used for equipment grounding purposes.

~~(c)~~ (3) Temperature Limitations. Type SE service-entrance cable used to supply appliances shall not be subject to conductor temperatures in excess of the temperature specified for the type of insulation involved.

~~338-4.~~ (4) Installation Methods for Branch Circuits and Feeders.

(a) Interior Installation. In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Parts A and B of Article 336 and shall comply with the applicable provisions of Article 300.

(FPN): See Section 310-10 for temperature limitation of conductors.

(b) Exterior Installation. In addition to the provisions of this article, service-entrance cable used for feeders or branch circuits, where installed as exterior wiring, shall be installed as required by Article

225. The cable shall be supported in accordance with Section 336-18, unless used as messenger-supported wiring as allowed by Article 321.

Type USE cable shall be installed outside in accordance with the provisions of Article 339. Where Type USE cable emerges above ground at terminations, it shall be protected in accordance with Section 300-5(d).

Multiconductor service-entrance cable shall be permitted to be installed as messenger-supported wiring in accordance with Article 225 and 321.

Revise "338-5. Marking." to "338-120. Marking."

Revise "338-6. Bends." To "338-24. Bending Radius."

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering cable and wiring.

A uniform format is proposed to achieve consistency across all of the cable and wiring articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as stated in the NEC Style Manual 2.4.1. It is hoped that the parallel Code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for cable and wiring not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-195a.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

(Log #2064)

7- 198 - (338-1): Accept in Principle

SUBMITTER: Joel A. Rencsok, Scottsdale, AZ

RECOMMENDATION: Add a Scope section to Article 338 to read as follows:

338-1. Scope. The provisions of this article covers the use and installation requirements of service-entrance cable.

Renumber remaining sections.

SUBSTANTIATION: Each Article should have a scope section.

The NEC style manual on style also shows a scope article.

To keep the Articles consistent all Articles should be similar.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-195a.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #2221)

7- 199 - (338-1(a) and (b)): Reject

SUBMITTER: Ravindra H. Ganatra, Alcan Cable

RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested."

SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.

[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]

PANEL ACTION: Reject.

PANEL STATEMENT: The term "flame-retardant" is used throughout the Code as a means of expressing to the user that the material resists ignition or the spread of flames, albeit the test methods are often not defined. The term "flame tested" is similarly undefined, but can be understood to mean a test which does not necessarily measure the ability of a material to resist ignition or flame propagation. Some articles of the NEC offer information regarding the tests deemed appropriate for the required level of resistance to ignition or flame propagation. Others rely on the product standard to provide such information. The panel suggests that specific proposals be made wherever the generic reference to "flame retardant" is not sufficient.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

COMMENT ON AFFIRMATIVE:

STEWART: The panel statement is correct. Changing the words "flame tested" is an undefined term that would lead to improper testing for the intended application.

TEMBLADOR: See comment on Ravi Gantra's Proposal 6-3.

(Log #365)

7- 200 - (338-1(b)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise second paragraph:

Cabled ~~single conductor~~ Type USE constructions recognized for underground use may have a bare copper conductor cabled with the assembly. Type USE ~~single~~ parallel or cabled conductor assemblies recognized for underground use may have a bare copper concentric conductor applied. These constructions do not require an outer covering overall.

SUBSTANTIATION: Editorial. If a single (insulated) conductor is "cabled" with a bare conductor it seems it is no longer a single-conductor cable.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed change does not enhance the clarity of this section. The present terminology is commonly understood.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #3902)

7- 201 - (338-2): Reject

SUBMITTER: Alfred A. Fiorello, Fiorello Electric Inc.

RECOMMENDATION: Add new text to read as follows:

"Service entrance cable shall be sealed with a suitable, listed sealant, at service entrance caps to prevent the entry of water into the cable."

SUBSTANTIATION: Where service entrance cable is tied into service drop wires, a big problem exists when it rains. As the service drop is shaken by the wind, a capillary action causes the water on the uninsulated service cable to travel up into the cable. Once a little

water gets into the cable, it acts like a siphon and as it goes into the cable it sucks more water into the cable. Over time, the water rusts out the meter equipment and the electric panel. NEMA recommends any circuit breaker which gets wet should be replaced. Thousands of these problems of malfunctioning main and branch circuit breaker wiring could be prevented. How safe is a circuit breaker which doesn't trip? The panels rust out and must replaced.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 230-54 and proper workmanship adequately cover the requirements for preventing the entrance of water or moisture into service equipment. The submitter has not provided any documented instances where this issue has resulted in a problem.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #830)

7- 202 - (338-3(a), (b) and Exception (New)): Accept
Note: The Technical Correlating Committee directs the Panel to correlate the action on this Proposal with the action on Proposals 7-203 and 7-209.
The Technical Correlating Committee understands that the recommended text replaces the text in 338-10(b)(1) and (2) in Proposal 7-195a.
This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
(a) Grounded Conductor Insulated. Type SE service-entrance cable shall be permitted in ~~interior~~ wiring systems where all of the circuit conductors of the cable are of the rubber-covered or thermoplastic type.
(b) Grounded Conductor Not Insulated. Type SE service-entrance cable without individual insulation on the grounded circuit conductor shall not be used as a branch or feeder ~~within a building,~~ except a cable that has a final nonmetallic covering and is supplied by alternating-current at not over 150 volts to ground shall be permitted as a feeder or branch circuit ~~to~~ supply conductors only for other buildings or structures on the same premises.
Exception: A bare grounded conductor shall be permitted in accordance with Section 250-140.
SUBSTANTIATION: Article 225 apparently does not prohibit Type SE cable for use outside on buildings. Since it is permitted outside as service conductors, why should feeder or branch circuit use be limited to interior wiring? Since present requirements for insulated conductors applies for interior wiring, it is not clear whether cable with an uninsulated grounded conductor can be used on the exterior of buildings where not used as a feeder for other buildings. Uninsulated grounded conductors can present the same potential hazard whether inside or outside of buildings. If an uninsulated grounded conductor is suitable as a feeder to other buildings, why not as a branch circuit supply? The number and size of conductors could be exactly the same for a feeder or branch circuit. An uninsulated grounded conductor should also be suitable as supply conductors to structures other than buildings.
The exception is proposed for correlation with Section 250-140.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel directs staff to insert the existing second paragraph of Section 338-3(b) after the new exception.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #3885)

7- 203 - (338-3(b)): Accept in Principle
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Change the first paragraph of this section as follows:
(b) Grounded Conductor Not Insulated. Type SE service-entrance cables without individual insulation on the grounded circuit conductor shall not be used as a branch circuit or as a feeder within a building. A ~~except a~~ cable that has a final nonmetallic outer covering and is supplied by alternating current at not over 150 volts to ground shall be permitted as a feeder to supply only other buildings or structures on the same premises where the grounded conductor is grounded at the additional building or structure as provided in Section 250-32(b)(2).
SUBSTANTIATION: These changes will bring this section into compliance with Section 250-32(b)(2) which permits the grounded system conductor to be grounded at additional buildings or structures under specific conditions. Type SE cable with an uninsulated conductor should be permitted as a feeder to other buildings or structures only where the grounded conductor is grounded as provided in Section 250-32(b)(2).
PANEL ACTION: Accept in Principle.
Revise the proposed wording to read:
338-3. Uses Permitted as Branch Circuits or Feeders.
(a) Grounded Conductor Insulated. Type SE service-entrance cables shall be permitted in wiring systems where all of the circuit conductors of the cable are of the rubber-covered or thermoplastic type.
(b) Grounded Conductor Not Insulated. Type SE service-entrance cables shall be permitted for use where the insulated conductors are used for circuit wiring and the uninsulated conductor is used only for equipment grounding purposes.
Exception: Uninsulated conductors shall be permitted as the a grounded conductor in accordance with 250-140.
PANEL STATEMENT: The panel's action addresses the submitter's concern and improves the clarity of this section. The revision to 338-3(a) and the addition of the new exception to 338-3(b) is a result of the panel's action on Proposal 7-202.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #831)

7- 204 - (338-3(d) (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add:
"Ampacity. The ampacity of Type SE cable shall be that of 75°C (167°F) conductors in accordance with Section 310-15."
SUBSTANTIATION: The ampacity of Type SE cable is not specified in this article nor specifically indicated in Table 310-16. The UL "white book" indicates the conductors are Type RHW, XHHW, or THWN, 75°C rated. The proposal would be a user friendly addition.
PANEL ACTION: Reject.
PANEL STATEMENT: The conductors of Type SE cable can be either 75 or 90 degree C insulation and those ampacities can be used for ampacity correction and adjustment.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #832)

7- 205 - (338-4(a)): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 6-84. The Technical Correlating Committee understands that the action text replaces 338-10(b)(4)(a) of Proposal 7-195a.
This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
(a) Interior Installations. In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Part A and B of Article 336, excluding Section 336-26, and shall comply with the applicable provisions of Article 300.
SUBSTANTIATION: Edit. Section 336-26 is in Part B. Since Type SE cable contains insulated conductors rated for 75°C, ampacity should be based on that rating. If the panel feels a 60°C ampacity should be adhered to, a provision should be made to permit the 75°C rating for derating purposes, similar to the second paragraph of Section 336-26.
PANEL ACTION: Accept in Principle.
Revise the proposed text:
"Interior Installations. In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Parts A and B of Article 336, excluding Section 336-26."

PANEL STATEMENT: The panel has accepted the proposal in principle, deleting the reference to Article 300 in accordance with the NFPA NEC Style Manual.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
NOT RETURNED: 1 Ensign
EXPLANATION OF NEGATIVE:
STRANIERO: Type SE cables are constructed from the same insulation and jacket materials as other wiring used for interior branch circuit wiring. Where embedded in thermal insulation, type SE is subjected to the same temperature degradation and the same rules of physics as the other types of wire. There is no reason Type SE should be subjected to less stringent requirements.

(Log #2222)

7- 206 - (338-4(a)): Accept in Principle
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Revise to read:
In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements <u>other than 336-26</u> of Parts A and B of Article 336 and shall comply with the applicable provisions of Article 300.
SUBSTANTIATION: During the 1999 NEC cycle, proposal 7-119 and comment 7-182, changed the text of 336-30 (renumbered as 336-26). This change, although appropriate for Article 336, is not appropriate for Article 338. Ampacity requirements for products in Article 338 are already addressed in Chapter 3. Requirements in 336-30 (new 336-26) are specific to the products in Article 336.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concerns are addressed by the panel's action on Proposal 7-205.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1
NOT RETURNED: 1 Ensign
EXPLANATION OF NEGATIVE:
STRANIERO: See my Explanation of Negative Vote on Proposal 7-205.

(Log #3907)

7- 207 - (338-4(a)): Accept in Principle
SUBMITTER: Ronald E. Gnotke, Rep. Minnesota Board of Electricity
RECOMMENDATION: Revise text to read as follows:
338-4(a) Interior Installations. In addition to the provisions of this article, Type SE service-entrance cable used for interior within shall comply with the installation requirements of Parts A and B of Article 336, <u>except Section 336.26,</u> and shall comply with the applicable provisions of Article 300.
SUBSTANTIATION: The application of a 60°C rating on SE when used for electric ranges appears to have become more restricted than necessary when Section 336.26 was added to the 1996 NEC. A #8/4 SE aluminum cable for example supplying a range in the 1999 NEC is restricted to a maximum of 30 ampere overcurrent device. In previous code revisions, this cable was adequately protected at 40 amperes at the 75°C rating. This cable is rarely used to supply lighting fixtures which require supply conductors of 90°C. If an installer uses a raceway for this circuit and pulls in #8 aluminum RHW, XHHW, or THWN, a 40 ampere overcurrent device would be code compliant for 75°C conductors. Assuming that an electric range normally has a power consumption time of 3 hours or less, and is less than 80 percent loaded on the branch circuit, there would appear to be no hazard created by protecting this cable at 40 amperes.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concerns are addressed by the panel's action on Proposal 7-205.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:

NOT RETURNED: 1 Ensign
EXPLANATION OF NEGATIVE:
STRANIERO: See my Explanation of Negative Vote on Proposal 7-205.

(Log #4207)

7- 208 - (338-4(a)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
(a) Interior Installations. In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Parts A and B of Article 336. <u>Section 336-26 shall only apply where Type SE cable runs in thermal insulation. The installation</u> ~~and~~ shall comply with the applicable provisions of Article 300.
SUBSTANTIATION: Due to the relocation of the 60°C rule from Part C to Part B in the last cycle, Type SE cable installed within buildings has, inadvertently, come under its restrictions. This wiring method has never had those limitations applied to it, there wasn't any substantiation to do it at this time, and in general it shouldn't now.
However, what immediately follows this provision is a FPN about Sec. 310-10. This NEMA proposal (Proposal 7-131 in the A86TCR) had elaborate substantiation that CMP 7 should review. It described actual testing involving this wiring method, specifically No. 2 SEU Aluminum XHHW. When this cable was embedded in cellulose insulation, it rapidly exceeded its temperature rating at currents well below its table ampacity. For example, at just 65A this 100A 90°C cable already was running at 96°C. Another test showed the overall jacket completely charred when the cable ran at its rated current, but under a 7-in. insulation blanket. To give the conduit folks equal time, another test involving No. 6 THHN in a metal conduit produced similar overheating in the area of insulation contact on the pipe.
This proposal provides a small safety factor, not enough but better than nothing, to address this issue. When installers and designers come up against a rule that says they can't use the cable in anywhere near the way the were probably planning if the cable runs in insulation, they'll most likely make sure it doesn't run in insulation. That's the best result. As long as it stays out of insulation, it can function and be installed just as it always has.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided technical substantiation to limit the ampacities of Type SE cable as specified in Section 336-26.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 1

EXPLANATION OF NEGATIVE:
STRANIERO: See my Explanation of Negative Vote on Proposal 7-205.

(Log #3759)

7- 209 - (338-4(b)): Accept
Note: The Technical Correlating Committee understands that the accepted text replaces the second paragraph of 338-10(b)(4)(b) of Proposal 7-195a.
SUBMITTER: Timothy M. Croushore, Allegheny Power Service Corp.
RECOMMENDATION: Reword the second paragraph of (b) to read as follows:
"Type USE cable shall be installed outside in accordance with the provisions of Article 339. Type USE shall be permitted to be terminated in enclosures at an indoor location where Type USE cable emerges above ground. The length of the cable extending indoors to the first termination box shall not exceed 6 ft. Where Type USE cable emerges above ground at termination's, it shall be protected in accordance with Section 300-5(d)."
SUBSTANTIATION: This change allows short lengths of Type USE cable to be terminated indoors. Currently, some inspectors interpret this section and not allow Type USE cable installed indoors at the first termination point. In their opinion, this type cable must be terminated outdoors in order to be used. However, many electrical inspectors will permit this type of cable to be used as manufactured home feeder cable, which is terminated within the manufactured home. There have not been any reports of problems.
PANEL ACTION: Accept.

(Log #1353)

7- 210 - (338-6): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise existing 338-6 (338-24 new) as follows:

~~338-6. Bends.~~ 338-24. Bending Radius. Bends in Type USE and SEcable shall be made~~, and other handlings shall be such,~~ so that the ~~protective coverings of the~~ cable will not be damaged~~. , and the~~ The radius of the curve of the inner edge of any bend, during or after installation, shall not be less than five times the diameter of the cable.

SUBSTANTIATION: 1. " and other handlings" was deleted as it does not concern bending. In addition, the phrase "as such" was deleted because it should be followed by an example as required by NEC Style Manual Section 3.3.4. The phrase "during or after installation" was added to use wording consistent with the current requirement in Section 300-34.

2. "protective coverings" was deleted as the requirement for not causing damage applies to the whole cable not just the "protective coverings".

3. Other suggested changes are editorial and provide clarity.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-195a.

ARTICLE 339 — UNDERGROUND FEEDER AND BRANCH-CIRCUIT CABLE: TYPE UF

(Log #CP714)

7- 210a - (339): Accept

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: CMP 7

RECOMMENDATION: Rewrite Article 339 to comply with NEC Style Manual.

ARTICLE 339 -- Underground Feeder and Branch-Circuit Cable: Type UF

I General

339-1. Scope. This article covers the use, installation, and construction specifications for Underground Feeder and Branch-Circuit Cable, Type UF.

339-2. Definition.

Underground Feeder and Branch-Circuit Cable, Type UF. A listed factory assembly of one or more insulated conductors with an integral or an overall covering of nonmetallic material suitable for direct burial in the earth.

339-10. Uses Permitted. Type UF cable shall be permitted:

(1) For use underground, including direct burial in the earth. For underground requirements, see 300-5.

(2) As feeder or branch-circuit cable where provided with overcurrent protection of the rated ampacity as required in 339-4.

(3) As single-conductor cables. Where so installed, all cables of the feeder circuit or branch circuit, including the neutral and equipment grounding conductor, if any, shall be run together in the same trench or raceway.

(4) For interior wiring in wet, dry, or corrosive locations under the recognized wiring methods of this Code,

(5) Installed as nonmetallic-sheathed cable. Where so installed, the installation and conductor requirements shall comply with the provisions of Article 336 and shall be of the multiconductor type.

(6) For solar photovoltaic systems in accordance with 690-31.

(7) As single-conductor cables as the nonheating leads for heating cables as provided in 424-43.

(8) Supported by cable trays. Type UF cable supported by cable trays shall be of the multiconductor type.

FPN: See 310-10 for temperature limitation of conductors.

339-12. Uses Not Permitted. Type UF cable shall not be used:

(1) As service-entrance cable

(2) In commercial garages

(3) In theaters and similar locations.

(4) In motion picture studios

(5) In storage battery rooms

(6) In hoistways, or on elevators or escalators.

(7) In hazardous (classified) locations

(8) Embedded in poured cement, concrete, or aggregate, except where embedded in plaster as nonheating leads where permitted in 424-43

(9) Where exposed to direct rays of the sun, unless identified as sunlight resistant

(10) Where subject to physical damage

339-24. Bending Radius. Bends in Type UF cable shall be made so that the cable shall not be damaged. The radius of the curve of the inner edge of any bend shall not be less than five times the diameter of the cable.

339-80. Ampacity The ampacity of Type UF cable shall be that of 60º C (140º F) conductors in accordance with 310-15..

III Construction Specifications

339-104. Conductors. The conductors shall be sizes 14 AWG copper or 12 AWG aluminum or copper-clad aluminum through 4/0 AWG.

339-108. Equipment Grounding. In addition to the insulated conductors, the cable shall be permitted to have an insulated or bare conductor for equipment grounding purposes only.

339-112. Insulation. The conductors of Type UF shall be one of the moisture-resistant types listed in Table 310-13 that is suitable for branch-circuit wiring or one that is identified for such use.

339-116. Sheath. The overall covering shall be flame retardant; moisture, fungus, and corrosion resistant, and suitable for direct burial in the earth.

SUBSTANTIATION: This revision to Article 339 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with the usability effort. Specific proposals addressed by this revision include 7-211, 7-212, 7-213, 7-214, 7-217, 7-218, 7-219, 7-221, 7-225, 7-227 and 7-231.

PANEL ACTION: Accept.

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #1386)

7- 211 - (339): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise text to read as follows:

Article 339 –Underground Feeder and Branch-Circuit Cable: Type UF

I. General

~~339-1 Description and Marking. (a) Description.~~

339-2. Definition. Underground feeder and branch-circuit cable (Type UF). ~~shall be a~~ A listed ~~Type UF~~ cable in sizes No. 14 copper or No. 12 aluminum or copper-clad aluminum through No. 4/0. The conductors of Type UF shall be one of the moisture-resistant types listed in Table 310-13 that is suitable for branch-circuit wiring or one that is identified for such use. In addition to the insulated conductors, the cable shall be permitted to have an insulated or bare conductor for equipment grounding purposes only. The overall covering shall be flame retardant; moisture, fungus, and corrosion resistant; and suitable for direct burial in the earth.

~~339-2.~~ 339-3. Other Articles. In addition to the provisions of this article, installations of underground feeder and branch-circuit cable (Type UF) shall comply with other applicable provisions of this Code, especially Article 300 and Section 310-13.

II. Installation

~~339-3. Use~~

~~339-3(a)~~ 339-10. Uses Permitted.

1. Type UF cable shall be permitted for use underground, including direct burial in the earth, as feeder or branch-circuit cable where provided with overcurrent protection of the rated ampacity as required in Section 339-4.

2. Where single-conductor cables are installed, all cables of the feeder circuit or branch circuit, including the neutral and equipment grounding conductor, if any, shall be run together in the same trench or raceway.

3. For underground requirements, see Section 300-5.

4. Type UF cable shall be permitted for interior wiring in wet, dry, or corrosive locations under the recognized wiring methods of this Code, and, where installed as nonmetallic-sheathed cable, the installation and conductor requirements shall comply with the provisions of Article 336 and shall be of the multiconductor type.
5. For solar photovoltaic systems in accordance with Section 690-31.
6. Single-conductor cables shall be permitted as the nonheating leads for heating cables as provided in Section 424-43.

Type UF cable supported by cable trays shall be of the multiconductor type.

FPN: See Section 310-10 for temperature limitation of conductors.

~~339-3(b)~~ 339-12. Uses Not Permitted. Type UF cable shall not be used in the following:
1. As service-entrance cables
2. In commercial garages
3. In theaters
4. In motion picture studios
5. In storage battery rooms
6. In hoistways
7. In any hazardous (classified) location
8. Embedded in poured cement, concrete, or aggregate, except where embedded in plaster as nonheating leads as provided in Article 424
9. Where exposed to direct rays of the sun, unless identified as sunlight resistant
10. Where subject to physical damage

~~339-5.~~ 339-80. Ampacity. The ampacity of Type UF cable shall be that of 60°C (140°F) conductors in accordance with Section 310-15.

~~339-4.~~ 339-90. Overcurrent Protection. Overcurrent protection shall be provided in accordance with the provisions of Section 240-3.

III. Construction Specifications

~~339-1.(b)~~

339-120. Marking. The cable shall be marked in accordance with Section 310-11.

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering cable and wiring.

A uniform format is proposed to achieve consistency across all of the cable and wiring articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as stated in the NEC Style Manual 2.4.1. It is hoped that the parallel Code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for cable and wiring not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-210a.

NOT RETURNED: 1 Ensign

(Log #1356)

7- 213 - (339-1): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Add a new definition of Type UF cable. Relocate existing description specifications to new III. Construction Specifications. Revise existing 339-1 (339-2 New) to read as follows:

339-2 Definition. Underground feeder and branch-circuit cable (Type UF). A listed factory assembly of one or more insulated conductors with an integral or an overall covering of nonmetallic material suitable for direct burial in the earth.

Relocate portions of existing text in Section 339-1 to New Part III sections as follows:

III. Construction Specifications

339-104. Conductors. The conductors shall be sizes No. 14 copper or No. 12 aluminum or copper-clad aluminum through ~~No.~~ 4/0 AWG.

339-108. Equipment Grounding. In addition to the insulated conductors, the cable shall be permitted to have an insulated or bare conductor for equipment grounding purposes only.

339-112. Insulation. The conductors of Type UF shall be one of the moisture-resistant types listed in Table 310-13 that is suitable for branch-circuit wiring or one that is identified for such use.

339-116. Sheath. The overall covering shall be flame retardant; moisture, fungus, and corrosion resistant; and suitable for direct burial in the earth.

SUBSTANTIATION: Section 339-1 contains information concerning "Construction Specifications." The section was relocated to III. Construction Specs. Specific construction information was placed under the appropriate revised numbering system section. A new definition was added for consistency with other cable & wiring articles.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-210a.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #2223)

7- 215 - (339-1): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested."
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The

NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.

[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]

PANEL ACTION: Reject.

PANEL STATEMENT: The term "flame-retardant" is used throughout the Code as a means of expressing to the user that the material resists ignition or the spread of flames, albeit the test methods are often not defined. The term "flame tested" is similarly undefined, but can be understood to mean a test which does not necessarily measure the ability of a material to resist ignition or flame propagation. Some articles of the NEC offer information regarding the tests deemed appropriate for the required level of resistance to ignition or flame propagation. Others rely on the product standard to provide such information. The panel suggests that specific proposals be made wherever the generic reference to "flame retardant" is not sufficient.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

COMMENT ON AFFIRMATIVE:

STEWART: The panel statement is correct. Changing the words "flame tested" is an undefined term that would lead to improper testing for the intended application.

TEMBLADOR: See comment on Ravi Gantra's Proposal 6-3.

(Log #1065)

7- 216 - (339-1(a)): Accept

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Change:

"No. 14" to "14 AWG"

"No. 12" to "12 AWG"

"No. 4/0" to "4/0 AWG".

SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Accept.

(Log #833)

7- 220 - (339-3): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise:

(a) Uses Permitted. (1) Type UF cable shall be permitted for use underground, including direct burial in the earth, as feeder or branch circuit ~~cable~~ conductors. ~~where provided with overcurrent protection of the rated ampacity as required in Section 339-4.~~

(2) ~~Where single conductor cables are installed, all cables of the feeder or branch circuit, including the neutral and equipment grounding conductor, if any, shall be run together in the same trench or raceway.~~ All conductors of the same circuit and, where used, the equipment grounding conductor shall be contained in the same raceway or multiconductor cable.

Exception No. 1: Conductors in parallel as specified in Section 310-4 shall be permitted in separate raceways or cables provided each phase, polarity, grounded conductor, and equipment grounding conductor is contained in each raceway or multiconductor cable.

Exception No. 2: Switch loops shall be permitted to consist of only those conductors connected to the switching device(s) and, where used, the equipment grounding conductor.

(3) For underground requirements, see Section 300-5.

(4) Type UF cable shall be permitted for ~~interior~~ wiring in wet, dry, or corrosive locations under the recognized wiring methods of this Code, and, where ~~installed as nonmetallic sheathed cable, the installation and conductor requirements shall comply with~~ of the multiconductor type shall be permitted to be installed under the provisions of Article 336, except it shall be permitted in wet locations . ~~and shall be of the multiconductor type.~~

(5) No change

(6) No change

(7) Type UF cable shall be permitted to be supported by cable trays ~~shall be~~ where of the multiconductor type or installed in a raceway.

FPN: No change

(b) Uses Not Permitted. Type UF cable shall not be used in e following:

(1) As service-entrance conductors. ~~cables~~.

(2) In commercial garages having hazardous (classified) locations.

(3) No change

(4) No change

(5) No change

(6) No change

(7) No change

(8) No change
(9) No change
(10) No change
Exception No 1 for (7): Multiconductor Type UF cable shall be permitted in accordance with Sections 501-4(b) Exception, and 502-4(b) Exception.
Exception No. 2 for (1) through (8): Single-conductor Type UF cable shall be permitted in approved raceways.
Exception No. 3 for (3) and (4): Multiconductor Type UF cable shall be permitted where nonmetallic-sheathed cable is permitted by Section 520-5(c).

SUBSTANTIATION: Edit. In (a)(1) the reference to OCP is superfluous as it is covered in the following section. In (a)(2) the proposal includes multiconductor cables and "all conductors of the same circuit" includes neutrals.

Proposed Exceptions No. 1 and 2 for (a) appear to be necessary as the text doesn't provide for those installations.

Proposed (a)(4) deletes "interior" as recognized wiring methods appears to permit Type UF where suitable for exterior installation (wet locations, sunlight resistant, in raceways). "Exposed to direct rays of the sun" suggests exterior installation and (b)(10) provides for necessary protection. Section 336-6 permits exposed installation where in accordance with that article.

Type UF cable may be installed in conformance with Article 336 but does not transform into another type cable and Article 336 doesn't provide for wet locations.

In (b)(2) commercial garages should be qualified as having hazardous (classified) locations as Section 511-2 indicates some garages are not classified.

The proposed exceptions for (b) conform to recognized wiring methods permitted elsewhere in the Code and provide clarification.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed wording adds language that is presently covered in the Code and it is not necessary to provide the additional cross-references. There is proposed new text that does not have technical substantiation. See panel's editorial action on Proposal 7-210a.

7- 221 - (339-3): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise existing 339-3 (339-10 New) to convert text to a list.

~~339-3.~~ 339-10. Use.
~~(a)~~ Uses Permitted.
~~1.~~ Type UF cable shall be permitted:
(a) For ~~for~~ use underground, including direct burial in the earth.~~,~~ For underground requirements, see Section 300-5.
(2) As ~~as~~ feeder or branch-circuit cable where provided with overcurrent protection of the rated ampacity as required in Section 339-4.
(3) ~~2.~~ As ~~Where~~ single-conductor cables. Where so ~~are~~ installed, all cables of the feeder circuit or branch circuit, including the neutral and equipment grounding conductor, if any, shall be run together in the same trench or raceway.
~~3. For underground requirements, see Section 300-5.~~
~~4. Type UF cable shall be permitted~~
(4) For ~~for~~ interior wiring in wet, dry, or corrosive locations under the recognized wiring methods of this Code,
(5) ~~and, where installed~~ Installed as nonmetallic-sheathed cable~~,~~. Where so installed, the installation and conductor requirements shall comply with the provisions of Article 336 and shall be of the multiconductor type.
(6) ~~5. For~~ For solar photovoltaic systems in accordance with Section 690-31.
(7) ~~6. Single~~ As single-conductor cables ~~shall be permitted~~ as the nonheating leads for heating cables as provided in Section 424-43.
(8) Supported ~~supported~~ by cable trays. Type UF cable supported by cable trays shall be of the multiconductor type.
FPN: See Section 310-10 for temperature limitation of conductors.

SUBSTANTIATION: NEC Style Manual Section 3.3.2 requires that where possible lists or tables be used to present requirements, rather than long text descriptions.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-210a.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #835)

7- 222 - (339-3(a)(1)): Accept in Part

Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 7-210a. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise:

(1) Type UF cables shall be permitted for use underground, including direct burial in the earth as feeders ~~or~~ branch circuits, ~~cable~~ or tap conductors, for power, lighting, control, and signal circuits. ~~Where provided with overcurrent protection of the rated ampacity as required in Section 339-4.~~

SUBSTANTIATION: Edit. The limitation of use to feeders or branch circuits may be interpreted as not permitting use as tap conductors or control and signal circuits. Sections 330-3 and 334-3 indicate power and lighting (which could be tap conductors) and control and signal circuits. Limitation of use in this section infers such other use is literally not permitted. Overcurrent protection is a different category.

PANEL ACTION: Accept in Part.

Revise first sentence to read:

"Type UF cables shall be permitted for use underground, including direct burial in the earth as feeders or branch circuits where..."

PANEL STATEMENT: The accepted change conforms with the NFPA NEC Manual of Style.

The panel rejects the remainder of the proposed text as Section 339-3(a) is not intended to be an all inclusive list of uses permitted, but a list of common applications for the wiring method. Uses not permitted are specifically covered in Section 339-3(b) and the wiring methods proposed by the submitter are not excluded.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #2170)

7- 223 - (339-3(a)(3) and FPN (New)): Reject

SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.

RECOMMENDATION: Revise as follows:

~~(3) For underground requirements, see Section 300-5.~~
FPN: See 300-5 for underground requirements.

SUBSTANTIATION: This deleted sentence is an explanatory reference to another NEC rule; therefore, it should be a fine print note. The NEC Style Manual 4.1 states, "Explanatory references shall be in fine print notes." The Style Manual 4.1.2 also states, "... references shall include only the number of the rule being referenced; the word section,... shall not be used.

PANEL ACTION: Reject.

PANEL STATEMENT: The inclusion of this text as a Fine Print Note could cause confusion that application of Section 300-5 is not mandatory. The panel's editorial action on Proposal 7-210a has deleted unnecessary redundant references.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #2168)

7- 224 - (339-3(a)(5)): Accept in Principle

SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.

RECOMMENDATION: Revise as follows:

(5) Type UF cable shall be permitted for solarvoltaic systems in accordance with Section 690-31.

SUBSTANTIATION: This is not a complete sentence like the rest of the subsections of 339-3(a). Revise the subsection to make it a complete sentence. This change will also provide parallel construction in accordance with the NEC Style Manual 3.3.5 Lists which states, "Parallel Construction means stating similar requirements in similar ways", for example using all complete sentences in related subsections.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concern has been addressed by the Panel's action on Proposal 7-210a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1359)

7- 225 - (339-3(b)): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Relocate the text contained in 339-3(b) to new 339-12 and revise to read as follows:
339-12. Uses Not Permitted. Type UF cable shall not be used ~~in the following~~:
(1) As service-entrance cable~~s~~
(2) In commercial garages
(3) In theaters and similar locations,
(4) In motion picture studios
(5) In storage battery rooms
(6) In hoistways, or on elevators or escalators
(7) In ~~any~~ hazardous (classified) locations,
(8) Embedded in poured cement, concrete, or aggregate, except where embedded in plaster as nonheating leads where permitted in 424-43 ~~as provided in Article 424~~
(9) Where exposed to direct rays of the sun, unless identified as sunlight resistant
(10) Where subject to physical damage
SUBSTANTIATION: "As provided" was replaced with "where permitted" to aid in word clarity in accordance with NEC Style Manual Section 3.3.4.
NEC Style Manual Section 4.1.1 prohibits referencing an entire Article unless additional conditions are specified. Referencing parts within Articles is permitted.
(6) was revised to provide consistent text in all the wire and cable articles.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-210a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #3813)

7- 226 - (339-3(b)(2) (New)): Accept in Principle
Note: The Technical Correlating Committee understands the new text is Item 11 of 339-12 in Proposal 7-210a.
SUBMITTER: Douglas Hansen, Codecheck
RECOMMENDATION: Add new item 2 to read "As overhead feeders." Renumber the remaining portion of the section.
SUBSTANTIATION: This proposal would correct a common hazardous practice. Overhead conductors without support are subjected to bending stresses and stretching. UF cable is not permitted as service entrance cable, yet nothing presently prohibits the common practice of stringing it overhead between buildings. The code presently addresses only the installation requirements in buildings or underground. Support every 4 1/2 ft is already required indoors, but not outdoors.
PANEL ACTION: Accept in Principle.
Amend the proposed text to read:
"As overhead cable except where installed as messenger supported wiring in accordance with Article 321."
PANEL STATEMENT: The use of this type of cable is permitted as an overhead cable where installed accordance with Section 321-3(a). The panel agrees with the submitter's concern that multiconductor Type UF cable is not intended to be installed without support or messenger.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1360)

7- 227 - (339-4): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Delete Section 339-4.
SUBSTANTIATION: Section 90-3 adequately covers this requirement. NEC Style Manual, Section 4.1 requires that references not be provided if the material is already covered by Section 90-3.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-210a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #834)

7- 228 - (339-5): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
Ampacity. Conductors shall be rated at 90°C (194°F). The ampacity of Type UF cable shall be that of 60°C (140°F) conductors in accordance with Section 310-15. The 90°C (194°F) rating shall be permitted to be used for ampacity derating purposes provided the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor.
SUBSTANTIATION: Section 339-3(a)(4) requires compliance with provisions of Article 336 where installed in accordance with that article. There doesn't seem to be a valid safety reason to restrict Type UF more than Type NM. Present Code deters use as nonmetallic sheathed cable due to conductor temperature restrictions.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 339-3(a)(4) refers to the requirements of Article 336 where multiconductor Type UF cable is installed as nonmetallic-sheathed cable. Therefore the requirement of Section 336-30(b) for 90 degree C conductors is applicable. There is no substantiation provided to require that all UF cable have 90 degree C conductors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1856)

7- 229 - (339-5): Reject
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise as follows:
339-5. Ampacity. The ampacity of Type UF cable shall be determined ~~that of 60°C (140°F) conductors~~ in accordance with ~~Section~~ 310-15.
The ampacity shall be in accordance with the 60°C (140°F) conductor temperature rating. The 90°C (194°F) rating shall be permitted to be used for ampacity derating purposes provided the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor.
The ampacity of Type UF cable installed in cable tray shall be determined in accordance with 318-11.
SUBSTANTIATION: Reworded for clarity and to incorporate text consistent with that used in other cable articles.
Section 4.1.2 of the 1999 National Electrical Code Style Manual stipulates that "...references shall include only the number of the rule being referenced; the word section, subsection, and paragraph shall not be used."
318-3(a) permits Type UF cables to be installed in cable tray; the additional text clarifies what ampacities apply to cable tray.
PANEL ACTION: Reject.
PANEL STATEMENT: Acceptance of this change would mandate that all UF cable have 90 degree C conductor insulation. This is not necessary where the cable is used in underground applications. Section 339-3(a)(4) covers indoor uses of Type UF cable.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #2287)

7- 230 - (339-5): Reject
SUBMITTER: Greg Fretwell, Blue Light Inspection Services
RECOMMENDATION: Remove the entire text of 339-5.
SUBSTANTIATION: Type NM and Type UF are the only wiring methods that have this restriction and I see no relevant difference between them and a method like SE or conductors in raceways. 310-16 conductor and termination ratings should prevail as it does everywhere else.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirement is necessary as it relates to product performance and construction requirements.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1357)

7- 231 - (339-24): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Add a new section to cover requirements for bending as follows:
339-24. Bending Radius. Bends in Type UF cable shall be made so that the cable will not be damaged. The radius of the curve of the inner edge of any bend shall not be less than five times the diameter of the cable.
SUBSTANTIATION: To promote usability a section on bending is being added to provide consistency and continuity with other similar wire and cable articles, such as Articles 336 and 338. A recommended minimum bending radius of 5 times is based on 336-16.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-210a.

ARTICLE 340 — POWER AND CONTROL TRAY CABLE: TYPE TC

(Log #CP715)

7- 231a - (340): Accept
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: CMP 7
RECOMMENDATION: Rewrite Article 340 to comply with NEC Style Manual.
ARTICLE 340 -- Power and Control Tray Cable: Type TC
I General
340-1. Scope. This article covers the use, installation, and construction specifications for Power and Control Tray Cable, Type TC.
340-2. Definition
Power and Control Tray Cable, Type TC. A factory assembly of two or more insulated conductors, with or without associated bare or covered grounding conductors, under a nonmetallic sheath, for installation in cable trays, in raceways, or where supported by a messenger wire.
II Installation
340-10. Uses Permitted. Type TC tray cable shall be permitted to be used in the following:
(1) For power, lighting, control, and signal circuits.
(2) In cable trays, or in raceways, or where supported in outdoor locations by a messenger wire.
(3) In cable trays in hazardous (classified) locations as permitted in Articles 318, 501, 502, 504, and 505 in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation.
(4) For Class 1 circuits as permitted in Article 725.
(5) For nonpower-limited fire alarm circuits if conductors comply with the requirements of 760-27.
(6) In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage, Type TC tray cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted as open wiring in lengths not to exceed a total of 15 m (50 ft) between a cable tray and the utilization equipment or device.
The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft).
Equipment grounding for the utilization equipment shall be provided by an equipment grounding conductor within the cable.
(7) Where installed in wet locations, Type TC cable shall also be resistant to moisture and corrosive agents.
FPN: See 310-10 for temperature limitation of conductors.
340-12. Uses Not Permitted. Type TC tray cable shall not be used in the following:
(1) Installed where it will be exposed to physical damage
(2) Installed as open cable on brackets or cleats
(3) Used where exposed to direct rays of the sun, unless identified as sunlight resistant
(4) Direct buried, unless identified for such use
340-24. Bending radius. Bends in Type TC cable shall be made so that the cable will not be damaged. The radius of the curve of the inner edge of any bend shall not be less than five times the diameter of the cable.
340-80. Ampacity. The ampacity of Type TC tray cable shall be determined in accordance with 318-11 for 14 AWG and larger conductors and in accordance with 402-5 for 18 - 16 AWG conductors.
III Construction Specifications
340-100. Construction. A metallic sheath shall not be permitted either under or over the nonmetallic sheath.
340-104. Conductors. The insulated conductors of Type TC tray cable shall be in sizes 18 AWG through 1000 kcmil copper and sizes 12 AWG through 1000 kcmil aluminum or copper-clad aluminum. Insulated conductors of sizes 14 AWG and larger copper and sizes 12 AWG and larger aluminum or copper-clad aluminum shall be one of the types listed in Tables 310-13 or 310-62 that is suitable for branch circuit and feeder circuits or one that is identified for such use.
(a) Fire Alarm Systems. Where used for fire alarm systems, conductors shall also be in accordance with 760-27.
(b) Thermocouple Circuits. Conductors in Type TC cables used for thermocouple circuits in accordance with Article 725 shall also be permitted to be any of the materials used for thermocouple extension wire.
. (c) Class 1 Circuit Conductors. Insulated conductors of sizes 18 AWG and 16 AWG copper shall also be in accordance with 725-27.
340-116. Sheath. The outer sheath shall be a flame-retardant, nonmetallic material.
340-120. Marking. There shall be no voltage marking on a Type TC cable employing thermocouple extension wire.
SUBSTANTIATION: This revision to Article 340 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with the usability effort. Specific proposals addressed by this revision include 7-233, 7-234, 7-237, 7-238, 7-246, 7-247, 7-249, 7-250, 7-251, 7-253, and 7-254.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1066)

7- 232 - (340): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise Article 340 as follows:
340-3 - change:
"No. 18" to "18 AWG"
"No. 14" to "14 AWG"
"No. 12" to "12 AWG" in two places.
340-3(d) - revise as follows: "Insulated conductors of ~~sizes No.~~ 18 and ~~No.~~ 16 AWG copper shall also be in accordance with Section 725-27.
340-7 - change "No. 14" to "14 AWG".

SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #1387)

7- 233 - (340): Accept in Principle

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Add "I. General" between the Article heading and the first Section.

Renumber and revise Section 340-1 as follows:

~~340-1.~~ 340-2. Definition. ~~Type TC power and control tray cable~~ Power and control tray cable (Type TC). ~~is a~~ A factory assembly of two or more insulated conductors, with or without associated bare or covered grounding conductors under a nonmetallic sheath, for installation in cable trays, in raceways, or where supported by a messenger wire.

Renumber "340-2. Other Articles" as "340-3. Other Articles."

Add "II. Installation" following the above Section.

Renumber and revise "340-4. Use Permitted." to read "340-10. Uses Permitted." and add Section 340-3(a) before the FPN as (7) to read:

(7) ~~340-3(a) Wet Locations.~~ Where installed in wet locations, Type TC cable shall also be resistant to moisture and corrosive agents.

Renumber "340-5. Uses Not Permitted." as "340-12. Uses Not Permitted."

Renumber and revise "340-8. Bends." to read "340-24. Bending Radius."

Renumber "340-7. Ampacity." as "340-80. Ampacity."

Add "III. Construction Specifications" immediately following the above Section.

Revise Section 340-3 to read as follows:

~~340-3.~~ 340-100. Construction. A metallic sheath shall not be permitted either under or over the nonmetallic sheath.

340-104. Conductors. The insulated conductors of Type TC tray cable shall be in sizes No. 18 through 1000 kcmil copper and sizes No. 12 through 1000 kcmil aluminum or copper-clad aluminum. Insulated conductors of sizes No. 14 and larger copper and sizes No. 12 and larger aluminum or copper-clad aluminum shall be one of the types listed in Tables 310-13 or 310-62 that is suitable for branch circuit and feeder circuits or one that is identified for such use. ~~The outer sheath shall be a flame-retardant, nonmetallic material.~~ [Note – text relocated to 340-116 below.] ~~A metallic sheath shall not be permitted either under or over the nonmetallic sheath.~~ [Note – text relocated to 340-100 above.]

~~(a) Wet Locations. Where installed in wet locations, Type TC cable shall also be resistant to moisture and corrosive agents.~~ [Note – relocated to 340-10 above.]

(a) ~~(b)~~ Fire Alarm Systems. Where used for fire alarm systems, conductors shall also be in accordance with Section 760-27.

(b) ~~(c)~~ Thermocouple Circuits. Conductors in Type TC cables used for thermocouple circuits in accordance with Article 725 shall also be permitted to be any of the materials used for thermocouple extension wire.

~~There shall be no voltage marking on a Type TC cable employing thermocouple extension wire.~~ [Note – text relocated to 340-120 below.]

(c) ~~(d)~~ Class 1 Circuit Conductors. Insulated conductors of sizes No. 18 and No. 16 copper shall also be in accordance with ~~Section~~ 725-27.

Relocate the text from the second sentence of 340-3 to new Section 340-116 to read as follows:

340-116. Sheath. The outer sheath shall be a flame-retardant, nonmetallic material.

Renumber "340-6. Marking." as "340-120. Marking" and relocate the text from the second paragraph of 340-3(c) so the Section reads as follows:

~~340-6.~~ 340-120. Marking. The cable shall be marked in accordance with ~~Section~~ 310-11.

~~340-3.(c)~~ There shall be no voltage marking on a Type TC cable employing thermocouple extension wire.

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering cable and wiring.

A uniform format is proposed to achieve consistency across all of the cable and wiring articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as stated in the NEC Style Manual 2.4.1. It is hoped that the parallel Code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for cable and wiring not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-231.

(Log #1708)

7- 235 - (340-1): Reject

SUBMITTER: Paul Petit, American Insulated Wire Corp.

RECOMMENDATION: Revise text as follows:

340-1. Definition. Type TC Power and Control Tray Cable is a single conductor or a factory assembly of two or more insulated conductors, ...

SUBSTANTIATION: The problem is the confusion with regard to the 1/C cables out in the field marked either "CT USE" or "for use in cable trays." They're not being allowed for uses specifying "TYPE TC." These are clearly 1/C tray cables and should be marked "TC" to eliminate confusion. Section 12-2204 of the Canadian Electrical Code clearly shows that the Canadian CEC recognizes 1/C Type TC Tray Cables.

Note: Supporting material available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: Type TC cable was intentionally defined as a factory assembly of two or more insulated conductors under a nonmetallic sheath. The nonmetallic sheath provides additional mechanical protection to the insulated conductors. Single conductors do not have the additional nonmetallic sheath.

318-3(a) does not permit single conductors in cable tray as a general wiring method. 318(3)(b)(1) does permit single conductors, 1/0 AWG and larger, to be installed in cable tray under certain conditions as specified in 318-3(b), Industrial Establishments.

(Log #1859)

7- 239 - (340-3): Accept in Principle

Note: The Technical Correlating Committee understands that the text modifies 340-116 of Proposal 7-231a.

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Revise the last two sentences in 340-3 and add an additional sentence to read as follows:

"The outer ~~sheath~~ jacket shall be a flame-retardant, nonmetallic material. A metallic sheath or armor shall not be permitted either under or over the nonmetallic ~~sheath~~ jacket. A shielding tape or foil shall be permitted under the nonmetallic jacket."

SUBSTANTIATION: To prevent possible confusion with the use of the term "sheath" for a continuous metallic sheath in Type MC cable. This correlates with a proposal for a similar change in 340-1.

To clarify that neither a metallic sheath or an interlocking tape armor is permitted.

To clarify that a metal tape or metallic foil shield is permitted under the nonmetallic jacket.

PANEL ACTION: Accept in Principle.

The panel accepts the change of "sheath" to "jacket." The other changes are accepted in principle.

PANEL STATEMENT: The panel concurs with the submitter's substantiation on changing the terminology and accepts in principle the remainder of the proposed text. See panel action on Proposal 7-241.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #2224)

7- 240 - (340-3): Reject

SUBMITTER: Ravindra H. Ganatra, Alcan Cable

RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested."

SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.

[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]

PANEL ACTION: Reject.

PANEL STATEMENT: The term "flame-retardant" is used throughout the Code as a means of expressing to the user that the material resists ignition or the spread of flames, albeit the test methods are often not defined. The term "flame tested" is similarly undefined, but can be understood to mean a test which does not necessarily measure the ability of a material to resist ignition or flame propagation. Some articles of the NEC offer information regarding the tests deemed appropriate for the required level of resistance to ignition or flame propagation. Others rely on the product standard to provide such information. The panel suggests that specific proposals be made wherever the generic reference to "flame retardant" is not sufficient.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

COMMENT ON AFFIRMATIVE:

STEWART: The panel statement is correct. Changing the words "flame tested" is an undefined term that would lead to improper testing for the intended application.

TEMBLADOR: See comment on Ravi Gantra's Proposal 6-3.

(Log #2267)

7- 241 - (340-3 and 727-6): Accept in Principle

Note: The Technical Correlating Committee understands that the text modifies 340-100 of Proposal 7-231a. In addition, the Panel is directed to reconsider the Proposal and correlate with Proposal 7-239. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Kenneth E. Bow, The Dow Chemical Co.

RECOMMENDATION: Insert: A metallic shield or metalized foil shield with drain wire(s) shall be permitted to be applied either over the cable core, over groups of conductors or both into 340-3 and 727-6. Note: this insertion has been extracted from Article 725-71(e) of the 1999 NEC.

SUBSTANTIATION: This proposal will clarify the use of shielding in tray cable (Type TC), instrument tray cable (Type ITC), and power limited tray cable (Type PLTC). Shielding is often important to satisfactory operations of such cables. There is confusion on the part of users relative to the permitted use of shields for these three types of tray cable. Therefore, the wording of 725-71(e) should be added to Articles 340-3 and 727-6 to eliminate the confusion. Shielding of tray cables is covered in UL 13, Section 10, UL 1277, Section 10.4, but not in UL 2250. Therefore, a section such as in UL 13 or UL 1277 also needs to be added to UL 2250.

PANEL ACTION: Accept in Principle.

Amend the existing last sentence of Section 340-3 to read:

"A metallic sheath or armor as defined in 334-22 shall not be permitted either under or over the nonmetallic jacket. Metallic shield(s) shall be permitted over groups of conductors, under the outer jacket, or both."

PANEL STATEMENT: The panel's action clarifies that a metallic armor is not permitted and that metal shields are permitted. The term "sheath" has been changed to "jacket" in order to avoid confusion with the term "sheath" as used in Article 334. See panel action on Proposal 7-239.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #338)

7- 242 - (340-3, Exception (New)): Reject

SUBMITTER: Frank H. Rocchio, The Okonite Co., Inc.

RECOMMENDATION: The last line of section 340-3 "A metallic sheath shall not be permitted either under or over the nonmetallic sheath." treats Type TC cable differently than other armored cable types in that a cable core marked Type TC cannot be armored while the same unmarked core can be armored and marked Type MC. This proposal is to provide a clarification of this sentence.

Add:

Exception: Type TC cable can be converted to Type MC cable with the addition of a metallic sheath and an overall jacket marked in accordance with Article 334.

SUBSTANTIATION: The wording "A metallic sheath shall not be permitted either under or over the nonmetallic sheath," was added to Section 340-3 during the 1978-81 era. The purpose was to avoid seeing the marking Type TC as the first cable type indication after the unjacketed armor was removed. Type TC without marking has been used in Type MC cable for many years. Recently, environmental concerns have prevented the removal of the print legend containing Type TC from previously completed cable in order to convert it to Type MC. The same environmental concerns forced the markings of Type TC to be indent printed so as to prevent the removal of the Type TC markings without complete replacement of the jacket. This proposal is to permit type TC cable to be made into Type MC cable with an overall jacket containing the legend of a Type MC cable for the following reasons.

Type TC Section 340-3 is inconsistent with other cable Types listed in the code with regard to a metallic sheath as indicated in the following sections of the NEC.

Section 340-5, Exception, permits Type TC cable marked "OPEN WIRING" to be used in the traditional role of Type MC cable for lengths not to exceed 50 feet.

Section 340-3, Type TC cable, prohibits the addition of a metallic sheath either over or under the nonmetallic sheath. The construction of a Type TC cable can be identical to the construction of a Type MC core under the metallic sheath before armoring except that the Type TC cable being armored cannot be marked Type TC. The allowed ampacity of Type TC cable (reference Section 340-7) and Type MC cable (reference Section 334-13 and Exception No. 1 and 2) are identical. Section 340-4 (6) permits a Type TC cable that complies with the crash and impact test of a Type MC cable to be used as a Type MC cable by permitting the Type TC cable to be marked OPEN WIRING and used in lengths not to exceed a total of 50 ft (15.24 m) between a cable tray and the utilization equipment or device.

Type PLTC with the addition of a metallic sheath remains Type PLTC. (Reference Section 725-71, Exception No. 1). Section 725-61(d), Exception No. 3 provides the same limitations for Type PLTC cable as Section 340-4(6) does for Type TC cable. Section 723-71(e) permits nonmetallic sheathed cable to be listed as Type PLTC. Section 723-71(e) Exception No. 1 permits a smooth metallic sheath, welded and corrugated metallic sheath or interlocked tape armor to be applied over the nonmetallic jacket of a Type PLTC cable while still being listed as Type PLTC.

Type ITC with the addition of a metallic sheath remains Type ITC (Reference Section 727-1, 727-3, Exception No. 2: and 727-4, Exception). Section 727-4, Exception No. 2 provides the same limitations for Type ITC cable as Section 340-4(6) does for type TC cable. Section 727-6 permits nonmetallic-sheathed cable to be listed as Type ITC. This article also permits a smooth metallic sheath, welded and corrugated metallic sheath or interlocked tape armor to be applied over the nonmetallic jacket of a Type ITC cable while still being listed as Type ITC. Article 334, Type MC recognizes conductors rated 2001 to 35,000 volts in Section 310-60. Type MV with the addition of a metallic sheath becomes Type MV and Type MC (Reference Sections 318-12 and 318-13).

PANEL ACTION: Reject.

PANEL STATEMENT: All Type TC cables may not be appropriate for use as MC cables. There are inherent construction differences such as equipment grounding conductor provisions and type of conductor insulation that preclude a dual designation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NEGATIVE: 2

NOT RETURNED: 1 Ensign

EXPLANATION OF NEGATIVE:

PROPST: In order for a cable to be "marked" in accordance with Article 334," the product would have to comply with the construction requirements of 334, including the issues identified in the panel statement. I recommend that the panel accept this proposal as written.

STEWART: The panel statement is insufficient to reject. The fact that some TC may not be appropriate to use to manufacture an MC cable would only mean that these cables could not be used. The completed cable would be a Type MC cable and would be required to comply with all Type MC cable requirements.

The completed cable with armor would be a Type MC cable. The cable with armor removed would be a Type TC cable.

This type installation is quite common where a portion of a cable circuit is Type MC and a portion is Type TC (particularly at cable ends inside control rooms).

This exception would increase the reliability of the installation as the conversion from MC to TC could be made without the need for a splice or double terminations into a junction box.

This proposal, if accepted, would increase the system reliability and reduce possible errors in installation.

(Log #1532)

7- 243 - (340-3(d)): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 10 for action. This action will be considered by the Panel as a Public Comment.

SUBMITTER: William J. Tipton, I.B.E.W. Local 575

RECOMMENDATION: Delete 240-3 in its entirety.

SUBSTANTIATION: Text moved back to Table 310-16 and 310-17.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter's proposal is outside the scope of CMP 7.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NOT RETURNED: 1 Ensign

(Log #1860)

7- 244 - (340-4(6)): Accept in Principle

Note: The Technical Correlating Committee understands that the accepted text replaces the text in the last paragraph of 340-10(6) of Proposal 7-231a.

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Add an additional sentence to the last paragraph of 340-4(6) so the paragraph reads:

Equipment grounding for the utilization equipment shall be provided by an equipment grounding conductor within the cable. One or more insulated conductors shall be permitted to be permanently identified as an equipment grounding conductor at the time of installation in accordance with 250-119(b).

SUBSTANTIATION: Type TC Tray Cable is not normally manufactured with an equipment grounding conductor since the cable tray usually provides the equipment grounding. This revision will permit industrial facilities that meet the definition in 340-4(6), which is more limited that the definition in 250-119(b), to use standard tray cable and identify one of the insulated conductors in the cable as an equipment grounding conductor at the time of installation as already authorized by 250-119(b). This revision will eliminate the need to manufacture a special TC cable construction for use as open wiring.

PANEL ACTION: Accept in Principle.
Revise the proposed text to read:
Equipment grounding for the utilization equipment shall be provided by an equipment grounding conductor within the cable. In cables containing conductors size 6 AWG or smaller, the equipment grounding conductor shall be provided within the cable or, at the time of installation, one or more insulated conductors shall be permanently identified as an equipment grounding conductor in accordance with 250-119(b).
PANEL STATEMENT: This recognizes an already permitted practice in accordance with 250-119(b). This change allows the construction of this type cable without a separate identified equipment grounding conductor.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #4344)

7- 245 - (340-4(6)): Reject
SUBMITTER: Robert B. Alexander, Fluor Daniel
RECOMMENDATION: Delete from the the first sentence the clause:
"in lengths not to exceed a total of 50 ft (15.42 m) between a cable tray ant the utilization equipment or device."
SUBSTANTIATION: In reviewing the previous ROP/ROC for this section, it is obvious that the 50 ft limit is a commercial rather than technical or safety issue. There is NO offer in either ROP or ROC to substantiate the limit.
Section 336-4(3) permits NM,NMC and NMS, identified for the use, to be used in cable trays.
Section 336-4(2) permits their general use except as specifically prohibited by section 336-5.
Section 336-5 does not prohibit open wiring as a METHOD. The prohibitions are for conditions of location.
It is extremely difficult to understand why a vastly superior product(TC), in fact, one that meets the crush and impact tests of an even more superior product(MC), has greater restrictions placed on it than NM, NMC, or NMS - EXCEPT that it is a commercial restriction.
PANEL ACTION: Reject.
PANEL STATEMENT: By definition Type TC cable is intended to be supported by a cable tray, in raceways or where supported by a messenger wire. The panel has concerns relative to the use of the cable in unlimited lengths as open wiring including increased exposure to physical damage. Section 340-5(2) does not permit the installation of Type TC cable as open cable on brackets or cleats.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 2
NOT RETURNED: 1 Ensign
EXPLANATION OF NEGATIVE:
PROPST: During the discussion of this proposal, there appeared to be concern among the panel that approval of this proposal would result in unlimited open wiring using Tray Cable. I do not believe that this was the intent of the proposal.
To help clarify this issue, I believe that the panel should keep in perspective that this proposal does not apply to ordinary Tray Cable as defined in Article 340-1 and of a construction described in 340-3. This proposal applies only to a hybrid class of Tray Cable. It applies only to a Tray Cable, which in addition to meeting all the requirements described in Section 340, also meets the crush and impact requirements of Type MC cable. This is not to imply that it is equal to MC cable, but rather, that from a mechanical protection standpoint it will meet all the physical protection requirements which type MC cable is required to meet. This is one important factor that the panel should consider in reviewing this proposal. This cable is not ordinary Tray Cable. It is a hybrid Tray Cable that has the enhanced mechanical properties resulting in a higher level of mechanical protection.
The second issue that the panel must consider is that this proposal applies only for the very specific application of this hybrid tray cable only "In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage." There are two significant factors for the panel to consider in this statement. First, the restricted use in industrial establishments. This is a very specific application for this hybrid cable. Second, there is the additional restriction that it will only be used "where not subject to physical damage". During the panel discussions and in the panel statement, the issue of physical damage was cited as a concern. I believe that this concern is somewhat related to the rather broad and vague term of "open wiring". While the concept of open wiring could be envisioned to the extreme of looping, laying, mounting on brackets or cleats, and otherwise stringing cable in an uncontrolled manner across industrial facilities, I do not believe that this was the intent of the original proposal creating this exception, nor of this proposal to remove the 50 foot limit. This is an issue that the panel may want to address through additional language that would clarify the intent. I believe that there are two approaches which the panel could consider to clarify this intent. The first would be to provide additional language similar to the ITC language found in 727-4, exception stating "where the cable is supported and protected against physical damage using mechanical protection, such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 6 ft." I believe that this is the level of support that the creators of this section intended. Another issue that the panel expressed was the concern that this exception would permit the user to install the entire length of cable without the need for any cable tray. Again, I do not think that this was the intent or desire of those proposing this exception nor those seeking to drop the 50 foot restriction. The reason for seeking relief on the 50 foot restriction is that in large manufacturing locations with major cable trays running in elevated racks, it is not unusual to have tray located nearly 50 feet above grade. This does not provide a reasonable method to use this method to drop from the tray to the utilization equipment. I believe that this concern will not result in abuses because the economics of installing strut, angle, or channel versus tray. The installed cost per foot of cable will automatically result in the maximized use of tray while minimizing the use of strut, angle, and channel. The existing wording of the exception does require that this exception only applies from tray to the utilization equipment. While not being totally prescriptive to the user, it does require that the cable be installed in tray before making a transition using this exception.
In considering the suggestions and wording mentioned above, I would suggest that the panel reconsider this proposal with the following additional wording for clarification of the intent:
340-4(6) In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is ~~not subject to physical damage~~ supported and protected against physical damage using mechanical protection, such as struts, angles, or channel, Type TC tray cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted as open wiring ~~in lengths not to exceed a total of 50 ft (15.24 m)~~ between a cable tray and the utilization equipment or device.
The cable shall be supported and secured at intervals not exceeding 6 ft (1.83 m).
Equipment grounding for the utilization equipment shall be provided by an equipment grounding conductor within the cable.
FPN: See Section 310-10 for temperature limitation of conductors.
STEWART: The elimination of the 50 ft limit is not a safety issue. In fact, it could improve reliability and safety by avoiding problems involved with changing wiring methods when dropping out of the cable tray.
This does not allow for unlimited lengths as open wiring as the cable must be supported and secured at 6 ft intervals.
There is no increased exposure to physical damage as Section 340-4(6) states: "where the cable is not subject to physical damage."
If the cable is not subject to physical damage, how can there be "increased exposure to physical damage"?
This type installation is not as open cable on brackets or cleats as prohibited in Section 340-5(2).

(Log #474)

7- 246 - (340-4(b)): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Change "50 ft (15.24 m)" to "15 m (50 ft)"
Change "6 ft (1.83 m)" to "1.8 m (6 ft)"

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept in Principle.

7- 251 - (340-7): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise 340-7 (340-80 New) to read as follows:
340-7. Ampacity. The ampacity of Type TC tray cable shall be determined in accordance with 318-11 for 14 AWG and larger conductors and in accordance with 402-5 for 18-16 AWG conductors. ~~The ampacities of the conductors of Type TC tray cable shall be determined from Section 402-5 for conductors smaller than No. 14 and from Section 318-11.~~
SUBSTANTIATION: For clarity and to incorporate text consistent with that used in other cable articles.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-231a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1931)

7- 252 - (340-7): Accept in Principle
Note: The Technical Correlating Committee understands that this Proposal modifies 340-80 of Proposal 7-231a.
SUBMITTER: Warren Kohm, Briner Electric
RECOMMENDATION: Revise to read as follows:
340-7. Ampacity. The ampacities of the conductors of Type TC tray cable shall be determined from Section 402-5 for conductors smaller than No. 14 ~~and~~, from Section 318-11 where installed in cable tray, and from Section 310-15 where installed in a raceway or supported by a messenger wire.
SUBSTANTIATION: Section 340-7 currently gives only two choices for determining the ampacity of Type TC tray cable: (1) Section 402-5 for conductors smaller than No. 14 and (2) Section 318-11. Section 318-11 only applies to cables installed in cable tray. Where Type TC tray cable is installed in a raceway or supported by a messenger wire as permitted by Section 340-4, Section 340-7 is silent on how to determine the ampacity. Section 310-15 should be referenced so that the correct ampacity can be determined.
PANEL ACTION: Accept in Principle.
Revise Section 340-7 to read:
340-7. Ampacity. The ampacity of Type TC tray cable shall be determined in accordance with 318-11 for 14 AWG and larger conductors, in accordance with 402-5 for 18-16 AWG conductors where installed in cable tray, and in accordance with Section 310-15 where installed in a raceway or as messenger supported wiring.
PANEL STATEMENT: The panel has accepted the proposer's concept and modified the text to comply with the NFPA NEC Style Manual.

NOT RETURNED: 1 Ensign

(Log #CP702)

7- 252a - (340-8): Accept
Note: The Technical Correlating Committee understands that this Proposal modifies 340-24 of Proposal 7-231a. The Technical Correlating Committee assumes a soft conversion is to be used for the metric conversions.
SUBMITTER: CMP 7
RECOMMENDATION: Revise existing Section 340-8 to read:
340-8. Bending Radius. Bends in Type TC cable shall be made so as not to damage the cable. For Type TC cable without metal shielding, the minimum bending radius shall be:

(1) Cables with an outside diameter of 1.000 inches or less- 4 times the overall diameter
(2) cables with diameter of 1.001 to 2.000 inch-5 times the overall diameter
(3) Cables with diameters of 2.001 inch and larger-6 times the overall diameter
Type TC cables with metallic shielding shall have a minimum bending radius of not less than 12 times the cable overall diameter.
SUBSTANTIATION: These are the minimum accepted industry requirements for bending Type TC cable.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1365)

7- 253 - (340-8): Reject
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise existing 340-8 (340-24 New) as follows:
~~340-8. Bends.~~ 340-24. Bending Radius. Bends in Type TC cable shall be made so ~~as not to damage the cable.~~ that the cable will not be damaged. The radius of the curve of the inner edge of any bend shall not be less than five times the diameter of the cable.
SUBSTANTIATION: A value for the minimum bending radius is being added to provide consistency and continuity with other wire and cable articles. A recommended minimum bending radius of 5 times is based on a ICEA value for power cable. ICEA S-61-402 / NEMA WC5 recommends a value of 4. The value recommended for this proposal was increased to 5 so as to be conservative and is the same as the value that is used by UL in the performance of the cold bend test requirements for non shielded Type TC cable (UL 1277).
PANEL ACTION: Reject.
PANEL STATEMENT: The panel has accepted minimum bending radius requirements for Type TC cable through their action on Proposal 7-252a. The values accepted by the panel reflect current industry standards for the minimum bending radius of Type TC cable.

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee the Panel Action.
SUBMITTER: CMP 7
RECOMMENDATION: Rewrite Article 342 to comply with NEC Style Manual.
. ARTICLE 342 -- Nonmetallic Extensions
I General
342-1. Scope. This article covers the use, installation, and construction specifications for Nonmetallic Extensions.
342-2. Definition. Nonmetallic Extension. An assembly of two insulated conductors within a nonmetallic jacket or an extruded thermoplastic covering. The classification includes surface extensions intended for mounting directly on the surface of walls or ceilings.
II Installation
342-10. Uses Permitted. Nonmetallic extensions shall be permitted only where all of the following conditions are met.
(a) From an Existing Outlet. The extension is from an existing outlet on a 15- or 20-ampere branch circuit.
(b) Exposed and in a Dry Location. The extension is run exposed and in a dry location.
(c) Nonmetallic Surface Extensions. For nonmetallic surface extensions, the building is occupied for residential or office purposes and does not exceed the height limitations specified in 336-5(a)(1).
. FPN: See 310-10 for temperature limitation of conductors.
342-12. Uses Not Permitted. Nonmetallic extensions shall not be used:
(1) In unfinished basements, attics, or roof spaces.
(2) Where the voltage between conductors exceeds 150 volts for nonmetallic surface extension and 300 volts for aerial cable.
(3) Where subject to corrosive vapors.
(4) Where run through a floor or partition, or outside the room in which it originates.
342-15. Exposed. One or more extensions shall be permitted to be run in any direction from an existing outlet, but not on the floor or within 50 mm (2 in.) from the floor.
342-26. Bends. A bend that reduces the normal spacing between the conductors shall be covered with a cap to protect the assembly from physical damage.
342-30. Securing and Supporting. Nonmetallic surface extensions shall be secured in place by approved means at intervals not exceeding 200 mm (8 in.), with an allowance for 300 mm (12 in.) to the first fastening where the connection to the supplying outlet is by means of an attachment plug. There shall be at least one fastening between each two adjacent outlets supplied. An extension shall be attached to only woodwork or plaster finish, and shall not be in contact with any metal work or other conductive material other than with metal plates on receptacles.
342-40. Boxes and Fittings. Each run shall terminate in a fitting that covers the end of the assembly. All fittings and devices shall be of a type identified for the use.
342-56. Splices and Taps. Extensions shall consist of a continuous unbroken length of the assembly, without splices, and without exposed conductors between fittings. Taps shall be permitted where approved fittings completely covering the tap connections are used. Aerial cable and its tap connectors shall be provided with an approved means for polarization. Receptacle-type tap connectors shall be of the locking type.
SUBSTANTIATION: This revision to Article 342 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with

the usability effort. Specific proposals addressed by this revision include 7-255, 7-256, 7-257, 7-258, 7-259, 7-260, 7-261, 7-262, 7-263 and 7-265.
PANEL ACTION: Accept.

(Log #1388)

7- 255 - (342): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise text to read as follows:
Article 342 — Nonmetallic Extensions
I. General
~~342-1~~ 342-2. Definition.
Nonmetallic extensions are an assembly of two insulated conductors within a nonmetallic jacket or an extruded thermoplastic covering. The classification includes both surface extensions, intended for mounting directly on the surface of walls or ceilings, and aerial cable containing a supporting messenger cable as an integral part of the cable assembly.
~~342-2~~ 342-3. Other Articles.
In addition to the provisions of this article, nonmetallic extensions shall be installed in accordance with the applicable provisions of this Code.
II. Installation
~~342-3~~ 342-10. Uses Permitted
Nonmetallic extensions shall be permitted only where all of the following conditions are met.
(a) From an Existing Outlet. The extension is from an existing outlet on a 15- or 20-ampere branch circuit. ~~in conformity with the requirements of Article 210.~~
(b) Exposed and in a Dry Location. The extension is run exposed and in a dry location.
(c) Nonmetallic Surface Extensions. For nonmetallic surface extensions, the building is occupied for residential or office purposes and does not exceed the height limitations specified in ~~Section~~ 336-5(a)(1).
(c1) [Alternate to (c)]. For aerial cable, the building is occupied for industrial purposes, and the nature of the occupancy requires a highly flexible means for connecting equipment.
~~(b) Aerial Cable.~~ Where used as aerial cable nonmetallic extensions shall conform to the following:
1. Aerial cable shall be supported by its messenger cable and securely attached at each end with clamps and turnbuckles. Intermediate supports shall be provided at not more than 20-ft (6.1-m) intervals. Cable tension shall be adjusted to eliminate excessive sag. The cable shall have a clearance of not less than 2 in. (50.8 mm) from steel structural members or other conductive material.
2. Aerial cable shall have a clearance of not less than 10 ft (3.05 m) above floor areas accessible to pedestrian traffic, and not less than 14 ft (4.27 m) above floor areas accessible to vehicular traffic.
3. Cable suspended over work benches, not accessible to pedestrian traffic, shall have a clearance of not less than 8 ft (2.44 m) above the floor.
4. Aerial cables shall be permitted as a means to support lighting fixtures where the total load on the supporting messenger cable does not exceed that for which the assembly is intended.
5. The supporting messenger cable where installed in conformity with the applicable provisions of Article 250 and if properly identified as an equipment grounding conductor, shall be permitted to ground equipment. The messenger cable shall not be used as a branch-circuit conductor.
FPN: See Section 310-10 for temperature limitation of conductors.
~~342-4~~ 342-12. Uses Not Permitted. Nonmetallic extensions shall not be used as follows:
(a) Aerial Cable. As aerial cable to substitute for one of the general wiring methods specified by this Code.
(b) Unfinished Areas. In unfinished basements, attics, or roof spaces.
(c) Voltage Between Conductors. Where the voltage between conductors exceeds 150 volts for nonmetallic surface extension and 300 volts for aerial cable.
(d) Corrosive Vapors. Where subject to corrosive vapors.
(e) Through a Floor or Partition. Where run through a floor or partition, or outside the room in which it originates.
~~342-7.~~ 342-15. Exposed. ~~Nonmetallic extensions shall be installed as specified in (a) and (b).~~
~~(a) Nonmetallic Surface Extensions.~~
~~1.~~ One or more extensions shall be permitted to be run in any direction from an existing outlet, but not on the floor or within 2 in. (50.8 mm) from the floor.
342-26. Bends.
~~3.~~ A bend that reduces the normal spacing between the conductors shall be covered with a cap to protect the assembly from physical damage.
342-30 Securing and Supporting.
~~2.~~ Nonmetallic surface extensions shall be secured in place by approved means at intervals not exceeding 8 in. (203 mm), with an allowance for 12 in. (305 mm) to the first fastening where the connection to the supplying outlet is by means of an attachment plug. There shall be at least one fastening between each two adjacent outlets supplied. An extension shall be attached to only woodwork or plaster finish, and shall not be in contact with any metal work or other conductive material other than with metal plates on receptacles.
~~342-6.~~ 342-40. Boxes and Fittings. Each run shall terminate in a fitting that covers the end of the assembly. All fittings and devices shall be of a type identified for the use.
~~342-5.~~ 342-56. Splices and Taps. Extensions shall consist of a continuous unbroken length of the assembly, without splices, and without exposed conductors between fittings. Taps shall be permitted where approved fittings completely covering the tap connections are used. Aerial cable and its tap connectors shall be provided with an approved means for polarization. Receptacle-type tap connectors shall be of the locking type.
III. Construction
~~342-8.~~ 342-120. Marking. Nonmetallic extensions shall be marked in accordance with Section 110-21.
SUBSTANTIATION: The proposed article re-write was developed as part of a larger effort by the NEC Usability Committee to re-format existing raceway, cable and wiring articles. The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as state in the NEC Style Manual 2.4.1. It is hoped that the parallel code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.
To the extent that this was possible in this article, this has been done. It is not the intent or purpose of this re-write to change the actual intent of the existing article requirements. The only new material in this proposal is the proposed new article scope which has been added to conform with the NEC Style Manual 2.2.1
A companion proposal has also been submitted which re-structures the article to a greater degree by splitting existing Code requirements into new sections to better adhere to the new article format. In some cases this is done with an alternate article re-write while in other cases, individual proposals have been submitted. These proposals are also intended to further enhance the structure and format of the article but in some cases existing code text requirements had to be revised or altered to meet the re-formatting needs. For this reason the proposals are separate which will allow the Code Making Panels to individually consider each proposal.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-254a.

NOT RETURNED: 1 Ensign

(Log #1389)

7- 256 - (342): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise Article 342 as follows: (renumber existing sections accordingly)
Article 342 — Nonmetallic Extensions
342-1. Definition.

Nonmetallic extensions are an assembly of two insulated conductors within a nonmetallic jacket or an extruded thermoplastic covering. The classification includes ~~both~~ surface extensions, intended for mounting directly on the surface of walls or ceilings~~, and aerial cable containing a supporting messenger cable as an integral part of the cable assembly~~.

342-2. Other Articles. In addition to the provisions of this article, nonmetallic extensions shall be installed in accordance with the applicable provisions of this Code.

342-3. Uses Permitted. Nonmetallic extensions shall be permitted only where all of the following conditions are met.

(a) From an Existing Outlet. The extension is from an existing outlet on a 15- or 20-ampere branch circuit in conformity with the requirements of Article 210.

(b) Exposed and in a Dry Location. The extension is run exposed and in a dry location.

(c) Nonmetallic Surface Extensions. For nonmetallic surface extensions, the building is occupied for residential or office purposes and does not exceed the height limitations specified in Section 336-5(a)(1).

~~(c1) [Alternate to (c)]. For aerial cable, the building is occupied for industrial purposes, and the nature of the occupancy requires a highly flexible means for connecting equipment.~~

FPN: See Section 310-10 for temperature limitation of conductors.

342-4. Uses Not Permitted. Nonmetallic extensions shall not be used as follows:

~~(a) Aerial Cable. As aerial cable to substitute for one of the general wiring methods specified by this Code.~~

~~(b)~~ (a) Unfinished Areas. In unfinished basements, attics, or roof spaces.

~~(c)~~ (b) Voltage Between Conductors. Where the voltage between conductors exceeds 150 volts ~~for nonmetallic surface extension and 300 volts for aerial cable.~~

~~(d)~~ (c) Corrosive Vapors. Where subject to corrosive vapors.

~~(e)~~ (d) Through a Floor or Partition. Where run through a floor or partition, or outside the room in which it originates.

342-5. Splices and Taps. Extensions shall consist of a continuous unbroken length of the assembly, without splices, and without exposed conductors between fittings. Taps shall be permitted where approved fittings completely covering the tap connections are used. Aerial cable and its tap connectors shall be provided with an approved means for polarization. Receptacle-type tap connectors shall be of the locking type.

342-6. Fittings. Each run shall terminate in a fitting that covers the end of the assembly. All fittings and devices shall be of a type identified for the use.

342-7. Installation. Nonmetallic extensions shall be installed as specified ~~in (a) and (b)~~.

(a) Nonmetallic Surface Extensions.

1. One or more extensions shall be permitted to be run in any direction from an existing outlet, but not on the floor or within 2 in. (50.8 mm) from the floor.

2. Nonmetallic surface extensions shall be secured in place by approved means at intervals not exceeding 8 in. (203 mm), with an allowance for 12 in. (305 mm) to the first fastening where the connection to the supplying outlet is by means of an attachment plug. There shall be at least one fastening between each two adjacent outlets supplied. An extension shall be attached to only woodwork or plaster finish, and shall not be in contact with any metal work or other conductive material other than with metal plates on receptacles.

3. A bend that reduces the normal spacing between the conductors shall be covered with a cap to protect the assembly from physical damage.

~~(b) Aerial Cable.~~

~~1. Aerial cable shall be supported by its messenger cable and securely attached at each end with clamps and turnbuckles. Intermediate supports shall be provided at not more than 20 ft (6.1 m) intervals. Cable tension shall be adjusted to eliminate excessive sag. The cable shall have a clearance of not less than 2 in. (50.8 mm) from steel structural members or other conductive material.~~

~~2. Aerial cable shall have a clearance of not less than 10 ft (3.05 m) above floor areas accessible to pedestrian traffic, and not less than 14 ft (4.27 m) above floor areas accessible to vehicular traffic.~~

~~3. Cable suspended over work benches, not accessible to pedestrian traffic, shall have a clearance of not less than 8 ft (2.44 m) above the floor.~~

~~4. Aerial cables shall be permitted as a means to support lighting fixtures where the total load on the supporting messenger cable does not exceed that for which the assembly is intended.~~

~~5. The supporting messenger cable, where installed in conformity with the applicable provisions of Article 250 and if properly identified as an equipment grounding conductor, shall be permitted to ground equipment. The messenger cable shall not be used as a branch circuit conductor.~~

342-8. Marking. Nonmetallic extensions shall be marked in accordance with ~~Section~~ 110-21.

SUBSTANTIATION: This particular wiring method is no longer being manufactured or used. Article 320 and Article 321 covers similar requirements. Deleting the portions related to use as aerial cable within this article will improve usability and increase consistency with the other cable and wiring articles.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-254a.

RECOMMENDATION: Revise text to read as follows:

Article 342 — Nonmetallic Extensions

I. General

~~342-1.~~ 342-2. Definition.

Nonmetallic extensions are an assembly of two insulated conductors within a nonmetallic jacket or an extruded thermoplastic covering. The classification includes both surface extensions, intended for mounting directly on the surface of walls or ceilings, and aerial cable containing a supporting messenger cable as an integral part of the cable assembly.

~~342-2.~~ 342-3. Other Articles. In addition to the provisions of this article, nonmetallic extensions shall be installed in accordance with the applicable provisions of this Code.

II. Installation

~~342-3.~~ 342-10. Uses Permitted. Nonmetallic extensions shall be permitted only where all of the following conditions are met.

(a) From an Existing Outlet. The extension is from an existing outlet on a 15- or 20-ampere branch circuit in conformity with the requirements of Article 210.

(b) Exposed and in a Dry Location. The extension is run exposed and in a dry location.

(c) Nonmetallic Surface Extensions. For nonmetallic surface extensions, the building is occupied for residential or office purposes and does not exceed the height limitations specified in Section 336-5(a)(1).

(c1) [Alternate to (c)]. For aerial cable, the building is occupied for industrial purposes, and the nature of the occupancy requires a highly flexible means for connecting equipment.

FPN: See Section 310-10 for temperature limitation of conductors.

~~342-4.~~ 342-12. Uses Not Permitted. Nonmetallic extensions shall not be used as follows:

(a) Aerial Cable. As aerial cable to substitute for one of the general wiring methods specified by this Code.

(b) Unfinished Areas. In unfinished basements, attics, or roof spaces.

(c) Voltage Between Conductors. Where the voltage between conductors exceeds 150 volts for nonmetallic surface extension and 300 volts for aerial cable.

(d) Corrosive Vapors. Where subject to corrosive vapors.

(e) Through a Floor or Partition. Where run through a floor or partition, or outside the room in which it originates.

~~342-7.~~ 342-13. Installation. Nonmetallic extensions shall be installed as specified in (a) and (b).

(a) Nonmetallic Surface Extensions.

1. One or more extensions shall be permitted to be run in any direction from an existing outlet, but not on the floor or within 2 in. (50.8 mm) from the floor.

2. Nonmetallic surface extensions shall be secured in place by approved means at intervals not exceeding 8 in. (203 mm), with an allowance for 12 in. (305 mm) to the first fastening where the connection to the supplying outlet is by means of an attachment plug. There shall be at least one fastening between each two adjacent outlets supplied. An extension shall be attached to only woodwork or plaster finish, and shall not be in contact with any metal work or other conductive material other than with metal plates on receptacles.

3. A bend that reduces the normal spacing between the conductors shall be covered with a cap to protect the assembly from physical damage.

(b) Aerial Cable.

1. Aerial cable shall be supported by its messenger cable and securely attached at each end with clamps and turnbuckles. Intermediate supports shall be provided at not more than 20-ft (6.1-m) intervals. Cable tension shall be adjusted to eliminate excessive sag. The cable shall have a clearance of not less than 2 in. (50.8 mm) from steel structural members or other conductive material.

2. Aerial cable shall have a clearance of not less than 10 ft (3.05 m) above floor areas accessible to pedestrian traffic, and not less than 14 ft (4.27 m) above floor areas accessible to vehicular traffic.

3. Cable suspended over work benches, not accessible to pedestrian traffic, shall have a clearance of not less than 8 ft (2.44 m) above the floor.

4. Aerial cables shall be permitted as a means to support lighting fixtures where the total load on the supporting messenger cable does not exceed that for which the assembly is intended.

5. The supporting messenger cable, where installed in conformity with the applicable provisions of Article 250 and if properly identified as an equipment grounding conductor, shall be permitted to ground equipment. The messenger cable shall not be used as a branch-circuit conductor.

~~342-6.~~ 342-40. Boxes and Fittings.

Each run shall terminate in a fitting that covers the end of the assembly. All fittings and devices shall be of a type identified for the use.

~~342-5.~~ 342-56. Splices and Taps.

Extensions shall consist of a continuous unbroken length of the assembly, without splices, and without exposed conductors between fittings. Taps shall be permitted where approved fittings completely covering the tap connections are used. Aerial cable and its tap connectors shall be provided with an approved means for polarization. Receptacle-type tap connectors shall be of the locking type.

III. Construction

~~342-8.~~ 342-120. Marking.

Nonmetallic extensions shall be marked in accordance with Section 110-21.

SUBSTANTIATION: The proposed article re-write was developed as part of a larger effort by the NEC Usability Committee to re-format existing raceway, cable and wiring articles. The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as state in the NEC Style Manual 2.4.1. It is hoped that the parallel code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.

To the extent that this was possible in this article, this has been done. It is not the intent or purpose of this re-write to change the actual intent of the existing article requirements. The only new material in this proposal is the proposed new article scope which has been added to conform with the NEC Style Manual 2.2.1

A companion proposal has also been submitted which re-structures the article to a greater degree by splitting existing Code requirements into new sections to better adhere to the new article format. In some cases this is done with an alternate article re-write while in other cases, individual proposals have been submitted. These proposals are also intended to further enhance the structure and format of the article but in some cases existing code text requirements had to be revised or altered to meet the re-formatting needs. For this reason the proposals are separate which will allow the Code Making Panels to individually consider each proposal.

ARTICLE 343 — NONMETALLIC UNDERGROUND CONDUIT WITH CONNECTORS: TYPE NUCC

(Log #1222)

8- 74 - (343): Accept in Principle
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise Article 343 to read as follows:
Article 343 -- Nonmetallic Underground Conduit with Conductors: Type NUCC
A. General
343-1. Scope. This article covers the use, installation, and construction specifications for Nonmetallic Underground Conduit with Conductors (NUCC).
343-2. ~~343-1.~~ Definition. Nonmetallic Underground Conduit with Conductors (NUCC). A ~~is a~~ factory assembly of conductors or cables inside a nonmetallic, smooth wall conduit with a circular cross section.
~~The nonmetallic conduit shall be composed of a material that is resistant to moisture and corrosive agents. It shall also be capable of being supplied on reels without damage or distortion and shall be of sufficient strength to withstand abuse, such as impact or crushing, in handling and during installation without damage to conduit or conductors.~~
343-3. ~~343-2.~~ Other Articles. Installations for NUCC ~~nonmetallic underground conduit with conductors~~ shall comply with the provisions of ~~the~~ applicable sections of Article 300. ~~Where equipment grounding is required by Article 250, an assembly containing a separate equipment grounding conductor shall be used~~.
343-6. Listing Requirements. NUCC and associated fittings shall be listed.
B. Installation
~~343-3.~~ 343-10. Uses Permitted. The use of NUCC ~~listed nonmetallic underground conduit with conductors~~ and fittings shall be permitted in the following.
(1) For direct burial underground installation. For minimum cover requirements, see Tables 300-5 and 300-50 under Rigid Nonmetallic Conduit.
(2) Encased or embedded in concrete.
(3) In cinder fill.
(4) In underground locations subject to severe corrosive influences as covered in Section 300-6 and where subject to chemicals for which the assembly is specifically approved.
~~343-4.~~ 343-12. Uses Not Permitted. NUCC ~~Nonmetallic underground conduit with conductors~~ shall not be used in the following:
(1) In exposed locations
(2) Inside buildings

Exception: The conductor or the cable portion of the assembly, where suitable, shall be permitted to extend within the building for termination purposes in accordance with Section 300-3.
(3) In hazardous (classified) locations except as permitted by Sections 503-3(a), 504-20, 514-8, and 515-5, and in Class I, Division 2 locations as permitted in Section 501-4(b), Exception
~~343-5.~~ 343-20. Size.
(a) Minimum.
NUCC ~~Nonmetallic underground conduit with conductors~~ smaller than 1/2-in. ~~electrical~~ trade size shall not be used.
(b) Maximum.
NUCC ~~Nonmetallic underground conduit with conductors~~ larger than 4-in. ~~electrical~~ trade size shall not be used.
FPN: Metric trade numerical designations for NUCC ~~nonmetallic underground conduit with conductors~~ are 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, and 4 = 103.
343-22. Number of Conductors. The number of conductors or cables shall not exceed that permitted by the percentage fill in Table 1, Chapter 9.
~~343-10.~~ 343-24. Bends — How Made.
Bends ~~of Nonmetallic underground conduit with conductors~~ shall be manually made so that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. The radius of the curve of the centerline of such bends shall not be less than shown in Table ~~343-10~~ 343-24.
Table ~~343-10.~~ 343-24. Minimum Bending Radius ~~of Conduit Bends~~ for Nonmetallic Underground Conduit with Condutors (NUCC).
[*****1999 NEC Table 343-10 here*****]
~~343-11.~~ 343-26. Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between termination points.
~~343-6.~~ 343-28. Trimming. For termination, the conduit shall be trimmed away from the conductors or cables using an approved method that will not damage the conductor or cable insulation or jacket. All conduit ends shall be trimmed inside and out to remove rough edges.
~~343-9.~~ 343-46. Bushings. Where the NUCC ~~Nonmetallic underground conduit with conductors~~ enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the conductor or cable from abrasion unless the design of the box, fitting, or enclosure provides equivalent protection.
FPN: See Section 300-4(f) for the protection of conductors size No. 4 or larger.
~~343-7.~~ 343-48. Joints. All joints between conduit, fittings, and boxes shall be made by an approved method.
~~343-8.~~ 343-50. Conductor Terminations. All terminations between the conductors or cables and equipment shall be made by an approved method for that type of conductor or cable.
~~343-12.~~ 343-56. Splices and Taps. Splices and taps shall be made in junction boxes or other enclosures. See Article 370 for rules on the installation and use of boxes and conduit bodies.
343-60. Grounding. Where equipment grounding is required by Article 250, an assembly containing a separate equipment grounding conductor shall be used.
C. Construction Specifications.
343-100. Construction.
(a) General. NUCC ~~Nonmetallic underground conduit with conductors~~ is an assembly that is provided in continuous lengths shipped in a coil, reel, or carton.
(b) Nonmetallic Underground Conduit. The nonmetallic underground conduit shall be composed of a material that is resistant to moisture and corrosive agents. It shall also be capable of being supplied on reels without damage or distortion and shall be of sufficient strength to withstand abuse, such as impact or crushing, in handling and during installation without damage to conduit or conductors.
~~343-14.~~ (c) Conductors and Cables. Conductors and cables used in NUCC ~~Nonmetallic underground conduit with conductors~~ shall be listed, shall be suitable for use in wet locations, and shall be as follows.
~~(a)~~ (1) 600 Volts or Less.
Alternating-current and direct-current circuits shall be permitted. All conductors shall have an insulation rating equal to at least the maximum nominal circuit voltage of any conductor or cable within the conduit.
~~(b)~~ (2) Over 600 Volts.
Conductors or cables rated over 600 volts shall not occupy the same conduit with conductors or cables of circuits rated 600 volts or less.
~~343-15.~~ (d) Conductor Fill.
The maximum number of conductors or cables in NUCC ~~Nonmetallic underground conduit with conductors~~ shall not exceed that permitted by the percentage fill in Table 1, Chapter 9.
~~343-16.~~ 343-120. Marking. NUCC ~~Nonmetallic underground conduit with conductors~~ shall be clearly and durably marked at least every 10 ft (3.05 m) as required by Section 110-21. The type of conduit material shall also be included in the marking.
Identification of conductors or cables used in the assembly shall be provided on a tag attached to each end of the assembly or to the side of a reel. Enclosed conductors or cables shall be marked in accordance with Section 310-11.

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways of circular cross-section. For the 1999 NEC, a previous Sub-Task Group recommended that all of the circular raceway articles be combined into a single article (Article 344), to present a more uniform approach to the conduit and tubing requirements and to consolidate common requirements.
Review of public comments led the Panel to conclude that the goal of more user friendly code language had not been realized by the proposed Article 344. Furthermore, the Panel requested that a committee be appointed to consider the issue of user friendly code as it relates to the circular raceway articles.
The Sub-Task Group was asked to address such possibilities as revising the rejected 1999 proposal in light of the public comments, developing one or more articles to address the requirements presented in the nine current circular raceway articles, or revising the current nine circular raceway articles using a similar style manual format. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.
A uniform format is proposed to achieve consistency across all of the circular raceways. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. A table that provides the uniform format for each circular raceway has been provided with this proposal.
For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for conduit and tubing not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.
Explanation of proposed renumbering and editorial changes;

- Title Added Type and the Acronym "NUCC"
- 343-1 New Scope added to conform with the style manual.
- 343-2

(1) Definition renumbered from Section 343-1 to 343-2.
(2) Added acronym after title.
(3) Material composition and strength characteristics moved to Section 343-100(b).
343-3
(1) Other Articles renumbered from Section 343-2 to 343-3.
(2) Substitute acronym "NUCC" for the product proper name
(3) Moved grounding requirements to 343-60.
343-6
(1) New section specifically for listing requirements.
(2) Listing requirements moved here from 343-3 (99 NEC)
343-10
(1) Uses Permitted renumbered from Section 343-3 to 343-10.
(2) Delete product name and replace with acronym "NUCC".
343-12
(1) Uses Not Permitted renumbered from Section 343-4 to 343-12.
(2) Delete product name and replace with acronym "NUCC".
(3) Correct section references.
343-20
(1) Size renumbered from Section 343-5 to 343-20.
(2) Delete product description or product name and replace with acronym "NUCC" (three places).
(3) The word "electrical" was deleted as it added nothing to the clarity of this section (two places).
343-22
(1) Number of Conductors renumbered from 343-6 to 343-22.

(2) Reword section adding reference to cables for clarity.
(3) Removed the reference to tubing for clarity (two places).
343-24
(1) Bends-How Made renumbered from 343-9 to 343-24.
(2) Delete product name for clarity.
(3) Corrected section reference.
343-26 Bends-Number in One Run renumbered from 343-10 to 343-26.
343-28
(1) Trimming renumbered from 343-7 to 343-28.
(2) Delete " of tubing" for clarity.
343-30
(1) Securing and Supporting renumbered from 343-11 to 343-30.
(2) Title changed from "Supports" to "Securing and Supporting" since section addresses both subjects.
(3) Deleted product name and replaced with acronym "NUCC" (two places)
(4) Separated the Section into two parts for clarity.
(5) Added text for clarity without changing the original requirement.
343-40
(1) Boxes and Fittings renumbered from 343-12 to 343-40.
(2) Listing requirement for fittings moved to 343-6.
343-46 Bushings renumbered from 343-14 to 343-46
343-48 Joints renumbered from 343-8 to 343-48.
343-56
(1) Splices and Taps renumbered from 343-13 to 343-56.
(2) Referenced 300-15 and deleted list of products for clarity.
343-60 New Section for the grounding requirements. Text moved from 343-2 (99 NEC).
343-100
(1) Construction renumbered and renamed from 343-15 General to 343-100 Construction.
(2) Deleted product name and replaced with acronym "NUCC"
(3) Material characteristics moved from 343-1 (99 NEC).
(4) Moved marking requirements to 343-120.
New section for marking requirements moved from 343-15 (99 NEC).

The following Section numbers have been assigned unilaterally throughout all 10 raceway articles.	**Common Numbering System for the Circular Raceway Articles**
	Article 3XX, <title>: <acronym>
	Part A. General
3XX - 1	Scope.
3XX - 2	Definitions.
3XX - 3	Other Articles.
3XX - 6	Listing Requirements.
	Part B. Installation
3XX - 10	Uses Permitted.
3XX - 12	Uses Not Permitted.
3XX - 14	Dissimilar Metals.
3XX - 16	Temperature Limits.
3XX - 20	Size.
3XX - 22	Number of Conductors.
3XX - 24	Bends – How Made.
3XX - 26	Bends – Number in One Run.
3XX - 28	Reaming & Threading.
3XX - 28	Trimming.
3XX - 30	Securing and Supporting.
3XX - 40	Boxes and Fittings.
3XX - 42	Coupling and Connectors
3XX - 44	Expansion Fittings
3XX - 46	Bushings.
3XX - 48	Joints.
3XX - 50	Conductor Terms
3XX - 56	Splices and Taps.
3XX - 60	Grounding.
	Part C. Construction Specifications.
3XX - 100	Construction.
3XX - 110	Corrosion Protection.
3XX - 120	Marking.
3XX - 130	Standard Lengths.

PANEL ACTION: Accept in Principle.
Delete proposed Section 343-3.
Revise proposed Section 343-22 to read:
"The ~~maximum~~ number of conductors or cables ~~in nonmetallic underground conduit with conductors~~ shall not exceed that permitted by the percentage fill in Table 1, Chapter 9".
Delete the second sentence from proposed 343-56.
PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP-8 recommends approval of the scope section by the TCC.
The proposed 343-3 and the second sentence of 343-56 are deleted as Section 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.
Proposed Section 343-22 is revised because section 4-3.3 of the Regulations Governing Committee Projects requires that a proposal include the words to be deleted.
The panel recognizes that the submitter inadvertently omitted the correct renumbering sequence in its substantiation. The panel has corrected the renumbering as follows:
Explanation of proposed renumbering and editorial changes;
· Title Added Type and the Acronym "NUCC"
· 343-1 New Scope added to conform with the style manual.
· 343-2
(1) Definition renumbered from Section 343-1 to 343-2.
(2) Added acronym after title.
(3) Material composition and strength characteristics moved to Section 343-100(b).
· 343-3
(1) Other Articles renumbered from Section 343-2 to 343-3.
(2) Substitute acronym "NUCC" for the product proper name
(3) Moved grounding requirements to 343-60.
· 343-6
(1) New section specifically for listing requirements.
(2) Listing requirements moved here from 343-3 (99 NEC)
· 343-10
(1) Uses Permitted renumbered from Section 343-3 to 343-10.
(2) Delete product name and replace with acronym "NUCC".
· 343-12
(1) Uses Not Permitted renumbered from Section 343-4 to 343-12.
(2) Delete product name and replace with acronym "NUCC".
(3) Correct section references.
· 343-20
(1) Size renumbered from Section 343-5 to 343-20.
(2) Delete product description or product name and replace with acronym "NUCC" (three places).
(3) The word "electrical" was deleted as it added nothing to the clarity of this section (two places).
· 343-22
(1) Number of Conductors renumbered from 343-15 to 343-22.
· 343-24
(1) Bends-How Made renumbered from 343-10 to 343-24.
(2) Delete product name for clarity.
(3) Corrected section reference.

Table 343 –10. Radius of Conduit Bends

Metric Designator	Trade Size	Minimum Bending Radius	
		mm	in.
16	1/2	250	10
21	3/4	300	12
27	1	350	14
35	1 1/4	450	18
41	1 1/2	500	20
53	2	650	26
63	2 1/2	900	36
78	3	1200	48
103	4	1500	60

· 343-26 Bends-Number in One Run renumbered from 343-11 to 343-26.
· 343-28
(1) Trimming renumbered from 343-6 to 343-28.
(2) Added the word "conduit" for clarity.
· 343-46
(1) Bushings renumbered from 343-9 to 343-46
(2) Delete product name and replace with acronym "NUCC".
· 343-48 Joints renumbered from 343-7 to 343-48.
· 343-5 Conductor Terminations renumbered from 343-8 to 343-50.
· 343-56
(1) Splices and Taps renumbered from 343-12 to 343-56.
· 343-60 New Section for the grounding requirements. Text moved from 343-2 (99 NEC).
· 343-100 Construction.
343-100(a) General.
(1) Construction renumbered and renamed from 343-3 General to 343-100 Construction.
(2) Deleted product name and replaced with acronym "NUCC"
343-100(b) Nonmetallic Underground Conduit.
(1) Material characteristics moved from 343-1 (99 NEC).
343-100(c) Conductors and Cables.
(1) Conductor and Cable requirements moved from 343-14.
343-100(d) Conductor Fill.
(1) Conductor fill requirements moved from 343-15.
· 343-120 New section for marking requirements moved from 343-16 (99 NEC).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1279)

8- 75 - (343): Accept

Note: The Technical Correlating Committee notes that the FPN in the proposal is modified by the action on Proposal 8-80.#EF3

SUBMITTER: #BF4Technical Correlating Committee National Electrical Code #EF4

RECOMMENDATION: Revise as follows:

343 - 5 (a) Minimum. Nonmetallic underground conduit with conductors smaller than metric designator 16 (1/2) ~~1/2 in. electrical trade size~~ shall not be used.

343-5 (b) Maximum. Nonmetallic underground conduit with conductors larger than metric designator 103 (4)~~4 in. electrical trade size~~ shall not be used.

FPN: Metric trade numerical designations for nonmetallic underground conduit with conductors are 16 = 1/2 ~~1/2 = 16~~, 21 = 3/4 ~~3/4 = 21~~, 27 = 1 ~~1 = 27~~, 35 = 1 1/4 ~~1 1/4 = 35~~, 41 = 1 1/2 ~~1 1/2 = 41~~, 53 = 2 ~~2 = 53~~, 63 = 2 1/2 ~~2 1/2 = 63~~, 78 = 3 ~~3 = 78~~, 91 = 3 1/2 ~~3 1/2 = 91~~, and 103 = 4 ~~4 = 103~~.

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis.
In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised.
In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.

PANEL ACTION: Accept.

(Log #2067)

8- 76 - (343-1): Accept in Principle

SUBMITTER: Joel A. Rencsok, Scottsdale, AZ

RECOMMENDATION: Add a Scope section to Article 343 to read as follows:

343-1. Scope. The provisions of this article covers the use, installation, and construction specifications requirements of nonmetallic underground conduit with conductors.

Renumber remaining sections.

SUBSTANTIATION: Each Article should have a scope section.
The NEC style manual on style also shows a scope article.
To keep the Articles consistent all Articles should be similar.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-74.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2966)

8- 77 - (343-1): Accept

Note: The Technical Correlating Committee directs the panel to clarify the action on this Proposal. The Technical Correlating Committee assumes that the Panel Action on Proposal 8-74 appropriately handles the issue through the introduction of 343-6. This action will be considered by the Panel as a Public Comment.

SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions

RECOMMENDATION:
Revise text to read as follows:
"The nonmetallic conduit shall be listed and composed of a material that is resistant to moisture and corrosive agents. It shall also be capable of being supplied on reels without damage or distortion and shall be of sufficient strength to withstand abuse, such as impact or crushing, in handling and during installation without damage to conduit or conductors."

SUBSTANTIATION: This proposal requires the conduit, as a component, to be listed. Currently the conductors are required to be listed per Section 343-14. This will prohibit the use of communication raceways and require the use of electrical conduit.

PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1427)

8- 78 - (343-2): Accept in Principle

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Revise as follows:

343-2. Other Articles. ~~Installations for nonmetallic underground conduit with conductors shall comply with the provisions of the applicable sections of Article 300.~~ Where equipment grounding is required by Article 250, an assembly containing a separate equipment grounding conductor shall be used.

SUBSTANTIATION: 1999 National Electrical Code Style Manual:
Section 4.1 states "Do not use a reference if the requirement is already covered by 90.3."
Section 4.1.1 stipulates that "References shall not be made to an entire article... unless additional conditions are specified.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-74.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2180)

8- 79 - (343-3(1), FPN (New)): Reject

SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.

RECOMMENDATION: Revise as follows:

(1) For direct burial underground installation. ~~For minimum cover requirements, see Table 300-5 and 300-50 under rigid nonmetallic conduit.~~

FPN: See Tables 300-5 and 300-50 under rigid nonmetallic conduit, for minimum cover requirements.
SUBSTANTIATION: This deleted sentence is an explanatory reference to another NEC rule; therefore, it should be a fine print note. The NEC Style Manual 4.1 states, "Explanatory references shall be in fine print notes." Also 4.1.2 states, "References shall indicate the subject of the rules being referenced; the subject shall follow the number."
PANEL ACTION: Reject.
PANEL STATEMENT: This information is necessary as mandatory text since Tables 300-5 and 300-50 do not specifically refer to Nonmetallic Underground Conduit with Conductors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3037)

8- 80 - (343-5): Accept in Principle
SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Revise text as follows:
(a) Minimum. NUCC ~~Nonmetallic underground conduit with conductors~~ smaller than 1/2 (16) ~~-in. electrical trade size~~ shall not be used.
(b) Maximum. NUCC ~~Nonmetallic underground conduit with conductors~~ larger than 4 (103) ~~-in. electrical trade size~~ shall not be used.
FPN: The Trade Sizes and Metric Designators are for identification purposes only and do not relate to actual dimensions. See 300-1(c).
~~FPN: Metric trade numerical designations for nonmetallic underground conduit with conductors are 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/2 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, and 4 = 103.~~
SUBSTANTIATION: To correlate with proposal submitted by NEMA to CMP 3 to add a table showing current trade sizes and metric designators. The table provides universal information throughout the Code. This cuts out a lot of excess language in the Code which is no longer needed. Metric designators for trade sizes have been established for two Code cycles and cover raceways and system components. Also, picks up use of acronym as proposed for the 2002 Code.
PANEL ACTION: Accept in Principle.
The Panel accepts in principle the addition of the new FPN to read as follows:
FPN: See 300-1(c) for the Metric Designators and Trade Sizes. These are for identification purposes only and do not relate to actual dimensions.
The panel accepts the deletion of the old FPN. The Panel accepts in principle the replacement of the product name with the acronym "NUCC" and the deletion of "in. electrical trade size" by action on Proposals 8-74 and 8-75.
PANEL STATEMENT: The acceptance of the changes to the Fine Print Notes are contingent upon an acceptance of Proposal 3-6 by CMP-3. If CMP-3 does not accept Proposal 3-6, the panel directs staff to revert to the existing FPN. The proposed Fine Print Note was revised to comply with Section 4.1.2 of the NEC Style Manual. See Panel Action on Proposals 8-74 and 8-75.

(Log #1067)

8- 81 - (343-9, FPN): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Change "No. 4" to "4 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1156)

8- 82 - (343-11): Reject
SUBMITTER: Charles N. Landey, Wisconsin Dept. of Transportation
RECOMMENDATION: Delete 343-11.
SUBSTANTIATION: Purpose of material cited in Section 343 is low-cost protection of cable which would otherwise be direct buried. There are other methods for usable raceways with less than 360 degrees of bend. This material is often installed with greater than 360 degrees of bends and twists.
PANEL ACTION: Reject.
PANEL STATEMENT: Raceways are to be installed so conductors will not be subjected to installation stresses by being pulled through more than 360 degrees of total bends. This installation requirement is applicable to NUCC because conductors are permitted to be removed and installed just like any other raceway.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #837)

8- 83 - (343-14): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
(a) 600 Volts or Less. Conductors of different systems rated 600 volts, nominal, or less, ~~Alternating~~ alternating current or direct-current circuits shall be permitted in the same conduit. All conductors shall have an insulation rating ~~equal to at least~~ not less than the maximum nominal circuit voltage of any conductor or cable within the conduit.
(b) Over 600 Volts. Conductors or cables of circuits rated over volts shall not occupy the same conduit with conductors or cables of circuits rated 600 volts or less.
SUBSTANTIATION: It is presumed the intent of (a) is to permit different systems in the same conduit per Section 300-3(c)(1), not limited to just ac or dc circuits.
The intent of (b) is not clear. UL listing indicates the voltage rating of all conductors rated over 600 volts is the same. The first part relates to insulation rating, the last part relates to circuit rating. Present wording prohibits conductors with insulation rating over 600 volts being used for circuits rated less than 600 volts. If this is the intent, the wording should indicate that.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed text is introducing material that is under the purview of CMP 3. See Panel action on Proposal 8-83a.

(Log #125)

8- 84 - (344): Accept

NOTE: The following proposal consists of Comment 8-168 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 8-5a was:

Delete Article 331–Electrical Nonmetallic Tubing

Delete Article 343–Nonmetallic Underground Conduit With Conductors

Delete Article 345–Intermediate Metal Conduit

Delete Article 346–Rigid Metal Conduit

Delete Article 347–Rigid Nonmetallic Conduit

Delete Article 348–Electrical Metallic Tubing

Delete Article 349–Flexible Metallic Tubing

Delete Article 350–Flexible Metal Conduit

Delete Article 351–Liquidtight Flexible Metal Conduit and Liquidtight Flexible Nonmetallic Conduit

Add new Article 315

Raceways of Circular Cross Section-Conduit, Tubing and Prewired Assemblies

A. General

315-1. Scope. This article covers the use, installation, and construction specifications for those raceways defined in Section 315-2.

315-2. Definitions.

FPN: See Section 315-100 for the construction specifications of these raceways.

Electrical Metallic Tubing (EMT): A ferrous or nonferrous metal raceway of circular cross section with or without integral couplings.

Electrical Nonmetallic Tubing (ENT): A pliable corrugated nonmetallic raceway of circular cross section that can be bent by hand with a reasonable force, but without other assistance.

Flexible Metal Conduit (FMC): A flexible ferrous or nonferrous metal raceway of circular cross section.

Flexible Metallic Tubing (FMT): A metal raceway of circular cross section that is flexible, and liquidtight without a nonmetallic jacket.

Intermediate Metal Conduit (IMC). A steel raceway of circular cross section, with integral or associated couplings.

Liquidtight Flexible Metal Conduit (LFMC): A raceway of circular cross section having an outer liquidtight, nonmetallic, sunlight-resistant jacket over an inner flexible metal core.

Liquidtight Flexible Nonmetallic Conduit (LFNC): A flexible nonmetallic raceway of circular cross section.

Nonmetallic Underground Conduit (NUC): A factory assembly of conductors or cables inside a nonmetallic, smooth-walled raceway with a circular cross section.

Rigid Metal Conduit (RMC). A ferrous or nonferrous metal raceway of circular cross section, with integral or associated couplings.

Rigid Nonmetallic Conduit (RNC): A nonmetallic raceway of circular cross section with or without integral couplings.

Schedule 80: A PVC heavy walled raceway with a wall thickness conforming to schedule 80- Iron Pipe Size (IPS) dimensions.

Schedule 40: A PVC raceway with a wall thickness conforming to schedule 40-IPS dimensions.

Type A: A PVC thin walled raceway with wall thickness conforming to schedule A-IPS dimensions.

Type EB: A PVC thin walled raceway with wall thickness designed to achieve a duct stiffness of 20 lbs/in./in.

HDPE: A high density polyethelyne raceway with a wall thickness conforming to schedule 40-IPS dimensions.

RTRC: A rigid thermosetting resin raceway with a wall thickness conforming to industry specifications.

315-3. Other Articles. All raceway installations in this article shall comply with other applicable provisions of this *Code*.

315-7. Listing Requirements. All raceways covered in this article, and their associated fittings shall be listed.

B. Installation

315-12. Uses Permitted and Not Permitted. Uses permitted and not permitted for raceways covered in this article shall be as shown in Tables 315-12(a),(b) and (c).

315-14. Temperature Limitations.

(a) LFMC and LFNC shall not be permitted where any combination of ambient and conductor insulation temperatures will produce an operating temperature in excess of that for which the material is listed.

(b) ENT and RNC:

(1) ENT and RNC shall not be permitted where subject to ambient temperatures exceeding those for which the material is listed.

FPN: The maximum ambient temperature of PVC conduit and tubing is 50 degrees C (122 degrees F).

(2) ENT and RNC shall not be permitted for conductors whose insulation temperature limitation would exceed those for which the conduit or tubing is listed.

315-15. Corrosive Locations and Raceway Degradation

(a) Metal Raceways. Metal raceways subject to airborne or splash chemical exposure shall utilize materials approved for the installation. Coated metal raceways subject to airborne and splash chemical exposure and ultraviolet degradation shall utilize materials approved for the installation

(b) Nonmetallic Raceways.

(1) Nonmetallic raceways subject to ultraviolet degradation shall utilize materials approved for the installations and shall be listed as sunlight resistant.

(2) Non-metallic raceways subject to chemical solvent airborne or splash exposure shall be suitable for the installation.

FPN: See Section 300-6 for protection against corrosion.

315-17. Dissimilar Metals. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action.

Aluminum fittings and enclosures shall be permitted to be used with EMT, IMC and steel RMC. Steel fittings and enclosures shall be permitted to be used with aluminum RMC.

Table 315-12(a). Uses Permitted and Not Permitted for EMT, IMC, and RMC.

P = Permitted N = Not Permitted

Direct burial i.e. soil or cover in direct contact with the raceway	P1	N	P	P	N	P	P	N
Exposed to the direct rays of the sun	P	P	P	P	P	P	P	P
Exposed to physical damage	P	P	P	P	P	P	P	P
Support of fixtures or other equipment.	N2	N2	P	P	P	P	P	P
System voltages over 600 volts, nominal.	P	P	P	P	P	P	P	P

Notes:

Note: 1. Ferrous EMT, elbows, couplings, and fittings shall be permitted to be in direct contact with the earth where provided with corrosion protection judged suitable for the conditions.

Note: 2. EMT shall be permitted to support conduit bodies no larger than the largest trade size of an entering raceway. The conduit bodies shall not contain devices or support fixtures.

Note: 3. Ferrous raceways and fittings protected from corrosion solely by enamel shall be permitted only indoors and in occupancies not subject to severe corrosive influences.

Table 315-12(b) Uses permitted and not permitted for ENT, NUC, and RNC.
P = Permitted N = Not Permitted

	ENT	NUC	RNC

(FPN) Extreme cold may cause some types of nonmetallic raceways to become brittle and, therefore, more susceptible to damage from physical contact.

Notes:

Note: 1. In any building not exceeding three floors above grade.

Note: 2. Where used in any building exceeding three floors above grade, the walls, floors, and ceilings, including suspended ceilings, behind which the tubing is concealed shall provide a thermal barrier of material that has at least a 15-minute finish rating, as identified in listings of fire-rated assemblies. The 15-minute finish-rated thermal barrier shall be permitted to be used for combustible or noncombustible walls, floors, and ceilings.

(FPN): A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature rise of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.

Note: 3. The conductor or the cable portion of the assembly, where suitable, shall be permitted to extend within the building for termination purposes, in accordance with Section 300-3.

Note: 4. Conduit shall be permitted to support conduit bodies no larger than the largest trade size of an entering raceway. The conduit bodies shall not contain devices or support fixtures.

Note: 5. ENT shall be permitted in accordance with Article 600.

Table 315-12(c) Uses permitted and Not permitted for FMC, FMT, LFMC, and LFNC.
P = Permitted N = Not Permitted

(FPN): Extreme cold may cause some types of nonmetallic conduit to become brittle and, therefore, more susceptible to damage from physical contact.

Notes:

Note: 1. If the conductors are approved for the specific conditions and the installation is such that liquid is not likely to enter raceways or enclosures to which the conduit is connected.
Note: 2. Where listed and marked for the purpose.
Note: 3. For branch circuits only.
Note: 4. Not permitted where installed in direct contact with masonry.
Note: 5. For system voltages of 1000 volts maximum.
Note: 6. LFNC shall be permitted where longer length is essential for a required degree of flexibility.
Note: 7. Flexible conduit shall be permitted in accordance with Article 600.
Note: 8. FMC and LFMC shall be permitted in accordance with Section 430-123.

315-23. Size. Permitted sizes for raceways shall be as shown in Table 315-23.

315-25. Bends.

(a) General. Bends of raceways shall be so made that the raceway will not be damaged and its internal diameter will not be effectively reduced. Field bends shall be made only with bending equipment identified for the purpose. Bends of ENT, FMC, FMT, LFMC, LFNC, and NUC shall be permitted to be made manually.

(b) Number of Bends.

There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, e.g., conduit bodies and boxes.

(c) Radius of Curve. The radius of the curve to the centerline of a bend shall not be less than as shown in Table 315-25.

315-30. Reaming and Threading.

(a) Reaming and Trimming. All cut ends of raceways covered in this article shall be reamed or otherwise trimmed to remove rough edges. Reaming and trimming shall not be required where fittings are inside the raceway.

(b) Threaded.

(1) EMT shall not be threaded. Where integral couplings are used, such couplings shall be permitted to be factory threaded.

(2) Where IMC or RMC is threaded in the field, a standard conduit cutting die with a 3/4-in. taper per ft (1 in 16) shall be used.

(FPN): See Standard for Pipe Threads, General Purpose (Inch), ANSI/ASME, B.1.20.1-1983.

Table 315-23. Permitted Sizes for Raceways.

P = Permitted N = Not Permitted

	Trade size (inches)									
	Metal			Nonmetallic			Flexible			
Specification	EMT	IMC	RMC	ENT	NUC	RNC	FMC	FMT	LFMC	LFNC
Minimum	1/2	1/2	1/2	1/2	1/2	1/2	1/2	1/2	1/2	1/2
Maximum	4	4	6	2	4	6	4	3/4	4	4
3/8" permitted	N	N	P1	N	N	N	P2	P3	P2	P4

(FPN): Metric trade numerical designations for raceways are the same as those found in Extra-heavy Duty Rigid Steel Conduits for Electrical Installations, IEC 981-1989; namely, 3/8 = 12, 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, 4 = 103, 5 = 129, 6 = 155.

Notes to Table 315-23:
1. For enclosing the leads of motors, as permitted by Section 430-145(b).

2. Permitted for the following:
(a) Enclosing the leads of motors, as permitted in Section 430-145(b)
(b) Lengths not in excess of 6 ft (1.83 m) as part of a listed assembly, or for tap conductors to lighting fixtures as permitted in Section 410-67(c), or for utilization equipment
(c) Manufactured wiring systems, as permitted in Section 604-6(a)
(d) Hoistways, as permitted in Section 620-21(a)(1)
(e) As part of a listed assembly to connect wired fixture sections, as permitted in Section 410-77(c)

3. Permitted for the following:
(a) Lengths not in excess of 6 ft (1.83 m) as part of an listed assembly, or for lighting fixtures. See Section 410-67(c).
(b) In accordance with Sections 300-22(b) and (c)

4. Permitted for the following:
(a) Enclosing the leads of motors, as permitted in Section 430-145(b)
(b) Lengths not in excess of 6 ft (1.83 m) as part of a listed assembly, or for tap conductors to lighting fixtures as permitted in Section 410-67(c), or for utilization equipment
(c) Electric sign conductors on insulators, in accordance with Section 600-32(a)

Table 315-25. Minimum Radii for Bends (Inches)

Trade Size (inches)	ENT, IMC, RMC, RNC EMT, FMC, LFMC, LFNC	NUC	FMT	
			Fixed Bends (1)	Field Bends (2)

3-1/2	15	–	–	–
4	16	60	–	–
5	24	–	–	–
6	30	–	–	–

For SI Units: (Radius) 1 in. = 25.4 mm

Note 1 - Where bent for installation purposes and is not flexed or bent as required by use after installation.
Note 2 - Where infrequently flexed in service after installation.

315-35. Supports.
(a) General. Section 315-35 does not apply to NUC .
(b) Nonflexible Raceways.
(1) Complete System. Raceways shall be installed as a complete system, as provided in Article 300, and shall be securely fastened. RNC shall be fastened so that movement from thermal expansion or contraction will be permitted.
a. EMT shall be securely fastened at intervals not exceeding 10 ft (3.05 m). Unbroken lengths of EMT shall be permitted to be fished for concealed work in finished buildings or prefinished wall panels where such securing is impracticable.
b. IMC and RMC shall be supported at intervals not exceeding 10 ft (3.05 m).
Exception No. 1: Where made up with threaded couplings, it shall be permissible to support straight runs in accordance with Table 315-35(a), provided such supports prevent transmission of stresses to termination where conduit is deflected between supports.
Exception No. 2: For exposed vertical risers from industrial machinery, the distance between supports shall be permitted to be increased to 20 ft (6.1 m), provided that the conduit is made up with threaded couplings, is firmly supported at the top and bottom of the riser, and no other means of intermediate support is readily available.
c. ENT shall be securely fastened at intervals not exceeding 3 ft.
Exception: Lengths not exceeding 6 ft (1.83 m) from a fixture terminal connection for tap conductors to lighting fixtures, as permitted in Section 410-67(c).
d. RNC shall be supported as required in Table 315-35(b). RNC listed for support at spacings other than as shown in Table 315-35(b) shall be permitted to be installed in accordance with the listing.
(2) Horizontal Runs through Framing Members.
a. Horizontal runs of EMT, IMC, or RMC supported by openings through framing members at intervals not exceeding 10 ft (3.05 m)

and securely fastened within 3 ft (914 mm) of termination points shall be permitted.

b. Horizontal runs of ENT supported by openings through framing members at intervals not exceeding 3 ft (914 mm) and securely fastened within 3 ft (914 mm) of termination points shall be permitted.

c. Horizontal runs of RNC supported by openings through framing members at intervals not exceeding those specified in Table 315-35(b) and securely fastened within 3 ft (914 mm) of termination points shall be permitted.

(3) Distance from Fastening to Termination. Raceways shall be securely fastened within 3 ft (914 mm) of each outlet box, junction box, device box, cabinet, conduit body, or other termination.

Exception No. 1: Where approved, IMC and RMC shall not be required to be securely fastened within 3 ft (914 mm) of the service head for above-the-roof termination of a mast.

Exception No. 2: Fastening of EMT, IMC, and RMC at their termination points shall be permitted to be increased to 5 ft (1.52 m) where structural members do not readily permit fastening within 3 ft (914 mm). For EMT, this exception shall apply to unbroken lengths only.

Exception No. 3: RNC listed for securing at other than 3 ft (914 mm) shall be permitted to be installed in accordance with the listing.

Exception No. 4: For concealed work in finished buildings or prefinished wall panels where such securing is impracticable, unbroken lengths of EMT shall be permitted to be fished.

Table 315-35(a). Support for Straight Runs of RMC or IMC Made Up with Threaded Couplings

Trade Size (inches)	Maximum Distance Between Supports (feet)
1/2 – 3/4	10
1	12
1 1/4 – 1 1/2	14
2 – 2 1/2	16
3 and larger	20

For SI units: (Supports) 1 ft = 0.3048 m.

Table 315-35(b). Support for RNC

Trade Size (inches)	Maximum Distance Between Supports (feet)
1/2–1	3
1 1/4–2	5
2 1/2–3	6
3 1/2–5	7
6	8

For SI units: (Supports) 1 ft = 0.3048 m.

(c) Flexible Raceways.
(1) Supported or Secured.
a. FMC and LFMC shall be supported and secured at intervals not exceeding 4 1/2 ft (1.37 m). Supporting and securing shall not be required where the conduit is fished or where installed in lengths not exceeding 6 ft (1.83 m) from a fixture terminal connection for tap conductors to lighting fixtures, as permitted in Section 410-67(c).
b. Where installed in lengths longer than six feet, LFNC as described in Section 315-100(d)(2) shall be securely fastened at intervals not exceeding 3 ft (914 mm) unless the conduit is fished.

(2) Distance from Fastening to Termination. LFNC, as described in Section 315-100(d)(2), installed in lengths longer than six feet, FMC, and LFMC shall be securely fastened by an approved means within 12 in. (305 mm) of each box, cabinet, conduit body, or other termination of the conduit unless:

(a) the conduit is fished, or
(b) the length does not exceed 3 ft (914 mm) at terminals where flexibility is necessary, or
(c) the length does not exceed 6 ft (1.83 m) from a fixture terminal connection for tap conductors to lighting fixtures, as permitted in Section 410-67(c).
(3) Horizontal Runs through Framing Members.
a. Horizontal runs of FMC and LFMC supported by openings through framing members at intervals not exceeding 4 1/2 ft (1.37 m) and securely fastened within 12 in. (305 mm) of termination points shall be permitted.

315-40. Boxes. Boxes shall comply with the applicable provisions of Articles 300 and 370.

315-50. Fittings.
(a) General. Fittings shall comply with the applicable provisions of Articles 300 and 370.

(b) Expansion Fittings for RNC. Expansion fittings shall be provided for RNC to compensate for thermal expansion and contraction where the length change, in accordance with Chapter 9, Table 10, is expected to be 0.25 in. (6.36 mm) or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other termination of the conduit.

(c) FMT Fittings. FMT fittings shall effectively close any openings in the connection.

(d) Angle Connectors. Angle connectors shall not be used for concealed installations of FMC, LFMC, or LFNC.

(e) Threadless Couplings and Connectors. Threadless couplings and connectors used with EMT, IMC, and RMC shall be made up tight. Where buried in masonry or concrete, they shall be concrete-tight. Where installed in wet locations, they shall be raintight.

(f) Running Threads. Running threads shall not be used on IMC or RMC for connection at couplings.

(g) Joints. Where ENT, NUC, or RNC is used, all joints between lengths of raceways and between raceways, fittings, and boxes shall be by an approved method.

(h) Bushings. Where a nonflexible raceway enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the conductor or cable from abrasion, unless the design of the box, fitting, or enclosure provides equivalent protection. See Section 300-4(f) for the protection of conductors size No. 4 or larger.

315-60. Grounding and Bonding.
(a) Grounding. Metal raceways shall be permitted as a grounding means as covered in Section 250-91(b). Where FMC or LFMC is used to connect equipment where flexibility is required, an equipment grounding conductor shall be installed.

(b) Bonding. Where an equipment bonding jumper is required, it shall be installed in accordance with Article 250, Part G.

315-70. Number of Conductors.
The number of conductors permitted in a single raceway shall not exceed the percentage fill specified in Chapter 9, Table 1, using the conduit or tubing dimensions of Chapter 9, Table 4. The number of conductors permitted in 3/8-in. FMC, FMT, or LFMC shall not exceed that specified in Table 315-70.

Table 315-70. Maximum Number of Insulated Conductors in 3/8-in. FMC, FMT, or LFMC*

Column A = Internal fitting
Column B = External fitting

Size AWG	Types RFH-2, SF-2		Types TF, XHHW, AF, TW		Types TFN, THHN, THWN		Types FEP, FEPB, PF, PGF	
	A	B	A	B	A	B	A	B
18	2	3	3	5	5	8	5	8
16	1	2	3	4	4	6	4	6
14	1	2	2	3	3	4	3	4
12	—	—	1	2	2	3	2	3
10	—	—	1	1	1	1	1	2

***In addition, one covered or bare equipment grounding conductor of the same size shall be permitted.**
b. Horizontal runs of LFNC supported by openings through framing members at intervals not exceeding 3 ft (914 mm) and securely fastened within 12 in. (305 mm) of termination points shall be permitted.

C. Construction Specifications

315-100. Construction.
(a) EMT.
(1) Finish. EMT shall have such a finish or treatment of outer surfaces as will provide an approved durable means of readily distinguishing it, after installation, from RMC and IMC.
(2) Connector. Where EMT is coupled together by threads, the connector shall be so designed as to prevent bending of the tubing at any part of the thread.
(b) ENT. ENT shall be composed of a material that is resistant to moisture and chemical atmospheres and is flame-retardant. ENT shall be made of material that does not exceed the ignitibility, flammability, smoke generation, and toxicity characteristics of rigid (nonplasticized) polyvinyl chloride.
(c) FMC. FMC shall be constructed of helically wound, formed, interlocked metal strip
(d) LFNC. LFNC shall be flame-resistant and shall be constructed as one of the following types:
(1) a smooth seamless inner core and cover bonded together and having one or more reinforcement layers between the core and cover
(2) a smooth inner surface with integral reinforcement within the conduit wall
(3) a corrugated internal and external surface without integral reinforcement within the conduit wall
(e) NUC.
(1) General. NUC is an assembly that is provided in continuous lengths shipped in a coil, reel, or carton.
(2) Conduit. The nonmetallic conduit shall be composed of a material resistant to moisture and corrosive agents. It shall also be capable of being supplied on reels without damage or distortion and shall be of sufficient strength to withstand abuse, such as impact or crushing, in handling and during installation without damage to conduit or conductors.
(3) Conductors and Cables. Conductors and cables used in NUC shall be listed, shall be suitable for use in wet locations, and shall be as follows:
a. 600 Volts or Less. Alternating-current and direct-current circuits shall be permitted. All conductors shall have an insulation rating equal to at least the maximum nominal circuit voltage of any conductor or cable within the raceway.
b. Over 600 Volts. Conductors or cables rated over 600 volts shall not occupy the same raceway with conductors or cables of circuits rated 600 volts or less.
(f) RNC. RNC and fittings shall be of suitable nonmetallic material resistant to moisture and chemical atmospheres. For use aboveground, RNC shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low temperature and sunlight effects. For use underground, RNC shall be resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. RNC listed for the purpose shall be permitted to be installed underground in continuous lengths from a reel. Where intended for direct burial, without encasement in concrete, the RNC shall also be capable of withstanding continued loading likely to be encountered after installation.

315-107. Standard Lengths.
IMC and RMC shall be shipped in standard lengths of 10 ft (3.05 m), including coupling, one coupling to be furnished with each length. For specific applications or uses, it shall be permitted to ship lengths shorter or longer than 10 ft (3.05 m) with or without couplings and with or without threads.
315-190. Marking.
(a) Clear and Durable.
(1) Each length of EMT, ENT, and RMC shall be clearly and durably marked at intervals not exceeding 10 ft (3.05 m). See Section 110-21.
(2) IMC. In addition to the requirements of Section 315-190(a)(1), each length of IMC shall be clearly and durably identified at 2 1/2 ft (762 MM) intervals with the letters IMC.
(3) NUC. NUC shall be clearly and durably marked at least every 10 ft (3.05M) as required by Section 110-21. Identification of conductors or cables used in NUC shall be provided on a tag attached to each end of the assembly or to the side of a reel. Enclosed conductors or cables, shall be marked in accordance with Section 310-11.
(4) RNC. Each length of RNC shall be clearly and durably marked at intervals not exceeding 10 ft (3.05 m). See Section 110-21. For RNC recognized for use aboveground, markings shall be permanent. For RNC limited to underground use only, markings shall be sufficiently durable to remain legible until the material is installed.
(b) Type of Material.
(1) RNC and NUC. For NUC, the type of conduit material shall also be included in the marking. For RNC, the type of material shall also be included in the marking, unless it is visually identifiable.
(2) ENT and RNC shall be permitted to be surface-marked to indicate special characteristics of the material.
(FPN): Examples of these [optional] markings include, but are not limited to, the suffix "LS" for limited-smoke and markings such as "sunlight resistant."
(3) Corrosion-Resistant Material. Nonferrous IMC or RMC of corrosion-resistant material shall have suitable markings.
This panel desires the 1999 Code to be published with a reference note where all of the deleted articles (i.e. 331, 343, 345, 346, 347, 348, 349, 350, and 351) would have been located in the 1999 Code. The reference should indicate Article 315 has been added to replace each Article.
SUBMITTER: David Ullian Larson, Port St. Lucie, FL
RECOMMENDATION: Delete proposed Article 344 in its entirety. Keep separate articles for each raceway of circular cross section conduit, tubing and prewired assemblies.
SUBSTANTIATION: A new article is not needed. The existing articles are not difficult to find. The existing articles contain concise information. A new article would scatter this existing order into disarray. Installation errors would likely be more frequent. Education of new workers would be more difficult.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel agrees with the submitter that combining the nine articles into one article (Proposal 8-5a of the 1999 NEC cycle) would not enhance usability, therefore the individual articles have been retained.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

(Log #126)

8- 85 - (344): Reject
NOTE: The following proposal consists of Comment 8-169 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Noel Williams, Salt Lake City, UT
RECOMMENDATION: This proposal should remain accepted. The Technical Correlating Committee recommendation to keep the titles of deleted Articles with a note referencing the new Article should be followed.
SUBSTANTIATION: This proposal will go a long way in making this part of the NEC easier to use. Many objections relate to the usability of the new tables. These tables will be much easier for new users than the existing format of multiple Articles and many redundant rules. Experienced users will find the new Article somewhat difficult at first, but those difficulties are likely due mostly to the need to get used to the new arrangement. The grouping of requirements of the same type will be much easier in the long run. For example, users who wish to know whether a specific use is acceptable for some product, say EMT, will be able to find not only the permitted uses for EMT, but also suitable substitutes, or an appropriate wiring method for a condition for which EMT is not suitable. Previous codes have required searching through individual Articles to find this information.
Arguments for the status quo should be rejected.
In the interest of usability, the old Article headings with notes directing users to the new Article should be retained for at least one code cycle. The recommended headings did not appear in the Report on Proposals preprint.
PANEL ACTION: Reject.
PANEL STATEMENT: Article 344 did not meet the requirements of usability and the objectives of the sub-task group. The sub task group to the TCC usability task group proposed reformatted individual raceway articles for user friendly code. Any comments that proposed text and which applied exclusively to Article 344 (Proposal 8-5a of the 1999 NEC cycle) are no longer applicable.

(Log #127)

8- 86 - (344): Accept in Principle
NOTE: The following proposal consists of Comment 8-170 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Keith M. Whitesel, Whitesel Electric
RECOMMENDATION: Delete new Article 344. Let the existing articles stand. Combining all these articles in the name of simplification is ludicrous. The way it is now, when I want information about EMT, I go to Article 348. We know where to find the applicable information needed.
SUBSTANTIATION: None.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See Proposal 8-84 for panel action and panel statement.

8- 87 - (344 (New)): Reject
NOTE: The following proposal consists of Comment 8-171 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: To organize Chapter 3 in a logical progression the Technical Correlating Committee directs that proposed new Article 315 will be numbered as new Article 344. The Technical Correlating Committee notes that the language in this Proposal as accepted by the Panel is modified by subsequent technical proposals submitted to Code-Making Panel 8. To provide the user with a ready reference as to those Proposals they are listed here:
8-58, 66, 72, 79, 109, 111a, 112, 114, 121, 126, 144, 152,157, 163, 164, 181a, 187, 199, 207,214, 222,and 295.
The Technical Correlating Committee directs the Panel to give further consideration to the affirmative comments on voting.
The Technical Correlating Committee directs the Panel to clarify the "*" note in the Title of Table 315-70 so it is clear that the note applies to all the conduit types covered by the Table.
The Technical Correlating Committee recommends to NFPA staff that they keep the present Article number and Title in place for the deleted articles and place a single paragraph following the title which states: "The material in this Article has been deleted and the requirements have been integrated into Article 344."
The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Reject.
PANEL STATEMENT: See Proposal 8-85 for panel action and panel statement.

NOTE: The following proposal consists of Comment 8-172 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: David Cabello, Brown & Heim
RECOMMENDATION: I request that CMP 8 leave the nine raceway articles alone. They are somewhat easy to understand. The way I hear they are wanting to change, I believe they would become difficult to understand, too jumbled together.
SUBSTANTIATION: New Article 344 would be too confusing. I've been in trade seven years and believe that the articles are fine the way they are.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See Proposal 8-84 for panel action and panel statement.

NOTE: The following proposal consists of Comment 8-175 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8- 84 (Log #125)].
SUBMITTER: Greg Gale, Denver Electric
RECOMMENDATION: I very much hope that CMP 8 will see their way clear to leave the nine raceway articles alone in the 1999 NEC.
SUBSTANTIATION: I feel that the Code book is complex enough and the new article and 344 will make the Code book too difficult and confusing to use.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See Proposal 8-84 for panel action and panel statement.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

NOTE: The following proposal consists of Comment 8-178 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Gary A. Thompson, City of Portland, OR/Rep. IAEI
RECOMMENDATION: Delete entire proposed Article 344. Reject.
SUBSTANTIATION: I do plan review, teach, and related training. My students are Canadian, West Coast States of Washington, Idaho, Montana, Utah, Oregon, Alaska, California; beginning apprentices through experienced electrical engineers. Testing engineers for word usage from the Code will produce 75 percent results. Plan review proves that most engineers (19 in 20) will test 35 percent or less. Article 344 adds confusion to an already burdened electrical engineering society.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See Proposal 8-84 for panel action and panel statement.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

NOTE: The following proposal consists of Comment 8-180 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete this section or accept in principle revised as follows:
315-7 ~~Aluminum~~ Nonferrous metal raceways, fittings, and enclosures shall be permitted to be used with ~~EMT, IMC, and steel RMC.~~ ferrous metal raceways, fittings, and enclosures. ~~Steel~~ Ferrous metal raceways, fittings, and enclosures shall be permitted to be used with ~~aluminum RMC~~ nonferrous metal raceways, fittings, or enclosures. Bare conductors, where permitted to be used, shall be permitted in ferrous or nonferrous metal raceways or enclosures.
SUBSTANTIATION: This is probably one of the most disregarded rules in the Code. Is anyone prohibiting aluminum raceways clamped directly to steel framing members, or flexible aluminum conduit connected directly to RMC, EMT, or wireways, or bare copper grounding conductors in aluminum raceways? In any case, present wording of second sentence is too limited. It doesn't provide for dissimilar metal raceway-to-raceway connections, such as steel RMC to aluminum RMC or aluminum flexible conduit, or aluminum raceway to steel wireway, etc. It does not refer to flexible metal raceways, does not cover brass conduit or boxes, and does not address bare conductors in metal raceways.
The second sentence of the comment may be considered superfluous as the first sentence incorporates what it says, but may offer clarity.
PANEL ACTION: Reject.

8- 115 - (344): Accept in Principle
NOTE: The following proposal consists of Comment 8-200 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Jack A. Gruber, Wheatland Tube Co.
RECOMMENDATION: This proposal should be rejected.
SUBSTANTIATION: This is extremely confusing and has not made this article more "user friendly". Installers will look at the table to see what is permitted but will not check the notes for all possible exceptions.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See Proposal 8-84 for panel action and panel statement.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #157)

8- 116 - (344): Accept in Principle in Part
NOTE: The following proposal consists of Comment 8-201 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Ronald P. O'Riley, Innovative Education, Inc.
RECOMMENDATION: Delete new layout and return to individual Articles 345 through 351 for circular cross-sectional wiring methods. Accept the various revisions to the particular wiring method and the rewording of exceptions for Article 345 through 351.

Delete Article 331, Electrical Nonmetallic Tubing, and make it into a new Article 344 so it will be with the other circular cross-section conduits and tubing. Delete the permitting of ENT to be prewired.
SUBSTANTIATION: The new revised layout is not user friendly., It is much harder to locate information in and interpret. In the 1996 Code layout, when a person was designing or installing electrical metallic tubing, it was simple to look under the particular wiring method at hand, Article 348 Electrical Metallic Tubing. The article was then divided into very logical three parts, General, Installation, and Construction. Next was the identifying bold face headings that made it easy to find the rules for such things as use permitted, bending, supporting, and etc. This was an easy, clear cut way to locate and interpret the rules.

The Code already has grouped the circular wiring methods together between Articles 345 and 351 with the exception of ENT. Article 311 could be moved to 344 and then all the circular wiring methods would be together.

The new layout now requires the designer or the installer to reverse the procedure. Now they must first decide if they want to know something about use, bending, supporting or such. Now they must sort through all of what used to be a simple heading and or table until they find the type of raceway they are working with. The tables with their multitude of notes, which as tables will be in very small print, are going to be very hard to interpret.

I question the value of permitting prewired ENT. Past experiences with the Code shows that once the Code does something for one particular wiring method, it is found necessary to permit the same for other competitive wiring methods. Take a look at the number of tables in the Code today because a special table was suggested for nonmetallic conduit. There will no reason this should not be done with other metallic or nonmetallic flexible wiring methods.
PANEL ACTION: Accept in Principle in Part.
PANEL STATEMENT: The Panel agrees that Proposal 8-5a should not be accepted. See Panel action and statement on Proposal 8-84. The Panel offers the following comments relative to the submitter's recommendation referring to revisions to Articles 345 through 351, the renumbering of Article 331, and the deletion of prewired ENT:
1. All proposed revisions related to Articles 345 through 351 have been evaluated on their individual merits.
2. The renumbering of articles is not within the scope of CMP 8.
3. CMP -8 believes the data presented for the acceptance of prewired ENT was sufficient for the Panel to accept it.

NOTE: The following proposal consists of Comment 8-205 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Daniel Caddigan, Midwest Interstate Electrical Const. Co.
RECOMMENDATION: Reject this proposal.
SUBSTANTIATION: This proposal needs more work, although I agree with the intent of this proposal. This proposal does not enhance the usability of the NEC, in fact it detracts from the usability. Presently, all the rules for a particular conduit system are in one section. Under this proposal, they are all combined. The use of the matrix format is not user friendly when the tables each have 3-8 notes following the table. As it is, the tables do not correlate with other sections of the Code (i.e., Table 315-23 and Article 430-145(b)). This proposal needs more work.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See Proposal 8-84 for panel action and panel statement.

NOTE: The following proposal consists of Comment 8-207 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: W. Creighton Schwan, Hayward, CA
RECOMMENDATION: This proposal, and proposal 8-5, should be REJECTED. Leave the round raceway Articles as they are in the 1996 NEC.
SUBSTANTIATION: Large Tables with many footnotes are difficult to use, and easily misread. An installer is only interested in one wiring method at a time, and the information required is much more accessible in the 1996 format. This proposed change is definitely not user friendly.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See Proposal 8-84 for panel action and panel statement.

SUBMITTER: Ray C. Mullin, Ray C. Mullin Books
RECOMMENDATION: Delete entire new Article 344 and revert back to original arrangement.
SUBSTANTIATION: I have perused this proposed new Article that combines all of the many tubular wiring methods into one Article. It is my personal feeling that although the intent of the combing is well intended, that the rearrangement will cause more confusion to the user. When I want to look up something in the NEC such as nonmetallic-sheathed cable, I refer to the article relating to nonmetallic-sheathed cable. I do not want to be confused with a multitude of references, footnotes, FPNs, exceptions, etc. that are not related to nonmetallic-sheathed cable.
The NEC is difficult to use.
There will be confusion and much unnecessary time consumed trying to sort out what the user is looking for in the NEC.
I commend the committee on its efforts to combine all of the tubular raceway material into one article, but I am afraid that it needs more time to "soak" before making the final decision.
Let's hold off for another Code cycle on this major proposed change.
PANEL ACTION: Accept in Principle.

SUBMITTER: Richard E. Loyd, R&N Assoc.
RECOMMENDATION: Please reconsider and reject this proposal.
SUBSTANTIATION: As a member of the task working group and the Panel, I believe we did complete the task that we were requested to do by the Usability Task Committee in developing this article and it certainly has not been wasted time. The draft does provide a clearer picture of some of the Code inconsistencies and also provided ideas on what type of changes would be user friendly. After spending hours of time in finding further changes that are needed for correlation with the 1996 Code and accepted proposals other than 8-5a, we must conclude that the rewrite does not provide the user friendliness anticipated. To make such a dramatic change without accomplishing that goal would be a disservice to the Code. There is a good chance that you will not hear from a lot of users. That does not mean they necessarily agree with the change. This is overwhelming in its magnitude and has not been gone through in detail at meetings around the country. Only true Code change participants are likely to realize the impact, or study it. I have heard that the group most likely to benefit from this combined article could be designers. The NEC is not a design manual, and it should be the most user friendly to installers (who generally work with one or two wiring methods at a time) and to inspectors who have to determine that a proper installation has been made.

There are some things that need to be done, but truly believe this exercise has shown that combining the articles is not the right process. There are far too many notes needed for the tables. In addition, critical information is contained beyond the tables and is sure to be ignored in many cases. There is a tendency when a matrix is provided to look only at permitted or not permitted by the majority of the people, another small percentage will follow the notes, and an even smaller percentage will follow the entire article. With today's trend of cutting back on inspection services this is especially troubling.

Some User Friendly Task Group members have agreed that while some of the rewrites are beneficial, the conduit article just does not reach that goal. While commending the effort and spending many hours to catch errors and omissions, I urge the Panel to reject this proposal and let's search for another solution.

SUBMITTER: William Wusinich, IBEW/Eastern Code Advisory Gro
RECOMMENDATION: I strongly recommend to CMP 8 that they reconsider their action on this new article and reject the concept of doing away with the nine existing articles on raceways.
SUBSTANTIATION: Since the ROP meetings in Hilton Head, I have conducted four seminars on this proposed change. One was with a group of contractors, one was at an IAEI meeting and two were for groups of electricians. During the first two seminars I tried to maintain a positive attitude and sell the idea that this change would take some time to get use to but after you worked with the proposed new article you would slowly get use to it. The last two seminars I gave were very uncomfortable on my part. The audience was livid as to why this major change was made without any request from within the electrical construction industry.
The vast majority of the industry does not have a problem understanding the provisions for raceways as written in the present Code.
One person suggested that "the user friendly committee rewrite the plumbing Code and stay out of the NEC".
PANEL ACTION: Accept in Principle.

8- 142 - (344): Accept in Principle
NOTE: The following proposal consists of Comment 8-230 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Paul E. Guidry, Sugar Land, TX
RECOMMENDATION: Leave raceways in independent Articles. Do not combine all raceways into one Article.
SUBSTANTIATION: The Usability Task Group (UTG) has gone overboard in it's attempt to simplify the Code by combining all raceways into one common Article. I strongly disagree with this format. While it is true that most raceways have many common features and some of the information in the independent articles is redundant, each type of raceway differs in one fashion or another. I believe this format will NOT make the Code easier to use. I urge the UTG and CMP 8 and the Correlating Committee to reconsider this decision.
PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See Proposal 8-84 for panel action and panel statement.

8- 143 - (344): Reject
NOTE: The following proposal consists of Comment 8-231 on Proposal 8-52 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 8-52 was:
Add new wording:
"Where cables 600 volts or less are permitted in the same tray, as stated in NEC Section 318-16(f), Exception No. 2, the number of cables rated 600 volts or less shall conform to NEC Section 318-9(a)."
SUBMITTER: Danny King, City of Fort Smith, AK
RECOMMENDATION: Reject; "Hold for Further Study".
SUBSTANTIATION: Reject; "Hold for Further Study".
PANEL ACTION: Reject.
PANEL STATEMENT: There was no substantiation made by the submitter. Section 4-3.3 of the Regulations Governing Committee Projects details the required content of proposals. Among other things, it requires proposals to provide a statement of the problem and substantiation.

NOTE: The following proposal consists of Comment 8-232 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Larry E. Fuhrnian, City of Titusville, FL
RECOMMENDATION: Reject.
SUBSTANTIATION: The present Code sections dealing with separate raceways, each having a section is not improved by lumping them all together in one section. New system and raceways need new sections.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See Proposal 8-84 for panel action and panel statement.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #186)

8- 145 - (344): Accept in Principle
NOTE: The following proposal consists of Comment 8-233 on Proposal 8-66 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 8-66 was:
Add a new permitted use:
(x) 1/2" through 1" as listed manufactured prewired assembly.
SUBMITTER: David Alan Munk, Brown and Heim Electric Co./Rep. IBEW
RECOMMENDATION: I think we should reject the CMP 8 proposal and leave the nine articles on raceways in the Code.
SUBSTANTIATION: The new Article 344 is way too difficult. I've been in the trade for four years and it is confusing.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See Proposal 8-84 for panel action and panel statement. The panel recognizes that the submitter's comment incorrectly references Proposal 8-66. The correct reference is Proposal 8-5a.

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: The proposal should be rejected.
SUBSTANTIATION: The new combined article has a set of three matrix tables and accompanying notes to address the allowable uses and restrictions on the tubular raceway wiring methods. This is supposed to be a great advance in the cause of a more user-friendly, more simplified code. Actually, the combined article is anything but, with three basic tables accompanied by a total of 17 notes, seven supplementary tables, and section numbers running from 1 to 190. In total column inches it's about the same size as the articles it replaces. Users of the code never work with all the various wiring methods at the same time. We work with one or two, and we need to find the relevant requirements quickly. That will be far more difficult with this rewrite. This effort belongs in a handbook or instructional materials for untrained per-sons; it does not belong in the Code.

This isn't to say there isn't a place for this kind of exercise. It's a valuable teaching tool for journeyman classes, and it helps a panel sort out when requirement differences across wiring methods exist for a reason as opposed to a simple lack of correlation. It may have a place in some kind of handbook. No one ever asserted, as part of the substantiation, that there is a safety problem with the present Code organization. The astronomical expenses, however, that are involved in redoing training materials on wiring methods are obvious.

In the past we used to demand compelling technical justification based on safety concerns in order to make changes in the Code, or at least we were supposed to. Some of us still think that to be a valuable ideal. This proposal has no such substantiation. I can remember (on CMP 9) attempting to make a minor change on lighting and appliance branch-circuit panelboards and running into entrenched NEMA opposition because it would have forced changes in some of the labels. Where was the safety issue that they should be forced to undergo this expense? A fair question, actually, and we didn't make the change. Now let's consider the expense of shredding every training manual in the world that refers to NEC

recognized wiring method articles.
The impetus for this type of reorganization seems to have come from middle management at NFPA and not from the industry, and it certainly isn't in our interest. Although there will undoubtedly be suggestions to hold this for a cycle, I think this approach needs the proverbial stake through its heart right now, so we can go on and study Code proposals that actually ad-dress safety issues.
I am well aware of the amount of effort that went into this proposal, and for that reason this is a difficult comment to write. I am asking the panel to set aside hundreds, no, thousands of person-hours of work. I do so reluctantly, but in the firm belief that the direction given the panel was badly flawed and from a task group that was improperly supervised.
PANEL ACTION: Accept in Principle.

SUBMITTER: Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Reject this proposal.
SUBSTANTIATION: The Task Group and the Panel did yeoman's duty in developing this article and it certainly has not been wasted time. We believe it has provided a clearer picture of some of the Code inconsistencies and also provided ideas on what type of changes would be user friendly. After spending hours of our own time in finding further changes that are needed for correlation with the 1996 Code and accepted proposals other than 8-5a, we must conclude that the rewrite does not provide the User Friendliness anticipated. To make such a dramatic change without accomplishing that goal would be a disservice to the Code. There is a good chance that you will not hear from a lot of users. That does not mean they necessarily agree with the change. This is overwhelming in its magnitude and has not been gone through in detail at meetings around the country. Only true Code change participants are likely to realize the impact, or study it. We have heard that the group most likely to benefit from this combined article could be designers. The NEC is not a design manual, and it should be the most user friendly to installers (who generally work with one or two wiring methods at a time) and to inspectors who have to determine that a proper installation has been made.
There are some things that need to be done, but we truly believe this exercise has shown that combining the articles is not the right process. There are far too many notes needed for the Tables. In addition, critical information is contained beyond the Tables and is sure to be ignored in many cases. There is a tendency when a matrix is provided to look only at Permitted or Not Permitted by the majority of the people, another small percentage will follow the notes, and an even smaller percentage will follow the entire article. With today's trend of cutting back on inspection services this is especially troubling.
Some User Friendly Task Group members have agreed that while some of the rewrites are wonderful, the conduit article just does not reach the goal. While commending the effort and spending many hours to catch glitches ourselves, we urge the Panel to reject this proposal and let's search for another solution.
PANEL ACTION: Accept in Principle.

(Log #241)

8- 159 - (344): Accept in Principle
NOTE: The following proposal consists of Comment 8-213 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8- 84 (Log #125)].
SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION: Either reject this proposal, or at the least, hold for further study.
SUBSTANTIATION: I have provided a rewrite in government text of the changes that need to be made to this rewrite of several articles in order to correlate with the 1996 NEC and Proposals accepted in the ROP. These are far too extensive to publish without in-depth

public review. Holding for further study would provide an opportunity before the next Code for such review. To publish without providing a substantial period of time for the public to assimilate this whole concept with whatever changes are submitted during the comment period would be wrong.

We must not forget that many jurisdictions do not adopt every edition of the NEC. That was a problem when the Neher-McGrath tables were put into the Code with a future effective date, and then removed. We do not want to make the same mistake.

The support section is very important in assuring a quality installation that will maintain good joints and require less maintenance. Continuity is very important for a safe installation. This section is extremely difficult. For example, it is necessary to go to four specific sections and two general sections in order to find out the requirements for securing EMT. It is very difficult to pick out and much easier to use when located together as it is in the current NEC.

REJECTION WOULD BE A BETTER ALTERNATIVE. THE MANY HOURS SPENT ON THE LITTLE NUANCES THAT ARE DIFFICULT TO PICK UP IN TABLES, AND THE RESULTING NEED FOR SO MANY ADDITIONAL NOTES SUPPORTS THAT "USER FRIENDLINESS" HAS NOT BEEN ACHIEVED. The effort has not been totally without merit because it has revealed numerous inconsistencies in the Code that will need to be addressed next time around. It also makes one appreciate the existing Code structure. The rewrite is going to take more pages than the current text requires, not less. We do not believe it serves the purpose for which it was intended and suggest that for the 2002 Code, separate articles, all written in consistent format might provide to be more user friendly.

This rewrite also has not improved safety, but will require revision and printing of millions of dollars of literature, textbooks, and other instructional materials. While the Code changes every three years, the article references have remained consistent and much literature is written in a manner not to require changes. Let's be sure to accomplish our goal and have a really user friendly structure when we make such a monumental change.

A separate comment has been submitted by members for each suggested revision contained in the rewrite which I have provided, so only the concept of rejecting (or holding) the rewrite need be addressed by the Panel for this particular comment. The full document is supplied to assist your deliberations and provide a complete picture of the changes needed to correlate with the 1996 Code requirements and proposals accepted at the first CMP meeting.

Note: Supporting material is available for review at NFPA Headquarters.

SUBMITTER: Patricia Horton, Elaine Thompson, Allied Tube & Conduit
RECOMMENDATION: We believe this rewrite should either be rejected or held for further study. However, if it is accepted, make the following changes to the definitions in this Section.
Coated Conduit/Tubing: Steel conduit or tubing that is provided with a corrosion protection coating that is an alternate to galvanizing, but is not supplementary.
Electrical Metallic Tubing (EMT): An unthreaded light-weight metal raceway of circular cross-section, with or without integral couplings, designed for the physical protection and routing of wire conductors and use as an equipment grounding conductor when installed utilizing appropriate fittings. ~~A ferrous or nonferrous metal raceway of circular cross section with or without integral couplings.~~
Electrical Nonmetallic Tubing (ENT): A pliable corrugated nonmetallic raceway of circular cross section that can be formed~~bent~~ by hand with a reasonable force,without the use of bending equipment. ~~but without other assistance.~~
Flexible Metal Conduit (FMC): A raceway of circular cross section made of helically wound, formed, interlocked ferrous or nonferrous metal strip. ~~A flexible ferrous or nonferrous metal raceway of circular cross section.~~
Intermediate Metal Conduit (IMC). A threaded intermediate-weight steel raceway of circular cross-section supplied with a standard conduit coupling or integral coupling. It is designed for the physical protection and routing of wire conductors and for use as an equipment grounding conductor when installed utilizing appropriate fittings. ~~A steel raceway of circular cross section, with integral or associated couplings.~~
Liquidtight Flexible Nonmetallic Conduit (LFNC): A flexible nonmetallic raceway of circular cross section having an outer liquidtight, nonmetallic, sunlight-resistant jacket over an inner flexible nonmetallic core.
Manufactured prewired assembly. A pliable or flexible raceway containing removable conductors which are installed at the raceway manufacturing facility.
Nonmetallic Underground Conduit (NUCC): A factory assembly of conductors or cables inside a nonmetallic, smooth-walled raceway of~~with~~ a circular cross section which is capable of being reeled..
Rigid Metal Conduit (RMC). A threaded heavy-weight metal raceway of circular cross section supplied with a standard conduit coupling or integral coupling. It is designed for the physical protection and routing of wire conductors and for use as an equipment grounding conductor when installed utilizing appropriate fittings. ~~A ferrous or nonferrous metal raceway of circular cross section, with integral or associated couplings.~~
Definitions for RNFC and RTRC to be located under rigid nonmetallic conduit (RNC).
RNFC. A fiberglass reinforced epoxy raceway of circular cross section with a wall thickness conforming to Schedule 40-IPS dimensions.
RTRC: A raceway of circular cross-section made of reinforced thermosetting resin (Type BG-Underground; Type AG-Aboveground, underground, direct burial.) ~~A rigid thermosetting resin raceway with a wall thickness conforming to Schedule 40 IPS dimensions.~~
Supplementary Coating. A coating applied over standard galvanized conduit or tubing to provide additional corrosion protection in severely corrosive locations.
SUBSTANTIATION: Coated Conduit/Tubing Substantiation: "Coated" is used in Table 315-12(c) and requires definition.
Electrical Metallic Tubing Substantiation: This language more appropriately defines EMT.
Electrical Nonmetallic Tubing Substantiation: To clarify that ENT is not being "bent" by a hand bender, which the phrase "bent by hand" could be construed to mean.
Flexible Metal Conduit Substantiation: This language is from the 1996 NEC and is more descriptive than the 315 draft.
Intermediate Metal Conduit Substantiation: This language more appropriately defines IMC.
Liquidtight Flexible Nonmetallic Conduit Substantiation: To make this definition more consistent with Liquidtight Flexible Metallic Conduit (LFMC) and provide more complete information.
Manufactured prewired assembly Substantiation: This term is now used in Article 315 and requires definition.
Nonmetallic Underground Conduit Substantiation: A "C" was added after "NUC" to clarify that this is nonmetallic underground conduit with conductors installed. There is an important distinction between empty conduit and conduit with factory installed conductors. It is also important to note the pliable characteristic that is needed.
Rigid Metal Conduit Substantiation: This language more appropriately defines RMC.
RNFC Substantiation: Definition of this product which has a separate application column, was not in 8-5a.
RTRC Substantiation: An application column has been added for this nonmetallic raceway and requires definition.
Supplementary Coating Substantiation: This term is needed to differentiate between a new type of rigid conduit with a PVC coating over bare steel, as opposed to the familiar supplementary coated conduit which is PVC over galvanizing for extra protection in severely corrosive environments.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-84.

8- 167 - (344-3): Accept in Principle
NOTE: The following proposal consists of Comment 8-257 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Patricia Horton, Elaine Thompson, Allied Tube & Co
RECOMMENDATION: We believe this rewrite should either be rejected or held for further study. However, if it is accepted, revise the section as follows:
315-3. Other Articles. All ~~raceway~~ installations of raceways, NUCC, and manufactured prewired assemblies in this article shall comply with other applicable provisions of this Code.
SUBSTANTIATION: Article 315 includes NUCC and

manufactured prewired assemblies. It should be clear that these wiring methods differ from empty raceways and that there may be conductor considerations. (See related comments on 315-1 and 315-7).
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-84.

AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #247)

8- 170 - (344-12): Accept in Principle
NOTE: The following proposal consists of Comment 8-260 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Patricia Horton, Elaine Thompson, Allied Tube & Conduit
RECOMMENDATION: We believe this rewrite should either be rejected or held for further study. However, if it is accepted, revise this section to read as follows:
315-12. Uses Permitted and Not Permitted. Uses permitted and not permitted for raceways and assemblies covered in this article shall be those applications ~~as~~ shown in Tables 315-12(a), (b), ~~and~~ (c),and (d) and in sections (a) through (c) below.
NOTE: Application lines do not stand independently; some applications modify other applications, e.g. outdoor or indoor application reads "P", but exposed to physical damage reads "N". Therefore, the raceway could not be used indoors or outdoors where subject to physical damage.
SUBSTANTIATION: It is not clear that individual lines in the "Uses Permitted and Not Permitted" Tables 344-12(a), 12(b), 12(c), and 12(d) modify other lines, which could lead to misapplication of the products. As Mr. Forsberg noted in his affirmative comment, "The Code user must read all of the applications because one condition may modify another, i.e. 'Outdoors', 'Exposed to physical damage', and 'Systems over 600 volts, nominal.' For instance, Table 315-12(c) LFMC is permitted for 'Outdoors' and in accordance with Notes 7 and 8 for 'Systems over 600 volts, nominal', but not permitted 'Exposed to physical damage'. LFMC thus would not be permitted for that application."
The change "and (a) through (c) below" relates to Uses Permitted and Not Permitted which have been moved from other locations within the Article and are explained in Comments on Sections 315-14, 315-15 and 315-23. This additional language is needed if those comments are accepted. The relocation is necessary for a more complete "Uses Permitted and Not Permitted" Section.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-84.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

Note: The sequence no. 8-171 was not used.

(Log #200)

8- 172 - (344-12(a)): Reject
NOTE: The following proposal consists of Comment 8-262 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Charles W. Forsberg, Lamson & Sessions
RECOMMENDATION: For the Galvanized EMT column in the application, "Encased or embedded in poured concrete below grade", replace "N" with "P1".
SUBSTANTIATION: This change was noted in item 5 of the CMP 8 substantiation for this proposal, but it was overlooked by NFPA staff.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 8-85.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #248)

8- 173 - (344-12(a)): Accept in Principle
NOTE: The following proposal consists of Comment 8-261 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8- 84 (Log #125)].
SUBMITTER: Patricia Horton, Elaine Thompson, Allied Tube & Conduit
RECOMMENDATION: We believe this rewrite should either be rejected or held for further study. However, if it is accepted, make the following changes to Table 315-12(a):
1. Add a Fine Print Note below Table 315-12(a) as follows: "(FPN) Coated, as used in this Table, does not pertain to coatings which are applied as supplementary corrosion protection in severe corrosive environments such as those covered in Section 300-6".
2. Change Note 1 as follows: "Ferrous EMT, elbows, couplings, and fittings shall be permitted to be in direct contact with the earth or embedded in poured concrete below grade where provided with

corrosion protection judged suitable for the conditions."
3. Change "N" to "P1" for Galv. EMT "Encased or embedded in poured concrete below grade."
4. Change "P" to "P4" for Galv. and Alum. EMT "Exposed to physical damage" and add Note 4: "EMT shall not be permitted where subject to severe physical damage."
5. Change "P" to "P5" for Galv. and Alum. EMT "System voltages over 600 volts, nominal" and add Note 5: "EMT shall be permitted for system voltages over 600 V. nominal, in accordance with Section 300-37."
6. Change "N" to "P7" for Alum. EMT "Encased or embedded in poured concrete on or above grade" and add Note 7: "Aluminum EMT used in concrete or in direct contact with the earth requires supplementary corrosion protection."
7. Change "N" to "P7" for Alum. EMT "Encased or embedded in poured concrete below grade".
8. Change "N" to "P7" for Alum. EMT "Direct Burial".
9. Change "P" to "P6" for Coated RMC or IMC "Indoors, Exposed" and "Indoors, Concealed" and add Note 6: "Raceways having corrosion protection coatings which are alternatives to galvanizing shall not be permitted in spaces covered by Section 300-22."
SUBSTANTIATION: 1. There are conduits now on the market which utilize alternate methods of corrosion protection to galvanizing. It is important that Code users know that this type of "coated" RMC is a different type of product from galvanized RMC that has a supplementary coating applied over the galvanizing. Supplementary coatings have not been addressed in Article 346 - they are referenced in Section 300-6 and can be applied either at a factory or in the field.
2. This language is included in the 1996 NEC and should not have been deleted from the Draft of Article 315. The listing also permits such use. There is no reason to prohibit use when supplementary protection can be provided where necessary.
3. This is an errata listed in the Substantiation to Proposal 8-5a.
4. The current code does not permit EMT where subject to severe physical damage.
5. EMT has been identified for Installations of over 600 Volts. It will now be shown in Section 300-37 (ROP 13-37) as an aboveground wiring method.

6. Since the Task Force that drafted Article 315 included separate columns for galvanized and aluminum EMT, it is necessary to be specific as to the requirements for each type. Listing requires supplementary corrosion protection for aluminum EMT in these applications.
7. See Substantiation directly above.
8. See Substantiation above.
9. There is a type of RMC now available which uses a PVC coating as an alternate to galvanizing (not supplementary to galvanizing) and which should be subject to the same restrictions as nonmetallic products are in Section 300-22.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-84.

NOTE: The following proposal consists of Comment 8-263 on Proposal 8-5 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 8-5 was:
Delete Article 331–Electrical Nonmetallic Tubing
Delete Article 343–Nonmetallic Underground Conduit With Conductors
Delete Article 345–Intermediate Metal Conduit
Delete Article 346–Rigid Metal Conduit
Delete Article 347–Rigid Nonmetallic Conduit
Delete Article 348–Electrical Metallic Tubing
Delete Article 349–Flexible Metallic Tubing
Delete Article 350–Flexible Metal Conduit
Delete Article 351–Liquidtight Flexible Metal Conduit and Liquidtight Flexible Nonmetallic Conduit
Add new Article 315–Wiring Methods–Conduit And Tubing

A. General

315-1. Scope.
This article covers the use, installation, and construction specifications for conduit and tubing.

315-2. Definitions.

Electrical Metallic Tubing (EMT): A metal raceway of circular cross section with associated couplings, connectors, and fittings.

Electrical Nonmetallic Tubing (ENT): A pliable corrugated nonmetallic raceway of circular cross section with integral or associated couplings, connectors, and fittings. A pliable raceway is a raceway that can be bent by hand with a reasonable force, but without other assistance.

Flexible Metal Conduit (FMC): A flexible metal raceway of circular cross section with associated fittings.

Flexible Metallic Tubing (FMT): A metal raceway of circular cross section and associated fittings that is flexible, and liquidtight without a nonmetallic jacket.

Intermediate Metal Conduit (IMC): A metal raceway of circular cross section with integral or associated couplings, connectors, and fittings.

Liquidtight Flexible Metal Conduit (LFMC): A raceway of circular cross section having an outer liquidtight, nonmetallic, sunlight-resistant jacket over an inner flexible metal core with associated fittings.

Liquidtight Flexible Nonmetallic Conduit (LFNC): A flexible nonmetallic raceway of circular cross section with associated fittings.

Nonmetallic Underground Conduit (NUC): A factory assembly of conductors or cables inside a nonmetallic, smooth-walled conduit with a circular cross section with associated fittings.

Rigid Metal Conduit (RMC): A metal raceway of circular cross section with associated couplings, connectors, and fittings.

Rigid Nonmetallic Conduit (RNC): A nonmetallic raceway of circular cross section with associated couplings, connectors, and fittings.

315-3. Other Articles.
All installations of conduit or tubing shall also comply with other applicable provisions of this *Code.*

315-7. Listing Requirements.
All conduit, tubing, and their associated fittings shall be listed.

B. Installation

315-12. Uses Permitted and Not Permitted.
Uses permitted and not permitted for conduit and tubing shall be as shown in Table 315-12(a),(b) or (c).

Table 315-12(a). Uses Permitted and Not Permitted for EMT, IMC, and RMC.

P = Permitted N = Not Permitted

	EMT		IMC	RMC			
Application	Galv	Alum	Galv	Galv	Alum	Other Non-ferrous	Coated
Outdoors	P	P	P	P	P	P	P
Indoors, Exposed	P	P	P	P	P	P	P
Indoors, Concealed	P	P	P	P	P	P	P
Wet locations (Indoor)	P	P	P	P	P	P	P
Damp locations	P	P	P	P	P	P	P
Dry locations	P	P	P	P	P	P	P
Encased or embedded in poured concrete on or above grade	P	N	P	P	N	P	P
Encased or embedded in poured concrete below grade	N	N	P	P	N	P	P
Direct burial i.e. soil or cover in direct contact with the conduit or tubing	P1	N	P	P	N	P	P
Exposed to the direct rays of the sun	P	P	P	P	P	P	P
Exposed to physical damage	P	P	P	P	P	P	P
Support of fixtures or other equipment.	N2	N2	P	P	P	P	P
System voltages over 600 volts, nominal.	P	P	P	P	P	P	P

Notes:
Note: 1. Ferrous EMT, elbows, couplings, and fittings shall be permitted to be in direct contact with the earth where protected by corrosion protection and judged suitable for the condition.
Note: 2. Except conduit bodies no larger than the largest trade size of the tubing.

Table 315-12(b) Uses permitted and not permitted for ENT, NUC, and RNC.

	ENT	NUC	RNC					
Application		with conductors	Sch. 40 PVC	Sch. 80 PVC	Type A PVC	Type EB PVC	RTRC	HDPE
Outdoors	N	N	P	P	N	N	P	N
Indoors, Exposed	P1,2	N3	P	P	N	N	P	N
Indoors, Concealed	P2	N	P	P	N	N	P	N
Wet locations (Indoor)	P	N	P	P	N	N	P	N
Damp locations	P	N	P	P	N	N	P	N
Dry locations	P	N	P	P	N	N	P	N
Encased or embedded in poured concrete on or above grade	P	N	P	P	P	N	P	N
Encased or embedded in poured concrete below grade	P	P	P	P	P	P	P	P
Direct burial i.e. soil or cover in direct contact with the conduit or tubing	N	P	P	P	N	N	P	P
Exposed to the direct rays of the sun	N	N	P	P	N	N	P	N
Exposed to physical damage	N	N	N	P	N	N	N	N
Support of fixtures or other equipment.	N	N	N4	N4	N	N	N4	N
System voltages over 600 volts, nominal.	N5	P	P	P	P	P	P	P

(FPN) Extreme cold may cause some types of nonmetallic conduits to become brittle and, therefore, more susceptible to damage from physical contact.

Notes:
Note: 1. In any building not exceeding three floors above grade.
Note: 2. Where used in any building exceeding three floors above grade, the walls, floors, and ceilings, including suspended ceilings, behind which the tubing is concealed shall provide a thermal barrier of material that has at least a 15-minute finish rating, as identified in listings of fire-rated assemblies. The 15-minute finish-rated thermal barrier shall be permitted to be used for combustible or noncombustible walls, floors, and ceilings.
(FPN): A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature rise of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.
Note: 3. Exception: The conductor or the cable portion of the assembly, where suitable, shall be permitted to extend within the building for termination purposes, in accordance with Section 300-3.
Note: 4. Except conduit bodies no larger than the largest trade size of an entering raceway. The conduit bodies shall not contain devices or support fixtures.
Note: 5. Except as permitted in Article 600.

Table 315-12(c) Uses permitted and Not permitted for FMC, FMT, LFMC, and LFNC.

	FMC		FMT	LFMC	LFNC		
Application	Steel	Alum			Type 1	Type 2	Type 3
Outdoors	N1	N1	N	P	P2	P2	P2
Indoors, Exposed	P	P	P3	P	P	P	P
Indoors, Concealed	P	P	P3	P	P	P	P
Wet locations	N1	N1	N	P	P	P	P
Damp locations	P	P4	N	P	P	P	P
Dry locations	P	P	P3	P	P	P	P
Encased or embedded in poured concrete on, above and below grade	N	N	N	P2	P2	P2	P2
Direct burial i.e. soil or cover in direct contact with the conduit or tubing	N	N	N	P2	P2	P2	P2
Exposed to physical damage	N	N	N	N	N	N	N
Support of fixtures or other equipment.	N	N	N	N	N	N	N
Flexibility	P	P	N	P	P	P	P
Lengths over 6 ft (1.83 m).	P	P	N	P	N6	P	N6
System voltages over 600 volts, nominal.	N7,8	N7,8	P3,5	N7,8	N7	N7	N7

(FPN): Extreme cold may cause some types of nonmetallic conduits to become brittle and, therefore, more susceptible to damage from physical contact.

Notes:
Note: 1. If the conductors are approved for the specific conditions and the installation is such that liquid is not likely to enter raceways or enclosure to which the conduit is connected.
Note: 2. Where listed and marked for the purpose.
Note: 3. Branch circuits only.
Note: 4. Not permitted where installed in direct contact with masonry.
Note: 5. For system voltages of 1000 volts maximum.
Note: 6. LFNC shall be permitted where longer length is essential for a required degree of flexibility.
Note: 7. Except as permitted in Article 600.
Note: 8. Except as permitted in Section 430-123.

Definitions of abbreviations used in Tables 315-12(a),(b), and (c) entries:

Flexibility: Where flexibility is required for installation, operation, or maintenance.

RTRC: Rigid Thermosetting Resin Conduit.

HDPE: High Density Polyethylene Conduit

315-14. Temperature Limitations.
(a) LFMC and LFNC shall not be permitted where any combination of ambient and conductor insulation temperatures will produce an operating temperature in excess of that for which the material is listed.
(b) ENT and RNC:
(1) ENT and RNC shall not be permitted where subject to ambient temperatures exceeding those for which the material is listed.
FPN: The ambient of PVC conduit and tubing is limited to 50 degrees C (122 degrees F) for application of this section.
(2) ENT and RNC shall not be permitted for conductors whose insulation temperature limitation would exceed those for which the conduit or tubing are listed.

315-15. Corrosive Influences.
In locations subject to severe corrosive influences or where subject to chemicals, conduit and tubing shall be made of materials specifically approved for the environment and shall comply with Section 300-6.

315-17. Dissimilar Metals.
Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action.
Exception: Aluminum fittings and enclosures shall be permitted to be used with EMT, IMC and steel RMC. Steel fittings and enclosures shall be permitted to be used with aluminum RMC.

315-23. Size.
Permitted sizes for conduit and tubing shall be as shown in Table 315-23.

Table 315-23. Permitted Sizes for Conduit and Tubing.

P = Permitted N = Not Permitted

Trade size (inches)

	Metal			Nonmetallic			Flexible Conduit			
Specification	EMT	IMC	RMC	ENT	NUC	RNC	FMC	FMT	LFMC	LFNC
Minimum	1/2	1/2	1/2	1/2	1/2	1/2	1/2	1/2	1/2	1/2
Maximum	4	4	6	2	4	6	4	3/4	4	4
3/8" permitted	N	N	P1	N	N	N	P2	P3	P2	P4

(FPN): Metric trade numerical designations for conduits and tubing are the same as those found in Extra-heavy Duty Rigid Steel Conduits for Electrical Installations, IEC 981-1989; namely, 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, 4 = 103.

Notes to Table 315-23:
1. For enclosing the leads of motors, as permitted by Section 430-145(b).

2. Permitted for the following:
(a) Enclosing the leads of motors, as permitted in Section 430-145(b)
(b) Lengths not in excess of 6 ft (1.83 m) as part of a listed assembly, or for tap conductors to lighting fixtures as permitted in Section 410-67(c), or for utilization equipment
(c) Manufactured wiring systems, as permitted in Section 604-6(a)
(d) Hoistways, as permitted in Section 620-21(a)(1)
(e) As part of a listed assembly to connect wired fixture sections, as permitted in Section 410-77(c)

3. Permitted for the following:
(a) Lengths not in excess of 6 ft (1.83 m) as part of an listed assembly, or for lighting fixtures. See Section 410-67(c).
(b) In accordance with Sections 300-22(b) and (c)

4. Permitted for the following:
(a) Enclosing the leads of motors, as permitted in Section 430-145(b)
(b) Lengths not in excess of 6 ft (1.83 m) as part of a listed assembly, or for tap conductors to lighting fixtures as permitted in Section 410-67(c), or for utilization equipment
(c) Electric sign conductors on insulators, in accordance with Section 600-32(a)

315-25. Bends .
(a) General. Bends of conduit and tubing shall be so made that the conduit or tubing will not be damaged and its internal diameter will not be effectively reduced. Field bends shall be made only with bending equipment identified for the purpose.
Exception: Bends of ENT, FMT, LFMC, LFNC, and NUC shall be permitted to be made manually.
(b) Number of Bends.
There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, e.g., conduit bodies and boxes.
(c) Radius of Curve. The radius of the curve to the centerline of any field bend shall not be less than as shown in Table 315-25(a).
Exception No. 1: Field bends of FMT shall have a minimum radius not less than as shown in Table 315-25(b).
Exception No. 2: Field bends of NUC shall conform to their listing requirements.

Table 315-25(a). Minimum Radii for Conduit Bends (Inches)

Size of Conduit	Radius to Center of Conduit
1/2	4
3/4	4 1/2
1	5 3/4
1 1/4	7 1/4
1 1/2	8 1/4
2	9 1/2
2 1/2	10 1/2
3	13
3 1/2	15
4	16
5	24
6	30

For SI units: (Radius) 1 in. = 25.4 mm.

Table 315-25(b). Minimum Radii for FMT (Inches)

Trade Size	Minimum Radius	
	Fixed Bends 1	Flexing Bends 2
3/8	3 1/2	10
1/2	4	12 1/2
3/4	5	17 1/2

note 1 - Not flexed or bent after installation.
note 2 - Infrequently flexed after installation.
For SI units: (Radius) 1 in. = 25.4 mm.

315-30. Reaming and Threading.
(a) Reamed.
(1) All cut ends of EMT, FMC, IMC, and RMC shall be reamed or otherwise finished to remove rough edges.
Exception: FMC, where fittings that thread into the convolutions are used.

(b) Threaded.
(1) EMT shall not be threaded. Where integral couplings are used, such couplings shall be permitted to be factory threaded.
(2) Where IMC or RMC is threaded in the field, a standard conduit cutting die with a 3/4-in. taper per ft (1 in 16) shall be used.
(FPN): See Standard for Pipe Threads, General Purpose (Inch), ANSI/ASME, B.1.20.1-1983.

315-35. Supports.
a) General. Section 315-35 does not apply to NUC .
(b) Nonflexible Conduit and Tubing.
(1) Complete System. Conduit and tubing shall be installed as a complete system, as provided in Article 300, and shall be securely

fastened. RNC shall be fastened so that movement from thermal expansion or contraction will be permitted.

a. EMT shall be securely fastened at intervals not exceeding 10 ft (3.05 m).

Exception: For concealed work in finished buildings or prefinished wall panels where such securing is impracticable, unbroken lengths of electrical metallic tubing shall be permitted to be fished.

b. IMC and RMC shall be supported at intervals not exceeding 10 ft (3.05 m).

Exception No. 1: Where made up with threaded couplings, it shall be permissible to support straight runs in accordance with Table 315-35(a), provided such supports prevent transmission of stresses to termination where conduit is deflected between supports.

Exception No. 2: For exposed vertical risers from industrial machinery, the distance between supports shall be permitted to be increased to 20 ft (6.1 m), provided that the conduit is made up with threaded couplings, is firmly supported at the top and bottom of the riser, and no other means of intermediate support is readily available.

c. ENT shall be securely fastened at intervals not exceeding 3 ft.

Exception: Lengths not exceeding 6 ft (1.83 m) from a fixture terminal connection for tap conductors to lighting fixtures, as permitted in Section 410-67(c).

d. RNC shall be supported as required in Table 315-35(b).
Exception: RNC listed for support at spacings other than as shown in Table 315-35(b) shall be permitted to be installed in accordance with the listing.

(2) Horizontal Runs through Framing Members.
a. Horizontal runs of EMT, IMC, or RMC supported by openings through framing members at intervals not exceeding 10 ft (3.05 m) and securely fastened within 3 ft (914 mm) of termination points shall be permitted.

b. Horizontal runs of ENT supported by openings through framing members at intervals not exceeding 3 ft (914 mm) and securely fastened within 3 ft (914 mm) of termination points shall be permitted.

c. Horizontal runs of RNC supported by openings through framing members at intervals not exceeding those specified in Table 315-35(b) and securely fastened within 3 ft (914 mm) of termination points shall be permitted.

(3) Distance from Fastening to Termination. Conduit and tubing shall be securely fastened within 3 ft (914 mm) of each outlet box, junction box, device box, cabinet, conduit body, or other termination.

Exception No. 1: Where approved, IMC and RMC shall not be required to be securely fastened within 3 ft (914 mm) of the service head for above-the-roof termination of a mast.

Exception No. 2: Fastening of EMT, IMC, and RMC at their termination points shall be permitted to be increased to 5 ft (1.52 m) where structural members do not readily permit fastening within 3 ft (914 mm). For EMT, this exception shall apply to unbroken lengths only.

Exception No. 3: RNC listed for securing at other than 3 ft (914 mm) and support at spacings other than as shown in Table 315-35(b) shall be permitted to be installed in accordance with the listing.

Table 315-35(a). Support for Straight Runs of Rigid or Intermediate Metal Conduit Made Up with Threaded Couplings

Conduit Size (inches)	Maximum Distance Between Supports (feet)
1/2 – 3/4	10
1	12
1 1/4 – 1 1/2	14
2 – 2 1/2	16
3 and larger	20

For SI units: (Supports) 1 ft = 0.3048 m.

Table 315-35(b). Support for Rigid Nonmetallic Conduit

Conduit Size (inches)	Maximum Distance Between Supports (feet)
1/2–1	3
1 1/4–2	5
2 1/2–3	6
3 1/2–5	7
6	8

For SI units: (Supports) 1 ft = 0.3048 m.

(c) Flexible Conduit and Tubing.

(1) Supported or Secured.
a. FMC and LFMC shall be supported and secured at intervals not exceeding 4 1/2 ft (1.37 m).
Exception: Where the conduit is fished.

b. LFNC shall be securely fastened at intervals not exceeding 3 ft (914 mm).

Exception: Where the conduit is fished.
(2) Distance from Fastening to Termination. FMC, LFMC, and LFNC shall be securely fastened by an approved means within 12 in. (305 mm) of each box, cabinet, conduit body, or other conduit termination.

Exception No. 1: Where the conduit is fished.

Exception No. 2: Lengths not exceeding 3 ft (914 mm) at terminals where flexibility is necessary.

Exception No. 3: Lengths not exceeding 6 ft (1.83 m) from a fixture terminal connection for tap conductors to lighting fixtures, as permitted in Section 410-67(c).

(3) Horizontal Runs through Framing Members.
a. Horizontal runs of FMC and LFMC supported by openings through framing members at intervals not exceeding 4 1/2 ft (1.37 m) and securely fastened within 12 in. (305 mm) of termination points shall be permitted.

b. Horizontal runs of LFNC supported by openings through framing members at intervals not exceeding 3 ft (914 mm) and securely fastened within 12 in. (305 mm) of termination points shall be permitted.

315-40. Boxes and Fittings.
(a) General. Boxes and fittings shall comply with the applicable provisions of Articles 300 and 370.

(b) Expansion Fittings for RNC. Expansion fittings shall be provided for rigid nonmetallic conduit to compensate for thermal expansion and contraction where the length change, in accordance with Chapter 9, Table 10, is expected to be 0.25 in. (6.36 mm) or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.

(c) Flexible Conduit and Tubing.
(1) Angle Connectors. Angle connectors shall not be used for concealed raceway installations of FMC, LFMC, or LFNC.

(2) FMT Fittings. FMT fittings shall effectively close any openings in the connection.

315-50. Couplings and Connectors.
(a) Threadless. Threadless couplings and connectors used with EMT, IMC, and RMC shall be made up tight. Where buried in masonry or concrete, they shall be concretetight. Where installed in wet locations, they shall be raintight.

(b) Running Threads. Running threads shall not be used on IMC or RMC for connection at couplings.

(c) Joints. Where ENT, NUC, or RNC is used, all joints between lengths of conduit or tubing and between conduit or tubing and couplings, fittings, and boxes shall be by an approved method.

315-55. Bushings.
Where nonflexible conduit or tubing enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the conductor or cable from abrasion, unless the design of the box, fitting, or enclosure provides equivalent protection. See Section 300-4(f) for the protection of conductors size No. 4 or larger.
315-60. Grounding and Bonding.
(a) Grounding. Metal conduit and tubing shall be permitted as a grounding means as covered in Section 250-91(b). Where FMC or LFMC is used to connect equipment where flexibility is required, an equipment grounding conductor shall be installed.

(b) Bonding. Where an equipment bonding jumper is required, it shall be installed in accordance with Article 250, Part G.

315-70. Number of Conductors.
The number of conductors permitted in a single conduit or tubing shall not exceed the percentage fill specified in Chapter 9, Table 1, using the conduit or tubing dimensions of Chapter 9, Table 4. The number of conductors permitted in 3/8-in. FMC, FMT, or LFMC shall not exceed that specified in Table 315-70.

C. Construction Specifications

315-100. Construction.
(a) EMT.
(1) Finish. EMT shall have such a finish or treatment of outer surfaces as will provide an approved durable means of readily distinguishing it, after installation, from rigid metal conduit.
(2) Connector. Where EMT is coupled together by threads, the connector shall be so designed as to prevent bending of the tubing at any part of the thread.
(b) ENT. ENT shall be composed of a material that is resistant to moisture and chemical atmospheres and is flame-retardant. Electrical nonmetallic tubing shall be made of material that does not exceed the ignitibility, flammability, smoke generation, and toxicity characteristics of rigid (nonplasticized) polyvinyl chloride.

(c) FMC. FMC shall be constructed of helically wound, formed, interlocked metal strip

(d) LFNC. LFNC shall be flame-resistant and shall be constructed as one of the following types:
(1) a smooth seamless inner core and cover bonded together and having one or more reinforcement layers between the core and cover
(2) a smooth inner surface with integral reinforcement within the conduit wall
(3) a corrugated internal and external surface without integral reinforcement within the conduit wall
(e) NUC.
(1) Conduit. The nonmetallic conduit shall be composed of a material resistant to moisture and corrosive agents. It shall also be capable of being supplied on reels without damage or distortion and shall be of sufficient strength to withstand abuse, such as impact or crushing, in handling and during installation without damage to conduit or conductors.
(2) Conductors and Cables. Conductors and cables used in nonmetallic underground conduit with conductors shall be listed, shall be suitable for use in wet locations, and shall be as follows:

a. 600 Volts or Less. Alternating-current and direct-current circuits shall be permitted. All conductors shall have an insulation rating equal to at least the maximum nominal circuit voltage of any conductor or cable within the conduit.

b. Over 600 Volts. Conductors or cables rated over 600 volts shall not occupy the same conduit with conductors or cables of circuits rated 600 volts or less.

Table 315-70. Maximum Number of Insulated Conductors in 3/8-in. FMC, FMT, or LFMC*

Column A = With fitting inside conduit
Column B = With fitting outside conduit

Size AWG	Types RFH-2, SF-2		Types TF, XHHW, AF, TW		Types TFN, THHN, THWN		Types FEP, FEPB, PF, PGF	
	A	B	A	B	A	B	A	B
18	2	3	3	5	5	8	5	8
16	1	2	3	4	4	6	4	6
14	1	2	2	3	3	4	3	4
12	—	—	1	2	2	3	2	3
10	—	—	1	1	1	1	1	2

*In addition, one covered or bare equipment grounding conductor of the same size shall be permitted.

(f) RNC. RNC conduit and fittings shall be of suitable nonmetallic material resistant to moisture and chemical atmospheres. For use aboveground, it shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Conduits listed for the purpose shall be permitted to be installed underground in continuous lengths from a reel. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading likely to be encountered after installation.

315-107. Standard Lengths.
IMC and RMC shall be shipped in standard lengths of 10 ft (3.05 m), including coupling, one coupling to be furnished with each length. For specific applications or uses, it shall be permitted to ship lengths shorter or longer than 10 ft (3.05 M) with or without couplings and with or without threads.

315-190. Marking.
(a) Clear and Durable.
(1) Each length of ENT, RMC, and RNC shall be clearly and durably marked at intervals not exceeding 10 ft (3.05 m). See Section 110-21.
(2) IMC. In addition to the requirements of Section 315-190(a)(1), each length of IMC shall be clearly and durably identified at 2 1/2 ft (762 MM) intervals with the letters IMC.
(3) NUC. NUC shall be clearly and durably marked at least every 10 ft (3.05M) as required by Section 110-21. Identification of conductors or cables used in NUC shall be provided on a tag attached to each end of the assembly or to the side of a reel. Enclosed conductors or cables, shall be marked in accordance with Section 310-11.
(4) RNC. For RNC recognized for use aboveground, markings shall be permanent. For RNC limited to underground use only, markings shall be sufficiently durable to remain legible until the material is installed.

(b) Type of Material.
(1) RNC and NUC. For NUC, the type of conduit material shall also be included in the marking. For RNC, the type of material shall also be included in the marking, unless it is visually identifiable.
(2) ENT and RNC shall be permitted to be surface-marked to indicate special characteristics of the material.
(FPN): Examples of these [optional] markings include, but are not limited to, the suffix "LS" for limited-smoke and markings such as "sunlight resistant."

(3) Corrosion-Resistant Material. Nonferrous IMC or RMC of corrosion-resistant material shall have suitable markings.

SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Accept in principle revised as follows:
Table 315-12(a), Note 2. Except conduit bodies no larger than the largest trade size of the tubing. The conduit bodies shall not contain devices or support fixtures or other equipment.
Table 315-12(b), Note 4. Except conduit bodies no larger than the largest trade size of ~~an entering raceway~~ the conduit. The conduit bodies shall not contain devices or support fixtures or other equipment.
315-35(a)(1)a. Add:
Exposed installations of electrical metallic tubing on rooftops with a slope of less than 4 in. (102 mm) in 12 in. (305 mm) shall be securely fastened within 3 ft (914 mm) on each side of couplings.
315-35(a)(1)b Exception No. 1:
Where made up with threaded couplings, it shall be permissible to support horizontal straight runs in accordance with Table 315-35(a), provided such supports prevent transmission of stresses to termination where conduit is deflected between supports.
315-35(a)(1)b, Exception No. 2:
For exposed vertical risers from ~~industrial machinery~~ stationary equipment, the distance between supports shall be permitted to be increased to 20 ft (6.1 m), provided that the conduit is made up with threaded couplings, is firmly supported at the top and bottom of the riser, and no other means of intermediate support is readily available.
Table 315-70. Change the number of conductors in each column (A and B) to the next higher number. Revise asterisk note: ~~In addition~~ One ~~covered or bare~~ equipment grounding conductor not larger than the circuit conductors ~~of the same size~~ shall be permitted, if it is bare or has the same type insulation as the circuit conductors. An equipment grounding conductor shall be counted in applying this table.
SUBSTANTIATION: The proposed revision for Table 315-12(a) Note 2 and Table 315-12(b) Note 4 is editorial to correlate the notes for similar wording and to clarify that other equipment is not to be supported. It states this in the tables but the notes indicate exception to the "other equipment" prohibition. Note 4 can be construed as permitting a conduit body with no devices and not supporting fixtures, but supporting other equipment such as photocells, horns, speakers, etc. The comment for Section 315-15(a)(1) is an adjunct to Panel Action on Proposal 8-157 relating to loss of EMT continuity on rooftops. The separations I have observed appeared to be caused to a great extent by lack of support adjacent to both sides of couplings. Where one support is within 3 ft or less of a coupling and the next support is 10 ft away, the EMT is more susceptible to separation due to human activity. Where roofs cannot be readily walked upon, this requirement is not so important.
315-35(a)(1)b, Exception No. 2: While there is a need for this exception for industrial machinery there is also a need for other equipment. A plant could have two equipments adjacent to each other, one designated industrial machinery, the other not so designated. This exception could be utilized for one but not the other an Authority Having Jurisdiction may reasonably permit both under Section 90-4, or use Section 315-35(a)(1)b, Exception No. 1 for extended lengths since a vertical riser may be "straight". This type installation is being routinely done and accepted as can be verified by visits to department stores, markets, home building supply centers, etc. Table 315-70. In general, a single conductor in a raceway is prohibited by Section 300-3(b). Section 250-91(b), Exception permits the metal conduits as a grounding means under certain conditions, or a bonding jumper could be used outside a raceway not over 6 ft. However, the omission of an EGC does not increase the number of circuit conductors permitted by the table. If column B permits 3 No. 12 THHN conductors plus one No. 12 covered grounding conductor, a better use of resources would be to permit 4 conductors with a user choice whether one is an EGC. "Covered" and "same size" are deleted as covered conductors designated in the past as "weatherproof" type have a thicker covering than types in the table, and "same size" literally does not permit a smaller EGC which may be otherwise permitted.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 8-85.

NOTE: The following proposal consists of Comment 8-264 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Dan Gearing, Perma Cote Industries
RECOMMENDATION: Add a new fine print note to read:
Coated, as used in this table is not the coating applied over galvanized RMC as supplementary protection in severely corrosive environments such as those in the (FPN) to 300-6.
Also, the note number should be placed by the heading "Coated" in the table.
SUBSTANTIATION: This is necessary to make sure a new PVC over nongalvanized steel is not mistakenly used in severely corrosive environments where the galvanic action beneath a supplementary coating of PVC is needed in case of damage to the PVC. The new product only provides one layer of protection, not two.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 8-85.

NOTE: The following proposal consists of Comment 8-266 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].

SUBMITTER: Charles W. Forsberg, Lamson & Sessions

RECOMMENDATION: For RTRC RNC, make RTRC the heading to cover 2 columns:

1. Label the current RTRC column, "AG".
2. Add a second column under RTRC labeled "BG".
3. The application entries for the "BG" column will be, "N,N,N,N,N,N,N,P,P,N,N,N,P".

SUBSTANTIATION: Types AG and BG RTRC have recently been added to the UL listing and should be included in this table.

PANEL ACTION: Reject.

NOTE: The following proposal consists of Comment 8-265 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].

SUBMITTER: Patricia Horton, Elaine Thompson, Allied Tube & Conduit

RECOMMENDATION: We believe this rewrite should either be rejected or held for further study. However, if it is accepted, make the following changes to Table 315-12(b):

1. Change Note 1 as follows: "ENT in straight lengths, or as a manufactured prewired assembly, shall be permitted Iin any building not exceeding three floors above grade."
2. Change the first sentence of Note 2 as follows: "Where ENT, including manufactured prewired assemblies, is used in any building exceeding three floors above grade, the walls, floors, and ceilings, including suspended ceilings, behind which the tubing is concealed shall provide a thermal barrier of material that has at least a 15-minute finish rating, as identified in listings of fire-rated assemblies."
3. Change the acronym for NUC to NUCC throughout the Table, Notes, and Text.
4. Change "P" to "P7" for ENT "Wet locations" and add Note 7: "Fittings identified for this purpose shall be used for connections."
5. Revise Note 5 as follows: "~~Also~~ ENT shall be permitted under a concrete slab on grade where the ENT is placed upon sand or approved screenings."
6. Change "P6" to "P7" for ENT "Encased or embedded in poured concrete below grade".
7. Delete "6" from the ENT columns "indoors, exposed", "indoors, concealed", "wet locations", "damp locations", "dry locations".
8. Change "N5" to "N" for ENT "System voltages over 600 volts, nominal".
9. Change "P" to "P12" for all RNC "System voltages over 600 volts, nominal" columns.

Add new Note 12: "Where unshielded cables over 600V nominal are installed in RNC or NUCC, the conduit shall be encased in not less than 3 in. (76mm) of concrete. (ROP 13-35).

10. Add "13" to all Application lines of RTRC except "concrete below grade", "exposed to physical damage", and "system voltages over 600 volts". Add a new Note 13 as follows: "Only RTRC Type AG is permitted. RTRC Type B is permitted only underground with or without concrete encasement."
11. Add a new column to the right of RTRC entitled "RFNC" with the following references:

"P14" for Application lines 1 through 7 ("Outdoors" through "encased or embedded in poured concrete on or above grade") and for "Exposed to the direct rays of the sun."

"P" for "Encased or embedded in poured concrete below grade" and "Direct burial."

"N" for "Support of fixtures or other equipment."

"P12" for "System voltage over 600 volts, nominal."

12. Add a new Note 14 as follows: "RNFC marked "Rigid Nonmetallic Conduit Underground" is not permitted in these applications. (Source UL Directory.)"
13. Place a new section headed "Manufactured Prewired Assemblies" to the right of column "HDPE." Divide this from the other columns with a heavier vertical line. Subdivide the new column into two columns: "NUCC" (Move the column for "NUC" from its current position next to ENT and change the acronym to "NUCC") and "ENT."

In the new prewired ENT column, add the following references:

Outdoors	N
Indoors, Exposed	P1
Indoors, Concealed	P1,2
Wet locations	P
Damp locations	P
Dry locations	P
Encased or embedded in poured concrete on or above grade	P7
Encased or embedded in poured concrete below grade	P7
Direct burial	N
Exposed to the direct rays of the sun	N
Exposed to physical damage	N
Support of fixtures	N
System voltages over 600	N

14. Add a superscript 6 after ENT under prewired.
15. Add a new Note 8 as follows: "NUCC shall be permitted in underground locations subject to severe corrosive influences as covered in Section 300-6 and where subject to chemicals for which the assembly is specifically approved."
16. Add a new Note 9 as follows: "NUCC cover requirements shall be as required in Tables 300-5 and 710-4(b) (New Table 300-50 per proposal 3-148) for RNC".
17. Add a new Note 10 as follows: "NUCC 600 Volts or Less. Alternating-current and direct-current circuits shall be permitted. All conductors shall have an insulation rating equal to at least the maximum nominal circuit voltage of any conductor or cable within the raceway."
18. Add a new Note 11 as follows: "NUCC over 600 Volts. Conductors or cables rated over 600 volts shall not occupy the same raceway with conductors or cables or circuits rated 600 volts or less.
19. Change "P" to "P9,10,11" for NUCC "encased or embedded in poured concrete below grade."
20. Change "P" to P"8,9,10,11" for NUCC "Direct Burial."
21. Change "P" to "P11" for NUCC "System voltages over 600 volts, nominal."
22. Add a new note 12 to NUCC "Systems Voltages over 600V, nominal."

SUBSTANTIATION: 1. Panel 8 accepted the addition of prewired ENT (ROP 8-66). The Note was also rewritten in sentence format to be consistent with other Notes.

2. Panel 8 accepted the addition of prewired ENT (ROP 8-66).
3. NUCC stands for "Nonmetallic underground conduit with conductors." This change is necessary to clarify that this type of conduit is shipped from the factory with conductors installed and is not an empty raceway. It also eliminates confusion with other N/M conduit which is marked for underground use only.
4. This language is in the 1996 NEC (331-3(7) and should continue to be included.
5. Note 5 has been rewritten in sentence form to be consistent with other Notes. Panel 8 accepted ENT for this use (ROP 8-58).
6. Note 6 has been deleted (see Substantiation above). Note 7 is required in order to retain important language from the l996 NEC which was omitted from the Draft of Article 315.
7. A separate column has been added for prewired ENT. As a result, Note 6 is no longer needed in this column.
8. Note 5 in the Draft refers to ENT under a concrete slab. This is the wrong reference for this application. We think the reference was supposed to be for electric signs. The TCC directed that Note 5 to Table 315-12(b) be deleted (ROP 8-71). The Task Group must have added a new Note 5.
9. This requirement has been moved from Article 710 to Article 300. It is an important consideration and should be so noted in the 600Volt columns. It also correlates with Panel 13 action and current section 710-4(b).
10. RTRC was not specifically mentioned in Article 347 of the NEC. Since the Task Group specifically included RTRC in a column in Table 315-12(b), it is necessary to be specific as to its listed uses. There are two types of RTRC: Type AG and Type BG. Type BG is only permitted underground with or without concrete encasement, according to its listing.

11. Type RFNC conduit was not specifically mentioned in Article 347 of the 1996 NEC. Since the Task Group that drafted Article 315 specifically included the other types of Rigid Nonmetallic Conduits, this type should also be included. The Notes which govern the Uses Permitted and Not Permitted for RFNC are according to its listing.
12. The Note is included so that the product will be applied according to its listing.
13. Both NUCC and prewired ENT are different from the other types of raceways in this Article. They are shipped from the factory with conductors installed. They should be separate from the other types of raceways . "NUC" was changed to "NUCC" for greater clarity: "Nonmetallic Underground Conduit with Conductors". Prewired ENT is shown in its own column for greater clarity and to separate it from the other raceways that do not have factory-installed conductors. Although the Uses Permitted and Not Permitted are the same as ENT at this time, a separate column provides the ability to review prewired requirements independently in the future. Also, the prewired sizes are limited.
14. A separate column has been added for prewired ENT. Note 6 clarifies that the full size range is not permitted.
15. To pick up language that was deleted from the 1996 NEC (343-3(4). This information is necessary to assure proper application of the product.
16. To pick up language that was deleted from the 1996 NEC (343-3(1). This information is necessary to assure proper application of the product.
17. Voltage requirements should be included in the Uses Permitted and Not Permitted section of the Article. These are important considerations when applying the product. Even though the conduit is shipped from the factory with conductors installed, they are removable in the field and this note will assure proper application.
18. Voltage requirements should be included in the Uses Permitted and Not Permitted section of the Article. These are important considerations when applying the product. Even though the conduit is shipped from the factory with conductors installed, they are removable in the field and this note will assure proper application.
19. These references are necessary for the proper application of NUCC. (See the Substantiations for Notes 9, 10, and 11 above).
20. These references are necessary for the proper application of NUCC. (See the Substantiations for Notes 8, 9, 10, and 11 above).
21. This reference is necessary for the proper application of NUCC.
22. The conduit is HDPE and should have same cover requirements as other RNC.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle.

8- 179 - (Table 344-12(b) Note 7): Reject
NOTE: The following proposal consists of Comment 8-268 on Proposal 8-66 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 8-66 was:
Add a new permitted use:
(x) 1/2" through 1" as listed manufactured prewired assembly.
SUBMITTER: William Wusinich, IBEW/Eastern Code Advisory Group
RECOMMENDATION: I urge CMP 8 to reconsider their action taken on this proposal and reject the concept of prewired ENT.
SUBSTANTIATION: After reading the fact finding report which was submitted with Proposal 8-66, I discovered that the test was performed using 200 ft lengths of ENT containing three circuit conductors of #10 size only. Table C-2 on page 945 of the 1996 NEC permits 15-#10. I would think that this would present a whole new set of problems while installing this product. The additional weight will put a severe strain on the ENT itself when being installed through partitions, (wood or metal).
The proposal does not limit this product to a maximum of three conductors, nor is there any limitation to the length of this product.
Other prewired assemblies have an outer wrapping of mylar or paper around the conductors for additional protection to the conductors. This product does not have such a wrapping. My concerns would be damage to the circuit conductors while installing this product and while cutting the outer sheath.
I have no problem with the product being used as a raceway. Install it, secure and support it according to the NEC. After it is firmly fixed in place then pull the conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: This proposal was held because of the reference to Table 344-12(b). The proposal itself pertains to Pre-Wired ENT which was accepted by the panel for Article 331 in the 1999 NEC.

8- 180 - (344-12(c)): Accept in Principle
NOTE: The following proposal consists of Comment 8-269 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8- 84 (Log #125)].
SUBMITTER: Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: We believe this rewrite should either be rejected or held for further study. However, if it is accepted, make the following changes to Table 315-12(c): (Substantiation for each revision is numbered correspondingly.) (A complete Table as it would appear with suggested changes is provided on disk. Document name: Article315(344)Tables.doc.)
1. Revise Note 1 as follows: "FMC shall be permitted outdoors and in wet locations where ~~If~~ the conductors are approved for the specific conditions and the installation is such that liquid is not likely to enter raceways or enclosures to which the conduit is connected.
2. Revise Note 2 as follows: "LFMC and FNC shall be permitted ~~W~~where listed and marked for the purpose.
3. Revise Note 3 as follows: "FMT shall be permitted ~~F~~for branch circuits only."
4. Revise Note 4 as follows: "Aluminum FMC shall ~~N~~not be permitted where installed in direct contact with masonry.
5. Revise Note 5 as follows: "FMT shall be permitted ~~F~~for system voltages of 1000 volts maximum.
6. Revise Note 6 as follows: "Types A and C LFNC shall be permitted where a longer length is approved as essential for a required degree of flexibility."
7. Change "flexible conduit" to "FMC and LFMC."
8. Change "P" to "P11,12" for FMC Steel and Alum. "Indoors, Exposed" and "Indoors, Concealed".
9. Add new Note 11 as follows: "FMC shall be permitted in lengths not in excess of 6 ft. (1.83m): (1) for utilization equipment (2) as part of a manufactured listed prewired assembly (3) for tap connections to lighting fixtures as permitted in Section 410-67(c). FMC shall also be permitted for manufactured wiring systems as permitted in Section 604-5(a), and as part of a listed assembly to connect wired fixture sections as permitted in Section 410-77(c).

10. Add new Note 12 as follows: "FMC in 3/8 trade size shall be permitted in lengths not in excess of 6 ft. (1.83m) as part of an approved assembly or for lighting fixtures. (See Section 410-67(C). The number of conductors in 3/8 trade size shall not exceed that permitted in Table 350-12.
11. Change "P3" to "P3,13" for FMT "Indoors, Exposed" and "Indoors, Concealed". Add new Note 13 as follows: "FMT shall be permitted in lengths not in excess of 6 ft. (1.83m) as part of an approved prewired assembly or for lighting fixtures. See Section 410-67(c).
12. Change "P" to "P9" for LFMC "Indoors, Exposed" and "Indoors, Concealed". Add a new Note 9 to read as follows: "LFMC is not a general wiring method and shall be permitted to be used only where conditions of installation, operation, or maintenance require flexibility or protection from liquids, vapors, or solids.
13 Change "P" to "P10" for LFNC Type A, Type B, Type C "Indoors, Exposed" and "Outdoors, Exposed". Add new Note 10 to read as follows: "LFNC is not a general wiring method and shall be permitted to be used only where (1) flexibility is required for installation, operation, or maintenance; (2) protection of the contained conductors is required from vapors, liquids, or solids, (3) outdoors, (note 2) and (4) for direct burial (note 2.)"
SUBSTANTIATION: 1. The Note has been rewritten in sentence form to make it consistent with the format of the other Notes.
2. The Note has been rewritten in sentence form to make it consistent with the format of the other Notes.
3. The Note has been rewritten in sentence form to make it consistent with the format of the other Notes.
4. The Note has been rewritten in sentence form to make it consistent with the format of the other Notes.
5. The Note has been rewritten in sentence form to make it consistent with the format of the other Notes.
6. Since there are three different types of LFNC, it is necessary to differentiate among the three and to be specific as to which types are permitted for specific uses. This Note agrees with the Uses Permitted in the 1996 Code (351-23(3)).
7. All flexible conduit is not permitted for this application.
8. To correlate with the instruction of the TCC.
9. To correlate with the instruction of the TCC on Proposal 3-125 and with existing Article 350-10 from the 1996 NEC.
10. To correlate with the instruction of the TCC on Proposal 3-125 and with existing Article 350-10 from the 1996 NEC.
11. To correlate with the instruction of the TCC on Proposal 3-125 and to correlate with 349-10 of the 1996 NEC.
12. By putting the information about LFMC in this product matrix (Table 315-12(C)), it is not clear anymore that this is not a general wiring method. This must be made clear. The sentence also includes important information contained in 351-4(1) and 351-4(2) of the 1996 NEC and perhaps inadvertently dropped from the Article 315 Draft.
13. By putting the information about LFNC in this product matrix, it is not clear that this is not a general wiring method. This must be made clear. (See Panel Statement to Proposal 8-214: "The panel does not intend LFNC to be used as a general purpose wiring method.") The sentence also includes important information contained in 351-23(a)(1) and (2).
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-84.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

NOT RETURNED: 1 Corry

(Log #207)

8- 181 - (Table 344-12(c)): Reject
NOTE: The following proposal consists of Comment 8-270 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Charles W. Forsberg, Lamson & Sessions
RECOMMENDATION: For columns LFMC and LFNC for applications "Indoors, Exposed" and "Indoors, Concealed", add the appropriate number for a new note, and a new note:
x. Shall be permitted only where conditions of installation, operation, or maintenance require flexibility or protection from liquids, vapors, or solids.
SUBSTANTIATION: This will provide continuity for the proper use of these wiring methods, based on current NEC rules.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 8-85.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

8- 182 - (344-14): Accept in Principle
NOTE: The following proposal consists of Comment 8-271 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: We believe this rewrite should either be rejected or held for further study. However, if it is accepted, move Section 315-14 to become the second paragraph of Section 315-12 (a).
SUBSTANTIATION: In the 1996 NEC, the text now covered in Section 315-14 is included in the "Uses Not Permitted" Sections of the respective articles. These temperature requirements should continue to be included in the "Uses Permitted and Not Permitted" Section of new Article 315 to assure that these important considerations are not overlooked and that the products are properly applied.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-84.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #209)

8- 183 - (344-15): Accept in Principle
NOTE: The following proposal consists of Comment 8-272 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: We believe this rewrite should either be rejected or held for further study. However, if it is accepted, move Section 315-15 to Section 315-12b and revise as follows:
344-12. (b) Corrosive Locations and Raceway Degradation.
(1) Metal Raceways. Metal raceways that utilize materials approved for the installation shall be permitted where subject to airborne or splash chemical exposure. Coated metal raceways subject to airborne and splash chemical exposure and ultraviolet degradation shall be permitted where materials approved for the installation are utilized.
(2) Nonmetallic Raceways.
a. Nonmetallic raceways subject to ultraviolet degradation shall be permitted where materials approved for the installations are utilized. Nonmetallic raceways shall be listed as sunlight resistant.
b. Nonmetallic raceways that utilize materials approved for the installation shall be permitted where subject to airborne or splash exposure to chemical solvents.
(FPN):See Section 300-6 for protection against corrosion.
SUBSTANTIATION: These requirements for corrosive locations belong in Section 315-12 "Uses Permitted and Not Permitted". Table 315-12(a), for example, already contains four Notes concerning corrosion protection.
The sentence structure has been changed to more appropriately fit the sentence structure of a "Use Permitted".
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-84.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #210)

8- 184 - (344-15(b)(1)): Reject
NOTE: The following proposal consists of Comment 8-273 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Charles W. Forsberg, Lamson & Sessions
RECOMMENDATION: Delete, ".... shall utilize materials approved for the installation and".
SUBSTANTIATION: Section 344-7 already requires nonmetallic raceways to be listed. To further add the requirement for "approval" by the authority having jurisdiction is not warranted.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 8-85.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #211)

8- 185 - (344-23): Accept in Principle
NOTE: The following proposal consists of Comment 8-274 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: We believe this rewrite should either be rejected or held for further study.
However, if it is accepted, do the following:
(1) Move Section 315-23, Table, and Notes to Table, to Section 315-12.
(2) Add 315-12(c) to read: Size. Permitted sizes for raceways shall be as shown in Table 315-12(d).
(3) Renumber the Table as Table 315-12(d) and revise the Table and Notes as shown on the attached Table.
SUBSTANTIATION: Table 315-23 "Permitted Sizes for Raceways" limits the uses permitted to certain sizes of raceways. Including "Size" text and Table in Section 315-12 "Uses Permitted and Not Permitted" completes the Article by putting all Use requirements in one section.
Panel 8 accepted the addition of 1/2 through 1 Manufactured Prewired ENT (Proposal 8-66). The Table has been changed to add Manufactured Prewired ENT. A separated column is necessary because the size range is different from empty ENT.
The words "inches" and "Trade Size" and the inch (") designator after 3/8 and in the heading have been deleted. The terminology used today is "trade size" without referencing inches or metric - the numbers are merely designators. Trade has been added before Size in the heading.
Notes have been rewritten in mandatory language for consistency with language in other Tables in Article 315.
Note 4(b) has been revised to agree with the language of Note 2(b) which was developed as a result of the Panel action on Proposal 8-181a. Also to correlate with the instruction of the TCC on Proposal 3-125.
Note 4(c) was deleted per TCC directive to correlate with Panel action on Proposal 8-222.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle.

8- 188 - (344-35): Reject
NOTE: The following proposal consists of Comment 8-277 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Wayne A. Lilly, Bridgewater, VA
RECOMMENDATION: Replace the proposed Section 315-35 with the following:
315-35. Supports. This section does not apply to NUC. All other raceways covered in this article shall comply with (a) or (b) below.
(a) Nonflexible Raceways. Nonflexible raceways shall be installed as a complete system, as provided for in Article 300, and be securely fastened at intervals not exceeding those specified in Table 315-35(a) and its notes.

Table 315-35(a) Nonflexible Raceways

Installation Requirement	Distance (In Feet)				
	EMT	ENT	IMC	RMC	RNC
Shall be securely fastened at intervals not exceeding	10a	3b	-	-	I
Shall be securely fastened at a distance from each outlet box, junction box, device box, cabinet, conduit body, or other termination at a distance not exceeding	3 a f	3 b	3 c f	3 c f	3 g
Shall be supported at intervals not exceeding	-	-	10 c d	10 c d	h
Horizontal runs hall be supported at intervals and securely fastened at distances not exceeding	k	m	k	k	o

For SI units: 1 ft = 0.3048 m

Notes to Table 315-35(a):

a. Unbroken lengths (without coupling) of EMT shall be permitted to be fished for concealed work in finished buildings or prefinished wall panels where such securing is impracticable.

b. ENT shall be permitted to be installed without being secured for lengths not exceeding 6 ft (1.83 m) from a fixture terminal connection for tap connections to lighting fixtures.

c. The distance between supports for straight runs of conduit shall be permitted in accordance with Table 315-35(a)(1), provided that the conduit is made up with threaded couplings, and such supports prevent transmission of stresses to termination where conduit is deflected between supports.

d. The distance between supports shall be permitted to be increased to 20 ft (6.1 m) for exposed vertical risers from industrial machinery, provided that the conduit is made up with threaded couplings, is firmly supported at the top and bottom of the riser, and no other means of intermediate support is readily available.

e. Where approved, IMC and RMC shall not be required to be securely fastened within 3 ft (914 mm) of the service head for above-the-roof termination of a mast.

f. Fastening of EMT, IMC and RMC at their termination points shall be permitted to be increased to 5 ft (1.52 m) where structural members do not readily permit fastening within 3 ft (914 mm). For EMT, this exception shall apply to unbroken lengths only.

g. RNC listed for securing at other than 3 ft (914 mm) shall be permitted to be installed in accordance with the listing.

h. RNC shall be supported as required in Table 315-35(a)(2). RNC listed for support at spacings other than as shown in Table 315-35(a)(2) shall be permitted to be installed in accordance with the listing.

i. RNC shall be fastened so that movement from thermal expansion or contraction will be permitted.

k. Horizontal runs of EMT, IMC, or RMC supported by openings through framing members at intervals not exceeding 10 ft (3.05 m) and securely fastened within 3 ft (914 mm) of termination points shall be permitted.

m. Horizontal runs of ENT supported by openings through framing members at intervals not exceeding 3 ft (914 mm) and securely fastened within 3 ft (914 mm) of termination points shall be permitted.

o. Horizontal runs of RNC supported by openings through framing members at intervals not exceeding those specified in Table 315-35(a)(2) and securely fastened within 3 ft (914 mm) of termination points shall be permitted.

Table 315-35(a)(1). Support for Straight Runs of RMC or IMC Made Up with Threaded Couplings.

Trade Size (inches)	Maximum Distance Between Supports (Feet)
1/2 - 3/4	10
1	12
1 1/4 - 1 1/2	14
2 - 2 1/2	16
3 and larger	20

For SI units: (Supports) 1 ft = 0.3048 m

Table 315-35(a)(2). Support for RNC

Trade Size (inches)	Maximum Distance Between Supports (feet)
1/2-1	3
1 1/4-2	5
2 1/2-3	6
3 1/2-5	7
6	8

For SI unit: (Supports) 1ft - 0.3048 m.

(b) Flexible Raceways. Flexible raceways shall be supported or secured at intervals not exceeding those specified in Table 315-35(b).

Table 315-35(b). Flexible Raceways

Installation Requirement	Distance (In Feet)		
	FMC	LFMC	LFNC
Shall be supported and secured at intervals not exceeding	4 1/2 a	4 1/2 a	3 b
Shall be securely fastened by an approved means at a distance from each box,cabinet, conduit body, or other termination of the conduit not exceeding	1 c	1 c	1 c
Horizontal runs supported at intervals and securely fastened at distances not exceeding	d	d	c

For SI units: 1 ft = 0.3048

Notes to Table 315-35(b):

a. Supporting and securing shall not be required where the conduit is fished or where installed in lengths not exceeding 6 ft (1.83 m) from a fixture terminal connection for tap conductors to lighting fixtures, as permitted in Section 410-67(c).

b. Where installed in lengths longer than six ft LFNC as described in Section 315-100(d)(2) shall be securely fastened at intervals not exceeding 3 ft (914 mm) unless the conduit is fished.

c. LFNC, as described in Section 315-100(d)(2), installed in lengths longer than 6 ft, FMC, and LFMC shall not be required to be securely fastened within 1 ft (0.3048 m) when one of the following conditions are met:

1. The conduit is fished, or
2. The length does not exceed 3 ft (9.14 mm) at terminals where flexibility is necessary, or
3. The length does not exceed 6 ft (1.83 m) from a fixture terminal connection for tap conductors to lighting fixtures, as permitted in Section 410-67(c).

d. Horizontal runs of FMC and LFMC supported by openings through framing members at intervals not exceeding 4 1/2 ft (1.37 m) and securely fastened within 12 in. (305 mm) of termination points shall be permitted.

e. Horizontal runs of LFNC supported by openings through framing members at intervals not exceeding 3 ft (914 mm) and securely fastened within 12 in. (305 mm) of termination points shall be permitted.

SUBSTANTIATION: Conversion of the wording in the proposed section into a tabular form will make the requirements more understandable and enforceable.
PANEL ACTION: Reject.

8- 193 - (344-35(b)(3) Exception No. 3): Reject
NOTE: The following proposal consists of Comment 8-282 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Delete this exception.
SUBSTANTIATION: It is redundant to 315-35 d -- if revision is accepted. Otherwise, it is redundant to existing 315-35(b)(1), last sentence.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 8-85.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #220)

8- 194 - (344-53(b)(3) Exception No. 4): Reject
NOTE: The following proposal consists of Comment 8-283 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8- 84 (Log #125)].
SUBMITTER: Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Delete this Exception.
SUBSTANTIATION: It is redundant to 315-35(b)(1)a.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 8-85.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #221)

8- 195 - (344-60(a)(1)): Reject
NOTE: The following proposal consists of Comment 8-284 on Proposal 8-157 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 8-157 was:
Article 348-1 should be split into two sections to comply with the NEC style manual. Also additional text is shown underline to read as follows.
348-1. Uses Permitted. The use of electrical metallic tubing shall be permitted for both exposed and concealed work.
A separate equipment grounding conductor, sized as required by Section 250-95, shall be installed in all electrical metallic tubing.
SUBMITTER: Noel Williams, Salt Lake City, UT
RECOMMENDATION: This proposal should remain accepted in principle although I think "accepted in principle in part" would be a more appropriate description of the action that was taken.
SUBSTANTIATION: I agree with the comments of Lilly. This proposal provides a partial solution. If EMT is used in locations where it is subjected to abuse sufficient to cause breakage of fittings, then the EMT is probably being misapplied. However, I have seen many installations of EMT, especially in larger sizes, that have existed for many years without the damage described. While the addition of an equipment grounding conductor won't hurt, it won't solve problems where the EMT is subject to such physical damage.
The term "severe physical damage" is not defined in the NEC, but in my view, much of the damage described is severe physical damage. The same actions that would cause breakage and disconnection of 1/2 in. EMT would not cause similar damage in 2 in. EMT. Not all rooftops are the same either. Many of the failures described should be attributed to poor design choices and misapplication of the product rather than to some fault of the product itself.
Requiring a separate equipment grounding conductor in all EMT installations is clearly overkill. The vast majority of EMT is not installed in conditions where the EMT will be climbed on or stepped on.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 8-85.

(Log #223)

8- 197 - (344-100): Accept in Principle
NOTE: The following proposal consists of Comment 8-288 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8- 84 (Log #125)].
SUBMITTER: Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: We believe this rewrite should either be rejected or held for further study. However, if it is accepted, change subsection heading "~~C.~~ Construction Specification" to "D. Construction Specifications."

SUBSTANTIATION: To correlate with Comment on Section 315B and 315C (New).
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-84.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #224)

8- 198 - (344-100(3) and (b)): Accept in Principle
NOTE: The following proposal consists of Comment 8-289 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: We believe this rewrite should either be rejected or held for further study. However, if it is accepted, move sections 315-100(3)(a) and (b) to Table 315-12(b), Notes 10 and 11.
SUBSTANTIATION: Voltage considerations more appropriately belong in the "Uses Permitted and Not Permitted" Section.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-84.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #225)

8- 199 - (344-100(3)): Reject
NOTE: The following proposal consists of Comment 8-290 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Revise to read:
"NUCC is ~~an~~ factory assembly of conduit and cable or conductors that is..."
SUBSTANTIATION: To clarify what constitutes the "assembly."
PANEL ACTION: Reject.
PANEL STATEMENT: See Proposal 8-85 for panel action and panel statement.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #226)

8- 200 - (344-100(b)): Reject
NOTE: The following proposal consists of Comment 8-291 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8- 84 (Log #125)].
SUBMITTER: Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Revise the last sentence regarding ENT as follows: In addition, ENT, as a prewired manufactured assembly, ~~is provided~~ shall be in continuous lengths ~~shipped in a coil, reel, or carton.~~ and shall be made of material which can be coiled or reeled without damage to the tubing or conductors during handling or installation.
SUBSTANTIATION: The existing text is informational only -- not a construction specification. If prewired ENT continues to be accepted the revised text is critical from a construction aspect to assure that all producers meet this important criteria. This text is similar to that for NUCC.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 8-85.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #227)

8- 201 - (344-190): Accept in Principle
NOTE: The following proposal consists of Comment 8-292 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: We believe this rewrite should either be rejected or held for further study. However, if it is accepted, insert a new subsection heading "E. Marking" before 344-190.
SUBSTANTIATION: Marking is an important consideration for properly identifying conduit and should have a separate subsection in order to make the information easier to find.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-84.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #228)

8- 202 - (344-190(1)): Accept in Principle
NOTE: The following proposal consists of Comment 8-293 on Proposal 8-5a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. [See Proposal 8-84 (Log #125)].
SUBMITTER: Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: We believe this rewrite should either be rejected or held for further study. However, if it is accepted, change the first sentence as follows: (1) EMT and RMC. Each length shall be clearly and durably marked at intervals not exceeding 10 ft.(3.05m).
SUBSTANTIATION: To be consistent with the structure of 315-190(2),(3) and (4) and to make the information on these products easier to find.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-84.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #229)

8- 203 - (344-190(5)): Accept in Principle

ARTICLE 345 — INTERMEDIATE METAL CONDUIT: TYPE IMC

(Log #1223)

8- 204 - (345): Accept in Principle
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION:
Revise Article 345 to read as follows:
Article 345 Intermediate Metal Conduit: Type IMC

A. General

345-1. Scope. This article covers the use, installation, and construction specifications for Intermediate Metal Conduit (IMC) and associated fittings.

345-2. ~~345-1.~~ Definition.
Intermediate Metal Conduit (IMC). ~~Intermediate metal conduit is a listed~~ A steel raceway of circular cross section with integral or associated couplings, approved for the installation of electrical conductors and used with ~~listed~~ fittings to provide electrical continuity.

345-3. ~~345-2~~ Other Articles.
Installations for IMC ~~intermediate metal conduit~~ shall comply with ~~the~~ applicable provisions ~~of the applicable provisions sections~~ of Article 300.

345-6. Listing Requirements. IMC and associated fittings shall be listed.

B. Installation

345-10. ~~345-3.~~ Uses Permitted.

(a) All Atmospheric Conditions and Occupancies.
Use of ~~intermediate metal conduit~~ IMC shall be permitted under all atmospheric conditions and occupancies. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action. ~~Intermediate metal conduit shall be permitted as an equipment grounding conductor.~~

Exception: Aluminum fittings and enclosures shall be permitted to be used with steel IMC ~~intermediate metal conduit~~.

(b) Corrosion Protection. IMC ~~Intermediate metal conduit~~, elbows, couplings, and fittings shall be permitted to be installed in concrete, in direct contact with the earth, or in areas subject to severe corrosive influences where protected by corrosion protection and judged suitable for the condition.

~~FPN: See Section 300-6 for protection against corrosion.~~

(c) Cinder Fill. IMC ~~Intermediate metal conduit~~ shall be permitted to be installed in or under cinder fill where subject to permanent moisture where protected on all sides by a layer of noncinder concrete not less than 2 in. (50.8 mm) thick; where the conduit is not less than 18 in. (457 mm) under the fill; or where protected by corrosion protection and judged suitable for the condition.

~~FPN: See Section 300-6 for protection against corrosion.~~

~~345-5.~~ (d) Wet Locations. All supports, bolts, straps, screws, etc., shall be of corrosion-resistant materials or protected against corrosion by corrosion-resistant materials.

FPN: See Section 300-6 for protection against corrosion.

345-20. ~~345-6~~ Size.
(a) Minimum. IMC ~~conduit~~ smaller than 1/2-in. ~~electrical~~ trade size shall not be used.

(b) Maximum. IMC ~~conduit~~ larger than 4-in. ~~electrical~~ trade size shall not be used.

(FPN): Metric trade numerical designations for ~~intermediate metal conduit~~ IMC are ~~the same as those found in Extra heavy Duty Rigid Steel Conduits for Electrical Installations, IEC 981-1989; namely,~~ 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, 4 = 103.

345-22. ~~345-7.~~ Number of Conductors ~~in Conduit.~~
The number of conductors or cables ~~in a single conduit~~ shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9~~., using the conduit dimensions of Table 4, Chapter 9.~~

345-24. ~~345-10~~. Bends -- How Made.
Bends of IMC ~~intermediate metal conduit~~ shall be so made so that the conduit will not be damaged and so that the internal diameter of the conduit will not be effectively reduced. The radius of the curve of the inner edge of any field bend shall not be less than indicated in Table ~~346-10~~ 346-24.

Exception: For field bends for conductors without lead sheath and made with a single operation (one shot) bending machine designed for the purpose, the minimum radius shall not be less than indicated in Table ~~346-10~~ 346-24, Exception.

345-26. ~~345-11.~~ Bends -- Number in One Run.
There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, e.g., conduit bodies and boxes.

345-28. ~~345-8~~. Reaming and Threading.
All cut ends ~~of conduits~~ shall be reamed or otherwise finished to remove rough edges. Where conduit is threaded in the field, a standard cutting die with a 3/4-in. taper per foot (1 in 16) shall be used.

FPN: See Standards for Pipe Threads, General Purpose (Inch), ANSI/ASME B.1.20.1-1983.

345-30. ~~345-12.~~ Securing and Supporting.
IMC ~~Intermediate metal conduit~~ shall be installed as a complete system as provided in Article 300 and shall be securely fastened in place and supported in accordance with (a) and (b).

(a) Securely Fastened.
Each ~~intermediate metal conduit~~ IMC shall be securely fastened within 3 ft (914 mm) of each outlet box, junction box, device box, cabinet, conduit body, or other conduit termination. Fastening shall be permitted to be increased to a distance of 5 ft (1.52 m) where structural members do not readily permit fastening within 3 ft (914 mm). Where approved, conduit shall not be required to be securely fastened within 3 ft (914 mm) of the service head for above-the-roof termination of a mast.

(b) Supports.
IMC ~~Intermediate metal conduit~~ shall be supported in accordance with one of the following.

(1) Conduit shall be supported at intervals not exceeding 10 ft (3.05 m).
