SUBSTANTIATION: This article is very specific and is basically a "design manual" contrary to Article 90(c). The NEC adequately covers wet locations, wiring methods, and grounding. It is troublesome that electrical industry personnel carry this information with them in the NEC when very few in the industry would have any involvement in this equipment.
PANEL ACTION: Reject.
PANEL STATEMENT: The inclusion or exclusion of articles in the Code is outside of the Panel scope.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #2236)

19- 156 - (675-4(a)): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Revise to read:
The cable used to interconnect enclosures on the structure of an irrigation machine shall be ~~an~~ a flame tested assembly of stranded, insulated conductors with nonhygroscopic and nonwicking filler in a core of ~~moisture- and flame-resistant~~ moisture-resistant nonmetallic material overlaid with a metallic covering and jacketed with a moisture-, corrosion-, and sunlight-resistant nonmetallic material.
The conductor insulation shall be of a type listed in Table 310-13 for an operating temperature of 75°C (167°F) and for use in wet locations. The ~~core insulating material thickness shall not be less than 30 mils (762 µm), and the~~ metallic overlay thickness shall not be less than 8 mils (203 µm). The jacketing material thickness shall not be less than 50 mils (1.27 mm).
A composite of power, control, and grounding conductors in the cable shall be permitted.
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.
[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
Construction requirements for conductors listed in Table 310-13 are addressed in Table 310-13. No need to repeat those here.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing Code language is adequate. The TCC may want to review this issue on a Code wide basis. A specific flame test was not indicated in the recommendation. Additionally, criteria were not given on what would be done with the results of the flame test.

(Log #1105)

19- 157 - (675-10(a)(3)): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Change "No. 14" to "14 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
PANEL STATEMENT: The NEC Style of Manual does not specify the language used one way or another. The NFPA Stle of Manual,1M seems to prefer 10AWG. Product standards use 10 AWG or 10 AWG 110-6 says that the conductor sizes are expressed in AWG or in circular mils so the AWG is implied The Panel recognizes that the TCC may desire to take a different action to be consistent with the Code.

ARTICLE 680 — SWIMMING POOLS, FOUNDAINTS, AND SIMILAR INSTALLATIONS

(Log #528)

20- 29 - (680): Accept

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: 1. In Section 680-4. Definitions. Permanently Installed Swimming, Wading, and Therapeutic Pools., replace "42 in. (1.07 m)" with "1.0 m (42 in.)".

2. In Section 680-4. Definitions. Storable Swimming or Wading Pool., replace "42 in. (1.07 m)" with "1.0 m (42 in.)".

3. In Section 680-6(a)(1), replace "5 and 10 ft (1.52 m and 3.05 m)" with "1.5 and 3.0 m (5 and 10 ft)" and replace "10 ft (3.05 m)" with "3.0 m (10 ft)".

4. In Section 680-6(a)(2), replace "10 ft (3.05 m)" with "3.0 m (10 ft)"; "20 ft (6.08 m)" with "6.0 m (20 ft)"; and "6 ft 6 in. (1.98 m)" with "2.0 m (6 ft 6 in.)".

5. In Section 680-6(a)(3), replace "20 ft (6.08 m)" with "6.0 m (20 ft)".

6. In Section 680-6(b)(1), replace "5 ft (1.52 m)" with "1.5 m (5 ft)" and replace "12 ft (3.66 m)" with "3.7 m (12 ft)".

7. In Section 680-6(b)(2), replace "5 ft (1.52 m)" with "1.5 m (5 ft)" throughout.

8. In Section 680-6(b)(3)(c), replace "7 ft 6 in. (2.29 m)" with "2.3 m (7 ft 6 in.)".

9. In Section 680-6(b)(4), replace "5 ft (1.52 m)" with "1.5 m (5 ft)" throughout and replace "10 ft (3.05 m)" with "3.0 m (10 ft)".

10. In Section 680-6(b)(4), replace "16 ft (4.88 m)" with "4.9 m (16 ft)".

11. In Section 680-6(c), replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

12. In Section 680-7, replace "3 ft (914 mm)" with "900 mm (3 ft)".

13. In Section 680-8(1), replace "10 ft (3.05 m)" with "3.0 m (10 ft)".

14. In Section 680-8 second paragraph, replace "10 ft (3.05 m)" with "3.0 m (10 ft)".

15. In Section 424-35, replace "3 in. (76 mm)" with "75 mm (3 in.)".

16. In Section 424-36, replace "2 in. (50.8 mm)" with "50 mm (2 in.)" throughout.

17. In Section 680-12, replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

18. In Section 680-20(a)(3), replace "18 in. (457 mm)" with "450 mm (18 in.)" and replace "4 in. (102 mm)" with "100 mm (4 in.)".

19. In Section 680-21(a)(5), replace "4 in. (102 mm)" with "100 mm (4 in.)"; "8 in. (203 mm)" with "200 mm (8 in.)"; and "4 ft (1.22 m)" with "1.2 m (4 ft)".

20. In Section 680-21(a)(5)(b), replace "4 ft (1.22 m)" with "1.2 m (4 ft)".

21. In Section 680-21(b)(5), replace "4 in. (102 mm)" with "100 mm (4 in.)"; "8 in. (203 mm)" with "200 mm (8 in.)"; and "4 ft (1.22 m)" with "1.2 m (4 ft)".

22. In Section 680-22(a)(3), replace "4 in. (102 mm)" with "100 mm (4 in.)" and replace "1 in. (25.4 mm)" with "25 mm (1 in.)".

23. In Section 680-22(a)(5), replace "5 ft (1.52 m)" with "1.5 m (5 ft)" and replace "12 ft (3.66 m)" with "3.7 m (12 ft)".

24. In Section 680-24(3), replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

25. In Section 680-25(b)(3) Exception, replace "6 ft (1.83 m)" with "1.8 m (6 ft)" and replace "10 ft (3.05 m)" with "3.0 m (10 ft)".

26. In Section 680-26(a), replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

27. In Section 680-27, replace "20 ft (6.1 m)" with "6.0 m (20 ft)".

28. In Section 680-27(a), replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

29. In Section 680-27(b), replace "5 ft (1.52 m)" with "1.5 m (5 ft)" and replace "12 ft (3.66 m)" with "3.7 m (12 ft)".

30. In Section 680-38, replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

31. In Section 680-40(a), replace "6 ft (1.83 m)" with "1.8 m (6 ft)" and replace "15 ft (4.57 m)" with "4.5 m (15 ft)".

32. In Section 680-41(a), replace "5 ft (1.52 m)" with "1.5 m (5 ft)" and replace "10 ft (3.05 m)" with "3.0 m (10 ft)".

33. In Section 680-41(a)(1), replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

34. In Section 680-41(a)(2), replace "10 ft (3.05 m)" with "3.0 m (10 ft)".

35. In Section 680-41(b)(1), replace "5 ft (1.52 m)" with "1.5 m (5 ft)"; "7 ft 6 in. (2.29 m)" with "2.3 m (7 ft 6 in.)"; and "12 ft (3.66 m)" with "3.7 m (12 ft)".

36. In Section 680-41(b)(2), replace "7 ft 6 in. (2.29 m)" with "2.3 m (7 ft 6 in.)".

37. In Section 680-41(c), replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

38. In Sections 680-41(d)(3), (4) and (5), replace "5 ft (1.52 m)" with "1.5 m (5 ft)" throughout.

39. In Section 680-41(f)(1), replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

40. In Section 680-50, replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

41. In Section 680-51(e), replace "10 ft (3.05 m)" with "3.0 m (10 ft)".

42. In Section 680-54(1), replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

43. In Section 680-57(c), replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

44. In Sections 680-62(c)(3), (4) and (5), replace "5 ft (1.52 m)" with "1.5 m (5 ft)" throughout.

45. In Section 680-62(e)(1), replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

46. In Section 680-62(g), replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

47. In Section 680-70, replace "5 ft (1.52 m)" with "1.5 m (5 ft)".

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ryan

(Log #1106)

20- 30 - (680):

Note: It was the action of the Technical Correlating Committee that this Proposal be reported as "Accept" to correlate with the action on Proposal 1-222. This action will be considered by the Panel as a Public Comment.

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Revise Article 680 as follows:

680-7 - change "No. 12" to "12 AWG"

680-20(b)(1) - change "a No. 8" to "an 8 AWG" and "the No. 8" to "the 8 AWG"

680-22 - change "No. 8" to "8 AWG"

680-22(b) - change "No. 8" to "8 AWG"

680-22(b)(3) - change "No. 8" to "8 AWG"

680-23(b) - change "a No. 8" to "an 8 AWG" and "the No. 8" to "the 8 AWG"

680-25(b)(1) - change "No. 12" to "12 AWG"

680-25(b)(5) - change "No. 16" to "16 AWG"

680-25(c) - change "No. 12" to "12 AWG" in the 1st and 3rd paragraphs

680-25(d) - change "No. 12" to "12 AWG" and "No. 8" to "8 AWG"

680-41(e)(3) - change "No. 8" to "8 AWG"

680-62(d)(4) - change "No. 8" to "8 AWG"

680-73 - change "No. 8" to "8 AWG".

SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel believes that, with reference to Section 110-6, it is understood that conductor sizes are specified in AWG. To repeat "AWG" would be redundant.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9

NEGATIVE: 1

NOT RETURNED: 1 Ryan

EXPLANATION OF NEGATIVE:

EGAN: Even though AWG references are inherent throughout the code, specific reference to AWG is useful in field code application.

(Log #CP2001)

20- 30a - (680): Accept

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: CMP 20

RECOMMENDATION: ARTICLE 680—Swimming Pools, Fountains, and Similar Installations

I General

680.1 Scope

The provisions of this article apply to the construction and installation of electrical wiring for and equipment in or adjacent to all swimming, wading, therapeutic, and decorative pools, fountains, hot tubs, spas, and hydromassage bathtubs, whether permanently installed or storable, and to metallic auxiliary equipment, such as pumps, filters, and similar equipment.

680.2 Definitions.

Cord- and Plug-Connected Lighting Assembly. A lighting assembly consisting of a lighting fixture intended for installation in the wall of a spa, hot tub, or storable pool, and a cord- and plug-connected transformer.

Dry-Niche Lighting Fixture. A lighting fixture intended for installation in the wall of a pool or fountain in a niche that is sealed against the entry of pool water.

Equipment—Fixed. Equipment that is fastened or otherwise secured at a specific location.

Equipment—Portable. Equipment that is actually moved or can easily be moved from one place to another in normal use.

Equipment—Stationary. Equipment that is not easily moved from one place to another in normal use.

Forming Shell. A structure designed to support a wet-niche lighting fixture assembly and intended for mounting in a pool or fountain structure.

Fountain. Fountains, ornamental pools, display pools, and reflection pools. The definition does not include drinking fountains.

Hydromassage Bathtub. A permanently installed bathtub equipped with a recirculating piping system, pump, and associated equipment. It is designed so it can accept, circulate, and discharge water upon each use.

Maximum Water Level. The highest level that water can reach before it spills out.

No-Niche Lighting Fixture. A lighting fixture intended for installation above or below the water without a niche.

Packaged Spa or Hot Tub Equipment Assembly. A factory-fabricated unit consisting of water-circulating, heating, and control equipment mounted on a common base, intended to operate a spa or hot tub. Equipment can include pumps, air blowers, heaters, lights, controls, sanitizer generators, etc.

Packaged Therapeutic Tub or Hydrotherapeutic Tank Equipment Assembly. A factory-fabricated unit consisting of water-circulating, heating, and control equipment mounted on a common base, intended to operate a therapeutic tub or hydrotherapeutic tank. Equipment can include pumps, air blowers, heaters, lights, controls, sanitizer generators, etc.

Permanently Installed Decorative Fountains and Reflection Pools. Those that are constructed in the ground, on the ground, or in a building in such a manner that the fountain cannot be readily disassembled for storage, whether or not served by electrical circuits of any nature. These units are primarily constructed for their aesthetic value and are not intended for swimming or wading.

Permanently Installed Swimming, Wading, and Therapeutic Pools. Those that are constructed in the ground or partially in the ground, and all others capable of holding water in a depth greater than 1.1 m (42 in.), and all pools installed inside of a building, regardless of water depth, whether or not served by electrical circuits of any nature.

Pool. Manufactured or field-constructed equipment designed to contain water on a permanent or semi-permanent basis and used for swimming, wading, or purposes.

Pool Cover, Electrically Operated. Motor-driven equipment designed to cover and uncover the water surface of a pool by means of a flexible sheet or rigid frame.

Self-Contained Spa or Hot Tub. Factory-fabricated unit consisting of a spa or hot tub vessel with all water-circulating, heating, and control equipment integral to the unit. Equipment can include pumps, air blowers, heaters, lights, controls, sanitizer generators, etc.

Self-Contained Therapeutic Tubs or Hydrotherapeutic Tanks. A factory-fabricated unit consisting of a therapeutic tub or hydrotherapeutic tank with all water-circulating, heating, and control equipment integral to the unit. Equipment may include pumps, air blowers, heaters, light controls, sanitizer generators, etc.

Spa or Hot Tub. A hydromassage pool, or tub for recreational or therapeutic use, not located in health care facilities, designed for immersion of users, and usually having a filter, heater, and motor-driven blower. It may be installed indoors or outdoors, on the ground or supporting structure, or in the ground or supporting structure. Generally, a spa or hot tub is not designed or intended to have its contents drained or discharged after each use.

Storable Swimming or Wading Pool. Those that are constructed on or above the ground and are capable of holding water to a maximum depth of 1.0 m (42 in.), or a pool with nonmetallic, molded polymeric walls or inflatable fabric walls regardless of dimension.

Through-Wall Lighting Assembly. A lighting assembly intended for installation above grade, on or through the wall of a pool, consisting of two interconnected groups of components separated by the pool wall.

Wet-Niche Lighting Fixture. A lighting fixture intended for installation in a forming shell mounted in a pool or fountain structure where the fixture will be completely surrounded by water.

680.3 Other Articles

Except as modified by this article, wiring and equipment in or adjacent to pools and fountains shall comply with other applicable provisions of this Code, including those provisions identified in Table 680.3.

Table 680.3 Other Articles

Topic	Section or Article
Wiring	Chapters 1 - 4
Junction box support	370.23
Rigid nonmetallic conduit	347.3
Audio Equipment	Article 640, Parts I and II
Adjacent to pools and fountains	640.10
Underwater speakers*	

*Note: Underwater loudspeakers shall be installed in accordance with 680.27(A).

680.4 Approval of Equipment

All electrical equipment installed in the water, walls, or decks of pools, fountains, and similar installations shall comply with the provisions of this article.

680.5 Ground-Fault Circuit Interrupters.

Ground-fault circuit interrupters (GFCI) shall be self-contained units, circuit-breaker or receptacle types, or other listed types.

680.6 Grounding.

Electrical equipment shall be grounded in accordance with Parts V, VI, and VII of Article 250 and connected by wiring methods of Chapter 3, except as modified by this article. The following equipment shall be grounded:

(1) Through-wall lighting assemblies and underwater lighting fixtures, other than those low-voltage systems listed for the application without a grounding conductor

(2) All electrical equipment located within 1.5 m (5 ft) of the inside wall of the pool or fountain

(3) All electrical equipment associated with the recirculating system of the pool or fountain

(4) Junction boxes

(5) Transformer enclosures

(6) Ground-fault circuit interrupters

(7) Panelboards that are not part of the service equipment and that supply any electrical equipment associated with the pool or fountain

680.7 Cord- and Plug-Connected Equipment.

Fixed or stationary equipment ~~rated 20 amperes or less~~, other than an underwater lighting fixture for a permanently installed pool, shall be permitted to be connected with a flexible cord to facilitate the removal or disconnection for maintenance or repair.

(A) Length. For other than storable pools, the flexible cord shall not exceed 900 mm (3 ft) in length.

(B) Equipment Grounding. The flexible cord shall have a copper equipment grounding conductor sized in accordance with 250.122 but not smaller than No. 12. The cord shall terminate in a grounding-type attachment plug.

(C) Construction. The equipment grounding conductors shall be connected to a fixed metal part of the assembly. The removable part shall be mounted on or bonded to the fixed metal part.

680.8 Overhead Conductor Clearances.

(A) Power. With respect to service drop conductors and open overhead wiring, swimming pool and similar installations shall comply with the minimum clearances given in Table 680.8 and illustrated in Figure 680.8.

Table 680.8 Overhead Conductor Clearances

	Insulated Supply or Service Drop Cables, 0–750 Volts to Ground, Supported on and Cabled Together with an Effectively Grounded Bare Messenger or Effectively Grounded Neutral Conductor		All Other Supply or Service-Drop Conductors Voltage to Ground			
			0 through 15 kV		Over 15 through 50 kV	
	m	ft	m	ft	m	ft
A Clearance in any direction to the water level, edge of water surface, base of diving platform, or permanently anchored raft	6.7	22	7.5	25	8.0	27
B Clearance in any direction to the observation stand, tower, or diving platform ~~or tower~~.	4.3	14	5.2	17	5.5	18
C Horizontal limit of clearance measured from inside wall of the pool	This limit shall extend to the outer edge of the structures listed in A and B of this table but not less than 3 m (10 ft).					

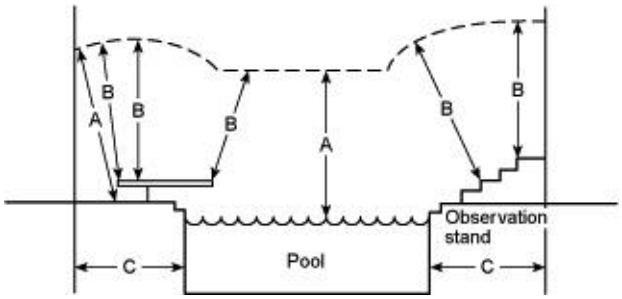

Figure 680.8 Clearances from Pool Structures

(B) Communications Systems. Communication, radio, and television coaxial cables covered by Articles 800 through 820 shall be permitted at a height of not less than 3.0 m (10 ft) above swimming and wading pools, diving structures, and observation stands, towers, or platforms.

(C) Network-Powered Broadband Communications Systems. The minimum clearances for overhead network-powered broadband communications systems conductors from pools or fountains shall comply with the provisions in Table 680.8 for conductors operating at 0 to 750 volts to ground.

Table 680.10 Minimum Burial Depths

Wiring Method	Minimum Burial	
	mm	in.
Rigid metal conduit	150	6
Intermediate metal conduit	150	6
Nonmetallic raceways listed for direct burial without concrete encasement	450	18
Other approved raceways*	450	18

* Raceways approved for burial only where concrete encased shall require a concrete envelope not less than 50 mm (2 in.) thick.

680.9 Electric Pool Water Heaters.

All electric pool water heaters shall have the heating elements subdivided into loads not exceeding 48 amperes and protected at not over 60 amperes. The ampacity of the branch-circuit conductors and the rating or setting of overcurrent protective devices shall not be less than 125 percent of the total nameplate-rated load.

680.10 Underground Wiring Location.

Underground wiring shall not be permitted under the pool or within the area extending 1.5 m (5 ft) horizontally from the inside wall of the pool unless this wiring is necessary to supply pool equipment permitted by this article. Where space limitations prevent wiring from being routed a distance 1.5 m (5 ft) or more from the pool, such wiring shall be permitted where installed in rigid metal conduit, intermediate metal conduit, or a nonmetallic raceway system. All metal conduit shall be corrosion resistant and suitable for the location. The minimum burial depth shall be as given in Table 680.10.

680.11 Equipment Rooms and Pits.

Electric equipment shall not be installed in rooms or pits that do not have drainage that adequately prevents water accumulation during normal operation or filter maintenance.

680.12 Maintenance Disconnecting Means.

One or more disconnecting means from all ungrounded conductors shall be provided for all utilization equipment other than lighting. Each means shall be accessible and within sight from its equipment.

II Permanently Installed Pools

680.20 General.

Electrical installations at permanently installed pools shall comply with the provisions of Part I and Part II.

680.21 Motors.

(A) Wiring Methods.

(1) General. The branch circuits for pool-associated motors shall be installed in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or Type MC cable listed for the location. Other wiring methods and materials shall be permitted in specific locations or applications as covered in this section. Any wiring method employed shall contain a copper equipment grounding conductor sized in accordance with 250.122 but not smaller than No. 12.

(2) On or Within Buildings. Where installed on or within buildings, electrical metallic tubing shall be permitted.

(3) Flexible Connections. Where necessary to employ flexible connections at or adjacent to the motor, liquidtight flexible metal or nonmetallic conduit with approved fittings shall be permitted.

(4) One-Family Dwellings. In the interior of one-family dwellings, or in the interior of accessory buildings associated with a one-family dwelling, any of the wiring methods recognized in Chapter 3 of this Code shall be permitted that comply with the provisions of this paragraph. Where run in a raceway the equipment grounding conductor shall be insulated. Where run in a cable assembly, the equipment grounding conductor shall be permitted to be uninsulated, but it shall be enclosed within the outer sheath of the cable assembly.

(5) Cord- and Plug-Connections. Pool-associated motors shall be permitted to employ cord- and plug-connections. The flexible cord shall not exceed 900 mm (3 ft) in length. The flexible cord shall include an equipment grounding conductor sized in accordance with Section 250.122 and shall terminate in a grounding-type attachment plug.

(B) Double Insulated Pool Pumps. A listed cord- and plug-connected pool pump incorporating an approved system of double insulation that provides a means for grounding only the internal and nonaccessible, noncurrent-carrying metal parts of the pump shall be connected to any wiring method recognized in Chapter 3 that is suitable for the location.

680.22 Area Lighting, Receptacles, and Equipment.

(A) Receptacles.

(1) Circulation and Sanitation System, Location. Receptacles that provide power for water-pump motors or for other loads directly related to the circulation and sanitation system shall be located at least 3.0 m (10 ft) from the inside walls of the pool, or not less than 1.5 m (5 ft) from the inside walls of the pool if they meet all of the following conditions:

(1) Consist of single receptacles
(2) Employ a locking configuration
(3) Are of the grounding type
(4) Have GFCI protection

(2) Other Receptacles, Location. Other receptacles shall be not less than 3.0 m (10 ft) from the inside walls of a pool.

(3) Dwelling Unit(s). If a permanently installed pool is installed at a dwelling unit(s), no fewer than one 125-volt 15- or 20-ampere receptacle on a general-purpose branch circuit shall be located not less than 1.5 m (5 ft) from and not more than 6.0 m (20 ft) from the inside wall of the pool. This receptacle shall be located not more than 2.0 m (6 ft 6 in.) above the floor, platform, or grade level serving the pool.

(4) Restricted Space. Where a pool is within 3.0 m (10 ft) of a dwelling and the dimensions of the lot preclude meeting the required clearances, not more than one receptacle outlet shall be permitted if not less than 1.5 m (5 ft) measured horizontally from the inside wall of the pool.

(5) GFCI Protection. All 125-volt receptacles located within 6.0 m (20 ft) of the inside walls of a pool or fountain shall be protected by a ground-fault circuit interrupter. Receptacles supplying pool pump motors rated 15 or 20 amperes, 120 volt through 240 volt, single phase, shall be provided with GFCI protection.

(6) Measurements. In determining the dimensions in this section addressing receptacle spacings, the distance to be measured shall be the shortest path the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening, or other effective permanent barrier.

(B) Lighting Fixtures, Lighting Outlets, and Ceiling-Suspended (Paddle) Fans.

(1) New Outdoor Installation Clearances. In outdoor pool areas, lighting fixtures, lighting outlets, and ceiling-suspended (paddle) fans installed above the pool or the area extending 1.5 m (5 ft) horizontally from the inside walls of the pool shall be installed at a height not less than 3.7 m (12 ft) above the maximum water level of the pool.

(2) Indoor Clearances. For installations in indoor pool areas, the clearances shall be the same as for outdoor areas unless modified as provided in this paragraph. If the branch circuit supplying the equipment is protected by a ground-fault circuit-interrupter, the following equipment shall be permitted at a height not less than 2.3 m (7 ft 6 in). above the maximum pool water level:

(1) Totally enclosed fixtures.
(2) Ceiling-suspended (paddle) fans identified for use beneath ceiling structures such as provided on porches or patios.

(3) Existing Installations. Existing lighting fixtures and lighting outlets located less than 1.5 m (5 ft) measured horizontally from the inside walls of a pool shall be not less than 1.5 m (5 ft) above the surface of the maximum water level, shall be rigidly attached to the existing structure, and shall be protected by a ground-fault circuit interrupter.

(4) GFCI Protection in Adjacent Areas. Lighting fixtures, and lighting outlets, and ceiling-suspended (paddle) fans installed in the area extending between 1.5 m (5 ft) and 3.0 m (10 ft) horizontally from the inside walls of a pool shall be protected by a ground-fault circuit interrupter unless installed not less than 1.5 m (5 ft) above the maximum water level and rigidly attached to the structure adjacent to or enclosing the pool.

(5) Cord- and Plug-Connected Lighting Fixtures. Cord- and plug-connected lighting fixtures shall comply with the requirements of Section 680.7 where installed within 4.9 m (16 ft) of any point on the water surface, measured radially.

(C) Switching Devices. Switching devices shall be located at least 1.5 m (5 ft) horizontally from the inside walls of a pool unless separated from the pool by a solid fence, wall, or other permanent barrier. Alternatively, a switch that is listed as being acceptable for use within 1.5 m (5 ft) shall be permitted.

680.23 Underwater Lighting Fixtures.

This section covers all lighting fixtures installed below the normal water level of the pool.

(A) General.

(1) Fixture Design, Normal Operation. The design of an underwater lighting fixture supplied from a branch circuit either directly or by way of a transformer meeting the requirements of this section shall be such that, where the fixture is properly installed without a ground-fault circuit interrupter, there is no shock hazard with any likely combination of fault conditions during normal use (not relamping).

(2) Transformers. Transformers used for the supply of underwater fixtures, together with the transformer enclosure, shall be listed for the purpose. The transformer shall be an isolated winding type with an ungrounded seconary that has a grounded metal barrier between the primary and secondary windings.

(3) GFCI Protection, Relamping. A ground-fault circuit interrupter shall be installed in the branch circuit supplying fixtures operating at more than 15 volts, so that there is no shock hazard during relamping. The installation of the ground-fault circuit interrupter shall be such that there is no shock hazard with any likely fault-condition combination that involves a person in a conductive path from any ungrounded part of the branch circuit or the fixture to ground.

(4) Voltage Limitation. No lighting fixtures shall be installed for operation on supply circuits over 150 volts between conductors.

(5) Location, Wall Mounted Fixtures. Lighting fixtures mounted in walls shall be installed with the top of the fixture lens not less than 450 mm (18 in.) below the normal water level of the pool, unless the lighting fixture is listed and identified for use at lesser depths. No fixture shall be installed less than 100 mm (4 in.) below the normal water level of the pool.

(6) Bottom-Mounted Fixtures. A lighting fixture facing upward shall have the lens adequately guarded to prevent contact by any person.

(7) Dependence on Submersion. Fixtures that depend on submersion for safe operation shall be inherently protected against the hazards of overheating when not submerged.

(8) Compliance. Compliance with these requirements shall be obtained by the use of a listed underwater lighting fixture, and by installation of a listed ground-fault circuit interrupter in the branch circuit or a listed transformer for fixtures operating at not more than 15 volts.

(B) Wet-Niche Fixtures.

(1) Forming Shells. Forming shells shall be installed for the mounting of all wet-niche underwater fixtures and shall be equipped with provisions for conduit entries. Metal parts of the fixture and forming shell in contact with the pool water shall be of brass or other approved corrosion-resistant metal. All forming shells used with nonmetallic conduit systems, other than those that are part of a listed low-voltage lighting system not requiring grounding, shall include provisions for terminating a No. 8 copper conductor.

(2) Wiring Extending Directly to the Forming Shell. Conduit shall be installed from the forming shell to a suitable junction box or other enclosure located as provided in 680.24. Conduit shall be rigid metal, intermediate metal, liquidtight flexible nonmetallic, or rigid nonmetallic.

(a) Metal Conduit. Metal conduit shall be approved, and shall be of brass or other approved corrosion-resistant metal.

(b) Nonmetallic Conduit. Where a nonmetallic conduit is used, a No. 8 insulated solid or stranded copper equipment grounding conductor shall be installed in this conduit unless a listed low-voltage lighting system not requiring grounding is used. The

equipment grounding conductor shall be terminated in the forming shell, junction box or transformer enclosure, or ground-fault circuit-interrupter enclosure The termination of the No. 8 equipment grounding conductor in the forming shell shall be covered with, or encapsulated in, a listed potting compound to protect the connection from the possible deteriorating effect of pool water.

(3) Equipment Grounding Provisions for Cords. Wet-niche lighting fixtures that are supplied by a flexible cord or cable shall have all exposed noncurrent-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of the cord or cable. This grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure. The grounding conductor shall not be smaller than the supply conductors and not smaller than No. 16.

(4) Fixture Grounding Terminations. The end of the flexible-cord jacket and the flexible-cord conductor terminations within a fixture shall be covered with, or encapsulated in, a suitable potting compound to prevent the entry of water into the fixture through the cord or its conductors. In addition, the grounding connection within a fixture shall be similarly treated to protect such connection from the deteriorating effect of pool water in the event of water entry into the fixture.

(5) Fixture Bonding. The fixture shall be bonded to and secured to the forming shell by a positive locking device that ensures a low-resistance contact and requires a tool to remove the fixture from the forming shell. Bonding shall not be required for fixtures that are listed for the application and have no noncurrent-carrying metal parts.

(C) Dry-Niche Fixtures.

(1) Construction. A dry-niche lighting fixture shall be provided with a provision for drainage of water and a means for accommodating one equipment grounding conductor for each conduit entry.

(2) Junction Box. A junction box shall not be required but, if used, shall not be required to be elevated or located as specified in 680.24(A)(2), if the fixture is specifically identified for the purpose.

(D) No-Niche Fixtures. A no-niche fixture shall meet the construction requirements of 680.23(B)(3) and be installed in accordance with the requirements of 680.23(B). Where connection to a forming shell is specified, the connection shall be to the mounting bracket.

(E) Through-Wall Lighting Assembly. A through-wall lighting assembly shall be equipped with a threaded entry or hub, or a nonmetallic hub listed for the purpose, for the purpose of accommodating the termination of the supply conduit. A through-wall lighting assembly shall meet the construction requirements of 680.23(B)(3) and be installed in accordance with the requirements of 680.23. Where connection to a forming shell is specified, the connection shall be to the conduit termination point.

(F) Branch-Circuit Wiring.

(1) Wiring Methods. Branch circuit wiring on the supply side of enclosures and junction boxes connected to conduits run to wet-niche and no-niche fixtures, and the field wiring compartments of dry-niche fixtures, shall be installed using rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or rigid nonmetallic conduit. Where installed on buildings, electrical metallic tubing shall be permitted, and where installed within buildings, electrical nonmetallic tubing or electrical metallic tubing shall be permitted.

FPN: For requirements of electrical nonmetallic tubing, see Article 331.

Exception: Where connecting to transformers for pool lights, liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted to be used when installed in accordance with Article 351. The length shall not exceed 6 ft (1.83 m) for any one length, nor exceed 10 ft (3.05 m) in total length used.

(2) Equipment Grounding. Through-wall lighting assemblies, wet-niche, dry-niche, or no-niche lighting fixtures shall be connected to an insulated copper equipment grounding conductor installed with the circuit conductors. The equipment grounding conductor shall be installed without joint or splice except as permitted in (a) and (b). The equipment grounding conducor shall be sized in accordance with Table 250.122 but shall not be smaller than No. 12.

Exception: An equipment grounding conductor between the wiring chamber of the secondary winding of a transformer and a junction box shall be sized in accordance with the overcurrent device in this circuit.

(a) If more than one underwater lighting fixture is supplied by the same branch circuit, the equipment grounding conductor, installed between the junction boxes, transformer enclosures, or other enclosures in the supply circuit to wet-niche fixtures, or between the field-wiring compartments of dry-niche fixtures, shall be permitted to be terminated on grounding terminals.

(b) If the underwater lighting fixture is supplied from a transformer, ground-fault circuit interrupter, clock-operated switch, or a manual snap switch that is located between the panelboard and a junction box connected to the conduit that extends directly to the underwater lighting fixture, the equipment grounding conductor shall be permitted to terminate on grounding terminals on the transformer, ground-fault circuit interrupter, clock-operated switch enclosure, or an outlet box used to enclose a snap switch.

(3) Conductors. Conductors on the load side of a ground-fault circuit interrupter or of a transformer, used to comply with the provisions of 680.23(A)(8), shall not occupy raceways, boxes, or enclosures containing other conductors unless one of the following conditions applies:

(1) The other conductors are protected by ground-fault circuit interrupters.

(2) The other conductors are grounding conductors.

(3) The other conductors are supply conductors to a feed-through type ground-fault circuit interrupter.

(4) Ground-fault circuit interrupters shall be permitted in a panelboard that contains circuits protected by other than ground-fault circuit interrupters.

680.24 Junction Boxes and Enclosures for Transformers or Ground-Fault Circuit Interrupters.

(A) Junction Boxes. A junction box connected to a conduit that extends directly to a forming shell or mounting bracket of a no-niche fixture shall meet the requirements of this section.

(1) Construction. The junction box shall be listed and labeled for the purpose and:

(1) Equipped with threaded entries or hubs or a nonmetallic hub listed for the purpose.

(2) Comprised of copper, brass, suitable plastic, or other approved corrosion-resistant material.

(3) Provided with electrical continuity between every connected metal conduit and the grounding terminals by means of copper, brass, or other approved corrosion-resistant metal that is integral with the box.

(2) Installation. Where the fixture operates over 15 volts, the junction box location shall comply with (a) and (b). Where the fixture operates at less than 15 volts, the junction box location shall be permitted to comply with (c).

(a) Vertical Spacing. The junction box shall be located not less than 100 mm (4 in.), measured from the inside of the bottom of the box, above the ground level, or pool deck, or not less than 200 mm (8 in.) above the maximum pool water level, whichever provides the greater elevation.

(b) Horizontal Spacing. The junction box shall be located not less than 1.2 m (4 ft) from the inside wall of the pool, unless separated from the pool by a solid fence, wall, or other permanent barrier.

(c) Flush Deck Box. If used on a lighting system operating at 15 volts or less, a flush deck box shall be permitted if both of the following apply:

(1) An approved potting compound is used to fill the box to prevent the entrance of moisture, and

(2) The flush deck box is located not less than 1.2 m (4 ft) from the inside wall of the pool.

(B) Other Enclosures. An enclosure for a transformer, ground-fault circuit interrupter, or a similar device connected to a conduit that extends directly to a forming shell or mounting bracket of a no-niche fixture shall meet the requirements of this section.

(1) Construction. The enclosure shall be listed and labeled for the purpose and meet the following requirements:

(1) Equipped with threaded entries or hubs or a nonmetallic hub listed for the purpose.

(2) Comprised of copper, brass, suitable plastic, or other approved corrosion-resistant material.

(3) Provided with an approved seal, such as duct seal at the conduit connection, that prevents circulation of air between the conduit and the enclosures

(4) Provided with electrical continuity between every connected metal conduit and the grounding terminals by means of copper, brass, or other approved corrosion-resistant metal that is integral with the box.

(2) Installation.

(a) Vertical Spacing. The enclosure shall be located not less than 100 mm (4 in.), measured from the inside of the bottom of the box, above the ground level, or pool deck, or not less than 200 mm (8 in.) above the maximum pool water level, whichever provides the greater elevation.

(b) Horizontal Spacing. The enclosure shall be located not less than 1.2 m (4 ft) from the inside wall of the pool, unless separated from the pool by a solid fence, wall, or other permanent barrier.

(C) Protection. Junction boxes and enclosures mounted above the grade of the finished walkway around the pool shall not be located in the walkway unless afforded additional protection, such as by location under diving boards, adjacent to fixed structures, and the like.

(D) Grounding Terminals. Junction boxes, transformer enclosures, and ground-fault circuit-interrupter enclosures connected to a conduit that extends directly to a forming shell or mounting bracket of a no-niche fixture shall be provided with a number of grounding terminals that shall be no fewer than one more than the number of conduit entries.

(E) Strain Relief. The termination of a flexible cord of an underwater lighting fixture within a junction box, transformer enclosure, ground-fault circuit interrupter, or other enclosure shall be provided with a strain relief.

(F) Grounding. The junction box, transformer enclosure, or other enclosure in the supply circuit to a wet-niche or no-niche lighting fixture and the field-wiring chamber of a dry-niche lighting fixture shall be grounded to the equipment grounding terminal of the panelboard. This terminal shall be directly connected to the panelboard enclosure.

680.25 Feeders.

These provisions shall apply to any feeder on the supply side of panelboards supplying branch circuits for pool equipment covered in Part II and on the load side of the service equipment or the source of a separately derived system.

(A) Wiring Methods. Feeders shall be installed in rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or rigid nonmetallic conduit. Electrical metallic tubing shall be permitted where installed on or within a building, and electrical nonmetallic tubing shall be permitted where installed within a building.

Exception: An existing feeder between an existing remote panelboard and service equipment shall be permitted to run in flexible metal conduit or an approved cable assembly with an insulated or covered equipment grounding conductor.

(B) Grounding. An insulated equipment grounding conductor shall be installed with the feeder conductors between the grounding terminal of the pool equipment panelboard and the grounding terminal of the applicable service equipment or source of a separately derived system.

(1) Size. This conductor shall be sized in accordance with 250.122 but not smaller than No. 12. On separately derived systems, this conductor shall be sized in accordance with Table 250.66 but not smaller than No. 8.

(2) Separate Buildings. A panelboard at a separate building shall be permitted to supply swimming pool equipment if the feeder meets the requirements for grounding in 250.32. Where installed, a separate equipment grounding conductor shall be an insulated conductor.

680.26 Bonding.

(A) Performance. The bonding required by this section shall be installed to eliminate voltage gradients in the pool area as prescribed.

FPN: This section does not require that the No. 8 or larger solid copper bonding conductor be extended or attached to any remote panelboard, service equipment, or any electrode.

(B) Bonded Parts. The following parts shall be bonded together.

(1) Metallic Structural Components. All metallic parts of the pool structure, including the reinforcing metal of the pool shell, coping stones, and deck, shall be bonded. The usual steel tie wires shall be considered suitable for bonding the reinforcing steel together, and welding or special clamping shall not be required. These tie wires shall be made tight. If reinforcing steel is effectively insulated by an encapsulating nonconductive compound, at the time of manufacture and installation, it shall not be required to be bonded.

(2) Underwater Lighting. All forming shells, and mounting brackets of no-niche fixtures, shall be bonded unless a listed low-voltage lighting system with nonmetallic forming shells is used, not requiring bonding.

(3) Metal Fittings. All metal fittings within or attached to the pool structure shall be bonded. Isolated parts that are not over 100 mm (4 in.) in any dimension and do not penetrate into the pool structure more than 25 mm (1 in.) shall not require bonding.

(4) Electrical Equipment. Metal parts of electrical equipment associated with the pool water circulating system, including pump motors and metal parts of equipment associated with pool covers, including electric motors, shall be bonded. Metal parts of listed equipment incorporating an approved system of double insulation and providing a means for grounding internal nonaccessible, noncurrent-carrying metal parts shall not be bonded.

Where a double-insulated water-pump motor is installed under the provisions of this rule, a solid No. 8 copper conductor that is of sufficient length to make a bonding connection to a replacement motor shall be extended from the bonding grid to an accessible point in the motor vicinity. Where there is no connection between the swimming pool bonding grid and the equipment grounding system for the premises, this bonding conductor shall be connected to the equipment grounding conductor of the motor circuit.

(5) Metal Wiring Methods and Equipment. Metal-sheathed cables and raceways, metal piping, and all fixed metal parts except those separated form the pool by a permanent barrier, shall be bonded that are within the following distances of the pool:

(1) Within 1.5 m (5 ft) horizontally of the inside walls of the pool

(2) Within 3.7 m (12 ft) measured vertically above the maximum water level of the pool, or any observation stands, towers, or platforms, or any diving structures.

(C) Common Bonding Grid. The parts specified in 680.26(B) shall be connected to a common bonding grid with a solid copper conductor, insulated, covered, or bare, not smaller than No. 8. Connection shall be made by exothermic welding or by pressure connectors or clamps that are labeled as being suitable for the purpose and are of the following material: stainless steel, brass, copper, or copper alloy. The common bonding grid shall be permitted to be any of the following:

(1) The structural reinforcing steel of a concrete pool where the reinforcing rods are bonded together by the usual steel tie wires or the equivalent.

(2) The wall of a bolted or welded metal pool.

(3) A solid copper conductor, insulated, covered, or bare, not smaller than No. 8.

(4) Rigid metal conduit or intermediate metal conduit of brass or other identified corrosion-resistant metal conduit.

(D) Connections. Where structural reinforcing steel or the walls of bolted or welded metal pool structures are used as a common bonding grid for nonelectrical parts, the connections shall be made in accordance with 250.8.

(E) Pool Water Heaters. For pool water heaters rated at more than 50 amperes that have specific instructions regarding bonding and grounding, only those parts designated to be bonded shall be bonded, and only those parts designated to be grounded shall be grounded.

680.27 Specialized Pool Equipment

(A) Underwater Audio Equipment. All underwater audio equipment shall be identified for the purpose.

(1) Speakers. Each speaker shall be mounted in an approved metal forming shell, the front of which is enclosed by a captive metal screen, or equivalent, that is bonded to and secured to the forming shell by a positive locking device that ensures a low-resistance contact and requires a tool to open for installation or servicing of the speaker. The forming shell shall be installed in a recess in the wall or floor of the pool.

(2) Wiring Methods. Rigid metal conduit or intermediate metal conduit of brass or other identified corrosion-resistant metal, liquidtight flexible nonmetallic conduit (LFNC-B) or rigid

nonmetallic conduit shall extend from the forming shell to a suitable junction box or other enclosure as provided in 680.24. Where rigid nonmetallic conduit or liquidtight flexible nonmetallic conduit (LFNC-B) is used, a No. 8 insulated solid or stranded copper equipment grounding conductor shall be installed in this conduit. The equipment grounding conductor shall be terminated in the forming shell and the junction box. The termination of the No. 8 equipment grounding conductor in the forming shell shall be covered with, or encapsulated in, a listed potting compound to protect such connection from the possible deteriorating effect of pool water.

(3) Forming Shell and Metal Screen. The forming shell and metal screen shall be of brass or other approved corrosion-resistant metal. All forming shells shall include provisions for terminating a No. 8 copper conductor.

(B) Electrically Operated Pool Covers.

(1) Motors and Controllers. The electric motors, controllers, and wiring shall be located not less than 1.5 m (5 ft) from the inside wall of the pool unless separated from the pool by a wall, cover, or other permanent barrier. Electric motors installed below grade level shall be of the totally enclosed type.

FPN No. 1: For cabinets installed in damp and wet locations, see 373.2(A).

FPN No. 2: For switches or circuit breakers installed in wet locations, see 380.4

FPN No. 3: For protection against liquids, see 430.11.

(2) Protection. The electric motor and controller shall be connected to a circuit protected by a ground-fault circuit interrupter.

(C) Deck Area Heating. These provisions of this section shall apply to all pool deck areas, including a covered pool, where electrically operated comfort heating units are installed within 6.0 m (20 ft) of the inside wall of the pool.

(1) Unit Heaters. Unit heaters shall be rigidly mounted to the structure and shall be of the totally enclosed or guarded types. Unit heaters shall not be mounted over the pool or within the area extending 1.5 m (5 ft) horizontally from the inside walls of a pool.

(2) Permanently Wired Radiant Heaters. Radiant electric heaters shall be suitably guarded and securely fastened to their mounting device(s). Heaters shall not be installed over a pool or within the area extending 1.5 m (5 ft) horizontally from the inside walls of the pool and shall be mounted at least 3.7 m (12 ft) vertically above the pool deck unless otherwise approved.

(3) Radiant Heating Cables Not Permitted. Radiant heating cables embedded in or below the deck shall not be permitted.

III Storable Pools

680.30 General. Electrical installations at storable pools shall comply with the provisions of Part I and Part III.

680.31 Pumps.

A cord-connected pool filter pump shall incorporate an approved system of double insulation or its equivalent and shall be provided with means for grounding only the internal and nonaccessible noncurrent-carrying metal parts of the appliance.

The means for grounding shall be an equipment grounding conductor run with the power-supply conductors in the flexible cord that is properly terminated in a grounding-type attachment plug having a fixed grounding contact member.

680.32 Ground-Fault Circuit Interrupters Required.

All electrical equipment, including power-supply cords, used with storable pools shall be protected by ground-fault circuit interrupters.

FPN: For flexible cord usage, see Section 400.4.

680.33 Lighting Fixtures.

An underwater lighting fixture, if installed, shall be installed in or on the wall of the storable pool. It shall comply with one of the following two provisions:

(A) 15 Volts or Less. A lighting fixture shall be part of a cord- and plug-connected lighting assembly. This assembly shall be listed as an assembly for the purpose and have the following construction features:

(1) No exposed metal parts

(2) A fixture lamp that operates at 15 volts or less

(3) An impact-resistant polymeric lens, fixture body, and transformer enclosure

(4) A transformer meeting the requirements of 680.23(A)(2) with a primary rating not over 150 volts

(B) Over 15 Volts But Not Over 150 Volts. A lighting assembly without a transformer and with the fixture lamp(s) operating at not over 150 volts shall be permitted to be cord- and plug-connected where the assembly is listed as an assembly for the purpose. The installation shall comply with 680.23(A)(5) and the assembly shall have the following construction features:

(1) No exposed metal parts.

(2) An impact-resistant polymeric lens and fixture body.

(3) A ground-fault circuit interrupter with open neutral protection ~~is provided~~ as an integral part of the assembly.

(4) The fixture lamp is permanently connected to the ground-fault circuit interrupter with open-neutral protection.

(5) Compliance with the requirements of 680.23(A).

IV Spas and Hot Tubs

680.40 General. Electrical installations at spas and hot tubs shall comply with the provisions of Part I and Part IV.

680.41 Emergency Switch for Spas and Hot Tubs.

A clearly labeled emergency shutoff or control switch for the purpose of stopping the motor(s) that provide power to the recirculation system and jet system shall be installed at a point readily accessible to the users and not less than 1.5 m (5 ft) away, adjacent to, and within sight of the spa or hot tub. This requirement shall not apply to single-family dwellings.

680.42 Outdoor Installations.

A spa or hot tub installed outdoors shall comply with the provisions of Parts I and II of this article, except as permitted in (A) and (B), that would otherwise apply to pools installed outdoors.

(A) Flexible Connections. Listed packaged spa or hot tub equipment assemblies or self-contained spas or hot tubs utilizing a factory-installed or assembled control panel or panelboard shall be permitted to use flexible connections as covered in (1) and (2):

(1) Flexible Conduit. Liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted in lengths of not more than 1.8 m (6 ft).

(2) Cord- and Plug-Connections. Cord and plug connections with a cord not longer than 4.6 m (15 ft) shall be permitted where protected by a ground-fault circuit interrupter.

(B) Bonding. Bonding by metal-to-metal mounting on a common frame or base shall be permitted. The metal bands or hoops used to secure wooden staves shall not be required to be bonded as required in 680.26.

(C) Interior Wiring to Outdoor Installations. In the interior of a one-family dwelling or in the interior of another building or structure associated with a one-family dwelling, any of the wiring methods recognized in Chapter 3 of this Code that contain a copper equipment grounding conductor that is insulated or enclosed within the outer sheath of the wiring method and not smaller than No. 12 shall be permitted to be used for the connection to a self-contained spa or hot tub, or a packaged spa or hot tub equipment assembly.

680.43 Indoor Installations

A spa or hot tub installed indoors shall comply with the provisions of Parts I and II except as modified by this section, and shall be connected by the wiring methods of Chapter 3.

Exception: Listed spa and hot tub packaged units rated 20 amperes or less shall be permitted to be cord and plug connected to facilitate the removal or disconnection of the unit for maintenance and repair.

(A) Receptacles. At least one 125-volt, 15- or 20-ampere receptacle on a general-purpose branch circuit shall be located not less than of 1.5 m (5 ft) from and not exceeding 3.0 m (10 ft) from the inside wall of the spa or hot tub.

(1) Location. Receptacles shall be located at least 1.5 m (5 ft) measured horizontally from the inside walls of the spa or hot tub.

(2) Protection, General. Receptacles rated 125 volts and 30 amperes or less located within 3.0 m (10 ft) of the inside walls of a spa or hot tub shall be protected by a ground-fault circuit interrupter.

(3) Protection, Spa or Hot Tub Supply Receptacle. Receptacles that provide power for a spa or hot tub shall be ground-fault circuit-interrupter protected.

(4) Measurements. In determining the dimensions in this section addressing receptacle spacings, the distance to be measured shall be the shortest path the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening, or other effective permanent barrier.

(B) Installation of Lighting Fixtures, Lighting Outlets, and Ceiling-Suspended (Paddle) Fans.

(1) Elevation. Lighting fixtures except as covered in Section 680.43(B)(2), lighting outlets, and ceiling-suspended (paddle) fans

located over the spa or hot tub or within 1.5 m (5 ft) from the inside walls of the spa or hot tub shall comply with the following clearances above the maximum water level.

(a) Without GFCI. Where no GFCI protection is provided, the mounting height shall be not less than 3.7 m (12 ft).

(b) With GFCI. Where GFCI protection is provided, the mounting height shall be permitted to be not less than 2.3 m (7 ft 6 in.)

(c) Below 2.3 m (7 ft 6 in.). Lighting fixtures meeting the requirements of (1) or (2) and protected by a ground-fault circuit interrupter shall be permitted to be installed less than 2.3 m (7 ft 6 in.) over a spa or hot tub.

(1) Recessed fixtures with a glass or plastic lens, nonmetallic or electrically isolated metal trim, and suitable for use in damp locations.

(2) Surface-mounted fixtures with a glass or plastic globe a nonmetallic body or a metallic body isolated from contact, and suitable for use in damp locations.

(2) Underwater Applications. Underwater lighting fixtures shall comply with the provisions of Section 680.23 or Section 680.33.

(C) Wall Switches. Switches shall be located at least 1.5 m (5 ft), measured horizontally, from the inside walls of the spa or hot tub.

(D) Bonding. The following parts shall be bonded together.

(1) All metal fittings within or attached to the spa or hot tub structure

(2) Metal parts of electrical equipment associated with the spa or hot tub water circulating system, including pump motors

(3) Metal conduit and metal piping that are within 1.5 m (5 ft) of the inside walls of the spa or hot tub and that are not separated from the spa or hot tub by a permanent barrier

(4) All metal surfaces that are within 1.5 m (5 ft) of the inside walls of the spa or hot tub and that are not separated from the spa or hot tub area by a permanent barrier.

Exception: Small conductive surfaces not likely to become energized, such as air and water jets and drain fittings, where not connected to metallic piping, towel bars, mirror frames, and similar nonelectrical equipment, shall not be required to be bonded.

(5) Electrical devices and controls that are not associated with the spas or hot tubs and that are located not less than 1.5 m (5 ft) from such units; otherwise they shall be bonded to the spa or hot tub system.

(E) Methods of Bonding. All metal parts associated with the spa or hot tub shall be bonded by any of the following methods:

(1) The interconnection of threaded metal piping and fittings

(2) Metal-to-metal mounting on a common frame or base

(3) The provisions ~~.~~ of a copper bonding jumper, insulated, covered, or bare, not smaller than No. 8 solid

(F) Grounding. The following equipment shall be grounded:

(1) All electric equipment located within 1.5 m (5 ft) of the inside wall of the spa or hot tub

(2) All electric equipment associated with the circulating system of the spa or hot tub

(G) Underwater Audio Equipment. Underwater audio equipment shall comply with the provisions of Part II of this article.

680.44 Protection.

Except as otherwise provided in this section, the outlet(s) that supplies a self-contained spa or hot tub, a packaged spa or hot tub equipment assembly, or a field-assembled spa or hot tub protected by a ground-fault circuit interrupter.

(A) Listed Units. If so marked, a listed self-contained unit or listed packaged equipment assembly that includes integral ground-fault circuit-interrupter protection for all electrical parts within the unit or assembly (pumps, air blowers, heaters, lights, controls, sanitizer generators, wiring, etc.) shall be permitted without additional GFCI protection.

(B) Subdivided Loads. If the load has been subdivided to comply with 680.9 or for other reasons, and if the unit is not rated 3 phase or over 250 volts, GFCI protection shall be provided for each subdivided portion of the load.

(C) Other Units. A field assembled spa or hot tub rated 3 phase or rated over 250 volts shall not require the supply to be protected by a ground-fault circuit interrupter.

(D) Combination Pool and Spa or Hot Tub. A combination pool/hot tub or spa assembly commonly bonded need not be protected by a ground-fault circuit interrupter.

FPN: See 680.2 for definitions of self-contained spa or hot tub and for packaged spa or hot equipment assembly.

V Fountains

680.50 General.

The provisions of Part I and Part V shall apply to all permanently installed fountains as defined in 680.2. Fountains that have water common to a pool shall additionally comply with the requirements in Part II of this article. Part V does not cover self-contained, portable fountains not larger than 1.5 m (5 ft) in any dimension. Portable fountains shall comply with Parts II and III of Article 422.

680.51 Lighting Fixtures, Submersible Pumps, and Other Submersible Equipment.

(A) Ground-Fault Circuit Interrupter. Fountain equipment, unless listed for operation at 15 volts or less and supplied by a transformer that complies with 680.23(A)(2), shall be protected by a ground-fault circuit interrupter.

(B) Operating Voltage. No lighting fixtures shall be installed for operation on supply circuits over 150 volts between conductors. Submersible pumps and other submersible equipment shall operate at 300 volts or less between conductors.

(C) Lighting Fixture Lenses. Lighting fixtures shall be installed with the top of the fixture lens below the normal water level of the fountain unless listed for above-water locations. A lighting fixture facing upward shall have the lens adequately guarded to prevent contact by any person.

(D) Overheating Protection. Electrical equipment that depends on submersion for safe operation shall be protected against overheating by a low-water cutoff or other approved means when not submerged.

(E) Wiring. Equipment shall be equipped with provisions for threaded conduit entries or be provided with a suitable flexible cord. The maximum length of exposed cord in the fountain shall be limited to 3.0 m (10 ft). Cords extending beyond the fountain perimeter shall be enclosed in approved wiring enclosures. Metal parts of equipment in contact with water shall be of brass or other approved corrosion-resistant metal.

(F) Servicing. All equipment shall be removable from the water for relamping or normal maintenance. Fixtures shall not be permanently imbedded into the fountain structure ~~so~~ such that the water level must be reduced or the fountain drained for relamping, maintenance, or inspection.

(G) Stability. Equipment shall be inherently stable or be securely fastened in place.

680.52 Junction Boxes and Other Enclosures.

(A) General. Junction boxes and other enclosures used for other than underwater installation shall comply with 680.24.

(B) Underwater Junction Boxes and Other Underwater Enclosures. Junction boxes and other underwater enclosures shall meet the requirements of (1) and (2):

(1) Construction.

(a) Underwater enclosures shall be equipped with provisions for threaded conduit entries or compression glands or seals for cord entry.

(b) Underwater enclosures shall be submersible, and made of copper, brass, or other approved corrosion-resistant material.

(2) Installation. Underwater enclosure installations shall comply with (a) and (b).

(a) Underwater enclosures shall be filled with an approved potting compound to prevent the entry of moisture.

(b) Underwater enclosures shall be firmly attached to the supports or directly to the fountain surface and bonded as required. Where the junction box is supported only by the conduit, the conduit shall be of copper, brass, or other approved corrosion-resistant metal. Where the box is fed by nonmetallic conduit, it shall have additional supports and fasteners of copper, brass, or other approved corrosion-resistant material.

FPN: See 370.23 for support of enclosures.

680.53 Bonding.

All metal piping systems associated with the fountain shall be bonded to the equipment grounding conductor of the branch circuit supplying the fountain.

FPN: See 250.122 for sizing of these conductors.

680.54 Grounding.

The following equipment shall be grounded:

(1) All electrical equipment located within the fountain or within 1.5 m (5 ft) of the inside wall of the fountain

(2) All electrical equipment associated with the recirculating system of the fountain

(3) Panelboards that are not part of the service equipment and that supply any electrical equipment associated with the fountain

680.55 Methods of Grounding.

(A) Applied Provisions. The provisions of 680.21(A), 680.23(B)(3), 680.23(F)(1-2), 680.24(F), and 680.25 shall apply.

(B) Supplied by a Flexible Cord. Electrical equipment that is supplied by a flexible cord shall have all exposed noncurrent-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of this cord. The grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure.

680.56 Cord- and Plug-Connected Equipment.

(A) Ground-Fault Circuit Interrupter. All electrical equipment, including power-supply cords, shall be protected by ground-fault circuit interrupters.

(B) Cord Type. Flexible cord immersed in or exposed to water shall be of a type for "extra hard usage" as designated in Table 400.4 and shall be listed and marked for the purpose.

(C) Sealing. The end of the flexible cord jacket and the flexible cord conductor termination within equipment shall be covered with, or encapsulated in, a suitable potting compound to prevent the entry of water into the equipment through the cord or its conductors. In addition, the ground connection within equipment shall be similarly treated to protect such connections from the deteriorating effect of water that may enter into the equipment.

(D) Terminations. Connections with flexible cord shall be permanent, except that grounding-type attachment plugs and receptacles shall be permitted to facilitate removal or disconnection for maintenance, repair, or storage of fixed or stationary equipment not located in any water-containing part of a fountain.

680.57 Signs.

(A) General. This section covers electric signs installed within or adjacent to fountains.

(B) Ground-Fault Circuit-Interrupter Protection for Personnel. All circuits supplying the sign shall have ground-fault circuit-interrupter protection for personnel.

(C) Location.

(1) Fixed or Stationary. A fixed or stationary electric sign installed within a fountain shall be not less than 1.5 m (5 ft) inside the fountain measured from the outside edges of the fountain.

(2) Portable. A portable electric sign shall not be placed within a pool or fountain, or within 1.5 m (5 ft) measured horizontally from the inside walls of the fountain.

(D) Disconnect. A sign shall have a local disconnecting means in accordance with Section 600.6 and Section 680.12.

(E) Bonding and Grounding. A sign shall be grounded and bonded in accordance with Section 600.7.

VI. Pools and Tubs for Therapeutic Use

680.60 General.

The provisions of Part I and Part VI shall apply to pools and tubs for therapeutic use in health care facilities, gymnasiums, athletic training rooms, and similar areas. Portable therapeutic appliances shall comply with Parts II and III of Article 422.

FPN: See 517.2 for definition of health care facilities.

680.61 Permanently Installed Therapeutic Pools.

Therapeutic pools that are constructed in the ground, on the ground, or in a building in such a manner that the pool cannot be readily disassembled shall comply with Parts I and II of this article.

Exception: The limitations of 680.22(A)(1) and (2) shall not apply where all lighting fixtures are of the totally enclosed type.

680.62 Therapeutic Tubs (Hydrotherapeutic Tanks)

Therapeutic tubs, used for the submersion and treatment of patients, that are not easily moved from one place to another in normal use or that are fastened or otherwise secured at a specific location, including associated piping systems, shall conform to this part.

(A) Protection. Except as otherwise provided in this section, the outlet(s) that supplies a self-contained therapeutic tub or hydrotherapeutic tank, a packaged therapeutic tub or hydrotherapeutic tank, or a field-assembled therapeutic tub or hydrotherapeutic tank shall be protected by a ground-fault circuit interrupter.

(1) Listed Units. If so marked, a listed self-contained unit or listed packaged equipment assembly that includes integral ground-fault circuit-interrupter protection for all electrical parts within the unit or assembly (pumps, air blowers, heaters, lights, controls, sanitizer generators, wiring, etc.) shall be permitted without additional GFCI protection.

(2) Subdivided Loads. If the load has been subdivided to comply with 680.9 or for other reasons, and where the unit is not rated 3 phase or over 250 volts, GFCI protection shall be provided for each subdivided portion of the load.

(3) Other Units. A therapeutic tub or hydrotherapeutic tank rated 3 phase or rated over 250 volts shall not require the supply to be protected by a ground-fault circuit interrupter.

(B) Bonding. The following parts shall be bonded together.

(1) All metal fittings within or attached to the tub structure

(2) Metal parts of electrical equipment associated with the tub water circulating system, including pump motors

(3) Metal-sheathed cables and raceways and metal piping that are within 1.5 m (5 ft) of the inside walls of the tub and not separated from the tub by a permanent barrier

(4) All metal surfaces that are within 1.5 m (5 ft) of the inside walls of the tub and not separated from the tub area by a permanent barrier

(5) Electrical devices and controls that are not associated with the therapeutic tubs and that are located a minimum of 1.5 m (5 ft) from such units; otherwise they shall be bonded to the therapeutic tub system.

(C) Methods of Bonding. All metal parts associated with the tub required to be bonded by this section shall be bonded by any of the following methods:

(1) The interconnection of threaded metal piping and fittings

(2) Metal-to-metal mounting on a common frame or base

(3) Connections by suitable metal clamps

(4) By the provisions of a solid copper bonding jumper, insulated, covered, or bare, not smaller than No. 8

(D) Grounding.

(1) Fixed or Stationary Equipment. The following equipment shall be grounded:

(a) Location. All electrical equipment located within 1.5 m (5 ft) of the inside wall of the tub shall be grounded.

(b) Circulation System. All electrical equipment associated with the circulating system of the tub shall be grounded.

(2) Portable Equipment. Portable therapeutic appliances shall meet the grounding requirements in 250.114.

(E) Receptacles. All receptacles within 1.5 m (5 ft) of a therapeutic tub shall be protected by a ground-fault circuit interrupter.

(F) Lighting Fixtures. All lighting fixtures used in therapeutic tub areas shall be of the totally enclosed type.

VII Hydromassage Bathtubs

680.70 General. Hydromassage bathtubs as defined in 680.2 shall comply with Part VII. They shall not be required to comply with other parts of this article.

680.71 Protection.

Hydromassage bathtubs and their associated electrical components shall be protected by a ground-fault circuit interrupter. All 125-volt, single-phase receptacles not exceeding 30 amperes and located within 1.5 m (5 ft) measured horizontally of the inside walls of a hydromassage tub shall be protected by a ground-fault circuit interrupter(s).

680.72 Other Electrical Equipment.

Lighting fixtures, switches, receptacles, and other electrical equipment located in the same room, and not directly associated with a hydromassage bathtub, shall be installed in accordance with the requirements of Chapters 1 through 4 in this Code covering the installation of that equipment in bathrooms.

680.73 Accessibility.

Hydromassage bathtub electrical equipment shall be accessible without damaging the building structure or building finish.

680.74 Bonding.

All metal piping systems, metal parts of electrical equipment, and pump motors associated with the hydromassage tub shall be bonded together using a copper bonding jumper, insulated, covered, or bare, not smaller than No. 8 solid. Metal parts of listed equipment incorporating an approved system of double insulation and providing a means for grounding internal nonaccessible, noncurrent-carrying metal parts shall not be bonded.

SUBSTANTIATION: This editorial rewrite of Article 680 is to comply with the new style and format of the Code. It also meets the intent of Proposal 20-31.

A summary of the changes are shown on the following pages:

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9

NEGATIVE: 1

NOT RETURNED: 1 Ryan

EXPLANATION OF NEGATIVE:

TALKA: There is no argument over the long overdue rewrite of Article 680, however the rewrite as presented and accepted by the panel allows significant changes to be made to Article 680 without sufficient technical substantiation. For example:

Section 680-2 Definitions - The definition of fixed, portable and stationary equipment has been added. The definitions are vague and subject to wide interpretation. The definitions also conflict with other definitions on other ANSI standards. Finally, an essentially identical Proposal 20-5, was rejected by the Panel during this cycle. For consistency alone the Panel should also reject these definitions.

Section 680-7 has been revised to eliminate the 20 amperes limitation on cord and plug connected equipment. Besides the fact that it now allows motors and other equipment rated greater than 240 volts, 20 amperes to be connected via cord and plug, it also has an impact on present Section 680-(6)(a)(1). No technical substantiation was provided to justify this loosening of requirements. This is a major change in philosophy that would be substantiated.

Section 680-26(b)(2) has been revised to require the metallic forming shell of a low voltage no niche fixture to be bonded. This is in contradiction with the present requirement of 680-22(a)(2). This requirement presently reads: "All forming shells and mounting brackets of a no-niche fixture unless a listed low-voltage lighting system is used, not requiring bonding." The qualifying factor is the use of a low voltage fixture. The proposal as written increases the qualifying factor to low voltage and nonmetallic. No substantiation was provided to warrant the tightening of the requirement.

Section 680-44 - The first sentence is missing the words "shall be" between the words tub and protected. It should read "Except as otherwise provided in this section, the outlet(s) that supplies a self-contained spa or hot tub, a packaged spa or hot tub equipment or assembly, or a field assembled spa or hot tub shall be protected by a ground-fault circuit interrupter.

COMMENT ON AFFIRMATIVE:

LABRAKE: The Electric Light and Power Group affirms the panel's action on the Article 680 rewrite with the following comments:

Section 680-8(a) proposed in 20-30a would be acceptable according to the panel's action taken on NFPA 70 A98 ROP Proposal 20-103 if the words were changed throughout 680-8 as follows: delete "supply or" and after "service drop", add "feeder or branch circuit or supply lines associated with separately derived systems." The panel should refer to CMP 4's actions taken to distinguish between utility services and customer-installed outside feeders and branch circuits.

Also, the first column of the 0 to 750V-Ground cables' clearances needs to be harmonized with the 1997 NESC values of 6.9 m (22.5 ft) for "A" and 4.4 m (14.5 ft) for "B" in Table 680-8. The description of cables in the first column of Table 680-8 correspond to Rule 230C2 of the 1997 NESC.

Submitter's Proposed Section	1999 NEC Section	Action	Statement
1	1	N/A	Note: Hard metric conversions applied throughout, incorporating Proposal 20-29 objectives.
2	4	AIP	Incorporate Style Manual revisions to "Fountain; change "may" to "can" three places in other definitions.
Equip.-Fixed		Accept	
Equip.-Port.		Accept	
Equip.-Sta.		Accept	
Maximum Water Level	N/A	AIP	Inserts new definition accepted by the action on Proposal 20-3.
Through-Wall Light. Assembly	N/A	AIP	Inserts new definition accepted by the action on Proposal 20-35.
Pool		Accept	
3	3	AIP	Insert other articles table per Style Manual provisions.
4	2		
5	5(b)	AIP	Pluralize the description, per Style Manual.
6	24	AIP	Specify Article 250 locations, per Style Manual
6(1)		AIP	Incorporate through-wall lighting assemblies as covered in the action on Proposal 20-91.
6(2)		AIP	Change to: "pool or fountain" from "contained body of water" to avoid implication that a pond is covered within Article 680. See panel statement on Proposal 20-32.
6(3)		AIP	Change to: "pool or fountain". See §680.6(2)
6(7)		AIP	Change to: "pool or fountain". See §680.6(2)
7		Accept	
7(A and B)	7	Accept	
7(C)	25(e)	Accept	
8(A)	8	AIP	(A) Power. With respect to service drop conductors and open overhead wiring, swimming pool and similar installations shall comply with the minimum clearances given in Table 680.8. This avoids the contained body of water problem; see §680.6(2). It also deletes proposed coverage of a roofed structure because as proposed it could allow drop conductors to pass over the pool , even if below the roof. The table and figure has an expanded title per current Style Manual preferences, and the text of the rule now refers to the figure for the same reason. The table has its internal references corrected, and the words "over" and "through" are used because the current format can be interpreted as meaning greater than the entire 15kV to 50kV range.
8(B)	8	AP	Accept only "(B) Communications Systems." See Panel action and statement on Proposal 20-53 for wording and reasoning. Retain, however the word "covered" instead of "complying with" for the reasons given in the substantiation hereto in Proposal 20-31.
8(C)(new)		Accept	Add: "(C) Network-Powered Broadband Communications Systems. The minimum clearances for overhead network-powered broadband communications systems conductors from pools or fountains shall comply with the provisions in Table 680.8 for conductors operating at 0 to 750 volts to ground." This correlates with a proposal to change §830.10(e), which if approved by CMP 16 will defer to Art. 680.
Table 680.8	Table 680.8	AIP	Insert metric columns per Proposal 20-56; revise wording in Row B per Proposal 20-57.
9	9	AIP/AP	Leave the word "pool" in this section. Change last part to: "…the total nameplate rated load." Change "more than" to "over". The first change avoids the contained body of water problem; see §680-6(2). The second and third changes are editorial.
10	10	AIP	Metrication integrated per Proposal 20-58. Title added to table, with text reference, per Style Manual
11	11	N/A	Editorial change to drainage description.
12	12	AIP	Wording revised to incorporate the action on Proposal 20-62.
20 (new)		Accept	
21(A)	25(c)	Accept	
(1)	25(c)	Accept	
(2)	25(c)	Accept	
(3)	25(c)	Accept	
(4)	25(c)	Accept	

Submitter's Proposed Section	1999 NEC Section	Action	Statement
(5)	25(c)	AIP	Change to: "(5) Cord- and Plug-Connections. Pool-associated motors shall be permitted to employ cord- and plug-connections in accordance with Section 680.7." The other part of the submitter's text needlessly recapitulated §680.7.
21(B)	6(d)	Reject	The panel decided to retain GFCI protection, but only on receptacle outlets. This material is covered in Section 680.22(A)(5).
21(C)	28	Accept	This becomes 21(B).
22(A)(1)	6(a)(1)	Accept	
22(A)(2)	6(a)(1)	AIP	"Not less than" per Style Manual
22(A)(3)	6(a)(2)	AIP	Edits per Style Manual
22(A)(4) (new)		Accept	Add new: "(4) Restricted Space. Where a pool is within 3 m (10 ft) of a dwelling and the dimensions of the lot preclude meeting the required clearances, not more than one receptacle outlet shall be permitted if at least 1.5 m (5 ft) measured horizontally from the inside wall of the pool." Responds to Proposal 20-39. Renumber following sections (4) & (5) to (5) & (6).
22(A)(5)	6(a)(3)	AIP	Remove "…or fountain…" This part of the article doesn't cover fountains.
22(A)(5)	6(d)	AIP	Added sentence from originally proposed §680.21(B), reworded to only apply to receptacle outlets. The panel reconsidered the concept of providing GFCI protection for all small motors and decided that there was insufficient substantiation to keep the rule for hard wired motors. The voltage range reflects Section 220-2 circuit (as opposed to device) voltages, and the panel action on Proposal 20-49.
22(A)(6)	6(a)FPN	AIP	Keep "doorway with hinged or sliding door". The panel believes that potentially requiring GFCI on inside receptacles near a sliding door is excessive. Change "is" to "shall be" because this is now a requirement.
22(B)	6(b)		N/C
(1)	6(b)(1)	AIP	Editorially delete "For new installations" and change heading to "(1) New Outdoor Installation Clearances."
(2)	6(b)(2)	AIP	Change (2) to (3). Existing installations follows requirements for indoor clearances.
(3)	6(b)(3)	AIP	Change (3) to (2). Change "at least" to "not less than" per Style Manual
(4)	6(b)(4)	AIP	Change in heading "Contiguous" to "Adjacent".
(5)	6(b)(5)	AIP	Change 680-20 to 680-7. The change in title and the beginning of the text (adding "and plug-") incorporates the panel action on Proposal 20-43.
22(C)	6(c)	AIP	See Panel action on 20-44, incorporated herein.
23	20	Accept	
23(A)(1)	20(a)(1) 1st ¶	Accept	
23(A)(2)	5(a)	AIP	Add ungrounded secondary per Proposal 20-36.
23(A)(3)	20(a)(1) 2nd ¶	Accept	
23(A)(4)	20(a)(2)	Accept	
23(A)(5)	20(a)(3)	AIP	Change "at least" to "not less than" per Style Manual
23(A)(6)	20(a)(4)	Accept	
23(A)(7)	20(a)(5)	Accept	
23(A)(8)	20(a)(1) 3rd ¶	Accept	
23(B)(1)	20(b)(1) 1st ¶; 20(b)(1) 4th ¶, 1st, 3rd sentences	Accept	
23(B)(2)	20(b)(1) 2nd ¶	Accept	
(a)		Accept	
(b)		AIP	Add "solid or stranded" to incorporate the panel action on Proposal 20-77. Add "equipment grounding" after "insulated copper" in the first sentence, add "equipment" ahead of "grounding conductor" in the second sentence, and add "equipment grounding" after "No. 8" in the third sentence. This uses terms consistently and incorporates the recommendation of Proposal 20-75. The panel notes that on the submitter's relocation chart, Sections 680.23(b)(3)(a-b) should be 680.23(b)(2)(a-b).
23(B)(3)	25(b)(5)	Accept	
23(B)(4)	20(b)(2)	Accept	
23(B)(5)	20(b)(3)	Accept	
23(C)(1)	20(c) 1st ¶	Accept	
23(C)(2)	20(c) 2nd ¶, 4th sentence	Accept	
23(D)	20(d)	AIP	Delete "be" after "A no-niche fixture shall".

Submitter's Proposed Section	1999 NEC Section	Action	Statement
23(E)	N/A	N/A	Results from action on Proposal 20-115, editorially corrected to correlate with related material. Based on the limited information provided, the panel assumes this product is comparable to a wet-niche fixture while operating. The submitter is invited to provide additional information during the comment period.
23(E)(1)	25(b)(2-3); 20(c) 2nd ¶, 1st, 2nd, 3rd sentences	AIP	Renumber as -23(F)(1) per action on 20-115

26	22		
26(A)		Accept	
26(B)		AIP	Deletion of "listed" in Section 680.22(B)(1) reflects action on Proposal 20-82. In Section 680.22(B)(4), add the second paragraph as accepted in the action on Proposal 20-84. Change (B)(5)(b) strikethrough to underline for "(b) Vertical. Within", corrects a typo in the submittal.
26(C)		Accept	Note that "(C) Common Bonding Grid. …" is a level one subsection to 680.26.
26(D)		Accept	
26(E)	22(c)	Accept	
27(A)	23	AIP	Insert "solid or stranded" to correlate with the panel action on Proposal 20-77 in a directly comparable application. Revise Section 680-27(A)(2) to include LFNC and change "suitable" to "listed" as covered in the action on Proposal 20-89. Add "equipment grounding" after "insulated copper"; add "equipment" prior to "grounding conductor"; add "equipment grounding after "of the No. 8, in 680.27(A)(2). This is for consistent use of terminology. See Panel action on Proposal 20-75.
27(B)	26	Accept	
27(C)	27	Accept	
30 (new)		AIP	Add the heading "General." Sections require titles.
31	30	Accept	
32	31	AIP	Reword the FPN per current style.
33	32	AIP	The Panel notes the last sentence of 680.33(A) to be newly relocated material from 680.32(a)(5). Remove the dash between "shall" and "be". Item (4) shall end with "…150 volts." Delete the comma and the word "and" at the end of item (4). In (B)(4), delete "is", and in (B)(5) change "It complies" to "Compliance" for style considerations on list items.
40 (new)		AIP	Add the heading "General." Sections require titles.
41	38	AIP	Use the phrase "not less than" per current style.
42	40	AIP	(The rewrite proposal already covered the panel action on the first half of Proposal 20-118 and on Proposal 20-119.) The proposed language is further changed by adding Section 680.42(C) as covered in the second half of Proposal 20-118, slightly modified with regard to the equipment grounding conductor to directly correlate with the language in 680.21(A)(4) of the rewrite. The title is more fully descriptive for clarity.
43	41	Accept	The word "Exception:" is new material.
43(A)	41(a)	AIP	Use "not less than", "not exceeding" per current style.

Submitter's Proposed Section	1999 NEC Section	Action	Statement
43(A)(4)	41(a)(2)FPN	AIP	Add after "ceiling,": "doorway with hinged or sliding door, window opening,". This is consistent with Panel action on 680.22(A)(5), which will be 680.22(A)(6). Change "is" to "shall be" for style.
43(B)(1)(a)	41(b)	AIP	Change "where" to "If" because it describes a condition of existence not location.
43(B)(2)	41(b)(2)	AIP	Change format of 680.43(B)(1)(1) and (2) to 680.43(B)(1)(a) and (b). Add titles "Without GFCI" to the first, and "With GFCI" to the second. Make the rules complete sentences: "Where no GFCI protection is provided, the mounting height shall be not less than 3.7 m (12 ft)." and, for the second item "Where GFCI protection is provided, the mounting height shall be permitted to be not less than 2.3 m (7 ft 6 in.)." Change 680.43(B)(2) in the proposal to 680.43(B)(1)(c) and rewrite as follows: "(c) Below 2.3 m (7 ft 6 in.). Lighting fixtures meeting the requirements of (1) or (2) and protected by a GFCI shall be permitted to be installed less than 2.3 m (7 ft 6 in.) over a spa or hot tub. (1) Recessed fixtures with a glass or plastic lens and nonmetallic or electrically isolated metal trim, and suitable for use in damp locations. (2) Surface-mounted fixtures with a glass or plastic globe, a nonmetallic body or a metallic body isolated from contact, and suitable for use in damp locations."
43(B)(3)		Accept	Item (3) in the proposal, covering "Underwater Applications, will now be 680.43(B)(2). This change and the one preceding it are editorial, addressing Style Manual rules about third level entries and list entries.
43(C)	41(c)	AIP	Use "not less than" per current Style Manual
43(D)	41(d)	AIP	Use "that are" consistently to maintain parallel construction on the list; reword (5) for style and proper grammar in a list
Between 43(F) and (G)	41(g) & (h)	Accept	Removed parts (g) and (h) from old 680-41(g) and (h).
43(G)	41(i)	Accept	
44	42	AIP	Change "where" to "if" in (A) and (B) (three places) because it is a condition of existence and not place.
44(A)	42 Exception	Accept	
44(B)		Accept	
44(C)	42	Accept	
44(D)	42	Accept	
44 FPN	42 FPN	AIP	Change reference to Section 680.2.
50	50	AIP	Specify applicable parts of Art. 422 per Style Manual
51	51	AIP	Section 680.51(A) reworded as covered in the panel action on Proposal 20-125. Section 680.51(C) changed from "approved" to "listed" as covered in the action on Proposal 20-126.
52(B)	52	AIP	At end of last sentence, delete the word "following", and remove colon and add "of (1) and (2) at the end." In (1) and (2), leave only the title, and restate the numbered paragraphs as rules instead of a list format, at the suggestion of the staff editor. This structure better complies with the Style Manual.
55(A)	55	AIP	Change to: "(A) Applied Provisions. The provisions of ~~680-25~~ 680-21(A), 680-23(B)(3), 680-23(E)(1-2), 680-24(F), and 680-25 shall apply." Editorial change to reduce the verbage.
56(B)	56(b)	AIP	Reworded to incorporate the panel action on the Panel proposal associated with Proposal 20-129.
57	57	AIP	Reworded to incorporate the concept of the panel action on Proposal 20-130. This wording supersedes the action on that proposal.
60	60	AIP	Reference to Article 517 changed from 3 to 2 to reflect likely reorganization of that article relative to mandatory Style Manual rule about definition locations. Statement made a fine print note because it is merely explanatory in nature. Applicable parts of Art. 422 specified per Style Manual requirements.
62(A)	62	Accept	
62(A)(1)		Accept	
62(A)(2)		Accept	
62(A)(3)		Accept	
62(B)(5)	62(c)(5)	AIP	Revised to better accommodate the status as a list item.
62(C) – (F)		AIP	Change items (d) to (C), (e) to (D), (g) to (E), and (h) to (F). Corrects numbering error in the submittal.
62(C)	62(d)	AIP	Reworded to incorporate the panel action on Proposal 20-132
70 (new)		Accept	
71	70	Accept	
72	71	Accept	
	72 (deleted)	Reject	Make as Section 680.73. The panel is concerned as to how accessible and well understood the rules are in Section 110-26 regarding access.
73	73	AIP	Change to Section 680.74.

(Log #4256)

20- 31 - (680): Accept in Principle in Part

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Revise Article 680 as follows:

ARTICLE 680—Swimming Pools, Fountains, and Similar Installations

I. General

680-1. Scope. The provisions of this article apply to the construction and installation of electrical wiring for and equipment in or adjacent to all swimming, wading, therapeutic, and decorative pools, fountains, hot tubs, spas, and hydromassage bathtubs, whether permanently installed or storable, and to metallic auxiliary equipment, such as pumps, filters, and similar equipment.

680-2. Definitions

Cord- and Plug-Connected Lighting Assembly. A lighting assembly consisting of a lighting fixture intended for installation in the wall of a spa, hot tub, or storable pool, and a cord- and plug-connected transformer.

Dry-Niche Lighting Fixture. A lighting fixture intended for installation in the wall of a pool or fountain in a niche that is sealed against the entry of pool water.

Equipment—Fixed. Equipment that is fastened or otherwise secured at a specific location.

Equipment—Portable. Equipment that is actually moved or can easily be moved from one place to another in normal use.

Equipment—Stationary. Equipment that is not easily moved from one place to another in normal use.

Forming Shell. A structure designed to support a wet-niche lighting fixture assembly and intended for mounting in a pool or fountain structure.

Fountain. As used in this article, the term includes fountains, ornamental pools, display pools, and reflection pools. It does not include drinking fountains.

Hydromassage Bathtub. A permanently installed bathtub equipped with a recirculating piping system, pump, and associated equipment. It is designed so it can accept, circulate, and discharge water upon each use.

No-Niche Lighting Fixture. A lighting fixture intended for installation above or below the water without a niche.

Packaged Spa or Hot Tub Equipment Assembly. A factory-fabricated unit consisting of water-circulating, heating, and control equipment mounted on a common base, intended to operate a spa or hot tub. Equipment may include pumps, air blowers, heaters, lights, controls, sanitizer generators, etc.

Packaged Therapeutic Tub or Hydrotherapeutic Tank Equipment Assembly. A factory-fabricated unit consisting of water-circulating, heating, and control equipment mounted on a common base, intended to operate a therapeutic tub or hydrotherapeutic tank. Equipment may include pumps, air blowers, heaters, lights, controls, sanitizer generators, etc.

Permanently Installed Decorative Fountains and Reflection Pools. Those that are constructed in the ground, on the ground, or in a building in such a manner that the fountain cannot be readily disassembled for storage, whether or not served by electrical circuits of any nature. These units are primarily constructed for their aesthetic value and are not intended for swimming or wading.

Permanently Installed Swimming, Wading, and Therapeutic Pools. Those that are constructed in the ground or partially in the ground, and all others capable of holding water in a depth greater than 42 in. (1.07 m), and all pools installed inside of a building, regardless of water depth, whether or not served by electrical circuits of any nature.

Pool. ~~As used in this article, the term includes~~ manufactured or field-constructed equipment designed to contain water on a permanent or semi-permanent basis and used for swimming, wading, ~~and~~ or ~~permanently installed~~ therapeutic ~~pools~~ purposes.

Pool Cover, Electrically Operated. Motor-driven equipment designed to cover and uncover the water surface of a pool by means of a flexible sheet or rigid frame.

Self-Contained Spa or Hot Tub. Factory-fabricated unit consisting of a spa or hot tub vessel with all water-circulating, heating, and control equipment integral to the unit. Equipment may include pumps, air blowers, heaters, lights, controls, sanitizer generators, etc.

Self-Contained Therapeutic Tubs or Hydrotherapeutic Tanks. A factory-fabricated unit consisting of a therapeutic tub or hydrotherapeutic tank with all water-circulating, heating, and control equipment integral to the unit. Equipment may include pumps, air blowers, heaters, light controls, sanitizer generators, etc.

Spa or Hot Tub. A hydromassage pool, or tub for recreational or therapeutic use, not located in health care facilities, designed for immersion of users, and usually having a filter, heater, and motor-driven blower. It may be installed indoors or outdoors, on the ground or supporting structure, or in the ground or supporting structure. Generally, a spa or hot tub is not designed or intended to have its contents drained or discharged after each use.

Storable Swimming or Wading Pool. Those that are constructed on or above the ground and are capable of holding water to a maximum depth of 42 in. (1.07 m), or a pool with nonmetallic, molded polymeric walls or inflatable fabric walls regardless of dimension.

Wet-Niche Lighting Fixture. A lighting fixture intended for installation in a forming shell mounted in a pool or fountain structure where the fixture will be completely surrounded by water.

680-3. Other Articles

(a) Except as modified by this ~~section~~ article, wiring and equipment in or adjacent to pools and fountains shall comply with the applicable requirements of Chapters 1 through 4.

FPN: See Section 370-23 for junction boxes and Section 347-3 for rigid nonmetallic conduit.

(b) The installation and wiring of audio equipment adjacent to pools and fountains shall comply with the applicable requirements of Article 640. Underwater loudspeakers shall be installed in accordance with Section 680-23.

680-4. Approval of Equipment. All electrical equipment installed in the water, walls, or decks of pools, fountains, and similar installations shall comply with the provisions of this article.

680-5. Ground-Fault Circuit Interrupters. A ground-fault circuit interrupter (GFCI) shall be a self-contained unit, or a circuit-breaker or receptacle type, or other ~~approved~~ listed type.

680-6. Grounding. Electrical equipment shall be grounded in accordance with Article 250 and connected by wiring methods of Chapter 3, except as modified by this article. The following equipment shall be grounded:

(1) ~~Wet-niche and no-niche~~ Underwater lighting fixtures, other than those low-voltage systems listed for the application without a grounding conductor

~~2. Dry-niche underwater lighting fixtures~~

(2) All electrical equipment located within 5 ft (1.52 m) of the inside wall of the ~~pool~~ contained body of water.

(3) All electrical equipment associated with the recirculating system of the ~~pool~~ contained body of water.

(4) Junction boxes

(5) Transformer enclosures

(6) Ground-fault circuit interrupters

(7) Panelboards that are not part of the service equipment and that supply any electrical equipment associated with the ~~pool~~ contained body of water

680-7. Cord- and Plug-Connected Equipment. Fixed or stationary equipment ~~rated 20 amperes or less~~, other than an underwater lighting fixture for a permanently installed pool, shall be permitted to be connected with a flexible cord to facilitate the removal or disconnection for maintenance or repair.

(a) Length. For other than storable pools, the flexible cord shall not exceed 3 ft (914 mm) in length.

(b) Equipment Grounding. The flexible cord ~~and~~ shall have a copper equipment grounding conductor sized in accordance with Section 250-122 but not smaller than No. 12. The cord shall terminate in ~~with~~ a grounding-type attachment plug.

(c) Construction. The equipment grounding conductors shall be connected to a fixed metal part of the assembly. The removable part shall be mounted on or bonded to the fixed metal part.

~~FPN: See Section 680-25(c) for connection with flexible cords.~~

~~(f) Other Equipment. Other electrical equipment shall be grounded in accordance with Article 250 and connected by wiring methods of Chapter 3.~~

680-8. Overhead Conductor Clearances.

(a) Power. With respect to service drop conductors and open overhead wiring, including messenger supported wiring and festoon lighting, swimming pool and similar installations shall comply with the minimum clearances given in Table 680-8 unless the contained body of water is fully enclosed by a solid or screened permanent structure.

~~The following parts of pools shall not be placed under existing service-drop conductors or any other open overhead wiring; nor shall such wiring be installed above the following:~~

~~1. Pools and the area extending 10 ft (3.05 m) horizontally from the inside of the walls of the pool,~~
~~2. Diving structure, or~~
~~3. Observation stands, towers, or platforms unless the installations provide the clearances in Table 680-8.~~

Table 680.8. Clearances

	Insulated Supply or Service Drop Cables, 0–750 Volts to Ground, Supported on and Cabled Together with an Effectively Grounded Bare Messenger or Effectively Grounded Neutral Conductor	All Other Supply or Service-Drop Conductors Voltage to Ground	
		0–15 kV	Greater than 15–50 kV
A Clearance in any direction to the water level, edge of water surface, base of diving platform, or permanently anchored raft	22 ft (6.7 m)	25 ft (7.62 m)	27 ft (8.23 m)
B Clearance in any direction to the diving platform or tower	14 ft (4.27 m)	17 ft (5.2 m)	18 ft (5.49 m)
C Horizontal limit of clearance measured from inside wall of the pool	This limit shall extend to the outer edge of the structures listed in (1) and (2) but not less than 10 ft (3.05 m).		

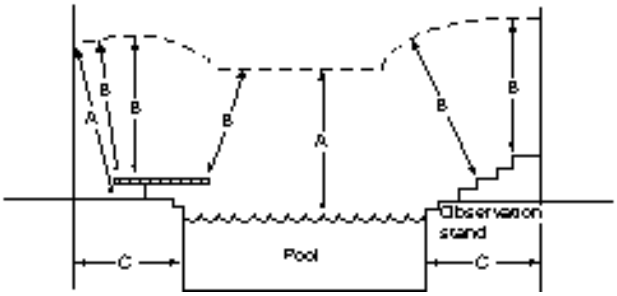

Figure 680-8

(b) Communications Systems. ~~Community antenna system coaxial cables complying with Article 820~~ The following communications systems conductors and ~~the~~ their supporting messengers shall ~~be permitted at a height~~ have a minimum clearance of not less than 10 ft (3.05 m) above swimming and wading pools, diving structures, and observation stands, towers, or platforms:

(1) Communications circuit conductors covered in Article 800.

(2) Community antenna system coaxial cables ~~complying with~~ covered in Article 820.

FPN: See Sections 225-18 and 225-19 for clearances for conductors not covered by this section.

680-9. Electric ~~Pool~~ Water Heaters. All electric ~~pool~~ water heaters shall have the heating elements subdivided into loads not exceeding 48 amperes and protected at not more than 60 amperes. The ampacity of the branch-circuit conductors and the rating or setting of overcurrent protective devices shall not be less than 125 percent of the total rated load ~~of~~ as given on the nameplate ~~rating~~.

680-10. Underground Wiring Location. Underground wiring shall not be permitted under the pool or within the area extending 5 ft (1.52 m) horizontally from the inside wall of the pool unless this wiring is necessary to supply pool equipment permitted by this article. Where space limitations prevent wiring from being routed 5 ft (1.52 m) or more from the pool, such wiring shall be permitted where installed in rigid metal conduit, intermediate metal conduit, or a nonmetallic raceway system. All metal conduit shall be corrosion resistant and suitable for the location. The minimum burial depth shall be as follows.

Wiring Method	Minimum Burial (in.)
Rigid metal conduit	6
Intermediate metal conduit	6
Nonmetallic raceways listed for direct burial without concrete encasement	18
Other approved raceways*	18

Note: For SI units, 1 in. = 25.4 mm.
* Raceways approved for burial only where concrete encased shall require a concrete envelope not less than 2 in. (50.8 mm) thick.

680-11. Equipment Rooms and Pits. Electric equipment shall not be installed in rooms or pits that do not have adequate drainage to prevent water accumulation during normal operation or filter maintenance.

680-12. Disconnecting Means. One or more ~~a~~ disconnecting means shall be ~~provided and be accessible, located within sight from all pools, spas, and~~ installed for motor-operated pool, spa, or hot tub equipment, and for pool, spa, or hot tub heating equipment. The disconnecting means shall be accessible and located within sight of the equipment supplied, at a point at least 5 feet (1.52 m) horizontally from the inside walls of the pool, spa, or hot tub.

II. Permanently Installed Pools

680-20. General. Electrical installations at permanently installed pools shall comply with the provisions of Part I and this part.

680-21. Motors.

(a) Wiring Methods.

(1) General. The branch circuits for pool-associated motors shall be installed in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or Type MC cable listed for the location ~~application~~. Other wiring methods and materials shall be permitted in specific locations or applications as covered in this section. Any wiring method employed shall contain a copper equipment grounding conductor sized in accordance with ~~Table~~ Section 250-122 but not smaller than No. 12.

(2) On or Within Buildings. Where installed on or within buildings, electrical metallic tubing shall be permitted ~~to be used to protect the conductors~~.

(3) Flexible Connections. Where necessary to employ flexible connections at or adjacent to the motor, liquidtight flexible metal or nonmetallic conduit with approved fittings shall be permitted.

(4) One-Family Dwellings. In the interior of ~~a~~ one-family dwellings, or in the interior of ~~another~~ accessory buildings ~~or structure~~ associated with a one-family dwelling, any of the wiring methods recognized in Chapter 3 of this Code shall be permitted that comply with the provisions of this paragraph.. ~~that contain a copper equipment grounding conductor that is insulated or covered by the outer sheath of the wiring method and is not smaller than No. 12 shall be permitted to be used for the connection of pool-associated motors.~~ Where run in a raceway the equipment grounding conductor shall be insulated. Where run in a cable assembly, the equipment grounding conductor shall be permitted to be uninsulated, but it shall be enclosed within the outer sheath of the cable assembly.

(5) Cord- and Plug-Connections. Pool-associated motors shall be permitted to employ cord- and plug-connections. The flexible cord shall not exceed 3 ft (914 mm) in length. The flexible cord shall include an equipment grounding conductor sized in accordance with Section 250-122 and shall terminate in a grounding-type attachment plug.

(b) GFCI Protection. ~~Motors in Other than Dwelling Units. Wiring~~ Outlets supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 ~~and~~ or 20 amperes, 125 volt or 240 volt, single phase, whether by receptacle or direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.

(c) Double Insulated Pool Pumps. A ~~permanently installed pool shall be permitted to be provided with~~ listed cord- and plug-connected pool ~~pumps~~ pump incorporating an approved system of double insulation that provides a means for grounding only the internal and nonaccessible, noncurrent-carrying metal parts of the pump shall be connected to any wiring method recognized in Chapter 3 that is suitable for the location.

680-22. Area Lighting, Receptacles, and Equipment.

(a) Receptacles.

(1) Circulation and Sanitation System, Location. Receptacles that provide power for water-pump motors or for other loads directly related to the circulation and sanitation system shall be located at least 10 ft (3.05 m) from the inside walls of the pool, or not less than 5 ft (1.52 m) from the inside walls of the pool if they meet all of the following conditions:

(1) Single receptacle.

(2) Locking configuration.

(3) Grounding type.

(4) GFCI protected.

~~a permanently installed pool or fountain, as permitted in Section 680-7, shall be permitted between 5 ft and 10 ft (1.52 m and 3.05 m) from the inside walls of the pool or fountain, and, where so located, shall be single-and of the locking-and-grounding types and shall be protected by a ground-fault circuit interrupter(s).~~

(2) Other Receptacles, Location. Other receptacles ~~on the property~~ shall be located at least 10 ft (3.05 m) from the inside walls of a pool ~~or fountain~~.

(3) Dwelling Unit(s). Where a permanently installed pool is installed at a dwelling unit(s), at least one 125-volt 15- or 20-ampere receptacle on a general-purpose branch circuit shall be located a minimum of 10 ft (3.05 m) from and not more than 20 ft (6.08 m) from the inside wall of the pool. This receptacle shall be located not more than 6 ft 6 in. (1.98 m) above the floor, platform, or grade level serving the pool.

(4) GFCI Protection. All 125-volt receptacles located within 20 ft (6.08 m) of the inside walls of a pool or fountain shall be protected by a ground-fault circuit interrupter.

(5) Measurements. ~~FPN:~~ In determining the ~~above~~ dimensions in this section addressing receptacle spacings, the distance to be measured is the shortest path the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, ~~doorway with hinged or sliding door,~~ window opening, or other effective permanent barrier.

(b) Lighting Fixtures, Lighting Outlets, and Ceiling-Suspended (Paddle) Fans.

(1) Outdoor Clearances. For new installations in outdoor pool areas, lighting fixtures, lighting outlets, and ceiling-suspended (paddle) fans installed above the pool or the area extending 5 ft (1.52 m) horizontally from the inside walls of the pool shall ~~not~~ be installed at least 12 ft (3.66 m) above the maximum water level ~~over~~ of the pool. ~~or over the area extending 5 ft (1.52 m) horizontally from the inside walls of a pool unless no part of the lighting fixture or ceiling suspended (paddle) fan is less than 12 ft (3.66 m) above the maximum water level.~~

(2) Existing Installations. Existing lighting fixtures and lighting outlets located less than 5 ft (1.52 m) measured horizontally from the inside walls of a pool shall be at least 5 ft (1.52 m) above the surface of the maximum water level, shall be rigidly attached to the existing structure, and shall be protected by a ground-fault circuit interrupter.

(3) Indoor Clearances. For installations in indoor pool areas, the clearances shall be the same as for outdoor areas unless modified as provided in this paragraph. Where the branch circuit supplying the equipment is protected by a ground-fault circuit-interrupter, the following equipment shall be permitted at a height not less than 7 ft 6 in. (2.29 m) above the maximum pool water level: ~~the limitations of Section 680-6(b)(1) shall not apply if all of the following conditions are complied with~~

(1) Totally enclosed fixtures.

(2) Ceiling-suspended (paddle) fans identified for use beneath ceiling structures such as provided on porches or patios.

~~A ground-fault circuit interrupter is installed in the branch circuit supplying the fixture(s) or ceiling-suspended (paddle) fans, and~~

~~c. The distance from the bottom of the fixture or ceiling-suspended (paddle) fan to the maximum water level is not less than 7 ft 6 in. (2.29 m).~~

(4) GFCI Protection in Contiguous Areas. Lighting fixtures, ~~and~~ lighting outlets, and ceiling-suspended (paddle) fans installed in the area extending between 5 ft (1.52 m) and 10 ft (3.05 m) horizontally from the inside walls of a pool shall be protected by a ground-fault circuit interrupter unless installed not less than 5 ft (1.52 m) above the maximum water level and rigidly attached to the structure adjacent to or enclosing the pool.

(5) Cord-Connected Lighting Fixtures. Cord-connected lighting fixtures shall comply with the requirements of Section 680-20 ~~meet the same specifications as other cord- and plug-connected equipment as set forth in Section 680-7~~ where installed within 16 ft (4.88 m) of any point on the water surface, measured radially.

(c) Switching Devices. Switching devices ~~on the property~~ shall be located at least 5 ft (1.52 m) horizontally from the inside walls of a pool unless separated from the pool by a solid fence, wall, or other permanent barrier.

680-23. Underwater Lighting Fixtures.

~~Paragraphs (a) through (d) apply to~~ This section covers all lighting fixtures installed below the normal water level of the pool.

(a) General.

(1) Fixture Design, Normal Operation. The design of an underwater lighting fixture supplied from a branch circuit either directly or by way of a transformer meeting the requirements of ~~Section 680-5(a)~~ this section shall be such that, where the fixture is properly installed without a ground-fault circuit interrupter, there is no shock hazard with any likely combination of fault conditions during normal use (not relamping).

(2) Transformers. Transformers used for the supply of underwater fixtures, together with the transformer enclosure, shall be ~~identified~~ listed for the purpose. The transformer shall be an isolated winding type that has a grounded metal barrier between the primary and secondary windings.

(3) GFCI Protection, Relamping. ~~In addition,~~ A ground-fault circuit interrupter shall be installed in the branch circuit supplying fixtures operating at more than 15 volts, so that there is no shock hazard during relamping. The installation of the ground-fault circuit interrupter shall be such that there is no shock hazard with any likely fault-condition combination that involves a person in a conductive path from any ungrounded part of the branch circuit or the fixture to ground.

(4) Voltage Limitation. No lighting fixtures shall be installed for operation on supply circuits over 150 volts between conductors.

(5) Location, Wall Mounted Fixtures. Lighting fixtures mounted in walls shall be installed with the top of the fixture lens at least 18 in. (457 mm) below the normal water level of the pool, unless the lighting fixture is listed and identified for use at lesser depths. No fixture shall be installed ~~a depth of not~~ less than 4 in. (102 mm) below the normal water level of the pool.

(6) Bottom-Mounted Fixtures. A lighting fixture facing upward shall have the lens adequately guarded to prevent contact by any person.

(7) Dependence on Submersion. Fixtures that depend on submersion for safe operation shall be inherently protected against the hazards of overheating when not submerged.

(8) Compliance. Compliance with ~~this~~ these requirements shall be obtained by the use of a listed underwater lighting fixture, and by installation of a listed ground-fault circuit interrupter in the branch circuit or a listed transformer for fixtures operating at not more than 15 volts.

(b) Wet-Niche Fixtures.

(1) Forming Shells. Forming shells shall be installed for the mounting of all wet-niche underwater fixtures and shall be equipped with provisions for conduit entries. Metal parts of the fixture and forming shell in contact with the pool water shall be of brass or other approved corrosion-resistant metal. All forming shells used with nonmetallic conduit systems, other than those that are part of a listed low-voltage lighting system not requiring grounding, shall include provisions for terminating a No. 8 copper conductor.

(2) Wiring Extending Directly to the Forming Shell. Conduit shall ~~extend~~ be installed from the forming shell to a suitable junction box or other enclosure located as provided in Section 680-24. Conduit shall be rigid metal, intermediate metal, liquidtight flexible nonmetallic, or rigid nonmetallic.

(a) Metal Conduit. Metal conduit shall be approved, and shall be of brass or other approved corrosion-resistant metal.

(b) Nonmetallic Conduit. Where a nonmetallic conduit is used, a No. 8 insulated copper conductor shall be installed in this conduit unless a listed low-voltage lighting system is used, not requiring grounding. ~~with provisions for terminating in~~ The grounding conductor shall be terminated in the forming shell, junction box or transformer enclosure, or ground-fault circuit-interrupter enclosure The termination of the No. 8 conductor in the forming shell shall be covered with, or encapsulated in, a listed potting compound to protect ~~such~~ the connection from the possible deteriorating effect of pool water. ~~Metal parts of the fixture and forming shell in contact with the pool water shall be of brass or other approved corrosion-resistant metal.~~

(3) Equipment Grounding Provisions for Cords. Wet-niche ~~or no-niche~~ lighting fixtures that are supplied by a flexible cord or cable shall have all exposed noncurrent-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of the cord or cable. This grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure. The grounding conductor shall not be smaller than the supply conductors and not smaller than No. 16.

(4) Fixture Grounding Terminations. The end of the flexible-cord jacket and the flexible-cord conductor terminations within a fixture shall be covered with, or encapsulated in, a suitable potting compound to prevent the entry of water into the fixture through the cord or its conductors. In addition, the grounding connection within a fixture shall be similarly treated to protect such connection from the deteriorating effect of pool water in the event of water entry into the fixture.

(5) Fixture Bonding. The fixture shall be bonded to and secured to the forming shell by a positive locking device that ensures a low-resistance contact and requires a tool to remove the fixture from the forming shell. Bonding ~~is~~ shall not be required for fixtures listed for the application, having no noncurrent-carrying metal parts.

(c) Dry-Niche Fixtures.

(1) Construction. A dry-niche lighting fixture shall be provided with a provision for drainage of water and a means for accommodating one equipment grounding conductor for each conduit entry.

(2) Junction Box. A junction box shall not be required but, if used, shall not be required to be elevated or located as specified in Section 680-21(a)(4), if the fixture is specifically identified for the purpose. ~~Approved rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or rigid nonmetallic conduit shall be installed from the fixture to the service equipment or panelboard. Where installed on buildings, electrical metallic tubing shall be permitted to be used to protect conductors. Where installed within buildings, electrical nonmetallic tubing or electrical metallic tubing shall be permitted to be used to protect conductors.~~

(d) No-Niche Fixtures. A no-niche fixture shall be meet the construction requirements of Section 680-23(B)(3) and be installed in accordance with the requirements of Section 680-23(B). Where connection to a forming shell is specified, the connection shall be to the mounting bracket.

~~1. Listed for the purpose~~

~~2. Installed in accordance with the requirements of Section 680-20(b)~~

~~Where connection to a forming shell is specified, the connection shall be to the mounting bracket.~~

(e) Branch-Circuit Wiring.

(1) Wiring Methods. Branch circuit wiring on the supply side of enclosures and junction boxes connected to conduits run to wet-niche and no-niche fixtures, and the field wiring compartments of dry-niche fixtures, shall be installed using rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or rigid nonmetallic conduit. Where installed on buildings, electrical metallic tubing shall be permitted, and where installed within buildings, electrical nonmetallic tubing or electrical metallic tubing shall be permitted.

FPN: For requirements of electrical nonmetallic tubing, see Article 331.

Exception: Where connecting to transformers for pool lights, liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted to be used when installed in accordance with Article 351. The length shall ~~and does~~ not exceed 6 ft (1.83 m) for any one length, nor ~~or~~ more than 10 ft (3.05 m) ~~of~~ in total length used.

(2) Equipment Grounding. Wet-niche, dry-niche, or no-niche lighting fixtures shall be connected to an insulated copper equipment grounding conductor installed with the circuit conductors. The equipment grounding conductor shall be installed without joint or splice except as permitted in (a) and (b). The equipment grounding conductor shall be sized in accordance with Table 250-122 but not smaller than No. 12.

Exception: An equipment grounding conductor between the wiring chamber of the secondary winding of a transformer and a junction box shall be sized in accordance with the overcurrent device in this circuit.

(a) Where more than one underwater lighting fixture is supplied by the same branch circuit, the equipment grounding conductor, installed between the junction boxes, transformer enclosures, or other enclosures in the supply circuit to wet-niche fixtures, or between the field-wiring compartments of dry-niche fixtures, shall be permitted to be terminated on grounding terminals.

(b) Where the underwater lighting fixture is supplied from a transformer, ground-fault circuit interrupter, clock-operated switch, or a manual snap switch that is located between the panelboard and a junction box connected to the conduit that extends directly to the underwater lighting fixture, the equipment grounding conductor shall be permitted to terminate on grounding terminals on the transformer, ground-fault circuit interrupter, clock-operated switch enclosure, or an outlet box used to enclose a snap switch.

(3) Conductors. Conductors on the load side of a ground-fault circuit interrupter or of a transformer, used to comply with the provisions of Section 680-23(a)(8), shall not occupy raceways, boxes, or enclosures containing other conductors unless one of the following conditions applies:

(a) GFCI Protection. The other conductors are protected by ground-fault circuit interrupters.

(b) Grounding Conductors. The other conductors ~~or~~ are grounding conductors.

(c) With Supply Conductors. The other conductors are supply conductors to a feed-through type ground-fault circuit interrupter ~~shall be permitted in the same enclosure~~.

(d) In a Common Panelboard. Ground-fault circuit interrupters shall be permitted in a panelboard that contains circuits protected by other than ground-fault circuit interrupters.

680-24. Junction Boxes and Enclosures for Transformers or Ground-Fault Circuit Interrupters

(a) Junction Boxes. A junction box connected to a conduit that extends directly to a forming shell or mounting bracket of a no-niche fixture shall ~~be as follows~~ meet the requirements of this section.

(1) Construction. The junction box shall be listed and labeled for the purpose and:

(1) Equipped with threaded entries or hubs or a nonmetallic hub listed for the purpose.

(2) Of copper, brass, suitable plastic, or other approved corrosion-resistant material.

(3) Provided with electrical continuity between every connected metal conduit and the grounding terminals by means of copper,

brass, or other approved corrosion-resistant metal that is integral with the box.

(2) Installation. Where the fixture operates over 15 volts, the junction box location shall comply with (a) and (b). Where the fixture operates at 15 volts or less, the junction box location shall be permitted to comply with (c).

(a) Vertical Spacing. The junction box shall be located not less than 4 in. (102 mm), measured from the inside of the bottom of the box, above the ground level, or pool deck, or not less than 8 in. (203 mm) above the maximum pool water level, whichever provides the greater elevation.

(b) Horizontal Spacing. The junction box shall be located not less than 4 ft (1.22 m) from the inside wall of the pool, unless separated from the pool by a solid fence, wall, or other permanent barrier.

(c) Flush Deck Box. If used on a lighting system operating at 15 volts or less, a flush deck box shall be permitted provided

(1) An approved potting compound is used to fill the box to prevent the entrance of moisture, and

(2) The flush deck box is located not less than 4 ft (1.22 m) from the inside wall of the pool.

(b) Other Enclosures. An enclosure for a transformer, ground-fault circuit interrupter, or a similar device connected to a conduit that extends directly to a forming shell or mounting bracket of a no-niche fixture shall ~~be as follows~~ meet the requirements of this section.

(1) Construction. The enclosure shall be listed and labeled for the purpose and:

(a) Equipped with threaded entries or hubs or a nonmetallic hub listed for the purpose.

(b) Of copper, brass, suitable plastic, or other approved corrosion-resistant material.

(c) Provided with an approved seal, such as duct seal at the conduit connection, that prevents circulation of air between the conduit and the enclosures

(d) Provided with electrical continuity between every connected metal conduit and the grounding terminals by means of copper, brass, or other approved corrosion-resistant metal that is integral with the box.

(2) Installation.

(a) Vertical Spacing. The enclosure shall be located not less than 4 in. (102 mm), measured from the inside of the bottom of the box, above the ground level, or pool deck, or not less than 8 in. (203 mm) above the maximum pool water level, whichever provides the greater elevation.

(b) Horizontal Spacing. The enclosure shall be located not less than 4 ft (1.22 m) from the inside wall of the pool, unless separated from the pool by a solid fence, wall, or other permanent barrier.

(c) Protection. Junction boxes and enclosures mounted above the grade of the finished walkway around the pool shall not be located in the walkway unless afforded additional protection, such as by location under diving boards, adjacent to fixed structures, and the like.

(d) Grounding Terminals. Junction boxes, transformer enclosures, and ground-fault circuit-interrupter enclosures connected to a conduit that extends directly to a forming shell or mounting bracket of a no-niche fixture shall be provided with a number of grounding terminals that shall be at least one more than the number of conduit entries.

(e) Strain Relief. The termination of a flexible cord of an underwater lighting fixture within a junction box, transformer enclosure, ground-fault circuit interrupter, or other enclosure shall be provided with a strain relief.

(f) Grounding. The junction box, transformer enclosure, or other enclosure in the supply circuit to a wet-niche or no-niche lighting fixture and the field-wiring chamber of a dry-niche lighting fixture shall be grounded to the equipment grounding terminal of the panelboard. This terminal shall be directly connected to the panelboard enclosure.

680-25. Feeders.

These provisions shall apply to any feeder on the supply side of panelboards supplying branch circuits for pool equipment covered in Part II of this Article and on the load side of the service equipment or the source of a separately derived system.

(a) Wiring Methods. Feeders shall be installed in rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or rigid nonmetallic conduit. Electrical metallic tubing shall be permitted ~~to be used to protect conductors~~ where installed on or within a ~~the~~ building, and ~~in accordance with Article 348~~. electrical nonmetallic tubing shall be permitted ~~to be used to enclose the conductors~~ where installed within ~~the~~ a building ~~in accordance with Article 331~~.

Exception: An existing feeder between an existing remote panelboard and ~~the~~ service equipment ~~is~~ shall be permitted to run in ~~connected by means of a~~ flexible metal conduit or an approved cable assembly with an insulated or covered equipment grounding conductor~~, the conduits listed above shall not be required~~.

(b) Grounding. ~~A panelboard and, where installed, a disconnecting means, that are not part of the service equipment or source of a separately derived system, shall have~~ An insulated equipment grounding conductor shall be installed with the feeder conductors between ~~it's~~ the grounding terminal of the pool equipment panelboard and the grounding terminal of the applicable service equipment or source of a separately derived system.

(1) Size. This conductor shall be sized in accordance with ~~Table~~ Section 250-122 but not smaller than No. 12. On separately derived systems, this conductor shall be sized in accordance with Table 250-66 but not smaller than No. 8.

(2) Separate Buildings. A panelboard at a separate building shall be permitted to supply swimming pool equipment if the feeder meets the requirements for grounding in Section 250-32. Where installed, a separate equipment grounding conductor shall be an insulated conductor.

680-26. Bonding.

(a) Performance. The bonding required by this section shall be installed ~~employed~~ to eliminate voltage gradients in the pool area as prescribed. ~~It shall not be the intent of~~

FPN: This section ~~to~~ does not require that the No. 8 or larger solid copper bonding conductor be extended or attached to any remote panelboard, service equipment, or any electrode~~, but only that it~~.

(b) Bonded Parts. The following parts shall be bonded together.

(1) Metallic Structural Components. All metallic parts of the pool structure, including the reinforcing metal of the pool shell, coping stones, and deck, shall be bonded. The usual steel tie wires shall be considered suitable for bonding the reinforcing steel together, and welding or special clamping shall not be required. These tie wires shall be made tight. Where reinforcing steel is effectively insulated by a listed encapsulating nonconductive compound, at the time of manufacture and installation, it shall not be required to be bonded.

(2) Underwater Lighting. All forming shells, and mounting brackets of ~~a~~ no-niche fixtures, shall be bonded unless a listed low-voltage lighting system with nonmetallic forming shells is used, not requiring bonding.

(3) Metal Fittings. All metal fittings within or attached to the pool structure shall be bonded. Isolated parts that are not over 4 in. (102 mm) in any dimension and do not penetrate into the pool structure more than 1 in. (25.4 mm) shall not require bonding.

(4) Electrical Equipment. Metal parts of electrical equipment associated with the pool water circulating system, including pump motors and metal parts of equipment associated with pool covers, including electric motors shall be bonded. Metal parts of listed equipment incorporating an approved system of double insulation and providing a means for grounding internal nonaccessible, noncurrent-carrying metal parts shall not be bonded.

(5) Metal Wiring Methods and Equipment. Metal-sheathed cables and raceways, metal piping, and all fixed metal parts shall be bonded that are within the following distances of the pool:

(a) Horizontal. Within 5 ft (1.52 m) horizontally of the inside walls of the pool~~, unless separated from the pool by a permanent barrier~~. ~~and~~

~~(b) Vertical. Within~~ 12 ft (3.66 m) above the maximum water level of the pool, or any observation stands, towers, or platforms, or ~~from~~ any diving structures.

(c) Permanent Barrier. The bonding requirement shall not apply to metal parts that are ~~not~~ separated from the pool by a permanent barrier.

(c) Common Bonding Grid. The parts specified in (A) shall be connected to a common bonding grid with a solid copper conductor, insulated, covered, or bare, not smaller than No. 8. Connection shall be made by exothermic welding or by pressure connectors or clamps that are labeled as being suitable for the purpose and are of the following material: stainless steel, brass, copper, or copper alloy. The common bonding grid shall be permitted to be any of the following:

(1) Reinforcing Steel. The structural reinforcing steel of a concrete pool where the reinforcing rods are bonded together by the usual steel tie wires or the equivalent.
(2) Metal Pool Structure. The wall of a bolted or welded metal pool.
(3) Solid Copper Conductor. A solid copper conductor, insulated, covered, or bare, not smaller than No. 8.
(4) Metal Conduit. Rigid metal conduit or intermediate metal conduit of brass or other identified corrosion-resistant metal conduit.
(d) Connections. Where structural reinforcing steel or the walls of bolted or welded metal pool structures ~~shall be permitted~~ are used as a common bonding grid for nonelectrical parts, ~~where~~ the connections shall ~~can~~ be made in accordance with Section 250-8.
(e) Pool Water Heaters. For pool water heaters rated at more than 50 amperes that have specific instructions regarding bonding and grounding, only those parts designated to be bonded shall be bonded, and only those parts designated to be grounded shall be grounded.
680-27. Specialized Pool Equipment
(a) Underwater Audio Equipment. All underwater audio equipment shall be identified for the purpose.
(1) Speakers. Each speaker shall be mounted in an approved metal forming shell, the front of which is enclosed by a captive metal screen, or equivalent, that is bonded to and secured to the forming shell by a positive locking device that ensures a low-resistance contact and requires a tool to open for installation or servicing of the speaker. The forming shell shall be installed in a recess in the wall or floor of the pool.
(2) Wiring Methods. Rigid metal conduit or intermediate metal conduit of brass or other identified corrosion-resistant metal or rigid nonmetallic conduit shall extend from the forming shell to a suitable junction box or other enclosure as provided in Section 680-24. Where rigid nonmetallic conduit is used, a No. 8 insulated copper conductor shall be installed in this conduit. ~~with provisions for terminating~~ The grounding conductor shall be terminated in the forming shell and the junction box. The termination of the No. 8 conductor in the forming shell shall be covered with, or encapsulated in, a suitable potting compound to protect such connection from the possible deteriorating effect of pool water.
(3) Forming Shell and Metal Screen. The forming shell and metal screen shall be of brass or other approved corrosion-resistant metal. All forming shells shall include provisions for terminating a No. 8 copper conductor.
(b) Electrically Operated Pool Covers
(1) Motors and Controllers. The electric motors, controllers, and wiring shall be located at least 5 ft (1.52 m) from the inside wall of the pool unless separated from the pool by a wall, cover, or other permanent barrier. Electric motors installed below grade level shall be of the totally enclosed type.
FPN No. 1: For cabinets installed in damp and wet locations, see Section 373-2(a).
FPN No. 2: For switches or circuit breakers installed in wet locations, see Section 380-4.
FPN No. 3: For protection against liquids, see Section 430-11.
(2) ~~Wiring Methods~~ Protection. The electric motor and controller shall be connected to a circuit protected by a ground-fault circuit interrupter.
(c) Deck Area Heating. These provisions ~~of this section~~ shall apply to all pool deck areas, including a covered pool, where electrically operated comfort heating units are installed within 20 ft (6.1 m) of the inside wall of the pool.
(1) Unit Heaters. Unit heaters shall be rigidly mounted to the structure and shall be of the totally enclosed or guarded types. Unit heaters shall not be mounted over the pool or within the area extending 5 ft (1.52 m) horizontally from the inside walls of a pool.
(2) Permanently Wired Radiant Heaters. Radiant electric heaters shall be suitably guarded and securely fastened to their mounting device(s). Heaters shall not be installed over a pool or within the area extending 5 ft (1.52 m) horizontally from the inside walls of the pool and shall be mounted at least 12 ft (3.66 m) vertically above the pool deck unless otherwise approved.
(3) Radiant Heating Cables Not Permitted. Radiant heating cables embedded in or below the deck shall not be permitted.
III. Storable Pools
680-30. Electrical installations at storable pools shall comply with the provisions of Part I and this part.
680-31. Pumps. A cord-connected pool filter pump shall incorporate an approved system of double insulation or its equivalent and shall be provided with means for grounding only the internal and nonaccessible noncurrent-carrying metal parts of the appliance. The means for grounding shall be an equipment grounding conductor run with the power-supply conductors in the flexible cord that is properly terminated in a grounding-type attachment plug having a fixed grounding contact member.
680-32. Ground-Fault Circuit Interrupters Required
All electrical equipment, including power-supply cords, used with storable pools shall be protected by ground-fault circuit interrupters.
FPN: Where flexible cords are used, see Section 400-4.
680-33. Lighting Fixtures. An underwater lighting fixture, if installed, shall be installed in or on the wall of the storable pool. It shall comply with one of the following two provisions:
(a) 15 Volts or Less. A lighting fixture ~~installed in or on the wall of a storable pool~~ shall be part of a cord- and plug-connected lighting assembly. This assembly shall ~~l~~be listed as an assembly for the purpose and ~~as follows~~ have the following construction features:
(1) ~~Have~~ No exposed metal parts
(2) ~~Have~~ A fixture lamp that operates at 15 volts or less
(3) ~~Have~~ An impact-resistant polymeric lens, fixture body, and transformer enclosure
(4) ~~Have~~ A transformer meeting the requirements of Section 680-23(A)(2) with a primary rating not over 150 volts, and
~~5. Be listed as an assembly for the purpose~~
(b) Over 15 Volts But Not Over 150 Volts. A lighting assembly without a transformer, and with the fixture lamp(s) operating at not over 150 volts, shall be permitted to be cord- and plug-connected where the assembly is listed as an assembly for the purpose. The installation shall comply with Section 680-23(A)(5) and the assembly shall have ~~complies with all of the following.~~ the following construction features:
(1) No exposed metal parts.
(2) An impact-resistant polymeric lens and fixture body.
(3) A ground-fault circuit interrupter with open neutral protection ~~is provided~~ as an integral part of the assembly.
(4) The fixture lamp is permanently connected to the ground-fault circuit interrupter with open-neutral protection.
(5) It complies with the requirements of Section 680-23(A).
~~6. It is listed as an assembly for the purpose.~~
IV. Spas and Hot Tubs
680-40. Electrical installations at spas and hot tubs shall comply with the provisions of Part I and this part.
680-41. Emergency Switch for Spas and Hot Tubs. A clearly labeled emergency shutoff or control switch for the purpose of stopping the motor(s) that provide power to the recirculation system and jet system shall be installed at a point readily accessible to the users and at least 5 ft (1.52 m) away, adjacent to, and within sight of the spa or hot tub. This requirement shall not apply to single-family dwellings.
680-42. Outdoor Installations. A spa or hot tub installed outdoors shall comply with the provisions of Parts I and II of this article except as permitted in (A) and (B) that would otherwise apply to pools installed outdoors.
(a) Flexible Connections. Listed packaged spa or hot tub equipment assemblies or self-contained spas or hot tubs ~~units~~ utilizing a factory-installed or assembled control panel or ~~remote~~ panelboard shall be permitted to use flexible connections as covered in (1) and (2):
(1) Flexible Conduit. Liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted in lengths of ~~be connected with~~ not more than 6 ft (1.828 m).
(2) Cord- and Plug-Connections. Cord and plug connections with a cord not longer than 15 ft (4.57 m) shall be permitted where ~~if~~ protected by a ground-fault circuit interrupter.
(b) Bonding. Bonding by metal-to-metal mounting on a common frame or base shall be permitted. The metal bands or hoops used to secure wooden staves shall not be required to be bonded as required in Section 680-26.
680-43. Indoor Installations. A spa or hot tub installed indoors shall comply with the provisions of Parts I and II except as modified by this section, and shall be connected by the wiring methods of Chapter 3.
Exception: Listed spa and hot tub packaged units rated 20 amperes or less shall be permitted to be cord and plug connected to facilitate the removal or disconnection of the unit for maintenance and repair.
(a) Receptacles. At least one 125-volt, 15- or 20-ampere receptacle on a general-purpose branch circuit shall be located a minimum of 5 ft (1.52 m) from and not more than 10 ft (3.05 m) from the inside wall of the spa or hot tub.

(1) Location. Receptacles ~~on the property~~ shall be located at least 5 ft (1.52 m) measured horizontally from the inside walls of the spa or hot tub.

(2) Protection, General. Receptacles ~~of~~ rated 125 volts and 30 amperes or less located within 10 ft (3.05 m) of the inside walls of a spa or hot tub shall be protected by a ground-fault circuit interrupter.

(3) Protection, Spa or Hot Tub Supply Receptacle. Receptacles that provide power for a spa or hot tub shall be ground-fault circuit-interrupter protected.

(4) Measurements. ~~FPN:~~ In determining the ~~above~~ dimensions in this section addressing receptacle spacings, the distance to be measured is the shortest path the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, or other effective permanent barrier.

(b) Installation ~~Mounting Height~~ of Lighting Fixtures, Lighting Outlets, and Ceiling-Suspended (Paddle) Fans.

(1) Elevation. Lighting fixtures except as covered in Section 680-43(B)(2), lighting outlets, and ceiling-suspended (paddle) fans located over the spa or hot tub or within 5 ft (1.52 m) from the inside walls of the spa or hot tub shall comply with the following clearances ~~be a minimum of 7 ft 6 in. (2.29 m)~~ above the maximum water level ~~and shall be protected by a ground-fault circuit interrupter~~.

(1) Where no GFCI protection is provided, 12 feet (3.66 m).

(2) Where GFCI protection is provided, 7 ft 6 in. (2.29 m).

~~Lighting fixtures, lighting outlets, and ceiling-suspended (paddle) fans that are located 12 ft (3.66 m) or more above the maximum water level shall not require a ground-fault circuit interrupter for protection.~~

(2) Low-Level Fixtures. Lighting fixtures meeting the requirements of (a) or (b) and protected by a ground-fault circuit interrupter shall be permitted to be installed less than 7 ft 6 in. (2.29 m) over a spa or hot tub.

(a) Recessed fixtures with a glass or plastic lens and nonmetallic or electrically isolated metal trim, suitable for use in damp locations shall be permitted.

(b) Surface-mounted fixtures with a glass or plastic globe and a nonmetallic body or a metallic body isolated from contact shall be permitted. Such fixtures shall be suitable for use in damp locations.

(3) Underwater Applications. Underwater lighting fixtures shall comply with the provisions of Section 680-23 or Section 680-33 of this article.

(c) Wall Switches. Switches shall be located at least 5 ft (1.52 m), measured horizontally, from the inside walls of the spa or hot tub.

(d) Bonding. The following parts shall be bonded together.

(1) All metal fittings within or attached to the spa or hot tub structure.

(2) Metal parts of electrical equipment associated with the spa or hot tub water circulating system, including pump motors.

(3) Metal conduit and metal piping within 5 ft (1.52 m) of the inside walls of the spa or hot tub and that are not separated from the spa or hot tub by a permanent barrier.

(4) All metal surfaces that are within 5 ft (1.52 m) of the inside walls of the spa or hot tub and not separated from the spa or hot tub area by a permanent barrier.

Exception: Small conductive surfaces not likely to become energized, such as air and water jets and drain fittings, where not connected to metallic piping, towel bars, mirror frames, and similar nonelectrical equipment, shall not be required to be bonded.

(5) Electrical devices and controls not associated with the spas or hot tubs shall be located a minimum of 5 ft (1.52 m) away from such units or they shall be bonded to the spa or hot tub system.

(e) Methods of Bonding. All metal parts associated with the spa or hot tub shall be bonded by any of the following methods:

(1) The interconnection of threaded metal piping and fittings.

(2) Metal-to-metal mounting on a common frame or base.

(3) The provision~~s~~ of a copper bonding jumper, insulated, covered, or bare, not smaller than No. 8 solid.

(f) Grounding. The following equipment shall be grounded:

(1) All electric equipment located within 5 ft (1.52 m) of the inside wall of the spa or hot tub

(2) All electric equipment associated with the circulating system of the spa or hot tub

~~(g) Methods of Grounding.~~

~~1. All electrical equipment shall be grounded in accordance with Article 250 and be connected by the wiring methods of Chapter 3.~~

~~2. Where equipment is connected with a flexible cord, the equipment grounding conductor shall be connected to a fixed metal part of the assembly.~~

~~(h) Electric Water Heaters. All electric spa or hot tub water heaters shall be listed and shall have the heating elements subdivided into loads not exceeding 48 amperes and protected at not more than 60 amperes.~~

~~The ampacity of the branch-circuit conductors, and the rating or setting of overcurrent protective devices, shall not be less than 125 percent of the total load of the nameplate rating.~~

(g) Underwater Audio Equipment. Underwater audio equipment shall comply with the provisions of Part II ~~or C~~ of this article.

680-44. Protection. Except as otherwise provided in this section, the outlet(s) that supplies a self-contained spa or hot tub, or a packaged spa or hot tub equipment assembly, or a field-assembled spa or hot tub ~~with a heater load of 50 amperes or less~~ shall be protected by a ground-fault circuit interrupter.

(a) Listed Units. Where so marked, a listed self-contained unit or listed packaged equipment assembly ~~marked to indicate~~ that includes integral ground-fault circuit-interrupter protection ~~is provided~~ for all electrical parts within the unit or assembly (pumps, air blowers, heaters, lights, controls, sanitizer generators, wiring, etc.) shall be permitted without additional GFCI protection.

~~not require that the outlet supply be protected by a ground-fault circuit interrupter.~~

(b) Subdivided Loads. Where the load has been subdivided to comply with Section 680-9 or for other reasons, and where the unit is not rated 3 phase or over 250 volts, GFCI protection shall be provided for each subdivided portion of the load.

(c) Other Units. A ~~field-assembled~~ spa or hot tub rated 3 phase or rated ~~greater than~~ over 250 volts shall not require the supply to be protected by a ground-fault circuit interrupter.

(d) Combination Pool and Spa or Hot Tub. A combination pool/hot tub or spa assembly commonly bonded need not be protected by a ground-fault circuit interrupter.

FPN: See Section 680-4 for definitions of self-contained spa or hot tub and for packaged spa or hot equipment assembly.

V. Fountains

680-50. General. The provisions of Part V shall apply to all permanently installed fountains as defined in Section 680-2. Fountains that have water common to a pool shall additionally comply with the ~~pool~~ requirements in Part II of this article. Part V does not cover self-contained, portable fountains not larger than 5 ft (1.52 m) in any dimension ~~are not covered by Part E.~~ Portable fountains shall comply with Article 422.

680-51. Lighting Fixtures, Submersible Pumps, and Other Submersible Equipment

(a) Ground-Fault Circuit Interrupter. A ground-fault circuit interrupter shall be installed in the branch circuit supplying fountain equipment unless the equipment is listed for operation at 15 volts or less and is supplied by a transformer that complies with Section 680-23(A)(2).

(b) Operating Voltage. No lighting fixtures shall be installed for operation on supply circuits over 150 volts between conductors. Submersible pumps and other submersible equipment shall operate at 300 volts or less between conductors.

(c) Lighting Fixture Lenses. Lighting fixtures shall be installed with the top of the fixture lens below the normal water level of the fountain unless approved for above-water locations. A lighting fixture facing upward shall have the lens adequately guarded to prevent contact by any person.

(d) Overheating Protection. Electrical equipment that depends on submersion for safe operation shall be protected against overheating by a low-water cutoff or other approved means when not submerged.

(e) Wiring. Equipment shall be equipped with provisions for threaded conduit entries or be provided with a suitable flexible cord. The maximum length of exposed cord in the fountain shall be limited to 10 ft (3.05 m). Cords extending beyond the fountain perimeter shall be enclosed in approved wiring enclosures. Metal parts of equipment in contact with water shall be of brass or other approved corrosion-resistant metal.

(f) Servicing. All equipment shall be removable from the water for relamping or normal maintenance. Fixtures shall not be permanently imbedded into the fountain structure so that the water level must be reduced or the fountain drained for relamping, maintenance, or inspection.

(g) Stability. Equipment shall be inherently stable or be securely fastened in place.

680-52. Junction Boxes and Other Enclosures

(a) General. Junction boxes and other enclosures used for other than underwater installation shall comply with Section 680-24.

(b) Underwater Junction Boxes and Other Underwater Enclosures. Junction boxes and other underwater enclosures shall ~~be submersible and~~ meet the following requirements:

(1) Construction. Underwater enclosures shall comply with the following:

(a) They shall be equipped with provisions for threaded conduit entries or compression glands or seals for cord entry.

(b) They shall be submersible, and made of copper, brass, or other approved corrosion-resistant material.

(2) Installation. Underwater enclosure installations shall comply with the following:

(a) They shall be filled with an approved potting compound to prevent the entry of moisture.

(b) They shall be firmly attached to the supports or directly to the fountain surface and bonded as required. Where the junction box is supported only by the conduit, the conduit shall be of copper, brass, or other approved corrosion-resistant metal. Where the box is fed by nonmetallic conduit, it shall have additional supports and fasteners of copper, brass, or other approved corrosion-resistant material.

FPN: See Section 370-23 for support of enclosures.

680-53. Bonding. All metal piping systems associated with the fountain shall be bonded to the equipment grounding conductor of the branch circuit supplying the fountain.

FPN: See Section 250-122 for sizing of these conductors.

680-54. Grounding. The following equipment shall be grounded:

(1) All electrical equipment located within the fountain or within 5 ft (1.52 m) of the inside wall of the fountain

(2) All electrical equipment associated with the recirculating system of the fountain

(3) Panelboards that are not part of the service equipment and that supply any electrical equipment associated with the fountain

680-55. Methods of Grounding.

(a) Applied Provisions. The provisions of Section ~~680-25~~ 680-21(A), Section 680-23(B)(3), Section 680-23(E)(1-2), Section 680-24(F), and Section 680-25 shall apply.

(b) Supplied by a Flexible Cord. Electrical equipment that is supplied by a flexible cord shall have all exposed noncurrent-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of this cord. This grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure.

680-56. Cord- and Plug-Connected Equipment.

(a) Ground-Fault Circuit Interrupter. All electrical equipment, including power-supply cords, shall be protected by ground-fault circuit interrupters.

(b) Cord Type. Flexible cord immersed in or exposed to water shall be of the hard-service type as designated in Table 400-4 and shall be marked water resistant.

(c) Sealing. The end of the flexible cord jacket and the flexible cord conductor termination within equipment shall be covered with, or encapsulated in, a suitable potting compound to prevent the entry of water into the equipment through the cord or its conductors. In addition, the ground connection within equipment shall be similarly treated to protect such connections from the deteriorating effect of water that may enter into the equipment.

(d) Terminations. Connections with flexible cord shall be permanent, except that grounding-type attachment plugs and receptacles shall be permitted to facilitate removal or disconnection for maintenance, repair, or storage of fixed or stationary equipment not located in any water-containing part of a fountain.

680-57. Signs.

(a) General. This section includes only fixed, stationary electrically illuminated utilization equipment installed within fountains that uses ~~with~~ words or symbols designed to convey information or attract attention.

(b) Ground-Fault Circuit-Interrupter Protection for Personnel. All circuits supplying the sign shall have ground-fault circuit-interrupter protection for personnel.

(c) Location. Any sign ~~installed inside a fountain~~ shall be at least 5 ft (1.52 m) inside the fountain measured from the outside edges of the fountain.

(d) Disconnect. A sign shall have a local disconnecting means in accordance ~~comply~~ with Section 600-6 and Section 680-12.

(e) Bonding and Grounding. A sign shall be grounded and bonded in accordance ~~Shall comply~~ with Section 600-7.

~~(f) Grounding. Any equipment associated with the sign shall be grounded as per Article 250.~~

VI. Pools and Tubs for Therapeutic Use

680-60. General. The provisions of Part I and Part VI shall apply to pools and tubs for therapeutic use in health care facilities, gymnasiums, athletic training rooms, and similar areas. See Section 517-3 for definition of health care facilities. Portable therapeutic appliances shall comply with Article 422.

680-61. Permanently Installed Therapeutic Pools. Therapeutic pools that are constructed in the ground, on the ground, or in a building in such a manner that the pool cannot be readily disassembled shall comply with Parts I and II of this article.

Exception: The limitations of Sections 680-22(A)(1) and (2) shall not apply where all lighting fixtures are of the totally enclosed type.

680-62. Therapeutic Tubs (Hydrotherapeutic Tanks). Therapeutic tubs, used for the submersion and treatment of patients, that are not easily moved from one place to another in normal use or that are fastened or otherwise secured at a specific location, including associated piping systems, shall conform to this part.

(a) Protection. Except as otherwise provided in this section, the outlet(s) that supplies a self-contained therapeutic tub or hydrotherapeutic tank, or a packaged therapeutic tub or hydrotherapeutic tank, or a field-assembled therapeutic tub or hydrotherapeutic tank ~~with a heater load of 50 amperes or less~~ shall be protected by a ground-fault circuit interrupter.

(1) Listed Units. Where so marked, a listed self-contained unit or listed packaged equipment assembly ~~marked to indicate~~ that includes integral ground-fault circuit-interrupter protection ~~is provided~~ for all electrical parts within the unit or assembly (pumps, air blowers, heaters, lights, controls, sanitizer generators, wiring, etc.) shall be permitted without additional GFCI protection.

~~not require that the outlet supply be protected by a ground fault circuit interrupter.~~

(2) Subdivided Loads. Where the load has been subdivided to comply with Section 680-9 or for other reasons, and where the unit is not rated 3 phase or over 250 volts, GFCI protection shall be provided for each subdivided portion of the load.

(3) Other Units. A ~~field assembled~~ therapeutic tub or hydrotherapeutic tank rated 3 phase or rated ~~greater than~~ over 250 volts shall not require the supply to be protected by a ground-fault circuit interrupter.

~~(b) Ground Fault Circuit Interrupter. A ground-fault circuit interrupter shall protect all therapeutic equipment.~~

~~Exception: Portable therapeutic appliances shall comply with Section 250-114.~~

(b) Bonding. The following parts shall be bonded together.

(1) All metal fittings within or attached to the tub structure.

(2) Metal parts of electrical equipment associated with the tub water circulating system, including pump motors.

(3) Metal-sheathed cables and raceways and metal piping that are within 5 ft (1.52 m) of the inside walls of the tub and not separated from the tub by a permanent barrier.

(4) All metal surfaces that are within 5 ft (1.52 m) of the inside walls of the tub and not separated from the tub area by a permanent barrier.

(5) Electrical devices and controls not associated with the therapeutic tubs shall be located a minimum of 5 ft (1.52 m) away from such units or they shall be bonded to the therapeutic tub system.

(d) Methods of Bonding. All metal parts associated with the tub shall be bonded by any of the following methods:

(1) The interconnection of threaded metal piping and fittings,

(2) Metal-to-metal mounting on a common frame or base,

(3) Connections by suitable metal clamps, or

(4) By the provision~~s~~ of a solid copper bonding jumper, insulated, covered, or bare, not smaller than No. 8

(e) Grounding.

(1) Fixed or Stationary Equipment. The following equipment shall be grounded:

(a) Location. All electrical equipment located within 5 ft (1.52 m) of the inside wall of the tub shall be grounded.

(b) Circulation System. All electrical equipment associated with the circulating system of the tub shall be grounded.

(2) Portable Equipment. Portable therapeutic appliances shall meet the grounding requirements in Section 250-114.

~~(f) Methods of Grounding.~~

~~1. All electrical equipment shall be grounded in accordance with Article 250 and connected by wiring methods of Chapter 3.~~

~~2. Where equipment is connected with a flexible cord, the equipment grounding conductor shall be connected to a fixed metal part of the assembly.~~

(g) Receptacles. All receptacles within 5 ft (1.52 m) of a therapeutic tub shall be protected by a ground-fault circuit interrupter.

(h) Lighting Fixtures. All lighting fixtures used in therapeutic tub areas shall be of the totally enclosed type.

VII. Hydromassage Bathtubs

680-70. General. Hydromassage bathtubs as defined in Section 680-2 shall comply with the provisions of this part. They shall not be required to comply with other parts of this article.

680-71. Protection. Hydromassage bathtubs and their associated electrical components shall be protected by a ground-fault circuit interrupter. All 125-volt, single-phase receptacles not exceeding 30 amperes and located within 5 ft (1.52 m) measured horizontally of the inside walls of a hydromassage tub shall be protected by a ground-fault circuit interrupter(s).

680-72. Other Electrical Equipment. Lighting fixtures, switches, receptacles, and other electrical equipment located in the same room, and not directly associated with a hydromassage bathtub, shall be installed in accordance with the requirements of Chapters 1 through 4 in this Code covering the installation of that equipment in bathrooms.

~~680-73. Accessibility. Hydromassage bathtub electrical equipment shall be accessible without damaging the building structure or building finish.~~

680-73. Bonding. All metal piping systems, metal parts of electrical equipment, and pump motors associated with the hydromassage tub shall be bonded together using a copper bonding jumper, insulated, covered, or bare, not smaller than No. 8 solid. Metal parts of listed equipment incorporating an approved system of double insulation and providing a means for grounding internal nonaccessible, noncurrent-carrying metal parts shall not be bonded.

SUBSTANTIATION: This rewrite has several overall objectives. First, it sets out straightforward requirements that electricians actually look for. For example, when you want to wire something, you need to know what wiring methods are appropriate. At key points, through the use of "wiring methods" headings, the rewrite does exactly that. The current NEC has the tail wagging the dog, as it only describes the wiring methods in the context of what could be used to enclose a grounding conductor. This not only unnecessarily confuses the article, it leads to overlapping and duplicative requirements, as frequently occurs between Section 680-20 and Section 680-25. The rewrite eliminates these difficulties.

This rewrite also addresses major editorial problems introduced in the prior NEC, where exceptions were converted to normal text without restructuring the main rule, and resulting in conflicting, orphaned, uncitable rules. In most cases the rewrite restructures the parent rule so as to correctly preserve the change to no exceptions, although the exception from was revived in a few instances.

Finally the rewrite addresses the demands of the new style manual, which will only permit topic subdivisions three layers deep. The new style manual also requires renumbering of the definitions section, elimination of Section 90-3 redundancies, changes the nomenclature on article parts, and other changes. These are covered in the specific substantiation that follows:

Section 680-2. This is the mandated section number for definitions. There is one technical change, the inclusion of definitions for fixed, stationary, and portable equipment. These terms are used all over Article 680, and should be defined here since CMP 1 has steadily refused to define them in Article 100.

Section 680-4. The new location of former Section 680-3.

Section 680-5. Former subsection (a) has been relocated into Part II of the article since it is a product requirement more closely related to other product requirements in the former Section 680-20. Although these transformers are used in other parts of the article, in every instance they're referred to as a specific cross reference [complying with Section 680-5(a)], and therefore, by simply modifying the cross reference in those few locations, the same effect results. Former Section 680-5(c) is a wiring requirement for wet-niche (and no-niche) fixture wiring only by virtue of the cross reference to Section 680-20(a)(1). This has been relocated into the branch-circuit wiring rules for these fixtures where it belongs, in Part II.

Section 680-6. Former Section 680-6 covered requirements that only applied to permanently installed pool installations, and this rewrite moves into Part II. On the other hand, former Section 680-24 includes grounding rules that apply throughout the article. In an effort to reduce the loading of Part II, this seemed a logical place to relocate this material, which otherwise needs to be repeated and repeated in each part of the article. Several grounding rules in other parts, which repeated this information, have been deleted accordingly. All that was necessary was converting "pool" to "contained body of water". In addition, since the rewritten Part II has unified grounding rules for all species of underwater fixtures, it simplified the section to use this terminology. The final change was to adapt and incorporate the generic grounding language of Section 680-25(e) into this

Section 680-7. This provision has been broadened beyond the former 20A limitation, since some applications now exceed that limit. In addition, since other article parts reference former Section 680-25(e), which is actually a generic requirement, it has been combined with this section, and deleted from Part II.

Section 680-8. This section has been restructured using much simple, positive language which has been broadened to include similar premises applications such as festoon lighting and messenger-supported open conductors. The errors in the last cycle of (1) making the table only applicable to observation stands, etc., and not to applications over the pool itself, and (2) the deletion of communications conductors, have been fixed. The prior inadvertent inclusion of indoor pools, which has been addressed in the NESC and also in the new Section 830-10(e) Exception No. 1, has been avoided. Finally, the term "complying with" has been changed to "covered in" in order to avoid a gap in code coverage when applications don't literally comply with all the requirements.

Section 680-9. Editorial revision because a load isn't "of" an equipment nameplate.

Section 680-12. Editorial revisions included in a separate proposal from the Massachusetts Electrical Code Advisory Committee. Please refer to that proposal for more detailed substantiation.

Section 680-20. A new section, made parallel throughout the remaining parts of the article, explaining what the part covers and what other parts of the article need to be applied simultaneously.

Section 680-21. Comprehensive rules on wiring motors in the permanently installed pool environment.

The first subsection (a) gives straightforward rules on wiring methods, and is essentially Section 680-25(c) relocated. Editorial changes include numbered and titled paragraphs for ease of citation, and proper setup language in the first paragraph to introduce the concept of modifications to the general rule in what follows without using exceptions. Flexible cord gets its own paragraph (a printing error in the 1999 NEC) so it won't be confused as only applying at dwellings. The dwelling rule has been technically corrected, since a bare equipment grounding conductor under the sheath of Type NM cable isn't actually covered within the definition in Article 100. In addition, the blanket Chapter 3 allowance has been slightly modified to remove Chapter 3 methods that don't include grounding or wiring assemblies, such as knob-and-tube.

The second subsection (b) is former Section 680-6(d) properly worded to cover "outlets" instead of "wiring" and all occupancies instead of only nonresidential applications. There wasn't any substantiation that supported a nonresidential restriction when the proposal was acted on, and it seems apparent that the original submitter was under the misapprehension that all residential applications already had a GFCI requirement. That, of course, isn't true. It also solves the problem of exactly what parameters are being measured in the ampere specification.

The third subsection (c) is the former Section 680-28 relocated with editorial changes to fit the new location.

Section 680-22. This is the new location of the former Section 680-6 with only editorial changes and titles to properly implement the elimination of exceptions in the prior cycle. The proximity rule for receptacles has been split apart so it is no longer a misworded, excessively long sentence. The expression "on the property" has been deleted throughout because it adds nothing to the requirement, and could be problematic under some condo-minimum forms of ownership. The fine print note on distance measurements appears to be a rule and this proposal makes it such. The proposal does suggest a technical change at this point, namely the deletion of the allowance to

count a doorway as an impenetrable barrier. This allowance does not exist in the comparable rule for spas and hot tubs. Very commonly people will evade the GFCI rule by leaving a door open and running a cord out to the pool area. If the pool is close to the house, this is a real problem.

The changes on area lighting are purely editorial as well, with one exception. In the 1996 NEC, Section 680-6(b)(1) Exception No. 2 implied that a paddle fan had to be totally enclosed, an obvious impossibility. However, it pro-vided the inspector with some leverage to ask that the installer follow a logical provision in the UL Orange Book, Guide Card GPRT. This mentions a type of paddle fan that has survived a water spray test, which seems appropriate for a fan hanging only 7.5 ft over a pool. The language in item (2) of Section 680-22(b)(3) directly quotes the Orange Book reference to that end. The reference in (5) to Section 680-7 on cord connections has been eliminated because Section 680-20 makes Part I rules mandatory for these applications.

Section 680-23. This is the new home of Section 680-20, with Section 680-25(b) rules included. All the formerly unnumbered paragraphs now have titles and independent numbering for ease in citation. Now a code user only needs to go to one section, titled "Underwater Lighting Fixtures" to get all the rules on wiring these fixtures and their circuits, with the exception of junction boxes and enclosures, and these still show up in the very next section. Section 680-23(a)(2) is the relocation of former §680-5(a). The previous allowance for an "identified" transformer has been changed here to "listed" to reflect current practice. Authorities having jurisdiction aren't making evaluations of this equipment and listed transformers are readily available.

Subsection (b) covers wet-niche fixtures with independently titled and citable paragraphs. Paragraph (1) includes language clarifying the implication in the 4th paragraph of 1999 Section 680-20(b)(1) ("with provisions for terminating in the forming shell") that forming shells used with nonmetallic conduit must include terminals for the No. 8 grounding conductor. The editorial sequence then runs from the forming shell out of the pool and back towards the home run, thereby leading the reader logically to the next section on enclosures. Paragraph (2)(a) includes an express allowance for the brass conduit to be approved instead of listed, thereby modifying Section 346-1. CMP 8 has been doctrinaire in its refusal to lift the listing requirement under any circumstances, and there isn't any listed brass conduit now in production. Heavy wall brass conduit, in every way suitable except for the listing, is available, and this wording allows the authority having jurisdiction to take this into account. Otherwise the elaborate requirements of this article that assume the practical possibility of brass conduits, such as the new bonding grid allowance, are all for nothing. Paragraph (5) is the relocation of former Section 680-25(b)(5).

Subsection (c) covers dry-niche fixtures. Since the wiring methods for underwater fixtures has converged over the years, the specific wiring rules have been relocated to a unified subsection on wiring methods in (e).

Subsection (d) has no substantive changes. The listing requirement has been dropped because it duplicates the requirement in Section 680-23(a)(8). The additional construction reference reflects the fact that Section 680-23(b)(3) contains a product requirement which formerly appeared in §680-25(b)(5), and which would otherwise be lost from the Code.

Subsection (e) continues the process of working from the pool out by incorporating the requirements for branch-circuit wiring on the supply side of dry-niche fixtures, and the supply side of pool junction boxes and enclosures for wet- or no-niche fixtures. All of these fixtures now have identical wiring method rules, and former Section 680-25(b)(2-3) now appear in (1). The exception for flexible connections has been relocated to this point, correcting an error in the 1999 NEC. The specialized equipment grounding conductor rules (no joint or splice, etc.) in former Section 680-25(b)(1, first half of 4) move here. Finally, former Section 680-5(c) arrives to cover separation rules between these conductors and other conductors in panels and in common raceways.

Section 680-24. This is the current Section 680-21 with only editorial changes for increased clarity and to meet the new style manual requirements on list items, and to provided titles as required. New subsection (f) incorporates what used to be the last half of former Section 680-25(b)(4) as a stand-alone set of grounding requirements which primarily apply to the overall subject of this section.

Section 680-25. This is the material formerly located in Section 680-25(d) It opens with clarifying language as to what feeders actually get covered. Since the principal impact of these rules, again, is on wiring method selection and wiring procedures in conjunction with installing the feeders, that seemed a better title for the section. The baggage about "used to protect the conductors" that was left over from the grounding location has been eliminated as unnecessary, along with the article references. The new style manual cautions against reiterating material implicit in Section 90-3, along with encouraging brevity, and this rewrite addresses both objectives. The language covering an existing feeder has been restored to an exception format since it otherwise directly conflicts with the main rule, and there isn't any other neat editorial fix for this.

Subsection (b) covers the special grounding rules. Since the section now directly addresses feeders instead of devices, and since a feeder will exist at any point between the source and the branch-circuit panelboard, the 1999 change that included disconnects is no longer necessary. The reference to 250-122 addresses the section and not the table because actually you only get to the table by way of the section. In addition, these applications frequently involve motor circuits which may make use of some of the specific provisions of Section 250-122 as well as its table. 680-21(a)(1) has the same change for the same reason.

Section 680-26. This is the former Section 680-22 with no substantive changes. The opening language properly restores the former FPN as truly advisory language by splitting out only the performance language, which is a rule, and leaving that in the mandatory section. There are editorial changes designed to improve readability and citability on the part of inspectors. The principal statements in (b) have been made complete sentences in order to transform a list into a sequence of requirements. This is more appropriate given the complex nature of many of the items. Section 680-26(b)(2) includes a minor technical change in that the low-voltage exclusion would only apply to nonmetallic forming shells. This seems to agree with the originating substantiation, and it removes the possibility that a substantial body of metal enclosing a fixture and in contact with pool water might be omitted from the bonding grid.

Section 680-27. This becomes a catch point for the former independent sections on underwater audio, pool covers, and deck area heating. There aren't any substantive changes, only minor editorial one chiefly reflected in the demoted status of the material. The reason for the demotion is to preserve some section numbers for the future, now that the new style manual requires parts to begin with even decade numberings. The alternative would be to preserve the section status for these items (which would become sections 27, 28, and 29) and then bump all the numbers in Parts III, IV, V, VI, and VII upwards by 10.

Section 680-30. This is the statement of applicability, paralleling other parts.

Section 680-33. These changes are primarily editorial aimed at making the lists in each subsection cover a coherent subject and moving the rules into the parent text. There is a minor technical change addressing low-voltage lighting assemblies, for which common sense and apparent intent indicate should only go in the walls of these pools, and not the bottoms. The literal text of the prior code, however, only addressed wall mounted fixtures, leaving a gap in the rules should someone attempt a floor installation. This proposal addresses this point on both the low-voltage and the line-voltage fixtures. As I recall, guide card restrictions also preclude floor installations, but the code should include the proper language.

Section 680-40. The parallel statement of applicable requirements for this part. The section number begins on the decade, in accordance with revised style manual requirements.

Section 680-41. The former Section 680-38 relocated and with a minor change to assist readability. The phrase "at a point" provides a verbal "hinge" so the reader transitions from what has to be installed into exactly where the installation takes place.

Section 680-42. This is the old Section 680-40, but rewritten to incorporate CMP 20 actions on Proposals 20-170, 171, and 172 in the last cycle. There are three substantive changes, all accepted and then inadvertently discarded as the panel did unrelated editorial work during the comment period. Specifically the rewrite includes the provision for the reference to Part II to apply to requirements that would otherwise apply to an outdoor pool; it addresses the newly defined equipment assemblies and self-contained units; and it added control panels to the list of possible applications.

Section 680-43 The second paragraph of the opening subsection has been returned to an exception format because there isn't any simpler way to cleanly state the allowance, an allowance that directly conflicts with the principal rule. As in other locations, the phrase "on the property" has been removed, and for the same reasons. The former FPN on measurements has been converted to a rule, which, after all, is what it actually is. The subsection on fixture and paddle fan mounting incorporates a Massachusetts Electrical Code Advisory Committee proposal restoring the coverage of underwater lighting fixtures that was dropped inadvertently and in violation of TCC express instructions in the previous cycle. The cross references, however, have been made explicit in view of current style manual preference. In addition, there is some editorial reformatting to recast the requirements as positive text and read more easily. The provisions of the text allowing for fixtures to be mounted at lower heights have been made into complete sentences so they will format as rules and not a list.

Former subsections (g) and (h) have been dropped since they exactly duplicate material now in Part I. The rules on grounding methods now appear in Section 680-6 and Section 680-7. And the water heater load subdivision rule appears in Section 680-9. The underwater audio rule deletes the reference to storable pools because they don't cover underwater audio. This reference entered the Code in 1987, apparently in error. The panel was adding storable pool references to Section 680-41(b) (the same ones that inadvertently fell out in the 1999 cycle) (see A86TCR 20-89 and 20-90), and also, simultaneously, adding underwater audio to spas and hot tubs. By the action on A86TCD 20-25, the panel created this subsection. The panel statement stated that "the change in-corporated by Proposal 20-90 remains." Although 20-90 only addressed adding storable pools to 680-41(b), the panel statement seems to have been misinterpreted by staff to mean that storable pools had to go into both locations. Given present (and former) provisions in Part C, this just isn't tenable.

Section 680-44. This contains a technical change, in that it fully addresses the concerns expressed at the 1998 Annual Meeting. No one, by virtue of field installation, should be able to build to a lesser standard of performance than a manufacturer subject to the listing process. Nevertheless, if I field construct and install a unit with, for example two 40A heater loads, total heater load of 80A, no GFCI requirement applies. Granted, 100A GFCI devices aren't available, but 50A devices are available, as are 60A devices. A 60A device will accommodate the largest heater load permitted without subdivision, namely, 48A. Therefore, any spa or hot tub, of whatever total heater loading, is within the range of commercially available GFCI protective devices unless the voltage exceeds 250 or the heaters are three-phase. The listed variety has comprehensive GFCI protection, and the field constructed units need not supply this protection unless their load falls to 50A or less. This in spite of the fact that the larger units present a somewhat greater shock exposure than smaller units. The present language stands these principles on their head and should be corrected.

The other changes are purely editorial, designed to eliminate a list comprised of such simple terms that a simple sentence flows better, and to create independently numbered and easily citable paragraphs.

Section 680-50. Minor editorial changes, and, to clarify the status of the portable fountain, language was added corresponding to the last sentence of §680-60, which addresses a comparable problem.

Section 680-52. This has editorial changes only, which make the former hanging second paragraph independently citable by including it in the numbered rules. In addition, the list items have been reformatted using complete sentences to make them rules. Although some of the items could be on a list, some of them state complex requirements, and the proposed language creates editorial consistency.

Section 680-53. This is unchanged. Note that the FPN (unchanged in this proposal) uses the correct reference to "Section" (not "Table") 250-122 in instances where motor circuits or other special rules may apply.

Section 680-55. The former reference, to Section 680-25 excluding -25(e), needs correlation with changes in Part II, herein supplied.

Section 680-57. The sign rules have been reformatted using titles and complete sentences as required for this level of detail by the new style manual. Since the relevant bonding and grounding rules for signs both occur in the same section, those topics have been combined in this proposal.

Section 680-60. The usual statement as to applicability of parts. For clarity, an express reference to Part I has been included.

Section 680-62. This is a substantive change, and the language and substantiation exactly parallel that covered in the proposed Section 680-44 revisions. The substantive only change between them is the common bonding allowance which applies to spas and hot tubs doesn't apply here, and has been omitted for that reason. Note that former Section 680-62(b), retained in the 1999 NEC due to a panel error, actually required GFCI for all of these units, and therefore directly conflicted with the new 1999 provisions. This proposal removes that obsolete provision. The portable equipment rule covered in the exception would otherwise be lost, and has been re-worded as positive text and relocated to Section 680-62(e)(2). The grounding rules at this point are stated as complete sentences so they will get letter designations as rules. The "methods of grounding" subsection has been deleted because it completely duplicates provisions in Section 680-6 and 680-7.

Section 680-70. The statement of applicability of provisions in the article. This one is important, because major controversies have erupted over applicability of Part I rules to this equipment, which was never intended. Some authorities having jurisdiction, for example, are insisting that cord-connected hydromassage tubs use No. 12 cord not over 3 ft long, as covered in Section 680-7. On the literal text of the Code, it would be hard to argue to the contrary.

Section 680-71. The only change here is an upper limit on the ampere rating of the receptacle to which the GFCI rule applies. Without this the rule could be abused. As covered in the 1999 changes in Section 305-6(a), 30A 125V GFCI circuit protective devices are readily available.

Section 680-73. This section adds nothing to the Code not already addressed in Section 110-26 and 110-26(c). The new style manual cautions against reiterating requirements for which Section 90-3 provides the remedy. In this case, the provisions in the Chapter 1 Article 110 apply because nothing in the Chapter 6 Article 680 modifies them. The section can be deleted without changing any requirements. I have used Section 110-26 for years to get access doors provided for this equipment.

The following tabular reference tracks the relationship between the 1999 NEC and this proposal.

PANEL ACTION: Accept in Principle in Part.

Revise the submitter's proposed text as follows:

Also see Proposal 20-30a.

Accept Proposal 20-31 in Principle; Revise Article 680 as follows:

ARTICLE 680—Swimming Pools, Fountains, and Similar Installations

I General

680.1 Scope

The provisions of this article apply to the construction and installation of electrical wiring for and equipment in or adjacent to all swimming, wading, therapeutic, and decorative pools, fountains, hot tubs, spas, and hydromassage bathtubs, whether permanently installed or storable, and to metallic auxiliary equipment, such as pumps, filters, and similar equipment.

680.2 Definitions.

Cord- and Plug-Connected Lighting Assembly. A lighting assembly consisting of a lighting fixture intended for installation in the wall of a spa, hot tub, or storable pool, and a cord- and plug-connected transformer.

Dry-Niche Lighting Fixture. A lighting fixture intended for installation in the wall of a pool or fountain in a niche that is sealed against the entry of pool water.

Equipment—Fixed. Equipment that is fastened or otherwise secured at a specific location.

Equipment—Portable. Equipment that is actually moved or can easily be moved from one place to another in normal use.

Equipment—Stationary. Equipment that is not easily moved from one place to another in normal use.

Forming Shell. A structure designed to support a wet-niche lighting fixture assembly and intended for mounting in a pool or fountain structure.

Fountain. ~~As used in this article, the term includes~~ Fountains, ornamental pools, display pools, and reflection pools. ~~It~~ The definition does not include drinking fountains.

Hydromassage Bathtub. A permanently installed bathtub equipped with a recirculating piping system, pump, and associated equipment. It is designed so it can accept, circulate, and discharge water upon each use.

Maximum Water Level. The highest level that water can reach before it spills out.

No-Niche Lighting Fixture. A lighting fixture intended for installation above or below the water without a niche.

Packaged Spa or Hot Tub Equipment Assembly. A factory-fabricated unit consisting of water-circulating, heating, and control equipment mounted on a common base, intended to operate a spa or hot tub. Equipment ~~may~~ can include pumps, air blowers, heaters, lights, controls, sanitizer generators, etc.

Packaged Therapeutic Tub or Hydrotherapeutic Tank Equipment Assembly. A factory-fabricated unit consisting of water-circulating, heating, and control equipment mounted on a common base, intended to operate a therapeutic tub or hydrotherapeutic tank. Equipment ~~may~~ can include pumps, air blowers, heaters, lights, controls, sanitizer generators, etc.

Permanently Installed Decorative Fountains and Reflection Pools. Those that are constructed in the ground, on the ground, or in a building in such a manner that the fountain cannot be readily disassembled for storage, whether or not served by electrical circuits of any nature. These units are primarily constructed for their aesthetic value and are not intended for swimming or wading.

Permanently Installed Swimming, Wading, and Therapeutic Pools. Those that are constructed in the ground or partially in the ground, and all others capable of holding water in a depth greater than 1.1 m (42 in.), and all pools installed inside of a building, regardless of water depth, whether or not served by electrical circuits of any nature.

Pool. ~~As used in this article, the term includes~~ Manufactured or field-constructed equipment designed to contain water on a permanent or semi-permanent basis and used for swimming, wading, ~~and~~ or ~~permanently installed~~ therapeutic ~~pools~~ purposes.

Pool Cover, Electrically Operated. Motor-driven equipment designed to cover and uncover the water surface of a pool by means of a flexible sheet or rigid frame.

Self-Contained Spa or Hot Tub. Factory-fabricated unit consisting of a spa or hot tub vessel with all water-circulating, heating, and control equipment integral to the unit. Equipment ~~may~~ can include pumps, air blowers, heaters, lights, controls, sanitizer generators, etc.

Self-Contained Therapeutic Tubs or Hydrotherapeutic Tanks. A factory-fabricated unit consisting of a therapeutic tub or hydrotherapeutic tank with all water-circulating, heating, and control equipment integral to the unit. Equipment may include pumps, air blowers, heaters, light controls, sanitizer generators, etc.

Spa or Hot Tub. A hydromassage pool, or tub for recreational or therapeutic use, not located in health care facilities, designed for immersion of users, and usually having a filter, heater, and motor-driven blower. It may be installed indoors or outdoors, on the ground or supporting structure, or in the ground or supporting structure. Generally, a spa or hot tub is not designed or intended to have its contents drained or discharged after each use.

Storable Swimming or Wading Pool. Those that are constructed on or above the ground and are capable of holding water to a maximum depth of 1.0 m (42 in.), or a pool with nonmetallic, molded polymeric walls or inflatable fabric walls regardless of dimension.

Through-Wall Lighting Assembly. A lighting assembly intended for installation above grade, on or through the wall of a pool, consisting of two interconnected groups of components separated by the pool wall.

Wet-Niche Lighting Fixture. A lighting fixture intended for installation in a forming shell mounted in a pool or fountain structure where the fixture will be completely surrounded by water.

680.3 Other Articles

Except as modified by this article, wiring and equipment in or adjacent to pools and fountains shall comply with other applicable provisions of this Code, including those provisions identified in Table 680.3.

Table 680.3 Other Articles

Topic	Section or Article
Wiring	Chapters 1 - 4
Junction box support	370.23
Rigid nonmetallic conduit	347.3
Audio Equipment	Article 640, Parts I and II
Adjacent to pools and fountains	640.10
Underwater speakers*	

*Note: Underwater loudspeakers shall be installed in accordance with 680.27(A).

~~**(A) Wiring.** Except as modified by this section article, wiring and equipment in or adjacent to pools and fountains shall comply with the applicable requirements of Chapters 1 through 4.~~

~~FPN: See Section 370.23 for junction boxes and Section 347.3 for rigid nonmetallic conduit.~~

~~**(B) Audio Equipment.** The installation and wiring of audio equipment adjacent to pools and fountains shall comply with the applicable requirements of Article 640. Underwater loudspeakers shall be installed in accordance with Section 680.23.~~

680.4 Approval of Equipment

All electrical equipment installed in the water, walls, or decks of pools, fountains, and similar installations shall comply with the provisions of this article.

680.5 Ground-Fault Circuit Interrupters.

~~A~~ Ground-fault circuit interrupters (GFCI) shall be ~~a~~ self-contained units, ~~or a~~ circuit-breaker or receptacle types, or other ~~approved~~ listed types.

680.6 Grounding.

Electrical equipment shall be grounded in accordance with Parts V, VI, and VII of Article 250 and connected by wiring methods of Chapter 3, except as modified by this article. The following equipment shall be grounded:

(1) ~~Wet niche and no niche~~ Through-wall lighting assemblies and underwater lighting fixtures, other than those low-voltage systems listed for the application without a grounding conductor

~~2. Dry niche underwater lighting fixtures~~

(2) All electrical equipment located within 1.5 m (5 ft) of the inside wall of the pool or fountain

(3) All electrical equipment associated with the recirculating system of the pool or fountain

(4) Junction boxes

(5) Transformer enclosures

(6) Ground-fault circuit interrupters

(7) Panelboards that are not part of the service equipment and that supply any electrical equipment associated with the pool or fountain

680.7 Cord- and Plug-Connected Equipment.

Fixed or stationary equipment ~~rated 20 amperes or less~~, other than an underwater lighting fixture for a permanently installed pool, shall be permitted to be connected with a flexible cord to facilitate the removal or disconnection for maintenance or repair.

(A) Length. For other than storable pools, the flexible cord shall not exceed 900 mm (3 ft) in length.

(B) Equipment Grounding. The flexible cord ~~and~~ shall have a copper equipment grounding conductor sized in accordance with 250.122 but not smaller than No. 12. The cord shall terminate in ~~with~~ a grounding-type attachment plug.

(C) Construction. The equipment grounding conductors shall be connected to a fixed metal part of the assembly. The removable part shall be mounted on or bonded to the fixed metal part.

~~FPN: See Section 680.25(c) for connection with flexible cords.~~

~~(f) Other Equipment. Other electrical equipment shall be grounded in accordance with Article 250 and connected by wiring methods of Chapter 3.~~

680.8 Overhead Conductor Clearances.

(A) Power. With respect to service drop conductors and open overhead wiring, swimming pool and similar installations shall comply with the minimum clearances given in Table 680.8 and illustrated in Figure 680.8.

~~The following parts of pools shall not be placed under existing service-drop conductors or any other open overhead wiring; nor shall such wiring be installed above the following:~~

~~1. Pools and the area extending 10 ft (3.05 m) horizontally from the inside of the walls of the pool,~~

~~2. Diving structure, or~~

~~3. Observation stands, towers, or platforms unless the installations provide the clearances in Table 680.8.~~

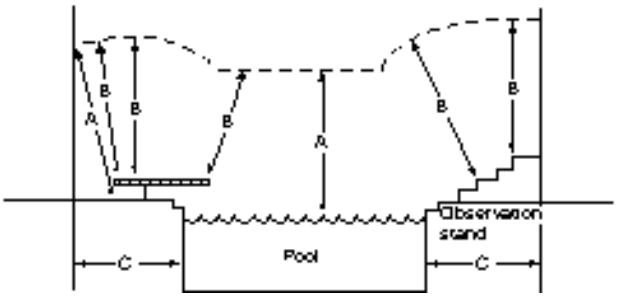

Figure 680.8 Clearances from Pool Structures

Table 680.8 Overhead Conductor Clearances

	Insulated Supply or Service Drop Cables, 0–750 Volts to Ground, Supported on and Cabled Together with an Effectively Grounded Bare Messenger or Effectively Grounded Neutral Conductor		All Other Supply or Service-Drop Conductors Voltage to Ground			
			0 through 15 kV		Over 15 through 50 kV	
	m	ft	m	ft	m	ft
A Clearance in any direction to the water level, edge of water surface, base of diving platform, or permanently anchored raft	6.7	22	7.5	25	8.0	27
B Clearance in any direction to the observation stand, tower, or diving platform ~~or tower~~.	4.3	14	5.2	17	5.5	18
C Horizontal limit of clearance measured from inside wall of the pool	This limit shall extend to the outer edge of the structures listed in ~~1~~A and ~~2~~B of this Table, but not less than 3 m (10 ft).					

(B) Communications Systems. Communication, radio, and television ~~Community antenna system~~ coaxial cables ~~complying~~ covered by Articles 800 through ~~with Article~~ 820 shall be permitted at a height of not less than 3.0 m (10 ft) above swimming and wading pools, diving structures, and observation stands, towers, or platforms.

(C) Network-Powered Broadband Communications Systems. The minimum clearances for overhead network-powered broadband communications systems conductors from pools or fountains shall comply with the provisions in Table 680.8 for conductors operating at 0 to 750 volts to ground.

~~FPN: See Sections 225-18 and 225-19 for clearances for conductors not covered by this section.~~

680.9 Electric Pool Water Heaters.

All electric pool water heaters shall have the heating elements subdivided into loads not exceeding 48 amperes and protected at not ~~more than~~ over 60 amperes. The ampacity of the branch-circuit conductors and the rating or setting of overcurrent protective devices shall not be less than 125 percent of the total nameplate-rated load ~~of the nameplate rating~~.

680.10 Underground Wiring Location.

Underground wiring shall not be permitted under the pool or within the area extending 1.5 m (5 ft) horizontally from the inside wall of the pool unless this wiring is necessary to supply pool equipment permitted by this article. Where space limitations prevent wiring from being routed 1.5 m (5 ft) or more from the pool, such wiring shall be permitted where installed in rigid metal conduit, intermediate metal conduit, or a nonmetallic raceway system. All metal conduit shall be corrosion resistant and suitable for the location. The minimum burial depth shall be as ~~follows.~~ given in Table 680.10.

Table 680.10 Minimum Burial Depths

Wiring Method	Minimum Burial	
	mm	in.
Rigid metal conduit	150	6
Intermediate metal conduit	150	6
Nonmetallic raceways listed for direct burial without concrete encasement	450	18
Other approved raceways*	450	18

~~Note: For SI units, 1 in. = 25.4 mm.~~

* Raceways approved for burial only where concrete encased shall require a concrete envelope not less than 50 mm (2 in.) thick.

680.11 Equipment Rooms and Pits.

Electric equipment shall not be installed in rooms or pits that do not have ~~adequate drainage to prevent~~ drainage that adequately prevents water accumulation during normal operation or filter maintenance.

680.12 Maintenance Disconnecting Means.

~~One or more a disconnecting means shall be provided and be accessible, located within sight from all pools, spas, and installed for motor-operated pool, spa, or hot tub equipment, and for pool, spa, or hot tub heating equipment. The disconnecting means shall be accessible and located within sight of the equipment supplied, at a point at least 1.5 m (5 ft.) horizontally from the inside walls of the pool, spa, or hot tub.~~

One or more disconnecting means from all ungrounded conductors shall be provided for all utilization equipment other than lighting. Each means shall be accessible and within sight from its equipment.

II Permanently Installed Pools

680.20 General.

Electrical installations at permanently installed pools shall comply with the provisions of Part I and Part II.

680.21 Motors.

(A) Wiring Methods.

(1) General. The branch circuits for pool-associated motors shall be installed in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or Type MC cable listed for the location ~~application~~. Other wiring methods and materials shall be permitted in specific locations or applications as covered in this section. Any wiring method employed shall contain a copper equipment grounding conductor sized in accordance with ~~Table~~ 250.122 but not smaller than No. 12.

(2) On or Within Buildings. Where installed on or within buildings, electrical metallic tubing shall be permitted ~~to be used to protect the conductors~~.

(3) Flexible Connections. Where necessary to employ flexible connections at or adjacent to the motor, liquidtight flexible metal or nonmetallic conduit with approved fittings shall be permitted.

(4) One-Family Dwellings. In the interior of ~~a~~ one-family dwellings, or in the interior of ~~another~~ accessory buildings ~~or structure~~ associated with a one-family dwelling, any of the wiring methods recognized in Chapter 3 of this Code shall be permitted that comply with the provisions of this paragraph.. ~~that contain a copper equipment grounding conductor that is insulated or covered by the outer sheath of the wiring method and is not smaller than No. 12 shall be permitted to be used for the connection of pool-associated motors.~~ Where run in a raceway the equipment grounding conductor shall be insulated. Where run in a cable assembly, the equipment grounding conductor shall be permitted to be uninsulated, but it shall be enclosed within the outer sheath of the cable assembly.

(5) Cord- and Plug-Connections. Pool-associated motors shall be permitted to employ cord- and plug-connections. The flexible cord shall not exceed 900 mm (3 ft) in length. The flexible cord shall include an equipment grounding conductor sized in accordance with Section 250.122 and shall terminate in a grounding-type attachment plug.

(B) Double Insulated Pool Pumps. A ~~permanently installed pool shall be permitted to be provided with~~ listed cord- and plug-connected pool ~~pumps~~ pump incorporating an approved system of double insulation that provides a means for grounding only the internal and nonaccessible, noncurrent-carrying metal parts of the pump shall be connected to any wiring method recognized in Chapter 3 that is suitable for the location.

680.22 Area Lighting, Receptacles, and Equipment.

(A) Receptacles.

(1) Circulation and Sanitation System, Location. Receptacles that provide power for water-pump motors or for other loads directly related to the circulation and sanitation system shall be located at least 3.0 m (10 ft) from the inside walls of the pool, or not less than 1.5 m (5 ft) from the inside walls of the pool if they meet all of the following conditions:

(1) Consist of single receptacles
(2) Employ a locking configuration
(3) Are of the grounding type
(4) Have GFCI protection

~~a permanently installed pool or fountain, as permitted in Section 680-7, shall be permitted between 5 ft and 10 ft (1.52 m and 3.05 m) from the inside walls of the pool or fountain, and, where so located, shall be single and of the locking and grounding types and shall be protected by a ground-fault circuit interrupter(s).~~

(2) Other Receptacles, Location. Other receptacles ~~on the property~~ shall be ~~located at least~~ not less than 3.0 m (10 ft) from the inside walls of a pool ~~or fountain~~.

(3) Dwelling Unit(s). ~~Where~~ If a permanently installed pool is installed at a dwelling unit(s), ~~at least~~ no fewer than one 125-volt 15- or 20-ampere receptacle on a general-purpose branch circuit shall be located ~~a minimum of~~ not less than 1.5 m (5 ft) from and not more than 6.0 m (20 ft) from the inside wall of the pool. This receptacle shall be located not more than 2.0 m (6 ft 6 in.) above the floor, platform, or grade level serving the pool.

(4) Restricted Space. Where a pool is within 3.0 m (10 ft) of a dwelling and the dimensions of the lot preclude meeting the required clearances, not more than one receptacle outlet shall be permitted if not less than 1.5 m (5 ft) measured horizontally from the inside wall of the pool.

(5) GFCI Protection. All 125-volt receptacles located within 6.0 m (20 ft) of the inside walls of a pool or fountain shall be protected by a ground-fault circuit interrupter. ~~Wiring~~ Receptacles supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 ~~and~~ or 20 amperes, ~~125 volt or~~ 120 volt through 240 volt, single phase, shall be provided with GFCI protection.

(6) Measurements. ~~FPN:~~ In determining the ~~above~~ dimensions in this section addressing receptacle spacings, the distance to be measured ~~is~~ shall be the shortest path the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening, or other effective permanent barrier.

(B) Lighting Fixtures, Lighting Outlets, and Ceiling-Suspended (Paddle) Fans.

(1) New Outdoor Installation Clearances. In outdoor pool areas, lighting fixtures, lighting outlets, and ceiling-suspended

(paddle) fans installed above the pool or the area extending 1.5 m (5 ft) horizontally from the inside walls of the pool shall ~~not~~ be installed at a height not less than 3.7 m (12 ft) above the maximum water level ~~over~~ of the pool. ~~or over the area extending 5 ft (1.52 m) horizontally from the inside walls of a pool unless no part of the lighting fixture or ceiling suspended (paddle) fan is less than 12 ft (3.66 m) above the maximum water level.~~

(2) Indoor Clearances. For installations in indoor pool areas, the clearances shall be the same as for outdoor areas unless modified as provided in this paragraph. If the branch circuit supplying the equipment is protected by a ground-fault circuit-interrupter, the following equipment shall be permitted at a height not less than 2.3 m (7 ft 6 in). above the maximum pool water level: ~~the limitations of Section 680.6(b)(1) shall not apply if all of the following conditions are complied with~~

(1) Totally enclosed fixtures.

(2) Ceiling-suspended (paddle) fans identified for use beneath ceiling structures such as provided on porches or patios. ~~A ground-fault circuit interrupter is installed in the branch circuit supplying the fixture(s) or ceiling suspended (paddle) fans, and c. The distance from the bottom of the fixture or ceiling suspended (paddle) fan to the maximum water level is not less than 7 ft 6 in. (2.29 m).~~

(3) Existing Installations. Existing lighting fixtures and lighting outlets located less than 1.5 m (5 ft) measured horizontally from the inside walls of a pool shall be ~~at least~~ not less than 1.5 m (5 ft) above the surface of the maximum water level, shall be rigidly attached to the existing structure, and shall be protected by a ground-fault circuit interrupter.

(4) GFCI Protection in Adjacent Areas. Lighting fixtures, ~~and~~ lighting outlets, and ceiling-suspended (paddle) fans installed in the area extending between 1.5 m (5 ft) and 3.0 m (10 ft) horizontally from the inside walls of a pool shall be protected by a ground-fault circuit interrupter unless installed not less than 1.5 m (5 ft) above the maximum water level and rigidly attached to the structure adjacent to or enclosing the pool.

(5) Cord- and Plug-Connected Lighting Fixtures. Cord- and plug-connected lighting fixtures shall comply with the requirements of Section 680.7 ~~meet the same specifications as other cord- and plug-connected equipment as set forth in Section 680.7~~ where installed within 4.9 m (16 ft) of any point on the water surface, measured radially.

(C) Switching Devices. Switching devices ~~on the property~~ shall be located at least 1.5 m (5 ft) horizontally from the inside walls of a pool unless separated from the pool by a solid fence, wall, or other permanent barrier. Alternatively, a switch that is listed as being acceptable for use within 1.5 m (5 ft) shall be permitted.

680.23 Underwater Lighting Fixtures.

~~Paragraphs (a) through (d) apply to~~ This section covers all lighting fixtures installed below the normal water level of the pool.

(A) General.

(1) Fixture Design, Normal Operation. The design of an underwater lighting fixture supplied from a branch circuit either directly or by way of a transformer meeting the requirements of ~~Section 680.5(a)~~ this section shall be such that, where the fixture is properly installed without a ground-fault circuit interrupter, there is no shock hazard with any likely combination of fault conditions during normal use (not relamping).

(2) Transformers. Transformers used for the supply of underwater fixtures, together with the transformer enclosure, shall be ~~identified~~ listed for the purpose. The transformer shall be an isolated winding type with an ungrounded seconary that has a grounded metal barrier between the primary and secondary windings.

(3) GFCI Protection, Relamping. ~~In addition,~~ A ground-fault circuit interrupter shall be installed in the branch circuit supplying fixtures operating at more than 15 volts, so that there is no shock hazard during relamping. The installation of the ground-fault circuit interrupter shall be such that there is no shock hazard with any likely fault-condition combination that involves a person in a conductive path from any ungrounded part of the branch circuit or the fixture to ground.

(4) Voltage Limitation. No lighting fixtures shall be installed for operation on supply circuits over 150 volts between conductors.

(5) Location, Wall Mounted Fixtures. Lighting fixtures mounted in walls shall be installed with the top of the fixture lens ~~at least~~ not less than 450 mm (18 in.) below the normal water level of the pool, unless the lighting fixture is listed and identified for use at lesser depths. No fixture shall be installed ~~a depth of not~~ less than 100 mm (4 in.) below the normal water level of the pool.

(6) Bottom-Mounted Fixtures. A lighting fixture facing upward shall have the lens adequately guarded to prevent contact by any person.

(7) Dependence on Submersion. Fixtures that depend on submersion for safe operation shall be inherently protected against the hazards of overheating when not submerged.

(8) Compliance. Compliance with ~~this~~ these requirements shall be obtained by the use of a listed underwater lighting fixture, and by installation of a listed ground-fault circuit interrupter in the branch circuit or a listed transformer for fixtures operating at not more than 15 volts.

(B) Wet-Niche Fixtures.

(1) Forming Shells. Forming shells shall be installed for the mounting of all wet-niche underwater fixtures and shall be equipped with provisions for conduit entries. Metal parts of the fixture and forming shell in contact with the pool water shall be of brass or other approved corrosion-resistant metal. All forming shells used with nonmetallic conduit systems, other than those that are part of a listed low-voltage lighting system not requiring grounding, shall include provisions for terminating a No. 8 copper conductor.

(2) Wiring Extending Directly to the Forming Shell. Conduit shall ~~extend~~ be installed from the forming shell to a suitable junction box or other enclosure located as provided in 680.24. Conduit shall be rigid metal, intermediate metal, liquidtight flexible nonmetallic, or rigid nonmetallic.

(a) Metal Conduit. Metal conduit shall be approved, and shall be of brass or other approved corrosion-resistant metal.

(b) Nonmetallic Conduit. Where a nonmetallic conduit is used, a No. 8 insulated solid or stranded copper equipment grounding conductor shall be installed in this conduit unless a listed low-voltage lighting system not requiring grounding is used. ~~with provisions for terminating in~~ The equipment grounding conductor shall be terminated in the forming shell, junction box or transformer enclosure, or ground-fault circuit-interrupter enclosure The termination of the No. 8 equipment grounding conductor in the forming shell shall be covered with, or encapsulated in, a listed potting compound to protect ~~such~~ the connection from the possible deteriorating effect of pool water. ~~Metal parts of the fixture and forming shell in contact with the pool water shall be of brass or other approved corrosion-resistant metal.~~

(3) Equipment Grounding Provisions for Cords. Wet-niche ~~or no-niche~~ lighting fixtures that are supplied by a flexible cord or cable shall have all exposed noncurrent-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of the cord or cable. This grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure. The grounding conductor shall not be smaller than the supply conductors and not smaller than No. 16.

(4) Fixture Grounding Terminations. The end of the flexible-cord jacket and the flexible-cord conductor terminations within a fixture shall be covered with, or encapsulated in, a suitable potting compound to prevent the entry of water into the fixture through the cord or its conductors. In addition, the grounding connection within a fixture shall be similarly treated to protect such connection from the deteriorating effect of pool water in the event of water entry into the fixture.

(5) Fixture Bonding. The fixture shall be bonded to and secured to the forming shell by a positive locking device that ensures a low-resistance contact and requires a tool to remove the fixture from the forming shell. Bonding ~~is~~ shall not be required for fixtures that are listed for the application ~~having~~ and have no noncurrent-carrying metal parts.

(C) Dry-Niche Fixtures.

(1) Construction. A dry-niche lighting fixture shall be provided with a provision for drainage of water and a means for accommodating one equipment grounding conductor for each conduit entry.

(2) Junction Box. A junction box shall not be required but, if used, shall not be required to be elevated or located as specified in 680.24(A)(2), if the fixture is specifically identified for the purpose. ~~Approved rigid metal conduit, intermediate metal conduit, liquidtight~~

~~flexible nonmetallic conduit, or rigid nonmetallic conduit shall be installed from the fixture to the service equipment or panelboard. Where installed on buildings, electrical metallic tubing shall be permitted to be used to protect conductors. Where installed within buildings, electrical nonmetallic tubing or electrical metallic tubing shall be permitted to be used to protect conductors.~~

(D) No-Niche Fixtures. A no-niche fixture shall meet the construction requirements of 680.23(B)(3) and be installed in accordance with the requirements of 680.23(B). Where connection to a forming shell is specified, the connection shall be to the mounting bracket.

~~1. Listed for the purpose~~

~~2. Installed in accordance with the requirements of Section 680-20(b) Where connection to a forming shell is specified, the connection shall be to the mounting bracket.~~

(E) Through-Wall Lighting Assembly. A through-wall lighting assembly shall be equipped with a threaded entry or hub, or a nonmetallic hub listed for the purpose, for the purpose of accommodating the termination of the supply conduit. A through-wall lighting assembly shall meet the construction requirements of 680.23(B)(3) and be installed in accordance with the requirements of 680.23. Where connection to a forming shell is specified, the connection shall be to the conduit termination point.

(F) Branch-Circuit Wiring.

(1) Wiring Methods. Branch circuit wiring on the supply side of enclosures and junction boxes connected to conduits run to wet-niche and no-niche fixtures, and the field wiring compartments of dry-niche fixtures, shall be installed using rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or rigid nonmetallic conduit. Where installed on buildings, electrical metallic tubing shall be permitted, and where installed within buildings, electrical nonmetallic tubing or electrical metallic tubing shall be permitted.

FPN: For requirements of electrical nonmetallic tubing, see Article 331.

Exception: Where connecting to transformers for pool lights, liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted to be used when installed in accordance with Article 351. The length shall ~~and does~~ not exceed 6 ft (1.83 m) for any one length ~~or~~, nor exceed 10 ft (3.05 m) ~~of~~ in total length used.

(2) Equipment Grounding. Through-wall lighting assemblies, wet-niche, dry-niche, or no-niche lighting fixtures shall be connected to an insulated copper equipment grounding conductor installed with the circuit conductors. The equipment grounding conductor shall be installed without joint or splice except as permitted in (a) and (b). The equipment grounding conducor shall be sized in accordance with Table 250.122 but shall not be smaller than No. 12.

Exception: An equipment grounding conductor between the wiring chamber of the secondary winding of a transformer and a junction box shall be sized in accordance with the overcurrent device in this circuit.

(a) ~~Where~~ If more than one underwater lighting fixture is supplied by the same branch circuit, the equipment grounding conductor, installed between the junction boxes, transformer enclosures, or other enclosures in the supply circuit to wet-niche fixtures, or between the field-wiring compartments of dry-niche fixtures, shall be permitted to be terminated on grounding terminals.

(b) ~~Where~~ If the underwater lighting fixture is supplied from a transformer, ground-fault circuit interrupter, clock-operated switch, or a manual snap switch that is located between the panelboard and a junction box connected to the conduit that extends directly to the underwater lighting fixture, the equipment grounding conductor shall be permitted to terminate on grounding terminals on the transformer, ground-fault circuit interrupter, clock-operated switch enclosure, or an outlet box used to enclose a snap switch.

(3) Conductors. Conductors on the load side of a ground-fault circuit interrupter or of a transformer, used to comply with the provisions of 680.23(A)(8), shall not occupy raceways, boxes, or enclosures containing other conductors unless one of the following conditions applies:

(1) The other conductors are protected by ground-fault circuit interrupters.

(2) The other conductors ~~or~~ are grounding conductors.

(3) The other conductors are supply conductors to a feed-through type ground-fault circuit interrupter ~~shall be permitted in the same enclosure~~.

(4) Ground-fault circuit interrupters shall be permitted in a panelboard that contains circuits protected by other than ground-fault circuit interrupters.

680.24 Junction Boxes and Enclosures for Transformers or Ground-Fault Circuit Interrupters.

(A) Junction Boxes. A junction box connected to a conduit that extends directly to a forming shell or mounting bracket of a no-niche fixture shall ~~be as follows~~ meet the requirements of this section.

(1) Construction. The junction box shall be listed and labeled for the purpose and:

(1) Equipped with threaded entries or hubs or a nonmetallic hub listed for the purpose.

(2) Comprised of copper, brass, suitable plastic, or other approved corrosion-resistant material.

(3) Provided with electrical continuity between every connected metal conduit and the grounding terminals by means of copper, brass, or other approved corrosion-resistant metal that is integral with the box.

(2) Installation. Where the fixture operates over 15 volts, the junction box location shall comply with (a) and (b). Where the fixture operates at less than 15 volts, the junction box location shall be permitted to comply with (c).

(a) Vertical Spacing. The junction box shall be located not less than 100 mm (4 in.), measured from the inside of the bottom of the box, above the ground level, or pool deck, or not less than 200 mm (8 in.) above the maximum pool water level, whichever provides the greater elevation.

(b) Horizontal Spacing. The junction box shall be located not less than 1.2 m (4 ft) from the inside wall of the pool, unless separated from the pool by a solid fence, wall, or other permanent barrier.

(c) Flush Deck Box. If used on a lighting system operating at 15 volts or less, a flush deck box shall be permitted ~~provided~~ if both of the following apply:

(1) An approved potting compound is used to fill the box to prevent the entrance of moisture, and

(2) The flush deck box is located not less than 1.2 m (4 ft) from the inside wall of the pool.

(B) Other Enclosures. An enclosure for a transformer, ground-fault circuit interrupter, or a similar device connected to a conduit that extends directly to a forming shell or mounting bracket of a no-niche fixture shall ~~be as follows~~ meet the requirements of this section.

(1) Construction. The enclosure shall be listed and labeled for the purpose and meet the following requirements:

(1) Equipped with threaded entries or hubs or a nonmetallic hub listed for the purpose.

(2) Comprised of copper, brass, suitable plastic, or other approved corrosion-resistant material.

(3) Provided with an approved seal, such as duct seal at the conduit connection, that prevents circulation of air between the conduit and the enclosures

(4) Provided with electrical continuity between every connected metal conduit and the grounding terminals by means of copper, brass, or other approved corrosion-resistant metal that is integral with the box.

(2) Installation.

(a) Vertical Spacing. The enclosure shall be located not less than 100 mm (4 in.), measured from the inside of the bottom of the box, above the ground level, or pool deck, or not less than 200 mm (8 in.) above the maximum pool water level, whichever provides the greater elevation.

(b) Horizontal Spacing. The enclosure shall be located not less than 1.2 m (4 ft) from the inside wall of the pool, unless separated from the pool by a solid fence, wall, or other permanent barrier.

(C) Protection. Junction boxes and enclosures mounted above the grade of the finished walkway around the pool shall not be located in the walkway unless afforded additional protection, such as by location under diving boards, adjacent to fixed structures, and the like.

(D) Grounding Terminals. Junction boxes, transformer enclosures, and ground-fault circuit-interrupter enclosures connected to a conduit that extends directly to a forming shell or mounting

bracket of a no-niche fixture shall be provided with a number of grounding terminals that shall be ~~at least~~ no fewer than one more than the number of conduit entries.

(E) Strain Relief. The termination of a flexible cord of an underwater lighting fixture within a junction box, transformer enclosure, ground-fault circuit interrupter, or other enclosure shall be provided with a strain relief.

(F) Grounding. The junction box, transformer enclosure, or other enclosure in the supply circuit to a wet-niche or no-niche lighting fixture and the field-wiring chamber of a dry-niche lighting fixture shall be grounded to the equipment grounding terminal of the panelboard. This terminal shall be directly connected to the panelboard enclosure.

680.25 Feeders.

These provisions shall apply to any feeder on the supply side of panelboards supplying branch circuits for pool equipment covered in Part II and on the load side of the service equipment or the source of a separately derived system.

(A) Wiring Methods. Feeders shall be installed in rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or rigid nonmetallic conduit. Electrical metallic tubing shall be permitted ~~to be used to protect conductors~~ where installed on or within a ~~the~~ building, and ~~in accordance with Article 348~~. electrical nonmetallic tubing shall be permitted ~~to be used to enclose the conductors~~ where installed within ~~the~~ a building ~~in accordance with Article 331~~.

Exception: An existing feeder ~~the~~ between an existing remote panelboard and ~~the~~service equipment ~~s~~shall be permitted to run ~~connected by means of~~ a flexible metal conduit or an approved cable assembly with an insulated or covered equipment grounding con~~ductor, the conduits listed above s~~hall not be ~~required~~

(B) Grounding. ~~A panelboard and, where installed, a disconnecting means, that are not part of the service equipment or source of a separately derived system, shall have~~ An insulated equipment grounding conductor shall be installed with the feeder conductors between ~~it's~~ the grounding terminal of the pool equipment panelboard and the grounding terminal of the applicable service equipment or source of a separately derived system.

(1) Size. This conductor shall be sized in accordance with 250.122 but not smaller than No. 12. On separately derived systems, this conductor shall be sized in accordance with Table 250.66 but not smaller than No. 8.

(2) Separate Buildings. A panelboard at a separate building shall be permitted to supply swimming pool equipment if the feeder meets the requirements for grounding in 250.32. Where installed, a separate equipment grounding conductor shall be an insulated conductor.

680.26 Bonding.

(A) Performance. The bonding required by this section shall be installed ~~employed~~ to eliminate voltage gradients in the pool area as prescribed. ~~It shall not be the intent of~~

FPN: This section ~~to~~ does not require that the No. 8 or larger solid copper bonding conductor be extended or attached to any remote panelboard, service equipment, or any electrode. ~~but only that it~~.

(B) Bonded Parts. The following parts shall be bonded together.

(1) Metallic Structural Components. All metallic parts of the pool structure, including the reinforcing metal of the pool shell, coping stones, and deck, shall be bonded. The usual steel tie wires shall be considered suitable for bonding the reinforcing steel together, and welding or special clamping shall not be required. These tie wires shall be made tight. If ~~Where~~ reinforcing steel is effectively insulated by an ~~listed~~ encapsulating nonconductive compound, at the time of manufacture and installation, it shall not be required to be bonded.

(2) Underwater Lighting. All forming shells, and mounting brackets of ~~a~~ no-niche fixtures, shall be bonded unless a listed low-voltage lighting system with nonmetallic forming shells is used, not requiring bonding.

(3) Metal Fittings. All metal fittings within or attached to the pool structure shall be bonded. Isolated parts that are not over 100 mm (4 in.) in any dimension and do not penetrate into the pool structure more than 25 mm (1 in.) shall not require bonding.

(4) Electrical Equipment. Metal parts of electrical equipment associated with the pool water circulating system, including pump motors and metal parts of equipment associated with pool covers, including electric motors, shall be bonded. Metal parts of listed equipment incorporating an approved system of double insulation and providing a means for grounding internal nonaccessible, noncurrent-carrying metal parts shall not be bonded.

Where a double-insulated water-pump motor is installed under the provisions of this rule, a solid No. 8 copper conductor that is of sufficient length to make a bonding connection to a replacement motor shall be extended from the bonding grid to an accessible point in the motor vicinity. Where there is no connection between the swimming pool bonding grid and the equipment grounding system for the premises, this bonding conductor shall be connected to the equipment grounding conductor of the motor circuit.

(5) Metal Wiring Methods and Equipment. Metal-sheathed cables and raceways, metal piping, and all fixed metal parts except those separated form the pool by a permanent barrier, shall be bonded that are within the following distances of the pool:

(1) Within 1.5 m (5 ft) horizontally of the inside walls of the pool, ~~unless separated from the pool by a permanent barrier~~. ~~and~~

(2) Within 3.7 m (12 ft) measured vertically above the maximum water level of the pool, or any observation stands, towers, or platforms, or ~~from~~ any diving structures.

(C) Common Bonding Grid. The parts specified in 680.26(B) shall be connected to a common bonding grid with a solid copper conductor, insulated, covered, or bare, not smaller than No. 8. Connection shall be made by exothermic welding or by pressure connectors or clamps that are labeled as being suitable for the purpose and are of the following material: stainless steel, brass, copper, or copper alloy. The common bonding grid shall be permitted to be any of the following:

(1) The structural reinforcing steel of a concrete pool where the reinforcing rods are bonded together by the usual steel tie wires or the equivalent.

(2) The wall of a bolted or welded metal pool.

(3) A solid copper conductor, insulated, covered, or bare, not smaller than No. 8.

(4) Rigid metal conduit or intermediate metal conduit of brass or other identified corrosion-resistant metal conduit.

(D) Connections. Where structural reinforcing steel or the walls of bolted or welded metal pool structures ~~shall be permitted~~ are used as a common bonding grid for nonelectrical parts, ~~where~~ the connections shall ~~can~~ be made in accordance with 250.8.

(E) Pool Water Heaters. For pool water heaters rated at more than 50 amperes that have specific instructions regarding bonding and grounding, only those parts designated to be bonded shall be bonded, and only those parts designated to be grounded shall be grounded.

680.27 Specialized Pool Equipment

(A) Underwater Audio Equipment. All underwater audio equipment shall be identified for the purpose.

(1) Speakers. Each speaker shall be mounted in an approved metal forming shell, the front of which is enclosed by a captive metal screen, or equivalent, that is bonded to and secured to the forming shell by a positive locking device that ensures a low-resistance contact and requires a tool to open for installation or servicing of the speaker. The forming shell shall be installed in a recess in the wall or floor of the pool.

(2) Wiring Methods. Rigid metal conduit or intermediate metal conduit of brass or other identified corrosion-resistant metal, liquidtight flexible nonmetallic conduit (LFNC-B) or rigid nonmetallic conduit shall extend from the forming shell to a suitable junction box or other enclosure as provided in 680.24. Where rigid nonmetallic conduit or liquidtight flexible nonmetallic conduit (LFNC-B) is used, a No. 8 insulated solid or stranded copper equipment grounding conductor shall be installed in this conduit. ~~with provisions for terminating~~ The equipment grounding conductor shall be terminated in the forming shell and the junction box. The termination of the No. 8 equipment grounding conductor in the forming shell shall be covered with, or encapsulated in, a ~~suitable~~ listed potting compound to protect such connection from the possible deteriorating effect of pool water.

(3) Forming Shell and Metal Screen. The forming shell and metal screen shall be of brass or other approved corrosion-resistant metal. All forming shells shall include provisions for terminating a No. 8 copper conductor.

(B) Electrically Operated Pool Covers.

(1) Motors and Controllers. The electric motors, controllers, and wiring shall be located ~~at least~~ not less than 1.5 m (5 ft) from the inside wall of the pool unless separated from the pool by a wall, cover, or other permanent barrier. Electric motors installed below grade level shall be of the totally enclosed type.

FPN No. 1: For cabinets installed in damp and wet locations, see 373.2(A).

FPN No. 2: For switches or circuit breakers installed in wet locations, see 380.4

FPN No. 3: For protection against liquids, see 430.11.

(2) ~~Wiring Methods~~Protection. The electric motor and controller shall be connected to a circuit protected by a ground-fault circuit interrupter.

(C) Deck Area Heating. These provisions ~~of this section~~ shall apply to all pool deck areas, including a covered pool, where electrically operated comfort heating units are installed within 6.0 m (20 ft) of the inside wall of the pool.

(1) Unit Heaters. Unit heaters shall be rigidly mounted to the structure and shall be of the totally enclosed or guarded types. Unit heaters shall not be mounted over the pool or within the area extending 1.5 m (5 ft) horizontally from the inside walls of a pool.

(2) Permanently Wired Radiant Heaters. Radiant electric heaters shall be suitably guarded and securely fastened to their mounting device(s). Heaters shall not be installed over a pool or within the area extending 1.5 m (5 ft) horizontally from the inside walls of the pool and shall be mounted at least 3.7 m (12 ft) vertically above the pool deck unless otherwise approved.

(3) Radiant Heating Cables Not Permitted. Radiant heating cables embedded in or below the deck shall not be permitted.

III. Storable Pools

680.30 General. Electrical installations at storable pools shall comply with the provisions of Part I and Part III.

680.31 Pumps.

A cord-connected pool filter pump shall incorporate an approved system of double insulation or its equivalent and shall be provided with means for grounding only the internal and nonaccessible noncurrent-carrying metal parts of the appliance.

The means for grounding shall be an equipment grounding conductor run with the power-supply conductors in the flexible cord that is properly terminated in a grounding-type attachment plug having a fixed grounding contact member.

680.32 Ground-Fault Circuit Interrupters Required.

All electrical equipment, including power-supply cords, used with storable pools shall be protected by ground-fault circuit interrupters.

FPN: ~~Where~~ For flexible cord~~s~~ usage ~~are used~~, see ~~Section~~ 400.4.

680.33 Lighting Fixtures.

An underwater lighting fixture, if installed, shall be installed in or on the wall of the storable pool. It shall comply with one of the following two provisions:

(A) 15 Volts or Less. A lighting fixture ~~installed in or on the wall of a storable pool~~ shall be part of a cord- and plug-connected lighting assembly. This assembly shall be listed as an assembly for the purpose and ~~as follows~~ have the following construction features:

(1) ~~Have~~ No exposed metal parts

(2) ~~Have~~ A fixture lamp that operates at 15 volts or less

(3) ~~Have~~ An impact-resistant polymeric lens, fixture body, and transformer enclosure

(4) ~~Have~~ A transformer meeting the requirements of 680.23(A)(2) with a primary rating not over 150 volts~~, and~~

~~5. Be listed as an assembly for the purpose~~

(B) Over 15 Volts But Not Over 150 Volts. A lighting assembly without a transformer and with the fixture lamp(s) operating at not over 150 volts shall be permitted to be cord- and plug-connected where the assembly is listed as an assembly for the purpose. The installation shall comply with 680.23(A)(5) and the assembly shall have ~~complies with all of the following~~ the following construction features:

(1) No exposed metal parts.

(2) An impact-resistant polymeric lens and fixture body.

(3) A ground-fault circuit interrupter with open neutral protection ~~is provided~~ as an integral part of the assembly.

(4) The fixture lamp is permanently connected to the ground-fault circuit interrupter with open-neutral protection.

(5) ~~It complies~~ Compliance with the requirements of 680.23(A).

~~6. It is listed as an assembly for the purpose.~~

IV. Spas and Hot Tubs

680.40 General. Electrical installations at spas and hot tubs shall comply with the provisions of Part I and Part IV.

680.41 Emergency Switch for Spas and Hot Tubs.

A clearly labeled emergency shutoff or control switch for the purpose of stopping the motor(s) that provide power to the recirculation system and jet system shall be installed at a point readily accessible to the users and ~~at least~~ not less than 1.5 m (5 ft) away, adjacent to, and within sight of the spa or hot tub. This requirement shall not apply to single-family dwellings.

680.42 Outdoor Installations.

A spa or hot tub installed outdoors shall comply with the provisions of Parts I and II of this article, except as permitted in (A) and (B), that would otherwise apply to pools installed outdoors.

(A) Flexible Connections. Listed packaged spa or hot tub equipment assemblies or self-contained spas or hot tubs ~~units~~ utilizing a factory-installed or assembled control panel or ~~remote~~ panelboard shall be permitted to use flexible connections as covered in (1) and (2):

(1) Flexible Conduit. Liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted in lengths of ~~be connected with~~ not more than 1.8 m (6 ft).

(2) Cord- and Plug-Connections. Cord and plug connections with a cord not longer than 4.6 m (15 ft) shall be permitted where ~~if~~ protected by a ground-fault circuit interrupter.

(B) Bonding. Bonding by metal-to-metal mounting on a common frame or base shall be permitted. The metal bands or hoops used to secure wooden staves shall not be required to be bonded as required in 680.26.

(C) Interior Wiring to Outdoor Installations. In the interior of a one-family dwelling or in the interior of another building or structure associated with a one-family dwelling, any of the wiring methods recognized in Chapter 3 of this Code that contain a copper equipment grounding conductor that is insulated or enclosed within the outer sheath of the wiring method and not smaller than No. 12 shall be permitted to be used for the connection to a self-contained spa or hot tub, or a packaged spa or hot tub equipment assembly.

680.43 Indoor Installations

A spa or hot tub installed indoors shall comply with the provisions of Parts I and II except as modified by this section, and shall be connected by the wiring methods of Chapter 3.

Exception: Listed spa and hot tub packaged units rated 20 amperes or less shall be permitted to be cord and plug connected to facilitate the removal or disconnection of the unit for maintenance and repair.

(A) Receptacles. At least one 125-volt, 15- or 20-ampere receptacle on a general-purpose branch circuit shall be located ~~a minimum~~ not less than of 1.5 m (5 ft) from and not ~~more than~~ exceeding 3.0 m (10 ft) from the inside wall of the spa or hot tub.

(1) Location. Receptacles ~~on the property~~ shall be located at least 1.5 m (5 ft) measured horizontally from the inside walls of the spa or hot tub.

(2) Protection, General. Receptacles ~~of~~ rated 125 volts and 30 amperes or less located within 3.0 m (10 ft) of the inside walls of a spa or hot tub shall be protected by a ground-fault circuit interrupter.

(3) Protection, Spa or Hot Tub Supply Receptacle. Receptacles that provide power for a spa or hot tub shall be ground-fault circuit-interrupter protected.

(4) Measurements. ~~FPN:~~ In determining the ~~above~~ dimensions in this section addressing receptacle spacings, the distance to be measured ~~is~~ shall be the shortest path the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening, or other effective permanent barrier.

(B) Installation ~~Mounting Height~~ of Lighting Fixtures, Lighting Outlets, and Ceiling-Suspended (Paddle) Fans.

(1) Elevation. Lighting fixtures except as covered in Section 680.43(B)(2), lighting outlets, and ceiling-suspended (paddle) fans located over the spa or hot tub or within 1.5 m (5 ft) from the inside walls of the spa or hot tub shall comply with the following clearances ~~be a minimum of 7 ft 6 in. (2.29 m)~~ above the maximum water level ~~and shall be protected by a ground fault circuit interrupter~~.

(a) Without GFCI. Where no GFCI protection is provided, the mounting height shall be not less than 3.7 m (12 ft).

(b) With GFCI. Where GFCI protection is provided, the mounting height shall be permitted to be not less than 2.3 m (7 ft 6 in.)

~~Lighting fixtures, lighting outlets, and ceiling suspended (paddle) fans that are located 12 ft (3.66 m) or more above the maximum water level shall not require a ground fault circuit interrupter for protection.~~

(c) Below 2.3 m (7 ft 6 in.). Lighting fixtures meeting the requirements of (1) or (2) and protected by a ground-fault circuit interrupter shall be permitted to be installed less than 2.3 m (7 ft 6 in.) over a spa or hot tub.

(1) Recessed fixtures with a glass or plastic lens, ~~and~~ nonmetallic or electrically isolated metal trim, and suitable for use in damp locations.

(2) Surface-mounted fixtures with a glass or plastic globe ~~and~~ a nonmetallic body or a metallic body isolated from contact, and suitable for use in damp locations.

(2) Underwater Applications. Underwater lighting fixtures shall comply with the provisions of Section 680.23 or Section 680.33.

(C) Wall Switches. Switches shall be located at least 1.5 m (5 ft), measured horizontally, from the inside walls of the spa or hot tub.

(D) Bonding. The following parts shall be bonded together.

(1) All metal fittings within or attached to the spa or hot tub structure

(2) Metal parts of electrical equipment associated with the spa or hot tub water circulating system, including pump motors

(3) Metal conduit and metal piping that are within 1.5 m (5 ft) of the inside walls of the spa or hot tub and that are not separated from the spa or hot tub by a permanent barrier

(4) All metal surfaces that are within 1.5 m (5 ft) of the inside walls of the spa or hot tub and that are not separated from the spa or hot tub area by a permanent barrier.

Exception: Small conductive surfaces not likely to become energized, such as air and water jets and drain fittings, where not connected to metallic piping, towel bars, mirror frames, and similar nonelectrical equipment, shall not be required to be bonded.

(5) Electrical devices and controls that are not associated with the spas or hot tubs and that are ~~shall be~~ located ~~a minimum~~ not less than ~~of~~ 1.5 m (5 ft) ~~away~~ from such units; otherwise ~~or~~ they shall be bonded to the spa or hot tub system.

(E) Methods of Bonding. All metal parts associated with the spa or hot tub shall be bonded by any of the following methods:

(1) The interconnection of threaded metal piping and fittings

(2) Metal-to-metal mounting on a common frame or base

(3) The provision~~s~~ of a copper bonding jumper, insulated, covered, or bare, not smaller than No. 8 solid

(F) Grounding. The following equipment shall be grounded:

(1) All electric equipment located within 1.5 m (5 ft) of the inside wall of the spa or hot tub

(2) All electric equipment associated with the circulating system of the spa or hot tub

~~(g) Methods of Grounding.~~

~~1. All electrical equipment shall be grounded in accordance with Article 250 and be connected by the wiring methods of Chapter 3.~~

~~2. Where equipment is connected with a flexible cord, the equipment grounding conductor shall be connected to a fixed metal part of the assembly.~~

~~(h) Electric Water Heaters. All electric spa or hot tub water heaters shall be listed and shall have the heating elements subdivided into loads not exceeding 48 amperes and protected at not more than 60 amperes.~~

~~The ampacity of the branch-circuit conductors, and the rating or setting of overcurrent protective devices, shall not be less than 125 percent of the total load of the nameplate rating.~~

(G) Underwater Audio Equipment. Underwater audio equipment shall comply with the provisions of Part II ~~or C~~ of this article.

680.44 Protection.

Except as otherwise provided in this section, the outlet(s) that supplies a self-contained spa or hot tub, ~~or~~ a packaged spa or hot tub equipment assembly, or a field-assembled spa or hot tub ~~with a heater load of 50 amperes or less~~ shall be protected by a ground-fault circuit interrupter.

(A) Listed Units. If so marked, a listed self-contained unit or listed packaged equipment assembly ~~marked to indicate~~ that includes integral ground-fault circuit-interrupter protection ~~is provided~~ for all electrical parts within the unit or assembly (pumps, air blowers, heaters, lights, controls, sanitizer generators, wiring, etc.) shall be permitted without additional GFCI protection.

~~not require that the outlet supply be protected by a ground-fault circuit interrupter.~~

(B) Subdivided Loads. If the load has been subdivided to comply with 680.9 or for other reasons, and if the unit is not rated 3 phase or over 250 volts, GFCI protection shall be provided for each subdivided portion of the load.

(C) Other Units. A ~~field-assembled~~ spa or hot tub rated 3 phase or rated ~~greater than~~ over 250 volts shall not require the supply to be protected by a ground-fault circuit interrupter.

(D) Combination Pool and Spa or Hot Tub. A combination pool/hot tub or spa assembly commonly bonded need not be protected by a ground-fault circuit interrupter.

FPN: See 680.2 for definitions of self-contained spa or hot tub and for packaged spa or hot equipment assembly.

V. Fountains

680.50 General.

The provisions of Part I and Part V shall apply to all permanently installed fountains as defined in 680.2. Fountains that have water common to a pool shall additionally comply with the ~~pool~~ requirements in Part II of this article. Part V does not cover self-contained, portable fountains not larger than 1.5 m (5 ft) in any dimension ~~are not covered by Part E.~~ Portable fountains shall comply with Parts II and III of Article 422.

680.51 Lighting Fixtures, Submersible Pumps, and Other Submersible Equipment.

(A) Ground-Fault Circuit Interrupter. ~~A ground-fault circuit interrupter shall be installed in the branch circuit supplying fountain equipment~~ Fountain equipment, unless ~~the equipment is~~ listed for operation at 15 volts or less and ~~is~~ supplied by a transformer that complies with ~~Section 680.5(a)~~ 680.23(A)(2), shall be protected by a ground-fault circuit interrupter.

(B) Operating Voltage. No lighting fixtures shall be installed for operation on supply circuits over 150 volts between conductors. Submersible pumps and other submersible equipment shall operate at 300 volts or less between conductors.

(C) Lighting Fixture Lenses. Lighting fixtures shall be installed with the top of the fixture lens below the normal water level of the fountain unless ~~approved~~ listed for above-water locations. A lighting fixture facing upward shall have the lens adequately guarded to prevent contact by any person.

(D) Overheating Protection. Electrical equipment that depends on submersion for safe operation shall be protected against overheating by a low-water cutoff or other approved means when not submerged.

(E) Wiring. Equipment shall be equipped with provisions for threaded conduit entries or be provided with a suitable flexible cord. The maximum length of exposed cord in the fountain shall be limited to 3.0 m (10 ft). Cords extending beyond the fountain perimeter shall be enclosed in approved wiring enclosures. Metal parts of equipment in contact with water shall be of brass or other approved corrosion-resistant metal.

(F) Servicing. All equipment shall be removable from the water for relamping or normal maintenance. Fixtures shall not be permanently imbedded into the fountain structure ~~so~~ such that the water level must be reduced or the fountain drained for relamping, maintenance, or inspection.

(G) Stability. Equipment shall be inherently stable or be securely fastened in place.

680.52 Junction Boxes and Other Enclosures.

(A) General. Junction boxes and other enclosures used for other than underwater installation shall comply with 680.24.

(B) Underwater Junction Boxes and Other Underwater Enclosures. Junction boxes and other underwater enclosures shall ~~be submersible and~~ meet the requirements of (1) and (2):

(1) Construction.

(a) Underwater enclosures shall be equipped with provisions for threaded conduit entries or compression glands or seals for cord entry.

(b) Underwater enclosures shall be submersible, and made of copper, brass, or other approved corrosion-resistant material.

(2) Installation. Underwater enclosure installations shall comply with (a) and (b).

(a) Underwater enclosures shall be filled with an approved potting compound to prevent the entry of moisture.

(b) Underwater enclosures shall be firmly attached to the supports or directly to the fountain surface and bonded as required. Where the junction box is supported only by the conduit, the conduit shall be of copper, brass, or other approved corrosion-resistant metal. Where the box is fed by nonmetallic conduit, it shall have additional supports and fasteners of copper, brass, or other approved corrosion-resistant material.

FPN: See 370.23 for support of enclosures.

680.53 Bonding.

All metal piping systems associated with the fountain shall be bonded to the equipment grounding conductor of the branch circuit supplying the fountain.

FPN: See 250.122 for sizing of these conductors.

680.54 Grounding.

The following equipment shall be grounded:

(1) All electrical equipment located within the fountain or within 1.5 m (5 ft) of the inside wall of the fountain

(2) All electrical equipment associated with the recirculating system of the fountain

(3) Panelboards that are not part of the service equipment and that supply any electrical equipment associated with the fountain

680.55 Methods of Grounding.

(A) Applied Provisions. The provisions of ~~Sections 680.25~~ 680.21(A), 680.23(B)(3), 680.23(F)(1-2), 680.24(F), and 680.25 shall apply.

(B) Supplied by a Flexible Cord. Electrical equipment that is supplied by a flexible cord shall have all exposed noncurrent-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of this cord. The grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure.

680.56 Cord- and Plug-Connected Equipment.

(A) Ground-Fault Circuit Interrupter. All electrical equipment, including power-supply cords, shall be protected by ground-fault circuit interrupters.

(B) Cord Type. Flexible cord immersed in or exposed to water shall be of ~~the hard-service type~~ a type for "extra hard usage" as designated in Table 400.4 and shall be ~~marked water-resistant.~~ listed and marked for the purpose.

(C) Sealing. The end of the flexible cord jacket and the flexible cord conductor termination within equipment shall be covered with, or encapsulated in, a suitable potting compound to prevent the entry of water into the equipment through the cord or its conductors. In addition, the ground connection within equipment shall be similarly treated to protect such connections from the deteriorating effect of water that may enter into the equipment.

(D) Terminations. Connections with flexible cord shall be permanent, except that grounding-type attachment plugs and receptacles shall be permitted to facilitate removal or disconnection for maintenance, repair, or storage of fixed or stationary equipment not located in any water-containing part of a fountain.

680.57 Signs.

(A) General. This section ~~includes only fixed, stationary electrically illuminated utilization equipment~~ covers electric signs installed within or adjacent to fountains. ~~with words or symbols designed to convey information or attract attention.~~

(B) Ground-Fault Circuit-Interrupter Protection for Personnel. All circuits supplying the sign shall have ground-fault circuit-interrupter protection for personnel.

(C) Location.

(1) Fixed or Stationary. A fixed or stationary electric sign installed within a fountain ~~Any sign installed inside a fountain~~ shall be ~~at least~~ not less than 1.5 m (5 ft) inside the fountain measured from the outside edges of the fountain.

(2) Portable. A portable electric sign shall not be placed within a fountain or within 1.5 m (5 ft) measured horizontally from the inside walls of the fountain.

(D) Disconnect. A sign shall have a local disconnecting means in accordance ~~comply~~ with Section 600.6 and Section 680.12.

(E) Bonding and Grounding. A sign shall be grounded and bonded in accordance ~~Shall comply~~ with Section 600.7.

~~(F) Grounding. Any equipment associated with the sign shall be grounded as per Article 250.~~

VI. Pools and Tubs for Therapeutic Use

680.60 General.

The provisions of Part I and Part VI shall apply to pools and tubs for therapeutic use in health care facilities, gymnasiums, athletic training rooms, and similar areas. ~~See Section 517.2 for definition of health care facilities.~~ Portable therapeutic appliances shall comply with Parts II and III of Article 422.

FPN: See 517.2 for definition of health care facilities.

680.61 Permanently Installed Therapeutic Pools.

Therapeutic pools that are constructed in the ground, on the ground, or in a building in such a manner that the pool cannot be readily disassembled shall comply with Parts I and II of this article.

Exception: The limitations of 680.22(A)(1) and (2) shall not apply where all lighting fixtures are of the totally enclosed type.

680.62 Therapeutic Tubs (Hydrotherapeutic Tanks)

Therapeutic tubs, used for the submersion and treatment of patients, that are not easily moved from one place to another in normal use or that are fastened or otherwise secured at a specific location, including associated piping systems, shall conform to this part.

(A) Protection. Except as otherwise provided in this section, the outlet(s) that supplies a self-contained therapeutic tub or hydrotherapeutic tank, ~~or~~ a packaged therapeutic tub or hydrotherapeutic tank, or a field-assembled therapeutic tub or hydrotherapeutic tank ~~with a heater load of 50 amperes or less~~ shall be protected by a ground-fault circuit interrupter.

(1) Listed Units. If so marked, a listed self-contained unit or listed packaged equipment assembly ~~marked to indicate~~ that includes integral ground-fault circuit-interrupter protection ~~is provided~~ for all electrical parts within the unit or assembly (pumps, air blowers, heaters, lights, controls, sanitizer generators, wiring, etc.) shall be permitted without additional GFCI protection.

~~not require that the outlet supply be protected by a ground-fault circuit interrupter.~~

(2) Subdivided Loads. If the load has been subdivided to comply with 680.9 or for other reasons, and where the unit is not rated 3 phase or over 250 volts, GFCI protection shall be provided for each subdivided portion of the load.

(3) Other Units. A ~~field-assembled~~ therapeutic tub or hydrotherapeutic tank rated 3 phase or rated ~~greater than~~ over 250 volts shall not require the supply to be protected by a ground-fault circuit interrupter.

~~(b) Ground-Fault Circuit Interrupter. A ground-fault circuit interrupter shall protect all therapeutic equipment.~~

~~Exception: Portable therapeutic appliances shall comply with Section 250-114.~~

(B) Bonding. The following parts shall be bonded together.

(1) All metal fittings within or attached to the tub structure

(2) Metal parts of electrical equipment associated with the tub water circulating system, including pump motors

(3) Metal-sheathed cables and raceways and metal piping that are within 1.5 m (5 ft) of the inside walls of the tub and not separated from the tub by a permanent barrier

(4) All metal surfaces that are within 1.5 m (5 ft) of the inside walls of the tub and not separated from the tub area by a permanent barrier

(5) Electrical devices and controls that are not associated with the therapeutic tubs ~~shall be~~ and that are located a minimum of 1.5 m (5 ft) ~~away~~ from such units; otherwise ~~or~~ they shall be bonded to the therapeutic tub system.

(C) Methods of Bonding. All metal parts ~~associated with the tub~~ required to be bonded by this section shall be bonded by any of the following methods:

(1) The interconnection of threaded metal piping and fittings

(2) Metal-to-metal mounting on a common frame or base

(3) Connections by suitable metal clamps

(4) By the provision~~s~~ of a solid copper bonding jumper, insulated, covered, or bare, not smaller than No. 8

(D) Grounding.

(1) Fixed or Stationary Equipment. The following equipment shall be grounded:

(a) Location. All electrical equipment located within 1.5 m (5 ft) of the inside wall of the tub shall be grounded.

(b) Circulation System. All electrical equipment associated with the circulating system of the tub shall be grounded.

(2) Portable Equipment. Portable therapeutic appliances shall meet the grounding requirements in 250.114.

~~(f) Methods of Grounding.~~

~~1. All electrical equipment shall be grounded in accordance with Article 250 and connected by wiring methods of Chapter 3.~~
~~2. Where equipment is connected with a flexible cord, the equipment grounding conductor shall be connected to a fixed metal part of the assembly.~~

(E) Receptacles. All receptacles within 1.5 m (5 ft) of a therapeutic tub shall be protected by a ground-fault circuit interrupter.

(F) Lighting Fixtures. All lighting fixtures used in therapeutic tub areas shall be of the totally enclosed type.

VII. Hydromassage Bathtubs

680.70 General. Hydromassage bathtubs as defined in 680.2 shall comply with Part VII. They shall not be required to comply with other parts of this article.

680.71 Protection.

Hydromassage bathtubs and their associated electrical components shall be protected by a ground-fault circuit interrupter. All 125-volt, single-phase receptacles not exceeding 30 amperes and located within 1.5 m (5 ft) measured horizontally of the inside walls of a hydromassage tub shall be protected by a ground-fault circuit interrupter(s).

680.72 Other Electrical Equipment.

Lighting fixtures, switches, receptacles, and other electrical equipment located in the same room, and not directly associated with a hydromassage bathtub, shall be installed in accordance with the requirements of Chapters 1 through 4 in this Code covering the installation of that equipment in bathrooms.

680.73 Accessibility.

Hydromassage bathtub electrical equipment shall be accessible without damaging the building structure or building finish.

680.74 Bonding.

All metal piping systems, metal parts of electrical equipment, and pump motors associated with the hydromassage tub shall be bonded together using a copper bonding jumper, insulated, covered, or bare, not smaller than No. 8 solid. Metal parts of listed equipment incorporating an approved system of double insulation and providing a means for grounding internal nonaccessible, noncurrent-carrying metal parts shall not be bonded.

PANEL STATEMENT: Proposal 20-30a presents a clean editorial rewrite of Article 680 that incorporates the concept recommended by the submitter and other amendments according to style and actions on subsequent proposals. See the following table for a summary of the changes made to the submitter's proposal that appear in Proposal 20-30a. (See table on next page)

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9
NEGATIVE: 1
NOT RETURNED: 1 Ryan

EXPLANATION OF NEGATIVE:

TALKA: This proposal should be rejected. Plese see Explanation of Negative Vote for Proposal 20-30a (Log #CP2001).

(Log #3124)

20- 32 - (680-3(a)): Reject

Note: The Technical Corrlating Committee agrees that this material is outside of the Scope of Article 680. If special safety needs exist, a separate Article could be proposed through the Code-Making process.

SUBMITTER: Neil F. LaBrake, Jr., Niagara Mohawk Power Corp.

RECOMMENDATION: Change:

680-3. Other Articles.

(a) Except as modified by this section, wiring and equipment in or adjacent to pools, ~~and~~ fountains, and other bodies of water shall comply with the applicable requirements of Chapters 1 through ~~4~~ 5.

SUBSTANTIATION: This change provides guidance to installers of fountains in natural bodies of water. It also clarifies NEC CMP 20's Panel Statement in their rejection of NFPA 70 A95 ROP Proposal 20-53 for 1993 NEC Section 680-4 to include ponds indicated in part: "Storm retention basins, sewage treatment ponds, and similar bodies of water are not covered under the scope of Article 680. It would be impractical to require these facilities to comply with Part E of Article 680. The term 'pond' is not even referred to in Part E covering fountains."

For example, the installation of an electric pump in a natural body of water could be accomplished in similar fashion as a submersible or jet water pump for a well. Reference to 1999 NEC Section 250-6 must be considered for an installation as described to prevent objectionable current flows. Chapter 2 of the IEEE Green Book (IEEE Standard 142) provides information as a reference on equipment grounding. Also, 1999 NEC Articles 553, "Floating Buildings," and 555, "Marinas and Boatyards," could be considered in determining the wiring method for this application. Whatever the case, complying with grounding and bonding rules, using GFCI protection where applicable, and having an accessible disconnect for electric equipment in natural bodies of water will result in safer conditions for people in the area.

PANEL ACTION: Reject.

PANEL STATEMENT: Inclusion of all bodies of water cannot be accomplished by a simple modification of scope. A detailed analysis and possibly substantial expansion of requirements should be performed to justify such a revision. With further justification, this issue should be addressed in a separate code article or by a different Code Making Panel.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

(Log #3876)

20- 33 - (680-3(a)): Accept

Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-3 of the rewrite of Article 680 in Proposal 20-30a.

SUBMITTER: J. Philip Simmons, Olympia, WA

RECOMMENDATION: Revise the section as follows:

(a) Except as modified by this section, wiring and equipment in or adjacent to pools and fountains shall comply with the applicable requirements of Chapters 1 through 4.

SUBSTANTIATION: Editorial correction.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

(Log #2918)

20- 34 - (680-4-Fountain): Reject

Note: The Technical Correlating Committee agrees that this material is outside of the Scope of Article 680. If special safety needs exist, a separate Article could be proposed through the Code-Making process.

SUBMITTER: Joseph N. Fiorello, Sr., Fiorello Electric Inc.

RECOMMENDATION: Revise the definition as follows:

Fountain. As used in this article, the term includes fountains, ornamental pools, display pools, reflection pools, land aeration fountains used in bodies of water natural, or manmade to prevent stagnation. It does not include drinking fountains.

SUBSTANTIATION: While inspecting a job and failing the job due to noncompliance with the NEC, the contractor stated that the NEC article on fountains did not cover aeration devices. Also that due to the fact of the pond being a natural body of water that the aeration device was not covered by the NEC.

PANEL ACTION: Reject.

PANEL STATEMENT: Inclusion of all bodies of water cannot be accomplished by a simple modification of scope. A detailed analysis and possibly substantial expansion of requirements should be performed to justify such a revision. With further justification, this issue should be addressed in a separate code article or by a different code making panel.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

Submitter's Proposed Section	1999 NEC Section	Action	Statement
1	1	N/A	Note: Hard metric conversions applied throughout, incorporating Proposal 20-29 objectives.
2	4	AIP	Incorporate Style Manual revisions to "Fountain; change "may" to "can" three places in other definitions.
Equip.-Fixed		Accept	
Equip.-Port.		Accept	
Equip.-Sta.		Accept	
Maximum Water Level	N/A	AIP	Inserts new definition accepted by the action on Proposal 20-3.
Through-Wall Light. Assembly	N/A	AIP	Inserts new definition accepted by the action on Proposal 20-35.
Pool		Accept	
3	3	AIP	Insert other articles table per Style Manual provisions.
4	2		
5	5(b)	AIP	Pluralize the description, per Style Manual.
6	24	AIP	Specify Article 250 locations, per Style Manual
6(1)		AIP	Incorporate through-wall lighting assemblies as covered in the action on Proposal 20-91.
6(2)		AIP	Change to: "pool or fountain" from "contained body of water" to avoid implication that a pond is covered within Article 680. See panel statement on Proposal 20-32.
6(3)		AIP	Change to: "pool or fountain". See §680.6(2)
6(7)		AIP	Change to: "pool or fountain". See §680.6(2)
7		Accept	
7(A and B)	7	Accept	
7(C)	25(e)	Accept	
8(A)	8	AIP	(A) Power. With respect to service drop conductors and open overhead wiring, swimming pool and similar installations shall comply with the minimum clearances given in Table 680.8. This avoids the contained body of water problem; see §680.6(2). It also deletes proposed coverage of a roofed structure because as proposed it could allow drop conductors to pass over the pool , even if below the roof. The table and figure has an expanded title per current Style Manual preferences, and the text of the rule now refers to the figure for the same reason. The table has its internal references corrected, and the words "over" and "through" are used because the current format can be interpreted as meaning greater than the entire 15kV to 50kV range.
8(B)	8	AP	Accept only "(B) Communications Systems." See Panel action and statement on Proposal 20-53 for wording and reasoning. Retain, however the word "covered" instead of "complying with" for the reasons given in the substantiation hereto in Proposal 20-31.
8(C)(new)		Accept	Add: "(C) Network-Powered Broadband Communications Systems. The minimum clearances for overhead network-powered broadband communications systems conductors from pools or fountains shall comply with the provisions in Table 680.8 for conductors operating at 0 to 750 volts to ground." This correlates with a proposal to change §830.10(e), which if approved by CMP 16 will defer to Art. 680.
Table 680.8	Table 680.8	AIP	Insert metric columns per Proposal 20-56; revise wording in Row B per Proposal 20-57.
9	9	AIP/AP	Leave the word "pool" in this section. Change last part to: "…the total nameplate rated load." Change "more than" to "over". The first change avoids the contained body of water problem; see §680-6(2). The second and third changes are editorial.
10	10	AIP	Metrication integrated per Proposal 20-58. Title added to table, with text reference, per Style Manual

Submitter's Proposed Section	1999 NEC Section	Action	Statement
11	11	N/A	Editorial change to drainage description.
12	12	AIP	Wording revised to incorporate the action on Proposal 20-62.
20 (new)		Accept	
21(A)	25(c)	Accept	
(1)	25(c)	Accept	
(2)	25(c)	Accept	
(3)	25(c)	Accept	
(4)	25(c)	Accept	
(5)	25(c)	AIP	Change to: "(5) Cord- and Plug-Connections. Pool-associated motors shall be permitted to employ cord- and plug-connections in accordance with Section 680.7." The other part of the submitter's text needlessly recapitulated §680.7.
21(B)	6(d)	Reject	The panel decided to retain GFCI protection, but only on receptacle outlets. This material is covered in Section 680.22(A)(5).
21(C)	28	Accept	This becomes 21(B).
22(A)(1)	6(a)(1)	Accept	
22(A)(2)	6(a)(1)	AIP	"Not less than" per Style Manual
22(A)(3)	6(a)(2)	AIP	Edits per Style Manual
22(A)(4) (new)		Accept	Add new: "(4) Restricted Space. Where a pool is within 3 m (10 ft) of a dwelling and the dimensions of the lot preclude meeting the required clearances, not more than one receptacle outlet shall be permitted if at least 1.5 m (5 ft) measured horizontally from the inside wall of the pool." Responds to Proposal 20-39. Renumber following sections (4) & (5) to (5) & (6).
22(A)(5)	6(a)(3)	AIP	Remove "…or fountain…" This part of the article doesn't cover fountains.
22(A)(5)	6(d)	AIP	Added sentence from originally proposed §680.21(B), reworded to only apply to receptacle outlets. The panel reconsidered the concept of providing GFCI protection for all small motors and decided that there was insufficient substantiation to keep the rule for hard wired motors. The voltage range reflects Section 220-2 circuit (as opposed to device) voltages, and the panel action on Proposal 20-49.
22(A)(6)	6(a)FPN	AIP	Keep "doorway with hinged or sliding door". The panel believes that potentially requiring GFCI on inside receptacles near a sliding door is excessive. Change "is" to "shall be" because this is now a requirement.
22(B)	6(b)		N/C
(1)	6(b)(1)	AIP	Editorially delete "For new installations" and change heading to "(1) New Outdoor Installation Clearances."
(2)	6(b)(2)	AIP	Change (2) to (3). Existing installations follows requirements for indoor clearances.
(3)	6(b)(3)	AIP	Change (3) to (2). Change "at least" to "not less than" per Style Manual
(4)	6(b)(4)	AIP	Change in heading "Contiguous" to "Adjacent".
(5)	6(b)(5)	AIP	Change 680-20 to 680-7. The change in title and the beginning of the text (adding "and plug-") incorporates the panel action on Proposal 20-43.
22(C)	6(c)	AIP	See Panel action on 20-44, incorporated herein.
23	20	Accept	
23(A)(1)	20(a)(1) 1st ¶	Accept	
23(A)(2)	5(a)	AIP	Add ungrounded secondary per Proposal 20-36.
23(A)(3)	20(a)(1) 2nd ¶	Accept	
23(A)(4)	20(a)(2)	Accept	
23(A)(5)	20(a)(3)	AIP	Change "at least" to "not less than" per Style Manual
23(A)(6)	20(a)(4)	Accept	
23(A)(7)	20(a)(5)	Accept	
23(A)(8)	20(a)(1) 3rd ¶	Accept	

Submitter's Proposed Section	1999 NEC Section	Action	Statement
23(B)(1)	20(b)(1) 1st ¶; 20(b)(1) 4th ¶, 1st, 3rd sentences	Accept	
23(B)(2)	20(b)(1) 2nd ¶	Accept	
(a)		Accept	
(b)		AIP	Add "solid or stranded" to incorporate the panel action on Proposal 20-77. Add "equipment grounding" after "insulated copper" in the first sentence, add "equipment" ahead of "grounding conductor" in the second sentence, and add "equipment grounding" after "No. 8" in the third sentence. This uses terms consistently and incorporates the recommendation of Proposal 20-75. The panel notes that on the submitter's relocation chart, Sections 680.23(b)(3)(a-b) should be 680.23(b)(2)(a-b).
23(B)(3)	25(b)(5)	Accept	
23(B)(4)	20(b)(2)	Accept	
23(B)(5)	20(b)(3)	Accept	
23(C)(1)	20(c) 1st ¶	Accept	
23(C)(2)	20(c) 2nd ¶, 4th sentence	Accept	
23(D)	20(d)	AIP	Delete "be" after "A no-niche fixture shall".
23(E)	N/A	N/A	Results from action on Proposal 20-115, editorially corrected to correlate with related material. Based on the limited information provided, the panel assumes this product is comparable to a wet-niche fixture while operating. The submitter is invited to provide additional information during the comment period.
23(E)(1)	25(b)(2-3); 20(c) 2nd ¶, 1st, 2nd, 3rd sentences	AIP	Renumber as -23(F)(1) per action on 20-115
23(E)(1) Exception	25(b)(3) Exception	AIP	Renumber as -23(F)(1) Exception per action on 20-115
23(E)(2)	25(b)(1); 25(b)(4), 3rd sentence	AIP	Renumber as -23(F)(2) per action on 20-115. Incorporate through-wall lighting assemblies as covered in the panel action on Proposal 20-93.
23(E)(2) Ex.	25(b)(3) Ex.	AIP	Renumber as -23(F)(2) Exception per action on 20-115
23(E)(2)(a)	25(b)(4)(a)	AIP	Renumber as -23(F)(2)(a) per action on 20-115
23(E)(2)(b)	25(b)(4)(b)	AIP	Renumber as -23(F)(2)(b) per action on 20-115
23(E)(3)	5(c)	AIP	Renumber as -23(F)(3) per action on 20-115
24(A-E)	21	AIP	Minor edits for Style Manual
24(F)	25(b)(4), 1st, 2nd sentences	Accept	
25	25(d)	Accept	
25(A)		Accept	
25(A) Exception		Accept	
25(B)		Accept	
(1)		Accept	
(2)		Accept	
26	22		
26(A)		Accept	
26(B)		AIP	Deletion of "listed" in Section 680.22(B)(1) reflects action on Proposal 20-82. In Section 680.22(B)(4), add the second paragraph as accepted in the action on Proposal 20-84. Change (B)(5)(b) strikethrough to underline for "(b) Vertical. Within", corrects a typo in the submittal.
26(C)		Accept	Note that "(C) Common Bonding Grid. …" is a level one subsection to 680.26.

Submitter's Proposed Section	1999 NEC Section	Action	Statement
26(D)		Accept	
26(E)	22(c)	Accept	
27(A)	23	AIP	Insert "solid or stranded" to correlate with the panel action on Proposal 20-77 in a directly comparable application. Revise Section 680-27(A)(2) to include LFNC and change "suitable" to "listed" as covered in the action on Proposal 20-89. Add "equipment grounding" after "insulated copper"; add "equipment" prior to "grounding conductor"; add "equipment grounding after "of the No. 8, in 680.27(A)(2). This is for consistent use of terminology. See Panel action on Proposal 20-75.
27(B)	26	Accept	
27(C)	27	Accept	
30 (new)		AIP	Add the heading "General." Sections require titles.
31	30	Accept	
32	31	AIP	Reword the FPN per current style.
33	32	AIP	The Panel notes the last sentence of 680.33(A) to be newly relocated material from 680.32(a)(5). Remove the dash between "shall" and "be". Item (4) shall end with "…150 volts." Delete the comma and the word "and" at the end of item (4). In (B)(4), delete "is", and in (B)(5) change "It complies" to "Compliance" for style considerations on list items.
40 (new)		AIP	Add the heading "General." Sections require titles.
41	38	AIP	Use the phrase "not less than" per current style.
42	40	AIP	(The rewrite proposal already covered the panel action on the first half of Proposal 20-118 and on Proposal 20-119.) The proposed language is further changed by adding Section 680.42(C) as covered in the second half of Proposal 20-118, slightly modified with regard to the equipment grounding conductor to directly correlate with the language in 680.21(A)(4) of the rewrite. The title is more fully descriptive for clarity.
43	41	Accept	The word "Exception:" is new material.
43(A)	41(a)	AIP	Use "not less than", "not exceeding" per current style.
43(A)(4)	41(a)(2)FPN	AIP	Add after "ceiling,": "doorway with hinged or sliding door, window opening,". This is consistent with Panel action on 680.22(A)(5), which will be 680.22(A)(6). Change "is" to "shall be" for style.
43(B)(1)(a)	41(b)	AIP	Change "where" to "If" because it describes a condition of existence not location.
43(B)(2)	41(b)(2)	AIP	Change format of 680.43(B)(1)(1) and (2) to 680.43(B)(1)(a) and (b). Add titles "Without GFCI" to the first, and "With GFCI" to the second. Make the rules complete sentences: "Where no GFCI protection is provided, the mounting height shall be not less than 3.7 m (12 ft)." and, for the second item "Where GFCI protection is provided, the mounting height shall be permitted to be not less than 2.3 m (7 ft 6 in.)." Change 680.43(B)(2) in the proposal to 680.43(B)(1)(c) and rewrite as follows: "(c) Below 2.3 m (7 ft 6 in.). Lighting fixtures meeting the requirements of (1) or (2) and protected by a GFCI shall be permitted to be installed less than 2.3 m (7 ft 6 in.) over a spa or hot tub. (1) Recessed fixtures with a glass or plastic lens and nonmetallic or electrically isolated metal trim, and suitable for use in damp locations. (2) Surface-mounted fixtures with a glass or plastic globe, a nonmetallic body or a metallic body isolated from contact, and suitable for use in damp locations."
43(B)(3)		Accept	Item (3) in the proposal, covering "Underwater Applications, will now be 680.43(B)(2). This change and the one preceding it are editorial, addressing Style Manual rules about third level entries and list entries.
43(C)	41(c)	AIP	Use "not less than" per current Style Manual
43(D)	41(d)	AIP	Use "that are" consistently to maintain parallel construction on the list; reword (5) for style and proper grammar in a list

Submitter's Proposed Section	1999 NEC Section	Action	Statement
Between 43(F) and (G)	41(g) & (h)	Accept	Removed parts (g) and (h) from old 680-41(g) and (h).
43(G)	41(i)	Accept	
44	42	AIP	Change "where" to "if" in (A) and (B) (three places) because it is a condition of existence and not place.
44(A)	42 Exception	Accept	
44(B)		Accept	
44(C)	42	Accept	
44(D)	42	Accept	
44 FPN	42 FPN	AIP	Change reference to Section 680.2.
50	50	AIP	Specify applicable parts of Art. 422 per Style Manual
51	51	AIP	Section 680.51(A) reworded as covered in the panel action on Proposal 20-125. Section 680.51(C) changed from "approved" to "listed" as covered in the action on Proposal 20-126.
52(B)	52	AIP	At end of last sentence, delete the word "following", and remove colon and add "of (1) and (2) at the end." In (1) and (2), leave only the title, and restate the numbered paragraphs as rules instead of a list format, at the suggestion of the staff editor. This structure better complies with the Style Manual.
55(A)	55	AIP	Change to: "(A) Applied Provisions. The provisions of ~~680-25~~ 680-21(A), 680-23(B)(3), 680-23(E)(1-2), 680-24(F), and 680-25 shall apply." Editorial change to reduce the verbage.
56(B)	56(b)	AIP	Reworded to incorporate the panel action on the Panel proposal associated with Proposal 20-129.
57	57	AIP	Reworded to incorporate the concept of the panel action on Proposal 20-130. This wording supersedes the action on that proposal.
60	60	AIP	Reference to Article 517 changed from 3 to 2 to reflect likely reorganization of that article relative to mandatory Style Manual rule about definition locations. Statement made a fine print note because it is merely explanatory in nature. Applicable parts of Art. 422 specified per Style Manual requirements.
62(A)	62	Accept	
62(A)(1)		Accept	
62(A)(2)		Accept	
62(A)(3)		Accept	
62(B)(5)	62(c)(5)	AIP	Revised to better accommodate the status as a list item.
62(C) – (F)		AIP	Change items (d) to (C), (e) to (D), (g) to (E), and (h) to (F). Corrects numbering error in the submittal.
62(C)	62(d)	AIP	Reworded to incorporate the panel action on Proposal 20-132
70 (new)		Accept	
71	70	Accept	
72	71	Accept	
	72 (deleted)	Reject	Make as Section 680.73. The panel is concerned as to how accessible and well understood the rules are in Section 110-26 regarding access.
73	73	AIP	Change to Section 680.74.

(Log #4078)

20- 35 - (680-4-Through Wall Lighting Assembly (New)): Accept in Principle in Part

Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-2 of the rewrite of Article 680 in Proposal 20-30a.

SUBMITTER: Gary Burkitt, PacFab, Inc.

RECOMMENDATION: New definition under heading.

Through Wall Lighting Assembly. A lighting assembly intended for installation above grade, on or through the wall of a pool, consisting of two interconnected groups of components separated by the pool wall. The design of the components outside of the pool wall addresses hazards related to these components being exposed above grade.

SUBSTANTIATION: This type of lighting assembly is currently being produced and installed without the benefit of a definition in Article 680.

This proposal is intended to provide Article 680 wording that would allow changes to be made to UL Standard 676 addressing the testing and listing of products conforming to these requirements.

PANEL ACTION: Accept in Principle in Part.

Accept as written, but without the last sentence. The definition will read:

"Through-Wall Lighting Assembly. A lighting assembly intended for installation above grade, on or through the wall of a pool, consisting of two interconnected groups of components separated by the pool wall."

PANEL STATEMENT: The last sentence of the suggested definition is not relevant.

(Log #984)

20- 36 - (680-5(a)): Accept

Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-23(A)(2) of the rewrite of Article 680 in Proposal 20-30a.

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise second sentence:

The transformer shall be an isolated winding type with an ungrounded secondary and having a grounded metal barrier between the primary and secondary windings.

SUBSTANTIATION: Editorial. "Isolated" while perceived to mean ungrounded also, does not specifically require "ungrounded". Many isolated winding types are grounded (See Section 250-26). Section 517-64(b) indicates an isolating transformer means not an autotransformer. Sections 668-20(b) and 668-21(a) specify an ungrounded secondary which clearly conveys what is required.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ryan

(Log #3850)

20- 37 - (680-6): Accept in Principle

SUBMITTER: J. Philip Simmons, Simmons Electrical Services

RECOMMENDATION: Revise existing Section 680-6 and create additional sections as follows:

680-6. Receptacle~~, Lighting Fixtures, Lighting Outlets, Switching Devices, and Ceiling Suspended (Paddle) Fans~~

(a) General. ~~Other~~ Unless otherwise provided in (b), receptacles on the property shall be located at least 10 ft (3.05 m) from the inside walls of a pool or fountain.

(b) Receptacles for Water-Pump Motor. 1. A receptacle(s) that provides power for a water-pump motor(s) for, or other loads directly related to the circulation and sanitation system, a permanently installed pool or fountain, as permitted in Section 680-7, shall be permitted between 5 ft and 10 ft (1.52 m and 3.05 m) from the inside walls of the pool or fountain, and, where so located, shall be single and of the locking and grounding types and shall be protected by a ground-fault circuit interrupter(s).

~~Other receptacles on the property shall be located at least 10 ft (3.05 m) from the inside walls of a pool or fountain.~~

(c) Receptacle Required ~~2.~~ Where a permanently installed pool is installed at a dwelling unit(s), at least one 125-volt 15- or 20-ampere receptacle on a general-purpose branch circuit shall be located a minimum of 10 ft (3.05 m) from and not more than 20 ft (6.08 m) from the inside wall of the pool. This receptacle shall be located not more than 6 ft 6 in. (1.98 m) above the floor, platform, or grade level serving the pool.

(d) Ground-Fault Circuit-Interrupter Protection. ~~3.~~ All 125-volt receptacles located within 20 ft (6.08 m) of the inside walls of a pool or fountain shall be protected by a ground-fault circuit interrupter.

FPN: In determining the above dimensions, the distance to be measured is the shortest path the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening, or other effective permanent barrier.

680-7. ~~(b)~~ Lighting Fixtures, Lighting Outlets, and Ceiling-Suspended (Paddle) Fans.

(a). General. ~~In outdoor pool areas~~, Lighting fixtures, lighting outlets, and ceiling-suspended (paddle) fans shall not be installed over the pool or over the area extending 5 ft (1.52 m) horizontally from the inside walls of a pool unless no part of the lighting fixture or ceiling-suspended (paddle) fan is less than 12 ft (3.66 m) above the maximum water level.

~~(d).~~ Lighting fixtures and lighting outlets installed in the area extending between 5 ft (1.52 m) and 10 ft (3.05 m) horizontally from the inside walls of a pool shall be protected by a ground-fault circuit interrupter unless installed 5 ft (1.52 m) above the maximum water level and rigidly attached to the structure adjacent to or enclosing the pool.

(b) Outdoor Areas. In outdoor pool areas, existing lighting fixtures and lighting outlets located less than 5 ft (1.52 m) measured horizontally from the inside walls of a pool shall be at least 5 ft (1.52 m) above the surface of the maximum water level, shall be rigidly attached to the existing structure, and shall be protected by a ground-fault circuit interrupter.

(c). Indoor Areas. In indoor pool areas, the limitations of Section 680-7(a) shall not apply if all of the following conditions are complied with

1. Fixtures are of a totally enclosed type,

2. A ground-fault circuit interrupter is installed in the branch circuit supplying the fixture(s) or ceiling-suspended (paddle) fans, and

3. The distance from the bottom of the fixture or ceiling-suspended (paddle) fan to the maximum water level is not less than 7 ft 6 in. (2.29 m).

~~(d). Lighting fixtures and lighting outlets installed in the area extending between 5 ft (1.52 m) and 10 ft (3.05 m) horizontally from the inside walls of a pool shall be protected by a ground-fault circuit interrupter unless installed 5 ft (1.52 m) above the maximum water level and rigidly attached to the structure adjacent to or enclosing the pool.~~

(d) ~~(c)~~ Cord-Connected Fixtures. Cord-connected lighting fixtures shall meet the same specifications as other cord- and plug-connected equipment as set forth in Section 680-7 where installed within 16 ft (4.88 m) of any point on the water surface, measured radially.

680-8 ~~(c)~~ Switching Devices. Switching devices on the property shall be located at least 5 ft (1.52 m) horizontally from the inside walls of a pool unless separated from the pool by a solid fence, wall, or other permanent barrier.

680-9 ~~(d)~~ Motors in Other than Dwelling Units. Wiring supplying pool pump motors rated 15 and 20 amperes, 125 volt or 240 volt, single phase, whether by receptacle or direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.

Renumber following sections.

SUBSTANTIATION: This proposal does not intend to make any substantive changes to this section but is intended to be editorial in nature.

The present section combines too many requirements in one section and is confusing to read. Providing a general section for lighting fixtures and grouping similar requirements should make the section more user-friendly.

PANEL ACTION: Accept in Principle.

See Proposal 20-30a.

PANEL STATEMENT: Proposal 20-30a addresses the submitter's concerns.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

(Log #2093)

20- 38 - (680-6(a)(1)): Accept
Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-22(A)(1) of the rewrite of Article 680 in Proposal 20-30a.
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Delete "for" from the second sentence:
Create a new sentence by breaking the first sentence into two.
Will now read as follows:
(a) Receptacles.
1. A receptacle(s) that provides power for a water-pump motor(s) for, or other loads directly related to the circulation and sanitation system, a permanently installed pool or fountain, as permitted in Section 680-7, shall be permitted between 5 ft and 10 ft (1.52 m and 3.05 m) from the inside walls of the pool or fountain.
This receptacle(s) where so located, shall be single and of the locking and grounding types and shall be protected by a ground-fault circuit interrupter(s).
Other receptacles on the property shall be located at least 10 ft (3.05 m) from the inside walls of a pool or fountain.
SUBSTANTIATION: This will help in the user better understand the code requirements.
There was no technical change.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

(Log #4303)

20- 39 - (680-6(a)(1), Exception (New)): Accept in Principle in Part
Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-22(A)(4) of the rewrite of Article 680 in Proposal 20-30a.
SUBMITTER: Glenn Soles, Clark County Building Dept./Rep. So. Nevada Electrical Code Committee
RECOMMENDATION: Add the following exception:
Exception: Where the authority having jurisdiction approves a pool or fountain on a residential lot the pool or fountain is within 10 in. of the dwelling, the existing receptacle outlet/s required by Section 210-52(e), shall be allowed to remain if they are at least 5 ft from the inside wall of the pool or fountain.
SUBSTANTIATION: Section 210-52(e) requires at least one receptacle outlet accessible at grade level at the front and back of the dwelling. Section 210-8(a)(3) requires those outlets to be GFCI protected. When the authority having jurisdiction approves a pool or fountain for a dwelling on a small lot, often this pool or fountain consumes this entire area. The pool or fountain could be designed in conjunction with the dwelling to come up to the outer wall of the dwelling. By removing the existing outlet a more hazardous situation has been created. the homeowner will plug their TV/Radio into the closest outlet they can find. This is often inside the rear door or slider in the living room, family room, dining room or a bedroom. Three problems are created b y this scenario:
1/ These outlets are not GFCI protected.
2/ The cords are routed through doorways or windows creating tripping hazards and subjecting these cords to physical damage.
3/ Due to this physical damage exposed bare conductors may be present to create more of a potential shock hazard.
PANEL ACTION: Accept in Principle in Part.
Revise 680-6(a) by adding a new item (3) to read:
"Where a pool or fountain is within 3m (10 ft) of a dwelling and the required clearances in (1) and (2) above cannot be met, one receptacle outlet shall be permitted if at least 1.5m (5 ft), measured horizontally, from the inside wall of the pool or fountain."
Renumber existing (3) to (4).
PANEL STATEMENT: The panel agrees that such situations exist and agrees with the necessity of this new requirement. In order to more clearly accomplish the objective of the submitter, the panel has revised the proposed exception as a positive requirement, has included a necessary reference to 680-6(a)(1) and has clarified the intent.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

(Log #2481)

20- 40 - (680-6(a)(2)): Accept in Principle
SUBMITTER: Ronald M. DeGesero, Bldg Dept., City of Coral Springs, FL
RECOMMENDATION: Revise as follows:
In severe distance restrictions the authority having jurisdiction will allow the distance to be between 5 ft to 10 ft.
SUBSTANTIATION: Across the nation including the southern states, smaller building lots and zero lot restrictions in many communities force pools and hot tubs to be nested closer to buildings and with patios or decks being screened. The distance restriction should be eased. Many small appliances or devices are built with shorter cords and with ground-fault circuit protection Section 680-6(a)(2) already in tact nothing will be jeopardized.
PANEL ACTION: Accept in Principle.
See Proposal 20-39.
PANEL STATEMENT: The action on Proposal 20-39 addresses the concern of the submitter.

(Log #1799)

20- 42 - (680-6(b)(4)): Accept
Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-22(B)(4) of the rewrite of Article 680 in Proposal 20-30a.
SUBMITTER: Noel Williams, Noel Williams Consulting
RECOMMENDATION: Add the words "at least" before the second instance of "5 ft."
SUBSTANTIATION: The literal requirement as written requires that the fixture be 5 ft above the water rather than at least 5 ft. While this should be obvious, it is different than the language of 680-6(b)(2) and 680-6(c) which may mislead users into thinking the requirements are different.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

(Log #985)

20- 43 - (680-6(b)(5), (d)): Accept in Part

Note: It is the understanding of the Technical Correlating Committee that the rejected portion of the Proposal was addressed in the Substantiaton of Proposal 20-31. The Panel Action is covered by 680-22(B)(5) of the rewrite of Article 680 in Proposal 20-30a.

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

(b)(5) Cord and plug-connected lighting fixtures shall meet the same specifications as set forth in Section 680-7 where installed within 16 ft (4.88 m) of any point on the water surface, measured radially.

(d) Motors ~~in Other than Dwelling Units.~~ ~~Wiring~~ Branch circuits supplying pool pump motors ~~rated 15 and 20 amperes, 125 volts or 240 volts, single phase, whether by receptacles or direct connection~~ from a grounded ac system shall be provided with ground-fault circuit-interruptor protection for personnel. Except as required in (a)(1) above this requirement shall not apply where the pool is located on the premises of a one family dwelling.

SUBSTANTIATION: The reference to Section 680-7 in (b)(5) covers cord and plug connected equipment while this section refers to Cord-connected fixtures which includes those of Section 410-30(b). The present wording applies the No. 12 EGC and attachment plug requirements to such fixtures.

The present syntax of (d) is awkward and confusing. It indicates the motors are rated 15- or 20-amperes, 125-or 240-volts single phase, not the circuits. The code uses nominal 120-volts for circuits and usually differentiates connections as cord-and plug or permanent. The reference to manner of connection is irrelevant to the requirement since it applies to either type of connection. Branch circuit should be specified as services and feeders are also wiring supplying the pump motor. Present wording applies to a 240-volt single-phase motor supplied from a 240-volt 3-phase 3-wire ungrounded system where the normal GFCI won't function and is limited by listing to grounded systems. Pool pumps in other than dwelling units may be supplied by grounded 3-phase systems. What is the rationale for limiting requirements to certain ampere and voltage ratings? If GFCI devices are not readily available for 480-volt grounded systems other circuits could be provided.

The proposed last sentence for (d) specifies one-family dwellings since "other dwelling units" in the heading may include multifamily dwellings, some hotels and motels, etc., which does not appear to be the intent.

This section, dealing with motors and GFCI protection is more appropriate for Section 680-5, or following Section 680-25(c), since the heading for this section doesn't include either item.

PANEL ACTION: Accept in Part.

Accept only the addition of "and Plug-" and reject the rest of the proposal.

PANEL STATEMENT: The panel agrees with the proposal only with respect to the addition of the words "and Plug-". The rejected portion of this proposal will be addressed in Proposal 20-30a.

20- 44 - (680-6(c)): Accept in Principle

Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-22(C) of the rewrite of Article 680 in Proposal 20-30a.

SUBMITTER: Gary A. Boughton, Town of Ridgefield, CT

RECOMMENDATION: In last sentence, change period to comma and add the following:

or the switch conforms to Section 9.7 of UL-1563 Standard and is listed for use within 5 feet [July 19, 1996 fourth edition.]

SUBSTANTIATION: Several companies makes switches that are tested to 9.7 of UL 1563 Standard and are listed for this use (Jandy, Compoo, and others I presume). The electrical code does not allow for their use. If the product has been tested as safe and listed it should be able to be used. I would also mention that the instructions for their installation should be looked at also. Some instructions allow the unit to be in the water submerged other subsections say that the water test is only a splash test. There is a problem with the installation of the switch if it is allowed to be submerged, as the conduit can bring water to the control panel.

PANEL ACTION: Accept in Principle.

Add a second sentence to 680-6(c) to read: "Alternatively, a switch that is listed as being acceptable for use within 1.5m (5 ft) shall be permitted."

PANEL STATEMENT: The Panel's rewrite of the submitter's proposal is to clarify the intent.

(Log #3226)

20- 45 - (680-6(c) Exception No. 1 (New)): Accept in Principle

SUBMITTER: Kevin Worswick, Teledyne Laars Jundy Products

RECOMMENDATION: Add an exception to read as follows:

Exception No. 1: Listed switching devices 15 volts or less specific to pool/spa applications may be accessible to occupants in circulating water.

SUBSTANTIATION: Many inspectors do not allow listed (UL 1563) switching devices within five feet of a permanent pool/spa. Portable spas already incorporate switching devices accessible to occupants. This would make an exception to allow listed devices to be used with permanent pool/spa installations.

PANEL ACTION: Accept in Principle.

See Proposal 20-44.

PANEL STATEMENT: The action on Proposal 20-44 addresses this issue.

(Log #1764)

20- 46 - (680-6(d)): Accept in Principle

Note: It is the understanding of the Technical Correlating Committee that the Proposal was addressed in the Substantiaton of Proposal 20-31.

SUBMITTER: Andrew T. Crescuillo, Rep. Genesee Chapter IAEI

RECOMMENDATION: Revise as follows:

(d) Motors in Other Than Dwelling Units. ~~Wiring~~ Branch-Circuits supplying pool pump motors rated 15 and 20 amperes, 125 volts or 250 volts, single phase, whether by receptacle or direct connection, shall be provided with ground-fault circuit interrupter protection for personnel.

SUBSTANTIATION: So as to only require ground fault protection for the branch-circuit not for the feeder or the service.

PANEL ACTION: Accept in Principle.

See Proposal 20-30a.

PANEL STATEMENT: This issue is being addressed by Proposal 20-30a.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ryan

(Log #2094)

20- 47 - (680-6(d)): Accept in Principle

SUBMITTER: Joel A. Rencsok, Scottsdale, AZ

RECOMMENDATION: Delete this section from 680-6 .

(d) Motors in Other than Dwelling Units. Wiring supplying pool pump motors rated 15 and 20 amperes, 125 volt or 240 volt, single phase, whether by receptacle or direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.

SUBSTANTIATION: This Section does not belong here.

See 680-6 Title.

Motors are not included here.

Also does not require GFCI's on motors installed for pools located for dwelling units. Why

It does not seem that motor installations around dwelling units are more safe.

Other than dwelling units imply that pools are more unsafe in this environment. Untrue statement.

A pool is a pool wherever it is located.

All rules must apply to all pool installations unless this code panel distinguishes the differences.

PANEL ACTION: Accept in Principle.

See Proposal 20-30a.

PANEL STATEMENT: The proposal here is to delete 680-6(d), but the editorial rewrite in Proposal CP2001 deletes the section, but incorporates the concept.

NOT RETURNED: 1 Ryan

(Log #2451)

20- 48 - (680-6(d)):

Note: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" to correlate with the action on Proposal 20-31.

SUBMITTER: John A. Hoffman, Centre Region Code Admin.

RECOMMENDATION: Revise to read as follows:

(d) Motors in other than dwelling units. Branch circuit wiring supplying pool pump motors rated 15 and 20 amperes, 125 volt or 240 volt, single phase, whether by receptacle or direct connection, shall be provided with a ground fault circuit interrupter type breaker for protection of personnel.

SUBSTANTIATION: This change clarifies use of mandated GFCI protection and eliminates use of GFCI receptacles and dead front GFCI protectors in other than dwelling units.

PANEL ACTION: Accept in Principle.

See Proposal 20-30a.

PANEL STATEMENT: This issue is being addressed by Proposal 20-30a.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ryan

(Log #3643)

20- 49 - (680-6(d)): Accept in Principle

SUBMITTER: Timothy D. Curry, Curry Electric, Inc.

RECOMMENDATION: Revise text to read as follows:

"Wiring supplying motors, rated 15 and 20 amperes, 125 volts ~~or~~ to 240 volts, single phase...".

SUBSTANTIATION: This section deals with "other than dwelling units", i.e., public buildings, and hotels, etc. A very common voltage for these types of buildings is 208/120 volts, 3 phase, 4 wire. With the present wording, a single phase, 208 volt motor does not need to be GFCI protected. I believe that this very important safeguard should not be allowed to slip through a loop hole.

PANEL ACTION: Accept in Principle.

See Proposal 20-30a.

PANEL STATEMENT: The concept is being retained in the rewrite of Proposal 20-30a, but the lower end of the range of applicable voltages has been changed from 125 to 120. The word "or" after 120-volts has been changed to the word "to", as suggested by the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ryan

(Log #3797)

20- 50 - (680-6(d)): Accept in Principle

Note: The Technical Correlating Committee directs the Panel to clarify the Panel Action and Statement on this Proposal, specific to the proposed addition of "One and Two Family" to the section title. It is not clear where this action is covered by the rewrite of Article 680 in Proposal 20-30a. This action will be considered by the Panel as a Public Comment.

SUBMITTER: John I. Williamson, Minnesota Board of Electricity

RECOMMENDATION: Modify the wording in this section as follows:

"Motors in Other than One- and Two-Family Dwelling Units. Wiring supplying pool pump motors rated 15 and 20 amperes, 125 volt or 240 volt, single phase, whether by receptacle or direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel."

SUBSTANTIATION: Based on the substantiation in Proposal 20-96 in the NFPA 70 A98 ROP, apartment complexes were listed along with other occupancies that constitute increased risks to life safety in and around pools. The title of this section has been changed to be clear that this section does not apply to one- and two-family dwellings, but in fact, it does apply to multifamily dwellings.

PANEL ACTION: Accept in Principle.

See Proposal 20-30a.

PANEL STATEMENT: The panel agrees with the concept set forth by the submitter and it has been incorporated into the editorial rewrite of Article 680 in Proposal 20-30a.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ryan

(Log #986)

20- 51 - (680-7, FPN No. 2 (New)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Add a fine print note to read as follows:

FPN No. 2: See Section 680-20 for flexible cords for underwater pool lighting fixtures and Section 680-56 for flexible cords in fountains.

SUBSTANTIATION: Editorial. To provide correlation with the referenced sections which have equal rank, and remove a literal conflict. Section 680-50 indirectly requires fountains with water common to a pool to comply with this section. Referencing cords in fountains allows this section to apply to cords with attachment plugs as permitted by Section 680-56(d), if that is the intent.

PANEL ACTION: Reject.

PANEL STATEMENT: Proliferation of fine print notes that cross reference other sections of the same article is redundant. The specific requirements modify the general requirements.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ryan

(Log #1800)

20- 52 - (680-8): Accept in Principle

SUBMITTER: Noel Williams, Noel Williams Consulting

RECOMMENDATION: Revise as follows:

"Except where installations provide the clearances in Table 680-8, the following part of pools shall not be placed under existing service-drop conductors or any other open overhead wiring; nor shall such wiring be installed above the following:

(1) Pools and the area extending 10 ft (3.05 m) horizontally from the inside of the walls of the pool,

(2) Diving structure, or

(3) Observation stands, towers, or platforms."

SUBSTANTIATION: As currently written, the clearances in Table 680-8 do not apply as shown in Figure 680-8, because the clearances only apply to (3) in the list. Although Figure 680-8 applies the clearance dimensions to areas above or near a pool, the text of the rule prohibits the installation of conductors above the pool, the diving structure, or the area within 10 feet of the pool. The apparent intent of the rule, given Table 680-8 and Figure 680-8, is that overhead conductors be allowed in the area outside/above the dotted line in the diagram. However, in the current rule, the conductors are permitted only above observation stands, towers, or platforms, and would be prohibited at any height above most of the area designated by the dotted line.

If the panel intent is as written, the Figure should be revised to reflect the rule as written.

PANEL ACTION: Accept in Principle.

See Proposal 20-30a.

PANEL STATEMENT: The panel agrees with the concept suggested by the submitter and it has been incorporated into the editorial rewrite of Article 680 in Proposal 20-30a.

(Log #3125)

20- 53 - (680-8): Accept in Principle
SUBMITTER: Neil F. LaBrake, Jr., Niagara Mohawk Power Corp.
RECOMMENDATION: Change second paragraph that follows Figure 680-8 as follows:
Communication, radio and television ~~Community antenna system coaxial~~ cables complying with Articles 800 through 820 and the supporting messengers shall be permitted at a height of not less than 10 ft (3.05 m) above swimming and wading pools, diving structures, and observation stands, towers, or platforms.
~~FPN: See Sections 225-18 and 225-19 for clearances for conductors not covered by this section.~~
SUBSTANTIATION: The proposed revision recognizes those cable types which are ~~not~~ utility-owned that were intended to be covered by the NEC as in the 1996 edition of the Code. Also, this proposed revision to delete the Fine Print Note (FPN) after the second paragraph maintains the original CMP 20 intent during the 1999 NEC cycle's comment period as the references are not related to pools. Refer to NFPA 70 A98 ROC items 20-99 and 20-100.
PANEL ACTION: Accept in Principle.
See Proposal 20-30a.
PANEL STATEMENT: The panel agrees with the concept suggested by the submitter and it has been incorporated into the editorial rewrite of Article 680 in Proposal 20-30a. However, the words "complying with" have been changed to "covered by" to comply with the NEC Style Manual.

(Log #4109)

20- 54 - (680-8): Accept in Principle
SUBMITTER: Robert E. Molde, Northern States Power Co./Rep. Wisconsin Utilities Assn.
RECOMMENDATION: Revise as follows:
B Clearance in any direction to the diving platform, observation stand or tower.
SUBSTANTIATION: The diagram clearly states that clearance "B" applies to the observation stand. To promote consistency and lessen confusion, this change should be made.
PANEL ACTION: Accept in Principle.
See Proposal 20-57.
PANEL STATEMENT: Proposal 20-57 addresses the concerns of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

(Log #4374)

20- 55 - (680-8): Reject
SUBMITTER: Joseph A. Hertel, Safety and Buildings Div., State of Wisconsin
RECOMMENDATION: Add a column to Table 680-8. Clearances to include:
Insulated communication conductors and cables.
Clearance
A. 6.7 m (22 ft)
B. 4.3 m (14 ft)
SUBSTANTIATION: Table 680-8 is extracted in part, from the National Electrical Safety Code (NESC) and while it prevents service or supply conductors from being installed above swimming pools it does not limit communication conductors with the exception of community antenna coaxial systems. By including the NESC table in its entirety it would restrict the installation of all types of conductors above or in proximity to a swimming pool. Addressing only service or supply conductors generates a degree of confusion and communication conductors can operate at voltages that may be lethal when experienced in a swimming pool.
PANEL ACTION: Reject.
PANEL STATEMENT: This is covered in the paragraph under Figure 680-8. The panel is reluctant to change the table.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

Table 680-8. Clearances

		Insulated Supply or Service Drop Cables, 0-750 Volts to Ground, Supported on and Cabled Together with an Effectively Grounded Bare Messenger or Effectively Grounded Neutral Conductor		All other supply or Service-Drop conductors Voltage to Ground			
				0-15 kV		Greater than 15-50 kV	
		m	ft	m	ft	m	ft
A	Clearance in any direction to the water level, edge of water surface, base of diving platform, or permanently anchored raft.	6.7	22	7.5	25	8.0	27
B	Clearance in any direction to the diving platform or tower	4.3	14	5.2	17	5.5	18
C	Horizontal limit of clearance measured from inside wall of the pool	This limit shall extend to the outer edge of the structures listed in (1) and (2) above but not less than 3.0 m (10 ft)					

(Log #3126)

20- 57 - (Table 680-8): Accept

Note: Table 680-8 It is the understanding of the Technical Correlating Committee that the Panel Action is covered by Table 680-8 of the rewrite of Article 680 in Proposal 20-30a.

SUBMITTER: Neil F. LaBrake, Jr., Niagara Mohawk Power Corp.

RECOMMENDATION: Change item B in Table 680-8 as follows:

Table 680-8. Clearances

		Insulated Supply or Service Drop Cables, 0-750 Volts to Ground, Supported on and Cabled Together with an Effectively Grounded Bare Messenger or Effectively Grounded Neutral Conductor	All Other Supply or Service-Drop Conductors Voltage to Ground	
			0-15 kV	Greater than 15-50 kV
A	Clearance in any direction to the water level, edge of water surface, base of diving platform, or permanently anchored raft	22 ft (6.7 m)	25 ft (7.62 m)	27 ft (8.23 m)
B	Clearance in any direction to the observation stand, tower, or diving platform ~~or tower~~	14 ft (4.27 m)	17 ft (5.2 m)	18 ft (5.49 m)
C	Horizontal limit of clearance measured from inside wall of the pool	This limit shall extend to the outer edge of the structures listed in (1) and (2) but not less than 10 ft (3.05 m)		

SUBSTANTIATION: This change relates to the diagram in Figure 680-8 that clearly states clearance "B" applies to the observation stand. Also, this provides added clarity in the Code.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

NOT RETURNED: 1 Ryan

(Log #530)

20- 58 - (680-10): Accept

Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-10 of the rewrite of Article 680 in Proposal 20-30a.

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: In Section 680-10, replace "5 ft (1.52 m)" with "1.5 m (5 ft)" throughout and change Wiring Method table as follows:

	Minimum Burial	
Wiring Method	**mm**	**in.**
Rigid metal conduit	150	6
Intermediate metal conduit	150	6
Nonmetallic raceways listed for direct burial without concrete encasement	450	18
Other approved raceways*	450	18

~~For SI units: 1 in = 25.4 mm.~~

*Note: Raceways approved for burial only where concrete-encased shall require a concrete envelope not less than 50 mm(2 in.) (~~50.8 mm~~)thick

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ryan

(Log #987)

20- 59 - (680-10): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise second sentence to read as follows:

Where space limitations prevent wiring from being routed 5 ft (1.52 m) or more from the pool such wiring shall be permitted where installed in rigid metal conduit or intermediate metal conduit bonded to a common bonding grid as covered in Section 680-22(b), or a nonmetallic raceway system.

SUBSTANTIATION: Such conduits may not be associated with the pool and thus are not covered by Section 680-22(a)(4) or (a)(5) since earth cover is a barrier. A metal service raceway with a low level ground fault could result in stray currents. Since this is a relaxation of the basic requirement, bonding may be warranted as it is for wiring that does supply pool equipment.

PANEL ACTION: Reject.

PANEL STATEMENT: The code now requires that conduit to be bonded. The panel does not consider earth to be a barrier.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ryan

(Log #2444)

20- 60 - (680-10): Reject

SUBMITTER: Michael J. Timpanaro, Silver Springs, FL

RECOMMENDATION: Revise text to read:

"Suitable for the location. The minimum burial depth for all underground wiring shall be as follows."

SUBSTANTIATION: The same hazards exist with wiring for pool equipment as with nonpool circuit wiring within the 5 ft zone. For example a 120 volt, GFCI protected circuit, for a wet-niche fixture installed within the 5 ft zone is the same as a 120 volt GFCI protected circuit for nonpool equipment or devices. All wiring within he 5 ft zone shall be installed at the same burial depth as in Table 680-10.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel does not believe adding these words will enhance the level of safety. Additional supporting information is needed.

(Log #CP2002)

20- 62a - (680-12): Accept
Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-12 of the rewrite of Article 680 in Proposal 20-30a.
SUBMITTER: CMP 20
RECOMMENDATION: Revise 680-12 to read:
"Maintenance Disconnecting Means. One or more disconnecting means from all ungrounded conductors shall be provided for all utilization equipment other than lighting. Each means shall be accessible and within sight from its equipment."
SUBSTANTIATION: The panel agrees that the original text did not clearly communicate the intent of the panel when it was originally added in 1996. This rewrite accomplishes the clarifications recommended in Proposals 20-62 and 20-69, and also incorporates the accepted elements of Proposals 20-64, 20-65, 20-67, and 20-68. None of the proposals offered technical justification. The panel has accepted only those recommended changes that relate to clarification of intent or improvement of style.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

(Log #2088)

20- 63 - (680-12): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Revise the text so that clarity of requirement applies:
Section 680-12 reads as follows:
680-12. Disconnecting Means. A disconnecting means shall be provided and be accessible, located within sight from all pools, spas, and hot tub equipment, and shall be located at least 5 ft (1.52 m) from the inside walls of the pool, spa, or hot tub.
Revise to read as follows:
680-12. Disconnecting Means. A disconnecting means for all pools, spas, and hot tub equipment shall be provided and be accessible. The disconnecting means shall be located within sight from all pools, spas, and hot tub equipment. Where the disconnecting means is located adjacent to the pool, spa, or hot tub the disconnecting means shall be located at least 5 ft (1.52 m) from the inside walls of the pool, spa, or hot tub.
SUBSTANTIATION: This section is unclear as to how many disconnects are required around a pool or equipment room.
If the disconnect is located remote of the pool or hot tub or spa another disconnect would be required with the area adjacent to the pool etc.
Section 680-38 now requires an emergency disconnect accessible to the user in occupancies other than a single family dwelling.
Why not dwellings?
Why not pools in all occupancies ?
Since the emergency disconnect is not required than Section 680-12 should be and is creating an emergency disconnect by the way it is presently worded.
This was not the original intent of Section 680-12.
I hope the Panel can clear this up.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed wording offers no effective change. The substantiation seems to indicate a desire to edit 680-38. See Proposal 20-62a for changes made which might satisfy the submitter's concern.

EXPLANATION OF NEGATIVE:
EGAN: Panel action on January 18, 2000 was unanimous vote on a motion to reject. Letter ballot indicates a panel action of APR which is contrary to the vote taken.

(Log #3127)

20- 65 - (680-12): Accept in Part
Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-12 of the rewrite of Article 680 in Proposal 20-30a.
SUBMITTER: Neil F. LaBrake, Jr., Niagara Mohawk Power Corp.
RECOMMENDATION: Change:
680-12. Disconnecting Means. An accessible single means for disconnecting ~~means~~ all ungrounded power conductors ~~shall be provided and be accessible, located within sight from~~ to all pools, spas, and hot tub equipment, shall be provided and located within

sight, ~~and shall be located~~ at least 5 ft (1.52 m) from the inside walls of the pool, spa, or hot tub.
SUBSTANTIATION: This change is necessary to clarify the reason for the disconnecting means to pools, spas, and hot tub equipment. Also, this improves the user-friendliness of the Code.
PANEL ACTION: Accept in Part.
Accept only the language "all ungrounded conductors"; reject all else. This is incorporated into Proposal 20-62a.
PANEL STATEMENT: A single disconnect is not intended and a disconnect for users is not intended.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

(Log #3805)

20- 66 - (680-12): Reject
SUBMITTER: Ronald Robinson, City of East Orange, NJ
RECOMMENDATION: Revise as follows:
Disconnecting means shall be accessible, located within sight from pools, spas, or hot tubs equipment, and shall be located at least 5 ft horizontally from inside wall of pools, spas, or hot tubs.
SUBSTANTIATION: The wording needs to reflect that the disconnecting means is for related equipment for pools, spas, and hot tubs.
PANEL ACTION: Reject.
PANEL STATEMENT: This would eliminate the requirement for the disconnect. See Proposal 20-62a for changes made which might satisfy the submitter's concern.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

(Log #3877)

20- 67 - (680-12): Accept in Part
Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-12 of the rewrite of Article 680 in Proposal 20-30a.
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Delete Section 680-12.
SUBSTANTIATION: It appears this section is not needed as Section 680-3(a) requires "Except as modified by this section, wiring and equipment in or adjacent (to) pools and fountains shall comply with the applicable requirements of Chapters 1 through 4." As a result, rules for disconnecting means for motors and other equipment is adequately provided for in other parts of Chapters 1 through 4. It is not clear in the existing section what other equipment is special or unique to pools, spas or hot tubs that need this additional requirement for a disconnecting means.
In addition, new Section 680-38 to the 1999 NEC provides the requirement for an emergency disconnecting means for spas and hot tubs so the disconnecting means provided in Section 680-12 does not seem to be necessary, at least for those installations. There is no indication that the disconnecting means required in Section 680-12 is for emergency purposes as these disconnects apply to all installations covered in Part A while one family dwellings are excluded from Section 680-38.
Finally, it is not clear what equipment this section was intended to apply to or what electrical equipment is intended to be disconnected. The disconnecting means is required within sight of "all pools, spas, and hot tub equipment." As worded, the requirement can be interpreted to require a disconnecting means within sight of lighting fixtures, receptacles and pool lighting junction boxes that are located outside and panelboards, timers, motor controllers and pump motors that are located inside. It does not seem that this would be the panel intent.
PANEL ACTION: Accept in Part.
Accept the deletion of the redundant text at end of sentence beginning with " . . . , and shall be located". Reject deletion of requirement for service disconnect. This has been incorporated into Proposal 20-62a.
PANEL STATEMENT: The location requirement is covered in 680-6(c), Switching Devices. It is the panel's intent to require the diconnecting means. See Proposal 20-62a for changes made which might satisfy the submitter's concern.

(Log #3903)

20- 68 - (680-12): Accept in Principle
Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-12 of the rewrite of Article 680 in Proposal 20-30a.
SUBMITTER: Alfred A. Fiorello, Fiorello Electric Inc.
RECOMMENDATION: Revise as follows:
Pools, spas and hot tub ~~equipment~~ motors.
SUBSTANTIATION: The word "equipment" could possible mean a light or heater, which is not the intent of this section.
PANEL ACTION: Accept in Principle.
See Proposal 20-62a.
PANEL STATEMENT: Proposal 20-62a addresses the submitter's concern and clarifies the requirements for disconnects. It is the panel's intent to include items such as heaters and sanitizers.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 1
NOT RETURNED: 1 Ryan
EXPLANATION OF NEGATIVE:
EGAN: Panel action on January 18, 2000 was unanimous vote on a motion to reject. Letter ballot indicates a panel action of APR which is contrary to the vote taken.

(Log #4257)

20- 69 - (680-12): Accept in Principle
Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-12 of the rewrite of Article 680 in Proposal 20-30a.
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
"One or more ~~a~~ disconnecting means shall be ~~provided and be accessible, located within sight from all pools, spas, and~~ installed for motor-operated pool, spa, or hot tub equipment, and for pool, spa, or hot tub heating equipment. The disconnecting means shall be accessible and located within sight of the equipment supplied, at a point at least 5 feet (1.52 m) horizontally from the inside walls of the pool, spa, or hot tub.
SUBSTANTIATION: This revision corrects numerous problems in the 1999 wording. First, multiple disconnects may be required, and the present language suggests only one is allowed. In addition, the present rule imposes the requirement on literally all equipment, which would include light fixtures; motors and heaters should be enough at this point. In addition, the present literal text requires disconnects in sight of bodies of water ("pools, spas") in addition to "hot tub equipment" due to grammatical errors in the 1999 rewrite. The disconnect rule properly applies to electrical equipment, not to bodies of water.
PANEL ACTION: Accept in Principle.
See Proposal 20-62a.
PANEL STATEMENT: The panel agrees that the original wording of 680-12 did not clearly communicate the panel's intention with respect to requirements for disconnects when this text was initially added to the 1996 edition of the Code. See Proposal 20-62a for the necessary changes.

(Log #3771)

20- 71 - (680-20(a)): Reject
SUBMITTER: Tarry L. Baker, Board of Rules and Appeals, Broward County, FL
RECOMMENDATION: Revise as follows:
~~In addition, a ground-fault circuit interrupter shall be installed in the branch circuit supplying fixtures operating a. more than 15 volts, so that there is no shock hazard during relamping. The installation of the ground-fault circuit interrupter shall be such that there is no shock hazard with any likely fault condition combination that involves a person in a conductive path from any ungrounded part of the branch circuit or the fixture to ground.~~ All underwater wet niche, dry-niche, and no-niche lighting fixtures shall be of the type for use with 15 volts or less.
SUBSTANTIATION: The ground-fault circuit interrupter receptacles installed in the field. (When reset) do not always give the GFCI protection. They give power to the circuit only. This code change provides a higher degree of safety. Eliminates hazards due to improper maintenance or installation of 110 Volt swimming pool underwater wet niche, dry-niche and no-niche lighting fixtures with false GFCI protection.
PANEL ACTION: Reject.
PANEL STATEMENT: The Panel does not wish to restrict the operating voltage to 15-volts or less. The submitter does not present any technical justification or safety data.

(Log #322)

20- 72 - (680-20(a)(1) and (2)): Reject
SUBMITTER: Henry Karnilowicz, Occidental Express
RECOMMENDATION: Modify the wording of (a) General (1) and (2).
Relocate (2) to (1) and state as follows:
(1) No lighting fixtures shall be installed for operation on supply circuits over 12 volts between conductors.
(2) The design of an underwater lighting fixture supplied from a branch circuit either directly or by way of a transformer meeting the requirements of Section 680-5(a) shall be such that, where the fixture is properly installed without a ground fault circuit-interrupter, there is no shock hazard with any likely combination of fault conditions during normal use (not relamping).
In addition, a ground-fault circuit-interrupter shall be installed in the branch circuit supplying the transformer ~~fixtures operating at more than 15 volts,~~ so that there is no shock hazard during relamping. The installation of the ground-fault circuit-interrupter shall be such that there is no shock hazard with any likely fault-condition combination that involves a person in a conductive path from any ungrounded part of the branch circuit or the fixture to ground.
Compliance with this requirement shall be obtained by the use of an approved underwater lighting fixture and by installation of an approved ground-fault circuit-interrupter in the branch circuit.
SUBSTANTIATION: This proposal would eliminate the possibility of voltage high enough, traveling through the water, which could cause a fatality.
PANEL ACTION: Reject.
PANEL STATEMENT: Having a GFCI on the primary of the transformer will not protect the secondary.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

(Log #3712)

20- 76 - (680-20(b)(1)): Reject
SUBMITTER: Gary Burkitt, KDI American Products, Inc.
RECOMMENDATION: Revise fourth paragraph, first sentence as follows:
Where a nonmetallic conduit is used, a No. 8 insulated copper conductor shall be installed in this conduit with provisions for terminating in the forming shell, junction box or transformer enclosure, or ground-fault circuit-interrupter enclosure unless a listed ~~low-voltage~~ lighting system is used, not requiring grounding.
SUBSTANTIATION: In addition to the low-voltage products currently listed for this application, new line voltage products have been proposed.
This proposal is intended to provide Article 680 wording that would allow changes to be made to UL Standard 676 addressing the testing and listing of these line-voltage products.
PANEL ACTION: Reject.
PANEL STATEMENT: No technical substantiation has been submitted to support this code change. The submitter should provide safety data.

NOT RETURNED: 1 Ryan

(Log #3772)

20- 77 - (680-20(b)(1)): Accept
Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-23(B)(2)(b) of the rewrite of Article 680 in Proposal 20-30a.
SUBMITTER: Patrick White, City of Coral Springs, FL
RECOMMENDATION: Change fifth sentence to read as follows:
Where a nonmetallic conduit is used, a No. 8 insulated solid or stranded copper conductor shall be installed in this conduit with provisions for terminating in the forming shell, junction box or transformer enclosure, or ground-fault circuit-interrupter enclosure unless a listed low-voltage lighting system is used not requiring grounding.
SUBSTANTIATION: Section 310-3 requires conductors No. 8 or larger to be stranded except where permitted elsewhere in this code. Section 680-20(b)(1) only mentions No. 8 insulated conductor where rigid nonmetallic conduit is run to the wet niche shell. Previously this section specified a No. 8 solid conductor. It appears that the word solid was dropped to allow a stranded No. 8 conductor. In practice No. 8 solid is still commonly used where rigid nonmetallic conduit is installed and this change will allow either stranded or solid conductors.
PANEL ACTION: Accept.

20- 82 - (680-22(a)(1)): Accept in Principle

Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-26(B)(1) of the rewrite of Article 680 in Proposal 20-30a.

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee

RECOMMENDATION: Delete the last sentence and add a new exception, as follows:

Exception: Where reinforcing steel is effectively insulated by an encapsulating nonconductive compound at the time of manufacture, it shall be permitted to be unbonded provided No. 8 or larger bare solid copper conductors are run in the pour around the perimeter of the pool below the normal water line, and through the pour at other locations such that no point in the pour, measured through the pour, is more than 15 ft (4.58 m) from a bonding conductor.

SUBSTANTIATION: This proposal is a resubmittal of the proposal that provoked the change in this section. Unlike the 1999 NEC, however, it aims at the objectives of bonding without imposing completely unrealistic requirements.

The present literal text requires bonding to every epoxy coated reinforcing bar (commonly supplied for corrosion resistance) unless the steel foundry that rolled the bar stock went out and had the epoxy coating listed. Some major pool installations use a double concrete pour with literally thousands of reinforcing members, every single one of which are epoxy coated. Even the tie wires are coated.

In the past a sensible inspector simply would have said that the reinforcing didn't involve "the usual steel tie wires" and agreed to other equivalent arrangements. Remember, even if someone did grind off the coating of all those steel rods, the construction specifications would have required repainting all the connections with epoxy so as to not defeat the objective of ordering the epoxy coating in the first place.

Now, however, the Code squarely addresses epoxy-coated reinforcing. The room for an inspector to maneuver has gotten far smaller. If enforced, this rule makes any such job prohibitive. No steel mill is going to go out and get 0.001% of its epoxy-coated steel bar stock listed when 99.999% of its market is for bridge construction and other venues for which listed epoxy is irrelevant. The 1999 NEC rule has not and will not see the light of day in Massachusetts. CMP 20 should step on this one quickly. Either accept some version of this proposal, or completely exempt coated reinforcing from consideration as a bonding candidate.

PANEL ACTION: Accept in Principle.

Revise the last sentence of 680-22(a)(1) to read: "Where reinforcing steel is effectively insulated by an encapsulating nonconductive compound at the time of manufacture and installation, it shall not be required to be bonded."

PANEL STATEMENT: The panel's action on this proposal meets the intent of the submitter.

(Log #3713)

20- 83 - (680-22(a)(2)): Reject

SUBMITTER: Gary Burkitt, KDI American Products, Inc.

RECOMMENDATION: Revise as follows:

All forming shells and mounting brackets of a no-niche fixture unless a listed ~~low-voltage~~ lighting system is used, not requiring bonding.

SUBSTANTIATION: In addition to the low-voltage products currently listed for this application, new line voltage products have been proposed.

This proposal is intended to provide Article 680 wording that would allow changes to be made to UL Standard 676 addressing the testing and listing of these line-voltage products.

PANEL ACTION: Reject.

PANEL STATEMENT: No technical substantiation has been submitted to support this code change. The submitter should provide safety data.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ryan

(Log #4259)

20- 84 - (680-22(a)(4)): Accept

Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-26(B)(4) of the rewrite of Article 680 in Proposal 20-30a.

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee

RECOMMENDATION: Add a second paragraph, as follows:

"Where a double-insulated water-pump motor is installed under the provisions of this exception, a solid No. 8 copper conductor that is of sufficient length to make a bonding connection to a replacement motor shall be extended from the bonding grid to an accessible point in the motor vicinity. Where there is no connection between the swimming pool bonding grid and the equipment grounding system for the premises, this bonding conductor shall be connected to the equipment grounding conductor of the motor circuit."

SUBSTANTIATION: The new allowance for double-insulated swimming-pool pump motors (and other "equipment") needs to be addressed for two reasons. First, if the DI motor is replaced by a conventional motor, qualified personnel may not be involved, and probably won't go to any great length to make a proper bonding connection if it isn't readily available. Second, for the first time in the history of the National Electrical Code, we now have a bonded structure that could be without any connection to the equipment grounding system for the premises. This would happen if a DI motor were the only electrical equipment at the pool (no wet-niche fixtures, etc.), a relatively common occurrence.

This proposal restores the equipment grounding connection in such cases. This removes the possibility, for example, that someone may be carrying a conductive object connected to the building equipment grounding system through an extension cord and touch a metal slide or ladder support at a different voltage although still grounded in the pool vicinity.

In the prior cycle, CMP 20 rejected this proposal on the grounds that the bonding conductor might get lost at the time of a future installation. That's both true and beside the point. If there isn't a bonding conductor, then at the time of the future installation the connection is much worse than misplaced; it's nonexistent. Depending on the pool construction, establishing a bonding connection after the fact my be extremely costly and difficult.

With respect to the second half of the proposal, the panel also referred to the former fine print note, now an improperly worded rule in Sec. 680-22. The Advisory Committee understands quite well that there isn't any need to make a direct bonding connection to a remote panelboard, and never suggested it. Having a bonded object of the nature of an entire swimming pool sitting without an equipment grounding reference to the local electrical system is quite different.

We understand that the bonding in place will create the necessary Faraday Cage effect to allow safety for the swimmers whether or not the pool sees the local equipment grounding reference. However, the pool doesn't sit in isolation. It may be served by a nearby cabana, or otherwise within access to someone electrically connected to the prevailing system ground, whether by walking nearby with a grounded object in one hand or otherwise. In that wet environment, the two systems should share a common reference.

I can't think of any other situation where a conductive object of that size gets a NEC blessing to live its useful life without any common reference. I also think this is the first time in the history of the NEC that such an allowance has ever been made. CMP 20 is being entirely too cavalier in failing to fully consider the enormity of this precedent and its eventual implications.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9

NEGATIVE: 1

NOT RETURNED: 1 Ryan

EXPLANATION OF NEGATIVE:
LABRAKE: The Electric Light and Power Group is negative to the panel's action with the following comment: This proposal action imposes additional unnecessary costs relative to a design issue and it implies that future work would not be performed according to code requirements, which is not a reasonable assumption.

(Log #3014)

20- 85 - (680-22(b)(1)): Reject
SUBMITTER: Robert H. Keis, Dover, DE
RECOMMENDATION: Add a new sentence to the end of (1) as follows:
The means of bonding to wire mesh shall be by pressure connectors or clamps of brass, copper, copper alloy, or an equally substantial approved means.
SUBSTANTIATION: During 29 years as an inspector I can't count the number of arguments about wire mesh not being the structural reinforcing steel mentioned in this section. People try to use wire (whatever kind that is laying around) to tie this wire mesh together and it just cannot be made tight like re-bar can. I have also seen wire mesh with a piece of itself bent over another piece just to hold it in place. Re-bar has many ties on each piece because of the length of each bar. Re-bar is usually installed by professionals who know what they are doing and when they are finished you can climb on it. Wire mesh is usually laid down by the home owner or concrete man who have no idea what stray currents are and could care less. Wire mesh is usually tied once or twice here and there. As for the precedent, Section 547-9 recognizes the problem and has addressed it. It seems that the human population deserves at least as much protection from electrocution or shock hazard as we are giving the cows.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided adequate substantiation for this procedure.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 1
NOT RETURNED: 1 Ryan
EXPLANATION OF NEGATIVE:
EGAN: Section 680-22(b) of the 1999 Code was changed to recognize exothermic welding as a means of connecting to a common bonding grid. This change also recognizes pressure connectors and clamps that are specifically listed for the purpose. Since wire mesh is a metallic part of the pool structure, it should be required to be bonded according to 680-22(a)(1).
The submitter has presented a valid recommendation to require adequate bonding.

(Log #4429)

20- 86 - (680-22(b)(3)): Reject
SUBMITTER: Scott T. MacDonald, Collyn Ferris, Aquadoor Inc.
RECOMMENDATION: Add new text:
A bare solid copper conductor not smaller than No. 6 running the circumference of the pool and ending at the deep end of the pool with a driven rod or equivalent.
SUBSTANTIATION: 680-22(b)(3) does not state how long the wire should be or where it is going to end. Also, if wire has no contact with large conductive surfaces it will be useless. For example, if a No. 6 solid insulated wire runs the circumference of the pool, it does no good unless many other objects are attached to it.
This bonding grid often works in reverse, current will come to the pool on the ground wire because the power pole ground caps have too high of resistance to ground. The current seeks the path of least resistance which is the ground under the pool.
This is due to small amounts of water leaking out of the pool and seeping down into the ground.
This is the path lightning will take if it strikes a power pole nearby.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided adequate substantiation to warrant this additional requirement.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

(Log #1978)

20- 87 - (680-22(d) (New)): Reject
SUBMITTER: Carl T. Wall, Alabama Power Co.
RECOMMENDATION: Add a new paragrah (d) to read as follows:
(d) Equipotential Plane. A concrete pool deck shall have wire mesh, reinforcing metal or other conductive element(s) installed in the concrete to form an equipotential plane. A minimum #8 solid bare copper conductor installed in the concrete pool deck a distance of one foot from the edge of the pool and forming a loop around the perimeter of the pool shall be permitted to serve as the conductive element of the pool deck.
SUBSTANTIATION: The number of complaints from owners of swimming pools concerning voltage differentials experienced when persons enter or exit pools has dramatically increased with the use of nonconductive fiber reinforcing materials for concrete. These nonconductive reinforcing materials are used in the pool decks in lieu of metallic reinforcing. The NEC does not require concrete decks around pools to have metallic elements. Investigations frequently determine that the pools involved in the complaints are compliant with the NEC requirements for a common bonding grid, thus indicating that additional requirements are needed. It is the intent of this change to require concrete pool decks to have metallic elements connected to the common bonding grid. Installing conductive elements in the concrete deck will establish an equipotential plane in the pool area and eliminate the complaints. This requirement is similar to the requirement in Article 547-9(b) for an equipotential plane in livestock areas.
PANEL ACTION: Reject.
PANEL STATEMENT: The code does not prevent this concept from being used, but no substantiation is provided to indicate that this should be required.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 1
NOT RETURNED: 1 Ryan
EXPLANATION OF NEGATIVE:
LABRAKE: The Electric Light and Power Group is negative to the panel's action with the following comment: Proposed new section 680-22(d) would be acceptable as a means to reduce shock hazards upon occurrence if it was reworded as follows:
(d) Equipotential Plane. Under engineering supervision to control surface voltage gradients, an equipotential plane shall be permitted in the area surrounding the pool to serve as the conductive element of the pool deck.

(Log #390)

20- 88 - (680-23(b)): Accept
Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-27(A)(2) of the rewrite of Article 680 in Proposal 20-30a.
SUBMITTER: Glenn W. Zieseniss, Crown Point, IN
RECOMMENDATION: In the second sentence, after the words "insulated copper" add the words equipment grounding...
SUBSTANTIATION: This revision is to identify the purpose of the conductor as an equipment grounding conductor (EGC) as opposed to a bonding conductor.
This conductor is terminated at the equipment grounding terminal within the junction box, thus it is an EGC. See 680-21(d) i.e., "Grounding Terminal".
PANEL ACTION: Accept.
PANEL STATEMENT: This is being incorporated into the rewrite of Article 680, Proposal 20-30a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

20- 100 - (680-25(d)(3) (New)): Reject
SUBMITTER: Michael J. Timpanaro, Silver Springs, FL
RECOMMENDATION: Add new text to read as follows:
"In the interior of a one-family dwelling or in the interior of another building associated with a one-family dwelling, any of the wiring methods recognized in Chapter 3 of this Code that contain a copper equipment grounding conductor that is insulated or covered by the outer sheath, and not smaller than No. 12, shall be permitted between the service equipment and the remote panelboard where the panelboard does not supply underwater lighting fixtures in accordance with Section 680-20."
SUBSTANTIATION: Not all permanently installed pools for one-family dwellings are wired with underwater lighting fixtures in accordance with Section 680-20. Many new pools have fiber optic lighting installed and not required to comply with Sections 680-20 and 680-25(b). Since the only equipment installed and wired from the pool panelboard may be pool pump motors, receptacles required by 680-6(a)(2), pool heaters, or spa pump motors, the same wiring methods in Section 680-25(c) for one-family dwelling motors should be permitted for panelboards.
PANEL ACTION: Reject.
PANEL STATEMENT: A more protective installation is required because the panelboard may be called upon to supply other equipment in the pool area.

(Log #4312)

20- 101 - (680-26): Reject
SUBMITTER: Scott T. MacDonald, Collyn Ferris, Aquadoor Inc.
RECOMMENDATION: Add new text:
The pool cover housing lids shall be strong enough to protect the pool cover equipment from damage due to normal pedestrian traffic.
SUBSTANTIATION: Pool covers are listed products, so there is a general assumption that because the 110 section requires testing of the lids that these lids are safe for this application. We have not found this to be true. Many pool cover lids carry a warning sticker that states "DO NOT STAND ON LIDS". This presents a collapse and drowning risk to the public and could damage the cover preventing it from operating.
PANEL ACTION: Reject.
PANEL STATEMENT: This is a listing issue, not an installation issue. The issue concerns the mechanical design of the lid, which is beyond the scope of the code. This issue should be referred to a third-party certification agency. In addition, no substantiation is provided that a problem exists.

20- 102 - (680-26): Reject
SUBMITTER: Scott T. MacDonald, Collyn Ferris, Aquadoor Inc.
RECOMMENDATION: Add new text:
The pool cover controller shall stop all current to the other pool cover components when not in use.
SUBSTANTIATION: It would be best for the public if the power stopped at the controller and only passed through when motion is requested. The design of our current pool cover is such that power is in the cover housing at all times, this is normal construction procedure for most pool covers and should be stopped. If a pool cover housing floods it is likely the water will become electrified if the GFCI fails.
PANEL ACTION: Reject.
PANEL STATEMENT: This is a design issue, not an installation issue, which is beyond the scope of the code. This issue should be referred to a third-party certification agency. In addition, no substantiation is provided that a problem exists.

20- 103 - (680-26): Reject
Note: It was the action of the Technical Correlating Committee that the Panel reconsider this Proposal as it is within the Scope of the NEC. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Scott T. MacDonald, Collyn Ferris, Aquadoor Inc.
RECOMMENDATION: Add new text:
The GFCI shall be located within five ft of the pool cover controller and only protect the pool cover circuit.
SUBSTANTIATION: This is necessary because sometimes the GFCI is located too far from the controller. The pool cover's owner often cannot find the GFCI switch to reset it. If the pool cover fails to operate, this becomes an extreme risk to children around a pool. Many children drown each year, a pool cover that does not operate because the GFCI cannot be found, could easily contribute to this tragedy! Pool covers need an exclusive GFCI because often the pool lights are connected to the same circuit. If the pool light trips the GFCI, the pool cover won't cover the pool increasing the risk of drowning due to a failure of the lights.
PANEL ACTION: Reject.
PANEL STATEMENT: This is a design issue, not an installation issue, which is beyond the scope of the code. This issue should be referred to a third-party certification agency. In addition, no substantiation is provided that a problem exists.

(Log #4317)

20- 104 - (680-26): Reject
SUBMITTER: Scott T. MacDonald, Collyn Ferris, Aquadoor Inc.
RECOMMENDATION: Add new text:
Power for a pool cover shall only be provided to a remote controller. Power shall not be provided directly to the pool cover housing.
SUBSTANTIATION: This is necessary because even with good drains, a below grade housing can flood. I have personally seen no less than 35 GFCIs that are frozen in the on position. This means that a live circuit can be completely under water. When you combine these facts you can end up with electrified water in the pool cover housing chamber. GFCIs are rarely replaced when they fail to the on position and always replaced when they fail to the off position. Here is an example of how it really happens. The controller is in pool cover housing, everything in the housing is always damp or wet. The person closing the pool cover is dripping wet from swimming, they put one or two knees on the ground to open the housing lid and reach down, below grade, with a soaking wet hand to the controller and run the cover while water runs down their arm onto the controller.
PANEL ACTION: Reject.
PANEL STATEMENT: This is a design issue, not an installation issue, which is beyond the scope of the code. This issue should be referred to a third-party certification agency. In addition, no substantiation is provided that a problem exists.

20- 105 - (680-26): Reject

Note: It was the action of the Technical Correlating Committee that the Panel reconsider this Proposal as it is within the Scope of the NEC. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Scott T. MacDonald, Collyn Ferris, Aquadoor Inc.

RECOMMENDATION: Add new text:

The controller for the pool cover shall be located such that a person cannot touch the water of the pool and the controller at the same time.

SUBSTANTIATION: This addition is necessary because the code allows the controller to be located about 1 1/2 feet away from the water. Section 680-26 states "unless separated from the pool by a wall, cover or other" and most electric covers are enclosed by "a cover". Since installing the controller right next to the motor is cheaper, it is sometimes still done this way, allowing a person to easily touch the water and controller at the same time.

PANEL ACTION: Reject.

PANEL STATEMENT: This is a design issue, not an installation issue, which is beyond the scope of the code. This issue should be referred to a third-party certification agency. In addition, no substantiation is provided that a problem exists.

20- 106 - (680-26): Reject

Note: It was the action of the Technical Correlating Committee that the Panel reconsider this Proposal as it is within the Scope of the NEC. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Scott T. MacDonald, Collyn Ferris, Aquadoor Inc.

RECOMMENDATION: Add new text:

The controller shall be located in full view of the pool and not more than 35 feet from the inside wall of the pool.

SUBSTANTIATION: a. This addition is necessary because the 430-103 is almost never invoked. When it is, people say, "that is intended for industrial applications only." In reality the controller is often located where only part of the pool can be viewed.

b. Sometimes the controller is located in excess of 200 feet. Even though the pool may be in full view it is too far away to be safely operated. This could be compared to driving your car around your backyard by remote control from 200 feet away with small children present.

PANEL ACTION: Reject.

PANEL STATEMENT: This is a design issue, not an installation issue, which is beyond the scope of the code. This issue should be referred to a third-party certification agency. In addition, no substantiation is provided that a problem exists.

(Log #2897)

20- 107 - (680-29 (New)): Reject

SUBMITTER: James Maldonado, City of Tempe, AZ/Rep. Central Arizona Chapter IAEI

RECOMMENDATION: Add new Section 680-29 to read as follows:

Mechanical and Electrical Equipment Location. Mechanical and electrical equipment not addressed in other sections in Article 680, shall not be permitted within the area extending 5 ft (1.52 mm) horizontally from the inside wall of the pool.

FPN: In determining the above dimension the distance to be measured is the shortest path to the equipment without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening, or other similar effective permanent barrier.

SUBSTANTIATION: The code currently restricts the installation of motors associated with pools, pool cover motors, underground conduit and disconnects from with 5 ft of a pool wall. This is hard to justify the logic when a motor not associated with the pool or air conditioning unit can be placed within this 5 ft zone. Even if it is bonded there is still a hazard that if corrosion occurs to this equipment since it will be splashed with chemically treated water on a continuous basis.

PANEL ACTION: Reject.

PANEL STATEMENT: No substantiation has been provided to justify this additional restriction that would be imposed by this proposal.

20- 115 - (680-32(e) (New)): Accept in Principle
Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-23(E) of the rewrite of Article 680 in Proposal 20-30a.
SUBMITTER: Gary Burkitt, PacFab, Inc.
RECOMMENDATION: Add a new 680-32(e):
(e) Through-Wall Lighting Assembly. A through wall lighting assembly shall be as follows:
(1) Listed for the purpose.
(2) Equipped with a threaded entry or hub or a nonmetallic hub listed for the purpose for the termination of the supply circuit conduit.
SUBSTANTIATION: This proposal implements the addition of the new definition of a Through-Wall Lighting Assembly to 680-4.
This proposal is intended to provide Article 680 wording that would allow changes to be made to UL Standard 676 addressing the testing and listing of these types of lighting assemblies.
PANEL ACTION: Accept in Principle.
Accept the proposed text as a new paragraph (e) to 680-20 and add a new item (3) to read as follows:
"(e) Through-Wall Lighting Assembly. A through wall lighting assembly shall be as follows:
(1) Listed for the purpose.
(2) Equipped with a threaded entry or hub or a nonmetallic hub listed for the purpose for the termination of the supply circuit conduit.
(3) Installed in accordance with the requirements of 680-20(b)."
In addition, the first sentence of 680-20 should read "Paragraphs (a) through (e)..."
PANEL STATEMENT: The panel agrees with the proposed text, but believes that this should properly be a new paragraph to Section 680-20 and also believes that a reference to 680-20(b) is needed.

(Log #4018)

20- 117 - (680-38): Reject

SUBMITTER: Christopher Pharo, Rep. IBEW

RECOMMENDATION: This proposal is to delete the last sentence.

Article 680-38... adjacent to, and within sight of the spa or hot tub. (DELETE THE NEXT SENTENCE):

~~This requirement shall not apply to single family dwellings.~~

SUBSTANTIATION: The requirement of a local disconnect within sight and labeled emergency shut-off pertaining to spas and hot tubs came about in the previous code cycle. A tragic accident had claimed the life of a teenage girl because the teenagers using the hot tube with her did not know where the shutoff for the equipment was located. It can be argued that the homeowner would not experience this degree of frustration because they do know the location of the circuit breakers. However, one would have to leave the equipment run inside the house, down the steps of the basement, move some storage boxes and then open the panel box in order to turn the power off to the equipment. This may take up to a minute and everyone know that in an emergency every minute counts. Other hazards exist in and around spas and hot tubs why not protect the homeowner. The homeowner would be more than willing to pay for a "safety feature" such as a local emergency disconnect switch adjacent to the equipment.

PANEL ACTION: Reject.

PANEL STATEMENT: This section does not restrict the homeowner from installing an emergency switch, but does not require one.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ryan

(Log #2047)

20- 118 - (680-40): Accept in Principle

SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ

RECOMMENDATION: Modify 680-40 as follows:

680-40 Outdoor Installations. A spa or hot tub installed outdoors shall comply with the provisions of Parts A and B of this article that would otherwise apply to pools installed outdoors except as permitted in (a) ~~and~~, (b,)or (c).

(c) Interior Wiring. In the interior of a one-family dwelling or in the interior of another building or structure associated with a one-family dwelling, any of the wiring methods recognized in Chapter 3 of this Code that contain a copper equipment grounding conductor that is insulated or covered by the outer sheath of the wiring method and is not smaller than No. 12 shall be permitted to be used for the connection to a self-contained spa or hot tub, or a packaged spa or hot tub equipment assembly.

SUBSTANTIATION: The language added to the main rule is that which was accepted by the Panel by its action on Proposal 20-170 Log #1280, in the A98 ROP. This was subsequently incorporated into the Panel's action on Proposal 20-171 Log #2048. The Panel accepted revisions to 680-1 in Proposal 20-80a (Log #CP2002), which also clarified the points made in the substantiation to Proposal 20-170. At the comment stage, the Panel accepted with a minor change, Comment 20-135 Log #2747 that modified Proposal 20-171. The language in Comment 20-135 did not include the already accepted language from Proposal 20-170. The Technical Correlating Committee then rejected the Panel's action on Proposal 20-80a, modifying 680-1 and removing the clarifying language. The net result of all these actions is that the points made in the original substantiation to Proposal 20-170 are still valid and this revision is needed.

A new paragraph (c) is proposed to clear up the confusion that exists with regards to the wiring methods to be employed. Current Code language requires a spa or hot tub installed outdoors to be wired as a permanently installed pool in accordance with Part B. If the spa or hot tub contains a light, 680-25(b) requires basically conduit back to the panelboard. If I install this same spa or hot tub indoors, 680-41 allows me to use any wiring methods of Chapter 3 whether or not there is a light installed. There should be no difference in the wiring methods in the interior of a dwelling. The unit doesn't know where it is installed. If we are to insist on the "conduit" rules in 680-25, shouldn't we insist that all of the other rules for lighting fixtures in Part B be applied? If a Cord- and Plug-Connected Lighting Assembly is used do we require the receptacle it plugs into be wired in conduit? The light assemblies used in the types of spas and hot tubs mentioned are part of the package, they have been investigated for that purpose and presumably are safe when applied within their listing.

PANEL ACTION: Accept in Principle.

This proposal is accepted and has been incorporated into 680-42 of the Article 680 rewrite, Proposal 20-30a.

PANEL STATEMENT: The panel agrees with the first part of this proposal.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ryan

(Log #3858)

20- 119 - (680-40(a)): Accept in Principle

Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-42(A) of the rewrite of Article 680 in Proposal 20-30a.

SUBMITTER: J. Philip Simmons, Olympia, WA

RECOMMENDATION: Revise as follows:

680-40. Outdoor Installations. A spa or hot tub installed outdoors shall comply with the provisions of Parts A and B of this article except as permitted in (a) and (b).

(a) Flexible Connections. Self-contained spas or hot tubs, or units supplied by a listed packaged spa or hot tub equipment assembly, ~~Listed packaged units utilizing a factory installed remote panelboard~~ shall be permitted to be connected with not more than 6 ft (1.828 m) of liquidtight flexible conduit or be cord and plug connected with a cord not longer than 15 ft (4.57 m) if protected by a ground-fault circuit interrupter.

SUBSTANTIATION: This proposal is both editorial and substantive.

It is editorial so far as incorporating the defined terms "Packaged Spa or Hot Tub Equipment Assembly" and "Self-Contained Spa or Hot Tub" that were accepted for the 1996 NEC.

It is substantive so far as accepting factory installed or assembled control panels is concerned. Most self-contained spas do not have a panelboard, in the control equipment, at least so far as the definition in Article 100 is concerned. If they do have a panelboard, it commonly is contained within the control equipment assembly where the feeder or branch circuit terminates.

The control panel often includes additional equipment like GFCIs, contactors, transformers and timers. The word "remote" should be deleted as the panelboard or control equipment is a part of the packaged spa or hot tub equipment assembly and is by nature of its installation installed "remote" from the service.

PANEL ACTION: Accept in Principle.

See Proposal 20-30a.

PANEL STATEMENT: Proposal 20-30a addresses the submitter's concerns.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ryan

(Log #3621)

20- 120 - (680-40(c) (New)): Reject

SUBMITTER: Robert T. Baird, City of Idaho Falls, ID

RECOMMENDATION: Add new text to read as follows:

680-40(c) Service-drop conductors over residential property, where not in excess of 300 volts to ground and a swimming pool is not located on the same property, shall have 12 ft (3.66 m) minimum clearance over the spa or hot tub. This distance shall be measured from the top of the spa or hot tub to the service-drop conductors.

SUBSTANTIATION: When a spa or hot tub is not located on the same property as a swimming pool, long handled tools will not be used to clean the spa or hot tub. The electrical hazard, from the sevice-drop conductors over the spa or hot tub, would be no different than the service-drop conductors over the backyard of residential property. The 22 ft clearance is difficult to meet on smaller residential lots.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not provided sufficient technical justification that would warrant a change to a lesser height.

RECOMMENDATION: Revise to read as follows:
(3) Metal ~~conduit,~~ raceways, metal enclosed cables, and metal piping within 5 ft (1.52 m) of the inside walls of the spa or hot tub and that are not separated from the spa or hot tub by a permanent barrier.
(e) Methods of Bonding. All metal parts ~~associated with the spa or hot tub~~ required to be bonded by (d) above, shall be bonded by any of the following methods:
(1) No change.
(2) No change.
(3) The provisions of a solid copper bonding jumper, insulated covered, or bare, not smaller than No. 8 ~~solid.~~
SUBSTANTIATION: Editorial. Exposed metal raceways not limited to conduit, and also metal cables not covered by (d)(2) should be included in (d)(3), as they are in Section 680-62(c)(3).
Metal enclosed wiring methods of (d)(3) which may not be associated with the spa or tub should also be required to be bonded in (e).
"Covered" conductors as defined in Article 100 appears to apply to an individually encased conductor for which (e)(3) may apply. Such conductors do not appear to be a listed product and are only indicated in one code table.
Literal wording of (e)(3) does not require a solid conductor only a copper conductor not smaller than No. 8 solid. A stranded copper No. 8 is not smaller than No. 8 solid copper in circular mil area and is larger in diameter.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no technical substantiation to support the change to allow any raceway method.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10

(Log #2792)

20- 123 - (680-41(g)): Reject
SUBMITTER: Jonathan DaBoi Saravia, E. Freetown, MA
RECOMMENDATION: Delete present 680-41(g)(1), 680-41(g)(2) and replace with the following:
The provisions of 680-25 shall apply to the grounding of all electrical equipment and enclosures associated with the spa or hot tub.
SUBSTANTIATION: Modern spas and hot tubs are equipment with everything from lighting, televisions, communications, and sound systems. Grounding requirements need to be as stringent for spas and hot tubs as they are for pools.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided substantiation to warrant the change.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

(Log #3015)

20- 124 - (680-42, FPN No. 2 (New)): Reject
SUBMITTER: Robert H. Keis, Dover, DE
RECOMMENDATION: Add new FPN No. 2 to end of section and renumber existing FPN as No. 1.
FPN No. 2: See Article 100 for definition of Outlet.
SUBSTANTIATION: Every time I teach a class or a continuing education seminar I ask the students what they think is meant by the word "outlet" when they read this section. The answer is always, "a receptacle." This is obviously not true when I read the definition of "outlet" in Article 100. If it is the intent of the panel that ALL spas and hot tubs are to have GFCI protection then we must either change the word "outlet" to something else, or else call the code user's attention to what this word means.
PANEL ACTION: Reject.
PANEL STATEMENT: This is a common term used throughout the code and is defined in Article 100.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

(Log #989)

20- 125 - (680-51(a)): Accept in Principle in Part
Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-51(A) of the rewrite of Article 680 in Proposal 20-30a.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Ground-Fault Circuit-Interruptor. ~~A ground-fault circuit interrupter shall be installed in the~~ A branch circuit supplying fountain equipment shall be protected by a ground-fault circuit-interruptor unless the equipment is listed for operation at 15-volts or less and is supplied by a transformer complying with Section 680-5(a).
SUBSTANTIATION: Editorial. Present wording permits the GFCI anywhere in the circuit, perhaps "downstream" of a location where water or appurtenances could be energized. Sections 680-26(b) and 680-56(a) indicate supply conductors are to be protected. The proposal provides correlation with those sections.
PANEL ACTION: Accept in Principle in Part.
Revise 680-51(a) to read:
"(a) Ground-Fault Circuit-Interrupter. Fountain equipment, unless the equipment is listed for operation at 15-volts or less and is supplied by a transformer complying with Section 680-5(a), shall be protected by a ground-fault circuit-interrrupter."
PANEL STATEMENT: This will meet the submitter's concern of requiring the fountain equipment to be protected by a GFCI. See Proposal 20-30a for final wording.

(Log #2090)

20- 126 - (680-51(c)): Accept

Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-51(C) of the rewrite of Article 680 in Proposal 20-30a.

SUBMITTER: Joel A. Rencsok, Scottsdale, AZ

RECOMMENDATION: Change the word "approved" to "listed".

Will now read as follows:

(c) Lighting Fixture Lenses. Lighting fixtures shall be installed with the top of the fixture lens below the normal water level of the fountain unless listed ~~approved~~ for above-water locations. A lighting fixture facing upward shall have the lens adequately guarded to prevent contact by any person.

SUBSTANTIATION: The word approved is difficult to install by and the many hazards associated with the corrosive atmosphere surrounding the treated water can not be judged by the authority having jurisdiction.

This requirement should be left to the Testing agency's and not to the authority having jurisdiction.

PANEL ACTION: Accept.

PANEL STATEMENT: This will be incorporated in the editorial rewrite of Article 680. See Proposal 20-30a.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

NOT RETURNED: 1 Ryan

(Log #2917)

20- 127 - (680-51(h) (New)): Reject

SUBMITTER: Joseph N. Fiorello, Sr., Fiorello Electric Inc.

RECOMMENDATION: Add new text to read:

(h) Clearance and Accessibility of Control Equipment. Control equipment shall be located at least 5 ft from the maximum level at the body of water. Area in front of control equipment shall be flat and not part of the shoreline. All equipment shall open away from the body of water, disconnects shall be visible looking at the body of water.

SUBSTANTIATION: While doing an inspection I found that the contractor installed the control box on the shoreline of the pond. It was inaccessible due to the steepness of the shoreline. The water level was also low and upon rise the clearance would be gone. The box also opened towards the water and the disconnect was not able to be seen posing a danger.

PANEL ACTION: Reject.

PANEL STATEMENT: See 110-26 for workspace. A detailed analysis and possibly substantial expansion of requirements should be performed to justify such a revision. With further justification, this issue should be addressed in a separate code article or by a different code-making panel.

(Log #1798)

20- 129 - (680-56(b)): Accept in Principle in Part

SUBMITTER: Noel Williams, Noel Williams Consulting

RECOMMENDATION: Replace the term "hard-service" with "hard usage or extra hard usage."

SUBSTANTIATION: The term "hard-service" is not used in Table 400-4. In addition, the existing language does not actually permit the use of extra hard usage types even though they are often used and may be preferable.

PANEL ACTION: Accept in Principle in Part.

See Proposal 20-129a.

PANEL STATEMENT: Proposal 20-129a addresses this issue.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Ryan

(Log #CP2003)

20- 129a - (680-56(b)): Accept

Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-56(B) of the rewrite of Article 680 in Proposal 20-30a.

SUBMITTER: CMP 20

RECOMMENDATION: Revise the text to read:

"Flexible cord immersed in or exposed to water shall be of a type for "extra hard usage", as designated in Table 400-4, and shall be listed and marked for the purpose."

SUBSTANTIATION: This revised language clarifies the intent of this requirement.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9

NEGATIVE: 1

NOT RETURNED: 1 Ryan

EXPLANATION OF NEGATIVE:

PEARSE: The intent of the present Section 680-56(b) has been modified where the marking requirement for "water resistant" has been changed to "mark for the purpose" without providing technical substantiation for the change.

(Log #2092)

20- 130 - (680-57(a)): Accept in Principle

Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-57(C) of the rewrite of Article 680 in Proposal 20-30a.

SUBMITTER: Joel A. Rencsok, Scottsdale, AZ

RECOMMENDATION: Add a new paragraph after the first one to read as follows:

"Portable electric signs shall not be placed within the pool or fountain, or within 5 ft (1.52 m) measured horizontally from the inside walls of the pool or fountain."

SUBSTANTIATION: The way this paragraph is now written would appear that I can place portable signs in a pool or fountain because they are not exempted by the main statement.

It also appears that this section only applies to fixed signs.

This will clarify this requirement.

Portable electric signs create a greater electrical shock risk than permanent mounted signs due to the many methods of installing these signs.

PANEL ACTION: Accept in Principle.

Revise 680-57(a) to read: "General. This section covers electric signs installed within or adjacent to fountains."

Add a new paragraph (g) to read as follows: "Portable Electric Signs. Portable electric signs shall not be placed within the fountain or within 5 ft (1.5 m) measured horizontally from the inside walls of the fountain."

PANEL STATEMENT: The panel believes that this revision will address the submitter's concerns more clearly. This will be incorporated in the editorial rewrite of Article 680, Proposal 20-30a, but in slightly revised language.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

(Log #990)

20- 132 - (680-62(d)): Accept in Principle
Note: It is the understanding of the Technical Correlating Committee that the Panel Action is covered by 680-62(C) of the rewrite of Article 680 in Proposal 20-30a.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(d) Methods of Bonding. All metal parts ~~associated with the tub~~ required to be bonded by (c) above, shall be bonded by any of the following methods: (remainder unchanged).
SUBSTANTIATION: Editorial. Cables, raceways, and metal piping covered by (c)(3) but not associated with the tub are required to be bonded, and the method of bonding in this subsection should apply.
PANEL ACTION: Accept in Principle.
Revise to 680-62(d) to read as follows:
"(d) Methods of Bonding. All metal parts required to be bonded by this section shall be bonded by any of the following methods: (remainder unchanged)."
PANEL STATEMENT: The panel's version is simpler.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Ryan

(Log #991)

20- 133 - (680-73): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Bonding. All metal piping systems, noncurrent-carrying metal parts of ~~electric equipment and~~ pump motors, and other electric equipment associated with the hydromassage tub, and other metal piping, raceways, cables, or electric equipment within 5 ft (1.52 m) measured horizontally, of the inside walls of the tub and not separately from the tub area by a permanent barrier shall be bonded together using a solid copper bonding jumper, insulated ~~covered~~ or bare, not smaller than No. 8 ~~solid.~~ (remainder unchanged).
SUBSTANTIATION: "Electric equipment and pump motors" is a redundancy. It seems prudent to include metal electric equipment not associated with the tub if within 5 ft and not separately by a barrier. "Noncurrent-carrying" is technically more correct. Literal wording does not require a solid conductor, only one not smaller than No. 8 solid. A stranded No. 8 is not smaller in circular mil area and is larger in diameter than a solid No. 8.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not consider a hydromassage tub the same as a hot tub, spa, or pool. The submitter does not provide substantiation to support these additional requirements.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10

ARTICLE 690 — SOLAR PHOTOVOLTAIC SYSTEMS

(Log #3961)

3- 142 - (690): Reject
SUBMITTER: Neil F. LaBrake, Jr., Niagara Mohawk Power Corp.
RECOMMENDATION: Revise and change Article 690 in its entirety as shown:
ARTICLE 690 – Alternate Energy Source Systems: Solar Photovoltaic, Fuel Cell, Etc. ~~Systems~~
A. General
690-1. Scope. The provisions of this article apply to alternate ~~solar photovoltaic~~ electrical energy systems including the array circuit(s), reformer, stack, inverter(s), transfer switch(es), and controller(s) for such systems [See Figure 690-1(a) and (b)]. Alternate energy source ~~Solar photovoltaic~~ systems covered by this article may be interactive with other electrical power production sources or stand alone, with or without electrical energy storage such as batteries. These systems may have ac or dc output for utilization.
FPN: NFPA 853 categorizes fuel cells of 50 kVA or smaller differently than fuel cells sized larger than 50 kVA. Fuel cells with ratings greater than 50 kVA are generally used in structures larger than single-family dwellings. However, single fuel cell systems may be paralleled with other fuel cell systems in order to increase the overall output rating at a site.
Some fuel cell designs do not require the storage of hydrogen. The hydrogen is used up in the fuel cell stack immediately after being reformed from another fuel. Fuel cell exhaust products may contain a small quantity of hydrogen gas. Proper ventilation and exhaust dilution using approved venting techniques will render the unit safe in non-hazardous classified areas. In compliance with all applicable codes it shall be permissible for the fuel cell system to be installed and operated in a non-hazardous classified location. An example of such a non-hazardous designation applied to a device that uses a potentially combustible gas is a natural gas or propane forced air furnace installed in a single-family dwelling.
Figure 690-1(a) Identification of solar photovoltaic system components.
<<Show existing NEC figure here.>>
Figure 690-1(b) Identification of solar photovoltaic system components in common system configurations.
<<Show existing NEC figure here.>>
690-2. Definitions
Alternating-Current Module (Alternating-Current Photovoltaic Module). A complete, environmentally protected unit consisting of solar cells, optics, inverter, and other components, exclusive of tracker, designed to generate ac power when exposed to sunlight.
Array. A mechanically integrated assembly of modules or panels with a support structure and foundation, tracker, and other components, as required, to form a direct-current power-producing unit.
Backfeed. To energize a section of premises wiring that is supplied from a source other than its normal source.
Blocking Diode. A diode used to block reverse flow of current into a photovoltaic source circuit.
Charge Controller. Equipment that controls dc voltage or dc current, or both, used to charge a battery.
Charge Controller. Equipment that controls dc voltage or dc current, or both, used to charge a battery.
Electrical Production and Distribution Network. A power production, distribution, and utilization system, such as a utility system and connected loads, that is external to and not controlled by the alternate energy source ~~photovoltaic power~~ system.
Fuel Cell. An electrochemical system that continuously consumes a fuel to produce an electrical current. The main chemical reaction used in a fuel cell for producing electrical power is not combustion as defined by other codes. There may, however, be forms of combustion used within the overall fuel cell system.
Fuel Cell System. The complete aggregate of equipment used to convert gas fuel into usable electricity. A fuel cell system typically consists of a reformer, stack, power conditioner, and auxiliary equipment.
Hybrid System. A system comprised of multiple power sources. These power sources may include photovoltaic, wind, micro-hydro generators, engine-driven generators, and others, but do not include electrical production and distribution network systems. Energy storage systems, such as batteries, do not constitute a power source for the purpose of this definition.
Interactive System. An alternate energy source ~~solar photovoltaic~~ system, such as fuel cell or solar photovoltaic types, that operates in parallel with and may deliver power to an electrical production and distribution network. For the purpose of this definition, an energy storage subsystem of a solar photovoltaic system, such as a battery, is not another electrical production source.
Inverter. Equipment that is used to change voltage level or waveform, or both, of electrical energy. Commonly, an inverter [also known as a power conditioning unit (PCU) or power conversion system (PCS)] is a device that changes dc input to an ac output. Inverters may also function as battery chargers that use alternating current from another source and convert it into direct current for charging batteries.
Inverter Input Circuit. Conductors between the inverter and the battery in stand-alone systems or the conductors between the inverter

and the alternate energy source ~~photovoltaic~~ output circuits for electrical production and distribution network.

Inverter Output Circuit. Conductors between the inverter and an ac load center for stand-alone systems or the conductors between the inverter and the service equipment or another electric power production source, such as a utility, for electrical production and distribution network.

Module. A complete, environmentally protected unit consisting of solar cells, optics, and other components, exclusive of tracker, designed to generate dc power when exposed to sunlight.

Output Circuit. The equipment used to connect an alternate energy source such as a fuel cell system to its electrical point of delivery to the premise wiring. In the case of sites that have paralleled, multiple units connected together, the term *output circuit* refers also to the equipment used to electrically interconnect the individual systems.

Panel. A collection of modules mechanically fastened together, wired, and designed to provide a field-installable unit.

Photovoltaic Output Circuit. Circuit conductors between the photovoltaic source circuit(s) and the inverter or dc utilization equipment.

Photovoltaic Power Source. An array or aggregate of arrays that generates dc power at system voltage and current.

Photovoltaic Source Circuit. Circuits between modules and from modules to the common connection point(s) of the dc system.

Piping System. All piping, valves and fittings used to connect the fuel cell system to the point of delivery.

Point of Common Coupling. The point at which the premises wiring and output circuit of an alternate energy source interface occurs. Typically, this is within the premise side of the service point.

Power Conditioner. The subsystem that converts the direct current from an alternate energy source such as a fuel cell stack subsystem, into alternating current of the proper voltage, frequency and phase angle compatible with power quality and power demand of the electrical load supplied.

Reformer. The subsystem that converts the gas supplied to the fuel cell into a hydrogen-rich mixture capable of being used by the fuel cell stack for producing electrical power.

Solar Cell. The basic photovoltaic device that generates electricity when exposed to light.

Solar Photovoltaic System. The total components and subsystems that, in combination, convert solar energy into electrical energy suitable for connection to a utilization load.

Stand-Alone System. A solar photovoltaic system that supplies power independently of an electrical production and distribution network.

System Voltage. The dc voltage output of the alternate energy source (e.g. solar photovoltaic array or fuel cell stack) or ac output voltage of the power conditioner, whichever is larger. For 3-wire or multiwire installations, including 2-wire circuits connected to 3-wire systems, the system voltage shall be the highest voltage between any two conductors that supplies the load.

~~**System Voltage.** The dc voltage of any photovoltaic source circuit or output circuit. For 3-wire or multiwire installations, including 2-wire circuits connected to 3-wire systems, the system voltage shall be the highest voltage between any two conductors.~~

690-3. Other Articles. Wherever the requirements of other articles of this Code and Article 690 differ, the requirements of Article 690 shall apply.

690-4. Installation

(a) Alternate Energy Source ~~Solar Photovoltaic~~ System. An alternate energy source ~~solar photovoltaic~~ system, such as a solar photovoltaic or fuel cell system, shall be permitted to supply a building or other structure in addition to any service(s) of another electricity supply system(s).

(b) Conductors of Different Systems. Alternate energy ~~Photovoltaic~~ source circuits and alternate energy ~~photovoltaic~~ output circuits shall not be contained in the same raceway, cable tray, cable, outlet box, junction box, or similar fitting as feeders or branch circuits of other systems, unless the conductors of the different systems are separated by a partition or are connected together.

(c) Module Connection Arrangement. The connections to a module or panel shall be arranged so that removal of a module or panel from a photovoltaic source circuit does not interrupt a grounded conductor to another photovoltaic source circuit. Sets of modules interconnected as systems rated at 50 volts or less, with or without blocking diodes, and having a single overcurrent device shall be considered as a single-source circuit. Supplementary overcurrent devices used for the exclusive protection of the photovoltaic modules are not considered as overcurrent devices for the purpose of this section.

(d) Grounded Conductor. Alternate energy source power conditioner grounded conductors shall not be disconnected while the alternate energy source output circuit is energized. Bonding shall be in accordance with Article 250. A power conditioner package that incorporates the dwelling's main distribution panel as a single unit shall be treated as a separately derived system in accordance with Article 250.

(e) ~~(d)~~ Equipment. Power conditioners using inverters or motor generators shall be identified for use in alternate energy source ~~solar photovoltaic~~ systems.

690-5. Ground-Fault Protection. Alternate energy sources ~~Roof-mounted dc photovoltaic arrays~~ located in ~~on~~ dwellings shall be provided with dc ground-fault protection to reduce fire hazards.

(a) Ground-Fault Detection and Interruption. The ground-fault protection device or system shall be capable of detecting a ground fault, interrupting the flow of fault current, and providing an indication of the fault.

(b) Disconnection of Conductors. The ungrounded conductors of the faulted source circuit shall be automatically disconnected. If the grounded conductors of the faulted source circuit are disconnected to comply with the requirements of Section 690-5(a), all conductors of the faulted source circuit shall be opened automatically and simultaneously. Interrupting the ground-fault current path to open the grounded conductor of the alternate energy source ~~array~~ or faulted sections of the alternate energy source ~~array~~ shall be permitted.

(c) Labels and Markings. Labels and markings shall be applied near the ground-fault indicator at a visible location stating that if a ground fault is indicated, the normally grounded conductors may be energized and ungrounded.

690-6. Alternating-Current Modules for Photovoltaic Sources

(a) Photovoltaic Source Circuits. The requirements of Article 690 pertaining to photovoltaic source circuits shall not apply to ac modules. The photovolaic source circuit, conductors, and inverters shall be considered as internal wiring of an ac module.

(b) Inverter Output Circuit. The output of an ac module shall be considered an inverter output circuit.

(c) Disconnecting Means. A single disconnecting means, in accordance with Sections 690-15 and 690-17, shall be permitted for the combined ac output of one or more ac modules. Additionally, each ac module in a multiple ac-module system shall be provided with a connector, bolted, or terminal-type disconnecting means.

(d) Ground-Fault Detection. Alternating-current-module systems shall be permitted to use a single detection device to detect only ac ground faults and to disable the array by removing ac power to the ac module(s).

(e) Overcurrent Protection. The output circuits of ac modules shall be permitted to have overcurrent protection and conductor sizing in accordance with Section 240-4(b)(2).

B. Circuit Requirements

690-7. Maximum Voltage

(a) Maximum System Voltage. In a dc photovoltaic source circuit or output circuit, the maximum system voltage for that circuit shall be computed as the sum of the rated open-circuit voltage of the series-connected photovoltaic modules corrected for the lowest expected ambient temperature. For crystalline and multi-crystalline silicon modules, the rated open-circuit voltage shall be multiplied by the correction factor provided in Table 690-7. This voltage shall be used to determine the voltage rating of cables, disconnects, overcurrent devices, and other equipment. Where the lowest expected ambient temperature is below -40ºC (-40ºF), or where other than crystalline or multi-crystalline silicon photovoltaic modules are used, the system voltage adjustment shall be made in accordance with the manufacturer's instructions.

The maximum ac system voltage in a fuel cell output circuit is the highest nominal fuel cell power conditioner output voltage between any ungrounded conductor and ground. The maximum dc system voltage is the highest fuel cell stack output voltage.

(b) Direct-Current Utilization Circuits. The voltage of dc utilization circuits shall conform to ~~with~~ Section 210-6.

Table 690-7. Voltage Correction Factors for Crystalline and Multi-Crystalline Silicon Modules

Ambient Temperature (°C)	Correction factors for ambient temperatures below 25°C (77°F), multiply the rated open-circuit voltage by the appropriate correction factor shown below.	Ambient Temperature (°F)
25 to 10	1.06	77 to 50
9 to 0	1.10	49 to 32
-1 to -10	1.13	31 to 14
-11 to -20	1.17	13 to -4
-21 to -40	1.25	-5 to -40

(c) Photovoltaic Source and Output Circuits. In one- and two-family dwellings, alternate energy ~~photovoltaic~~ source circuits and alternate energy ~~photovoltaic~~ output circuits that do not include lampholders, fixtures, or receptacles shall be permitted to have a maximum system voltage up to 600 volts. Other installations with a maximum system voltage over 600 volts shall comply with Article 690, Part I

(d) Circuits Over 150 Volts to Ground. In one- and two-family dwellings, live parts in alternate energy ~~photovoltaic~~ source circuits and alternate energy ~~photovoltaic~~ output circuits over 150 volts to ground shall be contained within the alternate energy source enclosure and shall not be accessible to other than qualified persons while energized.

FPN: See Section 110-27 for guarding of live parts, and Section 210-6 for voltage to ground and between conductors.

690-8. Circuit Sizing and Current

(a) Computation of Maximum Circuit Current. The maximum current for the specific circuit shall be computed as follows.

(1) Photovoltaic Source Circuit Currents. The maximum current shall be the sum of parallel module rated short-circuit currents multiplied by 125 percent.

(2) Photovoltaic Output Circuit Currents. The maximum current shall be the sum of parallel source circuit maximum currents as calculated in (1).

(3) Fuel Cell Output Instantaneous Current. The maximum current shall be 50% of the rated instantaneous output current rating of the power conditioner.

(4) Fuel Cell Output Continuous Current. The maximum current shall be 100% of the rated continuous current output of the power conditioner or fuel cell stack when no power conditioner subsystem is used.

(5) The instantaneous current rating of a power conditioner shall be considered for the starting of motors. A load-shedding scheme may be used to prevent coincident starts of motors if inadequate motor starting capability is anticipated.

(6) ~~(3)~~ Inverter Output Circuit Current. The maximum current shall be the inverter continuous output current rating.

(7) ~~(4)~~ Stand-Alone Inverter Input Circuit Current. The maximum current shall be the stand-alone continuous inverter input current rating when the inverter is producing rated power at the lowest input voltage.

(b) Ampacity and Overcurrent Device Ratings. Alternate energy source ~~Photovoltaic~~ system currents shall be considered continuous. The circuit conductors and overcurrent devices shall be sized to carry not less than 125 percent of the maximum currents as computed in (a). The rating or setting of overcurrent devices shall be permitted in accordance with Sections 240-3(b) and (c). Additional circuit overcurrent devices are not required if the alternate energy source power conditioner is provided with overcurrent protection that is sufficient to protect the circuit conductors that supply the load. Equipment and conductors connected to more than one electrical source shall have sufficient protection from all sources. The contribution of fault currents from the alternate energy source output circuit and the service point supply at the point of common coupling shall be considered, such that the equipment will be capable to withstand and interrupt short circuit current.

Exception No. 1: Circuits containing an assembly together with its overcurrent device(s) that is listed for continuous operation at 100 percent of its rating shall be permitted to be utilized at 100 percent of its rating.

Exception No. 1: Service conductors covered by Section 240-31 and equipment covered by Section 230-42.

(c) Systems with Multiple Direct-Current Voltages. For a photovoltaic power source that has multiple output circuit voltages and employs a common-return conductor, the ampacity of the common-return conductor shall not be less than the sum of the ampere ratings of the overcurrent devices of the individual output circuits.

690-9. Overcurrent Protection

(a) Circuits and Equipment. Alternate energy ~~Photovoltaic~~ source ~~circuit, photovoltaic~~ and output circuits, inverter output circuit, and storage battery circuit conductors and equipment shall be protected in accordance with the requirements of Article 240. Circuits connected to more than one electrical source shall have overcurrent devices located so as to provide overcurrent protection from all sources. The output circuits of alternate energy source systems shall be permitted to have overcurrent protection and conductor sizing in accordance with Section 240-4(b)(2).

Exception: An overcurrent device shall not be required for circuit conductors sized in accordance with Section 690-8(b) and located where
a. There are no external sources such as parallel-connected source circuits, batteries, or backfeed from inverters, or
b. The short-circuit currents from all sources do not exceed the ampacity of the conductors.

FPN: Possible backfeed of current from any source of supply, including a supply through an inverter into the alternate energy ~~photovoltaic~~ output ~~circuit~~ and ~~photovoltaic~~ source circuits, is a consideration in determining whether adequate overcurrent protection from all sources is provided for conductors and modules.

(b) Power Transformers. Overcurrent protection for a transformer with a source(s) on each side shall be provided in accordance with Section 450-3 by considering first one side of the transformer, then the other side of the transformer, as the primary.

Exception: A power transformer with a current rating on the side connected toward the alternate energy ~~photovoltaic~~ power source not less than the short-circuit output current rating of the inverter shall be permitted without overcurrent protection from that source.

(c) Alternate Energy ~~Photovoltaic~~ Source Circuits. Branch-circuit or supplementary-type overcurrent devices shall be permitted to provide overcurrent protection in alternate energy ~~photovoltaic~~ source circuits. The overcurrent devices shall be accessible, but shall not be required to be readily accessible.

(d) Direct-Current Rating. Overcurrent devices, either fuses or circuit breakers, used in any dc portion of an alternate energy ~~a photovoltaic~~ power system shall be listed for use in dc circuits and shall have the appropriate voltage, current, and interrupt ratings.

690-10. Stand-Alone Systems. The premises wiring system shall be adequate to meet the requirements of this Code for a similar installation connected to a service. The wiring on the supply side of the building or structure disconnecting means shall comply with this Code except as modified by (a), (b), and (c).

(a) Inverter Output. The ac inverter output from a stand-alone system shall be permitted to supply ac power to the building or structure disconnecting means at current levels below the rating of that disconnecting means.

(b) Sizing and Protection. The circuit conductors between the inverter output and the building or structure disconnecting means shall be sized based on the output rating of the inverter. These conductors shall be protected from overcurrents in accordance with Article 240. The overcurrent protection shall be located at the output of the inverter.

(c) Single 120-Volt Supply. The inverter output of a stand-alone alternate energy source ~~solar photovoltaic~~ system shall be permitted to supply 120 volts to single-phase, 3-wire 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less than the rating of the neutral bus in the service equipment. This equipment shall be marked
WARNING — SINGLE 120-VOLT SUPPLY — DO NOT CONNECT MULTIWIRE BRANCH CIRCUITS!

C. Disconnecting Means

690-13. All Conductors. Means shall be provided to disconnect all current-carrying conductors of an alternate energy ~~a photovoltaic~~ power source from all other conductors in a building or other structure. Where a circuit grounding connection is not designed to be automatically interrupted as part of the ground-fault protection system required by Section 690-5, a switch or circuit breaker used as a disconnecting means shall not have a pole in the grounded conductor.

FPN: The grounded conductor may have a bolted or terminal disconnecting means to allow maintenance or troubleshooting by qualified personnel.

690-14. Additional Provisions. The provisions of Article 230, Part F, as modified by (a) and (b), shall apply to the alternate energy ~~photovoltaic~~ power source disconnecting means.

(a) Disconnecting Means. The disconnecting means shall not be required to be suitable as service equipment and shall be rated in accordance with Section 690-17.

(b) Photovoltaic System Equipment. Equipment such as photovoltaic source circuit isolating switches, overcurrent devices, and blocking diodes shall be permitted on the photovoltaic side of the photovoltaic disconnecting means.

690-15. Disconnection of Photovoltaic Equipment. Means shall be provided to disconnect equipment, such as inverters, batteries, charge controllers, and the like, from all ungrounded conductors of all sources. If the equipment is energized from more than one source, the disconnecting means shall be grouped and identified.

A single disconnecting means in accordance with Section 690-17 shall be permitted for the combined ac output of one or more inverters or ac modules in an interactive system.

690-16. Fuses. Disconnecting means shall be provided to disconnect a fuse from all sources of supply if the fuse is energized from both directions and is accessible to other than qualified persons. Such a fuse in an alternate energy ~~a photovoltaic~~ source circuit shall be capable of being disconnected independently of fuses in other alternate energy ~~photovoltaic~~ source circuits.

690-17. Switch or Circuit Breaker. The disconnecting means for ungrounded conductors shall consist of a manually operable switch(es) or circuit breaker(s)

1. Located where readily accessible,
2. Externally operable without exposing the operator to contact with live parts,
3. Plainly indicating whether in the open or closed position, and
4. Shall have an interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment.

Where all terminals of the disconnecting means may be energized in the open position, a warning sign shall be mounted on or adjacent to the disconnecting means. The sign shall be clearly legible and shall read substantially:

WARNING — ELECTRIC SHOCK HAZARD — DO NOT TOUCH TERMINALS — TERMINALS ON BOTH THE LINE AND LOAD SIDES MAY BE ENERGIZED IN THE OPEN POSITION.

Exception No. 1: A disconnecting means located on the dc side shall be permitted to have an interrupting rating less than the current-carrying rating where the system is designed so that the dc switch cannot be opened under load.

Exception No. 2: A connector shall be permitted to be used as an ac or dc disconnecting means provided that it complies with the requirements of Section 690-33 and is listed and identified for the use.

690-18. Installation and Service of an Array. Open circuiting, short circuiting, or opaque covering shall be used to disable an array or portions of an array for installation and service.

FPN: Photovoltaic modules are energized while exposed to light. Installation, replacement, or servicing of array components while a module(s) is irradiated may expose persons to electric shock.

D. Wiring Methods

690-31. Methods Permitted

(a) Wiring Systems. All raceway and cable wiring methods included in this Code and other wiring systems and fittings specifically intended and identified for use on alternate energy source systems ~~a photovoltaic arrays~~ shall be permitted. Where wiring devices with integral enclosures are used, sufficient length of cable shall be provided to facilitate replacement.

(b) Single Conductor Cable. Types SE, UF, and USE single-conductor cable shall be permitted in alternate energy ~~photovoltaic~~ source circuits where installed in the same manner as a Type UF multiconductor cable in accordance with Article 339. Where exposed to direct rays of the sun, Type UF cable identified as sunlight-resistant or Type USE cable shall be used.

(c) Flexible Cords and Cables. Flexible cords and cables, where used to connect the moving parts of tracking photovoltaic ~~PV~~ modules, shall comply with Article 400 and shall be of a type identified as a hard service cord or portable power cable; shall be suitable for extra-hard usage, listed for outdoor use, water resistant, and sunlight resistant. Allowable ampacities shall be in accordance with Section 400-5. For ambient temperatures exceeding 30ºC (86ºF), the ampacities shall be derated by the appropriate factors given in Table 690-31(c).

Table 690-31(c). Correction Factors

Ambient Temperature (ºC)	Temperature Rating of Conductor Ambient Temperature 60ºC(140ºF) 90ºC(194ºF)	75ºC(167ºF) 105ºC(221ºF)	Ambient Temperature (ºF)
30	1.00	1.00	1.00
	1.00	86	
31–35	0.91	0.94	0.96
	0.97	87–95	
36–40	0.82	0.88	0.91
	0.93	96–104	
41–45	0.71	0.82	0.87
	0.89	105–113	
46–50	0.58	0.75	0.82
	0.86	114–122	
51–55	0.41	0.67	0.76
	0.82	123–131	
56–60	—	0.58	0.71
	0.77	132–140	
61–70	—	0.33	0.58
	0.68	141–149	
71–80	—	—	0.41
	0.58	150–158	

(d) Small Conductor Cables. Single-conductor cables listed for outdoor use that are sunlight resistant and moisture resistant with sizes No. 16 and No. 18 shall be permitted for module interconnections where such cables meet the ampacity requirements of Section 690-8. Section 310-15 shall be used to determine the cable ampacity and temperature derating factors.

690-32. Component Interconnections. Fittings and connectors that are intended to be concealed at the time of on-site assembly, where listed for such use, shall be permitted for on-site interconnection of alternate energy system modules, array or other ~~array~~ system components. Such fittings and connectors shall be equal to the wiring method employed in insulation, temperature rise, and fault-current withstand, and shall be capable of resisting the effects of the environment in which they are used.

690-33. Connectors. The connectors permitted by Article 690 shall comply with (a) through (e).

(a) Configuration. The connectors shall be polarized and shall have a configuration that is noninterchangeable with receptacles in other electrical systems on the premises.

(b) Guarding. The connectors shall be constructed and installed so as to guard against inadvertent contact with live parts by persons.

(c) Type. The connectors shall be of the latching or locking type.

(d) Grounding Member. The grounding member shall be the first to make and the last to break contact with the mating connector.

(e) Interruption of Circuit. The connectors shall be capable of interrupting the circuit current without hazard to the operator.

690-34. Access to Boxes. Junction, pull, and outlet boxes located behind modules or panels shall be installed so that the wiring contained in them can be rendered accessible directly or by displacement of a module(s) or panel(s) secured by removable fasteners and connected by a flexible wiring system.

E. Grounding

690-41. System Grounding. For an alternate energy ~~a photovoltaic~~ power source, one conductor of a 2-wire system rated over 50 volts and a neutral conductor of a 3-wire system shall be solidly grounded.

Exception: Other methods that accomplish equivalent system protection and that utilize equipment listed and identified for the use shall be permitted.

FPN: See Section 250-2(a).

690-42. Point of System Grounding Connection. The dc circuit grounding connection shall be made at any single point on the alternate energy source ~~photovoltaic~~ output circuit.

FPN: Locating the grounding connection point as close as practicable to the alternate energy ~~photovoltaic~~ source will better protect the system from voltage surges due to lightning.

690-43. Equipment Grounding. Exposed noncurrent-carrying metal parts of module frames, equipment, and conductor enclosures shall be grounded regardless of voltage.

690-45. Size of Equipment Grounding Conductor. The equipment grounding conductor shall be not smaller than the required size of the circuit conductors in systems where the available alternate energy ~~photovoltaic~~ power source short-circuit current is less than twice the current rating of the overcurrent device. In other systems, the equipment grounding conductor shall be sized in accordance with Section 250-122.

690-47. Grounding Electrode System. A grounding electrode system shall be provided in accordance with Sections 250-50 through 250-60.

F. Marking

690-51. Modules. Modules shall be marked with identification of terminals or leads as to polarity, maximum overcurrent device rating for module protection, and with rated

1. Open-circuit voltage
2. Operating voltage
3. Maximum permissible system voltage
4. Operating current
5. Short-circuit current, and
6. Maximum power

690-52. Alternating-Current Photovoltaic Modules. Alternating-current modules shall be marked with identification of terminals or leads, and with identification of the rated

1. Nominal operating ac voltage
2. Nominal operating ac frequency
3. Maximum ac power
4. Maximum ac current, and
5. Maximum overcurrent device rating for ac module protection

690-53. Photovoltaic Power Source. A marking, specifying the photovoltaic power source rated as follows shall be provided by the installer at the site at an accessible location at the disconnecting means for the photovoltaic power source:

1. Operating current
2. Operating voltage
3. Maximum system voltage, and
4. Short-circuit current

FPN: Reflecting systems used for irradiance enhancement may result in increased levels of output current and power.

690-54. Interactive System Point of Interconnection. All interactive system(s) points of interconnection with other sources shall be marked at an accessible location at the disconnecting means as a power source with the maximum ac output operating current and the operating ac voltage.

690-55. Fuel Cell Power Sources. A marking, specifying the fuel cell power source rating as follows shall be provided by the installer at the site at an accessible location at the disconnecting means for the fuel cell power source.

(1) Operating Voltage
(2) Output Power Rating
(3) Short Circuit Current
(4) Maximum System Voltage

690-56. Fuel Shut-Off. At the location of the primary disconnecting means of the building or circuits supplied, the location of the manual fuel shut-off valve shall be marked.

690-57. Fuel Cell Stored Energy. At the location of the primary disconnecting means of the building or circuits supplied, it shall be marked that the fuel cell unit stores electrical energy, if batteries or other energy storage device is used in the power conditioner section of the fuel cell.

690-58. DC Capacitors. DC capacitors shall have a means of discharging any stored charge whenever they are disconnected from their power source, or a warning label will be visible that warns of the hazard posed by their stored electrical energy. This label will be visible wherever a physical contact with these capacitors can be made.

G. Connection to Other Sources

690-60. Identified Interactive Equipment. Only inverters and ac modules listed and identified as interactive shall be permitted in interactive systems.

690-61. Output Characteristics. The output of an alternate energy source system operating in parallel with another electric supply system shall be compatible with the voltage, wave shape, and frequency of the system to which it is connected.

FPN: The term compatible does not necessarily mean matching the primary source wave shape.

690-62~~61~~. Loss of Interactive System Power. An inverter or an ac module in an interactive alternate energy ~~solar photovoltaic~~ system shall automatically de-energize its output to the connected electrical production and distribution network upon loss of voltage in that system and shall remain in that state until the electrical production and distribution network voltage has been restored.

A normally interactive alternate energy ~~solar photovoltaic~~ system shall be permitted to operate as a stand-alone system to supply loads that have been disconnected from electrical production and distribution network sources.

690-63. Non-Interactive Equipment. For alternate energy source systems installed in non-interactive systems, it shall be permitted to maintain isolation between the service point electric supply system and the alternate energy source system by means of either a manual or an automatic bus transfer switch, which may be located external or internal to the alternate energy source system enclosure. The contacts of the transfer switch shall be break-before-make to prevent interaction between the service point and the alternate energy source system. When the service conductors are connected to the transfer switch, the switch shall comply with Article 230, Parts E and F.

690-64~~62~~. Ampacity of Neutral Conductor. If a single-phase, 2-wire inverter output is connected to the neutral and one ungrounded conductor (only) of a 3-wire system or of a 3-phase, 4-wire, wye-connected system, the maximum load connected between the neutral and any one ungrounded conductor plus the inverter output rating shall not exceed the ampacity of the neutral conductor.

690-65~~63~~. Unbalanced Interconnections

(a) Single Phase. Single-phase inverters for alternate energy ~~photovoltaic~~ systems and ac modules in interactive solar photovoltaic systems shall not be connected to 3-phase power systems unless the interconnected system is designed so that significant unbalanced voltages cannot result.

(b) Three Phase. Three-phase inverters and 3-phase ac modules in interactive systems shall have all phases automatically de-energized upon loss of, or unbalanced, voltage in one or more phases unless the interconnected system is designed so that significant unbalanced voltages will not result.

690-66~~64~~. Point of Connection. The output of an alternate energy ~~a photovoltaic~~ power source shall be connected as specified in (a) or (b).

(a) Supply Side. An alternate energy ~~A photovoltaic~~ power source shall be permitted to be connected to the supply side of the service disconnecting means as permitted in Section 230-82(5).

(b) Load Side. An alternate energy ~~A photovoltaic~~ power source shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises provided that all of the following conditions are met.

1. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.
2. The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed the rating of the busbar or conductor.

Exception: For a dwelling unit, the sum of the ampere ratings of the overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.

3. The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources.

4. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor shall be marked to indicate the presence of all sources.

Exception: Equipment with power supplied from a single point of connection.

5. Equipment such as circuit breakers, if backfed, shall be identified for such operation.

FPN: Backfeeding certain devices such as ground fault circuit interrupter breakers or outlets can damage them. Manufacturers should be consulted or listing and labeling should indicate that the device may be safely backfed before subjecting the device to possible backfeed of electrical energy.

H. Storage Batteries

690-71. Installation. The power conditioner consisting of various components contained in a single enclosure shall be installed as a single unit or as a sub-component contained inside the main alternate energy source enclosure. Proper housing and guarding shall be maintained.

(a) General. Storage batteries in an alternate energy source ~~a solar photovoltaic~~ system shall be installed in accordance with the provisions of Article 480. The interconnected battery cells shall be considered grounded where the alternate energy source ~~photovoltaic~~ power source is installed in accordance with Section 690-41, Exception. Storage batteries used as part of a power conditioning section of an alternate energy source shall be installed and operated with proper safeguards.

(b) Dwellings.

1. Storage batteries for dwellings shall have the cells connected so as to operate at less than 50 volts.

Exception: Where live parts are not accessible during routine battery maintenance, a battery system voltage in accordance with Section 690-7 shall be permitted.

2. Live parts of battery systems for dwellings shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or battery type.

FPN: Batteries in solar photovoltaic systems are subject to extensive charge-discharge cycles and typically require frequent maintenance, such as checking electrolyte and cleaning connections.

(c) Current Limiting. A listed, current-limiting, overcurrent device shall be installed in each circuit adjacent to the batteries where the available short-circuit current from a battery or battery bank exceeds the interrupting or withstand ratings of other equipment in that circuit. The installation of current-limiting fuses shall comply with Section 690-16.

(d) Solid State Components. Where solid state components are used as circuit elements and are not individually protected by current limiting fuses, a listed current-limiting overcurrent protective device shall be installed and comply with Section 690-16. This fusing shall coordinate to allow the alternate energy source control system to function normally and permit an orderly shutdown of the alternate energy source system. Listed surge protection devices shall be included to protect solid state components. This surge protection shall include an indicating target or circuit annunciating compromised surge protection capability.

(e) Motor Generator Combination. A motor-generator is permitted to be used as an alternate energy source power conditioner. The motors shall comply with Article 430 and the generator shall comply with Article 445.

690-72. Charge Control. Equipment shall be provided to control the charging process of the battery. Charge control shall not be required where the design of the photovoltaic source circuit is matched to the voltage rating and charge current requirements of the interconnected battery cells, and the maximum charging current multiplied by 1 hour is less than 3 percent of the rated battery capacity expressed in ampere-hours or as recommended by the battery manufacturer. All adjusting means for control of the charging process shall be accessible only to qualified persons.

FPN: Certain battery types such as valve-regulated lead acid or nickel cadmium can experience thermal failure when overcharged.

690-73. Orderly Shutdown. The alternate energy source power conditioner shall disconnect its output to the premises wiring in an orderly manner if the battery is about to discharge below a level where it would be susceptible to damage.

690-74. Battery Interconnections. Flexible cables, as identified in Article 400, in sizes No. 2/0 and larger shall be permitted within the battery enclosure from battery terminals to nearby junction box where they shall be connected to an approved wiring method. Flexible battery cables shall also be permitted between batteries and cells within the battery enclosure. Such cables shall be listed for hard service use and identified as moisture resistant.

690-75. Equalize Voltage. On a semiannual basis a controlled overcharge shall be permitted to equalize the battery cell voltages.

FPN: Safeguards are needed to avoid thermal failure or excessive gassing when overcharging or recharging depleted batteries. Some types of batteries when severely depleted of charge will develop shorted cells. This will result in excessive gassing and heating when recharging is attempted. Nickel Cadmium batteries can be shorted when discharged to prevent voltage memory problems.

I. Systems Over 600 Volts

690-80. General. Alternate energy source ~~Solar photovoltaic~~ systems with a maximum system voltage over 600 volts dc shall comply with Articles 490, 685, 705, and other requirements applicable to installations rated over 600 volts.

690-85. Definitions. For the purposes of Part I of this article, the voltages used to determine cable and equipment ratings shall be defined as follows.

Battery Circuits. In battery circuits, the voltage shall be the highest voltage experienced under charging conditions.

Alternate Energy Source ~~Photovoltaic~~ Circuits. In dc alternate energy ~~photovoltaic~~ source circuits and alternate energy ~~photovoltaic~~ output circuits, the voltage shall be the maximum system voltage.

690-90. Interactive Systems Above 600 Volts. For single and multiple interconnected systems, the alternate energy source(s) shall not backfeed power to the service point upon a loss of electric service.

SUBSTANTIATION: This change in the Code is necessary to encompass the growing new techological sources of electrical power becoming available in the marketplace. Article 690 presently covers only photovoltaic sources. This article is the best application for this revision as these techologies are typically interconnected in premise wiring through an inverter for AC power use. Also, fuel cell technology is advancing into the marketplace as commercial units have been installed since 1997 and residential units are forthcoming within the next two years where this code change timing will meet the need. This proposal provides for a user-friendly format to avoid creating new articles in the Code that are managed in the same manner.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and panel statement on Proposal 3-206.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

COMMENT ON AFFIRMATIVE:

KREINER: I agree with the Panel Action but disagree with the Panel Statement. The Panel Action on Proposal 3-142 is to reject with a Panel Statement of a reference to Proposal 3-206 to Accept in Principle. A Panel Statement reflecting the reason for not incorporating the new text into existing Article 690 more appropriately provides the reason for rejecting this proposal. Change the Panel Statement to:

The new fuel cell technology is sufficiently different from solar photovoltaic systems to warrant its own Article and not be incorporated into Article 690. A separate Article will make it much easier for the user of this technology to determine the requirements without having to wade through the requirements for photovoltaic systems.

(Log #4060)

3- 143 - (690): Reject

SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./Rep. Edison Electric Inst.

RECOMMENDATION: Move Article 690 into CMP 15.

SUBSTANTIATION: Panel #15 is responsible for all of the articles involving auxiliary power, i.e., batteries, generators, legally required generators, optional standby generators and interconnected systems. Article 690 is no longer a stand-alone article because of the interconnection capabilities and the frequent use of Solar Photovoltaic Systems as an integral part of an auxiliary power system. Distributed Resources (DR) are becoming one of the fastest growing industries. A unified safety standard containing a set of fundamental rules applicable to any and all types of DR equipment installations, including Solar Photovoltaic Systems is currently under development by the IEEE. These rules will cover the basic requirements for connecting a DR system to the customer's wiring and/or the utility grid. These rules are needed to protect both life and property. Hopefully, these rules will be compatible with the NEC. But should need arise, having all of the Articles that pertain to DR within one Code Making Panel will make it easier to develop any NEC changes that may be appropriate.

PANEL ACTION: Reject.

PANEL STATEMENT: The assignment of Articles to the various NEC Panels is under the jurisdiction of the NEC Technical Correlating Committee and not Panel 3. This should not be submitted as a proposal to CMP-3 but as a letter to the NEC TCC.

Photovoltaic systems are a unique technology , unlike rotating machines that are the main focus of Article 705 and the other Articles addressed in CMP15.

CMP3 is a very capable, diverse group that is already educated in Photovoltaics.

Article 690 is concerned with the installation of photovoltaic systems that are 60% wiring methods (and thus appropriate for CMP3).

3- 148 - (690-2-System Voltage): Reject
SUBMITTER: Robert H. Wills, Advanced Energy, Inc.
RECOMMENDATION: Change the definition of System Voltage in 690-2 Definitions to read:
"...the system voltage shall be the highest voltage between any two conductors in the circuit."
SUBSTANTIATION: As written, this definition could be interpreted to mean the highest voltage between any two conductors in the system, including ac output conductors. There are two reasons for requesting this change:
1 for clarity, to ensure that it is the dc voltage difference on the input circuits that is used.
2 to allow for inverter topologies that have multiple array connections, or multipolar arrays in separate segments. In particular, the lowest cost inverter topology for PV systems is a bipolar PV array connected to a half-bridge inverter. Currently, this topology is not allowed due to this definition (a change that was made to the 1996 code). As cost is a major factor in the viability of PV technology, we must ensure that lowest cost designs are possible unde the code, providing that they meet safety requirements.
See proposal following for addition to 690-7 regarding bipolar arrays.
PANEL ACTION: Reject.
PANEL STATEMENT: The addition of the phrase "in the circuit" does not provide clarity as to which conductors are being referenced. The definition clearly indicates that the system voltage is determined by the output circuit but the substantiation indicates that the system voltage is determined by the input circuit.

3- 149 - (690-2-System Voltage, Photovoltaic Systems Voltage (New)): Accept in Principle
Note: The Technical Correlating Committee directs the Panel to revise the definition to remove the requirement in accordance with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum
RECOMMENDATION: Delete the definition of System Voltage and replace with the following:
Photovoltaic Systems Voltage. The direct current (dc) voltage of any photovoltaic source or photovoltaic output circuit. For bipolar or multiwire installations including 2-wire circuits connected to bipolar systems, the PV systems voltage shall be the highest voltage between any two dc conductors.
SUBSTANTIATION: Defines terms used in this article and updates terminology.
PANEL ACTION: Accept in Principle.
Delete the definition of System Voltage in the existing code, change "direct current (dc) in the first phrase of the proposal to "dc" in the proposed text, change "PV" in the second sentence of the proposal to "photovoltaic" to read as follows:
"Photovoltaic Systems Voltage. The direct current (dc) voltage of any photovoltaic source or photovoltaic output circuit. For bipolar or multiwire installations, ~~including 2-wire circuits connected to bipolar systems~~ the PV systems voltage shall be the highest voltage between any two dc conductors."
PANEL STATEMENT: The reference to 2-wire circuits connected to Bipolar systems was removed as the maximum voltage would be established between any two DC conductors. The changes were editorial in nature to provide consistency and clarity.

(Log #4061)

3- 150 - (690-3): Reject

SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./Rep. Edison Electric Inst.

RECOMMENDATION: Revise text to read as follows:

690.3 Other Articles. Wherever the requirements of other articles of this code and Article 690 differ, the requirements of Article 690 shall apply, unless the system is operated in parallel with another source of power, then Article 705 shall apply.

SUBSTANTIATION: Many States require utilities to buy back power produced by Independent Power Producers (IPPs). Solar Photovoltaic Systems (SPVS) are one of the sources used by the IPPs to supply this power. The States require that the amount of power supplies by the IPPs be measured VIA "net metering". Net metering implies parallel operation with the utility grid. Parallel operation requires compliance with Article 705. This Code change will help assure proper Code compliance whenever the SPVS are being operated in parallel with the utility grid or some other source of power.

PANEL ACTION: Reject.

PANEL STATEMENT: The requirements for parallel operation of inverters with other systems have been carefully and thoroughly included in Article 690 over the last 6 code cycles. Article 690 was deliberately removed from Article 705 in 1999 to prevent confusion with the 705 requirements that are largely associated with rotary equipment. Fifteen years of working with PV installers, nationally recognized testing laboratories, and AHJs have established the suitability of 690 language as is. Current code language in 705-3 Exception indicates the separation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

HORMAN: The proposal should be accepted in principle. The EEI Electric Light and Power Group believes the requirements of Article 705 should apply to installations of interconnected solar power production systems typically installed under the provisions of Article 690 and to be operated in parallel with the supply to the premises wiring. Specifically, the requirements of Section 705-12 Point of Connection, Section 705-14 Output Characteristics, Section 705-22 Disconnect Device, and section 705-40 Loss of Primary Source need to be incorporated in Article 690, Part G.

Section 705-12 Point of Connection is necessary to ensure that interconnected power production systems are connected to the premises wiring system at the service rather than on a feeder or a branch circuit as permitted by 690-64(b).

Section 705-14 Output characteristics is necessary to ensure that interconnected power production systems do not adversely affect the supply system by outputting power with improper wave shape, voltage, or frequency. This requirement is necessary to limit harmonic distortion on supply voltage for other customers served from the electric utility supply system.

Section 705-22 Disconnect Device is necessary to provide a method of disconnecting the interconnected power production system from the electric supply system when the solar photovoltaic system malfunctions or requires maintenance.

Section 705-40 Loss of Primary Source and Section 690-61 should be identical. Upon loss of primary source, all electric power production sources shall be automatically disconnected from all ungrounded conductors of the primary source and shall not be reconnected until the primary source is restored.

Considering the application of Article 705 rules within Article 690 provides for the safety of the premises wiring system and the safety of the supply system or its workers when photovoltaic systems are operated in parallel with the utility supply.

(Log #2313)

3- 151 - (690-4(b)): Reject

SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum

RECOMMENDATION: Delete the text in this section and replace with the following:

"Photovoltaic (PV) source and PV output circuits having disconnects from the PV energy source shall be permitted in the same raceway or junction box with circuits from nonphotovoltaic systems. Photovoltaic source and PV output circuits shall be permitted in the same raceway or junction box with other circuits from the same PV system."

SUBSTANTIATION: The intent of the basic requirement is to prevent PV source and output circuits that may normally be energized during daylight periods from being in the same raceway with circuits of other electrical systems that are unrelated to the PV system. In many cases, there are no disconnects in these PV circuits and they are always energized during daylight hours. Repairs and operations on these "other system" circuits might be affected by the always-energized PV circuits. "Other system" circuits include ac grid power conductors, telecomm circuits, or radio frequency cables. The term "other systems" was not clear, and the text has been revised accordingly. The text was also revised from the negative to the positive.

The first sentence of the proposed addition allows same-raceway installations if the PV circuits have an available disconnect provision that can deenergize these PV circuits. These PV source and output circuits then become no different than any other circuit in a multiple circuit raceway.

The second sentence recognizes that persons working on any circuits associated with the PV system (inverter ac outputs, control circuits, etc.) will be aware of the nature of the PV source circuits and take proper precautions. It allows any circuits from the same PV system to be in the same raceway without restriction.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed addition of a disconnect to the PV system would not keep inadvertent interconnection of the regular power system, if used, or the possible shorting of the regular system to the PV system , from occurring which was the reason for the wording in this section of the present Code. The title of this Section, Conductors of Different Systems, makes the second sentence in the proposal unnecessary. PV circuits of the same system can already be installed in the same raceway or junction box.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

BOWER: I vote in the negative because the Panel Statement does not appear to be consistent with the rest of the NEC, where multiple power systems are not prevented from being in the same raceway. Interconnection is not the issue here. Cutting into a live PV source circuit when working on the other system is the issue here. This is why the original 690-4(b) spelled out PV source circuits and not all PV circuits. Inspectors are often confused in this area. They generally do not interpret the current wording as allowing even circuits from the same PV system (e.g., inverter circuits) in the same raceway with the PV source circuits. The proposed requirement for a disconnect on the PV source circuit provides the ability to make this circuit as dead as any other circuit and should be no different than any other combination of ac circuits. I do affirm the elimination of the proposed second sentence.

(Log #2314)

3- 152 - (690-4(c)): Accept in Part

SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum

RECOMMENDATION: Delete the last two sentences from this paragraph.

They are: "Sets of modules interconnected as systems rated at 50 volts or less, with or without blocking diodes, and having a single overcurrent device shall be considered as a single-source circuit. Supplementary overcurrent devices used for the exclusive protection of the photovoltaic modules are not considered as overcurrent devices for the purpose of this section."

SUBSTANTIATION: These sentences conflict with the requirement established by labels on listed photovoltaic modules for a series module protective fuse on each module or string of modules. The first sentence in this section establishes the safety requirement. The industry is now using source circuit combiners to meet the requirement.

The labeling requirements for modules are being coordinated with Underwriters Laboratories (UL) to indicate on the module label or in the instructions, the maximum number of modules that may be connected in parallel.

PANEL ACTION: Accept in Part.
Delete the following sentence from the existing code text:
"Sets of modules interconnected as systems rated at 50 volts or less, with or without blocking diodes, and having a single overcurrent device shall be considered as a single-source circuit."
Retain the last sentence in the existing code text that reads as follows: "Supplementary overcurrent devices used for the exclusive protection of the photovoltaic modules are not considered as overcurrent devices for the purpose of this section."
PANEL STATEMENT: The present wording of the second sentence in this section was removed since a single overcurrent protection device might allow backfed fault current to the individual circuit. Sets of modules with a series protective fuse on each module or string of modules could still be considered as a single source circuit. The last sentence provides clarity that individual fuses used as supplementary protection of modules, series or parallel, are not considered as the overcurrent protection devices required by 690-9. To delete this last sentence may provide more questions in the field and may even cause some inspectors to require these overcurrent protection devices to comply with Article 240 as stated in Section 690-9.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3790)

3- 153 - (690-4(c)): Reject
SUBMITTER: Patrick B. Kiernan, Eco Electric, Inc.
RECOMMENDATION: Revise the existing:
"Sets of modules interconnected as systems rated at 50 volts or less,"
to read as:
"Sets of modules interconnected as systems with a rated operating voltage of 80 volts or less,"
SUBSTANTIATION: The intent of this 690-4(c) is to reduce the potential shock hazard when removing PV modules or panels for repair or replacement. The restrictions on wiring arrangements created by this article do not substantially improve safety beyond that already provided by 690-18. In practice, it is very simple to minimize the shock hazards of interrupted PV source circuit conductors by disconnecting the grounded and ungrounded conductors at affected PV modules prior to removal of any modules or panels.
Normally, if the removal of a module or panel interrupts the grounded conductor to another PV source circuit, it also interrupts the ungrounded conductor. (This is universally true when the grounded and ungrounded conductors are in the same conduit, and generally true even when single-conductor cable is used.) When both the grounded and ungrounded conductors are interrupted, the primary shock hazard exists between these two conductors rather than between either conductor and ground. This is the same shock hazard that exists in the source circuit in which a panel or module is being removed.
So if the person(s) removing a module or panel can safely service that source circuit, they should also be able to safely handle additional interrupted source circuits as required.
It should also be noted that PV modules are typically warranted from 10 to 25 years -- longer than most products addressed by the NEC. It seems unwise to add complexity and expense to systems when it is very unlikely that modules or panels will need replacement.
This proposal is an attempt to balance the desire to reduce shock hazards while minimizing system complexity and cost. The suggested limit of 80 volts can be safely managed using the practices required in 690-18. This voltage level applies to systems using readily available 48 volt nominal equipment.
PANEL ACTION: Reject.
PANEL STATEMENT: Increasing from 50 volts or less to 80 volts or less does not reduce the potential hazard but seems to increase the potential hazard. The submitter did not provide any technical substantiation for this increase in voltage from 50 to 80 volts.
The recognized cutoff level for safety in OSHA regulation 29CFR1910.333 is 50 volts.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1679)

3- 154 - (690-4(e)): Reject
SUBMITTER: Steve M. Rion, Colorado State Electrical Board
RECOMMENDATION: Sufficient space shall be provided and maintained about solar voltaic equipment to permit ready and safe operation in accordance with section 110-26[a].
SUBSTANTIATION: I made this proposal last code cycle and the code panel missed my point. Electricians and electrical inspectors are aware of the working clearance requirements found elsewhere in the NEC. Unfortunately many solarvoltaic systems are being installed by homeowners, quasi "solar contractors" and other individuals or firms that are not electricians. Whether you want to admit it or not the NEC is being used as a design manual, even by the installer most qualified to do this work. Working clearance is often overlooked, especially above the battery box, where it is not uncommon to have several thousand amperes of fault current available at the battery terminals with the inverter and charge controller mounted above. Imagine if you will, leaning over the battery box to service the photovoltaic equipment, the consequences could be fatal. We routinely inspect these systems in a varitey of applications and working clearance is the most common code violation found in stand alone systems, often times requiring great expense to bring into compliance. Section 110-26 is referenced in other NEC articles, by including it in Article 690 everyone from the professional installer to the grass roots solar installer would understand that it is required. One of the largest manufacturers of
inverters used in photovoltaic systems has an installation drawing included with its inverters that shows an inverter with an A/C panelboard mounted next to it with a large battery system mounted below, completely encroaching into the working clearance. Let's help the industry and include a reference to 110-26 in Article 690, whether it be the text suggested or a fine print note.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 90-3 already states that Chapters 1 through 4 apply except as amended or supplemented by Chapters 5, 6, or 7. Section 110-26 would then apply, unless amended by Article 690, so the addition of the proposed text is not necessary.

3- 161 - (690-6(c)): Reject
SUBMITTER: Gregory A. Kern, Applied Power Corp.
RECOMMENDATION: Delete the sentence, "~~Additionally, each ac module in a multiple ac module system shall be provided with a connector, bolted, or terminal-type disconnecting means.~~"
SUBSTANTIATION: This statement combined with 690-33, which appears to provide a definition of "connectors, and 690-3, which states that the requirements of 690 override all other sections of the Code, can be interpreted by inspectors to preclude the use of pressure connectors for connection of ac modules to a branch circuit. Also, this is not a requirement for other ac appliances, why must we make it one for ac modules? By deleting this sentence, we allow other, more appropriate, sections of the Code to define how the ac module may be connected to a branch circuit. This appears to be a carry over from dc modules, but should not apply to ac modules.
Also, in 690-15, the Code states "A single disconnecting means in accordance with Section 690-17 shall be permitted for the combined ac output of one or more inverters or ac modules in an interactive system." So this requirement in 690-6(c) conflicts with the existing language in 690-15.
Applied Power Corporation is a distributor, systems integrator and manufacturer of pv systems and ac modules. Applied Power Corporation owns and operates Solar Electric Specialties, Alternative Energy Engineering and Ascension Technology.
PANEL ACTION: Reject.
PANEL STATEMENT: The last sentence in Section 690-6(c) provides three different methods of disconnecting each ac module in a multiple ac module system that allows easy disconnection of the system. This section ties in with Sections 690-15, 690-17, and 690-33 to allow easy disconnection of modules. Section 690-33 provides very specific information on connectors for photovoltaic systems and since this equipment is very unique, it should remain in Article 690.

3- 166 - (690-6(d)): Reject
SUBMITTER: Gregory A. Kern, Applied Power Corp.
RECOMMENDATION: Delete the entire paragraph 690-6(d).
SUBSTANTIATION: Such standard equipment does not exist. Therefore, we suggest even this permissive language be removed from the Code.

Existing GFCIs are not rated for backfeed operation and are not tested by UL 943, "Ground-Fault Circuit Interrupters" for use with ac modules or other pv inverters connected to the Load side of the GFCI. My company's SunSine AC Modules will typically shutdown in 4 to 6 milliseconds on a ground fault GFCI trip, such as pushing the Trip button. However, I cannot guarantee that other companies AC Modules will shut down as fast. There are NO tests in UL1741 or UL943 that verify compatibility between AC Modules and GFCIs. The problem is that if an ac module inverter fails to shut down fast enought it is possible to burn up the trip coil which is connected to the Load side of the GFCI. GFCI installation instructions typically indicate "not for backfeed operation" just to prevent such burning up of the trip coil. In an extreme case, it might be possible to start a fire in the GFCI, we don't know because GFCIs are not tested for this condition.

It might be possible that expensive industrial ground-fault relay equipment could be found and used for such ground fault detection. But this would impose a severe cost penalty on ac modules which is not applied to other pv inverters or systems, and we believe was not the original intent of adding this to the Code in the first place. AC ground-fault protection is not permitted or required for inverter output circuits, so it should not be permitted or required for ac modules. 690-6(b) states "The output of an ac module shall be considered an inverter output circuit". Lets treat it as such.

AC module systems are the safest kind of system with respect to dc ground faults and fire prevention. In our units, there is transformer isolation between dc circuits of each module in the system and the branch circuit. UL 1741 requires and tests for isolation between the dc and ac circuits of an ac module. There is NO way for a ground fault in the dc circuit of one module to be fed by dc from any other modules in the system or by ac from the branch circuit. A dc ground fault in one module of an ac module system will not produce ac ground fault current. This is a level of safety presently not possible with a dc array. Therefore, this ground fault detection requirement has NO impact on the fire safety of ac module systems, and should not be permitted or required by this Code.

The only reason for ground fault detection and tripping is for personnel safety. GFCIs are typically used for personnel safety and are covered by UL 943. If personnel safety was the intention of the Code, then that should have been stated in the Code. But as mentioned above, we are not aware of any GFCIs that are suitable for backfeed operation, hence this equipment does not exist and should not be permitted or required by this Code.

SUBMITTER: William M. Kanzer, Evergreen Solar, Inc.
RECOMMENDATION: Revise as follows:
(d) Ground-Fault Detection. Alternating-current module systems shall not be required or permitted to use a ground fault detection device.
SUBSTANTIATION: Existing GFCIs are not rated for backfeed operation and are not tested by UL 943, "Ground-Fault Circuit Interrupters" for use with ac modules or other pv inverters connected to the Load side of the GFCI. The problem is that if an ac module inverter fails to shut down fast enough it is possible to burn up the trip coil which is connected to the load side of the GFCI. GFCI installation instructions typically indicate, "not for backfeed operation" just to prevent such burning up of the trip coil. In an extreme case, it might be possible to start a fire in the GFCI, we don't know because GFCI's are not tested for this condition.
AC ground-fault protection is not permitted or required for inverter output circuits, so it should not be permitted or required for ac modules. Section 690-6(b) states "The output of an ac module shall be considered an inverter output circuit." Let's treat it as such.
AC module systems are the safest kind of system with respect to dc ground faults and fire prevention. UL 1741 requires and tests for isolation between the dc and ac circuits of an ac module. There is NO way for a ground fault in the dc circuit of one module to be fed by dc from any other modules in the system or by ac from the branch circuit. A dc ground fault in one module of an ac module system will not produce ac ground fault current. This is a level of safety presently not possible with a dc array. Therefore, this ground fault detection requirement has NO ability to increase the fire safety of ac module systems, and should not be permitted or required by this code.
Evergreen Solar, Inc., is a manufacturer of photovoltaic modules and AC modules.
PANEL ACTION: Reject.
PANEL STATEMENT: The detection device referenced in this Section is not ground fault protection for personnel and should not be used for this application. The ground fault protection devices allowed by this Section are designed to disable the array by removing power to the ac modules. This may help reduce fire hazards where a ground fault does occur.

3- 168 - (690-6(d)): Reject
SUBMITTER: Gregory A. Kern, Applied Power Corp.
RECOMMENDATION: Delete the entire paragraph 690-6(d).
SUBSTANTIATION: Such standard equipment does not exist. Therefore, we suggest even this permissive language be removed from the code.
Existing GFCIs are not rated for backfeed operation and are not tested by UL 943, "Ground-Fault Circuit Interrupters" for use with ac modules or other pv inverters connected to the Load side of the GFCI. My company's SunSine AC Modules will typically shutdown in 4 to 6 milliseconds on a ground fault GFCI trip, such as pushing the trip button, However, I cannot guarantee that other companies. AC Modules will shut down as fast. There are NO tests in UL 1741 or UL 943 that verify compatibility between AC Modules and GFCIs. The problem is that if an ac module inverter fails to shut down fast enough it is possible to burn up the trip coil which is connected to the load side of the GFCI. GFCI installation instructions typically indicate, "not for backfeed operation" just to prevent such burning up of the trip coil. In an extreme case, it might be possible to start a fire in the GFCI, we don't know because GFCIs are not tested for this condition.
It might be possible that expensive industrial ground-fault relay equipment could be found and used for such ground fault detection. But this would impose a severe cost penalty on ac modules which is not applied to other pv inverters or systems, and we believe was not the original intent of adding this to the code in the first place. AC ground-fault protection is not permitted or required for inverter output circuits, so it should not be permitted or required for ac modules. Section 690-6(b) states "The output of an ac module shall be considered an inverter output circuit." Let's treat it as such.
AC module systems are the safest kind of system with respect to dc ground faults and fire prevention. In our units, there is transformer isolation between the dc circuits of each module in the system and the branch circuit. UL 1741 requires and tests for isolation between the dc and ac circuits of an ac module. There is NO way for a ground circuit in the dc circuit of one module to be fed by dc from any other modules in the system or by ac from the branch circuit. A dc ground fault in one module of an ac module system will not produce ac ground fault current. This is a level of safety presently not possible with a dc array. Therefore, this ground fault detection requirement has NO impact on the fire safety of ac module systems, and should not be permitted or required by this code.
The only other reason for ground fault detection and tripping is for personnel safety. GFCIs are typically used for personnel safety and are covered by UL 943. If personnel safety was the intention of the code, then that should have been stated in the code. But as mentioned above, we are not ware of any GFCIs that are suitable for backfeed operation, hence this equipment does not exist and should not be permitted or required by this code.
Applied Power Corporation is a distributor, systems integrator and manufacture of pv systems and ac modules. Applied Power Corporation owns and operates Solar Electric Specialties, Alternative Energy Engineering an Ascension Technology.

(Log #3006)

3- 170 - (690-6(f) (New)): Reject
SUBMITTER: William M. Kanzer, Evergreen Solar, Inc.
RECOMMENDATION: Create a new paragraph 690-6 (f) to read:
(f) Point of Connection. AC module systems shall be permitted to be connected to a receptacle of a branch circuit when the branch circuit wiring is rated for 1.25 times the maximum operating current of the ac module system plus the installed branch circuit protection rating.
SUBSTANTIATION: Small 100W ac module systems are becoming widely available and there is a need for safe simple connection of such systems. Many people are connecting such systems to branch circuits with 3 prong plug/receptacles on 120V circuits because they are unwilling to go to the cost and expense of installing a dedicated branch circuit. It is possible to prevent an overcurrent condition on the branch circuit conductors by following the above guideline. For example, a homeowner could then install a 300W system on a 120V 20A branch circuit, replace the 20A breaker with a 15A breaker, and be protected against overcurrent of the branch circuit wiring.
PANEL ACTION: Reject.
PANEL STATEMENT: A homeowner installing a cord and plug connected unit to a receptacle will not know what the branch circuit rating is and probably would not be able to do the calculation necessary outlined in the proposal. This proposal seems to imply that a receptacle connection would be made to an ac module developing power and transferred into the wiring system using a male attachment plug into the receptacle. This would be a violation of Section 410-56(g), last two sentences and could be a serious hazard with the energized cord cap. The proposed calculation also implies that the size of the circuit conductors would be 125% times the current of the ac module plus the rating of the branch circuit overcurrent protection device. A 15 ampere circuit breaker (120 volts times 15 amperes = 1800 watts) plus a 300 watt unit times 125% = 375 watts plus 1800 = 2175 watts divided by 120 volts = 18.125 amp conductor protected by a 15 ampere circuit breaker.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3769)

3- 175 - (690-7(e) (New)): Accept in Principle
SUBMITTER: Robert H. Wills, Advanced Energy, Inc.
RECOMMENDATION: Add Section 690-7(e) to read as follows:
(e) Multipole Source and Output Circuits. The maximum system voltage for 2-wire subcircuits of multipole photovoltaic arrays shall be the highest voltage between the conductors of that circuit providing:
(1) one conductor of each circuit is solidly grounded, or connected to a grounded power system conductor
(2) each subcircuit is connected to a separate subarray and is carried in separate cables or conduit
(3) the equipment is clearly marked:
Warning — multipole photovoltaic array. Removal of neutral or grounding conductors may result in overvoltage on array or inverter.

If these provisions are not met, the maximum system voltage shall be the highest voltage between any conductors in the photovoltaic source or input circuits.

SUBSTANTIATION: This allows for inverter topologies that have multiple array connections, or multipolar arrays in separate segments. In particular, the lowest cost inverter topology for PV systems is a bipolar PV array connected to a half-bridge inverter. Currently, this topology is not allowed due to the definition of system voltage (a change that was made to the 1996 code). As cost is a major factor in the viability of PV technology, we must ensure that lowest cost designs are possible under the code, providing that they meet safety requirements.

The likely configuration for such a system is two-dc subarrays, each 350 V dc peak, connected separately to the inverter. One subarray would be negative ground, the other, positive ground. The inverter would have 700 V available to it internally, and so would need to be listed for such service.

PANEL ACTION: Accept in Principle.

Rewrite proposal to read as follows:

"(e) Bipolar ~~Multipole~~ Source and Output Circuits. For 2-wire circuits connected to bipolar systems, the maximum system voltage shall be the highest voltage between the conductors of the 2-wire circuit if:

(1) one conductor of each circuit is solidly grounded, ~~or connected to a grounded power system conductor~~

(2) each circuit is connected to a separate subarray and ~~is carried in separate cables or conduit,~~

(3) the equipment is clearly marked with a label as follows: Warning-Bipolar ~~multipole~~ photovoltaic array. Disconnection ~~removal~~ of neutral or grounded conductors may result in overvoltage on array or inverter."

~~If these provisions are not met, the maximum system voltage shall be the highest voltage between any conductors in the photovoltaic source or input circuits.~~

PANEL STATEMENT: The word "multipole" was changed to "bipolar" where ever it appears in the proposal to match the new proposed definition in Proposal 3-146. The text in the introduction to this section was changed to be consistent with the accepted text in Proposal 3-149 which updates terminology and more clear definition of system voltage.

The phrase "or connected to a grounded power system conductor" was deleted since connection to a grounded power conductor would constitute a solidly grounded conductor already stated in (1).

The phrase "is carried in separate cables or conduit" would not be necessary if the conductor insulation is sufficient for the voltage.

In the warning marking, removal was replaced with the word "disconnection" to more accurately relate to the disconnecting of conductors in Section 690-13.

The last sentence of the proposal was deleted since the new section basically already implies that if the three provisions are not met, the maximum voltage would be between any two conductors of the system.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #2354)

3- 176 - (690-8(b)(1) (New)): Accept in Principle

SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum

RECOMMENDATION: Add new text to read:

"Overcurrent protection for photovoltaic output circuits that supply devices that internally limit the current drawn from that photovoltaic output circuit shall be permitted to be rated at less than the value computed in 690-8(b). This reduced rating shall be at least 125 percent of the limited-current value. An overcurrent device in an assembly listed for continuous operation at 100 percent of its rating shall be permitted to be used at 100 percent of its rating.

Photovoltaic output circuit conductors shall be sized in accordance with Section 690-8(b)."

SUBSTANTIATION: This addition allows the use of a smaller overcurrent device than the calculation in 690.8(B) normally requires. The reduction is allowable because certain listed devices such as charge controllers and inverters can limit the maximum current that can be drawn from a source circuit.

The second sentence ensures that the overcurrent device will not be operated at more than 80% of its rating.

The final sentence ensures that the conductors are properly sized to handle fault currents from the photovoltaic source that could result from faults on the photovoltaic side of the overcurrent device.

PANEL ACTION: Accept in Principle.

Rewrite Section 690-8(b) to incorporate the proposed change into the existing Code text as a new subsection to read as follows:

"(b) Ampacity and Overcurrent Device Ratings. Photovoltaic system currents shall be considered continuous.

(1) Sizing of Conductors and Overcurrent Devices. The circuit conductors and overcurrent devices shall be sized to carry not less than 125 percent of the maximum currents as computed in (a). The rating or setting of overcurrent devices shall be permitted in accordance with Sections 240-3(b) and (c).

Exception: Circuits containing an assembly together with its overcurrent device(s) that is listed for continuous operation at 100 percent of its rating shall be permitted to be utilized at 100 percent of its rating.

(2) Internal Current Limitation. Overcurrent protection for photovoltaic output circuits with ~~that supply~~ devices that internally limit the current ~~drawn~~ from the photovoltaic output circuit shall be permitted to be rated at less than the value computed in 690-8(b)(1). This reduced rating shall be at least 125 per cent of the limited current value. Photovoltaic output circuit conductors shall be sized in accordance with Section 690-8(b)(1).

Exception: An overcurrent device in an assembly listed for continuous operation at 100 percent of its rating shall be permitted to be utilized at 100 percent of its rating."

PANEL STATEMENT: Titles were added and separate subsections were established since the new proposed text provides an alternative to the standard calculation. The words "that" and "drawn" were removed or replaced strictly as editorial corrections.

(Log #2355)

3- 177 - (690-9(c)): Accept in Principle

SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum

RECOMMENDATION: Add the following second paragraph:

"The standard values of supplementary-type overcurrent devices allowed by this section shall have ratings in one-ampere increments from one to 15 amperes. Higher standard values shall comply with Section 240-6(a)."

SUBSTANTIATION: Section 240-6(a) sets standard values for class-type fuses. This Section allows listed supplementary-type fuses. Module-protection fuse requirements established by UL and the module label require fuses with ratings between 5 and 20 amps. For example, to increase the 8 amp required value of a module-protection fuse to the first standard value of 15 amps would create a safety problem. This proposal defines and requires that the proper fuse value be used.

PANEL ACTION: Accept in Principle.

Change the proposed text to read as follows:

"Standard values of supplementary fuse-type overcurrent devices allowed by this section shall be in one ampere size increments starting at one ampere up to and including 15 amperes. Higher standard values above 15 amperes for supplementary overcurrent devices shall be based upon the standard sizes provided in Section 240-6(a)."

PANEL STATEMENT: The proposed text was changed to provide clearer direction on the sizing of supplementary overcurrent devices for 15 ampere and smaller fuses for photovoltaic source circuits.

(Log #2356)

3- 178 - (690-9(e)): Accept in Principle

SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum

RECOMMENDATION: Add new text to read:

"A single overcurrent device shall be permitted to meet the conductor protection requirements established by Sections 690-8 and

690-9 and the photovoltaic module overcurrent protection requirements established by labels on the module."
SUBSTANTIATION: UL instructions and labeling require that a series module-protection fuse be used to protect each module from reverse currents. In series-connected strings of two or more modules, only a single overcurrent device is required to protect all of the modules in the string. The rating of this overcurrent device is normally the same as or greater than the rating of the code-required overcurrent device to protect the module interconnection conductors. Frequently, a single overcurrent device can be used to meet both of these requirements.
PANEL ACTION: Accept in Principle.
Revise the proposed text to read as follows:
"(e) Series Overcurrent Protection. In series-connected strings of two or more modules, a single overcurrent protection device shall be permitted."
PANEL STATEMENT: The new proposed text more closely follows the substantiation provided in the proposal for the suggested protection of the series connected system.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2358)

3- 179 - (690-9(f) (New)): Accept in Principle
SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum
RECOMMENDATION: Add new text to read:
"Where a single overcurrent device, allowed by Section 690-9(e), is used to protect a set of two or more parallel-connected module circuits, the ampacity of each of the module interconnection conductors shall not be less than the sum of (1) and (2).
(1) The rating of the single fuse.
(2) 125 percent of the short-circuit current from the other parallel-connected modules."
SUBSTANTIATION: Under fault conditions, the individual module conductors will be required to carry currents through the fuse from batteries or other sources plus 125 percent of the short-circuit currents from the other modules.
PANEL ACTION: Accept in Principle.
Change the proposed text to read as follows:
"690-8(d). Sizing of Module Interconnection Conductors. Where a single overcurrent device is used to protect a set of two or more parallel-connected module circuits, the ampacity of each of the module interconnection conductors shall not be less than the sum of the rating of the single fuse plus 125 percent of the short-circuit current from the other parallel-connected modules."
PANEL STATEMENT: The proposed new subsection reference to 690-9(e) is not relevant since 690-9(e) is dealing with series circuits, not parallel circuits. The title was added to more accurately reflect the intent of the proposal and comply with the Style Manual. This was relocated to 690-8 since it deals with conductor sizing. The other changes are editorial. The panel suggests for clarity the submitter provide a figure to depict the intent of the proposal.

3- 182 - (690-14(c) (New)): Accept in Principle
SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum
RECOMMENDATION: Add new text to read:
"The photovoltaic disconnecting means shall be grouped with other disconnecting means for the system. A photovoltaic disconnecting means shall not be required at the photovoltaic module or array location."
SUBSTANTIATION: To comply with the code requirements for grouping all disconnects of a power system in a single location, it is necessary to have the photovoltaic disconnecting means grouped with the other disconnecting means. Although photovoltaic modules and arrays may be located some distance away or on the roof, there is no requirement for a disconnect at the source because the source is energized in daylight whether or not the disconnect is opened.
PANEL ACTION: Accept in Principle.
Add the following new text to the proposed text:
"(c) Requirements for Disconnecting Means. Means shall be provided to disconnect all conductors in a building or other structure from the photovoltaic system conductors.
(1) Location. The photovoltaic disconnecting means shall be installed at a readily accessible location either outside of a building or structure or inside nearest the point of entrance of the system conductors.
The photovoltaic system disconnecting means shall not be installed in bathrooms.
(2) Marking. Each photovoltaic system disconnecting means shall be permanently marked to identify it as a photovoltaic system disconnect.
(3)Suitable for Use. Each photovoltaic system disconnecting means shall be suitable for the prevailing conditions. Equipment installed in hazardous (classified) locations shall comply with the requirements of Articles 500 through 517.
(4)Maximum Number of Disconnects. The photovoltaic system disconnecting means shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard.
(5)Grouping. The photovoltaic system disconnecting means shall be grouped with other disconnecting means for the system to comply

with (4). A photovoltaic disconnecting means shall not be required at the photovoltaic module or array location."
PANEL STATEMENT: The added text was modified from Part F of Article 230 to ensure that a means for disconnecting the photovoltaic system will exist at the proper location, with the proper marking and suitability of use, and with the proper maximum number of disconnecting means.

3- 185 - (690-31(c)): Accept
SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum
RECOMMENDATION: Change the last two Fahrenheit (°F) temperatures as follows:
Change 141-149 to 141-158.
Change 150-158 to 159-176.
SUBSTANTIATION: Corrects errors in the table
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1107)

3- 186 - (690-31(d)): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Change "with sizes No. 16 and No. 18" to "in sizes 16 and 18 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code. "In" is more descriptive than "with".
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2364)

3- 187 - (690-41): Accept
SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum
RECOMMENDATION: Replace the existing contents with the following:
"For a photovoltaic power source, one conductor of a two-wire system with a system voltage over 50 volts and the reference (center tap) conductor of a bipolar system shall be solidly grounded or shall use other methods that accomplish equivalent system protection in accordance with Section 250-2(a)."
SUBSTANTIATION: Updates the terminology to be consistent with new definitions and definitions in the 1999 NEC. Moves the exception into the basic requirement. All equipment in the code is required to be listed so that 1999 NEC requirement for listed devices is not needed. The proposal also merges the FPN into the requirement to ensure that the device used is fully defined.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3798)

3- 188 - (690-43): Reject
SUBMITTER: Patrick B. Kiernan, Eco Electric, Inc.
RECOMMENDATION: Add the following:
"Exposed noncurrent carrying metal parts of photovoltaic modules secured to and in electrical contact with a metal rack or structure provided for module support and grounded by one of the means indicated in Section 250.134, shall be considered effectively grounded. Separate bonding jumpers shall not be required at each module. "
SUBSTANTIATION: This proposal clarifies the equipment grounding requirements for photovoltaic modules, panels, and arrays and is entirely consistent with the grounding requirements of other equipment covered by the NEC.
In the absence of clear guidelines, some jurisdictions have been requiring individual bonding jumpers to each module frame even when these frames were effectively grounded according to 250-134 and 250-136.

PANEL ACTION: Reject.
PANEL STATEMENT: There was no technical substantiation submitted with the proposal in his second sentence justifying the deletion of separate bonding jumpers from module to module and module to frame. The overall system must be provided with a equipment grounding conductor connection to facilitate the operation of overcurrent protection devices and to bond the overall system together. Adverse conditions often affect frames and module interconnections.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2365)

3- 189 - (690-45): Reject
SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum
RECOMMENDATION: Replace the existing paragraph with the following:
"Where not protected by the ground-fault protection equipment required by Section 690-5, the equipment-grounding conductor for PV source and PV output circuits shall be sized for 125 percent of the PV-originated short-circuit currents in that circuit. Where protected by the ground-fault protection equipment required by Section 690-5, the equipment-grounding conductors for PV source and PV output circuits shall be sized in accordance with Section 250-122."
SUBSTANTIATION: When Underwriters Laboratories (UL) recently listed a PV combiner enclosure, they determined that ground faults in PV source and output circuits can result in continuous currents from the PV array flowing through the equipment-grounding conductor even after all overcurrent devices have tripped. This determination indicates that the equipment-grounding conductor for these circuits should be able to carry the currents from the PV sources. These equipment-grounding conductors should be sized at only 125 percent of the short-circuit current (Isc) since the additional 125 percent derating for continuous operation is not required. The equipment-grounding conductor (sized at 125 percent Isc) might be one size smaller than the circuit conductors (sized at 156 percent Isc) in a few systems.
If the system has a Section 690-5 ground-fault protection device installed, then the interruption of the fault current will prevent these PV currents from flowing in the equipment-grounding conductor and the increased size is not necessary. In this case, the requirements of Section 250-122 are appropriate.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter did not provide any technical substantiation for removing the requirement for the equipment grounding conductor to be not smaller than the required size of the circuit conductors where the available photovoltaic power source short-circuit current is less than twice the current rating of the overcurrent device. The second sentence of the substantiation states that this determination indicates that the equipment grounding conductor for these circuits should be able to carry the currents from the PV sources. This information should be provided to the panel to substantiate the proposed change.

(Log #992)

3- 190 - (690-47): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add new text to read as follows:
A grounding electrode conductor in accordance with Section 250-166 for grounded systems or Section 250-169 for ungrounded systems, installed in accordance with Section 250-64, shall be used to connect the grounding electrode system to the solar photovoltaic system.
SUBSTANTIATION: Referencing the requirements for the grounding electrode conductor is appropriate and helpful to code users.
PANEL ACTION: Accept in Principle.
Revise 690-47 to read as follows:
"690-47. Grounding Electrode System
(A) Alternating Current Systems. If installing an ac system, a grounding electrode system shall be provided in accordance with Sections 250-50 through 250-60. The grounding electrode conductor shall be installed in accordance with Section 250-64.
(B) Direct Current Systems. If installing a dc system, a grounding electrode system shall be provided in accordance with Section 250-166 for grounded systems or Section 250-169 for ungrounded systems. The grounding electrode conductor shall be installed in accordance with Section 250-64."
PANEL STATEMENT: The proposed text has been accepted with some editorial rewrite, given a title, and made into separate subsection (B). To cover ac system connections, the existing text from the 1999 NEC Section 690-47 has been incorporated into a new subsection (A).

(Log #2367)

3- 193 - (690-55 (New)): Accept in Principle
SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum
RECOMMENDATION: Add new text to read:
"Photovoltaic power systems employing energy storage shall also be marked with the information in (1) and (2).
(1) Maximum operating voltage including any equalization voltage
(2) Polarity of grounded circuit conductor."
SUBSTANTIATION: These additional markings will facilitate the inspection, maintenance, and operation of the system.
PANEL ACTION: Accept in Principle.
Delete the (1) and (2) in the proposal and make into a complete sentence to read as follows:
"Photovoltaic Power Systems Employing Energy Storage.
Photovoltaic power systems employing energy storage shall also be marked with the maximum operating voltage including any equalization voltage and the polarity of the grounded circuit conductor."

PANEL STATEMENT: The proposed text was revised for clarity and more user friendliness.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
BOWER: I affirm the comment that the term "labeled" should be used instead of "marked" and that the Panel Action still leaves a hole for center-tapped systems. I propose the Panel Action language should require labeling of the system grounded conductor with terms such as grounded positive, grounded negative or grounded center-tap.

(Log #2368)

3- 194 - (690-56 (New)): Accept in Principle
SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum
RECOMMENDATION: Add new text to read:
"Any structure or building with a photovoltaic power system capable of acting as a Stand-Alone System shall have a permanent plaque or other label placed in a visible location on the exterior of the building or structure with the notice (1) and information (2). For structures with a utility service entrance, the label shall be located adjacent to the service entrance, exterior meter socket, or exterior utility disconnect."
(1) This structure contains a Stand-Alone Electrical Power System
(2) Location of system disconnects (PV, battery, and other energy sources)."
SUBSTANTIATION: Facilitates the rapid shut down of all power to a building in an emergency.
PANEL ACTION: Accept in Principle.
Revise the proposed text to read as follows:
"690-56 Identification of Power Sources
(A) Facilities With Stand Alone Systems. Any structure or building with a photovoltaic power system that is not connected to a utility service source and is a stand alone system, shall have a permanent plaque or directory installed on the exterior of the building or structure at a readily visible location acceptable to the authority having jurisdiction. The plaque or directory shall provide the location of system disconnecting means and that the structure contains a stand alone electrical power system.
(B) Facilities with Utility Services and PV Systems. Buildings or structures with both utility service and a photovoltaic system shall have a permanent plaque or directory providing the location of the service disconnecting means and the photovoltaic system disconnecting means, if not located at the same location."
PANEL STATEMENT: The submitted text was restructured to comply with the 1999 NEC Style Manual to provide titles and separate subsections where dealing with different information.
The panel had a lengthy discussion regarding the location of the required plaque.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2369)

3- 195 - (690-64(b)(5)): Reject
SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum
RECOMMENDATION: Delete this section.
SUBSTANTIATION: With utility-interactive inverters, this section is not needed. Circuit breakers, used to conduct currents from a utility-interactive inverter into a load center, may be subjected to faults on the inverter side of the breaker. While the breaker may carry normal operating current in a reverse direction, any overcurrent tripping in a fault situation is in the normal forward direction.
Other sections of the code (not this one) may require clamping backfed breakers, but this is not necessary since these breakers, if removed while being used, immediately become deenergized or dead due to the deenergizing circuits in the connected inverter.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing section does not state that a backfed breaker is necessary, it only states that the breaker must be identified for such operation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
BOWER: I affirm the Panel Action with the comment that the existing code states: "Equipment such as circuit breakers, if backfed, shall be identified for such operation." The requirement for using breakers identified for backfeeding is unclear here. Does it mean simply that a standard circuit breaker be installed with a clamping device or does it mean the breaker must be listed for being backfed and come with its own clamping mechanism? The argument for deleting 690-64(b)(5) is that the use of standard circuit breakers with inverters identified for utility-interactive applications is perfectly safe. While the inverters do supply power from the load side of the breaker during normal operation, the load terminals are not energized when the breaker is removed from the panel. The listed utility-interactive inverters conform to UL1741 and do not supply power in the absence of the proper utility voltage.

(Log #CP306)

3- 195a - (690-71(b)): Accept
Note: The Technical Correlating Committee directs the Panel to correlate the action on this Proposal with the action on Proposal 3-196. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Technical Committee on National Electrical Code P03
RECOMMENDATION: Add headings to read as follows:
"(b) Dwellings.
1. Operating Voltage. Storage batteries for dwellings shall have the cells connected so as to operate at less than 50 volts.
Exception: Where live parts are not accessible during routine battery maintenance, a battery system voltage in accordance with Section 690-7 shall be permitted.
2. Guarding of Live Parts. Live parts of battery systems for dwellings shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or battery type.
FPN: Batteries in solar photovoltaic systems are subject to extensive charge-discharge cycles and typically require frequent maintenance, such as checking electrolyte and cleaning connections."
SUBSTANTIATION: The panel provided headings in (1) and (2) to conform with the 1999 NEC Style Manual.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
BOWER: I affirm the Panel Action with the comment that the "battery system voltage" is not defined in Article 690 and would be more appropriate if just "system voltage" were used.

(Log #3799)

3- 196 - (690-71(b)(1)): Accept
SUBMITTER: Patrick B. Kiernan, Eco Electric, Inc.
RECOMMENDATION: Revise as follows:
"Storage batteries for dwellings shall have the cells connected so as to operate at less than 50 volts nominal."
SUBSTANTIATION: This clarifies the wording to distinguish between the easily confused "system voltage," "rated voltage," "operating voltage," and the nominal 12, 24, and 48 volt ratings. This change will provide for the 48 volt nominal systems that are commonly in use.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

COMMENT ON AFFIRMATIVE:
BOWER: I affirm the Panel Action with the comment that the Panel should have removed the term "nominal". DC devices are rate at maximum ratings. The use of the term nominal could mislead installers into thinking there is a tolerance associated with 50 volts.

(Log #2370)

3- 197 - (690-71(d) (New)): Accept in Principle

Note: The Technical Correlating Committee directs the Panel to revise the FPN to remove the statement of intent or to move the statement into the mandatory code text. This action will be considered by the Panel as a Public Comment.

SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum

RECOMMENDATION: Add new text to read:

"Flooded, vented, lead-acid batteries with more than 24, 2-volt cells connected in series (nominal 48 volts) shall not use or be installed in conductive cases. Conductive racks used to support the nonconductive cases are permitted where no rack material is located within six inches of the tops of the nonconductive cases.

FPN: This requirement does not apply to any type of valve regulated lead-acid battery (VRLA) or any other types of sealed batteries that may require steel cases for proper operation."

SUBSTANTIATION: Battery cases of flooded, lead-acid batteries made of steel or other conductive materials must be grounded to meet the requirements of this code.

Acid and dirt films on the tops of the cells created during the normal charging and equalizing processes form conductive leakage paths between the circuit conductors and the grounded cases. These leakage paths may lead to higher and higher fault currents that can result in fires and explosions.

Attempts to float or otherwise electrically isolate these conductive cases may result in a shock hazard between the cases and the grounded racks or conductive floor. Paint or other thin insulating films have not proven effective in isolating grounded cases.

Sandia National Laboratories has documented battery fires, explosions, and shocks to qualified service personnel over the last five years on battery systems employing metal cases.

The FPN is added for explanatory reasons. This proposal does not apply to any type of valve regulated lead-acid battery (VRLA) or any other types of sealed batteries that may require steel cases for proper operation.

PANEL ACTION: Accept in Principle.

Delete the "are permitted" in the second sentence of the proposal and replace with "shall be permitted" to read as follows:

"(d) Battery Nonconductive Cases and Conductive Racks. Flooded, vented, lead-acid batteries with more than twenty four (24), 2-volt cells connected in series (48 volts, nominal) shall not use conductive cases or shall not be installed in conductive cases. Conductive racks used to support the nonconductive cases shall be permitted where no rack material is located within 150 mm (6 in.) of the tops of the nonconductive cases.

FPN: This requirement is not intended to apply to any type of valve regulated lead-acid battery (VRLA) or any other types of sealed batteries that may require steel cases for proper operation."

PANEL STATEMENT: The text in the proposal that is underlined was changed to be consistent with the 1999 NEC Style Manual and for clarity. The changes were strictly editorial in nature.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

COMMENT ON AFFIRMATIVE:
BOWER: I affirm with the Panel Action with the comment that current practice does not use the 6 in. spacing and that structural plastics do exist where the spacing may not be an issue with battery manufactures.

(Log #2371)

3- 198 - (690-71(e) (New)): Accept in Principle

SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum

RECOMMENDATION: Add new text to read:

"Battery circuits, subject to field servicing, where there are more than 24, 2-volt cells connected in series (nominal 48 volts) shall have provisions for qualified persons to disconnect the series-connected strings into segments of 24 cells or less for service. Non-load-break bolted or plug-in disconnects are permitted."

SUBSTANTIATION: Working on high-voltage strings of batteries is inherently hazardous, even for qualified persons. Breaking the strings into not more than 24-cell segments allows the individual cells or batteries to be serviced at voltages of 48 volts (nominal) or less. While it is optional with the servicing person to break the strings, the provisions for such disconnects should be required. Some battery systems are installed with welded inter-cell connections that cannot be disconnected without cutting cables.

The hazard is significantly reduced for batteries operating below 48 volts nominal. No problems have been documented using metal cased batteries at 48 volts nominal in forklift truck applications.

Some high-voltage sealed (VRLA) battery systems are sealed in a container at the factory and are not serviced in the field. They would not be subject to this requirement.

PANEL ACTION: Accept in Principle.

Delete the "are permitted" in the second sentence of the proposal and replace with "shall be permitted" to read as follows:

"(e) Disconnection of Series Battery Circuits. Battery circuits, subject to field servicing, where ~~there are~~ more than twenty four (24), 2-volt cells connected in series (48 volts, nominal), shall have provisions to disconnect the series-connected strings into segments of 24 cells or less for maintenance by qualified persons. Non-load-break bolted or plug-in disconnects shall be permitted."

PANEL STATEMENT: The text in the proposal that is underlined was changed to be consistent with the 1999 NEC Style Manual and for clarity. The changes were strictly editorial in nature.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2372)

3- 199 - (690-71(f) (New)): Accept in Principle

SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum

RECOMMENDATION: Add new text to read:

"Battery installations where there are more than 24, 2-volt cells connected in series (nominal 48 volts) shall have a switched disconnect, accessible only to qualified persons, that ungrounds the battery electrical system for maintenance. This switch shall not unground the remainder of the PV electrical system. The use of a non-load break rated switch shall be permitted."

SUBSTANTIATION: Battery systems, due to the presence of conductive acid films on batteries, are inherently hazardous to service. By allowing the qualified maintenance person to unground the battery, the hazards may be somewhat reduced even when protective clothing, proper tools, and correct procedures are used. Since it is generally acknowledged that a floated, high-voltage battery is safer for servicing, the requirement is mandatory.

The hazard is significantly reduced for batteries operating below 48 volts nominal and is not required for these lower-voltage systems.

PANEL ACTION: Accept in Principle.

Revise the proposed text as follows:

"(f) Battery Maintenence Disconnecting Means. Battery installations, where there are more than twenty four (24), 2-volt cells connected in series (48 volts, nominal), shall have a disconnecting means, accessible only to qualified persons, that disconnects the grounds in the battery electrical system for maintenance. This disconnecting means shall not disconnect the ground for the remainder of the photovoltaic electrical system. A non-load-break rated switch shall be permitted to be used as the disconnecting means."

PANEL STATEMENT: The text in the proposal that is underlined was changed to be consistent with the 1999 NEC Style Manual and for clarity. The changes were strictly editorial in nature. The "switched disconnect" was changed to "disconnecting means" to cover various means of disconnecting the battery for maintenance.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2373)

3- 200 - (690-71(g) (New)): Accept in Principle

SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum

RECOMMENDATION: Add new text to read:

"On photovoltaic systems where the battery system consists of more than 24, 2-volt cells connected in series (nominal 48 volts), the battery system shall be permitted to operate with ungrounded conductors provided that conditions (1) through (4) are met:

(1) The photovoltaic array source and output circuits shall be solidly grounded.

(2) The dc and ac load circuits shall be solidly grounded.

(3) All main ungrounded battery input/output circuit conductors shall be provided with switched disconnects and overcurrent protection.

(4) A ground-fault detector and indicator shall be installed to monitor for ground faults in the battery bank."

SUBSTANTIATION: This proposal permits high-voltage (above 48-volts nominal) battery systems to be operated in an ungrounded state if the listed conditions are met. Certain types of power processing equipment (inverters) can be designed for this type of operation. This proposal may be most likely applied on higher voltage (above 200 volts) systems. This ungrounded operation may increase long term reliability and fire safety in the system.

PANEL ACTION: Accept in Principle.

Revise the proposed text to read as follows:

"(g) Battery Systems of More Than 48 Volts. On photovoltaic systems where the battery system consists of more than twenty four (24), 2-volt cells connected in series (more than 48 volts, nominal), the battery system shall be permitted to operate with ungrounded conductors, provided the conditions in (1) through (4) are met:

(1) The photovoltaic array source and output circuits shall comply with 690-41."

Remainder of proposed text unchanged.

PANEL STATEMENT: The text in the proposal that is underlined was changed to be consistent with the 1999 NEC Style Manual and for clarity. The changes were strictly editorial in nature.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

COMMENT ON AFFIRMATIVE:

KREINER: Correction to Panel Action: Provide underlines for the following in accordance with the Panel Statement:

(g) Battery Systems of More than 48 Volts. On photovoltaic systems where the battery system consists of more than twenty four (24), 2-volt cells connected in series (more than 48 volts, nominal), the battery system shall be permitted to operate with ungrounded conductors, provided the conditions in (1) through (4) are met:

Remainder of text unchanged.

(Log #2374)

3- 201 - (690-72(a) (New)): Accept in Principle

SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum

RECOMMENDATION: Add new text to read:

"A photovoltaic power system employing a diversion charge controller as the sole means of regulating the charging of a battery shall be equipped with a second, independent means to prevent overcharging of the battery."

SUBSTANTIATION: Diversion controllers are connected between the battery and a diversion load. This external circuit will have overcurrent protection. If the controller fails, if the diversion load is sized improperly, or if the overcurrent device opens during a fault or is manually operated, the battery charging process is no longer regulated. In systems using the inverter to divert excess battery current into the utility, grid, the inverter may fail or the utility grid may go down.

An independent or backup charge regulating system is needed to improve the safety on those systems having diversion controllers. See related new proposal 690-72(b).

PANEL ACTION: Accept in Principle.

Revise the existing Code text to read as follows:

"690-72. Charge Control.

(A) General. Equipment shall be provided to control the charging process of the battery. Charge control shall not be required where the design of the photovoltaic source circuit is matched to the voltage rating and charge current requirements of the interconnected battery cells, and the maximum charging current multiplied by 1 hour is less than 3 percent of the rated battery capacity expressed in ampere-hours or as recommended by the battery manufacturer.

All adjusting means for control of the charging process shall be accessible only to qualified persons.

FPN: Certain battery types such as valve-regulated lead acid or nickel cadmium can experience thermal failure when overcharged."

Revise the proposed text to read as follows:

"(B) Diversion Charge Controller.

(1) A photovoltaic power system employing a diversion charge controller as the sole means of regulating the charging of a battery shall be equipped with a second independent means to prevent overcharging of the battery."

PANEL STATEMENT: The text in the proposal that is underlined was changed to be consistent with the 1999 NEC Style Manual and for clarity. The changes were strictly editorial in nature.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

VOTE ON PANEL ACTION:

COMMENT ON AFFIRMATIVE:

BOWER: I affirm the Panel Action with the comment that the terms "lead acid" and "nickel cadmium" should be hyphenated.

(Log #2375)

3- 202 - (690-72(b) (New)): Accept in Principle

SUBMITTER: John C. Wiles, Jr., Southwest Tech. Development Inst./Rep. Photovoltaic Power Industry Forum

RECOMMENDATION: Add new text to read:

"Circuits containing a direct-current diversion charge controller and a direct-current diversion load shall comply with (1) and (2).

(1) The current rating of the diversion load shall be rated at least 150 percent of the current of the diversion charge controller.

(2) The conductor ampacity and the rating of the overcurrent device for this circuit shall be at least 150 percent of the maximum current of the diversion charge controller.

FPN: This requirement does not apply to ac or dc circuits using inverters that control the battery charging process by feeding power into the utility lines. Such circuits are used in several modes and must be sized and protected in a normal manner as required elsewhere in Article 690."

SUBSTANTIATION: If the diversion load is undersized or if the overcurrent device in the circuit of a diversion charge controller opens from overloads due to excess diversion currents, the charge control process is lost and the battery may be over charged creating a safety hazard. Requiring the 150 percent rating on the diversion load, the overcurrent device, and the cable ampacity is consistent with other systems that could create hazardous conditions when overload protection is included. See Section 240-3(a). The 150 percent rating provides the necessary short-circuit protection. The FPN is added for explanatory reasons. This requirement does not apply to ac or dc circuits using inverters that control the battery charging process by feeding power into the utility lines. Such circuits are used in several modes and must be sized and protected in a normal manner as required elsewhere in Article 690.

PANEL ACTION: Accept in Principle.

Add as a new (2) under the (b)(1) as revised in Proposal 2-201 and revise the proposed text in this proposal to read as follows:

"(2) Circuits containing a dc diversion charge controller and a dc diversion load shall comply with (a) and (b).

(a) The current rating of the diversion load shall be rated at least 150 percent of the current rating of the diversion charge controller.

(b) The conductor ampacity and the rating of the overcurrent device for this circuit shall be at least 150 percent of the maximum current rating of the diversion charge controller.

(3) ~~FPN~~The requirements in (2) shall not apply to ac or dc circuits using inverters to control the battery charging process by feeding power into the utility ~~lines~~ system. These circuits, used in several modes, shall be sized and protected ~~in a normal manner~~ as required ~~elsewhere~~ in ~~Article~~ 690-8."

PANEL STATEMENT: The text in the proposal that is underlined was changed to be consistent with the 1999 NEC Style Manual and for clarity. The changes were strictly editorial in nature. The proposed

FPN contained mandatory text that is not allowed by Section 3.1.3 of the 1999 NEC Style Manual and was made into a separate subsection.

3- 203 - (690-74): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Change "No. 2/0" to "2/0 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.

AFFIRMATIVE: 12

(Log #2785)

3- 204 - (690 Part I): Reject
SUBMITTER: Ivan DeWitt, Holland, MI
RECOMMENDATION: Change Part "I" to Part "J".
(no other change in heading)
SUBSTANTIATION: The leters I and O have been omitted as identification of headings in the format of other articles of the NEC to eliminate any possible confusion with the numbers one and zero. Article 690 Part I is not consistent with this format and the style manual of the NEC. References: Articles 250, 410, 424, 430 and 620 (1999 Edition).
PANEL ACTION: Reject.
PANEL STATEMENT: Article parts will be identified by roman numeral numbers per 2.1.4 of the 1999 NEC Style Manual.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2192)

3- 205 - (690-85): Accept
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
For the purposes of Part I of this article, the voltages used to determine cable and equipment ratings is ~~shall be defined~~ as follows:~~.~~
Battery Circuits. In battery circuits, the voltage is ~~shall be~~ the highest voltage experienced under charging conditions.
Photovoltaic Circuits. In dc photovoltaic source circuits and photovoltaic output circuits, the voltage is ~~shall be~~ the maximum system voltage.
SUBSTANTIATION: This is a definition not a rule. It should be stated in a declarative sentence and should not use mandatory rule language, such as "shall be". Definitions shall not contain requirements. See the NEC Style Manual 2.2.2 and 3.1.
(I have submitted four other proposals on this same concept.)
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
COMMENT ON AFFIRMATIVE:
BOWER: I affirm the Panel Action with the comment that the word "photovoltaic" should be added to the last sentence so that it reads:
"...the voltage is the maximum photovoltaic system voltage."

(Log #3293)

3- 206 - (691 (New)): Accept in Principle
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee. The Technical Correlating Committee directs that the second sentence of the proposed Scope be deleted and considered for inclusion in a definition.
The Technical Correlating Committee directs that a new title "Fuel Cell Systems" be used and the Article be renumbered as Article 692.
The Technical Correlating Committee further directs the panel to remove the term "nationally recognized testing laboratory" from 691-6 since this term is specific to OSHA approval and the definition of listing in Article 100 is sufficient to describe the requirements for a laboratory. The Technical Correlating Committee directs that the Panel review the proposed text to eliminate the references to complete Articles in 691-3, 691-10(b), 691-14, and 691-80, in accordance with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Kenneth Krastins, Plug Power, Inc.
RECOMMENDATION: Add a new Article 691 to read as follows:
A. General.
691-1. Scope. The provisions of this article apply to fuel cell electrical energy systems installed as the primary electrical power source for a building or residential dwelling. This article identifies the requirements for the installation of a building/residential fuel cell system, which may be stand alone or interactive with other electrical power production sources, with or without electrical energy storage such as batteries. Fuel cell systems are typically packaged in enclosures that contain all of the components needed for operation requiring only the connection of the electrical wiring to the distribution panel, a fuel gas source, and, in the case of indoor units, an appropriate ventilation system. The sections contained herein provide the requirements for wiring the fuel cell system to the distribution panel. The fuel cell system itself shall be evaluated and listed for application as a building/residential power source by a nationally recognized test laboratory prior to installation.
FPN: NFPA 853 categorizes fuel cells of 50 kVA or smaller differently than fuel cells sized larger than 50 kVA. Fuel cells with ratings greater than 50 kVA are generally used in structures larger than single-family dwellings. However, single fuel cell systems are capable of being paralleled with other fuel cell systems in order to increase the overall output rating at a site.
691-2. Definitions.
Backfeed. To energize a section of a power network that is supplied from a source other than its normal source.
Charge Controller. Equipment that controls dc voltage or dc current, or both, used to charge a battery.
Fuel Cell. An electrochemical system that continuously consumes a fuel to produce an electrical current. The main chemical reaction used in a fuel cell for producing electrical power is not combustion as defined by other codes. There may, however, be sources of combustion used within the overall fuel cell system such as reformers/fuel processors.
Fuel Cell System. The complete aggregate of equipment used to convert chemical fuel into usable electricity. A fuel cell system typically consists of a reformer, stack, power conditioner, and auxiliary equipment.
Interactive System. A fuel cell system that operates in parallel with and may deliver power to an electrical production and distribution network. For the purpose of this definition, an energy storage subsystem of a fuel cell system, such as a battery, is not another electrical production source.
Maximum System Voltage. The highest nominal fuel cell power conditioner output voltage between any ungrounded conductors present at accessible output terminals.
Output Circuit. The equipment conductors used to connect the fuel cell system to its electrical point of delivery. In the case of sites that have paralleled, multiple units connected together, the term *output circuit*refers also to the equipment used to electrically interconnect the fuel cell systems.
Point Of Common Coupling. The point at which the power network and the customer interface occurs. Typically, this is the dwelling or customer side of the power network meter.
Power Conditioner. The subsystem that converts the direct current from the fuel cell stack subsystem into alternating current of the proper voltage, frequency and phase angle compatible with the connecting electric power system or the power demand of a dedicated

electrical load. It may also incorporate other power conversion functions including charging and discharging of batteries and supply of power to auxiliary systems within the fuel cell system.

Reformer. The subsystem that converts the gas supplied to the fuel cell into a hydrogen-rich mixture to be used by the fuel cell stack for producing electrical power.

Stack. The subsystem consisting of a series of plates placed side by side that electrochemically converts hydrogen to electricity. The individual voltages across the plates add to form the overall voltage across the fuel cell stack.

691-3. Other Articles. Wherever the requirements of other articles of this *Code* and Article 691 differ, the requirements of Article 691 shall apply.

691-4. Installation.

(a) Fuel Cell System. A fuel cell system shall be permitted to supply a building or other structure in addition to any service(s) of another electricity supply system(s).

(b) Grounded Conductor. Bonding shall be in accordance with Article 250-142.

(c) Equipment. The fuel cell system shall be identified and listed as a residential/building source for generating on site power.

(d) Directory. A permanent plaque or directory, denoting all electrical power sources on or in the premises, shall be installed at each service equipment location.

B. Circuit Requirements

691-7. Maximum Voltage.

(a) Circuits Over 150 Volts To Ground. In one and two family dwellings, live parts in fuel cell systems and circuits over 150 volts to ground shall be contained within the fuel cell enclosure and shall not be accessible to other than qualified persons while energized.

FPN: See Section 110-27 for guarding of live parts and Section 210-6 for voltage to ground and between conductors.

(b) Circuits of 120 Volts Nominal To Ground. In one and two-family dwellings, fuel cell output circuits 120 volts nominal to ground shall be permitted to supply branch circuits that supply lampholders, fixtures or receptacles.

691-8. Circuit Sizing and Current.

(a) Maximum Circuit Current. The maximum circuit current shall be the rated short circuit current indicated on the fuel cell nameplate.

(b) Ampacity And Overcurrent Device Ratings. Fuel cell system currents shall be considered continuous. The circuit conductors and overcurrent devices shall be sized to carry not less than 125 percent of the maximum circuit current specified in (a). The rating or setting of overcurrent devices shall be permitted in accordance with Section 240-3 (b) and (c). Additional circuit overcurrent devices shall not be required if the fuel cell power conditioner is provided with overcurrent protection that is sufficient to protect the circuit conductors that supply the load. Equipment and conductors connected to more than one electrical source shall have sufficient protection from all sources.

Exception: Service conductors covered by Section 230-31 and equipment covered by Article 230-42.

691-9. Overcurrent Protection.

(a) Circuits and Equipment. The fuel cell power conditioner output, or output of the fuel cell stack where a power conditioner is not used, shall be protected in accordance with the requirements of Article 240.

(b) Fuel Cell Output Circuits. Branch-circuit or supplementary-type overcurrent devices shall be permitted to provide overcurrent protection in output circuits. The overcurrent devices shall be accessible, but shall not be required to be readily accessible.

691-10. Stand-Alone Systems. The premises wiring system shall meet the requirements of this *Code* except as modified by (a), (b), and (c).

(a) Power Conditioner Output. The ac inverter output from a stand-alone system shall be permitted to supply ac power to the building or structure disconnecting means at current levels below the rating of that disconnecting means.

(b) Sizing and Protection. The circuit conductors between the inverter output and the building or structure disconnecting means shall be sized based on the output rating of the inverter. These conductors shall be protected from overcurrents in accordance with Article 240. The overcurrent protection shall be located at the output of the inverter.

(c) Single 120-Volt Supply. The inverter output of a stand alone fuel cell system shall be permitted to supply 120 volts to single-phase, 3-wire 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less that the rating of the neutral bus in the service equipment. This equipment shall be marked

WARNING – SINGLE 120-VOLT SUPPLY –
DO NOT CONNECT MULTIWIRE BRANCH
CIRCUITS!

C. Disconnecting Means

691-13. All Conductors. Means shall be provided to disconnect all current-carrying conductors of a fuel cell system power source from all other conductors in a building or other structure. Where a circuit grounding connection is not designed to be automatically interrupted as part of the ground-fault protection system required by Section 691-5, a switch or circuit breaker used as a disconnecting means shall not have a pole in the grounded conductor. The grounded conductor may have a bolted or terminal disconnecting means to allow maintenance or troubleshooting by qualified personnel.

691-14. Additional Provisions. The provisions of Article 230, Part F shall apply to the fuel cell system power source disconnecting means. The disconnecting means shall not be required to be suitable as service equipment and shall be rated in accordance with Section 691-17.

691-17. Switch or Circuit Breaker. The disconnecting means for ungrounded conductors shall consist of a manually operable switch(es) or circuit breaker(s)

(1) Located where readily accessible,
(2) Externally operable without exposing the operator to contact with live parts,
(3) Plainly indicating whether in the open or closed position, and
(4) Shall have an interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment.

Where all terminals of the disconnecting means may be energized in the open position, a warning sign shall be mounted on or adjacent to the disconnecting means. The sign shall be clearly legible and shall read substantially:

WARNING – ELECTRIC SHOCK HAZARD –
DO NOT TOUCH TERMINALS –
TERMINALS ON BOTH THE LINE AND
LOAD SIDES MAY BE ENERGIZED
IN THE OPEN POSITION.

Exception No. 1: A connector shall be permitted to be used as an ac disconnecting means provided that it complies with the requirements of Section 691-33 and is listed and identified for the use.

D. Wiring Methods

691-31. Methods Permitted.

(a) Wiring Systems. All raceway and cable wiring methods included in Chapter 3 of this *Code* and other wiring systems and fittings specifically intended and identified for use on fuel cell systems shall be permitted. Where wiring devices with integral enclosures are used, sufficient length of cable shall be provided to facilitate replacement.

(b) Single Conductor Cable. ***Types SE, UF, and USE single-conductor cable shall be permitted in fuel cell power systems where installed in the same manner as Type UF multiconductor cable in accordance with Article 339.***

691-33. Connectors. The connectors permitted by Article 691 shall comply with (a) through (e).

(a) Configuration. The connectors shall be polarized and shall have a configuration that is noninterchangeable with receptacles in other electrical systems on the premises.

(b) Guarding. The connectors shall be constructed and installed so as to guard against inadvertent contact with live parts by persons.

(c) Type. The connectors shall be of the latching or locking type.

(d) Grounding Member. The grounding member shall be the first to make and the last to break contact with the mating connector.

(e) Interruption of Circuit. The connectors shall be capable of interrupting the circuit current without hazard to the operator.

E. Grounding

691-41. System Grounding. For a fuel cell system, one conductor of a 2-wire system rated over 50 volts and a neutral conductor of a 3-wire system shall be solidly grounded.

Exception: Other methods that accomplish equivalent system protection and that use equipment listed and identified for the use shall be permitted.

FPN: See Section 250-2 (a)

691-45. Size of Equipment Grounding Conductor. The equipment grounding conductor shall not be smaller than the required size of the circuit conductors in systems where the available fuel cell system power source short-circuit current is less than twice the current rating of the overcurrent device. In other systems, the equipment grounding conductor shall be sized in accordance with Section 250-122.

691-47. Grounding Electrode System. A grounding electrode system shall be provided in accordance with Sections 250-50 through 250-60.

F. Marking

691-53. Fuel Cell Power Sources. A marking, specifying the fuel cell power source rating as follows shall be provided by the installer at the site at an accessible location at the disconnecting means for the fuel cell power source.

(1) Operating Voltage
(2) Output Power Rating
(3) Short Circuit Current

691-54. Fuel Shut-Off. At the location of the primary disconnecting means of the building or circuits supplied, the location of the manual fuel shut-off valve shall be marked.

691-56. Stored Energy. At the location of the primary disconnecting means of the building or circuits supplied, it shall be marked that the fuel cell unit stores electrical energy, if batteries or other energy storage devices are used in the power conditioner section of the fuel cell.

G. Connection to Other Circuits

691-59 Hybrid Systems Equipment. For power network interactive fuel cell systems installed in non-interactive systems, it shall be permitted to maintain isolation between the electrical production and distribution network and the fuel cell system by means of an automatic bus transfer switch. This switch may be located externally from or internal to the fuel cell system enclosure. When the utility service conductors of the dwelling are connected to the transfer switch, the switch shall comply with Article 230, Part E.

691-60 Identified Interactive Equipment. Only fuel cell systems listed and identified as interactive shall be permitted in interactive systems. When connected in an interactive system, the fuel cell system shall be operated in accordance with Article 705.

691-61 Output Characteristics. The output of a fuel cell system operating in parallel with an electric supply system shall be compatible with the voltage, wave shape, and frequency of the system to which it is connected.

FPN: The term compatible does not necessarily mean matching the primary source wave shape.

691-62. Loss of Interactive System Power. The fuel cell system shall be provided with a means of detecting when the electrical production and distribution network has become de-energized and shall not backfeed the electrical production and distribution network side of the point of common coupling under this condition. The fuel cell system shall remain in that state until the electrical production and distribution network voltage has been restored.

A normally interactive fuel cell system shall be permitted to operate as a stand-alone system to supply loads that have been disconnected from electrical production and distribution network sources.

691-63. Ampacity of Neutral Conductor. If a single-phase, 2-wire fuel cell output is connected to the neutral and one ungrounded conductor (only) of a 3-wire system or of a 3-phase, 4-wire, wye-connected system, the maximum load connected between the neutral and any one ungrounded conductor plus the fuel cell system output rating shall not exceed the ampacity of the neutral conductor.

691-64. Unbalanced Interconnections.

(a) Single Phase. Single-phase inverters in interactive fuel cell systems shall not be connected to 3-phase power system unless the interconnected system is designed so that significant unbalanced voltages cannot result.

(b) Three Phase. Three-phase inverters in interactive fuel cell systems shall have all phases automatically de-energized upon loss of, or unbalanced, voltage in one or more phases unless the interconnected system is designed so that significant unbalanced voltages will not result.

691-65. Point Of Connection. The output of a fuel cell system power source shall be connected as specified in (a) or (b).

(a) Supply Side. A fuel cell system power source shall be permitted to be connected to the supply side of the service disconnecting means as permitted in Section 230-82(5).

(b) Load Side. A fuel cell system power source shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises provided that all of the following conditions are met.

(1) Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(2) The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor not exceed the rating of the busbar or conductor.

Exception: For a dwelling unit, the sum of the ampere ratings of the overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.

(3) The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Equipment with power supplied from a single point of connection.

(4) Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor shall be marked to indicate the presence of all sources.

Exception: Equipment with power supplied from a single point of connection.

(5) Equipment such as circuit breakers, if backfed, shall be identified for such operation.

FPN: Backfeeding certain devices such as ground fault circuit interrupter breakers or outlets has the potential to damage them.

I. Systems Over 600 Volts

691-80. General. Fuel cell systems with a maximum system voltage over 600 volts dc shall comply with Articles 490, 685, 705, and other requirements applicable to installations rated over 600 volts.

691-81. Interactive Systems. For single and multiple systems, the fuel cell(s) shall not backfeed power to the electric production and distribution network side of the point of common coupling upon a loss of electric production and distribution network power.

691-85. Definitions. For the purposes of Part I of the article, the voltages used to determine cable and equipment ratings shall be defined as follows.

Battery Circuits. **In battery circuits, the voltage shall be the highest voltage experienced under charging conditions.**

Fuel Cell Circuits. In dc fuel cell outputs and fuel cell system output circuits, the voltage shall be the maximum system voltage.

SUBSTANTIATION: An important goal of building codes is to permit to the fullest extent possible, the use of modern methods, devices and technological improvements while protecting the health, safety, and welfare of the end user and general public. While new technology may offer many worthwhile benefits, appropriate regulations are needed to allow safe adoption of the technology and prevent misapplication. The fuel cell represents just such an emerging technology. Fuel cells provide a means, via an electrochemical process, of converting a fuel gas (such as natural gas, propane, etc.) into electrical energy that may then be used to power a building or residential dwelling. Fuel cells are virtually pollution free, very quiet when compared to other means of electric power generation, and can operate at high efficiency levels using very abundant and cheap fuels such as natural gas and LP gas.

There is growing interest in small, clean and quiet independent power generating units. The installation of fuel cell electrical generating systems used at residential and light commercial establishments is imminent. Recent advances in fuel cell technologies and more economical means of production will foster widespread acceptance of small distributed electrical generating units (under 50 kW) for single family home use and medium size units (51 kW to 250 kW) for multifamily units and small commercial buildings.

The interest in other clean forms of distributed generation is demonstrated by the adoption of the NEC Article 690, Solar Photovoltaic Systems. The direct interpretation of this article and its application deals specifically with solar photovoltaic electrical generating systems. It has been suggested that this article can also adequately cover other forms of distributed generation including fuel cell systems. However, since much of the language in Article 690 is specific to photovoltaic systems and rather complex to accommodate the interconnection requirements of the many sub-systems in photovoltaic systems, application of this article to fuel cells will be cumbersome.

Much of the information in Article 690 could apply to small and medium size electrical generating systems in general. Likewise, Article 705, Interconnected Electrical Power Production Sources, and Article 490, Equipment Over 600 Volts, Nominal, apply mainly to the large utility grid parallel independent electrical generating units. For example, Article 705-12, (b), (1) stipulates, "The aggregate of non-

utility sources of electricity has a capacity in excess of 100k W, or the service is above 1000 volts." Leaving the interpretation of Article 690 and other articles up to the local inspector to determine the requirements for fuel cell systems will be problematic and could hinder the use of this beneficial technology. While the combination of these existing articles and others may adequately address fuel cells, it is clearly advantageous to users of the National Electrical Code, to have an article which specifically articulates the electrical installation requirements of fuel cell systems.

This being stated, Article 690, Solar Photovoltaic Systems, does offer a good basis for the creation of a Fuel Cell Systems article. A description of and substantiation for the individual topics to be covered in the proposed article follows. Where appropriate, comparisons are made within the following detailed substantiation between this proposed fuel cell article and the extant Photovoltaic Article 690. Sections of the Photovoltaic article that do not appear at all in the proposed article are also discussed and distinguished in bold, italicized text.

691-1 Scope - This section provides the scope of the document. It identifies that the article pertains to fuel cell systems for residential and building applications. It identifies the fuel cell as a source of on-site, electrical power generation distinguishing it from fuel cell systems used in non-stationary or other applications. It also indicates that the proposed NEC article covers only the electrical installation but none of the gas or venting interfaces. It also indicates that the fuel cell system is a "black box" that needs to be evaluated by an independent, nationally recognized test laboratory for use in a building or residential dwelling prior to installation.

691-2 Definitions – Those words for which definitions already exist in the Photovoltaic Article 690; the definitions were taken from there. The source of the definition of "backfeed" comes from both The IEEE Standard Dictionary of Electrical and Electronics Terms (IEEE Std. 100-1996) and the IEEE Standard Definitions for Power Switchgear (IEEE Std. C37-100-1992). The definition of the "point of common coupling" finds its roots in both the proposed draft to the IEEE SCC 21 national interconnection standard and the proposed New York State Standard Interconnection Requirements (SIR). The remainder of the definitions come from our own experience as fuel cell manufacturers as modified by the suggestions of others who reviewed the article.

691-3 Other Articles – This statement is made, similar to the one in Article 690, to identify that the idiosyncrasies of fuel cell installations may result in inconsistencies between this article and the remainder of the Code. The statement provides a clear statement to inspectors of fuel cell installations that the proposed Article 691 is appropriate for evaluating a fuel cell installation and that it takes precedence over the remainder of the Code for a fuel cell evaluation.

691-4 Installation – Since the fuel cells systems covered by this article are intended to provide a primary source of on-site electrical power generation, the statement is made permitting them to do so and requiring that fuel cells be listed for such applications. The installation section does not include requirements for ground-fault protection as are included in the Photovoltaic article 690 due to the integrated, packaged configuration of the fuel cell system. The fuel cell system ground fault detection and protection requirements will be covered by the product evaluation of the fuel cell.

(691-5) *Ground-Fault Protection - There is no corresponding section needed on ground fault protection as there is in section 690-5 of the Photovoltaic article. The configuration of the fuel cell is a single, integrated enclosure that has already been evaluated and listed by an NRTL as a power source for a building or dwelling application. This obviates the need for an inspector working to the NEC to have to evaluate the product itself for ground-fault protection.*

(691-6) *Alternating-Current Modules - There is no corresponding section needed on AC modules as there is in section 690-6. The fuel cell system is contained within an enclosure that has already been evaluated by a third-party listing agency precluding the need for an inspector evaluating the installation to have to go into the fuel cell enclosure. It is not of modular construction as is a photovoltaic system.*

691-7 Maximum Voltage - A fuel cell system is a constant voltage, load following source of on-site power production. As such, the requirements for voltage correction factors for crystalline and multi-crystalline silicon modules contained in the fuel cell photovoltaic article are eliminated and not included in the proposed fuel cell article.

691-8 Circuit Sizing and Current – Due to the non-modular nature of fuel cell systems, the calculation of maximum current is unnecessary and can simply be read off of the fuel cell manufacturer's nameplate. Conductors and overcurrent devices are sized to carry 125 percent of the fuel cell system output rating to ensure that they are sufficiently large enough to carry the current output of the fuel cell system demanded by the load and to avoid unnecessary nuisance tripping.

691-9 Overcurrent Protection – The proposed fuel cell article points to the standard article for overcurrent protection (Article 240) for cell systems that are either not integrated in a single, already listed, enclosure, or for systems that are paralleled with other fuel cell systems to achieve an increased output level. Overcurrent protection for fuel cells systems integrated into a single enclosure will already be evaluated to product standards by an NRTL. Normally it is undesirable for one article of the NEC to reference an entire other article of the NEC rather than identifying specific sections of the referenced article. However, given the statement made in 691-3, it makes sense to identify similarities to the other sections of the codes along with the differences.

691-10 Stand-Alone Systems – Similar to the photovoltaic article, the proposed article indicates that fuel cell systems are not required to provide the full service-entrance rating of 100 or 200 amperes. The bulk of this sections follows along the lines of the corresponding section of the Photovoltaic Article 690.

691-13 All Conductors – This section provides a requirement for the capability to isolate the fuel cell system from the rest of the building/dwelling wiring for servicing and other purposes.

691-14 Additional Provisions – This wording is similar to the existing text of section 690-14 of the Code, modified for a fuel cell system.

(691-15) *Disconnection of Photovoltaic Equipment - There is no section on the disconnection of fuel cell equipment as there is for the photovoltaic equipment in section 690-15. Since the fuel cell system is a fully integrated system such wording is unnecessary.*

(691-16) *Fuses - There is no section on fuses within a fuel cell system as there is in section 690-16 of the photovoltaic article. Appropriate/sufficient fusing would be addressed by the NRTL evaluating the complete fuel cell system to the appropriate product standards.*

691-17 Switch or Circuit Breaker – This section is essentially lifted from section 690-17 of the existing Code and modified only to delete the provisions for dc circuitry. While a fuel cell stack generates dc power, that power is contained within the fuel cell enclosure, inaccessible to the user, and is inverted by the power conditioning prior to reaching the output terminals of the fuel cell system.

(691-18) *Installation and Service of an Array - There is no section on the installation of a service array as there is in section 690-18 of the Photovoltaic article as this does not apply to a fuel cell system.*

691-31 Methods Permitted – The permissible wiring follows along the lines of section 690-31 of the existing Code modified for use with a fuel cell system.

(691-32) *Component Interconnections - There is no section included on component interconnections corresponding to section 690-32, as this does not pertain to fuel cell systems.*

691-33 Connectors - This section is taken directly from the existing section 690-33 of the Code.

(691-33) *Access to Boxes - There is no section included on access to boxes corresponding to section 690-34, as this does not pertain to fuel cell systems.*

691-41 System Grounding – This section is taken directly from the existing section 690-41 of the Code.

(691-42) *Point of System Grounding Connection - There is no section needed on the point of system grounding connection corresponding to section 690-42 as this would already be verified during the listing to a product standard of an integrated, enclosed fuel cell system.*

(691-43) *Equipment Grounding – There is no section needed on the equipment grounding corresponding to section 690-43 as this would already be verified during the listing to a product standard of an integrated, enclosed fuel cell system.*

691-45 Size of Equipment Grounding Conductor – This section is taken directly from the existing section 690-45 of the Code.

691-47 Grounding Electrode System – This section is taken directly from the existing section 690-47 of the Code.

691-53 Fuel Cell Power Sources – The nature of fuel cell systems and the fact that they are provided in single, listed enclosures eliminates the need to identify and label all of the parameters identified in section 690-51, 690-52, and 690-53.

691-54 Fuel Shut-Off - The fuel cell system uses fuel gas as a source of energy. The location of the fuel shut-off valve identifies a means for shutting down the fuel cell gas supply, which will cause the fuel cell system to cease generating electrical energy. Residual energy, capable of being delivered externally, may still reside within the batteries of the fuel cell even after shutting down the fuel cell gas supply. This is addressed in the following proposed section 691-56.

691-56 Stored Energy – Section 691-54 identifies the location of the fuel gas supply shut-off valve. However, shutting down the fuel gas supply will not necessarily prevent a fuel cell system from continuing to deliver power using the energy stored within its batteries. Section 691-56 is included to ensure that this is recognized by anyone attempting to shutdown the fuel cell system.

691-59 Hybrid Systems Equipment – This section identifies an automatic bus transfer switch as a permissible means for maintaining isolation between the fuel cell system and the utility grid. A concern amongst the utilities with respect to distributed generation has to do with questions regarding the effectiveness of non-islanding inverters in grid-parallel systems. Non-islanding inverters prevent the energization of the utility power system by the fuel cell system upon a loss of utility grid power. By employing an automatic bus transfer switch, the fuel cell system can be installed in a non-paralleled, grid backup configuration precluding any issues concerning non-islanding inverters. Section 691-59 permits this configuration.

691-60 Identified Interactive Equipment – This section identifies that only fuel cell systems listed for parallel operation with utility grids are permitted to be connected in such a configuration.

691-61 Output Characteristics – This section is taken directly from the existing section 705-14 of the Code.

691-62 Loss of Interactive System Power – This section specifically spells out the non-islanding requirement for fuel cell systems intended to be operated in a grid-parallel configuration. It also states that fuel cell systems capable of grid-parallel operation need not necessarily be installed in a grid-parallel configuration and may instead be installed in a grid-independent configuration.

691-63 Ampacity of Neutral Conductor - This section is taken directly from the existing section 690-62 of the Code.

691-64 Unbalanced Interconnections – This section is taken directly from the existing section 690-63 of the Code.

691-65 Point Of Connection – This is essentially taken from the existing section 690-64 of the Code but modified for the configuration of a single, enclosed fuel cell system.

691-71 Installation – Fuel cell sections corresponding to sections 690-71, 690-72, and 690-74 of the photovoltaic have been omitted as the battery and battery charger will be contained within the fuel cell enclosure and be therefore covered by the product evaluation.

(691-72) *Installation & Charge Control of Batteries – Batteries will be contained within the fuel cell enclosure and will have already been evaluated along with the listed fuel cell system. They are therefore not included in the proposed fuel cell article.*

691-80 General – Sections 691-80, 691-81, and 691-85 are drawn from existing sections 690-80 and 690-85 of the Code.

Additional Changes – Revised wording is recommended for section 230-82 (5), the exception to section 705-3, and section 705-30 to include language to cover fuel cell systems, similar to what is currently included for solar photovoltaic systems.

Members of Plug Power, Inc. and DTE Energy Technologies drafted the original version of the proposed fuel cell article. The proposed article began to be referred to as 691 because of its similarity and relationship to Article 690. It is recognized that the number ultimately assigned to the article may be different from 691.

The article was then circulated, reviewed, and revised internally at Plug Power. Subsequently, an e-mail notification was forwarded on September 13, 1999 to the members of three different groups advising them of the existence of the proposed article and inviting them to request a copy for review and comment. The three different groups notified were

- The members of the IEEE Standards Coordinating Committee (SCC) 21 currently involved in the development of a national standard (P1547) to cover interconnection of distributed resources with electrical power systems
- The members of the technical working group involved in the development of Standard Interconnection Requirements (SIR) for New York State which have since been submitted to the NYS Public Service Commission
- The Codes & Standards Working Group of the US Fuel Cell Council

All totaled, these groups include over 200 individuals. Presentations concerning the proposed article were given by Plug Power at both the September 27, 1999 meeting of the IEEE-SCC21 committee in Arlington, Virginia and the October 8, 1999 Power Quality Workshop (Interconnect-3) sponsored by the US Fuel Cell Council in Phoenix, Arizona. Those individuals who requested a copy of the draft article as a result of the e-mail notification or the presentations were sent one for review. After comments were received, they were negotiated and incorporated in the proposed article currently being submitted. Substantial changes have been made to the proposed article since its original inception, but the input generously provided by the individuals of the groups listed above has served to help develop a much better article as a result.

PANEL ACTION: Accept in Principle.

A. General

691-3. Scope. This article identifies the requirements for the installation of fuel cell power systems, which may be stand alone or interactive with other electrical power production sources, and may be with or without electrical energy storage such as batteries. Fuel cell systems are ~~typically~~ packaged in enclosures that contain all of the components needed for operation requiring only the connection of the electrical wiring to the distribution panel, a fuel gas source, and, in the case of indoor units, an appropriate ventilation system. ~~The fuel cell system itself shall be evaluated and listed for its intended application by a nationally recognized test laboratory prior to installation.~~

~~FPN: NFPA 853 categorizes fuel cells of 50 kVA or smaller differently than fuel cells sized larger than 50 kVA. Fuel cells with ratings greater than 50 kVA are generally used in structures larger than single family dwellings. However, single fuel cell systems are capable of being paralleled with other fuel cell systems in order to increase the overall output rating at a site.~~

691-4. Definitions.

~~**Charge Controller.** Equipment that controls dc voltage or dc current, or both, used to charge a battery.~~

Fuel Cell. An electrochemical system that ~~continuously~~ consumes ~~a~~to fuel to produce an electrical current. The main chemical reaction used in a fuel cell for producing electrical power is not combustion ~~as defined by other codes~~. There may, however, be sources of combustion used within the overall fuel cell system such as reformers/fuel processors.

Fuel Cell System. The complete aggregate of equipment used to convert chemical fuel into usable electricity. A fuel cell system

typically consists of a reformer, stack, power ~~conditioner~~inverter, and auxiliary equipment.

Interactive System. A fuel cell system that operates in parallel with and may deliver power to an electrical production and distribution network. For the purpose of this definition, an energy storage subsystem of a fuel cell system, such as a battery, is not another electrical production source.

Maximum System Voltage. The highest ~~nominal~~ fuel cell ~~power~~ inverter output voltage between any ungrounded conductors present at accessible output terminals.

Output Circuit. The equipment conductors used to connect the fuel cell system to its electrical point of delivery. In the case of sites that have paralleled~~,~~ multiple units connected together, the term *output circuit*also refers ~~also~~ to the equipment used to electrically interconnect the fuel cell system(s).

Point Of Common Coupling. The point at which the power production and distribution network and the customer interface occurs in an interactive system. Typically, this is the load side of the power network meter.

~~**Power Conditioner.** The subsystem that converts the direct current from the fuel cell stack subsystem into alternating current of the proper voltage, frequency and phase angle compatible with the connecting electric power system or the power demand of a dedicated electrical load. It may also incorporate other power conversion functions including charging and discharging of batteries and supply of power to auxiliary systems within the fuel cell system.~~

~~**Reformer.** The subsystem that converts the gas supplied to the fuel cell into a hydrogen-rich mixture to be used by the fuel cell stack for producing electrical power.~~

~~**Stack.** The subsystem consisting of a series of plates placed side by side that electrochemically converts hydrogen to electricity. The individual voltages across the plates add to form the overall voltage across the fuel cell stack.~~

Stand-Alone System. A fuel cell system that supplies power independently of an electrical production and distribution network.

691-5. Other Articles. Wherever the requirements of other articles of this *Code*and Article 691 differ, the requirements of Article 691 shall apply.

691-6. Installation.

(a) Fuel Cell System. A fuel cell system shall be permitted to supply a building or other structure in addition to any service(s) of another electricity supply system(s).

~~**(b) Equipment.** The fuel cell system shall be identified and listed for the intended use.~~.

(b) Identification. A permanent plaque or directory, denoting all electrical power sources on or in the premises, shall be installed at each service equipment location.

691-6. Listing Requirement. The fuel cell system shall be evaluated and listed for its intended application by a nationally recognized testing laboratory prior to installation.

B. Circuit Requirements

~~**691-7. Maximum Voltage.**~~

~~**(a) Circuits Over 150 Volts To Ground.** In one and two family dwellings, live parts in fuel cell systems and circuits over 150 volts to ground shall be contained within the fuel cell enclosure and shall not be accessible to other than qualified persons while energized.~~

~~FPN: See Section 110-27 for guarding of live parts and Section 210-6 for voltage to ground and between conductors.~~

~~**(b) Circuits of 120 Volts Nominal To Ground.** In one and two-family dwellings, fuel cell output circuits 120 volts nominal to ground shall be permitted to supply branch circuits that supply lampholders, fixtures or receptacles.~~

691-8. Circuit Sizing and Current.

(a) ~~Maximum~~ Nameplate Rated Circuit Current. The ~~maximum~~ nameplate(s) rated circuit current shall be the rated~~ short circuit~~ current indicated on the fuel cell nameplate(s).

(b) Conductor Ampacity And Overcurrent Device Ratings. The ampacity of the feeder circuit conductors from the fuel cell system(s) to the premises wiring system shall not be less than the greater of (1) nameplate(s) rated circuit current, or (2) the rating of the fuel cell system(s) overcurrent protective device(s).

~~Fuel cell system currents shall be considered continuous.~~

(c)Ampacity of Grounded or Neutral Conductor. If ~~an~~ interactive single-phase, 2-wire fuel cell output(s) is connected to the grounded or neutral conductor and a single ungrounded conductor ~~(only)~~ of a 3-wire system or of a 3-phase, 4-wire, wye-connected system, the maximum unbalanced neutral load current ~~load connected between the grounded or neutral conductor and any one ungrounded conductor~~ plus the fuel cell system(s) output rating shall not exceed the ampacity of the grounded or neutral conductor.

691-11. Overcurrent Protection.

(a) Circuits and Equipment. If the fuel cell system is provided with overcurrent protection sufficient to protect the circuit conductors that supply the load, additional circuit overcurrent devices shall not be required. Equipment and conductors connected to more than one electrical source shall be protected.

(b) Accessibility. Overcurrent devices shall be readily accessible.

691-12. Stand-Alone Systems. The premises wiring system shall meet the requirements of this *Code*except as modified by (a), (b), and (c).

(a) ~~Power Conditioner~~ Fuel Cell System Output. The ~~ac inverter~~ fuel cell system output from a stand-alone system shall be permitted to supply ac power to the building or structure disconnecting means at current levels below the rating of that disconnecting means.

(b) Sizing and Protection. The circuit conductors between the ~~inverter~~ fuel cell system(s) output and the building or structure disconnecting means shall be sized based on the output rating of the ~~inverter~~ fuel cell system(s). These conductors shall be protected from overcurrents in accordance with Article 240. The overcurrent protection shall be located at the output of the ~~inverter~~ fuel cell system(s).

(c) Single 120-Volt Nominal Supply. The inverter output of a stand alone fuel cell system shall be permitted to supply 120 volts, nominal, to single-phase, 3-wire 120/240-volt service equipment or distribution panels where there are no 240-volt ~~outlets~~loads and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the ~~inverter~~ fuel cell system(s) shall be less tha~~t~~n the rating of the ~~neutral bus in the~~ service equipment. This equipment shall be marked

WARNING – SINGLE 120-VOLT SUPPLY –
DO NOT CONNECT MULTIWIRE BRANCH
CIRCUITS!

C. Disconnecting Means

691-13. All Conductors. Means shall be provided to disconnect all current-carrying conductors of a fuel cell system power source from all other conductors in a building or other structure.

~~**691-13. All Conductors.** Means shall be provided to disconnect all current carrying conductors of a fuel cell system power source from all other conductors in a building or other structure. Where a circuit grounding connection is not designed to be automatically interrupted as part of the ground-fault protection system required by Section 691-5, a switch or circuit breaker used as a disconnecting means shall not have a pole in the grounded conductor. The grounded conductor may have a bolted or terminal disconnecting means to allow maintenance or troubleshooting by qualified personnel.~~

691-14. ~~Additional~~ Provisions. The provisions of Article 215 or Article 225, Part B, as applicable, shall apply to the fuel cell system power source disconnecting means. The disconnecting means shall not be required to be suitable as service equipment and shall be rated in accordance with Section 691-17.

691-17. Switch or Circuit Breaker. The disconnecting means for ungrounded conductors shall consist of readily accessible, manually operable switch(es) or circuit breaker(s).

~~**691-17. Switch or Circuit Breaker.** The disconnecting means for ungrounded conductors shall consist of a manually operable switch(es) or circuit breaker(s)~~

~~(5) Located where readily accessible,~~

~~(6) Externally operable without exposing the operator to contact with live parts,~~

~~(7) Plainly indicating whether in the open or closed position, and~~

~~(8) Shall have an interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment.~~

Where all terminals of the disconnecting means may be energized in the open position, a warning sign shall be mounted on or adjacent to the disconnecting means. The sign shall be clearly legible and shall ~~read substantially~~have the following words or equivalent:

~~WARNING~~DANGER – ELECTRIC SHOCK HAZARD –
DO NOT TOUCH TERMINALS –
TERMINALS ON BOTH THE LINE AND
LOAD SIDES MAY BE ENERGIZED
IN THE OPEN POSITION.

Exception No. 1: A connector shall be permitted to be used as an ac disconnecting means provided that it complies with the requirements of Section 691-33 and is listed and identified for the use.

D. Wiring Methods

691-32. Methods Permitte.WIRING SYSTEMS.

. All raceway and cable wiring methods included in Chapter 3 of this *Code* and other wiring systems and fittings specifically intended and identified for use on with fuel cell systems shall be permitted. Where wiring devices with integral enclosures are used, sufficient length of cable shall be provided to facilitate replacement.

*(b) Single Conductor Cabl**Types SE, UF, and USE single-conductor cable shall be permitted in fuel cell power systems where installed in the same manner as Type UF multiconductor cable in accordance with Article 339.***

691-33. Connectors. The connectors permitted by Article 691 shall comply with (a) through (e).

(a) Configuration. The connectors shall be polarized and shall have a configuration that is noninterchangeable with receptacles in other electrical systems on the premises.

(b) Guarding. The connectors shall be constructed and installed so as to guard against inadvertent contact with live parts by persons.

(c) Type. The connectors shall be of the latching or locking type.

(d) Grounding Member. The grounding member shall be the first to make and the last to break contact with the mating connector.

(e) Interruption of Circuit. The connectors shall be capable of interrupting the circuit current without hazard to the operator.

E. Grounding

691-41. System Grounding. For a fuel cell system output circuit, one conductor of a 2-wire system rated over 50 volts and a neutral conductor of a 3-wire system shall be solidly grounded by either (A) or (B).

(A) Stand-Alone Systems

Grounding and bonding shall be in accordance with Section 250-30.

(B) Other than Stand-Alone Systems

(1) For two wire systems, one conductor shall be terminated at the grounded circuit conductor terminal of the premises wiring system.

(2) For three wire systems, the neutral conductor shall be terminated at the grounded circuit conductor terminal of the premises wiring system.

Exception: Other methods that accomplish equivalent system protection and that use equipment listed and identified for the use shall be permitted.

FPN: See Section 250-2 (a)

691-44. Equipment Grounding Conductor. A separate equipment grounding conductor shall be installed.

691-45. Size of Equipment Grounding Conductor. The equipment grounding conductor shall not be smaller than the required size of the circuit conductors in systems where the available fuel cell system power source short circuit current is less than twice the current rating of the overcurrent device. In other systems, the equipment grounding conductor shall be sized in accordance with Section 250-122 for ac systems and Section 250-166 for dc systems.

691-47. Grounding Electrode System. A grounding electrode system shall be provided in accordance with Sections 250-50 through 250-60.

Any supplementary equipment grounding electrode(s) required by the manufacturer shall be bonded connected to the provided equipment grounding conductor specified in 250-118.

F. Marking

691-53. Fuel Cell Power Sources. A marking, specifying the fuel cell system, power source rating as follows output voltage, output power rating, and short circuit continuous output current rating as follows shall be provided provided by the installer at the site at an accessible location at the disconnecting means for the fuel cell power source at an accessible location on the site.

(1) Operating Output Voltage

(2) Output Power Rating

(3) Short Circuit Current

691-54. Fuel Shut-Off. The location of the manual fuel shut-off valve shall be marked at the location of the primary disconnecting means of the building or circuits supplied, of the manual fuel shut-off valve shall be marked.

691-56. Stored Energy. A fuel cell system that stores electrical energy shall require the following warning sign, or similar equivalent, at the location of the service disconnecting means of the premises: WARNING – Fuel Cell Power System contains electrical energy storage devices.

.. At the location of the primary disconnecting means of the building oncircuits supplied, it shall be marked that the fuel cell unit stores electrical energy, if batteries or other energy storage devices are used in the power conditioner section of the fuel cell.

G. Connection to Other Circuits

691-59 Transfer Switch. A transfer switch shall be required in non-grid-interactive systems that use utility grid backup. The transfer switch maintains isolation between the electrical production and distribution network and the fuel cell system.. The transfer switch may be located externally or internally to the fuel cell system unit.. When the utility service conductors of the dwelling structure are connected to the transfer switch, the switch shall comply with Article 230, Part E.

691-62 Identified Interactive Equipment. Only fuel cell systems listed and identified as interactive shall be permitted in interactive systems. When connected in an interactive system, the fuel cell system shall be operated in accordance with Article 705.

691-63 Output Characteristics. The output of a fuel cell system operating in parallel with an electric supply system shall be compatible with the voltage, wave shape, and frequency of the system to which it is connected.

FPN: The term compatible does not necessarily mean matching the primary source wave shape.

691-62. Loss of Interactive System Power. The fuel cell system shall be provided with a means of detecting when the electrical production and distribution network has become de-energized and shall not feed the electrical production and distribution network side of the point of common coupling. under this condition.during this condition. The fuel cell system shall remain in that state until the electrical production and distribution network voltage has been restored.

A normally interactive fuel cell system shall be permitted to operate as a stand-alone system to supply loads that have been disconnected from electrical production and distribution network sources.

691-64. Unbalanced Interconnections.

(a) Single Phase. Single-phase inverters in interactive fuel cell systems shall not be connected to a 3-phase power system unless the interconnectedinteractive system is designed so that significant unbalanced voltages cannot result.

(b) Three Phase. Three-phase inverters in interactive fuel cell systems shall have all phases automatically de-energized upon loss of voltage, or unbalanced of, voltage in one or more phases unless the interconnectedinteractive system is designed so that significant unbalanced voltages will not result.

691-65. Point Of Connection. The output of a fuel cell system power source shall be connected as specified in (a) or (b).

(a) Supply Side. A fuel cell system power source shall be permitted to be connected to the supply side of the service disconnecting means as permitted in Section 230-82(5).

(b) Load Side. A fuel cell system power source shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises provided that all of the following conditions are met.

(1) Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(2) The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed the rating of the busbar or conductor.

Exception: For a dwelling unit, the sum of the ampere ratings of the overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.

(3) The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Equipment with power supplied from a single point of connection.

(4) Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor shall be marked to indicate the presence of all sources.

Exception: Equipment with power supplied from a single point of connection.

(5) Equipment such as circuit breakers, if backfed, shall be identified for such operation.

(6) The circuit breaker on the dedicated output of a utility-interactive inverter shall be positioned in the distribution equipment at the opposite (load) end from the input feeder connection or main circuit location. A permanent warning label shall be applied to the

distribution equipment with the following, ~~or similar language~~ or equivalent:
WARNING. Fuel Cell Power System Output. Do not ~~move~~relocate this circuit breaker. ~~from this position~~ .
I. ~~Systems~~ Outputs Over 600 Volts
691-80. General. Fuel cell systems with a maximum ~~system~~ output voltage over 600 volts ~~dc~~ ac shall comply with Article~~s~~ 490 ~~, 685, 705, and other~~ and the requirements of other articles applicable to such installations. ~~rated over 600 volts~~.
~~**691-81. Interactive Systems.** For single and multiple systems, the fuel cell(s) shall not backfeed power to the electric production and distribution network side of the point of common coupling upon a loss of electric production and distribution network power.~~
~~**691-85. Definitions.** For the purposes of Part I of the article, the voltages used to determine cable and equipment ratings shall be defined as follows.~~
~~Battery Circuits. **In battery circuits, the voltage shall be the highest voltage experienced under charging conditions.**~~
~~**Fuel Cell Circuits.** In dc fuel cell outputs and fuel cell system output circuits, the voltage shall be the maximum system voltage.~~
PANEL STATEMENT: The panel reviewed the proposal and determined the overall effort was very commendable. The proposed text was revised for clarity, to comply with the 1999 NEC Style Manual and to remove any inconsistencies. A reworked proposal was produced that focused on the complete listed system concept and associated wiring for the fuel cell installation. The panel reviewed and revised this proposal. This new revised document meets the approval of the submitter. Due to the similarities in technology between fuel cell systems and photovoltaic systems (690) Panel 3 should retain jurisdiction of proposed new Article 691. The panel recognizes that the TCC has the final jurisdiction over the numbering and assignment.

15- 78 - (695-2-Fault Tolerant External Control Conductors): Accept in Principle in Part
SUBMITTER: Richard Schneider, Joslyn Clark Controls, Inc.
RECOMMENDATION: Add a definition to read:
Fault Tolerant External Control Conductors. Those control conductors entering/leaving the fire pump controller enclosure, whose effect on the controller operation upon breakage, disconnection, shorting of wires or loss of power to those circuits, comply with 695-14(a).
SUBSTANTIATION: The term "Fault tolerant", as it pertains to control conductors used in fire pump controllers, is not now defined. This definition is in general concurrence with that contained in the IEEE Standard Dictionary of Electrical and Electronic Terms, 5th edition (IEEE Standard 1000-1992).
PANEL ACTION: Accept in Principle in Part.
Delete existing 695-2.
Add new 695-2 to read as follows:
695-2 Definitions
Fault Tolerant External Control Conductors. Those control conductors entering and/or leaving the fire pump controller enclosure which if broken, disconnected, or shorted will not prevent the controller from starting the fire pump and may cause the controller to start the pump under these conditions.
PANEL STATEMENT: This satisfies the NEC Style Manual and intent of the submitter and makes the definition independent of any section of the article. The reference to 695-14(a) was rejected so that the definition does not contain requirements. Existing 695-2 is not needed.

(Log #337)

15- 79 - (695-2-On-Site Power Production Facility (New) and On-Site Standby Generator (New)): Accept in Principle in Part
SUBMITTER: Richard Schneider, Joslyn Clark Controls, Inc.
RECOMMENDATION: Add the following definitions to 695-2:
On-Site Power Production Facility. An On-Site Power Production Facility (ref. 695-3(a)(2) is intended to serve as the normal supply of electric power for the site and is expected to be normally, constantly energized.
On-Site Standby Generator. An On-Site Standby Generator (ref. 695-3(b)) is a facility producing electric power on-site intended to serve as the alternate supply of electric power. It differs from On-Site Power Production Facility in that it is not expected to be normally, constantly energized.
SUBSTANTIATION: Section 695-3(a)(2) is being interpreted to mean that a standby generator is an acceptable power source for the normal supply to the fire pump motor.
PANEL ACTION: Accept in Principle in Part.
Add the following definitions to 695-2:
On-Site Power Production Facility. An On-Site Power Production Facility is the normal supply of electric power for the site and is expected to be constantly producing power.
On-Site Standby Generator. An On-Site Standby Generator is a facility producing electric power on-site, as the alternate supply of electric power. It differs from an On-Site Power Production Facility in that it is not constantly producing power.
PANEL STATEMENT: This satisfies the NEC Style Manual and intent of the submitter and makes the definition independent of any section of the article.
The part rejected is the two references to 695-3 which would introduce requirements into definitions.

(Log #2346)

15- 80 - (695-3(a)(1)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add the following underlined text.
(1) Electric Utility Service Connection. A fire pump shall be permitted to be supplied by a separate service, or by a tap located <u>electrically</u> ahead of and not within the same cabinet, enclosure, or vertical switchboard section as the service disconnecting means. The connection shall be located and arranged so as to minimize the possibility of damage by fire from within the premises and from exposing hazards. A tap ahead of the service disconnecting means shall comply with Section 230-82(4). The service equipment shall

comply with the labeling requirements in Section 230-2 and the location requirements in Section 230-72(b).
SUBSTANTIATION: This proposal is an attempt to show that the intent of the article was to have electrical separation, not physical separation. The installation of a tap or disconnect in the service equipment is permitted provided it is in a separate vertical section and /or meets the requirements of NEC 695-4(b)(2). The intent can be demonstrated by the following excerpt from NFPA 20 1996 Edition, Standard for the Installation of Centrifugal Fire Pumps.
"A-6-3.2.2 Where the alternate power is from an on-site generator, the alternate service equipment need not be located in the fire pump room.
The Committee considered the potential arrangement of providing fire pump power from the secondary side of the transformer, which supplies other electrical loads of the facility. The Committee recognizes that it is possible to supply the fire pump power ahead of other plant loads and to protect the fire pump power circuit by proper electrical coordination. However, the Committee is concerned that, while responding to an emergency, fire fighters may seek to disconnect electrical power to the facility by opening the transformer primary disconnect, which in this case would isolate power to the fire pump as well. In addition, the Committee is concerned that the designed electrical coordination may be compromised by ongoing additional electrical loads to the facility power distribution system. Therefore, if electrical service is supplied to the facility at voltage higher than utilization voltage, the Committee feels that a separate transformer to provide power to the fire pump is appropriate."
As can be seen, the committee was rightfully concerned about the possible inadvertent disconnection of the fire pump supply. Although they were concerned, they did not mandate a separate transformer, service, or even a disconnect located physically remote from the service, in fact, they recognized that any of these would be permitted, especially if a second source of supply (such as a stand-by generator) was provided.
While locating the disconnect, transformer or other source of supply remote from the service should provide a superior design, it is not required. As has been pointed out numerous times, the NEC is not a design manual, it is a minimum standard for safety.
Additional support for the above statements can be found in the two following excerpts from NFPA 20 1996 edition.
"A-6-3 Where risks involved are large and interruption of fire pump service would seriously affect protection, at least two separate circuits from the power plant(s) to the pump room should be provided. The circuits should be run by separate routes or in such a manner that failure of more than one at the same time would be only a remote possibility.
A completely underground circuit from generating station to the pump room is strongly recommended and should be obtained where practicable. Where such construction is not available, an overhead circuit may be allowed, but that part of the circuit adjacent to the plant served by the fire pump or to exposing plants should be run with special reference to damage in case of fire. Where the pump room is part of, or in close proximity to, the plant that the pump is designed to protect, the wires should be underground for some distance from the pump room."
"A-6-3.1.1 Under premise fire conditions, service and feeder connections are susceptible to failure from collapsing structural and other members within the premise as well as failure from fire. Under fire conditions generated by overcurrent within these service and feeder conductors, the characteristics of 6-3.1.1 minimize the possibility of fire spread.
Typical methods of routing power from the source to the motor are shown in Figure A-6-3.2.2. Other configurations may also be acceptable."
In both of these excerpts, the panel for NFPA 20 does not mandate a specific design, rather they state what should be provided.
Finally, it should be noted that the current edition of the NEC would require a more stringent installation for a fire pump when supplied from a normal source and a stand-by source than is required for an emergency system. This seems to be overly restrictive when you take into consideration that a fire pumps primary duty is to provide protection to a building, while an emergency system (NEC 700) primary function is to assure the safety of the occupants of a facility. At the worst case, the system should not be required to be held to a higher standard than an emergency system (except for the conductors).
PANEL ACTION: Reject.
PANEL STATEMENT: The current code language clearly states the intent. The proposed change does not add anything.
The panel does not agree with the submitter's statement that physical separation is not needed.

(Log #3913)

15- 81 - (695-3(a)(2), FPN (New)): Reject
SUBMITTER: James Stanley Nasby, Master Control Systems, Inc.
RECOMMENDATION: Add Fine Print Note:
FPN: This power production facility should always be in operation, 24 hours a day, 7 days per week, and of a reliability that is sufficient for the Authority Having Jurisdiction.
SUBSTANTIATION: To help differentiate this power source from an alternate emergency source, when used.
PANEL ACTION: Reject.
PANEL STATEMENT: A definition is clearer than a FPN. Refer to panel action on Proposal 15-79.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18

(Log #1180)

15- 82 - (695-3(b)): Reject
SUBMITTER: Lawrence A. Bey, Onan Corp.
RECOMMENDATION: Revise as follows:
"...in combination with an on-site ~~standby~~ emergency generator complying with...".
SUBSTANTIATION: NFPA 20 Section 6-6.3 requires a Level 1, Type 10 system in accordance with NFPA 110. In NEC terminology, that would be an emergency system to have 10 second power restoration and equipment specification level for life-safety loads.
PANEL ACTION: Reject.
PANEL STATEMENT: NFPA 20 defines the generator as a stand-by generator and purposely refrains from defining it as an emergency generator; it requires the stand-by generator to have the operating characteristics of a Level 1, Class 10 system in accordance with NFPA 110. The NEC does not classify or categorize a Level 1, Class 10 system as an emergency system.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18

(Log #3914)

15- 83 - (695-3(b), FPN (New)): Reject
SUBMITTER: James Stanley Nasby, Master Control Systems, Inc.
RECOMMENDATION: Add Fine Print Note:
FPN: An "on-site generator," when used, is a "standby" generator which may also be known as an emergency generator, or as an alternate source generator, or other designation, such as peak shaving or co-generation unit, when acceptable to the Authority Having Jurisdiction.
SUBSTANTIATION: To help differentiate this power source from an on-site power plant and to suggest the types of alternate sources which may be used.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed FPN does not clarify the term "on-site generator" and tends to confuse it with "standby" and "emergency." The submitters intent has been met by panel action on 15-79.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18

(Log #1177)

15- 84 - (695-3(b)(1)): Reject
SUBMITTER: Lawrence A. Bey, Onan Corp.
RECOMMENDATION: Add text to read:
"Generator capacity sufficient to carry locked-rotor current of the fire pump indefinitely shall not be required."
SUBSTANTIATION: Sizing the generator set to carry locked rotor current of the fire pump motor continuously is sometimes inferred from the sizing requirement for overcurrent protective devices at locked rotor indefinitely. A definitive code language statement is needed to prevent this inference. Depending on the percentage of fire pump load to the total generator load, generator sets sized to carry locked rotor current continuously may be oversized by as much as 300 percent of the capacity required to start and run the fire pump motor. The problem with oversized engine-generators is not just unnecessarily high equipment and installation cost; there are also significant operating problems. The problems with lightly-loaded diesel engines are wet-stacking, carboning, fuel dilution of lube oil, and water contamination of lube oil. If engines have these problems, the emergency source of power is not as reliable.
PANEL ACTION: Reject.
PANEL STATEMENT: This is extract performance-based material (NFPA 20, 6-2.3.1 and 6-2.4.1), NOT an installation requirement. It is impractical to expect the generator to deliver locked rotor amperes (LRA) indefinitely. In those cases where reduced voltage starting is used, the motor starting current is considerably less than motor LRA. The real issue is the starting and running of the motor as in the present text of 695-3(b)(1). LRA is a concern of protective devices, not the power supply. The present requirement addresses the need as a performance issue; the proposal offers a design criteria.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 18

(Log #2347)

15- 86 - (695-3(c) (New)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add new text to read as follows:
General Requirements. Power shall be made available to the fire pump in a time not to exceed 10 seconds. When the source of power is from a generator set, the fuel supply capacity shall be sufficient to provide 8 hours of fire pump operation at 100 percent of the rated pump capacity in addition to the supply required for other demands.
SUBSTANTIATION: NEC 695 and NFPA 20 do not currently require a minimum standard for the time required for power to be made available for starting a fire pump. NFPA 20 6-6.3 requires a type 10 generator. NFPA 110 defines a type 10 as one that will have power available to the load terminals of a transfer switch in not more than 10 seconds.
NFPA 20 6-6.3 does require a minimum fuel supply of 8 hours of pump operation. This requirement should also be stated in the NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: This is extract performance-based material (NFPA-20, 6-2, 6-2.1, 6-2.2, 6-2.3), NOT an NEC installation requirement.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18

(Log #1179)

15- 87 - (695-4(b) and Exception (New)): Accept in Principle
SUBMITTER: Lawrence A. Bey, Onan Corp.
RECOMMENDATION: Delete the sentence in 695-4(b):
~~"For on-site generators installed under the provisions of Section 695-3(b)(1), the overcurrent devices shall not be required."~~
Add an Exception to 695-4(b)(1) as follows:
Exception: Overcurrent protective devices between an on-site emergency generator and a fire pump controller shall be selected and sized according to 430-62 to provide short-circuit protection only.
SUBSTANTIATION: There is confusion about selecting and sizing an overcurrent device to feed a fire pump from an emergency generator system, because the language of 695-4(b) is not clear. The requirement for overcurrent protective device selection in 695-4(b)(1) is sometimes applied to on-site emergency generator systems, because there is no exception following that section.
PANEL ACTION: Accept in Principle.
Replace "emergency" with "standby" and replace the proposed deleted sentence with the modified exception as a positive statement in the second paragraph of 695-4(b) to read:
For systems installed under the provisions of Section 695-3(b)(2) only, such additional disconnecting means and associated overcurrent protective device(s) shall be permitted as required to comply with other provisions of this Code. Overcurrent protective devices between an on-site standby generator and a fire pump controller shall be selected and sized according to 430-62 to provide short-circuit protection only. All disconnecting devices and overcurrent protective devices that are unique to the fire pump loads shall comply with the following:
PANEL STATEMENT: See panel action on 15-82 regarding the issue of standby versus emergency generators for fire pumps. The statement is a requirement, not an exception.

(Log #1816)

15- 88 - (695-4(b)(1)): Accept
SUBMITTER: James L. Boyer, Firetrol, Inc.
RECOMMENDATION: Add a new sentence to the end of existing 695-4(b)(1) to read:
"An instantaneous trip circuit breaker shall be permitted to be used as the disconnecting means and overcurrent protection and shall be permitted to be set to a maximum of twenty times motor full load current."
SUBSTANTIATION: Typically, instantaneous trip circuit breakers are permitted only where coordinated with motor overload protection. However, overload protection is not permitted for the fire pump controller / motor. Listed combination switch / fuse units with the switch rated at 125% at motor FLA and the fuses rated to carry motor LRA indefinitely are not available (for larger motors with higher FLA); a thermal-magnetic breaker would have to be sized for continuous motor locked-rotor current. The use of an instantaneous trip circuit breaker will provide short-circuit protection without interfering with the operation of the fire pump motor under (permissible) overload conditions; it provides both disconnecting means and short-circuit protection.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
BOYER: This is extracted material which can be revised only by the NFPA 20 committee.

(Log #3915)

15- 89 - (695-4(b)(1), FPN No. 1 and 2 (New)): Reject
SUBMITTER: James Stanley Nasby, Master Control Systems, Inc.
RECOMMENDATION: Add two Fine Print Notes:
FPN No. 1: This requirement applies to devices, when used, upstream (ahead of) of the fire pump controller. It does not apply to the conductors connecting a circuit breaker supplied by an on-site standby (alternate, emergency) generator to the alternate (emergency) side input of a fire pump transfer switch, or a transfer switch fire pump controller combination.
FPN No. 2: Since the minimum wire size required is 125 percent of the fire pump motor full load current, plus other pump room loads, and since a protective device will usually be sized to at least 600 percent of the fire pump motor full load current (for typical design "B" squirrel cage induction motors), special lugs for the smaller (125 percent) wiring may be required to comply with the device's listed lug rating limitation(s).
SUBSTANTIATION: FPN No. 1: To help clarify the endless confusion about where and when this requirement applies.
FPN No. 2: To help reduce the endless confusion regarding fire pump controller versus incoming cable size requirements; and, to attempt to indicate the wire versus lug size coordination required. There is constant misunderstanding regarding (normal side) incoming cable size versus controller lug size versus protective device lug size.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing wording is adequate; the proposed FPNs contain only information already provided. This is Handbook material.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18

(Log #3929)

15- 90 - (695-4(b)(2)): Reject
SUBMITTER: Charles J. Palmieri, Palmieri Assoc.
RECOMMENDATION: Revise text as follows:
(2) Disconnecting Means. The disconnecting means shall be
a. Identified as suitable for use as service equipment,
b. Lockable in the closed position, and
c. Located sufficiently remote from other building or other fire pump source disconnecting means that inadvertent ~~contemporaneous~~ simultaneous operation would be unlikely.
Strike the word contemporaneous and replace with the word simultaneous as indicated.
SUBSTANTIATION: The Code has had marching orders to improve its readability. The term contemporaneous displays only one hit in the 1999 NEC. The word simultaneous appears 15 times and is just as effective.
PANEL ACTION: Reject.
PANEL STATEMENT: "Contemporaneous," meaning occurring within the same time, while "simultaneous" means occurring at the same time (instant).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
HIRSCHLER: The word "contemporaneous" is defined in Webster as "existing or occurring during the same time (as during a year, decade, or longer span of time)". I am sure the panel does not want to imply that the separation should be such that activation of the disconnecting means within the same decade should be discouraged. If the panel refuses to accept the word "simultaneous", the correct terminology should be "in rapid succession".

(Log #487)

15- 91 - (695-4(b)(3), 695-6(b), 695-12(d)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 695-4(b)(3) - change "1 in. (25.4 mm)" to "25 mm (1 in.)"
695-6(b) - change "2 in. (50.8 mm)" to "50 mm (2 in.)"
695-12(d) - change "12 in. (305 mm)" to "300 mm (12 in.)"
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18

(Log #2555)

15- 92 - (695-5(b)): Reject
SUBMITTER: Joseph C. Warren, Joseph C. Warren Electrical Consulting Services
RECOMMENDATION: Revise as follows:
(b) Overcurrent Protection. The primary overcurrent protective device(s) shall be selected or set to carry idenfinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. Secondary overcurrent protection shall not be permitted. When selecting primary overcurrent protection, it shall also be permitted to be selected or set up to 600 percent of the rated full-load current of the transformer.
SUBSTANTIATION: In the 1996 edition of the NEC, 600 percent was permitted for this calculation, in addition to locked rotor method and fire pump accessory equipment. This made the method of calculation easier to do and gave the designer this option instead of lengthy calculations. It was also easier for inspectors to make sure this calculation fell in line with Article 695 rules. This method of using 600 percent also gives higher overcurrent protection for the fire pump and accessory equipment which is best since the fire pump should run indefinitely until failure for the protection of human life and property.
PANEL ACTION: Reject.
PANEL STATEMENT: This matter is covered in 450-3(a) for supervised transformers with an impedance not greater than 6%. Using 600% of full load current of the transformer is not the same as the existing requirement.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18

(Log #3916)

15- 93 - (695-6, Exception (New)): Reject
SUBMITTER: James Stanley Nasby, Master Control Systems, Inc.
RECOMMENDATION: Add an exception to the main paragraph to read:
Exception: The requirements of (a) and (b) below do not apply to the conductors connecting a circuit breaker supplied by an on-site standby (alternate, emergency) generator to the alternate (emergency) side input of a fire pump transfer switch, or a transfer switch fire pump controller combination.
SUBSTANTIATION: To help clarify the ongoing field confusion about the normal versus emergency side wiring requirements on so-called dual source (transfer switch) installations. There is constant confusion by engineers (electrical and mechanical or fire protection), contractors, inspectors, and installers on this subject.
PANEL ACTION: Reject.
PANEL STATEMENT: 695-6(a) applies only to service conductors and only a utility can provide service; 695-6(b) is intended to apply to feeder conductors from a generator. The proponent invokes the word "emergency."
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18

(Log #2994)

15- 94 - (695-6(b)): Accept in Principle in Part

SUBMITTER: James Conrad, Rockbestors-Surprenant Cable Corp.

RECOMMENDATION: Revise Section 695-6(b) to read as follows:

Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by Section 695-4(b) shall be kept entirely independent of all other wiring. They shall only supply loads that are directly associated with the fire pump system, and they shall be protected to resist potential damage by fire, structural failure, or operational accident. They shall be permitted to be routed through a building(s) using one of the following conditions:

(1) Be encased in a minimum 2 in. (50.8 mm) of concrete

(2) Be within an enclosed construction dedicated to the fire pump circuit(s) and having a minimum of a 1-hour fire resistive rating

(3) Be a listed electrical circuit protection system with a minimum 1-hour fire rating

(4) Be a cable listed to maintain circuit integrity for a minimum of 1 hour when installed in accordance with the listing requirements

Exception: The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum 1-hour fire separation or fire resistance rating, unless otherwise required by Section 700-9(d) of this Code.

SUBSTANTIATION: This proposal does not delete nor add any methods that are currently contained in the 1999 NEC. It identifies and separates fire resistive cables from the electrical circuit protective systems. This would then be consistent with the terminology and the classifications as they appear in the Building Material Directory.

PANEL ACTION: Accept in Principle in Part.

Accept the proposal, except reword (3) as shown and reject (4):

"(3) Be a listed cable or listed electrical circuit protection system with a minimum of 1-hour fire rating."

PANEL STATEMENT: No listing presently exists for item 4; combining it into item 3 permits, without requiring, such a cable.

Editorially revise item 1) to satisfy the Manual of Style with regard to metric units appearing first.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

HIRSCHLER: This is premature. UL does not yet list cables to have a minimum 1 hour rating. This is expected to happen in the future, and the NEC should only be changed after such a listing becomes available from UL, or another listing organization. At the time of proposals to the NEC 1999 cycle, it was expected that the UL listing of cables would be imminent, but it has still not occurred.

(Log #4142)

15- 95 - (695-6(b)): Reject

SUBMITTER: L. James Milne, BICCGeneral

RECOMMENDATION: Delete text as follows:

Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by Section 695-4(b) shall be kept entirely independent of all other wiring. They shall only supply loads that are directly associated with the fire pump system, and they shall be protected to resist potential damage by fire, structural failure, or operational accident. They shall be permitted to be routed through a building(s) encased in 2 in. (50.8 mm) of concrete ~~or within enclosed construction dedicated to the fire pump circuit(s) and having a minimum of a 1-hour fire resistance rating,~~ or they shall be permitted to be within listed electrical circuit protective systems with a minimum of 1-hour fire resistance. The installation shall comply with any restrictions provided in the listing of the electrical circuit protective system used.

SUBSTANTIATION: This proposal recommends deletion of the "enclosed construction" option that first appeared in the 1999 NEC. Although fire protection of fire pump feeders has been a code mandate for many years, the 1999 NEC substantially weakened this requirement. Prior to this fire protection of fire pump feeders had to be achieved using "listed electrical circuit protective systems with a minimum of 1-hour fire resistance" or "enclosed within not less than two inches of concrete." The 1999 NEC allows "a fire-rated assembly having a minimum fire rating of 1 hour" to be used. The most common of these fire rated assemblies would be gypsum board enclosures. This additional method of compliance is concerning for the following reasons:

• Lack of Third Party Testing. Gypsum enclosures do not have a UL listing for electrical circuit protection but is used to achieve fire separation. The 1999 National Electrical Code Handbook warns: "It is important to understand the difference between a 1-hour fire rating of an electrical cable and a 1-hour fire resistance rating of a structural member, such as a wall. Simply stated, at the end of a 1-hour fire rating test on an electrical cable, the circuit and its insulation must be intact and electrically functioning. (No short circuits, grounds, or opens are permitted.) However, a wall subjected to a 1-hour fire resistance test must only prevent a fire from passing through or past the wall, without regard to damage to the wall. All fire ratings and fire-resistance ratings are based on the assumption that the structural supports for the assembly are not impaired by the effects of fire." The Underwriters Laboratories Fire Resistance Directory contains a similar warning: "All ratings are based on the assumption that the stability of structural members supporting the assembly are not impaired by the effects of fire. The extent of damage of the test assembly at the rating time is not a criteria for the rating." By requiring emergency feeders to be a listed electrical circuit protective system, there is assurance that the method used has been subjected to testing that confirms survival of this critical wiring during a fire emergency. By allowing gypsum board enclosures, compliance moves from distinct, tested methods to vague options subject to a wide spectrum of interpretation. Something as important as this demands specific means of compliance and backing by appropriate tests related directly to the protection of electrical wiring.

• Difficult to Inspect. The enclosure is constructed in the field often under less than ideal conditions. In many cases the enclosure is constructed by the general contractor (not the electrical contractor) who may not fully appreciate the role of the enclosure, viewing it as "putting up a little more sheet rock," an inexpensive and ineffective solution. The quality of the enclosure can be very difficult to inspect in the limited access areas so common in retrofit installations.

• Compliance Conflicts. When gypsum enclosures are used it is very difficult to comply with Section 346-11 Bends—Number in One run while meeting the requirements of Section 370-29 Conduit Bodies, Junction, Pull, and Outlet Boxes to be Accessible. In a conduit run, there can be no more than the equivalent of four quarter bends (360° total) between pull points, e.g., conduit bodies and boxes. If the installation mandates pull boxes, the pull boxes can't be inside the gypsum enclosure and still be "rendered accessible without removing any part of the building..." as stated in 370-29.

• System Easily Compromised. Even if properly constructed, the fire resistance of a typical gypsum enclosure can easily be compromised after the installation--and often is. The submitted photographs show how an additional conduit was run through the gypsum enclosure (the shortest routing), completely negating any fire rating it may have had. In most cases this goes unnoticed, resulting in a severely compromised emergency system.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The option of one hour fire-resistant construction rating needs to remain. What happens after the original installation is not part of the NEC. Any wiring methods or protection can be compromised after the original installation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

SOBEL: I agree with the submitter's substantiation.

(Log #CP1508)

15- 95a - (695-6(c)): Accept

SUBMITTER: CMP 15

RECOMMENDATION: Revise 695-6(c) to read as follows:

(c) Conductor Size

(1) Fire Pump Motors and Other Equipment. Conductors supplying a fire pump motor(s), pressure maintenance pumps, and associated fire pump accessory equipment shall have a rating not less than 125 percent of the sum of the fire pump motor(s) and pressure

maintenance motor(s) full-load current(s), and 100 percent of the associated fire pump accessory equipment.

(2) Fire Pump Motors Only. Conductors supplying only a fire pump motor(s) shall have a rating not less than 125 percent of the fire pump motor(s) full-load current(s).

SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 18

(Log #3921)

15- 96 - (695-6(c) (New)): Reject
SUBMITTER: James Stanley Nasby, Master Control Systems, Inc.
RECOMMENDATION: Add a new subparagraph to read:

(c) Emergency Side Conductors. The conductors supplying power to the alternate side of a fire pump transfer switch or a combination transfer switch fire pump controller unit shall meet the requirements of a motor branch circuit, including protection thereof, per Section 230.

Exception No. 1: If these alternate side conductors are installed to meet either service entrance requirements of (a) above or the normal side circuit conductors of (b) above, they shall be considered as meeting this requirement.

Exception No. 2: When such circuits are supplied by a gen set whose only load is one fire pump, this requirement may be met by the generator circuit breaker when the combination of this breaker and the maximum output from the generator provide adequate protection for these conductors.

SUBSTANTIATION: This is to help clarify the need for suitable protection for the alternate side conductors. There is rampant confusion on this issue. In the case of either large or multi pump generators or live emergency buses, these conductors are seldom protected. This poses a risk both to the fire protection integrity and also creates a fire hazard as well as a risk to any other emergency loads which are supplied by a larger generator.

Note: It is the intent of the submitter that this text coordinate with or be revised to merge with proposed text on this subject submitted by either NEMA Subcommittee SC-10 or by the NFPA 20 Electrical Task Group.

PANEL ACTION: Reject.
PANEL STATEMENT: The new subparagraph and exceptions are vague and confusing [Which part(s) of Article (not Section) 230? Motor branch circuits are in Article 430.] See panel action on 15-97. The requirements of Article 700 for emergency systems are not always applicable.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18

(Log #3098)

15- 97 - (695-6(d), Exception (New)): Accept
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Add an exception to 695-6(d), Overload Protection, as follows:

"Exception: For on-site standby generator(s) which produce continuous currents in excess of 225 percent of the FLA of the fire pump motor, the conductors between the on-site generator(s) and the combination fire pump transfer switch controller or separately mounted transfer switch shall be installed in accordance with Section 695-6(b) or protected in accordance with Section 430-52.

The protection provided shall be in accordance with the short-circuit current rating of the combination fire pump transfer switch controller or separately mounted transfer switch."

SUBSTANTIATION: At present neither NFPA 70 nor NFPA 20 require overcurrent protection in the conductors from the alternate source when that power source is an on-site generator. This is particularly a problem in installations where the generator capacity far exceeds the fire pump motor FLA. In these cases, the conductors are at risk and present a hazard to the premises. Two-hundred twenty-five percent of the FLA of the fire pump motor will permit a running motor subjected to single-phasing to continue to run.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 18

(Log #2981)

15- 98 - (695-6(e)): Reject
Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Revise text as follows:

(e) Pump Wiring. All wiring from the controllers to the pump motors shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, Schedule 80 Rigid Nonmetallic Conduit, or liquidtight flexible nonmetallic conduit Type LFNC-B, or Type MI cable.

SUBSTANTIATION: This proposal adds Schedule 80 Rigid Nonmetallic Conduit as an approved raceway for power circuits.

The UL Fact Finding Report on Schedule 80 Rigid PVC Conduit, 97NK31953, dated October 17, 1997, was first introduced to Panel 15 at the ROC for the 1999 NEC. It should be noted that all product exceeded the product standard's physical requirements. It should also be noted that Rigid Metal (aluminum) Conduit was selected for the comparison for its superior physical properties compared to the other approved pump wiring methods such as intermediate metal conduit, liquidtight flexible metal conduit or Type MI cable. 2-in. Schedule 80 Rigid PVC Conduit is used compared to the 1 1/2-in. Rigid Metal (aluminum) Conduit since a grounding conductor would be required in the Schedule 80 Rigid PVC Conduit increasing its wirefill.

The UL Fact Finding Report compares Schedule 80 Rigid PVC Conduit to Rigid Metal (aluminum) Conduit. Three types of tests were performed on these products, Impact, Crush, and Flammability. It should be noted that the test values for both Impact and Crush were increased from the product standards so that an electrical short would occur.

In both impact and crush testing Schedule 80 Rigid PVC Conduit satisfactorily protected the conductors in the conduit compatible, if not better than, to Rigid Metal (aluminum) Conduit. In the Flammability test, the integrity of the circuit remained with the Schedule 80 Rigid PVC Conduit as long as it would with the Rigid Metal (aluminum) Conduit.

The UL Fact Finding Report does provide sufficient technical substantiation that Schedule 80 Rigid PVC Conduit will resist physical damage equally to those wiring methods currently listed.

Note: Supporting material available for review at NFPA Headquarters.

PANEL ACTION: Reject.
PANEL STATEMENT: The tests performed do not show schedule 80 RNMC to be equal or superior to GRC. The test on shorts clearly shows more shorts for the RNMC. The impact tests do not show Schedule 80 PVC to be equal to GRC. The test should also use trade size to trade size for an accurate comparison. By using the worst case scenario for the crush test, Schedule 80 PVC does not equal GRC. In the flame test, the conduits were about equal. The larger sizes of conduit used, clearly shows that PVC does not equal GRC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 4
EXPLANATION OF NEGATIVE:
AMOS: I'm voting against the Panel Action to reject this proposal. The UL fact-finding report submitted with the proposal provides the entire technical substantiation necessary to support the acceptance of schedule 80 rigid nonmetallic conduit.

There is obvious reason, such as the added use of a grounding wire for the difference in trade sizes and there was no evidence that the comparison was an attempt to compare apples to oranges. The fact-finding report substantiated that the comparative qualities of RMC and RNMC regarding the impact test, crush test and flammability test. Liquidtight flexible nonmetallic conduit is presently allowed in this section of the code and has a proven track record of safety. There is

no reason to continue suppressing the use of proven product, simply because it's new.

GLENN: I am voting against the panel action to reject this proposal. The submitter provided adequate documentation in the form of a UL fact-finding report that supports the acceptance of schedule 80 rigid nonmetallic conduit to be installed from the controllers to the pump motors.

During the last code cycle, I voted against the panel when they rejected this same proposal. During the last code cycle, the panel was concerned about workman working around the conduit and that the conduit could be easily damaged. UL lists Schedule 80 RNMC as being resistant to physical damage and as being acceptable for electrical conduit installations. Now during this code cycle, the panel mistakenly concluded that the tests using 2 in. RNMC and 1 1/2 in. RMC were not equivalent and that UL choose the 2 in. because of its greater strength characteristics. UL selected the 2 in. RNMC based on equivalent wire sizing for the two types of conduit installations. The RNMC would require an additional ground wire while the RMC would not. The impact tests clearly show that the number of shorted wires in the RNMC conduit was as good as the GRC. The number of shorts during the crush test was exactly the same for both the RNMC and the RMC. The results of the flammability test for the 1/2 in. trade size were essentially the same. Although the flammability test time for the 1 1/2 in. RMC averaged 24 minutes, the lowest failure times for all the tests where essentially the same. The panel's statement that "the larger sizes of conduit used clearly shows that PVC does not equal GRC" is not the question. The question is not whether or not PVC equals GRC, but is RNMC safe for this application. The UL listing and the fact finding report clearly supports the safe use of RNMC for this application. It is also evident that the RNMC does a much better job of preventing the conduction of heat into the internal wiring. There is no sound reason for not including schedule 80 rigid nonmetallic conduit for this application.

HIRSCHLER: The UL fact finding report accompanying the proposal indicates that schedule 80 rigid nonmetallic conduit (RNMC) has appropriate performance for the application, in terms of impact resistance, crush resistance and flammability. The Fact-Finding report compared schedule 80 with rigid metallic conduit (i.e., aluminum conduit), and compares equivalent systems. The added use of grounding conductors in RNMC (not needed for the aluminum conduit) means that a larger outer diameter pipe is required to contain 3 circuit conductors of 1/0 AWG size; thus 40 percent conductor fill means a 1 1/2 inch diameter RMC conduit and a 2 inch diameter RNMC conduct. See details of results:

Impact test: for both RMC and RNMC the conduit protected the conductors from shorts when a 75 pound weight was dropped from up to a 6 ft height (with the larger diameter, compared to a listing requirement of 4 ft for RNMC) or when the weight was dropped from up to 1.5 ft (with the smaller diameter, compared to a listing requirement of 1.25 ft for RNMC).

Crush test: both RMC and RNMC the conduit protected the conductors from shorts when a crushing force was applied, with the crushing force required to cause a short being higher for the smaller size of RNMC than for that of RMC, while the opposite was true for the larger diameters, indicating comparable results.

Flammability: the smaller sizes of RMC and RNMC protected the conductors to exactly the same time, ca. 3 min. The flammability test on the larger diameter conduit was the single test for which there was a significant difference in circuit protection, with RMC being superior, but even there RNMC gave 5-12 min. circuit integrity, while 4 of the 6 RMC tests gave 10-16 min. circuit integrity, on exposure to a 60 kW gas burner flame.

Thus, schedule 80 rigid nonmetallic conduit is a UL-listed product, which has been shown in tests to be sufficiently resistant to physical damage for the application. It is also capable of preventing the heat transmission which occurs with metal conduit and which can destroy the conductors. The material used for schedule 80 rigid nonmetallic conduit is PVC, which has excellent fire performance, including low propensity for ignition and very low heat release once ignited. Moreover, supply conductors are required to be routed outside the buildings, or behind 2 inches of concrete or behind a fire rated wall, with a 1 hour rating.

KOVACIK: The Panel Statement that schedule 80 RNMC is not equal or superior to GRC is flawed logic. Schedule 80 RNMC needs to be equal or superior to only one and any of the raceways presently allowed by 695-6(e). If the Panel Statement were true, all raceways currently allowed would need to be equal or superior to GRC which is obviously not the case. The samples of conduit trade sizes were selected for testing based on equating wire fill rather than trade size. This was determined to provide a more accurate comparison of performance. The number of wires used in each trade size conduit was selected based on actual power supply configurations, which include ungrounded and grounded circuit conductors.

(Log #2995)

15- 99 - (695-6(e)): Reject

SUBMITTER: James Conrad, Rockbestors-Surprenant Cable Corp.

RECOMMENDATION: Revise Section 695-6(e) as follows:

All wiring from the controllers to the pump motors shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit Type LFNC-B, or Type MI cable, or Type MC cable having a smooth or corrugated sheath.

SUBSTANTIATION: It appears that the code is asking for some degree of mechanical protection as well as protection against liquids; while affording the installer the ability to maintain a flexible connection between the controller and the pump motor. Type MC cable having a smooth or corrugated sheath offers both mechanical and liquidtight protection in a flexible cable.

PANEL ACTION: Reject.

PANEL STATEMENT: There is no technical substantiation offered that Type MC cable is equivalent to presently accepted wiring methods.

(Log #1411)

15- 100 - (695-6(g)): Accept

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

Mechanical Protection. All wiring from engine controllers and batteries shall be protected against ~~mechanical injury~~ physical damage, and shall be installed in accordance with the controller and engine manufacturers instructions.

SUBSTANTIATION: Editorial. "Physical damage" is the term used throughout the Code and seems more technically appropriate. Damage can occur from other than mechanical sources, such as chemicals, and inanimate material is usually not thought of as subject to "injury". The extracted Section 695-14(d) uses this same term.

PANEL ACTION: Accept.

(Log #3920)

15- 101 - (695-7): Reject

SUBMITTER: James Stanley Nasby, Master Control Systems, Inc.

RECOMMENDATION: Revise the paragraph to read:

695-7 Voltage Drop. The fire pump power source, wiring and any devices such as transformers, when used, shall provide adequate starting and continuous duty power for the fire pump or fire pumps and any pump room loads on said power source; and, shall meet both of the following voltage drop requirements.

[x](a) The voltage at the controller line terminals or at a controller transfer switch combination or at a fire pump transfer switch normal and emergency side line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under normal automatic or manual electrical motor starting conditions. For reduced inrush (reduced voltage or reduced current) starting type controllers, the voltage shall not drop more than 15 percent under said reduced inrush starting. For across the line (full voltage) starting controllers, the voltage shall not drop more than 15 percent under said full voltage starting.

Exception: This limitation shall not apply for emergency run mechanical starting.

[x](b) The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.
SUBSTANTIATION: There persists continuing and frequent confusion over sizing of a required backup generator and over sizing incoming service or transformers and power wiring to and from same. The text revision aims at helping to clarify same.
The exception is moved since it applies to starting a reduced inrush starting type controller; but, not to the motor running voltage, since exceeding the 5 percent limitation will always result in an overheated motor and/or damage (possibly incipient damage) to the motor.
PANEL ACTION: Reject.
PANEL STATEMENT: This is extract performance-based material (NFPA 20, 6-3.1.2), NOT an installation requirement. The underlining does NOT reflect the changes being requested.

(Log #3917)

15- 102 - (695-7, FPN No. 1 and 2 (New)): Reject
SUBMITTER: James Stanley Nasby, Master Control Systems, Inc.
RECOMMENDATION: Add two Fine Print Notes:
FPN No. 1: The 15 percent maximum drop applies to normal reduced motor starting when a reduced inrush (starting) type of controller is used.
FPN No. 2: Exceeding the 15 percent maximum voltage drop during starting can cause motor or controller damage by causing the motor contactor(s) and/or other controller devices to chatter. Exceeding the 5 percent maximum voltage during running will cause the motor and/or controller components to overheat due by causing excessive motor full load and/or service factor currents.
SUBSTANTIATION: Undersized transformers and undersized emergency generators continue to cause a significant number of field problems or unreliable installations. This paragraph is the only NEC guide to proper sizing of these two items. Absent these guidelines, transformers and/or generators are sized based on thermal full load temperature rise ratings, which will rarely be near sufficient. The above FPNs may help to clarify both the requirements and their intent (need).
PANEL ACTION: Reject.
PANEL STATEMENT: The FPNs are handbook material, not Code material. These are extract material (NFPA-20, 6-3.1.2) and may belong in NFPA 20 Appendix A.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 18

(Log #3919)

15- 104 - (695-11 (New)): Reject
SUBMITTER: James Stanley Nasby, Master Control Systems, Inc.
RECOMMENDATION: Add new paragraph to read:
[x]695-11. Short Circuit and Withstand Rating Coordination. Electric fire pump controllers of all types shall be labeled with a short circuit current (withstand) rating at least equal to the available short circuit current available at the line terminals of the fire pump controller or at both sets of inputs at wither a power transfer switch or a combination transfer switch fire pump controller. When power transfer switches require upstream protection on their normal source input, such protection shall meet the continuous locked rotor requirements of Section 695-4(b)(1). Both...
SUBSTANTIATION: This coordination is often overlooked in field installations until inspection of the installation. The result can be installations of unknown safety. This requirement is important for: 1) personnel safety, 2) equipment and premises safety, and 3) reliability of the fire protection.
The second sentence is an attempt to clarify the very prevalent lack of understanding and compliance with this coordination requirement.
Notes:
1) The extract material reference is NFPA 20, Paragraph 7-1.2.2.
2) The above paragraph number (695-11) is tentative only. Extant text lacks paragraphs 695-8, -9, -11, and -13.
PANEL ACTION: Reject.
PANEL STATEMENT: The recommended material is presently covered by NEC Article 110 and NFPA 20 6-3.2.2.4. The recommedation re-introduces the term "withstand rating" not elsewhere used.

(Log #1178)

15- 105 - (695-12(a)): Reject
SUBMITTER: Lawrence A. Bey, Onan Corp.
RECOMMENDATION: Revise by deleting references to transfer switches as follows:
"(a) Controllers ~~and Transfer Switches~~. Electric motor-driven fire pump controllers ~~and power transfer switches~~ shall be located as close as practicable to the motors that they control...".
SUBSTANTIATION: The fire pump controller includes the disconnecting means for the fire pump motor so there is no safety need for the transfer switch to be located within sight of the motor. In existing facilities where the fire pump is being added to the generator, it may not be possible to locate the transfer switch in the pump room. Since conduits to the fire pump room are required to be protected from fire, locating the transfer switch closer to either the normal or generator source of power reduces the installed cost by use of a common set of cables and conduit rather than two sets both fire protected. If both normal power and automatic operation of the transfer switch are lost, a manual operation of the transfer switch will not necessarily restore power. The automatic control of the transfer switch also starts and monitors availability of generator power. The manual means of transfer switch operation will not start a generator set that isn't running.
Installation is within the scope of the NEC, not NFPA 20.
PANEL ACTION: Reject.
PANEL STATEMENT: NFPA 20 6-6.4 requires that transfer of power shall take place within the pump room. "In-sight" provides for consideration of safe maintenance and emergency manual transfer.

(Log #3060)

15- 108 - (695-14(a)): Accept in Principle in Part
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Add a new phrase in the first sentence and add a new last sentence:
[x](a) Control Circuit Failures.[x] External control circuits that extend outside the fire pump room shall be arranged so that failure of any external circuit (open or short circuit) shall not prevent the operation of a pump(s) from all other internal or external means. Breakage, disconnecting, shorting of the wires, or loss of power to these circuits may cause continuous running of the fire pump, but shall not prevent the controller(s) from starting the fire pump(s) due to causes other than these external control circuits. All control conductors within the fire pump room that are not fault tolerant (that is, breaking or shorting could disable the controller from starting) shall be protected against mechanical injury.
SUBSTANTIATION: The purpose of this proposal is to alert the CMP that new extract material is included in NFPA 20-1999 (7-5.2.6, External Circuits Connected to Controllers) which needs to be incorporated in NFPA 70. This proposal accomplishes that.
PANEL ACTION: Accept in Principle in Part.
Revise the submitter's recommendation to read as follows:
Add a new phrase in the first sentence and add a new last sentence:
[x](a) Control Circuit Failures.[x] External control circuits that extend outside the fire pump room shall be arranged so that failure of any external circuit (open or short circuit) shall not prevent the operation of a pump(s) from all other internal or external means. Breakage, disconnecting, shorting of the wires, or loss of power to these circuits may cause continuous running of the fire pump, but shall not prevent the controller(s) from starting the fire pump(s) due to causes other than these external control circuits. All control conductors within the fire pump room that are not fault tolerant shall be protected against physical damage.[NFPA 20 1999, 7-5.2.5]
PANEL STATEMENT: The statement in parentheses was eliminated because the definition introduced by Proposal 15-78 explains the concept. The term mechanical injury was replaced by physical damage to be consistent with 15-100 and 15-106 in compliance with the Manual of Style.

(Log #2982)

15- 111 - (695-14(e)): Reject
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Revise text as follows:
(e) Electric Fire Pump Control Wiring Methods. All electric motor-driven fire pump control wiring shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, Schedule 80 Rigid PVC Conduit, or Type MI cable.
SUBSTANTIATION: This proposal adds Schedule 80 Rigid Nonmetallic Conduit as an approved raceway for control wiring.
The UL Fact Finding Report on Schedule 80 Rigid PVC Conduit, 97NK31953, dated October 17, 1997, was first introduced to Panel 15 at the ROC for the 1999 NEC. It should be noted that all product exceeded the product standard's physical requirements. It should also be noted that Rigid Metal (aluminum) Conduit was selected for the comparison for its superior physical properties compared to the other approved pump wiring methods such as intermediate metal conduit, liquidtight flexible metal conduit or Type MI cable. 2-in. Schedule 80 Rigid PVC Conduit is used compared to the 1 1/2-in. Rigid Metal (aluminum) Conduit since a grounding conductor would

be required in the Schedule 80 Rigid PVC Conduit increasing its wirefill.

The UL Fact Finding Report compares Schedule 80 Rigid PVC Conduit to Rigid Metal (aluminum) Conduit. Three types of tests were performed on these products, Impact, Crush, and Flammability. It should be noted that the test values for both Impact and Crush were increased from the product standards so that an electrical short would occur.

In both impact and crush testing Schedule 80 Rigid PVC Conduit satisfactorily protected the conductors in the conduit compatible, if not better than, to Rigid Metal (aluminum) Conduit. In the Flammability test, the integrity of the circuit remained with the Schedule 80 Rigid PVC Conduit as long as it would with the Rigid Metal (aluminum) Conduit.

The UL Fact Finding Report does provide sufficient technical substantiation that Schedule 80 Rigid PVC Conduit will resist physical damage equally to those wiring methods currently listed.

Note: Supporting material available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: Refer to panel action and statement on Proposal 15-98.

NEGATIVE: 4

EXPLANATION OF NEGATIVE:

AMOS: See my Explanation of Negative Vote on Proposal 15-98.

GLENN: I am voting against the panel action to reject this proposal. The submitter provided adequate documentation in the form of a UL fact-finding report that supports the acceptance of schedule 80 rigid nonmetallic conduit to be installed for electric motor-driven fire pump control wiring.

During the last code cycle, I voted against the panel when they rejected this same proposal. During the last code cycle, the panel was concerned about workman working around the conduit and that the conduit could be easily damaged. UL lists Schedule 80 RNMC as being resistant to physical damage and as being acceptable for electrical conduit installations. Now during this code cycle, the panel mistakenly concluded that the tests using 2 in. RNMC and 1 1/2 in. RMC were not equivalent and that UL choose the 2 in. because of its greater strength characteristics. UL selected the 2 in. RNMC based on equivalent wire sizing for the two types of conduit installations. The RNMC would require an additional ground wire while the RMC would not. The impact tests clearly show that the number of shorted wires in the RNMC conduit was as good as the GRC. The number of shorts during the crush test was exactly the same for both the RNMC and the RMC. The results of the flammability test for the 1/2 in. trade size were essentially the same. Although the flammability test time for the 1 1/2 in. RMC averaged 24 minutes, the lowest failure times for all the tests where essentially the same. The panel's statement that "the larger sizes of conduit used clearly shows that PVC does not equal GRC" is not the question. The question is not whether or not PVC equals GRC, but is RNMC safe for this application. The UL listing and the fact finding report clearly supports the safe use of RNMC for this application. It is also evident that the RNMC does a much better job of preventing the conduction of heat into the internal wiring. There is no sound reason for not including schedule 80 rigid nonmetallic conduit for this application.

HIRSCHLER: See my Explanation of Negative Vote on Proposal 15-98.

KOVACIK: See my Explanation of Negative Vote on Proposal 15-98.

(Log #2983)

15- 112 - (695-14(e)): Accept

SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions

RECOMMENDATION: Revise text as follows:

(e) Electric Fire Pump Control Wiring Methods. All electric motor-driven fire pump control wiring shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, Liquidtight Flexible Nonmetallic Conduit Type B (LFNC-B), or Type MI cable.

SUBSTANTIATION: This proposal adds Liquidtight Flexible Nonmetallic Conduit Type B (LFNC-B) as an approved raceway for control wiring.

The UL Fact Finding Report on Liquidtight Flexible Nonmetallic Conduit Type B (LFNC-B), 97NK31950, dated October 17, 1997, was first introduced to Panel 15 at the ROC for the 1999 NEC. It should be noted that all product exceeded the product standard's physical requirements. 2-in. Liquidtight Flexible Nonmetallic Conduit Type B (LFNC-B) is used compare to the 1 1/2-in. Liquidtight Flexible Metal Conduit since a grounding conductor would be required in the Liquidtight Flexible Nonmetallic Conduit Type B (LFNC-B) increasing its wirefill.

The UL Fact Finding Report compares Liquidtight Flexible Nonmetallic Conduit Type B (LFNC-B) to Liquidtight Flexible Metal Conduit. Three types of tests were performed on these products, Impact, Crush, and Flammability. It should be noted that the test values for both Impact and Crush were increased from the product standards so that an electrical short would occur.

In both impact and crush testing Liquidtight Flexible Nonmetallic Conduit Type B (LFNC-B) satisfactorily protected the conductors in the conduit compatible, if not better than, to Liquidtight Flexible Metal Conduit. In the Flammability test, the integrity of the circuit remained with the Liquidtight Flexible Nonmetallic Conduit Type B (LFNC-B) as long as it would with the Liquidtight Flexible Metal Conduit.

Based on the data from this Fact Finding Report, Panel 15 accepted Liquidtight Flexible Nonmetallic Conduit Type B (LFNC-B) as an approved pump wiring raceway for the 1999 NEC, Section 695-6(e).

The UL Fact Finding Report does provide sufficient technical substantiation that Liquidtight Flexible Nonmetallic Conduit Type B (LFNC-B) will resist physical damage equally to those wiring methods currently listed.

Note: Supporting material available for review at NFPA Headquarters.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 18

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

(Log #284)

15- 114 - (695-14(f) (New)): Accept in Principle

SUBMITTER: Gerald N. Scampoli, Rosemont Engineering Inc.

RECOMMENDATION: Add new text to read:

695-14 Control Wiring.

(f) Generator Control Wiring Methods. Control conductors installed between the Fire Pump Power Transfer Switch and the Back-up Generator supplying the Fire Pump during normal power loss shall be kept entirely independent of all other wiring. They shall be protected to resist potential damage by fire or structural failure. They shall be permitted to be routed through a building(s) encased in 2 in. (50.8 mm) of concrete or within enclosed construction dedicated to the Fire Pump circuits and having a minimum a 1-hour fire resistance rating, or circuit protective systems with a minimum of 1-hour fire

resistance. The installation shall comply with any restrictions provided in the listing of the electrical circuit protective system used.
SUBSTANTIATION: Loss of the "start" conductors for the Fire Pump back-up generator during a fire, when the normal power is likely to be lost, could lead failure of the generator to start and to loss of sprinkler protection to the entire building. One hour fire rated wiring methods are already required for the conductors supplying in the normal and emergency power to the fire pump. It is not unreasonable to require the generator control wiring to be protected in a similar manner.
PANEL ACTION: Accept in Principle.
Revise the submitter's recommendation as follows:
Replace "Back-Up Generator" with "standby generator."
Change the order of units from "2 in. (50.8 mm)" to "50 mm (2 in.)"
PANEL STATEMENT: Meets the submitter's intent and maintains consistent use of "standby generator."

ARTICLE 700 — EMERGENCY SYSTEMS

(Log #2348)

15- 115 - (700-1, FPN No. 3): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Revise text in FPN No. 3 as follows, delete text that is struck out.
FPN No. 3: Emergency systems are generally installed in places of assembly where artificial illumination is required for safe exiting and for panic control in buildings subject to occupancy by large numbers of persons, such as hotels, theaters, sports arenas, health care facilities, and similar institutions. ~~Emergency systems may also provide power for such functions as ventilation where essential to maintain life, fire detection and alarm systems, elevators, fire pumps, public safety communications systems, industrial processes where current interruption would produce serious life safety or health hazards, and similar functions.~~
SUBSTANTIATION: This is an effort to clarify that only those systems that are classified by the Authority(s) Having Jurisdiction (AHJ) as emergency systems are permitted on an emergency system. FPN No. 3 has been interpreted to permit many systems that are in fact legally required standby systems on the emergency system, thus reducing the reliability of the emergency system. An example would be placing an elevator that is required by a model code to be on a "standby system" on the emergency system that provides emergency egress lighting.
It is believed by many that when a model code requires equipment to be supplied by a "standby system" the equipment may be placed on the emergency system because FPN No. 3 lists some or even all of that equipment. NEC 90-5(c) clearly states that the FPN(s) are not enforceable, they are informational, yet when confronted with this, the common reply is that the FPN shows the intent of the NEC. The NEC is written so that it may be used with many model codes, due to this, it can not specify which equipment is to be supplied by emergency, legally required or for that matter optional standby systems, again this is done by the AHJ per 700-1 and 701-2.
It must be clarified that the National Electrical Code does not determine what loads are to be placed on the emergency or legally required systems. This is to be done by the Authority Having Jurisdiction which may use any model building code to make the determination. Once the authority having jurisdiction has made a determination as to what equipment must be place on an emergency or legally required system, the NEC then dictates how those systems must be installed, if in fact the NEC has been adopted by the authority having jurisdiction.
As an example, if a Jurisdiction adopted model building code "XYZ" and that code stated in section 123-1 "Standby systems shall supply the following equipment: Smoke control, elevators, and all paths of egress." In that same code "XYZ" section 124-1 states "The following are classified as emergency systems, Exit signs, egress illumination that serves an occupant load of X occupants. These systems must be available in 10 seconds". In this example per NEC 700-1 and NEC 701-2, the first system (section 123-1) would be a legally required standby system (NEC 701) due to the fact that the authority having jurisdiction by adoption of code "XYZ" has required the equipment be placed on a standby system. In section 124-1 of code "XYZ" it has been clearly stated that these are emergency loads. Since code "XYZ" classified these as emergency, the system that supplies these must comply with NEC 700.
NOTE: This code "XYZ" is an imaginary code and uses verbiage that mimics some model codes, but is not verbatim from any model code, it is not the intent of this submittal to gain any clarification of any other code.
In the above example, these loads can not be supplied from the same system but may be supplied from the same power source per NEC 700-9(b). In other words two transfer switches would be required, one for the emergency system and one for the legally required system. This very closely mimics the Essential Electrical System required in some health care facilities, in which the life safety branch supplies a limited amount of equipment (again to insure reliability) and the critical branch.
By using multiple transfer switches to separate the emergency and legally required systems, the electrical system as a whole will become more complex and therefore the overall reliability of the system may suffer. It must be noted that the most critical part of the building electrical system, the emergency system, becomes more reliable by the exclusion of equipment, and since the equipment on the legally required system has been limited, it too becomes more reliable.
The intent here is not to mandate that power to the legally required system take 60 seconds to become available, that is a design consideration, if the designer wishes they may have that system available within 10 seconds, in fact, it would be permissible to design the legally required system to meet or exceed all the requirements of an emergency system, but, again the systems must be kept entirely separate from one another.
In the end the following should be clarified:
1. Limiting the amount of equipment on the emergency system will help its reliability.
2. The FPN(s) do not permit, mandate or instruct us to install any equipment on the emergency system, it is informational only.
3. FPN No. 3 is to illustrate that these are only examples of equipment that model codes may consider to be emergency loads.
4. The NEC is written to work with many different model codes in this respect, and again, the NEC does not determine what equipment is to be supplied by the emergency system.
5. The NEC only dictates the minimum requirements for emergency, legally required and optional standby systems.
PANEL ACTION: Reject.
PANEL STATEMENT: There is insufficient substantiation to prompt this code panel to eliminate the inclusion of any life safety function included in the referenced fine print note.

(Log #4406)

15- 119 - (700-3, Exception (New)): Reject
SUBMITTER: Terry Marsh, Centex-Rodgers Construction Co.
RECOMMENDATION: Add the following to 700-3:
Exception: Approval of generator sets and stationary combustion engines shall be in accordance with the Standard for Emergency and Standby Power Systems, NFPA 110, and Standard for the Installation and Use of Stationary Combustion Engines and Gas Turbines, NFPA 37 respectively.
SUBSTANTIATION: By adding the exception to 700-3, it will clarify the standard by which approval of this specific equipment is gained. The authority having jurisdiction can use these standards in conjunction with NFPA 70 as the tools for determining if the equipment is approved for use on emergency systems. NFPA 37 and 110 contain not only testing and acceptance criteria, but also aid in determining if the equipment or component is approved for its intended use. Use of these standards for this purpose by the authority having jurisdiction also aligns itself with NFPA's ideas on determining the acceptability of installations, procedures, equipment, or materials..., "In determining the acceptability of installations, procedures, equipment, or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards." (excerpt from NFPA 110, A-2).
PANEL ACTION: Reject.
PANEL STATEMENT: The stated proposal is not an exception to the equipment approval requirements of section 700-3. There has been no evidence to suggest that the referenced standards are necessary to focus the authority having jurisdiction on the appropriate standards. NFPA 110 is already referenced in FPN No. 5 within the scope of Article 700 and NFPA 37 does not specifically apply to emergency systems.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 19

(Log #4057)

15- 123 - (700-6(a)):
Note: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual to remove the statement of intent from the Fine Print Note. It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 4 for information. This action will be considered by the Panel as a Public Comment.
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./Rep. Edison Electric Inst.
RECOMMENDATION: Revise text as follows:
700-6. Transfer Equipment.
(a) Transfer equipment, including automatic transfer switches, shall be automatic, identified for emergency use, and approved by the authority having jurisdiction. Transfer equipment shall be designed and installed to prevent the inadvertent interconnection of normal and emergency sources of supply in any operation of the transfer equipment. Transfer equipment and electric power production systems installed to permit operation in parallel with the normal source shall meet the requirements of Article 705.
FPN: The purpose of this section is to protect the public, protect the electric system from catastrophic damage; and protect line workers from back feed while repairing supply lines.
SUBSTANTIATION: Operation of a generator in parallel with the supply system creates hazards to line workers, the public, and the generator unless the system is designed for parallel operation. Section 705-3 permits parallel operation of emergency systems with the normal source; however, there is no reference in Article 700 specifying that the requirements of Article 705 be met. Adding this language will clarify the requirement to comply with Article 705 when parallel operation is planned. This change will reduce the dangers. Adding the FPN will clarify the reasons for not permitting parallel operation.
PANEL ACTION: Accept in Principle.
Accept the submitter's recommendation but revise the proposed FPN to read as follows:
FPN: The purpose of this section is to protect the public, to protect line workers from back feed while repairing supply lines and to protect standby systems from catastrophic damage.
PANEL STATEMENT: The revision to the FPN revert the order of the information to improve the readibility.
It is recommended that the Technical Correlating Committee refer this proposal to CMP 4 for information.

(Log #239)

15- 125 - (700-9(d)): Accept in Part

NOTE: The following proposal consists of Comment 15-117 on Proposal 15-130a in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 15-130a was:

Revise existing Section 700-9(c)(1) to read as follows:

"(1) Feeder-circuit wiring shall meet one of the following conditions:

(a) Be installed within buildings that are fully protected by an approved automatic fire suppression system

(b) Be a listed electrical circuit protective system with a minimum 1-hour fire rating.

(c) Be protected by a listed Thermal Barrier System for Electrical System Components.

(d) Be protected by a fire-rated assembly having a minimum fire rating of 1-hour.

(e) Be embedded in a minimum of 2 inches (50.8 mm) of concrete."

SUBMITTER: Jim Milne, BICC Pyrotenax
RECOMMENDATION: Revise 700-9(c)(1) as follows:

(d) Be protected by a fire-rated assembly designed and listed to achieve a minimum fire rating of 1 hour.

SUBSTANTIATION: Sections (b) and (c) of Proposal 15-130a recognize the need for third party testing and listing for the critical circuits covered in this section. These methods have been specifically tested for their ability to keep critical wiring functional during fire conditions and receive listing on the basis of performance during these tests. The same criteria must apply for the fire-rated assemblies mentioned in (d) of the proposal. Without this, there can be no confidence in the survivability of the emergency wiring during a fire.
PANEL ACTION: Accept in Part.
In the submitter's recommended text delete the words "designed and".
PANEL STATEMENT: The correct section reference is 700-9(d)1(d). The words have been deleted because the intent of the design is not relevant as the listing already encompasses the design.

(Log #3766)

15- 127 - (700-9(d)(1)): Reject
SUBMITTER: L. James Milne, BICCGeneral
RECOMMENDATION: Revise as follows:

Fire Protection. Emergency systems shall meet the following additional requirements in assembly occupancies greater than 1000 persons or in buildings above 75 ft (23 m) in height with any of the following occupancy classes: assembly, educational, residential, detention and correctional, business, and mercantile.

1. Feeder-circuit wiring shall meet one of the following conditions:

a. Be installed within buildings that are fully protected by an approved automatic fire suppression system.

b. Be a listed electrical circuit protective system with a minimum 1-hour fire rating.

c. Be protected by a listed thermal barrier system for electrical system components.

~~d. Be protected by a fire-rated assembly having a minimum fire rating of 1 hour~~

d. Be embedded in a minimum of 2 in. (50.8 mm) of concrete

e. Be a cable listed to maintain circuit integrity for a minimum of 1 hour when installed in accordance with the listing requirements.

SUBSTANTIATION: The 1996 National Electrical Code took an enormous step forward in the area of life safety by requiring emergency feeders to be protected from fire for a period of one hour. However, the 1996 NEC was substantially weakened in the 1999 version. In the 1996 NEC, fire protection of emergency feeders had to be achieved using "listed electrical circuit protective systems with a minimum of 1-hour fire resistance" or be installed in "spaces fully protected by approved automatic fire suppression systems". Electrical circuit protective systems are required to pass a fire endurance test and subsequent fire hose test at a recognized testing facility like Underwriters Laboratories. In addition to electrical circuit protective systems, the 1999 NEC allows a "fire-rated assembly having a minimum fire rating of 1 hour" to be used. The most common of these fire rated assemblies would be gypsum board enclosures. This additional method of compliance is concerning for the following reasons:

• Lack of 3rd Party Testing. Gypsum board does not have a UL listing for electrical circuit protection but rather is used to achieve fire separation. The UL Building Materials Directory lists several electrical circuit protective systems and gives specific installation requirements. This sort of control is essential to assure the highest quality installation of wiring that safeguards human life and property. Even the 1999 National electrical Code Handbook states: "It is important to understand the difference between a 1-hour fire rating of an electrical cable and a 1-hour fire resistance rating of a structural member, such as a wall. Simply stated, at the end of a 1-hour fire rating test on an electrical cable, the circuit and its insulation must be intact and electrically functioning. (No short circuits, grounds, or opens are permitted.) However, a wall subjected to a 1-hour fire resistance test must only prevent a fire from passing through or past the wall, without regard to damage to the wall. All fire ratings and fire-resistance ratings are based on the assumption that the structural supports for the assembly are not impaired by the effects of fire." The Underwriters Laboratories Fire Resistance Directory contains a similar warning — "All ratings are based on the assumption that the stability of structural members supporting the assembly are not impaired by the effects of fire. The extent of damage of the test assembly at the rating time is not a criteria for the rating." By requiring emergency feeders to be a listed electrical circuit protective system, there is assurance that the method used has been subjected to testing that confirms survival of this critical wiring during a fire emergency. By allowing gypsum board enclosures, compliance moves from distinct, tested methods to vague options subject to a wide spectrum of interpretation. Something as important as this demands specific means of compliance and backing by appropriate tests related directly to the protection of electrical wiring.

• Difficult to Inspect. The enclosure is constructed in the field often under less than ideal conditions. In many cases the enclosure is

constructed by the general contractor (not the electrical contractor) who may not fully appreciate the role of the enclosure, viewing it as "putting up a little more sheet rock", an inexpensive and ineffective solution. The quality of the enclosure can be very difficult to inspect in the limited access areas so common in retrofit installations.

• Compliance Conflicts. When gypsum enclosures are used it is very difficult to comply with Article 346-11 Bends Number in One Run while meeting the requirements of Article 370-29 Conduit Bodies, Junction, Pull, and Outlet Boxes to be Accessible. In a conduit run, there can be no more than the equivalent of four quarter bends (360° total) between pull points, e.g. conduit bodies and boxes. If the installation mandates pull boxes, the pull boxes can't be inside the gypsum enclosure and still be "rendered accessible without removing any part of the building..." as stated in 370-29.

• System Easily Compromised. Even if properly constructed, the fire resistance of a typical gypsum enclosure can easily be compromised after the installation and often is. The photographs I have provided show how an additional conduit was run through the gypsum enclosure (the shortest routing), completely negating any fire rating it may have had. In most cases this goes unnoticed, resulting in a severely compromised emergency system.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The option of one hour fire-resistant construction rating needs to remain. What happens after the original installation is not part of the NEC. Any wiring methods or protection can be compromised after the original installation.

Access to the conduit system can be acheived through a one hour rated access panel.

Also refer to the panel actions and statements on Proposals 15-95 and 15-125.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 19

(Log #3767)

15- 128 - (700-9(d)(1)): Reject

SUBMITTER: L. James Milne, BICCGeneral

RECOMMENDATION: Revise as follows:

Feeder-circuit wiring shall meet one of the following conditions:

a. Be installed within buildings that are fully protected by an approved automatic fire suppression system.

b. Be a listed electrical circuit protective system with a minimum ~~1~~ 2-hour fire rating.

c. Be protected for 2 hours by a listed thermal barrier system for electrical system components

d. Be protected by a fire-rated assembly having a minimum fire rating of 1 2 hours.

e. Be embedded in a minimum of ~~2~~ 5 in. (50.8 mm) of concrete.

f. Be a cable listed to maintain circuit integrity for a minimum of ~~1~~ 2 hours when installed in accordance with the listing requirements.

SUBSTANTIATION: Section 700-12(b)(2) of the 1999 NEC states: "Where internal combustion engines are used as the prime mover, an on-site fuel supply shall be provided with an on-premise fuel supply sufficient for not less than 2 hours full demand operation of the system." Building codes in the US and Canada have the same requirement. This proposal would assure the emergency feeder circuit wiring would survive at least as long as the emergency generator.

PANEL ACTION: Reject.

PANEL STATEMENT: The substantiation does not provide evidence of a relationship between the required 2 hour fuel supply and the 2 hour fire rating.

(Log #1176)

15- 130 - (700-12): Reject

SUBMITTER: Lawrence A. Bey, Onan Corp.

RECOMMENDATION: In the last sentence of the last paragraph of 700-12, revise as follows:

"...shall be installed either in ~~spaces~~ buildings fully protected by approved automatic fire suppression systems (sprinklers, carbon dioxide systems, etc.) or in ~~spaces~~ rooms with a 1-hr fire rating."

SUBSTANTIATION: For editorial consistency with the change made to 700-9(d)(1)(a) last cycle.

PANEL ACTION: Reject.

PANEL STATEMENT: The term space is the appropriate term and there is no need to require protection for the entire building. The submitter's inclusion of the whole building changes the requirements without substantiation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 19

(Log #1136)

15- 131 - (700-12, Exception (New)): Reject

SUBMITTER: Thomas F. Leake, Giant Food Inc. of Maryland

RECOMMENDATION: Add a new Exception to read:

Exception: When the branch circuit feeding normal lighting in the local area of the unit equipment originates in a panel that is contactor controlled, provision shall be made to allow normal off-hour operation of the normal lighting while not energizing the unit equipment. The unit equipment shall energize under loss of voltage source to the normal lighting equipment panel.

SUBSTANTIATION: In a general sales area of a mercantile store, lighting is generally accomplished by contactor controlled lighting panels. These panels, in effect, simulate a power outage under normal off-hour operation by deenergizing the entire panel. Unit equipment attached to a branch circuit from this type of panel would energize at end of day store illumination. The unit equipment would operate for the 1 1/2 hour specified time and then cease to function until recharged when the circuit is reenergized at store normal hours. The unit equipment device would not be able to operate as intended if not isolated to a constant voltage source circuit.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The suggested exception would defeat the connection of unit equipment to the branch circuitry serving the normal lighting in the area requiring emergency lighting.

The existing exception to 700-12(e) permits a separate circuit for unit equipment. Your circumstance could easily be solved with a contactor panelboard with two busses; one contactor controlled and one normally on.

(Log #4261)

15- 132 - (700-12, Exception (New)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Add an Exception after the first paragraph as follows:
Exception: A fire pump shall be permitted to use a connection ahead of the service disconnecting means in accordance with Section 695-3(a)(1).
SUBSTANTIATION: This proposal corrects a lack of correlation between this article and Article 695 on the issue of whether a tap can be made ahead of a service main as a fire pump source. Some contend that there is no conflict, since the source in Article 695 is the normal source for the fire pump.
In general, it is true that Article 700 only applies to an emergency system when it is functioning in that mode, which is why the first paragraph of Section 700-1 uses the words "when the normal electrical supply or system is interrupted".
This means that a normal circuit to egress lighting, for example, need not comply with Article 700, provided that the full electrical circuit pathway to that lighting was arranged so as to comply with Article 700 during an outage. This train of logic might seem to support the view that a since the tap ahead of the main is the normal source for a fire pump, it need not comply with Article 700.
The fallacy in this is that in the case of a fire pump, where the reliability of the service connection is cited as the basis for not needing a standby generator as provided in Section 695-4(a), the tap ahead of the main is the standby source as well as the normal source. In other words, if the tap ahead of the main is augmented by a standby generator, then the circuiting to the fire pump from that generator becomes the Article 700 circuit. Suppose there is no generator due to a finding that the utility service connection is reliable, as is often the case in metropolitan areas with networked utility grids. Now that tap ahead of the main becomes not only the normal source, but also, in effect, the standby source as well.
The next question is whether the fire pump is properly classified as an emergency load. That depends on local rulemaking, as covered in the second paragraph of Section 700-1. Note that that paragraph doesn't only apply to lighting, but also power circuits. There are many instances where local rules will classify a fire pump as an emergency load, which is why they are specifically mentioned in Section 700-1, (FPN No. 3).
Therefore, if the fire pump is legally mandated equipment for life-safety purposes (usually), and if the fire pump has no other supply (depends on facility design and local conditions), then Article 700 will apply to the circuiting. The literal result will be to disallow the tap ahead of the main, because the rules in Chapters 6 and 7 are of equal rank. In this case the only way to comply with both chapters is to use a separate service [complies with Section 700-12(d) if the authority having jurisdiction goes along], or to use a standby generator that the system doesn't need in terms of its previously judged reliability [complies with Section 695-4(a)]. That is unfortunate.
Every consideration needs to be given to allowing this particular tap ahead of the main, even in cases where a jurisdiction had a policy of never approving such sources for emergency circuits. Remember, the fire pump provisions are based on concerns about firefighters deciding to disconnect the building and ending up opening every service switch including the fire pump disconnect. In this unique case, this is a problem with reliability of human behavior and not with the reliability of a utility power grid. The prospect of a utility outage is covered in different provisions in Article 695. This proposal addresses these technical issues through a very simple exception.
The panel rejected this in the previous cycle, saying that the tap ahead of the main wasn't an acceptable emergency source. As we took great pains to point out in the proposal, however, and do so again, when the fire pump is running in a municipality that has designated it by law as an emergency load, its source becomes, at that moment, an emergency system. To say otherwise is to say that an emergency load need not be connected to an emergency source. This section and Section 695-3(a) need better correlation. In general taps ahead of a service main don't work in any meaningful way, but this is a very unique load that has an entirely different set of technical assumptions governing its connections.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal allows a tap ahead of the service as emergency power. A tap ahead of the main is not considered emergency power by 700-12, only as normal power.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 19

(Log #2281)

15- 133 - (700-12 Exception No. 2 (New)): Reject
SUBMITTER: Sal Reina, Reina Electric
RECOMMENDATION: Add Exception No. 2 to Section 700-12(e):
"The branch circuit feeding the unit equipment shall be the same branch circuit as that feeding the normal lighting in the area..."
Add exception – "It shall be permitted to have the emergency lighting unit served by the same branch circuit serving the smoke detectors where the smoke detectors have been retrofitted subsequent to the completion of the structure and have no other loads on this circuit."
SUBSTANTIATION: The general input of this section is that there be emergency lights when there is a power failure. However, in existing apartment buildings the hall lights have general utility receptacles on the same circuit as the hall lights. Retrofitted interconnected smoke detectors are on a dedicated circuit with no other loads; since this is already an emergency circuit, adding emergency lights provide a safer emergency lighting situation. Often hall lights have other loads and are often on time clocks. Installation of emergency lights in these situations require extensive and costly installations and provide no greater safety.
PANEL ACTION: Reject.
PANEL STATEMENT: The connection of unit equipment to the same branch circuit that supplies normal lighting in any given area is required so that a loss of power to normal lighting will energize emergency lighting automatically. Connection of unit equipment to any other branch circuit would circumvent this operation.
Article 760 covers fire alarm systems. The proposal does not comply with 760-10 or 760-26(b).

AFFIRMATIVE: 19

(Log #CP1512)

15- 133a - (700-12(b)): Accept
SUBMITTER: CMP 15
RECOMMENDATION: Revise 700-12(b) to read as follows:
(b) Generator Set.
(1) Prime Mover-Driven. For a generator set driven by a prime mover acceptable to the authority having jurisdiction and sized in accordance with Section 700-5, means shall be provided for automatically starting the prime mover on failure of the normal service and for automatic transfer and operation of all required electrical circuits. A time-delay feature permitting a 15-minute setting shall be provided to avoid retransfer in case of short-time reestablishment of the normal source.
(2) Internal Combustion Engines as Prime Movers. Where internal combustion engines are used as the prime mover, an on-site fuel supply shall be provided with an on-premise fuel supply sufficient for not less than 2 hours full-demand operation of the system. Where power is needed for the operation of the fuel transfer pumps to deliver fuel to a generator set day tank, this pump shall be connected to the emergency power system.
(3) Dual Supplies. Prime movers shall not be solely dependent on a public utility gas system for their fuel supply or municipal water supply for their cooling systems. Means shall be provided for automatically transferring from one fuel supply to another where dual fuel supplies are used.

Exception: Where acceptable to the authority having jurisdiction, the use of other than on-site fuels shall be permitted where there is a low probability of a simultaneous failure of both the off-site fuel delivery system and power from the outside electrical utility company.

(4) Battery Power and Dampers. Where a storage battery is used for control or signal power, or as the means of starting the prime mover, it shall be suitable for the purpose and shall be equipped with an automatic charging means independent of the generator set. Where the battery charger is required for the operation of the generator set, it shall be connected to the emergency system. Where power is required for the operation of dampers used to ventilate the generator set, the dampers shall be connected to the emergency system.

(5) Auxillary Power Supply. Generator sets that require more than 10 seconds to develop power shall be permitted if an auxiliary power supply energizes the emergency system until the generator can pick up the load.

SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual.
PANEL ACTION: Accept.

AFFIRMATIVE: 19

(Log #2205)

15- 134 - (700-12(b) and (d)): Reject
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:

(b) Generator Set.

1. A generator set driven by a prime mover approved ~~acceptable to the authority having jurisdiction~~ and sized in accordance with Section 700-5...

(d) Separate Service. Where approved ~~acceptable to the authority having jurisdiction~~ as suitable for use as an emergency source, a second service shall be permitted...

SUBSTANTIATION: "Approved" is defined in Article 100 of the NEC as "acceptable to the authority having jurisdiction."

"Standard terms have been established through accepted use or by definition and are to be used...". [NEC Style Manual 3.2.4 Standard Terms]. "Approved" is listed as one of the standard terms in Annex B of the Style Manual and defined in the code; therefore, "approved" should be used in place of its definition.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal's language of "approved" would lead to controversy. The existing language needs to remain to ensure that the AHJ is the one who accepts the installation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 19

(Log #1181)

15- 135 - (700-12(b)(6) and 701-11(b)(5)): Accept in Principle

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 4 for information.

SUBMITTER: Lawrence A. Bey, Onan Corp.
RECOMMENDATION: Add a new 700-12(b)(6) and 701-11(b)(5) as follows:

"Where an outdoor housed generator set equipped with a generator disconnecting means according to 445-10 supplies a building or structure, an additional disconnecting means where ungrounded conductors pass through the building or structure shall not be required."

SUBSTANTIATION: Some inspection authorities are using Article 225-31 to require a disconnecting means where conductors from an outdoor generator set pass through the building, regardless of whether or not the generator is supplied with a disconnecting means. This then puts two disconnecting means in series in the generator output, which has an adverse effect on system reliability.
PANEL ACTION: Accept in Principle.
Add a new 700-12(b)(6) and 701-11(b)(5) as follows:

"Where an outdoor housed generator set equipped with a readily accessible disconnecting means supplies a building or structure, an additional disconnecting means shall not be required where ungrounded conductors pass through the building or structure."

PANEL STATEMENT: The revised text more clearly expresses the requirement and meets the intent of the submitter. The term readily accessible was included because the disconnecting means needs to be readily accessible.

COMMENT ON AFFIRMATIVE:
FLACH: Change "pass through" to "enter", or add enter or before "pass through".

(Log #3437)

15- 136 - (700-25, FPN): Accept in Principle
SUBMITTER: Erik Swendsen, Pierce, SD
RECOMMENDATION: Change the FPN to a second paragraph. "Fuses and circuit breakers for emergency circuit overcurrent protection, shall be coordinated to ensure selective clearing of fault currents."
SUBSTANTIATION: This is a safety issue. As is currently written, the emergency system can be designed and installed with a built-in blackout. When the owner pays for an emergency system, he or she expects a system that will not shut down because of an insignificant short in a branch circuit. Both fuses and circuit breakers are available to meet this proposed requirement. Fuses can be coordinated by using ratio charts and circuit breakers have adjustable instantaneous trips, short time delay and zone selective interlocking to help them coordinate. Why pay good money for an emergency system if we are going to allow a design-in black-out?
PANEL ACTION: Accept in Principle.
Delete the FPN and add a new 700-26 to read as follows:

"700-26 Coordination. Fuses and circuit breakers for emergency circuit overcurrent protection shall be coordinated to selectively clear fault currents."

Renumber existing 700-26 to 700-27.
PANEL STATEMENT: The revised text more clearly expresses the requirement and meets the intent of the submitter. The requirement was added in a new section because the requirement is not related to accessibility.

(Log #CP1513)

15- 138a - (701-7): Accept

SUBMITTER: CMP 15

RECOMMENDATION: Revise 701-7 to read as follows:

701-7. Transfer Equipment.

(a) General. Transfer equipment, including automatic transfer switches, shall be automatic and identified for standby use and approved by the authority having jurisdiction. Transfer equipment shall be designed and installed to prevent the inadvertent interconnection of normal and alternate sources of supply in any operation of the transfer equipment.

(b) Bypass Isolation Switches. Means to bypass and isolate the transfer switch equipment shall be permitted. Where bypass isolation switches are used, inadvertent parallel operation shall be avoided.

(c) Automatic Transfer Switches. Automatic transfer switches shall be electrically operated and mechanically held.

SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual.

[The addition text resulting from panel action on Proposal 15-139 should also be added at the end of (a).]

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 19

(Log #4058)

15- 139 - (701-7(a)): Accept in Principal

Note: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual to remove the statement of intent from the Fine Print Note. It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 4 for information. This action will be considered by the Panel as a Public Comment.

SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./Rep. Edison Electric Inst.

RECOMMENDATION: Revise text as follows:

701-7. Transfer Equipment.

(a) Transfer equipment, including automatic transfer switches, shall be automatic, identified for emergency use, and approved by the authority having jurisdiction. Transfer equipment shall be designed and installed to prevent the inadvertent interconnection of normal and emergency sources of supply in any operation of the transfer equipment. Transfer equipment and electric power production systems installed to permit operation in parallel with the normal source shall meet the requirements of Article 705.

FPN: The purpose of this section is to protect the public, protect the electric system from catastrophic damage; and protect line workers from back feed while repairing supply lines.

SUBSTANTIATION: Operation of a generator in parallel with the supply system creates hazards to line workers, the public, and the generator unless the system is designed for parallel operation. Section 705-3 permits parallel operation of legally required standby systems with the normal source; however, there is no reference in Article 701 specifying that the requirements of Article 705 be met. Adding this language will clarify the requirement to comply with Article 705 when parallel operation is planned. This change will reduce the dangers. Adding the FPN will clarify the reasons for not permitting parallel operation.

PANEL ACTION: Accept in Principle.

Accept the submitter's recommendation but revise the proposed FPN to read as follows:

FPN: The purpose of this section is to protect the public, to protect line workers from back feed while repairing supply lines and to protect standby systems from catastrophic damage.

PANEL STATEMENT: The revision to the FPN revert the order of the information to improve the readibility.

It is recommended that the Technical Correlating Committee refer this proposal to CMP 4 for information.

(Log #1741)

15- 140 - (701-9): Accept

SUBMITTER: Jamie McNamara, Hastings, MN

RECOMMENDATION: Revise as follows:

701-9. Signs

(a) .....

(b) Grounding. Where the grounded circuit conductor connected to the ~~emergency~~ legally required standby power source is connected to a grounding electrode conductor at a location remote from the ~~emergency~~ legally required standby power source, there shall be a sign at the grounding location that shall identify all ~~emergency~~ legally required standby power and normal sources connected at that location.

SUBSTANTIATION: This wording makes the requirement clearer, article 700 is emergency systems and article 701 is for legally required standby systems.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 19

COMMENT ON AFFIRMATIVE:

KLEIN: The Panel Action revises this section as follows:

701-9(b) Grounding. Where the grounded circuit conductor connected to the legally required standby power source is connected to a grounded electrode conductor at a location remote from the legally required standby source, there shall be a sign at the grounding location that shall identify all legally required standby power and normal sources connected at that location.

Although the word sign tacitly infers visibility, I would have altered the Panel's response in the following fashion:

7019(b) Grounding. Where the grounded circuit conductor connected to the legally required standby power source is connected to a grounded electrode conductor at a location remote from the legally required standby source, there shall be a sign at the grounding location where it first becomes visible that shall identify all legally required standby power and normal sources connected at that location.

(Log #993)

15- 141 - (701-9(b)): Accept in Principle in Part

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

(b) Grounding. Where the grounded circuit conductor connected to the ~~emergency~~ legally required standby system is connected to a grounding electrode ~~conductor~~ at a location remote from the ~~emergency~~ legally required standby system source, there shall be a durable and permanent sign at the grounding electrode location that shall identify all ~~emergency~~ legally required standby and ~~normal~~ other sources ~~connected~~ grounding connections at that location.

SUBSTANTIATION: Editorial. "Emergency" source relates to Article 700 and has special meaning. This article deals with a different system. It is assumed this section is intended to address remote grounding electrode connections and not the grounding electrode conductor connection to the grounded circuit conductor. Identification of the grounding connections would be more informative than indicating that different systems are grounded at that location, which is obvious if more than one grounding connection is present. "Normal" is not defined; does it exclude emergency or optional standby sources or separately derived systems?
PANEL ACTION: Accept in Principle in Part.
The panel accepts in principle the changes to replace "emergency" with "legally required standby" in three places. The remaining changes are rejected.
PANEL STATEMENT: Refer to the panel action on Proposal 15-140 for portion accepted in principle.
Reject the deletion of conductor because connections can still be made.
Reject durable and permanent since these words cannot be enforced.
Reject electrode since each electrode may not be visible (concrete encased electrode or ground ring).
Reject other since normal is appropriate in the context used.
Reject grounding connections since it is not appropriate to the issue of providing a sign.

(Log #2576)

15- 147 - (702-1): Accept in Principle
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. The Technical Correlating Committee directs that this proposal be referred to Code-Making Panels 3 and 4 for information.
SUBMITTER: Gordon S. Johnson, Dundee, FL
RECOMMENDATION: Revise the second paragraph to read:
The systems covered by this article consist ~~only~~ of those that are permanently installed in their entirety, including prime movers, and those that are arranged for a portable alternate power supply.
SUBSTANTIATION: Many optional power systems are designed to be supplied by a portable alternate power supply. These systems are not covered by any section of the National Electrical Code. The users of these systems should not be left to improvise connection of the portable power supply, Improvised connection can energize the normal line and cause a hazard to linemen thinking that the line is unenergized. It can also cause unauthorized paralleling of the normal and standby source. It is also common to have the connection made at an inappropriate point in the system such as a receptacle. In addition, the standby source must be appropriately grounded.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle.
Revise the second paragraph to read:
The systems covered by this article consist of those that are permanently installed in their entirety, including prime movers, and those that are arranged for a connection to a premises wiring system from a portable alternate power supply.
PANEL STATEMENT: The revised text meets the intent of the submitter.
It is recommended that the Technical Correlating Committee refer this proposal to CMP 4 for information.

(Log #2928)

15- 148 - (702-1): Accept in Principle
SUBMITTER: Jeffrey F. Morin, State of Maine / Rep. Maine Dept. of Prof. and Finalcial Regulation
RECOMMENDATION: Revise text to read as follows:
702-1. Scope. The provisions of this article apply to the installation and operation standby systems.
~~(The systems covered by this article consist only of those that are permanently installed in their entirety, including prime movers.)~~
SUBSTANTIATION: With the removal of NEC Article 230-83 in the 1999 NEC, there presently is no requirement for transfer equipment to be installed in an alternate power source or separately derived power source that is used as an optional standby system, where the prime mover is not permanently installed.
Current wording of the National Electrical Code for Optional Standby Systems only applies to "...those systems that are permanently installed in their entirety, including the prime movers."
It is not uncommon for the prime mover to be installed in a portable configuration. One reason is for the connection of that prime mover to be used at other locations.
The submitter is very aware of the life safety hazards that are presented to emergency personnel if proper transfer equipment is not installed in an optional standby system where the prime mover is portable.
During the most recent ice storm that the northeastern section of the United States endured in 1998, many residents relied solely upon alternate power sources in which portable prime movers were used to protect their lives and property. Through the requirements of the then current 1996 National Electrical Code of which the State of Maine adopted, the State was able to use NEC Article 230-83 to require transfer equipment in such installations. With the adoption of the 1999 National Electrical Code, there is no longer any way to require such equipment through enforcement of the National Electrical Code.
The hazards associated with the interconnection of different systems range from destruction of equipment to loss of life. Consumers, utility workers and emergency personnel depend upon properly installed equipment to protect against these preventable hazards.
Removal of the last paragraph of Article 702-1 would prevent the electrical hazards associated with the simultaneous interconnection of the standby and normal power sources. The new wording would require that suitable transfer equipment be installed in all optional standby systems whether or not the prime mover is permanently installed.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to the panel action and statement on Proposal 15-147. The revised text meets the intent stated by the submitter's substantiation.

15- 149 - (702-1): Accept in Principle
SUBMITTER: Alan Manche, Square D Co.
RECOMMENDATION: Revise NEC 702-1 with the additions (underlined) and deletions (strike through) as shown. The entire text of 702-1 is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.
702-1. Scope. The provisions of this article apply to the installation and operation of optional standby systems.
The systems covered by this article consist ~~only~~ of ~~those that are~~ the permanently installed electrical system and either ~~in their entirety,~~

~~including~~ a permanently connected or temporarily connected power source ~~prime movers~~.

SUBSTANTIATION: The Scope of Article 702 does not recognize the installation of electrical systems for connection to a portable power sources such as a generator, UPS, power cell, ... that is not permanently connected. This proposal simply expands the scope of Article 702 in order to include other than permanently installed prime movers. Optional Standby Systems are installed in residential and commercial facilities using portable generators with a temporary connection to the electrical system through transfer equipment. Installation and inspection for these optional standby systems are using Article 702 even though the scope of the article does not include a temporary installation. The objective is to modify the scope to give the enforcing authority some basis for their judgement to use Article 702.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to the panel action and statement on Proposal 15-147. The revised text meets the intent stated by the submitter's substantiation.

15- 150 - (702-1): Accept in Principle in Part

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 4 for information.

SUBMITTER: J. Philip Simmons, Olympia, WA

RECOMMENDATION: Revise text as follows:

702-1. Scope. The provisions of this article apply to the installation and operation of optional standby systems.

The systems covered by this article consist ~~only~~ of those where the transfer equipment is permanently installed and the prime mover is either ~~that are~~ permanently installed or supplies power to the system on a temporary basis ~~in their entirety, including prime movers~~.

SUBSTANTIATION: The scope of this article needs to be changed to apply to optional standby systems whether the generator is installed or located on a permanent or temporary basis.

Without the coverage of optional standby systems supplied from portable generators, there is no location in the NEC that clearly requires the installation of transfer equipment for disconnecting all utility sources of power before connecting the optional source. This certainly is a safety concern to inspectors and utility personnel.

Section 230-83 in the 1996 NEC contained a requirement that a transfer switch be installed to disconnect all sources of supply before connecting another. That section was deleted during the processing of the 1999 NEC. As a result, there is no clear requirement for transfer equipment for optional standby systems where the prime mover is not permanently installed.

Many installations of feeder circuits have been (and are being) made where all the electrical equipment is permanently installed except for the generator and prime mover. This includes sites for telephone systems, cellular telephone equipment repeaters, and sewer or storm water pumping stations.

Finally, Section 250-34 covers the grounding requirements for portable and vehicle-mounted generators so the fact that the generator often is portable or vehicle-mounted for these optional standby systems should not prevent those systems from being covered by Article 702.

PANEL ACTION: Accept in Principle in Part.

PANEL STATEMENT: Refer to the panel action and statement on Proposal 15-147. The revised text meets the intent stated by the submitter's substantiation.

The reference to transfer equipment is rejected because it is not appropriate to 702-1. It is properly addressed in 702-6.

It is recommended that the Technical Correlating Committee refer this proposal to CMP 4 for information.

15- 151 - (702-1): Accept in Principle

SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./Rep. Edison Electric Inst.

RECOMMENDATION: Delete text as follows:

702-1. Scope. The provisions of this article apply to the installation and operation of optional standby systems.

~~The systems covered by this article consist only of those that are permanently installed in their entirety, including prime movers.~~

SUBSTANTIATION: The use of portable generators has increased dramatically. Permanent equipment and wiring is being installed for connecting portable generators to premises wiring. Present wording of this scope precludes application to portable systems. Many users connect portable generators to premises wiring using methods and equipment that present hazards to themselves and others. The intent of this proposal is to revise this section so that it covers the installation and operation of portable generators.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to the panel action and statement on Proposal 15-147.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 19

(Log #4262)

15- 152 - (702-1): Accept in Principle

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Revise as follows:

"The provisions of this article apply to the installation and operation of optional standby systems.

The systems covered by this article consist ~~only~~ of those that are permanently installed in their entirety, including prime movers, or those for which permanent electrical arrangements have been made for periodic connection to a portable or stationary prime mover as necessary."

SUBSTANTIATION: Frequently portable generators are used for optional standby purposes. Misapplications abound, as witnessed in the successful effort in the 1999 cycle to add language prohibiting the energization of a female receptacle from a male cord cap, in Section 410-56(g). Now comes the big enchilada, in this scope statement. The proposal makes permanent wiring arrangements subject to the provisions of the article, even if the actual power source isn't always connected. For example, the article would cover a permanently installed power inlet and feeder to a transfer switch and standby panel, even if the actual prime mover were cord-connected.

We now have enforceable language to get a power inlet instead of a receptacle, but what about the utility line crew? Thanks to Y2K hysteria, thousands of installations of standby panels went in, with no transfer equipment. An untrained owner is supposed to remember to turn off the main before pulling the cord on his generator. Sure. 702-6? Useless. It doesn't mandate transfer equipment. Even if it did, the present language of this section keeps this application out of the scope of Art. 702. 230-83? Oops, CMP 4 deleted it in 1999.

Protection of utility line crews from inadvertent backfeed is a basic, longstanding assumption behind code requirements, and the protection has effectively disappeared. The combined membership of the EC&M Code Forum Panel (Hartwell, Summers, Stallcup, Ross, Leaf) couldn't find a single mandatory requirement in the NEC to enforce this principle at this time. It's time to revisit this scope statement, because it effectively precludes effective action to make these installations safe.

There is a separate proposal to broaden Section 702-6 from the Massachusetts Electrical Code Advisory Committee. However, unless this scope statement changes, that proposal even if accepted would be a very limited improvement. If, on the other hand, both this proposal and the Massachusetts proposal are accepted, then we have the basis for real, properly enforceable protection.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to the panel action and statement on Proposal 15-147.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 19

(Log #4358)

15- 153 - (702-1): Reject
SUBMITTER: Michael A. Anthony, Univ. of Michigan
RECOMMENDATION: Proposal: A complete rewrite of Article 702 — Optional Standby Systems.
SUBSTANTIATION: Some consideration should be given to putting together a special workgroup to reconfigure/refine the scope of Article 702 and/or Article 445 to include portable, small residential generators--typically low voltage single-phase equipment in the 750 to 7500 watt range—which are not permanently installed in their entirety. Such systems are either operated isolated from home wiring or connected to home wiring during power outages through a permanent transfer switch.

With more commerce and medical care occurring within the home (and in multiple occupancy dwellings not covered by Article 701) in the same time frame in which there is very little impetus for local utilities to invest in the reliability of the last mile of power infrastructure, the next upgrade to the National Electrical Code ought to put in one place as many safety requirements as practical that apply to this type of installation; even at the risk of creating redundancy with respect to other parts of the code. Among the issues that should be pulled together in this article:

1. Equipment grounding methods that are unique to portable generators. (How to size the bare wire, for example)
2. Listing and/or service equipment rating of transfer switches
3. Restoring proper grounding regimes if portable units are moved among various locations
4. Ground fault protection for kitchen and bathrooms
5. Plug and receptacle requirements for generator flexible cords
6. References to other NFPA documents that cover fuel handling and ventilation safety
7. Reference to the NESC

In many cases electrical equipment manufacturers and retailers make enigmatic references to National Electrical Code requirements (in their disclaimers in manuals and on terminal tags) which point the finger at local inspection authorities and/or installers. The authorities and/or installers point the finger at the manufacturers. These and all other parties involved in this market need a simple written tool to explain to the paying customer how the safety requirements of the National Electrical Code figure into the installation cost. Cross-references to generic safety requirements in three or four other articles are not simple as they might be if put under one roof.

A specialty workgroup might be able to pull together the details and cast them in fresh language (rather than try to cut, patch, or paint the existing language). If homeowners can see something more in the National Electrical Code that applies to their situation they may be more educated consumers when retaining a qualified electrical installer. It would position the framers of the National Electrical Code as having begun to meet the challenge of small, distributed generation systems which may be even more prevalent by the time the 2005 National Electrical Code is in the making.
PANEL ACTION: Reject.
PANEL STATEMENT: No specific recommendation is provided as required by NFPA Regulations Governing Committee Projects, Section 4-3.3, Contents of Proposals.

The submitter should consider providing specific text as a comment.

15- 154 - (702-2): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

Optional Standby System. Optional standby systems are intended to protect public or private facilities and ~~or~~ property where life safety does not depend on the performance of the system. Optional standby systems are intended to supply on-site electric power to selected loads either automatically or manually. The optional standby system shall be supplied by on-site generated power.

FPN: No change.
SUBSTANTIATION: Editorial. Clarification of perceived intent. If on-site generated power is required, the phrase "are intended to supply on-site generated power" is not specific enough. I have assumed separate services were not intended as the power source, especially since Section 702-1 notes prime movers. Section 230-2, Exception No. 2. indicates an additional service may be the source of power. Comment 14-168 in the 1995 ROC, intended to recognize service-supplied power was rejected. Proposal 4-48 in the 1998 ROP was rejected with panel statement indicating service-supplied power is suitable. Comments 4-39 and 4-96 in the 1998 ROC were rejected with panel statements indicating optional standby systems supplied by a service are not covered by Article 702. Such disparate responses by code panels leads to confusion by code users, and clarification of intent is warranted.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing language already addresses power as being generated on-site. Article 702 is intended only for on-site standby sources.

15- 156 - (702-6): Accept
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 4 for information.
SUBMITTER: Alan Manche, Square D Co.
RECOMMENDATION: Revise NEC 702-6 with deletions (strike through) as shown. The entire text of 702-6 is shown for clarity, but only those changes shown as strike-through are part of this proposal.

702-6. Transfer Equipment. Transfer equipment shall be suitable for the intended use and designed and installed so as to prevent the inadvertent interconnection of normal and alternate sources of supply in any operation of the transfer equipment.

~~Transfer equipment, located on the load side of branch circuit protection, shall be permitted to contain supplementary overcurrent protection having an interrupting rating sufficient for the available fault current that the generator can deliver.~~

SUBSTANTIATION: The permission to place supplemental protection on the load side of branch circuit protection is not required in Article 702. The general rule is found in section 240-10, which states: "Supplementary Overcurrent Protection. Where supplementary overcurrent protection is used for lighting fixtures, appliances, and other equipment or for internal circuits and components of equipment, it shall not be used as a substitute for branch-circuit overcurrent devices or in place of the branch-circuit protection specified in Article 210." Since chapter 7 modifies chapters 1 through 4, there is no need for the text in 702-6.

Furthermore, the text in section 702-6 is being misinterpreted to allow supplemental protection to be used in place of branch circuit protection, leaving the branch circuit wiring and outlets unprotected. Transfer equipment is being listed for installation on the "load side of the branch-circuit protection." When the transfer equipment is switched to the alternate power source (generator), the branch-circuit protection is switched out of the circuit leaving the branch circuit protected by a Supplementary Protector.

Utilizing supplementary protection as the branch circuit protector is compromising the protection of the branch circuit. This is inconsistent with the definition of a branch-circuit in Article 100 "Branch Circuit. The circuit conductors between the final overcurrent device protecting the circuit and the outlet(s)."

Branch circuit protectors are evaluated to comply with UL 489 Molded Case Circuit Breakers and also the UL 248 series of nonsupplemental fuse standards. Supplemental protectors are evaluated to UL 1077 Supplementary Protectors. Reviewing the scope of UL 489 and UL 1077 supports that misapplication and compromised safety is occurring due to the misinterpretation of 702-6.

UL 489: Scope - The requirements of this Standard cover molded case circuit breakers, ... These circuit breakers are specifically intended to provide service entrance, feeder, and branch circuit protection in accordance with the National Electrical Code, NFPA 70….

UL 1077: Scope - These requirements apply to supplementary protectors intended for use as overcurrent, or over- or under-voltage protection within an appliance or other electrical equipment where branch circuit overcurrent protection is already provided, or is not required. Compliance with the following is acceptable for use as a component of an end product.

In order to fully understand the significance of this issue, a review of theses two standards will point to the safety issues that have been created due to misinterpretation of section 702-6.

The first basic difference is branch circuit protection devices are Listed to UL 489 (Circuit Breakers) or UL 248 (Fuses) and Supplementary Protectors are Recognized Components evaluated in accordance with UL 1077. Conditions of Acceptability are placed on supplementary protectors that must be considered for each appliance in which they are installed. Products Listed to UL 489, which include circuit breakers and fuses, are periodically tested as part of the certification agency's Follow-Up inspection testing program. Supplemental Protectors are not held to this rigorous Follow-Up testing program.

Secondly, a circuit breaker must perform within the predetermined overload trip curve characteristics established in the UL 489 standard in order to demonstrate protection of branch circuit conductors. Supplemental protectors evaluated to UL 1077 are not required to perform within predetermine overload trip characteristics, which means a supplementary protector may not properly protect the branch circuit conductors from an overload condition. Also, supplementary protectors are permitted to be tested in series with a branch-circuit device and may become inoperable after testing. Therefore a branch circuit device can not be replaced with a supplemental protection device, the supplementary protector must always be used on the load side of a branch circuit device such as a circuit breaker or fuse, and as required in section 240-10.

Finally, clearance and spacing are also an issue. Many supplemental protectors have shorter spacings than devices evaluated to UL 489. There is a perceived benefit to fit these smaller devices into tighter package, but a supplemental protector with short spacings does not comply with the performance requirements of a branch circuit device and the compromised spacings establishes a safety hazard associated with “pollution” levels and overvoltage coordination (insulation coordination). The installation of supplemental protectors due to the misinterpretation of section 702-6 is an unnecessary safety hazard that can easily be addressed by deleting the text in section 702-6 and allowing section 240-10 to address the use of supplemental protection.

PANEL ACTION: Accept.

PANEL STATEMENT: It is recommended that the Technical Correlating Committee refer this proposal to CMP 4 for information.

15- 157 - (702-6): Accept in Principal

Note: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual to remove the statement of intent from the Fine Print Note. It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 4 for information. This action will be considered by the Panel as a Public Comment.

SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./Rep. Edison Electric Inst.

RECOMMENDATION: Revise text as follows:

702-6. Transfer Equipment. Transfer equipment shall be suitable for the intended use and designed and installed so as to prevent the inadvertent interconnection of normal and alternate sources of supply in any operation of the transfer equipment. Transfer equipment and electric power production systems installed to permit operation in parallel with the normal source shall meet the requirements of Article 705.

Transfer equipment, located on the load side of branch-circuit protection, shall be permitted to contain supplementary overcurrent protection having an interrupting rating sufficient for the available fault current that the generator can deliver.

FPN: The purpose of this section is to protect the public, protect standby systems from catastrophic damage; and protect line workers from back feed while repairing supply lines.

SUBSTANTIATION: Operation of a generator in parallel with the supply system creates hazards to line workers, the public, and the generator unless the system is designed for parallel operation. Section 705-3 permits parallel operation of optional standby systems with the normal source; however, there is no reference in Article 702 specifying that the requirements of Article 705 be met. Adding this language will clarify the requirement to comply with Article 705 when parallel operation is planned. This change will reduce the dangers. Adding the FPN will clarify the reasons for not permitting parallel operation.

PANEL ACTION: Accept in Principle.

Accept the submitter's recommendation but revise the proposed FPN to read as follows:

FPN: The purpose of this section is to protect the public, to protect line workers from back feed while repairing supply lines and to protect standby systems from catastrophic damage.

PANEL STATEMENT: The revision to the FPN revert the order of the information to improve the readibility.

It is recommended that the Technical Correlating Committee refer this proposal to CMP 4 for information.

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee

RECOMMENDATION: Revise by adding the following as a third paragraph:

“Transfer equipment shall be required for all permanently installed standby systems subject to the provisions of this article and for which an electric-utility supply is either the normal or standby source.”

SUBSTANTIATION: This proposal was first accepted and then rejected during the 1996 NEC cycle. In the end it failed because it would have inadvertently affected some large industrial systems that generate their own power and use other switching methods than transfer switches to bring alternate sources on line. The panel action was well taken because the former proposal was never intended to apply to such installations. This proposal takes the panel objections into account and fashions a more technically correct amendment.

In the 1999 cycle, CMP 15 rejected this for reasons that would astound CMP 4 were they ever to find out that a panel thinks a noninteractive system can coexist with a utility supply without a transfer switch. These days we increasingly see unqualified people putting utility line crews at risk through improper or nonexistent transfer arrangements, especially with the Y2K paranoia abroad everywhere. CMP 15 should be tightening these rules, not making excuses.

PANEL ACTION: Accept.

PANEL STATEMENT: It is recommended that the Technical Correlating Committee refer this proposal to CMP 4 for information.

(Log #2350)

15- 166 - (702-10 Exception No. 2 (New)): Reject

SUBMITTER: Mark Ptashkin, City of Phoenix, AZ

RECOMMENDATION: Add the following Exception:

Exception No. 2: The provisions of this section shall not apply to the output breaker on Uninterruptible Power Supply systems rated 1000 amps or more provided all of the following conditions are met:

1. The output breaker is located in the UPS enclosure.
2. The UPS is part of a listed multi-module paralleling system.
3. The paralleling switch gear has Ground Fault Protection.

SUBSTANTIATION: Presently manufacturers of multi-module UPS systems are not providing Ground Fault Protection of their systems if the system is 1000 amps or greater and is a 277/480 volts. In addition, when larger systems that employ multiple UPS units that may be rated 1000 KVA or more are utilized and these units have an output breaker they believe that the units themselves should not be required to have GFP. They state that the GFP at the paralleling gear is sufficient. It is clear in 215-10 that these disconnects must have GFP. It must be pointed out that since these are in fact feeders, these conductors may be run in unlimited lengths through a structure. In a feeder this large, this could be unsafe. The intent of this proposal is to show that GFP is required for the output breaker or switch on a UPS unit per 215-10 or, if units are paralleled, to show that the output breaker or switch in the paralleling gear should have Ground Fault Protection.

PANEL ACTION: Reject.

PANEL STATEMENT: The ground fault protection should not be required since the power source is optional.

There is no existing 702-10., let alone any exception. The ground fault protection is not required since the system grounding may interfere with the service ground fault protection.

ARTICLE 705 — INTERCONNECTED ELECTRICAL POWER PRODUCTION SOURCES

(Log #3293b)

3- 207 - (705-3): Accept in Principle

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 15 for action. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Kenneth Krastins, Plug Power, Inc.

RECOMMENDATION: Revise the Exception to Section 705-3 to read as follows:

Exception No. 1: Installation of solar photovoltaic systems operated as interconnected power sources shall be in accordance with Article 690.

Exception No. 2: Installation of fuel cell systems operated as interconnected power sources shall be in accordance with Article 691.

SUBSTANTIATION: This proposal is submitted to provide correlation for a new Article 691.

An important goal of building codes is to permit to the fullest extent possible, the use of modern methods, devices and technological improvements while protecting the health, safety, and welfare of the end user and general public. While new technology may offer many worthwhile benefits, appropriate regulations are needed to allow safe adoption of the technology and prevent misapplication. The fuel cell represents just such an emerging technology. Fuel cells provide a means, via an electrochemical process, of converting a fuel gas (such as natural gas, propane, etc.) into electrical energy that may then be used to power a building or residential dwelling. Fuel cells are virtually pollution free, very quiet when compared to other means of electric power generation, and can operate at high efficiency levels using very abundant and cheap fuels such as natural gas and LP gas.

There is growing interest in small, clean and quiet independent power generating units. The installation of fuel cell electrical generating systems used at residential and light commercial establishments is imminent. Recent advances in fuel cell technologies and more economical means of production will foster widespread acceptance of small distributed electrical generating units (under 50 kW) for single family home use and medium size units (51 kW to 250 kW) for multifamily units and small commercial buildings.

The interest in other clean forms of distributed generation is demonstrated by the adoption of the NEC Article 690, Solar Photovoltaic Systems. The direct interpretation of this article and its application deals specifically with solar photovoltaic electrical generating systems. It has been suggested that this article can also adequately cover other forms of distributed generation including fuel cell systems. However, since much of the language in Article 690 is specific to photovoltaic systems and rather complex to accommodate the interconnection requirements of the many subsystems in photovoltaic systems, application of this article to fuel cells will be cumbersome.

Much of the information in Article 690 could apply to small and medium size electrical generating systems in general. Likewise, Article 705, Interconnected Electrical Power Production Sources, and Article 490, Equipment Over 600 Volts, Nominal, apply mainly to the large utility grid parallel independent electrical generating units. For example, Article 705-12, (b), (1) stipulates, “The aggregate of non-utility sources of electricity has a capacity in excess of 100k W, or the service is above 1000 volts.” Leaving the interpretation of Article 690 and other articles up to the local inspector to determine the requirements for fuel cell systems will be problematic and could hinder the use of this beneficial technology. While the combination of these existing articles and others may adequately address fuel cells, it is clearly advantageous to users of the National Electrical Code, to have an article which specifically articulates the electrical installation requirements of fuel cell systems.

This being stated, Article 690, Solar Photovoltaic Systems, does offer a good basis for the creation of a Fuel Cell Systems article. A description of and substantiation for the individual topics to be covered in the proposed article follows. Where appropriate, comparisons are made within the following detailed substantiation between this proposed fuel cell article and the extant Photovoltaic Article 690. Sections of the Photovoltaic article that do not appear at all in the proposed article are also discussed and distinguished in bold, italicized text.

Additional Changes – Revised wording is recommended for section 230-82 (5), the exception to section 705-3, and section 705-30 to include language to cover fuel cell systems, similar to what is currently included for solar photovoltaic systems.

Members of Plug Power, Inc. and DTE Energy Technologies drafted the original version of the proposed fuel cell article. The proposed article began to be referred to as 691 because of its similarity and relationship to Article 690. It is recognized that the number ultimately assigned to the article may be different from 691.

The article was then circulated, reviewed, and revised internally at Plug Power. Subsequently, an e-mail notification was forwarded on September 13, 1999 to the members of three different groups advising them of the existence of the proposed article and inviting them to request a copy for review and comment. The three different groups notified were

• The members of the IEEE Standards Coordinating Committee (SCC) 21 currently involved in the development of a national standard (P1547) to cover interconnection of distributed resources with electrical power systems

• The members of the technical working group involved in the development of Standard Interconnection Requirements (SIR) for New York State which have since been submitted to the NYS Public Service Commission

• The Codes & Standards Working Group of the US Fuel Cell Council

All totaled, these groups include over 200 individuals. Presentations concerning the proposed article were given by Plug Power at both the September 27, 1999 meeting of the IEEE-SCC21 committee in Arlington, Virginia and the October 8, 1999 Power Quality Workshop (Interconnect-3) sponsored by the US Fuel Cell Council in Phoenix, Arizona. Those individuals who requested a copy of the draft article as a result of the e-mail notification or the presentations were sent one for review. After comments were received, they were negotiated and incorporated in the proposed article currently being submitted. Substantial changes have been made to the proposed article since its original inception, but the input generously provided by the individuals of the groups listed above has served to help develop a much better article as a result.

PANEL ACTION: Accept in Principle.

Revise the exception in the existing code to be Exception No. 1 and accept the submitter's new Exception No. 2 to read as follows:

"Exception No. 1: Installation of solar photovoltaic systems operated as interconnected power sources shall be in accordance with Article 690.

Exception No. 2: Installation of fuel cell systems operated as interconnected power sources shall be in accordance with Article 691."

PANEL STATEMENT: The panel action has revised the proposal to add the Title "Exception No. 1" to the existing exception and accepted the proposed second exception, which meets the submitter's intent.

SUBMITTER: CMP 15

RECOMMENDATION: Revise 705-12 to read as follows:

705-12. Point of Connection. The outputs of electric power production systems shall be interconnected at the premises service disconnecting means,. unless permitted in (a) or (b).

(a) Integrated Electric System. The outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where the system qualifies as an integrated electric system and incorporates protective equipment in accordance with all applicable sections of Article 685.

(b) General. The outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where all of the following conditions are met.

(1) The aggregate of nonutility sources of electricity has a capacity in excess of 100 kW, or the service is above 1000 volts;

(2) The conditions of maintenance and supervision ensure that qualified persons will service and operate the system; and

(3) Safeguards and protective equipment are established and maintained.

SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual.

PANEL ACTION: Accept.

Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 15 for action. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Kenneth Krastins, Plug Power, Inc.

RECOMMENDATION: Add an additional line to Section 750-20 to read as follows:

(d) Fuel cell systems shall be protected in accordance with Article 691.

SUBSTANTIATION: This proposal is submitted to provide correlation for a new Article 691.

An important goal of building codes is to permit to the fullest extent possible, the use of modern methods, devices and technological improvements while protecting the health, safety, and welfare of the end user and general public. While new technology may offer many worthwhile benefits, appropriate regulations are needed to allow safe adoption of the technology and prevent misapplication. The fuel cell represents just such an emerging technology. Fuel cells provide a means, via an electrochemical process, of converting a fuel gas (such as natural gas, propane, etc.) into electrical energy that may then be used to power a building or residential dwelling. Fuel cells are virtually pollution free, very quiet when compared to other means of

electric power generation, and can operate at high efficiency levels using very abundant and cheap fuels such as natural gas and LP gas.

There is growing interest in small, clean and quiet independent power generating units. The installation of fuel cell electrical generating systems used at residential and light commercial establishments is imminent. Recent advances in fuel cell technologies and more economical means of production will foster widespread acceptance of small distributed electrical generating units (under 50 kW) for single family home use and medium size units (51 kW to 250 kW) for multifamily units and small commercial buildings.

The interest in other clean forms of distributed generation is demonstrated by the adoption of the NEC Article 690, Solar Photovoltaic Systems. The direct interpretation of this article and its application deals specifically with solar photovoltaic electrical generating systems. It has been suggested that this article can also adequately cover other forms of distributed generation including fuel cell systems. However, since much of the language in Article 690 is specific to photovoltaic systems and rather complex to accommodate the interconnection requirements of the many sub-systems in photovoltaic systems, application of this article to fuel cells will be cumbersome.

Much of the information in Article 690 could apply to small and medium size electrical generating systems in general. Likewise, Article 705, Interconnected Electrical Power Production Sources, and Article 490, Equipment Over 600 Volts, Nominal, apply mainly to the large utility grid parallel independent electrical generating units. For example, Article 705-12, (b), (1) stipulates, "The aggregate of non-utility sources of electricity has a capacity in excess of 100k W, or the service is above 1000 volts." Leaving the interpretation of Article 690 and other articles up to the local inspector to determine the requirements for fuel cell systems will be problematic and could hinder the use of this beneficial technology. While the combination of these existing articles and others may adequately address fuel cells, it is clearly advantageous to users of the National Electrical Code, to have an article which specifically articulates the electrical installation requirements of fuel cell systems.

This being stated, Article 690, Solar Photovoltaic Systems, does offer a good basis for the creation of a Fuel Cell Systems article. A description of and substantiation for the individual topics to be covered in the proposed article follows. Where appropriate, comparisons are made within the following detailed substantiation between this proposed fuel cell article and the extant Photovoltaic Article 690. Sections of the Photovoltaic article that do not appear at all in the proposed article are also discussed and distinguished in bold, italicized text.

Additional Changes – Revised wording is recommended for section 230-82 (5), the exception to section 705-3, and section 705-30 to include language to cover fuel cell systems, similar to what is currently included for solar photovoltaic systems.

Members of Plug Power, Inc. and DTE Energy Technologies drafted the original version of the proposed fuel cell article. The proposed article began to be referred to as 691 because of its similarity and relationship to Article 690. It is recognized that the number ultimately assigned to the article may be different from 691.

The article was then circulated, reviewed, and revised internally at Plug Power. Subsequently, an e-mail notification was forwarded on September 13, 1999 to the members of three different groups advising them of the existence of the proposed article and inviting them to request a copy for review and comment. The three different groups notified were

- The members of the IEEE Standards Coordinating Committee (SCC) 21 currently involved in the development of a national standard (P1547) to cover interconnection of distributed resources with electrical power systems
- The members of the technical working group involved in the development of Standard Interconnection Requirements (SIR) for New York State which have since been submitted to the NYS Public Service Commission
- The Codes & Standards Working Group of the US Fuel Cell Council

All totaled, these groups include over 200 individuals. Presentations concerning the proposed article were given by Plug Power at both the September 27, 1999 meeting of the IEEE-SCC21 committee in Arlington, Virginia and the October 8, 1999 Power Quality Workshop (Interconnect-3) sponsored by the US Fuel Cell Council in Phoenix, Arizona. Those individuals who requested a copy of the draft article as a result of the e-mail notification or the presentations were sent one for review. After comments were received, they were negotiated and incorporated in the proposed article currently being submitted. Substantial changes have been made to the proposed article since its original inception, but the input generously provided by the individuals of the groups listed above has served to help develop a much better article as a result.

PANEL ACTION: Accept in Principle.
Change the recommended location from 750-20 to new 705-30(d).
The panel accepts the remainder of the proposal.

(Log #34)

10- 85 - (710-20): Reject

NOTE: The following proposal consists of Comment 13-46 on Proposal 13-43 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-43 was:

Revise text:

"Overcurrent protection shall be provided for each ungrounded conductor at its point of supply by one of the following:"

SUBMITTER: Ted A. Stutheit, City of Lincoln, NE / Rep. City of Lincoln / NE State Elect. Board
RECOMMENDATION: Revise text:

"Overcurrent protection shall be provided for each ungrounded conductor at its point of supply by one of the following:".

SUBSTANTIATION: The problem and substantiation remain the same as in the original proposal, with the additional problem that CMP 13 doesn't understand the original substantiation. CMP 13 presumes there is "some device located well ahead of the actual point of supply." Then CMP 13 uses the circular argument "the point of supply is not defined in the Code." See 240-21(a), and the second sentence of Article 100 - Definitions - Scope regarding what a point of supply is.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and the submitter's substantiation on Proposal 10-77.

NOTE: The following proposal consists of Comment 13-48 on Proposal 13-43 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-43 was:

Revise text:

"Overcurrent protection shall be provided for each ungrounded conductor at its point of supply by one of the following:"

SUBMITTER: Terry L. Carlson, Nebraska State Electrical Board

RECOMMENDATION: Revise text to read:

"Overcurrent protection shall be provided for each ungrounded conductor at its point of supply by one of the following:"

The Code Panel should reconsider this proposal and accept it.

SUBSTANTIATION: The entire NEC is very unclear for overcurrent requirements of systems operating at over 600-volts. The present language does not address the location of protection devices in the circuit. It states that overcurrent protection must be in the circuit, but it is not a "clear cut" rule as to the location in the circuit. By adding the words "at its point of supply" to the present language, it makes it very clear that the device must be installed at the beginning of the circuit, not at the end or in the middle. The Panel Statement that "There is no reason why the required overcurrent protection cannot be provided by some device located well ahead of the actual point of supply. The point of supply is not defined in the Code." does not take into account that according to several electrical engineers, the present language allows the device to be on the load end of the circuit. This is an excellent chance for the Code Panel to clarify the rule by adding five words to the sentence, while at the same time they would be enhancing the usability of the Code.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and the submitter's substantiation on Proposal 10-77.

ARTICLE 720 — CIRCUITS AND EQUIPMENT OPERATING AT LESS THAN 50 VOLTS

(Log #996)

16- 23 - (720): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Delete this article.

SUBSTANTIATION: Since the exception for Section 720-1 excludes other installations of 50-volts or less covered by the code, this article appears to be relegated to power and lighting systems. I believe the original envisioned applications (battery-powered systems with windmill generators) have not been made for many years since the inception of the Federal Rural Electrification Administration, circa 1935 which extended power lines to rural areas. There are more practical and viable methods available today to provide power in remote isolated areas without utility power, such as generators and solar photovoltaic systems with inverters which can provide 120-volt power. Less than 50-volt systems are impractical for businesses, manufacturing, farms, and dwellings, if only due to lack of suitable utilization equipment. I am not aware of any utility which provides service at less than 50 volts ac or dc.

All the sections of this article are already covered in other articles, other than 720-4 and 720-5. Section 90-3 indicates Chapters 1 through 4 apply unless amended by Chapter 7. This indicates Chapter 3 wiring methods must be used and properly supported. Section 720-11 was added in the 1996 code because of an apparent assumption that some form of low-voltage cables are used.

The systems covered by this article cannot be reconciled with other code rules, e.g., (1) required 20-ampere laundry and small appliance branch circuits shall be computed at 1500 va per Section 220-16, but a 48 volt 20-ampere branch circuit can only supply a maximum 960 va load. Section 220-2 indicates where other voltages are specified, they shall be used. The panel stated in Proposal 2-183 in the 1989 TCR that Article 220 applies to this article. (2) GFCI protection required by Section 210-8 would be difficult to accomplish since available devices are suitable for ac grounded circuits at standard voltages (See UL listing). This article permits ungrounded ac or dc systems per Section 250-3 and 250-5. Section 250-162(b) would require a 3-wire dc 12-24 volt or 24-48 volt system to be grounded. (3) Identified (white) terminals of devices such as receptacles cannot be connected to ungrounded conductors per Section 200-9.

Over a period of many years I have never seen or been made aware of installations covered in this article. Is the panel aware of any?

PANEL ACTION: Reject.

PANEL STATEMENT: There are systems installed and may be installed for which this article would be applicable.

ARTICLE 725 — CLASS 1, CLASS 2, AND CLASS 3 REMOTE-CONTROL, SIGNALING, AND POWER-LIMITED CIRCUITS

(Log #43)

16- 26 - (725, 760 and 800): Reject

NOTE: The following proposal consists of Comment 16-11 on Proposal 16-10 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 16-10 was:

Make global change from Type MP cables to Type PLMP cables and from "multipurpose" to "power-limited multipurpose."

Revise Sections 725-71(f) (new) and 800-51(g) by adding the following as the last sentence:

"The change in marking from MP to PLMP shall become effective on July 1, 2004."

SUBMITTER: Irving Mande, EST

RECOMMENDATION: In response to the Panel Statements for rejecting this Proposal, (that "All the applications of Type MP cables are not necessarily power-limited"), and for rejecting Proposal 16-56, (that "The panel established communications cables (Type CM) as the primary cable type for cable substitutions."), change the Panel Action from Reject to Accept after making the following revisions:

1. In addition to making the global change from Type MP to Type PLMP and from "multipurpose" to "power-limited multipurpose", add a second classification of communications cables for Type PLCM, power-limited communications cables.

2. Revise subsection 800-51(g) by adding the following after "MP," in the last line "....where used for nonpower-limited applications and Types PLMPP, PLMPR, PLMPG, and PLMP, where used for power-limited applications, respectively. The required change in cable marking for power-limited applications shall become effective on July 1, 2004."

3. Add a new 800-51(j) to read:

(j) Power-Limited Communications Cables. Where communications cables are used on power-limited circuits, they shall be marked PLCMP, PLCMR, PLCMG, and PLCM instead of CMP, CMR, CMG, and CM, respectively. This requirement shall become effective on July 1, 2004.

SUBSTANTIATION: The only reason the Panel gave for rejecting this Proposal was that all the applications of Type MP cables are not necessarily power-limited. If this is true, it creates a safety hazard that I am sure the Panel never intended. CMP 16 has always been very firm on requiring a separation between power-limited and nonpower-limited cables. I don't believe that the Panel now intends to change course and permit power-limited cables to be used for nonpower-limited applications which, in addition to the safety hazard, will cause an enforcement nightmare.

If some types of power-limited cables are being used on nonpower-limited circuits it is urgent that corrective action be taken. Since CL2, CL3 and FPL cables are always used with power-limited sources, the misapplications should be limited to CM and MP cables. The intent of this comment is to create a means for distinguishing between CM and MP Type cables used on power-limited and nonpower-limited circuits. It is also consistent with the original intent of Proposal 16-10.

PANEL ACTION: Reject.

PANEL STATEMENT: Refer to panel action and statement on Proposal 16-29. This proposal is similar and is rejected for the same reason.

(Log #44)

16- 27 - (725, 760, and 800): Reject

NOTE: The following proposal consists of Comment 16-13 on Proposal 16-10 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 16-10 was:

Make global change from Type MP cables to Type PLMP cables and from "multipurpose" to "power-limited multipurpose."

Revise Sections 725-71(f) (new) and 800-51(g) by adding the following as the last sentence:

"The change in marking from MP to PLMP shall become effective on July 1, 2004."

SUBMITTER: Larry Miller, Nat'l Electrical Mfrs Assn. (NEMA)

RECOMMENDATION: In response to the Panel statements for rejecting this proposal, that "All the applications of Type MP cables are not necessarily power-limited," and for rejecting Proposal 16-56, that "The Panel established communications cables (Type CM) as the primary cable type for cable substitutions," change the Panel Action from Reject to Accept in Principle after making the following revisions:

a. In addition to making the global change from Type MP to Type PLMP and from "multipurpose" to "power-limited multipurpose," add a second classification of communications cables for Type PLCM, power-limited communications cables.

b. Revise subsection 800-51(g) by adding the following after "MP," in the last line "...where used for nonpower-limited applications and Type PLMPP, PLMPR, PLMPG, and PLMP, where used for power-limited applications, respectively. The required change in cable marking for power-limited applications shall become effective on July 1, 2004."

c. Add a new 800-51(j) to read:

(j) Power-Limited Communications Cables. Where communications cables are used on power-limited circuits, they shall be marked PLCMP, PLCMR, PLCMG, and PLCM instead of CMP, CMR, CMG, and CM respectively. This requirement shall become effective on July 1, 2004.

SUBSTANTIATION: The only reason the Panel gave for rejecting this proposal was that all applications of Type MP cables are not necessarily power-limited. If this is true, it creates a safety hazard that we are sure the Panel never intended. CMP 16 has always been very firm on requiring separation of power-limited and nonpower-limited cables. We don't believe it was the Panel's intent to change course and permit power-limited cables to be used for nonpower-limited applications, which, in addition to the safety hazard will cause an enforcement nightmare. If some types of power-limited cables are being used on nonpower-limited circuits, it is urgent that corrective action be taken. Since CL2, CL3 and FPL cables are always used with power-limited sources, the misapplications would be limited to CM and MP cables. The intent of this comment is to create a means for distinguishing between CM and MP Type cables used on power-limited and nonpower-limited circuits. It is also consistent with the original intent of Proposal 16-10.

PANEL ACTION: Reject.

PANEL STATEMENT: Refer to panel action and statement on Proposal 16-29. This proposal is similar and is rejected for the same reason.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 22

(Log #1110)

16- 28 - (725): Accept

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Revise Article 725 as follows:

725-23 - change:
"No. 14" to "14 AWG"
"No. 18" to "18 AWG"
"No. 16" to "16 AWG"
725-24, Exception No. 4 - change "No. 14" to "14 AWG"
725-27(a) - change:
"No. 18 and 16" to "18 and 16 AWG"
"No. 16" to "16 AWG"
725-27(b) - change:
"No. 16" to "16 AWG"

"No. 18 and 16" to "18 and 16 AWG"
725-51, Exception - change:
"No. 14" to "14 AWG"
"No. 18" to "18 AWG"
725-71(e) - change "Nos. 22 through 12" to "22 through 12 AWG"
725-71(g) - change "No. 18" to "18 AWG".

SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 22

(Log #2476)

16- 29 - (725, 760, 800, 820, 830): Reject
SUBMITTER: Irving Mande, Edwards Systems Technology
RECOMMENDATION: Globally, revise the required marking for communications cables permitted to be used as a substitute for types CL3-,CL2-,FPL-,CATV-, and BL- power-limited circuit cables by,

1. requiring the present "CM-" marking to be changed to "CM-/PLC"
2. changing the description of Type CM- cables from "communications cables" to "communications/power-limited circuit cables."

This change shall become effective on July 1,2003. Existing inventories shall be permitted to be used until depleted.

The sections of the listed Articles that will be affected by this change are,

- 725-61(g)FPN
- Figure 725-61
- Table 725-61
- 760-61(d)FPN
- Figure 760-61
- Table 760-61
- 800-50
- Table 800-50
- 800-51
- 800-53
- Figure 800-53
- Table 800-53
- Figure 820-53
- Table 820-53
- Table 830-58

SUBSTANTIATION: The Code permits Type CM- cables to be used for two distinctly different types of applications, as a communications cable for Article 800 applications and as a substitute for the power-limited circuit cables required by Articles 725, 760, 820 and 830. The required markings for communications cables used as substitutes for the power-limited circuit cables should identify its permitted use for both applications and not only as a communications cable.
PANEL ACTION: Reject.
PANEL STATEMENT: Additional marking is not required to be able to identify cables carrying power-limited circuits. Class 2 (CL2), class 3 (CL3) and power-limited fire alarm (FPL) cables are permitted to be used for power-limited circuits only. Using any of these cables will identify the circuit as power-limited.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22
VOTE ON PANEL ACTION:
AFFIRMATIVE: 22

(Log #3333)

16- 30 - (725): Reject
SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Delete the word "remote" where used throughout Article 725.
SUBSTANTIATION: The word remote is vague and adds no value. The term should be "control circuit". How far away is considered remote? If the control circuit and the "controlled equipment" are in the same enclosure is the circuit still considered remote? A corresponding proposal has been submitted to change the definition in Article 100.
PANEL ACTION: Reject.
PANEL STATEMENT: The word "remote" has long been associated with the term "remote control" and connotes controlling over some medium, such as metallic conductors. To use the term "remote control circuit" without the word "remote" would impart confusion because a control circuit is often an integral part of and embedded within electrical equipment, with no external access or transmission medium required.

(Log #3197)

16- 31 - (725, Title): Accept

Note: The Technical Correlating Committee advises that Title Statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: S. E. Egesdal, Honeywell Inc.
RECOMMENDATION: Revise Article title to read as follows:
ARTICLE 725 —Class 1, Class 2, and Class 3 Remote-Control and Signaling Systems.
SUBSTANTIATION: This change coordinates with the deletion of the power-limited power sources from Section 725-21. "Circuits" is changed to "Systems" because Article 725 has requirements for equipment (power sources) as well as circuits.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
LANNI: If power limited class 1circuits are in use, the category cannot be eliminated from the code.

An example of a power limited class 1 circuit is a 24 volt damper motor circuit used to control environmental air flows.

Reference: "Guide to Low-Voltage & Limited - Energy Systems", page 4, by Mike Holt.

MANGAN: I support Mr. Lanni's reasons for Explanation of Negative Vote.
COMMENT ON AFFIRMATIVE:
EGESDAL: Support the Panel Action.

(Log #4039)

16- 32 - (725-2-Abandoned Cable (New)): Accept
SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l
RECOMMENDATION: Add a new definition to read as follows:
Abandoned Cable. Cable that is neither terminated at both ends, at a connector or other equipment, nor identified for future use with a tag.
SUBSTANTIATION: The definition of abandoned cable is needed to accompany the proposals that require removal of abandoned cable. This definition reflects industry practices.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22
VOTE ON PANEL ACTION:
AFFIRMATIVE: 19
NEGATIVE: 2
ABSTENTION: 1
EXPLANATION OF NEGATIVE:
DORNA: The definition of "Abandoned Cable" should be the same here as what we accepted in Proposal 16-273. It should be "Cable that is neither terminated at ~~both ends, at a connector or other~~ equipment, nor identified for future use with a tag." (This is the same wording as Proposal 16-273.)

The reason we took out the reference to connectors in Proposal 16-273 is because CATV cable usually has connectors attached. It was our concern that CATV cables would have connectors attached and then would not fall under the proposed original definition and therefore would not have to be removed if abandoned. I believe this also could

be the case with cables in this Article 725. These cables could also have connectors attached, and therefore would not fall under the definition the panel had accepted in principal. If we make the definition the same as I have suggested above (the same as 16-273) then it will make it irrelevant on whether the cable has connectors or not. I can foresee someone using the fact that the cable has a connector on it, therefore it does not fall under "abandoned cable" and does not need to be removed.

JOHNSON: The provision for allowing cables with connectors still attached to be considered abandoned may not meet with the proposal's intent. Wording used in Proposal 16-273 is a more acceptable choice. I am in agreement with Mr. Dorna's comments on other related proposals.

COMMENT ON AFFIRMATIVE:

BRUNSSEN: I concur with the Panel's intent. However, the definition of "abandoned cable" should be identical throughout the code. The definition should be states as follows:

"Abandoned Cable. Cable that is neither terminated at equipment nor idntified for future use with a tag." It is possible for abandoned cable formerly used for any application, CATV, data, telecommunications, etc., to have a connector attached. Therefore, the presence of a connector should not be a determining factor.

KAHN: I agree with the Panel's intent but perhaps the definition should read "Cable that is neither terminated at equipment nor identified for future use with a tag." In many applications abandoned cables might have connectors and such cables should be removed.

EXPLANATION OF ABSTENTION:

CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #4044)

16- 33 - (725-2-Excessive Accumulation of Abandoned Cables (New)): Reject

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design / Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Add a new definition to read as follows:

Excessive Accumulation of Abandoned Cables. When the number of abandoned cables is greater than 1/3 of the total number of cables within a fire-containment zone.

SUBSTANTIATION: After the concept of plenum cables was introduced into the 1975 NEC, Underwriters Laboratories initially listed plenum cables by comparing the smoke production of plenum cables with the smoke production of conventional cables of the same physical design (but not plenum grade materials) in conduit. Plenum cables (not in conduit) were tested and compared with an equal number of conventional cables in conduit. It was assumed that the plenum cables were a replacement for conventional cables and that in case of a fire the amount of smoke would be reduced because of the lower smoke production of plenum cables. It was not anticipated that plenum cables would be abandoned. Since conventional cables in conduit were deemed to be acceptable the smoke from these cables is the benchmark for comparison and a fire involving an excessive amount of abandoned cables could emit excessive amount of smoke. Until research better defines what amount of abandoned cable might be excessive, allowing up to 1/3 excess of abandoned cables is prudent.

PANEL ACTION: Reject.

PANEL STATEMENT: The term is not used. The proposal that introduced this term was modified to eliminate the term.

16- 36 - (725-3(a) (New)): Accept

SUBMITTER: Dann M. Strube, Lanesville, IN

RECOMMENDATION: Insert new subsection :

(a) Number and size of conductors in raceway. Section 300-17.

Renumber the remaining subsections.

SUBSTANTIATION: Section 725-28(a) refers to Section 300-17 so Section 725-3 should include the reference.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 22

(Log #3775)

16- 37 - (725-3(b)): Accept in Principal

Note: The Technical Correlating Committee directs that the action on this Proposal be rewritten to comply with the NEC Style Manual 3.3 to read as follows: "Section 300-22 for Class 1, Class 2, and Class 3 circuits installed in ducts, plenums or other space used for environmental air Type CL2P or CL3P cables shall be permitted for Class 2 and Class 3 circuits." This action will be considered by the Panel as a Public Comment.

SUBMITTER: Stanley D. Kahn, Tri-City Electric Co., Inc.

RECOMMENDATION: Delete the Exception:

Change the text to read as follows:

(b) Ducts, Plenums and Other Air Handling Spaces. For Class 1, Class 2 and Class 3 circuits Section 300-22, where installed in ducts or plenums or other space used for environmental air. For Class 2 and Class 3 circuits listed Type CL2P or CL3P cables shall be permitted.

SUBSTANTIATION: There are numerous Exceptions in the NEC which can be expressed in positive code language. This proposal converts the Exception into the section text without altering its intent.

PANEL ACTION: Accept in Principle.

Change the submitter's recommendation as follows:

Delete the Exception

Change the text to read as follows:

"(b) Ducts, Plenums and Other Air Handling Spaces. For Class 1, Class 2 and Class 3 circuits Section 300-22, where installed in ducts or plenums or other space used for environmental air. For Class 2 and Class 3 circuits Type CL2P or CL3P cables shall be permitted."

PANEL STATEMENT: The word "listed" is deleted from the submitter's recommendation. Type CL2P and CL3P are always listed and the word "listed" is redundant.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 22

(Log #1664)

16- 38 - (725-5): Accept in Principal

Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting of a similar Proposal 16-192. The Technical Correlating Committee directs that the action of this Proposal be revised to comply with the NEC Style Manual 3.2.1 relative to use of the unenforceable terms "practicable" and "impracticable." Also, cables above suspended ceilings are considered to be exposed and the wording approved for this proposal could be considered to conflict with the Action on Proposal 16-39. This action will be considered by the Panel as a Public Comment. It was also the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 3 for Comment.

SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions

RECOMMENDATION: Revise 725-5 as follows:

725-5. Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to equipment shall not be denied by an excess accumulation of conductors and cables ~~that prevents~~ sufficient to prevent the removal of panels, including suspended ceiling panels.

SUBSTANTIATION: Section 725-5 may be misinterpreted to mean that conductors and cables may not be placed directly on suspended ceilings. While the 1999 National Electrical Code Handbook emphasizes "excess accumulation" in the interpretive text, Figures 725-2 and 725-3 lead the reader to conclude that no wires or cables are permitted to rest directly on the suspended ceiling. This was not the intent of CMP 16 when 725-5 was introduced into the 1993 NEC. At that time CMP 16 stated in response to a proposal to Article 725 (1992 TCD Comment 16-18) that the proposed requirement "... would still allow some cabling of a limited quantity above the ceiling tile, but not to an excessive amount." The proposed revision emphasizes that it is an excessive accumulation of wire and cable that is of concern. A limited amount of wiring or cabling laid directly on a suspended ceiling is permitted, will not deny access to equipment, and does not present an unsafe working environment. This is a companion proposal and is intended to correlate with 760-5, 770-7, 800-5, 820-5 and 830-6.

PANEL ACTION: Accept in Principle.

Revise 725-5 to read as follows:

"725-5. Access to Electrical Equipment Behind Panels Designed to Allow Access

Access to electrical equipment shall not be denied by an accumulation of wires and cables that prevents removal of panels. Cables shall be installed in such a manner that the cable will not be damaged by normal building use. Access to electrical equipment behind ceilings designed to allow access shall comply with (a) or (b).

a. New building construction (e.g., renovation, remodeling, new spaces). Installation of cables shall comply with Section 300.11.

b. Buildings with existing cabling systems.

Where practicable, installation of cables shall comply with Section 300-11. Where impracticable to comply with Section 300-11, cables less than 13 mm (0.5 in) in diameter shall be permitted to be installed unsupported by the building structure in accordance with 1 or 2.

1. In areas having ceilings with access points or access panels, it shall be permissible to fish a maximum of three cables between access points in the ceiling.

2. In areas having suspended lay-in ceilings, it shall be permissible to install a maximum three unsupported cables on top of any one ceiling tile. The cables shall be run parallel to the ceiling grid."

PANEL STATEMENT: The revised text satisfies the intent of the original recommendation in that it allows some cabling of a limited quantity above ceiling tile but not an excessive amount, which would interfere with accessibility.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 21

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

EGESDAL: See my Explanation of Negative on Proposal 16-192.

COMMENT ON AFFIRMATIVE:

BRUNSSEN: I concur with the panel action in providing relief for a limited amount of after-construction fire alarm and low voltage signaling wiring and cable to be placed directly on the suspended ceiling tiles. However, proposed Section 725-5(b)(2), as presently written, is confusing and could be interpreted as permitting a total of only three unsupported cables. The intent of the panel was that up to a maximum of three unsupported cables may be routed across each and every ceiling tile. Revising 725-5(b)(2) to state: "...permissible to install a maximum of three unsupported cables on top of ~~any one~~ each ceiling tile, i.e., up to three cables are permitted to lay on a ceiling tile." would clarify the intent. Note that the word "of" is inserted and is missing in the original text.

(Log #3100)

16- 39 - (725-7): Accept in Principle

SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)

RECOMMENDATION: Revise text to read as follows:

"Mechanical Execution of Work. Class 1, Class 2, and Class 3 circuits shall be installed in a neat and workmanlike manner. Exposed ~~C~~cables and conductors shall be supported by ~~the~~ structural components of the building ~~structure~~ in such a manner that the cable or conductors will not be damaged by normal building use. Exposed cables and conductors shall be attached to structural components at intervals not exceeding 5 ft (1.52 m) and within 12 in. (305 mm) from every cabinet, box or fitting by straps, staples, hangers or similar fittings designed and installed so as not to damage the cable or conductors. The installation shall also conform with Section 300-4(d).

Also, delete the Fine Print Note.

SUBSTANTIATION: Systems continue to be installed by "tossing" exposed cables and conductors across lay-in ceiling tiles and routed through open joist construction with no regard for proper support of the cables and conductors as just one example. The intent is that these exposed cables and conductors are supported by structural components of the building, such as; beams, joists, columns or walls. Too often, the sole means of support is by laying these cables and conductors on removable ceiling panels or attaching them to a ceiling support system (T-bars or wires) which is prohibited by the National Electrical Code.

Another common observation is seeing them "strung" through open joist construction with little or no means of support other than occasionally being wrapped around a portion of the joist to keep them from sagging. The addition and use of "exposed" was carefully chosen to avoid conflict with acceptable methods within the section of installing "concealed" cables and conductors, which typically are not going to be subjected to physical damage. The reference to 300-4(d) is to protect concealed cables and conductors when appropriate.

The new text has been taken partially from, and with, Sections 330-12, 333-7 and 336-18 in mind which also deal with exposed cable systems. These changes will ensure that cables and conductors are supported properly as well as provided with strain relief when entering electrical enclosures for connections, splicing and termination's.

PANEL ACTION: Accept in Principle.

Revise the submitter's recommendation to read as follows:

Revise text to read as follows:

"Mechanical Execution of Work. Class 1, Class 2, and Class 3 circuits shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed on the surface of ceiling and sidewalls shall be supported by ~~the~~ structural components of the building ~~structure~~ in such a manner that the cable or conductors will not be damaged by normal building use. Such cables and conductors shall be attached to structural components at intervals not exceeding 1.52 m (5 ft) and within 305 mm (12 in.) from every cabinet, box or fitting by straps, staples, hangers or similar fittings designed and installed so as not to damage the cable or conductors. The installation shall also conform with Section 300-4(d)."

Also, delete the Fine Print Note.

PANEL STATEMENT: The revised text conforms to the definitions in Article 100, and satisfies the intent of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

HUGHES: The submitter's desire is to require measurable intervals between supports and from points of attachment. I agree with the concept but disagree with the distances identified. Limiting the minimum support intervals to 5 ft will result in unnecessary installation costs with very little or no benefit. A more practical support interval would be 2 meters. As to minimum distance from

cabinets, etc., it is more important to provide some sort of strain relief at the cabinet so the cable will not pull out than to establish a minimum distance.

I suggest a change to the last sentence of the proposal that says:

"Such cables and conductors shall be secured to structural components at intervals not exceeding 2 meters and within 2 meters from every cabinet, box or fitting by straps, staples, hangers or similar fittings designed and installed so as not to damage the cable or conductors. Strain relief shall be provided at cabinets, boxes, or fittings so the cables or conductors will not pull out."

JOHNSON: See my Explanation of Negative Vote on Proposal 16-2a.

(Log #3659)

16- 40 - (725-7): Accept

SUBMITTER: Melvin J. Wierenga, Wierenga & Assoc.

RECOMMENDATION: Delete the FPN associated with this section.

SUBSTANTIATION: Problem: The standards listed contain insufficient information to determine accepted industry practice for systems and equipment included in Article 725.

Substantiation: A detailed review of ANSI/EIA/TIA/568A-1995, ANSI/EIA/TIA/569-1990 , and ANSI/EIA/TIA/570-1991 was completed by the submitter and no significant information, guidance, or directives were found, that would be helpful to a user of this Article of the Code. These standards were developed by the telecom and computer industries. They provide the details covering telecommunication infrastructure such as cable pathways, equipment spaces, telephone grounding/bonding, and telecommunication administration. They are excellent standards but they do not address typical cabling installation issues such as:

(a) how to properly pull wire(s) above a lay in ceiling.

(b) when and where to support the wire in a building structure.

(c) how to dress various types of audio signal wires coming into and within an equipment cabinet.

(d) how and where to set up wire reels for riser cables in tall structures.

(e) how and where to dress audio speaker wire along a steel beam in a gymnasium or factory.

(f) what to watch out for when pulling a cable into a raceway.

These standards are purported to be the concept standards for guiding the users of the Code in determining appropriate mechanical execution of work and determination of acceptable industry practices. However, such is not the intent of the standards. For those who do not have a set of the standard available, the submitter has provided an Appendix that summarizes each section of each standard. The appendix will give you an overview of the contents of each section of each standard and enable you to gain a better understanding of what the standards cover.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept.

PANEL STATEMENT: The proposed recommendation has been incorporated by the panel action on Proposal 16-39.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

LANNI: After reviewing the NECA index No. 5037, I realized that there are very useful National Electrical Installation Standards available and a Fine Print Note is the appropriate way to guide the code user. I also feel that the panel did satisfy the original submitter when the Fine Print Note was incorporated into the code. Improving the references, instead of removing the Fine Print Note, would improve our original work. Installation documents are being produced all the time partially in response to our note in the code. The panel could only answer one of the Submitter's concerns, namely, "when and where to support the wire in a building structure." Other issues are left unanswered. Good workmanship is an important component of a safe installation, but the code cannot address all these issues and other documents are more suited for the purpose.

ROMLEIN: See my Explanation of Negative Vote on Proposal 16-3.

(Log #4021)

16- 41 - (725-7): Reject

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Revise the FPN to read: "One way to determine accepted industry practice is to refer to nationally recognized standards such as Commercial Building Telecommunications Cabling Standard, ANSI/EIA/TIA 568-A-1995; Commercial Building Standard for Telecommunications Pathways and Spaces, ANSI/TIA/EIA 569-A-1997; and Residential ~~and Light Commercial~~ Telecommunications Cabling ~~Wiring~~ Standard, ~~ANSI/EIA/TIA 570-1991~~ ANSI/EIA/TIA 570-A-1999, ANSI/NECA/BICSI 568 or other ANSI-approved installation standards."

SUBSTANTIATION: A revision to the standard number and the title for residential cabling has been updated. Another standard is currently under review that will be focused at the installation of telecommunications cabling and connectors and will become an ANSI standard within the next year.

PANEL ACTION: Reject.

PANEL STATEMENT: Section 725-7 has been revised to remove the FPN and provide specific installation requirements. A FPN is no longer necessary. Refer to the panel action and statement on Proposal 16-39.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

(Log #3754)

16- 42 - (725-7(a)): Accept in Principle

SUBMITTER: Douglas R. Erb, Construction Insp. Dept., Ocean County, NJ

RECOMMENDATION: Add a new Section 725-7(a) to read as follows:

"Supports. Class 2 and Class 3 cables shall be secured by staples, cable ties, straps or similar fittings designed and installed as not to damage the cable. Cables shall be secured at intervals not exceeding 6 ft and within 12 in. from every cabinet, box or device.

Exception No. 1: For concealed work in finished buildings where such support is impracticable, it shall be permissible to fish cable between access points."

SUBSTANTIATION: The absence of a definitive support requirement for PLFA cables which is provided for other wiring method throughout this code is needed. Without a definite support requirement enforcement of the general requirements of 725-7 provide no consistency. With the increased presence of Class 2 and Class 3 cables especially in drop ceilings damage to these cables and the integrity of their systems has increased with the lack of proper support. Lack of support for these cables creates an unsafe work area for others attempting work in these spaces.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to the panel action and statement on Proposals 16-38 and 16-39. The revised text meets the intent of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

SUBMITTER: S. E. Egesdal, Honeywell Inc.

RECOMMENDATION: Delete "Classifications and" from section heading, delete (a) and (b), and change the first paragraph of Section 725-21 to read as follows:

725-21. Class 1 Circuit Power Source Requirements. The power source of Class 1 remote control or signaling circuits shall comply with Chapters 1 through 4, and the output voltage shall not be more than 600 volts, nominal.

SUBSTANTIATION: There is no apparent need for the power-limited requirement presently in Section 725-21(a). A review of UL listings shows no listed product meeting the requirements of Section 725-21(a). This requirement was introduced written in Article 725 in the 1975 edition of the NEC. The purpose of the requirement was to provide requirements equivalent to article 450. The proposed revision retains the Chapter 4 requirements, while reducing the confusion by deleting the term "power-limited source." The proposed change has requirements for Class 1 circuits identical to those for nonpower-limited circuits in Section 760-21.

The title is revised as "classification and" is no longer appropriate.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

LANNI: If power limited class 1circuits are in use, the category cannot be eliminated from the code.

An example of a power limited class 1 circuit is a 24 volt damper motor circuit used to control environmental air flows.

Reference: "Guide to Low-Voltage & Limited - Energy Systems", page 4, by Mike Holt.

The submitter's claim that there are no UL Listed products meeting the requirements of Section 725-21(a) is not accurate. If by "product" the submitter was only referring to "systems", his claim is true. But it ignores the abundance of Class I power-limited sources (mainly low voltage transformers) which do meet the requirements of Section 725-21(a) and are UL Listed.

If the proposed changes to Section 725-21(a) are adopted, it will eliminate numerous applications now permitted by the code with no substantiation that they constituted a safety hazard.

Most Article 725 installations are not systems (which can be UL Listed). They are field installations, using UL Listed power sources and conductors connected to loads using Article 725 wiring methods.

These installations use individual UL Listed components, but are not UL Listed as systems that can be listed in a UL directory.

Proposal 16-31 is based on the acceptance of proposal 16-43. If Proposal 16-43 is rejected, this proposal should also be rejected. If adopted, it would limit the use of Article 725 to remote-control and signaling applications and eliminate its use for all other power-limited applications.

MANGAN: I support Mr. Lanni's reasons for Explanation of Negative Vote.

COMMENT ON AFFIRMATIVE:

EGESDAL: Support the Panel Action.

(Log #997)

16- 44 - (725-21(b)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Add new text to read as follows:

Class 2 and Class 3 power sources shall be permitted to supply Class 1 circuits.

SUBSTANTIATION: This is not explicitly prohibited by the code although it appears many code users believe it is not permitted. The limitations indicated for Class 1 circuits are maximums; lower limits are not specified and could be within parameters for Class 2 and 3 circuits. Class 1 circuits powered by Class 2 sources are apparently permitted by UL (See January/February 1992 IAEI News).

PANEL ACTION: Reject.

PANEL STATEMENT: While the code does not prohibit the application, the proposed wording could result in confusion regarding the required separation of Class 1 from Class 2 and 3 systems.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 22

(Log #998)

16- 45 - (725-23): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise last sentence of first paragraph:

Overcurrent protection shall not exceed ~~7~~ 6 amperes for No. 18 conductors and ~~10~~ 8 amperes for No. 16.

SUBSTANTIATION: Section 725-27(b) basically requires No. 18 and No. 16 conductors to be fixture wire and doesn't allow it for larger sizes. Section 402-12 refers to Section 240-4 which requires overcurrent protection for fixture wires in accordance with ampacity specified in Table 402-5. Fixture wire is not covered by permissive conditions of Section 240-3(b). The basic overcurrent protection ratings should agree with basic ratings indicated elsewhere in the code to minimize confusion for code users. Why should Article 725 ampacities differ from table ampacities? Present ratings would permit possible current in excess of Table 402-5 ampacities.

PANEL ACTION: Reject.

PANEL STATEMENT: The intermittent nature of the circuits covered in Article 725 are different from the general conditons covered in Chapters 1 through 4 and more liberal limitations on the overcurrent protection permitted are appropriate. Also refer to the FPN following 725-1.

(Log #4264)

16- 46 - (725-23 Exception No. 2): Reject

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee

RECOMMENDATION: Designate the existing Exception as Exception No. 1 and add a second exception as follows:

Exception No. 2: Conductors qualifying under the provisions of Section 725.27(c) shall be protected by overcurrent devices rated or set not over 5 amperes for No. 20 and larger conductors, and not over 3 amperes for No. 22 conductors.

SUBSTANTIATION: This is a companion proposal to another on Section 725.27 which brings the essential requirements of Article 727 into Article 725, and a third proposal to delete Article 727. The principal substantiation is on the proposal for the new Section 725.27(c). Please refer to that proposal for more information.

PANEL ACTION: Reject.

PANEL STATEMENT: 725-27(a) permits 18 and 16 AWG. No justification has been provided to allow the proposed smaller sizes for Class 1 circuits.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 22

(Log #3199)

16- 47 - (725-24): Accept in Principle

SUBMITTER: S. E. Egesdal, Honeywell Inc.

RECOMMENDATION: Revise as follows:

725-24. Class 1 Circuit Overcurrent Device Location. Overcurrent devices shall be located as specified in (a) through (e).

(a) Point of Supply. Overcurrent devices shall be located at the point where the conductor to be protected receives its supply.

(b) Feeder Taps. Class 1 circuit conductors shall be permitted to be tapped, without overcurrent protection at the tap, where the overcurrent device protecting the circuit conductor is sized to protect the tap conductor.

(c) Transformer Taps. Class 1 circuit conductors No. 14 and larger that are tapped from the load side of the overcurrent-protective device(s) of a controlled light and power circuit shall require only short-circuit and ground-fault protection and shall be permitted to be

protected by the branch-circuit overcurrent protective device(s) where the rating of the protective device(s) is not more than 300 percent of the ampacity of the Class 1 circuit conductor.

(d) Supply Side of Transformer. Class 1 circuit conductors supplied by the secondary of a single-phase transformer having only a 2-wire (single-voltage) secondary shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, provided this protection is in accordance with Section 450-3 and does not exceed the value determined by multiplying the secondary conductor ampacity by the secondary-to-primary transformer voltage ratio. Transformer secondary conductors other than 2 wire shall not be considered to be protected by the primary overcurrent protection.

(e) Supply Side of Electronic Power Source. Class 1 circuit conductors supplied by the output of a single-phase, listed electronic power source, other than a transformer, having only a 2-wire (single voltage) output for connection to Class 1 circuits shall be permitted to be protected by overcurrent protection provided on the input side of the electronic power source, provided this protection does not exceed the value determined by multiplying the Class 1 circuit conductor ampacity by the output-to-input voltage ratio. Electronic power source outputs, other than 2 wire (single voltage).

SUBSTANTIATION: The power source exceptions are changed to positive language in compliance with 3.1.4.2 of the Style Manual.

PANEL ACTION: Accept in Principle.

Revise the submitter's recommendation to read as follows:

"725-24. Class 1 Circuit Overcurrent Device Location. Overcurrent devices shall be located as specified in (a) through (e).

(a) Point of Supply. Overcurrent devices shall be located at the point where the conductor to be protected receives its supply.

(b) Feeder Taps. Class 1 circuit conductors shall be permitted to be tapped, without overcurrent protection at the tap, where the overcurrent device protecting the circuit conductor is sized to protect the tap conductor.

(c) Transformer Taps. Class 1 circuit conductors No. 14 and larger that are tapped from the load side of the overcurrent-protective device(s) of a controlled light and power circuit shall require only short-circuit and ground-fault protection and shall be permitted to be protected by the branch-circuit overcurrent protective device(s) where the rating of the protective device(s) is not more than 300 percent of the ampacity of the Class 1 circuit conductor.

(d) Primary Side of Transformer. Class 1 circuit conductors supplied by the secondary of a single-phase transformer having only a 2-wire (single-voltage) secondary shall be permitted to be protected by overcurrent protection provided on the primary side of the transformer, provided this protection is in accordance with Section 450-3 and does not exceed the value determined by multiplying the secondary conductor ampacity by the secondary-to-primary transformer voltage ratio. Transformer secondary conductors other than 2 wire shall not be considered to be protected by the primary overcurrent protection.

(e) Input Side of Electronic Power Source. Class 1 circuit conductors supplied by the output of a single-phase, listed electronic power source, other than a transformer, having only a 2-wire (single voltage) output for connection to Class 1 circuits shall be permitted to be protected by overcurrent protection provided on the input side of the electronic power source, provided this protection does not exceed the value determined by multiplying the Class 1 circuit conductor ampacity by the output-to-input voltage ratio. Electronic power source outputs, other than 2 wire (single voltage)."

PANEL STATEMENT: The text and titles have been revised to make them consistent with terminology used elsewhere in the code.

(Log #2525)

16- 49 - (725-24 Exception No. 2): Reject

SUBMITTER: Allen F. KnicKrehm, The KnicKrem Co.

RECOMMENDATION: Revise as follows:

Delete Exception No. 2 and insert a fine print note as follows:

FPN: See Section 240-3(f) for transformer secondary conductor protection.

SUBSTANTIATION: The revisions to Section 240-3 state the requirements in stand alone clear text. The jurisdiction for this requirement is with the CMP for Article 240. This proposal is in keeping with the effort to make the code easy to use.

PANEL ACTION: Reject.

PANEL STATEMENT: The substantiation is incorrect. 240-3(g) refers specifically back to Article 725. Refer also to the panel action on Proposal 16-47 where all exceptions were converted into positive language. The FPN is not needed because the requirements are included in Proposal 16-47.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 22

(Log #2291)

16- 50 - (725-25): Accept in Principal

Note: The Technical Correlating Committee directs that the action on this Proposal be revised to comply with the NEC Style Manual 3.1.4 regarding the wording of Exceptions No. 1 and No.2. The Technical Correlating Committee notes that the revised wording in the Panel Action appears to conflict with Section 725-3 that states in part that "Only those sections of Article 300 referenced in this article shall apply." The revised Section 725-25 does not refer to any specific section of Article 300. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Dann M. Strube, Lanesville, IN

RECOMMENDATION: Add a new second and third sentence as follows:

"Splices and taps shall be made in accordance with Section 300-15. See Article 370 for rules on the installation and use of boxes and conduit bodies."

SUBSTANTIATION: Section 725-3 does not require the application of Section 300-15. Therefore, the only code path to require a box where Class 1 circuits are spliced is through the Chapter 3 rules for the type of raceway used. For example if EMT is used then Section 348-15 would require the use of Section 300-15. The problem with this is that Section 90-3 allows Chapter 7 to modify Chapters 1 through 4 but does not allow Chapter 3 to modify Chapter 7. Therefore, Chapter 3 cannot require the use of Section 300-15 which Article 725 has exempted in Section 725-3. The proposed change will correct this change.

PANEL ACTION: Accept in Principle.

Revise 725-25 to read as follows:

"725-25. Class 1 Circuit Wiring Methods

Installations of Class 1 circuits shall be in accordance with Article 300 and the other appropriate articles in Chapter 3.

Exception No. 1: As provided in Sections 725-26 through 725-28.

Exception No. 2: Where other articles of this Code permit or require other methods."

PANEL STATEMENT: The revised text provides clarification requested by the submitter that Article 300 is appropriate to the installation of Class 1 circuits. Confusion was added when the Technical Correlating Committee moved Exception No. 2 from 300-1 of the 1996 code to the main text of 725-3 in the 1999 code.

16- 51a - (725-26): Accept
SUBMITTER: CMP 16
RECOMMENDATION: Revise as follows:
"725-26. Conductors of Different Circuits in the Same Cable, Cable Tray, Enclosure, or Raceway. Class 1 circuits shall be permitted to be installed with other circuits as specified in (a) through (b).
(a) Two or More Class 1 Circuits. Class 1 circuits shall be permitted to occupy the same cable, cable tray, enclosure, or raceway without regard to whether the individual circuits are alternating current or direct current, provided all conductors are insulated for the maximum voltage of any conductor in the cable, cable tray, enclosure, or raceway.
(b) Class 1 Circuits with Power Supply Circuits. Class 1 circuits shall be permitted to be installed with power supply conductors as specified in (1) through (4).
(1) In a Cable, Enclosure, or Raceway. Class 1 circuits and power supply circuits shall be permitted to occupy the same cable, enclosure, or raceway only where the equipment powered is functionally associated.
(2) In Factory- or Field-Assembled Control Centers. Class 1 circuits and power supply circuits shall be permitted to be installed in factory- or field-assembled control centers.
(3) In a Manhole. Class 1 circuits and power supply circuits shall be permitted to be installed as underground conductors in a manhole in accordance with (a), (b), or (c).
(a) The power-supply or Class 1 circuit conductors are in a metal-enclosed cable or Type UF cable.
(b) The conductors are permanently separated from the power-supply conductors by a continuous firmly fixed nonconductor, such as flexible tubing, in addition to the insulation on the wire.
(c) The conductors are permanently and effectively separated from the power supply conductors and securely fastened to racks, insulators, or other approved supports.
(4) In cable trays, where the Class 1 circuit conductors and power-supply conductors not functionally associated with them are separated by a solid fixed barrier of a material compatible with the cable tray, or where the power-supply or Class 1 circuit conductors are in a metal-enclosed cable."
SUBSTANTIATION: The use of "cable tray" has been added within the requirements of this section. Refer to panel action on Proposal 16-54. The exceptions are changed to positive language. Refer to panel action on Proposal 16-51.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22
VOTE ON PANEL ACTION:
AFFIRMATIVE: 21
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
HUGHES: I do not feel cable tray needs to be added to this Section (625-26) of the code. This section addresses "conductors", which implies individual conductors and not cables. Individual conductors for this class of wiring are not allowed in cable tray. Adequate protection is provided in cable trays by the outer jacket of the cable assembly.

(Log #3200)

16- 51 - (725-26): Accept in Principle
SUBMITTER: S. E. Egesdal, Honeywell Inc.
RECOMMENDATION: Revise as follows:
725-26. Conductors of Different Circuits in Same Cable, Enclosure, or Raceway. Class 1 circuits shall be permitted to be installed with other circuits as specified in (a) through (b).
(a) Two or More Class 1 Circuits. Class 1 circuits shall be permitted to occupy the same cable, enclosure, or raceway without regard to whether the individual circuits are alternating current or direct current, provided all conductors are insulated for the maximum voltage of any conductor in the cable, enclosure, or raceway.
(b) Class 1 Circuits with Power Supply Circuits. Class 1 circuits shall be permitted to be installed with power supply conductors as specified in (1) through (3).
(1) In a Cable, Enclosure, or Raceway. Class 1 circuits and power supply circuits shall be permitted to occupy the same cable, enclosure, or raceway only where the equipment powered is functionally associated.
(2) In Factory- or Field-Assembled Control Centers. Class 1 circuits and power supply circuits shall be permitted to be installed in factory- or field-assembled control centers.
(3) In a Manhole. Class 1 circuits and power supply circuits shall be permitted to be installed as underground conductors in a manhole in accordance with (a), (b), or (c).
(a) The power-supply or Class 1 circuit conductors are in a metal-enclosed cable or Type UF cable.
(b) The conductors are permanently separated from the power-supply conductors by a continuous firmly fixed nonconductor, such as flexible tubing, in addition to the insulation on the wire.
(c) The conductors are permanently and effectively separated from the power supply conductors and securely fastened to racks, insulators, or other approved supports.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 22

(Log #999)

16- 52 - (725-26(b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(b) Class 1 Circuits with Power Supply circuits. Class 1 circuits and power supply circuits shall be permitted to occupy the same cable, enclosure, or raceway only where the Class 1 circuit(s) ~~equipment powered~~ is functionally associated with one or more of the power supply circuits.
~~Exception No. 1: Where installed in factory or field asembled control centers.~~
Exception No. ~~2~~1: Underground conductors in a manhole or other enclosure shall not be required to be functionally associated where one or more of the following conditions is met:
a. The power-supply or Class 1 conductors are in a metal-armored cable or multiconductor Type UF cable;
b. The Class 1 circuit conductors are permanently separated from the power-supply conductors by a firmly fixed nonconductor, such as flexible tubing, in addition to insulation on the wire;
c. The conductors of the Class 1 circuits are permanently and effectively separated from the power-supply conductors and all conductors are securely fastened to racks, insulators, or other approved supports.
SUBSTANTIATION: Present wording requires all power circuits and all Class 1 circuits to be functionally associated regardless of the number of power circuits or Class 1 circuits. This does not permit a power circuit with its associated Class 1 circuit in a raceway with another set of power conductors with its associated Class 1 unless all are functionally associated. What is the added hazard? The proposal would allow, in many cases a single raceway in lieu of multiple runs. Subsection (a) permits mixing of different Class 1 circuits regardless of functional association and Section 300-3(c)(1) appears to indicate no safety hazard in mixing different system circuits in the same enclosure, nor does the intent of present Exception No. 1.
Present Exception No. 2 is revised to require Type UF cable to be multiconductor type and require power circuit conductors to be fastened, since they may be subject to movement which could result in contact with Class 1 circuit conductors.
The present exceptions do not specifically indicate what is excepted, literally except the permitted association under the condition of the rule. For example present Exception No. 1 does not permit the rule where installed in control centers whereas the intent is apparently to allow nonassociated conductors in control centers.
Section 760-26(a) permits Class 1 and nonpower-limited circuit conductors in the same raceway or cable without regard to functional association.
PANEL ACTION: Reject.
PANEL STATEMENT: While the code does not prohibit the application, the proposed wording could result in confusion regarding the required separation of Class 1 from Class 2 and 3 systems.

16- 56 - (725-27(c) (New)): Reject
Note: The Technical Correlating Committee directs the Panel to reconsider the Proposal relative to the incorporation of Article 727 into Article 725. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Add a new subsection (c) as follows:
(c) Instrumentation Tray Cable, Type ITC. Class 1 control circuits other than those covered in Section 725-8(a) shall be permitted to be wired using multiconductor factory-assembled cables containing two or more conductors with insulation rated for 300 volts, cabled with or without grounding conductor(s), and enclosed in a nonmetallic jacket. The cables shall be permitted to be shielded, and a metallic sheath or armor shall be permitted to be applied over the nonmetallic jacket.
(1) Uses Permitted. Type ITC cable shall be permitted to be used only in industrial establishments where the conditions of maintenance and supervision assure that only qualified persons will service the installation. The cable shall only be permitted to be used where provided with additional protection and support as follows:
(1) In cable trays.
(2) In raceways.
(3) In hazardous locations as permitted in Articles 501, 502, 503 and 505.
(4) As open wiring where equipped with a smooth metallic sheath, continuous corrugated metallic sheath, or interlocking tape armor

applied over the nonmetallic sheath in accordance with this section. The cable shall be supported and secured at intervals not exceeding 6 ft (1.83 m).

Exception No. 1: Type ITC cable without a metallic sheath or armor shall be permitted to be installed as open wiring between cable tray and equipment in lengths not to exceed 50 ft, where the cable is supported and protected against physical damage using mechanical protection, such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 6 ft (1.83 m).

Exception No. 2: Type ITC cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted as open wiring between the cable tray and the equipment in lengths not to exceed 50 ft (15.2m). The cable shall be supported and secured at intervals not exceeding 6 ft (1.83 m).

(5) As aerial cable on a messenger.

(6) Direct buried where identified for the use.

(7) Under raised floors in control rooms and rack rooms where arranged to prevent damage to the cable.

(2) Uses Not Permitted. Type ITC cable shall not be installed for circuits operating at more than 150 volts nominal, or more than 5.0 amperes. Type ITC cable shall not be installed with power, lighting, or other nonpower limited circuits.

Exception No. 1: Type ITC cable shall be permitted to terminate within enclosures where the conductors are permanently and effectively separated from other nonpower limited conductors in accordance with the requirements for the separation of Class 2 and Class 3 circuits from nonpower limited circuits in Section 725-54(a)(1) Exception No. 2 or Exception No. 3. For the purposes of applying Exception No. 2 only, the insulation on Type ITC cables shall be assumed to be equivalent to Class 3 insulation.

Exception No. 2: Type ITC cable shall be permitted to be installed with power, lighting, or other nonpower limited circuits where otherwise permitted for Class 1 circuits by this article, and in addition where a smooth metallic sheath, welded and corrugated metallic sheath, or interlocking metallic tape armor is applied over the nonmetallic jacket.

(3) Construction. The insulated conductors of Type ITC cable shall be in sizes No. 22 through No. 12. The conductor material shall be copper or thermocouple alloy.

(4) Marking. Type ITC cable shall be marked in accordance with Section 310-11.

(5) Bends. Bends in Type ITC cable shall be made so as to not damage the cable.

SUBSTANTIATION: This proposal and its two companions incorporate the concepts in the new NEC Article 727 into Article 725 where they belong. The proposal has been updated since the version submitted in the last cycle to incorporate the changes CMP 16 made in the 1999 version of Article 727. Leaving a separate Article 727 in place leaves a standing, unavoidable conflict with other provisions in Article 725. In effect, it retains the disadvantages of the rejected Class 4 circuit concept with the additional confusion the inevitably stems from the fact that Article 727 wiring is for control circuits and not power circuits. We have no problem with and well understand the goals of the proponents of that article, but we cannot support the means.

There are a few changes from Article 727. The 600-volt insulation rule is retained for safety control equipment where a failure would create a direct fire or life hazard. Section 725-27(c)(1)c. excludes Article 504 because Class 1 circuits are not intrinsically safe. The cable could certainly be used for IS circuits, but not under this part of Article 725. Section 725-27(c)(2) Exception No. 1 includes a specific description of exactly how one maintains "separations ... by other means."

The only other way to accomplish the goals of the new article would be to include this wiring under the Class 3 category. That has merit if the users of ITC cable can live with the power limitations. On balance, the Advisory Committee has chosen this approach, as Class 1, because we believe in the objectives of the Article 727 submitters so strongly that we don't want to create an unintended barrier to the use of their methodology. As Class 1 they will have a free hand, and yet the separation requirements in place in this proposal are assuring safety in Massachusetts now and we are confident they will nationally if this proposal is accepted.

We have been dismayed at the hostility toward this proposal from members of CMP 16, given our constructive viewpoint on these issues. The Technical Correlating Committee, apparently, is going to have to aggressively address the continuing implicit and inevitable conflict between Article 725 and 727. Here's a multiple choice example I ran in EC&M Magazine to illustrate the problem: Suppose you run a 2A 120V control circuit for a motor contactor using the new Type ITC cable, with a 5A time-delay fuse for protection. Other than the fuse, there won't be any power limitation on this circuit. What insulation level do you need on this cable?

a. 150V
b. 300V
c. 600V
d. Ask the authority having jurisdiction.

And here's the answer I gave the readers: "d, Section 725-27(b); Section 727-4. This circuit squarely conforms to the scope of Article 725, and it cannot be a Class 2 or Class 3 control circuit because it doesn't have a listed source. It's well beyond the allowable energy parameters of such circuits anyway. That makes it a Class 1 control circuit, which has to have 600V insulation. On the other hand, the fact that it runs in Type ITC cable means it can have 300V insulation. These two provisions are in direct conflict, leaving the authority having jurisdiction with a decision. The panel intent is to allow the 300V insulation level."

We don't see how a stand-alone Article 727 will ever avoid this problem, and ITC cable, with its extreme power limitations, should never go back into Chapter 3 either. We see no realistic alternative than to accept some version of this approach.

PANEL ACTION: Reject.

PANEL STATEMENT: ITC Cable is limited to specific applications and is not applicable to all Article 725 wiring methods.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 22

COMMENT ON AFFIRMATIVE:

KAHN: The Panel is correct; this particular proposal should be rejected. All the Articles in Chapter 7 deal with Systems except Article 727, which deals with a Specific Type or Cable. The Panel should consider incorporating the requirements of Article 727 into the appropriate system Articles.

Log #1001)

16- 57 - (725-28(a), (b)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

(a) Class 1 Circuit Conductors. Where only Class 1 circuit conductors are in a raceway or cable the number of conductors in a raceway shall be determined in accordance with Section 300-17. (remainder unchanged).

(b) Power-Supply Conductors and Class 1 Circuit Conductors. Where power-supply conductors and Class 1 circuit conductors are permitted in a raceway or cable in accordance with Section 725-26, the number of conductors in a raceway shall be determined in accordance with Section 300-17. (remainder unchanged).

SUBSTANTIATION: Editorial. Although the second sentences of (a) and (b) do not literally preclude Section 310-15(b)(2)(a) from applying to cables, the provisions of this section may suggest the rating modifications only apply to conductors in a raceway, since cables are not mentioned. The proposal continues to indicate the number of conductors applies to a raceway but more clearly indicates the derating modifications apply also to cables.

PANEL ACTION: Reject.

PANEL STATEMENT: The section explicitly deals with the number of conductors permitted in a raceway. Inserting the word "cable" causes confusion and raises a question as to the number of Class 1 circuit conductors that are permitted in a cable.

(Log #3201)

16- 58 - (725-30 (New), 725-31 (New), and 725-25): Reject

SUBMITTER: S. E. Egesdal, Honeywell Inc.

RECOMMENDATION: To correlate with the proposed new text in 725-30 and 31, revise Section 725-25, Exception No. 1 by changing "725-28" to "725-30" to read as follows:

"Exception No. 1: As provided in Sections 725-26 through 725-30."

The proposed new Section 725-30 and 31 text follows:

725-30. Multiconductor CL1 Cables. Multiconductor Class 1 cables that meet the requirements of Section 725-31 shall be permitted to be used on remote control circuits operating at 150 volts or less and shall be installed in accordance with (a) and (b).

(a) Class 1 Wiring Method. Multiconductor Class circuit cables shall be installed as follows.

1. In raceway or exposed on surface of ceiling and sidewalls or fished in concealed spaces. Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, ledges, etc. Where located within 7 ft (2.13 m) of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 18 in. (457 mm).

2. In metal raceway or rigid nonmetallic conduit where passing through a floor or wall to a height of 7 ft (2.13 m) above the floor unless adequate protection can be afforded by building construction such as detailed in (1), or unless an equivalent solid guard is provided.

3. In rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, or electrical metallic tubing where installed in hoistways.

Exception: As provided for in Section 620-21 for elevators and similar equipment.

(b) Applications of Listed Class I Cables. The use of Class I circuit cables shall comply with (1) through (4).

(1) Ducts and Plenums. Multiconductor Class 1 circuit cables. Type CL1P, CL1, and CL1, shall not be installed exposed in ducts or plenums. See Section 300-22(b).

(2) Other Spaces Used for Environmental Air. Cables installed in other spaces used for environmental air shall be Type CL1.

Exception No. 1: Types CL1R and CL1 cables installed in compliance with Section 300-22(c).

Exception No. 2: Other wiring methods in accordance with Section 300-22(c) and conductors in compliance with Section 760-27(c).

(3) Riser. Cables installed in vertical runs and penetrating more than one floor or cables installed in vertical runs in a shaft shall be Type CL1R. Floor penetrations requiring Type CL1R shall contain only cables suitable for riser or plenum use.

Exception No. 1: Type CL1 or other cables specified in Chapter 3 that are encased in metal raceway.

Exception No. 2: Type CL1 cables located in a fireproof shaft having firestops at each floor.

FPN: See Section 300-21 for firestop requirements for floor penetrations.

(4) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in Section 725-30(b)(1)(2) and (3) shall be Type CL1.

Exception No. 1: Chapter 3 wiring methods.

Exception No. 2: Type CL1P or Type CL1R cables shall be permitted.

760-31. Listing and Marking of CL1 Cables. Class 1 cables installed as wiring within buildings shall be listed in accordance with (a) and (b) and as being resistant to the spread of fire in accordance with (c) through (f), and shall be marked in accordance with (g).

(a) Class 1 Conductors. Conductors shall be No. 18 or larger, solid or stranded.

(b) Insulated Conductors. Insulated conductors shall be suitable for 600 volts. Insulated conductors No. 14 and larger shall be one of the types listed in Table 310-13 or one that is identified for this use. Insulated conductors No. 18 and No. 16 shall be in accordance with Section 725-27.

(c) Type CL1P. Type CL1P cable for use in other space used for environmental air shall be listed as being suitable for use in other space used for environmental air as described in Section 300-22(c) and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance with the Standard Method of Test for Fire and Smoke Characteristics of Wires and Cables, NFPA 262-1994, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 5 ft (1.52 m) when tested in accordance with the same test.

(d) Type CL1R. Type CL1R riser cable shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that cables pass the Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts, ANSI/UL 1666-1997.

(e) Type CL1. Type CL1 cable shall be listed as being suitable for general-purpose fire alarm use, with the exception of risers, ducts, plenums, and other space used for environmental air, and shall also be listed as being resistant to the spread of fire.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in the Reference Standard for Electrical Wires Cables and Flexible Cords, ANSI/UL 1581-1991.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 4 ft 11 in. (1.5 m) when performing the CAS vertical flame test — cables in cable trays as described in Test Methods for Electrical Wires and Cables, CSA C22.2 No. 0.3-M-1985.

(f) NPLFA Cable markings. Multiconductor Class 1 circuit cables shall be marked in accordance with Table 725-31(f). Class 1 circuits cables shall be permitted to be marked with a maximum usage voltage rating of 150 volts.

Table 725-31(g) NPLFA Cable Markings

Cable Marking	Type	Reference
CL1P	Class 1 circuit cable for use in other space used for environmental air	725-31(c)
CL1R	Class 1 circuit riser cable	760-31(d)
CL1	Class 1 circuit cable	760-31(e)

FPN: Cable types are listed in descending order of fire-resistance rating.

SUBSTANTIATION: The proposed new sections are parallel requirements to those found in Article 760-30 and 31. There are a number of Class 1 circuits that become fire alarm circuits when a fire alarm system is installed, especially when a smoke control system is installed. The circuits fall under either Article 725 or Article 760, depending on the type of control system. The equipment controlled includes, but is not limited to the following: fans, dampers, lighting, process control equipment, and door locks. Where this equipment is connected to a fire alarm system, nonpower-limited multiconductor cable can be installed. If the equipment is connected to a remote control and signaling circuit, Class 1 conductors or Chapter 3 conductors must be installed in raceway to meet the requirements of Article 725, Part B.

The proposed multiconductor cable circuits permit 150 volts to ground, maximum.

PANEL ACTION: Reject.

PANEL STATEMENT: The substantiation provides no justification other than to parallel a fire alarm system and did not address safety considerations. The allowance for nonpower limited fire alarm cable was given special consideration due to its specific application to fire alarm systems and limited use for this purpose.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 22

(Log #2142)

16- 60 - (725-41(a)(2), Exception (New)): Reject

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: The new Exception to 725(a)(2) will read:

"Where new or existing control panels do not have enough space for multiple Class 2 or 3 listed power supplies, a larger listed power supply may be fused multiple times to supply multiple circuits as long as each circuit meets the power requirements of Chapter 9 Tables 11(a) and 11(b)."

SUBSTANTIATION: The demand in the industry is for small control panels. The change in this article last year resulted in the exclusion of large power supplies feeding multiple control circuits. It now requires that only items in 725-41(a)(1) through (5) be acceptable as power sources. In the Minneapolis/St. Paul area, the panel shops are building control panels with listed power supplies that meet the requirements of Class 2 or 3 but are not specifically designated as Class 2 or 3 or are fused to meet the Class 2 or 3 requirement. Of the X vendors polled across the nation, only one manufacturer has taken this change to heart and produced listed power supplies specifically designated as Class 2 or 3. But, at this time, they only have 24 volt, 4 amp supplies and 8 amp are not available. There are, however, many listed 10 and 15 amp 24 volt power supplies available. The installations in thousands of control panels across the United States were safe before the 1993 code, and new installations after that date are still safe even after 1996 and 1999 code made them illegal. It is not the intent of the National Electrical Code to be ignored if a rule is found unenforceable. The rule must instead be modified to fit what reality is.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: Overcurrent protection alone can not be used to create a Class 2, or Class 3 power source. Refer to the listing requirements in Chapter 9 Table 11(a). The panel understands that the proposal reference is 725-41(a)(2).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 21

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

HUGHES: The Panel Action ignores a very real problem that exists in industry. This problem was adequately communicated by the proposer in the substantiation. Practical safeguarding will not be compromised by the addition of this exception.

(Log #2144)

16- 61 - (725-41(a)(2), Exception (New)): Reject

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: The new Exception to 725-41(a)(2) will read:

"Where new or existing control panels utilize a larger listed power supply which is fused multiple times to supply multiple circuits as long as each circuit meets the power requirements of a Class 2 or 3 listed power supply."

SUBSTANTIATION: The demand in the industry is for small control panels. The change in this article last year resulted in the exclusion of large power supplies feeding multiple control circuits. It now requires that only items in 725-41(a)(1) through (5) be acceptable as power sources. In the Minneapolis/St. Paul area, the panel shops are building control panels with listed power supplies that meet the requirements of Class 2 or 3 but are not specifically designated as Class 2 or 3 or are fused to meet the Class 2 or 3 requirement. Of the 27 vendors polled across the nation, three manufacturers have taken this change to heart and produced listed power supplies specifically designated as Class 2 or 3. But, at this time, they only have 24 volt, 4 amp supplies and 8 amp are not available. There are, however, many listed 10 and 15 amp 24 volt power supplies available. The installation in thousands of control panels across the United States were safe before the 1993 code, and new installations after that date are still safe even after 1996 and 1999 code made them illegal. It is not the intent of the National Electrical Code to be ignored. The rule must instead be modified to fit what reality is. An example of what this new rule has done to process machine control is that of a new machine that was built for 3M. To meet the requirement of the NEC, the panel manufacturer had to install 16 separate 4.2 amp power supplies, when in the past 1/2 to 1/4 of that many larger power supplies correctly fused would have sufficed. Because of this 3M incurred higher cost in the engineering and construction of that machine to the tune of more pages of elementrys, a larger panel, more internal equipment and more wiring on the machine and larger conduit to accommodate this wiring. It will also impact 3M in the future maintenance of that machine as there is now far more complexity, equipment and wiring that can go wrong.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: Overcurrent protection alone can not be used to create a Class 2, or Class 3 power source. Refer to the listing requirements in Chapter 9 Table 11(a).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 21

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

HUGHES: See my Explanation of Negative Vote on Proposal 16-60.

(Log #3202)

16- 62 - (725-42 (New), and 725-52): Accept in Principle

SUBMITTER: S. E. Egesdal, Honeywell Inc.

RECOMMENDATION: Revise text as follows. [Note: The existing first paragraph becomes 725-52(b).]

760-52. Wiring Methods and materials on Load Side of the Class 2 or Class 3 Power Source. Class 2 and Class 3 circuits on the load side of the power source shall be permitted to be installed using wiring methods and materials in accordance with either (a) or (b).

(a) Class I Wiring Methods and Materials. Installation shall be in accordance with Section 725-25.

Exception No. 1: The derating factors given in Section 310-15(b)(2)(a) shall not apply.

Exception No. 2: Conductors and multiconductor cables described in and installed in accordance with Sections 725-27 and 725-30 shall be permitted.

Exception No. 3: Class 2 and Class 3 circuits shall be permitted to be reclassified and installed as Class I circuits if the Class 2 and Class 3 markings required by Section 725-42 are eliminated and the entire circuit is installed using the wiring methods and materials in accordance with Part B, Class 1 Circuits.

FPN: Class 2 and Class 3 circuits reclassified and installed as Class I circuits are no longer power-limited circuits, regardless of the continued connection to a Class 2 or Class 3 power source.

(b) Conductors on the load side of the power source shall be insulated at not less than the requirements of Section 725-71 and shall be installed in accordance with Sections 725-54 and 725-61.

Exception No. 1: As provided for in Section 620-21 for elevators and similar equipment.

Exception No. 2: Other wiring methods and materials installed in accordance with the requirements of Section 725-3 shall be permitted to extend or replace the conductors and cables described in Section 725-71 and permitted by Section 725-52(b).

Add a new Section 760-42 to support the proposed Section 760-52(a) Exception No. 3.

760-42. Circuit Marking. The equipment shall be durably marked where plainly visible to indicate each circuit that is a Class 2 or Class 3 circuit.

FPN: See Section 725-52(a), Exception No. 3, where a Class 2 or Class 3 circuit is to be reclassified as a Class 1 circuit.

SUBSTANTIATION: Statement of Problem: Article 725 does not provide for installing Class 2 and Class 3 circuits with other than Class 2 or Class 3 wiring methods (cable), except in plenums and risers. The present Section 725-61(e) reads as follows:

"(e) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in (a) through (d) shall be Type CL2 or CL3." Many code jurisdictions require circuits to be installed in raceway, which is not specifically permitted by Article 725. The proposed revision provides an alternative to this requirement.

Substantiation: The proposed revision to Section 725-52 provides requirements equivalent to Section 760-52. The Article 760 wiring methods have a proven track record of safe installations using the installation methods proposed. The proposed change permits Class 2 and Class 3 circuits to be installed using Class 1 wiring methods, or appropriate Chapter 3 methods. Present day installations in commercial buildings typically use Class 1 wiring methods (Type TFN in EMT), even though not specifically permitted by Article 725.

The new Section 725-42 is a parallel requirement to Section 760-42. The new section provides for reclassification of Class 2 and Class 3 circuits to a Class 1 circuit by using Class I wiring methods and materials, and installing overcurrent protection.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to Panel Proposal 16-62(a). 16-62(a) satisfies the submitter's intent with changes for added clarity.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 22

(Log #CP1602)

16- 62a - (725-52, 725-42, 725-10): Accept

SUBMITTER: CMP 16

RECOMMENDATION: Revise text to read as follows:

725-52. Wiring Methods and Materials on Load Side of the Class 2 or Class 3 Power Source.

Class 2 and Class 3 circuits on the load side of the power source shall be permitted to be installed using wiring methods and materials in accordance with either (a) or (b).

(a) Class 1 Wiring Methods and Materials. Installation shall be in accordance with Section 725-25.

Exception No. 1: The derating factors given in Section 310-15(b)(2)(a) shall not apply.

(FPN): Class 2 and Class 3 circuits reclassified and installed as Class 1 circuits are no longer Class 2 or Class 3 circuits, regardless of the continued connection to a Class 2 or Class 3 power source.

(b) Conductors on the load side of the power source shall be insulated at not less than the requirements of Section 725-71 and shall be installed in accordance with Sections 725-54 and 725-61.

Exception No. 1: As provided for in Section 620-21 for elevators and similar equipment.

Exception No. 2: Other wiring methods and materials installed in accordance with the requirements of Section 725-3 shall be permitted to extend or replace the conductors and cables described in Section 725-71 and permitted by Section 725-52(b).

Add a new Section 725-42 to read as follows:

725-42. Circuit Marking

The equipment shall be durably marked where plainly visible to indicate each circuit that is a Class 2 or Class 3 circuit.

Add a new Section 725-10 to read as follows:

725-10. Class 1, Class 2, and Class 3 Circuit Identification

Class 1, Class 2, and Class 3 circuits shall be identified at terminal and junction locations, in a manner that will prevent unintentional interference with other circuits during testing and servicing.

SUBSTANTIATION: The proposed change permits Class 2 and Class 3 circuits to be installed using Class 1 wiring methods, or appropriate Chapter 3 methods. Present day installations in commercial buildings typically use Class 1 wiring methods (Type TFN in EMT), even though not specifically permitted by Article 725.

The addition of 725-10, Class 1, Class 2, and Class 3 Circuit Identification will provide authorities having jurisdiction with identification of the circuits installed using various permitted wiring methods and minimize system malfunctions during testing and servicing.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

EGESDAL: The new marking requirement is unsupported and is unnecessary, particularly where only Class 1 wiring is present. We are concerned about the protection of a Class 2 circuit when it is reclassified as a Class 1 circuit.

HUGHES: I don't have a problem with the proposed rewording of 725-52.

The addition of new Section 725-42 brings in several issues I don't think the Panel intended. The word "equipment" is defined as (in part) "material, fittings, devices, appliances, fixtures, apparatus, and the like". Do we really want conduit, fittings, doorbells, thermostats, etc. marked as to its wiring class. A more palatable solution might be to mark at the power supply only.

I don't really remember what the Panel's intention was for adding Section 725-10. The Panel substantiation does not make much sense as written. Taken literally, it would require unique identification of these classes of circuits everywhere, even when there are no other circuits around. If the Panel feels Section 725-10 belongs, it should be limited to Class 2 circuits being wired per Class 1 wiring methods.

(Log #1023)

16- 63 - (725-54): Reject

SUBMITTER: Stanley Kaufman, Lucent Technologies

RECOMMENDATION: Revise 725-54 as shown:

725-54. Installation of Conductors and Equipment

(a) Separation from Electric Light, Power, Class 1, Nonpower-Limited Fire Alarm Circuit Conductors, ~~and~~ Medium and High Power Network-Powered Broadband Communications Cables.

(1) In Cables, Compartments, Cable Trays, Enclosures, Manholes, Outlet Boxes, Device Boxes, and Raceways. Cables and conductors of Class 2 and Class 3 circuits shall not be placed in any cable, cable tray, compartment, enclosure, manhole, outlet box, device box, raceway, or similar fitting with conductors of electric light, power, Class 1, nonpower-limited fire alarm circuits, ~~and~~ medium and high power network-powered broadband communications cables.

Exception No. 1: Where the conductors of the electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuits are separated by a barrier from the Class 2 and Class 3 circuits. In enclosures, Class 2 or Class 3 circuits shall be permitted to be installed in a raceway within the enclosure to separate them from Class 1, electric light, power, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuits.

Exception No. 2: Conductors in compartments, enclosures, device boxes, outlet boxes, or similar fittings, where electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuit conductors are introduced solely to connect to the equipment connected to Class 2 or Class 3 circuits to which the other conductors are connected, and

a. The electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuit conductors are routed to maintain a minimum of 0.25 in. (6.35 mm) separation from the conductors and cables of Class 2 and Class 3 circuits, or

b. The circuit conductors operate at 150 volts or less to ground and also comply with one of the following:

1. The Class 2 and Class 3 circuits are installed using Type CL3, CL3R, or CL3P or permitted substitute cables, provided these Class 3 cable conductors extending beyond the jacket are separated by a minimum of 0.25 in. (6.35 mm) or by a nonconductive sleeve or nonconductive barrier from all other conductors, or

2. The Class 2 and Class 3 circuit conductors are installed as a Class 1 circuit in accordance with Section 725-21.

Exception No. 3: Conductors entering compartments, enclosures, device boxes, outlet boxes, or similar fittings, where electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered communications circuit conductors are introduced solely to connect the equipment connected to Class 2 or

Class 3 circuits to which the other conductors in the enclosure are connected. If the conductors must enter an enclosure that is provided with a single opening, they shall be permitted to enter through a single fitting (such as a tee) provided the conductors are separated from the conductors of the other circuits by a continuous and firmly fixed nonconductor, such as flexible tubing.

Exception No. 4: Underground conductors in a manhole where one of the following conditions is met.

a. The electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuit conductors are in a metal-enclosed cable or Type UF cable.

b. The conductors are permanently and effectively separated from the conductors of the other circuits by a continuous and firmly fixed nonconductor, such as flexible tubing, in addition to the insulation or covering on the wire.

c. The conductors are permanently and effectively separated from conductors of the other circuits and securely fastened to racks, insulators, or other approved supports.

Exception No. 5: As permitted by Section 780-6(a) and installed in accordance with Article 780.

Exception No. 6: In cable trays, where the conductors of the electric light, power, Class 1, and nonpower-limited fire alarm circuits are separated by a solid fixed barrier of a material compatible with the cable tray, or where the Class 2 and Class 3 circuits are installed in Type MC cable.

(2) In Hoistways. Class 2 or Class 3 circuit conductors shall be installed in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, or electrical metallic tubing in hoistways.

Exception: As provided for in Section 620-21 for elevators and similar equipment.

(3) Other Applications. Conductors of Class 2 and Class 3 circuits shall be separated by at least 2 in. (50.8 mm) from conductors of any electric light, power, Class 1, nonpower-limited fire alarm, ~~or~~ medium or high power network-powered broadband communications circuits.

Exception No. 1: Where either (1) all of the electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuit conductor or (2) all of the Class 2 and Class 3 circuit conductors are in raceway or in metal-sheathed, metal-clad, nonmetallic-sheathed, or Type UF cables.

Exception No. 2: Where all of the electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuit conductors are permanently separated from all of the Class 2 and Class 3 circuit conductors by a continuous and firmly fixed nonconductor, such as porcelain tubes or flexible tubing, in addition to the insulation on the conductors.

(b) Conductors of Different Circuits in Same Cable, Enclosure, or Raceway.

(1) Two or More Class 2 Circuits. Conductors of two or more Class 2 circuits shall be permitted within the same cable, enclosure, or raceway.

(2) Two or More Class 3 Circuits. Conductors of two or more Class 3 circuits shall be permitted within the same cable, enclosure, or raceway.

(3) Class 2 Circuits with Class 3 Circuits. Conductors of one or more Class 2 circuits shall be permitted within the same cable, enclosure, or raceway with conductors of Class 3 circuits, provided that the insulation of the Class 2 circuit conductors in the cable, enclosure, or raceway is at least that required for Class 3 circuits.

(4) Class 2 and Class 3 Circuits with Communications Circuits. Class 2 and Class 3 circuit conductors shall be permitted in the same cable with communications circuits, in which case the Class 2 and Class 3 circuits shall be classified as communications circuits and shall meet the requirements of Article 800. The cables shall be listed as communications cables or multipurpose cables.

Exception: Cables constructed of individually listed Class 2, Class 3, and communications cables under a common jacket shall not be required to be classified as communications cables. The fire-resistance rating of the composite cable shall be determined by the performance of the composite cable.

(5) Class 2 or Class 3 Cables with Other Circuit Cables. Jacketed cables of Class 2 or Class 3 circuits shall be permitted in the same enclosure or raceway with jacketed cables of any of the following:

a. Power-limited fire alarm systems in compliance with Article 760

b. Nonconductive and conductive optical fiber cables in compliance with Article 770

c. Communications circuits in compliance with Article 800

d. Community antenna television and radio distribution systems in compliance with Article 820

e. Low power network-powered broadband communications in compliance with Article 830

(c) Circuit Conductors Extending Beyond One Building. Where Class 2 or Class 3 circuit conductors extend beyond one building and are run so as to be subject to accidental contact with electric light or power conductors operating at over 300 volts to ground, or are exposed to lightning on interbuilding circuits on the same premises, the requirements of the following shall also apply:

1. Sections 800-10, 800-12, 800-13, 800-30, 800-31, 800-32, 800-33, and 800-40 for other than coaxial conductors

2. Sections 820-10, 820-33, and 820-40 for coaxial conductors

(d) Support of Conductors. Class 2 or Class 3 circuit conductors shall not be strapped, taped, or attached by any means to the exterior of any conduit or other raceway as a means of support.

Exception: Except as permitted by Section 300-11(b)(2).

SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. This proposal amends the separation rules between circuits to provide appropriate separation from these new high-power communications circuits.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 22

(Log #3203)

16- 64 - (725-54): Reject

SUBMITTER: S. E. Egesdal, Honeywell Inc.

RECOMMENDATION: Revise as follows:

725-54. Installation of Conductors and Equipment.

(a) Separation from Electric Light, Power, Class 1, Nonpower-Limited Fire Alarm Circuit Conductors, and Medium Power Network-Powered Broadband Communications Cables.

(1) In Cables, Compartments, Cable Trays, Enclosures, Manholes, Outlet Boxes, Device Boxes, and Raceways. Cables and conductors of Class 2 and Class 3 circuits shall not be placed in any cable, cable tray, compartment, enclosure, manhole, outlet box, device box, raceway, or similar fitting with conductors of electric light, power, Class 1, nonpower-limited fire alarm circuits, and medium power network-powered broadband communications cables, unless meeting requirements specified in (1) through (6).

(a) Where the conductors of the electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuits are separated by a barrier from the Class 2 and Class 3 circuits. In enclosures, Class 2 or Class 3 circuits shall be permitted to be installed in a raceway within the enclosure to separate them from Class 1, electric light, power, nonpower-limited fire alarm, and medium power network-powered broadband communications circuits.

(b) Conductors in compartments, enclosures, device boxes, outlet boxes, or similar fittings, where electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuit conductors are introduced soley to connect to the equipment connected to Class 2 or Class 3 circuits to which the other conductors are connected, and

(1) The electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuit conductors are routed to maintain a minimum of 0.25 in. (6.35 mm) separation from the conductors and cables of Class 2 and Class 3 circuits, or

(2) The circuit conductors operate at 150 volts or less to ground also comply with one of the following:

a. The Class 2 and Class 3 circuits are installed using Type CL3, CL3R, or CL3P or permitted substitute cables, provided these Class 3 cable conductors extending beyond the jacket are separated by a minimum of 0.25 in. (6.35 mm) or by a nonconductive sleeve or nonconductive barrier from all other conductors, or

b. The Class 2 and Class 3 circuit conductors are installed as a Class 1 circuit in accordance with Section 725-21.

(c) Conductors entering compartments, enclosures, device boxes, outlet boxes, or similar fittings, where electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered communications circuit conductors are introduced solely to connect the equipment connected to Class 2 or Class 3 circuits to which the other conductors in the enclosures are connected. If the conductors must enter an enclosure that is provided with a single opening, they shall be permitted to enter though a single fitting (such as a tee) provided the conductors are separated from the conductors of the other circuits by a continuous and firmly fixed nonconductor, such as flexible tubing.

(d) Underground conductors in a manhole where one of the following conditions is met:

(1) The electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuit conductors are in a metal-enclosed cable or Type UF cable.

(2) The conductors are permanently and effectively separated from the conductors of the other circuits by a continuous and firmly fixed nonconductor, such as flexible tubing, in addition to the insulation or covering on the wire.

(3) The conductors are permanently and effectively separated from conductors of the other circuits and securely fastened to racks, insulators, or other approved supports.

(e) As permitted by Section 780-6(a) and installed in accordance with Article 780.

(f) In cable trays, where the conductors of the electric light, power, Class 1, and nonpower-limited fire alarm circuits are separated by a solid fixed barrier of a material compatible with the cable tray, or where the Class 2 and Class 3 circuits are installed in Type MC cable.

(2) In Hoistways.

(a) Class 2 or Class 3 circuit conductors shall be installed in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, or electrical metallic tubing in hoistways.

(b) Class 2 or Class 3 circuit conductors shall be permitted to be installed in accordance with the requirements in Section 620-21 for elevators and similar equipment.

(3) Other Applications.

(a) Conductors of Class 2 and Class 3 circuits shall be separated by at least 2 in. (50.8 mm) from conductors of any electric light, power, Class 1, nonpower-limited fire alarm, or medium power network powered broadband communications circuits.

(b) Conductors of Class 2 and Class 3 circuits shall be permitted to be installed with electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuit conductor where either

(1) All of the electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuit conductor, or

(2) All of the Class 2 and Class 3 circuit conductors are in raceway or in metal-sheathed, metal-clad, nonmetallic-sheathed, or Type UF cables.

(c) Conductors of Class 2 and Class 3 circuits shall be permitted to be installed with electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuit conductor where all of the electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuit conductors are permanently separated from all of the Class 2 and Class 3 circuit conductors by a continuous and firmly fixed nonconductor, such as porcelain tubes or flexible tubing, in addition to the insulation on the conductors.

(b) Conductors of Different Circuits in Same Cable, Enclosure, or Raceway.

(1) Two or More Class 2 Circuits. Conductors of two or more Class 2 circuits shall be permitted within the same cable, enclosure, or raceway.

(2) Two or More Class 3 Circuits. Conductors of two or more Class 3 circuits shall be permitted within the same cables, enclosure, or raceway.

(3) Class 2 Circuits with class 3 Circuits. Conductors of one or more Class 2 circuits shall be permitted within the same cable, enclosure, or raceway with conductors of Class 3 circuits, provided that the insulation of the Class 2 circuit conductors in the cable, enclosure, or raceway is at least that required for Class 3 circuits.

(4) Class 2 and Class 3 Circuits with Communications Circuits.

(a) Class 2 and Class 3 circuit conductors. Class 2 and Class 3 circuit conductors shall be permitted in the same cable with communications circuits, in which case the Class 2 and Class 3 circuits shall be classified as communications circuits and shall meet the requirements of Article 800. The cables shall be listed as communications cables or multipurpose cables.

(b) Class 2 and Class 3 Cables. Cables constructed of individually listed Class 2, Class 3, and communications cables shall be permitted under a common jacket. The composite cables shall not be required to be classified as communications cables. The fire-resistance rating of the composite cable shall be determined by the performance of the composite cable.

(5) Class 2 or Class 3 Cables with Other Circuit Cables. Jacketed cables of Class 2 or Class 3 circuits shall be permitted in the same enclosure or raceway with jacketed cables of any of the following:

(a) Power-limited fire alarm systems in compliance with Article 760.

(b) Nonconductive and conductive optical fiber cables in compliance with Article 770.

(c) Communications circuits in compliance with Article 800.

(d) Community antenna television and radio distribution systems in compliance with Article 820.

(e) Low power network-powered broadband communications in compliance with Article 830.

(c) Circuit Conductors Extending Beyond One Building. Where Class 2 or Class 3 circuit conductors extend beyond one building and are run so as to be subject to accidental contact with electric light or power conductors operating at over 300 volts to ground, or are exposed to lightning or interbuilding circuits on the same premises, the requirements of the following shall also apply:

(1) Sections 800-10; 800-12; 800-13; 800-30; 800-31; 800-32; 800-33; and 800-40 for other than coaxial conductors.

(2) Sections 820-10, 820-33, and 820-40 for coaxial conductors.

(D) Support of Conductors.

(a) Supported by Building Structure. Class 2 or Class 3 circuit conductors shall be supported by the building structure as required by Section 725-7. Class 2 or Class 3 circuit conductors shall not be strapped, taped, or attached by any means to the exterior of any conduit or other raceway as a means of support, unless permitted by (b).

(b) Supported by Raceway. Class 2 circuit conductors shall be permitted to be supported by raceway in accordance with Section 300-11(b)(2).

SUBSTANTIATION: The exceptions are changed to positive code language in compliance with 3.1.4.2 of the Style Manual.

PANEL ACTION: Reject.

PANEL STATEMENT: Though a complete rewrite of the section should be done, the proposed draft does not completely and clearly reflect all requirements and permitted methods. Time limitations have precluded attempting to do this at the panel meetings. The panel chair appointed a task group to do a complete rewrite and submit such a rewrite as a comment for the consideration of the full panel. The rewrite should conform with all the requirements of the new Manual of Style.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 22

(Log #2984)

16- 65 - (725-54(2)): Reject

SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions

RECOMMENDATION: Revise text as follows:

(2) In Hoistways. Class 2 or Class 3 circuit conductors shall be installed in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, <u>electrical nonmetallic tubing,</u> or electrical metallic tubing in hoistways.

Exception: As provided for in Section 620-21 for elevators and similar equipment.

SUBSTANTIATION: This proposal adds Electrical Nonmetallic Tubing (ENT) as an approved wiring method for Class 2 or Class 3 circuit conductors. ENT is currently allowed to be used for power conductors per Article 331. ENT will provide the required protection for Class 2 or Class 3 circuit conductors in a hoistway.

PANEL ACTION: Reject.

PANEL STATEMENT: Article 620 has jurisdiction over what may be installed in a hoistway; ENT is not presently permitted in hoistways.

(Log #2985)

16- 66 - (725-54(2)): Accept in Principal

Note: The Technical Correlating Committee directs that the Panel clarify the action on this Proposal. The Panel Action adds 620-37 in the Exception and refers to the Panel Action on Proposal 16-64. The Technical Correlating Committee notes that Proposal 16-64 was rejected so there is no action on it. The Technical Correlating Committee directs that this Proposal be forwarded to Code-Making Panel 12 for information. This action will be considered by the Panel as a Public Comment.

SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Revise text as follows:

(2) In Hoistways. Class 2 or Class 3 circuit conductors shall be installed in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or electrical metallic tubing in hoistways.

Exception: As provided for in Section 620-21 for elevators and similar equipment.

SUBSTANTIATION: This proposal adds Liquidtight Flexible Nonmetallic Conduit (LFNC) as an approved wiring method for Class 2 or Class 3 circuit conductors. LFNC is currently allowed to be used for power conductors per Article 351, Part B. LFNC will provide the required protection for Class 2 or Class 3 circuit conductors in a hoistway.
PANEL ACTION: Accept in Principle.
The panel accepts the proposal but adds a reference to 620-37 in the Exception. Refer to the panel action on Proposal 16-64.
PANEL STATEMENT: Refer to the panel action and panel statement on Proposal 16-64. 620-37 provides the uses permitted in a hoistway.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22
VOTE ON PANEL ACTION:
AFFIRMATIVE: 22

(Log #493)

16- 67 - (725-54(a)(1) Exception No. 2): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 725-54(a)(1) Exception No. 2(a) - change "0.25 in. (6.35 mm)" to "6.35 mm (0.25 in.)"
725-54(a)(1) Exception No. 2(b)(1) - change "0.25 in. (6.35 mm)" to "6.35 mm (0.25 in.)"
The CMP should consider rounding to "6 mm (0.25 in.)" if safety would not be compromised.
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept in Principle.
In the submitter's recommended text revise "6.35 mm (0.25 in.)" to "6 mm (0.25 in.)."
PANEL STATEMENT: The panel has accepted the TCC suggestion to round to "6 mm (0.25 in.)" and has included in the panel action text.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 22

(Log #2302)

16- 68 - (725-54(a)(1) Exception No. 7): Reject
SUBMITTER: Paul E. Guidry, Fluor Daniel, Inc.
RECOMMENDATION: Add new text to read as follows:
Exception No. 7: In cable trays, where all circuit conductors operate at 150 volts or less to ground and the Class 2 and 3 circuits are installed as Class 1 circuits in accordance with Section 725-21.
SUBSTANTIATION: Some PLCs and DCS equipment are listed Class 2 or 3 power supplies while others are power limited, but not listed as Class 2 or 3 power supplies, and are therefore Class 1 by default. Existing Section 725-54(a)(1), Exception No. 2(b)(2) allows Class 2 and 3 circuits to be installed in the same enclosure, outlet box, etc. with Class 1 circuits as long as all are installed as Class 1 circuits. In industrial facilities it is a common practice to install all instrument circuits with 600V insulation and route all instrument circuits together. As long as all circuits are installed with 600 volt insulation, the intent of Section 725-54(a)(1), Exception No. 2(b)(2) has been met and there will not be any safety issues.
PANEL ACTION: Reject.
PANEL STATEMENT: Class 2 and Class 3 circuits are not permitted to be installed with Class 1 circuits. Insulation alone does not provide the required separation of circuits. The insulation alone does not change the classification of the circuit.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22
VOTE ON PANEL ACTION:
AFFIRMATIVE: 22

(Log #491)

16- 69 - (725-54(a)(3), 725-61(d), Exception No. 3; 725-61(e), Exception Nos. 2 thru 4): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 725-54(a)(3) - change "2 in. (50.8 mm)" to "50 mm (2 in.)"
725-61(d), Exception No. 3:
change "50 ft (15.24 m)" to "15 m (50 ft)"
change "6 ft (1.83 m)" to "1.8 m (6 ft)"
725-61(e), Exception No. 2 - change "10 ft (3.05 m)" to "3.0 m (10 ft)"
725-61(e), Exception No. 3 - change "0.25 in. (6.4 mm)" to "6 mm (0.25 in.)" in two places.
725-61(e), Exception No. 4 - change "0.25 in. (6.4 mm)" to "6 mm (0.25 in.)" in two places.
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 22

(Log #2774)

16- 70 - (725-54(a)(4)): Reject
SUBMITTER: Gregory P. Bierals, Electrical Design Inst.
RECOMMENDATION: Revise as follows:
Raceways or Cable trays containing Class 1, Class 2, and Class 3 circuits shall not contain any pipe, tube, or equal for steam, water, air, gas, drainage, or any service other than electrical.
SUBSTANTIATION: There presently is no reference in Article 725 that prohibits this practice.
PANEL ACTION: Reject.
PANEL STATEMENT: Optical fiber cables are not electrical and they are permitted in raceway with other cables. Refer to 770-52. No technical substantiation has been provided. The revision is not required because it is covered in 300-8 and 725-25 has been revised to clarify the application of Article 300. There is no 725-54(a)(4) and it has been assumed that the proposer meant to add a new 725-54(a)(4).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22
VOTE ON PANEL ACTION:
AFFIRMATIVE: 22

(Log #3343)

16- 71 - (725-54(b)(5)(f) (New)): Reject
SUBMITTER: Michael R. Puckett, Puckett Engineering
RECOMMENDATION: Add a new paragraph (f) to read as follows:
(f) Closed-circuit television systems.
SUBSTANTIATION: Outdoor cameras and integrated indoor cameras have one location for conduit/cable entry. Therefore, it is required that the camera class 2 or Class 1 power supply, Class 3 data,

and video (coaxial) cables be combined in one conduit. The systems are not affected by combining these cables (based on experience of many installations).
PANEL ACTION: Reject.
PANEL STATEMENT: Closed circuit television systems are already covered either by Article 725 (Class 2 or Class 3 circuits) or Article 820 and no reference is required here.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22
VOTE ON PANEL ACTION:
AFFIRMATIVE: 22

(Log #1000)

16- 72 - (725-54(c), Exception (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add an exception to read as follows:
Exception for (1): Conductors shall be permitted in accordance with Article 225.
SUBSTANTIATION: The fine print note for Section 725-1 indicates cables and conductors specifically listed for Class 2 or 3 circuits are alternatives to requirements in Chapters 1 through 4 but does not indicate a prohibition of wiring methods covered in those chapters. If installations are in accordance with requirements for power and lighting circuits including sizes as specified in Section 225-6 and types specified in Section 225-4, such installations appear to be suitable. Section 760-7 permits power-limited fire alarm circuits in accordance with Article 225.
PANEL ACTION: Reject.
PANEL STATEMENT: The Article 800 Sections referenced in Section 725-54(c) (1) pertain to low voltage communications wiring similar to Class 2 and Class 3 circuits. These circuits require the application of a listed primary protector when exposed to power over 300 volts RMS, or to lightning. Article 225 addresses branch circuit wiring, operating at secondary power voltages, that neither requires nor includes such protection. Therefore, it is inappropriate to apply Article 225 to Class 2 and Class 3 circuits.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22
VOTE ON PANEL ACTION:
AFFIRMATIVE: 22

(Log #4016)

16- 73 - (725-54(d)): Accept in Principle
SUBMITTER: Christopher Pharo, Rep. IBEW
RECOMMENDATION: This proposal is to add a sentence before the current text.
Article 725-54(d) Support of Conductors. Class 2 and Class 3 circuit conductors shall be supported every 5 ft. Class 2 and Class 3 circuit conductors shall not be strapped, taped, or attached by any means to the exterior of any conduit or other raceway as a means of support.
SUBSTANTIATION: Article 725 deals with an ever increasing proportion of electrical installations. There are currently no maximum distances between circuit conductor supports. It may be installed with supports every 5 or 20 or even 100 feet. It does not matter because it is not addressed. The ANSI/TIA/EIA Standard 569 - Commercial Building Standard for Telecommunications Pathways and Spaces requires supports to be installed every 48 in. - 60 in. All other wiring methods used in the NEC have requirements for maximum supports. This method should be included.
If there continues to be no set requirements for supporting these conductors, then I think that inspectors would be forced to rely on 725-7 Mechanical Execution of Work. I am not an inspector but my concerns are probably theirs when it comes to the enforcement of "neat and workmanlike manner."
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to the panel action on Proposal 16-39. The changes in 725-7 apply to all parts of Article 725 and meet the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22
VOTE ON PANEL ACTION:
AFFIRMATIVE: 22

(Log #1133)

16- 74 - (725-54(e) (New)): Accept in Principle in Part
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Insert a new Section 725-54(e) as follows:
(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating. Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate. Accumulations of abandoned cables, not identified for future use, in ducts, plenums, and other space used for environmental air, shall be removed.
Exception: Type CL2P-50 and Type CL3P-50 cables shall not be required to be removed.
FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.
SUBSTANTIATION: See my proposal for Section 800-52(b).
PANEL ACTION: Accept in Principle in Part.
The part being rejected is the recommendation to add the exception. The panel actions in other proposals adopting the requirement to remove abandon cables satisfies the proposal other than the exception. There is inadequate justification to leave any debris (e.g. abandoned cable).
The remaining part of the proposal is accepted in principle.
PANEL STATEMENT: Refer to panel action on Proposal 16-80.

(Log #3204)

16- 75 - (725-54(e) (New)): Accept in Principle in Part
SUBMITTER: S. E. Egesdal, Honeywell Inc.
RECOMMENDATION: Insert a new Section 725-54(e) as follows:
(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating. Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate. Accumulations of abandoned cables, not identified for future use, in ducts, plenums, and other space used for environmental air, shall be removed.
Exception: Type CL2P-50 and Type CL3P-50 cables shall not be required to be removed.
FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.
SUBSTANTIATION: Addition of "to maintain the fire resistance rating" to the end of the second sentence will correlate this section with Section 300-21.
The proposed fine print Note No. 1 note was copied from the first sentence of the fine print note in Section 300-21. It assists installers in locating firestop information.
Cables installed in plenums (other space used for environmental air) are often abandoned, rather than removed, when no longer in use. Consequently, there may exist layer upon layer of abandoned cable in a hung ceiling as communications systems are changed and modernized. Some of this abandoned cable may be nonplenum cable that was installed before plenum cable requirements were in place. These accumulations of abandoned cables serve no useful purpose and unnecessarily increase the potential fire load. The wording of the proposed prohibition on allowing abandoned cables to accumulate is based on NFPA 75, "Standard for the Protection of Electronic Computer/Data Processing Equipment, Section 4-2.4 that states

"Abandoned cables shall not be allowed to accumulate. Cables not identified for future use shall be removed."

This proposed wording addresses the issue of excess combustibles in plenums without requiring the removal of all abandoned cable, only accumulations of abandoned cable, thus avoiding a burdensome requirement, which would require the removal of insignificant amounts of cable. The proposed first sentence, Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate, limits the amount of cable that will be permitted to be abandoned. It applies to all cable that is in place, plenum cable as well as nonplenum cable that was installed before the plenum cable requirements were in the code. The proposed second sentence, Accumulations of abandoned cables, not identified for future use, in ducts, plenums, and other space used for environmental air, shall be removed, deals with already abandoned cable. The NEC requirements for plenum cable were first promulgated in the 1975 NEC, consequently, abandoned cables in older buildings often include unlisted cable along with listed plenum cable.

Other sections of the NEC require the removal of abandoned wiring.

Article 354 — Underfloor Raceways, Section 354-7. Discontinued Outlets

Article 356 — Cellular Metal Floor Raceways, Section 356-7. Discontinued Outlets

Article 358 — Cellular Concrete Floor Raceways, Section 358-13. Discontinued Outlets

Article 305 — Temporary Wiring, Section 305-3(d). Time Constraints, (d) Removal.

Exempting Types CL2P-50 and CL3P-50, which are plenum cables that are also listed as limited combustible with a smoke developed rating of less than 50, correlates with NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems. Correlating with NFPA 90A acknowledges that the NFPA Standards Council has assigned primary responsibility for fire protection of plenums to NFPA 90A. The basic requirement for materials in a plenum in NFPA 90A is that the materials either be noncombustible or limited combustible with a smoke developed rating of less than 50.

PANEL ACTION: Accept in Principle in Part.

The part being rejected is the recommendation to add the exception. The panel actions in other proposals adopting the requirement to remove abandon cables satisfies the proposal other than the exception. There is inadequate justification to leave any debris (e.g. abandoned cable).

The remaining part of the proposal is accepted in principle.

PANEL STATEMENT: Refer to panel action on Proposal 16-80.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

NEGATIVE: 1

ABSTENTION: 1

EXPLANATION OF NEGATIVE:

LANNI: Even totally noncombustible cables should not be allowed to accumulate in the numbers that we have witnessed in the last ten years. The panel rejected the Exception because leaving debris in the work spaces is fundamentally bad workmanship in that:

1. It uses up already limited space.
2. It adds to the fuel load even if it has an excellent rating.
3. The accumulation causes confusion when combined with active systems.
4. It adds weight to the support structure.
5. It impedes the efforts of workmen forced to crawl in these spaces.
6. It attracts dust on the surface which adds to fuel load.
7. It has been reported that Type CL2P-50 and Type CL3P-50 insulation developed for this purpose produces toxic fumes at 200 degrees C, and should not be allowed to accumulate if not in service.

EXPLANATION OF ABSTENTION:

CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #3229)

16- 76 - (725-54(e) (New)): Accept in Principle

SUBMITTER: Hallie Smith-Petee, The Geon Co.

RECOMMENDATION: Insert a new Section 725-4(e) as follows:

(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating. Abandoned cables present in ducts,plenums and other air handling space shall not be allowed to accumulate. Cables not intended for future use shall be removed.

SUBSTANTIATION: See Substantiation for Section 800-52(b).

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The proposer's intent was satisfied by panel action on Proposal 16-80.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 21

ABSTENTION: 1

EXPLANATION OF ABSTENTION:

CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #3254)

16- 77 - (725-54(e) (New)): Accept in Principle in Part

SUBMITTER: Allen C. Weidman, Society of the Plastics Industry/Rep. Fluoropolymers Division of The Society of the Plastics Industry

RECOMMENDATION: Insert a new Section 725-54(e) as follows:

(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be fire stopped using approved methods to maintain the fire resistance rating. Cables in ducts, plenums, and other spaces used for environmental air, which are not intended for future use shall be removed. Cables marked type CL2PP and type CL3PP are not required to be removed.

FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

SUBSTANTIATION: 1. First two (2) sentences were copied from Article 300.21.

2. Fine print note was copied from Article 300.21s fine print note.

3. Cables installed in plenums and other space used for environmental air are very often left in these spaces after they have been removed from service. Therefore, many generations of unused cables can exist in the ceiling voids from previous systems which are no longer in service or intended for future use. There may also be cables, which are over 20 years old, which are not plenum rated cables. These unused cables increase the potential fuel load in plenums and other space used for environmental air.

This concept of removing unused cables, which will not be used in the future, is not a new concept. Other articles of the NEC have similar requirements. See the following Articles:

(a) 305, (b) 354, (c) 356, (d) 358

Also note NFPA 75 has a similar requirement.

Note: Underwriter Laboratories and Intertek (ETL), both are in a position to start listing this new type of plenum cable having of "Limited Combustibility" requirement, also potentially known as "permanent plenum cable, e.g., CL2PP, CL3PP, OFCPP, OFNPP, CMPP, and MPPP. There is a research program in place at FPRF to establish the protocol to list PP cables.

PANEL ACTION: Accept in Principle in Part.

The part being rejected is the recommendation to add the last sentence before the FPN.

PANEL STATEMENT: The panel actions in other proposals adopting the requirement to remove abandon cables satisfies the proposal other than the last sentence before the FPN. There is inadequate justification to leave any debris (e.g. abandoned cable).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 21

EXPLANATION OF ABSTENTION:

CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #3801)

16- 78 - (725-54(e)): Accept in Principle

SUBMITTER: David B. Kiddoo, AlphaGary Corp.

RECOMMENDATION: Insert a new Section 725-54(e) as follows:

(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, ventilation ducts or air-handling plenums shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistant-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistant rating. Abandoned cables in these spaces, shafts ducts and plenums shall not be allowed to accumulate. Accumulations of abandoned cables, not identified for future use, in these spaces, shafts, ducts, plenums, and other space used for environmental air, shall be removed.

FPN No. 1: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

FPN No. 2: Definition of acceptable cable fire performance in various applications are described in Section 725-71.

SUBSTANTIATION: This issue has been discussed and reviewed in the last cycle of the NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems. The membership of the NFPA did NOT support a proposal to change the provisions for cables in the paragraphs on "ceiling cavity plenums" (2-3.10.1) and "raised floor plenums" (2-3.10.5) that would have allowed "Permanent Plenum Cables" to accumulate in these plenums. ("Permanent Plenum Cables" are so named through a Project being conducted by the National Fire Protection Research Foundation (NFPRF) and are described to meet a new, undefined, cable Listing for "limited combustibility" and "smoke developed index".) The more comprehensive solution to the issue of accumulating abandoned cables would have been to adopt a requirement to remove "ALL" abandoned cables that are removed from service and not intended for future use. Allowing for "Permanent Plenum Cables" to remain in plenums when abandoned would not address the serious issues of "congestion", "air flow restriction", and "total fuel load accumulation".

An appeal to the Standards Council was generated by proponents of the provisions for "Permanent Plenum Cable" to overturn the Membership Action that occurred at the 1999 Annual Meeting. The Standards Council upheld the NFPA Membership Action after the hearing of the appeal. Comments form the final decision of the Standards Council on this matter are:

- "After a hearing, the Council reviewed and considered all of the information available to it, and voted to deny the appeals."
- "...wire and cable represents a significant potential fuel load in plenums and that, due to the rapidly increasing use of such cable in recent years, some approach to the problem should be devised."
- "...while it is the floor vote in favor of a return to the previous edition text that resulted in this recommendation, informational ballots of the TC (NFPA 90A Technical Committee) following that vote give further support to the conclusion that a lack of consensus exists in favor of going forward with the abandoned cable provisions. A majority of TC members voting on these informational ballots also supported the return to previous edition text..."
- "...the previous edition text is, in the Council's view, clearly suitable."
- "...the Council itself has concerns about the TCs approach and has concluded that further study of this important issue is needed."
- "...the Council wants to ensure, that as the TC undertakes to fully and fairly address these issues going forward, it has the best available range of expertise, representation, and experience. The Council, therefore, is referring the matter of committee membership to the Council's membership task group for review and recommendations."

While plenum cables are not typically the ignition source of fires, due to the low energy conducted through them, the fuel characteristics of high volumes of abandoned cable in plenums, whether combustible or limited combustible by definition, will most certainly add to the heat and energy released in a large, exposing fire, such as those where the ignition source is a room and contents fire below or above the plenum

This proposal addressed the growing safety issue of accumulating abandoned cable in concealed spaces, without selectively favoring any cable geometry or synergy of materials. It does not allow for further accumulation of "Permanent Plenum Cables" which, when removed from service and not intended for future use, no longer have any function — except perhaps to serve as fuel for some future conflagration.

This proposal adopts consistent wording from NFPA 70, National Electrical Code, Section 300-21 and NFPA 75, Protection of Electronic Computer/Data Processing Equipment, paragraph 4-2.4. Basing this new requirement on existing code shows the strong intent, stated in the past by the Standard Council, to have good consistent code language across the various NFPA standards. Arguments by the proponents of "Permanent Plenum Cable" in the NFPA 90A review process to somehow create a new cable for building construction products would be a further misuse of the NFPA 255 and NFPA 259 "materials" test methods.

In spite of the rapid attempts by the proponents of "Permanent Plenum Cable", neither Underwriters Laboratories (UL) nor Interlek Testing Services (ITS/ETL) have yet established Listing criteria for "Permanent Plenum Cable" that could cover the matrix of cable types used in a plenum (fiber optics, coax, etc.). In fact, initial attempts over the first 9 months of the NFPRF Project to test finished cable in the NFPA 255 and NFPA 259 test methods has only shown inconsistencies and extremely limited capability for cables to meet the established definitions of "limited combustibility" and "smoke developed index" established for construction products. These test methods do NOT allow for cables to be tested based on their installed condition, nor can they be used to test cables with the important integration of finished cable geometry's and materials/conductor or fiber synergy's as they impact fire performance.

The proponents of "Permanent Plenum Cable" are applying these "material" tests inappropriately to cables. This is partially why more sophisticated, integrated "cable" fire tests such as NFPA 262 (Plenum), ANSI/UL 1666 (Riser), and ANSI/UL 1581 (Vertical Tray) have been established and referenced in Standards such as the NFPA 70, NFPA 90A, etc. These tests more accurately simulate the actual fire hazards for installed cables, both in terms of the building environment AND the installed configuration. Integrated tests such as these are used to show the cables are designed to help contribute to minimizing the spread of fire and smoke generation in the early stages of a fire, allowing time for people to egress from the building. The fire safety record clearly shows that these tests have been successful in differentiating the fire performance of cables more accurately than material tests such as NFPA 255 or NFPA 259.

The definition for cable fire performance in NFPA 90A, Sections 2-3.10.1 and 2-3.10.5 are listed as Exceptions because the covering paragraphs (a) in each section refer only to "materials" used in the construction of plenums. Proponents of "Permanent Plenum Cable" tried to make the argument in the NFPA 90A proposal review that IF the cable can be shown to meet the requirements of the plenum construction materials, accumulation of this cable is justifiable. As was acknowledged by members of the Standards Council during the NFPA 90A Appeal Hearing, cable jackets and insulation's will NEVER look like the rigid materials used to construct plenums. Establishing a "Permanent Plenum Cable" Exception in a requirement to remove abandoned cable would clearly allow for a loop-hole to continue to proliferate abandoned cable accumulation and NOT address the serious issues of total fuel load, congestion, and air flow.

NFPA 75 Appendix A, paragraph A-4-2.4 says: "Abandoned cable will potentially interfere with air flow extinguishing systems. Abandoned cable also adds to the fuel loading." This proposal would provide consistency with the established fire testing criteria and/or abandoned cable removal provisions established by NFPA 70, NFPA 75 and the appropriate Exceptions established for cables in NFPA 90A.

As was shared by Richard G. Gewain of Hughes Associates (with many years of direct involvement in these definitions) at the NFPA 90A TC meeting in December, 1998, the NFPA 220 Building Construction Committee (BCC) reviewed the definition of "non-combustible" and the new definition "limited combustible" in 1975. The BCC made it clear that these definitions "apply to the materials used in the construction of buildings (floors, roofs, columns, walls, etc.), but do NOT apply to furnishings or the contents of buildings, or to the fire hazard evaluation of materials." This language is clearly spelled out in the Special Interest Bulletin No. 294, currently entitled "Noncombustible and Limited-Combustible Building Construction Materials", published and updated several times since 1956 by the National Board of Fire Underwriters (a.k.a. American Insurance Association, currently known as the American Insurance Services Group).

Because of the concern that other NFPA Committees have been misusing the term "limited combustible", the Standards Council has assigned the responsibility for the term "limited combustible" to the BCC. The BCC has recently requested its Chairman to contact the Chairmen of the other NFPA Committees (covering 48 NFPA standards) using this term and ask for a clarification of what is intended for its use. A BCC Task Group is now established to develop proposals or comments to ensure that the term in other standards such as NFPA 90A is used correctly. From a fire hazards point of view, it has clearly NOT been shown that using the current definitions of "limited combustible" and "smoke developed index" and NFPA 259/NFPA 255 test methods are appropriate for installed cables.

This proposal also alleviates the concern and burden to the authority having jurisdiction inspector enforcing NFPA 70 to identify different types of cables currently in the concealed spaces and removed from service. The requirement to removal ALL abandoned cable not intended for future use should be less cumbersome than to remove only "some" of the cables.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to panel action on Proposal 16-80 which meets the intent of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

16- 79 - (725-54(e) (New)): Accept in Principle

SUBMITTER: Hallie Smith-Petee, The Geon Co.

RECOMMENDATION: Insert a new Section 725-54 (e) to read as follows:

(e) Spread of Fire or Products of Combustion: Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating. Abandoned cables present in ducts, plenums and other air handling space shall not be allowed to accumulate. Cables not intended for future use shall be removed.

SUBSTANTIATION: See Substantiation for Section 800-52(b).

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The proposer's intent was satisfied by panel action on Proposal 16-80.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 21

ABSTENTION: 1

EXPLANATION OF ABSTENTION:

CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #4049)

16- 80 - (725-54(e) (New)): Accept in Principle

Note: The Technical Correlating Committee understands that "725-3(a)" in the Panel Action is "725-3(b)" based on the action on Proposal 16-36.

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Insert a new Section 725-54(e) as follows:

(b) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate. Excessive accumulations of abandoned cables, in ducts, plenums, and other space used for environmental air, shall be removed where practicable.

FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

SUBSTANTIATION: BICSI members have been extensively involved with the design and installation of telecommunications cabling. Technology changes have resulted in newer high performance cabling being installed in support of those technologies. We have observed excessive accumulations of abandoned cabling adding to the fuel loading within plenum spaces. This proposal is offered to the NFPA to help reduce the fuel load within these plenum areas.

Addition of "to maintain the fire resistance rating" to the end of the second sentence will correlate this section with section 300-21.

The proposed fine print No. 1 note was copied from the first sentence of the fine print note in section 300-21. It assists installers in locating firestop information.

Acceptance of this proposal will result in cable removal being included in the scope of the installation of a new communications and data system. The contractor will remove the old cable before installing the new system.

Acceptance of this proposal will result in many BICSI members specifying abandoned cable removal within the scope of the installation of new communications and data systems.

In two separate proposals, we have offered definitions for "abandoned cable" and "excessive accumulation of abandoned cables".

This proposed wording addresses the issue of excess combustibles in plenums without requiring the removal of all abandoned cable, only excessive accumulations of abandoned cable, thus avoiding a burdensome requirement of removing insignificant amounts of cable. The proposed first sentence, Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate, limits the amount of cable that will be permitted to be abandoned. It applies to all cable that is in place, plenum cable as well as non-plenum cable that was installed before the plenum cable requirements were in the Code. The proposed second sentence, Excessive accumulations of abandoned cables, in ducts, plenums, and other space used for environmental air, shall be removed, where practicable, deals with already abandoned cable. The wording of "where practicable" aid the situations where cable may be intertwined and cannot be removed without disruption of active services. The NEC requirements for plenum cable were first promulgated in the 1975 NEC, consequently, abandoned cables in older buildings often include unlisted cable along with listed plenum cable.

Other sections of the NEC require the removal of abandoned wiring.

ARTICLE 354 — Underfloor Raceways, Section 354-7. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

ARTICLE 356 — Cellular Metal Floor Raceways, Section 356-7. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

ARTICLE 358 — Cellular Concrete Floor Raceways, Section 358-13. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case of abandoned outlets on loop wiring, shall be allowed in raceways.

ARTICLE 305 — Temporary Wiring, Section 305-3(d). Time Constraints, (d) Removal. Temporary wiring shall be removed immediately upon completion of construction or purpose for which the wiring was installed.

PANEL ACTION: Accept in Principle.

Revise 725-3(a) to read as follows:

"(a) Spread of Fire or Products of Combustion. Section 300-21. Abandoned cables not intended for future use shall not be permitted to remain."

PANEL STATEMENT: The revision meets the intent of the submitter. It is more appropriate to place the requirement in 725-3(a) which addresses the subject.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:
AFFIRMATIVE: 21
ABSTENTION: 1
EXPLANATION OF NEGATIVE:
COMMENT ON AFFIRMATIVE:
BRUNSSEN: I concur with the panel's intent, but feel that the words "not intended for future use" are redundant and should be removed.
DORNA: The revised wording for 725-3(a) should read as follows:
"(a) Spread of Fire or Products of Combustion. Section 300-21. Abandoned cables ~~not intended for future use~~ shall not be permitted to remain."
The use of the phrase "not intended for future use" is redundant. The definition of "abandoned cable" has this phrase in the definition. To restate this phrase would be grammatically incorrect.
JOHNSON: I am in agreement with Mr. Dorna's comments on this proposal. "Abandoned cables not intended for future use..." is redundant when we have previously defined abandoned cables not to include those intended for future use.
KAHN: The words "not intended for future use" are redundant as that is included in the definition of Abandoned Cables.
LANNI: The word "abandoned" and the words "not intended for future use" are redundant, and the words "not intended for future use" should be removed.
WIERENGA: The revised wording for Panel Action for 725-3(a) should read as follows: "(a) Spread of Fire or Products of Combustion. Section 300-21. Abandoned cables ~~not intended for future use~~ shall ~~not~~ be removed.
The use of the phrase "not intended for future use" is redundant because it is already included in the definition of "abandoned cable". The deletion of the words "not" and "permitted to remain" can be readily stated by use of positive code language using the word "removed".
EXPLANATION OF ABSTENTION:
CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #3205)

16- 81 - (725-61): Reject
SUBMITTER: S. E. Egesdal, Honeywell Inc.
RECOMMENDATION: Revise as follows:
725-61. Applications of Listed Class 2, Class 3, and PLTC Cables. Class 2, Class 3, and PLTC cables shall comply with the requirements specified in (a) through (g).
(a) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be as specified in (1) through (2).
(1) Type CL2P or CL3P cables.
(2) Listed wires and cables installed in compliance with Section 300-22.
(b) Riser. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be as specified in (1) through (3).
FPN: See Section 300-21 for firestop requirements for floor penetrations.
(1) Type CL2R or CL3R. Floor penetrations requiring Type CL2R or CL3R shall contain only cables suitable for riser or plenum use.
(2) Other cables as covered in Table 725-61 and other listed wiring methods as covered in Chapter 3, where installed in metal raceways or located in a fireproof shaft having firestops at each floor.
(3) Types CL2, CL3, CL2X, and CL3X cable in one- and two-family dwellings.
(c) Cable Trays. Cables installed in cable trays outdoors shall be Type PLTC. Cables installed in cable trays indoors shall be Types PLTC, CL3P, CL3R, CL3, CL2P, CL2R, and CL2.
FPN: See Section 800-52(d) for cables permitted in cable trays.
(d) Hazardous (Classified) Locations. Cables installed in hazardous (classified) locations shall be Type PLTC, except as permitted or required by (1) through (4).
(1) Where the use of Type PLTC cable is permitted in Sections 501-4(b), 502-4(b), and 504-20, the cable shall be installed in cable trays; in raceways; supported by messenger wire, or otherwise adequately supported and mechanically protected by angles, struts, channels, other mechanical means; or directly buried where the cable is listed for this use.
(2) Class 2 circuits as permitted by Section 501-4(b), Exception.
(3) Conductors in Type PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.
(4) In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage, Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted as open wiring between cable tray and utilization equipment in lengths not to exceed 50 ft (15.24 m), where the cable is supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 6 ft (1.83 m).
(e) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in (a) through (d) shall be as specified in (1) through (6).
(1) Type CL2 or CL3.
(2) Type CL2X or CL3X where installed in a raceway, or other wiring methods as covered in Chapter 3.
(3) Cable in nonconcealed spaces where the exposed length of cables does not exceed 10 ft (3.05 m).
(4) Listed Type CL2X, Class 2 cables less than 0.25 in. (6.4 mm) in diameter and listed Type Cl#x, Class 3 cables less than 0.25 in. (6.4 mm) in diameter installed in one- or two-family dwellings.
(5) Listed Type CL2X, Class 2 cables less than 0.25 in. (6.4 mm) in diameter and listed Type CL3X, Class 3 cables less than 0.25 in. (6.4 mm) installed in nonconcealed spaces in multifamily dwellings.
(6) Type CMUC undercarpet communications wires and cables installed under carpet.
(f) Cross-Connect Arrays. Type CL2 or CL3 conductors or cable shall be used.
(g) Class 2 and Class 3 Cable Uses and Permitted Substitutions. The uses and permitted substitutions for Class 2 and Class 3 cables listed in Table 725-61 shall be considered suitable for the purpose and shall be permitted.
FPN: For information on Types CMP, CMR, CMG, CM, and CMX cables, see Section 800-50.
Figure 725-61. Cable substitution hierarchy. and Table 725-61. Cable Uses and Permitted Substitutions. remain unchanged.
SUBSTANTIATION: The exceptions are changed to positive language in compliance with 3.1.4.2 of the Style Manual.
PANEL ACTION: Reject.
PANEL STATEMENT: Though a complete rewrite of the section should be done, the proposed draft does not completely and clearly reflect all requirements and permitted methods. Time limitations have precluded attempting to do this at the panel meetings. The panel chair appointed a task group to do a complete rewrite and submit such a rewrite as a comment for the consideration of the full panel. The rewrite should conform with all the requirements of the new Manual of Style.

(Log #4136)

16- 83 - (725-61(a)): Accept in Principle
SUBMITTER: Marcelo M. Hirschler, GBH Int'l, Inc./Rep. Plenum Cable Assn.
RECOMMENDATION: Revise as follows:
725-61. Applications of Listed Class 2, Class 3, and PLTC Cables. Class 2, Class 3, and PLTC cables shall comply with (a) through (g) below.
(a) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CL2P or CL3P. Abandoned cables, not intended for future use, shall not be permitted to remain.
Exception: Listed wires and cables installed in compliance with Section 300-22.

SUBSTANTIATION: There is a significant amount of information indicating that the amount of cables installed in plenums, and other air-handling spaces, is increasing rapidly. An understanding of cabling practices indicates that the most common way in which cable installation is carried out is by disconnecting existing cable and leaving it abandoned in place, while introducing the cable needed to perform the additional functions. This creates an increased full load in plenum and other air-handling spaces, which is best controlled. There is, as yet, no indication that the additional cables in plenums causes an added fire hazard, and the fire record of cables in concealed spaces, both above ceilings and below floors, remains excellent. In fact, plenum cables, which meet the fire test requirements of NFPA 262, have been shown to have extremely good fire performance and to spread flame only very slowly, if at all. However, this type of preventive measure is worthwhile.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The proposer's intent was satisfied by panel action on Proposal 16-80.

(Log #3802)

16- 84 - (725-71): Reject
SUBMITTER: David B. Kiddoo, AlphaGary Corp.
RECOMMENDATION: With regards to Section 725-71, "Limited Combustion Cable" or "Permanent Plenum Cable" should not be accepted as an additional Listing based on the lack of testing definition, the absence of cable Listing capability, and the proven adequacy of an integrated and enhanced NFPA 262 test method. NFPA 262 differentiates cables as to their fire performance to provide acceptable values for smoke generation and flame travel distance.
Proponents of "Limited Combustible Cable" or "Permanent Plenum Cable" have been actively soliciting support form cable market trade organizations, Code-Making Panel 16 Members or Alternates, cable manufacturers, etc. for a proposal to include a new paragraph in this section to provide for a new type of cable based on the definitions of "limited combustibility" and "smoke developed index" per the definitions in NFPA 90A. These definitions ONLY govern construction products for the installation of air conditioning and ventilating systems. The NFPA 255 and NFPA 259 fire test methods being promoted are NOT applicable to evaluate the fire hazard nor the geometry's and material synergy's in cables as they pertain to fire performance.
As these proposals have been made public through this solicitation for support, I wish to respond at this time to say that there is no safety record or fire performance issue necessitating any additional cable type for use in plenum cable applications. The inclusion of this new Type of cable is partially as a means to provide for an Exception from the proposed requirement in Section 725-54 to remove accumulations of abandoned cable. "Limited Combustible Cable" or "Permanent Plenum Cable" definitions seen in this proposals for a new cable type

are NOT based on any test incorporating an actual cable fire hazard evaluation. Without adequate test methods and with the current status of the NFPRF "Permanent Plenum Cable Project", NO cables have been shown to meet the requirements proposed. The data generated in the Project have NOT been related to any appropriate fire hazard evaluation and should NOT be used to establish ANY relative cable fire performance comparisons.

SUBSTANTIATION: This issue has been discussed and reviewed in the last cycle of the NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems. The membership of the NFPA did NOT support a proposal to change the provisions for cables in the paragraphs on "ceiling cavity plenums" (2-3.10.1) and "raised floor plenums" (2-3.10.5) that would have allowed "Permanent Plenum Cables" to accumulate in these plenums. ("Permanent Plenum Cables" are so named through a Project being conducted by the National Fire Protection Research Foundation (NFPRF) and are described to meet a new, undefined, cable Listing for "limited combustibility" and "smoke developed index".) The more comprehensive solution to the issue of accumulating abandoned cables would have been to adopt a requirement to remove "ALL" abandoned cables that are removed from service and not intended for future use. Allowing for "Permanent Plenum Cables" to remain in plenums when abandoned would not address the serious issues of "congestion", "air flow restriction", and "total fuel load accumulation".

An appeal to the Standards Council was generated by proponents of the provisions for "Permanent Plenum Cable" to overturn the Membership Action that occurred at the 1999 Annual Meeting. The Standards Council upheld the NFPA Membership Action after the hearing of the appeal. Comments form the final decision of the Standards Council on this matter are:

- "After a hearing, the Council reviewed and considered all of the information available to it, and voted to deny the appeals."
- "...wire and cable represents a significant potential fuel load in plenums and that, due to the rapidly increasing use of such cable in recent years, some approach to the problem should be devised."
- "...while it is the floor vote in favor of a return to the previous edition text that resulted in this recommendation, informational ballots of the TC (NFPA 90A Technical Committee) following that vote give further support to the conclusion that a lack of consensus exists in favor of going forward with the abandoned cable provisions. A majority of TC members voting on these informational ballots also supported the return to previous edition text..."
- "...the previous edition text is, in the Council's view, clearly suitable."
- "...the Council itself has concerns about the TCs approach and has concluded that further study of this important issue is needed."
- "...the Council wants to ensure, that as the TC undertakes to fully and fairly address these issues going forward, it has the best available range of expertise, representation, and experience. The Council, therefore, is referring the matter of committee membership to the Council's membership task group for review and recommendations."

While plenum cables are not typically the ignition source of fires, due to the low energy conducted through them, the fuel characteristics of high volumes of abandoned cable in plenums, whether combustible or limited combustible by definition, will most certainly add to the heat and energy released in a large, exposing fire, such as those where the ignition source is a room and contents fire below or above the plenum

This proposal addressed the growing safety issue of accumulating abandoned cable in concealed spaces, without selectively favoring any cable geometry or synergy of materials. It does not allow for further accumulation of "Permanent Plenum Cables" which, when removed from service and not intended for future use, no longer have any function — except perhaps to serve as fuel for some future conflagration.

This proposal adopts consistent wording from NFPA 70, National Electrical Code, Section 300-21 and NFPA 75, Protection of Electronic Computer/Data Processing Equipment, paragraph 4-2.4. Basing this new requirement on existing code shows the strong intent, stated in the past by the Standard Council, to have good consistent code language across the various NFPA standards. Arguments by the proponents of "Permanent Plenum Cable" in the NFPA 90A review process to somehow create a new cable for building construction products would be a further misuse of the NFPA 255 and NFPA 259 "materials" test methods.

In spite of the rapid attempts by the proponents of "Permanent Plenum Cable", neither Underwriters Laboratories (UL) nor Interlek Testing Services (ITS/ETL) have yet established Listing criteria for "Permanent Plenum Cable" that could cover the matrix of cable types used in a plenum (fiber optics, coax, etc.). In fact, initial attempts over the first 9 months of the NFPRF Project to test finished cable in the NFPA 255 and NFPA 259 test methods has only shown inconsistencies and extremely limited capability for cables to meet the established definitions of "limited combustibility" and "smoke developed index" established for construction products. These test methods do NOT allow for cables to be tested based on their installed condition, nor can they be used to test cables with the important integration of finished cable geometry's and materials/conductor or fiber synergy's as they impact fire performance.

The proponents of "Permanent Plenum Cable" are applying these "material" tests inappropriately to cables. This is partially why more sophisticated, integrated "cable" fire tests such as NFPA 262 (Plenum), ANSI/UL 1666 (Riser), and ANSI/UL 1581 (Vertical Tray) have been established and referenced in Standards such as the NFPA 70, NFPA 90A, etc. These tests more accurately simulate the actual fire hazards for installed cables, both in terms of the building environment AND the installed configuration. Integrated tests such as these are used to show the cables are designed to help contribute to minimizing the spread of fire and smoke generation in the early stages of a fire, allowing time for people to egress from the building. The fire safety record clearly shows that these tests have been successful in differentiating the fire performance of cables more accurately than material tests such as NFPA 255 or NFPA 259.

The definition for cable fire performance in NFPA 90A, Sections 2-3.10.1 and 2-3.10.5 are listed as Exceptions because the covering paragraphs (a) in each section refer only to "materials" used in the construction of plenums. Proponents of "Permanent Plenum Cable" tried to make the argument in the NFPA 90A proposal review that IF the cable can be shown to meet the requirements of the plenum construction materials, accumulation of this cable is justifiable. As was acknowledged by members of the Standards Council during the NFPA 90A Appeal Hearing, cable jackets and insulation's will NEVER look like the rigid materials used to construct plenums. Establishing a "Permanent Plenum Cable" Exception in a requirement to remove abandoned cable would clearly allow for a loop-hole to continue to proliferate abandoned cable accumulation and NOT address the serious issues of total fuel load, congestion, and air flow.

NFPA 75 Appendix A, paragraph A-4-2.4 says: "Abandoned cable will potentially interfere with air flow extinguishing systems. Abandoned cable also adds to the fuel loading." This proposal would provide consistency with the established fire testing criteria and/or abandoned cable removal provisions established by NFPA 70, NFPA 75 and the appropriate Exceptions established for cables in NFPA 90A.

As was shared by Richard G. Gewain of Hughes Associates (with many years of direct involvement in these definitions) at the NFPA 90A TC meeting in December, 1998, the NFPA 220 Building Construction Committee (BCC) reviewed the definition of "non-combustible" and the new definition "limited combustible" in 1975. The BCC made it clear that these definitions "apply to the materials used in the construction of buildings (floors, roofs, columns, walls, etc.), but do NOT apply to furnishings or the contents of buildings, or to the fire hazard evaluation of materials." This language is clearly spelled out in the Special Interest Bulletin No. 294, currently entitled "Noncombustible and Limited-Combustible Building Construction Materials", published and updated several times since 1956 by the National Board of Fire Underwriters (a.k.a. American Insurance Association, currently known as the American Insurance Services Group).

Because of the concern that other NFPA Committees have been misusing the term "limited combustible", the Standards Council has assigned the responsibility for the term "limited combustible" to the BCC. The BCC has recently requested its Chairman to contact the Chairmen of the other NFPA Committees (covering 48 NFPA standards) using this term and ask for a clarification of what is intended for its use. A BCC Task Group is now established to develop proposals or comments to ensure that the term in other standards such as NFPA 90A is used correctly. From a fire hazards point of view, it has clearly NOT been shown that using the current definitions of "limited combustible" and "smoke developed index" and NFPA 259/NFPA 255 test methods are appropriate for installed cables.

This proposal also alleviates the concern and burden to the authority having jurisdiction inspector enforcing NFPA 70 to identify different types of cables currently in the concealed spaces and removed from

service. The requirement to removal ALL abandoned cable not intended for future use should be less cumbersome than to remove only "some" of the cables.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal does not conform to section 4-3.3(c) of the Regulations Governing Committee Projects. The submitter has made other proposals on this subject that meet the Regulations Governing Committee Projects. The issues raised in this proposal were addressed when the other proposals were considered.

(Log #1214)

16- 85 - (Table 725-71): Accept
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise Table 725-71. Cable Marking as follows:

Table 725-71. Cable Markings

Cable Marking	Type	Listing References
CL3P-50	Limited combustible class 3 plenum cable	725-71(a),(b), (g), and (i)
CL3P	Class 3 plenum cable	725-71(a), (g), and (i)
CL2P-50	Limited combustible class 2 plenum cable	725-71(a), (b) and (i)
CL2P	Class 2 plenum cable	725-71(a) and (i)
CL3R	Class 3 riser cable	725-71(c), (g), and (i)
CL2R	Class 2 riser cable	725-71(c) and (i)
PLTC	Power-limited tray cable	725-71(f) and (i)
CL3	Class 3 cable	725-71(d), (g), and (i)
CL2	Class 2 cable	725-71(d), (g), and (i)
CL3X	Class 3 cable, limited use	725-71(e), (g), and (i)
CL2X	Class 2 cable, limited use	725-71(e), (g), and (i)

The fine print note is unchanged.
SUBSTANTIATION: If my proposal to establish a new section 725-71(b) is accepted, a new section is added and the sections will be renumbered. The new section creates two new cable types, Type CL3-50 and Type CL2P-50. This proposal correlates Table 725-71 with those proposed changes.
PANEL ACTION: Accept.

Note: The Technical Correlating Committee directs that this Proposal be referred to the NFPA 90A Technical Committee on Air Conditioning for comment.
SUBMITTER: S. E. Egesdal, Honeywell Inc.
RECOMMENDATION: Renumber sections as follows:
Existing Section Renumbered section
725-71(b) 725-71(c)
725-71(c) 725-71(d)
725-71(d) 725-71(e)
725-71(e) 725-71(f)
725-71(f) 725-71(g)
725-71(g) 725-71(h)
725-71(h) 725-71(i)
Add a new Section 725-71(b) to read:

(b) Limited Combustible Cable. Types CL2P and Types CL3P cables that are also listed as being limited combustible and having a maximum smoke developed index of 50 shall be permitted to be listed and marked as Types CL2P-50 and Types CL3P-50 respectively.

FPN No. 1: See NFPA 90A-1999, Standard for the Installation of Air Conditioning and Ventilating Systems for a definition of limited combustible. See NFPA 255-2000, Standard Method of Test of Surface Burning Characteristics of Building Materials for a definition of the smoke developed index.

FPN No. 2: For further information on the requirements for materials in ceiling cavity and raised floor plenums, see NFPA 90A-1999, Standard for the Installation of Air Conditioning and Ventilating Systems, Sections 2-3.10.1 Ceiling Cavity Plenum and 2-3.10.5 Raised Floor Plenum.

SUBSTANTIATION: The NFPA Standards Council has assigned primary responsibility for the fire protection of plenums to the Technical Committee on Air Conditioning. That technical committee is responsible for NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems. The NFPA 90A (1996) requirements for ceiling cavity and raised floor plenums for electrical wires and cables are shown below:

2-3.10 Plenums.

2-3.10.1 Ceiling Cavity Plenum. The space between the top of the finished ceiling and the underside of the floor or roof above shall be permitted to be used to supply air to, or return or exhaust air from, the occupied area, provided that the following conditions are met:

(a) All materials exposed to the airflow shall be noncombustible or limited combustible and have a maximum smoke developed index of 50.

Exception No. 1: The following materials shall be permitted in the ceiling cavity plenum where listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 ft (1.5 m) or less when tested in accordance with the specified test method:

(a) Electrical wires and cables. NFPA 262, Standard Method of Test for Fire and Smoke Characteristics of Wires and Cables.

2-3.10.5 Raised Floor Plenum. The space between the top of the finished floor and the underside of a raised floor shall be permitted to be used to supply air to, or return exhaust air from, or return and exhaust air from, the occupied area, provided that the following conditions are met:

(a) All materials exposed to the airflow shall be noncombustible or limited combustible and shall have a maximum smoke developed index of 50.

Exception No. 1: The following materials shall be permitted in the raised floor plenum where listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 ft (1.5 m) or less when tested in accordance with the specified test method:

(a) Electrical wires and cables. NFPA 262, Standard Method of Test for Fire and Smoke Characteristics of Wires and Cables.

Establishing Types CL2P-50 and CL3P-50 cables is a step toward correlating NFPA 70, the National Electrical Code and NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems. Types CL2P-50 and CL3P-50 cables qualify for use by meeting the basic rule for plenum materials, i.e., limited combustible and a smoke developed rating below 50, and meeting the flame spread and smoke requirements of the NFPA 90A Exception which are identical to those in the NEC fine print notes.

PANEL ACTION: Accept.

(Log #2237)

16- 90 - (725-71(d)): Accept in Principle

SUBMITTER: Ravindra H. Ganatra, Alcan Cable

RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested."

SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.

[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]

PANEL ACTION: Accept in Principle.

Replace "flame retardant" with "resistant to flame spread"

PANEL STATEMENT: This change will correlate with the wording used for the requirements for CMX and CATVX.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

(Log #3633)

16- 91 - (725-71(e)): Accept

Note: The Technical Correlating Committee understands that the reference to "725-71(e)" in the Proposal is incorrect and should be "725-71(h)." The Technical Correlating Committee notes that this section will be renumbered "725-71(i)" based on the Action on Proposal 16-89. The Technical Correlating Committee directs that the action on this Proposal be revised to comply with the NEC Style Manual 3.1.4 regarding the use of an Exception within the same sentence as the main rule. The Technical Correlating Committee directs the Panel to refer to the action on similar Proposal 16-106 and correlate the wording of the two Proposals. A separate Exception may be appropriate. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Gerald Lee Dorna, Belden Wire & Cable Co.

RECOMMENDATION: In Section 725-71(e) in the first sentence, modify as follows:

"...marked in accordance with Section 310-11 (except voltage ratings shall not be marked on the cables) and Table 725-71."

SUBSTANTIATION: Section 310-11(a)(1) says "The maximum rated voltage for which the conductor was listed" is to be marked on the cable. However, 725-71 says that cables shall be marked in accordance with 725-71(h). 725-71(h) says "Voltage ratings shall not be marked on the cable." Which is it, to be marked or not to be marked? The UL standard for Power-Limited Circuit Cables, UL-13, says that for PLTC cables "PLTC 300 V" or "PLTC 300 volts" must be on the cable.

PANEL ACTION: Accept.

(Log #4149)

16- 93 - (725-71(f)): Accept

Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

SUBMITTER: William Keezer, Bose Corp./Rep. Nat'l Systems Contractors Assn. (NSCA)

RECOMMENDATION: Revise subsection (f) to Section 725-71 as follows:

(f) Class 2 and Class 3 Cable Voltage ~~Rating~~ Ratings. Class 2 cables shall have a voltage rating of not less than 150 volts. Class 3 cables shall have a voltage rating of not less than 300 volts.

SUBSTANTIATION: Problem:

1) It has been stated that Class 2 cable has no requirement for dielectric integrity of the insulation. This has caused concern about whether Class 2 wire is suitable for the purposes for which it is used. This proposal adds a Class 2 requirement in the same manner as the voltage requirement for Class 3 is specified, and for the same reason - to insure a minimum level of electrical performance for Class 2 cables.

Substantiation:

1) The proposed subsection clarifies that all Class 2 cables must meet a minimum level of dielectric integrity. It has been argued that a Nationally Recognized Testing Laboratory (NRTL) other than UL can establish its own listing tests and ignore insulation integrity. This requirement would set a minimum dielectric integrity requirement specified by the code rather than within a listing standard. This requirement does not require the voltage rating to be marked on the wire.

2) This proposal would insure that non-UL NRTLs will be required to apply a dielectric withstand test or spark test to their testing protocol if they do not use UL 13 as the basis for listing.

3) UL 13 Power-Limited Circuit Cables, Second Edition is a listing standard for Class 2 cables. That standard specifically requires that Class 2 cables be tested using either a spark test or a dielectric withstand test. Section 25 - Spark Test and Dielectric Withstand Test Alternatives for Class 2 Cables of that standard allows either a spark test or dielectric test as alternative methods of qualification. The spark test specifies either a 2500 vdc or 1750 vac limit without failure. The dielectric withstand test is an option for nonintegral cable with a 1250 vdc or 900 vac limit for 2 seconds without failure. The methods for performing these tests are found in UL 1581 Reference Standard for Electrical Wires, Cables and Flexible Cords.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 21

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

EGESDAL: Article 725 has never required a voltage rating on Class 2 cable. In the definition of a Class 2 Circuit, Article 725 states, "Due to its power limitations, a Class 2 circuit considers safety from a fire initiation standpoint and provides acceptable protection from electric shock. Proposal 16-93 provided no substantiation that included evidence of fire initiation or shock from Class 2 circuits; such as from open frame transformers with exposed terminals. Article 725 presently requires Class 2 cable to be resistant to the spread of fire - no voltage rating. Inclusion of the 150 volt requirement on Class 2 cable without sufficient substantiation appears to be a barrier to trade. Additionally, Article 725 requires a Class 2 power source to be listed. According to sources at UL, UL permits listing of Class 2 power sources with a maximum output of 30 vac and 60 vdc. There seems to be no technical reason to require conductor insulation 5 times in excess of the presently UL Listed 30 vac Class 2 power sources.

(Log #4266)

16- 94 - (725-71(g), Exception (New)): Accept in Principle

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Add an Exception as follows:

Exception: Conductors not listed as Type CL3 shall be permitted to be used for Class 3 circuits where run within recognized cable and raceway wiring methods covered in Chapter 3.

SUBSTANTIATION: This proposal unwinds the preposterous result in the last code cycle, where a No. 14 THHN conductor can't be used for a Class 3 circuit run in EMT, but the same conductor can be used in the same raceway for general building wire purposes at far higher power levels.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to panel action on Proposal 16-62(a). The revised text meets the intent of the submitter.

ARTICLE 727 — INSTRUMENTATION TRAY CABLE: TYPE ITC

(Log #1111)

16- 95 - (727): Accept

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Revise Article 727 as follows:

727-6 - change "No. 22 through No. 12" to "22 through 12 AWG"

727-8 - change "No. 22" to "22 AWG"

727-9 - change "Nos. 20" to "20 AWG" and "No. 22" to "22 AWG".

SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #4267)

16- 96 - (727): Reject

Note: See the Technical Correlating Committee Action on Proposal 16-56.

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee

RECOMMENDATION: Delete this Article 727.

SUBSTANTIATION: This is a companion proposal to another on Section 725-27 which brings the essential requirements of Article 727 into Article 725, and a third proposal to add certain material as a new Section 725-23 Exception No. 4. The principal substantiation is on the proposal for the new Section 725-27(c). Please refer to that proposal for more information.

PANEL ACTION: Reject.

PANEL STATEMENT: Refer to panel action on Proposal 16-56. Since the requirements in Article 727 have not been incorporated into Article 725, Article 727 must remain in place.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #2299)

16- 97 - (727-2(6)): Reject

SUBMITTER: David Wechsler, Union Carbide Corp.

RECOMMENDATION: Delete "control rooms" and revise the text as follows:

(6) Under raised floors and in rack rooms where arranged to prevent damage to the cable.

SUBSTANTIATION: The term "control room" is not defined in Article 727 or within the NEC and thus the application of this specific section has come under much debate. It was the intent that ITC cable be permitted to be run under raised floors. Whether the raised floor is within a section of a building, a room within a building, or even in an entire building, does not alter the permitted use of using ITC under the raised floor. While one solution might be to provide a definition of a control room, this is not very easy and a more workable solution is to simply delete "control room".

PANEL ACTION: Reject.

PANEL STATEMENT: The industry has general understanding of what constitutes a "control room." The submitter's revised wording allowing the use of ITC Cable under a raised floor anywhere in a building was never the intent. The panel has assumed that the reference was to 727-4(7).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #1867)

16- 98 - (727-4): Reject
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise as follows:
727-4. Uses Permitted. Type ITC cable shall be permitted to be used in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation.
(1) In cable trays.
(2) In raceways.
(3) In hazardous locations as permitted in Articles 501, 502, 503, 504, and 505
(4) As open wiring where ~~equipped with~~ enclosed in a smooth metallic sheath, continuous corrugated metallic sheath, or interlocking tape armor applied over the nonmetallic sheath in accordance with Section 727-6. The cable shall be supported and secured at intervals not exceeding 6 ft (1.83 m).
(5) As open wiring between cable tray and equipment in lengths not to exceed 50 ft (15.24 m), where the cable is supported and protected against physical damage using mechanical protection, such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 6 ft (1.83 m).
~~Exception No. 1: Type ITC cable without a metallic sheath or armor shall be permitted to be installed as open wiring between cable tray and equipment in lengths not to exceed 50 ft (15.24 m), where the cable is supported and protected against physical damage using mechanical protection, such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 6 ft (1.83 m).~~
~~Exception No. 2: Type ITC cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted as open wiring between the cable tray and the equipment in lengths not to exceed 50 ft (15.24 m). The cable shall be supported and secured at intervals not exceeding 6 ft (1.83 m).~~
(6)~~(5)~~ As aerial cable on a messenger.
(7) ~~(6)~~ Direct buried where identified for the use.
(8) ~~(7)~~ Under raised floors in control rooms and rack rooms where arranged to prevent damage to the cable.
SUBSTANTIATION: The two exceptions have been rewritten into positive language in accordance with Section 3.1.4 and Annex A of the 1999 National Electrical Code Style Manual.
The positive language in the new (5) permits the use of cables specified in both exceptions.
Exception No. 1 already permitted ITC cable to be installed as open wiring in lengths not to exceed 50 ft without meeting the crush and impact requirements of Type MC cable and being identified for the use, so Exception No. 2 is not needed.
Exception No. 1 required that open wiring be "supported and protected against physical damage using mechanical protection, such as dedicated struts, angles, or channels." Section 300-4 already requires conductors to be adequately protected and the phrase "such as dedicated struts, angles, or channels" provides additional clarity.
PANEL ACTION: Reject.
PANEL STATEMENT: It was the submitter's intent to rewrite the exceptions into positive language. However in doing so the current allowance in Exception No. 2 is not retained.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #2143)

16- 99 - (727-4 Exception No. 1): Reject
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: The new Exception to 725(a)(2) will read:
"Where new or existing control panels utilize a larger listed power supply which is fused multiple times to supply multiple circuits as long as each circuit meets the power requirements of a Class 2 or 3 listed power supply."
SUBSTANTIATION: The demand in the industry is for small control panels. The change in this article last year resulted in the exclusion of large power supplies feeding multiple control circuits. It now requires that only items in 725-41(a)(1) through (5) be acceptable as power sources. In the Minneapolis/St. Paul area, the panel shops are building control panels with listed power supplies that meet the requirements of Class 2 or 3 but are not specifically designated as Class 2 or 3 or are fused to meet the Class 2 or 3 requirement. Of the 27 vendors polled across the nation, three manufacturers have taken this change to heart and produced listed power supplies specifically designated as Class 2 or 3. But, at this time, they only have 24 volt, 4 amp supplies and 8 amp are not available. There are, however, many listed 10 and 15 amp 24 volt power supplies available. The installation in thousands of control panels across the United States were safe before the 1993 code, and new installations after that date are still safe even after 1996 and 1999 code made them illegal. It is not the intent of the National Electrical Code to be ignored. The rule must instead be modified to fit what reality is. An example of what this new rule has done to process machine control is that of a new machine that was built for 3M. To meet the requirement of the NEC, the panel manufacturer had to install 16 separate 4.2 amp power supplies, when in the past 1/2 to 1/4 of that many larger power supplies correctly fused would have sufficed. Because of this 3M incurred higher cost in the engineering and construction of that machine to the tune of more pages of elementrys, a larger panel, more internal equipment and more wiring on the machine and larger conduit to accommodate this wiring. It will also impact 3M in the future maintenance of that machine as there is now far more complexity, equipment and wiring that can go wrong.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The wording does not match the Section number.
Overcurrent protection alone can not be used to create a Class 2, or Class 3 power source. Refer to the listing requirements in Chapter 9 Table 11(a).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20
COMMENT ON AFFIRMATIVE:
HUGHES: The text of this proposal and substantiation obviously does not apply to the referenced article and section. A more appropriate recommendation for the wording of 727-4 Exception No. 1 would be as follows:
727-4 Exception No. 1 will read: Type ITC cable without a metallic sheath or armor shall be permitted to be installed as open wiring between cable tray and equipment in lengths not to exceed 50 ft. (15.24m), where the cable is supported and protected against physical damage using mechanical protection, such as ~~dedicated~~ struts, angles or channels. The cable shall be supported and secured at intervals not exceeding 6 ft (1.83m).
Substantiation:
The examples cited for mechanical protection could already be part of the building or equipment infrastructure, and if so, are not solely dedicated for the purpose of protection of a wiring system. This change will clarify the exception, avoid the interpretation that the mechanical protection means can only be used for that purpose, and continue to provide protection of the wiring system as intended.

(Log #1868)

16- 100 - (727-4(3)): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise as follows:
(3) In hazardous locations as permitted in 501-4, 502-4, 503-3, 504-20, 504-30, 504-80, and 505-15. ~~Articles 501, 502, 503, 504, and 505.~~
SUBSTANTIATION: Section 4.1.1 of the 1999 National electrical Code Style Manual stipulates that "References shall not be made to an entire article... unless additional conditions are specified."

VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #2267a)

16- 104 - (727-6): Reject
SUBMITTER: Kenneth E. Bow, The Dow Chemical Co.
RECOMMENDATION: Insert: A metallic shield or metalized foil shield with drain wire(s) shall be permitted to be applied either over the cable core, over groups of conductors or both into 340-3 and 727-6. Note: this insertion has been extracted from Article 725-71(e) of the 1999 NEC.
SUBSTANTIATION: This proposal will clarify the use of shielding in tray cable (Type TC), instrument tray cable (Type ITC), and power limited tray cable (Type PLTC). Shielding is often important to satisfactory operations of such cables. There is confusion on the part of users relative to the permitted use of shields for these three types of tray cable. Therefore, the wording of 725-71(e) should be added to Articles 340-3 and 727-6 to eliminate the confusion. Shielding of tray cables is covered in UL 13, Section 10, UL 1277, Section 10.4, but not in UL 2250. Therefore, a section such as in UL 13 or UL 1277 also needs to be added to UL 2250.
PANEL ACTION: Reject.
PANEL STATEMENT: Shielding is already allowed by the last sentence of the first paragraph of 727-6.

16- 106 - (727-7): Accept
SUBMITTER: Gerald Lee Dorna, Belden Wire & Cable Co.
RECOMMENDATION: Add the following sentence at the end of 727.7 to read:
"Voltage ratings shall not be marked on the cable."
SUBSTANTIATION: Currently 727.7 says the marking are to be to Section 310.11. Section 310.11(a)(1) says "The maximum rated voltage for which the conductor was listed" is to be marked on the surface of the cable. The conductors are rated for 300 volts, therefore, the UL standard for ITC (UL-2250) says the voltage rating of "300 volts" or "300 V" is to be surface marked on the cable. See UL-2250, paragraph 39.1(f). NEC Section 727-1 is very specific for the use of ITC cables. "...circuits operating at 150 volts or less." This seems to cause some confusion with the user. Not allowing any voltage rating to be marked on the cable will eliminate this problem.
PANEL ACTION: Accept.

16- 109 - (760-2-Abandoned Cable (New)): Accept
SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design / Rep. Building Industry Consulting Service Int'l
RECOMMENDATION: Add a new definition to read as follows:
Abandoned Cable. Cable that is neither terminated at both ends, at a connector or other equipment, nor identified for future use with a tag.
SUBSTANTIATION: The definition of abandoned cable is needed to accompany the proposals that require removal of abandoned cable. This definition reflects industry practices.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 19
NEGATIVE: 1
ABSTENTION: 1
EXPLANATION OF NEGATIVE:
DORNA: The definition of "Abandoned Cable" should be the same here as what we accepted in Proposal 16-273. It should be "Cable that is neither terminated at ~~both ends, at a connector or other~~ equipment, nor identified for future use with a tag." (This is the same wording as Proposal 16-273.)
The reason we took out the reference to connectors in Proposal 16-273 is because CATV cable usually has connectors attached. It was our concern that CATV cables would have connectors attached and then would not fall under the proposed original definition and therefore would not have to be removed if abandoned. I believe this also could be the case with cables in this Article 760. These cables could also have connectors attached, and therefore would not fall under the definition the panel had accepted in principal. If we make the definition the same as I have suggested above (the same as 16-273) then it will make it irrelevant on whether the cable has connectors or not. I can foresee someone using the fact that the cable has a connector on it, therefore it does not fall under "abandoned cable" and does not need to be removed.

(Log #4045)

16- 110 - (760-2- Excessive Accumulation of Abandoned Cables (New)): Reject
SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design / Rep. Building Industry Consulting Service Int'l
RECOMMENDATION: Add a new definition to read as follows:
Excessive Accumulation of Abandoned Cables. When the number of abandoned cables is greater than 1 / 3 of the total number of cables within a fire-containment zone.
SUBSTANTIATION: After the concept of plenum cables was introduced into the 1975 NEC, Underwriters Laboratories initially listed plenum cables by comparing the smoke production of plenum cables with the smoke production of conventional cables of the same physical design (but not plenum grade materials) in conduit. Plenum cables (not in conduit) were tested and compared with an equal number of conventional cables in conduit. It was assumed that the plenum cables were a replacement for conventional cables and that in case of a fire the amount of smoke would be reduced because of the lower smoke production of plenum cables. It was not anticipated that plenum cables would be abandoned. Since conventional cables in conduit were deemed to be acceptable the smoke from these cables is the benchmark for comparison and a fire involving an excessive amount of abandoned cables could emit excessive amount of smoke. Until research better defines what amount of abandoned cable might be excessive, allowing up to 1 / 3 excess of abandoned cables is prudent.
PANEL ACTION: Reject.
PANEL STATEMENT: The term is not used. The proposal that introduced this term was modified to eliminate the term.

16- 112 - (760-5): Accept in Principal
Note: See Technical Correlating Committee action on Proposal 16-38. It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting of a similar Proposal 16-192. The Technical Correlating Committee directs that the Action on this Proposal be revised to comply with the NEC Style Manual 3.2.1 relative to the use of the unenforceable terms "practicable" and "impracticable". This action will be considered by the Panel as a Public Comment. It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 3 for Comment.
SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions
RECOMMENDATION: Revise 760-5 as follows:
760-5. Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to equipment shall not be denied by an excess accumulation of conductors and cables ~~that prevents~~ sufficient to prevent the removal of panels, including suspended ceiling panels.
SUBSTANTIATION: Section 760-5 may be misinterpreted to mean that conductors and cables may not be placed directly on suspended ceilings. While the 1999 National Electrical Code Handbook emphasizes "excess accumulation" in the interpretive text, Figures 760-3 and 760-4 lead the reader to conclude that no conductors or cables are permitted to rest directly on the suspended ceiling. This was not the intent of CMP 16 when 760-5 was introduced into the 1993 NEC. At that time, CMP 16 stated in response to a similar proposal to Article 725 (1992 TCD, Comment 16-18) that the proposed requirement "... would still allow some cabling of a limited quantity above the ceiling tile, but not to an excessive amount." The proposed revision emphasizes that it is an excessive accumulation of conductors and cable that is of concern. A limited amount of cabling laid directly on a suspended ceiling is permitted, will not deny access to equipment, and does not present an unsafe working environment. This is a companion proposal and is intended to correlate with 725-5, 770-7, 800-5, 820-5 and 830-6.
PANEL ACTION: Accept in Principle.
Revise 760-5 to read as follows:
"760-5. Access to Electrical Equipment Behind Panels Designed to Allow Access
Access to electrical equipment shall not be denied by an accumulation of wires and cables that prevents removal of panels. Cables shall be installed in such a manner that the cable will not be damaged by normal building use. Access to electrical equipment behind ceilings designed to allow access shall comply with (a) or (b).
a. New building construction (e.g., renovation, remodeling, new spaces). Installation of cables shall comply with Section 300.11.
b. Buildings with existing cabling systems.
Where practicable, installation of cables shall comply with Section 300-11. Where impracticable to comply with Section 300-11, cables less than 13 mm (0.5 in) in diameter shall be permitted to be installed unsupported by the building structure in accordance with 1 or 2.
1. In areas having ceilings with access points or access panels, it shall be permissible to fish a maximum of three cables between access points in the ceiling.
2. In areas having suspended lay-in ceilings, it shall be permissible to install a maximum three unsupported cables on top of any one ceiling tile. The cables shall be run parallel to the ceiling grid."
PANEL STATEMENT: The revised text satisfies the intent of the original recommendation in that it allows some cabling of a limited quantity above ceiling tile but not an excessive amount, which would interfere with accessibility.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
EGEDSAL: See my Explanation of Negative Vote on Proposal 16-192.
COMMENT ON AFFIRMATIVE:
BRUNSSEN: I concur with the panel action in providing relief for a limited amount of after-construction fire alarm wiring and cables to be placed directly on the suspended ceiling tiles. However, proposed Section 760-5(b)(2), as presently written, is confusing and could be interpreted as permitting a total of only three unsupported cables. The intent of the panel was that up to a maximum of three unsupported cables may be routed across each and every ceiling tile. Revising 760-5(b)(2) to state: "...permissible to install a maximum of three unsupported cables on top of ~~any one~~ each ceiling tile, i.e., up to three cables are permitted to lay on a ceiling tile." would clarify the intent. Note that the word "of" is inserted and is missing in the original text.

(Log #CP1610)

16- 112a - (760-7): Accept
SUBMITTER: CMP 16
RECOMMENDATION: Revise 760-7 to read as follows:
"Fire Alarm Circuits Extending Beyond One Building. Power-limited fire alarm circuits that extend beyond one building and run outdoors shall either meet the installation requirements of Parts B, C, and D of Article 800, or shall meet the installation requirements of Part A of Article 300. Nonpower-limited fire alarm circuits that extend beyond one building and run outdoors shall meet the installation requirements of Part A of Article 300 and the applicable sections of Part A of Article 225.
SUBSTANTIATION: Fire alarm circuits are neither branch nor feeder circuits and referring to the complete Article 225 is inappropriate. Adding the reference to Part A of Article 300 provides the methods and materials for both power-limited and nonpower-limited fire alarm circuits that run outdoors.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:

(Log #4268)

16- 113 - (760-7): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
"…or shall meet the installation requirements in Part A of Article 225….".
SUBSTANTIATION: The 1999 NEC rewrite of this section inadvertently brought in the entire panoply of Article 225 requirements for outside circuits, including building disconnects. Based on several conversations with panel members, this doesn't appear to have been intended, at least for power-limited applications. This proposal is limited to the power-limited part of this section, but if the panel intends a similar recognition for nonpower-limited applications, it can and should take this opportunity to clarify that issue as well.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to the panel action on Proposal 16-112a which includes the submitter's recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #1803)

16- 114 - (760-7, Exception): Accept in Principle
SUBMITTER: Noel Williams, Noel Williams Consulting
RECOMMENDATION: Add new Exception to read as follows:
"Exception: Disconnecting means shall not be required on fire alarm circuits."
SUBSTANTIATION: Disconnecting means are required on outside branch circuits and feeders running from one building and another. Such disconnects are not appropriate for fire alarm circuits and may introduce a significant risk if provided. I believe such disconnects should be prohibited, but as I cannot contemplate all possible installations, the proposal is simply to exclude the requirement for disconnects.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to the panel action on Proposal 16-112a which includes the submitter's recommendation. It is not necessary to add an exception.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #3101)

16- 115 - (760-8): Accept in Principle
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Revise text to read as follows:
"Mechanical Execution of Work. Fire alarm circuits shall be installed in a neat and workmanlike manner. Exposed ~~C~~cables and conductors shall be supported by ~~the~~ structural components of the building ~~structure~~ in such a manner that the cable or conductors will not be damaged by normal building use. Exposed cables and conductors shall be attached to structural components at intervals not exceeding 5 ft (1.52 m) and within 12 in. (305 mm) from every cabinet, box or fitting by straps, staples, hangers or similar fittings designed and installed so as not to damage the cable or conductors. The installation shall also conform with Section 300-4(d)."
Also, delete the Fine Print Note.
SUBSTANTIATION: Systems continue to be installed by "tossing" exposed cables and conductors across lay-in ceiling tiles and routed through open joist construction with no regard for proper support of the cables and conductors as just one example. The intent is that these exposed cables and conductors are supported by structural components of the building, such as; beams, joists, columns or walls. Too often, the sole means of support is by laying these cables and conductors n removable ceiling panels or attaching them to a ceiling support system (T-bars or wires) which is prohibited by the National Electrical Code.
Another common observation is seeing them "strung" through open joist construction with little or no means of support other than occasionally being wrapped around a portion of the joist to keep them from sagging. The addition and use of "exposed" was carefully chosen to avoid conflict with acceptable methods within the section of installing "concealed" cables and conductors, which typically are not going to be subjected to physical damage. The reference to 300-4(d) is to protect concealed cables and conductors when appropriate.
The new text has been taken partially from, and with, Sections 330-12, 333-7 and 336-18 in mind which also deal with exposed cable systems. These changes will ensure that cables and conductors are supported properly as well as provided with strain relief when entering electrical enclosures for connections, splicing and termination's.
PANEL ACTION: Accept in Principle.
Revise the submitter's recommendation to read as follows:
Revise text to read as follows:
"Mechanical Execution of Work. Class 1, Class 2, and Class 3 circuits shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed on the surface of ceiling and sidewalls shall be supported by ~~the~~ structural components of the building ~~structure~~ in such a manner that the cable or conductors will not be damaged by normal building use. Such cables and conductors shall be attached to structural components at intervals not exceeding 1.52 m (5 ft) and within 305 mm (12 in.) from every cabinet, box or fitting by straps, staples, hangers or similar fittings designed and installed so as not to damage the cable or conductors. The installation shall also conform with Section 300-4(d).
Also, delete the Fine Print Note.
PANEL STATEMENT: The revised text conforms to the definitions in Article 100, and satisfies the intent of the submitter.

(Log #3664)

16- 116 - (760-8): Accept
SUBMITTER: Melvin J. Wierenga, Wierenga & Assoc.
RECOMMENDATION: Delete the FPN associated with this section.
SUBSTANTIATION: Problem: The standards listed contain insufficient information to determine accepted industry practice for systems and equipment included in Article 760.
Substantiation: A detailed review of ANSI/EIA/TIA/568A-1995, ANSI/EIA/TIA/569-1990 , and ANSI/EIA/TIA/570-1991 was completed by the submitter and no significant information, guidance, or directives were found, that would be helpful to a user of this Article of the Code. These standards were developed by the telecom and computer industries. They provide the details covering telecommunication infrastructure such as cable pathways, equipment spaces, telephone grounding/bonding, and telecommunication administration. They are excellent standards but they do not address typical cabling installation issues such as:
(a) how to properly pull wire(s) above a lay ceiling.
(b) when and where to support the wire in a building structure.
(c) how to dress various types of audio signal wires coming into and within an equipment cabinet.
(d) how and where to set up wire reels for riser cables in tall structures.
(e) how and where to dress audio speaker wire along a steel beam in a gymnasium or factory.
(f) what to watch out for when pulling a cable into a raceway.
These standards are purported to be the concept standards for guiding the users of the Code in determining appropriate mechanical execution of work and determination of acceptable industry practices. However, such is not the intent of the standards. For those who do not have a set of the standard available, the submitter has provided an Appendix that summarizes each section of each standard. The appendix will give you an overview of the contents of each section of each standard and enable you to gain a better understanding of what the standards cover.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept.
PANEL STATEMENT: The proposed recommendation has been incorporated by the panel action on Proposal 16-115.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 19
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
LANNI: After reviewing the NECA index No. 5037, I realized that there are very useful National Electrical Installation Standards available and a Fine Print Note is the appropriate way to guide the code user. I also feel that the panel did satisfy the original submitter when the Fine Print Note was incorporated into the code. Improving the references, instead of removing the Fine Print Note, would improve our original work. Installation documents are being produced all the time partially in response to our note in the code. The panel could only answer one of the Submitter's concerns, namely, "when and where to support the wire in a building structure." Other issues are left unanswered. Good workmanship is an important component of a safe installation, but the code cannot address all these issues and other documents are more suited for the purpose.
ROMLEIN: See my Explanation of Negative Vote on Proposal 16-3.

(Log #3753)

16- 117 - (760-8): Accept in Principle
SUBMITTER: Douglas R. Erb, Construction Insp. Dept., Ocean County, NJ
RECOMMENDATION: Add a second paragraph to read as follows:
"Type PLFA Cables shall be secured by staples, cable ties, straps or similar fittings designed and installed as not to damage the cable. Cables shall be secured at intervals not exceeding 6 ft and within 12 in. from every cabinet, box, or device.
Exception No. 1: For concealed work in finished buildings where such support is impracticable, it shall be permissible to fish cable between access points."
SUBSTANTIATION: The absence of a definitive support requirement for PLFA cables which is provided for other wiring method throughout this code is needed. Without a definite support requirement enforcement of the general requirements of 760-8 provide no consistency. With the increased presence of PLFA cables especially in drop ceilings damage to these cables and the integrity of their systems has increased with the lack of proper support. Lack of support for these cables creates an unsafe work area for others attempting work in these spaces.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to the panel action and statement on Proposal 16-115 and 16-116. The revised text meets the intent of the submitter.

(Log #2775)

16- 122 - (760-25(b)): Reject
SUBMITTER: Gregory P. Bierals, Electrical Design Inst.
RECOMMENDATION: Add new text to read as follows:
Raceways or Cable trays containing fire alarm circuits shall not contain any pipe, tube, or equal for steam, water, air, gas, drainage, or any service other than electrical.
SUBSTANTIATION: There presently is no reference in Article 760 that prohibits this practice.
PANEL ACTION: Reject.
PANEL STATEMENT: Refer to the panel action and statement on Proposal 16-70. This proposal deals with the same issues as Proposal 16-70 and is rejected for the same reasons.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #1004)

16- 123 - (760-28(a), (b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) NPLFA Circuits and Class 1 Circuits. Where only nonpower-limited fire alarm circuits and Class 1 circuit conductors are in a raceway or cable, the number of conductors in a raceway shall be determined in accordance with Section 300-17. (remainder unchanged).
(b) Power-Supply Conductors and Fire Alarm Circuit Conductors. Where power-supply conductors and fire alarm conductors are permitted in a raceway or cable in accordance with Section 760-26, the number of conductors in a raceway shall be determined in accordance with Section 300-17. (remainder unchanged).
SUBSTANTIATION: Editorial. Although the second sentences of (a) and (b) do not literally preclude application of Section 310-15(b)(2)(a) to cables, the provisions of this section re: derating may suggest the modifications only apply to conductors in a raceway, since cables are not mentioned. The proposal continues to indicate the number of conductor in a raceway but more clearly indicates the derating modifications apply also to cables.
PANEL ACTION: Reject.
PANEL STATEMENT: The section explicitly deals with the number of conductors permitted in a raceway. Inserting the word "cable" causes confusion and raises a question as to the number of nonpower-limited circuit conductors that are permitted in a cable.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #4137)

16- 127 - (760-30(b)(2)): Accept in Principle
SUBMITTER: Marcelo M. Hirschler, GBH Int'l, Inc./Rep. Plenum Cable Assn.
RECOMMENDATION: Revise as follows:
760-30. Multiconductor NPLFA Cables. Multiconductor nonpower-limited fire alarm cables that meet the requirements of Section 760-31 shall be permitted to be used on fire alarm circuits operating at 150 volts or less and shall be installed in accordance with (a) through (b) below.
(b) Applications of Listed NPLFA Cables. The use of nonpower-limited fire alarm circuit cables shall comply with (1) through (4).
(2) Other Spaces Used for Environmental Air. Cables installed in other spaces used for environmental air shall be Type NPLFP. Abandoned cables, not intended for future use, shall not be permitted to remain.
Exception No. 1: Types NPLFR and NPLF cables installed in compliance with Section 300-22(c).
Exception No. 2: Other wiring methods in accordance with Section 300-22(c) and conductors in compliance with Section 760-27(c).
SUBSTANTIATION: There is a significant amount of information indicating that the amount of cables installed in plenums, and other air-handling spaces, is increasing rapidly. An understanding of cabling practices indicates that the most common way in which cable installation is carried out is by disconnecting existing cable and leaving it abandoned in place, while introducing the cable needed to perform the additional functions. See Log #43136. There is, as yet, no indication that the additional cables in plenums causes an added fire hazard, and the fire record of cables in concealed spaces, both above ceilings and below floors, remains excellent. In fact, plenum cables, which meet the fire test requirements of NFPA 262, have been shown to have extremely good fire performance and to spread flame only very slowly, if at all. However, this type of preventive measure is worthwhile.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The proposer's intent was satisfied by panel action on Proposal 16-144.

(Log #4145)

16- 131 - (760-41(d) (New)): Reject

SUBMITTER: William Keezer, Bose Corp./Rep. Nat'l Systems Contractors Assn. (NSCA)

RECOMMENDATION: Add a new paragrph 760-41(d), as follows:

(d) Audio Amplifiers. Audio amplifiers meeting the listing requirements of Section 640-9(c) and permitted to employ Class 2 or Class 3 wiring and wiring methods in accorance with Article 725, shall be considered a power source for PLFA circuits when used in a voice/alarm or combination system in accordance with NFPA 72, 1999 National Fire Alarm Code. PLFA audio amplifier output circuits shall be installed in accordance with Sections 760-42, 760-52, 760-54, 760-61, and 760-71 as applicable.

SUBSTANTIATION: 1) The methods for determining the safety of PLFA Circuits as defined in Tables 12(a) and 12(b) in Chapter 9 are inappropriate for determining the safety of audio amplifier output circuits. Recent developments in the area of voice/alarm performance requirements in NFPA 72, 1999 suggest that some voice/alarm performance requirements would be best met through the use of commercial audio system components suitably listed for fire alarm use. This proposal would permit the use of PLFA wiring methods for audio amplifier output circuits when the audio amplifier output circuit has been found to be of equivalent safety to a Class 2 or Class 3 circuit as defined in Article 725. The sections of Article 760 that would be applicable to amplifier output wiring materials and methods are clearly specified to avoid confusion.

2) When an amplifier is used in a voice/alarm or combination system in accordance with NFPA 72, 1999 National Fire Alarm Code, the safety concerns for appropriately wiring such systems should be equivalent to those concerns for the installation of a nonemergency audio systems. Since Article 760 clearly considers PLFA circuits to be of equivalent safety to a Class 3 circuit as defined in Article 725, then an audio amplifier output circuit listed as permitting Class 2 or Class 3 wiring methods is clearly safe enough to employ PLFA wiring methods. This proposal would allow the listing standard to specify that the use of PLFA wiring methods is permitted when an amplifier meets the Class 2 or Class 3 listing requirements of Section 640-9(c).

Not only are the methods for determining the safety of PLFA Circuits as defined in Tables 12(a) and 12(b) in Chapter 9 inappropriate for determining the safety of audio amplifier output circuits, but a similar limitation may be found in Tables 11(a) and 11(b) when one attempts to apply them to audio amplifiers used for nonemergency purposes. It is for this reason that Section 640-9(c) was written in a manner which recognizes the unique power and voltage characteristics of an audio signal when determining whether Class 2 or Class 3 wiring methods can be employed.

An audio amplifier is clearly neither a Class 2 or Class 3 transformer or power supply, yet listing test methods have been devised to define when an audio amplifier's output characteristics represent a power source of equivalent safety. It is clear from 760-41(a) and 760-41(b), that sources of energy equal to that of Class 3 circuits as defined in Article 725 are considered of equivalent safety to PLFA circuits. If so, an amplifier entitled to employ Class 2 or Class 3 wiring methods should also be considered of equivalent or superior safety to a PLFA source of power.

It is recognized that, should this proposal be adopted, audio amplifiers listed for use with Class 2 or Class 3 in accordance with Section 640-9(c) would be recognized as clearly meeting the circuit safety concerns for PLFA circuits. This does not mean that such amplifiers should be used in fire alarm audio system unless the amplifier also meets certain additional performance criteria such as is found in Amplifiers for Fire Protective Signaling Systems ANSI/UL 1711-1994. It is anticipated that listing requirements consequent to this proposal will be addressed by UL through appropriate revision of UL 1711 or other applicable listing standards.

Note to Correlating Committee: While this proposal could be independently adopted, it is suggested that a companion proposal by the same submitter to change Section 640-9(c) be correlated with this one. That proposal similarly addresses the same issue, and refers back to Article 760 to establish reciprocity between the two articles.

PANEL ACTION: Reject.

PANEL STATEMENT: Notification appliance circuits are under the purview of NFPA 72 which requires equipment to be listed for the purpose (fire alarm) being installed.

760-54. Installation of Conductors and Equipment

(a) Separation from Electric Light, Power, Class 1, NPLFA, ~~and~~ Medium and High Power Network-Powered Broadband Communications Circuit Conductors.

(1) In Cables, Compartments, Enclosures, Outlet Boxes, or Raceways. Power-limited circuit cables and conductors shall not be placed in any cable, cable tray, compartment, enclosure, outlet box, raceway, or similar fitting with conductors of electric light, power, Class 1, nonpower-limited fire alarm circuit conductors, ~~or~~ medium or high power network-powered broadband communications circuits.

Exception No. 1: Where the conductors of the electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuit conductors are separated by a barrier from the power-limited fire alarm circuits. In enclosures, power-limited fire alarm circuits shall be permitted to be installed in a raceway within the enclosure to separate them from Class 1, electric light, power, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuits.

Exception No. 2: Conductors in compartments, enclosures, device boxes, outlet boxes, or similar fittings, where electric light, power, Class 1, nonpower-limited fire alarm, ~~or~~ medium or high power network-powered broadband communications circuit conductors are introduced solely to connect to the equipment connected to power-limited circuits to which the other conductors are connected, and

a. The electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuit conductors are routed to maintain a minimum of 0.25 in. (6.35 mm) separation from the conductors and cables of power-limited fire alarm circuits, or

b. The circuit conductors operate at 150 volts or less to ground and also comply with one of the following.

1. The fire alarm power-limited circuits are installed using Types FPL, FPLR, FPLP or permitted substitute cables, provided these power-limited cable conductors extending beyond the jacket are separated by a minimum of 0.25 in. (6.35 mm) or by a nonconductive sleeve or nonconductive barrier from all other conductors, or

2. The fire alarm power-limited circuit conductors are installed as nonpower-limited fire alarm circuits in accordance with Section 760-25.

Exception No. 3: Conductors entering compartments, enclosures, device boxes, outlet boxes, or similar fittings, where electric light, power, Class 1, nonpower-limited fire alarm, ~~or~~ medium or high power network-powered broadband communications circuit conductors are introduced solely to connect to the equipment connected to power-limited fire alarm circuits or to other circuits controlled by the fire alarm system to which the other conductors in the enclosure are connected. If the conductors must enter an enclosure that is provided with a single opening, they shall be permitted to enter through a single fitting (such as a tee) provided the conductors are separated from the conductors of the other circuits by a continuous and firmly fixed nonconductor, such as flexible tubing.

(2) In Hoistways. Power-limited fire alarm circuit conductors shall be installed in rigid metal conduit, intermediate metal conduit, or electrical metallic tubing in hoistways.
Exception: As provided for in Section 620-21 for elevators and similar equipment.

(3) Other Applications. Power-limited fire alarm circuit conductors shall be separated at least 2 in. (50.8 mm) from conductors of any electric light, power, Class 1, nonpower-limited fire alarm, ~~or~~ medium or high power network-powered broadband communications circuits.

Exception No. 1: Where either (1) all of the electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuit conductors or (2) all of the power-limited fire alarm circuit conductors are in raceway or in metal-sheathed, metal-clad, nonmetallic-sheathed, or Type UF cables.

Exception No. 2: Where all of the electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuit conductors are permanently separated from all of the power-limited fire alarm circuit conductors by a continuous and firmly fixed nonconductor, such as porcelain tubes or flexible tubing in addition to the insulation on the wire.

(b) Conductors of Different PLFA Circuits, Class 2, Class 3, and Communications Circuits in Same Cable, Enclosure, or Raceway.

(1) Two or More PLFA Circuits. Cable and conductors of two or more power-limited fire alarm circuits, communications circuits, or Class 3 circuits shall be permitted in the same cable, enclosure, or raceway.

(2) Class 2 Circuits with PLFA Circuits. Conductors of one or more Class 2 circuits shall be permitted within the same cable, enclosure, or raceway with conductors of power-limited fire alarm circuits, provided that the insulation of the Class 2 circuit conductors in the cable, enclosure, or raceway is at least that required by the power-limited fire alarm circuits.

(3) Low Power Network-Powered Broadband Communications Cables and PLFA Cables. Low power network-powered broadband communications circuits shall be permitted in the same enclosure or raceway with PLFA cables.

(c) Support of Conductors. Power-limited fire alarm circuit conductors shall not be strapped, taped, or attached by any means to the exterior of any conduit or other raceway as a means of support.

(d) Conductor Size. Conductors of No. 26 shall only be permitted where spliced with a connector listed as suitable for No. 26 to No. 24 or larger conductors that are terminated on equipment or where the No. 26 conductors are terminated on equipment listed as suitable for No. 26 conductors. Single conductors shall not be smaller than No. 18.

SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. This proposal amends the separation rules between circuits to provide appropriate separation from these new high-power communications circuits.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.

16- 134 - (760-54(a) Exception No. 1): Accept
SUBMITTER: Robert L. Hughes, Chattanooga, TN
RECOMMENDATION: Revise text to read as follows:

(a) Separation from Electric Light, Power, Class 1, NPLFA, and Medium Power Network-Powered Broadband Communications Circuit Conductors.

(1) In Cables, Compartments, Enclosures, Outlet Boxes, or Raceways. Power-limited circuit cables and conductors shall not be placed in any cable, cable tray, compartment, enclosure, outlet box, raceway, or similar fitting with conductors of electric light, power, Class 1, nonpower-limited fire alarm circuit conductors, or medium power network-powered broadband communications circuits.

Exception No. 1: Where the conductors of the electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuit conductors are separated by a barrier from the power-limtied fire alarm circuits. In enclosures or cable tray, power-limited fire alarm circuits shall be permitted to be installed in a raceway or in a continuous nonconductor, such as a porcelain tube or flexible tubing within the enclosure or cable tray to separate them from Class 1, electric light, power, nonpower-limited fire alarm, and medium power network-powered broadband communications circuits.

SUBSTANTIATION: Cable tray was added to 760-54(a) in the 1999 NEC. Making this revision to Exception No. 1 will better align Section (1) and Section (3) and still maintain the intent of adding cable tray to the Article.
PANEL ACTION: Accept.

16- 135 - (760-54(a)(1) Exception No. 2): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 760-54(a)(1) Exception No. 2(a) - change "0.25 in. (6.35 mm" to "6.35 mm (0.25 in.)."
760-54(a)(1) Exception No. 2(b)(1) - change "0.25 in. (6.35 mm)" to "6.35 mm (0.25 in.)"
The CMP should consider rounding to "6 mm (0.25 in.)" in both instances if safety would not be compromised.
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
The SI units are not rounded since the dimensions specify minimum values for safety.
PANEL ACTION: Accept in Principle.
In the submitter's recommended text revise "6.35 mm (0.25 in.)" to "6 mm (0.25 in.)."
PANEL STATEMENT: The Panel has accepted the TCC suggestion to round to "6 mm (0.25 in.)" and has included in the panel action text.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #643)

16- 137 - (760-54(b)(3)): Accept in Principle
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Renumber 760-54(b)(3) to 760-54(b)(5) and add:
(3) Communications Circuits with PLFA Cables. Communications circuits shall be permitted in the same enclosure or raceway with PLFA cables.
(4) Community antenna television and radio distribution circuits with PLFA Cables. Community antenna television and radio distribution systems shall be permitted in the same enclosure or raceway with PLFA cables.
SUBSTANTIATION: The title of 760-54(b) includes communications circuits. Apparently they were left out in error.
PANEL ACTION: Accept in Principle.
Revise and renumber 760-54(b)(3) to 760-54(b)(5) and add:
(3) Communications Circuits with PLFA Circuits. Communications circuits shall be permitted in the same enclosure or raceway with PLFA circuits.
(4) Community antenna television and radio distribution circuits with PLFA Circuits. Community antenna television and radio distribution cables shall be permitted in the same enclosure or raceway with PLFA circuits."
In addition revise the new section (5) to replace the word "cables" with "circuits."
PANEL STATEMENT: The wording changes have been made for consistency and clarity.

(Log #1003)

16- 138 - (760-54(c)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Power-limited fire alarm circuit conductors shall not be strapped, taped, or attached by any means to the exterior of any ~~conduit or other~~ raceway or cable as ~~a~~ the required means of support.
Exception: Where installed in accordance with 760-6 attachment to an approved service mast in accordance with Exception No. 2 for Section 800-10(b) shall be permitted.
SUBSTANTIATION: Editorial. "Conduit" is superfluous. Cables such as Types AC, MC, MI, NM, SE, etc., should be included. The proposal would not bar bundling or strapping together where it is incidental but not prime support. The exception would correlate Section 760-7 and 800-10(b), Exception No. 2 and remove a perceived conflict.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed exception references 760-6, "Fire Alarm Circuit and Equipment Grounding" and is an inappropriate reference for attachments to a service mast.

16- 139 - (760-54(e) (New)): Accept in Principle in Part
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Insert a new Section 760-54(e) as follows:
(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating. Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate. Accumulations of abandoned cables, not identified for future use, in ducts, plenums, and other space used for environmental air, shall be removed.
Exception: Type FPLP-50 cables shall not be required to be removed.
FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.
SUBSTANTIATION: See my proposal for Section 800-52(b).
PANEL ACTION: Accept in Principle in Part.
The part being rejected is the recommendation to add the exception. The panel actions in other proposals adopting the requirement to remove abandon cables satisfies the proposal other than the exception. There is inadequate justification to leave any debris (e.g. abandoned cable).
The remaining part of the proposal is accepted in principle.
PANEL STATEMENT: Refer to panel action on Proposal 16-144.

(Log #3210)

16- 140 - (760-54(e) (New)): Accept in Principle in Part
SUBMITTER: S. E. Egesdal, Honeywell Inc.
RECOMMENDATION: Insert a new Section 760-54(e) as follows:
(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating. Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to acccumulate. Accumulations of abandoned cables, not identified for future use, in ducts, plenums, and other space used for environmental air, shall be removed.
Exception: Type FPLP-50 cables shall not be required to be removed.
FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire resistive rating of assemblies where penetrations or openings are made.
SUBSTANTIATION: Addition of "to maintain the fire resistance rating" to the end of the second sentence will correlate this section with Section 300-21.
The proposed Fine Print No.1 Note was copied from the first sentence of the Fine Print Note in Section 300-21. It assists installers in locating fire stop information.
Cables installed in plenums (other space used for environmental air) are often abandoned, rather than removed, when no longer in use. Consequently, there may exist layer upon layer of abandoned cable in a hung ceiling as communications systems are changed and modernized. Some of this abandoned cable may be nonplenum cable that was installed before plenum cable requirements were in place. These accumulations of abandoned cables serve no useful purpose and unnecessarily increase the potential fire load. The wording of the proposed prohibition on allowing abandoned cables to accumulate is based on NFPA 75, Standard for the Protection of Electronic Computer/Data Processing Equipment, Section 4-2.4 that states "Abandoned cables shall not be allowed to accumulate. Cables not identified for future use shall be removed."
This proposed wording addresses the issue of excess combustibles in plenums without requiring the removal of all abandoned cable, only accumulations of abandoned cable, thus avoiding a burdensome requirement, which would require the removal of insignificant amounts of cable. The proposed first sentence, Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate, limits the amount of cable that will be permitted to be abandoned. It applies to all cable that is in place, plenum cable as well as nonplenum cable that was installed before the plenum cable requirements were in the code. The proposed second sentence, Accumulations of abandoned cables, not identified for future use, in ducts, plenums, and other space used for environmental air, shall be removed, deals with already abandoned cable. The NEC requirements for plenum cable were first promulgated in the 1975 NEC, consequently, abandoned cables in older buildings often include unlisted cable along with listed plenum cable.
Other sections of the NEC require the removal of abandoned wiring.
Article 354 — Underfloor Raceways, Section 354-7. Discontinued Outlets.
Article 356 — Cellular Metal Floor Raceways, Section 356-7. Discontinued Outlets.
Article 358 — Cellular Concrete Floor Raceways, Section 358-13. Discontinued Outlets.
Article 305 — Temporary Wiring, Section 305-3(d). Time Constraints.
(d) Removal.
Exempting Type FPLP-50, which is a plenum cable that is also listed as limited combustible with a smoke developed rating of less than 50, correlates with NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems. Correlating with NFPA 90A acknowledges that the NFPA Standards Council has assigned primary responsibility for fire protection of plenums to NFPA 90A. The basic requirement for materials in a plenum in NFPA 90A is that the materials either be noncombustible or limited combustible with a smoke developed rating of less than 50.
PANEL ACTION: Accept in Principle in Part.
The part being rejected is the recommendation to add the exception. The panel actions in other proposals adopting the requirement to remove abandon cables satisfies the proposal other than the exception. There is inadequate justification to leave any debris (e.g. abandoned cable).
The remaining part of the proposal is accepted in principle.

(Log #3625)

16- 142 - (760-54(e) (New)): Accept in Principle
SUBMITTER: David B. Kiddoo, AlphaGary Corp.
RECOMMENDATION: Insert a new Section 760-54(e) as follows:
(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, ventilation ducts or air-handling plenums shall be made so that the possible spread of fire or fire resistant-rated walls, partitions, floors or ceilings shall be firestopped using approved methods to maintain the fire resistant rating. Abandoned cables in these spaces, shafts, ducts and plenums shall not be allowed to accumulate. Accumulations of abandoned cables, not identified for future use, in these spaces, shafts, ducts, plenums, and other space used for environmental air, shall be removed.
FPN No. 1: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.
FPN No. 2: Definition of acceptable cable fire performance in various applications are described in Section 760-71.
SUBSTANTIATION: This issue has been discussed and reviewed in the last cycle of the NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems). The membership of the NFPA did NOT support a proposal to change the provisions for cables in the paragraphs on "ceiling cavity plenums" (2-3.10.1) and "raised floor plenums" (2-3.10.5) that would have allowed "Permanent Plenum Cables" to accumulate in these plenums. ("Permanent Plenum Cables" are so named through a Project being conducted by the National Fire Protection Research Foundation (NFPRF) and are described to meet a new, undefined, cable Listing for "limited combustibility" and "smoke developed index".) The more comprehensive solution to the issue of accumulating abandoned

cables would have been to adopt a requirement to remove "ALL" abandoned cables that are removed from service and not intended for future use. Allowing for "Permanent Plenum Cables" to remain in plenums when abandoned would not address the serious issues of "congestion", "air flow restriction", and "total fuel load accumulation".

An appeal to the Standards Council was generated by proponents for "Permanent Plenum Cable" to overturn the Membership Action that occurred at the 1999 Annual Meeting. The Standards Council upheld the NFPA Membership Action after the hearing of the appeal. Comments from the final decision of the Standards Council on this matter are:

- "After a hearing, the Council reviewed and considered all of the information available to it, and voted to deny the appeals."
- "...wire and cable represents a significant potential fuel load in plenums and that, due to the rapidly increasing use of such cable in recent years, some approach to the problem should be devised."
- "...while it is the floor vote in favor of a return to the previous edition text that resulted in this recommendation, informational ballots of the TC (NFPA 90A Technical Committee) following that vote give further support to the conclusion that a lack of consensus exists in favor of going forward with the abandoned cable provisions. A majority of TC members voting on these informational ballots also supported the return to previous edition text..."
- "...the previous edition text is, in the Council's view, clearly suitable."
- "...the Council itself has concerns about the TC's approach and has concluded that further study of this important issue is needed."
- "...the Council wants to ensure that, as the TC undertakes to fully and fairly address these issued going forward, it has the best available range of expertise, representation, and experience. The Council, therefore, is referring the matter of committee membership to the Council's membership task group for review and recommendations."

While plenum cables are not typically the ignition source of fires, due to the low energy conducted through them, the fuel characteristics of high volumes of abandoned cable in plenums, whether combustible or limited combustible by definition, will most certainly add to the heat and energy released in a large, exposing fire, such as those where the ignition source is a room and contents fire below or above the plenum.

This proposal addresses the growing safety issue of accumulating abandoned cable in concealed spaces, without selectively favoring any cable geometry or synergy of materials. It does not allow for further accumulation of "Permanent Plenum Cables" which, when removed from service and not intended for future use, no longer have any function—except perhaps to serve as fuel for some future conflagration.

The proposal adopts consistent wording from NFPA 70, National Electrical Code, Section 300-21 and NFPA 75, Protection of Electronic Computer/Data Processing Equipment, paragraph 4-2.4. Basing this new requirement on existing code shows the strong intent, stated in the past by the Standards Council, to have good consistent code language across the various NFPA standards. Arguments by the proponents of "Permanent Plenum Cable" in the NFPA 90A review process to somehow create a new cable test requirement based on the definition of "limited combustibility" and "smoke developed index" created for building construction products would be a further misuse of the NFPA 255 and NFPA 259 "materials" test methods.

In spite of the rapid attempts by the proponents of "Permanent Plenum Cable", neither Underwriters Laboratories (UL) nor Intertek Testing Services (ITS/ETL) have yet established Listing criteria for "Permanent Plenum Cable" that could cover the matrix of cable types used in a plenum (fiber optics, coax, etc.). In fact, initial attempts over the first 9 months of the NFPRF Project to test finished cable in the NFPA 255 and NFPA 259 test methods has only shown inconsistencies and extremely limited capability of cables to meet the established definitions of "limited combustibility" and "smoke developed index" established for construction products. These test methods do NOT allow for cables to be tested based on their installed condition, nor can they be used to test cables with the important integration of finished cable geometries and materials/conductor or fiber synergies as they impact fire performance.

The proponents of "Permanent Plenum Cable" are applying these "material" tests inappropriately to cables. This is particularly why more sophisticated, integrated "cable" fire tests such as NFPA 262 (Plenum), ANSI/UL 1666 (Riser), and ANSI/UL 1581 (Vertical Tray) have been established and referenced in Standards such as the NFPA 70, NFPA 90A, etc. These tests more accurately simulate the actual fire hazards for installed cables, both in terms of the building environment AND the installed configuration. Integrated tests such as these are used to show the cables are designed to help contribute to minimizing the spread of fire and smoke generation in the early stages of a fire, allowing time for people to egress from the building. The fire safety record clearly shows that these tests have been successful in differentiating the fire performance of cables more accurately than materials tests such as NFPA 255 or NFPA 259.

The definition for cable fire performance in NFPA 90A Sections 2-3.10.1 and 2-3.10.5 are listed as Exceptions because the covering paragraphs (a) in each Section refer only to "materials" used in the construction of plenums. Proponents of "Permanent Plenum Cable" tried to make the argument in the NFPA 90A proposal review that IF the cable can be shown to meet the requirements of the plenum construction materials, accumulation of this cable is justifiable. As was acknowledged by members of the Standards Council during the NFPA 90A Appeal Hearing, cable jackets and insulations will NEVER look like the rigid materials used to construct plenums. Establishing a "Permanent Plenum Cable" Exception in a requirement to remove abandoned cable would clearly allow for a loop-hole to continue to proliferate abandoned cable accumulation and NOT address the serious issues of total fuel load, congestion, and air flow.

NFPA 75 Appendix A, paragraph A-4-2.4 says: "Abandoned cable will potentially interfere with air flow and extinguishing systems. Abandoned cable also adds to the fuel loading." This proposal would provide consistency with the established fire testing criteria and/or abandoned cable removal provisions established by NFPA 70, NFPA 75 and the appropriate Exceptions established for cables in NFPA 90A.

As was shared by Richard G. Gewain of Hughes Associates (with many years of direct involvement in these definitions) at the NFPA 90A TC meeting in December, 1998, the NFPA 220, Building Construction Committee (BCC) reviewed the definition of "non-combustible" and the new definition "limited combustible" in 1975. The BCC made it clear that these definitions "apply to the materials used in the construction of buildings (floors, roofs, columns, walls, etc.), but do NOT apply to furnishings or the contents of buildings, or to the fire hazard evaluation of materials." This language is clearly spelled out in the Special Interest Bulletin No. 294, currently entitled "Noncombustible and Limited-Combustible Building Construction Materials", published and updated several times since 1956 by the National Board of Fire Underwriters (a.k.a. American Insurance Association, currently known as the American Insurance Services Group).

Because of the concern that other NFPA Committees have been misusing the term "limited combustible", the Standards Council has assigned the responsibility for the term "limited combustible" to the BCC. The BCC has recently requested its Chairman to contact the Chairmen of the other NFPA Committees (covering 48 NFPA Standards) using this term and ask for a clarification of what is intended for its use. A BCC Task Group is now established to develop proposals or comments to ensure that the term in other standards such as NFPA 90A is used correctly. From a fire hazards point of view, it has clearly NOT been shown that using the current definitions of "limited combustible" and "smoke developed index" and NFPA 259/NFPA 255 test methods are appropriate for installed cables.

This proposal also alleviates the concern and burden to the authority having jurisdiction inspector enforcing NFPA 70 to identify different types of cables currently in the concealed spaces and removed from service. The requirements to remove ALL abandoned cable not intended for future use should be less cumbersome than to remove only "some" of the cables.

PANEL ACTION: Accept in Principle.

(Log #4051)

16- 144 - (760-54(e)): Accept in Principle
SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design / Rep. Building Industry Consulting Service Int'l
RECOMMENDATION: Revise Section 760-54(e) as follows:
(b) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.
Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate. Excessive accumulations of abandoned cables, in ducts, plenums, and other space used for environmental air, shall be removed where practicable.
FPN : Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.
SUBSTANTIATION: BICSI members have been extensively involved with the design and installation of telecommunications cabling. Technology changes have resulted in newer high performance cabling being installed in support of those technologies. We have observed excessive accumulations of abandoned cabling adding to the fuel loading within plenum spaces. This proposal is offered to the NFPA to help reduce the fuel load within these plenum areas.
Addition of "to maintain the fire resistance rating" to the end of the second sentence will correlate this section with section 300-21.
The proposed fine print No. 1 note was copied from the first sentence of the fine print note in section 300-21. It assists installers in locating firestop information.
Acceptance of this proposal will result in cable removal being included in the scope of the installation of a new communications and data system. The contractor will remove the old cable before installing the new system.
Acceptance of this proposal will result in many BICSI members specifying abandoned cable removal within the scope of the installation of new communications and data systems.
In two separate proposals, we have offered definitions for "abandoned cable" and "excessive accumulation of abandoned cables".
This proposed wording addresses the issue of excess combustibles in plenums without requiring the removal of all abandoned cable, only excessive accumulations of abandoned cable, thus avoiding a burdensome requirement of removing insignificant amounts of cable. The proposed first sentence, Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate, limits the amount of cable that will be permitted to be abandoned. It applies to all cable that is in place, plenum cable as well as non-plenum cable that was installed before the plenum cable requirements were in the Code. The proposed second sentence, Excessive accumulations of abandoned cables, in ducts, plenums, and other space used for environmental air, shall be removed, where practicable, deals with already abandoned cable. The wording of "where practicable" aid the situations where cable may be intertwined and cannot be removed without disruption of active services. The NEC requirements for plenum cable were first promulgated in the 1975 NEC, consequently, abandoned cables in older buildings often include unlisted cable along with listed plenum cable.
Other sections of the NEC require the removal of abandoned wiring.
ARTICLE 354 — Underfloor Raceways, Section 354-7. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.
ARTICLE 356 — Cellular Metal Floor Raceways, Section 356-7. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.
ARTICLE 358 — Cellular Concrete Floor Raceways, Section 358-13. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case of abandoned outlets on loop wiring, shall be allowed in raceways.
ARTICLE 305 — Temporary Wiring, Section 305-3(d). Time Constraints, (d) Removal. Temporary wiring shall be removed immediately upon completion of construction or purpose for which the wiring was installed.
PANEL ACTION: Accept in Principle.
Revise 760-3(a) to read as follows:
"(a) Spread of Fire or Products of Combustion. Section 300-21. Abandoned cables not intended for future use shall not be permitted to remain."
PANEL STATEMENT: The revision meets the intent of the submitter. It is more appropriate to place the requirement in 760-3(a) which addresses the subject.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20
ABSTENTION: 1
COMMENT ON AFFIRMATIVE:
BRUNSSEN: See my Comment on Affirmative Vote on Proposal 16-80.
DORNA: The revised wording for 760-3(a) should read as follows:
"(a) Spread of Fire or Products of Combustion. Section 300-21. Abandoned cables ~~not intended for future use~~ shall not be permitted to remain."
The use of the phrase "not intended for future use" is redundant. The definition of "abandoned cable" has this phrase in the definition. To restate this phrase would be grammatically incorrect.
JOHNSON: See my Comment on Affirmative on Proposal 16-80.
KAHN: See my Comment on Affirmative on Proposal 16-80.
WIERENGA: The revised wording for 760-3(a) should read as follows:
"(a) Spread of Fire or Products of Combustion. Section 300-21. Abandoned cables ~~not intended for future use~~ shall ~~not~~ be removed.
The use of the phrase "not intended for future use" is redundant because it is already included in the definition of "abandoned cable". The deletion of the words "not" and "permitted to remain" can be readily stated by use of positive code language using the word "removed".
EXPLANATION OF ABSTENTION:
CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #1218)

16- 145 - (Table 760-61): Accept in Principle
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise Table 760-61. Cable Uses and Permitted Substitutions as shown on the next page:

Table 760-61. Cable Uses and Permitted Substitutions

			Permitted Substitutions	
Cable Type	**Use**	**References**	**Multiconductor**	**Coaxial**
FPLP	Power-limited fire alarm plenum cable	760-61(a)	CMP-50, CMP	MPP-50, MPP
FPLR	Power-limited fire alarm riser cable	760-61(b)	CMP-50, CMP, FPLP-50, FPLP, CMR	MPP-50, MPP, MPR
FPL	Power-limited fire alarm cable	760-61(c)	CMP-50, CMP, FPLP-50, FPLP,CMR, FPLR, CMG, CM	MPP-50, MPP, MPR, MPG, MP

SUBSTANTIATION: If my proposal to establish a new section 760-71(e) is accepted, a new section is added and the sections will be renumbered. The new section creates a new cable type, Type FPLP-50. This proposal correlates Table 760-61 with those proposed changes.
PANEL ACTION: Accept in Principle.
Revise the submitter's recommendation as follows:
Strike all references to MPP-50 proposed Table 760-61.
PANEL STATEMENT: The revision is made to reflect the panel action on Proposal 16-232.

ABSTENTION: 1
COMMENT ON AFFIRMATIVE:
KAUFMAN: In addition to revising Table 760-61, Figure 760-61 should be revised in order to illustrate the changes in Table 760-61.

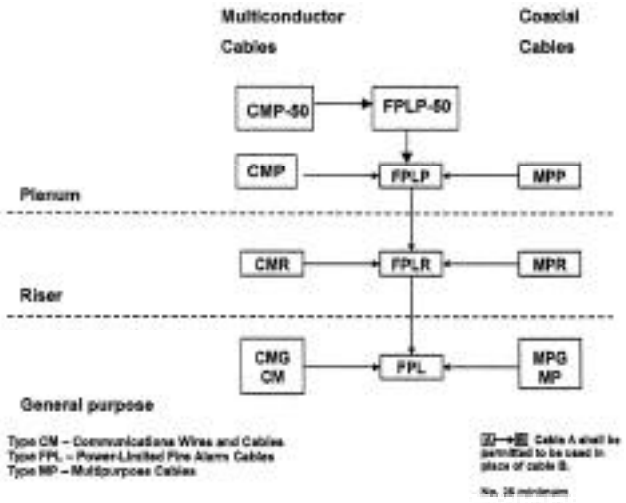

Figure 760-61. Cable Substitution Hierarchy

EXPLANATION OF ABSTENTION:
CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #1813)

16- 146 - (760-61(a), Exception): Accept
SUBMITTER: Irving Mande, Edwards Systems Technology
RECOMMENDATION: Delete "FPLP".
SUBSTANTIATION: Though technically correct, including "FPLP" in the Exception has caused confusion.
The Panel has been inconsistent in its wording for this Exception in other Articles under its jurisdiction. In 725-61(a), the Exception applies to all listed wires and cables. In 770-53(a), the Exception omits reference to "OFNP" cables, which is consistent with the recommendation in this Proposal. If the Panel intends for these requirements to be different, an explanation is needed to clarify the rationale for the user.
This Proposal is being submitted at the request of an AHJ. After comparing the wording in all the related Articles, he concluded that the intent in this Article was to have all cables (including plenum cable) installed in ducts, plenums, and other spaces used for environmental air be installed in compliance with Section 300-22.
PANEL ACTION: Accept.

(Log #3632)

16- 148 - (760-71): Reject
SUBMITTER: David B. Kiddoo, AlphaGary Corp.
RECOMMENDATION: With regards to Section 760-71, "Limited Combustion Cable" or "Permanent Plenum Cable" should not be accepted as an additional Listing based on the lack of testing definition, the absence of cable Listing capability, and the proven adequacy of an integrated and enhanced NFPA 262 test method. NFPA 262 differentiates cables as to their fire performance to provide acceptable values for smoke generation and flame travel distance.
Propoents of "Limited Combustible Cable" or "Permanent Plenum Cable" have been actively soliciting support from cable market trade organizations, Code-Making Panel 16 Members or Alternates, cable manufacturers, etc. for a proposal to include a new paragraph in the Section to provide for a new Type of cable based on the definitions of "limited combustibility" and "smoke developed index" per the definitions in NFPA 90A. These definitions ONLY govern construction products for the installation of air conditioning and ventilating systems. The NFPA 255 and NFPA 259 fire test methods being promoted are NOT applicable to evaluate the fire hazard nor the geometries and material synergies in cables as they pertain to fire performance.
As these proposals have been made public through this solicitation for support, I wish to respond at this time to say that there is no safety record or fire performance issue necessitating any additional cable

type of ruse in plenum cable applications. The inclusion of this new Type of cable is partially as a means to provide for an Exception from the proposed requirement in Section 800-52 to remove accumulations of abandoned cable. "Limited Combustible Cable" or "Permanent Plenum Cable" definitions seen in these proposals for a new cable Type are NOT based on any test method incorporating an actual cable fire hazard evaluation. Without adequate test methods and with the current status of the NFPRF "Permanent Plenum Cable Project", NO cables have been shown to meet the requirements proposed. The data generated in this Project have NOT been related to any appropriate fire hazard evaluation and should NOT be used to establish ANY relative cable fire performance comparisons.

SUBSTANTIATION: This issue has been discussed and reviewed in the last cycle of the NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems). The membership of the NFPA did NOT support a proposal to change the provisions for cables in the paragraphs on "ceiling cavity plenums" (2-3.10.1) and "raised floor plenums" (2-3.10.5) that would have allowed "Permanent Plenum Cables" to accumulate in these plenums. ("Permanent Plenum Cables" are so named through a Project being conducted by the National Fire Protection Research Foundation (NFPRF) and are described to meet a new, undefined, cable Listing for "limited combustibility" and "smoke developed index".) The more comprehensive solution to the issue of accumulating abandoned cables would have been to adopt a requirement to remove "ALL" abandoned cables that are removed from service and not intended for future use. Allowing for "Permanent Plenum Cables" to remain in plenums when abandoned would not address the serious issues of "congestion", "air flow restriction", and "total fuel load accumulation".

An appeal to the Standards Council was generated by proponents for "Permanent Plenum Cable" to overturn the Membership Action that occurred at the 1999 Annual Meeting. The Standards Council upheld the NFPA Membership Action after the hearing of the appeal. Comments from the final decision of the Standards Council on this matter are:

- "After a hearing, the Council reviewed and considered all of the information available to it, and voted to deny the appeals."
- "...wire and cable represents a significant potential fuel load in plenums and that, due to the rapidly increasing use of such cable in recent years, some approach to the problem should be devised."
- "...while it is the floor vote in favor of a return to the previous edition text that resulted in this recommendation, informational ballots of the TC (NFPA 90A Technical Committee) following that vote give further support to the conclusion that a lack of consensus exists in favor of going forward with the abandoned cable provisions. A majority of TC members voting on these informational ballots also supported the return to previous edition text..."
- "...the previous edition text is, in the Council's view, clearly suitable."
- "...the Council itself has concerns about the TC's approach and has concluded that further study of this important issue is needed."
- "...the Council wants to ensure that, as the TC undertakes to fully and fairly address these issued going forward, it has the best available range of expertise, representation, and experience. The Council, therefore, is referring the matter of committee membership to the Council's membership task group for review and recommendations."

While plenum cables are not typically the ignition source of fires, due to the low energy conducted through them, the fuel characteristics of high volumes of abandoned cable in plenums, whether combustible or limited combustible by definition, will most certainly add to the heat and energy released in a large, exposing fire, such as those where the ignition source is a room and contents fire below or above the plenum.

This proposal addresses the growing safety issue of accumulating abandoned cable in concealed spaces, without selectively favoring any cable geometry or synergy of materials. It does not allow for further accumulation of "Permanent Plenum Cables" which, when removed from service and not intended for future use, no longer have any function—except perhaps to serve as fuel for some future conflagration.

The proposal adopts consistent wording from NFPA 70, National Electrical Code, Section 300-21 and NFPA 75, Protection of Electronic Computer/Data Processing Equipment, paragraph 4-2.4. Basing this new requirement on existing code shows the strong intent, stated in the past by the Standards Council, to have good consistent code language across the various NFPA standards. Arguments by the proponents of "Permanent Plenum Cable" in the NFPA 90A review process to somehow create a new cable test requirement based on the definition of "limited combustibility" and "smoke developed index" created for building construction products would be a further misuse of the NFPA 255 and NFPA 259 "materials" test methods.

In spite of the rapid attempts by the proponents of "Permanent Plenum Cable", neither Underwriters Laboratories (UL) nor Intertek Testing Services (ITS/ETL) have yet established Listing criteria for "Permanent Plenum Cable" that could cover the matrix of cable types used in a plenum (fiber optics, coax, etc.). In fact, initial attempts over the first 9 months of the NFPRF Project to test finished cable in the NFPA 255 and NFPA 259 test methods has only shown inconsistencies and extremely limited capability of cables to meet the established definitions of "limited combustibility" and "smoke developed index" established for construction products. These test methods do NOT allow for cables to be tested based on their installed condition, nor can they be used to test cables with the important integration of finished cable geometries and materials/conductor or fiber synergies as they impact fire performance.

The proponents of "Permanent Plenum Cable" are applying these "material" tests inappropriately to cables. This is particularly why more sophisticated, integrated "cable" fire tests such as NFPA 262 (Plenum), ANSI/UL 1666 (Riser), and ANSI/UL 1581 (Vertical Tray) have been established and referenced in Standards such as the NFPA 70, NFPA 90A, etc. These tests more accurately simulate the actual fire hazards for installed cables, both in terms of the building environment AND the installed configuration. Integrated tests such as these are used to show the cables are designed to help contribute to minimizing the spread of fire and smoke generation in the early stages of a fire, allowing time for people to egress from the building. The fire safety record clearly shows that these tests have been successful in differentiating the fire performance of cables more accurately than materials tests such as NFPA 255 or NFPA 259.

The definition for cable fire performance in NFPA 90A Sections 2-3.10.1 and 2-3.10.5 are listed as Exceptions because the covering paragraphs (a) in each Section refer only to "materials" used in the construction of plenums. Proponents of "Permanent Plenum Cable" tried to make the argument in the NFPA 90A proposal review that IF the cable can be shown to meet the requirements of the plenum construction materials, accumulation of this cable is justifiable. As was acknowledged by members of the Standards Council during the NFPA 90A Appeal Hearing, cable jackets and insulations will NEVER look like the rigid materials used to construct plenums. Establishing a "Permanent Plenum Cable" Exception in a requirement to remove abandoned cable would clearly allow for a loop-hole to continue to proliferate abandoned cable accumulation and NOT address the serious issues of total fuel load, congestion, and air flow.

NFPA 75 Appendix A, paragraph A-4-2.4 says: "Abandoned cable will potentially interfere with air flow and extinguishing systems. Abandoned cable also adds to the fuel loading." This proposal would provide consistency with the established fire testing criteria and/or abandoned cable removal provisions established by NFPA 70, NFPA 75 and the appropriate Exceptions established for cables in NFPA 90A.

As was shared by Richard G. Gewain of Hughes Associates (with many years of direct involvement in these definitions) at the NFPA 90A TC meeting in December, 1998, the NFPA 220, Building Construction Committee (BCC) reviewed the definition of "non-combustible" and the new definition "limited combustible" in 1975. The BCC made it clear that these definitions "apply to the materials used in the construction of buildings (floors, roofs, columns, walls, etc.), but do NOT apply to furnishings or the contents of buildings, or to the fire hazard evaluation of materials." This language is clearly spelled out in the Special Interest Bulletin No. 294, currently entitled "Noncombustible and Limited-Combustible Building Construction Materials", published and updated several times since 1956 by the National Board of Fire Underwriters (a.k.a. American Insurance Association, currently known as the American Insurance Services Group).

Because of the concern that other NFPA Committees have been misusing the term "limited combustible", the Standards Council has assigned the responsibility for the term "limited combustible" to the BCC. The BCC has recently requested its Chairman to contact the Chairmen of the other NFPA Committees (covering 48 NFPA Standards) using this term and ask for a clarification of what is intended for its use. A BCC Task Group is now established to develop

proposals or comments to ensure that the term in other standards such as NFPA 90A is used correctly. From a fire hazards point of view, it has clearly NOT been shown that using the current definitions of "limited combustible" and "smoke developed index" and NFPA 259 / NFPA 255 test methods are appropriate for installed cables.

This proposal also alleviates the concern and burden to the authority having jurisdiction inspector enforcing NFPA 70 to identify different types of cables currently in the concealed spaces and removed from service. The requirements to remove ALL abandoned cable not intended for future use should be less cumbersome than to remove only "some" of the cables.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal does not conform to section 4-3.3(c) of the Regulations Governing Committee Projects. The submitter has made other proposals on this subject that meet the Regulations Governing Committee Projects. The issues raised in this proposal were addressed when the other proposals were considered.

EXPLANATION OF ABSTENTION:

CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #3211)

16- 149 - (760-71(b) (New)): Accept

Note: The Technical Correlating Committee directs that this Proposal be referred to the NFPA 90A Technical Committee on Air Conditioning for Comment.

SUBMITTER: S. E. Egesdal, Honeywell Inc.

RECOMMENDATION: Renumber sections as follows:

Existing section	Renumbered section
760-71(e)	760-71(f)
760-71(f)	760-71(g)
760-71(g)	760-71(h)
760-71(h)	760-71(i)
760-71(i)	760-71(j)

Add a new Section 760-71(e):

(e) Limited Combustible Cable. Type FPLP cables that are also listed as being limited combustible and having a maximum smoke developed index of 50 shall be permitted to be listed and marked as Type FPLP-50.

FPN No. 1: See NFPA 90A-1999, Standard for the Installation of Air Conditioning and Ventilating Systems for a definition of limited combustible. See NFPA 255-2000, Standard Method of Test of Surface Burning Characteristics of Building Materials for a definition of the smoke developed index.

FPN No. 2: For further information on the requirements for materials in ceiling cavity and raised floor plenums, see NFPA 90A-1999, Standard for the Installation of Air Conditioning and Ventilating Systems, Sections 2-3.10.1 Ceiling Cavity Plenum and 2-3.10.5 Raised Floor Plenum.

SUBSTANTIATION: The NFPA Standards Council has assigned primary responsibility for the fire protection of plenums to the Technical Committee on Air Conditioning. That technical committee is responsible for NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems. The NFPA 90A (1996) requirements for ceiling cavity and raised floor plenums for electrical wires and cables are shown below:

2-3.10 Plenums.

2-3.10.1 Ceiling Cavity Plenum. The space between the top of the finished ceiling and the underside of the floor or roof above shall be permitted to be used to supply air to, or return or exhaust air from, the occupied area, provided that the following conditions are met:

(a) All materials exposed to the airflow shall be noncombustible or limited combustible and have a maximum smoke developed index of 50.

Exception No. 1: The following materials shall be permitted in the ceiling cavity plenum where listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 ft (1.5 m) or less when tested in accordance with the specified test method:

(a) Electrical wires and cables. NFPA 262, Standard Method of Test for Fire and Smoke Characteristics of Wires and Cables.

2-3.10.5 Raised Floor Plenum. The space between the top of the finished floor and the underside of a raised floor shall be permitted to be used to supply air to, or return exhaust air from, or return and exhaust air from, the occupied area, provided that the following conditions are met:

(a) All materials exposed to the airflow shall be noncombustible or limited combustible and shall have a maximum smoke developed index of 50.

Exception No. 1: The following materials shall be permitted in the raised floor plenum where listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 ft (1.5 m) or less when tested in accordance with the specified test method:

(a) Electrical wires and cables. NFPA 262, Standard Method of Test for Fire and Smoke Characteristics of Wires and Cables.

Establishing Types CL2P-50 and CL3P-50 cables is a step toward correlating NFPA 70, the National Electrical Code and NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems. Types CL2P-50 and CL3P-50 cables qualify for use by meeting the basic rule for plenum materials, i.e., limited combustible and a smoke developed rating below 50, and meeting the flame spread and smoke requirements of the NFPA 90A Exception which are identical to those in the NEC fine print notes.

ARTICLE 770 — OPTICAL FIBER CABLES AND RACEWAYS

(Log #1523)

16- 168 - (770): Reject
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Renumber Article 770 to Article 870.
SUBSTANTIATION: Optical fiber cable installations are predominantly communications installations, hence this article belongs in Chapter 8.
PANEL ACTION: Reject.
PANEL STATEMENT: There are applications other than communications. In accordance with 90-3, special applications involving occupancies, equipment and conditions belong in Chapters 5, 6 and 7.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #2987)

16- 153 - (770-2): Accept in Principle
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Revise text as follows:
Optical Fiber Raceway. A raceway designed for enclosing and routing nonconductive <u>and conductive</u> optical fiber cable.
SUBSTANTIATION: This proposal revises the aforementioned sections to all Conductive Optical Fiber Cables to be used in Optical Fiber Raceways. Conductive cables are cables containing noncurrent-carrying conductive members [see 770-5(b)]. Optical Fiber/Communication Raceways are listed raceways used in plenum, riser, and general purpose areas of a building per Articles 770 and 800. These listed raceways are used in Article 800 with communication cables. The communication cables may have a conductive sheathing that cover the conductor assembly that may include one or more metallic members, strength members, or jackets. Conductive cables, per Article 800, have been used in Optical Fiber/Communication Raceways satisfactorily and without incident. In addition, per Article 770-53(c), General Purpose Raceways are currently allowed to used with conductive general-purpose cabling.
See companion proposal 770-53(a) and (b).
PANEL ACTION: Accept in Principle.
Change the definition to read:
"Optical Fiber Raceway. A raceway designed for enclosing and routing listed optical fiber cables."
PANEL STATEMENT: Optical fiber raceway is intended for use with optical fiber building cable. It is not intended for use with unlisted (non-fire-resistant) outside plant cable. The panel agrees with the submitter that optical fiber raceway should be permitted to be used with conductive optical fiber cable.

(Log #4041)

16- 154 - (770-2-Abandoned Cable (New)): Accept
SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l
RECOMMENDATION: Add a new definition to read as follows:
<u>Abandoned Cable. Cable that is neither terminated at both ends, at a connector or other equipment, nor identified for future use with a tag.</u>
SUBSTANTIATION: The definition of abandoned cable is needed to accompany the proposals that require removal of abandoned cable. This definition reflects industry practices.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
DORNA: The definition of "Abandoned Cable" should be the same here as what we accepted in Proposal 16-273. It should be "Cable that is neither terminated at ~~both ends, at a connector or other~~ equipment, nor identified for future use with a tag." (This is the same wording as Proposal 16-273.)
The reason we took out the reference to connectors in Proposal 16-273 is because CATV cable usually has connectors attached. It was our concern that CATV cables would have connectors attached and then would not fall under the proposed original definition and therefore would not have to be removed if abandoned. I believe this also could be the case with cables in this Article 770. These cables could also have connectors attached, and therefore would not fall under the definition the panel had accepted in principal. If we make the definition the same as I have suggested above (the same as 16-273) then it will make it irrelevant on whether the cable has connectors or not. I can foresee someone using the fact that the cable has a connector on it, therefore it does not fall under "abandoned cable" and does not need to be removed.
JOHNSON: The provision for allowing cables with connectors still attached to be considered abandoned may not meet with the proposal's intent. Wording used in Proposal 16-273 is a more acceptable choice. I am in agreement with Mr. Dorna's comments on this proposal.
COMMENT ON AFFIRMATIVE:
BRUNSSEN: See my Comment on Affirmative Vote on Proposal 16-32.
KAHN: See my Comment on Affirmative on Proposal 16-32.

(Log #4046)

16- 155 - (770-2- Excessive Accumulation of Abandoned Cables (New)): Reject

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Add a new definition to read as follows:

Excessive Accumulation of Abandoned Cables. When the number of abandoned cables is greater than 1/3 of the total number of cables within a fire-containment zone.

SUBSTANTIATION: After the concept of plenum cables was introduced into the 1975 NEC, Underwriters Laboratories initially listed plenum cables by comparing the smoke production of plenum cables with the smoke production of conventional cables of the same physical design (but not plenum grade materials) in conduit. Plenum cables (not in conduit) were tested and compared with an equal number of conventional cables in conduit. It was assumed that the plenum cables were a replacement for conventional cables and that in case of a fire the amount of smoke would be reduced because of the lower smoke production of plenum cables. It was not anticipated that plenum cables would be abandoned. Since conventional cables in conduit were deemed to be acceptable the smoke from these cables is the benchmark for comparison and a fire involving an excessive amount of abandoned cables could emit excessive amount of smoke. Until research better defines what amount of abandoned cable might be excessive, allowing up to 1/3 excess of abandoned cables is prudent.

PANEL ACTION: Reject.

PANEL STATEMENT: The term is not used. The proposal that introduced this term was modified to eliminate the term.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #1524)

16- 156 - (770-3): Accept in Principle in Part

SUBMITTER: Stanley Kaufman, Lucent Technologies

RECOMMENDATION: Delete Section 770-3.

SUBSTANTIATION: Section 770-3 violates the scope of Article 770. Article 770 scope states "The provisions of this article apply to the installation of optical fiber cables and raceways. This article does not cover the construction of optical fiber cables and raceways." Section 770-3 covers "circuits and equipment."

Section 770-3(a) refers to Section 300-21 which covers "electrical installations." Article 770 does not cover electrical installations. Acceptance of my proposal for Section 770-52(d) (new) will apply the equivalent requirements.

Section 770-3(b) is redundant. Section 770-53(a) has the same requirements.

PANEL ACTION: Accept in Principle in Part.

In 770-3 of the code delete the words "Circuits and equipment" and replace them with "Optical fiber cables and raceways."

PANEL STATEMENT: The part to delete 770-3 is rejected. This section is still needed and was amended in Proposal 16-176.

The part accepted in principle is to correct the language of 770-3 in accordance with the submitter's substantiation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #1130)

16- 157 - (770-3(a)): Reject

Note: The Technical Correlating Committee understands that the reference to "770-54(e)" in the Panel Statement should be to "770-52(d)."

SUBMITTER: Stanley Kaufman, Lucent Technologies

RECOMMENDATION: Revise Section 770-3(a) as follows:

(a) Spread of Fire or Products of Combustion. See Sections 300-21 and 770-52(d).

SUBSTANTIATION: This proposal correlates with my proposal for Section 770-52(d).

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter's recommendation for 770-54(e) was accepted in principle. Hence this correlating proposal is not needed.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #3047)

16- 158 - (770-6): Reject

SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit

RECOMMENDATION: Revise text as follows:

Raceways for Optical Fiber Cables. The raceway shall be either:

(a) A ~~of a~~ type permitted in Chapter 3 and installed in accordance with Chapter 3, or ~~.~~

(b) A listed nonmetallic optical fiber raceway and associated fittings both of which comply with Sections 770-51(e), (f), or (g) and 770-53(a) or (b), as applicable, installed in accordance with Article 331.

Exception No. 1: The thermal barrier required in Section 331-3(2) shall not be required for plenum-rated optical fiber raceway.

Exception No. 2: Unlisted underground or outside plant construction plastic innerduct shall be terminated at the point of entrance.

~~Listed nonmetallic optical fiber raceway identified as general purpose, riser, or plenum optical fiber raceway in accordance with Section 770-51 and installed in accordance with Sections 331-7 through 331-14, where the requirements applicable to electrical nonmetallic tubing shall apply. Unlisted underground or outside plant construction plastic innerduct shall be terminated at the point of entrance.~~

~~FPN: For information on listing requirements for optical fiber raceways, see Standard for Optical Fiber Raceways, UL 2024.~~ (Move this FPN to Section 770-51 – after (g) to apply to (e), (f), and (g).)

(The last two paragraphs of the section to remain unchanged.)

SUBSTANTIATION: The revised text in the main paragraph clarifies the requirements for use of optical fiber raceway, moves it from an exception, and is more user-friendly. Article 331 in total should apply to this raceway. An exception has been made for the plenum-rated type until such time that the NFPA 90A Committee and others resolve how much of these plenum-rated products is too much. Fittings for the nonmetallic raceways need to meet the same test requirements as the raceway. This is a companion proposal to changes suggested for 770-51 and 770-53 to provide more user-friendly text and to better correlate with the actual requirements of Section 300-22. The FPN has been moved to Section 770-51 as it contains listing requirements and is a more appropriate location.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has provided no substantiation why all the requirements of Article 331 should apply.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

(Log #1539)

16- 159 - (770-7): Accept in Principal

Note: See Technical Correlating Committee action on Proposal 16-38. It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting of a similar proposal 16-192. The Technical Correlating Committee directs that the Action on this Proposal be revised to comply with the NEC Style Manual 3.2.1 relative to use of the unenforceable terms "practicable" and "impracticable." This action will be considered by the Panel as a Public Comment. It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 3 for Comment.

SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions

RECOMMENDATION: Revise 770-7 as follows:

770-7. Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to equipment shall not be denied by an excess accumulation of cables ~~that prevents~~ sufficient to prevent the removal of panels, including suspended ceiling panels.

SUBSTANTIATION: Section 770-7 may be misinterpreted to mean that cables may not be placed directly on suspended ceilings. While the 1999 National Electrical Code Handbook reference to the commentary following Section 725-5 emphasizes "excess accumulation" in the interpretive text, Figures 725-2 and 725-3 lead the reader to conclude that no cables are permitted to rest directly on the suspended ceiling. This was not the intent of CMP 16 when 770-7 was introduced into the 1993 NEC. At that time CMP 16 stated in response to a similar proposal to Article 725 (1992 TCD, Comment 16-18) that the proposed requirement"... would still allow some cabling of a limited quantity above the ceiling tile, but not to an excessive amount." The proposed revision emphasizes that it is an excessive accumulation of cable that is of concern. A limited amount of cabling laid directly on a suspended ceiling is permitted, will not deny access to equipment, and does not present an unsafe working environment. This is a companion proposal and is intended to correlate with 725-5, 760-5, 800-5, 820-5 and 830-6.

PANEL ACTION: Accept in Principle.

Revise 770-7 to read as follows:

"770-7. Access to Electrical Equipment Behind Panels Designed to Allow Access

Access to electrical equipment shall not be denied by an accumulation of wires and cables that prevents removal of panels. Cables shall be installed in such a manner that the cable will not be damaged by normal building use. Access to electrical equipment behind ceilings designed to allow access shall comply with (a) or (b).

a. New building construction (e.g., renovation, remodeling, new spaces). Installation of cables shall comply with Section 300.11.

b. Buildings with existing cabling systems.

Where practicable, installation of cables shall comply with Section 300-11. Where impracticable to comply with Section 300-11, cables less than 13 mm (0.5 in) in diameter shall be permitted to be installed unsupported by the building structure in accordance with 1 or 2.

1.In areas having ceilings with access points or access panels, it shall be permissible to fish a maximum of three cables between access points in the ceiling.

2.In areas having suspended lay-in ceilings, it shall be permissible to install a maximum three unsupported cables on top of any one ceiling tile. The cables shall be run parallel to the ceiling grid."

PANEL STATEMENT: The revised text satisfies the intent of the original recommendation in that it allows some cabling of a limited quantity above ceiling tile but not an excessive amount, which would interfere with accessibility.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 19

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

EGEDSAL: See my Explanation of Negative Vote on Proposal 16-192.

COMMENT ON AFFIRMATIVE:

BRUNSSEN: I concur with the panel action in providing relief for a limited amount of after-construction optical fiber cables to be placed directly on the suspended ceiling tiles. However, proposed Section 770-7(b)(2), as presently written, is confusing and could be interpreted as permitting a total of only three unsupported cables. The intent of the panel was that up to a maximum of three unsupported cables may be routed across each and every ceiling tile. Revising 770-7(b)(2) to state: "...permissible to install a maximum <u>of</u> three unsupported cables on top of ~~any one~~ <u>each</u> ceiling tile, <u>i.e., up to three cables are permitted to lay on a ceiling tile.</u>" would clarify the intent. Note that the word "of" is inserted and is missing in the original text.

(Log #CP1604)

16- 159a - (770-8): Accept

SUBMITTER: CMP 16

RECOMMENDATION: Revise text to read as follows:

"Mechanical Execution of Work. Optical fiber cables shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceiling and sidewalls shall be supported by the structural components of the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be attached to structural components at intervals not exceeding 1.52 m (5 ft) and within 305 (12 in.) from every cabinet, box or fitting by straps, staples, hangers or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with Section 300-4(d)."

Also, delete the Fine Print Note.

SUBSTANTIATION: This proposal provides additional rules for the mechanical execution of the work. Since there are additional rules, the fine print note is not necessary. This provides parallel requirements to those used in Articles 640, 725, 760, 800, 820, and 830.

PANEL ACTION: Accept.

(Log #3970)

16- 165 - (770-51): Reject
SUBMITTER: David B. Kiddoo, AlphaGary Corp.
RECOMMENDATION: With regards to Section 770-51, "Limited Combustion Cable" or "Permanent Plenum Cable" should not be accepted as an additional Listing based on the lack of testing definition, the absence of cable Listing capability, and the proven adequacy of an integrated and enhanced NFPA 262 test method. NFPA 262 differentiates cables as to their fire performance to provide acceptable values for smoke generation and flame travel distance.
Proponents of "Limited Combustible Cable" or "Permanent Plenum Cable" have been actively soliciting support form cable market trade organizations, Code-Making Panel 16 Members or Alternates, cable manufacturers, etc. for a proposal to include a new paragraph in this section to provide for a new type of cable based on the definitions of "limited combustibility" and "smoke developed index" per the definitions in NFPA 90A. These definitions ONLY govern construction products for the installation of air conditioning and ventilating systems. The NFPA 255 and NFPA 259 fire test methods being promoted are NOT applicable to evaluate the fire hazard nor the geometry's and material synergy's in cables as they pertain to fire performance.
As these proposals have been made public through this solicitation for support, I wish to respond at this time to say that there is no safety record or fire performance issue necessitating any additional cable type for use in plenum cable applications. The inclusion of this new Type of cable is partially as a means to provide for an Exception from the proposed requirement in Section 770-52 to remove accumulations of abandoned cable. "Limited Combustible Cable" or "Permanent Plenum Cable" definitions seen in this proposals for a new cable type are NOT based on any test incorporating an actual cable fire hazard evaluation. Without adequate test methods and with the current status of the NFPRF "Permanent Plenum Cable Project", NO cables have been shown to meet the requirements proposed. The data generated in the Project have NOT been related to any appropriate fire hazard evaluation and should NOT be used to establish ANY relative cable fire performance comparisons.
SUBSTANTIATION: This issue has been discussed and reviewed in the last cycle of the NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems. The membership of the NFPA did NOT support a proposal to change the provisions for cables in the paragraphs on "ceiling cavity plenums" (2-3.10.1) and "raised floor plenums" (2-3.10.5) that would have allowed "Permanent Plenum Cables" to accumulate in these plenums. ("Permanent Plenum Cables" are so named through a Project being conducted by the National Fire Protection Research Foundation (NFPRF) and are described to meet a new, undefined, cable Listing for "limited combustibility" and "smoke developed index".) The more comprehensive solution to the issue of accumulating abandoned cables would have been to adopt a requirement to remove "ALL" abandoned cables that are removed from service and not intended for future use. Allowing for "Permanent Plenum Cables" to remain in plenums when abandoned would not address the serious issues of "congestion", "air flow restriction", and "total fuel load accumulation".

An appeal to the Standards Council was generated by proponents of the provisions for "Permanent Plenum Cable" to overturn the Membership Action that occurred at the 1999 Annual Meeting. The Standards Council upheld the NFPA Membership Action after the hearing of the appeal. Comments form the final decision of the Standards Council on this matter are:

- "After a hearing, the Council reviewed and considered all of the information available to it, and voted to deny the appeals."
- "...wire and cable represents a significant potential fuel load in plenums and that, due to the rapidly increasing ruse of such cable in recent years, some approach to the problem should be devised."
- "...while it is the floor vote in favor of a return to the previous edition text that resulted in this recommendation, informational ballots of the TC (NFPA 90A Technical Committee) following that vote give further support to the conclusion that a lack of consensus exists in factor of going forward with the abandoned cable provisions. A majority of TC members voting on these informational ballots also supported the return to previous edition text..."
- "...the previous edition text is, in the Council's view, clearly suitable."
- "...the Council itself has concerns about the TCs approach and has concluded that further study of this important issue is needed."
- "...the Council wants to ensure, that as the TC undertakes to fully and fairly address these issues going forward, it has the best available range of expertise, representation, and experience. The Council, therefore, is referring the matter of committee membership to the Council's membership task group for review and recommendations."

While plenum cables are not typically the ignition source of fires, due to the low energy conducted through them, the fuel characteristics of high volumes of abandoned cable in plenums, whether combustible or limited combustible by definition, will most certainly add to the heat and energy released in a large, exposing fire, such as those where the ignition source is a room and contents fire below or above the plenum

This proposal addressed the growing safety issue of accumulating abandoned cable in concealed spaces, without selectively favoring any cable geometry or synergy of materials. It does not allow for further accumulation of "Permanent Plenum Cables" which, when removed from service and not intended for future use, no longer have any function — except perhaps to serve as fuel for some future conflagration.

This proposal adopts consistent wording from NFPA 70, National Electrical Code, Section 300-21 and NFPA 75, Protection of Electronic Computer/Data Processing Equipment, paragraph 4-2.4. Basing this new requirement on existing code shows the strong intent, stated in the past by the Standard Council, to have good consistent code language across the various NFPA standards. Arguments by the proponents of "Permanent Plenum Cable" in the NFPA 90A review process to somehow create a new cable for building construction products would be a further misuse of the NFPA 255 and NFPA 259 "materials" test methods.

In spite of the rapid attempts by the proponents of "Permanent Plenum Cable", neither Underwriters Laboratories (UL) nor Interlek Testing Services (ITS/ETL) have yet established Listing criteria for "Permanent Plenum Cable" that could cover the matrix of cable types used in a plenum (fiber optics, coax, etc.). In fact, initial attempts over the first 9 months of the NFPRF Project to test finished cable in the NFPA 255 and NFPA 259 test methods has only shown inconsistencies and extremely limited capability for cables to meet the established definitions of "limited combustibility" and "smoke developed index" established for construction products. These test methods do NOT allow for cables to be tested based on their installed condition, nor can they be used to test cables with the important integration of finished cable geometry's and materials/conductor or fiber synergy's as they impact fire performance.

The proponents of "Permanent Plenum Cable" are applying these "material" tests inappropriately to cables. This is partially why more sophisticated, integrated "cable" fire tests such as NFPA 262 (Plenum), ANSI/UL 1666 (Riser), and ANSI/UL 1581 (Vertical Tray) have been established and referenced in Standards such as the NFPA 70, NFPA 90A, etc. These tests more accurately simulate the actual fire hazards for installed cables, both in terms of the building environment AND the installed configuration. Integrated tests such as these are used to show the cables are designed to help contribute to minimizing the spread of fire and smoke generation in the early stages of a fire, allowing time for people to egress from the building. The fire safety record clearly shows that these tests have been successful in differentiating the fire performance of cables more accurately than material tests such as NFPA 255 or NFPA 259.

The definition for cable fire performance in NFPA 90A, Sections 2-3.10.1 and 2-3.10.5 are listed as Exceptions because the covering paragraphs (a) in each section refer only to "materials" used in the construction of plenums. Proponents of "Permanent Plenum Cable" tried to make the argument in the NFPA 90A proposal review that IF the cable can be shown to meet the requirements of the plenum construction materials, accumulation of this cable is justifiable. As was acknowledged by members of the Standards Council during the NFPA 90A Appeal Hearing, cable jackets and insulation's will NEVER look like the rigid materials used to construct plenums. Establishing a "Permanent Plenum Cable" Exception in a requirement to remove abandoned cable would clearly allow for a loop-hole to continue to proliferate abandoned cable accumulation and NOT address the serious issues of total fuel load, congestion, and air flow.

NFPA 75 Appendix A, paragraph A-4-2.4 says: "Abandoned cable will potentially interfere with air flow extinguishing systems. Abandoned cable also adds to the fuel loading." This proposal would provide consistency with the established fire testing criteria and/or abandoned cable removal provisions established by NFPA 70, NFPA 75 and the appropriate Exceptions established for cables in NFPA 90A.

As was shared by Richard G. Gewain of Hughes Associates (with many years of direct involvement in these definitions) at the NFPA 90A TC meeting in December, 1998, the NFPA 220 Building Construction Committee (BCC) reviewed the definition of "non-combustible" and the new definition "limited combustible" in 1975. The BCC made it clear that these definitions "apply to the materials used in the construction of buildings (floors, roofs, columns, walls, etc.), but do NOT apply to furnishings or the contents of buildings, or to the fire hazard evaluation of materials." This language is clearly spelled out in the Special Interest Bulletin No. 294, currently entitled "Noncombustible and Limited-Combustible Building Construction Materials", published and updated several times since 1956 by the National Board of Fire Underwriters (a.k.a. American Insurance Association, currently known as the American Insurance Services Group).

Because of the concern that other NFPA Committees have been misusing the term "limited combustible", the Standards Council has assigned the responsibility for the term "limited combustible" to the BCC. The BCC has recently requested its Chairman to contact the Chairmen of the other NFPA Committees (covering 48 NFPA standards) using this term and ask for a clarification of what is intended for its use. A BCC Task Group is now established to develop proposals or comments to ensure that the term in other standards such as NFPA 90A is used correctly. From a fire hazards point of view, it has clearly NOT been shown that using the current definitions of "limited combustible" and "smoke developed index" and NFPA 259/NFPA 255 test methods are appropriate for installed cables.

This proposal also alleviates the concern and burden to the authority having jurisdiction inspector enforcing NFPA 70 to identify different types of cables currently in the concealed spaces and removed from service. The requirement to removal ALL abandoned cable not intended for future use should be less cumbersome than to remove only "some" of the cables.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal does not conform to section 4-3.3(c) of the Regulations Governing Committee Projects. The submitter has made other proposals on this subject that meet the Regulations Governing Committee Projects. The issues raised in this proposal were addressed when the other proposals were considered.

16- 169 - (770-51(b)): Accept
Note: The Technical Correlating Committee directs that this Proposal be refered to the NFPA 90A Technical Committee on Air Conditioning for Comment.
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Renumber sections as follows:
Existing section Renumbered section
770-51(b) 770-51(c)
770-51(c) 770-51(d)
770-51(d) 770-51(e)
770-51(e) 770-51(f)
770-51(f) 770-51(g)
770-51(g) 770-51(h)
Add a new section 770-51(b).
(b) Limited Combustible Cable. Types OFNP and Types OFCP cables that are also listed as being limited combustible and having a maximum smoke developed index of 50 shall be permitted to be listed and marked as Types OFNP–50 and Types OFCP–50 respectively.
FPN No. 1: See NFPA 90A-1999, Standard for the Installation of Air Conditioning and Ventilating Systems for a definition of limited combustible. See NFPA 255-2000, Standard Method of Test of Surface Burning Characteristics of Building Materials for a definition of the smoke developed index.
FPN No. 2: For further information on the requirements for materials in ceiling cavity and raised floor plenums, see NFPA 90A-1999, Standard for the Installation of Air Conditioning and Ventilating Systems, Sections 2-3.10.1 Ceiling Cavity Plenum and 2-3.10.5 Raised Floor Plenum.
SUBSTANTIATION: See my proposal for section 800-51(h) to establish limited combustible cables.
PANEL ACTION: Accept.

(Log #3049)

16- 170 - (770-51(e), (f), and (g)): Reject
SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Revise to read as follows:
(e) Plenum-Rated Optical Fiber Raceway. Plenum-rated optical fiber raceways shall be listed as having adequate fire-resistant and low smoke-producing characteristics.
(f) Riser Optical Fiber Raceway. Riser optical fiber raceways shall be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.
(g) General-Purpose Optical Fiber Cable Raceway. General-purpose optical fiber cable raceway shall be listed as being resistant to the spread of fire.
FPN: For information on listing requirements for optical fiber raceways, see Standard for Optical Fiber Raceways, UL 2024.
SUBSTANTIATION: In the absolute these raceways should be termed plenum-rated, as they are not actually to be used in plenums (see 300-22(b), but rather only in other spaces used for environmental air (in accordance with Section 300-22(c). The FPN was moved from 770-6 as this appears to be a more appropriate location.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "rated" is not required. It does not add to the clarity of the requirement.

AFFIRMATIVE: 20

(Log #1025)

16- 171 - (770-52): Reject
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise 770-52 as shown:
770-52. Installation of Optical Fibers and Electrical Conductors
(a) With Conductors for Electric Light, Power, Class 1, Nonpower-Limited Fire Alarm, ~~or~~ Medium or High Power Network-Powered Broadband Communications Circuits. Optical fibers shall be permitted within the same composite cable for electric light, power, Class 1, nonpower-limited fire alarm, ~~or~~ medium or high power network-powered broadband communications circuits operating at 600 volts or less only where the functions of the optical fibers and the electrical conductors are associated.
Nonconductive optical fiber cables shall be permitted to occupy the same cable tray or raceway with conductors for electric light, power, Class 1, nonpower-limited fire alarm, ~~or~~ medium or high power network-powered broadband communications circuits operating at 600 volts or less. Conductive optical fiber cables shall not be permitted to occupy the same cable tray or raceway with conductors for electric light, power, Class 1, nonpower-limited fire alarm, ~~or~~ medium or high power network-powered broadband communications circuits.
Composite optical fiber cables containing only current-carrying conductors for electric light, power, Class 1 circuits rated 600 volts or less shall be permitted to occupy the same cabinet, cable tray, outlet box, panel, raceway, or other termination enclosure with conductors for electric light, power, or Class 1 circuits operating at 600 volts or less.
Nonconductive optical fiber cables shall not be permitted to occupy the same cabinet, outlet box, panel, or similar enclosure housing the electrical terminations of an electric light, power, Class 1, nonpower-limited fire alarm, ~~or~~ medium or high power network-powered broadband communications circuit.
Exception No. 1: Occupancy of the same cabinet, outlet box, panel, or similar enclosure shall be permitted where nonconductive optical fiber cable is functionally associated with the electric light, power, Class 1, nonpower-limited fire alarm, ~~or~~ medium or high power network-powered broadband communications circuit.
Exception No. 2: Occupancy of the same cabinet, outlet box, panel, or similar enclosure shall be permitted where nonconductive optical fiber cables are installed in factory- or field-assembled control centers.
Exception No. 3: In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons will service the installation, nonconductive optical fiber cables shall be permitted with circuits exceeding 600 volts.

Exception No. 4: In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons will service the installation, composite optical fiber cables shall be permitted to contain current-carrying conductors operating over 600 volts.

Installations in raceway shall comply with Section 300-17.

(b) With Other Conductors. Optical fibers shall be permitted in the same cable, and conductive and nonconductive optical fiber cables shall be permitted in the same cable tray, enclosure, or raceway with conductors of any of the following:

1. Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 725
2. Power-limited fire alarm systems in compliance with Article 760
3. Communications circuits in compliance with Article 800
4. Community antenna television and radio distribution systems in compliance with Article 820
5. Low power network-powered broadband communications circuits in compliance with Article 830

(c) Grounding. Noncurrent-carrying conductive members of optical fiber cables shall be grounded in accordance with Article 250.

SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. This proposal amends the separation rules between circuits to provide appropriate separation from these new high-power communications circuits.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #2777)

16- 172 - (770-52(a)(2)): Reject

SUBMITTER: Gregory P. Bierals, Electrical Design Inst.

RECOMMENDATION: Add new text as follows:

Raceways or cable trays containing optical fiber cables shall not contain any pipe, tube, or equal for steam, water, air, gas, drainage, or any service other than electrical.

SUBSTANTIATION: There presently is no reference in Article 770 that prohibits this practice.

PANEL ACTION: Reject.

PANEL STATEMENT: Refer to the panel action and statement on Proposal 16-70. This proposal deals with the same issues as Proposal 16-70 and is rejected for the same reasons.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

COMMENT ON AFFIRMATIVE:

JOHNSON: By definition, fiber optic communication is an optical signal rather than an electrical signal. This proposal, as written, would not allow raceways containing fiber optic cables to carry fiber optic cables.

(Log #1129)

16- 173 - (770-52(d) (New)): Accept in Principle in Part

SUBMITTER: Stanley Kaufman, Lucent Technologies

RECOMMENDATION: Insert a new Section 770-52(d) as follows:

(b) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating. Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate. Accumulations of abandoned cables, not identified for future use, in ducts, plenums, and other space used for environmental air, shall be removed.

Exception: Type OFNP-50 and Type OFCP-50 cables shall not be required to be removed.

FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

SUBSTANTIATION: See my proposal for Section 800-52(b).

PANEL ACTION: Accept in Principle in Part.

The part being rejected is the recommendation to add the exception. The panel actions in other proposals adopting the requirement to remove abandon cables satisfies the proposal other than the exception. There is inadequate justification to leave any debris (e.g. abandoned cable).

The remaining part of the proposal is accepted in principle.

PANEL STATEMENT: Refer to panel action on Proposal 16-176.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

EXPLANATION OF ABSTENTION:

CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #3256)

16- 174 - (770-52(d)): Accept in Principle in Part

SUBMITTER: Allen C. Weidman, Society of the Plastics Industry/Rep. Fluoropolymers Division of The Society of the Plastics Industry

RECOMMENDATION: Insert a new Section 725-54(e) as follows:

(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be fire stopped using approved methods to maintain the fire resistance rating. Cables in ducts, plenums, and other spaces used for environmental air, which are not intended for future use shall be removed. Cables marked type CL2PP and type CL3PP are not required to be removed.

FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

SUBSTANTIATION: 1. First two (2) sentences were copied from Article 300.21.

2. Fine print note was copied from Article 300.21s fine print note.

3. Cables installed in plenums and other space used for environmental air are very often left in these spaces after they have been removed from service. Therefore, many generations of unused cables can exist in the ceiling voids from previous systems which are no longer in service or intended for future use. There may also be cables, which are over 20 years old, which are not plenum rated cables. These unused cables increase the potential fuel load in plenums and other space used for environmental air.

This concept of removing unused cables, which will not be used in the future, is not a new concept. Other articles of the NEC have similar requirements. See the following Articles:

(a) 305, (b) 354, (c) 356, (d) 358

Also note NFPA 75 has a similar requirement.

Note: Underwriter Laboratories and Intertek (ETL), both are in a position to start listing this new type of plenum cable having of "Limited Combustibility" requirement, also potentially known as "permanent plenum cable, e.g., CL2PP, CL3PP, OFCPP, OFNPP, CMPP, and MPPP. There is a research program in place at FPRF to establish the protocol to list PP cables.

PANEL ACTION: Accept in Principle in Part.

The part being rejected is the recommendation to add the last sentence before the FPN.

PANEL STATEMENT: The panel actions in other proposals adopting the requirement to remove abandon cables satisfies the proposal other than the last sentence before the FPN. There is inadequate justification to leave any debris (e.g. abandoned cable).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

(Log #3626)

16- 175 - (770-52(d) (New)): Accept in Principle

SUBMITTER: David B. Kiddoo, AlphaGary Corp.

RECOMMENDATION: Insert a new Section 770-52(d) as follows:

(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, ventilation ducts or air-handling plenums shall be made so that the possible spread of fire or fire resistant-rated walls, partitions, floors or ceilings shall be firestopped using approved methods to maintain the fire resistant rating. Abandoned cables in these spaces, shafts, ducts and plenums shall not be allowed to accumulate. Accumulations of abandoned cables, not identified for future use, in these spaces, shafts, ducts, plenums, and other space used for environmental air, shall be removed.

FPN No. 1: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

FPN No. 2: Definition of acceptable cable fire performance in various applications are described in Section 770-51.

SUBSTANTIATION: This issue has been discussed and reviewed in the last cycle of the NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems). The membership of the NFPA did NOT support a proposal to change the provisions for cables in the paragraphs on "ceiling cavity plenums" (2-3.10.1) and "raised floor plenums" (2-3.10.5) that would have allowed "Permanent Plenum Cables" to accumulate in these plenums. ("Permanent Plenum Cables" are so named through a Project being conducted by the National Fire Protection Research Foundation (NFPRF) and are described to meet a new, undefined, cable Listing for "limited combustibility" and "smoke developed index".) The more comprehensive solution to the issue of accumulating abandoned cables would have been to adopt a requirement to remove "ALL" abandoned cables that are removed from service and not intended for future use. Allowing for "Permanent Plenum Cables" to remain in plenums when abandoned would not address the serious issues of "congestion", "air flow restriction", and "total fuel load accumulation".

An appeal to the Standards Council was generated by proponents for "Permanent Plenum Cable" to overturn the Membership Action that occurred at the 1999 Annual Meeting. The Standards Council upheld the NFPA Membership Action after the hearing of the appeal. Comments from the final decision of the Standards Council on this matter are:

- "After a hearing, the Council reviewed and considered all of the information available to it, and voted to deny the appeals."
- "...wire and cable represents a significant potential fuel load in plenums and that, due to the rapidly increasing use of such cable in recent years, some approach to the problem should be devised."
- "...while it is the floor vote in favor of a return to the previous edition text that resulted in this recommendation, informational ballots of the TC (NFPA 90A Technical Committee) following that vote give further support to the conclusion that a lack of consensus exists in favor of going forward with the abandoned cable provisions. A majority of TC members voting on these informational ballots also supported the return to previous edition text..."
- "...the previous edition text is, in the Council's view, clearly suitable."
- "...the Council itself has concerns about the TC's approach and has concluded that further study of this important issue is needed."
- "...the Council wants to ensure that, as the TC undertakes to fully and fairly address these issued going forward, it has the best available range of expertise, representation, and experience. The Council, therefore, is referring the matter of committee membership to the Council's membership task group for review and recommendations."

While plenum cables are not typically the ignition source of fires, due to the low energy conducted through them, the fuel characteristics of high volumes of abandoned cable in plenums, whether combustible or limited combustible by definition, will most certainly add to the heat and energy released in a large, exposing fire, such as those where the ignition source is a room and contents fire below or above the plenum.

This proposal addresses the growing safety issue of accumulating abandoned cable in concealed spaces, without selectively favoring any cable geometry or synergy of materials. It does not allow for further accumulation of "Permanent Plenum Cables" which, when removed from service and not intended for future use, no longer have any function—except perhaps to serve as fuel for some future conflagration.

The proposal adopts consistent wording from NFPA 70, National Electrical Code, Section 300-21 and NFPA 75, Protection of Electronic Computer/Data Processing Equipment, paragraph 4-2.4. Basing this new requirement on existing code shows the strong intent, stated in the past by the Standards Council, to have good consistent code language across the various NFPA standards. Arguments by the proponents of "Permanent Plenum Cable" in the NFPA 90A review process to somehow create a new cable test requirement based on the definition of "limited combustibility" and "smoke developed index" created for building construction products would be a further misuse of the NFPA 255 and NFPA 259 "materials" test methods.

In spite of the rapid attempts by the proponents of "Permanent Plenum Cable", neither Underwriters Laboratories (UL) nor Intertek Testing Services (ITS/ETL) have yet established Listing criteria for "Permanent Plenum Cable" that could cover the matrix of cable types used in a plenum (fiber optics, coax, etc.). In fact, initial attempts over the first 9 months of the NFPRF Project to test finished cable in the NFPA 255 and NFPA 259 test methods has only shown inconsistencies and extremely limited capability of cables to meet the established definitions of "limited combustibility" and "smoke developed index" established for construction products. These test methods do NOT allow for cables to be tested based on their installed condition, nor can they be used to test cables with the important integration of finished cable geometries and materials/conductor or fiber synergies as they impact fire performance.

The proponents of "Permanent Plenum Cable" are applying these "material" tests inappropriately to cables. This is particularly why more sophisticated, integrated "cable" fire tests such as NFPA 262 (Plenum), ANSI/UL 1666 (Riser), and ANSI/UL 1581 (Vertical Tray) have been established and referenced in Standards such as the NFPA 70, NFPA 90A, etc. These tests more accurately simulate the actual fire hazards for installed cables, both in terms of the building environment AND the installed configuration. Integrated tests such as these are used to show the cables are designed to help contribute to minimizing the spread of fire and smoke generation in the early stages of a fire, allowing time for people to egress from the building. The fire safety record clearly shows that these tests have been successful in differentiating the fire performance of cables more accurately than materials tests such as NFPA 255 or NFPA 259.

The definition for cable fire performance in NFPA 90A Sections 2-3.10.1 and 2-3.10.5 are listed as Exceptions because the covering paragraphs (a) in each Section refer only to "materials" used in the construction of plenums. Proponents of "Permanent Plenum Cable" tried to make the argument in the NFPA 90A proposal review that IF the cable can be shown to meet the requirements of the plenum construction materials, accumulation of this cable is justifiable. As was acknowledged by members of the Standards Council during the NFPA 90A Appeal Hearing, cable jackets and insulations will NEVER look like the rigid materials used to construct plenums. Establishing a "Permanent Plenum Cable" Exception in a requirement to remove abandoned cable would clearly allow for a loop-hole to continue to proliferate abandoned cable accumulation and NOT address the serious issues of total fuel load, congestion, and air flow.

NFPA 75 Appendix A, paragraph A-4-2.4 says: "Abandoned cable will potentially interfere with air flow and extinguishing systems. Abandoned cable also adds to the fuel loading." This proposal would provide consistency with the established fire testing criteria and/or abandoned cable removal provisions established by NFPA 70, NFPA 75 and the appropriate Exceptions established for cables in NFPA 90A.

As was shared by Richard G. Gewain of Hughes Associates (with many years of direct involvement in these definitions) at the NFPA 90A TC meeting in December, 1998, the NFPA 220, Building Construction Committee (BCC) reviewed the definition of "non-combustible" and the new definition "limited combustible" in 1975. The BCC made it clear that these definitions "apply to the materials used in the construction of buildings (floors, roofs, columns, walls, etc.), but do NOT apply to furnishings or the contents of buildings, or to the fire hazard evaluation of materials." This language is clearly spelled out in the Special Interest Bulletin No. 294, currently entitled "Noncombustible and Limited-Combustible Building Construction Materials", published and updated several times since 1956 by the National Board of Fire Underwriters (a.k.a. American Insurance

Association, currently known as the American Insurance Services Group).

Because of the concern that other NFPA Committees have been misusing the term "limited combustible", the Standards Council has assigned the responsibility for the term "limited combustible" to the BCC. The BCC has recently requested its Chairman to contact the Chairmen of the other NFPA Committees (covering 48 NFPA Standards) using this term and ask for a clarification of what is intended for its use. A BCC Task Group is now established to develop proposals or comments to ensure that the term in other standards such as NFPA 90A is used correctly. From a fire hazards point of view, it has clearly NOT been shown that using the current definitions of "limited combustible" and "smoke developed index" and NFPA 259/NFPA 255 test methods are appropriate for installed cables.

This proposal also alleviates the concern and burden to the authority having jurisdiction inspector enforcing NFPA 70 to identify different types of cables currently in the concealed spaces and removed from service. The requirements to remove ALL abandoned cable not intended for future use should be less cumbersome than to remove only "some" of the cables.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to panel action on Proposal 16-176 which meets the intent of the submitter.

(Log #4050)

16- 176 - (770-52(d)): Accept in Principle

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Revise Section 770-52(d) as follows:

(b) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate. Excessive accumulations of abandoned cables, in ducts, plenums, and other space used for environmental air, shall be removed where practicable.

FPN : Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

SUBSTANTIATION: BICSI members have been extensively involved with the design and installation of telecommunications cabling. Technology changes have resulted in newer high performance cabling being installed in support of those technologies. We have observed excessive accumulations of abandoned cabling adding to the fuel loading within plenum spaces. This proposal is offered to the NFPA to help reduce the fuel load within these plenum areas.

Addition of "to maintain the fire resistance rating" to the end of the second sentence will correlate this section with section 300-21.

The proposed fine print No. 1 note was copied from the first sentence of the fine print note in section 300-21. It assists installers in locating firestop information.

Acceptance of this proposal will result in cable removal being included in the scope of the installation of a new communications and data system. The contractor will remove the old cable before installing the new system.

Acceptance of this proposal will result in many BICSI members specifying abandoned cable removal within the scope of the installation of new communications and data systems.

In two separate proposals, we have offered definitions for "abandoned cable" and "excessive accumulation of abandoned cables".

This proposed wording addresses the issue of excess combustibles in plenums without requiring the removal of all abandoned cable, only excessive accumulations of abandoned cable, thus avoiding a burdensome requirement of removing insignificant amounts of cable. The proposed first sentence, Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate, limits the amount of cable that will be permitted to be abandoned. It applies to all cable that is in place, plenum cable as well as non-plenum cable that was installed before the plenum cable requirements were in the Code. The proposed second sentence, Excessive accumulations of abandoned cables, in ducts, plenums, and other space used for environmental air, shall be removed, where practicable, deals with already abandoned cable. The wording of "where practicable" aid the situations where cable may be intertwined and cannot be removed without disruption of active services. The NEC requirements for plenum cable were first promulgated in the 1975 NEC, consequently, abandoned cables in older buildings often include unlisted cable along with listed plenum cable.

Other sections of the NEC require the removal of abandoned wiring.

ARTICLE 354 — Underfloor Raceways, Section 354-7. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

ARTICLE 356 — Cellular Metal Floor Raceways, Section 356-7. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

ARTICLE 358 — Cellular Concrete Floor Raceways, Section 358-13. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case of abandoned outlets on loop wiring, shall be allowed in raceways.

ARTICLE 305 — Temporary Wiring, Section305-3(d). Time Constraints, (d) Removal. Temporary wiring shall be removed immediately upon completion of construction or purpose for which the wiring was installed.

PANEL ACTION: Accept in Principle.

Revise 770-3(a) to read as follows:

"(a) Spread of Fire or Products of Combustion. Section 300-21. Abandoned cables not intended for future use shall not be permitted to remain."

PANEL STATEMENT: The revision meets the intent of the submitter. It is more appropriate to place the requirement in 770-3(a) which addresses the subject.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 19

ABSTENTION: 1

COMMENT ON AFFIRMATIVE:

BRUNSSEN: See my Comment on Affirmative Vote on Proposal 16-80.

DORNA: The revised wording for 770-3(a) should read as follows:

"(a) Spread of Fire or Products of Combustion. Section 300-21. Abandoned cables ~~not intended for future use~~ shall not be permitted to remain."

The use of the phrase "not intended for future use" is redundant. The definition of "abandoned cable" has this phrase in the definition. To restate this phrase would be grammatically incorrect.

JOHNSON: See my Comment on Affirmative on Proposal 16-80.

KAHN: See my Comment on Affirmative on Proposal 16-80.

WIERENGA: The revised wording for 770-3(a) should read as follows:

"(a) Spread of Fire or Products of Combustion. Section 300-21. Abandoned cables ~~not intended for future use~~ shall ~~not~~ be removed."

The use of the phrase "not intended for future use" is redundant because it is already included in the definition of "abandoned cable". The deletion of the words "not" and "permitted to remain" can be readily stated by use of positive code language using the word "removed".

EXPLANATION OF ABSTENTION:

CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #1210)

16- 177 - (Table 770-53): Accept
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise Table 770-53. Cable Substitutions as follows:

Table 770-53. Cable Substitutions

Cable Type	Permitted Substitutions
OFNP	OFNP-50
OFCP	OFNP-50, OFNP, OFCP-50
OFNR	OFNP-50, OFNP
OFCR	OFNP-50, OFNP, OFCP-50, OFCP, OFNR
OFNG, OFN	OFNP-50, OFNP, OFNR
OFCG, OFC	OFNP-50, OFNP, OFCP-50, OFCP, OFNR, OFCR, OFNG, OFN

SUBSTANTIATION: If my proposal to establish a new section 770-51(b) is accepted, a new section is added and the sections will be renumbered. The new section creates two new cable types, Type OFNP-50 and Type OFCP-50. This proposal correlates section 770-51 with those proposed changes.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #2988)

16- 180 - (770-53(a) and (b)): Accept
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Revise text as follows:
770-53. Applications of Listed Optical Fiber Cables and Raceways. Nonconductive and conductive optical fiber cables shall comply with (a) through (f) as applicable.
(a) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP.
Also, listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in Section 300-22(b) and in other space used for environmental air as described in Section 300-22(c). Only Type OFNP and OFCP cables shall be permitted to be installed in these raceways.
Exception: Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with Section 300-22.
(b) Riser. Cables installed in vertical runs and penetrating more than one floor or cables installed in vertical runs in a shaft shall be Types OFNR or OFCR. Floor penetrations requiring Types OFNR or OFCR shall contain only cables suitable for riser or plenum use.
Also, listed riser optical fiber raceways shall be permitted to be installed in vertical runs in a shaft or from floor to floor. Only Types OFNR, OFCR, ~~and~~ OFNP, and OFCP cables shall be permitted to be installed in these raceways.
Exception No. 1: Where Types OFNG, OFN, OFCG, and OFC cables are encased in metal raceway or are located in a fireproof shaft having firestops at each floor.
Exception No. 2: Type OFNG, OFN, OFCG, or OFC cable in one- and two-family dwellings.

FPN: See Section 300-21 for firestop requirements for floor penetrations.

(c) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in (a) and (b) shall be Type OFNG, OFN, OFCG, or OFC. Such cables shall be permitted to be installed in listed general-purpose optical fiber raceways.

SUBSTANTIATION: This proposal revises the aforementioned sections to all Conductive Optical Fiber Cables to be used in Optical Fiber Raceways. Conductive cables are cables containing noncurrent-carrying conductive members [see 770-5(b)]. Optical Fiber/Communication Raceways are listed raceways used in plenum, riser, and general purpose areas of a building per Articles 770 and 800. These listed raceways are used in Article 800 with communication cables. The communication cables may have a conductive sheathing that cover the conductor assembly that may include one or more metallic members, strength members, or jackets. Conductive cables, per Article 800, have been used in Optical Fiber/Communication Raceways satisfactorily and without incident. In addition, per Article 770-53(c), General Purpose Raceways are currently allowed to used with conductive general-purpose cabling.

See companion proposal 770-2.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #3051)

16- 181 - (770-53(a)): Reject

SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit

RECOMMENDATION: Revise this section to read as follows:

(a) ~~Plenum.~~ Ducts, Plenums, and Other Environmental Air Spaces. Optical fiber ~~C~~ cables shall not be installed in ducts or plenums as covered in Sections 300-22(a) and (b). Open runs of optical fiber cables installed in ~~, and~~ other spaces used for environmental air covered in Section 300-22(c) shall be Type OFNP or OFCP. Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with Section 300-22(c)(1) shall be permitted in other spaces used for environmental air.

~~Also, t~~ Listed plenum optical fiber raceways shall be permitted to be installed in ~~ducts and plenums as described in Section 300-22(b) and in~~ other space used for environmental air as described in Section 300-22(c). Only Type OFNP cable shall be permitted to be installed in these raceways.

~~Exception: Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with Section 300-22.~~

SUBSTANTIATION: Section 300-22(a) does not permit any wiring. Section 300-22(b) does not permit plenum-rated wiring methods. The exception has been moved to the first paragraph to make it part of the main text and to clarify that cables that cannot meet the requirements for "plenum" rated must be enclosed in metal.

PANEL ACTION: Reject.

PANEL STATEMENT: No technical substantiation has been submitted to provide for the removal of allowing plenum optical fiber cables from being installed in ducts or plenums.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #4138)

16- 182 - (770-53(a)): Accept in Principle

SUBMITTER: Marcelo M. Hirschler, GBH Int'l, Inc./Rep. Plenum Cable Assn.

RECOMMENDATION: Revise as follows:

770-53. Applications of Listed Optical Fiber Cables and Raceways. Nonconductive and conductive optical fiber cables shall comply with (a) through (f) as applicable.

(a) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP.

Also, listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in Section 300-22(b) and in other space used for environmental air as described in Section 300-22(c). Only Type OFNP cable shall be permitted to be installed in these raceways. Abandoned cables, not intended for future use, shall not be permitted to remain.

Exception: Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with Section 300-22.

SUBSTANTIATION: There is a significant amount of information indicating that the amount of cables installed in plenums, and other air-handling spaces, is increasing rapidly. An understanding of cabling practices indicates that the most common way in which cable installation is carried out is by disconnecting existing cable and leaving it abandoned in place, while introducing the cable needed to perform the additional functions. See Log #4136. There is, as yet, no indication that the additional cables in plenums causes an added fire hazard, and the fire record of cables in concealed spaces, both above ceilings and below floors, remains excellent. In fact, plenum cables, which meet the fire test requirements of NFPA 262, have been shown to have extremely good fire performance and to spread flame only very slowly, if at all. However, this type of preventive measure is worthwhile.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The proposer's intent was satisfied by panel action on Proposal 16-176.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

ARTICLE 780 — CLOSED-LOOP AND PROGRAMMED POWER DISTRIBUTION

(Log #4271)

10- 88 - (780-3): Accept
Note: At the recommendation of Code-Making Panel 10, the Technical Correlating Committee is recommending that Article 780 be deleted from the 2002 NEC and invites Public Comment. The Technical Correlating Committee directs that this Proposal be forwarded to Code-Making Panel 7 for information.
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Delete the phrase "of a closed-loop power distribution system" from Section 780-3(a) and the phrase "in a closed-loop power distribution system" from Section 780-3(b)(1).
SUBSTANTIATION: This is a resubmittal of a 1999 proposal. This wording went into the 1996 NEC to create a distinction between programmed power systems which are not closed-loop and "smart-house" systems that are. They are indeed distinct, as distinct as day and night. The problem is that they are so distinct that programmed power systems are outside of the scope of Article 780. This change created the wholly unwarranted inference that Article 780 protects programmed power systems running on "smart-house" cabling (Type NMS) from other restrictions in the Code that assume true closed-loop power. Barring a change in the scope of this article that inference is false and needs to be corrected.
The 1999 Panel rejection statement failed to address the article scope issue, and the TCC should direct acceptance of this proposal on that basis alone. The subject it did address, the suitability of NMS cable, is outside of its responsibilities. In fact, Article 336 does restrict this cable to closed loop purposes. Section 336-30(b), third paragraph, requires the signaling conductors to comply with Section 780-5. That can't happen if those signaling conductors are being used beyond the scope of the article, and that brings us back to square one.
There is a much more fundamental issue here. In the 1987 code cycle, closed-loop allowances went all over the code book. Section 240-20(c) and Section 300-15(m) are just two examples. Every Code Making Panel that was inserting these allowances thought they were addressing closed loop systems. If the scope of Article 780 gets effectively broadened in this way, it will threaten to unravel code rules that have been fought over and perfected throughout the history of the NEC. It could allow an end run around system separation rules in Article 725, for example. All the system installer would have to say is that they're not using a Class 2 signaling system, they're an Article 780 system instead.
I'm sorry that true closed-loop distributions appear to have failed in the market, and that less sophisticated systems are filling the niche. I wish them well. However, they belong in Article 725 and not Article 780. Perhaps the TCC might organize a small task group between CMP 7 and CMP 16 to squarely address correlation issues around Type NMS cable.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #1113)

10- 89 - (780-6): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Change "No. 24" to "24 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
PANEL STATEMENT: No clarity is added for U.S. and some other locations, where the meaning of "No. 14" and "14 AWG" are universally known and interchangeable; further, the Code is generally consistent in listing "xx AWG" in the tables and "No. xx" in the text. However, this proposal adds considerable clarity for international locations that might accept the NEC, where common U.S. trade sizes are less well known.
The panel suggests that the Technical Correlating Committee ensures that all final actions on similar proposals are consistent throughout the Code.

ARTICLE 800 — COMMUNICATIONS CIRCUITS

(Log #294)

16- 187 - (800): Reject
SUBMITTER: J. H. Walling, Insulated Cables Engineers Assn./Rep. Communications Cable Section of ICEA (Insulated Cable Engineers Assn.)
RECOMMENDATION: In response to the proposal to roll Article 800 into the main body of the NEC, it is herewith proposed to leave Article 800 as is and not to roll it into the main body of the NEC.
SUBSTANTIATION: ICEA represents the position of the cable manufacturers with respect to codes and standards.

At our last meeting on March 8-12, 1999 in Atlanta, Georgia, we discussed an eventual change of NEC Article 800, i.e., specifically if this article should remain a separate article or should be rolled into the main body of the NEC.

After discussing the subject in detail, it was the overwhelming opinion of all representatives of cable manufacturers, that the Article 800 should remain as it is. I have been mandated by the ICEA Communications Cable Section to contact NFPA, to express the concern of the cable manufacturers with respect to an eventual change of Article 800 by rolling it into the main body of the NEC. In fact, it was the unanimous decision of the representatives of the cable manufacturers to recommend to leave Article 800 as it is.

This decision has been taken also in view of the very complexity of the task to roll in Article 800 into the main body of the NEC. This task from a time and effort point of view does not seem to be justified at all, if compared to the "questionable gain" of having the issues of Article 800 covered in the main body of the NEC.

PANEL ACTION: Reject.

PANEL STATEMENT: Proposal provides no recommended wording and therefore does not conform to Section 4-3.3 (c) of the NFPA Regulations Governing Committee Projects.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

COMMENT ON AFFIRMATIVE:

JOHNSON: I agree with the submitter's position that Article 800 (and all of Chapter 8) should remain independent. The submitter proposed no recommended text and therefore there was no other action the Panel could take but to reject.

(Log #294a)

1- 314 - (800): Reject

SUBMITTER: J. H. Walling, Insulated Cables Engineers Assn./Rep. Communications Cable Section of ICEA (Insulated Cable Engineers Assn.)

RECOMMENDATION: In response to the proposal to roll Article 800 into the main body of the NEC, it is herewith proposed to leave Article 800 as is and not to roll it into the main body of the NEC.

SUBSTANTIATION: ICEA represents the position of the cable manufacturers with respect to codes and standards.

At our last meeting on March 8-12, 1999 in Atlanta, Georgia, we discussed an eventual change of NEC Article 800, i.e., specifically if this article should remain a separate article or should be rolled into the main body of the NEC.

After discussing the subject in detail, it was the overwhelming opinion of all representatives of cable manufacturers, that the Article 800 should remain as it is. 16- 189 - (800-2-Abandoned Cable (New)): Accept

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Add a new definition to read as follows:

Abandoned Cable. Cable that is neither terminated at both ends, at a connector or other equipment, nor identified for future use with a tag.

SUBSTANTIATION: The definition of abandoned cable is needed to accompany the proposals that require removal of abandoned cable. This definition reflects industry practices.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

DORNA: The definition of "Abandoned Cable" should be the same here as what we accepted in Proposal 16-273. It should be "Cable that is neither terminated at ~~both ends, at a connector or other~~ equipment, nor identified for future use with a tag." (This is the same wording as Proposal 16-273.)

The reason we took out the reference to connectors in Proposal 16-273 is because CATV cable usually has connectors attached. It was our concern that CATV cables would have connectors attached and then would not fall under the proposed original definition and therefore would not have to be removed if abandoned. I believe this also could be the case with cables in this Article 800. These cables could also have connectors attached, and therefore would not fall under the definition the panel had accepted in principal. If we make the definition the same as I have suggested above (the same as 16-273) then it will make it irrelevant on whether the cable has connectors or not. I can foresee someone using the fact that the cable has a connector on it, therefore it does not fall under "abandoned cable" and does not need to be removed.

JOHNSON: See my Explanation of Negative Vote on Proposal 16-154.

COMMENT ON AFFIRMATIVE:

BRUNSSEN: See my Comment on Affirmative Vote on Proposal 16-32.

KAHN: See my Comment on Affirmative on Proposal 16-32.

(Log #4047)

16- 190 - (800-2- Excessive Accumulation of Abandoned Cables (New)): Reject

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Add a new definition to read as follows:

Excessive Accumulation of Abandoned Cables. When the number of abandoned cables is greater than 1/3 of the total number of cables within a fire-containment zone.

SUBSTANTIATION: After the concept of plenum cables was introduced into the 1975 NEC, Underwriters Laboratories initially listed plenum cables by comparing the smoke production of plenum cables with the smoke production of conventional cables of the same physical design (but not plenum grade materials) in conduit. Plenum cables (not in conduit) were tested and compared with an equal number of conventional cables in conduit. It was assumed that the plenum cables were a replacement for conventional cables and that in case of a fire the amount of smoke would be reduced because of the

lower smoke production of plenum cables. It was not anticipated that plenum cables would be abandoned. Since conventional cables in conduit were deemed to be acceptable the smoke from these cables is the benchmark for comparison and a fire involving an excessive amount of abandoned cables could emit excessive amount of smoke. Until research better defines what amount of abandoned cable might be excessive, allowing up to 1/3 excess of abandoned cables is prudent.

PANEL ACTION: Reject.

PANEL STATEMENT: The term is not used. The proposal that introduced this term was modified to eliminate the term.

Note: See Technical Correlating Committee action on Proposal 16-38. It was the action of the Technical Correlating Committee that further consideraton be given to the comments expressed in the voting. The Technical Correlating Committee directs that the Action on this Proposal be revised to comply with the NEC Style Manual 3.2.1 relative to use of the unenforceable terms "practicable" and "impracticable." This action will be considered by the Panel as a Public Comment. It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 3 for Comment.

SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions

RECOMMENDATION: Revise 800-5 as follows:

800-5. Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to equipment shall not be denied by an excess accumulation of wires and cables ~~that prevents~~ sufficient to prevent the removal of panels, including suspended ceiling panels.

SUBSTANTIATION: Section 800-5 has been misinterpreted to mean that wires and cables may not be placed directly on suspended ceilings. While the 1999 National Electrical Code Handbook emphasizes "excess accumulation" in the interpretive text, Figures 800-1 and 800-2 lead the reader to conclude that no wires or cables are permitted to rest directly on the suspended ceiling. This was not the intent of CMP 16 when 800-5 was introduced into the 1993 NEC. At that time, CMP 16 stated in response to a similar proposal to Article 725 (1992 TCD, Comment 16-18) that the proposed requirement "... would still allow some cabling of a limited quantity above the ceiling tile, but not to an excessive amount." The proposed revision emphasizes that it is an excessive accumulation of wire and cable that is of concern. A limited amount of wiring or cabling laid directly on a suspended ceiling is permitted, will not deny access to equipment, and does not present an unsafe working environment. This is a companion proposal and is intended to correlate with 725-5, 760-5, 770-7, 820-5 and 830-6.

PANEL ACTION: Accept in Principle.

Revise 800-5 to read as follows:

"800-5. Access to Electrical Equipment Behind Panels Designed to Allow Access

Access to electrical equipment shall not be denied by an accumulation of wires and cables that prevents removal of panels. Cables shall be installed in such a manner that the cable will not be damaged by normal building use. Access to electrical equipment behind ceilings designed to allow access shall comply with (a) or (b).

a. New building construction (e.g., renovation, remodeling, new spaces). Installation of cables shall comply with Section 300.11.

b. Buildings with existing cabling systems.

Where practicable, installation of cables shall comply with Section 300-11. Where impracticable to comply with Section 300-11, cables less than 13 mm (0.5 in) in diameter shall be permitted to be installed unsupported by the building structure in accordance with 1 or 2.

1. In areas having ceilings with access points or access panels, it shall be permissible to fish a maximum of three cables between access points in the ceiling.

2. In areas having suspended lay-in ceilings, it shall be permissible to install a maximum three unsupported cables on top of any one ceiling tile. The cables shall be run parallel to the ceiling grid."

PANEL STATEMENT: The revised text satisfies the intent of the original recommendation in that it allows some cabling of a limited quantity above ceiling tile but not an excessive amount, which would interfere with accessibility.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

EGEDSAL: A suspended ceiling is not intended to support electrical wires or cables.

SPEER: The panel's action on this proposal greatly reduces the effectiveness of the previous changes in the code which eliminated any unsupported cable laying on suspended ceilings. The panel's statement indicates that the revised language limits the quantity of cable laying on suspended ceilings and "not an excessive amount, which would interfere with accessibility" would be allowed.

Unfortunately, by allowing some cable on each tile, a condition which would limit accessibility has been created. Not to mention, the extra weight added to each tile in the suspended ceiling system. By making the ceiling grid a support system for loose cable, have we changed the engineering requirements for the ceiling? What will be the practical effect of this action, as normal operation of the building takes place and multiple cables are laid on the same tiles?

I strongly believe this change is a mistake and should not take place.

COMMENT ON AFFIRMATIVE:

BRUNSSEN: I concur with the panel action in providing relief for a limited amount of after-construction telecommunications wire and cable to be placed directly on the suspended ceiling tiles. However, proposed Section 800-5(b)(2), as presently written, is confusing and could be interpreted as permitting a total of only three unsupported wires and cables. The intent of the panel was that up to a maximum of three unsupported wires and cables may be routed across each and every ceiling tile. Revising 800-5(b)(2) to state: "...permissible to install a maximum of three unsupported wires and cables on top of ~~any one~~ each ceiling tile, i.e., up to three wires and cables are permitted to lay on a ceiling tile." would clarify the intent. Note that the word "of" is inserted and is missing in the original text.

(Log #CP1605)

16- 192a - (800-6): Accept

SUBMITTER: CMP 16

RECOMMENDATION: Revise text to read as follows:

"Mechanical Execution of Work. Communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceiling and sidewalls shall be supported by the structural components of the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be attached to structural components at intervals not exceeding 1.52 m (5 ft) and within 305 mm (12 in.) from every cabinet, box or fitting by straps, staples, hangers or similar

fittings designed and installed so as not to damage the cable. The installation shall also conform with Section 300-4(d)."
Also, delete the Fine Print Note.
SUBSTANTIATION: This proposal provides additional rules for the mechanical execution of the work. Since there are additional rules, the fine print note is not necessary. This provides parallel requirements to those used in Articles 640, 725, 760, 770, 820, and 830.
PANEL ACTION: Accept.

(Log #3755)

16- 193 - (800-6): Accept in Principle
SUBMITTER: Douglas R. Erb, Construction Insp. Dept., Ocean County, NJ
RECOMMENDATION: Add a second paragraph to read as follows:
"Cables shall be secured by staples, cable ties, straps, or similar fittings designed and installed as not to damage the cable. Cables shall be secured at intervals not exceeding 6 ft and within 12 in. from every cabinet, box or device.
Exception No. 1: For concealed work in finished buildings where such support is impracticable, it shall be permissible to fish cable between access points."
SUBSTANTIATION: The absence of a definitive support requirement for these cables which is provided for other wiring methods throughout this code is needed. Without a definite support requirement enforcement of the general requirements of 800-6 provide no consistency. With the increased presence of PLFA cables especially in drop ceilings damage to these cables and the integrity of their systems has increased with the lack of proper support. Lack of support for these cables creates an unsafe work area for others attempting work in these spaces.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to the panel action, substantiation, and statement on Proposals 16-192(a) and 16-192. The revised text meets the intent of the submitter.

(Log #500)

16- 199 - (800-10(a)(4)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 800-10(a)(4) - change "12 in. (30.48 cm)" to "300 mm (12 in.)" and change "40 in. (1.02 m" to "1.0 m (40 in.)"
800-10(b) - change "8 ft (2.44 m)" to "2.5 m (8 ft)"
800-10(b) Exception No. 2 - change "18 in. (457 mm)" to "450 mm (18 in.)" and change "4 ft (1.22 m)" to "1.2 m (4 ft)"
800-10(b) Exception No. 3 - revise as follows:
"Exception No. 3: Where the roof has a slope of not less than 100 mm (4 in.) ~~4 in. (102 mm)~~ in 300 mm (12 in.) ~~12 in. (305 mm),~~ a reduction in clearance to not less than 900 mm (3 ft) ~~3 ft (914 mm)~~ shall be permitted."
800-11(c) - change "20 ft (7.0 m) to "6.0 m (20 ft)"
800-12(b) - change "4 in. (102 mm)" to "100 mm (4 in.)"
800-13 - change "6 ft (1.83 m)" to "1.8 m (6 ft)"
800-30(a) FPN No. 2 (2) - change "140 ft (42.7 m)" to "42 m (140 ft)"
800-30(b) - change "30 ft (9.14 m)" to "9.0 m (30 ft)" in two places
80-30(b)(3) - change "5 ft (1.52 m) to "1.5 m (5 ft)"; change "1/2 in. (12.7 mm) to "12.7 mm (1/2 in.)"; change "6 ft (1.83 m)" to "1.8 m (6 ft)"
800-41(a) - change "30 ft (9.14 m)" to "9.0 m (30 ft)"
800-50 Exception No. 3 - change "50 ft (15.2 m)" to "15 m (50 ft)"
800-50 Exception No. 3 FPN No. 2 - change "50 ft (15.2 m)" to "15 m (50 ft" in three places.
800-52(a)(2) - change "2 in. (50.8 mm)" to "50 mm (2 in.)"
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
In 800-11(c), 7.0 m was corrected to 6 m.
In 800-40(b)(3), the SI units for 1/2 in. cannot be rounded since it specifies a minimum trade size.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #1005)

16- 200 - (800-10(a)(4), (b) Exception No. 2): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a)(4) Separation. ~~Clearance. Supply service drops of 0-750 volts running above and parallel to communications~~ Communications circuit service drops running parallel to electric light or power service-drops shall have a minimum separation of 12 in. (30.48 cm) at any point in the span, including the point of ~~and at their~~ attachment to the building, provided the ~~nongrounded~~ electric light or power conductors are insulated and that a clearance separation of not less than 40 in. (1.02 m) is maintained between the ~~two services~~ communications circuit service-drop conductors and the electric light or power service-drop conductors at the pole.
(b) Exception No. 2: A reduction in clearance above only the overhanging portion of the roof to not less than 18 in. (457 mm) shall be permitted if (1) not more than ~~4 ft (1.22 m)~~ 6 ft (1.83 m) of communications circuit service-drop conductors, 4 ft (1.22 m) horizontally, pass above the roof overhang and (2) they are terminated at ~~a through or~~ an above-the-roof approved raceway mast or other approved support.
SUBSTANTIATION: Editorial. The proposal for (a)(4) addresses the rule to the communication service-drop conductors instead of the electric power system service-drop conductors which are under the purview of panel 4. The present rule literally doesn't apply where the electric service-drop is not above the communication service-drop. The common code term for conductors not connected to ground is "ungrounded"; however, I believe separation should include grounded conductors as they may be subject to above-ground voltage due to various causes and are often bare.
There could be more than two services supplying service drops.
In (b) Exception No. 2 "Through" (the roof) is superfluous, and a raceway (any type?) could be through the roof but not a mast. The raceway should be designated as an approved mast type.
The 6 ft length (4 ft horizontal) would allow for a slope in the service-drop while maintaining the 4 ft requirement. This is similar to Section 230-24, Exception No. 3.
The voltage designation of electric service-drops is deleted, as it infers separation requirements do not apply for higher voltages and doesn't indicate clearance may be required by other standards or codes.
PANEL ACTION: Reject.
PANEL STATEMENT: The wording changes are not editorial, and no substantiation has been provided for the changes. The current text is clear and accurate. The service mast can go through the roof. The rules for power service drops are in Article 230.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #327)

16- 201 - (800-10(c) (New)): Reject
NOTE: In accordance with 4-6.2(c) of the Regulations Governing Committee Projects, the following Proposal 16-164 and Comment 16-88 were returned to Committee at the 1998 Annual Meeting, and now are being processed as a Proposal for this revision.
SUBMITTER: Roger Witt, State Farm Ins. Co.
RECOMMENDATION: The Proposal 16-164:
RECOMMENDATION: Add new Section 800-10(c) to read as follows:
(c) Point of Entry Where practicable, the point of entry for communications wiring and cables shall be within 5 feet of the electrical service entry point.
(FPN) The distance to the electrical system grounding electrode has a direct relationship to the potential difference between the communications circuits and the power circuits.
SUBSTANTIATION: It has been observed that when the communication circuit's point of entry is located remote from the electric service point, proper bonding is not provided. When power and communications service entry points are remote and the systems are bonded, then L di/dt losses come into play and the equalization of potential is not achieved.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: As worded, this proposed requirement would be very difficult, if not impossible to enforce. There would seldom be agreement between installers and inspectors as to whether meeting this requirement was practical.
The Comment 16-88:
SUBMITTER: Roger Witt, State Farm Ins. Co.
COMMENT ON PROPOSAL NO.: 16-164
RECOMMENDATION: Add new Section 800-10(c) to read as follows:
(c) Point of Entry. The point of entry for communications wiring and cables shall be within 5 feet of the electrical service entry point.
(FPN): The distance to the electrical system, grounding electrode has a direct relationship to the potential difference between the communications circuits and the power circuits.
Exception: Where it is not practicable to install the communications and electrical service in this manner, a separate grounding electrode, installed in compliance with 250-83 (c), shall be installed for the communications systems and the grounding electrodes for the electrical and communications systems shall be connected with a bare or insulated #4 copper conductor. The conductor shall not be

exposed to mechanical injury, and when buried, shall be buried to a depth of 24 inches

SUBSTANTIATION: Change in proposed text as recommended by one of the panel members and shown in the ROP.

By requiring a specific point of entry, the requirement becomes enforceable. Single point grounding for all communications services and power services is needed to provide equal potential between the systems.

There is evidence that when communications services are installed remote from the power system service, separate ground rods are installed and not bonded to the electrical service grounding electrode. By specifying a service entrance location adjacent to the power system service entrance a better chance of single point grounding is presented.

PANEL ACTION: Accept in Principle.

Add new Section 800-10(c) to read as follows:

(c) Point of Entry. The point of entry for communications wiring and cables shall be within 20 feet of the electrical service entry point.

Exception: Where it is not practicable to install the communications service in this manner, a separate grounding electrode, installed in compliance with 800-40(b)(3) and bonded in accordance with 800-40(c) and 800-40(d).

(FPN): Under certain conditions, the length of the bonding conductor has a direct relationship to the difference in potential between the communications and the power circuits.

PANEL STATEMENT: The Panel believes these changes meet the concerns of the submitter and add clarity to the text.

SUBSTANTIATION: (See the Recomendation field above that includes substantiation for 1998 edition Proposal 16-164 and 1998 edition Comment 16-88.)

NOTE: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action on Proposal 16-212. The submitter is concerned with voltage differences between the telephone and power service on the premises because of excessive telephone grounding conductor length. Locating the power and telephone entrances within 5 feet of each other as the submitter proposes will not necessarily ensure a short telephone grounding conductor. Proposal 16-212 addresses that issue directly and ensures that this conductor shall be a maximum of 20 feet in length, thereby minimizing potential differences.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #1673)

16- 202 - (800-10(c) (New)): Reject

SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions

RECOMMENDATION: Add new Section 800-10(c) as follows:

(c) On Masts. Communications wires and cables shall be permitted to be attached to a service mast that is listed for the purpose of accepting multiple attachments.

SUBSTANTIATION: This is a companion proposal to the proposal adding a new exception to Section 230-28. The proposed Section 230-28, Exception, would permit communications service drop attachments to a power service mast that is listed for the purpose of supporting multiple attachments. Presently, Section 800-10 does not address the issue of communications attachments to power service masts. However, such attachments can be made to a single mast in a safe and cost effective manner when the service mast is designed and listed for such application. It is unnecessarily costly to the building owner and aesthetically unsightly when two service masts must be provided, one for power and another for communications service. The safety of craft personnel is not an issue since they are trained to work in close proximity to power conductors. Section 800-10(a)(4) permits a minimum separation of 12 inches between power-service drops and communications drops at their point of attachment to the building, provided that the nongrounded power conductors are insulated and that a clearance of 40 inches between the two services is maintained at the pole.

This issue was not previously addressed in Article 800. However, for reasons of correlation with the proposed addition of Section 230-28, Exception and consistency with Section 820-10(c), it now becomes necessary that Section 800-10 address the issue of multiple attachments to the power service mast.

PANEL ACTION: Reject.

PANEL STATEMENT: Although requirements for the power service mast are specified in Article 230, the detailed design and installation requirements are not defined. The electric service company specifies the type, size and height of mast to be used and the manner in which it is to be installed. The NEC can not dictate to the utility the specific installation requirements. Code Panel 4, which has jurisdiction over service masts, has consistently rejected this concept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

BRUNSSEN: This proposal was developed as a companion proposal to the proposal to revise Section 230-28. The proposal to revise Section 230-28 to permit communications wires and cables to be attached to a service mast that is listed for the purpose of accepting multiple attachments should be accepted. There is no reason to force a homeowner to install a separate mast to accommodate communications (telephone, CATV) service drops when the service mast can be listed to do so. The panel acknowledged that detailed design and installation requirements are not defined. This is the purpose of listing the service mast. The listing is only valid when the listed product is installed properly for its intended use.

JOHNSON: An arbitrary prohibition of attaching to electrical masts is not reasonable. Where the mast can be shown to support additional attachments without creating a safety hazard, these attachments should be allowed. Reasonable qualifications would include: the ability to support the weight (with ice loading) and not damage the mast or structure, ability to maintain proper clearance, etc.

(Log #4273)

16- 203 - (800-10(c) (New)): Reject

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Add a new (c) as follows:

(c) Overhead (aerial) spans of communications cables or wires shall be permitted to be attached to the exterior of a raceway-type mast intended for the attachment and support of such conductors.

SUBSTANTIATION: This is Section 800-52(e) Exception, properly located where it covers overhead outdoor spans. This was the original substantiation. The 1999 result is almost unusable; how many applications could possible exist of communications circuits attaching to masts and running across a large open shop floor, for example? Nevertheless, that's the only application literally allowed under the 1999 revision.

PANEL ACTION: Reject.

PANEL STATEMENT: 800-52(e) already allows strapping of these type circuits to a communications raceway whether inside or out. Refer to 800-52 main rule.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

(Log #1662)

16- 204 - (800-11(c)): Accept

SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions

RECOMMENDATION: Delete Section 800-11(c), including the exception and fine print note (FPN).

Revise the text of 800-11 as follows:

Underground communications wires and cables entering buildings shall comply with (a) ~~through (c)~~ and (b).

SUBSTANTIATION: This is a companion proposal and is intended to correlate Section 800-11 with the proposed revision to Section 800-40(a)(4)(New). During the 1999 code cycle, a number of proposals and comments were submitted to limit the separation of power and communications entrances to the building. The intent of these proposals and comments was to limit the potential difference between power and communications circuits during lightning events.

This potential difference is generally a function of conductor inductance (L), which increases in direct proportion to conductor length, and the rate of rise of the current (di/dt). These proposals and comments were generally rejected as they did not address the real issue, the length of the communications primary protector grounding conductor. However, through oversight, one appearance of the separations limit between power and communications entrances to the building was overlooked and remains in Section 800-11(c). The companion proposal indicated above addresses the issue of potential difference between power and communications by limiting the length of the primary grounding conductor and eliminates the need to specify a separation distance between power and communications entrances to the building. If 800-11(c) is deleted, then the text of 800-11 must be revised to indicate that there are now only two subsections, (a) and (b).

(Log #2798)

16- 205 - (800-11(c)): Accept
SUBMITTER: Melvin J. Anna, Prescott, AZ
RECOMMENDATION: Delete Section 800-11(c) in its entirety.
SUBSTANTIATION: The exception to Section 800-11(c) is an incomplete sentence that cannot be interpreted, used, or enforced as code. When the exception is deleted, the main rule must also be deleted because the remedy intended by the exception to cover "impracticable" installation situations will not be available.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #4274)

16- 206 - (800-11(c)): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Delete this subsection.
SUBSTANTIATION: During the 1998 NFPA Annual Meeting, all but one of a series of changes that set a maximum distance between a Chapter 8 wiring entry and the electrical service entry point of 20 ft came to the floor for action. A consensus emerged that the proposals would be impracticable, particularly in cases where the communications entry arrived first. No one seriously believes, for example, that a telephone drop would influence the location of a 2000A service switchboard. The rule does contain an exception for a bond between separated electrodes, but that is already in the Code.
The floor motions affected proposed Section 800-10(c) on overhead telephone drops, Section 810-55 on antenna lead-in conductors (which had already been rejected by the panel), Section 820-11(c) for CATV, and Section 830-10(j) and Section 830-11(c) for network-powered broadband communications systems. The submitter of the successful floor motions, a member of CMP 16 and the Correlating Committee, plainly overlooked this section on underground entries for communications circuits. This proposal is simply to correlate with the other actions. By this proposal, the Advisory Committee expresses its support of making the TIA in process on this point permanent code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #1690)

16- 207 - (800-30(b)): Accept in Principle
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Delete "for purposes of this section, the point at which the exposed cable enters shall be considered to be the point of emergence through an exterior wall, a concrete floor slab, or from a rigid or intermediate metal conduit grounded to an electrode in accordance with Section 800-40(b)."
SUBSTANTIATION: Point of entrance is defined in Section 800-2.
PANEL ACTION: Accept in Principle.
Revise 800-30(b) of the code as follows:
1) Delete the second paragraph.
2) Change wording of the first paragraph to read as follows:
"The primary protector shall be located in, on, or immediately adjacent to the structure or building served and as close as practicable to the point of entrance."
3) Add a new FPN after the first paragraph to read as follows:
"FPN: See 800-2 for the definition of the point of entrance."
PANEL STATEMENT: Adding the "point of entrance" to the first paragraph correlates with the definition in Section 800-2.
Adding a FPN alerts the readers to the definition.
The deleted paragraph is not needed due to wording change in the first paragraph.

16- 212 - (800-40(a)(4) and Exception (New)): Accept
Note: The Technical Correlating Committee directs the Panel to change "residences" to "dwellings."
SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions
RECOMMENDATION: Insert new 800-40(a)(4) and Exception as follows. Renumber existing 800-40(a)(4) and 800-40(a)(5) as 800-40(a)(5) and 800-40(a)(6), respectively.
(4) Length. The primary protector grounding conductor shall be as short as practicable. In one and two-family residences, the primary protector grounding conductor shall be as short as practicable, not to exceed 20 ft (6.0 m) in length.
Exception: In one- and two-family residences where it is not practicable to achieve an overall maximum primary protector grounding conductor length of 20 ft (6.0 m), a separate communications ground rod meeting the minimum dimensional criteria of Section 800-40(b)(3) shall be driven, the primary protector shall be grounded to the communications ground rod in accordance with Section 800-40(c) and the communications ground rod bonded to the power grounding electrode system in accordance with Section 800-40(d).
SUBSTANTIATION: During the 1999 Code cycle, a number of proposals and comments were submitted to limit the separation of power and communications entrances to the building. The intent of these proposals and comments was to limit the potential difference between power and communications circuits during lightning events. That potential difference is generally a function of conductor inductance (L), which increases in direct proportion to conductor length, and the rate of rise of the current (di/dt). These proposals and comments were generally rejected as they did not address the real issue, the length of the communications primary protector grounding conductor. This proposal addresses that issue, encourages short primary protector grounding conductors, provides guidance as to a reasonable maximum length, and provides an alternative where it is not practicable to meet the maximum length (20 ft) restriction. The proposed length restriction is limited to one- and two-family residences as it is such installations that are more likely to have diverse power and communications entrances and experience lightning-related problems. (urban/suburban environment with fewer elevated structures and extensive buried metallic objects). This is a companion proposal and is intended to correlate Section 800-40(a)(4)(New) with similar changes proposed for Sections 820-40(a)(4)(New) and 830-40(a)(4)(New).
PANEL ACTION: Accept.
PANEL STATEMENT: Editorially change "20 ft (6.0 m)" to "6.0 m (20 ft)" in both places of the recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 19
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
JOHNSON: Keeping grounding conductors as short as practicable has always been the rule. There is no technical substantiation for the 20 ft specification, however. The 20 ft rule is often not practical to maintain and would result in a huge backlash from homeowners whenever an additional electrode is to be placed and 6AWG wire to be used to bond it to the existing electrode system. The substantiation provided is not supported by sufficient data about safety problems.

(Log #1404)

16- 213 - (800-40(a)(5), (d)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add to (a)(5):
Underground installations shall be installed to meet the minimum cover requirements of Table 300-5, except where the conductor rises for termination or transition to aboveground installation.
Revise (d) to read as follows:
~~Bonding of Electrodes. A bonding jumper not smaller than No. 6 copper or equivalent shall be connected between the communications grounding electrode and the power grounding electrode at the building or structure served where separate electrodes are used. Bonding together of all separate electrodes shall be permitted.~~
Supplementary Grounding Electrodes. Supplementary grounding electrodes shall be permitted to be connected to the grounding conductor specified in (a) above, but the earth shall not be used as the sole grounding conductor. Bonding together of all separate electrodes shall be permitted...
SUBSTANTIATION: Section 800-40(a) requires a minimum No. 14 grounding conductor run to the building or structure grounding electrode specified in (b). If a separate electrode is installed, it does not abrogate that section. If a No. 14 grounding conductor is so installed, but a shorter or more direct run to a nonrequired electrode is desired for additional safety, the wording of this section requires a minimum No. 6 copper as a bonding conductor between the driven electrode(s) and the electrodes of (b). Since the No. 14 grounding conductor alone complies with Code, the No. 6 requirement would, for economic reasons, deter the installation of a separate electrode, which diminishes any additional safety provided by such an electrode. Section 250-54, for other type installations permits the equipment grounding conductor to serve as a "bonding" conductor from supplementary electrodes.
In (a)(5), the proposal provides for buried conductor cover requirements. While burial depth may not relate to shock hazard, it does relate to physical damage. While section 800-48 may invoke Table 300-5 for raceways, it is limited to within buildings only, per the heading.
PANEL ACTION: Reject.
PANEL STATEMENT: The depth of burial requirements of Table 300-5 are specific to service conductors and are concerned with possible shock hazard. Section 800-40 deals with the grounding of the telecommunications primary protector, and bonding (800-40(d)) of spearate communications and power grounding electrodes. These conductors do not carry power, and in the case of bonding of separate electrodes, the conductor is a minimum of 6 AWG and is unlikely to be damaged by general yard maintenance.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #2210)

16- 214 - (800-40(b)): Accept in Principle
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise text as follows:
(b) Electrode. The grounding conductor shall be connected as follows:
1. In Buildings or Structures With Grounding Means. To the nearest accessible location on the following:
a. The building or structure grounding electrode system as covered in Section 250-50
b. The grounded interior metal water piping system as covered in Section 250-104(a)
c. The power service accessible means external to enclosures as covered in Section 250-92(b)
d. The metallic power service raceway
e. The service equipment enclosure

f. The grounding electrode conductor or the grounding electrode conductor metal enclosure; or

g. To the grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in Section 250-32.

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in Section 800-30(b), shall be considered accessible.

2. In Buildings or Structures Without Grounding Means. If the building or structure served has no grounding means, as described in (b)(1):

a. To any one of the individual electrodes described in Section 250-50; or,

b. If the building or structure served has no grounding means, as described in (b)(1) or (b)(2)(a), to an effectively grounded metal structure or to a ground rod or pipe not less than 5 ft (1.52 m) in length and 1/2 in. (12.7 mm) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in Section 800-13 and at least 6 ft (1.83 m) from electrodes of other systems. Steam or hot water pipes or lightning-rod conductors shall not be employed as electrodes for protectors

SUBSTANTIATION: The new style manual requires titles for this section.

PANEL ACTION: Accept in Principle.

Revise the submitter's recommendation as follows:

Change 800-40(b)(1)(b) to read as follows:

"(b) The grounded interior metal water piping system, within 5 ft (1.52 m) from its point of entrance to the building, as covered in Section ~~250-104(a)~~ 250-50."

In the last sentence, replace the term "lightning-rod conductors" with "air terminal conductors (lightning-rod conductors)."

The remainder of the recommendation is unchanged.

PANEL STATEMENT: The change incorporates Proposals 16-215 and 16-216.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

COMMENT ON AFFIRMATIVE:

WIERENGA: After further research into NFPA 780 I believe the Panel should revise its action to replace the term "lightning-rod conductors" with the term "air terminal grounding conductors". This terminology would provide words that are clearly understandable and would remove the confusion that is present with the existing text ("lightning-rod conductors"). I think that a conductor that is installed on the outside of a building, to connect the air terminal of a lightning strike to the point of ground potential, could be best described as an "air terminal grounding conductor".

(Log #1671)

16- 215 - (800-40(b)(1)(b)): Accept

SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions

RECOMMENDATION: Revise the text of 800-40(b)(1)(b) as follows:

(b) The grounded interior metal water piping system, within 5 ft (1.52 m) from its point of entrance to the building, as covered in Section ~~250-104(a)~~ 250-50.

SUBSTANTIATION: Section 250-50 (formerly Section 250-81) was revised in the 1993 NEC to eliminate the use of the interior metal water piping system as a grounding (bonding) conductor. This was done because of the increased use of nonconductive piping for repair and maintenance rendering the interior metallic water piping system electrically discontinuous. Section 800-40(b)(1)(b) has not been revised to reflect this change. This proposed revision underscores that the interior metal water pipe may no longer be used as an intersystem bonding conductor to interconnect communications and power, and correlates Section 800-40(b)(1)(b) with Section 250-50. Further, Section 250-104(a) concerns bonding of piping systems and building steel. Since connections to the interior metallic water piping systems are now permitted only within the first 5 feet of the pipe's entrance to the building, the more appropriate reference is Section 250-50. This is a companion proposal and is intended to correlate Section 820-40(b)(1)(b) with similar changes proposed for Sections 810-21(f)(1)(b), 820-40(b)(1)(b) and 830-40(b)(1)(b).

PANEL ACTION: Accept.

PANEL STATEMENT: The final text is in Proposal 16-214.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #1806)

16- 216 - (800-40(b)(3)): Accept in Principle

SUBMITTER: Noel Williams, Noel Williams Consulting

RECOMMENDATION: In the last sentence, replace the term "lightning -rod conductors" with "air terminal conductors."

SUBSTANTIATION: Similar changes were made in Section 250-60 in the 1999 NEC. The use of the term "lightning rod" is inaccurate and inconsistent with the language of NFPA 780. In fact, in the context of NFPA 780, "down conductors," "main conductors," or "secondary conductors" would be more accurate, but "air terminal conductors" is sufficiently descriptive and is consistent with other language in the NEC.

(See Section 250-60.)

PANEL ACTION: Accept in Principle.

Revise the submitter's recommendation as follows:

In the last sentence, replace the term "lightning-rod conductors" with "air terminal conductors (lightning-rod conductors)."

PANEL STATEMENT: The parenthetical phrase was added to aid in the transition in terminology. The final text is shown in Proposal 16-214.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

DORNA: The revised wording to add "air terminal conductors" to me is more confusing then the current wording which is "lightning-rod conductors". The submitter's substantiation says: "The use of the term "lightning rod" is inaccurate…". I don't know about anybody else, but it sure describes exactly what it means, as far as I'm concerned. What is an "air terminal"? I, like some other panel member, thought it was a place where I caught my plane to go some where. So I guess an "air terminal conductor" is a conductor in the air terminal? Is that United's or Delta's terminal? In addition the panel statement said, "The parenthetical phrase was added to aid in the transition in terminology." If the term "air terminal conductor" is so accurate of a description and understood by everybody(except me), then why do we need the parenthetical? Because it is confusing and I believe the wording should stay as currently written.

SPEER: By adding the revised text "air terminal conductors" the code is made more confusing. Users of this code have a long standing and accepted understanding of the term "lightning rod and lightning rod conductors". Such industry terminology exists in the code today and we should refrain from making technical changes without improving the use or application of the code.

COMMENT ON AFFIRMATIVE:

WIERENGA: The revised wording for 820-3(a) should read as follows:

Adopt the use of the term air terminal (lightning rod) in 800-40(b)(3) for the following reasons:

1. The term "air terminal" has been used by NFPA 780 for many years.

2. NFPA 780-97 has included the term "air terminal" in its definitions.

3. Currently the NEC uses the term "air terminals" in Section 250-52, Section 250-60, Section 250-60 FPN No. 1, and Section 250-106.

4. Currently the NEC uses the term "air terminals (lightning rods)" in Section 800-40(d) FPN No. 1, and in Section 820-40 FPN No. 1.

(Log #1006)

16- 217 - (800-40(d), 810-21(j), 820-40(d), 830-40(d)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise sections:

A bonding jumper not smaller than No. 6 copper ~~or equivalent,~~ or No. 4 aluminum or copper-clad aluminum shall be connected between the (communications) (radio and television equipment)

(antenna systems) grounding electrode system and the electric power grounding electrode system at the building or structure served, where separate electrodes are used. The bonding jumper shall be installed in accordance with Section 250-64. The points of attachment of the bonding jumper shall be accessible.

(Words in parenthesis to be applied to applicable article.)

SUBSTANTIATION: The phrase "or equivalent" is ambiguous; does it mean size, material, or both? Assuming the jumper is a safety-related requirement, other requirements of Section 250-64 relating to aluminum and earth, protection, splicing, enclosures, should apply, also requirements for accessible points of attachment as is required for other bonding jumpers.

PANEL ACTION: Reject.

PANEL STATEMENT: Section 250-64 is specific to the grounding electrode conductor, that conductor intended to provide the service-to-grounding electrode connection at the building or structure. The referenced sections adequately address the grounding conductor, and that the text "or equivalent" is clear and in reference to the AWG. Further, the proposal does not follow the Rules Governing Committee Projects in that a single proposal was presented to cover multiple Sections.

16- 218 - (800-40(d), FPN No. 3 (New)): Reject

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design / Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Add:

FPN No. 3: See Section 250-58 for additional common grounding electrode principles.

SUBSTANTIATION: This reference to 250-58 is needed in 800-40(d) so that the principles established for the common grounding electrodes can be safely implemented.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed FPN is not accurate. Section 800-40(b) presently and adequately covers the connection of the grounding conductor to the building or structure grounding electrode system, and specifically references Section 250-50. There is typically only one intersystem grounding (bonding) conductor from the communications primary protector to the grounding electrode system and its connection to the building or structure grounding electrode system is already covered in Section 800-40 (b) and (c). Section 250-58 is specific to ac power grounding, grounding of conductor enclosures and equipment, and use of the same grounding electrode for grounding separate services, and is inappropriate for communications.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

(Log #3043)

16- 219 - (800-48): Accept in Principle in Part

SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit

RECOMMENDATION: Revise text as follows:

800-48. Raceways for Communications Wires and Cables. Where communications wire and cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3, or a listed nonmetallic raceway complying with Sections 800-51(j), (k), or (l), as applicable.

~~Exception: Listed nonmetallic communications raceway identified as general purpose, riser, or plenum in accordance with Section 800-51 and installed in accordance with Sections 331-7 through 331-14, where the requirements applicable to electrical nonmetallic tubing shall apply.~~

SUBSTANTIATION: This is a positive statement which eliminates an exception. The requirements of Article 331 have been included in a companion proposal to Section 800-51(j). The companion proposal makes the Code more user-friendly.

Other companion proposals are suggested for Sections 800-51(k) and (l), and Section 800-53(a).

PANEL ACTION: Accept in Principle in Part.

Revise text as follows:

"800-48. Raceways for Communications Wires and Cables. Where communications wires and cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3, or a listed nonmetallic raceway complying with Sections 800-51(j), (k), or (l), as applicable, and installed in accordance with Sections 331-7 through 331-14, where the requirements applicable to electrical nonmetallic tubing shall apply."

PANEL STATEMENT: The panel rejects the intent to include all the requirements of Article 331 for this requirement as stated in the substantiation. For example, the inclusion of 331-6 would impose requirements for conductor fill that are not appropriate to the application.

The panel accepts in principle the concept of converting exception into positive code language and has added revisions to the recommendation to more effectively convert the exception.

16- 223 - (800-50, 800-51, 800-52, and 800-53): Reject
SUBMITTER: Irving Mande, Edwards Systems Technology
RECOMMENDATION: The purpose of this Proposal is to discontinue the use of all MP type cables for new installations, and after July 1, 2002 for adding to existing installations.
In Table 800-50, delete all information for MPP, MPR, MPG, and MP cables, and in FPN No.1 delete everything after "...fire resistance rating" on second line.
Delete 800-51(g) and renumber the subsections that follow.
In 800-52(d), delete "Types MPP, MPR, MPG, and MP multipurpose cables and" and renumber the subsections that follow.
In Table 800-53:
1. for Cable Type CMP, delete MPP as permitted substitution and replace with "None".
2. for Cable Type CMR, delete MPP and MPR.
3. for Cable Types CMG, CM, delete MPP, MPR, MPG, and MP.
4. for Cable Type CMX, delete MPP, MPR, MPG, and MP.

In Figure 800-53:
either delete the Figure as no longer being neccessary, or
delete the MP column, the horizontal arrows to the CM column, the line reading "Type MP-Multipurpose cable", and the two lines explaining the meaning of the horizontal arrows.
SUBSTANTIATION: As the original proposer of multipurpose cables, I think that it is appropriate for me to be the one that recommends that they be discontinued. Though there is still a need for multipurpose cables, that need has been filled in the marketplace by CM cables. Existing inventories of MP cables should be permitted to be used until the supply is exhausted.
Also see related Proposals for 760-61(d), Figure 760-61, Table 760-61, and Table 830-58.
PANEL ACTION: Reject.
PANEL STATEMENT: Although there are a few differences between multiconductor MP cable and CM cable, coaxial MP cable has a unique requirement. Consequently MP cable should be retained. Furthermore, if the listing of MP cable were to be eliminated, provisions for the reuse of these cables would need to be provided.
There was no wording to allow the continued use of Type MP Cable after July 1, 2002.
Removal of this type of cable while it is still being listed could lead to a problem.

AFFIRMATIVE: 20

(Log #3629)

16- 227 - (800-51): Reject
SUBMITTER: David B. Kiddoo, AlphaGary Corp.
RECOMMENDATION: With regards to Section 800-51, "Limited Combustion Cable" or "Permanent Plenum Cable" should not be accepted as an additional Listing based on the lack of testing definition, the absence of cable Listing capability, and the proven adequacy of an integrated and enhanced NFPA 262 test method.

NFPA 262 differentiates cables as to their fire performance to provide acceptable values for smoke generation and flame travel distance.

Proponents of "Limited Combustible Cable" or "Permanent Plenum Cable" have been actively soliciting support from cable market trade organizations, Code-Making Panel 16 Members or Alternates, cable manufacturers, etc. for a proposal to include a new paragraph in the Section to provide for a new Type of cable based on the definitions of "limited combustibility" and "smoke developed index" per the definitions in NFPA 90A. These definitions ONLY govern construction products for the installation of air conditioning and ventilating systems. The NFPA 255 and NFPA 259 fire test methods being promoted are NOT applicable to evaluate the fire hazard nor the geometries and material synergies in cables as they pertain to fire performance.

As these proposals have been made public through this solicitation for support, I wish to respond at this time to say that there is no safety record or fire performance issue necessitating any additional cable type of ruse in plenum cable applications. The inclusion of this new Type of cable is partially as a means to provide for an Exception from the proposed requirement in Section 800-52 to remove accumulations of abandoned cable. "Limited Combustible Cable" or "Permanent Plenum Cable" definitions seen in these proposals for a new cable Type are NOT based on any test method incorporating an actual cable fire hazard evaluation. Without adequate test methods and with the current status of the NFPRF "Permanent Plenum Cable Project", NO cables have been shown to meet the requirements proposed. The data generated in this Project have NOT been related to any appropriate fire hazard evaluation and should NOT be used to establish ANY relative cable fire performance comparisons.

SUBSTANTIATION: This issue has been discussed and reviewed in the last cycle of the NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems). The membership of the NFPA did NOT support a proposal to change the provisions for cables in the paragraphs on "ceiling cavity plenums" (2-3.10.1) and "raised floor plenums" (2-3.10.5) that would have allowed "Permanent Plenum Cables" to accumulate in these plenums. ("Permanent Plenum Cables" are so named through a Project being conducted by the National Fire Protection Research Foundation (NFPRF) and are described to meet a new, undefined, cable Listing for "limited combustibility" and "smoke developed index".) The more comprehensive solution to the issue of accumulating abandoned cables would have been to adopt a requirement to remove "ALL" abandoned cables that are removed from service and not intended for future use. Allowing for "Permanent Plenum Cables" to remain in plenums when abandoned would not address the serious issues of "congestion", "air flow restriction", and "total fuel load accumulation".

An appeal to the Standards Council was generated by proponents for "Permanent Plenum Cable" to overturn the Membership Action that occurred at the 1999 Annual Meeting. The Standards Council upheld the NFPA Membership Action after the hearing of the appeal. Comments from the final decision of the Standards Council on this matter are:

- "After a hearing, the Council reviewed and considered all of the information available to it, and voted to deny the appeals."
- "...wire and cable represents a significant potential fuel load in plenums and that, due to the rapidly increasing use of such cable in recent years, some approach to the problem should be devised."
- "...while it is the floor vote in favor of a return to the previous edition text that resulted in this recommendation, informational ballots of the TC (NFPA 90A Technical Committee) following that vote give further support to the conclusion that a lack of consensus exists in favor of going forward with the abandoned cable provisions. A majority of TC members voting on these informational ballots also supported the return to previous edition text..."
- "...the previous edition text is, in the Council's view, clearly suitable."
- "...the Council itself has concerns about the TC's approach and has concluded that further study of this important issue is needed."
- "...the Council wants to ensure that, as the TC undertakes to fully and fairly address these issued going forward, it has the best available range of expertise, representation, and experience. The Council, therefore, is referring the matter of committee membership to the Council's membership task group for review and recommendations."

While plenum cables are not typically the ignition source of fires, due to the low energy conducted through them, the fuel characteristics of high volumes of abandoned cable in plenums, whether combustible or limited combustible by definition, will most certainly add to the heat and energy released in a large, exposing fire, such as those where the ignition source is a room and contents fire below or above the plenum.

This proposal addresses the growing safety issue of accumulating abandoned cable in concealed spaces, without selectively favoring any cable geometry or synergy of materials. It does not allow for further accumulation of "Permanent Plenum Cables" which, when removed from service and not intended for future use, no longer have any function—except perhaps to serve as fuel for some future conflagration.

The proposal adopts consistent wording from NFPA 70, National Electrical Code, Section 300-21 and NFPA 75, Protection of Electronic Computer/Data Processing Equipment, paragraph 4-2.4. Basing this new requirement on existing code shows the strong intent, stated in the past by the Standards Council, to have good consistent code language across the various NFPA standards. Arguments by the proponents of "Permanent Plenum Cable" in the NFPA 90A review process to somehow create a new cable test requirement based on the definition of "limited combustibility" and "smoke developed index" created for building construction products would be a further misuse of the NFPA 255 and NFPA 259 "materials" test methods.

In spite of the rapid attempts by the proponents of "Permanent Plenum Cable", neither Underwriters Laboratories (UL) nor Intertek Testing Services (ITS/ETL) have yet established Listing criteria for "Permanent Plenum Cable" that could cover the matrix of cable types used in a plenum (fiber optics, coax, etc.). In fact, initial attempts over the first 9 months of the NFPRF Project to test finished cable in the NFPA 255 and NFPA 259 test methods has only shown inconsistencies and extremely limited capability of cables to meet the established definitions of "limited combustibility" and "smoke developed index" established for construction products. These test methods do NOT allow for cables to be tested based on their installed condition, nor can they be used to test cables with the important integration of finished cable geometries and materials/conductor or fiber synergies as they impact fire performance.

The proponents of "Permanent Plenum Cable" are applying these "material" tests inappropriately to cables. This is particularly why more sophisticated, integrated "cable" fire tests such as NFPA 262 (Plenum), ANSI/UL 1666 (Riser), and ANSI/UL 1581 (Vertical Tray) have been established and referenced in Standards such as the NFPA 70, NFPA 90A, etc. These tests more accurately simulate the actual fire hazards for installed cables, both in terms of the building environment AND the installed configuration. Integrated tests such as these are used to show the cables are designed to help contribute to minimizing the spread of fire and smoke generation in the early stages of a fire, allowing time for people to egress from the building. The fire safety record clearly shows that these tests have been successful in differentiating the fire performance of cables more accurately than materials tests such as NFPA 255 or NFPA 259.

The definition for cable fire performance in NFPA 90A Sections 2-3.10.1 and 2-3.10.5 are listed as Exceptions because the covering paragraphs (a) in each Section refer only to "materials" used in the construction of plenums. Proponents of "Permanent Plenum Cable" tried to make the argument in the NFPA 90A proposal review that IF the cable can be shown to meet the requirements of the plenum construction materials, accumulation of this cable is justifiable. As was acknowledged by members of the Standards Council during the NFPA 90A Appeal Hearing, cable jackets and insulations will NEVER look like the rigid materials used to construct plenums. Establishing a "Permanent Plenum Cable" Exception in a requirement to remove abandoned cable would clearly allow for a loop-hole to continue to proliferate abandoned cable accumulation and NOT address the serious issues of total fuel load, congestion, and air flow.

NFPA 75 Appendix A, paragraph A-4-2.4 says: "Abandoned cable will potentially interfere with air flow and extinguishing systems. Abandoned cable also adds to the fuel loading." This proposal would provide consistency with the established fire testing criteria and/or abandoned cable removal provisions established by NFPA 70, NFPA 75 and the appropriate Exceptions established for cables in NFPA 90A.

As was shared by Richard G. Gewain of Hughes Associates (with many years of direct involvement in these definitions) at the NFPA 90A TC meeting in December, 1998, the NFPA 220, Building Construction Committee (BCC) reviewed the definition of "non-combustible" and the new definition "limited combustible" in 1975.

The BCC made it clear that these definitions "apply to the materials used in the construction of buildings (floors, roofs, columns, walls, etc.), but do NOT apply to furnishings or the contents of buildings, or to the fire hazard evaluation of materials." This language is clearly spelled out in the Special Interest Bulletin No. 294, currently entitled "Noncombustible and Limited-Combustible Building Construction Materials", published and updated several times since 1956 by the National Board of Fire Underwriters (a.k.a. American Insurance Association, currently known as the American Insurance Services Group).

Because of the concern that other NFPA Committees have been misusing the term "limited combustible", the Standards Council has assigned the responsibility for the term "limited combustible" to the BCC. The BCC has recently requested its Chairman to contact the Chairmen of the other NFPA Committees (covering 48 NFPA Standards) using this term and ask for a clarification of what is intended for its use. A BCC Task Group is now established to develop proposals or comments to ensure that the term in other standards such as NFPA 90A is used correctly. From a fire hazards point of view, it has clearly NOT been shown that using the current definitions of "limited combustible" and "smoke developed index" and NFPA 259 / NFPA 255 test methods are appropriate for installed cables.

This proposal also alleviates the concern and burden to the authority having jurisdiction inspector enforcing NFPA 70 to identify different types of cables currently in the concealed spaces and removed from service. The requirements to remove ALL abandoned cable not intended for future use should be less cumbersome than to remove only "some" of the cables.

PANEL ACTION: Reject.
PANEL STATEMENT: The proposal does not conform to section 4-3.3(c) of the Regulations Governing Committee Projects. The submitter has made other proposals on this subject that meet the Regulations Governing Committee Projects. The issues raised in this proposal were addressed when the other proposals were considered.

16- 228 - (800-51(a)): Reject
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Revise text as follows:
(a) Type CMP. Type CMP communications plenum cable shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air per Sections 300-22(b) and 300-22(c), and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.
SUBSTANTIATION: This proposal clarifies that Optical Fiber Cables Type CMP is suitable for use per Sections 300-22(b) and 300-22(c).
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed change does not add any value to a listing agency when it determines the appropriate listing requirements for plenum cable.

800-51(h)	800-51(i)
800-51(i)	800-51(j)
800-51(j)	800-51(k)
800-51(k)	800-51(l)
800-51(l)	800-51(m)

Add a new section 800-51(h).
(h) Limited Combustible Cables. Types CMP and MPP cables that are also listed as being limited combustible and having a maximum smoke developed index of 50 shall be permitted to be listed and marked as Types CMP-50 and MPP-50.
FPN No. 1: See NFPA 90A-1999, Standard for the Installation of Air Conditioning and Ventilating Systems for a definition of limited combustible. See NFPA 255-2000, Standard Method of Test of Surface Burning Characteristics of Building Materials for a definition of the smoke developed index.
FPN No. 2: For further information on the requirements for materials in ceiling cavity and raised floor plenums, see NFPA 90A-1999, Standard for the Installation of Air Conditioning and Ventilating Systems, Sections 2-3.10.1 Ceiling Cavity Plenum and 2-3.10.5 Raised Floor Plenum.

SUBSTANTIATION: The NFPA Standards Council has assigned primary responsibility for the fire protection of plenums to the Technical Committee on Air Conditioning. That technical committee is responsible for NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems. The NFPA 90A (1996) requirements for ceiling cavity and raised floor plenums are shown below:

2-3.10 Plenums.

2-3.10.1 Ceiling Cavity Plenum. The space between the top of the finished ceiling and the underside of the floor or roof above shall be permitted to be used to supply air to, or return or exhaust air from, or return and exhaust air from, the occupied area, provided that the following conditions are met:

(a) All materials exposed to the airflow shall be noncombustible or limited combustible and have a maximum smoke developed index of 50.

Exception No. 1: The following materials shall be permitted in the ceiling cavity plenum where listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 ft (1.5 m) or less when tested in accordance with the specified test method:

(a) Electrical wires and cables NFPA 262, Standard Method of Test for Fire and Smoke Characteristics of Wires and Cables

(b) Pneumatic tubing for control systems — UL 1820, Standard for Safety Fire Test of Pneumatic Tubing for Flame and Smoke Characteristics Only

(c) Optical-fiber cables NFPA 262, Standard Method of Test for Fire and Smoke Characteristics of Wires and Cables

(d) Fire sprinkler piping — UL 1887, Standard for Safety Fire Test of Plastic Sprinkler Pipe for Flame and Smoke Characteristics

(e) Optical-fiber raceway NFPA 262, Standard Method of Test for Fire and Smoke Characteristics of Wires and Cables.

Exception No. 2: Smoke detectors.

Exception No. 3: Loudspeakers, loudspeaker assemblies, and their accessories shall be permitted in the ceiling cavity plenum where listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a peak heat release rate of 100 kW or less when tested in accordance with UL 2043, Standard for Safety Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces.

(b) The integrity of the firestopping for penetrations shall be maintained.

(c) Light diffusers, other than those made of metal or glass, used in air-handling light fixtures shall be listed and marked "Fixture Light Diffusers for Air-Handling Fixtures."

(d) The temperature of air delivered to these plenums shall not exceed 250°F (121°C).

(e) Materials used in the construction of a ceiling plenum shall be suitable for continuous exposure to the temperature and humidity conditions of the environmental air in the plenum.

(f) Where the plenum is a part of a floor-ceiling or roof-ceiling assembly that has been tested or investigated and assigned a fire resistance rating of 1 hour or more, the assembly shall meet the requirements of 3-3.3.

2-3.10.2 Duct Distribution Plenum. A duct enclosure used for the multiple distribution or gathering of ducts or connectors shall be constructed of materials and methods specified in 2-3.1.

2-3.10.3 Apparatus Casing Plenum. A fabricated plenum and apparatus casing shall be permitted to be used for supply, return, or exhaust air service and shall be constructed of materials and methods specified in 2-3.1, and in accordance with the following:

(a) The casing and plenum construction standards in SMACNA HVAC Duct Construction Standards — Metal and Flexible;

(b) The 1992 ASHRAE Handbook — HVAC Systems and Equipment;

(c) Paragraph 2-3.3 for all air duct coverings, duct lining acoustical liner/cells, and miscellaneous materials.

2-3.10.4 Air-Handling Unit Room Plenum.

(a) Individual rooms containing an air-handling unit(s) gather return air from various sources and combine the return air within the room for returning to the air-handling unit. Duct covering, duct lining, acoustical liner/cells, and miscellaneous materials shall comply with 2-3.3.

(b) Air-handling unit room plenums shall not be used for storage or occupied other than during equipment servicing.

2-3.10.5 Raised Floor Plenum. The space between the top of the finished floor and the underside of a raised floor shall be permitted to be used to supply air to, or return exhaust air from, or return and exhaust air from, the occupied area, provided that the following conditions are met:

(a) All materials exposed to the airflow shall be noncombustible or limited combustible and shall have a maximum smoke developed index of 50.

Exception No. 1: The following materials shall be permitted in the raised floor plenum where listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 ft (1.5 m) or less when tested in accordance with the specified test method:

(a) Electrical wires and cables NFPA 262, Standard Method of Test for Fire and Smoke Characteristics of Wires and Cables

(b) Pneumatic tubing for control systems — UL 1820, Standard for Safety Fire Test of Pneumatic Tubing for Flame and Smoke Characteristics Only

(c) Optical-fiber cables NFPA 262, Standard Method of Test for Fire and Smoke Characteristics of Wires and Cables

(d) Fire sprinkler piping — UL 1887, Standard for Safety Fire Test of Plastic Sprinkler Pipe for Flame and Smoke Characteristics

(e) Optical-fiber cable raceway NFPA 262, Standard Method of Test for Fire and Smoke Characteristics of Wires and Cables.

Exception No. 2: Raised floors, intermachine cables, electrical wires, listed plenum optical-fiber cable raceways, and optical-fiber cables in computer/data processing rooms where these rooms are designed and installed in accordance with NFPA 75, Standard for the Protection of Electronic Computer/Data Processing Equipment.

Exception No. 3: Smoke detectors.

(b) The integrity of the firestopping for penetrations shall be maintained.

(c) The temperature of air delivered to these plenums shall not exceed 250°F (121°C).

(d) Materials used in the construction of a raised floor plenum shall be suitable for continuous exposure to the temperature and humidity conditions of the environmental air in the plenum.

Exception No. 3: Use of egress corridors as part of an engineered smoke-control system.

Exception No. 4: In detention and correctional occupancies with corridor separations of open construction (e.g., grating doors or grating partitions).

Establishing Types CMP-50 and MPP-50 cables is a step toward correlating NFPA 70, the National Electrical Code and NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems. Types CMP-50 and MPP-50 cables will be superior plenum cables because they will qualify for use by meeting the basic rule for plenum materials, i.e., limited combustible and a smoke developed rating below 50, and meeting the flame spread and smoke requirements of the NFPA 90A Exception which are identical to those in the NEC fine print notes. Cables that meet the CMP-50/MPP-50 requirement typically have less than 1/5 the smoke production of CMP/MPP rated cables.

PANEL ACTION: Accept in Principle.

Revise the submitter's recommendation as follows:

1) Strike "and MPP" and "and MPP-50"

2) Change "cables" to "cable" wherever they appear

3) Change "Types" to "Type" wherever they appear.

PANEL STATEMENT: Multipair MPP cables are essentially identical to multipair CMP cables, hence there is no need to promulgate another cable type.

ABSTENTION: 1

EXPLANATION OF ABSTENTION:

CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #3050)

16- 233 - (800-51(j)): Reject
SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Revise to read as follows:
(j) Plenum Communications Raceways. ~~Plenum c~~ Communications raceways and associated fittings and boxes installed in ~~listed as plenum optical fiber raceways shall be permitted for use in ducts, plenums, and~~ other spaces used for environmental air ~~and~~ shall ~~also~~ be listed as having ~~adequate~~ fire-resistant and low-smoke producing characteristics equivalent to those required by NFPA 262. Plenum raceway shall be permitted to contain only listed plenum-rated conductors or cables having the same fire-resistant and low-smoke producing characteristics. Installation shall comply with Article 331 and Section 300-21.
Exception: The thermal barrier required in Section 331-3(2) shall not be required for listed plenum communications raceway.
SUBSTANTIATION: • It is not necessary to grant permission for use in these spaces as that is already covered in Section 800-53(a).
• Open plenum-rated wiring is not permitted in Section 300-22(b), which covers ducts and plenums, therefore the raceway should only be permitted in other spaces used for environmental air.
• Placing information on the type of cables acceptable in these raceways in this section makes the Code more user friendly and less prone to error.
• Fittings and boxes making up the raceway system must be of the same material as the raceway.
• Plenum, riser, and general-purpose communications raceway all have different characteristics. The plenum-rated raceway has to be listed to UL 910 (which is equivalent to NFPA 262 but cannot be referenced in the Code except in FPN). Reference to NFPA 262 does not change the current requirements, but does make the testing requirement for plenum rating mandatory.
• The exception that permits installation of the plenum-rated raceway without a thermal barrier has been included for the 2002 NEC while the issue of permanent plenum-rated wiring is being reviewed by the NFPA 90A Committee and others.
See companion proposals to revise Sections 800-48, 800-51(k), 800-51(l), and 800-53(a) for correlation.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation provided by the submitter does not provide rationale for restricting listed plenum communications raceways from their current acceptable applications.
The panel rejects the intent to include all the requirements of Article 331 for this requirement. For example, the inclusion of 331-6 would impose requirements for conductor fill that are not appropriate to the application.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #3045)

16- 234 - (800-51(k)): Reject
SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Revise to read as follows:
(k) Riser Communications Raceway. Riser communications raceways shall be listed as having adequate fire-resistant characteristics capable of preventing the carrying of fire from floor to floor. Installation of riser communications raceway shall be in accordance with Article 331.
SUBSTANTIATION: Riser communication raceway is ENT which is covered in the Code by Article 331. Article 331 describes ENT as flame retardant, which is not the same test as UL 1666 which is used for listing of CMR cable. There is no justification for installation practices different from ENT used for other purposes, and the thermal barrier requirement in Section 331-3(2) was added after review by the Toxicity Advisory Committee. Even though CMR cable can be used in some applications without being installed in a raceway, adding the raceway significantly adds to the fireload and to the products of combustion. There is also the danger that the raceway will be used for power conductors once it is in place.
This is a companion proposal to suggested changes to Sections 800-48, 800-51(j) and (l), and 800-53(a).
PANEL ACTION: Reject.
PANEL STATEMENT: The title of Section 800-51 is Listing Requirements for Communications Wires and Cables.
The proposal contains installation requirements. Installation requirements are inappropriate for a section on listing requirements.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #3046)

16- 235 - (800-51(l)): Accept in Part
SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Revise to read as follows:
(l) General-Purpose Communications Raceway. General-purpose communications raceways shall be listed as resistant to the spread of fire and shall be installed in accordance with Article 331.
SUBSTANTIATION: General-purpose communications raceway is similar to ENT, except that it is thinner, lighter weight. This would make it more likely to burn than regular ENT. There is no justification for not requiring the same thermal barrier as that required for ENT. Although CM communications cable can be used without raceway, the addition of this raceway adds substantially to the material available for fireload and products of combustion. The term "resistant to the spread of fire" is the same as that used for general purpose communications cable in Section 800-51(d). They should be the same, particularly as there is no way to show mandatory test requirements to assure what is meant by the term. At least this way it can be referenced back to the FPN in 800-51(d).
One of the failings of the NEC relative to fire testing is that terms such as flame retardant (which is used for ENT in Article 331), flame resistant, resistant to the spread of fire, fire retardant, capable of preventing carrying of fire from floor to floor, etc., are not defined in the Code. It would be very helpful in determining appropriate use if Article 100 contained information to make this determination. With globalization this becomes ever more important. Proposals to add definitions for these terms have been submitted to Panel 1 in the past, but were rejected. Panel 16, with its multitude of listing requirements, might be a catalyst for this change. If you add them to Article 800 via a panel proposal perhaps they would end up later in Article 100.
This is a companion proposal to suggested changes to 800-48, 800-51(j) and (k), and 800-53.
PANEL ACTION: Accept in Part.
Revise the submitter's recommendation to read as follows:
"(l) General-Purpose Communications Raceway. General-purpose communications raceways shall be listed as being resistant to the spread of fire."
PANEL STATEMENT: The change from "having adequate fire resistant characteristics" to "being resistant to the spread of fire" is accepted to use the same wording as that which applies to cables in 800-51(d). This is an editorial change.
The title of Section 800-51 is Listing Requirements for Communications Wires and Cables.
The proposal contains installation requirements. Installation requirements are inappropriate for a section on listing requirements.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #1026)

16- 236 - (800-52): Reject
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise 800-52 as shown:
800-52. Installation of Communications Wires, Cables, and Equipment
Communications wires and cables from the protector to the equipment or, where no protector is required, communications wires and cables attached to the outside or inside of the building shall comply with (a) through (e).
(a) Separation from Other Conductors.

(1) In Raceways, Boxes, and Cables.

a. Other Power-Limited Circuits. Communications cables shall be permitted in the same raceway or enclosure with cables of any of the following:

1. Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 725

2. Power-limited fire alarm systems in compliance with Article 760

3. Nonconductive and conductive optical fiber cables in compliance with Article 770

4. Community antenna television and radio distribution systems in compliance with Article 820

5. Low power network-powered broadband communications circuits in compliance with Article 830

b. Class 2 and Class 3 Circuits. Class 1 circuits shall not be run in the same cable with communications circuits. Class 2 and Class 3 circuit conductors shall be permitted in the same cable with communications circuits, in which case the Class 2 and Class 3 circuits shall be classified as communications circuits and shall meet the requirements of this article. The cables shall be listed as communications cables or multipurpose cables.

Exception: Cables constructed of individually listed Class 2, Class 3, and communications cables under a common jacket shall not be required to be classified as communications cable. The fire-resistance rating of the composite cable shall be determined by the performance of the composite cable.

c. Electric Light, Power, Class 1, Nonpower-Limited Fire Alarm, ~~and~~ Medium and High Power Network-Powered Broadband Communications Circuits.

1. In Raceways, Compartments, and Boxes. Communications conductors shall not be placed in any raceway, compartment, outlet box, junction box, or similar fitting with conductors of electric light, power, Class 1, nonpower-limited fire alarm, ~~or~~ medium or high power network-powered broadband communications circuits.

Exception No. 1: Where all of the conductors of electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuits are separated from all of the conductors of communications circuits by a barrier.

Exception No. 2: Power conductors in outlet boxes, junction boxes, or similar fittings or compartments where such conductors are introduced solely for power supply to communications equipment. The power circuit conductors shall be routed within the enclosure to maintain a minimum of 0.25-in. (6.35-mm) separation from the communications circuit conductors.

(2) Other Applications. Communications wires and cables shall be separated at least 2 in. (50.8 mm) from conductors of any electric light, power, Class 1, nonpower-limited fire alarm, ~~or~~ medium or high power network-powered broadband communications circuits.

Exception No. 1: Where either (1) all of the conductors of the electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuits are in a raceway or in metal-sheathed, metal-clad, nonmetallic-sheathed, Type AC, or Type UF cables, or (2) all of the conductors of communications circuits are encased in raceway.

Exception No. 2: Where the communications wires and cables are permanently separated from the conductors of electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuits by a continuous and firmly fixed nonconductor, such as porcelain tubes or flexible tubing, in addition to the insulation on the wire.

(b) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods.

(c) Equipment in Other Space Used for Environmental Air. Section 300-22(c) shall apply.

(d) Cable Trays. Types MPP, MPR, MPG, and MP multipurpose cables and Types CMP, CMR, CMG, and CM communications cables shall be permitted to be installed in cable trays.

(e) Support of Conductors. Raceways shall be used for their intended purpose. Communications cables or wires shall not be strapped, taped, or attached by any means to the exterior of any conduit or raceway as a means of support.

Exception: Overhead (aerial) spans of communications cables or wires shall be permitted to be attached to the exterior of a raceway-type mast intended for the attachment and support of such conductors.

SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. This proposal amends the separation rules between circuits to provide appropriate separation from these new high-power communications circuits.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.

(Log #1807)

16- 238 - (800-52(a)(1)c): Accept

SUBMITTER: Noel Williams, Noel Williams Consulting

RECOMMENDATION: Revise heading of the subsection (a)(1)(c) to read as follows:

(c) Electric Light, Power, Class 1, Nonpower-Limited Fire Alarm, and Medium Power Network-Powered Broadband Communications Circuits In Raceways, Compartments and Boxes.

(Eliminate number 1. but retain the rest of the language of the subsection.)

SUBSTANTIATION: Currently, (c) is subdivided into numbered paragraph 1. with no paragraph 2. This arrangement is confusing and inconsistent with the editorial style of the document.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #4275)

16- 239 - (800-52(a)(1)c): Accept in Principle

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee

RECOMMENDATION: Make no change in the requirements. Delete the heading "1." and the title thereof "In Raceways, Compartments and Boxes." [The result is that "(c)" becomes the title of the rule that in the NEC has the title: "1. In Raceways, Compartments, and Boxes."]

SUBSTANTIATION: This proposal is for editorial clarity. The 1996 NEC had two numbered paragraphs under Section 800-52(a)(1)c., one on enclosures of various sorts and the second on wiring in shafts. The 1999 NEC has effectively incorporated the requirements for shafts elsewhere in this section, allowing that paragraph to be deleted, which was done. That left an orphaned paragraph "1." with no subsequent paragraphs. Ordinarily this wouldn't be of great concern, however, in this case what happens to immediately follow this text is "(2) Other Applications." When users see a "1" they look for a "2", and in this case the temptation will be to see (2) as part of "(c)", which it is not. It is the second numbered paragraph below (a), and has nothing to do with (a)(1)(c). This proposal is in the interest of good code and uniformity of interpretation and application.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to panel action on Proposal 16-238. The revised text meets the intent of the submitter.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #502)

16- 240 - (800-52(a)(1)c1 Exception No. 2): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Change "0.25 in. (6.35 mm)" to "6.35 mm (0.25 in.)"
The CMP should consider rounding to "6 mm (0.25 in.)" if safety would not be compromised.
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
The SI units are not rounded since the dimensions specify minimum values for safety.
PANEL ACTION: Accept in Principle.
In the submitter's recommended text revise "6.35 mm (0.25 in.)" to "6 mm (0.25 in.)."
PANEL STATEMENT: The Panel has accepted the TCC suggestion to round to "6 mm (0.25 in.)" and has included in the panel action text.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #1007)

16- 241 - (800-52(a)(2)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Other Applications. Communications wires and cables shall be separated at least 2 in. (508 mm) from open conductors of any electric light, power, Class 1, nonpower-limited fire, alarm, or medium power network-powered broadband communications circuits, unless the communications wires and cables are in a raceway or permanently separated from the conductors of the other circuits by a continuous firmly fixed nonconductor such as porcelain tubes or flexible tubing in addition to the insulation on the wire.
Delete Exception No. 1 and No. 2.
SUBSTANTIATION: Editorial. The proposal simplifies and maintains the requirements. The rule and exceptions infer the separation applies to open conductors, not other wiring methods indicated in Chapter 3 which would otherwise be used, as indicated in Exception No. 1 for which separation is not required. Note that Type UF cable of Exception No. 1 literally includes single-conductor type which may not be intended.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "open conductor" is not defined.

(Log #1127)

16- 243 - (800-52(b)): Accept in Principle in Part
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise Section 800-52(b) as follows:
(b) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating. Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate. Accumulations of abandoned cables, not identified for future use, in ducts, plenums, and other space used for environmental air, shall be removed.
Exception: Type CMP-50 and Type MPP-50 cables shall not be required to be removed.
FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.
SUBSTANTIATION: Addition of "to maintain the fire resistance rating" to the end of the second sentence will correlate this section with section 300-21.
The proposed fine print No. 1 note was copied from the first sentence of the fine print note in section 300-21. It assists installers in locating firestop information.
Cables installed in plenums (other space used for environmental air) are often abandoned, rather than removed, when no longer in use. Consequently, there may exist layer upon layer of abandoned cable in a hung ceiling as communications systems are changed and modernized. Some of this abandoned cable may be nonplenum cable that was installed before plenum cable requirements were in place. These accumulations of abandoned cables serve no useful purpose and unnecessarily increase the potential fire load. The wording of the proposed prohibition on allowing abandoned cables to accumulate is based on NFPA 75, Standard for the Protection of Electronic Computer/Data Processing Equipment, section 4-2.4 that states "Abandoned cables shall not be allowed to accumulate. Cables not identified for future use shall be removed."
This proposed wording addresses the issue of excess combustibles in plenums without requiring the removal of all abandoned cable, only accumulations of abandoned cable, thus avoiding a burdensome requirement, which would require the removal of insignificant amounts of cable. The proposed first sentence, Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate, limits the amount of cable that will be permitted to be abandoned. It applies to all cable that is in place, plenum cable as well as non-plenum cable that was installed before the plenum cable requirements were in the Code. The proposed second sentence, Accumulations of abandoned cables, not identified for future use, in ducts, plenums, and other space used for environmental air, shall be removed, deals with already abandoned cable. The NEC requirements for plenum cable were first promulgated in the 1975 NEC, consequently, abandoned cables in older buildings often include unlisted cable along with listed plenum cable.
Other sections of the NEC require the removal of abandoned wiring. ARTICLE 354 — Underfloor Raceways, Section 354-7. Discontinued Outlets When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.
ARTICLE 356 — Cellular Metal Floor Raceways, Section 356-7. Discontinued Outlets When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

ARTICLE 358 — Cellular Concrete Floor Raceways, Section 358-13. Discontinued Outlets

When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case of abandoned outlets on loop wiring, shall be allowed in raceways.

ARTICLE 305 — Temporary Wiring, Section305-3(d). Time Constraints, (d) Removal. Temporary wiring shall be removed immediately upon completion of construction or purpose for which the wiring was installed.

Exempting Types CMP-50 and MPP-50, which are plenum cables that are also listed as limited combustible with a smoke developed rating of less than 50, correlates with NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems. Correlating with NFPA 90A acknowledges that the NFPA Standards Council has assigned primary responsibility for fire protection of plenums to NFPA 90A. The basic requirement for materials in a plenum in NFPA 90A is that the materials either be noncombustible or limited combustible with a smoke developed rating of less than 50.

PANEL ACTION: Accept in Principle in Part.

The part being rejected is the recommendation to add the exception. The panel actions in other proposals adopting the requirement to remove abandon cables satisfies the proposal other than the exception.

There is inadequate justification to leave any debris (e.g. abandoned cable).

The remaining part of the proposal is accepted in principle.

PANEL STATEMENT: Refer to panel action on Proposal 16-250.

(Log #1537)

16- 244 - (800-52(b)): Accept

SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions

RECOMMENDATION: Revise 800-52(b) as follows:

(b) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through ~~fire~~ fire-resistance-rated walls, partitions, floors, or ceilings shall be fire stopped using approved methods to maintain the fire resistance rating.

SUBSTANTIATION: This proposed revision underscores the true purpose of the rule, to maintain the fire resistance rating, and correlates 800-52(b) with 300-21.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #3232)

16- 245 - (800-52(b) (New)): Accept in Principle

SUBMITTER: Hallie Smith-Petee, The Geon Co.

RECOMMENDATION: Add to Section 800-52(b):

(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating. Abandoned cables present in ducts,plenums and other air handling space shall not be allowed to accumulate. Cables not intended for future use shall be removed.

SUBSTANTIATION: Cable congestion in plenum spaces is becoming a problem. Numerous generations of cables are present in plenums, causing restrictions in air flow as well as increased fuel load. Electrical cables, fiber optic cables, and various control/signal cables are present in is area of the ceiling or raised floor.

The proposed wording is based on NFPA 75, Standard for the Protection of Electronic Computer/Data Processing Equipment, Section 4-2.4 which states, "abandoned cables shall not be allowed to accumulate. Cables not identified for future use shall be removed." This wording would enable the NEC to be consistent with NFPA code language.

Removal of abandoned cable applies to all cable contained in the air-handling space, nonplenum as well as plenum-rated products. Since the NEC did not require the use of plenum-rated cables until 1975, abandoned cables in older buildings may contain unlisted, potentially hazardous cable. Removal of unused cable decreases latent fuel load, and improves air flow within the plenum or air-handling space. Recent innovations in data and communication systems have contributed to the installation of several generations of enhanced plenum-rated cables in the plenum space. Layers upon layers of cable may exist, because abandoned cable is not required to be removed.

This modification to the NEC would promote safety as well as address potential concerns regarding air movement within the plenum space.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The proposer's intent was satisfied by panel action on Proposal 16-250.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #3255)

16- 246 - (800-52(b)): Accept in Principle in Part

SUBMITTER: Allen C. Weidman, Society of the Plastics Industry

RECOMMENDATION: Insert a new Section 800-52(b) as follows:

(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be fire stopped using approved methods to maintain the fire resistance rating. Cables in ducts, plenums, and other spaces used for environmental air, which are not intended for future use shall be removed. Cables marked type CL2PP and type CL3PP are not required to be removed.

FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

SUBSTANTIATION: 1. First two (2) sentences were copied from Article 300.21.

2. Fine print note was copied from Article 300.21s fine print note.

3. Cables installed in plenums and other space used for environmental air are very often left in these spaces after they have been removed from service. Therefore, many generations of unused cables can exist in the ceiling voids from previous systems which are no longer in service or intended for future use. There may also be cables, which are over 20 years old, which are not plenum rated cables. These unused cables increase the potential fuel load in plenums and other space used for environmental air.

This concept of removing unused cables, which will not be used in the future, is not a new concept. Other articles of the NEC have similar requirements. See the following Articles:

(a) 305, (b) 354, (c) 356, (d) 358

Also note NFPA 75 has a similar requirement.

Note: Underwriter Laboratories and Intertek (ETL), both are in a position to start listing this new type of plenum cable having of "Limited Combustibility" requirement, also potentially known as "permanent plenum cable, e.g., CL2PP, CL3PP, OFCPP, OFNPP, CMPP, and MPPP. There is a research program in place at FPRF to establish the protocol to list PP cables.

PANEL ACTION: Accept in Principle in Part.

The part being rejected is the recommendation to add the last sentence before the FPN. The panel actions in other proposals

adopting the requirement to remove abandon cables satisfies the proposal other than the last sentence before the FPN. There is inadequate justification to leave any debris (e.g. abandoned cable).

The remaining part of the proposal is accepted in principle.

PANEL STATEMENT: Refer to panel action on Proposal 16-250.

(Log #3630)

16- 247 - (800-52(b)): Accept in Principle
SUBMITTER: David B. Kiddoo, AlphaGary Corp.
RECOMMENDATION: Revise 800-52(b) as follows:

(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, ventilation ducts or air-handling plenums shall be made so that the possible spread of fire or fire resistant-rated walls, partitions, floors or ceilings shall be firestopped using approved methods to maintain the fire resistant rating. Abandoned cables in these spaces, shafts, ducts and plenums shall not be allowed to accumulate. Accumulations of abandoned cables, not identified for future use, in these spaces, shafts, ducts, plenums, and other space used for environmental air, shall be removed.

FPN No. 1: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

FPN No. 2: Definition of acceptable cable fire performance in various applications are described in Section 800-51.

SUBSTANTIATION: This issue has been discussed and reviewed in the last cycle of the NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems). The membership of the NFPA did NOT support a proposal to change the provisions for cables in the paragraphs on "ceiling cavity plenums" (2-3.10.1) and "raised floor plenums" (2-3.10.5) that would have allowed "Permanent Plenum Cables" to accumulate in these plenums. ("Permanent Plenum Cables" are so named through a Project being conducted by the National Fire Protection Research Foundation (NFPRF) and are described to meet a new, undefined, cable Listing for "limited combustibility" and "smoke developed index".) The more comprehensive solution to the issue of accumulating abandoned cables would have been to adopt a requirement to remove "ALL" abandoned cables that are removed from service and not intended for future use. Allowing for "Permanent Plenum Cables" to remain in plenums when abandoned would not address the serious issues of "congestion", "air flow restriction", and "total fuel load accumulation".

An appeal to the Standards Council was generated by proponents for "Permanent Plenum Cable" to overturn the Membership Action that occurred at the 1999 Annual Meeting. The Standards Council upheld the NFPA Membership Action after the hearing of the appeal. Comments from the final decision of the Standards Council on this matter are:

- "After a hearing, the Council reviewed and considered all of the information available to it, and voted to deny the appeals."
- "...wire and cable represents a significant potential fuel load in plenums and that, due to the rapidly increasing use of such cable in recent years, some approach to the problem should be devised."
- "...while it is the floor vote in favor of a return to the previous edition text that resulted in this recommendation, informational ballots of the TC (NFPA 90A Technical Committee) following that vote give further support to the conclusion that a lack of consensus exists in favor of going forward with the abandoned cable provisions. A majority of TC members voting on these informational ballots also supported the return to previous edition text..."
- "...the previous edition text is, in the Council's view, clearly suitable."
- "...the Council itself has concerns about the TC's approach and has concluded that further study of this important issue is needed."
- "...the Council wants to ensure that, as the TC undertakes to fully and fairly address these issued going forward, it has the best available range of expertise, representation, and experience. The Council, therefore, is referring the matter of committee membership to the Council's membership task group for review and recommendations."

While plenum cables are not typically the ignition source of fires, due to the low energy conducted through them, the fuel characteristics of high volumes of abandoned cable in plenums, whether combustible or limited combustible by definition, will most certainly add to the heat and energy released in a large, exposing fire, such as those where the ignition source is a room and contents fire below or above the plenum.

This proposal addresses the growing safety issue of accumulating abandoned cable in concealed spaces, without selectively favoring any cable geometry or synergy of materials. It does not allow for further accumulation of "Permanent Plenum Cables" which, when removed from service and not intended for future use, no longer have any function—except perhaps to serve as fuel for some future conflagration.

The proposal adopts consistent wording from NFPA 70, National Electrical Code, Section 300-21 and NFPA 75, Protection of Electronic Computer/Data Processing Equipment, paragraph 4-2.4. Basing this new requirement on existing code shows the strong intent, stated in the past by the Standards Council, to have good consistent code language across the various NFPA standards. Arguments by the proponents of "Permanent Plenum Cable" in the NFPA 90A review process to somehow create a new cable test requirement based on the definition of "limited combustibility" and "smoke developed index" created for building construction products would be a further misuse of the NFPA 255 and NFPA 259 "materials" test methods.

In spite of the rapid attempts by the proponents of "Permanent Plenum Cable", neither Underwriters Laboratories (UL) nor Intertek Testing Services (ITS/ETL) have yet established Listing criteria for "Permanent Plenum Cable" that could cover the matrix of cable types used in a plenum (fiber optics, coax, etc.). In fact, initial attempts over the first 9 months of the NFPRF Project to test finished cable in the NFPA 255 and NFPA 259 test methods has only shown inconsistencies and extremely limited capability of cables to meet the established definitions of "limited combustibility" and "smoke developed index" established for construction products. These test methods do NOT allow for cables to be tested based on their installed condition, nor can they be used to test cables with the important integration of finished cable geometries and materials/conductor or fiber synergies as they impact fire performance.

The proponents of "Permanent Plenum Cable" are applying these "material" tests inappropriately to cables. This is particularly why more sophisticated, integrated "cable" fire tests such as NFPA 262 (Plenum), ANSI/UL 1666 (Riser), and ANSI/UL 1581 (Vertical Tray) have been established and referenced in Standards such as the NFPA 70, NFPA 90A, etc. These tests more accurately simulate the actual fire hazards for installed cables, both in terms of the building environment AND the installed configuration. Integrated tests such as these are used to show the cables are designed to help contribute to minimizing the spread of fire and smoke generation in the early stages of a fire, allowing time for people to egress from the building. The fire safety record clearly shows that these tests have been successful in differentiating the fire performance of cables more accurately than materials tests such as NFPA 255 or NFPA 259.

The definition for cable fire performance in NFPA 90A Sections 2-3.10.1 and 2-3.10.5 are listed as Exceptions because the covering paragraphs (a) in each Section refer only to "materials" used in the construction of plenums. Proponents of "Permanent Plenum Cable" tried to make the argument in the NFPA 90A proposal review that IF the cable can be shown to meet the requirements of the plenum construction materials, accumulation of this cable is justifiable. As was acknowledged by members of the Standards Council during the NFPA 90A Appeal Hearing, cable jackets and insulations will NEVER look like the rigid materials used to construct plenums. Establishing a "Permanent Plenum Cable" Exception in a requirement to remove abandoned cable would clearly allow for a loop-hole to continue to proliferate abandoned cable accumulation and NOT address the serious issues of total fuel load, congestion, and air flow.

NFPA 75 Appendix A, paragraph A-4-2.4 says: "Abandoned cable will potentially interfere with air flow and extinguishing systems. Abandoned cable also adds to the fuel loading." This proposal would provide consistency with the established fire testing criteria and/or abandoned cable removal provisions established by NFPA 70, NFPA 75 and the appropriate Exceptions established for cables in NFPA 90A.

As was shared by Richard G. Gewain of Hughes Associates (with many years of direct involvement in these definitions) at the NFPA 90A TC

meeting in December, 1998, the NFPA 220, Building Construction Committee (BCC) reviewed the definition of "non-combustible" and the new definition "limited combustible" in 1975. The BCC made it clear that these definitions "apply to the materials used in the construction of buildings (floors, roofs, columns, walls, etc.), but do NOT apply to furnishings or the contents of buildings, or to the fire hazard evaluation of materials." This language is clearly spelled out in the Special Interest Bulletin No. 294, currently entitled "Noncombustible and Limited-Combustible Building Construction Materials", published and updated several times since 1956 by the National Board of Fire Underwriters (a.k.a. American Insurance Association, currently known as the American Insurance Services Group).

Because of the concern that other NFPA Committees have been misusing the term "limited combustible", the Standards Council has assigned the responsibility for the term "limited combustible" to the BCC. The BCC has recently requested its Chairman to contact the Chairmen of the other NFPA Committees (covering 48 NFPA Standards) using this term and ask for a clarification of what is intended for its use. A BCC Task Group is now established to develop proposals or comments to ensure that the term in other standards such as NFPA 90A is used correctly. From a fire hazards point of view, it has clearly NOT been shown that using the current definitions of "limited combustible" and "smoke developed index" and NFPA 259/NFPA 255 test methods are appropriate for installed cables.

This proposal also alleviates the concern and burden to the authority having jurisdiction inspector enforcing NFPA 70 to identify different types of cables currently in the concealed spaces and removed from service. The requirements to remove ALL abandoned cable not intended for future use should be less cumbersome than to remove only "some" of the cables.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to panel action on Proposal 16-250 which meets the intent of the submitter.

(Log #3897)

16- 248 - (800-52(b)): Accept in Principle in Part

SUBMITTER: Marek Kapuscinski, NORDX/CDT, Inc.

RECOMMENDATION: Revise Section 800-52(b) as follows:

(b) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire-resistance rated walls, partitions, floors, or ceilings shall be fire stopped using approved methods to maintain the fire resistance rating. Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate. Accumulations of abandoned cables, not identified for future use, in ducts, plenums, and other space used for environmental air, shall be removed.

Exception: Type CMP 50 and Type MPP 50 cables shall not be required to be removed.

FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

SUBSTANTIATION: Addition of "to maintain the fire resistance rating" to the end of the second sentence will correlate this section with Section 300-21.

The proposed fine print note No. 1 was copied from the first sentence of the fine print note in Section 300-21. It assists installers in locating firestop information.

Cables installed in plenums (other space used for environmental air) are often abandoned, rather than removed, when no longer in use. Consequently, there may exist layer upon layer of abandoned cable in a hung ceiling as communications systems are changed and modernized. Some of this abandoned cable may be nonplenum cable that was installed before plenum cable requirements were in place. These accumulations of abandoned cables serve no useful purpose and unnecessarily increase the potential fire load. he wording of the proposed prohibition of allowing abandoned cables to accumulate is based on NFPA 75, Standard for the Protection of Electronic Computer/Data Processing Equipment, Section 4-2.4 that states "Abandoned cables shall not be allowed to accumulate. Cables not identified for future use shall be removed."

Acceptance of this proposal will result in cable removal being included in the scope of the installation of a new communications and data system. The contractor will remove the old cable before installing the new system.

This proposed wording addresses the issue of excess combustibles in plenums without requiring the removal of all abandoned cable, only accumulations of abandoned cable thus avoiding a burdensome requirement, which would require the removal of insignificant amounts of cable. The proposed first sentence, Abandoned cables in ducts plenums, and other space used for environmental air shall not be allowed to accumulate, limits the amount of cable that will be permitted to be abandoned. It applies to all cables that is in place, plenum cable as well as nonplenum cable that was installed before the plenum cable requirements were in the code. The proposed second sentence, Accumulations of abandoned cables, not identified for future use, in ducts, plenums and other space used for environmental air, shall be removed, deals with already abandoned cable. The NEC requirements for plenum cable were first promulgate in the 1975 NEC consequently abandoned cables in older buildings often include unlisted cable along with listed plenum cable.

Other sections of the NEC require the removal of abandoned wiring.

Article 354 —Underfloor Raceways, Section 354-7. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

Article 356 — Cellular Metal Floor Raceways, Section 356-7. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

Article 358 — Cellular Concrete Floor Raceways, Section 358-13. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case of abandoned outlets on loop wiring, shall be allowed in raceways.

Article 305 — Temporary Wiring, Section 305-3(d). Time Constraints, (d) Removal. Temporary wiring shall be removed immediately upon completion of construction or purpose for which the wiring was installed.

Exempting Types CMP 50 and MPP 50, which are plenum cables that are also listed as limited combustible with a smoke developed rating of less than 50, correlates with NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems. Correlating with NFPA 90A acknowledges that the NFPA Standards Council has assigned primary responsibility for fire protection of plenums to NFPA 90A. The basic requirement for materials in a plenum in NFPA 90A is that the materials either be noncombustible or limited combustible with a smoke developed rating of less than 50.

PANEL ACTION: Accept in Principle in Part.

The part being rejected is the recommendation to add the exception. The panel actions in other proposals adopting the requirement to remove abandon cables satisfies the proposal other than the exception. There is inadequate justification to leave any debris (e.g. abandoned cable).

The remaining part of the proposal is accepted in principle.

PANEL STATEMENT: Refer to panel action on Proposal 16-250.

(Log #3968)

16- 249 - (800-52(b) (New)): Accept in Principle

SUBMITTER: Hallie Smith-Petee, The Geon Co.

RECOMMENDATION: Add text to Section 800-52(b) to read as follows:

(b) Spread of Fire or Products of Combustion: Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be so made that the possibile spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods. Abandoned cables present in ducts, plenums and other air handling space shall not be allowed to accumulate. Cables not intended for future use shall be removed.

SUBSTANTIATION: Statement of Problem:

Cable congestion in plenum spaces is becoming a problem. Numerous generations of cables are present in plenums, causing restrictions in air flow as well as increased fuel load. Electrical cables, fiber optic cables, and various control/signal cables are present in this area of the ceiling or raised floor.

Substantiation for Proposal:

The proposed wording is based on NFPA 75, Standard for the Protection of Electronic Computer/Data Processing Equipment, section 4-2.4 which states, "(a)bandoned cables shall not be allowed to accumulate. Cables not identified for future used shall be removed." This wording would enable the NEC to be consistent with NFPA code language.

Removal of abandoned cable applies to all cable contained in the air-handling space, nonplenum as well as plenum-rated products. Since the NEC did not require the use of plenum-rated cables until 1975, abandoned cables in older buildings may contain unlisted, potentially hazardous cable. Removal of unused cable decreases latent fuel load, and improves air flow within the plenum or air-handling space. Recent innovations in data and communication systems have contributed to the installation of several generations of enhanced plenum-rated cables in the plenum space. Layers upon layers of cable may exist, because abandoned cable is not required to be removed.

This modification to the NEC would promote safety as well as address potential concerns regarding air movement within the plenum space.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The proposer's intent was satisfied by panel action on Proposal 16-250.

(Log #4052)

16- 250 - (800-52(b)): Accept in Principle

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Revise Section 800-52(b) as follows:

(b) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate. Excessive accumulations of abandoned cables, in ducts, plenums, and other space used for environmental air, shall be removed where practicable.

FPN : Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

SUBSTANTIATION: BICSI members have been extensively involved with the design and installation of telecommunications cabling. Technology changes have resulted in newer high performance cabling being installed in support of those technologies. We have observed excessive accumulations of abandoned cabling adding to the fuel loading within plenum spaces. This proposal is offered to the NFPA to help reduce the fuel load within these plenum areas.

Addition of "to maintain the fire resistance rating" to the end of the second sentence will correlate this section with section 300-21.

The proposed fine print No. 1 note was copied from the first sentence of the fine print note in section 300-21. It assists installers in locating firestop information.

Acceptance of this proposal will result in cable removal being included in the scope of the installation of a new communications and data system. The contractor will remove the old cable before installing the new system.

Acceptance of this proposal will result in many BICSI members specifying abandoned cable removal within the scope of the installation of new communications and data systems.

In two separate proposals, we have offered definitions for "abandoned cable" and "excessive accumulation of abandoned cables".

This proposed wording addresses the issue of excess combustibles in plenums without requiring the removal of all abandoned cable, only excessive accumulations of abandoned cable, thus avoiding a burdensome requirement of removing insignificant amounts of cable. The proposed first sentence, Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate, limits the amount of cable that will be permitted to be abandoned. It applies to all cable that is in place, plenum cable as well as non-plenum cable that was installed before the plenum cable requirements were in the Code. The proposed second sentence, Excessive accumulations of abandoned cables, in ducts, plenums, and other space used for environmental air, shall be removed, where practicable, deals with already abandoned cable. The wording of "where practicable" aid the situations where cable may be intertwined and cannot be removed without disruption of active services. The NEC requirements for plenum cable were first promulgated in the 1975 NEC, consequently, abandoned cables in older buildings often include unlisted cable along with listed plenum cable.

Other sections of the NEC require the removal of abandoned wiring.

ARTICLE 354 — Underfloor Raceways, Section 354-7. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

ARTICLE 356 — Cellular Metal Floor Raceways, Section 356-7. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

ARTICLE 358 — Cellular Concrete Floor Raceways, Section 358-13. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case of abandoned outlets on loop wiring, shall be allowed in raceways.

ARTICLE 305 — Temporary Wiring, Section 305-3(d). Time Constraints, (d) Removal. Temporary wiring shall be removed immediately upon completion of construction or purpose for which the wiring was installed.

PANEL ACTION: Accept in Principle.

Revise Section 800-52(b) as follows:

"(b) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

Abandoned cables not intended for future use shall not be permitted to remain.

FPN : Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made."

PANEL STATEMENT: The second paragraph has been revised to provide a clear concise requirement.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 19
ABSTENTION: 1
COMMENT ON AFFIRMATIVE:
BRUNSSEN: See my Comment on Affirmative Vote on Proposal 16-80.
DORNA: The revised wording in 800-52(b) for the last sentence before the FPN should be:
"Abandoned cables ~~not intended for future use~~ shall not be permitted to remain."
The use of the phrase "not intended for future use" is redundant. The definition of "abandoned cable" has this phrase in the definition. To restate this phrase would be grammatically incorrect.
JOHNSON: See my Comment on Affirmative on Proposal 16-80.
KAHN: See my Comment on Affirmative on Proposal 16-80.
WIERENGA: The revised wording for 800-52(b) for the last sentence before the FPN should read as follows:
"(a) Spread of Fire or Products of Combustion. Section 300-21. Abandoned cables ~~not intended for future use~~ shall ~~not~~ be removed."
The use of the phrase "not intended for future use" is redundant because it is already included in the definition of "abandoned cable". The deletion of the words "not" and "permitted to remain" can be readily stated by use of positive code language using the word "removed".
EXPLANATION OF ABSTENTION:
CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #1008)

16- 251 - (800-52(c)(2)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
In Shafts. Communications wires and cables run in the same shaft with open individual conductors of electric light or power, Class 1, or nonpower-limited fire alarm circuits shall be separated from the electric light or power, Class 1, or nonpower-limited fire alarm circuit conductors by not less than 2 in. (50.8 mm) unless the communications wires and cables are installed in a raceway.
Exception No. 1: Delete.
Exception No. 2: Delete.
SUBSTANTIATION: Editorial. The gist of this rule and the exception infer the conductors of the light or power, Class 1, and fire alarm circuits are open individual conductors, even though such use is restricted by the code and perhaps other codes. If they are not open conductors they are likely to be one of the wiring methods indicated in Exception No. 1 and 2. The condition of raceway use in Exception No. 2 is redundant to the same condition of Exception No. 1. The metal-sheathed (Type MI), metal-clad (Type MC) ignores Type AC which should also be suitable. Type UF cable per Article 339 encompasses single-conductor type which doesn't appear intended. Section 760-25 apparently allows the wiring method of Article 320 where suitable.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "open individual conductor" is not defined.

(Log #1201)

16- 254 - (Table 800-53): Accept in Principle
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise Table 800-53. Cables Uses and Permitted Substitions, as shown below:
The note is unchanged.
SUBSTANTIATION: If my proposal to establish a new section 820-51(b) is accepted, a new section is added and the sections will be renumbered. The new section creates a new type of cable, Type CATVP-50. This proposal correlates Table 820-53 with those proposed changes.
PANEL ACTION: Accept in Principle.
Revise the submitter's recommendation as follows:
Strike "MPP-50" wherever it appears.
PANEL STATEMENT: The revision reflects the panel action on Proposal 16-232.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 19
ABSTENTION: 1

Table 800-53. Cable Uses and Permitted Substitutions

Cable Type	Use	References	Permitted Substitutions
CMP	Communications plenum cable	800-53(a)	MPP-50, MPP
CMR	Communications riser cable	800-53(b)	MPP-50, MPP, CMP-50, CMP, MPR
CMG, CM	Communications general-purpose cable	800-53(d)	MPP-50, MPP, CMP-50, CMP, MPR, CMR, MPG, MP
CMX	Communicatons cable, limited use	800-53(d)	MPP-50, MPP, CMP-50, CMP, MPR, CMR, MPG, MP, CMG, CM

COMMENT ON AFFIRMATIVE:
KAUFMAN: In addition to revising Table 800-53, Figure 800-53 should be revised in order to illustrate the changes in Table 800-53, furthermore Type CMP-50 should be added to Table 800-53 as a premitted substitute for Type CMP.

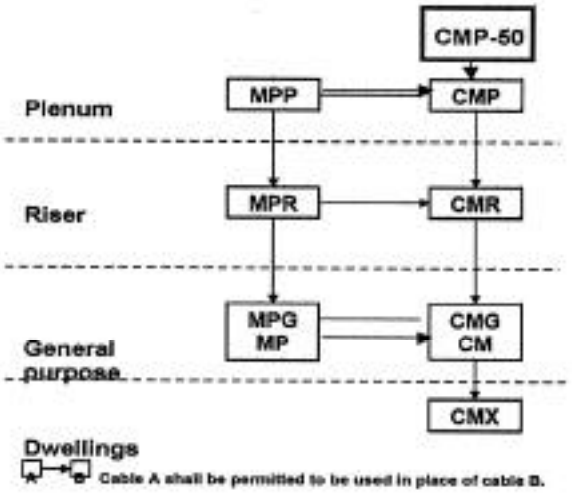

Figure 800-53. Cable Substitution Hierarchy

EXPLANATION OF ABSTENTION:
CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #3044)

16- 255 - (800-53(a)): Reject
SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Revise to read as follows:
800-53. Applications of Listed Communications Wires and Cables, and Communications Raceways. Communications wires and cables shall comply with (a) through (f).
(a) Plenums and Other Environmental Air Spaces. Cables installed as open wiring in ~~ducts, plenums, and~~ other spaces used for environmental air, as described in Section 300-22(c), shall be Type CMP. ~~Also, l~~Listed plenum communications raceways complying with Section 800-51(j) shall be permitted to be installed in ~~ducts and plenums as described in Section 300-22(b) and in~~ other spaces used for environmental air as described in Section 300-22(c). Only Type CMP cable shall be permitted to be installed in these raceways. Other type conductors shall be installed in EMT, IMC, RMC, FMC, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.
~~Exception: Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with Section 300-22.~~
SUBSTANTIATION: • Plenum-rated wiring is not permitted in Section 300-22(b) which covers fabricated ducts and plenums, therefore Type CMP cable and plenum communications raceway have been limited to 300-22(c).
• The reference to Section 800-51(j) is more appropriate as a listing reference than Section 300-22(c).
• By adding the applicable portions of Section 300-22(c), the Exception has been eliminated. This provides clarity, does not make it appear that such installations are secondary choices, and makes the Code more user-friendly in application.
• Acronyms have been used for the wiring methods because a Task Group for Panel 8 is recommending this throughout the Code. Full product names can be used if the TG proposal is not accepted.
This is a companion proposal to suggested revisions for Sections 800-48, and 800-51(j), (k), and (l).
PANEL ACTION: Reject.
PANEL STATEMENT: No technical substantiation (other than correlation with 300-22) has been submitted to provide for the removal of allowing plenum communications cables and plenum communications raceway from being installed in ducts or plenums.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #4139)

16- 256 - (800-53(a)): Accept in Principle
SUBMITTER: Marcelo M. Hirschler, GBH Int'l, Inc./Rep. Plenum Cable Assn.
RECOMMENDATION: Revise as follows:
800-53. Applications of Listed Communications Wires and Cables, and Communications Raceways. Communications wires and cables shall comply with (a) through (f).
(a) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. Also, listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in Section 300-22(b) and other spaces used for environmental air as described in Section 300-22(c). Only Type CMP cable shall be permitted to be installed in these raceways. Abandoned cables, not intended for future use, shall not be permitted to remain.
Exception: Types CMP, CMR, CM, and CMX and communications wire installed in compliance with Section 300-22.
SUBSTANTIATION: There is a significant amount of information indicating that the amount of cables installed in plenums, and other air-handling spaces, is increasing rapidly. An understanding of cabling practices indicates that the most common way in which cable installation is carried out is by disconnecting existing cable and leaving it abandoned in place, while introducing the cable needed to perform the additional functions. See Log #4136. There is, as yet, no indication that the additional cables in plenums causes an added fire hazard, and the fire record of cables in concealed spaces, both above ceilings and below floors, remains excellent. In fact, plenum cables, which meet the fire test requirements of NFPA 262, have been shown to have extremely good fire performance and to spread flame only very slowly, if at all. However, this type of preventive measure is worthwhile.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The proposer's intent was satisfied by panel action on Proposal 16-250.

16- 267 - (810-21(f)(1)b): Accept
SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions
RECOMMENDATION: Revise the text of 810-21(f)(1)(b) as follows:
(b) The grounded interior metal water piping systems, within 5 ft (1.52 m) from its point of entrance to the building, as covered in Section ~~250-104(a)~~ 250-50.
SUBSTANTIATION: Section 250-50 (formerly Section 250-81) was revised in the 1993 NEC to eliminate the use of interior metal water piping system as a grounding (bonding) conductor. This was done because of the increased use of nonconductive piping for repair and maintenance rendering the interior metallic water piping system electrically discontinuous. Section 810-21(f)(1)(b) has not been revised to reflect this change. This proposed revision underscores that the interior metal water pipe may no longer be used as a bonding conductor to interconnect a receiving station grounding conductor to the building grounding electrode system, and correlates Section 810-21(f)(1)(b) with Section 250-50. Further, Section 250-104(a) concerns bonding of piping systems and building steel. Since connections to the interior metallic water piping system are now permitted only within the first 5 feet of the pipe's entrance to the building, the more appropriate reference is Section 250-50. This is a companion proposal and is intended to correlate Section 810-21(f)(1)(b) with similar changes proposed for Sections 800-40(b)(1)(b), 820-40(b)(1)(b), and 830-40(b)(1)(b).
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #1405)

16- 268 - (810-21(j) and (k)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise (j) to read as follows: (j) ~~Bonding of Electrodes. A bonding jumper not smaller than No. 6 copper or equivalent shall be connected between the radio and television equipment equipment grounding electrode and the power grounding electrode system at the building or structure served where separate electrodes are used.~~ Supplementary Grounding Electrodes. Supplementary grounding electrodes shall be permitted to be connected to the grounding conductor specified in this section, but the earth shall not be used as the sole grounding conductor. Bonding together of all separate electrodes shall be permitted.
Add a new (k) to read as follows:
(k) Underground Installations. Conductors (including grounding conductors) shall be installed to meet the minimum cover requirements specified in Column 4 of Table 300-5, except where conductors rise for termination or transition to aboveground installation.
SUBSTANTIATION: Section 810-21(h) requires a (minimum No. 10 copper) grounding conductor run to the building or structure grounding to electrode specified in (f). If a separate electrode is installed at a mast or supporting structure, it does not abrogate that requirement. Many masts are installed at a substantial distance from the building served by the system. If a supplementary (optional) driven electrode is installed at the dish or other antenna for additional safety, this section (j) requires a minimum No. 6 copper as a bonding conductor between the driven electrode and the electrodes of (f). Since the No. 10 copper grounding conductor alone is code-compliant the No. 6 bonding requirement may preclude the installation of separate electrodes for economic reasons, which diminishes any additional safety provided. Section 250-54 in effect, permits the equipment grounding conductor to serve as a bonding conductor from supplemental electrodes.
A new subsection (k) is proposed as no cover requirements are indicated for buried circuit or grounding conductors. This would provide an established criterion for reasonable protection of underground installations.
PANEL ACTION: Reject.
PANEL STATEMENT: No technical substantiation has been given to support the change from mandatory to permissive language.
Subparagraph j refers to the bonding of electrodes. Subparagraph g refers to the grounding conductor. Bonding and grounding conductors are not the same.
With regard to proposed new subparagraph k, the depth of burial requirements of Table 300-5 are specific to service conductors and are concerned with possible shock hazard. These conductors do not carry power and, in the case of bonding of separate electrodes, the conductor is a minimum of 6 AWG and is unlikely to be damaged by general yard maintenance.

(Log #1117)

16- 269 - (Table 810-52): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise column heading as follows: "Minimum Size of Conductors (AWG) Where Maximum Open Span Length Is".
SUBSTANTIATION: AWG should be added to the column heading since the numbers in the columns do not have any unit of measure associated with them.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #1118)

16- 270 - (810-58): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: 810-58(b) - change "No. 10" to "10 AWG"
810-58(c) - change "No. 14" to "14 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.

ARTICLE 820 — COMMUNITY ANTENNA TELEVISION AND RADIO DISTRIBUTION SYSTEMS

(Log #506)

16- 271 - (820): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 820-10(b) Exception - change "12 in. (305 mm)" to "300 mm (12 in.)"
820-10(d) - change "8 ft (2.44 m)" to "2.5 m (8 ft)"
820-10(d) Exception No. 2:
change "18 in. (457 mm)" to "450 mm (18 in.)"
change "4 ft (1.22 m)" to "1.2 m (4 ft)"
820-10(d) Exception No. 3 - revise as follows:
"Exception No. 3: Where the roof has a slope of not less than 100 mm (4 in.) ~~4 in. (102 mm)~~ in 300 mm (12 in.) ~~12 in. (305 mm)~~, a reduction in clearance to not less than 900 mm (3 ft) ~~3 ft (914 mm)~~ shall be permitted."
820-10(f)(1) - change "4 in. (102 mm)" to "100 mm (4 in.)"
820-10(f)(3) - change "6 ft (1.83 m)" to "1.8 m (6 ft)"
820-11(b) - change "12 in. (305 mm)" to "300 mm (12 in.)"
820-33 - change "30 ft (9.14 m)" to "9.0 m (30 ft)" in two places in the second paragraph.
820-42 - change "30 ft (9.14 m)" to "9.0 m (30 ft)" in two places.
820-50 Exception No. 3 - change "50 ft (15.2 m)" to "15 m (50 ft)"
820-52(a)(2) - change "2 in. (50.8 mm)" to "50 mm (2 in.)"
820-53(c) Exception No. 2 - change "10 ft (3.05 m)" to "3.0 m (10 ft)"
820-53(c) Exception No. 3 - change "0.375 in. (9.52 mm)" to "9.5 mm (0.375 in.)"
820-53(c) Exception No. 4 - change "0.375 in. (9.52 mm)" to "9.5 mm (0.375 in.)"
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #4048)

16- 274 - (820-2- Excessive Accumulation of Abandoned Cables (New)): Reject
SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l
RECOMMENDATION: Add a new definition to read as follows:
Excessive Accumulation of Abandoned Cables. When the number of abandoned cables is greater than 1/3 of the total number of cables within a fire-containment zone.
SUBSTANTIATION: After the concept of plenum cables was introduced into the 1975 NEC, Underwriters Laboratories initially listed plenum cables by comparing the smoke production of plenum cables with the smoke production of conventional cables of the same physical design (but not plenum grade materials) in conduit. Plenum cables (not in conduit) were tested and compared with an equal number of conventional cables in conduit. It was assumed that the plenum cables were a replacement for conventional cables and that in case of a fire the amount of smoke would be reduced because of the lower smoke production of plenum cables. It was not anticipated that plenum cables would be abandoned. Since conventional cables in conduit were deemed to be acceptable the smoke from these cables is the benchmark for comparison and a fire involving an excessive amount of abandoned cables could emit excessive amount of smoke. Until research better defines what amount of abandoned cable might be excessive, allowing up to 1/3 excess of abandoned cables is prudent.
PANEL ACTION: Reject.
PANEL STATEMENT: The term is not used. The proposal that introduced this term was modified to eliminate the term.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:

(Log #297)

16- 275 - (820-3(g)): Reject
SUBMITTER: Steven C. Johnson, Time Warner Cable
RECOMMENDATION: Revise 820-3(g) to read as follows:
(g) Alternate Wiring Methods. The wiring methods of Articles 830 and 831 shall be permitted to substitute for the wiring methods of Article 820.
FPN: Use of Articles 830 and 831 wiring methods will facilitate the upgrading of Article 820 installations to network-powered broadband applications.
SUBSTANTIATION: The original proposed Article 830 in the NEC 1999 cycle included low, medium, and high power options. During the ROC, high power was removed. In the 2002 cycle, high power is being proposed as a separate Article 831. It was the original proposer's intent to allow transition from traditional CATV to Network powered broadband communications systems by allowing use of Network powered wiring methods in CATV systems.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #1659)

16- 276 - (820-5): Accept in Principle
Note: See Technical Correlating Committee action on Proposal 16-38. It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. The Technical Correlating Committee directs that the Action on this Proposal be revised to comply with the NEC Style Manual 3.2.1 relative to use of the unenforceable terms "practicable" and "impracticable." This action will be consideed by the Panel as a Public Comment. It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 3 for Comment.
SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions
RECOMMENDATION: Revise 820-5 as follows:
820-5. Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to equipment shall not be denied by an excess

accumulation of cables ~~that prevents~~ sufficient to prevent the removal of panels, including suspended ceiling panels.

SUBSTANTIATION: Section 820-5 may be misinterpreted to mean that conductors and cables may not be placed directly on suspended ceilings. While the 1999 National Electrical Code Handbook emphasizes "excess accumulation" in the interpretive text, Figures 820-1 and 820-2 lead the reader to conclude that no conductors or cables are permitted to rest directly on the suspended ceiling. This was not the intent of CMP 16 when 820-5 was introduced into the 1993 NEC. At that time, CMP 16 stated in response to a similar proposal to Article 725 (1992 TCD, Comment 16-18) that the proposed requirement "... would still allow some cabling of a limited quantity above the ceiling tile, but not to an excessive amount." The proposed revision emphasizes that it is an excessive accumulation of cabling that is of concern. A limited amount of cabling laid directly on a suspended ceiling is permitted, will not deny access to equipment, and does not present an unsafe working environment. This is a companion proposal and is intended to correlate with 725-5, 760-5, 770-7, 800-5, and 830-6.

PANEL ACTION: Accept in Principle.

Revise 820-5 to read as follows:

"820-5. Access to Electrical Equipment Behind Panels Designed to Allow Access

Access to electrical equipment shall not be denied by an accumulation of wires and cables that prevents removal of panels. Cables shall be installed in such a manner that the cable will not be damaged by normal building use. Access to electrical equipment behind ceilings designed to allow access shall comply with (a) or (b).

a. New building construction (e.g., renovation, remodeling, new spaces). Installation of cables shall comply with Section 300.11.

b. Buildings with existing cabling systems.

Where practicable, installation of cables shall comply with Section 300-11. Where impracticable to comply with Section 300-11, cables less than 13 mm (0.5 in) in diameter shall be permitted to be installed unsupported by the building structure in accordance with 1 or 2.

1. In areas having ceilings with access points or access panels, it shall be permissible to fish a maximum of three cables between access points in the ceiling.

2. In areas having suspended lay-in ceilings, it shall be permissible to install a maximum three unsupported cables on top of any one ceiling tile. The cables shall be run parallel to the ceiling grid."

PANEL STATEMENT: The revised text satisfies the intent of the original recommendation in that it allows some cabling of a limited quantity above ceiling tile but not an excessive amount, which would interfere with accessibility.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

EGEDSAL: See my Explanation of Negative Vote on Proposal 16-192.

COMMENT ON AFFIRMATIVE:

BRUNSSEN: I concur with the panel action in providing relief for a limited amount of after-construction CATV cables to be placed directly on the suspended ceiling tiles. However, proposed Section 820-5(b)(2), as presently written, is confusing and could be interpreted as permitting a total of only three unsupported cables. The intent of the panel was that up to a maximum of three unsupported cables may be routed across each and every ceiling tile. Revising 820-5(b)(2) to state: "...permissible to install a maximum of three unsupported cables on top of ~~any one~~ each ceiling tile, i.e., up to three cables are permitted to lay on a ceiling tile." would clarify the intent. Note that the word "of" is inserted and is missing in the original text.

(Log #CP1606)

16- 276a - (820-6): Accept

SUBMITTER: CMP 16

RECOMMENDATION: Revise text to read as follows:

"Mechanical Execution of Work. Community antenna television and radio distribution systems shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceiling and sidewalls shall be supported by the structural components of the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be attached to structural components at intervals not exceeding 1.52 m (5 ft) and within 305 (12 in.) from every cabinet, box or fitting by straps, staples, hangers or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with Section 300-4(d)."

Also, delete the Fine Print Note.

SUBSTANTIATION: This proposal provides additional rules for the mechanical execution of the work. Since there are additional rules, the fine print note is not necessary. This provides parallel requirements to those used in Articles 640, 725, 760, 770, 800, and 830.

PANEL ACTION: Accept.

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

JOHNSON: See my Explanation of Negative Vote on Proposal 16-2a.

(Log #3658)

16- 277 - (820-6): Accept

SUBMITTER: Melvin J. Wierenga, Wierenga & Assoc.

RECOMMENDATION: Delete the FPN associated with this section.

SUBSTANTIATION: Problem: The standards listed contain insufficient information to determine accepted industry practice for systems and equipment included in Article 820.

Substantiation: A detailed review of ANSI/EIA/TIA/568A-1995, ANSI/EIA/TIA/569-1990 , and ANSI/EIA/TIA/570-1991 was completed by the submitter and no significant information, guidance, or directives were found, that would be helpful to a user of this Article of the Code. These standards were developed by the telecom and computer industries. They provide the details covering telecommunication infrastructure such as cable pathways, equipment spaces, telephone grounding/bonding, and telecommunication administration. They are excellent standards but they do not address typical cabling installation issues such as:

(a) how to properly pull wire(s) above a lay in ceiling.

(b) when and where to support the wire in a building structure.

(c) how to dress various types of audio signal wires coming into and within an equipment cabinet.

(d) how and where to set up wire reels for riser cables in tall structures.

(e) how and where to dress audio speaker wire along a steel beam in a gymnasium or factory.

(f) what to watch out for when pulling a cable into a raceway.

These standards are purported to be the concept standards for guiding the users of the Code in determining appropriate mechanical execution of work and determination of acceptable industry practices. However, such is not the intent of the standards. For those who do not have a set of the standard available, the submitter has provided an Appendix that summarizes each section of each standard. The appendix will give you an overview of the contents of each section of each standard and enable you to gain a better understanding of what the standards cover.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept.

PANEL STATEMENT: The proposed recommendation has been incorporated by the panel action on Proposal 16-276(a).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

LANNI: After reviewing the NECA index No. 5037, I realized that there are very useful National Electrical Installation Standards available and a Fine Print Note is the appropriate way to guide the code user. I also feel that the panel did satisfy the original submitter when the Fine Print Note was incorporated into the code. Improving the references, instead of removing the Fine Print Note, would improve our original work. Installation documents are being produced all the time partially in response to our note in the code. The panel could only answer one of the Submitter's concerns, namely, "when and where to support the wire in a building structure." Other issues are left unanswered. Good workmanship is an important component of a safe installation, but the code cannot address all these issues and other documents are more suited for the purpose.

(Log #4025)

16- 278 - (820-6): Reject

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design / Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Revise the FPN to read: "One way to determine accepted industry practice is to refer to nationally recognized standards such as Commercial Building Telecommunications Cabling Standard, ANSI / EIA / TIA 568-A-1995; Commercial Building Standard for Telecommunications Pathways and Spaces, ANSI / TIA / EIA 569-A-1997; and Residential ~~and Light Commercial~~ Telecommunications Cabling ~~Wiring~~ Standard, ~~ANSI / EIA / TIA 570-1991~~ ANSI / EIA / TIA 570-A-1999, ANSI / NECA / BICSI 568 or other ANSI-approved installation standards."

SUBSTANTIATION: A revision to the standard number and the title for residential cabling has been updated. Another standard is currently under review that will be focused at the installation of telecommunications cabling and connectors and will become an ANSI standard within the next year.

PANEL ACTION: Reject.

PANEL STATEMENT: Section 820-6 has been revised to remove the FPN and provide specific installation requirements. A FPN is no longer necessary. Refer to the panel action and statement on Proposal 16-276(a).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #4030)

16- 279 - (820-10): Accept

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design / Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Add a Fine Print Note to read as follows:

FPN: For additional information regarding overhead wires and cables, see National Electric Safety Code, ANSI C2-1997, Part 2 Safety Rules For Overhead Lines.

SUBSTANTIATION: The primary focus of this recommendation is to promote parity between the two codes in an effort to eliminate confusion and multiple interpretations of codes contained in two separate volumes that are attempting to safely address the same issue. Due to the de-regulation of cabling on the customer premises and electrical power distribution, adhearance to the NESC is required.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21

VOTE ON PANEL ACTION:

AFFIRMATIVE: 21

(Log #4272)

16- 280 - (820-10(b), Exception): Accept in Part

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Revise as follows:

Exception: Where proximity to electric light, power, Class 1, or nonpower-limited fire alarm circuit service conductors cannot be avoided, and where the ungrounded nonpower-limited conductors are insulated, the installation shall be such as to provide clearances of not less than 12 in. (305 mm) from light, power, Class 1, or nonpower-limited fire alarm circuit service drops. The clearance requirement shall apply at all points along the drop, and it shall increase to 40 in. (1.02 m) at the pole.

SUBSTANTIATION: This rule presently differs from the rule in Article 800 [Sec. 800-10(b)(4)] for a similar application, even though Art. 800 circuits could run in coaxial cable assemblies. With increasing interaction and competition between these technologies, differing Code rule on similar topics should be as consistent as technically possible, within the boundaries of effective safety. This proposal is intended as a vehicle to allow CMP 16 to act on this issue by making comparable rules consistent. A companion proposal has been made to Article 830.

PANEL ACTION: Accept in Part.

The addition of the phrase "and where the ungrounded nonpower-limited conductors are insulated," is rejected.

The balance of the recomendation is accepted.

PANEL STATEMENT: Nonpower-limited conductors are always insulated. Refer to 760-27 (b).

The reference to 800-10(b)(4) in the substantiation is incorrect; it is believed that the reference is 800-10(a)(4).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21

VOTE ON PANEL ACTION:

AFFIRMATIVE: 21

(Log #1675)

16- 281 - (820-10(c)): Reject

SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions

RECOMMENDATION: Revise the text of Section 820-10(c) as follows:

(c) On Masts. Aerial cable shall be permitted to be attached to an above-the-roof raceway mast. ~~that does not enclose or support conductors of electric light or power circuits.~~ Aerial cable shall be permitted to be attached to a service mast that is listed for the purpose of accepting multiple attachments.

SUBSTANTIATION: The present wording of Section 820-10(c) prohibits the attachment of aerial cable to a raceway mast that either encloses or supports conductors of electric light or power circuits. Such prohibition is excessive. Where the mast is listed for the purpose of attaching multiple service drops, multiple attachments should be permitted. It is unnecessarily costly to the building owner and aesthetically unsightly when two service masts must be provided, one for power service and another for CATV aerial services.

Note that a companion proposal for a new Section 230-28, Exception has been submitted. The proposed Section 230-28, Exception would permit a CATV service drop attachment to a power service mast where the mast is listed for the purpose.

PANEL ACTION: Reject.

PANEL STATEMENT: Although requirements for the power service mast are specified in Article 230, the detailed design and installation requirements are not defined. The electric service company specifies the type, size and height of mast to be used and the manner in which it is to be installed. The NEC can not dictate to the utility the specific installation requirements. Code Panel 4, which has jurisdiction over service masts, has consistently rejected this concept.

BRUNSSEN: See my Explanation of Negative Vote on Proposal 16-202.

JOHNSON: See my Explanation of Negative Vote on Proposal 16-202.

(Log #2378)

16- 282 - (820-11): Reject

SUBMITTER: Rodney Parker, GTE North / Rep. Network Design

RECOMMENDATION: Part (c) is missing. Language should be similar to Point of Entry in Section 800-11(c).

SUBSTANTIATION: Since this Section 820-11 is titled "Entering Building" a(n) additional part should be added explaining where communications wires and cables shall enter the building. The language should be similar to that written in Section 800-11(c). Or reference should be made to refer to Section 800-11(c).

PANEL ACTION: Reject.

PANEL STATEMENT: The proposer did not provide the specific language to be used.

Section 820-11(c) was removed by floor action at the 1998 NFPA Annual Meeting. TIA-608 seeks to remove 800-11(c) and will likely be approved by the Standards Council. Further, the critical issue is not the separation of power and communications entrances, but the length of the grounding conductor. See panel action on Proposals 16-196 and 16-293.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #1010)

16- 283 - (820-11(b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

(b) Direct-buried Cables and Raceways. Direct-buried coaxial cable shall be separated at least 12 in. (305 mm) from conductors of any light, power, ~~or~~ Class 1, or nonpower-limited fire alarm circuits.

Exception: Separation shall not be required where (1) all electric service conductors are installed in raceways or have metal cable armor or (2) all coaxial cables have metal cable armor or (3) all feeder, branch-circuit, Class 1, and nonpower-limited fire alarm circuit conductors are installed in raceways or in Type MC, Type MI, or multiconductor Type UF or Type USE cables.

Delete present Exception No. 1 and No. 2.

SUBSTANTIATION: Since nonpower-limited fire alarm circuits can have the same parameters as Class 1 circuits, and there is apparently no prohibition against direct-burial in the form of single-conductor Type UF cable, they should be included.

Proposal combines both exceptions in sentence form and clarifies Type UF to be multiconductor type, deletes two references to coaxial cable in raceways since such installations do not require separation and are not direct cable burial addressed in the rule, and therefore not an exception to anything in the rule.

PANEL ACTION: Reject.
PANEL STATEMENT: The proposed recommendation would permit the installation of Class 1 and nonpower-limited conductors in the same raceway as electric power and light conductors (branch and feeder circuits). This would violate the separation rules in Articles 725 and 760.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #328)

16- 284 - (820-11(c)): Reject

NOTE: In accordance with 4-6.2(c) of the Regulations Governing Committee Projects, the following Proposal 16-220 and Comment 16-134 were returned to Committee at the 1998 Annual Meeting, and now are being processed as a Proposal for this revision.

SUBMITTER: Roger Witt, State Farm Ins. Co.
RECOMMENDATION: The Proposal 16-220:

RECOMMENDATION: Add new section 820-11(c) to read as follows:

(c) Point of Entry Where practicable, the point of entry for communications wiring and cables shall be within 5 feet of the electrical service entry point.

(FPN) The distance to the electrical system grounding electrode has a direct relationship to the potential difference between the communications circuits and the power circuits.

SUBSTANTIATION: It has been observed that when the communication circuit's point of entry is located remote from the electric service point, proper bonding is not provided. When power and communications service entry points are remote and the systems are bonded, then L di/dt losses come into play and the equalization of potential is not achieved.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: As worded, this proposed requirement would be very difficult, if not impossible to enforce. There would seldom be agreement between installers and inspectors as to whether meeting this requirement was practical.

The Comment 16-134:

SUBMITTER: Roger Witt, State Farm Ins. Co.

COMMENT ON PROPOSAL NO.: 16-220

RECOMMENDATION: Add new Section 820-11(c) to read as follows:

(c) Point of Entry. The point of entry for communications wiring and cables shall be within 5 feet of the electrical service entry point.

(FPN): The distance to the electrical system, grounding electrode has a direct relationship to the potential difference between the communications circuits and the power circuits.

Exception: Where it is not practicable to install the communications and electrical service in this manner, a separate grounding electrode, installed in compliance with 250-83 (c), shall be installed for the communications systems and the grounding electrodes for the electrical and communications systems shall be connected with a bare or insulated #4 copper conductor. The conductor shall not be exposed to mechanical injury, and when buried, shall be buried to a depth of 24 inches

SUBSTANTIATION: Change in proposed text as recommended by one of the panel members and shown in the ROP.

By requiring a specific point of entry, the requirement becomes enforceable. Single point grounding for all communications services and power services is needed to provide equal potential between the systems.

There is evidence that when communications services are installed remote from the power system service, separate ground rods are installed and not bonded to the electrical service grounding electrode. By specifying a service entrance location adjacent to the power system service entrance a better chance of single point grounding is presented.

PANEL ACTION: Accept in Principle.

Add new section 820-11(c) to read as follows:

(c) Grounding Point. The grounding terminal for communications wiring and cables shall be located within 20 feet of and bonded to the electrical service ground.

Exception: Where it is not practicable to install the communications service in this manner, a grounding electrode shall be installed in compliance with 820-40(b)(3) and bonded in accordance with 820-40(c) and 820-40(d).

(FPN): Under certain conditions, the length of the bonding conductor has a direct relationship to the difference in potential between the communications and the power circuits.

PANEL STATEMENT: The Panel believes these changes meet the concerns of the submitter and adds clarity to the text.

SUBSTANTIATION: (See the Recomendation field above that includes substantiation for 1998 edition Proposal 16-220 and 1998 edition Comment 16-134.)

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.
PANEL STATEMENT: See panel action on Proposal 16-293. The submitter is concerned with voltage differences between the telephone and power service on the premises because of excessive telephone grounding conductor length. Locating the power and telephone entrances within 5 feet of each other as the submitter proposes will not necessarily ensure a short telephone grounding conductor. Proposal 16-293 addresses that issue directly and ensures that this conductor shall be a maximum of 20 feet in length, thereby minimizing potential differences.

(Log #4027)

16- 285 - (820-12, 820-13, 820-30, 820-31): Reject
SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l
RECOMMENDATION: Add the following:

820-12. Circuits Requiring Primary Protectors. Circuits that require primary protectors as provided in Section 820-30 shall comply with the following.

(a) Insulation, Wires, and Cables. Communications wires and cables without a metallic shield, running from the last outdoor support to the primary protector, shall be listed as being suitable for the purpose and shall have current-carrying capacity as specified in Section 820-30(a)(1)(b) or 820-30(a)(1)(c).

(b) On Buildings. Communications wires and cables in accordance with Section 800-12(a) shall be separated at least 4 in. (102 mm) from electric light or power conductors not in a raceway or cable, or be permanently separated from conductors of the other system by a continuous and firmly fixed nonconductor in addition to the

insulation on the wires, such as porcelain tubes or flexible tubing. Communications wires and cables in accordance with Section 820-12(a) exposed to accidental contact with electric light and power conductors operating at over 300 volts to ground and attached to buildings shall be separated from woodwork by being supported on glass, porcelain, or other insulating material.

Exception: Separation from woodwork shall not be required where fuses are omitted as provided for in Section 820-30(a)(1), or where conductors are used to extend circuits to a building from a cable having a grounded metal sheath.

(c) Entering Buildings. Where a primary protector is installed inside the building, the communications wires and cables shall enter the building either through a noncombustible, nonabsorbent insulating bushing or through a metal raceway. The insulating bushing shall not be required where the entering communications wires and cables (1) are in metal-sheathed cable, (2) pass through masonry, (3) meet the requirements of Section 820-12(a) and fuses are omitted as provided in Section 820-30(a)(1), or (4) meet the requirements of Section 820-12(a) and are used to extend circuits to a building from a cable having a grounded metallic sheath. Raceways or bushings shall slope upward from the outside or, where this cannot be done, drip loops shall be formed in the communications wires and cables immediately before they enter the building.

Raceways shall be equipped with an approved service head. More than one communications wire and cable shall be permitted to enter through a single raceway or bushing. Conduits or other metal raceways located ahead of the primary protector shall be grounded.

820-13. Lightning Conductors. Where practicable, a separation of at least 6 ft (1.83 m) shall be maintained between communications wires and cables on buildings and lightning conductors.

C. Protection.

820-30. Protective Devices.

(a) Application. A listed primary protector shall be provided on each circuit run partly or entirely in aerial wire or aerial cable not confined within a block. Also, a listed primary protector shall be provided on each circuit, aerial or underground, located within the block containing the building served so as to be exposed to accidental contact with electric light or power conductors operating at over 300 volts to ground. In addition, where there exists a lightning exposure, each interbuilding circuit on a premises shall be protected by a listed primary protector at each end of the interbuilding circuit. Installation of primary protectors shall also comply with Section 110-3(b).

FPN No. 1: On a circuit not exposed to accidental contact with power conductors, providing a listed primary protector in accordance with this article will help protect against other hazards, such as lightning and above-normal voltages induced by fault currents on power circuits in proximity to the communications circuit.

FPN No. 2: Interbuilding circuits are considered to have a lightning exposure unless one or more of the following conditions exist.

1. Circuits in large metropolitan areas where buildings are close together and sufficiently high to intercept lightning.

2. Interbuilding cable runs of 140 ft (42.7 m) or less, directly buried or in underground conduit, where a continuous metallic cable shield or a continuous metallic conduit containing the cable is bonded to each building grounding electrode system.

3. Areas having an average of five or fewer thunderstorm days per year and earth resistivity of less than 100 ohm-meters. Such areas are found along the Pacific coast.

(1) Fuseless Primary Protectors. Fuseless-type primary protectors shall be permitted under any of the following conditions:

a. Where conductors enter a building through a cable with grounded metallic sheath member(s) and if the conductors in the cable safely fuse on all currents greater than the current-carrying capacity of the primary protector and of the primary protector grounding conductor

b. Where insulated conductors in accordance with Section 820-12(a) are used to extend circuits to a building from a cable with an effectively grounded metallic sheath member(s) and if the conductors in the cable or cable stub, or the connections between the insulated conductors and the exposed plant, safely fuse on all currents greater than the current-carrying capacity of the primary protector, or the associated insulated conductors and of the primary protector grounding conductor.

c. Where insulated conductors in accordance with Section 820-12(a) or (b) are used to extend circuits to a building from other than a cable with a metallic sheath member(s) if (1) the primary protector is listed for this purpose, and (2) the connections of the insulated conductors to the exposed plant or the conductors of the exposed plant safely fuse on all currents greater than the current-carrying capacity of the primary protector, or the associated insulated conductors and of the primary protector grounding conductor

d. Where insulated conductors in accordance with Section 820-12(a) are used to extend circuits aerially to a building from an unexposed buried or underground circuit

e. Where insulated conductors in accordance with Section 820-12(a) are used to extend circuits to a building from cable with an effectively grounded metallic sheath member(s) and if (1) the combination of the primary protector and insulated conductors is listed for this purpose, and (2) the insulated conductors safely fuse on all currents greater than the current-carrying capacity of the primary protector and of the primary protector grounding conductor

(2) Fused Primary Protectors. Where the requirements listed under Sections 820-30(a)(1)(a) through (e) are not met, fused-type primary protectors shall be used. Fused-type primary protectors shall consist of an arrester connected between each line conductor and ground, a fuse in series with each line conductor, and an appropriate mounting arrangement. Primary protector terminals shall be marked to indicate line, instrument, and ground, as applicable.

(b) Location. The primary protector shall be located in, on, or immediately adjacent to the structure or building served and as close as practicable to the point at which the exposed conductors enter or attach.

For purposes of this section, the point at which the exposed conductors enter shall be considered to be the point of emergence through an exterior wall, a concrete floor slab, or from a rigid metal conduit or an intermediate metal conduit grounded to an electrode in accordance with Section 820-40(b).

For purposes of this section, primary protectors located at mobile home service equipment located in sight from and not more than 30 ft (9.14 m) from the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with Section 250-32 and located in sight from and not more than 30 ft (9.14 m) from the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.

FPN: Selecting a primary protector location to achieve the shortest practicable primary protector grounding conductor will help limit potential differences between communications circuits and other metallic systems.

(c) Hazardous (Classified) Locations. The primary protector shall not be located in any hazardous (classified) location as defined in Article 500, nor in the vicinity of easily ignitible material.

Exception: As permitted in Sections 501-14, 502-14, and 503-12.

820-31. Primary Protector Requirements. The primary protector shall consist of an arrester connected between each line conductor and ground in an appropriate mounting. Primary protector terminals shall be marked to indicate line and ground as applicable.

SUBSTANTIATION: Coaxial systems are only protected by a thin shield. The center conductor of a coaxial system can accidentally come into contact with power on a pole line or underground system. Energizing the center conductor can cause electrical shock to personnel (end-user and technician) without having the center conductor protected. This proposal is in line with the requirements in Section 800 and 830-30. The evolving technologies on CATV systems are including voice and data transmission and require safety protection. It wouldn't be nice to blow up grandma's ear while she is on the phone and watching I Love Lucy on the TV.

PANEL ACTION: Reject.

PANEL STATEMENT: By referencing telephone applications, the proposal should more correctly apply to Articles 800 or 830. Both 800 and 830 already require protection to be installed. Additionally, the proposal references communication wires and cables without metallic shielding. Article 820's scope indicates the use of coaxial cables, which inherently include metallic shielding. No technical documentation has been included to indicate the presence of safety hazards to protect against.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21

VOTE ON PANEL ACTION:

COMMENT ON AFFIRMATIVE:

JOHNSON: By referencing telephone applications, the proposal should more correctly apply to Articles 800 or 830. Both 800 and 830 already require protection to be installed. Additionally, the proposal references communications wires and cables without metallic

shielding. Article 820's scope indicates the use of coaxial cables, which inherently include metallic shielding. No technical documentation has been included to indicate the presence of safety hazards to protect against. Data collected from cable television set top manufacturers indicate a negligible (less than (0.02%) problem with failures due to surges coming in on the coaxial input. A bigger problem is surges coming in on the power leads. No evidence was found of any significant damage to consumer owned electronics from the coaxial input.

(Log #379)

16- 286 - (820-33): Accept in Principle
SUBMITTER: Steven C. Johnson, Time Warner Cable/Rep. Nat'l Cable Television Assn.
RECOMMENDATION: Revise as follows:
820-33. Grounding of Outer Conductive Shield of a Coaxial Cable. ~~Where coaxial cable is exposed to lightning or to accidental contact with lightning arrester conductors or power conductors operating at a voltage of over 300 volts to ground, the~~The outer conductive shield of the coaxial cable shall be grounded at the building premises as close to the point of cable entry as practicable. For purposes of this section, the point at which the exposed cable enters shall be considered to be the point of emergence through an exterior wall, a concrete floor slab, or from a rigid or intermediate metal conduit grounded to an electrode in accordance with Section 820-40(b).
SUBSTANTIATION: This change would make 820 grounding requirements consistent with those of Articles 800 and 830. Common industry practice is to ground all installations. Removing the indicated text would eliminate confusion as to when grounding is necessary by requiring it in all cases.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to panel action on Proposal 16-288 which incorporates this proposal. The final text is shown in Proposal 16-288.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21

(Log #1046)

16- 288 - (820-33): Accept in Principle
SUBMITTER: Steven C. Johnson, Time Warner Cable/Rep. Nat'l Cable Television Assn.
RECOMMENDATION: Revise text to read:
820-33. Grounding of Outer Conductive Shield of a Coaxial Cable. Where coaxial cable is exposed to lightning or to accidental contact with lightning arrester conductors or power conductors operating at a voltage of over 300 volts to ground, the outer conductive shield of the coaxial cable shall be grounded at the building premises as close to the point of cable ~~entry~~ attachment as practicable. ~~For purposes of this section, the point at which the exposed cable enters shall be considered to be the point of emergence through an exterior wall, a concrete floor slab, or from a rigid or intermediate metal conduit grounded to an electrode in accordance with Section 820-40(b).~~
SUBSTANTIATION: The point of attachment does not necessarily coincide with the point of entrance. Standard practice is to attach to the building near the building's electrical ground and bond at that point.
The cable generally enters the building near the location of the customer's home entertainment equipment. Where this does not coincide with the location of the building electrical ground, the present code wording is requiring a less desirable grounding situation.
PANEL ACTION: Accept in Principle.
"Revise text to read:
"820-33. Grounding of Outer Conductive Shield of a Coaxial Cable. The outer conductive shield of the coaxial cable shall be grounded at the building premises as close to the point of cable entrance or attachment as practicable. ~~For purposes of this section, the point at which the exposed cable enters shall be considered to be the point of emergence through an exterior wall, a concrete floor slab, or from a rigid or intermediate metal conduit grounded to an electrode in accordance with Section 820-40(b).~~"
PANEL STATEMENT: The submitter's recommendation has been revised from "point of cable attachment" to the "point of cable entrance or attachment." The text has been revised to add clarity and be more consistent with other parallel articles. In addition the revised text incorporates the panel action on Proposal 16-286.

16- 293 - (820-40(a)(4) and Exception (New)): Accept
Note: The Technical Correlating Committee directs the Panel to change "residences" to "dwellings."
SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions
RECOMMENDATION: Insert new 820-40(a)(4) and Exception as follows. Renumber existing 820-40(a)(4) and 820-40(a)(5) as 820-40(a)(5) and 820-40(a)(6), respectively.
(4) Length. The grounding conductor shall be as short as practicable. In one- and two-family residences, the grounding conductor shall be as short as practicable, not to exceed 20 ft (6.0 m) in length.
Exception: In one- and two-famlily residences where it is not practicable to achieve an overall maximum grounding conductor length of 20 ft (6.0 m), a separate ground as specified in Section 250-52 shall be used, the grounding conductor shall be grounded to the separate ground in accordance with Section 250-70, and the separate ground bonded to the power grounding electrode system in accorance with Section 820-40(d).
SUBSTANTIATION: During the 1999 Code cycle, a number of proposals and comments were submitted to limit the separation of power and communications entrances to the building. The intent of these proposals and comments was to limit the potential difference between power and communications circuits during lightning events. That potential difference is generally a function of conductor inductance (L), which increases in direct proportion to conductor length, and the rate of rise of the current (di/dt). These proposals and comments were generally rejected as they did not address the real issue, the length of the coxial cable shield grounding conductor. This proposal addresses that issue, encourages short coxial cable, shield grounding conductors, provides guidance as to a reasonable maximum length, and provide an alternative where it is not practicable to meet the maximum length (20 ft) restriction. The proposed length restriction is limited to one- and two-family residences as it is such installations that are more likely to have diverse power and communications entrances and experience lightning-related problems. (urban/suburban environment with a fewer elevated structures and extensive buried metallic objects). This is a companion proposal and is intended to correlate Section 820-40(a)(4)(New) with similar changes proposed for Sections 800-40(a)(4)(New) and 830-40(a)(4)(New).
PANEL ACTION: Accept.
PANEL STATEMENT: Editorially change "20 ft (6.0 m)" to "6.0 m (20 ft)" in both places of the recommendation.

16- 294 - (820-40(b)): Accept in Principle
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise text as follows:
(b) Electrode. The grounding conductor shall be connected as follows:
1. In Buildings or Structures With Grounding Means. To the nearest accessible location on the following:
a. The building or structure grounding electrode system as covered in Section 250-50
b. The grounded interior metal water piping system as covered in Section 250-104(a)
c. The power service accessible means external to enclosures as covered in Section 250-92(b)
d. The metallic power serivce raceway
e. The service equipment enclosure
f. The grounding electrode conductor or the grounding electrode conductor metal enclosure; or
g. To the grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in Section 250-32.
2. In Buildings or Structures Without Grounding Means. If the building or structure served has no grounding means, as described in (b)(1):
a. To any one of the individual electrodes described in Section 250-50; or,
b. If the building or structure served has no grounding means, as described in (b)(1) or (b)(2)(a), to an effectively grounded metal structure or to any one of the individual electrodes described in Section 250-52.
SUBSTANTIATION: The new style manual requires titles for this section.
PANEL ACTION: Accept in Principle.
Revise the submitter's recommendation as follows:
Revise the text of 820-40(b)(1)(b) as follows:
"(b) The grounded interior metal water piping system, within 5 ft (1.52 m) from its point of entrance to the building, as covered in Section ~~250-104(a)~~ 250-50."
The remaining text is unchanged.
PANEL STATEMENT: The change incorporates the recommendation of Proposal 16-295 and this is the final text.

16- 295 - (820-40(b)(1)(b)): Accept
SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions
RECOMMENDATION: Revise the text of 820-40(b)(1)(b) as follows:
(b) The grounded interior metal water piping system, within 5 ft (1.52 m) from its point of entrance to the building, as covered in Section ~~250-104(a)~~ 250-50.
SUBSTANTIATION: Section 250-50 (formerly Section 250-81) was revised in the 1993 NEC to eliminate the use of the interior metal water piping system as a grounding (bonding) conductor. This was done because of the increased use of nonconductive piping for repair and maintenance rendering the interior metallic water piping system electrically discontinuous. Section 820-40(b)(1)(b) has not been revised to reflect this change. This proposed revision underscores that the interior metal water pipe may no longer be used as an intersystem bonding conductor to interconnect CATV and power, and correlates Section 820-40(b)(1)(b) with Section 250-50. Further, Section 250-104(a) concerns bonding of piping systems and building steel. Since connections to the interior metallic water piping system are now permitted only within the first 5 feet of the pipe's entrance to the building, the more appropriate reference is Section 250-50. This is a companion proposal and is intended to correlate Section 820-

40(b)(1)(b) with similar changes proposed for Sections 800-40(b)(1)(b), 810-21(f)(1)(b), and 830-40(b)(1)(b).

(Log #3628)

16- 299 - (820-51): Reject
SUBMITTER: David B. Kiddoo, AlphaGary Corp.
RECOMMENDATION: With regards to Section 820-51, "Limited Combustion Cable" or "Permanent Plenum Cable" should not be accepted as an additional Listing based on the lack of testing definition, the absence of cable Listing capability, and the proven adequacy of an integrated and enhanced NFPA 262 test method. NFPA 262 differentiates cables as to their fire performance to provide acceptable values for smoke generation and flame travel distance.
Propoents of "Limited Combustible Cable" or "Permanent Plenum Cable" have been actively soliciting support from cable market trade organizations, Code-Making Panel 16 Members or Alternates, cable manufacturers, etc. for a proposal to include a new paragraph in the Section to provide for a new Type of cable based on the definitions of "limited combustibility" and "smoke developed index" per the definitions in NFPA 90A. These definitions ONLY govern construction products for the installation of air conditioning and ventilating systems. The NFPA 255 and NFPA 259 fire test methods being promoted are NOT applicable to evaluate the fire hazard nor the geometries and material synergies in cables as they pertain to fire performance.
As these proposals have been made public through this solicitation for support, I wish to respond at this time to say that there is no safety record or fire performance issue necessitating any additional cable type of ruse in plenum cable applications. The inclusion of this new Type of cable is partially as a means to provide for an Exception from the proposed requirement in Section 820-52 to remove accumulations of abandoned cable. "Limited Combustible Cable" or "Permanent Plenum Cable" definitions seen in these proposals for a new cable Type are NOT based on any test method incorporating an actual cable fire hazard evaluation. Without adequate test methods and with the current status of the NFPRF "Permanent Plenum Cable Project", NO cables have been shown to meet the requirements proposed. The data generated in this Project have NOT been related to any appropriate fire hazard evaluation and should NOT be used to establish ANY relative cable fire performance comparisons.
SUBSTANTIATION: This issue has been discussed and reviewed in the last cycle of the NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems). The membership of the NFPA did NOT support a proposal to change the provisions for cables in the paragraphs on "ceiling cavity plenums" (2-3.10.1) and "raised floor plenums" (2-3.10.5) that would have allowed "Permanent Plenum Cables" to accumulate in these plenums. ("Permanent Plenum Cables" are so named through a Project being conducted by the National Fire Protection Research Foundation (NFPRF) and are described to meet a new, undefined, cable Listing for "limited combustibility" and "smoke developed index".) The more comprehensive solution to the issue of accumulating abandoned cables would have been to adopt a requirement to remove "ALL" abandoned cables that are removed from service and not intended for future use. Allowing for "Permanent Plenum Cables" to remain in plenums when abandoned would not address the serious issues of "congestion", "air flow restriction", and "total fuel load accumulation".
An appeal to the Standards Council was generated by proponents for "Permanent Plenum Cable" to overturn the Membership Action that occurred at the 1999 Annual Meeting. The Standards Council upheld the NFPA Membership Action after the hearing of the appeal. Comments from the final decision of the Standards Council on this matter are:
- "After a hearing, the Council reviewed and considered all of the information available to it, and voted to deny the appeals."
- "...wire and cable represents a significant potential fuel load in plenums and that, due to the rapidly increasing use of such cable in recent years, some approach to the problem should be devised."
- "...while it is the floor vote in favor of a return to the previous edition text that resulted in this recommendation, informational ballots of the TC (NFPA 90A Technical Committee) following that vote give further support to the conclusion that a lack of consensus exists in favor of going forward with the abandoned cable provisions. A majority of TC members voting on these informational ballots also supported the return to previous edition text..."
- "...the previous edition text is, in the Council's view, clearly suitable."
- "...the Council itself has concerns about the TC's approach and has concluded that further study of this important issue is needed."

• "...the Council wants to ensure that, as the TC undertakes to fully and fairly address these issued going forward, it has the best available range of expertise, representation, and experience. The Council, therefore, is referring the matter of committee membership to the Council's membership task group for review and recommendations."

While plenum cables are not typically the ignition source of fires, due to the low energy conducted through them, the fuel characteristics of high volumes of abandoned cable in plenums, whether combustible or limited combustible by definition, will most certainly add to the heat and energy released in a large, exposing fire, such as those where the ignition source is a room and contents fire below or above the plenum.

This proposal addresses the growing safety issue of accumulating abandoned cable in concealed spaces, without selectively favoring any cable geometry or synergy of materials. It does not allow for further accumulation of "Permanent Plenum Cables" which, when removed from service and not intended for future use, no longer have any function—except perhaps to serve as fuel for some future conflagration.

The proposal adopts consistent wording from NFPA 70, National Electrical Code, Section 300-21 and NFPA 75, Protection of Electronic Computer/Data Processing Equipment, paragraph 4-2.4. Basing this new requirement on existing code shows the strong intent, stated in the past by the Standards Council, to have good consistent code language across the various NFPA standards. Arguments by the proponents of "Permanent Plenum Cable" in the NFPA 90A review process to somehow create a new cable test requirement based on the definition of "limited combustibility" and "smoke developed index" created for building construction products would be a further misuse of the NFPA 255 and NFPA 259 "materials" test methods.

In spite of the rapid attempts by the proponents of "Permanent Plenum Cable", neither Underwriters Laboratories (UL) nor Intertek Testing Services (ITS/ETL) have yet established Listing criteria for "Permanent Plenum Cable" that could cover the matrix of cable types used in a plenum (fiber optics, coax, etc.). In fact, initial attempts over the first 9 months of the NFPRF Project to test finished cable in the NFPA 255 and NFPA 259 test methods has only shown inconsistencies and extremely limited capability of cables to meet the established definitions of "limited combustibility" and "smoke developed index" established for construction products. These test methods do NOT allow for cables to be tested based on their installed condition, nor can they be used to test cables with the important integration of finished cable geometries and materials/conductor or fiber synergies as they impact fire performance.

The proponents of "Permanent Plenum Cable" are applying these "material" tests inappropriately to cables. This is particularly why more sophisticated, integrated "cable" fire tests such as NFPA 262 (Plenum), ANSI/UL 1666 (Riser), and ANSI/UL 1581 (Vertical Tray) have been established and referenced in Standards such as the NFPA 70, NFPA 90A, etc. These tests more accurately simulate the actual fire hazards for installed cables, both in terms of the building environment AND the installed configuration. Integrated tests such as these are used to show the cables are designed to help contribute to minimizing the spread of fire and smoke generation in the early stages of a fire, allowing time for people to egress from the building. The fire safety record clearly shows that these tests have been successful in differentiating the fire performance of cables more accurately than materials tests such as NFPA 255 or NFPA 259.

The definition for cable fire performance in NFPA 90A Sections 2-3.10.1 and 2-3.10.5 are listed as Exceptions because the covering paragraphs (a) in each Section refer only to "materials" used in the construction of plenums. Proponents of "Permanent Plenum Cable" tried to make the argument in the NFPA 90A proposal review that IF the cable can be shown to meet the requirements of the plenum construction materials, accumulation of this cable is justifiable. As was acknowledged by members of the Standards Council during the NFPA 90A Appeal Hearing, cable jackets and insulations will NEVER look like the rigid materials used to construct plenums. Establishing a "Permanent Plenum Cable" Exception in a requirement to remove abandoned cable would clearly allow for a loop-hole to continue to proliferate abandoned cable accumulation and NOT address the serious issues of total fuel load, congestion, and air flow.

NFPA 75 Appendix A, paragraph A-4-2.4 says: "Abandoned cable will potentially interfere with air flow and extinguishing systems. Abandoned cable also adds to the fuel loading." This proposal would provide consistency with the established fire testing criteria and/or abandoned cable removal provisions established by NFPA 70, NFPA 75 and the appropriate Exceptions established for cables in NFPA 90A.

As was shared by Richard G. Gewain of Hughes Associates (with many years of direct involvement in these definitions) at the NFPA 90A TC meeting in December, 1998, the NFPA 220, Building Construction Committee (BCC) reviewed the definition of "non-combustible" and the new definition "limited combustible" in 1975. The BCC made it clear that these definitions "apply to the materials used in the construction of buildings (floors, roofs, columns, walls, etc.), but do NOT apply to furnishings or the contents of buildings, or to the fire hazard evaluation of materials." This language is clearly spelled out in the Special Interest Bulletin No. 294, currently entitled "Noncombustible and Limited-Combustible Building Construction Materials", published and updated several times since 1956 by the National Board of Fire Underwriters (a.k.a. American Insurance Association, currently known as the American Insurance Services Group).

Because of the concern that other NFPA Committees have been misusing the term "limited combustible", the Standards Council has assigned the responsibility for the term "limited combustible" to the BCC. The BCC has recently requested its Chairman to contact the Chairmen of the other NFPA Committees (covering 48 NFPA Standards) using this term and ask for a clarification of what is intended for its use. A BCC Task Group is now established to develop proposals or comments to ensure that the term in other standards such as NFPA 90A is used correctly. From a fire hazards point of view, it has clearly NOT been shown that using the current definitions of "limited combustible" and "smoke developed index" and NFPA 259/NFPA 255 test methods are appropriate for installed cables.

This proposal also alleviates the concern and burden to the authority having jurisdiction inspector enforcing NFPA 70 to identify different types of cables currently in the concealed spaces and removed from service. The requirements to remove ALL abandoned cable not intended for future use should be less cumbersome than to remove only "some" of the cables.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal does not conform to section 4-3.3(c) of the Regulations Governing Committee Projects. The submitter has made other proposals on this subject that meet the Regulations Governing Committee Projects. The issues raised in this proposal were addressed when the other proposals were considered.

16- 304 - (820-52): Reject

SUBMITTER: Stanley Kaufman, Lucent Technologies

RECOMMENDATION: Revise 820-52 as shown:

820-52. Installation of Cables and Equipment

Beyond the point of grounding, as defined in Section 820-33, the cable installation shall comply with (a) through (e).

(a) Separation from Other Conductors.

(1) In Raceways and Boxes.

a. Other Circuits. Coaxial cables shall be permitted in the same raceway or enclosure with jacketed cables of any of the following:

1. Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 725

2. Power-limited fire alarm systems in compliance with Article 760

3. Communications circuits in compliance with Article 800

4. Nonconductive and conductive optical fiber cables in compliance with Article 770

5. Low power network-powered broadband communications circuits in compliance with Article 830

b. Electric Light, Power, Class 1, Nonpower-Limited Fire Alarm, ~~and~~ Medium and High Power Network-Powered Broadband Communications Circuits. Coaxial cable shall not be placed in any raceway, compartment, outlet box, junction box, or other enclosures with conductors of electric light, power, Class 1, nonpower-limited fire alarm, ~~or~~ medium or high power network-powered broadband communications circuits.

Exception No. 1: Where all of the conductors of electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuits are separated from all of the coaxial cables by a barrier.

Exception No. 2: Power circuit conductors in outlet boxes, junction boxes, or similar fittings or compartments where such conductors are introduced solely for power supply to the coaxial cable system distribution equipment. The power circuit conductors shall be routed within the enclosure to maintain a minimum 0.25-in. (6.35-mm) separation from coaxial cables.

(2) Other Applications. Coaxial cable shall be separated at least 2 in. (50.8 mm) from conductors of any electric light, power, Class 1, nonpower-limited fire alarm, ~~or~~ medium or high power network-powered broadband communications circuits.

Exception No. 1: Where either (1) all of the conductors of electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications and circuits are in a raceway, or in metal-sheathed, metal-clad, nonmetallic-sheathed, Type AC, or Type UF cables, or (2) all of the coaxial cables are encased in raceway.

Exception No. 2: Where the coaxial cables are permanently separated from the conductors of electric light, power, Class 1, nonpower-limited fire alarm, ~~and~~ medium and high power network-powered broadband communications circuits by a continuous and firmly fixed nonconductor, such as porcelain tubes or flexible tubing, in addition to the insulation on the wire.

(b) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods.

(c) Equipment in Other Space Used for Environmental Air. Section 300-22(c) shall apply.

(d) Hybrid Power and Coaxial Cabling. The provisions of Section 780-6 shall apply for listed hybrid power and coaxial cabling in closed-loop and programmed power distribution.

(e) Support of Conductors. Raceways shall not be used as a means of support for coaxial cables.

SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. This proposal amends the separation rules between circuits to provide appropriate separation from these new high-power communications circuits.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.

Renumber 820-52(a)(1)(a)(4) to 820-52(a)(1)(a)(3).
SUBSTANTIATION: Editorial; the list of articles should be in numerical order.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #509)

16- 307 - (820-52(a)(1)b Exception No. 2): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Change "0.25-in. (6.35-mm)" to "6.35 mm (0.25 in.)"
The CMP should consider rounding to "6 mm (0.25 in.)" if safety would not be compromised.
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
The SI units are not rounded since the dimensions specify minimum values for safety.
PANEL ACTION: Accept in Principle.
In the submitter's recommended text revise "6.35 mm (0.25 in.)" to "6 mm (0.25 in.)."
PANEL STATEMENT: The panel has accepted the TCC suggestion to round to "6 mm (0.25 in.)" and has included in the panel action text.

(Log #1011)

16- 308 - (820-52(a)(2)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(2) Other Applications. Coaxial cable shall be separated at least 2 in. (50.8 mm) from open conductors of any electric light, power, Class 1, nonpower-limited fire alarm circuits, and ~~or~~ medium power network-powered broadband communications circuits.
Exception No. 1: Delete.
Exception ~~No. 2:~~ Separation shall not be required where ~~Where~~ the coaxial cable(s) ~~are~~ is ~~permanently separated from the conductors of~~ installed in a raceway(s), or the coaxial cable(s) or the electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuits conductors ~~by a continuous and~~ are enclosed in a firmly fixed nonconductor such as porcelain tubes or flexible tubing, in addition to the insulation on the wire. This nonconductor shall be continuous for any length of conductor(s) with less than 2 in. (50.8 mm) separation.
SUBSTANTIATION: Editorial. The conductors of the text are presumed to be open conductors, since, if not, they would be normally in a raceway or cable covered in Chapter 3 and as indicated in the present Exception No. 1, although Type UF referenced is not indicated as multiconductor form, which seems to be the intent. The proposal includes separation from single-conductor Type UF and incorporates all present requirements in Sentence form, and delineates how long "continuous" is.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "open conductor" is not defined.

(Log #1128)

16- 310 - (820-52(b)): Accept in Principle in Part
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise Section 820-52(b) as follows:
(b) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating. Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate. Accumulations of abandoned cables, not identified for future use, in ducts, plenums, and other space used for environmental air, shall be removed.
Exception: Type CATVP-50 cables shall not be required to be removed.
FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.
SUBSTANTIATION: See my proposal for Section 800-52(b).
PANEL ACTION: Accept in Principle in Part.
The part being rejected is the recommendation to add the exception. The panel actions in other proposals adopting the requirement to remove abandon cables satisfies the proposal other than the exception. There is inadequate justification to leave any debris (e.g. abandoned cable).
The remaining part of the proposal is accepted in principle.
PANEL STATEMENT: Refer to panel action on Proposal 16-313.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #3627)

16- 312 - (820-52(b)): Accept in Principle

SUBMITTER: David B. Kiddoo, AlphaGary Corp.

RECOMMENDATION: Revise 820-52(b) as follows:

(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, ventilation ducts or air-handling plenums shall be made so that the possible spread of fire or fire resistant-rated walls, partitions, floors or ceilings shall be firestopped using approved methods to maintain the fire resistant rating. Abandoned cables in these spaces, shafts, ducts and plenums shall not be allowed to accumulate. Accumulations of abandoned cables, not identified for future use, in these spaces, shafts, ducts, plenums, and other space used for environmental air, shall be removed.

FPN No. 1: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

FPN No. 2: Definition of acceptable cable fire performance in various applications are described in Section 820-51.

SUBSTANTIATION: This issue has been discussed and reviewed in the last cycle of the NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems). The membership of the NFPA did NOT support a proposal to change the provisions for cables in the paragraphs on "ceiling cavity plenums" (2-3.10.1) and "raised floor plenums" (2-3.10.5) that would have allowed "Permanent Plenum Cables" to accumulate in these plenums. ("Permanent Plenum Cables" are so named through a Project being conducted by the National Fire Protection Research Foundation (NFPRF) and are described to meet a new, undefined, cable Listing for "limited combustibility" and "smoke developed index".) The more comprehensive solution to the issue of accumulating abandoned cables would have been to adopt a requirement to remove "ALL" abandoned cables that are removed from service and not intended for future use. Allowing for "Permanent Plenum Cables" to remain in plenums when abandoned would not address the serious issues of "congestion", "air flow restriction", and "total fuel load accumulation".

An appeal to the Standards Council was generated by proponents for "Permanent Plenum Cable" to overturn the Membership Action that occurred at the 1999 Annual Meeting. The Standards Council upheld the NFPA Membership Action after the hearing of the appeal. Comments from the final decision of the Standards Council on this matter are:

- "After a hearing, the Council reviewed and considered all of the information available to it, and voted to deny the appeals."
- "...wire and cable represents a significant potential fuel load in plenums and that, due to the rapidly increasing use of such cable in recent years, some approach to the problem should be devised."
- "...while it is the floor vote in favor of a return to the previous edition text that resulted in this recommendation, informational ballots of the TC (NFPA 90A Technical Committee) following that vote give further support to the conclusion that a lack of consensus exists in favor of going forward with the abandoned cable provisions. A majority of TC members voting on these informational ballots also supported the return to previous edition text..."
- "...the previous edition text is, in the Council's view, clearly suitable."
- "...the Council itself has concerns about the TC's approach and has concluded that further study of this important issue is needed."
- "...the Council wants to ensure that, as the TC undertakes to fully and fairly address these issued going forward, it has the best available range of expertise, representation, and experience. The Council, therefore, is referring the matter of committee membership to the Council's membership task group for review and recommendations."

While plenum cables are not typically the ignition source of fires, due to the low energy conducted through them, the fuel characteristics of high volumes of abandoned cable in plenums, whether combustible or limited combustible by definition, will most certainly add to the heat and energy released in a large, exposing fire, such as those where the ignition source is a room and contents fire below or above the plenum.

This proposal addresses the growing safety issue of accumulating abandoned cable in concealed spaces, without selectively favoring any cable geometry or synergy of materials. It does not allow for further accumulation of "Permanent Plenum Cables" which, when removed from service and not intended for future use, no longer have any function—except perhaps to serve as fuel for some future conflagration.

The proposal adopts consistent wording from NFPA 70, National Electrical Code, Section 300-21 and NFPA 75, Protection of Electronic Computer/Data Processing Equipment, paragraph 4-2.4. Basing this new requirement on existing code shows the strong intent, stated in the past by the Standards Council, to have good consistent code language across the various NFPA standards. Arguments by the proponents of "Permanent Plenum Cable" in the NFPA 90A review process to somehow create a new cable test requirement based on the definition of "limited combustibility" and "smoke developed index" created for building construction products would be a further misuse of the NFPA 255 and NFPA 259 "materials" test methods.

In spite of the rapid attempts by the proponents of "Permanent Plenum Cable", neither Underwriters Laboratories (UL) nor Intertek Testing Services (ITS/ETL) have yet established Listing criteria for "Permanent Plenum Cable" that could cover the matrix of cable types used in a plenum (fiber optics, coax, etc.). In fact, initial attempts over the first 9 months of the NFPRF Project to test finished cable in the NFPA 255 and NFPA 259 test methods has only shown inconsistencies and extremely limited capability of cables to meet the established definitions of "limited combustibility" and "smoke developed index" established for construction products. These test methods do NOT allow for cables to be tested based on their installed condition, nor can they be used to test cables with the important integration of finished cable geometries and materials/conductor or fiber synergies as they impact fire performance.

The proponents of "Permanent Plenum Cable" are applying these "material" tests inappropriately to cables. This is particularly why more sophisticated, integrated "cable" fire tests such as NFPA 262 (Plenum), ANSI/UL 1666 (Riser), and ANSI/UL 1581 (Vertical Tray) have been established and referenced in Standards such as the NFPA 70, NFPA 90A, etc. These tests more accurately simulate the actual fire hazards for installed cables, both in terms of the building environment AND the installed configuration. Integrated tests such as these are used to show the cables are designed to help contribute to minimizing the spread of fire and smoke generation in the early stages of a fire, allowing time for people to egress from the building. The fire safety record clearly shows that these tests have been successful in differentiating the fire performance of cables more accurately than materials tests such as NFPA 255 or NFPA 259.

The definition for cable fire performance in NFPA 90A Sections 2-3.10.1 and 2-3.10.5 are listed as Exceptions because the covering paragraphs (a) in each Section refer only to "materials" used in the construction of plenums. Proponents of "Permanent Plenum Cable" tried to make the argument in the NFPA 90A proposal review that IF the cable can be shown to meet the requirements of the plenum construction materials, accumulation of this cable is justifiable. As was acknowledged by members of the Standards Council during the NFPA 90A Appeal Hearing, cable jackets and insulations will NEVER look like the rigid materials used to construct plenums. Establishing a "Permanent Plenum Cable" Exception in a requirement to remove abandoned cable would clearly allow for a loop-hole to continue to proliferate abandoned cable accumulation and NOT address the serious issues of total fuel load, congestion, and air flow.

NFPA 75 Appendix A, paragraph A-4-2.4 says: "Abandoned cable will potentially interfere with air flow and extinguishing systems. Abandoned cable also adds to the fuel loading." This proposal would provide consistency with the established fire testing criteria and/or abandoned cable removal provisions established by NFPA 70, NFPA 75 and the appropriate Exceptions established for cables in NFPA 90A.

As was shared by Richard G. Gewain of Hughes Associates (with many years of direct involvement in these definitions) at the NFPA 90A TC meeting in December, 1998, the NFPA 220, Building Construction Committee (BCC) reviewed the definition of "non-combustible" and the new definition "limited combustible" in 1975. The BCC made it clear that these definitions "apply to the materials used in the construction of buildings (floors, roofs, columns, walls, etc.), but do NOT apply to furnishings or the contents of buildings, or to the fire hazard evaluation of materials." This language is clearly spelled out in the Special Interest Bulletin No. 294, currently entitled "Noncombustible and Limited-Combustible Building Construction Materials", published and updated several times since 1956 by the National Board of Fire Underwriters (a.k.a. American Insurance Association, currently known as the American Insurance Services Group).

Because of the concern that other NFPA Committees have been misusing the term "limited combustible", the Standards Council has

assigned the responsibility for the term "limited combustible" to the BCC. The BCC has recently requested its Chairman to contact the Chairmen of the other NFPA Committees (covering 48 NFPA Standards) using this term and ask for a clarification of what is intended for its use. A BCC Task Group is now established to develop proposals or comments to ensure that the term in other standards such as NFPA 90A is used correctly. From a fire hazards point of view, it has clearly NOT been shown that using the current definitions of "limited combustible" and "smoke developed index" and NFPA 259/NFPA 255 test methods are appropriate for installed cables.

This proposal also alleviates the concern and burden to the authority having jurisdiction inspector enforcing NFPA 70 to identify different types of cables currently in the concealed spaces and removed from service. The requirements to remove ALL abandoned cable not intended for future use should be less cumbersome than to remove only "some" of the cables.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to panel action on Proposal 16-313 which meets the intent of the submitter.

(Log #4053)

16- 313 - (820-52(b)): Accept in Principle

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Revise Section 820-52(b) as follows:

(b) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fire resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate. Excessive accumulations of abandoned cables, in ducts, plenums, and other space used for environmental air, shall be removed where practicable.

FPN : Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

SUBSTANTIATION: BICSI members have been extensively involved with the design and installation of telecommunications cabling. Technology changes have resulted in newer high performance cabling being installed in support of those technologies. We have observed excessive accumulations of abandoned cabling adding to the fuel loading within plenum spaces. This proposal is offered to the NFPA to help reduce the fuel load within these plenum areas.

Addition of "to maintain the fire resistance rating" to the end of the second sentence will correlate this section with section 300-21.

The proposed fine print No. 1 note was copied from the first sentence of the fine print note in section 300-21. It assists installers in locating firestop information.

Acceptance of this proposal will result in cable removal being included in the scope of the installation of a new communications and data system. The contractor will remove the old cable before installing the new system.

Acceptance of this proposal will result in many BICSI members specifying abandoned cable removal within the scope of the installation of new communications and data systems.

In two separate proposals, we have offered definitions for "abandoned cable" and "excessive accumulation of abandoned cables".

This proposed wording addresses the issue of excess combustibles in plenums without requiring the removal of all abandoned cable, only excessive accumulations of abandoned cable, thus avoiding a burdensome requirement of removing insignificant amounts of cable. The proposed first sentence, Abandoned cables in ducts, plenums, and other space used for environmental air shall not be allowed to accumulate, limits the amount of cable that will be permitted to be abandoned. It applies to all cable that is in place, plenum cable as well as non-plenum cable that was installed before the plenum cable requirements were in the Code. The proposed second sentence, Excessive accumulations of abandoned cables, in ducts, plenums, and other space used for environmental air, shall be removed, where practicable, deals with already abandoned cable. The wording of "where practicable" aid the situations where cable may be intertwined and cannot be removed without disruption of active services. The NEC requirements for plenum cable were first promulgated in the 1975 NEC, consequently, abandoned cables in older buildings often include unlisted cable along with listed plenum cable.

Other sections of the NEC require the removal of abandoned wiring.

ARTICLE 354 — Underfloor Raceways, Section 354-7. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

ARTICLE 356 — Cellular Metal Floor Raceways, Section 356-7. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

ARTICLE 358 — Cellular Concrete Floor Raceways, Section 358-13. Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case of abandoned outlets on loop wiring, shall be allowed in raceways.

ARTICLE 305 — Temporary Wiring, Section 305-3(d). Time Constraints, (d) Removal. Temporary wiring shall be removed immediately upon completion of construction or purpose for which the wiring was installed.

PANEL ACTION: Accept in Principle.

Revise 820-3(a) to read as follows:

"(a) Spread of Fire or Products of Combustion. Section 300-21. Abandoned cables not intended for future use shall not be permitted to remain."

PANEL STATEMENT: The revision meets the intent of the submitter. It is more appropriate to place the requirement in 820-3(a) which addresses the subject.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

ABSTENTION: 1

COMMENT ON AFFIRMATIVE:

BRUNSSEN: See my Comment on Affirmative Vote on Proposal 16-80.

DORNA: The revised wording for 820-3(a) should read as follows:

"(a) Spread of Fire or Products of Combustion. Section 300-21. Abandoned cables ~~not intended for future use~~ shall not be permitted to remain."

The use of the phrase "not intended for future use" is redundant. The definition of "abandoned cable" has this phrase in the definition. To restate this phrase would be grammatically incorrect.

JOHNSON: See my Comment on Affirmative on Proposal 16-80.

KAHN: See my Comment on Affirmative on Proposal 16-80.

WIERENGA: The revised wording for 820-3(a) should read as follows:

"(a) Spread of Fire or Products of Combustion. Section 300-21. Abandoned cables ~~not intended for future use~~ shall ~~not~~ be removed."

The use of the phrase "not intended for future use" is redundant because it is already included in the definition of "abandoned cable". The deletion of the words "not" and "permitted to remain" can be readily stated by use of positive code language using the word "removed".

EXPLANATION OF ABSTENTION:

CAUDILL: See my Explanation of Abstention on Proposal 16-1a.

(Log #1012)

16- 314 - (820-52(e)): Accept in Principle

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

Support of Conductors. ~~Raceways shall not be used as a means of support for coaxial~~ Coaxial cables shall not be strapped, taped, or

attached by any means to the exterior of any raceway or cable as a means of support, except as permitted in Section 820-10(c).
SUBSTANTIATION: Editorial. Where installed in raceways support is obviously provided. Where terminated at a raceway mast support is also provided. The proposal is intended to clarify what is apparently intended and also includes cables such as Types AC, MC, MI, NM, etc.
PANEL ACTION: Accept in Principle.
Replace 820-52(e) as follows:
"(e) Support of Cables. Raceways shall be used for their intended purpose. Coaxial cables shall not be strapped, taped, or attached by any means to the exterior of any conduit or raceway as a means of support.
Exception: Overhead (aerial) spans of coaxial cables shall be permitted to be attached to the exterior of a raceway-type mast intended for the attachment and support of such cables."
PANEL STATEMENT: The revised wording satisfies the submitter's intent and correlates with 800-52(e), to provide consistent wording and requirements.

(Log #591)

16- 315 - (820-53): Accept in Principle
SUBMITTER: Gerald Lee Dorna, Belden Wire & Cable Co.
RECOMMENDATION: 1. Change "(c)" to "(d)"
2. Change "(d)" to "(e)"
3. Add new "(c)" Cable Trays. Cables installed in cable trays shall be types CATVP, CATVR, and CATV
Note: If this is accepted then the first sentence of Section 820-53 would need to be modified as follows:
"CATV cables shall comply with (a) through ~~(d)~~ (e) "
SUBSTANTIATION: This change will make Article 820 correspondent with Article 725.
It will also resolve the problem of whether or not CATV cables are allowed in cable trays.
PANEL ACTION: Accept in Principle.
Revise the submitter's recommendation by changing item 2) to read as follows: "Change "(d)" to "(f)""
In addition revise the last sentence of the recommendation to read as follows:
"CATV cables shall comply with (a) through ~~(d)~~ (f) "
PANEL STATEMENT: Refer to panel action on Proposal 16-319 where a new section (e) was added. The change in numbers are made to correlate with this.

(Log #2244)

16- 317 - (Figure 820-53): Reject
SUBMITTER: Irving Mande, Edwards Systems Technology
RECOMMENDATION: Add vertical arrows between CMP, CMR, CMG/CM, and CMX.
SUBSTANTIATION: Correct error in the 1999 Code
PANEL ACTION: Reject.
PANEL STATEMENT: The arrows were removed to simplify the diagram. Only substitutions for cables within the Article are shown.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21

Table 820-53. Coaxial Cable Uses and Permitted Substitutions

Cable Type	Use	References	Permitted Substitutions
CATVP	Coaxial plenum cable	820-53(a)	CATVP-50, CMP
CATVR	Coaxial riser cable	820-53(b)	CATVP-50, CATVP, CMP, CMR
CATV	Coaxial general-purpose cable	820-53(c)	CATVP-50, CATVP, CMP, CATVR, CMR, CMG, CM
CATVX	Coaxial cable, limited use	820-53(c)	CATVP-50, CATVP, CMP, CATVR, CMR, CATV, CMG, CM

The note is unchanged.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #4140)

16- 318 - (820-53(a)): Accept in Principle
SUBMITTER: Marcelo M. Hirschler, GBH Int'l, Inc./Rep. Plenum Cable Assn.
RECOMMENDATION: Revise as follows:
820-53. Applications of Listed CATV Cables. CATV cables shall comply wih (a) through (d).
(a) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables, not intended for future use, shall not be permitted to remain.
Exception: Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with Section 300-22.
SUBSTANTIATION: There is a significant amount of information indicating that the amount of cables installed in plenums, and other air-handling spaces, is increasing rapidly. An understanding of cabling practices indicates that the most common way in which cable installation is carried out is by disconnecting existing cable and leaving it abandoned in place, while introducing the cable needed to perform the additional functions. See Log #4136. There is, as yet, no indication that the additional cables in plenums causes an added fire hazard, and the fire record of cables in concealed spaces, both above ceilings and below floors, remains excellent. In fact, plenum cables, which meet the fire test requirements of NFPA 262, have been shown to have extremely good fire performance and to spread flame only very slowly, if at all. However, this type of preventive measure is worthwhile.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The proposer's intent was satisfied by panel action on Proposal 16-313.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:

(Log #2141)

16- 319 - (820-53(d) and (e)):
Note: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" since Code-Making Panel 14 rejected Proposals 14-73 and 14-217 that proposed to add Types CATVP, CATVR, and CATV cables. It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 14 for information.
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Renumber 820-53(d) Cable Substitutions, (e); and provide the following new 820-53(d) as follows:
(d) Hazardous (Classified) Locations. Where the use of Type CATVP, CATVR, CATV, and CATVX cable is permitted in Sections 501-4(b), 502-4(b), and 504-20, the cable shall be installed in cable trays; in raceways; supported by messenger wire, or otherwise adequately supported and mechanically protected by angles, struts, channels, or by other mechanical means.
SUBSTANTIATION: This is a companion proposal to correlate with the introduction of Coaxial cables in Sections 501-5(b) and 502-4(b). Type CATVP, CATVR, CATV, or CATVX coaxial cables, as described in Section 820-51, have the additional having fire-resistant characteristics similar to the requirements for other types of cables such as TC and ITC, which are currently permitted for Class II Division 2 locations. In addition they are suitable for installation in cable trays as permitted by Article 318. Coaxial cables are needed in modern industrial facilities for digital and video signal transmission.
PANEL ACTION: Accept in Principle in Part.
Revise the submitter's proposal by adding a new 820-53(e) as follows:
"(e) Hazardous (Classified) Locations. Where the use of Type CATVP, CATVR, and CATV cable is permitted in Sections 501-4(b), 502-4(b), and 504-20, the cable shall be installed in cable trays; in raceways; supported by messenger wire, or otherwise adequately supported and mechanically protected by angles, struts, channels, or by other mechanical means."
PANEL STATEMENT: The Type CATVX is rejected. Type CATVX cables have inadequate fire-resistance to be used in cable trays (to correlate with the panel action Proposal 16-315).
The numbering has been modified to correlate with Proposal 16-315.

change "22 ft (6.71 m)" to "6.7 m (22 ft)"
change "14 ft (4.27 m)" to "4.3 m (14 ft)"
830-10(e) Exception No. 2 - change "10 ft (3.05 m)" to "3.0 m (10 ft)"
830-10(f) - change "8 ft (2.44 m)" to "2.5 m (8 ft)"
830-10(f) Exception No. 2:
change "18 in. (457 mm)" to "450 mm (18 in.)"
change "4 ft (1.22 m)" to "1.2 m (4 ft)"
830-10(f) Exception No. 3 - revise as follows:
"Exception No. 3: Where the roof has a slope of not less than 100 mm (4 in.) ~~4 in. (102 mm)~~ in 300 mm (12 in.) ~~12 in. (305 mm)~~, a reduction in clearance to not less than 900 mm (3 ft) ~~3 ft (914 mm)~~ shall be permitted."
830-10(g) - change "3 ft (914 mm)" to "900 mm (3 ft)"
830-10(g) Exception - change "3-ft (914-mm)" to "900 mm (3 ft)"
830-10(i)(1) - change "4 in. (102 mm)" to "100 mm (4 in.)"
830-10(i)(3) - change "6 ft (1.83 m)" to "1.8 m (6 ft)"
830-10(i)(4) - change "8 ft (2.44 m)" to "2.5 m (8 ft)"
830-11(b) - change "12 in. (305 mm)" to "300 mm (12 in.)"
830-11(c):
change "8 ft (2.44 m)" to "2.5 m (8 ft)"
change "18 in. (457 mm)" to "450 mm (18 in.)"
830-11(d) - change "5 ft (1.52 m)" to "1.5 m (5 ft)"
830-11(d) Exception:
change "5 ft (1.52 m)" to "1.5 m (5 ft)"
add a (mm) column in addition to the (in.) column under Minimum Burial and insert "150" mm beside the two "6" in. dimensions and insert "450" mm beside the two "18" in. dimensions
delete "Note: For SI units, 1 in. = 25.4 mm."
change "2 in. (50.8 mm)" to "50 mm (2 in.)"
830-30(a) FPN No. 2 (2) - change "140 ft (42.7 m)" to "42 m (140 ft)"
830-30(b)(3) - change "30 ft (9.14 m)" to "9.0 m (30 ft)" in two places in the third paragraph.
830-33 - change "30 ft (9.14 m)" to "9.0 m (30 ft)" in two places in the second paragraph.
830-40(b)(3):
change "5 ft (1.52 m)" to "1.5 m (5 ft)"
change "_ in. (12.7 mm)" to "12.7 mm (_ in.)"
change "6 ft (1.83 m)" to "1.8 m (6 ft)"
830-42 - change "30 ft (9.14 m)" to "9.0 m (30 ft)" in two places
830-55(b) Exception No. 2 - change "0.375 in. (9.52 mm)" to "9.5 mm (0.375 in.)"
830-55(c) Exception No. 3 - change "0.375 in. (9.52 mm)" to "9.5 mm (0.375 in.)"
830-55(c) Exception No. 4 - change "50 ft (15.2 m)" to "15 m (50 ft)"
830-55(c) Exception No. 4 FPN - change "50 ft (15.2 m)" to "15 m (50 ft)"in three places
830-58(a)(2) - change "2 in. (50.8 mm)" to "50 mm (2 in.)"
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
In 830-40(b)(3), the SI units for 1/2 in. are not rounded since it specifies at minimum trade size.

16- 323 - (830-1): Reject
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise the title and scope of Article 830 as shown:
ARTICLE 830 Low and Medium Power Network-Powered Broadband Communications Systems
A. General
830-1. Scope. This article covers low and medium power network-powered broadband communications systems that provide any combination of voice, audio, video, data, and interactive services through a network interface unit.
FPN No. 1: A typical basic system configuration includes a cable supplying power and broadband signal to a network interface unit that converts the broadband signal to the component signals. Typical cables are coaxial cable with both broadband signal and power on the center conductor, composite metallic cable with a coaxial member for the broadband signal and a twisted pair for power, and composite optical fiber cable with a pair of conductors for power. Larger systems may also include network components such as amplifiers that require network power.
FPN No. 2: See Section 90-2(b)(4) for installations of broadband communications systems that are not covered.
SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. The title and scope of Article 830 need to be changed to distinguish Article 830 from Article 831.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.

16- 326 - (830-5): Reject
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise Section 830-5 as shown:

830-5. Low and Medium Power Network-Powered Broadband Communications Equipment and Cables. Low and medium power ~~N~~network-powered broadband communications equipment and cables shall be listed as suitable for the purpose.

Exception No. 1: This listing requirement shall not apply to community antenna television and radio distribution system coaxial cables that were installed prior to January 1, 2000, in accordance with Article 820 and are used for low power network-powered broadband communications circuits. See Section 830-9.

Exception No. 2: Substitute cables for low and medium power network-powered broadband communications cables shall be permitted as shown in Table 830-58.

(a) Listing and Marking. Listing and marking of low and medium power network-powered broadband communications cables shall comply with (1) or (2).

(1) Type BMU, Type BM, and Type BMR Cables. Network-powered broadband communications medium power underground cable, Type BMU; network-powered broadband communications medium power cable, Type BM; and network-powered broadband communications medium power riser cable, Type BMR, shall be factory-assembled cables consisting of a jacketed coaxial cable, a jacketed combination of coaxial cable and multiple individual conductors, or a jacketed combination of an optical fiber cable and multiple individual conductors. The insulation for the individual conductors shall be rated for 300 volts minimum. Cables intended for outdoor use shall be listed as suitable for the application. Cables shall be marked in accordance with Section 310-11. Type BMU cables shall be jacketed and listed as being suitable for outdoor underground use. Type BM cables shall be listed as being suitable for general purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire. Type BMR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN No. 1: One method of defining resistant to spread of fire is that the cables do not spread fire to the top of the tray in the vertical tray flame test in the Reference Standard for Electrical Wires, Cables and Flexible Cords, ANSI/UL 1581-1991. Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 4 ft. 11 in. (1.5 m) when performing the CSA vertical flame test for cables in cable trays, as described in Test Methods for Electrical Wires and Cables, CSA C22.2 No. 0.3-M-1985.

FPN No. 2: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of the Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts, ANSI/UL 1666-1997.

(2) Type BLU, Type BLX, and Type BLP Cables. Network-powered broadband communications low power underground cable, Type BLU; limited use network-powered broadband communications low power cable, Type BLX; and network-powered broadband communications low power plenum cable, Type BLP, shall be factory assembled cables consisting of a jacketed coaxial cable, a jacketed combination of coaxial cable and multiple individual conductors, or a jacketed combination of an optical fiber cable and multiple individual conductors. The insulation for the individual conductors shall be rated for 300 volts minimum. Cables intended for outdoor use shall be listed as suitable for the application. Cables shall be marked in accordance with Section 310-11. Type BLU cables shall be jacketed and listed as being suitable for outdoor underground use. Type BLX limited-use cables shall be listed as being suitable for use outside, for use in dwellings, and for use in raceways, and shall also be listed as being flame retardant. Type BLP cables shall be listed as being suitable for use in ducts, plenums, and other spaces for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN No. 1: One method of determining that cable is flame retardant is by testing the cable to VW-1 (vertical-wire) flame test in the Reference Standard for Electrical Wires, Cables and Flexible Cords, ANSI/UL 1581-1991.

FPN No. 2: One method of defining low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance with Standard Method of Test for Fire and Smoke Characteristics of Wires and Cables, NFPA 262 -1994, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing maximum allowable flame travel distance of 5 ft (1.52 m) when tested in accordance with the same test.

SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. Throughout Article 830 changes need to be made to distinguish Article 830 from Article 831.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20
COMMENT ON AFFIRMATIVE:

DORNA: I only comment on this proposal because the panel, including me, missed an opportunity to revise 830-5(a)(1) and 830-5(a)(2) with respect to not allowing the voltage rating to be marked on the cable. Both sections above { 830-5(a)(1) and 830-5(a)(2) } have a sentence in the middle of their sections which reads: "Cables shall be marked in accordance with Section 310-11."

Section 310-11(a)(1) says "The maximum rated voltage for which the conductor was listed" is to be marked on the cable. With respect to Medium Power (BM Types) they are for use on 0-150 volt circuits. However, the insulated conductor will have a 300 volt rating. In addition, the Low Power (BL Types) they are for use on 0-100 volt circuits. Their insulated conductor rating is also a 300 volt rating. In either case I do not believe that the panel wishes to have "the maximum rated voltage for which the conductor was listed" marked on the cable.

A new sentence should follow the one above in both sections { 830-5(a)(1) and 830-5(a)(2) } so it would now read: "… Section 310-11. The voltage rating shall not be marked on the cable."

This would make it correspondent with Article 725 (see Proposal 16-91), Article 727 (see Proposal 16-106), Article 800-50, and Article 820-50.

The voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1 and electric light applications.

(Log #3623)

16- 327 - (830-5): Reject
SUBMITTER: David B. Kiddoo, AlphaGary Corp.
RECOMMENDATION: With regards to Section 830-5, "Limited Combustion Cable" or "Permanent Plenum Cable" should not be accepted as an additional Listing based on the lack of testing definition, the absence of cable Listing capability, and the proven adequacy of an integrated and enhanced NFPA 262 test method. NFPA 262 differentiates cables as to their fire performance to provide acceptable values for smoke generation and flame travel distance.

Propoents of "Limited Combustible Cable" or "Permanent Plenum Cable" have been actively soliciting support from cable market trade organizations, Code-Making Panel 16 Members or Alternates, cable manufacturers, etc. for a proposal to include a new paragraph in the Section to provide for a new Type of cable based on the definitions of "limited combustibility" and "smoke developed index" per the definitions in NFPA 90A. These definitions ONLY govern construction products for the installation of air conditioning and ventilating systems. The NFPA 255 and NFPA 259 fire test methods being promoted are NOT applicable to evaluate the fire hazard nor the geometries and material synergies in cables as they pertain to fire performance.

As these proposals have been made public through this solicitation for support, I wish to respond at this time to say that there is no safety record or fire performance issue necessitating any additional cable type for use in plenum cable applications. The inclusion of this new Type of cable is partially as a means to provide for an Exception from the proposed requirement in Section 830-58 to remove accumulations of abandoned cable. "Limited Combustible Cable" or "Permanent Plenum Cable" definitions seen in these proposals for a new cable Type are NOT based on any test method incorporating an actual cable fire hazard evaluation. Without adequate test methods and with the current status of the NFPRF "Permanent Plenum Cable Project", NO cables have been shown to meet the requirements proposed. The data generated in this Project have NOT been related to any appropriate fire hazard evaluation and should NOT be used to establish ANY relative cable fire performance comparisons.

SUBSTANTIATION: This issue has been discussed and reviewed in the last cycle of the NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems). The membership of the NFPA did NOT support a proposal to change the provisions for cables in the paragraphs on "ceiling cavity plenums" (2-3.10.1) and "raised floor plenums" (2-3.10.5) that would have allowed "Permanent Plenum Cables" to accumulate in these plenums. ("Permanent Plenum Cables" are so named through a Project being conducted by the National Fire Protection Research Foundation (NFPRF) and are described to meet a new, undefined, cable Listing for "limited combustibility" and "smoke developed index".) The more comprehensive solution to the issue of accumulating abandoned cables would have been to adopt a requirement to remove "ALL" abandoned cables that are removed from service and not intended for future use. Allowing for "Permanent Plenum Cables" to remain in plenums when abandoned would not address the serious issues of "congestion", "air flow restriction", and "total fuel load accumulation".

An appeal to the Standards Council was generated by proponents for "Permanent Plenum Cable" to overturn the Membership Action that occurred at the 1999 Annual Meeting. The Standards Council upheld the NFPA Membership Action after the hearing of the appeal. Comments from the final decision of the Standards Council on this matter are:

- **"After a hearing, the Council reviewed and considered all of the information available to it, and voted to deny the appeals."**
- **"...wire and cable represents a significant potential fuel load in plenums and that, due to the rapidly increasing use of such cable in recent years, some approach to the problem should be devised."**
- **"...while it is the floor vote in favor of a return to the previous edition text that resulted in this recommendation, informational ballots of the TC (NFPA 90A Technical Committee) following that vote give further support to the conclusion that a lack of consensus exists in favor of going forward with the abandoned cable provisions. A majority of TC members voting on these informational ballots also supported the return to previous edition text..."**
- **"...the previous edition text is, in the Council's view, clearly suitable."**
- **"...the Council itself has concerns about the TC's approach and has concluded that further study of this important issue is needed."**
- **"...the Council wants to ensure that, as the TC undertakes to fully and fairly address these issued going forward, it has the best available range of expertise, representation, and experience. The Council, therefore, is referring the matter of committee membership to the Council's membership task group for review and recommendations."**

While plenum cables are not typically the ignition source of fires, due to the low energy conducted through them, the fuel characteristics of high volumes of abandoned cable in plenums, whether combustible or limited combustible by definition, will most certainly add to the heat and energy released in a large, exposing fire, such as those where the ignition source is a room and contents fire below or above the plenum.

This proposal addresses the growing safety issue of accumulating abandoned cable in concealed spaces, without selectively favoring any cable geometry or synergy of materials. It does not allow for further accumulation of "Permanent Plenum Cables" which, when removed from service and not intended for future use, no longer have any function—except perhaps to serve as fuel for some future conflagration.

The proposal adopts consistent wording from NFPA 70, National Electrical Code, Section 300-21 and NFPA 75, Protection of Electronic Computer/Data Processing Equipment, paragraph 4-2.4. Basing this new requirement on existing code shows the strong intent, stated in the past by the Standards Council, to have good consistent code language across the various NFPA standards. Arguments by the proponents of "Permanent Plenum Cable" in the NFPA 90A review process to somehow create a new cable test requirement based on the definition of "limited combustibility" and "smoke developed index" created for building construction products would be a further misuse of the NFPA 255 and NFPA 259 "materials" test methods.

In spite of the rapid attempts by the proponents of "Permanent Plenum Cable", neither Underwriters Laboratories (UL) nor Intertek Testing Services (ITS/ETL) have yet established Listing criteria for "Permanent Plenum Cable" that could cover the matrix of cable types used in a plenum (fiber optics, coax, etc.). In fact, initial attempts over the first 9 months of the NFPRF Project to test finished cable in the NFPA 255 and NFPA 259 test methods has only shown inconsistencies and extremely limited capability of cables to meet the established definitions of "limited combustibility" and "smoke developed index" established for construction products. These test methods do NOT allow for cables to be tested based on their installed condition, nor can they be used to test cables with the important integration of finished cable geometries and materials/conductor or fiber synergies as they impact fire performance.

The proponents of "Permanent Plenum Cable" are applying these "material" tests inappropriately to cables. This is particularly why more sophisticated, integrated "cable" fire tests such as NFPA 262 (Plenum), ANSI/UL 1666 (Riser), and ANSI/UL 1581 (Vertical Tray) have been established and referenced in Standards such as the NFPA 70, NFPA 90A, etc. These tests more accurately simulate the actual fire hazards for installed cables, both in terms of the building environment AND the installed configuration. Integrated tests such as these are used to show the cables are designed to help contribute to minimizing the spread of fire and smoke generation in the early stages of a fire, allowing time for people to egress from the building. The fire safety record clearly shows that these tests have been successful in differentiating the fire performance of cables more accurately than materials tests such as NFPA 255 or NFPA 259.

The definition for cable fire performance in NFPA 90A Sections 2-3.10.1 and 2-3.10.5 are listed as Exceptions because the covering paragraphs (a) in each Section refer only to "materials" used in the construction of plenums. Proponents of "Permanent Plenum Cable" tried to make the argument in the NFPA 90A proposal review that IF the cable can be shown to meet the requirements of the plenum construction materials, accumulation of this cable is justifiable. As was acknowledged by members of the Standards Council during the NFPA 90A Appeal Hearing, cable jackets and insulations will NEVER look like the rigid materials used to construct plenums. Establishing a "Permanent Plenum Cable" Exception in a requirement to remove abandoned cable would clearly allow for a loop-hole to continue to proliferate abandoned cable accumulation and NOT address the serious issues of total fuel load, congestion, and air flow.

NFPA 75 Appendix A, paragraph A-4-2.4 says: "Abandoned cable will potentially interfere with air flow and extinguishing systems. Abandoned cable also adds to the fuel loading." This proposal would provide consistency with the established fire testing criteria and/or abandoned cable removal provisions established by NFPA 70, NFPA 75 and the appropriate Exceptions established for cables in NFPA 90A.

As was shared by Richard G. Gewain of Hughes Associates (with many years of direct involvement in these definitions) at the NFPA 90A TC meeting in December, 1998, the NFPA 220, Building Construction Committee (BCC) reviewed the definition of "non-combustible" and the new definition "limited combustible" in 1975. The BCC made it clear that these definitions "apply to the materials used in the construction of buildings (floors, roofs, columns, walls, etc.), but do NOT apply to furnishings or the contents of buildings, or to the fire hazard evaluation of materials." This language is clearly spelled out in the Special Interest Bulletin No. 294, currently entitled "Noncombustible and Limited-Combustible Building Construction Materials", published and updated several times since 1956 by the National Board of Fire Underwriters (a.k.a. American Insurance Association, currently known as the American Insurance Services Group).

Because of the concern that other NFPA Committees have been misusing the term "limited combustible", the Standards Council has assigned the responsibility for the term "limited combustible" to the BCC. The BCC has recently requested its Chairman to contact the Chairmen of the other NFPA Committees (covering 48 NFPA Standards) using this term and ask for a clarification of what is intended for its use. A BCC Task Group is now established to develop proposals or comments to ensure that the term in other standards such as NFPA 90A is used correctly. From a fire hazards point of view, it has clearly NOT been shown that using the current definitions of "limited combustible" and "smoke developed index" and NFPA 259/NFPA 255 test methods are appropriate for installed cables.

This proposal also alleviates the concern and burden to the authority having jurisdiction inspector enforcing NFPA 70 to identify different types of cables currently in the concealed spaces and removed from service. The requirements to remove ALL abandoned cable not intended for future use should be less cumbersome than to remove only "some" of the cables.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal does not conform to section 4-3.3(c) of the Regulations Governing Committee Projects. The submitter has made other proposals on this subject that meet the Regulations Governing Committee Projects. The issues raised in this proposal were addressed when the other proposals were considered.

(Log #2238)

16- 329 - (830-5(a)(2)): Accept in Principle
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested."
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.
[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
PANEL ACTION: Accept in Principle.
Replace "flame retardant" with "resistant to flame spread" in the section and in FPN No. 1.
PANEL STATEMENT: This change will correlate with the wording used for the requirements for CMX and CATVX.

16- 332 - (830-6): Accept in Principle
Note: See Technical Correlating Committee action on Proposal 16-38. It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. The Technical Correlating Committee directs that the Action on this Proposal be revised to comply with the NEC Style Manual 3.2.1 relative to use of the unenforceable terms "practicable" and "impracticable." This action will be consideed by the Panel as a Public Comment. It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 3 for Comment.
SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions
RECOMMENDATION: Revise 830-6 as follows:
830-6. Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to equipment shall not be denied by an excess accumulation of cables ~~that prevents~~ sufficient to prevent the removal of panels, including suspended ceiling panels.
SUBSTANTIATION: Section 830-6 may be misinterpreted to mean that cables may not be placed directly on suspended ceilings. While the 1999 National Electrical Code Handbook emphasizes "excess accumulation" in the interpretive text, Figures 830-2 and 830-3 lead the reader to conclude that no cables are permitted to rest directly on the suspended ceiling. This was not the intent of CMP 16 when similar rules were introduced into other sections of the 1993 NEC. At that time, CMP 16 stated in response to a proposal to Article 725 (1992 TCD, Comment 16-18) that the proposed requirement "... would still allow some cabling of a limited quantity above the ceiling tile, but not to an excessive amount." The proposed revision emphasizes that is an excessive accumulation of cable that is of concern. A limited amount of cabling laid directly on a suspended ceiling is permitted, will not deny access to equipment, and does not present an unsafe working environment. This is a companion proposal and is intended to correlate with 725-5, 760-5, 770-7, 800-5 and 820-5.
PANEL ACTION: Accept in Principle.
Revise 830-6 to read as follows:
"830-6. Access to Electrical Equipment Behind Panels Designed to Allow Access
Access to electrical equipment shall not be denied by an accumulation of wires and cables that prevents removal of panels. Cables shall be installed in such a manner that the cable will not be damaged by normal building use. Access to electrical equipment behind ceilings designed to allow access shall comply with (a) or (b).
a. New building construction (e.g., renovation, remodeling, new spaces). Installation of cables shall comply with Section 300.11.
b. Buildings with existing cabling systems.
Where practicable, installation of cables shall comply with Section 300-11. Where impracticable to comply with Section 300-11, cables less than 13 mm (0.5 in) in diameter shall be permitted to be installed unsupported by the building structure in accordance with 1 or 2.
1. In areas having ceilings with access points or access panels, it shall be permissible to fish a maximum of three cables between access points in the ceiling.
2. In areas having suspended lay-in ceilings, it shall be permissible to install a maximum three unsupported cables on top of any one ceiling tile. The cables shall be run parallel to the ceiling grid."
PANEL STATEMENT: The revised text satisfies the intent of the original recommendation in that it allows some cabling of a limited quantity above ceiling tile but not an excessive amount, which would interfere with accessibility.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 19
NEGATIVE: 1

EXPLANATION OF NEGATIVE:
EGEDSAL: See my Explanation of Negative Vote on Proposal 16-192.
COMMENT ON AFFIRMATIVE:
BRUNSSEN: I concur with the panel action in providing relief for a limited amount of after-construction network-powered broadband communications cables to be placed directly on the suspended ceiling tiles. However, proposed Section 830-6(b)(2), as presently written, is confusing and could be interpreted as permitting a total of only three unsupported cables. The intent of the panel was that up to a maximum of three unsupported cables may be routed across each and every ceiling tile. Revising 830-6(b)(2) to state: "...permissible to install a maximum of three unsupported cables on top of ~~any one~~ each ceiling tile, i.e., up to three cables are permitted to lay on a ceiling tile." would clarify the intent. Note that the word "of" is inserted and is missing in the original text.

(Log #1037)

16- 334 - (830-7): Reject
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise Section 830-7 as shown:
830-7. Mechanical Execution of Work. Low and medium power ~~N~~network-powered broadband communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use.
FPN: One way to determine accepted industry practice is to refer to nationally recognized standards such as Commercial Building Telecommunications Cabling Standard, ANSI/EIA/TIA 568-A-1995; Commercial Building Standard for Telecommunications Pathways and Spaces, ANSI/TIA/EIA 569-A-1997; and Residential and Light Commercial Telecommunications Wiring Standard, ANSI/EIA/TIA 570-1991, or other ANSI-approved installation standards.
SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. Throughout Article 830 changes need to be made to distinguish Article 830 from Article 831.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.

(Log #3657)

16- 335 - (830-7): Accept
SUBMITTER: Melvin J. Wierenga, Wierenga & Assoc.
RECOMMENDATION: Delete the FPN associated with this section.
SUBSTANTIATION: Problem: The standards listed contain insufficient information to determine accepted industry practice for systems and equipment included in Article 830.
Substantiation: A detailed review of ANSI/EIA/TIA/568A-1995, ANSI/EIA/TIA/569-1990 , and ANSI/EIA/TIA/570-1991 was completed by the submitter and no significant information, guidance, or directives were found, that would be helpful to a user of this Article of the Code. These standards were developed by the telecom and computer industries. They provide the details covering telecommunication infrastructure such as cable pathways, equipment spaces, telephone grounding/bonding, and telecommunication administration. They are excellent standards but they do not address typical cabling installation issues such as:
(a) how to properly pull wire(s) above a lay in ceiling.
(b) when and where to support the wire in a building structure.
(c) how to dress various types of audio signal wires coming into and within an equipment cabinet.
(d) how and where to set up wire reels for riser cables in tall structures.
(e) how and where to dress audio speaker wire along a steel beam in a gymnasium or factory.
(f) what to watch out for when pulling a cable into a raceway.
These standards are purported to be the concept standards for guiding the users of the Code in determining appropriate mechanical execution of work and determination of acceptable industry practices. However, such is not the intent of the standards. For those who do not have a set of the standard available, the submitter has provided an Appendix that summarizes each section of each standard. The appendix will give you an overview of the contents of each section of each standard and enable you to gain a better understanding of what the standards cover.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept.
PANEL STATEMENT: The proposed recommendation has been incorporated by the panel action on Proposal 16-333(a).

(Log #1039)

16- 338 - (830-9): Reject
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise Section 830-9 as shown:
830-9. Entrance Cables. Cables installed outdoors shall be listed as suitable for the application. In addition, low and medium power network-powered broadband communications cables located outside and entering buildings shall comply with (a) and (b).
(a) Medium Power Circuits. Medium power network-powered broadband communications circuits located outside and entering buildings shall be installed using Type BMU, Type BM, or Type BMR network-powered broadband communications medium power cables.
(b) Low Power Circuits. Low power network-powered broadband communications circuits located outside and entering buildings shall be installed using Type BLU or Type BLX low power network-powered broadband communications cables. Cables shown in Table 830-58 shall be permitted to substitute.
Exception: Outdoor community antenna television and radio distribution system coaxial cables installed prior to January 1, 2000, and installed in accordance with Article 820, shall be permitted for low-power type, network-powered broadband communications circuits.
SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. Throughout Article 830 changes need to be made to distinguish Article 830 from Article 831.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #1029)

16- 339 - (830-10): Reject
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise Section 830-10 as shown:
830-10. Aerial Cables. Aerial low and medium power network-powered broadband communications cables shall comply with (a) through (g).
(a) On Poles. Where practicable, low and medium power network-powered broadband communications cables on poles shall be located below the electric light, power, Class 1, or nonpower-limited fire alarm circuit conductors and shall not be attached to a crossarm that carries electric light or power conductors.
(b) Climbing Space. The climbing space through low and medium power network-powered broadband communications cables shall comply with the requirements of Section 225-14(d).
(c) Lead-in Clearance. Lead-in or aerial-drop low and medium power network-powered broadband communications cables from a pole or other support, including the point of initial attachment to a building or structure, shall be kept away from electric light, power, Class 1, ~~or~~ nonpower-limited fire alarm, or high-power network-powered broadband communications circuit conductors so as to avoid the possibility of accidental contact.
Exception: Where proximity to electric light, power, Class 1, ~~or~~ nonpower-limited fire alarm circuit service or high-power network-powered broadband communications conductors cannot be avoided, the installation shall be such as to provide clearances of not less than 12 in. (305 mm) from light, power, Class 1, ~~or~~ nonpower-limited fire alarm circuit or high-power network-powered broadband communications service drops.
(d) Clearance from Ground. Overhead spans of low and medium power network-powered broadband communication cables shall conform to not less than the following:
9.5 ft (2.89 m) — above finished grade, sidewalks, or from any platform or projection from which they might be reached and accessible to pedestrians only
11.5 ft (3.50 m) — over residential property and driveways, and those commercial areas not subject to truck traffic
15.5 ft (4.72 m) — over public streets, alleys, roads, parking areas subject to truck traffic, driveways on other than residential property, and other land traversed by vehicles such as cultivated, grazing, forest, and orchard
FPN: These clearances have been specifically chosen to correlate with the National Electrical Safety Code, ANSI C2-1997, Table 232-1, which provides for clearances of wires, conductors, and cables above ground and roadways, rather than using the clearances referenced in Section 225-18. Because Article 800 and Article 820 have had no required clearances, the communications industry has used the clearances from the NESC for their installed cable plant.
(e) Over Pools. Clearance of network-powered broadband communications cable in any direction from the water level, edge of pool, base of diving platform, or anchored raft shall be not less than 22 ft (6.71 m). Clearance in any direction to the diving platform or tower shall be not less than 14 ft (4.27 m).
Exception No. 1: Where the pool is fully enclosed by a solid or screened permanent structure.
FPN: These clearances have been specifically chosen to correlate with Section 680-8 and to incorporate the more stringent clearance requirements of the National Electrical Safety Code, ANSI C2-1997, Table 234-3, which provides for clearances of wires, conductors, and cables over pools.
Exception No. 2: Where the cables are located more than 10 ft (3.05 m) horizontally from the following:
1. The edge of the pool
2. Diving structure or diving tower, or
3. Observation stands, towers, or platforms
(f) Above Roofs. Network-powered broadband communications cables shall have a vertical clearance of not less than 8 ft (2.44 m) from all points of roofs above which they pass.
Exception No. 1: Auxiliary buildings such as garages and the like.
Exception No. 2: A reduction in clearance above only the overhanging portion of the roof to not less than 18 in. (457 mm) shall be permitted if (1) not more than 4 ft (1.22 m) of the broadband communications drop cables pass above the roof overhang, and (2) they are terminated at a through-the-roof raceway or support.
Exception No. 3: Where the roof has a slope of not less than 4 in. (102 mm) in 12 in. (305 mm), a reduction in clearance to not less than 3 ft (914 mm) shall be permitted.
(g) Final Spans. Final spans of low and medium power network-powered broadband communications cables without an outer jacket shall be permitted to be attached to the building, but they shall be kept not less than 3 ft (914 mm) from windows that are designed to

be opened, doors, porches, balconies, ladders, stairs, fire escapes, or similar locations.

Exception: Conductors run above the top level of a window shall be permitted to be less than the 3-ft (914-mm) requirement above. Overhead low and medium power network-powered broadband communications cables shall not be installed beneath openings through which materials may be moved, such as openings in farm and commercial buildings, and shall not be installed where they will obstruct entrance to these building openings.

(h) Between Buildings. Low and medium power ~~N~~network-powered broadband communications cables extending between buildings and also the supports or attachment fixtures shall be acceptable for the purpose and shall have sufficient strength to withstand the loads to which they may be subjected.

Exception: Where a low and medium power network-powered broadband communications cable does not have sufficient strength to be self-supporting, it shall be attached to a supporting messenger cable that, together with the attachment fixtures or supports, shall be acceptable for the purpose and shall have sufficient strength to withstand the loads to which they may be subjected.

(i) On Buildings. Where attached to buildings, low and medium power network-powered broadband communications cables shall be securely fastened in such a manner that they will be separated from other conductors as follows.

(1) Electric Light or Power. The low and medium power network-powered broadband communications cable shall have a separation of at least 4 in. (102 mm) from electric light, power, Class 1, ~~or~~ nonpower-limited fire alarm circuit conductors or high-power network-powered broadband communications not in raceway or cable, or be permanently separated from conductors of the other system by a continuous and firmly fixed nonconductor in addition to the insulation on the wires.

(2) Other Communications Systems. Low and medium power ~~N~~network-powered broadband communications cables shall be installed so that there will be no unnecessary interference in the maintenance of the separate systems. In no case shall the conductors, cables, messenger strand, or equipment of one system cause abrasion to the conductors, cables, messenger strand, or equipment of any other system.

(3) Lightning Conductors. Where practicable, a separation of at least 6 ft (1.83 m) shall be maintained between any low and medium power network-powered broadband communications cable and lightning conductors.

(4) Protection from Damage. Low and medium power ~~N~~network-powered broadband communications cables attached to buildings and located within 8 ft (2.44 m) of finished grade shall be protected by enclosures, raceways, or other approved means.

Exception: A low power network-powered broadband communications circuit that is equipped with a listed fault protection device, appropriate to the network-powered broadband communications cable used, and located on the network side of the network-powered broadband communications cable being protected.

SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. Throughout Article 830 changes need to be made to distinguish Article 830 from Article 831.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #3777)

16- 340 - (830-10): Accept in Principle in Part

SUBMITTER: Rodney Parker, GTE North/Rep. Network Design

RECOMMENDATION: Revise text to read as follows:

830-10. Aerial Cables. Aerial-powered broadband communications cables shall comply with (a) through (j).

(j) Point of Entry. The point of entry for broadband communication cables shall be within 20 ft (7.0 m) of the electrical service entry point.

SUBSTANTIATION: Original text showed only (a) through (g) but the section had parts (a) through (i).

830(g) Final Span or 830(i) On buildings neither article located the entry point for the network-powered broadband communications cables in relations with the service entry point. It should not matter if we are protecting human life or equipment the requirements should be the same.

PANEL ACTION: Accept in Principle in Part.

Revise text to read as follows:

"830-10. Aerial Cables. Aerial-powered broadband communications cables shall comply with (a) through (i)."

PANEL STATEMENT: The first part of the proposal regarding the correction in section reference is accepted in principle. The reference is changed to (i) rather than (j) because the part of the proposal adding (j) is rejected.

The part adding (j) is rejected because the panel action taken on Proposal 16-357 limiting the length of the grounding conductor to 20 feet addresses the submitter's concern. While the submitter is concerned that the electric service entrance and the broadband communications service entrance be within 20 feet of each other, limiting the length of the grounding conductor to 20 feet accomplishes this intent.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #4029)

16- 341 - (830-10, FPN): Accept

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Add a fine print note to read as follows:

FPN: For additional information regarding overhead wires and cables, see National Electric Safety Code, ANSI C2-1997, Part 2 Safety Rules For Overhead Lines.

SUBSTANTIATION: The primary focus of this recommendation is to promote parity between the two codes in an effort to eliminate confusion and multiple interpretations of codes contained in two separate volumes that are attempting to safely address the same issue. Due to the de-regulation of cabling on the customer premises and electrical power distribution, adhearance to the NESC is required.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #4276)

16- 342 - (830-10(c), Exception): Accept in Part

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Revise as follows:

Exception: Where proximity to electric light, power, Class 1, or nonpower-limited fire alarm circuit service conductors cannot be avoided, and where the ungrounded nonpower-limited conductors are insulated, the installation shall be such as to provide clearances of not less than 12 in. (305 mm) from light, power, Class 1, or nonpower-limited fire alarm circuit service drops. The clearance requirement shall apply at all points along the drop, and it shall increase to 40 in. (1.02 m) at the pole.

SUBSTANTIATION: This rule presently differs from the rule in Article 800 [Section 800-10(b)(4)] for a similar application, even though Art. 800 circuits could run in coaxial cable assemblies. With increasing interaction and competition between these technologies, differing Code rule on similar topics should be as consistent as technically possible, within the boundaries of effective safety. This proposal is intended as a vehicle to allow CMP 16 to act on this issue by making comparable rules consistent. A companion proposal has been made to Article 820.

PANEL ACTION: Accept in Part.

The addition of the phrase "and where the ungrounded nonpower-limited conductors are insulated," is rejected.

The balance of the recomendation is accepted.

PANEL STATEMENT: Nonpower-limited conductors are always insulated. Refer to 760-27 (b).

The reference to 800-10(b)(4) in the substantiation is incorrect; it is believed that the reference is 800-10(a)(4).

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #3128)

16- 343 - (830-10(e)): Accept
SUBMITTER: Neil F. LaBrake, Jr., Niagara Mohawk Power Corp.
RECOMMENDATION: Change:
830.10. Aerial Cables.
(e) Over Pools. Clearance of network-powered broadband communications cable in any direction from the water level, edge of pool, base of diving platform, or anchored raft shall ~~be not less than 22 ft (6.71 m). Clearance in any direction to the diving platform or tower shall be not less than 14 ft (4.27 m).~~
~~Exception No. 1: Where the pool is fully enclosed by a solid or screened permanent structure.~~
~~FPN: These clearances have been specifically chosen to correlate with Section 680-8 and to incorporate the more stringent clearance requirements of the National Electrical Safety Code, ANSI C2-1997, Table 234-3, which provides for clearances of wires, conductors, and cables over pools.~~
~~Exception No. 2: Where the cables are located more than 10 ft (3.05 m) horizontally from the following:~~
~~1. The edge of the pool~~
~~2. Diving structure or diving tower, or~~
~~3. Observation stands, towers, or platforms~~
comply with those clearances in Section 680.8.
SUBSTANTIATION: This change is necessary to maintain consistency of applying overhead wiring clearances regarding pools already required in Section 680.8 of the 1999 NEC. Also, this improves the user-friendliness of the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 19
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
JOHNSON: The proposed revision does not add clarity. By refering the code user to another section, the requirements may be less clear than by listing them within the text of this section, as is being done in the present wording.

(Log #1672)

16- 344 - (830-10(j) (New)): Reject
SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions
RECOMMENDATION: Add a new Section 830-10(j) as follows:
(j) On Masts. Aerial cable shall be permitted to be attached to an above-the-roof raceway mast. Aerial cable shall be permitted to be attached to a service mast that is listed for the purpose of accepting multiple attachments.
SUBSTANTIATION: Section 830-10 does not presently address aerial cable attachments to an above-the-roof mast. This area needs to be addressed, however, for correlation with the companion proposal for new Section 230-28, Exception, that has also been submitted. The proposed Section 230-28, Exception, would permit a network-powered broadband communications system service drop attachment to a power service mast where the mast is listed for the purpose. It is unnecessarily costly to the building owner and aesthetically unsightly when two service masts must be provided, one for power service and another for broadband communications system aerial services.
PANEL ACTION: Reject.
PANEL STATEMENT: Although requirements for the power service mast are specified in Article 230, the detailed design and installation requirements are not defined. The electric service company specifies the type, size and height of mast to be used and the manner in which it is to be installed. The NEC can not dictate to the utility the specific installation requirements. Code Panel 4, which has jurisdiction over service masts, has consistently rejected this concept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
BRUNSSEN: This proposal was developed as a companion proposal to the proposal to revise Section 230-28. The proposal to revise Section 230-28 to permit comunications wires and cables to be attached to a service mast that is listed for the purpose of accepting multiple attachments should be accepted. There is no reason to force a homeowner to install a separate mast to accommodate communications (telephone, CATV, network-powered broadband) service drops when the service mast can be listed to do so. The panel acknowledged that detailed design and installation requirements are not defined. This is the purpose of listing the service mast. The listing is only valid when the listed product is installed properly for its intended use.
JOHNSON: See my Explanation of Negative Vote on Proposal 16-202.

(Log #1030)

16- 345 - (830-11): Reject
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: 830-11. Underground Circuits Entering Buildings.
(a) Underground Systems. Underground low and medium power network-powered broadband communications cables in a duct, pedestal, handhole, or manhole that contains electric light, power conductors, nonpower-limited fire alarm circuit conductors, ~~or~~ Class 1 or high-power network powered broadband communications circuits shall be in a section permanently separated from such conductors by means of a suitable barrier.
(b) Direct-Buried Cables and Raceways. Direct-buried low and medium power network-powered broadband communications cables shall be separated at least 12 in. (305 mm) from conductors of any light, power, nonpower-limited fire alarm circuit conductors ~~or~~ Class 1 or high-power network powered broadband communications circuit.
Exception No. 1: Where electric service conductors or low and medium power network-powered broadband communications cables are installed in raceways or have metal cable armor.
Exception No. 2: Where electric light or power branch-circuit or feeder conductors, nonpower-limited fire alarm circuit conductors, ~~or~~ Class 1 or high-power network powered broadband communications circuit conductors are installed in a raceway or in metal-sheathed, metal-clad, or Type UF or Type USE cables; or the low and medium power network-powered broadband communications cables have metal cable armor or are installed in a raceway.
(c) Mechanical Protection. Direct-buried cable, conduit, or other raceways shall be installed to meet the minimum cover requirements of Table 830-11. In addition, direct-buried cables emerging from the ground shall be protected by enclosures, raceways, or other approved means extending from the minimum cover distance required by Table 830-11 below grade to a point at least 8 ft (2.44 m) above finished grade. In no case shall the protection be required to exceed 18 in. (457 mm) below finished grade. Type BMU and BLU direct-buried cables emerging from the ground shall be installed in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or other approved means extending from the minimum cover distance required by Table 830-11 below grade to the point of entrance.
Exception: A low power network-powered broadband communications circuit that is equipped with a listed fault protection device, appropriate to the network-powered broadband communications cable used, and located on the network side of the network-powered broadband communications cable being protected.
Table 830-11. Low and medium power ~~N~~network-Powered Broadband Communications Systems Minimum Cover Requirements, Burial in Inches (Cover is the shortest distance measured between a point on the top surface of any direct-buried cable, conduit, or other raceway and the top surface of finished grade, concrete, or similar cover.)
(Except for the title, Table 830-11 is unchanged.)
(d) Pools. Underground cables shall not be permitted under the pool or within the area extending 5 ft (1.52 m) horizontally from the inside wall of the pool.
Exception: Where space limitations prevent cables from being routed 5 ft (1.52 m) or more from the pool, such wiring shall be permitted where installed in rigid metal conduit, intermediate metal conduit, or a nonmetallic raceway system. All metal conduit shall be corrosion resistant and suitable for the location. The minimum burial depth shall be as follows:

Wiring Method	Minimum Burial (in.)
Rigid metal conduit	6
Intermediate metal conduit	6
Nonmetallic raceways listed for direct burial	18
Other approved raceways*	18

Note: For SI units, 1 in. = 25.4 mm.
* Raceways approved for burial only where concrete encased shall require a concrete envelope not less than 2 in. (50.8 mm) thick.

SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. Throughout Article 830 changes need to be made to distinguish Article 830 from Article 831.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.

16- 348 - (830-11(d)): Accept
SUBMITTER: Neil F. LaBrake, Jr., Niagara Mohawk Power Corp.
RECOMMENDATION: Change:
830.11. Underground Circuits Entering Buildings.
(d) Pools. ~~Underground c~~Cables located ~~shall not be permitted~~ under the pool or within the area extending 5 ft (1.52 m) horizontally from the inside wall of the pool~~.~~
~~Exception: Where space limitations prevent cables from being routed 5 ft (1.52 m) or more from the pool, such wiring shall be permitted where installed in rigid metal conduit, intermediate metal conduit, or a nonmetallic raceway system. All metal conduit shall be corrosion resistant and suitable for the location. The minimum burial depth shall be as follows:~~

Table 830-11. Network-Powered Broadband Communications Systems Minimum Cover Requirements, ~~Burial in Inches~~ (Cover is the shortest distance measured between a point on the top surface of any direct-buried cable, conduit, or other raceway and the top surface of finished grade, concrete, or similar cover.)

Location of Wiring Method or Circuit	Direct Burial Cables		Rigid Metal Conduit or Intermediate Metal conduit		Nonmetallic Raceways Listed for Direct Burial; Without Concrete Encasement or Other Approved Raceways	
	mm	in.	mm	in.	mm	in.
All locations not specified below	450	18	150	6	300	12
In trench below 50 mm (2 in.) ~~2 in~~. thick concrete or equivalent	300	12	150	6	150	6
Under a building (in raceway only)	0	0	0	0	0	0
Under minimum of 100 mm (4 in.) ~~4 in~~. thick concrete exterior slab with no vehicular traffic and the slab extending not less than 150 mm (6 in.) ~~6 in~~. beyond the underground installation	300	12	100	4	100	4
One- and two-family dwelling driveways and outdoor parking areas and used only for dwelling related purposes	300	12	300	12	300	12

Notes:
~~1. For SI units, 1 in. = 25.4 mm.~~
~~2.~~ Raceways approved for burial only where concrete encased shall require a concrete envelope not less than 50 mm (2 in.) ~~2 in. (50.8 mm)~~ thick
~~3.~~ Lesser depths shall be permitted where cables rise for terminations or splices or where access is otherwise required.
~~4.~~ Where solid rock is encountered, all wiring shall be installed in metal or nonmetallic raceway permitted for direct burial. The raceways shall be covered by a minimum of 50 mm (2 in.) ~~2 in. (50.8 mm)~~ of concrete extending down to rock.
5. Low power network-powered broadband communications circuits using directly buried community antenna television and radio distribution system coaxial cables that were installed outside and entering buildings prior to January 1, 2000, in accordance with Article 820 shall be permitted were buried to a minimum depth of 300 mm (12 in.) ~~12 in. (30.48 cm)~~

~~Wiring Method — Minimum Burial (in.)~~
~~Rigid metal conduit — 6~~
~~Intermediate metal conduit — 6~~
~~Nonmetallic raceways listed for direct burial — 18~~
~~Other approved raceways* — 18~~
~~Note: For SI units, 1 in. = 25.4 mm.~~
~~*Raceways approved for burial only where concrete encase shall require a concrete envelope not less than 2 in. (50.8 mm) thick.~~
shall meet those clearances and requirements specified in 680.10.

SUBSTANTIATION: This change is necessary to maintain consistency of applying underground wiring clearances regarding pools already required in Section 680.10 of the 1999 NEC. Also, this improves the user-friendliness of the Code.
PANEL ACTION: Accept.

(Log #1031)

16- 350 - (830-30): Reject
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise Section 830-30 as shown:
830-30. Primary Electrical Protection.
(a) Application. Primary electrical protection shall be provided on all low and medium network-powered broadband communications conductors that are neither grounded nor interrupted and are run partly or entirely in aerial cable not confined within a block. Also, primary electrical protection shall be provided on all aerial or underground low and medium network-powered broadband communications conductors that are neither grounded nor interrupted and are located within the block containing the building served so as to be exposed to lightning or accidental contact with electric light or power conductors operating at over 300 volts to ground.
Exception: Where electrical protection is provided on the derived circuit(s) (output side of the NIU) in accordance with Section 830-30(b)(3).
FPN No. 1: On low and medium network-powered broadband communications conductors not exposed to lightning or accidental contact with power conductors, providing primary electrical protection in accordance with this article will help protect against other hazards, such as ground potential rise caused by power fault currents, and above-normal voltages induced by fault currents on power circuits in proximity to the network-powered broadband communications conductors.
FPN No. 2: Low and medium ~~N~~network-powered broadband communications circuits are considered to have a lightning exposure unless one or more of the following conditions exist.
1. Circuits in large metropolitan areas where buildings are close together and sufficiently high to intercept lightning.
2. Interbuilding cable runs of 140 ft (42.7 m) or less, directly buried or in underground conduit, where a continuous metallic cable shield or a continuous metallic conduit containing the cable is bonded to each building grounding electrode system.
3. Areas having an average of five or fewer thunderstorm days per year and earth resistivity of less than 100 ohm-meters. Such areas are found along the Pacific coast.
(1) Fuseless Primary Protectors. Fuseless-type primary protectors shall be permitted where power fault currents on all protected conductors in the cable are safely limited to a value no greater than the current-carrying capacity of the primary protector and of the primary protector grounding conductor.
(2) Fused Primary Protectors. Where the requirements listed under (1) are not met, fused-type primary protectors shall be used. Fused-type primary protectors shall consist of an arrester connected between each conductor to be protected and ground, a fuse in series with each conductor to be protected, and an appropriate mounting arrangement. Fused primary protector terminals shall be marked to indicate line, instrument, and ground, as applicable.
(b) Location. The location of the primary protector, where required, shall comply with (1), (2), or (3).
1. A listed primary protector shall be applied on each low and medium network-powered broadband communications cable external to and on the network side of the network interface unit.
2. The primary protection function shall be an integral part of and contained in the network interface unit. The network interface unit shall be listed for the purpose and shall have an external marking indicating that it contains primary electrical protection.
3. The primary protector(s) shall be provided on the derived circuit(s) (output side of the NIU), and the combination of the NIU and the protector(s) shall be listed for the purpose.
A primary protector, whether provided integrally or external to the network interface unit, shall be located as close as practicable to the point of entrance.
For purposes of this section, a network interface unit and any externally provided primary protectors located at mobile home service equipment located in sight from and not more than 30 ft (9.14 m) from the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with Section 250-32 and located in sight from and not more than 30 ft (9.14 m) from the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.
FPN: Selecting a network interface unit and primary protector location to achieve the shortest practicable primary protector grounding conductor will help limit potential differences between communications circuits and other metallic systems.
(c) Hazardous (Classified) Locations. The primary protector or equipment providing the primary protection function shall not be located in any hazardous (classified) location as defined in Article 500 or in the vicinity of easily ignitible material.
Exception: As permitted in Sections 501-14, 502-14, and 503-12.
SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. Throughout Article 830 changes need to be made to distinguish Article 830 from Article 831.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #CP1609)

16- 350a - (830-30(a)): Accept
SUBMITTER: CMP 16
RECOMMENDATION: In 830-30(a) revise FPN No 2 by deleting "(2)" and renumbering "(3)" to "(2)."
SUBSTANTIATION: Article 830 circuits are not designed for interbuilding use and, therefore, part (2) of FPN No. 2 is not required.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 19
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
JONES: This is a vote against the Panel Action to "accept 16-350a." Article 830 circuits are "Network-Powered Broadband Communications Circuits." The Panel assumes that utility or franchised operating companies, i.e., telephone, CATV etc. will be the only ones providing these type services to all locations. A company, school or other entity operating in a campus environment or even in a block can provide communications powering over

broadband circuits between buildings using the technologies of the Network-Powered Broadband Service. The Panel in this proposal is eliminating a portion of a Fine Print Note that helps to define the existence of a "lightning exposure" for interbuilding circuits. The Panel by eliminating this portion of the Fine Print Note takes away the guidance needed to ensure safe and proper protection on interbuilding circuits with a lightning exposure. (See also vote on Proposal 16-351 (Log #4277)).

(Log #4277)

16- 351 - (830-30(a)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise by adding the following sentence:
"In addition, where there exists a lightning exposure, each interbuilding circuit on a premises shall be provided with primary electrical protection at each end of the interbuilding circuit."
SUBSTANTIATION: This proposal makes this section consistent with comparable requirements in Section 800-30(a). That section has the same set of fine print notes (FPN No. 2 in each location) as this section covering interbuilding lightning exposure, and yet only this section omits the operational rule that says what you must do upon a showing of a lightning exposure. This makes no sense, and if CMP 16 rejects this proposal, it should immediately process a panel proposal to delete Section 830-30(a) FPN No. 2.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not anticipate that network-powered broadband communications systems will be run as an interbuilding circuit in a campus environment. The network-powered broadband communications system will enter the campus at a single point, and the various services, e.g., telephone, data, CATV, distributed from that point. The rules of Section 800, Section 820, etc., would then apply.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 19
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
JONES: This is a vote against the Panel Action to "reject Proposal 16-351 (Log #4277)". The Panel assumes that only utility and franchised operating companies, i.e., telephone, CATV, etc., will be providing these type services to all locations. A company, school or other entity operating in a campus environment or even within a block can provide communications powering over broadband circuits between buildings using the technologies of the Network-Powered Broadband service. The sentence, "In addition where there exists a lightning exposure, each interbuilding circuit on a premises shall be provided with primary electrical protection at each end of the interbuilding circuit." will add safety guidance for the ones providing their own such services. (See also vote on 16-350a (Log #CP1609)).

(Log #1032)

16- 352 - (830-33): Reject
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise Section 830-33 as shown:
830-33. Grounding or Interruption of Metallic Members of Low and Medium Power Network-Powered Broadband Communications Cables. The shields of low and medium power network-powered broadband communications cables used for communications or powering shall be grounded at the building as close to the point of entrance as practicable. Metallic cable members not used for communications or powering shall be grounded or interrupted by an insulating joint or equivalent device as close to the point of entrance as practicable.
For purposes of this section, grounding or interruption of low and medium power network-powered broadband communications cable metallic members installed at mobile home service equipment located in sight from and no more than 30 ft (9.14 m) from the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with Section 250-24 and located in sight from and not more than 30 ft (9.14 m) from the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.
FPN: Selecting a grounding location to achieve the shortest practicable grounding conductor will help limit potential differences between the network-powered broadband communications circuits and other metallic systems.
SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. Throughout Article 830 changes need to be made to distinguish Article 830 from Article 831.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:

(Log #1045)

16- 353 - (830-33): Accept in Principle
SUBMITTER: Steven C. Johnson, Time Warner Cable/Rep. Nat'l Cable Television Assn.
RECOMMENDATION: Revise text to read:
830-33. Grounding or Interruption of Metallic Members of Network-Powered Broadband Communications Cables. The shields of network-powered broadband communications cables used for communications or powering shall be grounded at the building as close to the point of ~~entrance~~ attachment as practicable. Metallic cable members not used for communications or powering shall be grounded or interrupted by an insulating joint or equivalent device as close to the point of ~~entrance~~ attachment as practicable.
SUBSTANTIATION: The point of attachment does not necessarily coincide with the point of entrance. Standard practice is to attach to the building near the building's electrical ground and bond at that point.
The cable generally enters the building near the location of the customer's home entertainment equipment. Where this does not coincide with the location of the building electrical ground, the present code wording is requiring a less desirable grounding situation.
PANEL ACTION: Accept in Principle.
Revise text to read:
"830-33. Grounding or Interruption of Metallic Members of Network-Powered Broadband Communications Cables. The shields of network-powered broadband communications cables used for communications or powering shall be grounded at the building as close as practicable to the point of entrance or attachment of the NIU. Metallic cable members not used for communications or powering shall be grounded or interrupted by an insulating joint or equivalent device as close as practicable to the point of entrance or attachment of the NIU."
PANEL STATEMENT: Article 830 cables are terminated at the NIU, and the NIU is often outside.
The revised text meets the intent of the submitter.
Proposal 16-357 adds requirements limiting the grounding conductor length to 20 feet.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #380)

16- 354 - (830-40): Accept in Principle
SUBMITTER: Steven C. Johnson, Time Warner Cable/Rep. Nat'l Cable Television Assn.
RECOMMENDATION: Revise as follows:
830-40. Cable, Network Interface Unit, and Primary Protector Grounding. Network interface units containing protectors, NIUs with metallic enclosures, primary protectors, and the ~~grounded~~ metallic members of the network-powered broadband communications cable, which are intended to be grounded, shall be grounded as specified in (a) through (d).
SUBSTANTIATION: Editorial changes intended to clarify.
PANEL ACTION: Accept in Principle.
Revise the submitter's recommendation by changing the word "which" to "that" in the added text.
PANEL STATEMENT: The change is made to be consistent with the Manual of Style.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #1121)

16- 355 - (830-40): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: 830-40(a)(3) - change:
"No. 14" to "14 AWG"
"No. 6" to "6 AWG"
830-40(d) - change "No. 6" to "6 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #1669)

16- 356 - (830-40): Accept in Principle
SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions
RECOMMENDATION: Revise the text of 830-40 as follows:
830-40. Cable, Network Interface Unit, and Primary Protector Grounding. Network interface units containing protectors, NIUs with metallic enclosures, primary protectors, and the ~~grounded~~ metallic members of the network-powered broadband communications cable required to be grounded shall be grounded as specified in (a) through (d).
SUBSTANTIATION: The proposed change is editorial. The text of 830-40, as presently written, requires that the "grounded metallic ... members of the cable shall be grounded". The statement directs that something that is already grounded shall be grounded. What is meant to be implied is that metallic members required to be grounded shall be grounded as specified in (a) through (d).
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to the panel action on Proposal 16-354. That language is preferred and meets the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 20

(Log #1660)

16- 357 - (830-40(a)(4) and Exception (New)): Accept
Note: The Technical Correlating Committee directs the Panel to change "residences" to "dwellings."
SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions
RECOMMENDATION: Insert new 830-40(a)(4) and Exception as follows. Renumber existing 830-40(a)(4) and 830-40(a)(5) as 830-40(a)(5) and 830-40(a)(6) respectively.
(4) Length. The grounding conductor shall be as short as practicable. In one and multifamily residences the grounding conductor shall be as short as permissible, not to exceed 20 ft (6.0 m) in length.
Exception: In one- and two-family residences where it is not practicable to achieve an overall maximum grounding conductor length of 20 ft (6.0 m), a separate communications ground rod meeting the minimum dimensional criteria of Section 830-40(b)(3) shall be driven, and the grounding conductor connected to the communications ground rod in accordance with Section 830-40(c). The communications ground rod shall be bonded to the power grounding electrode system in accordance with Section 830-40(d).
SUBSTANTIATION: During the 1999 Code cycle, a number of proposals and comments were submitted to limit the separation of power and communications entrances to the building. The intent of these proposals and comments was to limit the potential difference between power and communications circuits during lightning events. That potential difference is generally a function of conductor inductance (L), which increases in direct proportion to conductor length, and the rate of rise of the current (di/dt). These proposals and comments were generally rejected as they did not address the real issue, the length of the communications cable, NIU, and primary protector grounding conductor. This proposal addresses that issue, encourages short cable, NIU and primary protector grounding conductors, provides guidance as to a reasonable maximum length, and provides an alternative where it is not practicable to meet the maximum length (20 ft) restriction. The proposed length restriction is limited to one- and two-family residences as it is such installations that are more likely to have diverse power and communications entrances and experience lightning-related problems. (Urban/suburban environment with fewer elevated structures and extensive buried metallic objects). This is a companion proposal and is intended to correlate Section 830-40(a)(4)(New) with similar changes proposed for Sections 800-10(a)(4)(New) and 820-40(a)(4)(New).
PANEL ACTION: Accept.
PANEL STATEMENT: Editorially change "20 ft (6.0 m)" to "6.0 m (20 ft)" in both places of the recommendation.

JOHNSON: See my Explanation of Negative Vote on Proposal 16-212.

(Log #2212)

16- 358 - (830-40(b)): Accept
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise text as follows:
(b) Electrode. The grounding conductor shall be connected as follows:
1. In Buildings or Structures With Grounding Means. To the nearest accessible location on the following:
a. The building or structure grounding electrode system as covered in Section 250-50
b. The grounded interior metal water piping system as covered in Section 250-104(a)
c. The power service accessible means external to enclosures as covered in Section 250-92(b)
d. The metallic power service raceway
e. The service equipment enclosure
f. The grounding electrode conductor or the grounding electrode conductor metal enclosure; or
g. To the grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in Section 250-32.
For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in Section 830-33, shall be considered accessible.
2. In Buildings or Structures Without Grounding Means. If the building or structure served has no grounding means, as described in (b)(1):
a. To any one of the individual electrodes described in Section 250-50; or,
b. If the building or structure served has no grounding means, as described in (b)(1) or (b)(2)(a), to an effectively grounded metal structure or to a ground rod or pipe not less than 5 ft (1.52 m) in length and 1/2 in. (12.7 mm) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in Section 800-13 and at least 6 ft (1.83 m) from electrodes of other systems. Steam or hot water pipes or lightning-rod conductors shall not be employed as electrodes for protectors, NIUs with integral protection, grounded metallic members, NIUs with metallic enclosures, and other equipment.
SUBSTANTIATION: The new style manual requires titles for this section.
PANEL ACTION: Accept.

(Log #1666)

16- 360 - (830-40(b)(1)(b)): Accept
SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions
RECOMMENDATION: Revise the text of 830-40(b)(1)(b) as follows:
(b) The grounded interior metal water piping system, within 5 ft (1.52 m) from its point of entrance to the building, as covered in Section ~~250-104(a)~~ 250-50.
SUBSTANTIATION: Section 250-50 (formerly Section 250-81) was revised in the 1993 NEC to eliminate the use of the interior metal water piping system as a grounding (bonding) conductor. This was done because of the increased use of nonconductive piping for repair and maintenance rendering the interior metallic water piping system electrically discontinuous. Section 830-40(b)(1)(b) has not been revised to reflect this change. This proposed revision underscores that the interior metal water pipe may no longer be used as an intersystem bonding conductor to interconnect a network-powered broadband communications system and power, and correlates Section 830-40(b)(1)(b) with Section 250-50. Further, Section 250-104(a) concerns bonding of piping systems and building steel. Since connections to the interior metallic water piping system are now permitted only within the first 5 feet of the pipe's entrance to the building, the more appropriate reference is Section 250-50. This is a companion proposal and is intended to correlate Section 830-40(b)(1)(b) with similar changes proposed for Sections 800-40(b)(1)(b), 810-21(f)(1)(b), and 820-40(b)(1)(b).
PANEL ACTION: Accept.

(Log #1034)

16- 361 - (830-42): Reject
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise Section 830-42 as shown:
830-42. Bonding and Grounding at Mobile Homes
(a) Grounding. Where there is no mobile home service equipment located in sight from and not more than 30 ft (9.14 m) from the exterior wall of the mobile home it serves, or there is no mobile home disconnecting means grounded in accordance with Section 250-32 and located within sight from and not more than 30 ft (9.14 m) from the exterior wall of the mobile home it serves, the low and medium power network-powered broadband communications cable, network interface unit, and primary protector ground, shall be installed in accordance with Sections 830-40(b)(2) and (3).
(b) Bonding. The low and medium power network-powered broadband communications cable grounding terminal, network interface unit grounding terminal, if present, and primary protector grounding terminal shall be bonded together with a copper bonding conductor not smaller than No. 12. The low and medium power network-powered broadband communications cable grounding terminal, network interface unit grounding terminal, primary protector grounding terminal, or the grounding electrode shall be bonded to the metal frame or available grounding terminal of the mobile home with a copper bonding conductor not smaller than No. 12 under any of the following conditions:
1. Where there is no mobile home service equipment or disconnecting means as in (a), or
2. Where the mobile home is supplied by cord and plug.
SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. Throughout Article 830 changes need to be made to distinguish Article 830 from Article 831.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.

(Log #4141)

16- 364 - (830-55(a)): Accept in Principle
SUBMITTER: Marcelo M. Hirschler, GBH Int'l, Inc./Rep. Plenum Cable Assn.
RECOMMENDATION: Revise as follows:
830-55. Low Power Network Powered Broadband Communications System Wiring Methods. Low-power network-powered broadband communications systems shall be installed within buildings using listed Type BLX or Type BLP network-powered broadband communications low power cables.
(a) Ducts, Plenums, and Other Air-Handling Spaces. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type BLP. Abandoned cables, not intended for future use, shall not be permitted to remain.
Exception: Type BLX cables installed in compliance with Section 300-22.
SUBSTANTIATION: There is a significant amount of information indicating that the amount of cables installed in plenums, and other air-handling spaces, is increasing rapidly. An understanding of cabling practices indicates that the most common way in which cable installation is carried out is by disconnecting existing cable and leaving it abandoned in place, while introducing the cable needed to perform the additional functions. See Log #4136. There is, as yet, no indication that the additional cables in plenums causes an added fire hazard, and the fire record of cables in concealed spaces, both above ceilings and below floors, remains excellent. In fact, plenum cables, which meet the fire test requirements of NFPA 262, have been shown to have extremely good fire performance and to spread flame only very slowly, if at all. However, this type of preventive measure is worthwhile.
PANEL ACTION: Accept in Principle.
Revise 830-3(a) to read as follows:
"(a) Spread of Fire or Products of Combustion. Section 300-21. Abandoned cables not intended for future use shall not be permitted to remain."
PANEL STATEMENT: The revision meets the intent of the submitter. It is more appropriate to place the requirement in 830-3(a) which addresses the subject.

(Log #1036)

16- 365 - (830-58): Reject
SUBMITTER: Stanley Kaufman, Lucent Technologies
RECOMMENDATION: Revise 830-58 as shown:

830-58. Installation of Network-Powered Broadband Communications Cables and Equipment. Cable and equipment installations within buildings shall comply with (a) through (e), as applicable.

(a) Separation of Conductors.

(1) In Raceways and Enclosures.

a. Low and Medium Power Network-Powered Broadband Communications Circuit Cables. Low and medium power network-powered broadband communications cables shall be permitted in the same raceway or enclosure.

b. Low Power Network-Powered Broadband Communications Circuit Cables. Low power network-powered broadband communications cables shall be permitted in the same raceway or enclosure with jacketed cables of any of the circuits shown below:

1. Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 725
2. Power-limited fire alarm systems in compliance with Article 760
3. Communications circuits in compliance with Article 800
4. Nonconductive and conductive optical fiber cables in compliance with Article 770
5. Community antenna television and radio distribution systems in compliance with Article 820

c. Medium Power Network-Powered Broadband Communications Circuit Cables. Medium power network-powered broadband communications cables shall not be permitted in the same raceway or enclosure with conductors of any of the circuits shown below:

1. Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 725
2. Power-limited fire alarm systems in compliance with Article 760
3. Communications circuits in compliance with Article 800
4. Conductive optical fiber cables in compliance with Article 770
5. Community antenna television and radio distribution systems in compliance with Article 820

d. Electric Light, Power, Class 1, Nonpower-Limited Fire Alarm Circuits. Low and medium powered ~~N~~network-powered broadband communications cable shall not be placed in any raceway, compartment, outlet box, junction box, or similar fittings with conductors of electric light, power, Class 1, ~~or~~ nonpower-limited fire alarm circuit ~~cable~~s or high power network-powered communications cables.

Exception No. 1: Where all of the conductors of electric light, power, Class 1, nonpower-limited fire alarm circuits and high power network-powered communications cables are separated from all of the network-powered broadband communications cables by a barrier.

Exception No. 2: Power circuit conductors in outlet boxes, junction boxes, or similar fittings or compartments where such conductors are introduced solely for power supply to the network-powered broadband communications system distribution equipment. The power circuit conductors shall be routed within the enclosure to maintain a minimum 0.25-in. (6.35-mm) separation from network-powered broadband communications cables.

(2) Other Applications. Low and medium powered ~~N~~network-powered broadband communications cable shall be separated at least 2 in. (50.8 mm) from conductors of any electric light, power, Class 1, ~~and~~ nonpower-limited fire alarm circuits and high-power network-powered communications circuits.

Exception No. 1: Where either (1) all of the conductors of electric light, power, Class 1, ~~and~~ nonpower-limited fire alarm and high-power network-powered communications circuits are in a raceway, or in metal-sheathed, metal-clad, nonmetallic-sheathed, Type AC, or Type UF cables, or (2) all of the low and medium powered network-powered broadband communications cables are encased in raceway.

Exception No. 2: Where the low and medium network-powered broadband communications cables are permanently separated from the conductors of electric light, power, Class 1, ~~and~~ nonpower-limited fire alarm and high-power network-powered communications circuits by a continuous and firmly fixed nonconductor, such as porcelain tubes or flexible tubing, in addition to the insulation on the wire.

(b) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through fireresistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods.

(c) Equipment in Other Space Used for Environmental Air. Section 300-22(c) shall apply.

(d) Support of Conductors. Raceways shall be used for their intended purpose. Network-powered broadband communications cables shall not be strapped, taped, or attached by any means to the exterior of any conduit or raceway as a means of support.

(e) Cable Substitutions. The substitutions for network-powered broadband cables listed in Table 830-58 shall be permitted. All cables in Table 830-58, other than network-powered broadband cables, shall be coaxial cables.

Table 830-58. Cable Substitutions

Table 830-58, including FPN, is unchanged.

SUBSTANTIATION: This proposal is a companion proposal to the proposal for Article 831, Network-Powered High-Power Broadband Communications. This proposal amends the separation rules between circuits to provide appropriate separation from these new high-power communications circuits.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal to establish Article 831 was withdrawn, consequently all the correlating proposals are not needed.

(Log #1016)

16- 367 - (830-58(a)(2) Exception No. 1, (d)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

Exception No. 1: Where either (1) all of the conductors of the electric light, power, Class 1, and nonpower-limited fire alarm circuits are in a raceway(s) or in metal-sheathed, metal-clad, nonmetallic-sheathed cable, Type AC, or, or multiconductor Type UF, cables or, (2) all of the network-powered broadband communications cables are ~~encased~~ in a raceway.

(d) Support of Conductors. ~~Raceways shall be used for their intended purpose.~~ Network-powered broadband communications cables shall not be strapped, taped, or attached by any means to the exterior of any ~~conduit or~~ raceway or cable as ~~a~~ the required means of support except that overhead outdoor aerial cables shall be permitted to be attached to and supported by an approved raceway mast.

SUBSTANTIATION: Editorial. Type UF cable may be single-conductor type; if this is not intended it should be specified as multiconductor type. The word "encased" infers embedment (See definition of conductor in Article 100 and use of the word in other sections).

The first sentence of (d) doesn't specify Code related purposes, which are already covered in other articles. Present text does not prohibit support by Type AC, MC, MI, NM, or SE cables which are even less suitable than rigid metal conduit. "Conduit" is superfluous as it is a raceway.

Provision should be made to permit suitable raceway masts for support. An "approved" mast can be limited to one not supporting or enclosing conductors of other systems, in addition to other requirements.

Proposal does not prohibit bundling/strapping together of cables, provided it is incidental to other provided support.

PANEL ACTION: Reject.

PANEL STATEMENT: The changes are not editorial. The addition of the term multiconductor excludes single conductor cable. The changes includes reference to outside wiring which is not part of 830-58 and changes the intent of the existing section.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

(Log #1538)

16- 368 - (830-58(b)): Accept

SUBMITTER: James E. Brunssen, Telcordia Technologies, Inc./Rep. Alliance for Telecommunications Industry Solutions

RECOMMENDATION: Revise 830-58(b) as follows:

(b) Spread of Fire ofrProducts of Combustion. Installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations through ~~fire~~ fire-resistance-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

SUBSTANTIATION: This proposed revision underscores the true purpose of the rule, to maintain the fire resistance rating, and correlates 830-58(b) with 300-21.

PANEL ACTION: Accept.

AFFIRMATIVE: 20

(Log #3624)

16- 369 - (830-58(b)): Accept in Principle

SUBMITTER: David B. Kiddoo, AlphaGary Corp.

RECOMMENDATION: Revise 830-58(b) as follows:

(e) Spread of Fire or Products of Combustion. Installations in hollow spaces, vertical shafts, ventilation ducts or air-handling plenums shall be made so that the possible spread of fire or fire resistant-rated walls, partitions, floors or ceilings shall be firestopped using approved methods to maintain the fire resistant rating. Abandoned cables in these spaces, shafts, ducts and plenums shall not be allowed to accumulate. Accumulations of abandoned cables, not identified for future use, in these spaces, shafts, ducts, plenums, and other space used for environmental air, shall be removed.

FPN No. 1: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made.

FPN No. 2: Definition of acceptable cable fire performance in various applications are described in Section 830-5.

SUBSTANTIATION: This issue has been discussed and reviewed in the last cycle of the NFPA 90A, Standard for the Installation of Air Conditioning and Ventilating Systems). The membership of the NFPA did NOT support a proposal to change the provisions for cables in the paragraphs on "ceiling cavity plenums" (2-3.10.1) and "raised floor plenums" (2-3.10.5) that would have allowed "Permanent Plenum Cables" to accumulate in these plenums. ("Permanent Plenum Cables" are so named through a Project being conducted by the National Fire Protection Research Foundation (NFPRF) and are described to meet a new, undefined, cable Listing for "limited combustibility" and "smoke developed index".) The more comprehensive solution to the issue of accumulating abandoned cables would have been to adopt a requirement to remove "ALL" abandoned cables that are removed from service and not intended for future use. Allowing for "Permanent Plenum Cables" to remain in plenums when abandoned would not address the serious issues of "congestion", "air flow restriction", and "total fuel load accumulation".

An appeal to the Standards Council was generated by proponents for "Permanent Plenum Cable" to overturn the Membership Action that occurred at the 1999 Annual Meeting. The Standards Council upheld the NFPA Membership Action after the hearing of the appeal. Comments from the final decision of the Standards Council on this matter are:

- "After a hearing, the Council reviewed and considered all of the information available to it, and voted to deny the appeals."
- "...wire and cable represents a significant potential fuel load in plenums and that, due to the rapidly increasing use of such cable in recent years, some approach to the problem should be devised."
- "...while it is the floor vote in favor of a return to the previous edition text that resulted in this recommendation, informational ballots of the TC (NFPA 90A Technical Committee) following that vote give further support to the conclusion that a lack of consensus exists in favor of going forward with the abandoned cable provisions. A majority of TC members voting on these informational ballots also supported the return to previous edition text..."
- "...the previous edition text is, in the Council's view, clearly suitable."
- "...the Council itself has concerns about the TC's approach and has concluded that further study of this important issue is needed."
- "...the Council wants to ensure that, as the TC undertakes to fully and fairly address these issued going forward, it has the best available range of expertise, representation, and experience. The Council, therefore, is referring the matter of committee membership to the Council's membership task group for review and recommendations."

While plenum cables are not typically the ignition source of fires, due to the low energy conducted through them, the fuel characteristics of high volumes of abandoned cable in plenums, whether combustible or limited combustible by definition, will most certainly add to the heat and energy released in a large, exposing fire, such as those where the ignition source is a room and contents fire below or above the plenum.

This proposal addresses the growing safety issue of accumulating abandoned cable in concealed spaces, without selectively favoring any cable geometry or synergy of materials. It does not allow for further accumulation of "Permanent Plenum Cables" which, when removed from service and not intended for future use, no longer have any function—except perhaps to serve as fuel for some future conflagration.

The proposal adopts consistent wording from NFPA 70, National Electrical Code, Section 300-21 and NFPA 75, Protection of Electronic Computer/Data Processing Equipment, paragraph 4-2.4. Basing this new requirement on existing code shows the strong intent, stated in the past by the Standards Council, to have good consistent code language across the various NFPA standards. Arguments by the proponents of "Permanent Plenum Cable" in the NFPA 90A review process to somehow create a new cable test requirement based on the definition of "limited combustibility" and "smoke developed index" created for building construction products would be a further misuse of the NFPA 255 and NFPA 259 "materials" test methods.

In spite of the rapid attempts by the proponents of "Permanent Plenum Cable", neither Underwriters Laboratories (UL) nor Intertek Testing Services (ITS/ETL) have yet established Listing criteria for "Permanent Plenum Cable" that could cover the matrix of cable types used in a plenum (fiber optics, coax, etc.). In fact, initial attempts over the first 9 months of the NFPRF Project to test finished cable in the NFPA 255 and NFPA 259 test methods has only shown inconsistencies and extremely limited capability of cables to meet the established definitions of "limited combustibility" and "smoke developed index" established for construction products. These test methods do NOT allow for cables to be tested based on their installed condition, nor can they be used to test cables with the important integration of finished cable geometries and materials/conductor or fiber synergies as they impact fire performance.

The proponents of "Permanent Plenum Cable" are applying these "material" tests inappropriately to cables. This is particularly why more sophisticated, integrated "cable" fire tests such as NFPA 262 (Plenum), ANSI/UL 1666 (Riser), and ANSI/UL 1581 (Vertical Tray) have been established and referenced in Standards such as the NFPA 70, NFPA 90A, etc. These tests more accurately simulate the actual fire hazards for installed cables, both in terms of the building environment AND the installed configuration. Integrated tests such as these are used to show the cables are designed to help contribute to minimizing the spread of fire and smoke generation in the early stages of a fire, allowing time for people to egress from the building. The fire safety record clearly shows that these tests have been successful in differentiating the fire performance of cables more accurately than materials tests such as NFPA 255 or NFPA 259.

The definition for cable fire performance in NFPA 90A Sections 2-3.10.1 and 2-3.10.5 are listed as Exceptions because the covering paragraphs (a) in each Section refer only to "materials" used in the construction of plenums. Proponents of "Permanent Plenum Cable" tried to make the argument in the NFPA 90A proposal review

that IF the cable can be shown to meet the requirements of the plenum construction materials, accumulation of this cable is justifiable. As was acknowledged by members of the Standards Council during the NFPA 90A Appeal Hearing, cable jackets and insulations will NEVER look like the rigid materials used to construct plenums. Establishing a "Permanent Plenum Cable" Exception in a requirement to remove abandoned cable would clearly allow for a loop-hole to continue to proliferate abandoned cable accumulation and NOT address the serious issues of total fuel load, congestion, and air flow.

NFPA 75 Appendix A, paragraph A-4-2.4 says: "Abandoned cable will potentially interfere with air flow and extinguishing systems. Abandoned cable also adds to the fuel loading." This proposal would provide consistency with the established fire testing criteria and/or abandoned cable removal provisions established by NFPA 70, NFPA 75 and the appropriate Exceptions established for cables in NFPA 90A.

As was shared by Richard G. Gewain of Hughes Associates (with many years of direct involvement in these definitions) at the NFPA 90A TC meeting in December, 1998, the NFPA 220, Building Construction Committee (BCC) reviewed the definition of "non-combustible" and the new definition "limited combustible" in 1975. The BCC made it clear that these definitions "apply to the materials used in the construction of buildings (floors, roofs, columns, walls, etc.), but do NOT apply to furnishings or the contents of buildings, or to the fire hazard evaluation of materials." This language is clearly spelled out in the Special Interest Bulletin No. 294, currently entitled "Noncombustible and Limited-Combustible Building Construction Materials", published and updated several times since 1956 by the National Board of Fire Underwriters (a.k.a. American Insurance Association, currently known as the American Insurance Services Group).

Because of the concern that other NFPA Committees have been misusing the term "limited combustible", the Standards Council has assigned the responsibility for the term "limited combustible" to the BCC. The BCC has recently requested its Chairman to contact the Chairmen of the other NFPA Committees (covering 48 NFPA Standards) using this term and ask for a clarification of what is intended for its use. A BCC Task Group is now established to develop proposals or comments to ensure that the term in other standards such as NFPA 90A is used correctly. From a fire hazards point of view, it has clearly NOT been shown that using the current definitions of "limited combustible" and "smoke developed index" and NFPA 259/NFPA 255 test methods are appropriate for installed cables.

This proposal also alleviates the concern and burden to the authority having jurisdiction inspector enforcing NFPA 70 to identify different types of cables currently in the concealed spaces and removed from service. The requirements to remove ALL abandoned cable not intended for future use should be less cumbersome than to remove only "some" of the cables.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to panel action on Proposal 16-364 which meets the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:

EXPLANATION OF NEGATIVE:
LINDSAY: See my Explanation of Negative Vote on Proposal 8-11. Editorial - Reference in panel statement should be to Proposal 8-447, not 8-448.
LOYD: See my Explanation of Negative Vote on Proposal 8-11.
COMMENT ON AFFIRMATIVE:
BERMAN: Typographical error - Panel Statement should reference Proposal 8-447.
JANNOT: Panel statement should refer to action on Proposal 8-447.

(Log #1808)

8- 449 - (Chapter 9, Notes to Tables, Note (10) (New)): Reject
SUBMITTER: Noel Williams, Noel Williams Consulting
RECOMMENDATION: Add Note (10) as follows:
"Table 1 does not apply to communications conductors or cables installed in accordance with Article 800 or to Class 2 or Class 3 circuits installed in accordance with Article 725."
SUBSTANTIATION: The applicability of conduit fill requirements to "low voltage" or limited energy circuit conductors is often debated. Although Section 300-17 does not apply to communications and Class 2 and 3 circuits, the conduit fill table is referenced in the individual raceway articles. With the addition of new language in Section 800-48 in the 1999 NEC, these rules are now indirectly referenced for communications as well (although pointedly not applied to listed nonmetallic communications raceways as referenced in the exception to Section 800-48.) At the electrical section meeting at the NFPA annual meeting in 1998, four panel chairmen concerned with related issues were asked if conduit fill limits apply to the circuits referred to in this proposal. Two said yes and two said no. An article in EC&M magazine argued, in effect, that although Table 1 did seem to apply according to the rules, they should not be applied because overfilling conduits with limited energy circuits does not pose any significant risk. Although the submitter does not necessarily agree with this argument, the code panels should clarify the applicability of the conduit fill requirements. Similar exceptions could be added to every raceway article, but this addition is simpler and more comprehensive.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel intends that Table 1 apply to all conductors and cables installed in raceways. The operation of life saftey systems could be compromised by damage to conductors as a result of overfill.

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis.
In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised.
In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.
PANEL ACTION: Accept in Principle.
Delete "English" from second column globally.
I n the Table "Rigid PVC Schedule 80" change Trade Size 2, change "1 wire" column to 983mm2 and 1.523in2.
PANEL STATEMENT: The panel's actions are editorial.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 2
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
LINDSAY: See my Explanation of Negative Vote on Proposal 8-11.
LOYD: See my Explanation of Negative Vote on Proposal 8-11.

(Log #1825)

8- 454 - (Chapter 9, Table 4): Reject
SUBMITTER: Joseph A. Tedesco, Nat'l Technology Transfer, Inc.
RECOMMENDATION: Relocate each block of information that covers the specific dimensions into each article, in the section covering "number of conductors" in tubing or conduit. Replace the table with a reference to the following: "See Articles 348, 331, 350, 345, 351A, 351B, 346, 347."
SUBSTANTIATION: The information in Table 4 will be put to better use when it is located where it can be used to determine compliance with Table 1 in Chapter 9. If accepted, the list of articles should flow with the code numbers, instead of the way they are shown.
PANEL ACTION: Reject.
PANEL STATEMENT: The tables are more user friendly in the existing location as opposed to being distributed throughout the Code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3089)

8- 455 - (Chapter 9, Table 4): Reject
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Above each column headed "Internal Diameter," add the word "Nominal."
SUBSTANTIATION: For clarification. These ID dimensions have never been exact. This makes that clear and DOES NOT change anything from past practice.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided substantiation to demonstrate that the use of the existing tables will be enhanced by adding the term "nominal".
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 3
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
BERMAN: I agree with Mr. Dauberger that the present Table 4 internal diameters should not be perceived as exact, and the term "nominal" adds clarity.
DAUBERGER: The current inside diameter dimensions are inaccurately perceived to be exact. Addition of the term "nominal" will make Table 4 more user friendly.
LOYD: The I.D. diameters are perceived to be exact, they are not. Adding "nominal" will make Table 4 more user friendly. The word "nominal" in the heading of this table is appropriate as this implies a measurement with tolerance. Raw materials used in the manufacture of conduit products have inherent variation in the thickness. This has a direct impact on the I.D. measurement since the I.D. is a number derived by subtracting 2X the wall thickness from the nominal O.D. dimension.

(Log #3137)

8- 456 - (Chapter 9, Table 4): Reject
SUBMITTER: Brian Zawora, K.V. Electric
RECOMMENDATION: Add 60 percent column to Table 4 in Chapter 9, to aid in determining conduit fill for 24 in. or less conduit nipples.
SUBSTANTIATION: This situation is frequently encountered in the field and there should be a column in the table for this purpose.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on adding the 60% column in Proposal 8-451.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

(Log #3291)

8- 457 - (Chapter 9, Table 4): Accept
SUBMITTER: James T. Pauley, Square D Co.
RECOMMENDATION: Revise the headings in Chapter 9 Table 4 as shown by the underlines and strikeout.
Article 348 - Electrical Metallic Tubing (EMT)
Article 331 - Electrical Nonmetallic Tubing (ENT)
Article 350 - Flexible Metal Conduit (FMT)
Article 345 - Intermediate Metal Conduit (IMC)
Article 351 - Liquidtight Flexible Nonmetallic Conduit (~~Type~~ LFNC-B*)
Article 351 - Liquidtight Flexible Nonmetallic Conduit (~~Type~~ LFNC-A*)
Article 351 - Liquidtight Flexible Metal Conduit LFMC)
Article 346 - Rigid Metal Conduit (RMC)
Article 347 - Rigid PVC Conduit (RNC), Schedule 80
Article 347 - Rigid PVC Conduit (RNC), Schedule 40, and HDPE Conduit
Article 347 - Type A, Rigid PVC Conduit (RNC)
Article 347 - Type EB, PVC Conduit (RNC)
SUBSTANTIATION: The NEC Usability Task Group received a suggestion to add article numbers to the headings in Chapter 9, Table 4. The UTG agreed with the concept but did not have an opportunity to draft a proposal and agreed that submittal as an individual proposal would be a good idea. In addition to the Article numbers, the UTG discussed adding the wiring method acronyms to the title as well to correlate with the use of those acronyms in the revised articles submitted by the UTG.
PANEL ACTION: Accept.

(Log #123a)

6- 212 - (Chapter 9 Table 5):

NOTE: The Technical Correlating Committee understands that Type AF is deleted by the action on Proposal 6-202. The Techncial Correlating Committee directs that Item 5 of the Recommendation in this Proposal be reported as "Reject" to correlate with the action on Proposal 8-458.

The Technical Correlating Committee will form a Task Group between Panels 6 and 8 to correlate this Proposal with Proposal 8-458.

NOTE: The following proposal consists of Comment 6-89 on Proposal 6-47 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 6-47 was:

Change thickness of insulation for No. 14-10 AWG sizes of Type THHW and THW products from 45 Mils to 30 Mils.

SUBMITTER: Ravindra H. Ganatra, Alcan Cable /Rep. Self

RECOMMENDATION: Panel should continue to accept this proposal. However, following changes need to be made to support this change.

Make following changes in Table 5. Dimensions of Insulated Conductors and Fixture Wires of Chapter 9: (Note: Required additions are highlighted by an underline and required deletions are shown by strikeout.)

1. In row listing product types "AF, TW, XF, XFF" for # 14 AWG to "AF, TW, XF, XFF, <u>THHW, THW, THW-2".</u>

2. In row listing product type "TW" for # 12, 10, and 8 AWG to "TW, <u>THHW, THW, THW-2".</u>

3. In row listing product types "RHH*, RHW*, RHW-2*, THHW, THW, THW-2 " for # 14 AWG to "RHH*, RHW*, RHW-2*~~, THHW, THW, THW-2".~~

4. In row listing product types "RHH*, RHW*, RHW-2*, THHW, THW, THW-2 " for # 12, 10, and 8 AWG to "RHH*, RHW*, RHW-2*~~, THHW, THW, THW-2".~~

Make following changes in the Tables of Appendix C:

1. In Tables C1, C2,...C12, change row titled "TW" for # 14, 12, 10, and 8 AWG to "TW, <u>THHW, THW, THW-2".</u>

2. In Tables C1, C2,...C12, change row titled "RHH*, RHW*, RHW-2*, THHW, THW, THW-2 " for # 14 AWG to "RHH*, RHW*, RHW-2*, THHW, THW, THW-2".

3. In Tables C1, C2,...C12, change row titled "RHH*, RHW*, RHW-2*, THHW, THW" for # 12 and 10 AWG to "RHH*, RHW*, RHW-2*, THHW, THW".

4. In Tables C1, C2,...C12, change row titled "RHH*, RHW*, RHW-2*, THHW, THW, THW-2 " for # 8 AWG to "RHH*, RHW*, RHW-2*, THHW, THW, THW-2".

5. In Tables C1A, C2A,.....C12A, change the first row for # 8 AWG as follows: (Note: This values are obtained for # 8 AWG TW in Tables C1, C2,....C12, respectively.)

In Table C1A:	2	5	8	13	18	30	53	81	105	135		
In Table C2A:	1	4	7	13	17	29						
In Table C3A:	3	5	7	11	17	30	45	64	88	115		
In Table C4A:	3	5	8	15	20	33	47	72	97	124		
In Table C5A:	1	3	5	8	14	18	29					
In Table C6A:	1	3	5	8	13	18	30					
In Table C7A:	3	5	8	14	18	29	44	68	89	116		
In Table C8A:	3	5	8	14	19	31	44	68	91	118	185	267
In Table C9A:	1	3	6	11	15	26	37	59	79	103	163	234
In Table C10A:	2	4	7	13	18	30	43	66	89	115	181	261
In Table C11A:	3	6	10	16	21	33	50	75	98	125		
In Table C12A:	35	79	104	132	203	288						

SUBSTANTIATION: Acceptance of Proposal 6-47 requires that these changes be made in the Code.

PANEL ACTION: Accept.

* Types RHH, RHW, and RHW-2 without outer covering.

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
A "soft" conversion is necessary to conform to U.S. Industry practice and applicable product standards.

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis. In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised. In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3105)

6- 215 - (Chapter 9, Table 5): Accept
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Delete Type RH from the table heading and from two locations in the first column.
SUBSTANTIATION: Underwriters Laboratories canvassed subscribers of Thermoset-Insulated Wires and Cables, UL 44. It was determined that Type RH insulated conductor is no longer being produced.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #123)

8- 458 - (Chapter 9 Table 5): Reject
NOTE: The following proposal consists of Comment 6-89 on Proposal 6-47 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 6-47 was:
Change thickness of insulation for No. 14-10 AWG sizes of Type THHW and THW products from 45 Mils to 30 Mils.
Note: The Technical Correlating Committee will form a Task Group between Panels 6 and 8 to correlate this Proposal with 6-212.
SUBMITTER: Ravindra H. Ganatra, Alcan Cable / Rep. Self
RECOMMENDATION: Panel should continue to accept this proposal. However, following changes need to be made to support this change.
Make following changes in Table 5. Dimensions of Insulated Conductors and Fixture Wires of Chapter 9: (Note: Required additions are highlighted by an underline and required deletions are shown by strikeout.)
1. In row listing product types "AF, TW, XF, XFF" for # 14 AWG to "AF, TW, XF, XFF, <u>THHW, THW, THW-2".</u>
2. In row listing product type "TW" for # 12, 10, and 8 AWG to "TW, <u>THHW, THW, THW-2".</u>
3. In row listing product types "RHH*, RHW*, RHW-2*, THHW, THW, THW-2 " for # 14 AWG to "RHH*, RHW*, RHW-2*<u>, ~~THHW, THW, THW-2".~~</u>
4. In row listing product types "RHH*, RHW*, RHW-2*, THHW, THW, THW-2 " for # 12, 10, and 8 AWG to "RHH*, RHW*, RHW-2*<u>, ~~THHW, THW, THW-2".~~</u>
Make following changes in the Tables of Appendix C:
1. In Tables C1, C2,...C12, change row titled "TW" for # 14, 12, 10, and 8 AWG to "TW, <u>THHW, THW, THW-2".</u>

2. In Tables C1, C2,...C12, change row titled "RHH*, RHW*, RHW-2*, THHW, THW, THW-2 " for # 14 AWG to "RHH*, RHW*, RHW-2*, THHW, THW, THW-2".

3. In Tables C1, C2,...C12, change row titled "RHH*, RHW*, RHW-2*, THHW, THW" for # 12 and 10 AWG to "RHH*, RHW*, RHW-2*, THHW, THW".

4. In Tables C1, C2,...C12, change row titled "RHH*, RHW*, RHW-2*, THHW, THW, THW-2 " for # 8 AWG to "RHH*, RHW*, RHW-2*, THHW, THW, THW-2".

5. In Tables C1A, C2A,.....C12A, change the first row for # 8 AWG as follows: (Note: This values are obtained for # 8 AWG TW in Tables C1, C2,....C12, respectively.)

In Table C1A: 2 5 8 13 18 30 53 81 105 135
In Table C2A: 1 4 7 13 17 29
In Table C3A: 3 5 7 11 17 30 45 64 88 115
In Table C4A: 3 5 8 15 20 33 47 72 97 124
In Table C5A: 1 3 5 8 14 18 29
In Table C6A: 1 3 5 8 13 18 30
In Table C7A: 3 5 8 14 18 29 44 68 89 116
In Table C8A: 3 5 8 14 19 31 44 68 91 118 185 267
In Table C9A: 1 3 6 11 15 26 37 59 79 103 163 234
In Table C10A: 2 4 7 13 18 30 43 66 89 115 181 261
In Table C11A: 3 6 10 16 21 33 50 75 98 125
In Table C12A: 35 79 104 132 203 288

SUBSTANTIATION: Acceptance of Proposal 6-47 requires that these changes be made in the Code.
PANEL ACTION: Reject.
PANEL STATEMENT: CMP 8 does not have jurisdiction of Table 5 and therefore no action has been taken on the recommendation to change Table 5. The panel cannot accept the recommendation to revise the tables in Appendix C to increase the wire fills. By reducing the required insulation thickness for these wire types without changing the designation, there exists a possibility that installers may unknowingly permit the greater wire fill numbers using wire with the heavier insulation thickness. This would result in exceeding the permitted wire fills for the raceway per Chapter 9, Table 1. The panel refers this action to CMP-6 for information.

(Log #1255)

6- 216 - (Chapter 9, Table 5A): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise Table 5A of Chapter 9 as shown to add SI units:
(Table shown on following page)
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
A "soft" conversion is necessary to conform to U.S. Industry practice and applicable product standards.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

6- 217 - (Chapter 9, Table 5A): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise Table 5A as follows.
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis.

In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised. In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Proposal 6-216.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

These resistance values are valid ONLY for the parameters as given. Using conductors having coated strands, different stranding type, and, especially, other temperatures changes the resistance.

Formula for temperature change: $R2 = R1 [1 + \alpha(T2 - 75)]$ where: $\alpha_{cu} = 0.00323$, $\alpha_{AL} = 0.00330$ at 75° C.

Conductors with compact and compressed stranding have about 9 percent and 3 percent, respectively, smaller bare conductor diameters than those shown. See Table 5A for actual compact cable dimensions.

The IACS conductivities used: bare copper = 100%, aluminum = 61%.

Class B stranding is listed as well as solid for some sizes. Its overall diameter and area is that of its circumscribing circle.

(FPN): The construction information is per NEMA WC8-1988 or ANSI/UL 1581-1998. The resistance is calculated per National Bureau of Standards Handbook 100, dated 1966, and Handbook 109, dated 1972.

These resistance values are valid ONLY for the parameters as given. Using conductors having coated strands, different stranding type, and, especially, other temperatures changes the resistance.

Formula for temperature change: $R2 = R1 [1 + \alpha(T2 - 75)]$ where: $\alpha_{cu} = 0.00323$, $\alpha_{AL} = 0.00330$ at 75° C.

Conductors with compact and compressed stranding have about 9 percent and 3 percent, respectively, smaller bare conductor diameters than those shown. See Table 5A for actual compact cable dimensions.

(FPN): The construction information is per NEMA WC8-1988 or ANSI/UL 1581-1998. The resistance is calculated per National Bureau of Standards Handbook 100, dated 1966, and Handbook 109, dated 1972.

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.

A "soft" conversion is necessary to conform to U.S. Industry practice and applicable product standards.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The notes to the table must be numbered as in the existing code. In note 2 add "at 75 degree C" at the end of the sentence. In FPN add "or ANSI/UL 1581-1998" after "NEMA WC8-1988". The NEMA reference should be the 1992 edition not the 1988 edition.

In column title area change "Cir. Mills" to "Cir. Mils".

In the second page of the table, the numbers shown under "Cir. Mills" should be moved to be shown under "mm2".

AFFIRMATIVE: 11

(Log #3207)

16- 371 - (Chapter 9, Tables 11(a) and (b)): Reject

SUBMITTER: S. E. Egesdal, Honeywell Inc.

RECOMMENDATION: Delete the "Over 30 and through 150" columns in Tables 11(a) and Table 11(b).

SUBSTANTIATION: Chapter 9, Tables 11(a) and (b) each have a column which permits Class 2 power supplies to have an output of 150 VDC, .005 Amps, max. This requirement was put in the NEC in 1968, based on a proposal from GT&E Corporation, NY, NY. The 1968 edition of the NEC provided the voltage, current, and VA requirements, but did not require the Class 2 source to be listed. The present edition of the NEC requires Class 2 sources to be listed. UL has not listed power supplies to meet the voltage and current range permitted by the "Over 30 and through 150" column in Chapter 9, Tables 11(a) and 11(b).

PANEL ACTION: Reject.

PANEL STATEMENT: No substantiation was submitted to show that these voltages pose either shock or fire hazards. These columns should remain to provide guidance for the listing of these supplies.

(Log #3212)

16- 372 - (Chapter 9, Table 12(b)): Reject

SUBMITTER: S. E. Egesdal, Honeywell Inc.

RECOMMENDATION: Delete the "Over 100 and through 250" column in Chapter 9, Table 12(b).

SUBSTANTIATION: This voltage range and low current requirement was put in the NEC to accommodate a smoke detector that required a supply voltage of over 200 volts. These smoke detectors have not been sold for over 20 years. There is no reason to retain this special exception to the voltage ranges permitted by Table 12.

PANEL ACTION: Reject.

PANEL STATEMENT: The products using these voltages are still in use and the information should be retained.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

MOORE: The provisions of the NEC are not retroactive. The panel statement that "The products using these voltages are still in use and the information should be retained", is not correct. Nothing in the NEC would prevent the continued use of products already in service. However since there are no products currently manufactured that need this Exception, retention of the Exception serves no useful purpose.

Notes:

1. These values are based on the following constants: UL-type RHH wires with Class B stranding, in cradled configuration. Wire conductivities are 100 percent IACS copper and 61 percent IACS aluminum, and aluminum conduit is 45 percent IACS. Capacitive reactance is ignored, since it is negligible at these voltages.
These resistance values are valid only at 75°C (167°F) and for the parameters as given, but are representative for 600-volt wire types operating at 60 Hz.

2. Effective Z is defined as R cos(q) + X sin(q), where q is the power factor angle of the circuit. Multiplying current by effective impedance gives a good approximation for line-to-neutral voltage drop. Effective impedance values shown in this table are valid only at 0.85 power factor.

For another circuit power factor (PF), effective impedance (Ze) can be calculated from R and XL values given in this table as follows:

Ze = R x PF + XL sin[arccos(PF)].

APPENDIX A

(Log #3290)

1- 315 - (Annex A): Accept
SUBMITTER: James T. Pauley, Square D Co.
RECOMMENDATION: Add a new Annex A to read as follows:
Annex A (informative) - Product Safety Standards
This informative annex is intended to provide a list of product safety standards that are utilized for product listing where that listing is required by this Code. It is recognized that this list is current at the time of development, but new standards or modifications to existing standards can occur at any time while this Code is adopted.
This list does not form a mandatory part of the requirements of this Code, but is intended to only provide Code users some informational guidance on the product characteristics on which Code requirements have been based.

Product Standard Name	Product Standard Number
Antenna-Discharge Units	UL 452
Armored Cable	UL 4
Attachment Plugs and Receptacles	UL 498
Audio / Video and Musical Instrument Apparatus for Household, Commercial, and Similar General Use	UL 6500
Audio-Video Products and Accessories	UL 1492
Busways and Associated Fittings	UL 857
Cables - Thermoplastic-Insulated Underground Feeder and Branch-Circuit Cables	UL 493
Cables - Thermoplastic-Insulated Wires and Cables	UL 83
Cables - Thermoset-Insulated Wires and Cables	UL 44
Cables for Non-Power-Limited Fire-Alarm Circui ts	UL 1425
Cables for Power-Limited Fire-Alarm Circuits	UL 1424
Cellular Metal Floor Raceways and Fittings	UL 209
Class 2 Power Units	UL 1310
Commercial Audio Equipment	UL 813
Communication Circuit Accessories	UL 1863
Communications Cables	UL 444
Community-Antenna Television Cables	UL 1655
Conduit - Type EB and A Rigid PVC Conduit and HDPE Conduit	UL 651A
Continuous Length High Density Polyethylene Conduit	UL 651B
Control Centers for Changing Message Type Electric Signs	UL 1433
Cord Sets and Power-Supply Cords	UL 817
Data-Processing Cable	UL 1690
Dead-Front Switchboards	UL 891
Electric Signs	UL 48
Electric Spas, Equipment Assemblies, and Associated Equipment	UL 1563
Electric Water Heaters for Pools and Tubs	UL 1261
Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations	UL 2279
Electrical Metallic Tubing	UL 797
Electrical Nonmetallic Tubing	UL 1653
Electric-Battery-Powered Industrial Trucks	UL 583
Electrode Receptacles for Gas-Tube Signs	UL 879
Enclosed and Dead-Front Switches	UL 98
Enclosures for Electrical Equipment	UL 50
Energy Management Equipment	UL 916
Fire Pump Controllers	UL 218
Fittings for Cable and Conduit	UL 514B
Flexible Cord and Fixture Wire	UL 62
Flexible Metal Conduit	UL 1
Fluorescent Lighting Fixtures	UL 1570
Fluorescent-Lamp Ballasts	UL 935
Gas-Tube-Sign and Ignition Cable	UL 814
General-Use Snap Switches	UL 20
Ground-Fault Circuit-Interrupters	UL 943
Ground-Fault Sensing and Relaying Equipment	UL 1053
Grounding and Bonding Equipment	UL 467
High Intensity Discharge Lighting Fixtures	UL 1572
High-Intensity-Discharge Lamp Ballasts	UL 1029
Incandescent Lighting Fixtures	UL 1571
Industrial Battery Chargers	UL 1564
Industrial Control Equipment	UL 508
Instrumentation Tray Cable	UL 2250
Insulated Wire Connector Systems for Underground Use or in Damp or Wet Locations	UL 486D
Intermediate Metal Conduit	UL 1242
Isolated Power Systems Equipment	UL 1047
Junction Boxes for Swimming Pool Lighting Fixtures	UL 1241
Liquid-Tight Flexible Nonmetallic Conduit	UL 1660
Liquid-Tight Flexible Steel Conduit	UL 360
Low Voltage Landscape Lighting Systems	UL 1838
Low-Voltage Fuses - Part 1: General Requirements	UL 248-1
Low-Voltage Fuses - Part 10: Class L Fuses	UL 249-10
Low-Voltage Fuses - Part 11: Plug Fuses	UL 248-11
Low-Voltage Fuses - Part 12: Class R Fuses	UL 248-12
Low-Voltage Fuses - Part 15: Class T Fuses	UL 248-15
Low-Voltage Fuses - Part 2: Class C Fuses	UL 248-2
Low-Voltage Fuses - Part 3: Class CA and CB Fuses	UL 248-3
Low-Voltage Fuses - Part 4: Class CC Fuses	UL 248-4
Low-Voltage Fuses - Part 5: Class G Fuses	UL 248-5
Low-Voltage Fuses - Part 6: Class H Non-Renewable Fuses	UL 248-6
Low-Voltage Fuses - Part 7: Class H Renewable Fuses	UL 248-7
Low-Voltage Fuses - Part 8: Class J Fuses	UL 248-8
Low-Voltage Fuses - Part 9: Class K Fuses	UL 248-9
Machine-Tool Wires and Cables	UL 1063
Manufactured Wiring Systems	UL 183
Medical and Dental Equipment	UL 544
Medium-Voltage Power Cables	UL 1072
Metal-Clad Cables	UL 1569
Metal-Clad Cables and Cable-Sealing Fittings for Use in Hazardous (Classified) Locations	UL 2225
Metallic Outlet Boxes	UL 514A
Mobile Home Pipe Heating Cable	UL 1462

Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures	UL 489
Molded-Case Switches	UL 1087
Neon Transformers and Power Supplies	UL 2161
Nonmetallic Outlet Boxes, Flush-Device Boxes, and Covers	UL 514C
Nonmetallic Surface Raceways and Fittings	UL 5A
Nonmetallic Underground Conduit with Conductors	UL 1990
Office Furnishings	UL 1286
Optical Fiber Cable	UL 1651
Optical Fiber Cable Raceway	UL 2024
Panelboards	UL 67
Personal Protection Systems for Electric Vehicle Supply Circuits: General Requirements	UL 2231-1
Personal Protection Systems for Electric Vehicle Supply Circuits: Particular Requirements for Protection Devices for Use in Charging Systems	UL 2231-2
Portable Electric Lamps	UL 153
Potting Compounds for Swimming Pool, Fountain, and Spa Equipment	UL 676A
Power Outlets	UL 231
Power Units Other Than Class 2	UL 1012
Power-Limited Circuit Cables	UL 13
Professional Video and Audio Equipment	UL 1419
Protectors for Coaxial Communications Circuits	UL 497C
Protectors for Data Communication and Fire Alarm Circuits	UL 497B
Protectors for Paired Conductor Communications Circuits	UL 497
Radio Receivers, Audio Systems, and Accessories	UL 1270
Reference Standard for Electrical Wires, Cables, and Flexible Cords	UL 1581
Reinforced Thermosetting Resin Conduit (RTRC) and Fittings	UL 1684
Residential Pipe Heating Cable	UL 2049
Rigid Metal Conduit	UL 6
Roof and Gutter De-Icing Cable Units	UL 1588
Safety of Information Technology Equipment, Including Electrical Business Equipment	UL 1950
Schedule 40 and 80 Rigid PVC Conduit	UL 651
Secondary Protectors for Communications Circuits	UL 497A
Service-Entrance Cables	UL 854
Smoke Detectors for Fire Protective Signaling Systems	UL 268
Specialty Transformers	UL 506
Splicing Wire Connectors	UL 486C
Static Inverters and Charge Controllers for use in Photovoltaic Power Systems	UL 1741
Strut-Type Channel Raceways and Fittings	UL 5B
Surface Metal Raceways and Fittings	UL 5
Surface Raceways and Fittings for Use with Data, Signal and Control Circuits	UL 5C
Surge Arresters - Gapped Silicon-Carbide Surge Arresters for AC Power Circuits	IEEE C62.1
Surge Arresters - Metal-Oxide Surge Arresters for AC Power Circuits	IEEE C62.11
Swimming Pool Pumps, Filters, and Chlorinators	UL 1081
Telephone Equipment	UL 1459
Transfer Switch Equipment	UL 1008
Underfloor Raceways and Fittings	UL 884
Underwater Lighting Fixtures	UL 676
Vacuum Cleaners, Blower Cleaners, and Household Floor Finishing Machines	UL 1017
Wire Connectors and Soldering Lugs for Use with Copper Conductors	UL 486A
Wire Connectors for Use with Aluminum Conductors	UL 486B
Wireways, Auxiliary Gutters, and Associated Fittings	UL 870

SUBSTANTIATION: The relationship between the Code and the product standards is well known to the participants of the code process. Requirements in product standards are continually used as justification for specific code requirements and the code-making panels rely, in many cases, on the fact that products will be designed and manufactured to those standards in order to allow application of a specific code rule.

However, in a global environment, we can no longer afford to assume that everyone is aware of the importance of the connection of the standards to the code. This proposal serves to more directly indicate that interdependence through an informative annex.

The proposed list for the Annex was developed by reviewing all of the present requirements for product listing in the NEC. In each of these cases, the appropriate product standard was identified and added to the list. It is not the objective to indicate the specific standards reference by Section of the Code, but to simply have a list of standards that indeed include the appropriate standard for that particular section. The proposed list is in alphabetical order by product.

It is recognized that there are products covered by a standard that is not on the list. It is intentional to limit the list at this time to only those products that are affected by a listing requirement in the NEC. The list could indeed expand in future NEC editions to include products covered by a standard where listing is not explicitly indicated.

This proposal is critical to maintaining the consistency in our US Electrical Safety System. Everyone involved in the process realizes that the code cannot be properly applied without having products that are designed to standards compatible with those code requirements. See the attached paper on the US Electrical Safety System which discusses this interrelationship.

Note: Supporting Material is available for review at NFPA headquarters.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

NOT RETURNED: 1 Macias

EXPLANATION OF NEGATIVE:

PRICHARD: The proposal to include Annex A was originally submitted to Panel 6 whose panel action was to reject the inclusion of the Annex. Panel 1 did not have the opportunity to discuss or review the contents of the Annex. It is not a complete list of product standards.

COMMENT ON AFFIRMATIVE:

FISKE: We are voting affirmatively on the subject proposal, and wish to register the following comments.

Proposed Informative Annex A is extensive, and clearly required considerable effort on the submitter's part; however, it is incomplete. There are many electrical product safety standards to which the NEC refers, in Fine Print Notes, that are not included in the proposal. If the NEC is to include such an informative annex - as we believe it should - it should include the expressed standards as well as the implied ones. We have taken the liberty of compiling the electrical product safety standards named in the 1999 NEC Fine Print Notes. The list follows.

ANSI A17.5	Elevator and Escalator Electrical Equipment
ANSI B30	Overhead and Gantry Cranes
ANSI/IEEE C37.23	Guide for Metal-Enclosed Bus and Calculating Losses inIsolated-Phase Bus
ANSI/IEEE C57.12.00	Liquid-Immersed Distribution, Power, and Regulating Transformers
ANSI/ISA S12.12	Nonincendive Electrical Equipment for Use in Class I and II, Division 2 and Class III, Divisions 1 and 2 Hazardous (Classified) Locations
ANSI/ISA S12.23.01	Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection - Encapsulation “m”
ANSI/ISA S12.24.01	Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2
ANSI/NEMA 250	Enclosures for Electrical Equipment (100 Volts Maximum)
ANSI/NFPA 79	Electrical Standard for Industrial Machinery
ANSI/NFPA 496	Purged and Pressurized Enclosures for Electrical Equipment
ANSI/SAE J1284	Blade Type Electric Fuses
ANSI/SAE J554	Electric Fuses (Cartridge Type)
ANSI/UL 1581	Electrical Wires, Cables, and Flexible Cords
ANSI/UL 1666	Flame Propagation Height of Electrical and Optical-Fiber CableInstalled Vertically in Shafts
ANSI/UL 275	Automotive Glass-Tube Fuses
IEC 60079-1	Electrical Apparatus for Explosive Gas Atmospheres Part 1: Construction and Verification Test of Flameproof Enclosures of Electrical Apparatus
IEC 60079-6	Electrical Apparatus for Explosive Gas Atmospheres - Part 6: Oil-Immersion “o”
IEC 60079-7	Electrical Apparatus for Explosive Gas Atmospheres - Part 7: Increased Safety “E”
IEC 60079-11	Electrical Apparatus for Explosive Gas Atmospheres Part 11: Intrinsic Safety “i”
IEC 60079-15	Electrical Apparatus for Explosive Gas Atmospheres Part 15: Electrical Apparatus with Type of Protection “N”
IEC 60079-18	Electrical Apparatus for Explosive Gas Atmospheres Part 18: Encapsulation “m”
IEEE C57.12.01	Dry-Type Distribution and Power Transformers Including Those With Solid-Cast and/or Resin-Encapsulated Windings
ISA 12.0.01	Electrical Apparatus for Use in Class I, Zones 0 & 1 Hazardous (Classified) Locations: General Requirements
ISA S12.16.01	Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection - Increased Safety “e”
ISA S12.22.01	Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection - Flameproof “d”
ISA S12.25.01	Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations: Type of Protection - Powder Filling “q”
ISA S12.26.01	Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection - Oil-Immersion “O”
NFPA 262	Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces
SAE J1127	Battery Cable
SAE J1128	Low Tension Primary Cable
UL 2043	Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces
UL 2200	Stationary Engine Generator Assemblies

Standards that are identified in Fine Print Notes should be identified as American National Standards, where applicable. This would indicate that it is intended for standards' references to include ANSI designations, as indicated in 2-6.2 of NFPA Manual of Style. According to the information available to us, the following standards from proposed annex A are American National Standards.

UL 452	Antenna-Discharge Units
UL 4	Armored Cable
UL 498	Attachment Plugs and Receptacles
UL 6500	Audio/Video and Musical Instrument Apparatus for Household, Commercial, and Similar General Use
UL 857	Busways and Associated Fittings
UL 493	Cables - Thermoplastic-Insulated Wires and Cable
UL 1425	Cables for Non-Power-Limited Fire-Alarm Circuits
UL 1310	Class 2 Power Units
UL 651A	Conduit - Type EB and A Rigid PVC Conduit and HDPE Conduit
UL 817	Cord Sets and Power-Supply Cords
UL 1690	Data-Processing Cable
UL 891	Dead-Front Switchboards
UL 1563	Electric Spas, Equipment Assemblies, and Associated Equipment
UL 2279	Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations
UL 797	Electrical Metallic Tubing
UL 583	Electric-Battery-Powered Industrial Trucks
UL 98	Enclosed and Dead-Front Switches
UL 50	Enclosures for Electrical Equipment
UL 62	Flexible Cord and Fixture Wire
UL 20	General-Use Snap Switches
UL 943	Ground-Fault Circuit-Interrupters
UL 1053	Ground-Fault Sensing and Relaying Equipment
UL 467	Grounding and Bonding Equipment
UL 1029	High-Intensity-Discharge Lamp Ballasts
UL 1564	Industrial Battery Chargers
UL 1047	Isolated Power Systems Equipment
UL 248-1	Low-Voltage Fuses - Part 1: General Requirements
UL 248-10	Low-Voltage Fuses - Part 10: Class L Fuses
UL 248-11	Low-Voltage Fuses - Part 11: Plug Fuses
UL 248-12	Low-Voltage Fuses - Part 12: Class R Fuses
UL 248-15	Low-Voltage Fuses - Part 15: Class T Fuses
UL 248-2	Low-Voltage Fuses - Part 2: Class C Fuses
UL 248-3	Low-Voltage Fuses - Part 3: Class CA and CB Fuses
UL 248-4	Low-Voltage Fuses - Part 4: Class CC Fuses
UL 248-5	Low-Voltage Fuses - Part 5: Class G Fuses
UL 248-6	Low-Voltage Fuses - Part 6: Class H Non-Renewable Fuses
UL 248-7	Low-Voltage Fuses - Part 7: Class H Renewable Fuses
UL 248-8	Low-Voltage Fuses - Part 8: Class J Fuses

UL 248-9	Low-Voltage Fuses - Part 9: Class K Fuses
UL 1063	Machine-Tool Wires and Cable
UL 183	Manufactured Wiring Systems
UL 1072	Medium-Voltage Power Cables
UL 489	Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures
UL 1087	Molded-Case Switches
UL 1286	Office Furnishings
UL 1651	Optical Fiber Cable
UL 67	Panelboards
UL 153	Portable Electric Lamps
UL 231	Power Outlets
UL 1012	Power Units Other Than Class 2
UL 497	Protectors for Paired Conductor Communications Circuits
UL 1581	Reference Standard for Electrical Wires, Cables, and Flexible Cords
UL 1950	Safety of Information Technology Equipment, Including Electrical Business Equipment
UL 651	Schedule 40 and 80 Rigid PVC Conduit
UL 497A	Secondary Protectors for Communications Circuits
UL 854	Service-Entrance Cables
UL 506	Specialty Transformers
UL 486C	Splicing Wire Connectors
UL 5B	Strut-Type Channel Raceways and Fittings
UL 1459	Telephone Equipment
UL 1008	Transfer Switch Equipment
UL 486A	Wire Connectors and Soldering Lugs for Use with Copper Conductors
UL 870	Wireways, Auxiliary Gutters, and Associated Fittings

MINICK: Editorially revise the proposed language to read as suggested by CMP-1 member Brooke Stauffer.

I understand the revised language by Mr. Stauffer to read as follows:

Annex A (~~informative~~ informational) – Product Safety Standards

This ~~informative~~ informational annex ~~is intended to provide~~ provides a list of product safety standards ~~that are utilized~~ used for product listing where that listing is required by this Code. It is recognized that this list is current at the time of ~~development~~ publication, but that new standards or modifications to existing standards can occur at any time while this edition of the Code is ~~adopted~~ in effect.

This ~~list~~ Annex does not form a mandatory part of the requirements of this Code, but is intended ~~to only~~ only to provide Code users ~~some~~ with informational guidance ~~on~~ about the product characteristics on which Code requirements have been based.

STAUFFER: Editorially revise the proposed language to read as follows. ~~Strikeout~~ and underline format is used for the convenience of CMP-1 members reviewing these suggested changes:

Annex A (~~informative~~ informational) – Product Safety Standards

This ~~informative~~ informational annex ~~is intended to provide~~ provides a list of product safety standards ~~that are utilized~~ used for product listing where that listing is required by this Code. It is recognized that this list is current at the time of ~~development~~ publication, but that new standards or modifications to existing standards can occur at any time while this edition of the Code is ~~adopted~~ in effect.

This ~~list~~ Annex does not form a mandatory part of the requirements of this Code, but is intended ~~to only~~ only to provide Code users ~~some~~ with informational guidance ~~on~~ about the product characteristics on which Code requirements have been based.

APPENDIX B

(Log #1170)

6- 221 - (Appendix B): Reject
SUBMITTER: Harvey L. Williams, Pensacola, FL
RECOMMENDATION: Delete Appendix B.
SUBSTANTIATION: Removal of information that cannot be considered mandatory, should be included in the NECH commentary.
PANEL ACTION: Reject.
PANEL STATEMENT: The information in Appendix B is useful. Not all users of the Code have a copy of the NEC Handbook available.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3836)

6- 222 - (Appendix B): Accept
SUBMITTER: Rik Oldefest, Riviera Electric
RECOMMENDATION: In Appendix B, I recommend moving Table B-310-11 behind Table B-310-10. Follow this with Figures B-310-1 through B-310-5.
SUBSTANTIATION: I feel this change would improve the flow and make the tables and figures more user friendly.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3109)

6- 5 - (Table B-310-1): Accept in Principle

NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 8 and 12 for correlation. This action will be considered by Panels 8 and 12 as a Public Comment.

SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Delete Type RH from the third and sixth columns of the table heading.
SUBSTANTIATION: Underwriters Laboratories canvassed subscribers of Thermoset-Insulated Wires and Cables, UL 44. It was determined that Type RH insulated conductor is no longer being produced.
PANEL ACTION: Accept in Principle.
Delete "RH" throughout the code.
PANEL STATEMENT: The submitter's reference to Table 310-1 is incorrect. Type RH insulated conductor is no longer produced. This action will also correlate with Proposals 6-16, 6-45, 6-101, 6-107, 6-111, and 6-215.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3143)

6- 6 - (Table B-310-1): Accept in Principle

NOTE: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 6-5. The Technical Correlating Committee directs the Panel to correct the text in 310-15(b) to include the table. The Technical Correlating Committe directs that the Panel clarify the Panel Action of this Proposal relative to Table 310-16. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Brandon Bender, Sand Beach Electric
RECOMMENDATION: Move Table B-310-1 to Section 15 of Article 310 as Table 310-22.
SUBSTANTIATION: Electrical cables consisting of insulated conductors with an overall outer covering are frequently installed in raceways for lengths greater than 10 ft where the conductors required physical protection. Electricians are not permitted to use Appendix B so they are generally not aware that conductor ampacity under these conditions cannot be determined using Table 310-16. There needs to be a table available to electricians and inspectors to determine the allowable ampacity of multiconductor cables when installed in raceways for distances greater than 10 ft to reduce the chances of overheating and fires.
PANEL ACTION: Accept in Principle.
Change existing Table 310-21 to Table 310-23. Replace the existing note below the existing Table B-310-1 with "See 240-3(d)". Relocate and renumber Table B-310-1 to Table 310-21. Delete all of the existing asterisks. Delete wire size 14 from column 8. Add asterisks to columns number 1 and 8 for wire sizes 14,12, and 10.
PANEL STATEMENT: To correlate and maintain consistency of placing insulated conductor ampacity tables ahead of the bare covered ampacity tables. These tables should be formatted to be consistent with Tables 310-16 and 310-17.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2009)

6- 223 - (B-310-15(b)(1)): Reject
SUBMITTER: John E. Conley, Stratford, CT
RECOMMENDATION: Insert "scientific" before "ampacities" on the second line.
SUBSTANTIATION: See the substantiation for proposal on "Ampacity" definitions.
PANEL ACTION: Reject.
PANEL STATEMENT: Ampacity values provided in the tables (which utilize ampacities versus allowable ampacities) are no less or no more scientific than the calculated ampacity in accordance with 310-15(c). Substantiation, provided with the proposed definition in Proposal 1-101, does not provide any evidence of the problem with the use of ampacity values provided in various tables (which utilize ampacities versus allowable ampacities) or calculated in accordance with 310-15(c).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #24)

6- 224 - (Tables B-310-1, B-310-3, B-310-5 and through B-310-10): Accept in Principle
NOTE: The following proposal consists of Comment 6-90 on Proposal 6-58 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 6-58 was:

Change the line directly above the columns to refer users to Table 310-13 for insulation temperature ratings and use of conductors: For Temperature Rating and Use of Conductor See Table 310-13.
Replace the right-hand column of AWG/kcmil information with two columns listing nominal metric wire sizes and Standard metric wire gages.
Eliminate the alphabet soup letters at the head of each column.
(Table shown below)
SUBMITTER: Bob Macfarlane, McLean, VA
RECOMMENDATION: Add the following title at the top of the second table in the above referenced tables: "Ambient Temperature Adjustment Factors".
SUBSTANTIATION: This addition will make the format for the presentation of the referenced tables consistent with ROP 6-58. Presently, the two tables contained in each of the referenced tables are run together, and the second tables have no title, as do the tables in Section 310-16 and beyond. Another suggestion submitted with this group of suggestions recommends that the present title in the tables at 310-16 and beyond be changed from the present "Correction Factors" to "Adjustments for Ambient Temperature", which is the term I propose to use in the referenced tables.
PANEL ACTION: Accept in Principle.
In the recommendation, replace "Ambient Temperature Adjustment Factors" with "Correction Factors".
PANEL STATEMENT: The portion of the heading addressed in the recommendation for Table 310-20 should match the similar portion of the heading for Tables 310-16 through 310-19.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

Table 310-16 Allowable Ampacities of Insulated Conductors Rated 0 through 2000 Volts, 60°to 90°C (140° to 194°F) Not More Than Three Current-Carrying Conductors in Raceway or Cable or Earth (Directly Buried), Based on Ambient Temperature of 30°C (86°F)

*** Unless otherwise specifically permitted elsewhere in this *Code*, the overcurrent protection for conductor types marked with an asterisk (*) shall not exceed 15 amperes for No. 14, 20 amperes for No. 12 and 30 amperes for No. 10 copper; or 15 amperes for No. 12 and 25 amperes for No. 10 aluminum and copper-clad aluminum after any correction factors for ambient temperatures and number of conductors have been applied.**

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1123)

6- 225 - (Table B-310-1): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise footnote as follows:
*Unless otherwise specifically permitted elsewhere in this Code, the overcurrent protection for these conductor types shall not exceed 15 amperes for ~~No. 14~~ 14 AWG, 20 amperes for ~~No. 12~~ 12 AWG, and 30 amperes for ~~No. 10~~ 10 AWG copper; or 15 amperes for ~~No. 12~~ 12 AWG and 25 amperes for ~~No. 10~~ 10 AWG aluminum and copper-clad aluminum.
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
PANEL STATEMENT: See panel statement on Proposal 6-7.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1297)

6- 227 - (B-310-15(b)(2)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise as follows:
Appendix B
B310-15 (b) (2)
B-310-15(b)(2). Typical Applications Covered by Tables.
Typical ampacities for conductors rated 0 through 2000 volts are shown in Tables B-310-1 through B-310-10. Underground electrical duct bank configurations, as detailed in Figures B-310-3, B-310-4, and B-310-5, are utilized for conductors rated 0 through 5000 volts. In Figures B-310-2 through B-310-5, where adjacent duct banks are used, a separation of 1.5 m (5 ft) ~~(1.52 m)~~ between the centerlines of the closest ducts in each bank or 1.2 m (4 ft) ~~(1.22 m)~~ between the extremities of the concrete envelopes is sufficient to prevent derating of the conductors due to mutual heating. These ampacities were calculated as detailed in the basic ampacity paper, The Calculation of the Temperature Rise and Load Capability of Cable Systems, by J. H. Neher and M. H. McGrath, AIEE Paper 57-660. For additional information concerning the application of these ampacities, see Power Cable Ampacities, IEEE/ICEA Standard S-135/P-46-426 and IEEE Standard 835-1994, Standard Power Cable Ampacity Tables.
B310-15 (b) (3)
B-310-15(b)(3). Criteria Modifications.
Where values of load factor and Rho are known for a particular electrical duct bank installation and they are different from those shown in a specific table or figure, the ampacities shown in the table or figure can be modified by the application of factors derived from the use of Figure B-310-1.
Where two different ampacities apply to adjacent portions of a circuit, the higher ampacity can be used beyond the point of transition, a distance equal to 3 m (10 ft) ~~(3.05 m)~~ or 10 percent of the circuit length figured at the higher ampacity, whichever is less.
Where the burial depth of direct burial or electrical duct bank circuits are modified from the values shown in a figure or table, ampacities can be modified as shown in (1) and (2) as follows.
1. Where burial depths are increased in part(s) of an electrical duct run to avoid underground obstructions, no decrease in ampacity of the conductors is needed, provided the total length of parts of the duct run increased in depth to avoid obstructions is less than 25 percent of the total run length.
2. Where burial depths are deeper than shown in a specific underground ampacity table or figure, an ampacity derating factor of 6 percent per increased 300 mm (foot) ~~(305 mm)~~ of depth for all values of Rho can be utilized. No rating change is needed where the burial depth is decreased.
B310-15 (b) (5) (1)
B-310-15(b)(5). Tables B-310-6 and B-310-7.
1. To obtain the ampacity of cables installed in two electrical ducts in one horizontal row with 191 mm (7.5-in.) ~~(191 mm)~~ center-to-center spacing between electrical ducts, similar to Figure B-310-2, Detail 1, multiply the ampacity shown for one duct in Tables B-310-6 and B-310-7 by 0.88.
2. To obtain the ampacity of cables installed in four electrical ducts in one horizontal row with 191 mm (7.5-in.) ~~(191 mm)~~ center-to-center spacing between electrical ducts, similar to Figure B-310-2, Detail 2, multiply the ampacity shown for three electrical ducts in Tables B-310-6 and B-310-7 by 0.94.
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis. In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised. In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.
PANEL ACTION: Accept.

6- 229 - (Figures B-310-2; B-310-3; B-310-4 and B-310-5): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Change dimensions in Figures B-310-2, B-310-3, B-310-4, and B-310-5 to read as follows:
In Figure B-310-2:
~~7.5 in~~ 190 mm (7.5 in)
~~11.5 in. x 11.5 in.~~290 x 290 mm (11.5 in. x 11.5 in.)
~~19 in. x 19 in.~~ 475 x 475 mm (19 in. x 19 in.)
~~19 in. x 27 in.~~ 475 x 675 mm (19 in. x 27 in.)
~~27 in. x 27 in.~~ 675 x 675 mm (27 in. x 27 in.)
~~27 in. x 11.5 in.~~ 675 x 290 mm (27 in. x 11.5 in.)
~~27 in. x 19 in.~~ 675 x 475 mm (27 in. x 19 in.)
~~24 in.~~ 600 mm (24 in.)
Change dimensions in Note 1 in Figure B-310-2 to read as follows:
~~30 in.~~ 750 mm (30 in.)
~~36 in.~~ 900 mm (36 in.)
Delete Note 3 in Figure B-310-2.
Figure B-310-3:

~~6 in.~~ 150 mm (6 in.)
~~7.5 in.~~ 190 mm (7.5 in.)
~~24 in.~~ 600 mm (24 in.)
~~27 in.~~ 675 mm (27 in.)
~~30 in.~~ 750 mm (30 in.)

Under design criteria in Figure B-310-3:

Change "6 in." to "150 mm (6 in.)", change "3 to 5 in." to "75 to 125 mm (3 to 5 in.)", and delete "For SI Units: 1 in. = 25.4 mm".

In Figure B-310-4:

~~6 in.~~ 150 mm (6 in.)
~~10 in.~~ 250 mm (10 in.)
~~24 in.~~ 600 mm (24 in.)
~~38 in.~~ 950 mm (38 in.)
~~44 in.~~ 1.1 m (44 in.)

Under design criteria in Figure B-310-4: Change "6 in." to "150 mm (6 in.)", change "3 in." to "75 mm (3 in.)".

Under Notes to Figure B-310-4: Delete Note 1.

In Figure B-310-5:

~~6 in.~~ 150 mm (6 in.)
~~10 in.~~ 250 mm (10 in.)
~~24 in.~~ 600 mm (24 in.)
~~38 in.~~ 950 mm (38 in.)
~~54 in.~~ 1.4 m (44 in.)

Under design criteria in Figure B-310-5: Change "6 in." to "150 mm (6 in.)", change "3 in." to "75 mm (3 in.)".

Under Notes to Figure B-310-5: Delete Note 1.

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept.

(Log #1124)

6- 230 - (Table B-310-3): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise footnote as follows:

*Unless otherwise specifically permitted elsewhere in this Code, the overcurrent protection for these conductor types shall not exceed 15 amperes for ~~No. 14~~ 14 AWG, 20 amperes for ~~No. 12~~ 12 AWG, and 30 amperes for ~~No. 10~~ 10 AWG copper; or 15 amperes for ~~No. 12~~ 12 AWG and 25 amperes for ~~No. 10~~ 10 AWG aluminum and copper-clad aluminum.

SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.

(Log #3017)

8- 461 - (Appendix C): Accept
SUBMITTER: Robert H. Keis, Dover, DE
RECOMMENDATION: In Tables C1, C2, C3, C4, C5, C6, C7, C8, C9, C10, and C11 change the following wording:
Maximum Number of Conductors ~~and~~ or Fixture Wires in... (conduit/raceway types–remain the same as present).
SUBSTANTIATION: It seems that the correct word would be "or" not "and." Since Section 402-11 prohibits using fixture wires as branch-circuit conductors, it seems that there would be one or the other in a raceway, but usually not both together so it should be "or" not "and."
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3018)

8- 462 - (Appendix C): Reject
SUBMITTER: Robert H. Keis, Dover, DE
RECOMMENDATION: In Tables C1(A), C2(A), C3(A), C4(A), C5(A), C6(A), C7(A), C8(A), C9(A), C10(A), C11(A), and C12(A), add the word "Aluminum" between Compact Conductors. Table title would then read:
Maximum Number of Compact Aluminum Conductors in... (conduit/raceway types–remain the same as present).
SUBSTANTIATION: I submitted this same type proposal for the 1993 Code (and the panel accepted) to clarify that "compact conductors" were "compact aluminum conductors" and no others. The Codes before 1993 used the term compact conductors and it is confusing to those who are just beginning to use the Code. The words were changed in the 1993 Code and then for some reason reverted back to the old wording in the 1999 Code. Please help clarify what the Code means when it says "compact conductors." If this book is to be the least bit "user friendly," this will help. For example, Table 5A, Chapter 9, has the correct wording.
PANEL ACTION: Reject.
PANEL STATEMENT: Not all compact conductors are aluminum. Compact copper conductors are manufactured.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3189)

8- 463 - (Appendix C): Reject
SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION: Delete Appendix C.
SUBSTANTIATION: At the time these tables were placed in the NEC it appeared they would be helpful to the user. Many users prefer not to take up all the space required in the NEC. With the advent of more metrication of the NEC it appears another 25 pages would be needed to convert to metric. This is unrealistic. In addition, it has become apparent that there are instances where the computed number of conductors will not actually fit into the conduit due to configuration and only conductors of the same size are computed. This detracts from their usefulness. Table 4 of Chapter 9 will still be available and it is more complete than in the past.
PANEL ACTION: Reject.
PANEL STATEMENT: Appendix C is provided for the information and application of the user. It is not mandatory Code.
The two FPN's for Table 1 of Chapter 9 alert the user of situations that may result in difficulty when installing conductors in raceways. Eliminating Appendix C will not affect the problems associated with installing the conductors as the number of conductors will still be computed per Tables 1 and 4 of Chapter 9.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3950)

8- 464 - (Appendix C): Accept in Principle
SUBMITTER: Daniel J. Thomas, Jr., City of Durham, NC
RECOMMENDATION: Add a "Table of Contents" for Appendix C, listing the type raceway for each table and the page number for each. This "Table of Contents" should be the first page of Appendix C.
Appendix C
Table of Contents
(A) Where this is used in conjunction with Tables C1 through C12, the conductors installed, must be of the compact type.

SUBSTANTIATION: It is very difficult to find a specific type raceway being used, without going through each table until you find the particular table needed for your raceway.
PANEL ACTION: Accept in Principle.
Add the correct acronyms from the proposed article revisions after each table title.
PANEL STATEMENT: Panel action is editorial.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

8- 468 - (Appendix C, Table C1(a)): Reject
SUBMITTER: J. Kevin Vogel, Crescent Electrical Supply
RECOMMENDATION: For 350 kcmil XHHW, XHHW-2 compact conductors in 3-inch EMT: ~~8~~ 7.
SUBSTANTIATION: Eight conductors exceeds the 40 percent fill maximum allowed by Chapter 9, Table 1.
PANEL ACTION: Reject.
PANEL STATEMENT: Chapter 9, Table 4 lists the 40% fill square inch area of 3-inch EMT as 3.538. Chapter 9, Table 5A lists the approximate square inch area of 350 Type XHHW insulated conductor as .4536. (3.538 / .4536 = 7.7998236)
Utilizing a standard round-up method the result is a total of 7.8. Note (7) of Chapter 9, Notes to Tables states "(7) When calculating the maximum number of conductors permitted in a conduit or tubing, all of the same size (total cross-sectional area including insulation), the next higher whole number shall be used to determine the maximum number of conductors permitted when the calculation results in a decimal of 0.8 or larger." Because the number achieved by the above calculation is 7.8 the number can be increased to 8.

(Log #3390)

8- 477 - (Appendix C, Tables C7 and C7(A)): Reject
SUBMITTER: Will Dockham, Gilmanton Iron Works, NH
RECOMMENDATION: Add a 3/8 in. column to Tables C7 and C7(A). The conductor fill for the new 3/8 in. column of Tables C7 and C7(A) should be the same as the 3/8 in. column of Tables C4 and C4(A) because the internal diameter of 3/8 in. liquidtight flexible metal conduit is the same as the internal diameter of 3/8 in. liquidtight flexible nonmetallic conduit.
SUBSTANTIATION: Confusion is caused when applying Table 350-12, to 3/8 in. liquidtight flexible metal conduit because it is unclear as to which column - "Fitting Inside Conduit" or "Fitting Outside Conduit", should be used. Liquidtight flexible metal conduit fittings typically have a component that installs inside the liquidtight flexible metal conduit, however, I doubt that it is intended that the "Fitting Inside Conduit" column is the appropriate column to use. Also, 3/8 in. liquidtight flexible nonmetallic conduit, Type-B, has the same internal diameter per Chapter 9, Table 4, as 3/8 in. liquidtight flexible metal conduit, therefore the sizing criteria for both raceways should be the same.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not agree that it is necessary to add new columns to these tables based on the action taken on Proposal 8-334.

(Log #3832)

2- 310 - (Appendix D): Accept in Principle
SUBMITTER: Kevin Starkie, Riviera Electric
RECOMMENDATION: Revise text to read as follows:
"Laundry facilities on premises are available to all tenants. Add no circuit to individual dwelling unit. Add 1500 VA for each laundry circuit to have load and an example as a "house load" (code reference)."
SUBSTANTIATION: No where in the code book is there a reference for this modification to computing laundry circuits for laundry facilities. Add this example to code not just in the example.
PANEL ACTION: Accept in Principle.
In Examle D4(a), delete the last sentence of the existing text beginning with "Add 1500 VA for laundry circuit...".
PANEL STATEMENT: This revision corrects the problem as presented by the submitter.

2- 311 - (Appendix D, Examples No. D1 through D4): Reject
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Example D1(a), first paragraph, replace "1500 ft^2" with "139.5 m^2 (1500 ft^2)"
2. In Example D1(a), Computed Load, replace "1500 ft^2 at 3 VA per ft^2 with 139.5 m^2 at 33 VA per m^2 (1500 ft^2 at 3 VA per ft^2)"
3. In Example No. D2(a), first paragraph, replace "1500 ft^2" with "139.5 m^2 (1500 ft^2)"
4. In Example No. D2(a), Feeder Neutral Load per Section 220-22, replace "1500 ft^2 at 3VA per ft^2 with "139.5 m^2 at 33 VA per m^2 (1500 ft^2 at 3 VA per ft^2)"
5. In Example No. D2(b), first paragraph, replace "1500 ft^2" with "139.5 m^2 (1500 ft^2)"
6. In Example No. D2(b), General Load, replace "1500 ft^2 at 3 VA per ft^2" with "139.5 m^2 at 33 VA per m^2 (1500 ft^2 at 3 VA per ft^2)"
7. In Example No. D2(b), Feeder Neutral Load per Section 220-22, replace "1500 ft^2 at 3 VA per ft^2" with "139.5 m^2 at 33 VA per m^2 (1500 ft^2 at 3VA per ft^2)"
8. In Example No. D2(c), first paragraph, replace "2000 ft^2" with "186 m^2 (2000 ft^2)"
9. In Example No. D2(c), General Load, replace "2000 ft^2 at 3 VA" with "186 m^2 at 33 VA (2000 ft^2 at 3 VA)"
10. Example No. D3, first paragraph, replace "...50 by 60 ft, or 3000 ft^2, has 30 ft ..." with "...15 m (50 ft) by 18 m (60 ft), or 270 m^2 (3000 ft^2), has 9.0 m (30 ft)..."
11. In Example No. D3, Continuous Loads, replace "3000 ft^2 at 3 VA per ft^2 with "270 m^2 at 33 VA per m^2 (3000 ft^2 at 3 VA per ft^2)"
12. In Example No. D3, Continuous Loads, replace "30 ft at 200 VA per ft" with "9.0 m at 656 VA per m (30 ft at 200 VA per ft)"
13. In Example No. D4(a), 4th paragraph, replace "840 ft^2" with "78.12 m^2 (840 ft^2)"
14. In Example No. D4(a), Computed Load for Each Dwelling Unit, replace "...840 ft^2 at 3VA per ft^2" with "(78.12 m^2 at 33 VA per m^2 (840 ft^2 at 3 VA per ft^2)..."
15. In Example No. D4(b), 5th paragraph, replace "840 ft^2" with "78.12 m^2 (840 ft^2)"
16. In Example No. D4(b), Computed Load for Each Dwelling Unit, replace "840 ft^2 at 3 VA per ft^2" with "78.12 m^2 at 33 VA per m^2 (840 ft^2 at 3 VA per ft^2)"
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following in parenthesis. A soft conversion was generally used for area numbers to maintain consistency with the existing examples although the Panel may elect to use a hard conversion.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel recommends that the examples remain in inch-pound units for clarity. Using the conversions supplied by the Metrication Task Group, will result in two different electrical load calculations for the exact same example.

(Log #1019)

2- 312 - (Appendix D Example No.s D1(a) and D2(a)): Accept
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise Example D1(a) to read as follows:
~~Net computed load exceeds 10 kVA Section 230-42(b)(2) would require service conductors to be 100 amperes.~~ Sections 230-42(b) and 230-79 require service conductors and disconnecting means rated not less than 100-amperes.
D2(a) Therefore, the minimum service rating ~~size~~ would be 100-amperes in accordance with Sections 230-42 and 230-79.
SUBSTANTIATION: Editorial. There is no Section 230-42(b)(2). Sections 230-42 and 230-79 are sections requiring a 100 ampere "rating" which is more appropriate than "size".
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #3831)

2- 313 - (Appendix D Example No. D1(a)): Accept in Principle
SUBMITTER: Clint Bonham, Riviera Electric
RECOMMENDATION: Change Section 230.42(b) reference to Section 230.79(e).
SUBSTANTIATION: In example No. D1(a) net computed load for 120/240 volt, 3-wire, single-phase service or feeder, Section 230.42(b) is referenced. This reference is not accurate, it does not give the information required.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Proposal 2-312.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4338)

2- 314 - (Appendix D, Example No. D1(a)): Accept in Principle
SUBMITTER: Leo F. Martin, Martin Electrical & Technical Training Services
RECOMMENDATION: Delete: "Net computed load exceeds 10 kVA. Section 230-42(b) would require service conductors to be 100 A."
Replace with see Section 230-42(b).
SUBSTANTIATION: Statement mandates that 100 ampere rated service conductors are required only if the net computed load exceeds 10 kVA. Section 230-42(b) makes reference to 230-79 which requires a minimum of 100 amperes for all one-family dwellings, regardless of load calculation.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Proposal 2-312.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #4072)

2- 315 - (Appendix D, Example No. D2(c)): Reject
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./Rep. Edison Electric Inst./Electric Light & Power Group
RECOMMENDATION: This is a companion proposal to change Section 220.30(c).
Revise parts of Appendix D, Example No. D2(c) as follows:
20.76 kVA x ~~100%~~ 65% = ~~20.76 kVA~~ 13.49 kVA
Totals
Net general load 19,280 VA
Heat pump and supplementary heat 13,490 VA ~~20,760 VA~~
Total 32,770 VA ~~40,040 VA~~
Calculated Load for Service
~~40.04 kVA~~ 32.77 kVA x 1000) 240 V = ~~166.8 A~~ 136.5 A
This dwelling unit would be permitted to be served by a ~~175 A~~ 150 A Service.
SUBSTANTIATION: This example was changed in conjunction with a text change in Section 220.30 for the 1999 NEC method of counting central electric space heat at 100 percent back to 65 percent as it has been since 1971.
In the 1999 NEC a major change was made in calculations without adequate technical substantiation. This change impacts load calculations for single family dwellings with heat pumps when the compressor and supplemental heating is operating at the same time (normal installation) by counting the central space heat at 100 percent rather than at 65 percent as had been done by the Optional Method since the 1971 NEC. This change was made with no historical load data to justify the change. It significantly increases the main panel size and service entrance conductors on many homes and apartments thus increasing the cost with no improvements in safety. Also, the 1999 calculations are very erratic depending on whether or not the heat pump can be on at the same time as the supplementary heat. Based on the NFPA 70 A98 ROP Proposal 2-319 was rejected because it did not further clarify the present wording. See the NFPA 70 A98 ROC for Comments 2-164 and 2-165 that were accepted in principle as editorial revision to enhance clarity. In Proposal 2-319, the submitter stated that "These changes have no impact on the result of the calculation, only on the format of this section". In reality the example for the Optional Calculation using 220-30 in the 1996 and 1999 NEC is identical except for counting the central electric space heating at 100 percent in the 1999 NEC!
Numerous load surveys have been submitted by various utility companies throughout the years to verify the diversified demand of electric heat. Going back to the 1971 NEC and following codes as well, the key statement was, "Use the larger of the air conditioning load or the diversified demand of the heating load." Using 100 percent for the air conditioning and cooling, including heat pump compressors (from 1971 to 1996) meant that a heat pump could be used for cooling with or without supplemental electric heat and that the summer load could thus be greater than the winter load. Central Electric Space Heating, which was calculated at 65 percent, could include a heat pump compressor as well as integral supplemental heat, i.e., "strip" or electric resistance heat. All of the authors writing books on calculations have included resistance heat at 65 percent. A heat pump is more efficient (lower demand, higher heat output) than straight resistance heat. Also, heat pump systems are designed to turn off the heat pump if the outdoor temperature drops too low preventing continuous operation of the heat pump and the full backup resistance heat. Therefore the diversified demand for a residence would be less if the heat pump and strip heat were on at the same time. This is exactly opposite to the 1999 changes!! Appendix D Example No. 2(c) of the 1996 NEC added the heat pump load of 5.76 kVA and the 15 kVA and multiplied the total by 65 percent for a total of 13.49 kVA. However, example D2(c) of the 1999 NEC uses a total of 20.76 kVA. The statement that "If supplementary heat is not on at the same time as heat pump, heat pump kVA need not be added to total." would mean that one would use 65 percent of 15 kVA which would be 9.75 kVA. It is reasonable to assume that the winter heat diversified demand is based on the heat loss of the home with a particular thermostat setting. If more electric heat is installed than needed (or it is not divided into two or more stages) then it will just cycle more often, but essentially have the same electrical demand. However, look at the differences in calculations for the 1999 NEC when using a 5 kW heat pump and various amounts of supplemental heat.

Assume:	Heat Pump plus Supplemental Heat	Supplemental Heat Only	Diversified Demand 1971-96 NEC	1999 NEC
	5 + 15 = 20 kVA		13.0 kVA	20.0 kVA
		15 kVA	9.75 kVA	9.75 kVA
		20 kVA	13.0 kVA	13.0 kVA
	5 + 20 = 25 kVA		16.25 kVA	25 kVA
		20 kVA	13.0 kVA	13 kVA
		25 kVA	16.25 kVA	16.25 kVA

Thus, based on the 1999 NEC if one uses a 25 kVA central electric heating system with a heat pump, the load is 25 kVA, but if one uses 5 kVA of supplemental heat to replace the heat pump, then the diversified demand drops to 16.25 kVA. If one has 20 kVA of supplemental heat the demand is 13 kVA, but if a 5 kW heat pump is added, the demand jumps to 25 kVA. If one has a 15 kVA system calculated at 9.75 kVA, the demand more than doubles to 20 kVA if a 5 kVA heat pump is added. The 25 kVA heat pump system could actually have a lower demand than the 25 kVA supplemental heat only system that is calculated at 16.25 kVA!!

Note: Supporting material is available for review at NFPA Headquarters.

(Log #1126)

2- 316 - (Appendix D, Example No.s D4(a), D4(b), D5(a), and D5(b)): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise Appendix D as follows:
Example No. D4(a)
Minimum Number of Branch Circuits Required for Each Dwelling Unit
Small Appliance Load - change "No. 12" to "12 AWG"
Range Circuit - change "No. 8" to "8 AWG" and "No. 10" to "10 AWG"
Example No. D4(b)
Minimum Number of Branch Circuits Required for Each Dwelling Unit
Small Appliance Load - change "No. 12" to "12 AWG"
Range Circuit - change "No. 10" to "10 AWG"
Example No. D5(a)
Minimum Number of Branch Circuits Required for Each Dwelling Unit
Change "No. 8" to "8 AWG" and "No. 10" to "10 AWG"
Example No. D5(b)
Minimum Number of Branch Circuits Required for Each Dwelling Unit
Change "No. 8" to "8 AWG", "No. 10" to "10 AWG", and "No. 12" to "12 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Accept.
