(2) The distance between supports for straight runs of conduit shall be permitted in accordance with Table ~~346-12~~ 346-30(b)(2), provided the conduit is made up with threaded couplings, and such supports prevent transmission of stresses to termination where conduit is deflected between supports.

(3) Exposed vertical risers from industrial machinery shall be permitted to be supported at intervals not exceeding 20 ft (6.1 m), provided the conduit is made up with threaded couplings, is firmly supported at the top and bottom of the riser, and no other means of intermediate support is readily available.

(4) Horizontal runs of IMC ~~intermediate metal conduit~~ supported by openings through framing members at intervals not exceeding 10 ft (3.05 m) and securely fastened within 3 ft (914 mm) of termination points shall be permitted.

345-40. ~~345-13.~~ Boxes and Fittings.
~~See~~ Boxes and fittings shall comply with the applicable provisions of Article 370.

345-42. ~~345-9.~~ Couplings and Connectors.

(a) Threadless. Threadless couplings and connectors used with conduit shall be made tight. Where buried in masonry or concrete, they shall be the concretetight type. Where installed in wet locations, they shall be the raintight type.

(b) Running Threads. Running threads shall not be used on conduit for connection at couplings.

345-46. ~~345-15~~ Bushings.
Where a conduit enters a box, fitting, or other enclosure, a bushing shall be provided to protect the wire from abrasion unless the design of the box, fitting, or enclosure is such as to afford equivalent protection.

FPN: See Section 300-4(f) for the protection of conductors sizes No. 4 and larger at bushings.

345-56. ~~345-14~~. Splices and Taps.
Splices and taps shall be made in accordance with Section 300-15. See Article 370 for rules on the installation and use of boxes and conduit bodies.

345-60. Grounding.
IMC shall be permitted as an equipment grounding conductor.

C. Construction Specifications.

345-120. ~~345-16(c).~~ Marking.
Each length shall be clearly and durably marked at least every 5 ft (1.52 m) with the letters IMC. Each length shall be marked as required in the first sentence of Section 110-21.
~~345-16(b). Corrosion-Resistant Material.~~ Nonferrous conduit of corrosion-resistant material shall have suitable markings.

345-130. ~~345-16(a)~~ Standard Lengths.
The standard length of IMC ~~intermediate metal conduit~~ shall be 10 ft (3.05 m), including an attached coupling, and each end shall be threaded. Longer or shorter lengths with or without coupling and threaded or unthreaded shall be permitted.
SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways of circular cross-section. For the 1999 NEC, a previous Sub-Task Group recommended that all of the circular raceway articles be combined into a single article (Article 344), to present a more uniform approach to the conduit and tubing requirements and to consolidate common requirements.
Review of public comments led the Panel to conclude that the goal of more user friendly code language had not been realized by the proposed Article 344. Furthermore, the Panel requested that a committee be appointed to consider the issue of user friendly code as it relates to the circular raceway articles.
The Sub-Task Group was asked to address such possibilities as revising the rejected 1999 proposal in light of the public comments, developing one or more articles to address the requirements presented in the nine current circular raceway articles, or revising the current nine circular raceway articles using a similar style manual format. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.
A uniform format is proposed to achieve consistency across all of the circular raceways. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. A table that provides the uniform format for each circular raceway has been provided with this proposal.
For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for conduit and tubing not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.
Explanation of proposed renumbering and editorial changes;

- **Title** — **The text "Type" and the acronym "IMC" added**
- **345-1** — **New Scope added to conform with the style manual.**
- **345-2**
  (1) Definition renumbered from Section 345-1 to 345-2.
  (2) "IMC" acronym added.
  (3) "Intermediate Metal Conduit" capitalized as it is a proper name of a product.
  (4) Listing requirements relocated to new Section 345-6.
- **345-3**
  (1) Other Articles renumbered from Section 345-2 to 345-3.
  (2) Delete product name and replace with acronym "IMC".
  (3) Text revised for clarity.
- **345-6** — **New section to relocate listing requirements for IMC and associated fittings. Listing requirements for the conduit and fittings came from 345-2 (99 NEC).**
- **345-10**
  (1) Uses Permitted renumbered from Section 345-3 to 345-10.
  (2) Delete product name and replace with acronym "IMC" (four places).
  (3)Relocated equipment grounding to 345-60.
  (4)Subparagraph (d) added for Wet Locations relocated from 345-5.
  (5) Deleted Fine Print Note (two places) made redundant by adding new subparagraph (d).
- **345-20**
  (1) Size renumbered from Section 345-6 to 345-20.
  (2) Delete product name and replace with acronym "IMC" (three places).
  (3) The word "electrical" was deleted as it added nothing to the clarity of this section (two places).
  (4) Delete the text reference to the standard from which the metric trade numerical designations were taken.
- **345-22**
  (1) Number of Conductors renumbered from 345-7 to 345-22.
  (2) Reword section adding reference to cables for clarity.
  (3) Removed the reference to conduit for clarity (two places).
  (4) Deleted the text "using the conduit dimensions of Table 4, Chapter 9", which is not required for understanding this application.
- **345-24**
  (1) Bends-How Made renumbered from 345-10 to 345-24.
  (2) Delete product name and replace with acronym "IMC".
  (3) Corrected Table reference (two places).
- **345-26** — **Bends-Number in One Run renumbered from 345-11 to 345-26.**
- **345-28**
  (1) Reaming and Threading renumbered from 345-8 to 345-28.
  (2) Delete "of conduit" for clarity.
- **345-30**
  (1) Securing and Supporting renumbered from 345-12 to 345-30.
  (2) Deleted product name and replaced with acronym "IMC" (four places)
  (3) Corrected Table reference.

- 345-40
  (1) Boxes and Fittings renumbered from 345-13 to 345-40.
  (2) Revised text for clarity.

- 345-46 Bushings renumbered from 345-15 to 345-46

- 345-56 Splices and Taps renumbered from 345-14 to 345-56.

- 345-60 New Section for the grounding requirements. Text moved from 345-3 (99 NEC).

- 345-120
  (1) Marking requirements relocated from 345-16(b) and 345-16(c).
  (2) Section Tiltle "Corrosion Resistant Material" deleted since the text reference is to the marking.

- 345-130
  (1) Standard Lengths renumbered from 345-16(a) to 345-130.
  (2) Deleted product name and replaced with acronym "IMC".

The following Section numbers have been assigned unilaterally throughout all 10 raceway articles.	Common Numbering System for the Circular Raceway Articles
	Article 3XX, <title>: <acronym>
	Part A. General
3XX - 1	Scope.
3XX - 2	Definitions.
3XX - 3	Other Articles.
3XX - 6	Listing Requirements.
	Part B. Installation
3XX - 10	Uses Permitted.
3XX - 12	Uses Not Permitted.
3XX - 14	Dissimilar Metals.
3XX - 16	Temperature Limits.
3XX - 20	Size.
3XX - 22	Number of Conductors.
3XX - 24	Bends – How Made.
3XX - 26	Bends – Number in One Run.
3XX - 28	Reaming & Threading.
3XX - 28	Trimming.
3XX - 30	Securing and Supporting.
3XX - 40	Boxes and Fittings.
3XX - 42	Coupling and Connectors
3XX - 44	Expansion Fittings
3XX - 46	Bushings.
3XX - 48	Joints.
3XX - 50	Conductor Terms
3XX - 56	Splices and Taps.
3XX - 60	Grounding.
	Part C. Construction Specifications.
3XX - 100	Construction.
3XX - 110	Corrosion Protection.
3XX - 120	Marking.
3XX - 130	Standard Lengths.

PANEL ACTION: Accept in Principle.
Delete proposed 345-3.
Delete proposed 345-40.
In proposed 345-22 delete the words "or cables."
Delete second sentence of proposed 345-56.
PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP-8 recommends approval of the scope section by the TCC.
The proposed 345-3, 345-40 and second sentence of 345-56 are deleted as 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.
There was no technical substantiation provided to add the words "or cables" as part of the rewrite of 345-22.

(Log #1280)

8- 205 - (345): Accept
Note: The Technical Correlating Committee notes that the actions on this Proposal will be integrated into the revised sections by the action on Proposal 8-204 and is also modified by the action on Proposal 8-216.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION:
Revise as follows:
345-3 (c) Cinder Fill. Intermediate metal conduit shall be permitted to be installed in or under cinder fill where subject to permanent moisture where protected on all sides by a layer of noncinder concrete not less than 50 mm (2 in.)~~2 in. (50.8 mm)~~ thick; where the conduit is not less than 450 mm (18 in.)~~18 in. (457 mm)~~ under the fill; or where protected by corrosion protection and judged suitable for the condition.
345-6 (a) Minimum. Conduit smaller than metric designator 16 (1/2) ~~1/2 in. electrical trade size~~ shall not be used.
345-6 (b) Maximum. Conduit larger than metric designator 103 (4) ~~4 in. electrical trade size~~ shall not be used.
FPN: Metric trade numerical designations for intermediate metal conduit are the same as those found in Extra-heavy Duty Rigid Steel Conduits for Electrical Installations, IEC 981-1989; namely, 16 = 1/2~~1/2 = 16~~, 21 = 3/4~~3/4 = 21~~, 27 = 1~~1 = 27~~, 35 = 1 1/4~~1 1/4 = 35~~, 41 = 1 1/2~~1 1/2 = 41~~, 53 = 2~~2 = 53~~, 63 = 2 1/2~~2 1/2 = 63~~, 78 = 3~~3 = 78~~, 91 = 3 1/2~~3 1/2 = 91~~, and 103 = 4~~4 = 103~~.
345-8 All cut ends of conduits shall be reamed or otherwise finished to remove rough edges. Where conduit is threaded in the field, a standard cutting die with a taper of 1 in 16 (3/4-in. taper per foot)~~(1 in 16)~~ shall be used.
345-12 (a) Securely Fastened. Each intermediate metal conduit shall be securely fastened within 900 mm (3 ft)~~3 ft (914 mm)~~ of each outlet box, junction box, device box, cabinet, conduit body, or other conduit termination. Fastening shall be permitted to be

increased to a distance of 1.5 m (5 ft) ~~(1.52 m)~~where structural members do not readily permit fastening within 900 mm (3 ft)~~3 ft (914 mm)~~. Where approved, conduit shall not be required to be securely fastened within 900 mm (3 ft) ~~(914 mm)~~ of the service head for above-the-roof termination of a mast.

345-12 (b) (1) Conduit shall be supported at intervals not exceeding 3 m (10 ft) ~~(3.05 m)~~.

345-12 (b) (3) Exposed vertical risers from industrial machinery shall be permitted to be supported at intervals not exceeding 6 m (20 ft) ~~(6.1 m)~~, provided the conduit is made up with threaded couplings, is firmly supported at the top and bottom of the riser, and no other means of intermediate support is readily available.

345-12 (b) (4) Horizontal runs of intermediate metal conduit supported by openings through framing members at intervals not exceeding 3 m (10 ft) ~~(3.05 m)~~ and securely fastened within 900 mm (3 ft) ~~914 mm)~~ of termination points shall be permitted.

345-16 (a) Standard Lengths. The standard length of intermediate metal conduit shall be 3.05 m (10 ft) ~~(3.05 m)~~, including an attached coupling, and each end shall be threaded. Longer or shorter lengths with or without coupling and threaded or unthreaded shall be permitted.

345-16 (c) (c) Marking. Each length shall be clearly and durably marked at least every 1.5 m (5 ft) ~~(1.52 m)~~ with the letters IMC. Each length shall be marked as required in the first sentence of Section 110-21.

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis. In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised. In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.

PANEL ACTION: Accept.

(Log #2068)

8- 206 - (345-1 (New)): Accept in Principle

SUBMITTER: Joel A. Rencsok, Scottsdale, AZ

RECOMMENDATION:

Add a Scope section to Article 345 to read as follows:

345-1. Scope. The provisions of this article covers the use, installation, and construction specifications requirements of intermediate metal conduit.

Renumber remaining sections.

SUBSTANTIATION: Each Article should have a scope section.

The NEC style manual on style also shows a scope article.

To keep the Articles consistent all Articles should be similar.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Proposal 8-204.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3180)

8- 207 - (345-1 (New)): Accept in Principle

SUBMITTER: Tim Andrassy, Steel Tube Inst.

RECOMMENDATION:

Add a new section to read:

Scope. This article covers the use, installation, and construction requirements for Intermediate Metal Conduit (IMC), elbows, couplings and associated fittings.

SUBSTANTIATION: Several articles in the Code contain a section on "Scope" which is helpful in providing an overview of what the article covers or will cover. This new Scope for IMC contains references to elbows, couplings and associated fittings, which are all currently addressed in several sections of Article 345 and are important to the proper use of this product.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Proposal 8-204.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2197)

8- 208 - (345-1-Intermetal Metal Conduit): Accept in Principle

SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.

RECOMMENDATION:

Revise as follows:

Intermediate metal conduit is a listed steel raceway of circular cross section with integral or associated couplings, ~~approved~~ for the installation of electrical conductors and used with listed fittings to provide electrical continuity.

SUBSTANTIATION: A definition in the NEC cannot presuppose acceptance by the authority having jurisdiction (approved). The listing already qualifies intermediate metal conduit for use in accordance with Article 345 of the NEC. See the UL General Information for Electrical Equipment 1999. The NEC Style Manual 2.2.2 states, "Definitions shall not contain requirements or recommendations." Requiring intermediate metal conduit to be approved to comply with the definition is a requirement. This definition should be written similar to other related definitions, for example, see 331-1 first paragraph.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action on Proposal 8-209.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3181)

8- 209 - (345-1-Intermetal Metal Conduit): Accept

Note: The Technical Correlating Committee understands that this action revises the accepted text in 345-2 in Proposal 8-204.

SUBMITTER: Tim Andrassy, Steel Tube Inst.

RECOMMENDATION:

Revise the definition to read:

Intermediate Metal Conduit (IMC) is a steel threadable raceway of circular cross section designed for the physical protection and routing of conductors and cables and for use as an equipment grounding conductor when installed with its integral or associated coupling and appropriate fittings. ~~listed steel raceway of circular cross section with integral or associated couplings, approved for the installation of electrical conductors and used with listed fittings to provide electrical continuity.~~

SUBSTANTIATION: This definition aids in differentiating between wiring methods. Also, if accepted this definition will be proposed for a trinational standard under development. More detailed definitions will be beneficial in encouraging international use of the NEC. Also, steel is the only material to be used for IMC. Proof of equivalency to rigid was required before IMC was accepted.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry

EXPLANATION OF NEGATIVE:
BERMAN: This proposal should be rejected. This definition contains uses permitted, which are covered elsewhere in Article 345. The definition in Proposal 8-204 is preferred.

(Log #1428)

8- 210 - (345-2): Accept in Principle
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION:
Delete 345-2 in its entirety.
SUBSTANTIATION: 1999 National Electrical Code Style Manual:
Section 4.1 states "Do not use a reference if the requirement is already covered by 90.3."
Section 4.1.1 stipulates that "References shall not be made to an entire article... unless additional conditions are specified.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-204.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3166)

8- 211 - (345-3): Accept in Principle in Part
SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION: Split into Uses Permitted and Uses Not Permitted and number appropriately, as follows:
Uses Permitted: IMC, elbows, couplings and fittings shall be permitted
(a) Exposed and Concealed. For exposed and concealed work, under all
atmospheric conditions and occupancies;
(b) In Concrete and Direct Contact with Soil.
(1) In concrete;
(2) In direct contact with the soil;
(c) Corrosive Environment. In environments subject to severe corrosive influences where
protected by corrosion protection judged suitable for the condition.
FPN: See Section 300-6 for protection against corrosion.
(d) Cinder Fill. In or under cinder fill where subject to permanent moisture
where protected on all sides by a layer of noncinder concrete not less than
2 in. (50.8 mm) thick; where the conduit is not less than 18 in. (457 mm)
under the fill; or where protected by corrosion protection and judged
suitable for the condition.
(e) Equipment Grounding. As an equipment grounding conductor where installed in compliance
with Article 250.
Uses Not Permitted. IMC, elbows, couplings and associated fittings protected solely by enamel shall not be permitted to be used:
(a) Outdoors, including underground;
(b) In locations subject to severe corrosive influences.
FPN: See Section 300-6 for protection against corrosion.
SUBSTANTIATION: To provide a Uses Permitted and Uses Not Permitted Section which is formatted to be more consistent with other Code Articles for usability and clarity.
∑ The information on dissimilar metals which currently appears in 345-3 has been deleted. A separate proposal has been submitted to create a new section on Dissimilar Metals.
∑ The UL listing clearly permits IMC in concrete without supplementary protection. The listing also states that IMC does not generally require supplementary protection in direct contact with soil; the new (c) clarifies that additional protection could be required in severely corrosive locations. The title of this Section was revised from Corrosion Protection to Corrosive Environments as a more appropriate title
∑ In (b), "earth" was changed to "soil" in the heading and text for terminology consistent with the listing information.
PANEL ACTION: Accept in Principle in Part.
Accept in principle by adoption of the wording in proposed 345-10 in Proposal 8-204 with the following modification:
Change the title of proposed section 345-10(b) to "Corrosive Environments."
The proposed section "Uses Not Permitted" is not accepted.
PANEL STATEMENT: The panel's action on Proposal 8-204 satifies the concerns of the submitter, except that the proposed new section "Uses Not Permitted" is not accepted as enamel coated IMC is not produced.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #258)

8- 212 - (345-3(a)): Reject
SUBMITTER: Charles M. Trout, Maron Electric Co.
RECOMMENDATION: Add the following wording at the end of the third sentence:
"where an application of a listed grounding continuity liquid or compound has been applied to all threaded portions of the intermediate metal conduit raceway".
The last sentence will now read:
"Intermediate metal conduit shall be permitted as an equipment grounding conductor where an application of a listed grounding continuity liquid or compound has been applied to all threaded portions of the intermediate metal conduit raceway."
SUBSTANTIATION: Other than a separate equipment grounding conductor being run with the circuit or feeder conductors, the metallic raceway is the best equipment grounding conductor we have. But just as a separate grounding conductor must be properly terminated or spliced with listed devices, a metallic raceway must be terminated or joined together in an approved manner. The problems of corrosion at threaded joints in metallic raceways has been well-documented. The resulting high resistance connections prevent the installations from being in conformance with the requirements of Section 250-2(d) and the integrity of the ground fault path is severely diminished. The addition of this requirement will be another step toward the accomplishment of the purpose of the code. — "The practical safeguarding of persons and property from hazards arising from the use of electricity."
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not identified that there are any products available that have been evaluated for use with metal raceways and will meet the intent of this proposal. Factory cut threads are protected against corrosion.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #413)

8- 213 - (345-3(a), Articles 346, 347, 348-1): Reject
SUBMITTER: Salem L. Wardi, First Choice Electric
RECOMMENDATION:
Add sections to 345-3(a), 346, 347, 348-1 for each pipe run from distribution panel or power panel we should run grounding wire with circuit in the same raceway to meet 250-1 14.
SUBSTANTIATION: For every lighting fixture required to be grounded and equipment ground - if used with romax, MC or AC cable two wires plus the ground to the junction box where there is hot and neutral from the panel - the grounding connectors are leftover in the box.
PANEL ACTION: Reject.
PANEL STATEMENT: There was no specific recommendation made by the submitter. Section 4-3.3(c) of the Regulations Governing Commitee Projects requires proposals to include proposed text, including the words to be added, revised (and how revised), or deleted.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

NOT RETURNED: 1 Corry

(Log #3072)

8- 214 - (345-3(a)): Accept in Principle
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION:
Delete the text regarding dissimilar metals from 345-3(a) and the exception and add a new section to read:
xxx. Dissimilar Metals. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action. Aluminum fittings and enclosures shall be permitted to be used with steel intermediate metal conduit.
SUBSTANTIATION: The cautionary information on dissimilar metals is more appropriate in a separate section.

PANEL ACTION: Accept in Principle.
In Proposal 8-204 delete the second sentence and exception in 345-10(a) .
Add proposed language to 8-204 as amended: 345-14. Dissimilar Metals. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action.
Aluminum fittings and enclosures shall be permitted to be used with ~~steel intermediate metal conduit~~ IMC.
PANEL STATEMENT: The removal of the product name and use of the acronym complies with the style manual.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3183)

8- 215 - (345-3(a)): Accept in Principle
SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION:
Delete the text regarding dissimilar metals from 345-3(a) and the Exception and add a new section to read:
xxx. Dissimilar Metals. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action. Aluminum fittings and enclosures shall be permitted to be used with steel intermediate metal conduit.
SUBSTANTIATION: A companion proposal to split 345-3 into Uses Permitted and Uses Not Permitted has been submitted. The cautionary information on dissimilar metals is more appropriate in a separate section.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-214.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3073)

8- 216 - (345-6): Accept in Principle
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION:
Revise this section and the FPN to read:
(a) Minimum. IMC ~~Conduit~~ smaller than 1/2 (16) ~~in. electrical trade size~~ shall not be used.
(b) Maximum. IMC ~~Conduit~~ larger than 4 (103) ~~in. electrical trade size~~ shall not be used.
FPN: The Trade Sizes and Metric Designators are for identification purposes only and do not relate to actual dimensions. See 300-x.
~~FPN: Metric trade numerical designations for intermediate metal conduit are the same as those found in Extra-heavy Duty Rigid Steel Conduits for Electrical Installations, IEC 81-1989; namely, 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, 4 = 103.~~
SUBSTANTIATION: To correlate with proposal submitted to CMP 3 to add a table showing English and Metric trade size designators. The table provides universal information throughout the Code. This cuts out a lot of excess language in the Code, which is no longer needed. Metric trade sizes have been established for two Code cycles and cover raceways and system components. Also, picks up use of acronym as proposed for the 2002 Code.
PANEL ACTION: Accept in Principle.
The panel accepts in principle the addition of the new FPN to read as follows:
FPN: See 300-1(c) for the Metric Designators and Trade Sizes. These are for identification purposes only and do not relate to actual dimensions.
The panel accepts the deletion of the old FPN. The panel accepts in principle the replacement of the word "conduit" with the acronym "IMC" and the deletion of "in. electrical trade size" by action on Proposals 8-204 and 8-205.
PANEL STATEMENT: The acceptance of the changes to the Fine Print Notes are contingent upon an acceptance of Proposal 3-6 by CMP-3. If CMP-3 does not accept Proposal 3-6, the panel directs staff to revert to the existing FPN. The proposed Fine Print Note was revised to comply with Section 4.1.2 of the NEC Style Manual. See panel action on Proposals 8-204 and 8-205.

(Log #CP803)

8- 216a - (345-7): Accept
Note: The Technical Correlating Committee understands that this action is added to the accepted text in 345-22 in Proposal 8-204.
SUBMITTER: CMP 8
RECOMMENDATION:
Add new second paragraph to 345-7 to read:
"Cables shall be permitted to be installed where such use is permitted by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9."
SUBSTANTIATION: The proposed language clarifies that cables, where permitted elsewhere in the code, are allowed to be used in a raceway. It also provides clear direction on how to determine raceway fill where cables are installed.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

(Log #366)

8- 217 - (345-9(a), 346-9(a)): Accept in Principle
Note: The Technical Correlating Committee understands that this action added to the accepted text in 345-42(a) in Proposal 8-204.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION:
Add to (a):
Threadless couplings and connectors shall not be used on threaded conduit ends.
SUBSTANTIATION: I have seen hundreds of such uses of threadless couplings on threaded conduit ends where they were expedient due to labor saving and cost of Erickson type couplings, where conduit installation was difficult due to size and amount of rebar restricted space and impossibility of threading together of conduit bends. A judgment call by the authority having jurisdiction to allow this was based on lack of specific mention in U.L. listing and no data whether this was in violation of Section 250-2(d). A reasonable assumption is that a set-screw or compression type coupling installed on threads provides a questionable compliance with Section 250-2(d). The UL white book doesn't appear to provide any help for enforcement of Section 110-3(b).
PANEL ACTION: Accept in Principle.
Accept the proposal with modification to read:
Threadless couplings and connectors shall not be used on threaded conduit ends unless listed for the purpose.
PANEL STATEMENT: There are threadless fittings that are listed and the required markings indicate suitablity for use with threaded conduit ends.

8- 218 - (345-10): Accept
Note: The Technical Correlating Committee understands that this recommendation becomes the last sentence of, and deletes the Exception to, 345-24 of Proposal 8-204.
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION:
Revise the last sentence to read as follows and delete the exception:
The radius of the curve of any field bend to the centerline of the conduit ~~of the inner edge of any field bend~~ shall not be less than indicated in Table 346-10.
~~Exception: For field bends for conductors without lead sheath and made with a single operation (one shot) bending machine designed for the purpose, the minimum radius shall not be less than that indicated in table 346-10, Exception.~~
NOTE: This is a companion proposal to one for Section 346-10 and it is intended that the revised Table 346-10 suggested in that proposal would apply.

SUBSTANTIATION: Manufacturers of bending equipment measure to the centerline. This revised text and table clarifies the measurement in accordance with current field practice. The proposal defines that measurements are to the centerline regardless of the bender type. Lead sheath conductors are no longer made, therefore that option has been deleted and the one-shot bender information has been included in the new table.
PANEL ACTION: Accept.

(Log #2869)

8- 219 - (345-11, 346-11): Reject
SUBMITTER: Bruce Mitchell, Thornton, CO
RECOMMENDATION:
Revise text to read as follows:
The cumulative total of all angles formed by bending of the conduit between pull points (e.g. conduit bodies and boxes) shall not exceed 360°.
SUBSTANTIATION: Current language is imprecise and could be interpreted as implying that any bend greater than a quarter (90°) is not allowed.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing text adequately explains the requirements for conduit bends. Four quarter bends is used as an example and does not limit the angle of any bend to 90 degrees or less.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3070)

8- 221 - (345-12(b)(3)): Accept in Part
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION:
Revise Section 345-12(b)(3) as follows:
Exposed vertical risers from stationary equipment or fixtures ~~industrial machinery~~ shall be permitted to be supported at intervals not exceeding 20 ft (6.1 m), provided the conduit is made up with threaded couplings, is firmly supported at the top and bottom of the riser, and no other means of intermediate support is readily available.
SUBSTANTIATION: To correlate with the change to 346-12(b)(3), which was made to the 1999 NEC. IMC is equivalent to rigid conduit, with physical characteristics equal or greater than RMC.
PANEL ACTION: Accept in Part.
PANEL STATEMENT: The panel agrees with the proposed removal of the words "industrial machinery," but does not concur that the permission should apply to stationary equipment and fixtures. See panel action and statement on Proposal 8-222.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 2
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
COX: I disagree with the panel statement that the equipment must be fastened to the floor. When this section was originally put in the code, the submitter's intention was to be able to wire heavy equipment that would not move during operation without fastening it to the floor. Whatever term we use for this equipment, we should not require it to be fastened to the floor to meet the provisions of this section.
GRIFFITH: Although I support the idea that the application, in the case of equipment, should be limited to "fixed equipment", no substantiation has been provided to deny the application to "stationary industrial machinery". Countless installations of heavy (stationary) industrial machinery are in existence without any known problems. Section 345-12(b)(3) should read, "Exposed vertical risers from fixed equipment or stationary industrial machinery shall be...".
COMMENT ON AFFIRMATIVE:
BERMAN: Panel Action should have been Accept in Principle in Part, not Accept in Part. The Panel accepted the removal of the words "industrial machinery", but not the addition of "stationary equipment or fixtures". However, the Panel referred to its action and statement on Proposal 8-222, where "fixed equipment" was accepted.
LOYD: The proposal should be accepted. The panel went beyond the submitter's proposal without any substantiation. The submitter only asked that "stationary equipment or fixtures" be added to the types of equipment that could be supported at intervals not exceeding 20 ft (6.1 m), provided the conduit is made up with threaded couplings, is firmly supported at the top and bottom of the riser, and no other means of intermediate support is readily available. This change was to correlate with the change to 346-12(b)(3), which was made to the 1999 NEC.
IMC is permitted for the same uses as RMC. No substantiation was presented to limit this product's use or to show that any safety problems have occurred because of the change to 346-12(b)(3).

(Log #4208)

8- 222 - (345-12(b)(3)): Accept in Principle
Note: The Technical Correlating Committee understands that this action revises 345-30(b)(3) of Proposal 8-204.
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION:
Revise as follows:
Exposed vertical risers from fixed or stationary equipment ~~industrial machinery~~ shall be permitted to be supported at intervals not exceeding 20 ft (6.1 m), provided the conduit is made up with threaded couplings, is firmly supported at the top and bottom of the riser, and no other means of intermediate support is readily available.
SUBSTANTIATION: This is the 1999 change for rigid metal conduit, now to be correlated with Article 345. The actual wording of this proposal corresponds to a companion proposal to limit the allowance to fixed or stationary equipment and not cover fixtures. Please refer to the proposal to Section 346-12(b)(3) for more information.
PANEL ACTION: Accept in Principle.
In the proposed text delete the words "or stationary."
PANEL STATEMENT: Stationary equipment is usually not moved, but fixed equipment is fastened in place. Stationary equipment may be moved, thus possibly damaging fittings and couplings.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 2
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
COX: See my Explanation of Negative Vote on Proposal 8-221.
GRIFFITH: See my Explanation of Negative Vote on Proposal 8-221.
COMMENT ON AFFIRMATIVE:
BERMAN: Panel Action should have been Accept in Part, not Accept in Principle. The Panel accepted the removal of the words "industrial machinery" and the addition of "fixed equipment", but not the addition of "stationary equipment".

LOYD: The proposal should be accepted. This change was proposed in order to correlate with the 1999 Code change to the Rigid Metal Conduit section 346-12(b)(3). The words "stationary equipment" appear at least nine times in the code. The submitter did not ask for the deletion of the words "stationary equipment". No substantiation was provided nor were there any problems noted to justify this deletion.
Article 345 covers IMC, which is permitted for the same uses as RMC. No substantiation was provided nor was there any problems noted to justify the deletion of "stationary equipment".

(Log #1068)

8- 223 - (345-15, FPN): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION:
Change "No. 4" to "4 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.

ARTICLE 346 — RIGID METAL CONDUIT: TYPE RMC

(Log #1224)

8- 231 - (346): Accept in Principle
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION:
Revise Article 346 to read as follows:

Article346—Rigid Metal Conduit: Type RMC

A. General

346-1. Scope. This article covers the use, installation, and construction specifications for Rigid Metal Conduit (RMC) and associated fittings.

346-2. ~~346-1~~. Definition. ~~Rigid metal conduit is a listed~~ Rigid Metal Conduit (RMC). A metal raceway of circular cross section with integral or associated couplings, approved for the installation of electrical conductors and used with ~~listed~~ fittings to provide electrical continuity.

346-3. ~~346-2~~. Other Articles. Installations for RMC ~~rigid metal conduit~~ shall comply with ~~the provisions of the~~ applicable provisions ~~sections~~ of Article 300.

346-6. Listing Requirements. RMC and associated fittings shall be listed.

B. Installation

346-10. ~~346-3~~. Uses Permitted.

(a) All Atmospheric Conditions and Occupancies. Use of RMC ~~rigid metal conduit~~ shall be permitted under all atmospheric conditions and occupancies. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action. ~~Rigid metal conduit shall be permitted as an equipment grounding conductor.~~ Ferrous raceways and fittings protected from corrosion solely by enamel shall be permitted only indoors and in occupancies not subject to severe corrosive influences. Aluminum fittings and enclosures shall be permitted to be used with steel RMC ~~rigid metal conduit~~, and steel fittings and enclosures shall be permitted to be used with aluminum RMC ~~rigid metal conduit~~.

(b) Corrosion Protection. ~~Rigid metal conduit~~ RMC, elbows, couplings, and fittings shall be permitted to be installed in concrete, in direct contact with the earth, or in areas subject to severe corrosive influences where protected by corrosion protection and judged suitable for the condition.

~~FPN: See Section 300-6 for protection against corrosion.~~

(c) Cinder Fill. ~~Rigid metal conduit~~ RMC shall be permitted to be installed in or under cinder fill where subject to permanent moisture where protected on all sides by a layer of noncinder concrete not less than 2 in. (50.8 mm) thick; where the conduit is not less than 18 in. (457 mm) under the fill; or where protected by corrosion protection and judged suitable for the condition.

~~FPN: See Section 300-6 for protection against corrosion.~~

(d) ~~346-5.~~ Wet Locations. All supports, bolts, straps, screws, etc., shall be of corrosion-resistant materials or protected against corrosion by corrosion-resistant materials.

FPN: See Section 300-6 for protection against corrosion.

346-20. Size.

(a) Minimum. ~~Rigid metal conduit~~ RMC smaller than 1/2-in. ~~electrical~~ trade size shall not be used.

Exception: For enclosing the leads of motors as permitted in Section 430-145(b).

(b) Maximum. ~~Rigid metal conduit~~ RMC larger than 6-in. ~~electrical~~ trade size shall not be used.

FPN: Metric trade numerical designations for ~~rigid metal conduit~~ RMC are ~~the same as those found in Extra heavy Duty Rigid Steel Conduits for Electrical Installations, IEC 981-1989; namely,~~ 3/8 = 12, 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, 4 = 103, 5 = 129, and 6 = 155.

346-22. Number of Conductors ~~in Conduit~~.

The number of conductors or cables ~~in a single conduit~~ shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9~~, using the conduit dimensions of Table 4, Chapter 9~~.

346-24. ~~346-10.~~ Bends — How Made. Bends ~~of rigid metal conduit~~ shall be made so that the conduit will not be damaged and that the internal diameter of the conduit will not be effectively reduced. The radius of the curve of the inner edge of any field bend shall not be less than indicated in Table 346-24 ~~346-10.~~

Table 346-24. ~~346-10.~~ Radius of Conduit Bends

[1999 NEC® Table 346-10. Radius of Conduit Bends here]

Exception: For field bends for conductors without lead sheath and made with a single operation (one shot) bending machine designed for the purpose, the minimum radius shall not be less than that indicated in Table 346-24~~346-10~~, Exception.

Table 346-24. ~~346-10.~~ Exception, Radius of Conduit Bends

[1999 NEC® Table 346-10. Exception, Radius of Conduit Bends here]

346-26. ~~346-11.~~ Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, e.g., conduit bodies and boxes.

346-28. ~~346-8.~~ Reaming and Threading. All cut ends ~~of conduits~~ shall be reamed or otherwise finished to remove rough edges. Where conduit is threaded in the field, a standard cutting die with a 3/4-in. taper per foot (1 in 16) shall be used.

FPN: See Standards for Pipe Threads, General Purpose (Inch), ANSI/ASME B.1.20.1-1983.

346-30. ~~346-12.~~ Securing and Supporting. ~~Rigid metal conduit~~ RMC shall be installed as a complete system as provided in Article 300 and shall be securely fastened in place and supported in accordance with (a) and (b).

(a) Securely Fastened. ~~Each rigid metal conduit~~ RMC shall be securely fastened within 3 ft (914 mm) of each outlet box, junction box, device box, cabinet, conduit body, or other conduit termination. Fastening shall be permitted to be increased to a distance of 5 ft (1.52 m) where structural members do not readily permit fastening within 3 ft (914 mm). Where approved, conduit shall not be required to be securely fastened within 3 ft (914 mm) of the service head for above-the-roof termination of a mast.

(b) Supports. ~~Rigid metal conduit~~ RMC shall be supported in accordance with one of the following.

(1) Conduit shall be supported at intervals not exceeding 10 ft (3.05 m).

(2) The distance between supports for straight runs of conduit shall be permitted in accordance with Table 346-30(b)(2) ~~346-12(b)(2)~~, provided the conduit is made up with threaded couplings, and such supports prevent transmission of stresses to termination where conduit is deflected between supports.

(3) Exposed vertical risers from stationary equipment or fixtures shall be permitted to be supported at intervals not exceeding 20 ft (6.1 m), provided the conduit is made up with threaded couplings, is firmly supported at the top and bottom of the riser, and no other means of intermediate support is readily available.

(4) Horizontal runs of ~~rigid metal conduit~~ RMC supported by openings through framing members at intervals not exceeding 10 ft (3.05 m) and securely fastened within 3 ft (914 mm) of termination points shall be permitted.

Table 346-30(b)(2). ~~346-12(b)(2).~~ Supports for Rigid Metal Conduit

[1999 NEC® Table 346-12(b)(2). Supports for Rigid Metal Conduit here]

346-40. ~~346-13.~~ Boxes and Fittings. ~~See~~ Boxes and fittings shall comply with the applicable provisions of Article 370.

346-42. ~~346-9.~~ Couplings and Connectors.

(a) Threadless. Threadless couplings and connectors used with conduit shall be made tight. Where buried in masonry or concrete, they shall be the concretetight type. Where installed in wet locations, they shall be the raintight type.

(b) Running Threads. Running threads shall not be used on conduit for connection at couplings.

346-46. ~~346-15.~~ Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing shall be provided to protect the wire

from abrasion unless the design of the box, fitting, or enclosure is such as to afford equivalent protection.

FPN: See Section 300-4(f) for the protection of conductors sizes No. 4 and larger at bushings.

346-56. ~~346-14.~~ Splices and Taps. Splices and taps shall be made in accordance with Section 300-15. See Article 370 for rules on the installation and use of boxes and conduit bodies.

346-60. Grounding. ~~Rigid metal conduit~~ RMC shall be permitted as an equipment grounding conductor.

C. Construction Specifications.

346-120. ~~346-16(c).~~ Marking. Each length shall be clearly and durably identified in every 10 ft (3.05 m) as required in the first sentence of Section 110-21. ~~346-16(b) Corrosion Resistant Material.~~ Nonferrous conduit of corrosion-resistant material shall have suitable markings.

346-130. ~~346-16(a).~~ Standard Lengths. The standard length of ~~rigid metal conduit~~ RMC shall be 10 ft (3.05 m), including an attached coupling, and each end shall be threaded. Longer or shorter lengths with or without coupling and threaded or unthreaded shall be permitted.

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways of circular cross-section. For the 1999 NEC, a previous Sub-Task Group recommended that all of the circular raceway articles be combined into a single article (Article 344), to present a more uniform approach to the conduit and tubing requirements and to consolidate common requirements.

Review of public comments led the Panel to conclude that the proposed Article 344 had not realized its goal of a more user-friendly Code language. Furthermore, the Panel requested that a committee be appointed to consider the issue of user friendly code as it relates to the circular raceway articles.

The Sub-Task Group was asked to address possibilities such as revising the rejected 1999 proposal based on the public comments, developing one or more articles to address the requirements presented in the nine current circular raceway articles, or revising the current nine circular raceway articles using a similar style manual format. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.

A uniform format is proposed to achieve consistency across all of the circular raceways. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. A table that provides the uniform format for each circular raceway has been provided with this proposal.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for conduit and tubing not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

Explanation of proposed renumbering and editorial changes.

A general change in the rewrite of Article 346 was to add the acronym "RMC" and use it to replace Rigid Metal Conduit throughout the Article. The reason some Sections were moved in their entirety is to provide a uniform format of Section reference across all the circular raceway Articles.

- Title The text "Type" and acronym "RMC" added.

- 346-1
  - (1) New Scope added to conform to the NEC® style manual.

- 346-2
  - (1) Definition relocated from 346-1 to 346-2.
  - (2) "Rigid Metal Conduit" capitalized, as it is a proper name of a product.
  - (3) Acronym "RMC" added .
  - (4) Listing requirements relocated to 346-6.

- 346-3
  - (1) Other Articles relocated from 346-2 to 346-3.
  - (2) Delete product name and replace with acronym "RMC".
  - (3) Text revised for clarity.

- 346-6
  - (1) Relocate existing text to new 346-20.
  - (2) Rename Section "Listing Requirements"
  - (3) Relocate listing requirements for RMC and associated fittings from 346-2.

- 346-10

  (a)
  - (1) Uses Permitted relocated from 346-3 to 346-10.
  - (2) Delete product name and replace with acronym "RMC" (three places).
  - (3) Relocate equipment grounding to 346-60

  (b)
  - (1) Delete product name and replace with acronym "RMC".
  - (2) Delete the FPN reference made redundant by adding new subparagraph (d) that already contains the reference.

  (c)
  - (1) Delete product name and replace with acronym "RMC".
  - (2) Delete the FPN reference made redundant by adding new subparagraph (d) that already contains the reference.

  (d)
  - (1) Subparagraph (d) added for "Wet Locations" relocated from 346-5.

- 346-20 New Section
  - (1) Size relocated from 346-6 to 346-20.
  - (2) Delete product name and replace with acronym "RMC" (three places).
  - (3) Word "electrical" deleted as it added nothing to the clarity of the section.
  - (4) Delete the text reference to the standard from which the metric trade numerical designations were taken.
  - (5) Add trade size 3/8 and associated metric designator 12 as it is recognized in Section 430-145(b).

- 346-22 New Section
  - (1) Number of Conductors relocated from 346-7 to 346-22.
  - (2) Delete Section title text "in Conduit" for uniformity across raceway Articles.
  - (3) Add text "or cables" for clarity.
  - (4) Removed text "in single conduit" because it does not aid usability.
  - (5) Delete the text "using the conduit dimensions of Table 4, Chapter 9", which is not required for understanding and application.

- 346-24 New Section
  - (1) Bends-How Made relocated from 346-10 to 346-24.
  - (2) Delete text "of rigid metal conduit". Not needed for application since Article 346 covers Rigid Metal Conduit.
  - (3) Correct Table reference, from 346-10 to 346-24, caused by relocation of text and renumbering of Section (four places).

- 346-26 New Section
  - (1) Bends-Number in One Run relocated from 346-11 to 346-26.

- 346-28 New Section
  - (1) Relocated from 346-8 to 346-28.
  - (2) Delete text "of conduits" which is not needed for clarity.

- 346-30 New Section

(1) Securing and Supporting relocated from 346-12 to 346-30.
(2) Deleted product name and replaced with acronym "RMC" (four places).

(3) Correct Table reference, from 346-12(b)(2) to 346-30(b)(2), caused by relocation of text and renumbering of Section (two places).

· 346-40 New Section
(1) Boxes and Fittings relocated from 346-13 to 346-40.
(2) Text added for consistency among Articles without a change in requirement or intent.

· 346-42 New Section
(1) Couplings and Connectors relocated from 346-9 to 346-42.

· 346-46 New Section
(1) Bushings relocated from 346-15 to 346-46

· 346-56 New Section
(1) Splices and Taps relocation from 346-14 to 346-56.

· 346-60 New Section
(1) Text relocated from 346-3(a), third sentence.
(2) Deleted product name and replaced with acronym "RMC".

· 346-120 New Section
(1) Marking requirements relocated from 346-16(c) to 346-120.
(2) Text from 346-16(b) relocated to 346-120 and Section title "Corrosion Resistant Material" deleted. Since text reference is to marking it is more appropriate here.

· 346-130 New section
(1) Relocated from 346-16(a) to 346-130.
(2) Deleted product name and replaced with acronym "RMC".

The following Section numbers have been assigned unilaterally throughout all 10 raceway articles.	Common Numbering System for the Circular Raceway Articles
	Article 3XX, <title>: <acronym>
	Part A. General
3XX - 1	Scope.
3XX - 2	Definitions.

PANEL ACTION: Accept in Principle.
Delete from the proposal: 346-3, 346-40, and the second sentence of 346-56.
PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP 8 recommends approval of the scope section by the TCC.
The proposed 346-3, 346-40 and second sentence of 346-56 are deleted as 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1281)

8- 232 - (346): Accept
Note: The Technical Correlating Committee notes that the revisions to the metric units in this recommendation will be implemented in the rearrangement of Proposal 8-231. The Technical Correlating Committee understands that the FPN in this Proposal is deleted by the action on Proposal 8-244.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise as follows:
346-3 (c) Cinder Fill. Rigid metal conduit shall be permitted to be installed in or under cinder fill where subject to permanent moisture where protected on all sides by a layer of noncinder concrete not less than 50 mm (2 in.) ~~(50.8 mm)~~ thick; where the conduit is not less than 450 mm (18 in.) ~~(457 mm)~~ under the fill; or where protected by corrosion protection and judged suitable for the condition.
346-6 (a) Minimum. Rigid metal conduit smaller than metric designator 16(1/2) ~~in. electrical trade size~~ shall not be used.
346-6-(b) Maximum. Rigid metal conduit larger than metric designator 155 (6)~~in. electrical trade size~~ shall not be used.
FPN: Metric trade numerical designations for rigid metal conduit are the same as those found in Extra-heavy Duty Rigid Steel Conduits for Electrical Installations, IEC 981-1989; namely, 16 = 1/2~~1/2 = 16~~, 21 = 3/4~~3/4 = 21~~, 27 = 1~~1 = 27~~, 35 = 1 1/4~~1 1/4 = 35~~, 41 = 1 1/2~~1 1/2 = 41~~, 53 = 2~~2 = 53~~, 63 = 2 1/2~~2 1/2 = 63~~, 78 = 3~~3 = 78~~, 91 = 3 1/2~~3 1/2 = 91~~, 103 = 4 ~~4 = 103~~, 129 = 5~~5 = 129~~, and 155 = ~~66 = 155~~. 346-8 All cut ends of conduits shall be reamed or otherwise finished to remove rough edges. Where conduit is threaded in the field, a standard cutting die with a 1 in 16 taper (1-in. taper per foot) ~~(1 in 16)~~ shall be used.

Table 346-10. Radius of Conduit Bends

Metric Designator	Trade Size	Conductors Without Lead Sheath	
		mm	in.
16	1/2	100	4
21	3/4	125	5
27	1	150	6
35	1 1/4	200	8
41	1 1/2	250	10
53	2	300	12
63	2 1/2	375	15
78	3	450	18
91	3 1/2	525	21
103	4	600	24
129	5	750	30
155	6	900	36

Table 346-10. Exception, Radius of Conduit Bends

Metric Designator	Trade Size	Radius to Center of Conduit	
		mm	in.
16	1/2	100	4
21	3/4	110	4 1/2
27	1	140	5 3/4
35	1 1/4	180	7 1/4
41	1 1/2	200	8 1/4
53	2	240	9 1/2
63	2 1/2	265	10 1/2
78	3	330	13
91	3 1/2	380	15
103	4	400	16
129	5	610	24
155	6	760	30

346-12 (a) Securely Fastened. Each rigid metal conduit shall be securely fastened within 900 mm (3 ft) ~~(914 mm)~~ of each outlet box, junction box, device box, cabinet, conduit body, or other conduit termination. Fastening shall be permitted to be increased to a distance of 1.5 m (5 ft) ~~(1.52 m)~~ where structural members do not readily permit fastening within 900 mm (3 ft) ~~(914 mm)~~. Where approved, conduit shall not be required to be securely fastened within 900 mm (3 ft) ~~(914 mm)~~ of the service head for above-the-roof termination of a mast.

346-12 (b) (1) Conduit shall be supported at intervals not exceeding 3 m (10 ft) ~~(3.05 m)~~.

346-12 (b) (3) Exposed vertical risers from stationary equipment or fixtures shall be permitted to be supported at intervals not exceeding 6 m (20 ft) ~~(6.1 m)~~, provided the conduit is made up with threaded couplings, is firmly supported at the top and bottom of the riser, and no other means of intermediate support is readily available.

346-12 (b) (4) Horizontal runs of rigid metal conduit supported by openings through framing members at intervals not exceeding 3 m (10 ft) ~~(3.05 m)~~ and securely fastened within 900 mm (3 ft) ~~(914 mm)~~ of termination points shall be permitted.

346-16 (a) Standard Lengths. The standard length of rigid metal conduit shall be 3.05 m (10 ft) ~~(3.05 m)~~, including an attached coupling, and each end shall be threaded. Longer or shorter lengths with or without coupling and threaded or unthreaded shall be permitted.

346-16 (c) Marking. Each length shall be clearly and durably identified in every 3 m (10 ft) ~~(3.05 m)~~ as required in the first sentence of Section 110-21.

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis. In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised.

In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion

PANEL ACTION: Accept.

(Log #3184)

8- 234 - (346-1 (New)): Accept in Principle
SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION: Add a new section to read:
Scope. This article covers the use, installation, and construction requirements for Rigid Metal Conduit (RMC), elbows, couplings, and associated fittings.
SUBSTANTIATION: Several articles in the Code contain a section on "Scope", which is helpful in providing an overview of what the article covers or will cover. This new Scope for RMC includes references to elbows, couplings and associated fittings, which are all currently addressed in several sections of Article 346 and are important to the proper use of this product.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-231.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3185)

8- 235 - (346-1): Accept
Note: The Technical Correlating Committee understands that this action revises the text of 346-2 accepted in Proposal 8-231.
SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION: Revise the definition to read:
Rigid Metal Conduit (RMC) is a threadable raceway of circular cross section designed for the physical protection and routing of conductors and cables and for use as an equipment grounding conductor when installed with its integral or associated coupling and appropriate fittings. RMC is generally made of steel (ferrous) with protective coatings or aluminum (nonferrous). Special use types are silicone bronze and stainless steel. ~~listed metal raceway of circular cross section with integral or associated couplings, approved for the installation of electrical conductors and used with listed fittings to provide electrical continuity.~~
SUBSTANTIATION: This definition aids in differentiating between wiring methods. Also, if accepted this definition will be proposed for a tri-national standard under development. More complete definitions will be beneficial in encouraging international use of the NEC. There are a lot of questions in the field regarding what articles cover aluminum and other specialized conduits. There is also confusion over the terms "ferrous" and "nonferrous". This provides clarity.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
BERMAN: This proposal should be rejected. This definition contains uses permitted and construction requirements, which are covered elsewhere in Article 346. The definition in Proposal 8-231 is preferred.

(Log #4209)

8- 236 - (346-1, Exception (New)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Add an exception as follows:
Exception: Rigid metal conduit made from stainless steel or from nonferrous metals other than aluminum shall be permitted to be approved.
SUBSTANTIATION: This exception will prove useful on swimming pools for brass conduit, since as of our last survey of listees under the DYWV category the listed material is no longer available. It will also prove to be useful in specialized industrial occupancies where stainless steel and other special alloys are used, also without listing because such relatively small quantities aren't practical to have listed. Although listing is certainly an option that the authority having jurisdiction could fall back on, in many jurisdictions this will prove too expensive and cumbersome for the limited cases where this allowance is needed. Listing would be a nice feature if it were practical in all cases, but in these limited instances it doesn't appear to be so. I certainly think that this section shouldn't be the engine that effectively drives brass conduit out of Article 680 applications, for example.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel maintains its position that all RMC be listed.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2198)

8- 237 - (346-1-Rigid Metal Conduit): Accept in Principle
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
Rigid metal conduit is a listed metal raceway of circular cross section with integral or associated couplings, ~~approved~~ for the installation of electrical conductors and used with listed fittings to provide electrical continuity.
SUBSTANTIATION: A definition in the NEC cannot presuppose acceptance by the authority having jurisdiction (approved). The listing already qualifies intermediate metal conduit for use in accordance with Article 346 of the NEC. See the UL General Information for Electrical Equipment 1999. The NEC Style Manual 2.2.2 states, "Definitions shall not contain requirements or recommendations." Requiring intermediate metal conduit to be approved to comply with the definition is a requirement. This definition should be written similar to other related definitions, for example, see 331-1 first paragraph.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-235.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1429)

8- 238 - (346-2): Accept in Principle
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Delete 346-2 in its entirety.
SUBSTANTIATION: 1999 National Electrical Code Style Manual:
Section 4.1 states "Do not use a reference if the requirement is already covered by 90.3."
Section 4.1.1 stipulates that "References shall not be made to an entire article... unless additional conditions are specified.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-231.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3168)

8- 239 - (346-3): Accept in Principle in Part
SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION: Split into Uses Permitted and Uses Not Permitted and number appropriately, as follows:
Uses Permitted: RMC, elbows, couplings and fittings shall be permitted
(a) Exposed and Concealed. For exposed and concealed work, under all atmospheric conditions and occupancies;

(b) In Concrete and Direct Contact with Soil.
(1) In concrete;
(2) In direct contact with the soil;
Exception: Aluminum RMC in concrete or in direct contact with soil is required to be provided with supplemental protection.
(c) Corrosive Environment. In environments subject to severe corrosive
influences where protected by corrosion protection judged suitable for the
condition.
FPN: See Section 300-6 for protection against corrosion.
(d) Cinder Fill. In or under cinder fill where subject to permanent moisture
where protected on all sides by a layer of noncinder concrete not less than
2 in. (50.8 mm) thick; where the conduit is not less than 18 in. (457 mm)
under the fill; or where protected by corrosion protection and judged
suitable for the condition.
(e) Equipment Grounding. As an equipment grounding conductor where installed in compliance with Article 250.
Uses Not Permitted. RMC, elbows, couplings and associated fittings protected solely by enamel shall not be permitted to be used:
(a) Outdoors, including underground;
(b) In locations subject to severe corrosive influences.
FPN: See Section 300-6 for protection against corrosion.
SUBSTANTIATION: To provide a Uses Permitted and Uses Not Permitted Section which is formatted to be more consistent with other Code Articles for usability and clarity.
The information on dissimilar metals which currently appears in 346-3 has been deleted. A separate proposal has been submitted to create a new section on Dissimilar Metals.
The UL listing clearly permits RMC in concrete without supplementary protection. The listing also states that RMC does not generally require supplementary protection in direct contact with soil; the new (c) clarifies that additional protection could be required in severely corrosive locations. The title of this Section was revised from Corrosion Protection to Corrosive Environments as a more appropriate title.
The aluminum exception is consistent with the listing information. In (b), "earth" was changed to "soil" in the heading and text for terminology consistent with the listing information.
PANEL ACTION: Accept in Principle in Part.
Accept in principle by adoption of the wording in proposed 346-10 in Proposal 8-231 with the following modification:
Change the title of proposed section 346-10(b) to "Corrosive Environments."
The proposed section "Uses Not Permitted" is not accepted.
PANEL STATEMENT: The panel's action on Proposal 8-231 satisfies the concerns of the submitter, except that the proposed new section "Uses Not Permitted" is not accepted as enamel coated RMC is no longer produced.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #259)

8- 240 - (346-3(a)): Reject
SUBMITTER: Charles M. Trout, Maron Electric Co.
RECOMMENDATION: Add the following wording at the end of the third sentence:
"where an application of a listed grounding continuity liquid or compound has been applied to all threaded portions of the intermediate metal conduit raceway".
The third sentence will now read:
"Rigid metal conduit shall be permitted as an equipment grounding conductor where an application of a listed grounding continuity liquid or compound has been applied to all threaded portions of the intermediate metal conduit raceway."
SUBSTANTIATION: Other than a separate equipment grounding conductor being run with the circuit or feeder conductors, the metallic raceway may be the best equipment grounding conductor we have. But just as a separate grounding conductor must be properly terminated or spliced with listed devices, a metallic raceway must be terminated or joined together in an approved manner. The problems of corrosion as recognized in Section 300-6 and the problem of couplings and locknuts not being set up tight enough to carry fault currents at threaded joints in metallic raceways has been well documented. This is not a problem of poor installation by our labor forces or poor inspection by code enforcement personnel. This is a problem inherent to threaded connections. The resulting high resistance connections prevent the installations from being in conformance with the requirements of Section 250-2(d) and the integrity of the ground fault path is severely diminished. The addition of this requirement will be another step toward the accomplishment of the purpose of the code — "The practical safeguarding of persons and property from hazards arising from the use of electricity." We might take a tip from the plumbing or other pipe trades that realize the extent to which threads can be made up and apply sealing compounds or other means to prevent leaks. We can also look to Section 501-4(a)(1) where at least five threads are required to cool the vapors we recognize can escape through the threads.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 8-212.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2069)

8- 241 - (346-3(a)): Accept in Principle
Note: The Technical Correlating Committee understands that this action is to be incorporated in the revised 346-10(a) of Proposal 8-231.
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Revise section 346-3 second paragraph to read as follows:
346-3. Uses Permitted.
(a) All Atmospheric Conditions and Occupancies. Use of rigid metal conduit shall be permitted under all atmospheric conditions and occupancies. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action. Rigid metal conduit shall be permitted as an equipment grounding conductor. Ferrous raceways and fittings protected from corrosion solely by enamel shall be permitted only indoors and in occupancies not subject to severe corrosive influences.
Aluminum fittings and enclosures shall be permitted to be used with steel rigid metal conduit, and steel fittings and enclosures shall be permitted to be used with aluminum rigid metal conduit <u>where not subject to corrosive influences</u>.
SUBSTANTIATION: Aluminum fitting will corrode in corrosive areas and clarification is needed in the code.
This paragraph implies that corrosion protection is not required due to the location of the paragraph.
The ALUMINUM must also protected. Listed copper free aluminum fittings and enclosures will also have severe corrosion when located near the salt oceans of the world.
I have inspected industrial plants around the world and found that within 3 months corrosion to the aluminum enclosures and fittings start to become severe.
The code needs to address this concern.
PANEL ACTION: Accept in Principle.
Revise the last sentence of the proposal to read:
Aluminum fittings and enclosures shall be permitted to be used with steel rigid metal conduit, and steel fittings and enclosures shall be permitted to be used with aluminum rigid metal conduit <u>where not subject to severe corrosive influences.</u>
PANEL STATEMENT: The environments described in the substantiation are ones that present severe corrosive influences.

(Log #3187)

8- 242 - (346-3(a)): Accept
Note: The Technical Correlating Committee directs the Panel to clarify the action on this Proposal and correlate the Proposal with the action on Proposal 8-231. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Tim Andrassy, Steel Tube Inst.

RECOMMENDATION: Delete the two sentences regarding dissimilar metals from 346-3(a) and combine them into a new Section to read:

xxx. Dissimilar Metals. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action. Aluminum fittings and enclosures shall be permitted to be used with steel rigid metal conduit, and steel fittings and enclosures shall be permitted to be used with aluminum rigid conduit.

SUBSTANTIATION: A companion proposal to split 346-3 into Uses Permitted and Uses Not Permitted has been submitted. The cautionary information on dissimilar metals is more appropriate in a separate section.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NOT RETURNED: 1 Corry

(Log #3737)

8- 243 - (346-4 (New)): Reject

SUBMITTER: Wayne A. Lilly, Bridgewater, VA

RECOMMENDATION: Add a new Section 346-x to read as follows:

346-x. Uses Not Permitted. Nonferrous rigid metal conduit shall not be used as specified in (a) through (c) below.

(a) Nonferrous rigid metal conduit shall not be used as a mast to support conductors unless listed for the purpose.

(b) Nonferrous rigid metal conduit shall not be used in direct contact with the earth, installed within 18 in. (457 mm) of the earth, installed in concrete, or in areas subject to severe corrosive influences unless protected against corrosion in accordance with Section 300-6(b) and (c).

(c) Nonferrous rigid metal conduit shall not be used where subject to physical damage.

SUBSTANTIATION: Article 346 applies to all rigid metal conduits. This includes nonferrous metal conduit, such as aluminum RMC. The current provisions in Article 346 do not restrict the use of nonferrous rigid metal conduits for such uses as masts, earth burial, concrete encasement, and where subject to physical damage. This proposal seeks to exclude the use of nonferrous rigid metal conduit for purposes for which it is not suited. For example, aluminum RMC is not suitable for use as a mast, where in direct contact with the earth, etc. The inclusion of a provision for listing for the purpose is intended to allow nonferrous rigid metal conduit which is suitable to be utilized.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter does not provide substantiation to place the proposed restrictions on all nonferrous conduits.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NOT RETURNED: 1 Corry

(Log #3075)

8- 244 - (346-6): Accept in Principle in Part

SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)

RECOMMENDATION: Revise this section and the FPN to read:

(a) Minimum. RMC ~~Rigid metal conduit~~ smaller than 1/2 (16) ~~1/2 in. electrical trade size~~ shall not be used.

Exception: For enclosing the leads of motors as permitted in Section 430-145(b).

(b) Maximum. RMC ~~Rigid metal conduit~~ larger than 6 (155) ~~in. electrical trade size~~ shall not be used.

FPN: The Trade Sizes and Metric Designators are for identification purposes only and do not relate to actual dimensions. See 300-x.

~~FPN: Metric trade numerical designations for rigid metal conduit are the same as those found in Extra-heavy Duty Rigid Steel Conduits for Electrical Installations, IEC 81 1989; namely, 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, 4 = 103, 5 = 129, and 6 = 155.~~

SUBSTANTIATION: To correlate with proposal submitted to CMP 3 to add a table showing English and Metric trade size designators. The table provides universal information throughout the Code. This cuts out a lot of excess language in the Code, which is no longer needed. Metric trade sizes have been established for two Code cycles and cover raceways and system components. Also, picks up use of acronym as proposed for the 2002 Code.

PANEL ACTION: Accept in Principle in Part.

The panel accepts in principle the addition of the new FPN to read as follows:

FPN: See 300-1(c) for the Metric Designators and Trade Sizes. These are for identification purposes only and do not relate to actual dimensions.

The panel accepts the deletion of the old FPN. The panel accepts in principle the replacement of the words "rigid metal conduit" with the acronym "RMC" and the deletion of "in. electrical trade size" by action on Proposals 8-231 and 8-232.

PANEL STATEMENT: The acceptance of the changes to the Fine Print Notes are contingent upon an acceptance of Proposal 3-6 by CMP-3. If CMP-3 does not accept Proposal 3-6, the panel directs staff to revert to the existing FPN. The proposed Fine Print Note was revised to comply with Section 4.1.2 of the NEC Style Manual. See panel action on Proposals 8-231 and 8-232.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NOT RETURNED: 1 Corry

(Log #CP804)

8- 244a - (346-7): Accept

Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 8-231. This action will be considered by the Panel as a Public Comment.

SUBMITTER: CMP 8

RECOMMENDATION: Add new second paragraph to 346-7 to read:

"Cables shall be permitted to be installed where such use is permitted by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9."

SUBSTANTIATION: The proposed language clarifies that cables, where permitted elsewhere in the code, are allowed to be used in a raceway. It also provides clear direction on how to determine raceway fill where cables are installed.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NOT RETURNED: 1 Corry

(Log #3074)

8- 245 - (346-10): Accept in Principle

Note: The Technical Correlating Committee understands that the Panel action replaces the text and table of 346-24, including the Exception, accepted in Proposal 8-231.

SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)

RECOMMENDATION: Delete Table 346-10 and the exception in 346-10. Replace it with the existing Table 346-10, Exception and rename it Table 346-10, so it is no longer an exception, as shown below.

346-10. Bends—How Made. Bends of rigid metal conduit shall be made so that the conduit will not be damaged and that the internal diameter of the conduit will not be effectively reduced. ~~The radius of the curve of the inner edge of any field shall not be less than indicated in Table 346-10.~~

~~Table 346-10. Radius of Conduit Bends~~

~~Size of Conduit (in.)~~	~~Conductors Without Lead Sheath (in.)~~
~~1/2~~	~~4~~
~~3/4~~	~~5~~
~~1~~	~~6~~
~~1 1/4~~	~~8~~
~~1 1/2~~	~~10~~
~~2~~	~~12~~
~~2 1/2~~	~~15~~
~~3~~	~~18~~
~~3 1/2~~	~~21~~
~~4~~	~~24~~
~~5~~	~~30~~

~~6~~	~~36~~

~~Note: For SI units, 1 in. = 25.4 mm (radius).~~

~~Exception: For field bends for conductors without lead sheath and made with a single operation (one shot) bending machine designed for the purpose, the minimum radius shall not be less than that indicated in Table 346-10, Exception.~~

Table 346-10. Minimum Radius of Bends to Centerline of Conduit ~~Exception,~~ ~~Radius of Conduit Bends.~~

Trade Size of Conduit English/Metric		One Shot and Full Shoe Benders ~~Conductors Without Lead Sheath~~ (in.)	Other Benders (in.)
1/2	16	4	4
3/4	21	4 1/2	5
1	27	5 3/4	6
1 1/4	35	7 1/4	8
1 1/2	41	8 1/4	10
2	53	9 1/2	12
2 1/2	63	10 1/2	15
3	78	13	18
3 1/2	91	15	21
4	103	16	24
5	129	24	30
6	155	30	36

Note: For SI units, 1 in. = 25.4 mm (applies to radius columns only).

SUBSTANTIATION: Manufacturers of bending equipment measure to the centerline. This revised text and table clarifies the measurement in accordance with current field practice. The proposal defines that measurements are to the centerline regardless of the bender type. Lead sheath conductors are no longer made, therefore that option has been deleted and the one-shot bender information has been included in the new table.
PANEL ACTION: Accept in Principle.
Revise the wording in 346-10 to read as follows:
346-10. Bends-How Made. Bends of rigid metal conduit shall be made so that the conduit will not be damaged and that the internal diameter of the conduit will not be effectively reduced. The radius of the curve of any field bend to the centerline of the conduit shall not be less than indicated in Table 346-10.
Replace existing Table 346-10 and its exception and Table 346-10 exception, with the submitter's Table 346-10 as revised..
Change the title of the second column of the proposed Table 346-10 to read: "Bends Made by One Shot and Full Shoe Benders."
Replace the word "Benders" with "Bends" in the third column of proposed Table 346-10.
PANEL STATEMENT: 346-10 is revised to change the way the radius of the bend is measured. Measuring to the centerline of the conduit is in keeping with the accepted industry standard.
The title of the second column on the proposed Table 346-10 is changed to "Bends Made by One Shot and Full Shoe Benders" as the Table is applicable to bends and the revised heading agrees with the changes made to the proposed third column.
The word "Benders" is replaced with the word "Bends" in the third column so the column is applicable to bends made by other than one shot and full shoe benders. Bends made in ENT, RNC, FMC, and LFNC are examples of bends that would be made by means other than one shot and full shoe benders.
Staff is advised that action taken here will affect the proposed 346-10 and Tables 346-10 and 346-10 Exception, in Proposal 8-232. The metric equivalents for the values given in the second column of the proposed Table 346-10 can be found in Table 346-10, Exception of Proposal 8-232. The metric equivalents for the values given in the third column of the proposed Table 346-10 can be found in Table 346-10 of Proposal 8-232.
Staff is further advised that the cross reference in the Panel Statement on Proposal 8-232 is still applicable and can be used to cross reference the changes brought about by this Proposal (Proposal 8-245.)

(Log #4446)

8- 246 - (346-11): Reject
SUBMITTER: Frants Marvin Jensen, Consolidated Engr Labs
RECOMMENDATION: Add new last sentence:
There shall not be more than 270 degrees of bend in conduit runs containing conductors over 600V. Also, consideration of Section 300-34 shall be taken into account.
SUBSTANTIATION: With the newer insulations, HV conductors are getting larger. This would reduce the pulling stress.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided adequate technical substantiation to reduce the total degees of bends due to increased conductor sizes.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #345)

8- 247 - (346-12(a), Exception (New)): Reject
SUBMITTER: Jeffrey Rettig, Umatilla, OR
RECOMMENDATION: Add an exception stating:
Rigid metal conduit less than 36 in., connected between 2 boxes, each support per 370-23, does not need to be fastened.
SUBSTANTIATION: Problem resolved: Unnecessary supports.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The support requirements for raceways are independent of the support requirements in Article 370 for boxes.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #395)

8- 248 - (346-12(b)(3)): Reject
SUBMITTER: Michael A. Cuellar, Billings, MT
RECOMMENDATION: Section 346-12, subpart (b)3 suggests that a vertical fixture riser of 20 ft or less needs no support. Then changes it's mind and states you need supports at the top and bottom.
SUBSTANTIATION: This definition is not really clear and quite confusing.
PANEL ACTION: Reject.
PANEL STATEMENT: There was no specific recommendation made by the submitter. Section 4-3.3(c) of the Regulations Governing Commitee Projects requires proposals to include proposed text, including the words to be added, revised (and how revised), or deleted.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #4210)

8- 249 - (346-12(b)(3)): Accept in Principle
Note: The Technical Correlating Committee understands that the accepted text revises the text accepted in 346-30(b)(3) of Proposal 8-231.
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
Exposed vertical risers from fixed or stationary equipment ~~or fixtures~~ shall be permitted to be supported at intervals not exceeding 20 ft (6.1 m), provided the conduit is made up with threaded couplings, is firmly supported at the top and bottom of the riser, and no other means of intermediate support is readily available.
SUBSTANTIATION: The only legitimate use of this provision is for heavy utilization equipment unlikely to be shifted easily or frequently, and thereby threaten the integrity of the conduit drop. The Panel correctly broadened the rule from just industrial equipment, but the wording needs a little more work.
PANEL ACTION: Accept in Principle.
In the proposed text delete the words "or stationary."
PANEL STATEMENT: Stationary equipment is usually not moved, but fixed equipment is fastened in place. Stationary equipment may be moved, thus possibly damaging fittings and couplings. In accordance with the Article 100 defintion of equipment, fixtures are included.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

AFFIRMATIVE: 10
NEGATIVE: 3
NOT RETURNED: 1 Corry

EXPLANATION OF NEGATIVE:
COX: See my Explanation of Negative Vote on Proposal 8-221.
GRIFFITH: Although I support the idea that the application, in the case of equipment, should be limited to "fixed equipment", no substantiation has been provided to deny the application to "stationary industrial machinery". Countless installations of heavy (stationary) industrial machinery are in existence without any known problems. Section 345-12(b)(3) should read, "Exposed vertical risers from fixed equipment or stationary industrial machinery shall be ...".
LOYD: The proposal should be rejected. The submitter has not provided a single instance of a problem of any kind with the present language. The submitter did not ask for the deletion of the words "stationary equipment" which appears nine times in the present code. No substantiation was provided nor was there any problems noted to justify the deletion of "stationary equipment or fixtures". The word "fixture" is a better word than "fixed" for describing the types of equipment i.e., desks, cash register stations, counters etc. intended for the application addressed by the change. However "fixed" is acceptable Webster defined "fixture" as follows:
fixture is; Something securely fixed in place. Something attached as a permanent appendage, apparatus, or appliance: plumbing fixtures. a. The act or process of fixing. b. The condition of being fixed.

(Log #1282)

8- 250 - (Table 346-12(c)): Reject
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Add new section (c) to 346-12 as follows:
(c) Expansion Fittings. Expansion fittings for rigid metallic conduit shall be provided to compensate for thermal expansion and contraction where the length change, in accordance with Table 346-12(c), is expected to be 6.36 mm (1/4 in.) or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.
SUBSTANTIATION: The change is a result of facilitating the practical application of the numeric value in SI units and is a companion proposal to section 300-7(b)(FPN) where no table was provided in the 1999 NEC for steel conduit expansion characteristics.
Also, this proposed revision is intended to comply with NFPA 1M Manual of Style Section 4.1 with the respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following. This action is a result of the NEC Technical Correlating Committee Task Group on Metrication. This soft conversion is determined as follows:

1. Temperature differential for 1°C is 1.8°F calculation:

Calculation of Temperature Differential:

	Result °F for	°C	
°F	32	0	°C
°F	33.8	1	°C
°F differential	1.8	1	°C differential

2. Expansion factor conversion to SI:

Parameter	Value
Steel (inch-lbs)	6.500E-06 in per in per °F given in NEC99
Steel (SI)	1.170E-05 mm per mm per °C calculated

Since the dimension is a per unit value for either the inch-pound or SI factors (i.e., inch per inch and mm per mm) and the temperature is the varying value, the inch-pound factor is converted by multiplying by the 1.8 degree Fahrenheit per 1 degree Centigrade differential to obtain the SI equivalent.

PANEL ACTION: Reject.
PANEL STATEMENT: Although the panel concurs with the metrication concept, the addition of this proposed text and accompanying table does more than add metric values. There is no technical substantiation to require the proposed text. The expansion characteristics of RMC and common building materials are similar. Section 300-7(b) adequately covers the requirements for expansion fittings.

ARTICLE 347 — RIGID NONMETALLIC CONDUIT: TYPE RNC

(Log #1225)

8- 255 - (347): Accept in Principle
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise Article 347 to read as follows:
Article 347 – Rigid Nonmetallic Conduit: Type RNC

A. General

347-1. Scope. This article covers the use, installation, and construction specifications for Rigid Nonmetallic Conduit (RNC) and associated fittings.

347-2. Definition. Rigid Nonmetallic Conduit (RNC). A nonmetallic raceway of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors.

~~347-4.~~ 347-3. Other Articles. Installation of RNC ~~rigid nonmetallic conduit~~ shall comply with ~~the~~ applicable provisions of Article 300. ~~Where equipment grounding is required by Article 250, a separate equipment grounding conductor shall be installed in the conduit. Exception No. 1: As permitted in Section 250-134(b), Exception No. 2, for dc circuits and Section 250-134(b), Exception No. 1, for separately run equipment grounding conductors. Exception No. 2: Where the grounded conductor is used to ground equipment as permitted in Section 250-142.~~

347-6. Listing Requirements. RNC and associated fittings shall be listed.

~~A.~~ B. Installation
~~347-2.~~ 347-10. Uses Permitted. The use of RNC ~~listed rigid nonmetallic conduit~~ shall be permitted under the following conditions.
FPN: Extreme cold may cause some nonmetallic conduits to become brittle and therefore more susceptible to damage from physical contact.

(a) Concealed. In walls, floors, and ceilings.
(b) Corrosive Influences. In locations subject to severe corrosive influences as covered in Section 300-6 and where subject to chemicals for which the materials are specifically approved.
(c) Cinders. In cinder fill.
(d) Wet Locations. In portions of dairies, laundries, canneries, or other wet locations and in locations where walls are frequently washed, the entire conduit system including boxes and fittings used therewith shall be installed and equipped so as to prevent water from entering the conduit. All supports, bolts, straps, screws, etc., shall be of corrosion-resistant materials or be protected against corrosion by approved corrosion-resistant materials.
(e) Dry and Damp Locations. In dry and damp locations not prohibited by Section ~~347-3~~ 347-12.
(f) Exposed. For exposed work where not subject to physical damage if identified for such use.
(g) Underground Installations. For underground installations, see Sections 300-5 and 300-50. Conduits listed for the purpose shall be permitted to be installed underground in continuous lengths from a reel.
(h) Support of Conduit Bodies. Rigid nonmetallic conduit shall be permitted to support nonmetallic conduit bodies not larger than the largest trade size of an entering raceway. The conduit bodies shall not contain devices or support fixtures or other equipment.

~~347-3.~~ 347-12. Uses Not Permitted. ~~Rigid nonmetallic conduit~~ RNC shall not be used in the following locations.
(a) Hazardous (Classified) Locations.
(1) In hazardous (classified) locations, except as ~~covered~~ permitted in Sections 503-3(a), 504-20, 514-8, and 515-5
(2) In Class I, Division 2 locations, except as permitted in Section 501-4(b), Exception
(b) Support of Fixtures. For the support of fixtures or other equipment not described in Section ~~347-2(h)~~ 347-10(h).
(c) Physical Damage. Where subject to physical damage unless identified for such use.
(d) Ambient Temperatures. Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise.
(e) Insulation Temperature Limitations. For conductors whose insulation temperature limitations would exceed those for which the conduit is listed.
(f) Theaters and Similar Locations. In theaters and similar locations, except as provided in Articles 518 and 520.

~~347-10.~~ 347-20. Size.
(a) Minimum. RNC ~~Rigid nonmetallic conduit~~ smaller than 1/2-in. ~~electrical~~ trade size shall not be used.

(b) Maximum. RNC ~~Rigid nonmetallic conduit~~ larger than 6-in. ~~electrical~~ trade size shall not be used.

FPN: Metric trade numerical designations for RNC ~~rigid nonmetallic conduit~~ are 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, 4 = 103, 5 = 129, and 6 = 155.

~~347-11.~~ 347-22. Number of Conductors. The number of conductors or cables ~~permitted in a single conduit~~ shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

~~347-13.~~ 347-24. Bends — How Made. Bends ~~of rigid nonmetallic conduit~~ shall be made so that the conduit will not be damaged and that the internal diameter of the conduit will not be effectively reduced. Field bends shall be made only with bending equipment identified for the purpose, and the radius of the curve of the inner edge of such bends shall not be less than shown in Table ~~346-10~~ 346-24.

~~347-14.~~ 347-26. Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, e.g., conduit bodies and boxes.

~~347-5.~~ 347-28. Trimming. All cut ends shall be trimmed inside and outside to remove rough edges.

~~347-8.~~ 347-30. Securing and Supporting. RNC ~~Rigid nonmetallic conduit~~ shall be installed as a complete system as provided in Section 300-18 and shall be fastened so that movement from thermal expansion or contraction will be permitted. RNC ~~Rigid nonmetallic conduit~~ shall be securely fastened and supported in accordance with (a) and (b).

(a) Securely Fastened. ~~Each rigid nonmetallic conduit~~ RNC shall be securely fastened within 3 ft (914 mm) of each outlet box, junction box, device box, conduit body, or other conduit termination. Conduit listed for securing at other than 3 ft (914 mm) shall be permitted to be installed in accordance with the listing.

(b) Supports. RNC ~~Rigid nonmetallic conduit~~ shall be supported as required in Table ~~347-8~~ 347-30. Conduit listed for support at spacings other than as shown in Table ~~347-8~~ 347-30 shall be permitted to be installed in accordance with the listing. Horizontal runs of RNC ~~rigid nonmetallic conduit~~ supported by openings through framing members at intervals not exceeding those in Table ~~347-8~~ 347-30 and securely fastened within 3 ft (914 mm) of termination points shall be permitted.

Table ~~347-8.~~ 347-30. Support of Rigid Nonmetallic Conduit (RNC)

[*****1999 NEC Table 347-8 here*****]

~~347-15.~~ 347-40. Boxes and Fittings. ~~Rigid nonmetallic conduit shall be used only with listed fittings.~~ Boxes and fittings shall comply with the applicable provisions of Article 370.

~~347-9.~~ 347-44. Expansion Fittings. Expansion fittings for RNC ~~rigid nonmetallic conduit~~ shall be provided to compensate for thermal expansion and contraction where the length change, in accordance with Tables ~~347-9~~ 347-44(A) and (B), is expected to be 1/4-in. (6.36 mm) or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.

Table ~~347-9(A).~~ 347-44(A). Expansion Characteristics of PVC Rigid Nonmetallic Conduit Coefficient of Thermal Expansion = 3.38 X 10^{-5} in./in./°F

[*****1999 NEC Table 347-9(A) here*****]

Table ~~347-9(B).~~ 347-44(B). Expansion Characteristics of Fiberglass Reinforced Conduit (Rigid Nonmetallic Conduit) Coefficient of Thermal Expansion = 1.5 X 10^{-5} in./in./°F.

[*****1999 NEC Table and 347-9(B) here*****]

~~347-12.~~ 347-46. Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.
FPN: See Section 300-4(f) for the protection of conductors No. 4 and larger at bushings.

~~347-6.~~ 347-48. Joints. All joints between lengths of conduit, and between conduit and couplings, fittings, and boxes, shall be made by an approved method.

~~347-16.~~ 347-56. Splices and Taps. Splices and taps shall be made in accordance with Section 300-15. See Article 370 for rules on the installation and use of boxes and conduit bodies.

347-60. Grounding. Where equipment grounding is required by Article 250, a separate equipment grounding conductor shall be installed in the conduit.
Exception No. 1: As permitted in Section 250-134(b), Exception No. 2, for dc circuits and Section 250-134(b), Exception No. 1, for separately run equipment grounding conductors.
Exception No. 2: Where the grounded conductor is used to ground equipment as permitted in Section 250-142.

~~B.~~ C. Construction Specifications
~~347-17. General.~~ 347-100. Construction. ~~Rigid nonmetallic conduit shall comply with the following.~~

~~347-1. Description. This article shall apply to a type of conduit~~ RNC and fittings shall be composed of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. For use aboveground, it shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. ~~Conduits listed for the purpose shall be permitted to be installed underground in continuous lengths from a reel.~~ Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.

~~347-17.~~ 347-120. Marking. Each length of RNC ~~nonmetallic conduit~~ shall be clearly and durably marked at least every 10 ft (3.05 m) as required in the first sentence of Section 110-21. The type of material shall also be included in the marking unless it is visually identifiable. For conduit recognized for use above ground, these markings shall be permanent. For conduit limited to underground use only, these markings shall be sufficiently durable to remain legible until the material is installed. Conduit shall be permitted to be surface marked to indicate special characteristics of the material.
FPN: Examples of these optional markings include but are not limited to "LS" for limited-smoke and markings such as "sunlight resistant."

SUBSTANTIATION:
The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways of circular cross-section. For the 1999 NEC, a previous Sub-Task Group recommended that all of the circular raceway articles be combined into a single article (Article 344), to present a more uniform approach to the conduit and tubing requirements and to consolidate common requirements.

Review of public comments led the Panel to conclude that the goal of more user friendly code language had not been realized by the proposed Article 344. Furthermore, the Panel requested that a committee be appointed to consider the issue of user friendly code as it relates to the circular raceway articles.

The Sub-Task Group was asked to address such possibilities as revising the rejected 1999 proposal in light of the public comments, developing one or more articles to address the requirements presented in the nine current circular raceway articles, or revising the current nine circular raceway articles using a similar style manual format. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.

A uniform format is proposed to achieve consistency across all of the circular raceways. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30

covers securing and supporting, etc. A table that provides the uniform format for each circular raceway has been provided with this proposal.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for conduit and tubing not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

Explanation of renumbering and editorial changes:

Title Acronym "RNC" added.

(Part) A. General
347-1 Scope: New section added to conform to NEC Style Manual.
347-2 Definition: New section added to conform to NEC Style Manual.
347-3 Other Articles: Equipment grounding requirements relocated to new 347-60.
347-6 Listing Requirements: New section relocating existing requirements from 347-2 and 347-15.

(Part) B. Installation
347-10 Uses Permitted: Relocated from 347-2; Reference updated in 347-10(e); 347-10(g) includes text relocated from 347-1.
347-12 Uses Not Permitted: Relocated from 347-3; Reference updated in 347-12(b). Text "covered" changed to"permitted" for clarity.
347-20 Size: Relocated from 347-10; Editorially revised.
347-22 Number of Conductors: Relocated from 347-11; Editorially revised.
347-24 Bends – How Made: Relocated from 347-13; Reference updated;
Editorially revised.
347-26 Bends – Number in One Run: Relocated from 347-14.
347-28 Trimming: Relocated from 347-5.
347-30 Securing and Supporting: Relocated from 347-8; References updated.
Table 347-30
Table – Support of Rigid Nonmetallic Conduit: Relocated from
Table 347-8.
347-40 Boxes and Fittings: Relocated from 347-15; Listing requirement
relocated to 347-6.
347-44 Expansion Fittings: Relocated from 347-9; References updated.

Table 347-44(A)
Table 347-44(A) – Expansion Characteristics of PVC: Relocated from
Table 347-9(A).

Table 347-44(B)
Table347-44(B) – Expansion Characteristics of Fiberglass: Relocated
from T347-9(B).

347-46 Bushings: Relocated from 347-12.
347-48 Joints: Relocated from 347-6.
347-56 Splices and Taps: Relocated from 347-16.
347-60 Grounding: New section relocating existing requirements from.

(Part) C. Construction Specifications
347-100 Construction: New section relocating existing requirements from
347-1 and 347-17; Editorially revised.
347-120 Marking: Relocated from 347-17.

The following Section numbers have been assigned unilaterally throughout all 10 raceway articles.	Common Numbering System for the Circular Raceway Articles
	Article 3XX, <title>: <acronym>

	Part A. General
3XX - 1	Scope.
3XX - 2	Definitions.
3XX - 3	Other Articles.
3XX - 6	Listing Requirements.
	Part B. Installation
3XX - 10	Uses Permitted.
3XX - 12	Uses Not Permitted.
3XX - 14	Dissimilar Metals.
3XX - 16	Temperature Limits.
3XX - 20	Size.
3XX - 22	Number of Conductors.
3XX - 24	Bends – How Made.
3XX - 26	Bends – Number in One Run.
3XX - 28	Reaming & Threading.
3XX - 28	Trimming.
3XX - 30	Securing and Supporting.
3XX - 40	Boxes and Fittings.
3XX - 42	Coupling and Connectors
3XX - 44	Expansion Fittings
3XX - 46	Bushings.
3XX - 48	Joints.
3XX - 50	Conductor Terms
3XX - 56	Splices and Taps.
3XX - 60	Grounding.
	Part C. Construction Specifications.
3XX - 100	Construction.
3XX - 110	Corrosion Protection.
3XX - 120	Marking.
3XX - 130	Standard Lengths.

PANEL ACTION: Accept in Principle.
Delete from the proposal: 347-3, 347-40, and the second sentence of 347-56.
In proposed 347-6 add: ", factory elbows," after "RNC"
In proposed 347-22 delete the words "or cables."
In 347-44 amend the text to read "Table 347 -44(A) or (B).
PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP-8 recommends approval of the scope section by the TCC.
The proposed 347-3, 347-40 and second sentence of Proposal 347-56

are deleted as 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.

The addition of the term "factory elbows" is to harmonize this requirement with the proposed revision to other articles.
There was no technical substantiation provided to add the words "or cables" as part of the rewrite of 347-22.
The change in 347-44 clarifies that the use of both tables is not intended.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1283)

8- 256 - (347): Accept in Part
Note: The Technical Correlating Committee directs the panel to clarify the action on this Proposal and specifically state what the proper title for the table should be and to correlate that action with Proposal 8-266. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise as follows:
347-3 (d) Ambient Temperatures. Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise.
347-8 (a) Securely Fastened. Each rigid nonmetallic conduit shall be securely fastened within 900 mm (3 ft) ~~(914 mm)~~ of each outlet box, junction box, device box, conduit body, or other conduit termination. Conduit listed for securing at other than 900 mm (3 ft) ~~(914 mm)~~ shall be permitted to be installed in accordance with the listing.
(b) Supports. Rigid nonmetallic conduit shall be supported as required in Table 347-8. Conduit listed for support at spacings other than as shown in Table 347-8 shall be permitted to be installed in accordance with the listing. Horizontal runs of rigid nonmetallic conduit supported by openings through framing members at intervals not exceeding those in Table 347-8 and securely fastened within 900 mm (3 ft) ~~(914 mm)~~ of termination points shall be permitted.
Table 347-9 (a) Expansion fittings for rigid nonmetallic conduit shall be provided to compensate for thermal expansion and contraction where the length change, in accordance with Tables 347-9(A) and (B), is expected to be 6 mm (1/4 in.) ~~(6.36 mm)~~ or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.
~~Table 347-9(A). Expansion Characteristics of PVC Rigid Nonmetallic Conduit Coefficient of Thermal Expansion = 3.38 x 10-5 in./in./°F~~
Table 347-9(B). Expansion Characteristics of Fiberglass Reinforced Conduit (Rigid Nonmetallic Conduit) Coefficient of Thermal Expansion = 1.5 x 10-5 in./in./°F
347-10 (a) Minimum. Rigid nonmetallic conduit smaller than metric designator 16 (1/2) ~~in. electrical trade size~~ shall not be used.
347-10 (b) Maximum. Rigid nonmetallic conduit larger than metric designator 155 (6) ~~in. electrical trade size~~ shall not be used.
FPN: Metric trade numerical designations for rigid nonmetallic conduit are 16 = 1/2 ~~= 16~~, 21 = 3/4 ~~= 21~~, 27 = 1 ~~= 27~~, 35 = 1fl ~~= 35~~, 41 = 1 1/2 ~~= 41~~, 53 = 2 ~~= 53~~, 63 = 2 1/2 ~~= 63~~, 78 = 3 ~~= 78~~, 91 = 3 1/2 = ~~91~~, 103 = 4 ~~= 103~~, 129 = 5 ~~= 129~~, and 155 = 6 ~~= 155~~.

347-17
Rigid nonmetallic conduit shall comply with the following.
Marking. Each length of nonmetallic conduit shall be clearly and durably marked at least every 3 m (10 ft) ~~(3.05 m)~~ as required in the first sentence of Section 110-21. The type of material shall also be included in the marking unless it is visually identifiable. For conduit recognized for use above ground, these markings shall be permanent. For conduit limited to underground use only, these markings shall be sufficiently durable to remain legible until the material is installed. Conduit shall be permitted to be surface marked to indicate special characteristics of the material.
FPN: Examples of these optional markings include but are not limited to "LS" for limited-smoke and markings such as "sunlight resistant."
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis.
In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised.
In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.
PANEL ACTION: Accept in Part.
Accept proposed text except the deletion of the title "Table 347-9(A)."
PANEL STATEMENT: The panel action is editorial.

155	6	2.4	8

(Log #2225)

8- 258 - (347-1): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested."
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.
[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
PANEL ACTION: Reject.

(Log #2935)

8- 260 - (347-3(a)(1)): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: At the end of this section delete "and". Add 501-4(b), 514-8, 515-5, and 501-4(b)
SUBSTANTIATION: This proposal adds, Class I, Division 2 wiring to uses not permitted exception. This proposal is also being submitted to CMP 14.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 501-4(b) does not currently permit this wiring method.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #4013)

8- 260a - (347-3(c)): Reject
SUBMITTER: Christopher Pharo, Rep. IBEW
RECOMMENDATION: The proposal is to revise part (c) to read as follows:
Section 347-3(c) Physical Damage. Where subject to physical damage, unless Schedule 80 rigid nonmetallic conduit.
SUBSTANTIATION: There is always confusion when it comes to the installation of nonmetallic conduit. Most people do not realize exactly what this means "unless identified for such use". The only way one can know what is "identified for such use" is to carry the UL white book around. By removing the phrase "unless identified for such use" and placing "unless Schedule 80 rigid nonmetallic conduit" after the text "Where subject to physical damage", this code section would effectively eliminate any chance of inappropriate use of the product.
This type of specific reference to the use of Schedule 80 is made in Section 300-5(d) and Section 336-6(b). These articles specifically refer to Schedule 80 rigid nonmetallic conduit as an alternate wiring method in areas subject to physical damage. This was also done so as to prevent the misuse of Schedule 40 rigid nonmetallic conduit.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no technical substantiation to limit rigid nonmetallic conduit to Schedule 80 where subject to physical damage.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #4211)

8- 261 - (347-3(g) (New)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Add an additional subsection as follows:
(g) Where run from floor to floor in buildings more than 70 ft (21.3 m) above mean grade, unless encased in not less than 2 in. (50.8 mm) of concrete or concealed behind a thermal barrier as described in Section 331-3(2) and Section 331-3(5).
SUBSTANTIATION: This proposal removes a technical inconsistency in the Code, since rigid nonmetallic conduit constructed of polyvinyl chloride is the identical material as used in Electrical Nonmetallic Tubing (ENT). ENT, with a lower volume of nonmetallic material per comparable unit length, now has a more severe restriction.
In the prior cycle, CMP 8 suggested a comparison with surface nonmetallic raceway, which must run exposed, and which is also made of polyvinyl chloride. That comparison no longer applies because surface nonmetallic raceway doesn't run vertically in chases up high-rise buildings, to which this proposal now restricts itself, unlike the one in the prior cycle.
PANEL ACTION: Reject.
PANEL STATEMENT: Rigid nonmetallic conduit has been recognized for use in buildings without regard to height since 1971 and has a demonstrated record of safe use. A "technical inconsistency" is not adequate justification to accept the proposed restriction.

NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
KENDALL: See my explanation of negative comment on Proposal 8-271.

(Log #630)

8- 264 - (347-9): Reject
SUBMITTER: Larry T. Smith, Nat'l Electrical Seminars
RECOMMENDATION: Revise 347-9 to read as follows:
Expansion fittings for rigid nonmetallic conduit shall be provided to compensate for thermal expansion and contraction where the length change, in accordance with Tables 347-9(A) and (B), is expected to be 1/4 in. (6.36 mm) or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations. Expansion joints shall not be required for direct buried rigid nonmetallic conduit. Expansion joints shall not be required for concrete encased rigid nonmetallic conduit unless the concrete itself has an expansion joint.
(FPN No. 1): With direct buried rigid nonmetallic conduit expansion joints are not needed because the ground has a relatively constant temperature.
(FPN No. 2): The movement of concrete encased rigid nonmetallic conduit will coincide with the expansion and contraction of the concrete. The only place where an expansion joint would be necessary is where the concrete itself has an expansion joint.
SUBSTANTIATION: The installation of expansion fittings on direct buried rigid nonmetallic conduit was discussed in detail at the Western Section IAEI meeting in Bismarck, SD last year. It is also a topic discussed in almost every code seminar that I present -- evidence of the confusion. One of my clients, a large user of rigid nonmetallic conduit, had been in good faith mistakenly installing expansion fittings on direct buried runs. I am also getting reports from seminar participants that some well meaning electrical inspectors, in various parts of the country, are requiring the installation of expansion joints in underground installations of rigid nonmetallic conduit. We need to clear the confusion.
The following paragraphs are in the document "Expansion Joints for PVC Rigid Nonmetallic Conduit" prepared by the NEMA Polymer Raceway Products (5TC) Technical Committee:
In normal circumstances, expansion joints are not needed with concrete encased nonmetallic conduit since the movement of the conduit will coincide with the expansion and contraction of the concrete. The only place where an expansion joint would be utilized is where the concrete itself has an expansion joint.
In direct burial situations, expansion joints are not needed because the ground has relatively constant temperatures. In cold areas, buried lines must be below the frost line to prevent buckling during freezing and thawing cycles. In warmer areas, the depth of cover protects against temperature extremes.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: This is a more complex issue than the proposal addresses. The proposal does not sufficiently clarify where it is not required to install expansion fittings in underground conduit installations.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #4212)

8- 265 - (347-9): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise follows:
Expansion fittings for rigid nonmetallic conduit shall be provided to compensate for thermal expansion and contraction where the length change, in accordance with Tables 347-9(A) and (B), ~~is expected to be 1/4 in. (6.36 mm) or greater in a straight run between~~ will exceed 1/8 in. (3.18 mm) at securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.
SUBSTANTIATION: The NEC version sets the 1/4-inch dimension as the only value. As such it is unsafe because if a conduit is rigidly secured at a wall, the entire 1/4-inch of movement will be reflected at the box, and that degree of movement will take the mounting feet right off a PVC FS box, and it will force concentric knockouts right out of an enclosure.
The hidden essence of the 1/4-inch rule is the "straight run" provision between conduit terminations. If you take a straight run and cause the conduit to expand 1/4 inch, the result at each end will be 1/8 inch worth of movement at each end, which most mounting means can accommodate, albeit barely so. This wording addresses cases where the conduit emerges from concrete or otherwise cannot move at one end. Now if you heat the same length of conduit to the same degree, the full 1/4 inch appears at one end. That's almost a guaranteed failure. The only way to cover all cases is to focus on each conduit termination. If it will tend to move no more than 1/8 inch, then its okay without the expansion fitting; otherwise the fitting should be there.
PANEL ACTION: Reject.
PANEL STATEMENT: The current language of this section adequately conveys the requirement. In addition, there is not sufficient technical substantiation to remove the straight run phrase in the requirement. The "straight run" concept is important to the application of this requirement.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
LINDSAY: I believe the submitter is correct in his substantiation and clear in his proposed language. This proposal should be accepted by the panel.

(Log #1284)

8- 266 - (Table 347-9(a)): Accept

Note: The Technical Correlating Committee directs the Panel to correlate the Panel Action with Proposal 8-256. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION:

65	3.95	65	2.64	165	6.69
70	4.26	70	2.84	170	6.90
75	4.56	75	3.04	175	7.10
80	4.87	80	3.24	180	7.30
85	5.17	85	3.45	185	7.50
90	5.48	90	3.65	190	7.71
95	5.78	95	3.85	195	7.91
100	6.08	100	4.06	200	8.11

SUBSTANTIATION: The change is to facilitate practical application of the numeric value in SI units. This proposed revision is intended to comply with NFPA 1M Manual of Style Section 4.1 with the respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following. This action is a result of the NEC Technical Correlating Committee Task Group on Metrication. This soft conversion is determined as follows:

1. Temperature differential for 1°C is 1.8°F calculation:

Calculation of Temperature Differential:

Result °F for		°C	
°F	32	0	°C
°F	33.8	1	°C
°F differential	1.8	1	°C differential

2. Expansion factor conversion to SI:

NEC99	Parameter	Value	Converted Value
	PVC(Inch-lbs)	3.380E-05 in per in per °F	6.084E-05 mm per mm per °C

Since the dimension is a per unit value for either the inch-pound or SI factors (i.e., inch per inch and mm per mm) and the temperature is the varying value, the inch-pound factor is converted by multiplying by the 1.8 degree Fahrenheit per 1 degree Centigrade differential to obtain the SI equivalent.

(Log #646)

8- 267 - (Table 347-9(a) Note (New)): Accept

Note: The Technical Correlating Committee understands that the recommendation is to become a note to Table 347-44(A) of Proposal 8-255.

SUBMITTER: Larry T. Smith, Nat'l Electrical Seminars
RECOMMENDATION: New text to read as follows:

Note: Add 30°F to the estimated temperature range when conduit is installed in direct sunlight to allow for radiant heating.

SUBSTANTIATION: Information concerning expansion joints for PVD Rigid Nonmetallic Conduit has been published by the NEMA Polymer Raceway Products (5TC) PVC Technical Committee. The following statement regarding Rigid Nonmetallic Conduit installed in direct sunlight is on page two of the publication:

Conduit installed outdoors in direct sunlight will be considerably hotter than air temperature during the day because of the absorption of the sun's heat. Expansion joints should be installed to allow for the anticipated temperature change. For direct sunlight exposure, add 30°F to ambient temperature change.

Very few installers that I talk to are aware of the need to compensate for direct sunlight exposure. A note at the bottom of Table 347-9(a) will alert Code users to add 30°F for direct sunlight exposure. I am generating a companion proposal for Table 347-9(b).

PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:

LILLY: The substantiation for this proposal is for outdoor installations only. The proposed note would be applicable to all installations "in direct sunlight." This means indoor installations in direct sunlight would be required to have 30°F added to the estimated temperature change. There are many indoor installations where direct sunlight exposure occurs through skylights and other glazing. For indoor installations that do not have heat or air-conditioning, consideration of an increase in the temperature change due to direct sunlight exposure might be justified. However, if the indoor installation is in a controlled environment, where heating and air-conditioning are provided, an increase is not warranted. In these controlled environments, a temperature change of 10°F might be expected. Adding 30°F to this results in a total temperature change of 40°F. Table 347-9(A) lists a length change of 1.6 inches per 100 feet for a temperature change of 40°F. A total length of 15.625 feet would require an expansion fitting.

The substantiation did not provide information on how much direct sunlight exposure is needed before adding 30°F to the total temperature change is required. Is a fifteen-minute exposure required? Perhaps a 2-hour exposure is needed. There are many installations where the direct sunlight exposure is limited by items such as adjacent buildings. The proposed wording of the note would require the addition of 30°F for those installations with even a single minute of direct sunlight exposure.

I agree that consideration should be given to the impact direct sunlight might have on the overall temperature change of PVC RNC. However, the proposed wording would require an addition of 30°F to installations where it is not necessary to do so. This proposal should be rejected. The submitter can provide a comment that would offer language to address these issues.

(Log #1285)

8- 268 - (Table 347-9(b)): Accept in Principle

Note: The Technical Correlating Committee understands that the Panel Action replaces Table 347-44(B) of Proposal 8-255.

SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise Table 347-9(B) as shown below.

Table 347-9(B) Expansion Characteristics of Fiberglass Reinforced Conduit (Rigid Nonmetallic Conduit) Coefficient of Thermal Expansion = 2.7 x 10^{-5} mm per mm per °C (1.5 x 10^{-5} in. per in. per °F)

Temperature Change (°C)	Length Change of FRE Conduit (mm per m)	Temperature Change (°F)	Length Change of FRE Conduit (in. per 100 ft)	Temperature Change (°F)	Length Change of FRE Conduit (in. per 100 ft)
5	0.14	5	0.09	105	1.89
10	0.27	10	0.18	110	1.98

(Log #3039)

8- 270 - (347-10): Accept in Principle in Part
SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Revise this section and the FPN to read:
(a) Minimum. RNC ~~Rigid nonmetallic conduit~~ smaller than 1/2 (16) ~~in. electrical trade size~~ shall not be used.
(b) Maximum. RNC ~~Rigid nonmetallic conduit~~ larger than 6 (155) ~~in. electrical trade size~~ shall not be used.
FPN: The Trade Sizes and Metric Designators are for identification purposes only and do not relate to actual dimensions. See 300-1(c).
~~FPN: Metric trade numerical designations for rigid nonmetallic conduit are 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, 4 = 103, 5 = 129, and 6 = 155.~~
SUBSTANTIATION: To correlate with proposal submitted by NEMA to CMP 3 to add a table showing current trade sizes and metric designators. The table provides universal information throughout the Code. This cuts out a lot of excess language in the Code which is no longer needed. Metric designators for trade sizes have been established for two Code cycles and cover raceways and system components. Also, picks up use of acronym as proposed for the 2002 Code.
PANEL ACTION: Accept in Principle in Part.
The panel accepts in principle the addition of the new FPN to read as follows:
"FPN: See 300-1(c) for the Metric Designators and Trade Sizes. These are for identification purposes only and do not relate to actual dimensions".
The panel accepts the deletion of the old FPN. The panel accepts in principle the replacement of the words "rigid nonmetallic conduit" with the acronym "RNC" and the deletion of "in. electrical trade size" by action on Proposals 8-255 and 8-256.
PANEL STATEMENT: The acceptance of the changes to the Fine Print Notes are contingent upon an acceptance of Proposal 3-6 by CMP-3. If CMP-3 does not accept Proposal 3-6, the panel directs staff to revert to the existing FPN. The proposed Fine Print Note was revised to comply with Section 4.1.2 of the NEC Style Manual. See panel action on Proposals 8-255 and 8-256.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2967)

8- 271 - (347-10(b)): Reject
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Revise text to read as follows:
347.10. Size.
(a) Minimum. Rigid nonmetallic conduit smaller than 1/2-in. electrical trade size shall not be used.
(b) Maximum. Rigid nonmetallic conduit larger than ~~6 in~~ 8 in. electrical trade size shall not be used.
FPN: Metric trade numerical designations for rigid nonmetallic conduit are 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, 4 = 103, 5 = 129, ~~and~~ 6 = 155 and 8 = 200.

SUBSTANTIATION: Industry has requested a listed 8 in. rigid nonmetallic conduit for use with electrical conductors and can be inspected to the NEC. Nonlisted 8 in. rigid nonmetallic conduit is currently being manufactured and used by the utility companies. NEMA Standard TC-2 has adopted a 8 in. conduit into their standard. Once added to the NEC, UL 651 will be revised to add the 8 in. size and allow conduits to be listed.

This proposal is a companion proposal to Table 347-8.

PANEL ACTION: Reject.

PANEL STATEMENT: The substantiation offered is insufficient to warrant an increase in the maximum permitted size of RNC to 8 inches.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NEGATIVE: 1

NOT RETURNED: 1 Corry

EXPLANATION OF NEGATIVE:

KENDALL: 8 in. conduit has been used by the utilities for years with satisfactory results. Sometimes utilities will need to cross property that requires inspection to the NEC, and a listed product would ease the inspection process. Once the NEC requires 8 in. conduit to be listed, a listing agency can determine the physical requirements.

(Log #1070)

8- 272 - (347-12, FPN): Accept

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Change "No. 4" to "4 AWG".

SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NOT RETURNED: 1 Corry

(Log #3076)

8- 273 - (347-13): Accept

Note: The Technical Correlating Committee understands that the action replaces the second sentence of 347-24 of Proposal 8-255.

SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)

RECOMMENDATION: Revise the second sentence to read:

Field bends shall be made only with bending equipment identified for the purpose~~. , and the~~ The radius of the curve to the centerline ~~of the inner edge~~ of such bends shall not be less than shown in Table 346-10, column "Other Bends."

NOTE: This is a companion proposal to revise Table 346-10.

SUBSTANTIATION: This text clarifies that measurements are to be made to the centerline and provides radii consistent with other conduits.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NOT RETURNED: 1 Corry

(Log #2187)

8- 274 - (347-16, FPN (New)): Reject

SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.

RECOMMENDATION: Revise as follows:

Splices and taps shall be made in accordance with Section 300-15. ~~See Article 370 for rules on the installation and use of boxes and conduit bodies.~~

FPN: See Article 370 for rules on the installation and use of boxes and conduit bodies.

SUBSTANTIATION: This deleted sentence is an explanatory reference to another NEC rule; therefore, it should be a fine print note. The NEC Style Manual 4.1 states, "Explanatory references shall be in fine print notes."

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and statement on Proposal 8-255

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NOT RETURNED: 1 Corry

(Log #2825)

8- 275 - (347-17, FPN): Accept in Principle

Note: The Technical Correlating Committee understands that the action replaces the FPN of 347-120 accepted in Proposal 8-255.

SUBMITTER: Ravindra H. Ganatra, Alcan Cable /Rep. CANENA Tech Harmonization Subcomm. For Bldg Wire and Cable Products

RECOMMENDATION: Revise the FPN to 347-17 as follows:

FPN: Examples of these markings include but are not limited to markings suitable for limited smoke, sunlight resistant, etc. ~~"LS" for limited smoke and markings such as "sunlight resistant."~~

SUBSTANTIATION: This proposal is submitted on behalf of the THSC - Building Wire and Cable Product Standards, of Council of Harmonization of Electrotechnical Standardization of North America (CANENA).

Abbreviation LS has been found to represent different requirements in different national product standards in North America. In Mexico, "LS" is used to indicate compliance with requirements associated with marking for low smoke. In the US, "LS" marking has been used to indicate compliance with requirements associated with marking for limited smoke. However, the requirements in Mexico and the US are different. Further, requirements for "ST1" marking used in Canada are similar to limited smoke marking used in the US.

Thus, removal of the abbreviation in the Code will facilitate harmonization of marking requirements in the product standards.

The proposal does not recommend any change in the test method or performance requirements for a product being evaluated for limited smoke marking.

PANEL ACTION: Accept in Principle.

Revise the Fine Print Note to read:

"Examples of these markings include but are not limited to 'limited smoke' and 'sunlight resistant'."

PANEL STATEMENT: The revised wording adequately expresses the submitter's intent.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

ARTICLE 348 — ELECTRICAL METALLIC TUBING: TYPE EMT

(Log #1226)

8- 276 - (348): Accept in Principle

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 8-289a. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise Article 348 to read as follows:

Article 348 Electrical Metallic Tubing: Type EMT

A. General

348-1. Scope. This article covers the use, installation, and construction specifications for Electrical Metallic Tubing (EMT) and associated fittings.

348-2. ~~348-1.~~ Definition. Electrical Metallic Tubing (EMT). ~~Electrical metallic tubing is a listed~~ A metallic ~~tubing~~ raceway of circular cross section approved for the installation of electrical conductors when joined together with ~~listed~~ fittings.

348-3. ~~348-2.~~ Other Articles. Installations of ~~electrical metallic tubing~~ EMT shall comply with ~~the~~ applicable provisions of Article 300.

348-6. Listing Requirements. EMT and associated fittings shall be listed.

B. Installation

348-10. ~~348-4.~~ Uses Permitted.

(a) Exposed and Concealed. The use of ~~listed electrical metallic tubing~~ EMT shall be permitted for both exposed and concealed work.

(b) Corrosion Protection. Ferrous or nonferrous EMT ~~electrical metallic tubing~~, elbows, couplings, and fittings shall be permitted to be installed in concrete, in direct contact with the earth, or in areas subject to severe corrosive influences where protected by corrosion protection and judged suitable for the condition.

~~(FPN): See Section 300-6 for protection against corrosion.~~

(c) ~~348-6.~~ Wet Locations. All supports, bolts, straps, screws, etc., shall be of corrosion-resistant materials or protected against corrosion by corrosion-resistant materials.
(FPN): See Section 300-6 for protection against corrosion.

348-12. ~~348-5.~~ Uses Not Permitted. EMT ~~Electrical metallic tubing~~ shall not be used
(1) Where, during installation or afterward, it will be subject to severe physical damage.
(2) Where protected from corrosion solely by enamel.
(3) In cinder concrete or cinder fill where subject to permanent moisture unless protected on all sides by a layer of noncinder concrete at least 2 in. (50.8 mm) thick or unless the tubing is at least 18 in. (457 mm) under the fill.
(4) In any hazardous (classified) location except as permitted by Sections 502-4, 503-3, and 504-20.
(5) For the support of fixtures or other equipment except conduit bodies no larger than the largest trade size of the tubing. ~~Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action.~~
(6) Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action.
Exception: Aluminum fittings and enclosures shall be permitted to be used with steel EMT ~~electrical metallic tubing~~.

348-14. Dissimilar Metals. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action.
Exception: Aluminum fittings and enclosures shall be permitted to be used with steel EMT.

348-20. ~~348-7.~~ Size.

(a) Minimum. EMT ~~Tubing~~ smaller than 1/2-in. ~~electrical~~ trade size shall not be used.

Exception: For enclosing the leads of motors as permitted in Section 430-145(b).

(b) Maximum. The maximum size of EMT ~~tubing~~ shall be the 4-in. ~~electrical~~ trade size.

(FPN): Metric trade numerical designations for EMT ~~electrical metallic tubing~~ are ~~the same as those found in Extra heavy Duty Rigid Steel Conduits for Electrical Installations, IEC 981-1989, namely,~~ 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, 4 = 103.

348-22. ~~348-8.~~ Number of Conductors ~~in Tubing.~~ The number of conductors or cables ~~permitted in a single tubing~~ shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

348-24. ~~348-11.~~ Bends -- How Made.

Bends ~~in the tubing~~ shall be made so that the tubing will not be damaged and the internal diameter of the tubing will not be effectively reduced. The radius of the curve of the inner edge of any field bend shall not be less than shown in Table ~~346-10~~ 346-24.

Exception: For field bends made with a bending machine designed for the purpose, the minimum radius shall not be less than indicated in Table ~~346-10~~ 346-24 Exception.

348-26. ~~348-12.~~ Bends -- Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, e.g., conduit bodies and boxes.

348-28. ~~348-9.~~ Reaming and Threading. EMT ~~electrical metallic tubing~~ shall not be threaded. Where integral couplings are utilized, such couplings shall be permitted to be factory threaded.

All cut ends of EMT ~~electrical metallic tubing~~ shall be reamed or otherwise finished to remove rough edges.

348-30. ~~348-12. Supports.~~ Securing and Supporting. EMT ~~electrical metallic tubing~~ shall be installed as a complete system as provided in Article 300 and shall be securely fastened in place and supported in accordance with (a) and (b).

(a) Securely Fastened. ~~Each tubing length~~ EMT shall be securely fastened in place at least every 10 feet (3.05 m). In addition, ~~each tube~~ EMT shall be securely fastened within 3 ft (914 mm) of each outlet box, junction box, device box, cabinet, conduit body, or other tubing terminations.

Exception No. 1: Fastening of unbroken lengths shall be permitted to be increased to a distance of 5 ft (1.52 m) where structural members do not readily permit fastening within 3 ft (914 mm).

Exception No. 2: For concealed work in finished buildings or prefinished wall panels where such securing is impracticable, unbroken lengths (without coupling) of EMT ~~electrical metallic tubing~~ shall be permitted to be fished.

(b) Supports. Horizontal runs of EMT ~~electrical metallic tubing~~ supported by openings through framing members at intervals not greater than 10 ft (3.05 m) and securely fastened within 3 ft (914 mm) of termination points shall be permitted.

348-40. ~~348-14.~~ Boxes and Fittings. Boxes and fittings shall comply with the applicable provisions of Article 370.

348-42. ~~348-10.~~ Couplings and Connectors. Couplings and connectors used with ~~tubing~~EMT shall be made up tight. Where buried in masonry or concrete, they shall be concretetight type. Where installed in wet locations, they shall be of the raintight type.

348-56. ~~348-15.~~ Splices and Taps. Splices and taps shall be made in accordance with Section 300-15. See Article 370 for rules on the installation and use of boxes and conduit bodies.

C. Construction Specifications.

348-100. ~~348-16. General.~~ Construction

EMT ~~electrical metallic tubing~~ shall comply with (a) through (c) ~~(d) below~~.

(a) Cross Section. The ~~tubing~~EMT, and elbows and bends for use with the ~~tubing~~EMT, shall have a circular cross section.

(b) Finish. ~~Tubing~~EMT shall have such a finish or treatment of outer surfaces as will provide an approved durable means of readily distinguishing it, after installation, from ~~rigid metal conduit~~ Rigid Metal Conduit (RMC).

(c) Connectors. Where the ~~tubing~~EMT is coupled together by threads, the connector shall be designed so as to prevent bending of the ~~tubing~~EMT at any part of the thread.

348-120. ~~348-16(d).~~ Marking.

EMT ~~electrical metallic tubing~~ shall be clearly and durably marked at least every 10 ft (3.05 m) as required in the first sentence of Section 110-21.

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways of circular cross-section. For the 1999 NEC, a previous Sub-Task Group recommended that all of the circular raceway articles be combined into a single article (Article 344), to present a more uniform approach to the conduit and tubing requirements and to consolidate common requirements.

Review of public comments led the Panel to conclude that the goal of more user friendly code language had not been realized by the proposed Article 344. Furthermore, the Panel requested that a committee be appointed to consider the issue of user friendly code as it relates to the circular raceway articles.

The Sub-Task Group was asked to address such possibilities as revising the rejected 1999 proposal in light of the public comments, developing one or more articles to address the requirements

presented in the nine current circular raceway articles, or revising the current nine circular raceway articles using a similar style manual format. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.

A uniform format is proposed to achieve consistency across all of the circular raceways. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. A table that provides the uniform format for each circular raceway has been provided with this proposal.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for conduit and tubing not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

Explanation of proposed renumbering and editorial changes;

- Title Acronym "EMT" added
- 348-1 New Scope added to conform with the style manual.
- 348-2
  (1) Definition renumbered from Section 348-1 to 348-2.
  (2) Added the acronym "EMT".
  (3) "Electrical Metallic Tubing" capitalized as it is a proper name of a product.
  (4) Listing requirements relocated to new Section 348-6.
  (5) Change "tubing" to "raceway".
- 348-3
  (1) Other Articles renumbered from Section 348-2 to 348-3.
  (2) Delete product name and replace with acronym "EMT".
  (3) Text revised for clarity.
- 348-6 New section to relocate listing requirements for EMT and associated fittings. Listing requirements for the tubing and fittings came from 348-1 (1999 NEC).
- 348-10
  (1) Uses Permitted renumbered from Section 348-4 to 348-10.
  (2) Delete product name and replace with acronym "EMT" (two places).
  (3) New (c), Wet Locations moved from 348-6 (1999 NEC).
  (4) FPN in (b) moved to new (c) for clarity.
- 348-12
  (1) Uses Not Permitted renumbered from Section 348-5 to 348-12.
  (2) Delete product name and replace with acronym "EMT" (two places).
  (3) Dissimilar metals reference moved to new 348-14.
- 348-14
  (1) New section, dissimilar metal's text moved from 348-12 (5) (1999 NEC).
  (2) Exception added for clarity (Same exception as 348-12(6) (1999 NEC)).
- 348-20
  (1) Size renumbered from Section 348-7 to 348-20.
  (2) Delete product description or product name and replace with acronym "EMT" (three places).
  (3) The word "electrical" was deleted as it added nothing to the clarity of this section (two places).
  (4) Deleted the reference to the IEC for clarity.
- 348-22
  (1) Number of Conductors renumbered from 348-8 to 348-22.
  (2) Reword section adding reference to cables for clarity.
  (3) Removed the reference to tubing for clarity (two places).
- 348-24
  (1) Bends-How Made renumbered from 348-11 to 348-24.
  (2) Delete "in the tubing" for clarity.
  (3) Corrected section and table reference.
- 348-26 Bends-Number in One Run renumbered from 348-12 to 348-26.
- 348-28
  (1) Reaming and Threading renumbered from 348-9 to 348-28.
  (2) Deleted product name and replaced with acronym "EMT" (two places).
- 348-30
  (1) Securing and Supporting renumbered from 348-12 to 348-30.
  (2) Title changed from "Supports" to "Securing and Supporting" since section addresses both subjects.
  (3) Deleted product name and replaced with acronym "EMT" (five places).
  (4) Seperated the Section into two parts for clarity.
  (5) Added text for clarity without changing the original requirement.
- 348-40 Boxes and Fittings renumbered from 348-14 to 348-40.
- 348-42 Couplings and Connectors renumbered from 348-10 to 348-42.
  Replace "tubing" with with "EMT".
- 348-56 Splices and Taps renumbered from 348-15 to 348-56.
- 348-60 New Section for the grounding requirements. Text moved from 348-2 (1999 NEC).
- 348-100
  (1) Construction renumbered and renamed from 348-16 General to 348-100 Construction.
  (2) Deleted product name or "tubing" and replaced with acronym "EMT" (6 places).
  (3) "Rigid Metal Conduit" capitalized as it is a proper name of a product. "RMC" acronym added.
  (4) Moved marking requirements to 348-120.
- 348-120
  (1) New section for marking requirments moved from 348-16(d) (1999 NEC).
  (2) Deleted product name and replaced with acronym "EMT".

PANEL ACTION: Accept in Principle.
Delete from the proposal: 348-3, 348-14 348-40, and the second sentence of 348-56.
In proposed 348-22 delete the words "or cables."
In proposed 348-30 the 1999 reference should be changed to 348-13.

PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP-8 recommends approval of the scope section by the TCC.
The proposed 348-3, 348-40 and second sentence of 348-56 are deleted as 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.
Proposed 348-14 is deleted to eliminate redundant requirements.
There was no technical substantiation provided to add the words "or cables" as part of the rewrite of 348-22.

NOT RETURNED: 1 Corry

(Log #1286)

8- 277 - (348): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise as follows:
348-5 (3) In cinder concrete or cinder fill where subject to permanent moisture unless protected on all sides by a layer of noncinder concrete at least 50 mm (2 in.) ~~(50.8 mm)~~ thick or unless the tubing is at least 450 mm (18 in.) ~~(457 mm)~~ under the fill.
(a) Minimum. Tubing smaller than metric designator 16 (1/2) ~~in.~~ electrical trade size shall not be used.
348-7 (b) Maximum. The maximum size of tubing shall be metric designator 103 the (4) ~~in. electrical trade size~~.
FPN: Metric trade numerical designations for electrical metallic tubing are the same as those found in Extra-heavy Duty Rigid Steel Conduits for Electrical Installations, IEC 981-1989; namely, 16 = 1/2 ~~= 16~~, 21 = 3/4 ~~= 21~~, 27 = 1 ~~= 27~~, 35 = 1 1/4 ~~= 35~~, 41 = 1 1/2 ~~= 41~~, 53 = 2 ~~= 53~~, 63 = 2 1/2 ~~= 63~~, 78 = 3 ~~= 78~~, 91 = 3 1/2 ~~= 91~~, and 103 = 4 = ~~103~~.
348-13 Electrical metallic tubing shall be installed as a complete system as provided in Article 300. Each tubing length shall be securely fastened in place at least every 3 m (10 ft) ~~(3.05 m)~~. In addition, each tube shall be securely fastened within 900 mm (3 ft) ~~(914 mm)~~ of each outlet box, junction box, device box, cabinet, conduit body, or other tubing terminations.
Exception No. 1: Fastening of unbroken lengths shall be permitted to be increased to a distance of 1.5 m (5 ft) ~~(1.52 m)~~ where structural members do not readily permit fastening within 900 mm (3 ft) ~~(914 mm)~~.
Horizontal runs of electrical metallic tubing supported by openings through framing members at intervals not greater than 3 m (10 ft) ~~(3.05 m)~~ and securely fastened within 3 ft (914 mm) of termination points shall be permitted.
348-16 (d) Marking. Electrical metallic tubing shall be clearly and durably marked at least every 3 m (10 ft) ~~(3.05 m)~~ as required in the first sentence of Section 110-21.
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis. In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised. In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.
PANEL ACTION: Accept.

8- 278 - (348-1): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise 348-1 to read as follows:
348-1 Definition. Electrical Metallic tubing is a listed metallic ~~tubing~~ raceway of circular cross section approved for the installation of electrical conductors ~~when joined together with~~ and used with listed fittings to provide electrical and mechanical continuity.
SUBSTANTIATION: Editorial. Same type definition used for IMC and RMC except without a condition of tubing being joined together, to be approved for installation of conductors. Lengths of 10 ft or less may be joined to boxes, cabinets, panels, service heads, other raceways, or for support and protection of cable assemblies. The latter portion of the proposal does not require continuity, but only that listed fittings be used where it is required. Present definition basically states electrical metallic tubing is a tubing which is self evident.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-280.

8- 280 - (348-1): Accept in Principle
Note: The Technical Correlating Committee understands that the action is to revise the text of 348-2 in Proposal 8-276.
SUBMITTER: Tim Andrassy, Steel Tube Inst.
RECOMMENDATION: Revise the definition to read:
Electrical Metallic Tubing (EMT) is an unthreaded thinwall raceway of circular cross section designed for the physical protection and routing of conductors and cables and for use as an equipment grounding conductor when installed utilizing appropriate fittings. EMT is generally made of steel (ferrous) with protective coatings, or aluminum (nonferrous). is a listed metallic tubing of circular cross section approved for the installation of electrical conductors when joined together with listed fittings
SUBSTANTIATION: This definition aids in differentiating between wiring methods. Also, if accepted this definition will be proposed for a tri-national standard under development. More detailed definitions will be beneficial in encouraging international use of the NEC". There are a lot of questions in the field regarding what articles cover aluminum and other specialized conduits. There is also confusion over the terms "ferrous" and "nonferrous". This provides clarity.
PANEL ACTION: Accept in Principle.
Revise the proposed definition to read:
"Electrical Metallic Tubing (EMT) is an unthreaded thinwall raceway of circular cross section designed for the physical protection and routing of conductors and cables and for use as an equipment grounding conductor when installed utilizing appropriate fittings. EMT is generally made of steel (ferrous) with protective coatings, or aluminum (nonferrous)."
PANEL STATEMENT: The panel has amended the proposed definition to correct the submitter's error.

8- 282 - (348-4(a) (New)):

Note: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than 2/3 of the members eligible to vote have voted in the affirmative.

SUBMITTER: Joel A. Rencsok, Scottsdale, AZ

RECOMMENDATION: Add a new paragraph after the original text to read as follows:

(a) Exposed and Concealed. The use of listed electrical metallic tubing shall be permitted for both exposed and concealed work.

A separate equipment grounding conductor, sized as required by section 250-122, shall be installed in all electrical metallic tubing.

SUBSTANTIATION:

Grounding as provided by the EMT system is inadequate in many cases due to the separation, corrosion, loose fittings, thermal expansion, etc. This is due to inadequate code requirements on specific installation requirements causing EMT to move in such a manner that the fittings, couplings, and connectors loosen over time.

There have been many cases of human injuries due to this problem over time and across the country. In the Phoenix metropolitan area, there have been several cases of electrocution. Recently, an electrocution of an eight year old girl occurred, when the conduit came apart while she was playing on it. Another case was an electrocution of an air conditioning service technician who was taking the cover off of an ac unit with the conduit apart.

Additionally, the City of Phoenix Chief Electrical Inspector at the time, personally investigated many fires and injuries due to EMT conduit raceway failures. One such documented electrocution case occurred when a person attempted to turn on a water hose bib at a residence in Phoenix and was electrocuted. This was due to a shorted-grounded evaporative cooler motor and a broken and separated EMT conduit raceway. The metal water line had a plastic bushing which eliminated the electrical grounding continuity. The human body provided the path to ground. Even though a violation occurred, the missing bonding jumper on the isolation bushing on the water line would have no impact if the EMT raceway system was intact.

The Chief Electrical Inspector also investigated another documented serious injury which resulted in hospitalization. This occurred at the remodeling of a building in downtown Phoenix, Arizona. A power tool failed along with a broken EMT conduit raceway causing serious shock injury and near death.

Another injury was reported by a PE Electrical Engineer who personally investigated the accident. This injury took place at a Mall in Mesa, Arizona when a maintenance man came into contact with a broken EMT conduit raceway and was hurt due to a ground fault to the EMT down stream.

These are the injuries which occurred in the greater Phoenix area only. How many more deaths will it take before we take action?

"Fire investigation records of commercial buildings and military facilities show that metal raceways or cables are identified as the ignition source in a number of fires over recent years. Twelve such instances were identified in a Factory Mutual Technical Report, "A Review of Factory Mutual Technical Reports of Losses of Electrical Origin Involving Metal Conduits," by D.M. Karydas, FMRC J.I. 0N0R3.RU, July, 1986. A Shore Fire Management Report, prepared by the Naval Safety Center covering a period from April, 1982 through April, 1987 shows fires at seven U.S. military buildings were related to metallic raceways or cables. Also, the official NFPA investigation report of the tragic MGM fire indicates an arc between flexible aluminum conduit and EMT was the cause of the fire." Additionally, Factory Mutual conducted various studies on this problem and the summaries of their findings are as follows: "1. It was demonstrated that under ground fault conditions, metal conduit discontinuities release high thermal energy, visually manifested as showers of sparks, that is sufficient to ignite directly flammable gases, or pyrolyzate and melt, or even burn metallic parts (conduit fittings, etc.). 2. It was also demonstrated that under internal high-current arcing conditions, both plastic and metallic conduits suffer external wall rupture and the arcing fault releases high thermal energy to the ambient; molten metallic substance may ignite flammable material in the vicinity or at a distance from the immediate electrical fault area. No sustained fire involving conduit material itself was observed under these conditions." (Refer to 1989 TCR proposal 5-210) The panel's rejection statement on this proposal was not substantiated or answered by the panel. This raises the concern as to the technical intelligence of the panel members in response to the technical concerns that Factory Mutual's report states. The concerns to the public for safety are shown by the panel commented statements such as "Proposal would eliminate all raceways as grounding conductors. This would penalize both the good as well as the mediocre installations of wire/cable in conduit. It fails to take into account that if an equipment grounding conductor is in conduit, as recommended, that similar arcing can occur if the careless installer fails to securely attach each end of the equipment grounding conductor which is not visible after installation." Additionally, the concern of the internal arcing due to the differential impedance between the copper wire within the steel conduit raceway can be eliminated by requiring the equipment grounding conductor to be insulated. Presently over ninety percent of installations uses the insulated equipment grounding conductor. The only people who commented on the proposals are those who have an economic interest for maintaining market share and not for safety interest.

Installation(s) exposed on the surface of the roof have come apart during normal use. Also during the re-roofing of a roof, roof workmen, during the removal and installation of roofing material, have become severely shocked when the workman pick up the EMT raceway during the reroofing process. Roofers quite often move or step on the electrical conduits to install the new roofing. During this process, conduit fittings are being broken, pulled apart, or conductors damaged. Other nonelectrical trades are also called upon to perform on a roof are often not aware of the importance of grounding continuity. These persons do not take the necessary precautions to avoid damaging conduit or separating fittings.

Additionally, conduits exposed to the elements become rusted with a limited amount of ground continuity left and when moved or stepped on, they break quite easily.

Needless additional electrocutions and fires can be eliminated by the following minor change in installation requirements. By having an equipment grounding conductor installed within the raceway, the grounded appliance would have an assured means for ground return, thereby protecting the individual from shock hazard or injury. Since the only way that an appliance can remain energized, is when the conductors contained in the raceway remain continuous.

Interior raceways have the same problem as stated above, however, it has been proven everyday that the raceway system has a high impedance path. This proof is constantly shown by the fact that sensitive electronic equipments do not function correctly. Another line of reasoning involves computer grounding. A more solidly grounded conduit system would be less noisy and would help to encourage safe grounding practices for solid state equipment. Section 250-118(4) implies that this raceway system is adequate for grounding.

Section 250-118 is titled "Types of Equipment Grounding Conductors". Article 100 under definitions defines a "conductor". Nowhere in the definition of a conductor does it states that a raceway or a raceway which contains conductors is a conductor. Under the definitions, EMT is defined as a raceway. Since 250-118 only implies that a conductor can take other forms, it does not make it mandatory that these conductors are adequate as a equipment grounding conductor. If this was true, then the definition of conductor has to be revised to include any shape, any material, and so on.

Research of the standard relating to EMT shows no substantiated testing to confirm that raceways are adequate as an equipment grounding conductor. EMT Conduits have never been tested by UL or any testing laboratory as an equipment grounding conductor and there are no requirements under UL Standard 797 for resistance testing, for current testing, and for short circuit withstand testing of the conduit. In addition, UL Standard 514B does not require short circuit withstand testing for fittings and connectors. Additionally, Dr. C. Brenner, a PE electrical engineer, states that the technical article "Performance Evaluation of Steel Conduit Enclosed Power Systems" (conducted by Georgia Institute of Technology) does not address the real world conditions of broken, loose, or rusted EMT systems. The testing was done in an ideal condition and does not represent actual field application. The paper does not address the safety/hazard issue that exists when an electrical fault occurs and the metal conduit does not have a low conductivity path and a person contacts the conduit. Additionally, the Georgia Institute of Technology testing project is inadequate and does not addresses the issues of the previously mentioned Factory Mutual testing.

There is no guarantee that couplings, fittings and connectors have low impedance at the connection point. Therefore, it can not be assured that they comply with NEC 250-2(d) without a test of every branch circuit or feeder .

Where the EMT conduit is being used as the sole equipment grounding conductor, the ground path is often broken in normal field applications. As a result, equipment or a portion of the raceway may be energized with no equipment grounding to trip the overcurrent device. By installing an equipment grounding conductor within the raceway will help to ensure an effective

equipment grounding means (the grounding path remains intact) and will provide additional safety for personnel and property.

GENERAL STATEMENT TO THE PANEL

How much technical substantiation must we, the public, submit before the panel will take action and require an equipment grounding conductor in a raceway or cable which have uncontrolled impedances as used in a real world field application to conduct ground fault current and where the potential exists for people to get killed or shocked. In the past 10 years, people have submitted many code change proposals to require an equipment grounding conductor and they are constantly rejected by the panels. There has been overwhelming support for this change as documented by the TCRs and with substantiation of specific serious problem areas. The panel statements are always stating workmanship problems or design problems. The NEC is supposed to be an international safety standard. How many lives must be lost before the panel will take action?

Additional information was submitted under ROP (1998) 5-272 and 8-157 including the letters referenced above are available from NFPA.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 7

NEGATIVE: 6

NOT RETURNED: 1 Corry

EXPLANATION OF NEGATIVE:

BERMAN: Proposals to require the use of a separate equipment grounding conductor in EMT (and other metal raceways) have been considered by CMPs 5 and 8 for several code cycles. Primarily, the substantiation for these proposals consists of reports of incidents where the raceway was installed improperly or used in an area subject to severe physical abuse. Damage to the raceway by other trades or nonelectrical maintenance workers has been cited. This Panel has rejected similar proposals on that basis, and no new technical substantiation has been presented to warrant a change in this position.

Installation of a separate equipment grounding conductor, as suggested by the submitter, is permitted by the NEC. Section 250-118 clearly states that the equipment grounding conductor shall be one or more or a combination of the methods specified. Field experience has shown that properly installed EMT, without a separate equipment grounding conductor, used in an area not subject to severe physical damage, will perform acceptably, and can effectively serve as the equipment grounding conductor.

All UL Listed fittings used with EMT are required to comply with a fault current test, at the same test conditions and test criteria as other Listed grounding and bonding equipment. Compliant test results signify that these products are capable of transmitting fault currents back to the overcurrent protective device.

Discussion at the CMP 8 meeting could lead one to believe that if a separate equipment grounding conductor were required in all EMT, some installers might be less likely to thoroughly check or properly tighten all connections of the raceway system. Should a fault to the tubing occur within a length of EMT that does not employ properly fastened or broken fittings or couplings, a separate equipment grounding conductor will not be of any value in transmitting that fault back to the overcurrent protective device.

DAUBERGER: This proposal is very similar to a proposal that was submitted for the 1999 code cycle. At that time we reported that the problems we have investigated indicate that "poor workmanship" coupled with some "abuse" has been the cause of the problems. The manufacturers have responded by writing "installation guidelines" to assure proper installations. In addition, the substantiation for proposal 8-282 is exactly the same as that provided for the 1999 code. Therefore, no new substantiation has been provided which means that there is inadequate justification to require the installation of a separate grounding equipment conductor in all EMT installations.

DOLLINS: Where EMT and any other wiring method is installed and maintained in accordance with the NEC and their listing, the wiring method will perform as intended. The substantiation cites wiring methods that are installed where it will be damaged, exposed to corrosive environment, or that are poorly maintained. These conditions are already addressed by the code. If EMT is not suitable for a given condition of installation or use, an alternative wiring method should be used. It is not necessary to require a separate equipment grounding conductor for all installations of EMT.

JANNOT: CMP 8 rejected Proposal 8-8 that would have removed EMT from 250-118 as an acceptable equipment grounding conductor. Acceptance of this proposal (8-282) would seem to be in conflict with the panel's action on Proposal 8-8. EMT is, in fact, acceptable as an equipment grounding conductor when installed and maintained properly.

This same proposal with identical substantiation was submitted as Proposal 8-157 in the last code cycle. It was initially accepted in principle by requiring that a separate equipment grounding conductor be installed in all exposed rooftop installations of EMT. After public review and comment the proposal was rejected. Absolutely no new substantiation has been provided to justify accepting this proposal at this time.

LILLY: In comparing this proposal to Proposal 8-157 made in the 1998 NEC ROP, there is no new substantiation provided. For other than a few minor word changes, the wording in the substantiation of this proposal is exactly as found in 8-157. The substantiation presents situations of inadequate maintenance, poor workmanship, improper installation, product abuse, and failure on the part of workman to report damaged installations. The final disposition of Proposal 8-157 is found in the actions taken by Panel 8 on Comment Numbers 8-308 and 8-321 as found in the 1998 NEC ROC. Panel 8 rejected the concept that an equipment-grounding conductor be installed in EMT. The panel members should review Comment Number 8-321 as found in the 1998 NEC ROC. This comment offers good reasoning as to why this proposal should be rejected.

Category FKAV, Electrical Metallic Tubing Fittings, found on page 25 of Underwriters Laboratories 1999 General Information Directory states that listed EMT fittings are "considered suitable for grounding where installed in accordance with the National Electrical Code." UL has a testing program for EMT fittings that include pullout, continuity, and fault current testing.

348-4(a) requires EMT to be listed. EMT is to be securely fastened as required by 348-13. Expansion fittings are required for EMT by 300-7(b). 348-4(b) requires corrosion protection for concrete installations, where in direct contact with the earth, and where subject to severe corrosive influences. 348-6 requires protection of EMT, and "all supports, bolts, straps, screws, etc." against corrosion. EMT is to be installed within the parameters established in Sections 348-4 and 348-5 and in accordance with other applicable code requirements. 348-10 requires couplings and connectors for EMT to be made up tight. 90-1(b) anticipates "proper maintenance" will occur and states "This code contains provisions that are considered necessary for safety. Compliance therewith and proper maintenance will result in an installation that is essentially free from hazard but not necessarily efficient, convenient, or adequate for good service or future expansion of electrical use."

The present code requirements for expansion fittings, securing, permitted and not permitted uses, corrosion protection, listing, and installation provide for a safe EMT installation. The authority having jurisdiction, the installer and the owner are responsible for code compliant installations and maintenance. Rust broken and loose fittings and physical damage of the tubing are illustrations of inadequate maintenance, and misapplication of the raceway.

See my Explanation of Negative Vote on Proposal 2-283.

LOYD: This proposal should have been rejected for insufficient substantiation. The submitter did not substantiate the need to add a redundant equipment-grounding conductor in installations of EMT.

Although I recognize the effort Mr. Renscok has made to gather the information, the information submitted with the proposal is old material that has been submitted in previous code cycles with similar proposals that were rejected. All of the information related only to the Phoenix, Arizona area. All of the accidents involved small sizes of EMT (1/2 in. and 3/4 in.), improperly installed or damaged to the raceway systems by other trades, in combination with equipment failure. Section 90-1(b) clearly states it is not the intent of the NEC to guard against hazards that occur from improper installations or lack of maintenance.

The submitter also cites a 1986 Factory Mutual report which was prepared for Carlon for the purpose of substantiating several code changes to the 1990 NEC. All of these proposed changes were rejected. The panel statement said that the installations in the Factory Mutual tests did not meet Code requirements. There was only one negative vote, which was cast by Mr. C. Forsberg of Carlon.

The submitter blames the accidents cited on the fact that EMT does not provide an adequate grounding path. However, the examples he uses as substantiation deal with improper design, the use of EMT in the wrong application, or poor workmanship.

Over 50 years of field experience involving millions of feet of EMT have shown that, where installed and maintained properly, EMT is an effective equipment-grounding conductor, in accordance with Section 250-2(d). In fact, Panel 5, which is responsible for Article 250 (Grounding) unanimously rejected similar proposals in this code cycle and in past code cycles.

The accidents cited in the submitter's substantiation do not consider product improvements over the years nor is the age of the installation mentioned. The submitter stated that the UL standard for EMT does not contain grounding tests. However, each raceway

to fitting interface is subjected to the same ground current test as is required for grounding and bonding equipment. The grounding capability of steel EMT is well documented in standard engineering manuals and research reports.

The submitter has not provided any substantiation that the addition of a ground wire would make the installations safer. If he believes that poor workmanship contributes to improper connections, etc., why does he believe that the same would not happen with a supplemental grounding conductor? I have personally witnessed several installations where the supplemental grounding conductor was not properly terminated. It could be argued, in fact, that the addition of a supplemental ground could, in some instances, cause more potential problems that it would solve. Workmanship is an issue that must be dealt with by rigorous inspections, a strong licensing program by all jurisdictions, required education before licensing, and continued education annually to insure that only qualified installers perform and/or supervise the work.

Contrary to the submitter's statements, we have found that electronic equipment does function very well with EMT as a single path. A 1994 research report on grounding by the Georgia Institute of Technology shows that EMT actually has the lowest impedance path of all conduits. Where the metal raceway is used for shielding, a nonconductive fitting should be inserted in one end of the raceway system to prevent ground loops. When a redundant ground wire is run, because of the difference in impedance, it must be bonded to the raceway system at each outlet, junction box, or termination point.

The addition of a supplemental grounding conductor in EMT should remain a design decision. Present code requirements are adequate to provide for safe, reliable installations.

The position of the committee had always been that poor workmanship cannot be a substitute for complying with the code. It is not prohibited to install an internal ground wire and some engineers do require it already and they have that right since they can be held liable for the installations they design. I think it is and should remain a design consideration. Present code requirements are correct and are adequate to provide requirements necessary for safe reliable installations.

(Log #3395)

8- 283 - (348-4(a)): Accept in Principle

Note: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than 2/3 of the members eligible to vote have voted in the affirmative.

SUBMITTER: David Yee, Scottsdale, AZ

RECOMMENDATION: Add a new paragraph after the original text to read as follows:

(a) Exposed and Concealed. The use of listed electrical metallic tubing shall be permitted for both exposed and concealed work.

<u>A separate equipment grounding conductor, sized as required by Section 250-122, shall be installed in all electrical metallic tubing.</u>

SUBSTANTIATION: A. The title of Section 250-118(4) states "type of equipment grounding conductor".

Conductor is defined in Article 100 as follows:

Bare: A conductor having no covering or electrical insulation whatsoever.

Covered: A conductor encased within material of composition of thickness that is not recognized by this Code as electrical insulation.

Insulated: A conductor encased within material of composition and thickness that is recognized by this Code as electrical insulation.

Since the title references conductors, the code section should only reference conductors. Tubing, conduit, raceways, and other similar material should not be referenced as conductors in this section.

B. Grounding as provided by the EMT system is inadequate in many cases due to the separation, corrosion, loose fittings, thermal expansion, etc. This is due to inadequate code requirements on specific installation requirements causing EMT to move in such a manner that the fittings, couplings, and connectors loosen over time.

There have been many cases of human injuries due to this problem over time and across the country. Refer to my earlier submittal under ROP (1998) 5-272.

Installation(s) exposed on the surface of the roof have come apart during normal use. Also during the reroofing of a roof, roof workmen, during the removal and installation of roofing material, have become severely shocked when the workman pick up the EMT raceway during the reroofing process. Roofers quite often move or step on the electrical conduits to install the new roofing. During this process, conduit fittings are being broken, pulled apart, or conductors damaged. Other nonelectrical trades are also called upon to perform on a roof are often not aware of the importance of grounding continuity. These persons do not take the necessary precautions to avoid damaging conduit or separating fittings. Additionally, conduits exposed to the elements become rusted with a limited amount of ground continuity left and when moved or stepped on, they break quite easily.

Needless additional electrocutions and fires can be eliminated by the following minor change in installation requirements. By having an equipment grounding conductor installed within the raceway, the grounded appliance would have an assured means for ground return, thereby protecting the individual from shock hazard or injury. Since the only way that an appliance can remain energized, is when the conductors contained in the raceway remain continuous.

Interior raceways have the same problem as stated above, however, it has been proven everyday that the raceway system has a high impedance path. This proof is constantly shown by the fact that sensitive electronic equipments do not function correctly. Another line of reasoning involves computer grounding. A more solidly grounded conduit system would be less noisy and would help to encourage safe grounding practices for solid state equipment. Section 250-118(4) implies that this raceway system is adequate for grounding.

Where the EMT conduit is being used as the sole equipment grounding conductor, the ground path is often broken in normal field applications. As a result, equipment or a portion of the raceway may be energized with no equipment grounding to trip the overcurrent device. By installing an equipment grounding conductor within the raceway will help to ensure an effective equipment grounding means (the grounding path remains intact) and will provide additional safety for personnel and property.

Note: Additional information was submitted under ROP (1998) 5-272 and 8-157 including the letters referenced are available from NFPA.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action on proposal 8-282.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 7

NEGATIVE: 6

NOT RETURNED: 1 Corry

EXPLANATION OF NEGATIVE:

BERMAN: See my Explanation of Negative on Proposal 8-282.

DAUBERGER: See my Explanation of Negative on proposal 2-282.

DOLLINS: Where EMT and any other wiring method is installed and maintained in accordance with the NEC and their listing, the wiring method will perform as intended. The substantiation cites wiring methods that are installed where it will be damaged, exposed to corrosive environment, or that are poorly maintained. These conditions are already addressed by the code. If EMT is not suitable for a given condition of installation or use, an alternative wiring method should be used. It is not necessary to require a separate equipment grounding conductor for all installations of EMT.

JANNOT: See my Explanation of Negative Vote on Proposal 8-282.

LILLY: The substantiation for this proposal is not sufficient to warrant its acceptance. I offer the following responses to the points made in the proposal substantiation.

1. CMP 8 does not have jurisdiction over 250-118.

2. The first paragraph of Part B of the substantiation states "Grounding as provided by the EMT system is inadequate in many cases due to the separation, corrosion, loose fittings, thermal expansion, etc. This is due to inadequate code requirements on specific installation requirements causing EMT to move in such a manner that the fittings, couplings, and connectors loosen over time." There are not "inadequate code requirements." 300-6, 348-4(b) and 348-6 provide for the corrosion protection of EMT. 300-7 provides for expansion fittings for EMT, 348-5(1) prohibits EMT being used where subject to severe physical damage. 348-13 requires EMT to be securely fastened. 384-10 requires couplings and connectors for EMT to be made up tight. 90-1(b) tells us that code compliance and proper maintenance are necessary for "an installation that is essentially free from hazard but not necessarily efficient, convenient, or adequate for good service or future expansion of electrical use". 348-4 and 348-5 provide for the permitted and not permitted uses of EMT.

3. Installations of EMT on rooftops where workman "pick up the EMT" are not code compliant as the EMT is not securely fastened in accordance with 348-13. Installations on rooftops where the EMT is damaged by being stepped on are not code compliant, as 348-5(1) does not permit the EMT to be installed, "Where, during installation or afterward, it will be subject to severe physical damage."

4. Installations that comply with 300-7, 348-4, 348-5, 348-6, 348-13 and other applicable code requirements should not "come apart during normal use."
5. The installation of an equipment grounding conductor will not facilitate the overcurrent device operation on high impedance faults, such as arcing faults.
6. Grounding of "sensitive electronic equipment" is a design consideration. As such, it is beyond the scope of the NEC as 90-1(c) states "This code is not intended as a design specification nor an instruction manual for untrained persons."

Installations that are installed in accordance with the NEC and properly maintained are safe and the EMT is suitable as an equipment grounding conductor.

See my Explanation of Negative Vote on Proposal 8-282.

LOYD: This proposal should have been rejected. See my comments on ROP 8-282 vote and action.

(Log #3738)

8- 284 - (348-5): Reject

SUBMITTER: Wayne A. Lilly, Bridgewater, VA

RECOMMENDATION: Revise item (1) of Section 348-5 so the section reads as follows:

348-5. Uses Not Permitted. Electrical metallic tubing shall not be used.

(1) Where, during installation or afterward, ~~it~~ ferrous electrical metallic tubing will be subject to severe physical damage. Nonferrous electrical metallic tubing shall not be used where, during installation or afterward, it will be subject to physical damage unless listed for the purpose.

(2) Where protected from corrosion solely by enamel.

(3) In cinder concrete or cinder fill where subject to permanent moisture unless protected on all sides by a layer of noncinder concrete at least 2 in. (50.8 mm) thick or unless the tubing is at least 18 in. (457 mm) under the fill.

(4) In any hazardous (classified) location except as permitted by Sections 502-4, 503-3, and 504-20.

(5) For the support of fixtures or other equipment except conduit bodies no larger than the largest trade size of the tubing. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action.

Exception: Aluminum fittings and enclosures shall be permitted to be used with steel electrical metallic tubing.

SUBSTANTIATION: Nonferrous electrical metallic tubing is gaining acceptance throughout the electrical industry. Nonferrous EMT, such as aluminum, is much softer than ferrous EMT and is thus more susceptible to damage. Including a listing provision makes allowance for nonferrous EMT which may be suitable for exposure to physical damage.

PANEL ACTION: Reject.

PANEL STATEMENT: All EMT, ferrous and nonferrous is evaluated to the same product standard in order to qualify for listing and is permitted by the NEC to be installed in locations where not subject to severe physical damage. The determination of areas subject to physical damage is the responsibility of the authority having jurisdiction.

(Log #2073)

8- 285 - (348-5, Exception): Accept in Principle

Note: The Technical Correlating Committee understands that the Panel Action text revises the wording accepted in 384-12(6), Exception of Proposal 8-276.

SUBMITTER: Joel A. Rencsok, Scottsdale, AZ

RECOMMENDATION: Revise the exception to read as follows:

Exception: Aluminum fittings and enclosures shall be permitted to be used with steel electrical metallic tubing where not subject to corrosive influences.

SUBSTANTIATION: Aluminum fitting will corrode in corrosive areas and clarification is needed in the code.

This exception implies that corrosion protection is not required due to the location of the exception.

The aluminum must also protected. Listed copper free aluminum fittings and enclosures will also have severe corrosion when located near the salt oceans of the world.

I have inspected industrial plants around the world and found that within 3 months corrosion to the aluminum enclosures and fittings start to become severe.

The code needs to address this concern.

PANEL ACTION: Accept in Principle.

Revise the proposed text to read:

"Exception: Aluminum fittings and enclosures shall be permitted to be used with steel electrical metallic tubing where not subject to severe corrosive influences. "

PANEL STATEMENT: The environments described in the substantiation are ones that present severe corrosive influences.

Note: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

SUBMITTER: Charles M. Trout, Maron Electric Co.

RECOMMENDATION: Add a new part (6) to read:

"for installation on roof-tops".

SUBSTANTIATION: The deterioration of electrical metallic tubing used on roof-tops has been well documented over the years. A user should be able to expect an electrical installation to last the life of the building if properly installed and maintained. Electrical metallic tubing properly installed and properly maintained cannot withstand the deterioration and corrosive rotting when subjected to the adverse weather elements encountered in roof-top installations. The metallic protection for the conductors rusts, erodes and rots away leaving conductors subject to physical damage and with that also loses its performance of ground fault path so essential to safe electrical installations. Attempts have been made through proposals to prohibit the use of electrical metallic tubing as an equipment grounding conductor. But that is not the problem. The basic problem is that electrical metallic tubing is not suitable for use on roof-tops without some additional coating such as a PVC or other noncorrosive material.

PANEL ACTION: Accept.

PANEL STATEMENT:

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 7

NEGATIVE: 6

NOT RETURNED: 1 Corry

EXPLANATION OF NEGATIVE:

BERMAN: The submitter has indicated that properly installed and maintained EMT cannot withstand deterioration when subjected to adverse weather elements. However, except for the statement that this is well documented over the years, no further evidence of those specific conditions was presented to support the proposal.

It is agreed that any raceway can deteriorate when subjected to severe corrosive influences. This application is already prohibited by 348-4(b). Use of EMT on a rooftop would certainly be considered a wet location, but not necessarily a severe corrosive influence. UL Listing of EMT requires the tubing to be subjected to the same corrosion test conditions as rigid metal conduit.

DAUBERGER: Adding rooftop installations to "Uses Not Permitted" is unwarranted because the submitter failed to provide adequate substantiation.

DOLLINS: The proposed new nonpermitted use, "For installation on rooftops" is too broad. It covers all rooftop installations including the great majority where no problems exist. The present requirement of Section 348-5(1) prohibits EMT from use "Where, during installation or afterward, it will be subject to severe physical damage." The present requirements already prohibit the use of EMT on rooftops and anywhere else "Where, during installation or afterward, it will be subject to severe physical damage."

JANNOT: The submitter did not provide sufficient substantiation for making this drastic restriction.

LILLY: The substantiation states, in part, "The deterioration of electrical metallic tubing used on roof-tops has been well documented over the years." This is insufficient technical substantiation for the proposal as no such documentation was provided.

There is no need to prohibit EMT on rooftops. The substantiation for this proposal cites only corrosion problems, 300-6, 348-4(b), and 348-6 provide requirements for corrosion protection. 348-4(b)

additionally requires the EMT installation to be suitable for the condition. 348-4 and 348-5 provide use requirements. These corrosion requirements, in conjunction with corrosion protection requirements in ANSI and UL standards, provide adequate corrosion protection for rooftop installations. The authority having jurisdiction, installer, designer, and owner must make the determination as to the suitability of the installation based on code requirements. The installer, owner and designer are responsible for design considerations. The owner is responsible for maintenance.

I have performed electrical inspections for 23 years. During those years I have found no rooftop installations of EMT where the "metallic protection" for the conductors rusts, rots and erodes away leaving conductors subject to physical damage." Perhaps this is because of the different weathering conditions or roofing materials used in my area. It might even be because of different maintenance. Whatever the reason, prohibiting the use of EMT on all rooftops is overly restrictive, as there are many installations that do not exhibit the problems cited in the substantiation.

LOYD: This proposal should be rejected, if accepted it will eliminate the use of all EMT on rooftops without providing the substantiation to do so. The submitter states that deterioration of electrical metallic tubing used on rooftops is well documented. Yet, he has supplied no documentation to support this claim. As a former contractor, inspector and electrician, I have not found this to be true. We have used EMT as a poke-through to feed rooftop units for years without problems.

The submitter's rationale for not allowing EMT on rooftops is entirely focused on the supposed corrosive environment in which the EMT would be installed. The submitter states that the deterioration of EMT on rooftops is well documented. The submitter also states that properly installed and maintained EMT cannot withstand the deterioration and corrosive rotting that occurs on rooftops. Depending on the particular area of the country, EMT on rooftops may or may not be subjected to corrosive environments. However, the Code already covers this issue in 300-6:

300-6. Protection Against Corrosion. Metal Raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, fittings, supports, and support hardware shall be of materials suitable for the environment in which they are to be installed.

Noncompliance with Section 300-6 would be an improper installation. Section 90-1(b) clearly states it is not the intent of the NEC to guard against hazards that occur from improper installations or lack of maintenance.

The submitter finally states that the problem is not the use of EMT as an equipment-grounding conductor, but that EMT is not suitable for rooftop installations without adding a coating such as PVC. This is a design decision. As stated above, the Code already covers that issue in 300-6.

As a committee, we should continue to support allowing designers and the authorities having jurisdiction to make the decision as to when additional corrosion protection in required. There are other areas in which EMT, or any other wiring method, is installed where it may be subject to severe corrosion. That is insufficient reason for totally prohibiting the use of that product in that application. We have rejected setting the precedent of providing laundry lists of possible locations where additional corrosion protection is or may be required.

Each Code proposal is supposed to be voted on based on the substantiation in the proposal. Substantiation is completely lacking in this proposal and the only issue raised is corrosion protection, which is already covered in the Code. This proposal should be rejected.

COMMENT ON AFFIRMATIVE:

GRIFFITH: New part (6) should read "for installation in roof-tops <u>exposed to the outdoors</u>". Industrial plants have many control rooms and other roof-tops that are indoors, inside a larger building not subjected to the same conditions included in the submitter's substantiation.

(Log #261)

8- 287 - (348-5(7) (New)): Reject
SUBMITTER: Charles M. Trout, Maron Electric Co.
RECOMMENDATION: Add a new part (7) to read:

"For installation of trade sizes 1/2 in., 3/4 in., and 1 in. in accessible hollow spaces above ceilings unless the following conditions are met:

a. The electrical metallic tubing is rigidly supported every 4 1/2 ft and within 12 in. of every connector and coupling, and

b. An equipment grounding conductor, sized in accordance with Section 250-122, is installed in the conduit."

SUBSTANTIATION: The bending, kinking and separation of electrical metallic tubing at fittings where installed in these sizes in hollow spaces above ceilings has been well documented over the years. Properly installed and maintained installations are subjected to excessive vibration due to internal and external sources. Properly installed and maintained installations have been roughly pushed and pulled apart by other persons working above the ceiling. A properly maintained concealed installation is not checked with such regularity that disruption of the integrity of the conduit system would immediately be repaired. Attempts have been made with well documented proposals to require an equipment grounding conductor to be run with electrical metallic tubing installation such as these but these proposals have been rejected. So let's support electrical metallic tubing properly and maintain the electrical grounding continuity we desperately need and indeed are required to maintain in accordance with Section 250-2(d).
PANEL ACTION: Reject.
PANEL STATEMENT: The requirements for supporting and securing EMT are adequately addressed by the existing text of 348-13. The proposal does not provide sufficient technical substantiation to indicate that additional supports are needed. The equipment grounding conductor requirement is covered by the panel action on Proposal 8-282.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #262)

8- 288 - (348-5(8) (New)): Reject
SUBMITTER: Charles M. Trout, Maron Electric Co.
RECOMMENDATION: Add a new part (8) to read:

"for direct burial in the earth unless the following conditions are met:

a. The electrical metallic tubing is encased in 1 in. of concrete, and

b. An equipment grounding conductor, sized in accordance with Section 250-122, is installed in the conduit."

SUBSTANTIATION: A user should be able to expect an electrical installation to last the life of the building if properly installed and maintained. Contrary to the remarks sometimes heard from manufacturers' representatives lobbying for their employers products "poor workmanship" is not the cause of deterioration, rusting, and rotting. "Poor maintenance" is not the cause of deterioration, rusting or rotting. "Poor inspection" is not the cause of deterioration, rusting or rotting. Using a product that will deteriorate, rust or rot in this application is the problem. Corrosion protection applied by the manufacturer does not work as can be seen by well documented proposals. Maintaining an installation of electrical metallic tubing buried in direct contact with the earth is really "difficult". When electrical metallic tubing rusts or rots away, we lose the protection for our conductors leaving them subject to physical damage and with that we also lose our performance of ground fault path so essential to safe electrical installations and justifiably required by Section 250-2(d). The basic problem is that electrical metallic tubing is not suitable for direct burial use. Let's give our installers the proper products with a code to back them up and we can enjoy seeing the purpose of the code upheld.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal does not provide sufficient technical substantiation and the proposed text conflicts with 348-4(b).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3079)

8- 289 - (348-7): Accept in Principle in Part

Note: The Technical Correlating Committee understands that the Panel Action text revises the wording accepted in 348-20 of Proposal 8-276.

SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Revise this section and the FPN to read:

(a) Minimum. <u>EMT</u> ~~tubing~~ smaller than 1/2 <u>(16)</u> ~~in. electrical trade size~~ shall not be used.

Exception: For enclosing the leads of motors as permitted in Section 430-145(b).
(b) Maximum. EMT larger than 4 (103) shall not be used. ~~The maximum size of tubing shall be the 4 in. electrical trade size.~~
FPN: The Trade Size and Metric Designators are for identification purposes only and do not relate to actual dimensions. See 300-x.
~~FPN: Metric trade numerical designations for EMT electrical metallic tubing are the same as those found in Extra heavy duty Rigid Steel Conduits for Electrical Installations, IEC 81-1989; namely, 1/2 = 16, 3/4 = 21, 1 = 27. 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, 4 = 103.~~
SUBSTANTIATION: To correlate with proposal submitted to CMP 3 to add a table showing English and Metric trade size designators. The table provides universal information throughout the Code. This cuts out a lot of excess language in the Code, which is no longer needed. Metric trade sizes have been established for two Code cycles and cover raceways and system components. Also, picks up use of acronym as proposed for the 2002 Code.
PANEL ACTION: Accept in Principle in Part.
The panel accepts in principle the addition of the new FPN to read as follows:
"FPN: See 300-1(c) for the Metric Designators and Trade Sizes. These are for identification purposes only and do not relate to actual dimensions."
The panel accepts the deletion of the old FPN. The panel accepts in principle the replacement of the word "tubing" with the acronym "EMT" and the deletion of "in. electrical trade size" by action on Proposals 8-276 and 8-277.
The panel prefers the language used for "maximum size" per Proposal 8-276.
PANEL STATEMENT: The acceptance of the changes to the Fine Print Notes are contingent upon an acceptance of Proposal 3-6 by CMP-3. If CMP-3 does not accept Proposal 3-6, the panel directs staff to revert to the existing FPN. The proposed Fine Print Note was revised to comply with Section 4.1.2 of the NEC Style Manual. See panel action on Proposals 8-276 and 8-277.

NOT RETURNED: 1 Corry

(Log #3808)

8- 291 - (348-9 and Table 350-12): Reject
SUBMITTER: Franklin H. King, Eugene, OR
RECOMMENDATION: Revise text to read as follows:
When tubing cutters are used to cut partially through conduit and broken at the cut a reduction in wire pull number must be decreased.
Exception: No wire reduction needed when depth gage tubing cutters are used.
SUBSTANTIATION: As internal diameters may be reduced in pipe (EMT) using tubing cutters; guess work cutting is too careless type work (110-12). May cause reduction of wire size. 300-17 (ease of installation and withdrawal without conductor damage is required).
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient technical substatiation to limit the methods by which EMT is cut in the field. The requirements are adequately covered in 348-9.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3077)

8- 292 - (348-11): Accept
Note: The Technical Correlating Committee understands that the accepted text replaces the last sentence and deletes the Exception of 348-24 accepted in Proposal 8-276.
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Revise the last sentence to read as follows and delete the exception:
The radius of the curve of any field bend to the centerline of the conduit ~~the inner edge of any field bend~~ shall not be less than shown in Table 346-10 for one-shot and full shoe benders.
~~Exception: For field bends made with a bending machine designed for the purpose, the minimum radius shall not be less than indicated in Table 346-10, Exception.~~
NOTE: This is a companion proposal to revise Table 346-10.
SUBSTANTIATION: Only one shot and full shoe benders are used for EMT. This revised text clarifies that measurements are to be made to the centerline where these benders are used. The new Table 346-10 proposed in a companion proposal makes the exception unnecessary. Lead sheath conductors are no longer made and the existing Table 346-10 has been deleted and combined with the exception table.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
LILLY: I disagree with that part of the substantiation that states "Only one-shot and full shoe benders are used for EMT." EMT is also bent by use of "hickey" style benders. The proposed language "one-shot and full shoe benders" should be deleted, as it is overly restrictive. "Hickey" style benders have been successfully used in the industry for many years. Bends made using "hickey" style benders and complying with the column "Other Bends", in the proposed revised Table 346-10, will not damage the raceway nor will they pose problems with conductor installation.

(Log #4213)

8- 293 - (348-13): Accept in Principle in Part

Note: The Technical Correlating Committee understands that revision to "terminations" modifies 348-30(a) in Proposal 8-276.

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Revise as follows:

Electrical metallic tubing shall be installed as a complete system as provided in Article 300. ~~Each tubing length~~ It shall be securely fastened in place at least every 10 ft (3.05 m). In addition, ~~each tube~~ it shall be securely fastened within 3 ft (914 mm) of each outlet box, junction box, device box, cabinet, conduit body, or other tubing ~~terminations~~ termination.

SUBSTANTIATION: The revised wording of this section resulting from 1999 NEC changes can be interpreted to require individual lengths of EMT to be independently supported, regardless how short the length. For example, if I have a 2-ft scrap left over and I decide to put my box kick on that and then couple a 10-ft length to it, historically I only needed one clip, and it could go anywhere in the first 3 ft from the box. It might go at 30 in., and bypass the cut length entirely, or not.

The 1999 wording says every tubing length has to be supported "at least" (could be less) every 10 ft, and you could argue that the 2 ft scrap is a "tubing length" requiring support. Furthermore, "each tube" has to be supported within 3 ft of "tubing terminations" so you could say even the 10 ft length needs a clip within 3 ft of its coupling with the 2-ft piece. The proposal that produced this foolishness wasn't well substantiated, and we should go back and unfix what was never broken. This proposal does that.

PANEL ACTION: Accept in Principle in Part.

The panel accepts the change from "terminations" to "termination".

The panel accepts in principle the remainder of the proposal by panel action on Proposal 8-276, Section 348-30.

PANEL STATEMENT: The panel concurs with the submitter that the term "terminations" should be made singular.

See panel action and substantiation on Proposal 8-276.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 2

NOT RETURNED: 1 Corry

EXPLANATION OF NEGATIVE:

BERMAN: I agree with Mr. Lilly that the panel action reintroduces a potential interpretation issue that was partially resolved in the 1999 NEC. While the submitter is correct in pointing out that the present wording could be interpreted to mean that several short lengths in a run would each need to be securely fastened, the proposal could also potentially allow one to again "take credit" for securement on the opposite side of a box. Requiring "each tubing run" to be securely fastened as required would result in consistent application of the intent of this rule.

LILLY: The substantiation for Proposal 8-162 of the 1998 ROP was "Many interpretations have been made pertaining to this situation where installers wish to "take credit" for supports on opposite sides of an outlet box, junction box, device box, etc. The new wording would clarify the intent that supports are needed for each conduit terminating in such boxes, not just on one side of the box." The proposed revision to this section allows it to be interpreted as it was prior to the 1999 NEC. This will cause the code to regress by creating the same problem that was solved in the 1999 NEC.

(Log #4441)

8- 294 - (348-13): Reject

SUBMITTER: Doyle J. Cantrell

RECOMMENDATION: Revise text as follows:

Electrical metallic tubing shall be installed as a complete system as provided in Article 300. Each tubing length shall be securely fastened in place at least every 10 ft (3.05 m). In addition, each tube shall be securely fastened within 3 ft (914 mm) of each coupling, outlet box, junction box, device box, cabinet, conduit body, or other tubing terminations.

SUBSTANTIATION: Mechanical strength of coupling devices is not sufficient for self support in conduit runs.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter's substantiation is not correct. Couplings are evaluated and listed for mechanical strength.

NOT RETURNED: 1 Corry

(Log #839)

8- 297 - (348-13 Exception No. 3 (New)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Add:

Exception No. 3: Exposed electrical metallic tubing installed on a rooftop where the roof has a slope of less than 4 in. (102 mm) in 12 in. (305 mm) shall be fastened within 3 ft (914 mm) of each side of each coupling.

SUBSTANTIATION: I have observed many separations of EMT from couplings where installed on roofs where it is likely to be tripped over or stepped on by rooftop equipment installers or service personnel. Tubing runs are commonly secured to wooden blocks affixed by adhesive to built-up roof covering. The Los Angeles City Electrical Code once (before adoption of the NEC) required tubing support within 3 ft of both sides of couplings, which mitigates the separation problem, since when stepped on the tubing may be bent but not usually separated. With one support immediately adjacent to a coupling, the tubing may span nearly 10 ft before the next required support. Although this complies with present Code, if stepped on or tripped over the flexibility is more likely to result in separation at the coupling. Since some areas are not concerned with snow removal equipment, restriction due to severe physical damage may be difficult to enforce.

Prevention of separation, with attendant loss of grounding continuity should be the goal rather than requirements for separate grounding conductors.

The proposal is perhaps more warranted for smaller sizes of tubing; the majority of separations seem to occur in the 1/2 and 3/4 in. tubing due to lesser strength and rigidity.

PANEL ACTION: Reject.

PANEL STATEMENT: Section 348-5 does not permit EMT to be used where during installation or afterward, it would be subject to severe physical damage. Installations, such as those referred to in the substantiation and the recommendation would subject EMT to severe physical damage.

(Log #3774)

8- 305 - (348-60 (New)): Accept
SUBMITTER: Richard E. Loyd, R&N Assoc.
RECOMMENDATION: Add a new section "Grounding" as follows:
348-60. Grounding. EMT shall be permitted as an equipment ground conductor.
SUBSTANTIATION: I serve on the Usability Task Group, Subtask Group 1, which has submitted proposals to reformat the existing nine raceway articles using a common template. After these proposals were submitted, I noticed that all of the raceway articles except Article 348 contain a section on grounding. In the substantiation of the rewrite for Article 348, the submitter indicates there is a section on grounding for EMT. However, this section does not appear in the actual proposal. EMT is permitted to be used as an equipment grounding conductor and should so indicate in Article 348, since all of the other raceway articles indicate whether or not the raceway can be used as an equipment grounding conductor. Omitting this information only from the EMT article will confuse the Code user.

PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
GRIFFITH: The language of this change contradicts the panel's action on Proposal 8-282.

ARTICLE 349 — FLEXIBLE METALLIC TUBING: TYPE FMT

(Log #1227)

8- 306 - (349): Accept in Principle
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise Article 349 to read as follows:
Article 349—Flexible Metallic Tubing: Type FMT

A. General.

349-1. Scope. This article covers the use, installation, and construction specifications for Flexible Metallic Tubing (FMT) and associated fittings.

349-2. ~~349-1.~~ Definition. Flexible Metallic Tubing (FMT). ~~is a listed~~ A ~~tubing~~ raceway that is circular in cross section, flexible, metallic, and liquidtight without a nonmetallic jacket.

349-3. Other Articles. Installations of ~~flexible metallic tubing~~ FMT shall comply with ~~the provisions of the~~ applicable ~~sections~~ provisions of Article 300 ~~and Section 110-21~~.

349-6. Listing Requirements. FMT and associated fittings shall be listed.

B. ~~Construction and~~ Installation

349-10. ~~349-4.~~ Uses Permitted. ~~Flexible metallic tubing~~ FMT shall be permitted to be used for branch circuits

(1) In dry locations,
(2) Where concealed,
(3) In accessible locations, and
(4) For system voltages of 1000 volts maximum.

349-12. ~~349-5.~~ Uses Not Permitted. ~~Flexible metallic tubing~~ FMT shall not be used

(1) In hoistways;
(2) In storage battery rooms;
(3) In hazardous (classified) locations unless otherwise permitted under other articles in this Code;
(4) Underground for direct earth burial, or embedded in poured concrete or aggregate;
(5) Where subject to physical damage; and
(6) In lengths over 6 ft (1.83 m).

349-20. ~~349-10.~~ Size.
(a) Minimum. ~~Flexible metallic tubing~~ FMT smaller than 1/2-in. ~~electrical~~ trade size shall not be used.

Exception No. 1: ~~Flexible metallic tubing~~ FMT of 3/8-in. trade size shall be permitted to be installed in accordance with Sections 300-22(b) and (c).

Exception No. 2: ~~Flexible metallic tubing~~ FMT 3/8-in. trade size shall be permitted in lengths not in excess of 6 ft (1.83 m) as part of an approved assembly or for lighting fixtures. See Section 410-67(c).

(b) Maximum. The maximum size of ~~Flexible metallic tubing~~ FMT shall be the 3/4-in. trade size.

FPN: Metric trade numerical designations for FMT ~~Flexible metallic tubing~~ are 3/8 = 12, 1/2 = 16, and 3/4 = 21.

349-22. ~~349-12.~~ Number of Conductors.

(a) ~~Flexible metallic tubing~~ FMT — 1/2-in. and 3/4-in. Trade Size.

The number of conductors or cables ~~permitted~~ in 1/2-in. and 3/4-in. trade sizes ~~of Flexible metallic tubing~~ shall not exceed that permitted by the percentage ~~of~~ fill specified in Table 1, Chapter 9.

(b) ~~Flexible metallic tubing~~ FMT — 3/8-in. Trade Size.

The number of conductors ~~permitted~~ in 3/8-in. trade size ~~Flexible metallic tubing~~ shall not exceed that permitted in Table 350-22 ~~350-12~~.

349-24. ~~349-20.~~ Bends.

(a) Infrequent Flexing Use.

Where ~~the flexible metallic tubing~~ FMT ~~shall be~~ may be infrequently flexed in service after installation, the radii of bends measured to the inside of the bend shall not be less than specified in Table 349-24(a) ~~349-20(a)~~.

Table 349-24(a) ~~349-20(a)~~. Minimum Radii for Flexing Use
[*****1999 NEC Table 349-20(a) and note here *****]

(b) Fixed Bends.

Where ~~the flexible metallic tubing~~ FMT is bent for installation purposes and is not flexed or bent as required by use after installation, the radii of bends measured to the inside of the bend shall not be less than specified in Table 349-24(b) ~~349-20(b)~~.

Table 349-24(b) ~~349-20(b)~~. Minimum Radii for Fixed Bends
[******1999 NEC Table 349-20(b) and note here *****]

349-40. ~~349-18.~~ Boxes and Fittings.
~~Flexible metallic tubing shall be used only with listed terminal fittings.~~ Fittings shall effectively close any openings in the connection.

349-56. ~~349-17.~~ Splices and Taps.
Splices and taps shall be made in accordance with Section 300-15. See Article 370 for rules on the installation and use of boxes and conduit bodies.

~~349-16~~ 349-60. Grounding.

See Section 250-118(8) for rules on the use of ~~flexible metallic tubing~~ FMT as an equipment grounding conductor.

C. Construction Specifications.

349-120. Marking. FMT shall be marked according to Section 110-21.

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways of circular cross-section. For the 1999 NEC, a previous Sub-Task Group recommended that all of the circular raceway articles be combined into a single article (Article 344), to present a more uniform approach to the conduit and tubing requirements and to consolidate common requirements.
Review of public comments led the Panel to conclude that the goal of more user friendly code language had not been realized by the proposed Article 344. Furthermore, the Panel requested that a committee be appointed to consider the issue of user friendly code as it relates to the circular raceway articles.
The Sub-Task Group was asked to address such possibilities as revising the rejected 1999 proposal in light of the public comments, developing one or more articles to address the requirements presented in the nine current circular raceway articles, or revising the current nine circular raceway articles using a similar style manual format. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.

A uniform format is proposed to achieve consistency across all of the circular raceways. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. A table that provides the uniform format for each circular raceway has been provided with this proposal.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for conduit and tubing not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

Explanation of renumbering and editorial changes;

Title; Acronym "FMT" added
349-1. New Scope added to conform with the style manual
349-2.
1. Definition renumbered from Section 349-1 to 349-2
2. "FMT" added
3. Flexible Metallic Tubing capitalized as it is a proper name of a product.
4. Listing requirements relocated to new Section 349-6
5. Changed "metallic" to metal
6. Changed "tubing" to "raceway"

349-3. Add acronym FMT, reworded for clarity, moved 110-21 reference to 349-120.

349-6. New section for listing requirements for FMT and associated fittings.

Part B new title "Installation"; construction requirements relocated to a new part C.

349-10.

1. Delete product name and replace with acronym "FMT"

2. Renumbered 349-4.

349-12.
1. Delete product name and replace with acronym "FMT"
2. Renumbered 349-5.

349-20.
1. Delete product name and replace with acronym "FMT"everywhere the product name was used.
2. The word "electrical" deleted as it added nothing to the clarity of the section.
3. Renumbered 349-10.

349-22.
1. Delete product name and replace with acronym "FMT"
2. Reword section 349-22(a) adding reference to "cables" for clarity.
3. Delete "permitted" as it is unecessary.
4. Update reference.
5. Renumbered 349-12.

349-24.
1. Delete product name and replace with acronym "FMT" .

2. Renumbered 349-20.

349-40.
1. Delete product name and replace with acronym "FMT"
2. Relocated listing requirements for fittings to 349-6.
3. Renumbered 349-18.

349-56. Renumbered 349-17.
349-60.
1. Delete product name and replace with acronym "FMT".
2. Renumbered 349-16.

C. Construction Specifications.

349-120. New section marking requirements relocated from 349-1, Definition.

The following Section numbers have been assigned unilaterally throughout all 10 raceway articles.	Common Numbering System for the Circular Raceway Articles
	Article 3XX, <title>: <acronym>
	Part A. General
3XX - 1	Scope.
3XX - 2	Definitions.
3XX - 3	Other Articles.
3XX - 6	Listing Requirements.
	Part B. Installation

3XX - 12	Uses Not Permitted.
3XX - 14	Dissimilar Metals.
3XX - 16	Temperature Limits.
3XX - 20	Size.
3XX - 22	Number of Conductors.
3XX - 24	Bends – How Made.
3XX - 26	Bends – Number in One Run.
3XX - 28	Reaming & Threading.
3XX - 28	Trimming.
3XX - 30	Securing and Supporting.
3XX - 40	Boxes and Fittings.
3XX - 42	Coupling and Connectors
3XX - 44	Expansion Fittings
3XX - 46	Bushings.
3XX - 48	Joints.
3XX - 50	Conductor Terms
3XX - 56	Splices and Taps.
3XX - 60	Grounding.
	Part C. Construction Specifications.
3XX - 100	Construction.
3XX - 110	Corrosion Protection.
3XX - 120	Marking.
3XX - 130	Standard Lengths.

PANEL ACTION: Accept in Principle.
Delete from the proposal: 349-3, and the second sentence of 349-56.
In proposed section 349-22(a) delete the words "or cables".
PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP 8 recommends approval of the scope section by the TCC.

The proposed 349-3, and second sentence of 349-56 are deleted as 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.
There was no technical substantiation provided to add the words "or cables" as part of the rewrite of 349-22(a).

NOT RETURNED: 1 Corry

(Log #841)

8- 310 - (349-4): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise first sentence:
"Flexible metallic tubing shall be permitted for branch circuits and tap conductors."
SUBSTANTIATION: Branch circuits may end at an outlet to which FMT may be connected to supply utilization equipment with tap conductors, which may not be considered as branch circuit (conductors).
PANEL ACTION: Reject.
PANEL STATEMENT: Taps to a branch circuit are still considered as branch circuit conductors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2252)

8- 311 - (349-4(4)): Reject
SUBMITTER: Tim Quigley, Rome Electric Corp.
RECOMMENDATION: Should reference 430-145(b).
SUBSTANTIATION: 430-145(b) states that flexible metallic conduit can be used for any voltage to connect to motors.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation covers the use of FMC which is not covered by Article 349 (FMT).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3082)

8- 312 - (349-10): Accept in Principle in Part
Note: The Technical Correlating Committee understands that the revised text is to be placed in 349-20 of Proposal 8-306.
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Revise this section and the FPN to read:
(a) Minimum. FMT ~~Flexible metallic tubing~~ smaller than 1/2 (16) ~~in. electrical trade size~~ shall not be used.
Exception No. 1: FMT ~~Flexible metallic tubing~~ of 3/8 (12) ~~in. trade size~~ shall be permitted to be installed in accordance with Sections 300-22(b) and (c).
Exception No. 2: FMT ~~Flexible metallic tubing~~ of 3/8 (12) ~~in. trade size~~ shall be permitted in lengths not in excess of 6 ft (1.83 m) as part of an approved assembly or for lighting fixtures. See Section 410-67(c).
(b) Maximum. FMT larger than 3/4 (21) shall not be used. ~~The maximum size of flexible metallic tubing shall be in the 3/4 in. trade size.~~
FPN: The Trade Size and Metric Designators are for identification purposes only and do not relate to actual dimensions. See 300-x.
~~FPN: Metric trade numerical designations for flexible metal tubing are 3/8 = 12, 1/2 = 16, 3/4 = 21.~~
SUBSTANTIATION: To correlate with proposal submitted to CMP 3 to add a table showing English and Metric trade size designators. The table provides universal information throughout the Code. This cuts out a lot of excess language in the Code, which is no longer needed. Metric trade sizes have been established for two Code cycles and cover raceways and system components. Also, picks up use of acronym as proposed for the 2002 Code. The UL standard does not include trade size 3/8.
PANEL ACTION: Accept in Principle in Part.
The panel accepts in principle the addition of the new FPN to read as follows:
"FPN: See 300-1(c) for the Metric Designators and Trade Sizes. These are for identification purposes only and do not relate to actual dimensions."
The panel accepts the deletion of the old FPN. The panel accepts in principle the replacement of the word " Flexible Metallic Tubing" with the acronym "FMT" and the deletion of "in. electrical trade size" by action on Proposals 8-306 and 8-307.
The panel prefers the language used for "maximum size" per Proposal 8-306.
PANEL STATEMENT: The acceptance of the changes to the Fine Print Notes are contingent upon an acceptance of Proposal 3-6 by CMP-3. If CMP-3 does not accept Proposal 3-6, the panel directs staff to revert to the existing FPN. The proposed Fine Print Note was revised to comply with Section 4.1.2 of the NEC Style Manual. See panel action on Proposals 8-306 and 8-307.
The product standard (UL 360) used to evaluate FMT does cover 3/8" trade size.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3040)

8- 313 - (349-12): Accept in Principle
SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Revise to read:
(a) Flexible Metallic Tubing— ~~1/2 in. and 3/4 in.~~ Trade Sizes 1/2 (16) and 3/4 (21). The number of conductors permitted in 1/2 (16) ~~in.~~ and 3/4 (21) ~~in. trade sizes of flexible metallic tubing~~ FMC shall not exceed the percentage of fill specified in Table 1, Chapter 9.
(b) Flexible Metallic Tubing— ~~3/8 in.~~ Trade Size 3/8 (12). The number of conductors permitted in ~~3/8 in.~~ trade size 3/8 (12) FMC ~~flexible metallic tubing~~ shall not exceed that permitted in Table 350-12.
SUBSTANTIATION: Trade sizes for conduit and tubing no longer use the "inch" designation. This is a companion proposal to 349-10 submitted by NEMA.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposals 306 and 307.
The panel recognizes that the submitter intended to state "FMT" not "FMC".
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry
COMMENT ON AFFIRMATIVE:
BERMAN: Typographical error - Panel Statement should reference Proposals 8-306 and 8-307.

(Log #3041)

8- 314 - (349-20): Accept in Principle
SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Remove the "(in.)" from the Table in 349-20(a) and (b).
SUBSTANTIATION: Trade sizes for conduit and tubing no longer use the "inch" designation. This is a companion proposal to 349-10 submitted by NEMA.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Proposal 8-307.

ARTICLE 350 — FLEXIBLE METAL CONDUIT: TYPE FMC

(Log #1228)

8- 315 - (350): Accept in Principle

NOTE: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise Article 350 to read as follows:

ARTICLE 350 FLEXIBLE METAL CONDUIT: Type FMC

A. General

350-1. Scope. This article covers the use ~~and~~, installation, ~~of~~ and construction specifications for Flexible Metal Conduit (FMC) and associated fittings.

350-2. Definition. Flexible Metal Conduit (FMC). A ~~is a~~ raceway of circular cross section made of helically wound, formed, interlocked metal strip.

350-3. Other Articles. Installations of FMC ~~flexible metal conduit~~ shall comply with ~~the~~ applicable provisions of Article 300.

350-6. Listing Requirements. FMC and associated fittings shall be listed.

B. Installation

350-10. ~~350-4~~ Uses Permitted. FMC ~~Flexible metal conduit shall be listed and~~ shall be permitted to be used in exposed and concealed locations.

350-12. ~~350-5.~~ Uses Not Permitted. FMC ~~Flexible metal conduit~~ shall not be used in the following:

(1) In wet locations unless the conductors are approved for the specific conditions and the installation is such that liquid is not likely to enter raceways or enclosures to which the conduit is connected.

(2) In hoistways, other than as permitted in Section 620-21(a)(1)

(3) In storage battery rooms

(4) In any hazardous (classified) location other than as permitted in Sections 501-4(b) and 504-20

(5) Where exposed to materials having a deteriorating effect on the installed conductors, such as oil or gasoline

(6) Underground or embedded in poured concrete or aggregate

(7) Where subject to physical damage

350-20. ~~350-10.~~ Size.

(a) Minimum. FMC ~~Flexible metal conduit~~ less than 1/2 in. ~~electrical~~ trade size shall not be used unless permitted in (1) through (5) below for 3/8-in. ~~electrical~~ trade size.

(1) For enclosing the leads of motors as permitted in Section 430-145(b)

(2) In lengths not in excess of 6 ft (1.83 m)

(a) For utilizing equipment, or

(b) As part of a listed assembly, or

(c) For tap connections to lighting fixtures as permitted in Section 410-67(c)

(3) For manufactured wiring systems as permitted in Section 604-6(a)

(4) In hoistways, as permitted in Section 620-21(a)(1)

(5) As part of a listed assembly to connect wired fixture sections as permitted in

Section 410-77(c)

(b) Maximum. FMC ~~Flexible metal conduit~~ larger than 4-in. ~~electrical~~ trade size shall not be used.

FPN: Metric trade numerical designations for FMC ~~flexible metal conduit~~ are 3/8 = 12, 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, and 4 = 103.

~~350-12~~. 350-22. Number of Conductors. The number of conductors or cables ~~permitted in a flexible metal conduit~~ shall not exceed that permitted by the percentage ~~of~~ fill specified in Table 1, Chapter 9, or as permitted in Table 350-~~12~~ 22 for 3/8 in. trade size ~~flexible metal conduit~~.

Table 350-22. ~~Table 350-12.~~ Maximum Number of Insulated Conductors in 3/8-in. Flexible Metal Conduit*

***** 1999 NEC Table 350-12 here *****

350-26. ~~350-16.~~ Bends. There shall not be more that the equivalent of four quarter bends (360 degrees total) between pull points, e.g., conduit bodies and boxes. Bends in the conduit shall be made so that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. The radius of the curve of the inner edge of any field bend shall not be less than shown in Table 346-~~10~~ 24.

350-28. ~~350-22.~~ Trimming. All cut ends ~~of flexible metal conduit~~ shall be trimmed or otherwise finished to remove rough edges, except where fittings that thread into the convolutions are used.

350-30. ~~350-18. Supports.~~ Securing and Supporting. FMC shall be securely fastened in place and supported in accordance with (a) and (b).

(a) Securely Fastened. FMC ~~Flexible metal conduit~~ shall be securely fastened in place by an approved means within 12 in.(305 mm) of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 4 1/2 ft (137 mm).

Exception No. 1: Where ~~flexible metal conduit~~ FMC is fished.

Exception No. 2: Lengths not exceeding 3 ft (914 mm) at terminals where flexibility is required.

Exception No. 3: Lengths not exceeding 6 ft (1.83 m) from a fixture terminal connection for tap connections to light fixtures as permitted in Section 410-67(c).

(b) Supports. Horizontal runs of ~~flexible metal conduit~~ FMC supported by openings through framing members at intervals not greater than 4 1/2 ft (1.37 m) and securely fastened within 12 in. (305 mm) of termination points shall be permitted.

350-42. Couplings and Connectors. ~~350-20. Fittings. Fittings used with flexible metal conduit shall be listed.~~ Angle connectors shall not be used for concealed raceway installations.

350-56. ~~350-24.~~ Splices and Taps. Splices and taps shall be made in accordance with Section 300-15. See Article 370 for rules on the installation and use of boxes and conduit bodies.

350-60. ~~350-14.~~ Grounding. FMC ~~Flexible metal conduit~~ shall be permitted as a grounding means as covered in Section 250-118. Where an equipment bonding jumper is required around FMC ~~flexible metal conduit~~, it shall be installed in accordance with Section 250-102.

Where used to connect equipment where flexibility is required, an equipment grounding conductor shall be installed.

SUBSTANTIATION:

The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways of circular cross-section. For the 1999 NEC, a previous Sub-Task Group recommended that all of the circular raceway articles be combined into a single article (Article 344), to present a more uniform approach to the conduit and tubing requirements and to consolidate common requirements.

Review of public comments led the Panel to conclude that the goal of more user friendly code language had not been realized by the proposed Article 344. Furthermore, the Panel requested that a committee be appointed to consider the issue of user friendly code as it relates to the circular raceway articles.

The Sub-Task Group was asked to address such possibilities as revising the rejected 1999 proposal in light of the public comments, developing one or more articles to address the requirements presented in the nine current circular raceway articles, or revising the current nine circular raceway articles using a similar style manual format. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.

A uniform format is proposed to achieve consistency across all of the circular raceways. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. A table that provides the uniform format for each circular raceway has been provided with this proposal.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for conduit and tubing not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

Explanation of proposed renumbering and editorial changes;

Title Acronym "FMC" added

350-1 New language "and construction specifications for" added for consistency with other circular raceway articles; Flexible Metal Conduit capitalized as it is a proper name of a product; acronym added.

350-2 Acronym added; Flexible Metal Conduit capitalized as it is a proper name of a product.

350-3 Acronym "FMC" added, delete product name.

350-6 New section to relocate listing requirements for FMC and associated fittings.

Requirements formerly in 350-4 and 350-20

350-10 Formerly 350-4; acronym added; product name deleted; listing requirements

moved to 350-6

350-12 Formerly 350-5; acronym added; product name deleted.

350-20 Formerly 350-10; acronym added; product name deleted; word "electrical" deleted as it added nothing to the clarity of the section.

350-22 Formerly 350-12; editorial revisions for clarity.

350-26 Formerly 350-16; reference to Table 346-10 changed to reflect the new numberin sequence there (Table 346-24).

350-28 Formerly 350-22; product name deleted as it was unnecessary.

350-30 Formerly 350-18; retitled "Securing and Supporting" with respective sections added to separate the former requirements; acronym added; product name deleted.

350-42 Formerly 350-20; Retitled "Couplings and Connectors" to more accurately describe the section; listing requirements moved to 350-6.

350-56 Formerly 350-24

350-60 Formerly 350-14; acronym added; product name deleted.

The following Section numbers have been assigned unilaterally throughout all 10 raceway articles.	Common Numbering System for the Circular Raceway Articles
	Article 3XX, <title>: <acronym>
	Part A. General
3XX - 1	Scope.
3XX - 2	Definitions.
3XX - 3	Other Articles.
3XX - 6	Listing Requirements.
	Part B. Installation
3XX - 10	Uses Permitted.
3XX - 12	Uses Not Permitted.
3XX - 14	Dissimilar Metals.
3XX - 16	Temperature Limits.
3XX - 20	Size.
3XX - 22	Number of Conductors.
3XX - 24	Bends – How Made.
3XX - 26	Bends – Number in One Run.
3XX - 28	Reaming & Threading.
3XX - 28	Trimming.
3XX - 30	Securing and Supporting.
3XX - 40	Boxes and Fittings.
3XX - 42	Coupling and Connectors
3XX - 44	Expansion Fittings
3XX - 46	Bushings.
3XX - 48	Joints.
3XX - 50	Conductor Terms
3XX - 56	Splices and Taps.
3XX - 60	Grounding.
	Part C. Construction Specifications.
3XX - 100	Construction.
3XX - 110	Corrosion Protection.
3XX - 120	Marking.
3XX - 130	Standard Lengths.

PANEL ACTION: Accept in Principle.
Delete from the proposal: 350-3, and the second sentence of 350-56.
In proposed 350-22 delete the words "or cables."
PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP-8 recommends approval of the scope section by the TCC.
The proposed 350-3, and second sentence of 346-56 are deleted as 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.
There was no technical substantiation provided to add the words "or cables" as part of the rewrite of 350-22.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1288)

8- 316 - (350): Accept
NOTE: The Technical Correlating Committee understands that the revised dimensions will be implemented in the revisions of Proposal 8-315.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise as follows:
350-10 (a) Minimum. Flexible metal conduit less than metric designator 16 (1/2) ~~in. electrical trade size~~ shall not be used unless permitted in (1) through (5) below for metric designator 12 (3/8) - ~~in. electrical trade~~ size.
350-10 (a) (2) In lengths not in excess of 1.8 m (6 ft) ~~(1.83 m)~~
350-10 (b) Maximum. Flexible metal conduit larger than metric designator 103 (4) ~~in. electrical trade size~~ shall not be used.
FPN: Metric trade numerical designations for flexible metal conduit are 12 = 3/8 ~~= 12~~, 16 = 1/2 ~~= 16~~, 21 = 3/4 ~~= 21~~, 27 = 1 ~~= 27~~, 35 = 1 1/4 ~~= 35~~, 41 = 1 1/2 ~~= 41~~, 53 = 2 ~~= 53~~, 63 = 2 1/2 ~~= 63~~, 78 = 3 ~~= 78~~, 91 = 3 1/2 ~~= 91~~, and 103 = 4 ~~= 103~~.
350-12 The number of conductors permitted in a flexible metal conduit shall not exceed the percentage of fill specified in Table 1, Chapter 9, or as permitted in Table 350-12 for metric designator 12 (3/8) ~~in.~~ flexible metal conduit.
Table 350-12. Maximum Number of Insulated Conductors in Metric designator 12 (3/8) ~~in.~~ Flexible Metal Conduit*
350-18 Flexible metal conduit shall be securely fastened in place by an approved means within 300 mm (12 in.) ~~(305 mm)~~ of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 1.4 m (4 1/2 ft) ~~(1.37 m).~~
Exception No. 1: Where flexible metal conduit is fished.
Exception No. 2: Lengths not exceeding 900 mm (3 ft) ~~(914 mm)~~ at terminals where flexibility is required.

Exception No. 3: Lengths not exceeding 1.8 m (6 ft) ~~(1.83 m)~~ from a fixture terminal connection for tap connections to light fixtures as permitted in Section 410-67(c).

Horizontal runs of flexible metal conduit supported by openings through framing members at intervals not greater than 1.4 m (4 1/2 ft) ~~(1.37 m)~~ and securely fastened within 300 mm (12 in.) ~~(305 mm)~~ of termination points shall be permitted.

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis. In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised. In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.
PANEL ACTION: Accept.

NOT RETURNED: 1 Corry

(Log #842)

8- 318 - (350-5(8) (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add:
(8) For conductors operating at over 600 volts, nominal, except as permitted by Section 430-123 for motors, and Article 600 for electric signs and outline lighting.
SUBSTANTIATION: The UL "white book" indicates listed conduit is limited to 600 volts or less circuits except as otherwise permitted for motors and signs. Code users may infer from those uses permitted in the Code and this section that there is no general voltage restriction. The proposal would reinforce Sections 110-3 and 300-2 which are general in nature and may be overlooked. This section is a logical location to clearly indicate an important not permitted use. This is done in Section 351-23(b) for LTFNMC.
PANEL ACTION: Reject.
PANEL STATEMENT: This additional language is not necessary as Sections 110-3(b) and 300-2 already cover the requirement to use a product in accordance with its listing and respective voltage limitation. Sections 430-123 and 600-7 specifically permit the use of FMC for over 600 volt applications.

(Log #843)

8- 319 - (350-9): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
"Grounding. Flexible metal conduit shall be permitted as a grounding means as covered in Section 250-118. Where an equipment bonding jumper is ~~required~~ provided around flexible metal conduit..." (remainder unchanged)
SUBSTANTIATION: The word "required" is associated with Code rules; the provisions of Section 250-102 should apply where a bonding jumper is installed by choice.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-336. The panel believes that the submitter intended to reference Section 350-14 in his proposal.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3083)

8- 320 - (350-10): Accept in Principle in Part
NOTE: The Technical Correlating Committee understands that the action text revises the FPN following 350-20(b) in Proposal 8-315.
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Revise this section and the FPN to read:
(a) Minimum. FMC ~~Flexible metal conduit less~~ smaller than 1/2 (16) ~~in. electrical trade size~~ shall not be used unless permitted in (1) through (5) below for 3/8 (12). ~~in. electrical trade size.~~
(1) For enclosing the leads of motors as permitted in Section 430-145(b)
(2) In lengths not in excess of 6 ft (1.83 m)
a. For utilizing equipment, or
b. As part of a listed assembly, or
c. For tap connections to lighting fixtures as permitted in Section 410-67(c)
(3) For manufactured wiring systems as permitted in Section 604-6(a)
(4) In hoistways, as permitted in Section 620-21(a)(1)
(5) As part of a listed assembly to connect wired fixture sections as permitted in Section 410-77(c)
(b) Maximum. FMC ~~Flexible metal conduit~~ larger than 4 (103) ~~in. electrical trade size~~ shall not be used. ~~The maximum size of liquidtight flexible metal conduit shall be the 4 in. trade size.~~
FPN: The Trade Size and Metric Designators are for identification purposes only and do not relate to actual dimensions. See 300-x.
~~FPN: Metric trade numerical designations for flexible metal tubing are 3/8 = 12, 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, 4 = 103.~~
SUBSTANTIATION: To correlate with proposal submitted to CMP 3 to add a table showing English and Metric trade size designators. The table provides universal information throughout the Code. This cuts out a lot of excess language in the Code, which is no longer needed. Metric trade sizes have been established for two Code cycles and cover raceways and system components. Also, picks up use of acronym as proposed for 2002 Code.
PANEL ACTION: Accept in Principle in Part.
The panel accepts in principle the addition of the new FPN to read as follows:
"FPN: See 300-1(c) for the Metric Designators and Trade Sizes. These are for identification purposes only and do not relate to actual dimensions".
The panel accepts the deletion of the old FPN. The panel accepts in principle the replacement of the word " Flexible Metal Conduit" with the acronym "FMC" and the deletion of "in. electrical trade size" by action on Proposals 8-315 and 8-316.
PANEL STATEMENT: The acceptance of the changes to the Fine Print Notes are contingent upon an acceptance of Proposal 3-6 by CMP-3. If CMP-3 does not accept Proposal 3-6, the panel directs staff to revert to the existing FPN. The proposed Fine Print Note was revised to comply with Section 4.1.2 of the NEC Style Manual. See panel action on Proposals 8-315 and 8-316.
The panel points out that the second sentence of 5(b) is not part of the existing text and that the reference to flexible metallic tubing in the deleted FPN should be flexible metal conduit.
The product standard (UL 360) used to evaluate FMT does cover 3/8" trade size.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry
COMMENT ON AFFIRMATIVE:
BERMAN: The last sentence of the Panel Statement was incorrectly carried over from the Panel Statement on Proposal 8-312 and does not apply to this proposal.

(Log #1709)

8- 321 - (350-10(a)(2)c): Reject
SUBMITTER: Ray C. Mullin, Ray C. Mullin Books
RECOMMENDATION: Revise text as follows:
(c) For tap connections to lighting fixtures as permitted in Section 410-67(c). Where fished in the spaces above ceilings and in walls, the maximum total length shall not exceed 25 ft, and an equipment grounding conductor shall be installed.
SUBSTANTIATION: The present NEC permits 3/8 in. flex in lengths not over 6 ft to connect lighting fixtures.

When installing recessed lighting fixtures (cans) above ceilings in remodel work, electricians "fish" the flex in ceilings and down to the switches using 3/8 in. flex. They pull in the circuit conductors and generally include an equipment grounding conductor. When more than one lighting fixture is installed, they run the 3/8 in. flex to the first fixture, then "daisy chain" to the remaining fixtures.

In some areas, they use armored cable (BX) and in other areas they use nonmetallic-sheathed cable (NMC). But in the Chicagoland area and other parts of the country, electricians prefer to install 3/8 in. flex. This is their choice. They wish to have the advantage of being able to add or remove conductors in the future if needed. Their codes do not permit the use of armored cable or nonmetallic-sheathed cable.

It is impossible to install 1/2 in. flexible metal conduit because it is not flexible enough to bend the 1/2 in. flex into the knockouts on the lighting fixtures junction box. 3/8 in. flex offers the needed flexibility.

This proposal will make legal what is already being done in the field on remodel work. This proposal merely extends the present 6 ft maximum length for concealed remodel work where the flex is fished in above ceilings and in walls. This proposal is not intended to make 3/8 in. flex a wiring method, but instead, merely backing off of the present 6 ft maximum length for this specific application.
PANEL ACTION: Reject.
PANEL STATEMENT: Flexible metal conduit is produced in standard sizes of 1/2" through 4". The 3/8" size is produced for special applications and is not intended as a general use wiring method.

(Log #844)

8- 322 - (Table 350-12): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
Table 350-12 Maximum Number of Insulated Conductors in 3/8-in. Flexible Metal Conduit.*
SUBSTANTIATION: The reasoning behind this table is somewhat obscure. In general a single conductor in a raceway is not permitted by Section 300-3(b). Section 250-118 permits the conduit as a grounding means under certain conditions. Three No. 12 THHN circuit conductors are permitted with an additional No. 12 "covered" conductor for grounding, but if the grounding conductor is not required four circuit conductors are not permitted. Derating requirements are still applicable.

The present asterisk note literally only permits the grounding conductor if it is the same size as the circuit conductors, presumably not permitting a smaller size conductor, such as where a 15 ampere overcurrent device protects No. 10 conductors. It also literally does not provide for an insulated grounding conductor or bonding jumper.

Individually "covered" conductors per Article 100 are not indicated in Code tables re: area, material covering, temperature rating, etc. and do not appear to be a listed product. This creates a problem with other Code Sections such as 110-2, 110-3, 110-11, etc.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed table does not enhance clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #26)

8- 323 - (350-14): Accept in Principle
NOTE: The Technical Correlating Committee understands that the revised text replaces the text accepted in 350-60 of Proposal 8-315.
NOTE: The following proposal consists of Comment 8-330 on Proposal 8-187 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 8-187 was:
Revise paragraph 3 to read as follows:
"Where used to connect equipment where flexibility is required, or where vibration is likely to be present, an equipment grounding conductor shall be installed."
SUBMITTER: Morton L. Mullins, Chemical Manufacturers Assn.
RECOMMENDATION: The proposal needs to be clarified as to how the required equipment grounding conductor may be installed. If Article 315 is approved, add a new sentence to 315-60(a) that states:
The equipment grounding conductor may be installed inside or outside the flexible metal conduit. If 315 is not approved, add the new sentence to paragraph 3 of 350-14 after the word "installed".
SUBSTANTIATION: The addition of the requirement for an equipment grounding conductor where vibration is likely was done without clarifying that the conductor may be inside or outside the flexible metal conduit. The addition of the new sentence removes this confusion.
PANEL ACTION: Accept in Principle.
Revise the text of this section as follows:
"350-14. Grounding and Bonding.
Where used to connect equipment where flexibility is required, an equipment grounding conductor shall be installed.
Where required or installed, equipment grounding conductors shall be installed in accordance with 250-134(b).
Where required or installed, equipment bonding jumpers shall be installed in accordance with 250-102."
PANEL STATEMENT: The amended text adequately covers equipment grounding and bonding requirements. The panel does not agree that bonding jumpers shall always be contained inside the raceway. Section 250-102(e) permits the installation of the bonding jumper on the inside or outside of the raceway.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 2
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
GRIFFITH: Either an equipment grounding conductor or an equipment bonding jumper is acceptable to address the concern, provided a bonding jumper is installed in accordance with 250-102(e). The first sentence of Section 350-14 should, therefore, read "Where used to connect equipment where flexibility is required, an equipment grounding conductor or an equipment bonding jumper shall be installed". The remainder of the panel's revised text is correct as shown.

Table 350-12. Maximum Number of Insulated Conductors in 3/8-in. Flexible Metal Conduit*

Size (AWG)	Fittings Inside Conduit	Fittings Outside Conduit	Fittings Inside Conduit	Fittings Outside Conduit	Fittings Inside Conduit	Fittings Outside Conduit	Fittings Inside Conduit	Fittings Outside Conduit
18	~~2~~ 3	~~3~~ 4	~~3~~ 4	~~5~~ 6	~~5~~ 6	~~8~~ 9	~~5~~ 6	~~8~~ 9
16	~~1~~ 2	~~2~~ 3	~~3~~ 4	~~4~~ 5	~~4~~ 5	~~6~~ 7	~~4~~ 5	~~6~~ 7
14	~~1~~ 2	~~2~~ 3	~~3~~ 4	~~3~~ 4	~~3~~ 4	4 5	~~3~~ 4	4 5
12	—	—	~~1~~ 2	~~2~~ 3	~~2~~ 3	~~3~~ 4	~~2~~ 3	~~3~~ 4
10	—	—	~~1~~ 2	~~1~~ 2	~~1~~ 2	~~1~~ 2	~~1~~ 2	~~2~~ 3

~~* In addition, one covered or bare~~ An equipment grounding conductor or equipment bonding jumper that is bare or has the same insulation type and is not larger than the circuit conductors shall be permitted and shall be counted in applying the table.

LOYD: The proposal should have been rejected. I believe CMP 8 exceeded their scope in rewording this section of the code. A Technical Correlating Committee Task Group prior to this meeting addressed this issue. It was determined that CMP 8 could address 250-118 issues. However, it is the responsibility of CMP 5 to address the methods for grounding installations. No substantiation has been provided for adding this redundant text to Article 350. I also believe it adds confusion rather than clarity.

(Log #1927)

8- 324 - (350-14): Reject
SUBMITTER: W. Creighton Schwan, Hayward, CA
RECOMMENDATION: Revise the second paragraph to read:
Where used to connect equipment where flexibility is required or where likely to be subjected to vibration, an equipment grounding conductor shall be installed.
SUBSTANTIATION: This first appeared in the 1987 NEC as Section 350-5, Exception No. 2. It was added in response to reports of loose flex fittings or loose locknuts. Vibration is more often the cause of these failures than is the need for flexibility.
PANEL ACTION: Reject.
PANEL STATEMENT: The use of the term "vibration" is too subjective and the panel maintains its position that it is a design issue.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3084)

8- 325 - (350-16): Accept in Principle
NOTE: The Technical Correlating Committee understands that the panel action replaces the last sentence of 350-26 in Proposal 8-315. It was the action of the Technical Correlating Committee that this Proposal be reconsidered and that the panel utilize the common numbering system for the text in 350-26. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Revise the last sentence to read:
The radius of the curve ~~of the inner edge~~ to the centerline of any field bend shall not be less than shown in Table 346-10 using the column "Other Benders."
SUBSTANTIATION: This change is necessary to correlate with the proposal to revise Table 346-10. This text clarifies that measurements are to be made to the centerline and provides radii consistent with other conduits.
PANEL ACTION: Accept in Principle.
In the proposed text change "Other Benders" to "Other Bends".
PANEL STATEMENT: The word "Benders" is replaced with the word "Bends" in the third column so the column is applicable to bends made by other than one shot and full shoe benders. Bends made in ENT, RNC, FMC, and LFNC are examples of bends that would be made by means other than one shot and full shoe benders.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1461)

8- 326 - (350-20): Reject
SUBMITTER: Joseph E. McCann, City of Coral Springs, FL
RECOMMENDATION: Add new text to read as follows:
All fitting used with flexible metal conduit shall be made up tight.
SUBSTANTIATION: Since most circuits run within flexible metal conduit have equipment grounds with them, many installers don't see a reason for a good mechanical connection. But what happens when an equipment ground is not required, then there is no continuity.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's concerns are addressed by the requirements of 250-120(a) which covers the installation of equipment grounding conductors. This section of the code is applicable as FMC is an equipment grounding conductor.

ARTICLE 351 — LIQUIDTIGHT FLEXIBLE METAL CONDUIT: TYPE LFMC

(Log #1229)

8- 327 - (351): Accept in Principle
NOTE: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. The Technical Correlating Committee notes that an Article number will be assigned at the end of the revision cycle.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Separate existing Article 351 into two distinct articles; Liquidtight Flexible Metal Conduit and Liquidtight Flexible Nonmetallic Conduit. This proposal contains the proposed text for Liquidtight Flexible Metal Conduit. See companion proposal for Liquidtight Flexible Nonmetallic Conduit, Article 3YY.
Article 3XX Liquidtight Flexible Metal Conduit ~~and Liquidtight Flexible Nonmetallic Conduit~~: Type LFMC
A. General ~~Liquidtight Flexible Metal Conduit~~
3XX-1. Scope. This article covers the use, installation, and construction specifications for Liquidtight Flexible Metal Conduit ~~and liquidtight flexible nonmetallic conduit.~~ (LFMC) and associated fittings.
3XX-2. Definition. Liquidtight Flexible Metal Conduit (LFMC). A ~~is a listed~~ raceway of circular cross section having an outer liquidtight, nonmetallic, sunlight-resistant jacket over an inner flexible metal core with associated couplings, connectors, and fittings and approved for the installation of electric conductors.
3XX-3. Other Articles. Installations of LFMC ~~liquidtight flexible metal conduit~~ shall comply with ~~the~~ applicable provisions of Article 300 and with ~~the~~ specific sections of Articles 350, 501, 502, 503, and 553 referenced below.
FPN: For marking requirements, see Section 110-21.
3XX-6. Listing Requirements. LFMC and associated fittings shall be listed.

~~B. Installation~~
~~351-4 Use.~~
3XX-10. Uses Permitted.
~~(a) Permitted. Listed Liquidtight flexible metal conduit~~ LFMC shall be permitted to be used in exposed or concealed locations as follows:
1. Where conditions of installation, operation, or maintenance require flexibility or protection from liquids, vapors, or solids
2. As permitted by Sections 501-4(b), 502-4, 503-3, and 504-20 and in other hazardous (classified) locations where specifically approved, and by Section 553-7(b)
3. For direct burial where listed and marked for the purpose.

3XX-12. Uses Not Permitted.
~~(b) Not Permitted. Liquidtight flexible metal conduit~~ LFMC shall not be used as follows:
1. Where subject to physical damage
2. Where any combination of ambient and conductor temperature will produce an operating temperature in excess of that for which the material is approved.

3XX-20. ~~351-5.~~ Size.
(a) Minimum. LFMC ~~Liquidtight flexible metal conduit~~ smaller than 1/2-in. ~~electrical~~ trade size shall not be used.
Exception: LFMC ~~Liquidtight flexible metal conduit~~ of 3/8-in. size shall be permitted as covered in Section 350-20(a) ~~350-10(a).~~
(b) Maximum. The maximum size of LFMC ~~Liquidtight flexible metal conduit~~ shall be the 4-in. trade size.
FPN: Metric trade numerical designations for LFMC ~~liquidtight flexible metal conduit~~ are 3/8 = 12, 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, and 4 = 103.
3XX-22. ~~351-6.~~ Number of Conductors.
(a) 1/2-in. through 4-in. Trade Sizes. ~~Single Conduit.~~ The number of conductors or cables ~~permitted in a single conduit, 1/2 in. through 4-in. trade sizes,~~ shall not exceed that permitted by the percentage ~~of~~ fill specified in Table 1, Chapter 9.
(b) ~~Liquidtight Flexible Metal Conduit —~~ 3/8-in. Trade Size. The number of conductors ~~permitted in 3/8 in. liquidtight flexible metal conduit~~ shall not exceed that permitted in Table 350-22 ~~350-12~~.
3XX-26 ~~351-10~~. Bends -- Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, e.g., conduit bodies and boxes.
3XX-30. ~~351-8. Supports~~ Securing and Supporting. LFMC shall be securely fastened in place and supported in accordance with (a) and (b).

(a) Securely Fastened. ~~Liquidtight flexible metal conduit~~ LFMC shall be securely fastened in place by an approved means within 12 in. (305 mm) of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 4 1/2 ft (1.37 m).
Exception No. 1: Where ~~Liquidtight flexible metal conduit~~ LFMC is fished.
Exception No. 2: Lengths not exceeding 3 ft (914 mm) at terminals where flexibility is necessary.
Exception No. 3: Lengths not exceeding 6 ft (1.83 m) from a fixture terminal connection for tap conductors to lighting fixtures as permitted in Section 410-67(c).
(b) Supports. Horizontal runs of ~~liquidtight flexible metal conduit~~ LFMC supported by openings through framing members at intervals not greater than 4 1/2 ft (1.37 m) and securely fastened within 12 in. (305 mm) of termination points shall be permitted.
3XX-42. Couplings and Connectors. ~~351-7. Fittings. Liquidtight flexible metal conduit LFMC shall be used only with listed terminal fittings.~~ Angle connectors shall not be used for concealed raceway installations.
3XX-56. ~~351-11~~. Splices and Taps. Splices and taps shall be made in accordance with Section 300-15. See Article 370 for rules on the installation and use of boxes and conduit bodies.
3XX-60. ~~351-9~~. Grounding. ~~Liquidtight flexible metal conduit~~ LFMC shall be permitted as a grounding means as covered in Section 250-118. Where an equipment bonding jumper is required around ~~liquidtight flexible metal conduit~~ LFMC, it shall be installed in accordance with Section 250-102.
Where used to connect equipment where flexibility is required, an equipment grounding conductor shall be installed.
FPN: See Sections 501-16(b), 502-16(b), and 503-16(b) for types of equipment grounding conductors.
SUBSTANTIATION:
The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways of circular cross-section. For the 1999 NEC, a previous Sub-Task Group recommended that all of the circular raceway articles be combined into a single article (Article 344), to present a more uniform approach to the conduit and tubing requirements and to consolidate common requirements. Review of public comments led the Panel to conclude that the goal of more user friendly code language had not been realized by the proposed Article 344. Furthermore, the Panel requested that a committee be appointed to consider the issue of user friendly code as it relates to the circular raceway articles.
The Sub-Task Group was asked to address such possibilities as revising the rejected 1999 proposal in light of the public comments, developing one or more articles to address the requirements presented in the nine current circular raceway articles, or revising the current nine circular raceway articles using a similar style manual format. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.
A uniform format is proposed to achieve consistency across all of the circular raceways. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. A table that provides the uniform format for each circular raceway has been provided with this proposal.
For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for conduit and tubing not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.
The following text is provided to further substantiate all changes and to cross reference between the 1999 NEC® Article 351, Part A, and the proposed revision to this article for the 2002 cycle.
Split the existing Article 351 into two separate articles to accommodate both metallic and nonmetallic conduit. By using the Section Number 3XX as this particular article number, the numbering system conforms to the common section numbering format that this usability subtask group is proposing. This Subtask Group recognizes that only the Technical Correlating Committee has the authority to assign article numbers.

Explanation of proposed renumbering and editorial changes;
Title Acronym "LFMC" added
A. General

- 3XX-1 Scope revised to conform with the style manual.
- 3XX-2 (1) Acronym "LFMC" Added for clarity.
  (2) Listing requirements relocated to new Section 3XX-6.
- 3XX-3 Product name deleted and replaced with acronym "LFMC".
- 3XX-6 New section to relocate listing requirements for LFMC and associated fittings. Listing requirements for the conduit came from 351-2 (1999 NEC) and for the fittings from 351-7 (1999 NEC).

B. Installation.

- 3XX-10 (1) Title 351-4 Use was deleted.
  (2) Uses Permitted renumbered from Section 351-4(a) to 3XX-10.
  (3) Product name deleted and replaced with acronym "LFMC".
- 3XX-12 (1) Uses Not Permitted renumbered from Section 351-4(b) to 3XX-12.
  (2) Product name deleted and replaced with acronym "LFMC".
- 3XX-2 (1) Size renumbered from Section 351-5 to 3XX-20.
  (2) Product name deleted and replaced with acronym "LFMC" (four places).
  (3) Corrected section reference.

(4) The word "electrical" deleted as it added nothing to the clarity of the section.

- 3XX-22 (1) Number of Conductors renumbered from 351-6 to 3XX-22.
  (2) Text of section was revised for clarity and consistency with other articles.
  (3) Corrected section reference.
- 3XX-26 Bends--Number in One Run renumbered from 351-10 to 3XX-26.
- 3XX-30 (1) Securing and Supporting renumbered from 351-8 to 3XX-30.
  (2) Product name deleted and replaced with acronym "LFMC" (3 Places).
  (3) Separated the Section into two parts for clarity.
- 3XX-42 (1) Moved listing requirements to Section 3XX-6.
  (2) Angle connector requirement relocated from 351-7 to new Section 3XX-42 Couplings and Connectors.
- 3XX-56 Splices and Taps renumbered from 351-11 to 3XX-56.
- 3XX-60 (1) Grounding renumbered from 351-9 to 3XX-60.
  (2) Product name delet ed and replaced with acronym "LFMC" (2 places).

The following Section numbers have been assigned unilaterally throughout all 10 raceway articles.	Common Numbering System for the Circular Raceway Articles
	Article 3XX, <title>: <acronym>
	Part A. General
3XX - 1	Scope.
3XX - 2	Definitions.
3XX - 3	Other Articles.
3XX - 6	Listing Requirements.
	Part B. Installation
3XX - 10	Uses Permitted.

3XX - 12	Uses Not Permitted.
3XX - 14	Dissimilar Metals.
3XX - 16	Temperature Limits.
3XX - 20	Size.
3XX - 22	Number of Conductors.
3XX - 24	Bends – How Made.
3XX - 26	Bends – Number in One Run.
3XX - 28	Reaming & Threading.
3XX - 28	Trimming.
3XX - 30	Securing and Supporting.
3XX - 40	Boxes and Fittings.
3XX - 42	Coupling and Connectors
3XX - 44	Expansion Fittings
3XX - 46	Bushings.
3XX - 48	Joints.
3XX - 50	Conductor Terms
3XX - 56	Splices and Taps.
3XX - 60	Grounding.
	Part C. Construction Specifications.
3XX - 100	Construction.
3XX - 110	Corrosion Protection.
3XX - 120	Marking.
3XX - 130	Standard Lengths.

PANEL ACTION: Accept in Principle.
Delete from the proposal: the second sentence of 3XX-56.
In proposed 3XX-22 delete the words "or cables."
PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP-8 recommends approval of the scope section by the TCC.
The proposed second sentence of 3XX-56 is deleted as 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.
There was no technical substantiation provided to add the words "or cables" as part of the rewrite of 3XX-22.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1230)

8- 328 - (351): Accept in Principle
NOTE: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. The Technical Correlating Committee notes that an Article number will be assigned at the end of the revision cycle.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Separate existing Article 351 into two distinct articles; Liquidtight Flexible Metal Conduit and Liquidtight Flexible Nonmetallic Conduit. This proposal contains the proposed text for Liquidtihgt Flexible Nonmetallic Conduit. See companion proposal for Liquidtight Flexible Metallic Conduit, Article 351A.

Article 3YY Liquidtight Flexible Nonmetallic Conduit: Type LFNC

~~I General.~~
3YY-1. Scope. This article covers the use, installation, and construction specifications for liquidtight flexible nonmetallic conduit (LFNC) and associated fittings.
3YY.2 Definition. Liquidtight Flexible Nonmetallic Conduit (LFNC). A raceway of circular cross section of various types as follows:
(1) A smooth seamless inner core and cover bonded together and having one or more reinforcement layers between the core and covers, designated as Type LFNC-A
(2) A smooth inner surface with integral reinforcement within the conduit wall, designated as Type LFNC-B
(3) A corrugated internal and external surface without integral reinforcement within the conduit wall, designated as LFNC-C.
LFNC is flame resistant and with fittings, and is approved for the installation of electrical conductors.
FPN: FNMC is an alternate designation for LFNC. (ROP 8-342)
3YY.6 Listing Requirements. LFNC and associated fittings shall be listed.
II Installation.
3YY-10. Uses Permitted. LFNC shall be permitted to be used in exposed or concealed locations for the following purposes:
FPN: Extreme cold may cause some types of nonmetallic conduits to become brittle and therefore more susceptible to damage from physical contact.
(1) Where flexibility is required for installation, operation, or maintenance.
(2) Where protection of the contained conductors is required from vapors, liquids or solids.
(3) For outdoor locations where listed and marked as suitable for the purpose.
(ROP 8-343)
(4) For direct burial where listed and marked for the purpose.
(5) Type LFNC -B shall be permitted to be installed in lengths longer than 1.8 m (6 ft) where secured in accordance with 351B.30. (ROP 8-329, 8-345)
(6) Type LFNC_B as a listed manufactured prewired assembly, metric designator 16 (1/2) through 27 (1).
3YY.12 Uses Not Permitted. LFNC shall not be used as follows:
(1) Where subject to physical damage
(2) Where any combination of ambient and conductor temperatures is in excess of that for which the LFNC is approved
(3) In lengths longer than 1.8 m (6 ft), except as permitted by 351B.10(5) or where a longer length is approved as essential for a required degree of flexibility (ROP 8-329)
(4) Where voltage of the contained conductors is in excess of 600 volts, nominal
3YY.20 Size.
(a) Minimum. LFNC smaller than metric designator 16 (1/2) shall not be used unless permitted in (1) through (3) metric designator 12 (3/8). (ROP 8-329)
(1) For enclosing the leads of motors as permitted in Section 430-145(b)
(2) In lengths not exceeding 6 ft (1.83 m) as part of a listed assembly for tap connections to lighting fixtures as required in Section 410-67(c), or for utilization equipment
(3) For electric sign conductors in accordance with Section 600-32(a)
(b) Maximum. LFNC larger than metric designator 103 (4) shall not be used.
FPN: See 300.1(C) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions. (ROP 8-354)
3YY.22 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.
3YY.26 Bends. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, e.g., conduit bodies and boxes. Bends shall be made so that the conduit will not be damaged and that the internal diameter of the conduit shall not be effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment. The radius of the curve to the centerline of such bends shall not be less than shown in Table 346.10 using the column 'Other Bends'. (ROP 8-359)
3YY.30 Securing and Supporting. LFNC-B shall be securely fastened and supported in accordance with one of the following:
(1) The conduit shall be securely fastened at intervals not exceeding 900 mm (3 ft) and within 300 mm (12 in.) on each side of every outlet box, junction box, cabinet, or fitting. (ROP 8-329)

(b) Securing or supporting of the conduit shall not be required where it is fished, installed in lengths not exceeding 3 ft. (914 mm) at terminals where flexibility is required, or where installed in lengths not exceeding 6 ft. (1.83 m) from a fixture terminal connection for tap conductors to lighting fixtures permitted in Section 410-67(c).

(c) Horizontal runs of ~~liquidtight flexible nonmetallic conduit~~ LFNC supported by openings through framing members at intervals not exceeding 3 ft. (914 mm) and securely fastened within 12 in. (305 mm) of termination points shall be permitted.

3YY-42. Couplings and Connectors. ~~351 26. Fittings. Liquidtight flexible nonmetallic conduit shall be used only with listed terminal fittings.~~ Angle connectors shall not be used for concealed raceway installations.

3YY-56. ~~351 29.~~ Splices and Taps. Splices and taps shall be made in accordance with Section 300-15. See Article 370 for rules on the installation and use of boxes and conduit bodies.

3YY-60. ~~351-28. Equipment~~ Grounding. Where an equipment grounding conductor is required for the circuits installed in LFNC ~~liquidtight flexible nonmetallic conduit~~, it shall be permitted to be installed on the inside or outside of the LFNC ~~conduit~~. Where installed on the outside, the length of the equipment grounding conductor shall not exceed 6 ft (1.83 m) and shall be routed with the raceway or enclosure. Fittings and boxes shall be bonded or grounded in accordance with Article 250.

SUBSTANTIATION:

The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways of circular cross-section. For the 1999 NEC, a previous Sub-Task Group recommended that all of the circular raceway articles be combined into a single article (Article 344), to present a more uniform approach to the conduit and tubing requirements and to consolidate common requirements. Review of public comments led the Panel to conclude that the goal of more user friendly code language had not been realized by the proposed Article 344. Furthermore, the Panel requested that a committee be appointed to consider the issue of user friendly code as it relates to the circular raceway articles.

The Sub-Task Group was asked to address such possibilities as revising the rejected 1999 proposal in light of the public comments, developing one or more articles to address the requirements presented in the nine current circular raceways articles, or revising the current nine circular raceway articles using a similar style manual format. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.

A uniform format is proposed to achieve consistency across all of the circular raceways. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. A table that provides the uniform format for each circular raceway has been provided with this proposal.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for conduit and tubing not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

The following text is provided to further substantiate all changes and to cross-reference between the 1999 NEC Article 351 Part B and the proposed revision to this Article for the 2002 cycle.

The acronym "LFNC" has been added to improve clarity and usability of this raceway in this Article. Substantiation explaining all changes in reference to new Section numbers.

Split the existing Article 351 into two parts to accommodate both metallic and nonmetallic liquidtight conduit. By using Article 3YY as the Article number for Liquidtight Flexible Nonmetallic Conduit, the numbering system conforms to the common Section numbering format that this Usability Sub-Task Group is proposing. This Sub-task Group recognizes that only the Technical Correlating Committee has the authority to assign article numbers.

Title: Add the Acronym "LFNC".

A. General

3YY-1. Scope. The previous Scope 351-1, covered both metallic and nonmetallic conduit. The proposed scope identifies only the nonmetallic version and is consistant with the style manual.

Article 3YY Substantiation (cont.)

3YY-2. Definition. The definition has been relocated from 351-22. The listing requirements have been relocated to the new Section 3YY-6. Acronym used throughout this and other articles of this Code is introduced.

3YY-3. Other Articles. This section was added to be consistent with the format of other raceway articles.

3YY-6. Listing Requirements. This is a new section relocating listing requirements from Sections 351-22 and 351-26.

B. Installation

3YY-10. Uses Permittted. Title of Section 351-23, Use, has been deleted. Uses permitted has been relocated from Section 351-23(a). Replace "liquidtight flexible nonmetallic conduit" with "LFNC", two locations. Update section references.

3YY-12. Uses Not Permitted. Has been relocated from 350-23(b). Add the word "Uses" for consistency with other raceway articles. Replace "liquidtight flexible nonmetallic conduit" with "LFNC". Update section references.

3YY-20. Size. These requirements were relocated from Section 351-24. Reword the text to be stated in "minimum" and "maximum" to be consistent with other raceway articles. Replace "liquidtight flexible nonmetallic conduit" with "LFNC".

3YY-22. Number of Conductors. Relocated from Section 351-25. Added the words "or cables" and reworded existing text for consistency with other raceway articles.

3YY-26. Bends. Relocated from Section 351-30.

3YY-30. Securing and Supporting. Relocated from Section 351-27. Replaced "liquidtight flexible nonmetallic conduit" with "LFNC" in two locations. Update section references.

3YY-42. Couplings and Connectors. Text relocated from Section 351-26. Listing requirements were relocated to Section 3YY-6.

3YY-56. Splices and Taps. Relocated from Section 351-29.

3YY-60. Grounding. Relocated from Section 351-28. Delete the word "Equipment" from the section title to be consistent with other raceway articles. Replace "liquidtight flexible nonmetallic conduit" with "LFNC".

The following Section numbers have been assigned unilaterally throughout all 10 raceway articles.	Common Numbering System for the Circular Raceway Articles
	Article 3XX, <title>: <acronym>
	Part A. General
3XX - 1	Scope.
3XX - 2	Definitions.
3XX - 3	Other Articles.
3XX - 6	Listing Requirements.
	Part B. Installation
3XX - 10	Uses Permitted.
3XX - 12	Uses Not Permitted.
3XX - 14	Dissimilar Metals.
3XX - 16	Temperature Limits.
3XX - 20	Size.
3XX - 22	Number of Conductors.
3XX - 24	Bends – How Made.
3XX - 26	Bends – Number in One Run.
3XX - 28	Reaming & Threading.
3XX - 28	Trimming.
3XX - 30	Securing and Supporting.

3XX - 40	Boxes and Fittings.
3XX - 42	Coupling and Connectors
3XX - 44	Expansion Fittings
3XX - 46	Bushings.
3XX - 48	Joints.
3XX - 50	Conductor Terms
3XX - 56	Splices and Taps.
3XX - 60	Grounding.
	Part C. Construction Specifications.
3XX - 100	Construction.
3XX - 110	Corrosion Protection.
3XX - 120	Marking.
3XX - 130	Standard Lengths.

PANEL ACTION: Accept in Principle.
Delete from the proposal: 3YY-3 and the second sentence of 3YY-56.
In proposed 3YY-22 delete the words "or cables."
PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP-8 recommends approval of the scope section by the TCC.
The proposed 3-YY and the second sentence of 3YY-56 are deleted as 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.
There was no technical substantiation provided to add the words "or cables" as part of the rewrite of 3YY-22.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry
COMMENT ON AFFIRMATIVE:
BERMAN: Typographical error - The first sentence of the second paragraph of the Panel Statement should have referenced "3YY-3", and not '3-YY".

(Log #1289)

8- 329 - (351): Accept
NOTE: The Technical Correlating Committee notes that the revised dimensions will be implemented in the two new articles (3XX and 3YY) created by Proposals 8-327 and 8-328.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise as follows:
351-5 (a) Minimum. Liquidtight flexible metal conduit smaller than metric designator 16 (1/2) ~~in. electrical trade size~~ shall not be used.

Exception: Liquidtight flexible metal conduit of metric designator 12 (3/8) ~~in. size~~ shall be permitted as covered in Section 350-10(a).
(b) Maximum. The maximum size of liquidtight flexible metal conduit shall be metric designator 103 ~~the~~ (4) ~~in. trade size~~.
FPN: Metric trade numerical designations for liquidtight flexible metal conduit are 12 = 3/8 ~~= 12~~, 16 = 1/2 ~~= 16~~, 21 = 3/4 ~~= 21~~, 27 = 1 ~~= 27~~, 35 = 1 1/4 ~~= 35~~, 41 = 1 1/2 ~~= 41~~, 53 = 2 ~~= 53~~, 63 = 2 1/2 ~~= 63~~, 78 = 3 ~~= 78~~, 91 = 3 1/2 ~~= 91~~, and 103 = 4 ~~= 103~~.
351-6 (a) Single Conduit. The number of conductors permitted in a single conduit, metric deisginator 16 (1/2) ~~in.~~ through 103 (4) ~~in. trade sizes~~, shall not exceed the percentage of fill specified in Table 1, Chapter 9.
351-6 (b) Liquidtight Flexible Metal Conduit - Metric deisgnator 12 (3/8) ~~in. Size~~. The number of conductors permitted in metric designator 12 (3/8) ~~in.~~ liquidtight flexible metal conduit shall not exceed that permitted in Table 350-12.
351-8 Liquidtight flexible metal conduit shall be securely fastened in place by an approved means within 300 mm (12 in.) ~~(305 mm)~~ of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 1.4 m (4 1/2 ft) ~~(1.37 m)~~.
Exception No. 1: Where liquidtight flexible metal conduit is fished.
Exception No. 2: Lengths not exceeding 900 mm (3 ft) ~~(914 mm)~~ at terminals where flexibility is necessary.
Exception No. 3: Lengths not exceeding 1.8 m (6 ft) ~~(1.83 m)~~ from a fixture terminal connection for tap conductors to lighting fixtures as permitted in Section 410-67(c).
Horizontal runs of liquidtight flexible metal conduit supported by openings through framing members at intervals not greater than 1.4 m (4 1/2 ft) ~~(1.37 m)~~ and securely fastened within 300 mm (12 in.) ~~(305 mm)~~ of termination points shall be permitted.
351-23 (a) (5) Liquidtight flexible nonmetallic conduit as defined in Section 351-22(2) shall be permitted to be installed in lengths longer than 1.8 m (6 ft) ~~(1.83 m)~~ where secured in accordance with Section 351-27.
351-23 (a) (6) As a listed manufactured prewired assembly, metric designator 16 (1/2) ~~in.~~ through 27 (1) ~~in.~~ conduit, as defined in Section 351-22(2).
351-23 (b) (3) In lengths longer than 1.8 m (6 ft) ~~(1.83 m)~~, except as permitted by Section 351-23(a)(5) or where a longer length is approved as essential for a required degree of flexibility
351-24 The electrical trade sizes of liquidtight flexible nonmetallic conduit shall be in accordance with (a) or (b):
a. Metric deisignator 16 (1/2) ~~in.~~ to 103 (4) ~~in.~~ inclusive
b. Metric designator 12 (3/8) ~~in.~~ as permitted below
351-24 (b) (2) In lengths not exceeding 1.8 m (6 ft) ~~(1.83 m)~~ as part of a listed assembly for tap connections to lighting fixtures as required in Section 410-67(c), or for utilization equipment
FPN: Metric trade numerical designations for liquidtight flexible nonmetallic conduit are 12 = 3/8 ~~= 12~~, 16 = 1/2 ~~= 16~~, 21 = 3/4 ~~= 21~~, 27 = 1 ~~= 27~~, 35 = 1 1/4 ~~= 35~~, 41 = 1 1/2 ~~= 41~~, 53 = 2 ~~= 53~~, 63 = 2 1/2 = ~~63~~, 78 = 3 ~~= 78~~, 91 =3 1/2 ~~= 91~~, and 103 = 4 ~~= 103~~.
351-27
(a) The conduit shall be securely fastened at intervals not exceeding 900 mm (3 ft) ~~(914 mm)~~ and within 300 mm (12 in.) ~~(305 mm)~~ on each side of every outlet box, junction box, cabinet, or fitting.
(b) Securing and supporting of the conduit shall not be required where it is fished, installed in lengths not exceeding 900 mm (3 ft) ~~(914 mm)~~ at terminals where flexibility is required, or where installed in lengths not exceeding 1.8 m (6 ft) ~~(1.83 m)~~ from a fixture terminal connection for tap conductors to lighting fixtures as permitted in Section 410-67(c).
(c) Horizontal runs of liquidtight flexible nonmetallic conduit supported by openings through framing members at intervals not exceeding 900 mm (3 ft) ~~(914 mm)~~ and securely fastened within 300 mm (12 in.) (305 mm) of termination points shall be permitted.
351-28 Where an equipment grounding conductor is required for the circuits installed in liquidtight flexible nonmetallic conduit, it shall be permitted to be installed on the inside or outside of the conduit. Where installed on the outside, the length of the equipment grounding conductor shall not exceed 1.8 m (6 ft) ~~(1.83 m)~~ and shall be routed with the raceway or enclosure. Fittings and boxes shall be bonded or grounded in accordance with Article 250.
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis.
In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised.
In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.

PANEL ACTION: Accept.

(Log #2199)

8- 330 - (351-2): Accept
NOTE: The Technical Correlating Committee understands that 3XX-2 in Proposal 8-327 is the text intended to be accepted by the Panel with the words "and approved" deleted.
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
Liquidtight flexible metal conduit is a listed raceway of circular cross section..., connectors and fittings ~~and approved~~ for the installation of electric conductors.
SUBSTANTIATION: A definition in the NEC cannot presuppose acceptance by the authority having jurisdiction (approved). The listing already qualifies intermediate metal conduit for use in accordance with Article 351of the NEC. See the UL General Information for Electrical Equipment 1999. The NEC Style Manual 2.2.2 states, "Definitions shall not contain requirements or recommendations." Requiring intermediate metal conduit to be approved to comply with the definition is a requirement. This definition should be written similar to other related definitions, for example, see 331-1 first paragraph.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel believes that the submitter intended to reference LFMC instead of IMC in his substantiation.

(Log #845)

8- 332 - (351-4(b)(3) (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add:
(3) For conductors operating at over 600-volts, nominal, except as permitted by Section 430-123 for motors and Article 600 for electric signs and outline lighting.
SUBSTANTIATION: The UL "white book" indicates listed conduit is limited to 600 volts or less circuits except as permitted for motors and signs. Code users may infer from those Code-permitted uses and this section that there is no general voltage limitation. The proposal would reinforce Sections 110-3 and 300-2 which are general in nature and may be overlooked. This section is a logical location to indicate a not permitted use.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 8-318.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3086)

8- 333 - (351-5): Accept in Principle in Part
NOTE: The Technical Correlating Committee understands that revisions noted in the Panel Action will occur in 3XX-20 and 3YY-20
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Revise this section and the FPN to read:
(a) Minimum. LFMC ~~Liquidtight flexible metal conduit~~ smaller than 1/2 (16) shall not be used. ~~in. electrical trade size.~~
~~Exception:~~ LFMC ~~Liquidtight flexible metal conduit~~ of 3/8 (12) ~~in. size~~ shall be permitted as covered in Section 350-10(a).
(b) Maximum. LFMC larger than 4 (103) shall not be used. ~~The maximum size of liquidtight flexible metal conduit shall be the 4 in. trade size.~~
FPN: The Trade Sizes and Metric Designators are for identification purposes only and do not relate to actual dimensions. See 300-x.
~~FPN: Metric trade numerical designations for flexible metal tubing are 3/8 = 12, 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, 4 = 103.~~
SUBSTANTIATION: To correlate with proposal submitted to CMP 3 to add a table showing English and Metric trade size designators. The table provides universal information throughout the Code. This cuts out a lot of excess language in the Code, which is no longer needed. Metric trade sizes have been established for two Code cycles and cover raceways and system components. Also, picks up use of acronym as proposed for the 2002 Code.
PANEL ACTION: Accept in Principle in Part.
The panel accepts in principle the addition of the new FPN to read as follows:
"FPN: See 300-1(c) for the Metric Designators and Trade Sizes. These are for identification purposes only and do not relate to actual dimensions".
The panel accepts the deletion of the old FPN. The panel accepts in principle the replacement of the words "Liquidtight Flexible Metal Conduit" with the acronym "LFMC" and the deletion of "in. electrical trade size" by action on Proposals 8-327 and 8-329.
The panel prefers the language used for "maximum size" per Proposal 8-327.
PANEL STATEMENT: The acceptance of the changes to the Fine Print Notes are contingent upon an acceptance of Proposal 3-6 by CMP-3. If CMP-3 does not accept Proposal 3-6, the panel directs staff to revert to the existing FPN. The proposed Fine Print Note was revised to comply with Section 4.1.2 of the NEC Style Manual. See panel action on Proposals 8-327 and 8-329.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

(Log #3389)

8- 334 - (351-6(b)): Accept in Principle
NOTE: The Technical Correlating Committee understands that action text revises 3XX-22(b) of Proposal 8-327.
SUBMITTER: Will Dockham, Gilmanton Iron Works, NH
RECOMMENDATION: Delete Section 351-6(b):
~~(b) Liquidtight Flexible Metal Conduit — 3/8 in. Size. The number of conductors permitted in 3/8 in. liquidtight flexible metal conduit shall not exceed that permitted in Table 350-12.~~
SUBSTANTIATION: Confusion is caused when applying Table 350-12, to 3/8 in. liquidtight flexible metal conduit because it is unclear as to which column - "Fitting Inside Conduit" or "Fitting Outside Conduit", should be used. Liquidtight flexible metal conduit fittings typically have a component that installs inside the liquidtight flexible metal conduit, however, I doubt that it is intended that the "Fitting Inside Conduit" column is the appropriate column to use. Also, 3/8 in. liquidtight flexible nonmetallic conduit, Type-B, has the same internal diameter per Chapter r9, Table 4, as 3/8 in. liquidtight flexible metal conduit, therefore the sizing criteria for both raceways should be the same.
NOTE: Also see companion proposal to add a column for 3/8 in. liquidtight flexible metal conduit to Appendix C, Tables C6 and C6(A).
PANEL ACTION: Accept in Principle.
In 351-6(b) amend the text to read:
"(b) Liquidtight Flexible Metal Conduit — 3/8-in. Size. The number of conductors permitted in 3/8-in. liquidtight flexible metal conduit shall not exceed that permitted in Table 350-12, Fittings Outside Conduit columns."
PANEL STATEMENT: The panel's action has clarified the appropriate column to use for these fittings. The panel is aware that fittings currently used have a ferrule that inserts into the conduit.

NOT RETURNED: 1 Corry

(Log #1462)

8- 335 - (351-7): Reject
SUBMITTER: Joseph E. McCann, City of Coral Springs, FL
RECOMMENDATION: Add new sentence stating:
"All fitting used with liquid tight flexible metal conduit shall be made up tight."
SUBSTANTIATION: Since most circuits run within liquid tight flexible metal conduit have equipment grounds with them, many installers don't see a reason for a good mechanical connection. But, what happens when an equipment ground is not required and there is no continuity. Also, with this system the raceways should be water tight.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's concerns are addressed by the requirements of 250-120(a) which covers the installation of equipment grounding conductors. This section of the code is applicable as LFMC is an equipment grounding conductor.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #27)

8- 336 - (351-9): Accept in Principle
NOTE: The Technical Correlating Committee understands that the action text replaces 3XX-60 in Proposal 8-327 with the text from the Panel action.
NOTE: The following proposal consists of Comment 8-345 on Proposal 8-199 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 8-199 was:
Revise paragraph 3 to read as follows:
"Where used to connect equipment where flexibility is required, or where vibration is likely to be present, an equipment grounding conductor shall be installed."
SUBMITTER: Morton L. Mullins, Chemical Manufacturers Assn.
RECOMMENDATION: The proposal needs to be clarified as to how the required equipment grounding conductor may be installed. If Article 315 is approved, add a new sentence to 315-60(a) that states:
The equipment grounding conductor may be installed inside or outside the flexible metal conduit. If 315 is not approved, add the new sentence to paragraph 3 of 351-9.
SUBSTANTIATION: The addition of the requirement for an equipment grounding conductor where vibration is likely was done without clarifying that the conductor may be inside or outside the flexible metal conduit. The addition of the new sentence removes this confusion.
PANEL ACTION: Accept in Principle.
Revise the text of this section as follows and retain the existing fine print note:
"351-9. Grounding and Bonding.
Where used to connect equipment where flexibility is required, an equipment grounding conductor shall be installed.
Where required or installed, equipment grounding conductors shall be installed in accordance with 250-134(b).
Where required or installed, equipment bonding jumpers shall be installed in accordance with 250-102."
PANEL STATEMENT: The amended text adequately covers equipment grounding and bonding requirements. The panel does not agree that bonding jumpers shall always be contained inside the raceway. Section 250-102(e) permits the installation of the bonding jumper on the inside or outside of the raceway.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 2
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
GRIFFITH: Either an equipment grounding conductor or an <u>equipment bonding jumper</u> is acceptable to address the concern, provided a bonding jumper is installed in accordance with 250-102(e). The first sentence of Section 351-9 should, therefore, read "Where used to connect equipment where flexibility is required, an equipment grounding conductor <u>or an equipment bonding jumper</u> shall be installed". The remainder of the panel's revised text is correct as shown.
LOYD: The proposal should have been rejected. I believe CMP-8 exceeded their scope in rewording this section of the code. A Techanicl Correlating Committee Task Group prior to this meeting addressed this issue. It was determined that CMP-8 could address 250-118 issues. However, it is the responsibility of CMP-5 to address the methods for grounding installations. No substantiation has been provided for adding this redundant text to Article 351. I also believe it adds confusion rather than clarity.

(Log #846)

8- 337 - (351-9): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
Grounding. Liquidtight flexible metal conduit shall be permitted as a grounding means as covered in Section 250-118. Where an equipment bonding jumper is ~~required~~ <u>provided</u> around liquidtight flexible metal conduit, it shall be installed in accordance with Section 250-102. (remainder unchanged)
SUBSTANTIATION: The word "required" is associated with Code rules; the provisions of Section 250-102 should apply where a bonding jumper is installed by choice.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-336.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
LOYD: See my Explanation of Negative on Proposal 8-336 (Log #27).

(Log #1928)

8- 338 - (351-9): Reject
SUBMITTER: W. Creighton Schwan, Hayward, CA
RECOMMENDATION: Revise the second paragraph to read:
Where used to connect equipment where flexibility is required <u>or where likely to be subjected to vibration,</u> an equipment grounding conductor shall be installed.
SUBSTANTIATION: This first appeared in the 1987 NEC as Section 351-9 Exception No. 2. It was added in response to reports of loose flex connectors or loose locknuts. Vibration is more often the cause of these failures than is the need for flexibility.
PANEL ACTION: Reject.
PANEL STATEMENT: The use of the term "vibration" is too subjective and the panel maintains its position that it is a design issue.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2202)

8- 339 - (351-12 (New)): Accept in Principle
NOTE: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 8-327. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Add a new Section 351-12 to read as follows:
351-12. Bends. Bends in conduit shall be made so that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. The radius of the curve of the inner edge of any bend shall not be less than shown in Table 346-10.
SUBSTANTIATION: Article 351 Part A Liquidtight Flexible Metal Conduit does not address how bends are to be made nor the radii of the bends. This new rule should be added to address these issues. Section 350-16 addresses these issues for flexible metal conduit and it is similar in nature to liquidtight. I have used this rule as a basis for the wording of the newly proposed section. All other articles that pertain to conduit or tubing have rules about bends.

PANEL ACTION: Accept in Principle.
Amend the proposed text to read:
"351-12. Bends. Bends in conduit shall be made so that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. The radius of the curve of the inner edge to the centerline of any bend shall not be less than shown in Table 346-10 using the column "other bends". "
PANEL STATEMENT: The amended text will harmonize with Proposal 8-325 for 350-16.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3087)

8- 340 - (351-12 (New)): Accept
NOTE: The Technical Correlating Committee understands that the recommendation is to be added as a new Section 3XX-120 in a new Part III of Article 3XX.
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: 351 A. Liquidtight Flexible Metal Conduit--Create a new section to read:
351-12, Marking. LFMC shall be marked according to Section 110-21. The trade size and other information required by the listing shall also be marked on the conduit. Conduit suitable for direct burial shall be so marked.
SUBSTANTIATION: This is a companion proposal to 351 B. Liquidtight Flexible Nonmetallic Conduit. Section 351 A does not currently include marking requirements other than a Fine Print Note in 351-3, Other Articles. Most other raceway articles contain a section on marking or include information on marking in the Construction Specifications.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2226)

8- 341 - (351-22): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested."
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.
[NOTE: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 8-29.

NOT RETURNED: 1 Corry
COMMENT ON AFFIRMATIVE:
DOLLINS: See Ganatra's Explanation of Negative Vote on Proposal 6-3.

(Log #2969)

8- 342 - (351-22): Accept in Principle
NOTE: The Technical Correlating Committee understands the proposed FPN is to appear following 3YY-2(3) of Proposal 8-328.
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Revise text to read as follows:
"Liquidtight flexible nonmetallic conduit is a listed raceway of circular cross section of various types as follows:
(1) A smooth seamless inner core and cover bonded together and having one or more reinforcement layers between the core and cover, designated as Type LFNC-A or FNMC-A
(2) A smooth inner surface with integral reinforcement within the conduit wall, designated as Type LFNC-B or FNMC-B
(3) A corrugated internal and external surface without integral reinforcement within the conduit wall, designated as Type LFNC-C or FNMC-C."
SUBSTANTIATION: Currently, per UL 1660 all conduit is marked "FNMC" and per UL 514B, Section 77 and the 1999 UL Electrical Equipment Directory (DWTT) all liquidtight nonmetallic fittings are marked as "FNMC". FNMC is a currently recognized acronym by the inspectors.
PANEL ACTION: Accept in Principle.
Retain the existing wording of this section and after paragraph (3) add a new fine print note to read:
"FNMC is an alternate designation for LFNC."
PANEL STATEMENT: The panel does not concur that new text is necessary in paragraphs (1-3), but has added a new Fine Print Note to address the submitter's concerns.

(Log #1696)

8- 345 - (351-23(a)(5)): Accept
NOTE: The Technical Correlating Committee understands that the accepted text revises the text accepted in 3YY-10(5) Proposal 8-328.
SUBMITTER: George R. Dauberger, Thomas & Betts Corp.
RECOMMENDATION: Replace "Liquidtight flexible nonmetallic conduit as defined in Section 351-22(2)" with "Type LFNC-B".
SUBSTANTIATION: Replace unnecessary wording with the designation of the product permitted for this application. This will eliminate the need to refer back to Section 351-22(2) to determine the applicable designated type.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2970)

8- 346 - (351-23(a)(5)): Accept in Principle
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Revise text to read as follows:
(5) Liquidtight ~~flexible nonmetallic conduit~~ Flexible Nonmetallic Conduit, Type B (LFNC-B) ~~as defined in Section 351-22(2)~~ shall be permitted to be installed in lengths longer than 6 ft (1.83 m) where secured in accordance with Section 351-27.
SUBSTANTIATION: This proposal revises the text for clarification. The reference back to 351-22(2) was removed so that it is clear that only LFNC-B is allowed to be used in lengths longer than 6 ft.
Liquidtight Flexible Nonmetallic Conduit was capitalized because it is a proper name.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Proposal 8-345.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry
COMMENT ON AFFIRMATIVE:
BERMAN: Typographical error - Panel Statement should reference Proposal "8-345", and not "8-245".

(Log #1697)

8- 347 - (351-23(a)(6)): Accept
NOTE: The Technical Correlating Committee understands that the accepted text revises 3YY-10(6) accepted in Proposal 8-328.
SUBMITTER: George R. Dauberger, Thomas & Betts Corp.
RECOMMENDATION: Replace "as a listed manufactured prewired assembly, 1/2 in. through 1 in. conduit as defined in Section 351-22(2)" with "Type LFNC-B shall be permitted to be installed as a listed manufactured prewired assembly, in 1/2 in. through 1 in. sizes."
SUBSTANTIATION: Replace unnecessary wording with the designation of the product permitted for the application. This will eliminate the need to refer back to Section 351-22(2) to determine the applicable designated type.
PANEL ACTION: Accept.

(Log #3620)

8- 350 - (351-23(b)): Accept
NOTE: The Technical Correlating Committee understands that the Panel Action deletes the 3YY-12(4) Exception accepted in Proposal 8-328.
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Delete the Exception: This Section will now read as follows:
(b) Not Permitted. Liquidtight flexible nonmetallic conduit shall not be used in the following:
1. Where subject to physical damage.
2. Where any combination of ambient and conductor temperatures is in excess of that for which the liquidtight flexible nonmetallic conduit is approved.
3. In lengths longer than 6 ft (1.83 m), except as permitted by Section 351-23(a)(5) or where a longer length is approved as essential for a required degree of flexibility.
4. Where voltage of the contained conductors is in excess of 600 volts, nominal.
~~Exception: As permitted in Section 600-32(a) electric signs over 600 volts.~~
SUBSTANTIATION: This Section 600-32(a) refers to neon secondary circuit conductors only and not electric signs. The reference to electric signs would appear to address the primary circuit used to energize a manufactured product which can be or is listed and labeled.
We are not aware of any signs that require more than 600 volts to energize.
Therefore, the exception should be deleted to clarify any misinterpretation between secondary high voltage conductors and primary service voltage needs.
This Section also conflicts with Section 300-37 for wiring requirements for over 600 volts. Also conflicts with Section 90-3 which states that Chapters 1 through 4 apply generally to all these Sections and any exceptions should occur in Article 600 only.
Also Section 351-23(b)(4) now states that 600 volts is not permitted and that brings Section 300-37 back into agreement with Section 90-3.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #1758)

8- 351 - (351-23(b), Exception): Accept in Principle
SUBMITTER: Herbert Moulton, Masters Technology Inc.
RECOMMENDATION: Delete the exception.
This section will now read as follows:
(b) Not Permitted. Liquidtight flexible nonmetallic conduit shall not be used in the following:
1. Where subject to physical damage.
2. Where any combination of ambient and conductor temperatures is in excess of that for which the liquidtight flexible nonmetallic conduit is approved.
3. In lengths longer than 6 ft (1.83 m), except as permitted by Section 351-23(a)(5) or where a longer length is approved as essential for a required degree of flexibility.
4. Where voltage of the contained conductors is in excess of 600 volts, nominal.
~~Exception: As permitted in Section 600-32(a) for electric signs over 600 volts.~~
SUBSTANTIATION: This Section 600-32(a) refers to neon secondary circuit conductors only and not electric signs. The reference to electric signs would appear to address the primary circuit used to energize a manufactured product which can be or is listed and labeled.
We are not aware of any signs that require more than 600 volts to energize. Therefore, the exception should be deleted to clarify any misinterpretation between secondary high voltage conductors and primary service voltage needs.
This section also conflicts with Section 300-37 for wiring requirements for over 600 volts. Also, conflicts with Section 90-3 which states that Chapters 1 through 4 apply generally to all these sections and any exceptions should occur in Article 600 only.
Also, Section 351-23(b)(4) now states that 600 volts is not

permitted and that brings Section 300-37 back into agreement with Section 90-3.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Proposal 8-350.

NOT RETURNED: 1 Corry

(Log #3250)

8- 352 - (351-23(b)(3)): Reject
SUBMITTER: Craig M. Wellman, Newark, DE
RECOMMENDATION: Revise paragraph as follows:
In lengths longer than 6 ft (1.83 m), except as permitted by Section 351-23(a)(5) or where installed in cable tray or where a longer length is approved as essential for a required degree of flexibility.
SUBSTANTIATION: The change in this section in the 1999 Code added unnecessary restrictions on installations of cables for power limited applications in liquidtight flexible nonmetallic conduit in cable tray. Physical separation of the power limited signal cable from other cables in a tray is a common requirement.
PANEL ACTION: Reject.
PANEL STATEMENT: LFNC Type B is permitted to be installed in lengths longer than 6 feet per 351-23(a)(5) and can be installed in a cable tray. The panel is unaware of any evaluation for Type A and Type C for lengths greater than 6 feet.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2163)

8- 353 - (351-24): Reject
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
(a) 1/2 to 2 4 in. inclusive.
FPN: ..., 1 1/2 = 41, 2 = 53, ~~2 1/2 = 63, 3 78, 3 1/2 = 91, and 4 = 103~~
SUBSTANTIATION: Underwriters Laboratories, Inc. lists flexible nonmetallic conduit, liquid-tight (DXOQ) only up to 2 inch inclusive. (See UL General Information for Electrical Equipment 1999.) Manufacturers only make it up to 2 inch inclusive. (See the cut sheet which I have provided. Since the Code recognizes only listed flexible nonmetallic conduit in Section 351-23(a), the sizes in the code should match the listing.
NOTE: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: While it is true that current listings are only available up to 2 inch trade size, there is permission in the product standard (UL 1660) to manufacture the product in sizes up to 4 inches.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
LOYD: The submitter is correct. The 1999 UL General Information for Electrical Equipment, page 17 clearly states that LFNC is only listed 3/8 through 2 in. The panel's substantiation is not correct, as we do not reference the UL 1660 standard as a requirement; we only require the product to be listed. Therefore, we retain the responsibility to evaluate new products and sizes. The NEC size restrictions should be limited to the products submitted for acceptance.

(Log #3042)

8- 354 - (351-24): Accept in Principle in Part
SUBMITTER: Elaine Thompson, Patricia Horton, Allied Tube & Conduit
RECOMMENDATION: Revise this section and the FPN to read:
Size: The electrical trade sizes of LFNC ~~liquidtight flexible nonmetallic conduit~~ shall be in accordance with (a) or (b):
(a) Minimum. LFNC smaller than 1/2 (16) shall not be used unless permitted in (1) through (3) below for 3/8 (12). ~~1/2 in. to 4 in. inclusive.~~
(1) For enclosing the leads of motors as permitted in Section 430-145(b)
(2) In lengths not in excess of 6 ft (1.83 m) as part of a listed assembly for tap connections to lighting fixtures as required in Section 410-67(c), or for utilization equipment
(3) For electric sign conductors in accordance with Section 600-32(a)
(b) Maximum. LFNC larger than 4 (103) shall not be used. ~~3/8 in. as permitted below~~
FPN: The Trade Sizes and Metric Designators are for identification purposes only and do not relate to actual dimensions. See 300-1(c).
~~FPN: Metric trade numerical designations for liquidtight flexible nonmetallic conduit are 3/8 = 12, 1/2 = 16, 3/4 = 21, 1 = 27, 1 1/4 = 35, 1 1/2 = 41, 2 = 53, 2 1/2 = 63, 3 = 78, 3 1/2 = 91, and 4 = 103.~~
SUBSTANTIATION: To correlate with proposal submitted by NEMA to CMP 3 to add a table showing current trade sizes and metric designators. The table provides universal information throughout the Code. This cuts out a lot of excess language in the Code which is no longer needed. Metric designators for trade sizes have been established for two Code cycles and cover raceways and system components. Also, picks up use of acronym as proposed for the 2002 Code.
PANEL ACTION: Accept in Principle in Part.
The panel accepts in principle the addition of the new FPN to read as follows:
FPN: See 300-1(c) for the Metric Designators and Trade Sizes. These are for identification purposes only and do not relate to actual dimensions.
The panel accepts the deletion of the old FPN. The panel accepts in principle the replacement of the words "Liquidtight Flexible Nonmetallic Conduit" with the acronym "LFNC" by action on Proposals 8-328 and 8-329.
The panel prefers the language used for "minimum and maximum size" per Proposal 8-328.
PANEL STATEMENT: The acceptance of the changes to the Fine Print Notes are contingent upon an acceptance of Proposal 3-6 by CMP-3. If CMP-3 does not accept Proposal 3-6, the panel directs staff to revert to the existing FPN. The proposed Fine Print Note was revised to comply with Section 4.1.2 of the NEC Style Manual. See panel action on Proposals 8-328 and 8-329.

(Log #1700)

8- 355 - (351-27): Accept
NOTE: The Technical Correlating Committee understands that the accepted text revises the text accepted in 3YY-30 of Proposal 8-328.
SUBMITTER: George R. Dauberger, Thomas & Betts Corp.
RECOMMENDATION: Replace "Liquidtight flexible nonmetallic conduit, as defined in Section 351-22(2)..." with "Type LFNC-B shall be securely fastened and supported in accordance with one of the following:".
SUBSTANTIATION: Replace unnecessary wording with the designation of the product permitted for the application. This will eliminate the need to refer back to Section 351-22(2) to determine the applicable designated type.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #847)

8- 356 - (351-28): Accept in Principle
NOTE: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 8-328. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
Equipment Grounding and Bonding. Where an equipment grounding conductor is ~~required~~ installed for the circuit(s) installed in liquidtight flexible nonmetallic conduit it shall be ~~permitted to be installed on the inside or outside of the conduit~~ in accordance with Section 250-134(b). An equipment bonding jumper, where installed, shall be in accordance with Section 250-102(e). ~~Where installed on the outside, the length of the equipment grounding~~

~~conductor shall not exceed 6 ft (1.83 m) and shall be routed with the raceway or enclosure.~~ Where used to connect equipment where flexibility is required, an equipment bonding jumper, where employed, shall be installed within the raceway. Fittings, boxes, and other enclosures shall be bonded or grounded in accordance with Article 250.
SUBSTANTIATION: This section blurs the distinction between equipment grounding conductors and equipment bonding jumpers. Section 250-134(b) indicates an equipment grounding conductor shall be inside the raceway. The requirements of this section should apply whether such conductors are installed by choice or "required" by Code. The proposal references equipment bonding jumpers; Sections 350-14 and 351-9 require a grounding/bonding conductor inside the raceway where flexibility is required; this should also apply to this raceway.
PANEL ACTION: Accept in Principle.
Revise the text of this section as follows:
351-9. Grounding and Bonding.
Where used to connect equipment where flexibility is required, an equipment grounding conductor shall be installed.
Where required or installed, equipment grounding conductors shall be installed in accordance with 250-134(b).
Where required or installed, equipment bonding jumpers shall be installed in accordance with 250-102.
PANEL STATEMENT: The amended text adequately covers equipment grounding and bonding requirements. The panel does not agree that bonding jumpers shall always be contained inside the raceway. Section 250-102(e) permits the installation of the bonding jumper on the inside or outside of the raceway. See panel action on Proposal 8-357 relative to deleting the reference to Article 250.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 2
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
GRIFFITH: Either an equipment grounding conductor or an equipment bonding jumper is acceptable to address the concern, provided a bonding jumper is installed in accordance with 250-102(e). The first sentence of Section 350-28 should, therefore, read "Where used to connect equipment where flexibility is required, an equipment grounding conductor or an equipment bonding jumper shall be installed". The remainder of the panel's revised text is correct as shown.
LOYD: No substantiation has been provided for adding this redundant text to Article 351. I also believe it adds confusion rather than clarity.
The Task Group agreed with the proponent of this proposal. LFNC is an approved flexible wiring method for use with both metallic and nonmetallic wiring methods. Where it is used with metallic raceways, it must be bonded around in accordance with 250-102(e).
COMMENT ON AFFIRMATIVE:
BERMAN: In the Panel Action, the section number (351-9) and first sentence were incorrectly carried over from the Panel Action on Proposal 8-336.
The Panel Action should read as follows:
Panel Action: Accept in Principle
Revise the text of this section as follows:
351-28 Grounding and Bonding. Where required or installed, equipment grounding conductors shall be installed in accordance with 250-134(b).
Where required or installed, equipment bonding jumpers shall be installed in accordance with 250-102.

(Log #1701)

8- 357 - (351-28): Accept
NOTE: The Technical Correlating Committee understands that the action deletes the last sentence of 3YY-60 in Proposal 8-328.
SUBMITTER: George R. Dauberger, Thomas & Betts Corp.
RECOMMENDATION: Delete the last sentence that currently reads "fittings and boxes shall be bonded or grounded in accordance with Article 250."
SUBSTANTIATION: This article covers liquidtight flexible nonmetallic conduit and doesn't need to identify the needs of fittings and boxes. It's understood by everyone that Article 250 covers the grounding and bonding needs of all installations.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

(Log #1698)

8- 359 - (351-31 (New)): Accept in Principle
NOTE: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 8-328. This action will be considered by the Panel as a Public Comment.
SUBMITTER: George R. Dauberger, Thomas & Betts Corp.
RECOMMENDATION: Add the following wording:
Bends - How Made. Bends ends of LFNC shall be made so that the conduit will not be damaged and that the internal diameter of the conduit shall not be effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment, and the radius of the curve of the inner edge of such bends shall not be less than shown in Table 346-10.
SUBSTANTIATION: This article lacked requirements for bending LFNC, which is needed for protection of the conduit against damage and protection of the conductors, when pulled. Also, this article should be consistent with the requirements of articles covering similar raceways (e.g. Article 331).
PANEL ACTION: Accept in Principle.
Amend proposed language to read:
"Bends - How Made. Bends ends of LFNC shall be made so that the conduit will not be damaged and that the internal diameter of the conduit shall not be effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment. The radius of the curve of the inner edge to the centerline of such bends shall not be less than shown in Table 346-10 using the column 'Other Bends'."
PANEL STATEMENT: This language harmonizes with Proposal 8-325 for 350-16.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2203)

8- 360 - (351-31 (New)): Accept in Principle
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Add a new Section 351-31 to read as follows:
351-31. Bends. Bends in conduit shall be made so that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. The radius of the curve of the inner edge of any bend shall not be less than shown in Table 346-10.
SUBSTANTIATION: Article 351 Part B Liquidtight Flexible Metal Conduit does not address how bends are to be made nor the radii of the bends. This new rule should be added to address these issues. Section 350-16 addresses these issues for flexible metal conduit and it is similar in nature to liquidtight. I have used this rule as a basis for the wording of the newly proposed section. All other articles that pertain to conduit or tubing have rules about bends.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-359.

(Log #3088)

8- 361 - (351-31 (New)): Accept in Principle
NOTE: The Technical Correlating Committee understands that the panel action text is to be added as a new 3YY-120 in a new Part III, Construction Requirements of Proposal 8-328.
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: 351 B. Liquidtight Flexible Nonmetallic Conduit--Add a new Section 351-31 to read as follows:
351-31. Marking. The product name or appropriate acronym followed by Type A, B, or C shall also be marked on the conduit along with other markings required by the listing. The type, size, and quantity of conductors used in prewired manufactured assemblies shall be identified by printing on the jacket or by means of a printed tag or label attached to each end of the manufactured assembly and either the carton, coil, or reel. The enclosed conductors shall be marked in accordance with Section 310-11.
SUBSTANTIATION: No requirements for marking LFNC currently exist in this article, other than a Fine Print Note under 351-23(a)(3) outdoor locations. When prewired ENT was added to Article 331, marking requirements were also added and were apparently overlooked when prewired LFNC was added to Article 351. Similar information on marking is included in Article 343. It is appropriate to require the type to be marked as the requirements differ by type. This is done by UL, but with globalization, it should be clear in the Code.
PANEL ACTION: Accept in Principle.
Amend the proposed language to read:
"351-32. Marking. LFNC shall be marked at least every 600mm (2 ft) in accordance with 110-21. The marking shall include a type designation as required in 351-22 and the trade size. Conduit that is intended for outdoor use or direct burial shall be marked.
The type, size, and quantity of conductors used in prewired manufactured assemblies shall be identified by means of a printed tag or label attached to each end of the manufactured assembly and either the carton, coil, or reel. The enclosed conductors shall be marked in accordance with Section 310-11." PANEL STATEMENT: Provisions for outdoor use marking were added to the proposal, as this information is necessary for proper field installation. Not all listing information is necessary to be included in the marking.
For clarity, the requirements for prewired assemblies are displayed as a separate paragraph.
Staff is advised that the action taken on this proposal has added 3YY-120 in Proposal 8-328.

(Log #1699)

8- 362 - (351-32 (New)): Accept
NOTE: The Technical Correlating Committee understands that the recommended text is added as 3YY-28 in Proposal 8-328.
SUBMITTER: George R. Dauberger, Thomas & Betts Corp.
RECOMMENDATION: Add the following wording:
Trimming. All cut ends of conduit shall be trimmed inside and outside to remove rough edges.
SUBSTANTIATION: This article lacked requirements for trimming cut ends of LFNC. Cut ends should be trimmed to prevent chafing of pulled conductors. Also, this article should be consistent with the requirements of articles covering similar raceways (e.g. Article 331).
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #1703)

8- 363 - (351-33 (New)): Accept in Part
NOTE: The Technical Correlating Committee understands that the added text becomes 3YY-100 in Proposal 8-328.
SUBMITTER: George R. Dauberger, Thomas & Betts Corp.
RECOMMENDATION: Add the following wording:
Construction. LFNC shall be made of material that does not exceed the ignitability, flammability, smoke generation, and toxicity characteristics of rigid (nonplasticized) polyvinyl chloride. LFNC-B as a prewired manufactured assembly, shall be provided in continuous lengths capable of being shipped in a coil, reel, or carton without damage.
SUBSTANTIATION: This article lacked construction requirements necessary for the safe manufacture and transport of LFNC. Also, this article should be consistent with the requirements of articles covering similar raceways (e.g., Article 331).
PANEL ACTION: Accept in Part.
Delete the proposed first sentence.
PANEL STATEMENT: The proposed first sentence does not adequately describe the material used in this product. Listing requirements adequately evaluate the material characteristics.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
LOYD: This proposal should have been accepted as submitted, or the correct construction characteristics should have been added. Type B LFNC is an approved general wiring method. If this product does contribute more dangerous levels of ignitability, flammability, smoke generation, and toxicity properties than do other nonmetallic wiring methods (as was stated by one of the panel members during the panel discussion), then it is very important that we inform the designers and users before they choose this wiring method.

(Log #1704)

8- 364 - (351-34 (New)): Accept in Principle
SUBMITTER: George R. Dauberger, Thomas & Betts Corp.
RECOMMENDATION: Add the following wording:
Marking. Each length of LFNC shall be clearly and durably marked at least every 2 ft (600 mm) as required in the first sentence of Section 110-21. The type of material shall also be included in the marking and this marking shall be permanent. Conduit shall be permitted to be surface marked to indicate special characteristics of the material.
FPN: Examples of these optional markings include, but are not limited to, "ls" for limited-smoke and markings such as "outdoors."
SUBSTANTIATION: The marking requirements need to agree with the marking requirements from the product standard. The marking information should be located where it will be easily identified and consistent with other raceway articles. See companion proposal for Section 351b-10(3) fpn.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-361.

8- 366 - (352 Part A): Accept in Principle

NOTE: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Rewrite of Article 352 Part A.

This is a companion proposal to 352 Part B and 352 Part C

ARTICLE 3TT – Surface Metal Raceways ~~and Surface Nonmetallic Raceways~~

~~A. Surface Metal Raceways~~

A. General

3TT-1. Scope. This article covers the use, installation, and construction specifications for surface metal raceways and associated fittings.

3TT-2. Definition.

Surface Metal Raceway. A metallic raceway that is intended to be mounted to the surface of a structure, with associated couplings, connectors, boxes and fittings for the installation of electrical conductors.

3TT-3 ~~352-2.~~Other Articles

Surface metal raceways shall comply with the applicable provisions of Article 300.

~~352-5. Extension Through Walls and Floors~~

~~Surface metal raceways shall be permitted to pass transversely through dry walls, dry partitions, and dry floors if the length passing through is unbroken. Access to the conductors shall be maintained on both sides of the wall, partition, or floor.~~

~~352-6. Combination Raceways~~

~~Where combination surface metal raceways are used both for signaling and for lighting and power circuits, the different systems shall be run in separate compartments identified by sharply contrasting colors of the interior finish, and the same relative position of compartments shall be maintained throughout the premises.~~

B. Installations

3TT-10 ~~352-1.~~ Uses Permitted

~~(a) Permitted.~~ The use of surface metal raceways shall be permitted in the following:

1. In dry locations

2. In Class I, Division 2 hazardous (classified) locations as permitted in Section 501-4(b), Exception

3. Under raised floors, as permitted in Section 645-5(d)(2)

4. Extension Through Walls and Floors - surface metal raceway shall be permitted to pass transversely through dry walls, dry partitions, and dry floors if the length passing through is unbroken. Access to the conductors shall be maintained on both sides of the wall, partition, or floor.

3TT-12 Uses Not Permitted

~~(b) Not Permitted. The use of~~ Surface metal raceways shall not be used ~~permitted~~ in the following:

1. Where subject to severe physical damage, unless otherwise approved

2. Where the voltage is 300 volts or more between conductors, unless the metal has a thickness of not less than 0.040 in. (1.016 mm) nominal

3. Where subject to corrosive vapors

4. In hoistways

5. Where concealed, except as permitted in Section 3TT-10(3) ~~352-1(a)(3)~~

3TT-21 ~~352-3.~~ Size of Conductors

No conductor larger than that for which the raceway is designed shall be installed in surface metal raceway.

3TT-22 ~~352-4~~. Number of Conductors ~~in Raceways~~

The number of conductors installed in surface metal raceway ~~any raceway~~ shall not be greater than the number for which the raceway is designed.

The derating factors of Section 310-15(b)(2)(a) shall not apply to conductors installed in surface metal raceways where all of the following conditions are met:

1. The cross-sectional area of the raceway exceeds 4 in.2 (2580 mm2)

2. The current-carrying conductors do not exceed 30 in number

3. The sum of the cross-sectional areas of all contained conductors does not exceed 20 percent of the interior cross-sectional area of the surface metal raceway

3TT-56 ~~352-7~~. Splices and Taps

Splices and taps shall be permitted in surface metal raceways having a removable cover that is accessible after installation. The conductors, including splices and taps, shall not fill the raceway to more than 75 percent of its area at that point. Splices and taps in surface metal raceways without removable covers shall be made only in junction boxes. All splices and taps shall be made by approved methods.

Taps of Type FC cable installed in surface metal raceway shall be made in accordance with Section 363-10.

3TT-60 ~~352-9~~. Grounding

Surface metal raceway enclosures providing a transition from other wiring methods shall have a means for connecting an equipment grounding conductor.

3TT-70 Combination Raceways. When combination surface metal raceways are used both for signaling and for lighting and power circuits, the different systems shall be run in separate compartments identified by sharply contrasting colors of the interior finish, and the same relative position of compartments shall be maintained throughout the premises.

C. Construction Specifications

3TT-100 Construction. ~~352 8. General~~

Surface metal raceways shall be of such construction as will distinguish them from other raceways. Surface metal raceways and their elbows, couplings, and similar fittings shall be designed so that the sections can be electrically and mechanically coupled together and installed without subjecting the wires to abrasion.

Where covers and accessories of nonmetallic materials are used on surface metal raceways, they shall be identified for such use.

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways other than those in circular cross section.

Currently Article 352 is made up of three parts. The purpose of this proposal was to separate each Part into three separate Articles. These three new articles follow the format developed by Sub-Task Group 1. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.

A uniform format is proposed to achieve consistency across all of the raceways articles. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

For the purpose of this proposal an article numbering scheme of "3TT" was used. It was not the intent of the submitter that this numbering scheme be adopted. Instead, a "NEW" article number would be assigned by the Technical Correlating Committee.

Explanation of renumbering and editorial changes;

Title	Delete Surface Nonmetallic Raceways
3TT-1	New Scope added to conform with the style manual.
3TT-2	New Definition added to conform with the style manual
3TT-3	(1) Other Articles renumbered from Section 352-3 to 3TT-3.
352-5	Moved to Uses Permitted 3TT-10(4).
352-6	Moved to Construction 3TT-100.
3TT-10	(1) Uses "Permitted" renumbered from Section 352-1 to 3TT-10.
	(2) Added "Extension Trough Walls and Floors" 352-5.
	(3) Moved "uses not permitted" to section 3TT-12
3TT-12	(1) New section for "Uses Not Permitted".
	(2) Correct section references.
3TT-21	(1) Size renumbered from Section 352-3 to 3TT-21.
3TT-22	(1) Number of Conductors renumbered from 352-4 to 3TT-22.
	(2) Removed the reference to raceway for clarity.
3TT-56	(1) Splices and Taps renumbered from 352-7 to 3TT-56.
3TT-60	(1) Grounding renumbered from 352-9 to 3TT-60.
352-A-70	Moved 352-6 to this section called combination raceways.
3TT-100	(1) Construction renumbered and renamed from 352-8 General to 3TT-100 Construction.

PANEL ACTION: Accept in Principle.

Delete from the proposal 3TT-3.

PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP-8 recommends approval of the scope section by the TCC.

The proposed 3TT-3 is deleted as 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NOT RETURNED: 1 Corry

(Log #2075)

8- 367 - (352-1): Accept in Principle

SUBMITTER: Joel A. Rencsok, Scottsdale, AZ

RECOMMENDATION: Add a Scope section to Article 340 to read as follows:

352-1. Scope. The provisions of this article covers the use, installation, and construction specifications requirements of surface metal raceways and surface nonmetallic raceways.

Renumber remaining sections.

SUBSTANTIATION: Each Article should have a scope section.

The NEC style manual on style also shows a scope article.

To keep the Articles consistent all Articles should be similar.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Proposal 8-366.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NOT RETURNED: 1 Corry

(Log #848)

8- 368 - (352-1(b)(5)): Accept

NOTE: The Technical Correlating Committee understands that the revision will occur in 3TT-12(5) and that the reference will now be 3TT-10(4) based in Proposal 8-366.

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise:

(5) Where concealed, except as permitted in Section 352-~~1(a)(3)~~5.

SUBSTANTIATION: Edit. The reference to Section 352-1(a)(3) is technically incorrect as the area under the raised floor is required to be accessible by Section 645-5(d)(1) and does not meet the definition of concealed. Section 352-5 is more appropriate since portions passing through walls, etc. are likely to be "concealed".

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NOT RETURNED: 1 Corry

(Log #1435)

8- 369 - (352-2): Accept in Principle

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Delete 352-2 in its entirety.

SUBSTANTIATION: 1999 National Electrical Code Style Manual:

Section 4.1 states "Do not use a reference if the requirement is already covered by 90.3."

Section 4.1.1 stipulates that "References shall not be made to an entire article... unless additional conditions are specified.

PANEL ACTION: Accept in Principle.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

NOT RETURNED: 1 Corry

(Log #1303)

8- 370 - (352 Part B): Accept in Principle

NOTE: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Rewrite of Article 352 Part B

This is a compainion proposal to 352 Part A and 352 Part C

Article 3UU - Surface Nonmetallic Raceways

~~B. Surface Nonmetallic Raceways~~

A. General

3UU-1. Scope. This article covers the use, installation, and construction specifications for surface nonmetallic raceways and associated fittings.

3UU-2 Definition. ~~352-21. Description~~

Surface Nonmetallic Raceway. A nonmetallic raceway that is intended to be mounted to the surface of a structure, with associated couplings, connectors, boxes and fittings for the installation of electrical conductors.

3UU-3 ~~352-23.~~ Other Articles

Surface nonmetallic raceways shall comply with the applicable provisions of Article 300. ~~Where equipment grounding is required by Article 250, a separate equipment grounding conductor shall be installed in the raceway.~~

B. Installations

3UU-10 ~~352-22.~~ Uses Permitted

~~(a) Permitted.~~ (1) The use of surface nonmetallic raceways shall be permitted in dry locations.

(2) Extension Through Walls and Floors - surface nonmetallic raceway shall be permitted to pass transversely through dry walls, dry partitions, and dry floors if the length passing through is unbroken. Access to the conductors shall be maintained on both sides of the wall, partition, or floor.

3UU-12 Uses Not permitted

~~(b) Not Permitted.~~ Surface nonmetallic raceways shall not be used as in the following ~~follows:~~

1. Where concealed
2. Where subject to severe physical damage
3. Where the voltage is 300 volts or more between conductors, unless listed for higher voltage
4. In hoistways
5. In any hazardous (classified) location except Class I, Division 2 locations as permitted in Section 501-4(b), Exception
6. Where subject to ambient temperatures exceeding those for which the nonmetallic raceway is listed
7. For conductors whose insulation temperature limitations would exceed those for which the nonmetallic raceway is listed

3UU-21 ~~352-24.~~ Size of Conductors

No conductor larger than that for which the raceway is designed shall be installed in surface nonmetallic raceway.

3UU-22 ~~352-25.~~ Number of Conductors ~~in Raceways~~

The number of conductors installed in surface nonmetallic raceway ~~any raceway~~ shall not be greater than the number for which the raceway is designed.

~~352-28. Extension Through Walls and Floors~~

~~Surface nonmetallic raceways shall be permitted to pass transversely through dry walls, dry partitions, and dry floors if the length passing through is unbroken. Access to the conductors shall be maintained on both sides of the wall, partition, or floor.~~

3UU-56 ~~352-29.~~ Splices and Taps

Splices and taps shall be permitted in surface nonmetallic raceways having a removable cover that is accessible after installation. The conductors, including splices and taps, shall not fill the raceway to more than 75 percent of its area at that point. Splices and taps in surface nonmetallic raceways without removable covers shall be made only in junction boxes. All splices and taps shall be made by approved methods.

3UU-60 Grounding

Where equipment grounding is required by Article 250, a separate equipment grounding conductor shall be installed in the raceway.

3UU-70 (Relocated from 3UU-100 Construction to Part B. Installations) Combination Raceways. When combination surface nonmetallic raceways are used both for signaling and for lighting and power circuits, the different systems shall be run in separate compartments identified by sharply contrasting colors of the interior finish, and the same relative position of compartments shall be maintained throughout the premises.

C. Construction Specifications

3UU-100 Construction. ~~352-27. General~~

Surface nonmetallic raceways shall be of such construction as will distinguish them from other raceways. Surface nonmetallic raceways and their elbows, couplings, and similar fittings shall be designed so that the sections can be mechanically coupled together and installed without subjecting the wires to abrasion.

Surface nonmetallic raceways and fittings are made of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. It shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low-temperature effects.

3UU-120 Marking.

Surface nonmetallic raceway that have limited smoke-producing characteristics shall be permitted to be identified with the suffix LS.

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways other than those in circular cross section.

Currently Article 352 is made up of three parts. The purpose of this proposal was to separate each Part into three separate Articles. These three new articles follow the format developed by Sub-Task Group 1. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.

A uniform format is proposed to achieve consistency across all of the raceways articles. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

For the purpose of this proposal an article numbering scheme of "3UU" was used. It was not the intent of the submitter that this numbering scheme be adopted. Instead, a "NEW" article number would be assigned by the Technical Correlating Committee.

Explanation of renumbering and editorial changes;

Title New Title added.

3UU-1 New Scope added to conform with the style manual.

3UU-2 (1) Definition renumbered and renamed from 352-21 Description to 3UU-2 Definition.
(2) Deleted Part B from 352.
(3) Moved limited smoke producing marking requirement to 3UU-120

3UU-3 (1) Other Articles renumbered from Section 352-23 to 3UU-3.
(2) Moved Grounding Requirements to 3UU-60

3UU-10 (1) Uses "Permitted" renumbered from Section 352-22 to 3UU-10.
(2) Added "Extension Trough Walls and Floors" 352-28.
(3) Moved "uses not permitted" to section 3UU-12

3UU-12 (1) New section for "Uses Not Permitted".
(2) Correct text for clarity.

3UU-21 (1) Size renumbered from Section 352-24 to 3UU-21.

3UU-22 (1) Number of Conductors renumbered from 352-25 to 3UU-22.
(2) Removed the reference to raceway for clarity.

352-28 Moved Extension Through Walls and Floors to uses Permitted 3UU-10(2).

3UU-56 (1) Splices and Taps renumbered from 352-29 to 3UU-56.

3UU-60 (1) New Section
(2) Added grounding requirement from 3UU-3(352-23, 99 NEC).

3UU-70 Moved Combination Raceways from 352-26 to this section.

3UU-100 (1) Construction renumbered and renamed from 352-27 General to 3UU-100 Construction.

3UU-120 (1) New Section for Marking
(2) Added Marking requirements for "limited smoke producing" product from 3UU-2 Definition (352-21 Description, 99 NEC).

PANEL ACTION: Accept in Principle.
Delete from the proposal 3UU-3.
Amend proposed 3UU-120 to read:
"3UU-120 Marking.
Surface nonmetallic raceway that have limited smoke-producing characteristics shall be permitted to be so identified ~~with the suffix LS."~~

PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP-8 recommends approval of the scope section by the TCC.
The proposed 3UU-3 is deleted as 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.
The proposed 3UU-120 is amended to be consistent with the marking requirements of other articles.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2227)

8- 371 - (352-21): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested."
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.

[NOTE: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 8-29.

DOLLINS: See Ganatra's Explanation of Negative Vote on Proposal 6-3.

(Log #2826)

8- 372 - (352-21): Accept in Principle
SUBMITTER: Ravindra H. Ganatra, Alcan Cable /Rep. CANENA Tech Harmonization Subcomm. For Bldg Wire and Cable Products
RECOMMENDATION: Revise 352-21 to read:

352-21. Description. Part B of this article shall apply to a type of surface nonmetallic raceway and fittings of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. It shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low-temperature effects. ~~Surface nonmetallic raceways that have limited smoke producing characteristics shall be permitted to be identified with the suffix LS.~~ Marking for limited smoke shall be permitted on the surface nonmetallic raceways that have limited smoke-producing characteristics.

SUBSTANTIATION: This proposal is submitted on behalf of the THSC - Building Wire and Cable Product Standards, of Council of Harmonization of Electrotechnical Standardization of North America (CANENA).

Abbreviation LS has been found to represent different requirements in different national product standards in North America. In Mexico, "LS" is used to indicate compliance with requirements associated with marking for low smoke. In the US, "LS" marking has been used to indicate compliance with requirements associated with marking for limited smoke. However, the requirements in Mexico and the US are different. Further, requirements for "ST1" marking used in Canada are similar to limited smoke marking used in the US.

Thus, removal of the abbreviation in the Code will facilitate harmonization of marking requirements in the product standards.

Although the section does not deal with wire and cable products, this proposal is made for this section to address the change in the abbreviation for limited smoke marking.

The proposal does not recommend any change in the test method or performance requirements for a product being evaluated for limited smoke marking.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-370. This action meets the submitter's concern.

NOT RETURNED: 1 Corry

(Log #849)

8- 373 - (352-22(b)(1)): Accept
NOTE: The Technical Correlating Committee understands that the recommended text revises the text in 3UU-12(1) in Proposal 8-370.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:

(1) Where concealed, except as permitted in Section 352-28.

SUBSTANTIATION: Edit. For correlation with Section 352-28.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2508)

8- 374 - (352-26): Accept
NOTE: The Technical Correlating Committee understands the panel action removes the indicated text from the accepted text of 3UU-70 in Proposal 8-370.
SUBMITTER: Lorena Orbanic, Carlon, Lamson & Sessions
RECOMMENDATION: Revise as follows:

352-26. Combination Raceways. Where combination surface nonmetallic raceways are used both for signaling and for lighting and power circuits, the different systems shall be run in separate compartments, identified by printed legend or by sharply contrasting colors of the interior finish~~, and the same relative position of compartments shall be maintained throughout the premise.~~

SUBSTANTIATION: Manufacturers have accessories which would allow the different circuitry to crossover into other compartments while still maintaining the separation of signaling, lighting, and power circuits. In addition, some manufacturers have multi-compartment raceways systems which link together with single compartment raceway systems allowing the different systems to vary their positions. Thus, it is no longer necessary to maintain the same relative position of compartments throughout the premises.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
LOYD: The submitter has provided no technical substantiation to support this change. The manufacturers will now be permitted to redesign their products and the marking requirements left in this section will now have to be done by the installer as field markings rather than distinctive marking by the manufacturer.

Evidence must be provided to assure the committee that safety can be maintained if this change is accepted.

(Log #2521)

8- 375 - (352-26): Reject
SUBMITTER: Lorena Orbanic, Carlon, Lamson & Sessions
RECOMMENDATION: Revise as follows:

325-26. Combination Raceways. Where combination surface nonmetallic raceways are used both for signaling and for lighting and power circuits, the different systems shall be run in separate compartments, ~~identified by printed legend or by sharply contrasting colors of the interior finish,~~ and the same relative position of compartments shall be maintained throughout the premises.

SUBSTANTIATION: First of all, most wiring is labeled already so that you can identify your lighting, signaling, and power circuits. Secondly, preplanning is involved when you design your layout for surface raceway so that you know which surface raceway and fittings to purchase. Thus, during that preplanning, one must have already chosen in which compartments they will place the different types of circuitry. The additional labeling is unnecessary.

In addition, the statement can be misconstrued in two ways: One way is that the electrician/contractor must paint the interior of the surface raceway (not likely) or label the raceways. The second way is that the manufacturer must provide raceways with the compartments having painted interiors or labels saying which is for power, signaling, or lighting. Most manufacturers do not paint the interior compartments nor do they label the compartments which would take away the end user's choice to choose in which compartment they want to place power, signaling, or lighting circuits.

PANEL ACTION: Reject.
PANEL STATEMENT: Compartment identification is important to maintain system separation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
KENDALL: This is a requirement of the installer. Identification of the channel can easily be determined by visual inspection of the conductor, coaxial cable, or communication cable currently installed without additional markings. Marking has nothing to do with separation as indicated in the panel statement.

(Log #1306)

8- 376 - (352 Part C): Accept in Principle
NOTE: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Rewrite of Article 352 Part C
This is a companion proposal to 352 Part A and 352 Part B
Article 3VV - Strut-Type Channel Raceway
C. Strut-Type Channel Raceway
A. General
3VV-1 Scope. This article covers the use, installation, and construction specifications of strut type channel raceway.
3VV-2 Definition ~~352-40. Description~~
Strut-Type Channel Raceway. A metallic raceway that is intended to be mounted to the surface of or suspended from a structure, with associated accessories for the installation of electrical conductors.
3VV-3 352-43. Other Articles
Installation of strut-type channel raceways ~~strut-type channel raceways~~ shall comply with the applicable provisions of Articles 250 and 300.
3VV-6 Listing Requirements. Strut-type channel raceways, closure strips and accessories shall be listed and identified for such use.
B. Installations
3VV-10 ~~352-41. Uses Permitted~~
The ~~installation~~ use of ~~listed strut-type channel raceways~~ strut-type channel raceways shall be permitted in the following:
1. Where exposed
2. In dry locations
3. In locations subject to corrosive vapors where protected by finishes judged suitable for the condition
4. Where the voltage is 600 volts or less
5. As power poles
6. In Class I, Division 2 hazardous (classified) locations as permitted in Section 501-4(b), Exception
7. Extensions Through Walls and Floors - It shall be permitted to extend unbroken lengths of strut-type channel raceway through walls, partitions, and floors where closure strips are removable from either side and the portion within the wall, partition, or floor remains covered.
8. Ferrous channel raceways and fittings protected from corrosion solely by enamel shall be permitted only indoors.
3VV-12 ~~352-42.~~ Uses Not Permitted
1. Where concealed.
2. Ferrous channel raceways and fittings protected from corrosion solely by enamel shall not be permitted where subject to severe corrosive influences.
3VV-21 ~~352-44~~. Size of Conductors
No conductor larger than that for which the raceway is listed shall be installed in strut-type channel raceways ~~strut-type channel raceways~~.
3VV-22 ~~352-45~~. Number of Conductors ~~in Raceways~~
The number of conductors permitted in strut-type channel raceways ~~strut-type channel raceway~~ shall not exceed the percentage fill using Table 3VV-22 ~~352-45~~ and applicable outside diameter (O.D.) dimensions of specific types and sizes of wire given in the Tables in Chapter 9.
The derating factors of Section 310-15(b)(2)(a) shall not apply to conductors installed in strut-type channel raceways where all of the following conditions are met:
1. The cross-sectional area of the raceway exceeds 4 in.2 (2580 mm2)
2. The current-carrying conductors do not exceed 30 in number
3. The sum of the cross-sectional areas of all contained conductors does not exceed 20 percent of the interior cross-sectional area of the strut-type channel raceways ~~strut-type channel raceway~~
where:
N = number of wires
CA = channel area in square inches
WA = wire area
~~352-46. Extensions Through Walls and Floors~~
~~It shall be permitted to extend unbroken lengths of strut-type channel raceway through walls, partitions, and floors where closure strips are removable from either side and the portion within the wall, partition, or floor remains covered.~~
3VV-30 ~~352-47~~. Securing and Supporting of ~~Strut-Type Channel Raceways~~
(a) A surface mount strut-type channel raceways ~~strut-type channel raceway~~ shall be secured to the mounting surface with retention straps external to the channel at intervals not exceeding 10 ft (3.05 m) and within 3 ft (914 mm) of each outlet box, cabinet, junction box, or other channel raceway termination.
(b) Suspension Mount. strut-type channel raceways ~~Strut-type channel raceways~~ shall be permitted to be suspension mounted in air with approved appropriate methods designed for the purpose at intervals not to exceed 10 ft (3.05 m).
3VV-56 ~~352-48~~. Splices and Taps
Splices and taps shall be permitted in raceways that are accessible after installation by having a removable cover. The conductors, including splices and taps, shall not fill the raceway to more than 75 percent of its area at that point. All splices and taps shall be made by approved methods.
352-60 ~~352-50~~. Grounding
Installation of strut-type channel raceways shall comply with the applicable provisions of Article 250. Strut-type channel raceways ~~Strut-type channel raceway~~ enclosures providing a transition to or from other wiring methods shall have a means for connecting an equipment grounding conductor. Strut-type channel raceways shall be permitted as an equipment grounding conductor in accordance with Section 250-118(14). Where a snap-fit metal cover for strut-type channel raceways ~~strut-type channel raceway~~ is used to achieve electrical continuity in accordance with the listing, this cover shall not be permitted as the means for providing electrical continuity for a receptacle mounted in the cover.
C. Construction Specifications
3VV-100 Construction. ~~352-49. General~~
Strut-type channel raceways and their accessories shall be of a construction that distinguishes them from other raceways. Raceways

Table 3VV-22 ~~352-45.~~ Channel Size and Inside Diameter Area

	Area	40% Area*		25% Area**		
Size Channel	in.^{2}	mm^2	in.^{2}	mm^2	in.^{2}	mm^2
15/8 x 13/16	0.887	572	0.355	229	0.222	143

1 1/2 x 3	3.854	2487	1.542	995	0.964	622

***Raceways with external joiners shall use a 40 percent wire fill calculation to determine the number of conductors permitted.**
****Raceways with internal joiners shall use a 25 percent wire fill calculation to determine the number of conductors permitted.**

and their elbows, couplings, and other fittings shall be designed so that the sections can be electrically and mechanically coupled together and installed without subjecting the wires to abrasion. They shall comply with the following:
(a) Material. Raceways and accessories shall be formed of steel, stainless steel, or aluminum.
(b) Corrosion protection. Steel raceways and accessories shall be protected against corrosion by galvanizing, enamel, or a PVC coating.
(c) Covers. Covers of strut-type channel raceways shall be either metallic or nonmetallic.
3VV-120 ~~352-51.~~ Marking
Each length of strut-type channel raceways shall be clearly and durably identified as required in the first sentence of Section 110-21.
SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways other than those in circular cross section.

Currently Article 352 is made up of three parts. The purpose of this proposal was to separate each Part into three separate Articles. These three new articles follow the format developed by Sub-Task Group 1. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.

A uniform format is proposed to achieve consistency across all of the raceways articles. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

For the purpose of this proposal an article numbering scheme of "3VV" was used. It was not the intent of the submitter that this numbering scheme be adopted. Instead, a "NEW" article number would be assigned by the Technical Correlating Committee.

Explanation of renumbering and editorial changes;

- Title New Title added.
- 3VV-1 New Scope added to conform with the style manual.
- 3VV-2 (1) New definition added.
  (2) Deleted Part C from 352.
- 3VV-3 (1) Other Articles renumbered from Section 352-43 to 3VV-3.
  (2) Capitalize product name.
  (3) Moved Grounding Requirements to 3VV-60
- 3VV-6 Based on the reading of 352-41 and 352-49, the requirements have been combined into a single section requiring that strut-type channel raceway and its accessories be listed.
- 3VV-10 (1) Uses "Permitted" renumbered from Section 352-41 to 3VV-10.
  (2) Revised 352-42(b) to read as a use permitted and added to this section.
  (3) Added "Extension Trough Walls and Floors" 352-46.
- 3VV-12 (1) Uses "Uses Not Permitted" renumbered from Section 352-42 to 3VV-12.
  (2) Revised 352-42(b) to split out the use permitted from use not permitted.
  (4) Moved listing requirement to 3VV-6
- 3VV-21 (1) Size renumbered from Section 352-44 to 3VV-21.
  (2) Capitalize product name.
- 3VV-22 (1) Number of Conductors renumbered from 352-45 to 3VV-22.
  (2) Capitalize product name. (Two Places)
  (3) Removed the reference to raceway for clarity.
  (4) Corrected Table reference
  (5) Table for the Number of Conductors renumbered from 352-45 to 3VV-22.
- 352-46 Moved Extension Through Walls and Floors to uses Permitted 3VV-10(7).
- 3VV-30
  (1) Securing and Supporting renumbered and renamed from 352-47 Support of Strut Type Channel raceway to 3VV-30 Securing and Supporting.
  (2) Capitalize product name. (Two Places)
- 3VV-56
  (1) Splices and Taps renumbered from 352-48 to 3VV-56.
- 3VV-60 (1) Grounding renumbered from 352-50 to 3VV-60.
  (2) Added grounding requirement from 3VV-3(352-43, 99 NEC).
  (3) Capitalize product name. (Three Places)
- 3VV-100 (1) Construction renumbered and renamed from 352-49 General to 3VV-100 Construction.
  (2) Requirements from the decription in 352-40 have been moved to create an (a), (b) and (c) under construction since those items are related to specific construction of the raceway.
- 3VV-120 (1) Marking renumbered from 352-51 to 3VV-120.
  (2) Added "of Strut-Type Channel Raceways" for clarity.

PANEL ACTION: Accept in Principle.
Delete from the proposal 3VV-3.
In proposed 3VV-10(7) amend to read:
"7. As extensions of unbroken lengths through walls, partitions, and floors where closure strips are removable from either side and the portion within the wall, partition, or floor remains covered."
In 3VV-30(a) add title to read: Surface Mount.
In proposed 3VV-60 delete the first sentence.
PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP-8 recommends approval of the scope section by the TCC.
The proposed 3VV-3 and the first sentence of 3VV-60 are deleted as 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.
Proposed 3VV-10(7) has been amended to enhance clarity.
The title has been added to 3VV-30(a) to comply with the NEC Style Manual.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry
COMMENT ON AFFIRMATIVE:
JANNOT: The panel action should have included:
In proposed 3VV-22 add the formula: "Formula for wire fill:
$N = \frac{CA}{WA}$" as it appears in 352-45 in the existing NEC.
The panel statement for this action is that it is editorial and was inadvertently omitted.

(Log #1529)

8- 377 - (352-40): Reject
SUBMITTER: Tricia Sofia, MFMA
RECOMMENDATION: In the second sentence change the word "enamel" to "organic coated."
SUBSTANTIATION: The word "enamel" is used in a generic sense and is no longer applicable. The words organic coated are specific and more easily understood.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed new language does not enhance understanding of the product description.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 3
NOT RETURNED: 1 Corry
EXPLANATION OF NEGATIVE:
BERMAN: The submitter's proposal correctly reflects the industry terminology for the material coating and should be accepted.
DAUBERGER: Although enamel is still being used as a coating by some manufacturers, many have changed to other coatings such as nonmetallic coatings and powder coatings. The term "organic coated" accurately describes the various coatings currently being used on strut-type channel raceways.
LOYD: The proposal should be accepted. The term "Organic" is the correct term and is appropriate. "Enamel" is also an undefined term, but is generally identified as a washable paint.

(Log #2596)

8- 378 - (352-47(b)): Accept
NOTE: The Technical Correlating Committee understands that the recommended wording revises the wording of 3VV-30(b) in Proposal 8-376.
SUBMITTER: Donald R. Cook, Southern Section, IAEI
RECOMMENDATION: Revise Section 352-47(b) to read as follows:
(b) Suspension Mount. Strut-type channel raceways shall be permitted to be suspension mounted in air with approved appropriate methods designed for the purpose at intervals not to exceed 10 ft (3.05 m) and within 3 ft (914 mm) of channel raceway terminations and ends.

SUBSTANTIATION: The present wording allows up to a 20 ft length to be suspended on a single mount located so that no more than 10 ft of channel raceway is on each side of the mount. This does not provide the secure support necessary to prevent damage to the installation from movement as the channel strut rotates around the single mount.
PANEL ACTION: Accept.

8- 380a - (3UU-6): Accept
SUBMITTER: CMP 8
RECOMMENDATION: Add new section 3UU-6 to read:
"3UU-6 Listing Requirements. Surface nonmetallic raceway and associated fittings shall be listed."
SUBSTANTIATION: The panel intends that this product be evaluated and listed in accordance with the appropriate product standard.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry
COMMENT ON AFFIRMATIVE:
KENDALL: It needs to be clear to NFPA staff and the Technical Correlating Committee that this new section belongs with Surface Nonmetallic Raceway per Proposal 8-370. I believe this proposal number should have been numbered 8-370a to stay in sequence.

ARTICLE 353 — MULTIOUTLET ASSEMBLY

(Log #1436)

8- 381 - (353-1): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Delete 353-1 in its entirety including the fine print note.
SUBSTANTIATION: 1999 National Electrical Code Style Manual:
Section 4.1 states "Do not use a reference if the requirement is already covered by 90.3."
Section 4.1.1 stipulates that "References shall not be made to an entire article... unless additional conditions are specified.

PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2076)

8- 382 - (353-1): Accept in Principle
NOTE: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Add a Scope section to Article 353 to read as follows:
353-1. Scope. The provisions of this article covers the use and installation requirements of multioutlet assembly.
Renumber remaining sections.
SUBSTANTIATION: Each Article should have a scope section.
The NEC style manual on style also shows a scope article.
To keep the Articles consistent all Articles should be similar.
PANEL ACTION: Accept in Principle.
Amend the proposed text to read:
"353.1 Scope. This article covers the use and installation requirements for multioutlet assemblies."
PANEL STATEMENT: The amended text is consistent with the proposed revisions made by CMP-8 to other articles. The panel recommends that the TCC accept the proposed scope statement. It is not necessary to renumber the Article based on the panel's action on Proposal 8-381.

ARTICLE 354 — UNDERFLOOR RACEWAYS

(Log #1292)

8- 384 - (354(a), (b) and (d)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise as follows:
354-3 (a) Raceways Not Over 100 mm (4 in.) ~~(102 mm)~~ Wide. Half-round and flat-top raceways not over 100 mm (4 in.) ~~(102 mm)~~ in width shall have not less than 20 mm (3/4 in.) ~~(19 mm)~~ of concrete or wood above the raceway.
Exception: As permitted in (c) and (d) for flat-top raceways.
354-3 (b) Raceways Over 100 mm (4 in.) ~~(102 mm)~~ Wide but Not Over 200 mm (8 in.) ~~(203 mm)~~ Wide. Flat-top raceways over 100 mm (4 in.) ~~(102 mm)~~ but not over 200 mm (8 in.) ~~(203 mm)~~ wide with a minimum of 25 mm (1 in.) ~~(25.4 mm)~~ spacing between raceways shall be covered with concrete to a depth of not less than 25 mm (1 in.) ~~(25.4 mm)~~. Raceways spaced less than 25 mm (1 in.) ~~(25.4 mm)~~ apart shall be covered with concrete to a depth of 38 mm (1 1/2 in.) ~~(38 mm)~~.
354-3 (d) Other Raceways Flush with Concrete. In office occupancies, approved metal flat-top raceways, if not over 100 mm (4 in.) ~~(102 mm)~~ in width, shall be permitted to be laid flush with the concrete floor surface, provided they are covered with substantial linoleum that is not less than 1.6 mm (1/16 in.) ~~(1.59 mm)~~ in thickness or with equivalent floor covering. Where more than one and not more than three single raceways are each installed flush with the concrete, they shall be contiguous with each other and joined to form a rigid assembly.
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis. In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised. In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.
PANEL ACTION: Accept.

ARTICLE 362 — METAL WIREWAYS AND NONMETALLIC WIREWAYS

(Log #1293)

8- 397 - (362): Accept
NOTE: The Technical Correlating Committee notes that the revised dimensions in this Proposal will be implemented in the revised Articles 3AA and 3BB of Proposals 8-398 and 8-414.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise as follows:
362-6 Where insulated conductors are deflected within a wireway, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the wireway, or where the direction of the wireway is deflected greater than 30 degrees, dimensions corresponding to Section 373-6 shall apply. Where insulated conductors No. 4 or larger enter a wireway through a raceway or cable, the distance between those raceway and cable entries shall not be less than six times the trade diameter of the larger raceway or cable connector.
Where insulated conductors No. 4 or larger enter a wireway through a raceway or cable, the distance between raceway and cable entries enclosing the same conductor shall not be less than six times the trade diameter of the larger raceway or cable connector.
362-8 Wireways shall be supported in accordance with the following.
(a) Horizontal Support. Wireways shall be supported where run horizontally at each end and at intervals not to exceed 1.5 m (5 ft) ~~(1.52 m)~~ or for individual lengths longer than 1.5 m (5 ft) ~~(1.52 m)~~ at each end or joint, unless listed for other support intervals. The distance between supports shall not exceed 3 m (10 ft) ~~(3.05 m)~~.
(b) Vertical Support. Vertical runs of wireways shall be securely supported at intervals not exceeding 4.5 m (15 ft) ~~(4.57 m)~~ and shall not have more than one joint between supports. Adjoining wireway sections shall be securely fastened together to provide a rigid joint.
362-22 Nonmetallic wireway shall be supported in accordance with (a) and (b).
(a) Horizontal Support. Nonmetallic wireways shall be supported where run horizontally at intervals not to exceed 900 mm (3 ft) ~~(914 mm)~~, and at each end or joint, unless listed for other support intervals. In no case shall the distance between supports exceed 3 m (10 ft) ~~(3.05 m)~~.
(b) Vertical Support. Vertical runs of nonmetallic wireway shall be securely supported at intervals not exceeding 1.2 m (4 ft) ~~(1.22 m)~~, unless listed for other support intervals, and shall not have more than one joint between supports. Adjoining nonmetallic wireway sections shall be securely fastened together to provide a rigid joint.
362-23 Expansion fittings for nonmetallic wireway shall be provided to compensate for thermal expansion and contraction where the length change is expected to be 6 mm (0.25 in.) ~~(6.36 mm)~~ or greater in a straight run.
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis. In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised. In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.

(Log #1304)

8- 398 - (362 Part A): Accept in Principle
NOTE: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Rewrite of Article 362 Part A
This is a companion proposal to 362 Part B
ARTICLE 3AA – Metal Wireways and Nonmetallic Wireways
~~A. Metal Wireways~~
A. General
3AA-1. Scope. This article covers the use, installation, and construction specifications for metal wireways and associated fittings.
3AA-2 ~~362-1.~~ Definition
Metal wireways are sheet metal troughs with hinged or removable covers for housing and protecting electric wires and cable and in which conductors are laid in place after the wireway has been installed as a complete system.
3AA-3 ~~362-3.~~ Other Articles
Installations of Metal W~~w~~ireways shall comply with the applicable provisions of Article 300.
B. Installations
3AA-10 ~~362-2.~~ Uses Permitted
~~(a) Permitted.~~ The use of Metal W~~w~~ireways shall be permitted as in the follow~~s~~ing:
1. For exposed work
2. In concealed spaces only in accordance with Section 640-24
3. In hazardous (classified) locations as permitted by Section 501-4(b) for Class I, Division 2, locations; Section 502-4(b) for Class II, Division 2, locations; and Section 504-20 for intrinsically safe wiring Where installed in wet locations, wireways shall be listed for the purpose.
4. Extension Through Walls - Wireways shall be permitted to pass transversely through walls if the length passing through the wall is unbroken. Access to the conductors shall be maintained on both sides of the wall.
3AA-12 Uses Not Permitted.
~~(b) Not Permitted.~~ The use of Metal W~~w~~ireways shall not be used in the following: ~~permitted where subject to severe physical damage or corrosive vapor.~~
1. Where subject to severe physical damage
2. Where subject to corrosive vapors
3AA-21 ~~362-4.~~ Size of Conductors
No conductor larger than that for which the wireway is designed shall be installed in any wireway.
3AA-22 ~~362-5.~~ Number of Conductors
Metal wireways shall not contain more than 30 current-carrying conductors at any cross section. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.
The sum of cross-sectional areas of all contained conductors at any cross section of the wireway shall not exceed 20 percent of the interior cross-sectional area of the wireway.
The derating factors specified in Section 310-15(b)(2)(a) shall not be applicable to the 30 current-carrying conductors at 20 percent fill specified above.

Exception No. 1: Where the derating factors specified in Section 310-15(b)(2)(a) are applied, the number of current-carrying conductors shall not be limited, but the sum of the cross-sectional areas of all contained conductors at any cross section of the wireway shall not exceed 20 percent of the interior cross-sectional area of the wireway.

Exception No. 2: As provided in Section 520-6, the 30-conductor limitation shall not apply to theaters and similar locations.

Exception No. 3: As provided in Section 620-32, the 20 percent fill limitation shall not apply to elevators and dumbwaiters.

3AA-23 ~~362-6.~~ Deflected Insulated Conductors

Where insulated conductors are deflected within a wireway, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the wireway, or where the direction of the wireway is deflected greater than 30 degrees, dimensions corresponding to Section 373-6 shall apply. Where insulated conductors No. 4 or larger enter a wireway through a raceway or cable, the distance between those raceway and cable entries shall not be less than six times the trade diameter of the larger raceway or cable connector. Where insulated conductors No. 4 or larger enter a wireway through a raceway or cable, the distance between raceway and cable entries enclosing the same conductor shall not be less than six times the trade diameter of the larger raceway or cable connector.

3AA-30 Securing and Supporting ~~362-8. Supports~~

Metal wireways shall be supported in accordance with the following.

(a) Horizontal Support. Wireways shall be supported where run horizontally at each end and at intervals not to exceed 5 ft (1.52 m) or for individual lengths longer than 5 ft (1.52 m) at each end or joint, unless listed for other support intervals. The distance between supports shall not exceed 10 ft (3.05 m).

(b) Vertical Support. Vertical runs of wireways shall be securely supported at intervals not exceeding 15 ft (4.57 m) and shall not have more than one joint between supports. Adjoining wireway sections shall be securely fastened together to provide a rigid joint.

3AA-56 ~~362-7.~~ Splices and Taps

Splices and taps shall be permitted within a wireway provided they are accessible. The conductors, including splices and taps, shall not fill the wireway to more than 75 percent of its area at that point.

3AA-58 ~~362-10.~~ Dead Ends

Dead ends of metal wireways shall be closed.

3AA-60 ~~362-13.~~ Grounding

Grounding shall be in accordance with the provisions of Article 250.

~~362-9. Extension Through Walls~~

~~Wireways shall be permitted to pass transversely through walls if the length passing through the wall is unbroken. Access to the conductors shall be maintained on both sides of the wall.~~

3AA-70 ~~362-11.~~ Extensions from Metal Wireways

Extensions from wireways shall be made with cord pendants installed in accordance with Section 400-10 or any wiring method in Chapter 3 that includes a means for equipment grounding. Where a separate equipment grounding conductor is employed, connection of the equipment grounding conductors in the wiring method to the wireway shall comply with Sections 250-8 and 250-12. Where rigid nonmetallic conduit, electrical nonmetallic tubing, or liquidtight flexible nonmetallic conduit is used, connection of the equipment grounding conductor in the nonmetallic raceway to a metal wireway shall comply with Sections 250-8 and 250-12.

C. Construction Specifications

3AA-120 ~~362-12.~~ Marking

Metal wireways shall be marked so that their manufacturer's name or trademark will be visible after installation.

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways other than those in circular cross section.

Currently Article 362 is made up of two parts. The purpose of this proposal was to separate each Part into two separate Articles. These two new articles follow the format developed by Sub-Task Group 1. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.

A uniform format is proposed to achieve consistency across all of the raceways articles. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

For the purpose of this proposal an article numbering scheme of "3AA" was used. It was not the intent of the submitter that this numbering scheme be adopted. Instead, a "NEW" article number would be assigned by the Technical Correlating Committee.

Explanation of renumbering and editorial changes;

Title	Title Revised to remove Nonmetallic Wireways.
3AA-1	New Scope added to conform with the style manual.
3AA-2	(1) Definition renumbered from 362-1 to 3AA-2. (2) Deleted Part A from 362. (3) Added "Metal" to product name
3AA-3	(1) Other Articles renumbered from Section 362-3 to 3AA-3. (2) Added "Metal" and capitalize Wireway because it is a proper name.
3AA-10	(1) Uses "Permitted" renumbered from Section 362-2 to 3AA-10. (2) Added "Metal" and capitalize Wireway because it is a proper name. (3) Added "Extension Trough Walls and Floors" 362-9. (4) Moved "uses not permitted" to section 3AA-12.
3AA-12	(1) New section for "Uses Not Permitted". (2) Added "Metal" and capitalize Wireway because it is a proper name. (3) Listed uses not permitted
3AA-21	(1) Size renumbered from Section 362-4 to 3AA-21.
3AA-22	(1) Number of Conductors renumbered from 362-5 to 3AA-22. (2) Added "Metal" to product name.
3AA-23	(1) Deflected Insulated Conductors renumbered from 362-6 to 3AA-23.
3AA-30	(1) Securing and Supporting renumbered and renamed from 362-8 Supporting to 3AA-30 Securing and Supporting. (2) Added "Metal" to product name.
3AA-56	(1) Splices and Taps renumbered from 362-7 to 3AA-56.
3AA-58	(1) Dead Ends renumbered from Section 362-10 to 3AA-58. (2) Added "Metal" and capitalize Wireway because it is a proper name.
3AA-60	(1) Grounding renumbered from section 362-13 to 3 AA-60
362-9	Moved Extension Through Walls and Floors to Uses Permitted 3AA-10(4).
3AA-70	(1) Extension from Metal Wireways renumbered from 362-11 to 3AA-70. (2) Added "Metal" to product name.
3AA-120	(1) Marking renumbered from 362-12 to 3AA-120. (2) Added "Metal" to product name.

PANEL ACTION: Accept in Principle.

Delete "and Nonmetallic Wireways" from the title.

Delete from the proposal 3AA-3.

In proposed 3AA-10(4) amend language to read:

4. "As extensions to pass transversely through walls..."

Delete 3AA-60

PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP-8 recommends approval of the scope section by the TCC.

The proposed 3AA-3 and 3AA-60 are deleted as 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.

Proposed 3AA-10(4) has been amended to enhance clarity.

The title has changed due to reformatting of nonmetallic wireways into a separate article.

8- 401 - (362-2(a)(2)b): Accept in Principle
NOTE: The Technical Correlating Committee understands that the panel action does the following: The panel action for (a)(2) revises the text accepted in 3AA-10(2) of Proposal 8-398 and the text for (b) replaces the 3AA-12(2) with the text, "Where subject to severe corrosive environments".
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
(a)(2) In concealed spaces ~~only in accordance with~~ except as permitted in Section ~~640-24~~ 362-9.
(b) Not Permitted. The use of wireways shall not be permitted where subject to severe physical damage or corrosive vapor or liquid.
SUBSTANTIATION: Edit. Section 640-24 is irrelevent. The 1996 Section 640-4 Exception (c) which permitted concealment is not in the 1999 NEC. Section 362-9 should be noted for correlation and avoidance of conflict.
Since corrosive vapor is noted, it seems reasonable to include corrosive liquid.
PANEL ACTION: Accept in Principle.
Revise proposed (a)(2):
(a)(2) In concealed spaces ~~except~~ as permitted in 362-9.
Revise proposed text of (b) to read:
(b) Not Permitted. The use of wireways shall not be permitted where subject to severe physical damage or severe corrosive environments.
PANEL STATEMENT: The proposed language of (a)(2) was modified to clarify the only locations where wireway is permitted to be concealed. The revision of Paragraph (b) clarifies that wireway is not permitted to be used where installed in any severely corrosive environment. Some types of metal wireways can be used in locations not deemed to be severely corrosive.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry
COMMENT ON AFFIRMATIVE:
BERMAN: All types of wireways are suitable for use in environments that are not deemed to be severely corrosive. Therefore, the last sentence of the Panel Statement should not have been included.

(Log #1439)

8- 402 - (362-3): Accept in Principle
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Delete 362-3 in its entirety.
SUBSTANTIATION: 1999 National Electrical Code Style Manual:
Section 4.1 states "Do not use a reference if the requirement is already covered by 90.3."
Section 4.1.1 stipulates that "References shall not be made to an entire article... unless additional conditions are specified.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 8-398.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2317)

8- 403 - (362-5): Reject
SUBMITTER: Michael L. True, Abbott True Electric, Inc.
RECOMMENDATION: Revise the third paragraph to read as follows:
"The derating factors specified in Section 310-15(b)(2)(a) shall not be applicable to ~~the 30~~ current-carrying conductors at 20 percent fill specified above."
SUBSTANTIATION: Wireway fill shall be based on percentage of fill only. Table 310-15(b)(2)(a) is based on 40 percent conduit fill where the current-carrying conductors are "bundled". This should not apply to a wireway. The wireway allows the current-carrying conductors to be spread out over a larger area than a conduit, this allowing heat to dissipate. Table 310-15(b)(2)(a) should not apply to a gutter that is 20 percent filled. The derating chart should apply to wireways that are over 20 percent filled.
PANEL ACTION: Reject.
PANEL STATEMENT: There was no technical substantiation provided to expand the allowable fill.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2318)

8- 404 - (362-5): Reject
SUBMITTER: Michael L. True, Abbott True Electric, Inc.
RECOMMENDATION: Revise text to read as follows:
"Number of Conductors. ~~Wireways shall not contain more than 30 current-carrying conductors at any cross-section.~~ Conductors for signaling or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors."
SUBSTANTIATION: Wireway fill should be based on percentage of fill only. This will allow larger wireways with more unbundled current-carrying conductors thus allowing heat to dissipate.
PANEL ACTION: Reject.
PANEL STATEMENT: There was no technical substantiation provided to expand the allowable fill.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #4214)

8- 405 - (362-5): Accept
NOTE: The Technical Correlating Committee understands that the accepted text revises the text accepted in 3AA-22 of Proposal 8-398.
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
Number of Conductors. The sum of the cross-sectional areas of all contained conductors at any cross-section of a wireway shall not exceed 20 percent of the interior cross-sectional area of the wireway. The derating factors in Section 310-15(b)(2)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of Section 310-15(b)(4), exceeds 30. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors. ~~Wireways shall not contain more than 30 current-carrying conductors at any cross-section. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.~~

~~The sum of cross-sectional areas of all contained conductors at any cross section of the wireway shall not exceed 20 percent of the interior cross-sectional area of the wireway.~~

~~The derating factors specified in Section 310-15(b)(2)(a) shall not be applicable to the 30 current-carrying conductors at 20 percent fill specified above.~~

~~Exception No. 1: Where the derating factors specified in Section 310-15(b)(2)(a) are applied, the number of current carrying conductors shall not be limited, but the sum of the cross-sectional areas of all contained conductors at any cross section of the wireway shall not exceed 20 percent of the interior cross-sectional area of the wireway.~~

~~Exception No. 2: As provided in Section 520-6, the 30 conductor limitation shall not apply to theaters and similar locations.~~

~~Exception No. 3: As provided in Section 620-32, the 20 percent fill limitation shall not apply to elevators and dumbwaiters.~~

SUBSTANTIATION: This is an editorial simplification of a rule that has become more complex than it needs to be. The only real limit on fill is the 20 percent limitation. The opening statement about 30 conductors doesn't address fill, it addresses mutual conductor heating. The result is one paragraph to get us into trouble and a full-blown exception to get us back out by saying the putative opening limit ("not contain more than 30") isn't a real limit if you want to pay the derating penalty. It's much better to use one sentence to set out the physical limitation (20 percent), and then one sentence to say when you pay the derating penalty. I threw in the appropriate reference on when neutrals are current-carrying for clarity. Then I included the control circuit sentence, and that's it. A simple paragraph with three declarative sentences, written positively. The references to elevator and theater gutters now violates the Style Manual because Section 90-3 adequately addresses it, so I threw them out as well.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #3637)

8- 406 - (362-5 Exception No. 1 and Table 362-5): Reject
SUBMITTER: Will Dockham, Gilmanton Iron Works, NH
RECOMMENDATION: Revise the text of Section 362-5 Exception No. 1, and add a new Table 362-5 as follows:

Exception No. 1: Where the derating factors specified in ~~Section 310-15(b)(2)(a)~~ Table 362-5, are applied, the number of current-carrying conductors shall not be limited, but the sum of the cross-sectional areas of all contained conductors at any cross section of the wireway shall not exceed 20 percent of the interior cross-sectional area of the wireway.

Table 362-5. Adjustment Factors for More than 30 Current-Carrying Conductors in a Wireway

Number of Current Carrying Conductors	Percent of Values in Tables 310-16 and 310-18 as Adjusted for Ambient Temperature if Necessary
31 – 37	80
38 – 42	70
43 – 50	60
51 – 60	50
61 – 75	40
over 75	35

SUBSTANTIATION: There is a great deal of confusion when trying to determine the ampacity of conductors in a wireway that has more than 30 current-carrying conductors. A dilemma occurs when you attempt to derate per Section 310-15(b)(2)(a). It would imply that the ampacity of up to 30 current-carrying conductors would be at 100 percent of Tables 310-16 or 310-18, however, the ampacity of 31 current-carrying conductors would be at 40 percent of Tables 310-16 or 310-18. Obviously this makes no sense so an ampacity adjustment table needs to be created specifically for Section 362-5.

Please note the values in the purposed Table 362-5, are just a ratio of 30 divided by the applicable percent value. I realize that a more scientific method would be desirable and hope that this panel has the resources to fine tune the values in the table and not just reject this proposal for lack of substantive scientific data.
PANEL ACTION: Reject.
PANEL STATEMENT: The ampacity adjustment factors apply to all current carrying conductors and the submitter has not provided sufficient technical substantiation to apply the ampacity adjustment factors to only those current carrying conductors that exceed 30.

(Log #2597)

8- 409 - (362-6): Accept in Principle
SUBMITTER: Donald R. Cook, Southern Section, IAEI
RECOMMENDATION: Revise Section 362-6 so the section reads as follows:

362-6. ~~Deflected~~ Insulated Conductors. Insulated conductors installed in a metallic wireway shall comply with (a) and (b).

(a) Deflected Insulated Conductors. Where insulated conductors are deflected within a metallic wireway, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the metallic wireway, or where the direction of the metallic wireway is deflected greater than 30 degrees, dimensions corresponding to Section 373-6(a) shall apply.

(b) Where insulated conductors No. 4 or larger are pulled through a wireway, the distance between raceway and cable entries enclosing the same conductor shall not be less than that required in Section 370-28(a)(1) for straight pulls and Section 370-28(a)(2) for angle pulls.
SUBSTANTIATION: The addition of (b) to 373-6 is a specific reference. A reference to the entire 373-6 is confusing because we don't know whether to use 373-6(a) or 373-6(b). Also, where possible, we are to provide a specific reference.

Metallic wireways, by definition, are for use with conductors which "are laid in place after the wireway has been installed as a complete system". The requirements for deflection of conductors in 362-6 are intended to be utilized with conductors which are "laid in place". In today's installations wireways are also being used as pull boxes. Where wireways are being used as pull boxes the dimensional requirements for pull boxes should apply.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concern is addressed by the panel's action on Proposal 8-410.

8- 414 - (362 Part B): Accept in Principle
NOTE: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Rewrite of Article 362 Part B
This is a companion proposal to 362 Part A
ARTICLE 3BB - Nonmetallic Wireways
~~B. Nonmetallic Wireways~~
A. General
3BB-1. Scope. This article covers the use, installation, and construction specifications for nonmetallic wireways and associated fittings.
3BB-2 ~~362-14.~~ Definition
Nonmetallic Wwireways are flame retardant, nonmetallic troughs with removable covers for housing and protecting electric wires and cables in which conductors are laid in place after the wireway has been installed as a complete system.
3BB-3 ~~362-17.~~ Other Articles
Installations of nonmetallic wireways shall comply with the applicable provisions of Article 300. ~~Where equipment grounding is required by Article 250, a separate equipment grounding conductor shall be installed in the nonmetallic wireway.~~
~~Exception: Where the grounded conductor is used to ground equipment as permitted in Section 250-142.~~
3BB-6 Listing Requirements. Nonmetallic Raceways shall be listed.
B. Installations
3BB-10 ~~362-15.~~ Uses Permitted
The use of ~~listed~~ nonmetallic wireways shall be permitted ~~as~~ in the following:
1. Only for exposed work, except as permitted in accordance with Section 640-24
2. Where subject to corrosive vapors
3. In wet locations where listed for the purpose
FPN: Extreme cold may cause nonmetallic wireways to become brittle and, therefore, more susceptible to damage from physical contact.

4. Extension Through Walls - nonmetallic wireways shall be permitted to pass transversely through walls if the length passing through the wall is unbroken. Access to the conductors shall be maintained on both sides of the wall.

3BB-12 ~~362-16.~~ Uses Not Permitted

Nonmetallic wireways shall not be used ~~as~~ in the following:

1. Where subject to physical damage
2. In any hazardous (classified) location, except as permitted in Section 504-20
3. Where exposed to sunlight unless listed and marked as suitable for the purpose
4. Where subject to ambient temperatures other than those for which nonmetallic wireway is listed
5. For conductors whose insulation temperature limitations would exceed those for which the nonmetallic wireway is listed

3BB-21 ~~362-18.~~ Size of Conductors

No conductor larger than that for which the N~~n~~onmetallic W~~w~~ireway is designed shall be installed in any N~~n~~onmetallic W~~w~~ireway.

3BB-22 ~~362-19.~~ Number of Conductors

The sum of cross-sectional areas of all contained conductors at any cross section of the N~~n~~onmetallic W~~w~~ireway shall not exceed 20 percent of the interior cross-sectional area of the N~~n~~onmetallic W~~w~~ireway. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors. The derating factors specified in Section 310-15(b)(2)(a) shall be applicable to the current-carrying conductors up to and including the 20 percent fill specified above.

3BB-23 ~~362-20~~. Deflected Insulated Conductors

Where insulated conductors are deflected within a N~~n~~onmetallic W~~w~~ireway, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the N~~n~~onmetallic W~~w~~ireway, or where the direction of the N~~n~~onmetallic W~~w~~ireway is deflected greater than 30 degrees, dimensions corresponding to Section 373-6 shall apply.

3BB-30 Securing and Supporting ~~362-22. Supports~~

Nonmetallic W~~w~~ireway shall be supported in accordance with (a) and (b).

(a) Horizontal Support. Nonmetallic W~~w~~ireways shall be supported where run horizontally at intervals not to exceed 3 ft (914 mm), and at each end or joint, unless listed for other support intervals. In no case shall the distance between supports exceed 10 ft (3.05 m).

(b) Vertical Support. Vertical runs of N~~n~~onmetallic W~~w~~ireway shall be securely supported at intervals not exceeding 4 ft (1.22 m), unless listed for other support intervals, and shall not have more than one joint between supports. Adjoining N~~n~~onmetallic W~~w~~ireway sections shall be securely fastened together to provide a rigid joint.

3BB-44 ~~362-23~~. Expansion Fittings

Expansion fittings for N~~n~~onmetallic W~~w~~ireway shall be provided to compensate for thermal expansion and contraction where the length change is expected to be 0.25 in. (6.36 mm) or greater in a straight run.

FPN: See Table 347-9(A) for expansion characteristics of PVC Rigid Nonmetallic Conduit ~~rigid nonmetallic conduit~~. The expansion characteristics of PVC N~~n~~onmetallic W~~w~~ireway are identical.

3BB-56 ~~362-21~~. Splices and Taps

Splices and taps shall be permitted within a N~~n~~onmetallic W~~w~~ireway provided they are accessible. The conductors, including splices and taps, shall not fill the Nonmetallic Wwireway to more than 75 percent of its area at that point.

~~362-24. Extension Through Walls~~

~~Nonmetallic wireways shall be permitted to pass transversely through walls if the length passing through the wall is unbroken. Access to the conductors shall be maintained on both sides of the wall.~~

3BB-58 ~~362-25~~. Dead Ends

Dead ends of Nonmetallic Wwireway shall be closed using listed fittings.

3BB-60 Grounding

Where equipment grounding is required by Article 250, a separate equipment grounding conductor shall be installed in the Nonmetallic Wireway.

Exception: Where the grounded conductor is used to ground equipment as permitted in Section 250-142.

362A-70 ~~362-26~~. Extensions from Nonmetallic Wireways

Extensions from N~~n~~onmetallic W~~w~~ireway shall be made with cord pendants or any wiring method of Chapter 3. A separate equipment grounding conductor shall be installed in, or an equipment grounding connection shall be made to, any of the wiring methods used for the extension.

C. Construction Specifications

3BB-120 ~~362-27~~. Marking

Nonmetallic Wwireways shall be marked so that the manufacturer's name or trademark and interior cross-sectional area in square inches shall be visible after installation. Nonmetallic Wwireways that have limited smoke-producing characteristics shall be permitted to be identified with the suffix LS.

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering raceways other than those in circular cross section.

Currently Article 362 is made up of two parts. The purpose of this proposal was to separate each Part into two separate Articles. These two new articles follow the format developed by Sub-Task Group 1. This Sub-Task Group has completed their work, and has concluded that the goal of more user friendly code language would be best achieved by adopting a uniform format for each of the circular raceway articles.

A uniform format is proposed to achieve consistency across all of the raceways articles. This format is being proposed separately for each of the circular raceway articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

For the purpose of this proposal an article numbering scheme of "3BB" was used. It was not the intent of the submitter that this numbering scheme be adopted. Instead, a "NEW" article number would be assigned by the Technical Correlating Committee.

Explanation of renumbering and editorial changes;

- Title New Title added.
- 3BB-1 New Scope added to conform with the style manual.
- 3BB-2 (1) Definition renumbered from 362-14 to 3BB-2.
  (2) Deleted Part B from 362.
  (3) Capitalize Wireway because it is a proper name.
- 3BB-3 (1) Other Articles renumbered from Section 362-17 to 3BB-3.
  (2) Capitalize Nonmetallic Wireway because it is a proper name.
  (3) Moved grounding requirements to section 3BB-60.
- 3BB-6 (1) New section for listing requirements.
  (2) Move listing requirements from 3BB-10 (362-15, 99 NEC).
- 3BB-10 (1) Uses "Permitted" renumbered from Section 362-15 to 3BB-10.
  (2) Capitalize Nonmetallic Wireway because it is a proper name.
  (3) Moved listing requirements to 3BB-6
  (4) Added "Extension Trough Walls and Floors" 362-24.
- 3BB-12 (1) Uses "Not Permitted" renumbered from Section 362-16 to 3BB-12.
  (2) Capitalize Nonmetallic Wireway because it is a proper name.
- 3BB-21 (1) Size renumbered from Section 362-18 to 3BB-21.
  (2) Capitalize Nonmetallic Wireway because it is a proper name (Two Places).
- 3BB-22 (1) Number of Conductors renumbered from 362-19 to 3BB-22.
  (2) Capitalize Nonmetallic Wireway because it is a proper name (Two Places).
- 3BB-23 (1) Deflected Insulated Conductors renumbered from 362-20 to 3BB-23.
  (2) Capitalize Nonmetallic Wireway because it is a proper name (Three Places).
- 3BB-30 (1) Securing and Supporting renumbered and renamed from 362-22 Supporting to 3BB-30 Securing and Supporting.
  (2) Capitalize Nonmetallic Wireway because it is a proper name (Four Places).
- 3BB-44 (1) Expansion Fittings renumbered from 362-23 to 3BB-44.
  (2) Capitalize Nonmetallic Wireway because it is a proper name (Two Places).
  (3) Capitalize Rigid Nonmetallic Conduit because it is a proper name.
- 3BB-56 (1) Splices and Taps renumbered from 362-21 to 3BB-56.
  (2) Capitalize Nonmetallic Wireway because it is a proper nam (Two Places).

- 362-24 Moved Extension Through Walls and Floors to Uses Permitted 3BB-10(4).
- 3BB-58 (1) Dead Ends renumbered from Section 362-25 to 3BB-58.
  (2) Capitalize Nonmetallic Wireway because it is a proper name.
- 3BB-60 (1) New section for Grounding Requirements.
  (2) Moved Grounding requirments from 3BB-3 (362-17, 99 NEC).
- 3BB-70 (1) Extension from Nonmetallic Wireways renumbered from 362-26 to 3BB-70.
  (2) Capitalize Nonmetallic Wireway because it is a proper name.
- 3BB-120 (1) Marking renumbered from 362-27 to 3BB-120.
  (2) Capitalize Nonmetallic Wireway because it is a proper name.

PANEL ACTION: Accept in Principle.
Delete from the proposal 3BB-3.
In 3BB-6 amend language to read:
"Nonmetallic Wireways and associated fittings..."
In proposed 3BB-10(4) amend language to read:
4. "As extensions to pass transversely through walls..."
Correct 362A-70 to 3BB-70
PANEL STATEMENT: Section 2.2.1 of the 1999 NEC Style Manual states, "The approval of article scope statements is the responsibility of the Technical Correlating Committee". CMP-8 recommends approval of the scope section by the TCC.
The proposed 3BB-3 is deleted as 4.1.1 of the 1999 NEC Style Manual prohibits references being made to an entire article unless additional conditions are specified.
3BB-6 has been amended to clarify that nonmetallic wireways and associated fittings are required to be listed.
Proposed 3BB-10(4) has been amended to enhance clarity.
Change 362A-70 to 3BB-70 is editorial.

(Log #2228)

8- 415 - (362-14): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested."
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.
[NOTE: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
PANEL ACTION: Reject.

(Log #855)

8- 416 - (362-15(1), (2)): Accept in Principle
NOTE: The Technical Correlating Committee understands that the following actions occur: The Panel action text for (1) replaces the reference to 640-24 with 3BB-10(4) of Proposal 8-414 and that the action for (2) will revise 3BB-10(2) with the text "Where subject to corrosive environments."
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
(1) Only for exposed work, except as permitted in Section ~~640-24~~ 362-24.
(2) Where subject to corrosive vapors or liquids.
SUBSTANTIATION: Edit. Section 640-24 is irrelevant. Section 362-24 should be noted for correlation and avoidance of conflict. Since corrosive vapors are noted, it seems reasonable to include corrosive liquids.
PANEL ACTION: Accept in Principle.
Accept (1) as proposed.
Revise proposed (2) to read:
(2) Where subject to corrosive environments.
PANEL STATEMENT: The revision of (2) clarifies that nonmetallic wireway is permitted to be used in any corrosive environment.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry
COMMENT ON AFFIRMATIVE:
BERMAN: I agree with Mr. Loyd that the panel statement is not consistent with the panel action. CMP-8 was in agreement that nonmetallic wireways are permitted where subject to corrosive environments. However, the panel statement incorrectly indicates that this product is permitted in any corrosive environment. Although the terms are not clearly defined. I believe it to be the intent of CMP-8 to permit nonmetallic wireways only in "normally" corrosive enviroments, and not "severely" corrosive environments.
LOYD: I disagree with the panel statement. Many corrosive atmospheres are also degrading to PVC; the manufacturer of this product publishes a list of materials that are degrading to PVC (I have provided a copy). Therefore the panel statement should be revised to reflect the conditions in which the product can be used.
NOTE: Supporting material is available for review at NFPA Headquarters.

(Log #2185)

8- 417 - (362-15(1)): Accept in Principle
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
(1) ~~Only~~ for exposed work, ~~except as permitted in accordance with Section 640-24.~~
SUBSTANTIATION: In the 1996 NEC 640-4 Exception c., wireways were permitted in concealed places. In the 1999 NEC in accordance with 640-24, "The use of ...wireways,...shall comply with applicable articles with respect to permitted locations...". There are no exceptions; therefore, wireways shall only be used for exposed work and this erroneous reference to 640-24 should be deleted.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concerns are addressed by the panel's action on Proposal 8-416.

8- 421 - (362-20): Accept in Principle
NOTE: The Technical Correlating Committee understand that the recommendation is accepted with the modification shown in the panel action and that the text revises the accepted text in 3BB-23 of Proposal 8-414.
SUBMITTER: Donald R. Cook, Southern Section, IAEI
RECOMMENDATION: Revise the first paragraph and add a new second paragraph to Section 362-20 so the section reads as follows:
362-20. ~~Deflected~~ Insulated Conductors. Insulated conductors installed in a nonmetallic wireway shall comply with (a) and (b).
(a) Deflected Insulated Conductors. Where insulated conductors are deflected within a nonmetallic wireway, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the nonmetallic wireway, or where the direction of the nonmetallic wireway is deflected greater than 30 degrees, dimensions corresponding to Section 373-6(a) shall apply.
(b) Where insulated conductors No. 4 or larger are pulled through a wireway, the distance between raceway and cable entries enclosing the same conductor shall not be less than that required in Section 370-28(a)(1) for straight pulls and Section 370-28(a)(2) for angle pulls.
SUBSTANTIATION: The addition of (a) to 373-6 is a specific reference. A reference to the entire 373-6 is confusing because we don't know whether to use 373-6(a) or 373-6(b). Also, where possible, we are to provide a specific reference.
Nonmetallic wireways, by definition, are for use with conductors which "are laid in place after the wireway has been installed as a complete system". The requirements for deflection of conductors in 362-20 are intended to be utilized with conductors which are "laid in place". In today's installations wireways are also being used as pull boxes. Where wireways are being used as pull boxes the dimensional requirements for pull boxes should apply.
PANEL ACTION: Accept in Principle.
The panel adds a title to (b) to read:
Nonmetallic Wireways used as Pull Boxes.
PANEL STATEMENT: The panel's action conforms with the NEC Style Manual.

(Log #2827)

8- 423 - (362-27): Accept
NOTE: The Technical Correlating Committee understands that this action revises the text in 3BB-120 of Proposal 8-414.
SUBMITTER: Ravindra H. Ganatra, Alcan Cable /Rep. CANENA Tech Harmonization Subcomm. For Bldg Wire and Cable Products
RECOMMENDATION: Revise 362-27 to read:
362-27. Marking. Nonmetallic wireways shall be marked so that the manufacturer's name or trademark and interior cross-sectional area in square inches shall be visible after installation. ~~Nonmetallic wireways that have limited smoke-producing characteristics shall be permitted to be identified with the suffix LS.~~ Marking for limited smoke shall be permitted on the nonmetallic wireways that have limited smoke-producing characteristics.
SUBSTANTIATION: This proposal is submitted on behalf of the THSC - Building Wire and Cable Product Standards, of Council of Harmonization of Electrotechnical Standardization of North America (CANENA).
Abbreviation LS has been found to represent different requirements in different national product standards in North America. In Mexico, "LS" is used to indicate compliance with requirements associated with marking for low smoke. In the US, "LS" marking has been used to indicate compliance with requirements associated with marking for limited smoke. However, the requirements in Mexico and the US are different. Further, requirements for "ST1" marking used in Canada are similar to limited smoke marking used in the US.
Thus, removal of the abbreviation in the Code will facilitate harmonization of marking requirements in the product standards.
Although the section does not deal with wire and cable products, this proposal is made for this section to address the change in the abbreviation for limited smoke marking.
The proposal does not recommend any change in the test method or performance requirements for a product being evaluated for limited smoke marking.
PANEL ACTION: Accept.

ARTICLE 363 — FLAT CABLE ASSEMBLIES: TYPE FC

(Log #CP717)

7- 265a - (363): Accept
NOTE: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: CMP 7
RECOMMENDATION: Rewrite Article 363 to comply with NEC Style Manual.

ARTICLE 363 -- Flat Cable Assemblies: Type FC

I General.

363-1. Scope. This article covers the use, installation, and construction specifications for Flat Cable Assemblies, Type FC.
363-2. Definition.
Flat Cable Assembly, Type FC. An assembly of parallel conductors formed integrally with an insulating material web specifically designed for field installation in surface metal raceway.

II Installation

363-10. Uses Permitted. Flat cable assemblies shall be permitted only:
(1) As branch circuits to supply suitable tap devices for lighting, small appliances, or small power loads. The rating of the branch circuit shall not exceed 30 amperes.
(2) Where installed for exposed work.
(3) In locations where they will not be subjected to severe physical damage.
Where a flat cable assembly is installed less than 2.5 m (8 ft.) above the floor or fixed working platform, it shall be protected by a metal cover identified for the use.
(4) In surface metal raceways identified for the use. The channel portion of the surface metal raceway systems shall be installed as complete systems before the flat cable assemblies are pulled into the raceways.
363-12. Uses Not Permitted. Flat cable assemblies shall not be used:
(1) Where subject to corrosive vapors unless suitable for the application
(2) In hoistways, or on elevators or escalators
(3) In any hazardous (classified) location
(4) Outdoors or in wet or damp locations unless identified for the use.
363-30. Securing and Supporting. The flat cable assemblies shall be supported by means of their special design features, within the surface metal raceways.
The surface metal raceways shall be supported as required for the specific raceway to be installed.
363-40. Boxes and Fittings.
(a) Dead Ends. Each flat cable assembly dead end shall be terminated in an end-cap device identified for the use.
The dead-end fitting for the enclosing surface metal raceway shall be identified for the use.
(b) Fixture Hangers. Fixture hangers installed with the flat cable assemblies shall be identified for the use.
(c) Fittings. Fittings to be installed with flat cable assemblies shall be designed and installed to prevent physical damage to the cable assemblies.
(d) Extensions. All extensions from flat cable assemblies shall be made by approved wiring methods, within the junction boxes, installed at either end of the flat cable assembly runs.

363-56. Splices and Taps.
(a) Splices. Splices shall be made in listed junction boxes.
(b) Taps. Taps shall be made between any phase conductor and the grounded conductor or any other phase conductor by means of devices and fittings identified for the use. Tap devices shall be rated at not less than 15 amperes, or more than 300 volts to ground, and they shall be color-coded in accordance with the requirements of Section 363-20.

III Construction.

363-100. Construction. The flat cable assemblies shall consist of either two, three, or four conductors.
363-104. Conductors. Flat cable assemblies shall have conductors of 10 AWG special stranded copper wires.
363-112. Insulation. The entire flat cable assembly shall be formed to provide a suitable insulation covering all of the conductors and using one of the materials recognized in Table 310-13 for general branch-circuit wiring.
363-120. Marking.
(a) Temperature Rating. In addition to the provisions of 310-11, Type FC cable shall have the temperature rating durably marked on the surface at intervals not exceeding 600 mm (24 in.).
(b) Identification of Grounded Conductor. The grounded conductor shall be identified throughout its length by means of a distinctive and durable white or natural gray marking.
(c) Terminal Block Identification. Terminal blocks identified for the use shall have distinctive and durable markings for color or word coding. The grounded conductor section shall have a white marking or other suitable designation. The next adjacent section of the terminal block shall have a black marking or other suitable designation. The next section shall have a red marking or other suitable designation. The final or outer section, opposite the grounded conductor section of the terminal block, shall have a blue marking or other suitable designation.
SUBSTANTIATION: This revision to Article 363 incorporates all of the proposals submitted by the Technical Correlating Committee, other similar proposals, and revisions by the panel consistent with the usability effort. Specific proposals addressed by this revision include 7-266, 7-268, 7-269, 7-270, 7-271, 7-272, 7-274, 7-276, and 7-278.

7- 266 - (363): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise text to read as follows:

Article 363 — Flat Cable Assemblies Type FC

I. General

~~363-1.~~ 363-2. Definition

~~Type FC, a flat cable assembly,~~ Flat Cable Assembly (Type FC). ~~is a~~ An assembly of parallel conductors formed integrally with an insulating material web specifically designed for field installation in surface metal raceway.

~~363-2.~~ 363-3. Other Articles. In addition to the provisions of this article, installation of Type FC cable shall conform with the applicable provisions of Articles 210, 220, 250, 300, 310, and 352.

II. Installation

~~363-3.~~ 363-10. Uses Permitted. Flat cable assemblies shall be permitted only as branch circuits to supply suitable tap devices for lighting, small appliances, or small power loads. Flat cable assemblies shall be installed for exposed work only. Flat cable assemblies shall be installed in locations where they will not be subjected to severe physical damage.

(a) ~~363-18.~~ Protective Covers. Where a flat cable assembly is installed less than 8 ft (2.44 m) above the floor or fixed working platform, it shall be protected by a metal cover identified for the use.

(b) ~~363-5. Installation~~ Surface Metal Raceways. Flat cable assemblies shall be installed in the field only in surface metal raceways identified for the use. The channel portion of the surface metal raceway systems shall be installed as complete systems before the flat cable assemblies are pulled into the raceways.

(c) ~~363-16.~~ Rating. The rating of the branch circuit shall not exceed 30 amperes.

~~363-4.~~ 363-12. Uses Not Permitted. Flat cable assemblies shall not be installed in the following:

1. Where subject to corrosive vapors unless suitable for the application
2. In hoistways
3. In any hazardous (classified) location
4. Outdoors or in wet or damp locations unless identified for use in wet locations

~~363-15. Supports.~~ 363-30 Securing and Supporting. The flat cable assemblies shall be supported by means of their special design features, within the surface metal raceways.

The surface metal raceways shall be supported as required for the specific raceway to be installed.

363-40 Boxes and Fittings

~~363-11.~~ (a) Dead Ends. Each flat cable assembly dead end shall be terminated in an end-cap device identified for the use.

The dead-end fitting for the enclosing surface metal raceway shall be identified for the use.

~~363-12.~~ (b) Fixture Hangers. Fixture hangers installed with the flat cable assemblies shall be identified for the use.

~~363-13.~~ (c) Fittings. Fittings to be installed with flat cable assemblies shall be designed and installed to prevent physical damage to the cable assemblies.

~~363-14.~~ (d) Extensions. All extensions from flat cable assemblies shall be made by approved wiring methods, within the junction boxes, installed at either end of the flat cable assembly runs.

363-56. Splices and Taps

~~363-9.~~ (a) Splices. Splices shall be made in listed junction boxes.

~~363-10.~~ (b) Taps. Taps shall be made between any phase conductor and the grounded conductor or any other phase conductor by means of devices and fittings identified for the use. Tap devices shall be rated at not less than 15 amperes, or more than 300 volts to ground, and they shall be color-coded in accordance with the requirements of Section 363-20. 363-120(c).

III. Construction Specifications

~~363-6. Number of Conductors.~~ 363-100. Construction. The flat cable assemblies shall consist of either two, three, or four conductors.

~~363-7. Size of Conductors.~~ 363-104. Conductors. Flat cable assemblies shall have conductors of No. 10 special stranded copper wires.

~~363-8.Conductor Insulation.~~ 363-112. Insulation. The entire flat cable assembly shall be formed to provide a suitable insulation covering all of the conductors and using one of the materials recognized in Table 310-13 for general branch-circuit wiring.

~~363-17.~~ 363-120. Marking

(a) Temperature Rating. In addition to the provisions of Section 310-11, Type FC cable shall have the temperature rating durably marked on the surface at intervals not exceeding 24 in. (610 mm).

~~363-19. Identification~~ (b) Identification of Grounded Conductor. The grounded conductor shall be identified throughout its length by means of a distinctive and durable white or natural gray marking.

~~363-20.~~ (c) Terminal Block Identification. Terminal blocks identified for the use shall have distinctive and durable markings for color or word coding. The grounded conductor section shall have a white marking or other suitable designation. The next adjacent section of the terminal block shall have a black marking or other suitable designation. The next section shall have a red marking or other suitable designation. The final or outer section, opposite the grounded conductor section of the terminal block, shall have a blue marking or other suitable designation.

SUBSTANTIATION: The Technical Correlating Committee Task Group on the Usability of the NEC has directed a Sub-Task Group to study the organization of the Articles covering cable and wiring.

A uniform format is proposed to achieve consistency across all of the cable and wiring articles. In these proposals, Section xxx-1 of each article covers scope, xxx-10 covers uses permitted, xxx-30 covers securing and supporting, etc. . The purpose of the re-formatting was to re-organize the structure of the article to permit parallel code section numbering within similar articles as stated in the NEC Style Manual 2.4.1. It is hoped that the parallel Code section numbering format from article to article will increase the usability of the code and assist in the proper application of NEC requirements.

For each of the article rewrites, it is intended that the basic requirements found in the 1999 NEC for cable and wiring not be changed. To fit the uniform format, some requirements have been relocated within an article, or rewritten for editorial clarity or consistency. Where revisions were considered to be of a substantive nature, they have been submitted as separate proposals.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-265a.

7- 267 - (363): Reject
SUBMITTER: Edward Wesley, The Wiremold Co.
RECOMMENDATION: Revise as follows:

363-1. Scope. This article covers the use, installation, and construction specifications of Flat Cable Assemblies.

~~363-1~~ 2. Definition. Type FC, a flat cable assembly, is an assembly of parallel conductors formed integrally with an insulating material web specifically designed for field installation in surface metal raceway.

~~363-2~~ 3. Other Articles. In addition to the provisions of this article, installation of Type FC cable shall conform with the applicable provisions of Articles 210, 220, 250, 300, 310, and 352.

~~363-3~~ 4. Uses Permitted. Flat cable assemblies shall be permitted only as branch circuits to supply suitable tap devices for lighting, small appliances, or small power loads.

Flat cable assemblies shall be installed for exposed work only ~~Flat cable assemblies shall be installed~~. and in locations where ~~they will not be~~ subjected to severe physical damage.

~~363-4~~ 5. Uses Not Permitted. Flat cable assemblies shall not be installed in the following:

1. Where subject to corrosive vapors unless suitable for the application
2. In hoistways
3. In any hazardous (classified) location
4. Outdoors or in wet or damp locations unless ~~identified~~ listed for use in wet locations

~~363-5~~ 6. Installation. Flat cable assemblies shall be installed in the field only in surface metal raceways identified for the use. The channel portion of the surface metal raceway system shall be installed as a complete ~~systems~~ system before the flat cable ~~assemblies are~~ assembly is pulled into the ~~raceways~~ raceway.

~~363-6~~ 7. Number of Conductors. ~~The~~ Flat cable assemblies shall consist of ~~either~~ two or more insulated conductors. ~~three, or four~~ conductors.

~~363-7~~ 8. Size of Conductors. Flat cable assemblies shall have conductors of No. 10 ~~special~~ stranded copper wires.

~~363-8~~ 9. Conductor Insulation. The entire flat cable assembly shall be formed to provide a suitable insulation covering all of the conductors and using one of the materials recognized types listed in Table 310-13 for general branch-circuit wiring.

~~363-9~~ 10. Splices. Splices shall be made in listed junction boxes.

363-10 11. Taps. Taps shall be made between any phase conductor and the grounded conductor or any other phase conductor by means of devices and fittings identified listed for the use. Tap devices shall be rated at not less than 15 amperes, or nor more than 300 volts to ground, and they shall be color-coded or identified, in accordance with the requirements of Section 363-20.
363-11 12. Dead Ends. Each flat cable assembly dead end shall be terminated in an end-cap device identified listed for the use. The dead-end fitting for the enclosing surface metal raceway shall be identified listed for the use.
363-12 13. Fixture Hangers. Fixture hangers installed with the flat cable assemblies shall be identified listed for the use.
363-13 14. Fittings. Fittings to be installed with flat cable assemblies shall be designed and installed to prevent physical damage to the cable assemblies.
63-14 15. Extensions. All extensions from flat cable assemblies shall be made by approved wiring methods, within the junction boxes, installed at either end of the flat cable assembly runs.
363-15 16. Supports. The Flat cable assemblies shall be supported by means of their special design features, within the surface metal raceways.
The surface metal raceways shall be supported at intervals not exceeding 10 ft (3.0 M) and within 3 ft (914 mm) of each junction box or dead end. as required for the specific raceway to be installed.
363-16 17. Rating. The rating of the branch circuit shall not exceed 30 amperes.
363-17 18. Marking. In addition to the provisions of Section 310-11, Type FC cable shall have the temperature rating durably marked on the surface at intervals not exceeding 24 in. (610 mm).
363-18 19. Protective Covers. Where a flat cable assembly is installed less than 8 ft (2.44 m) above the floor or fixed working platform, it shall be protected by a metal cover identified listed for the use.
363-19 20. Identification. The grounded conductor shall be identified throughout its length by means of a distinctive and durable white or natural gray marking. outer finish.
The ungrounded conductors shall be identified black, red, blue, or by other approved means.
The equipment grounding conductor shall be identified by a continuous green outer finish.
363-20. Terminal Block Identification Terminal blocks identified for the use shall have distinctive and durable markings for color or word coding. The grounded conductor section shall have a white marking or other suitable designation. The next adjacent section of the terminal block shall have a black marking or other suitable designation. The next section shall have a red marking or other suitable designation. The final or outer section, opposite the grounded conductor section of the terminal block, shall have a blue marking or other suitable designation.
SUBSTANTIATION: This proposal is intended to editorially revise Article 363 into more clear language without substantial change. A Scope has been added for the CMP's consideration and for the Correlating Committee's acceptance. Section Nos. have been changed accordingly. Existing Section 363-20 has been revised to expand the "identification" of conductors to include ungrounded conductors and equipment grounding conductors. Provisions for "terminal blocks" have been deleted as they are no longer used and are no longer being manufactured. In lieu of terminal blocks, common twist-on splicing devices are used for conductor connections within the junction boxes.
PANEL ACTION: Reject.
PANEL STATEMENT: The use of the word listed in place of identified is more than editorial in nature and there are other proposed changes that are more than editorial. The panel is also concerned over the deletion of the section on terminal block identification with only substantiation from one manufacturer of this product. This article has been rewritten by the panel at the direction of the Technical Correlating Committee. See panel action on Proposal 7-265a.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #1371)

7- 276 - (363-10): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise the new proposed 363-10 to read as follows:
363-10 Uses Permitted.
Flat cable assemblies shall be permitted only:
(1) as branch circuit(s) to supply suitable tap devices for lighting, small appliances, or small power loads.
The rating of the branch circuit shall not exceed 30 amperes.
(2) where installed for exposed work.
(3) in locations where they will not be subjected to severe physical damage.
Where a flat cable assembly is installed less than 8 ft (2.44 m) above the floor or fixed working platform, it shall be protected by a metal cover identified for the use
(4) in surface metal raceways identified for the use. The channel portion of the surface metal raceway systems shall be installed as complete systems before the flat cable assemblies are pulled into the raceways.
SUBSTANTIATION: To incorporate text consistent with other wire and cable articles and to provide clarity in accordance with NEC Style Manual, Section 3.3.4.
NEC Style Manual Section 3.3.2 requires that where possible lists or tables be used to present requirements, rather than long text descriptions.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-265a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #856)

7- 277 - (363-15): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise second sentence:
"The surface raceways shall be supported as ~~required for the specific raceway to be installed~~ specified in Section 352-47."
SUBSTANTIATION: Edit. To provide a specific reference to support requirements for the raceway type used in this application.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient technical substantiation that the current wording has caused problems in application of this wiring method.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #476)

7- 278 - (363-17 and 18): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 363-17 - change "24 in. (610 mm)" to "610 mm (24 in.)"
363-18 - change "8 ft (2.44 m)" to "2.5 m (8 ft)"
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
The SI units in Section 363-17 are not rounded since the measurement is product specific and 610 mm may be required to complete the legend, 600 mm may be too short.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel's editorial action and statement on Proposal 7-265a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #857)

7- 279 - (363-18): Accept
NOTE: The Technical Correlating Committee understands that this Proposal modifies 363-10(3) of Proposal 7-265a.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
"Where a flat cable assembly is installed less than 8 ft (2.44 m) above the floor or fixed working platform, it shall be protected by a ~~metal~~ cover identified for the use."
SUBSTANTIATION: Edit. Section 352-40 permits either metallic or nonmetallic covers for strut type channel raceways which may be installed with the cover orientated in any position. If the panel feels a metal cover is required for FC cable because the cover is normally on the bottom, Section 352-40 should reflect this.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #2517)

7- 280 - (363-19): Accept in Principle
SUBMITTER: Richard E. Loyd, Perryville, AR
RECOMMENDATION: Revise as follows:
363-19. Identification. The grounded conductor shall be identified throughout its length by means of a distinctive and durable white ~~or natural gray~~ marking.
SUBSTANTIATION: This term is undefined. The past Chairman of CMP 5 and others with historical data as to where this term originally came from all relate to products or product manufacturing process that has not been used for the past 35 to 50 years. Since it is a term that was used to define a product no longer made it should be deleted to eliminate the confusion that continues to exist in the industry.
There are many shades of white and many shades of black. How does one determine if gray is a shade of black or white? Different manufactures use various shades of each color and often two or three different manufactures wire will be installed on the same job site. The continued use of the term causes confusion and is or could be a safety issue that might result in life threatening shock hazard.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concern is addressed by the panel's action on Proposal 7-281.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 1 Ensign

(Log #4297)

7- 281 - (363-19): Accept
NOTE: The Technical Correlating Committee understands that this Proposal modifies 363-120(b) of Proposal 7-265a.
SUBMITTER: Charles F. Mello, Milwaukie, OR
RECOMMENDATION: Revise text to read as follows:
363.19. Identification. The grounded conductor shall be identified throughout its length by means of a distinctive and durable white or ~~natural~~ gray marking.
SUBSTANTIATION: Delete the word "natural" since the color natural gray is not defined and in fact does not exist as a specified color for wire insulation. This proposal goes with the definition of gray within a specified range of color per the Munsell color system as used by industry for wire color coding. The definition of the gray is provided in another proposal.
PANEL ACTION: Accept.

ARTICLE 364 — BUSWAYS

(Log #1294)

8- 424 - (364): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise as follows:
364-4 (b) (4) Outdoors or in wet or damp locations unless identified for such use
Lighting busway and trolley busway shall not be installed less than 2.5 m (8 ft) ~~(2.44 m)~~ above the floor or working platform unless provided with a cover identified for the purpose.
364-5 Busways shall be securely supported at intervals not exceeding 1.5 m (5 ft) ~~(1.52 m)~~ unless otherwise designed and marked.
364-6 (b) (1) Busways shall be permitted to be extended vertically through dry floors if totally enclosed (unventilated) where passing through and for a minimum distance of 1.8 m (6 ft) ~~(1.83 m)~~ above the floor to provide adequate protection from physical damage.
364-6 (b) (2) In other than industrial establishments, where a vertical riser penetrates two or more dry floors, a minimum 100 mm (4-in.) ~~(102 mm)~~ high curb shall be installed around all floor openings for riser busways to prevent liquids from entering the opening. The curb shall be installed within 300 mm (12 in.) ~~(304.8 mm)~~ of the floor opening. Electrical equipment shall be located so that it will not be damaged by liquids that are retained by the curb.
364-8 (b) (2) The length of the cord or cable from a busway plug-in device to a suitable tension take-up support device shall not exceed 1.8 m (6 ft) ~~(1.83 m)~~.
Exception: In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, lengths exceeding 1.8 m (6 ft) ~~(1.83 m)~~ shall be permitted between the busway plug-in device and the tension take-up support device where the cord or cable is supported at intervals not exceeding 2.5 m (8 ft) ~~(2.4 m)~~.
364-11 Exception: For industrial establishments only, omission of overcurrent protection shall be permitted at points where busways are reduced in ampacity, provided that the length of the busway having the smaller ampacity does not exceed 15 m (50 ft) ~~(15.2 m)~~ and has an ampacity at least equal to one-third the rating or setting of the overcurrent device next back on the line, and provided that such busway is free from contact with combustible material.
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis. In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised. In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #4215)

8- 427 - (364-6): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise to read as follows:
364-6. Installation Requirements.
(a) Through Walls and Floors. It shall be permissible to extend unbroken lengths of busways through dry walls. It shall be permissible to extend busways vertically through dry floors if totally enclosed (unventilated) where passing through and for a minimum distance of 6 ft (1.83 m) above the floor to provide adequate protection from physical damage.
FPN: See Section 300-21, Spread of Fire of Products of Combustion.
(b) Protection from Liquids, Moisture and Other Contaminants. Busway shall be protected from liquids, moisture, and other contaminants or corrosion which could result in electrical failure.
(1) During Construction. Indoor busways shall be protected from moisture during storage as well as during or after installation. Special consideration shall be given to riser busways to protect them from moisture from uncompleted roofs, walls, etc.
Outdoor busways shall be treated the same as indoor busways until after busway is properly installed, as it is not weather resistant until completely and properly installed.
Busway shall have the exposed ends of uncompleted runs protected to prevent accidental contamination during the construction period.
(2) Protection from Snow Buildup. Outdoor busway shall be mounted in such a manner as to prevent snow or ice buildup forcing water into the busway through weep holes. This may require that consideration be given to horizontal snow or ice buildup or drifting of snow.
(3) Curbing. Four in. (102 mm) high minimum curbs shall be installed around all floor openings for riser busways to prevent floor level liquids from entering the opening.
(4) Protection from Falling Liquids. Slant shields, drip pans, or other approved protective shields shall be installed to protect indoor busway in locations where there is a possibility of water spillage or dripping condensate from roof drains, water pipes, and the like.
(5) Tests Prior to Energizing. Busway system joint tightness and joint resistance, phasing, and insulation resistance shall be verified by test prior to energizing the system for the first time. A written record of these tests shall be made available to the authority having jurisdiction.
SUBSTANTIATION: This is, essentially, extracted material from the NEMA busway standard governing installation practice for busways. It has been in the Massachusetts Electrical Code for five Code cycles. Now that CMP 8 took a major step towards including one of its key provisions (on curbing) in the 1999 NEC, the Advisory Committee wanted to take this opportunity to put the rest of the requirements on the table, ones that have worked well in this state for a long time. The proposal is in the form as it was adopted for the 1987 cycle, with the following exceptions:
First, in (b), "… may result in failure" has been changed to "could result in failure" to comply with the Style Manual, since this doesn't describe a discretionary action by an authority having jurisdiction. Second, the word "high" was added to (b)(3) to incorporate the 1999 clarification. The industrial waiver and the two or more dry floor threshold in the 1999 NEC is not part of this proposal, has never been in place in Massachusetts, and is not recommended because the Advisory Committee regards the substantiation presented for those allowances in the NEC as insufficiently substantiated. Third, in (5), the Committee added a requirement to test for joint resistance before first use in the 1993 adoption cycle. The 1993 state proposal noted that one shouldn't make an inference about joint resistance on the basis of bolt tightness in and of itself due to the fact that foreign material could have entered the joint surfaces.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter stated in the substantiation that the proposed language is essentially "extracted material from the NEMA busway standard governing installation practice for busways." The NEC is not a design manual, project specification manual, or installation instruction booklet. The proposed requirements are best left to manufacturer's installation instructions, project specifications, and engineering considerations.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #859)

8- 428 - (364-8(a)): Accept
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
"Branches from busways shall be made in accordance with Articles 330, 331, 333, 334, 345, 346, 347, 348, 350, 351, 352, and 364. Where a ~~nonmetallic raceway is used connection of equipment grounding conductors in the nonmetallic raceway~~ separate equipment grounding conductor is used, connection of the equipment grounding conductor to the busway shall comply with Sections 250-8 and 250-12."
SUBSTANTIATION: Edit. Wiring methods of Articles 330 and 331 warrant inclusion. The proposal would include all separate equipment grounding conductors whether in metal or nonmetallic raceways or cables or cord assemblies.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel believes that the submitter intended to reference Article 333 in his substatiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #4216)

8- 429 - (364-8(b)(2), Exception): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
By special permission in industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, lengths exceeding 6 ft (1.83 m) shall be permitted ~~between the busway and the plug-in device and the tension take-up support device~~ to extend horizontally greater lengths than 8 ft (2.44 m) where the longer length is essential for periodic repositioning of equipment. The flexible cord or bus drop cable shall be supported at intervals not exceeding 8 ft (2.44 m), and suitable tension take-up device(s) shall be installed at the end of the horizontal run to relieve strain in both the horizontal and vertical directions.
SUBSTANTIATION: The proposal puts reasonable limitations on the exception. It would now depend on special permission based on a finding that the greater distance is actually needed for the intended use. Otherwise the exception, as presently worded in the NEC, is an open invitation to wire the entire facility in cord or bus-drop cable. The proposed wording also clarifies a requirement for both horizontal and vertical strain relief, which is very important if heavy cords extend over substantial horizontal distances.
PANEL ACTION: Reject.
PANEL STATEMENT: The NEC permits the use of cord or bus drop cable where it is installed in accordance with the provisions of 400-7, 400-8, and other applicable Code rules. Items 1 through 4 can not be used if the cables and cords are not installed within the limitations of the first paragraph of 364-8(b).
Horizontal strain relief is not an issue as the current requirement is for support at no more than 8 foot intervals and the installation is limited to "industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation."

(Log #860)

8- 430 - (364-10 Exception No. 1): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
Exception No. 1: The applicable provisions of Section 240-3, 240-92, and Part I of Article 240 shall be permitted.
SUBSTANTIATION: Edit. The additional sections proposed would bring busways under provisions provided for other conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: The requirement in 364-10 is for busway to "be protected against overcurrent in accordance with the allowable current rating of the busway." Exception No. 1 is an exception to busway being protected against overcurrent in accordance with the allowable current rating of the busway. The exception allows busway to be protected at other than the rating of the busway in accordance

with the applicable provisions of 240-3.
Section 240-92 deals with protection of conductors at their point of supply. This section does not deal with the same material as 364-10.
Part I of Article 240 covers overcurrent protection for over 600 volts. Any references to that part of 240 should be located in Part B of Article 364.

8- 431 - (364-12 Exception No. 2): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete:
~~Exception No. 2: For fixed or semi-fixed lighting fixtures, where branch-circuit overcurrent device is part of the fixture cord plug on cord-connected fixtures.~~
SUBSTANTIATION: An overcurrent device in a cord plug is unlikely to be considered or listed as a branch-circuit overcurrent device, but rather a supplemental one. Branch-circuit overcurrent devices are generally located on the supply side of the outlet (bus plug-in connection point). No special requirement is needed for supplemental overcurrent devices in cord plugs where connected to suitable lighting bus circuits per Section 240-4. The rule relates to branch-circuit overcurrent devices.
PANEL ACTION: Reject.
PANEL STATEMENT: The exception mandates that the device be suitable for branch circuit overcurrent protection and does not permit supplemental protection devices as a substitute for such protection.

(Log #2186)

8- 432 - (364-27): Accept
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
Ventilated bus enclosures shall be installed in accordance with Article 110, Part C, and Section 490-24~~, unless designed so that foreign objects inserted through any opening will be deflected from energized parts.~~
SUBSTANTIATION: The deleted portion is in compliance with Section 110 Part C; therefore, it is incorrect to say "unless". The rest of the deleted part is stated exactly as written in both Section 110-31(a)(1) and Section 110-31(c); therefore, it is redundant and there in no need to repeat it here. The NEC Style Manual 4.1.2 states, "Use references to other NEC rules to avoid repeating a requirement."
PANEL ACTION: Accept.

ARTICLE 365 — CABLEBUS

(Log #1295)

8- 433 - (365): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise as follows:
365-3 (a) Types of Conductors. The current-carrying conductors in cablebus shall have an insulation rating of 75°C (167°F) or higher of an approved type and suitable for the application in accordance with Articles 310 and 490.
365-3 (c) Size and Number of Conductors. The size and number of conductors shall be that for which the cablebus is designed, and in no case smaller than No. 1/0.
365-3 (d) Conductor Supports. The insulated conductors shall be supported on blocks or other mounting means designed for the purpose.
The individual conductors in a cablebus shall be supported at intervals not greater than 900 mm (3 ft) ~~(914 mm)~~ for horizontal runs and 450 mm (1 1/2 ft) ~~(457 mm)~~ for vertical runs. Vertical and horizontal spacing between supported conductors shall not be less than one conductor diameter at the points of support.
365-6 (a) Support. Cablebus shall be securely supported at intervals not exceeding 3.7 m (12 ft) ~~(3.66 m)~~.
Exception: Where spans longer than 3.7 m (12 ft) ~~(3.66 m)~~ are required, the structure shall be specifically designed for the required span length.
365-6 (c) Through Dry Floors and Platforms. Except where firestops are required, cablebus shall be permitted to extend vertically through dry floors and platforms, provided the cablebus is totally enclosed at the point where it passes through the floor or platform and for a distance of 1.8 m (6 ft) ~~(1.83 m)~~ above the floor or platform.
365-6 (d) Through Floors and Platforms in Wet Locations. Except where firestops are required, cablebus shall be permitted to extend vertically through floors and platforms in wet locations where (1) there are curbs or other suitable means to prevent water flow through the floor or platform opening, and (2) where the cablebus is totally enclosed at the point where it passes through the floor or platform and for a distance of 1.8 m (6 ft) ~~(1.83 m)~~ above the floor or platform.
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis. In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised. In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #865)

8- 438 - (365-5): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
Cablebus shall be protected against overcurrent in accordance with the allowable ampacities of the cablebus conductors. ~~in accordance with Section 240-3.~~
Exception: The applicable provisions of Sections 240-3, 240-92, and Part I of Article 240 ~~Overcurrent protection~~ shall be permitted. ~~in accordance with Section 240-100 for over 600 volts, nominal.~~
SUBSTANTIATION: Edit. Section 240-3 first paragraph is the only part of that section that concurs with the basic requirement of this section, the other parts are "otherwise permitted or required" and basically exceptions. The proposal provides the basic requirement with an exception which covers approved alternatives as in the first paragraph of Section 240-3 and in Section 364-10 which are more technically correct. Overcurrent protection is only provided where the rating does not exceed conductor ampacity and is located at the point of supply for the conductors.
PANEL ACTION: Reject.
PANEL STATEMENT: The present text of the NEC sufficiently covers the overcurrent protection requirements for cablebus. The panel does not consider the proposal to be only editorial.

ARTICLE 370 — OUTLET, DEVICE, PULL AND JUNCTION BOXES, CONDUIT BODIES AND FITTINGS

(Log #537)

9- 6 - (370): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: (a) Section 370-16(a)(1): Before "cubic inch", add "cubic centimeter or".
(b) Section 370-16(a)(2): Replace "100 in.^{3} (1640 cm^3)" with "1650 cm^3 (100 in.^{3})"; Before "cubic inch", add "cubic centimeter or" in 3 locations.
(c) Section 370-16(b)(1): Before "cubic inches", add "cubic centimeters or".
(d) Section 370-16(c)(2): Before "cubic inch", add "cubic centimeter or".
(e) Section 370-17(c): Replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)" in 2 locations.
(f) Section 370-17(c) Exception: Replace "2 1/4 in. x 4 in." with "60 mm x 100 mm (2 1/4 in. x 4 in.)"; Replace "8 in. (203 mm)" with "200 mm (8 in.)"; Replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".
(g) Section 370-18: Replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".
(h) Section 370-20: Replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".
(i) Section 370-21: Replace "1/8 in. (3.18 mm)" with "3 mm (1/8 in.)".
(j) Section 370-23(b)(1): Replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".
(k) Section 370-23(b)(2): Replace "0.020 in. (508 µm)" with "0.51 mm (0.020 in.)"; Replace "1 in. x 2 in." with "25 mm x 50 mm (1 in. x 2 in.)".
(l) Section 370-23(d): Replace "100 in.^{3} (1640 cm^3)" with "1650 cm^3 (100 in.^{3})".
(m) Section 370-23(e): Replace "100 in.^{3} (1640 cm^3)" with "1650 cm^3 (100 in.^{3})"; Replace "3 ft (914 mm)" with "900 mm (3 ft)"; Replace "18 in. (457 mm)" with "450 mm (18 in.)".
(n) Section 370-23(f): Replace "100 in.^{3} (1640 cm^3)" with "1650 cm^3 (100 in.^{3})"; Replace "18 in. (457 mm)" with "450 mm (18 in.)".
(o) Section 370-23(f) Exception No. 2: Replace "3 ft (914 mm)" with "900 mm (3 ft)" in 2 locations; Replace "12 in. (305 mm)" with "300 mm (12 in.)" in 3 locations; Replace "8 ft (2.44 m)" with "2.5 m (8 ft)" in 2 locations; Replace "20 lb (9.08 kg)" with "9 kg (20 lb)".
(p) Section 370-23(h)(2): Replace "18 in. (457 mm)" with "450 mm (18 in.)"; Replace "8 ft (2.44 m)" with "2.5 m (8 ft)" in 2 locations; Replace "3 ft (914 mm)" with "900 mm (3 ft)"; Replace "12 in. (305 mm)" with "300 mm (12 in.)".
(q) Section 370-24: Replace "1/2 in. (12.7 mm)" with "13 mm (1/2 in.)"; Replace "15/16 in. (23.8 mm)" with "24 mm (15/16 in.)".
(r) Section 370-27(a) Exception: Replace "6 lb (2.72 kg)" with "3 kg (6 lb)"; Replace "16 in. (406 mm)" with "400 mm (16 in.)".
(s) Section 370-28(a)(1): Replace "trade" with "nominal".
(t) Section 370-28(a)(2): Replace "trade" with "nominal" in 2 locations.
(u) Section 370-28(b): Replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
(v) Section 370-40(b): Replace "100 in.^{3} (1640 cm^3)" with "1650

cm^3 (100 in.^{3})"; Replace "0.0625 in. (1.59 mm)" with "1.59 mm (0.0625 in.)"; Replace "3/32 in. (2.38 mm)" with "2.38 mm (3/32 in.)"; Replace "1/8 in. (3.17 mm)" with "3.17 mm (1/8 in.)".

(w) Section 370-40(c): Replace "100 in.^{3}" in title with "1650 cm^3 (100 in.^{3})"; Replace "100 in.^{3} (1640 cm^3)" in text with "1650 cm^3 (100 in.^{3})"; Replace "0.053 in. (1.35 mm)" with "1.35 mm (0.053 in.)".

(x) Section 370-41: Replace "1/32 in. (0.79 mm)" with "0.79 mm (1/32 in.)".

(y) Section 370-52: Replace "3 ft (914 mm)" with "900 mm (3 ft)"; Replace "2 1/2 ft (762 mm)" with "750 mm (2 1/2 ft)"; Replace "6 ft (1.83 m)" with "1.8 m (6 ft)"; Replace "1 ft (305 mm)" with "300 mm (1 ft)".

(z) Section 370-52 Exception: Replace "2 ft (608 mm)" with "600 mm (2 ft)"; Replace "6 ft (1.83 m)" with "1.8 m (6 ft)".

(aa) Section 370-53: Replace "100 lb (45.4 kg)" with "45 kg (100 lb)".

(bb) Section 370-54: Replace "6 ft (1.83 m)" with "1.8 m (6 ft)".

(cc) Section 370-55(a): Replace "26 in. x 22 in. (659 mm x 557 mm)" with "650 mm x 550 mm (26 in. x 22 in.)"; Replace "26 in. (659 mm)" with "650 mm (26 in.)".

(dd) Section 370-55(a) Exception: Replace "2 ft (608 mm)" with "600 mm (2 ft)".

(ee) Section 370-55(d): Replace "100 lb (45.4 kg)" with "45 kg (100 lb)".

(ff) Section 370-72(e): Replace "100 lb (45.4 kg)" with "45 kg (100 lb)"; Replace "1/2 in. (12.7 mm)" with "13 mm (1/2 in.)".

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement.

PANEL ACTION: Accept in Principle.

Revise the specified parts of the proposal as follows:

(a) Instead of the recommended action, delete the phrase in the existing Code, "cubic inch capacity" and insert "their volume."

(b) Instead of the final recommended action, delete the phrase in the existing Code, "cubic inch capacity" (three times) and replace it with "volume". The numbers will be 1650 cm^3 (100 in.^{3}).

(c) Instead of the recommended action, delete the phrase in the existing Code "in cubic inches".

(d) Instead of the recommended action, delete the phrase in the existing Code "cubic inch capacity" and replace it with "volume".

(e) No changes.

(f) Revise the first dimension in the proposed text to read: "57 mm x 100 mm (2 1/4 in. x 4 in.)"

(g) through (i) No changes

(j) Use a soft conversion, "6.35 mm (1/4 in.)".

(k) No change.

(l) No change.

(m) No changes.

(n) No changes.

(o) No changes.

(p) No changes.

(q) Use soft conversions, as follows: "23.8 mm (15/16 in.)" and "12.7 mm (1/2 in.)".

(r) To correlate with the action on Proposal 9-39, change the weight limit to "7 kg (15 lb)" and delete the length limit.

(s) Retain the word "trade." In addition, add the following sentence to the end of Section 370-28(a), immediately before Section 370-28(a)(1): "Where an enclosure dimension is to be calculated based on the trade diameter of entering raceways, the trade diameter shall be the trade size designator expressed in the units of measurement employed."

(t) Retain the word "trade"

(u) through (aa) No changes.

(bb) Delete the dimension entirely to correlate with the action on Proposal 9-50.

(cc) through (ff) No changes.

In addition to the actions on the recommendations submitted as part of the proposal, in Section 370-16(a), delete the words "in cubic inches" from the existing Code.

PANEL STATEMENT: The panel has made the revisions for the following reasons:

(a) through (d) editorial.

(f) Correction of an error.

(j) Soft conversion so as to not inadvertently force the redesign of products built to current standards.

(m) through (p) no changes.

(q) Soft conversion so as to not inadvertently force the redesign of products built to current standards.

(r) Correlation.

(s) This part of the Code uses a trade size multiplied by a pure number to get a required dimension. The trade size and the nominal size aren't necessarily the same thing. Trade sizes are no longer to be denominated in units of length. Furthermore, the only way to produce a dimension is to multiply the pure number in the calculations by a dimension. The additional sentence provides, by rule, the procedure to do this, namely, to take the trade size and assign it english or metric units as required, thereby making it a true dimension once again. For example, if using english measurements on a 4 raceway for a straight-across pull, the pull box needs to be 32 in.; if using the metric system on the same (103) raceway, the pull box would need to be 824 mm. Placing the sentence here avoids the necessity of elaborate parenthetical expressions in numerous places in the paragraphs that follow.

(t) This correlates with the action on item (s) above.

(u) through (aa) No changes.

(bb) Correlation.

(cc) through (ff) No changes.

The final item corrects a possible oversight.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #866)

9- 8 - (370-1): Accept in Part

NOTE: The Technical Correlating Committee advises that article scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise first sentence:

Scope. This article covers the installation and use of all boxes and conduit bodies used as outlet, <u>device,</u> junction, or pull boxes, ~~depending on their use,~~ and other electric enclosures intended for personnel entry.

SUBSTANTIATION: Edit. If box use is to be indicated, "device" should be included. A switch box, for example may not be an outlet, junction, or pull box. The phrase "depending on their use" is superfluous as use is already stated.

PANEL ACTION: Accept in Part.

The panel accepts adding the word "device", and rejects the remainder of the proposal.
PANEL STATEMENT: The existing wording, "depending on their use", is still appropriate to modify device, outlet, and pull boxes. The panel believes the submitter inadvertently left out the word "manholes" as it wasn't addressed in the substantiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #867)

9- 9 - (370-3): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
Nonmetallic Boxes. Nonmetallic boxes shall be permitted only with open wiring on insulators, concealed knob-and-tube wiring, nonmetallic-sheathed cable, Type UF cable, Type SE cable, flexible cords and cables, and nonmetallic raceways.
Exception No. 1: No change
"Exception No. 2: Where integral bonding means with a provision for attaching an equipment ~~grounding~~ bonding jumper inside the box are provided..." (remainder unchanged)
SUBSTANTIATION: Edit. Even though Type UF cable may be installed under provisions of Article 336 it does not become Type NM, and should be indicated for clear intent. Type SE should also be suitable. Flexible cords and cables should be included to accommodate their use in Articles 305, 430, 553, 555, etc. where they may be permitted to be permanently connected.
The first part of Exception No. 2 refers to bonding and it seems equipment bonding jumper is correct terminology. There is no definition for equipment grounding jumper and the term does not appear to be used in the Code.
PANEL ACTION: Accept in Principle.
Revise the main text of the proposal to read as follows: "...knob and tube wiring, cabled wiring methods with entirely nonmetallic sheaths, flexible cords, and nonmetallic raceways."
The panel accepts the proposed wording to Exception No. 2.
PANEL STATEMENT: The revised text meets the intent of the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3634)

9- 10 - (370-3 Exception No. 3 (New)): Reject
SUBMITTER: Pat Richardson, City of Coral Springs, FL
RECOMMENDATION: Add an Exception to read as follows:
Exception No. 3: Systems not required to be grounded per 250-21.
SUBSTANTIATION: 370-3 states that you cannot use metal raceways with plastic boxes. When running certain low voltage systems you would have to provide a ground to bond raceway(s), as per Exceptions No. 1 and No. 2.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 250-21 refers to the power distribution systems that are required to be delivered through grounded raceway systems.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1EXPLANATION OF NEGATIVE:
HARTWELL: The submitter makes a valid point, although his proposal is incorrectly worded, and needlessly introduces a third exception. This section doesn't line up properly with allowances in Section 250-112(i). The appropriate action would have been to amend existing Exception No. 1 as follows:
"Exception No. 1: Where internal bonding means are provided between all entries, or for wiring not requiring grounding continuity by other provisions of this code, nonmetallic boxes shall be permitted to be used with metal raceways or metal-armored cables."

(Log #3923)

9- 11 - (370-3 Exception No. 3 (New)): Reject
SUBMITTER: Patrick Richardson, City of Coral Springs, FL
RECOMMENDATION: Add a new Exception No. 3 to Section 370-3:
Systems not required to be grounded per 250-21.
SUBSTANTIATION: 370-3 states that you cannot use metal raceways with plastic boxes. When running certain low voltage systems you would have to provide a ground to bond raceway(s), as per Exception No. 1 and 2.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 9-10.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
HARTWELL: See my Explanation of Negative Vote on Proposal 9-10.

(Log #2972)

9- 12 - (370-15(a)): Accept in Principle
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Revise text to read as follows:
(a) Damp or Wet Locations. In damp or wet locations, boxes, conduit bodies, and fittings shall be placed or equipped so as to prevent moisture from entering or accumulating within the box, conduit body, or fitting. Boxes, conduit bodies, and fittings installed in wet locations shall be listed for use in wet locations. Junction Boxes used for direct burial applications shall have an enclosure Type 6P rating.
SUBSTANTIATION: This proposal revises the aforementioned section to protect the conductors and cables from corrosions due to water that may accumulate in the junction boxes due to underground water tables and watering. UL currently requires Junction Boxes to maintain a 6P rating to be listed for use in direct burial applications.
PANEL ACTION: Accept in Principle.
Revise the proposed wording to read as follows:
"Junction boxes installed below finished grade in accordance with Section 370-29, Exception shall have an enclosure Type 6P rating."
PANEL STATEMENT: The words "direct burial" indicate an application that is beyond the intent of the code in accordance with Section 370-29.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
HARTWELL: The panel action inadvertently begs the question of how a direct-buried box needs to be rated if it doesn't comply with Section 370-29, Exception. In addition, it omits other smaller boxes more routinely buried, such as device and outlet boxes. The wording should be changed in the comment period to "Boxes installed below finished grade, as covered in Section 370-29, Exception, shall have an enclosure Type 6P rating."

~~NOTE: For SI units, 1 $in.^3$ = 16/4 cm^3~~
*Where no volume allowances are required by Sections 370-16(b)(2) through 370-16(b)(5).
conversions as follows:

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement.
PANEL ACTION: Accept in Principle.
Make the following changes to the table as proposed:
(a) Delete the proposed left dimension column (SI units) entirely.
(b) Delete the subheaders "mm" and "in." to the left of the "Box Type" header as shown in the recommendation.
(c) Revise the left column header to read "Box Trade Size."
(d) Combine the remaining dimension column with the "Box Type" to form a single column under "Box Trade Size" as created immediately above. For example, one box in the new "Box Trade Size" column would be "4 x 1 1/2 square."
(e) For the FS and FD boxes only, express the depths using a soft conversion, as follows:
1. For minimum 1 3/4 in. depth boxes, use "44.5 mm (1 3/4 in.)"
2. For minimum 2 3/8 in. depth boxes, use "60.3 mm (2 3/8 in.)"
(f) Change the "Minimum Capacity" header to read "Minimum Volume".
(g) Use soft conversions in the body of the table, as follows:

cm^3	$in.^3$
205	12.5
254	15.5
353	21.5
295	18.0
344	21.0
497	30.3
418	25.5
484	29.5
689	42.0
123	7.5
164	10.0
172	10.5
205	12.5
230	14.0
295	18.0
169	10.3
213	13.0
238	14.5
230	14.0
344	21.0
221	13.5
295	18.0
295	18.0
395	24.0

PANEL STATEMENT: (a) through (d) These changes transform the opening column into a dimensionless trade size column, avoiding metric parameters which could cause problems with testing laboratories evaluating boxes with somewhat conflicting sizes.
(e) The depths of FS and FD boxes aren't trade sizes, and need to be stated as dimensions. To avoid unintended problems with existing designs, the panel decided to use a soft conversion for these numbers.
(f) This is an editorial change correlating with the action taken on items (a) through (d) in Proposal 9-6, which generally makes the corresponding text refer to volume instead of cubic inch capacities.
(g) The revised volumes reflect recalculations based on the soft conversion concept, done in a way that generally preserves precision to three significant figures. In concert with comparable numbers in Table 370-16(b) as modified by the action on Proposal 9-15, which also uses three significant figures, the resulting calculations don't upset box fill results for the boxes listed in Table 370-16(a).

(Log #4278)

9- 16 - (370-16(b)(1)): Reject
SUBMITTER: Sukanta Sengupta, FMC Corp.
RECOMMENDATION: Add a line after the existing first line.
"Each loop of a conductor installed in the box in a loop or coil shape shall be counted once."
SUBSTANTIATION: It is a common practice to leave extra length of a conductor in a loop or coil shape. The box can be over filled with the present box fill calculation.
PANEL ACTION: Reject.
PANEL STATEMENT: The code defines the required length of free conductors at outlets, junctions, and switch points in Section 300-14. It then makes allowances in volume for the defined lengths. While the additional wire may be good for future work, it is undefined and, therefore, an allowance cannot be determined.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
HARTWELL: This proposal should have been accepted in principle, modified to distinguish between a small loop left to assist wire pulling and a large loop left to allow cutting in the middle and then adding a splice or a device. The revision would be as follows:
"(1) Conductor Fill. Each conductor that originates outside the box and terminates or is spliced within the box shall be counted once, and each conductor that passes directly through the box without splice or termination shall be counted once. A looped, unbroken conductor not less than twice the minimum length required for free conductors in Section 300-14 shall be counted twice. The conductor fill, in cubic inches, shall be computed using Table 370-16(b). A conductor, no part of which leaves the box, shall not be counted."
SENGUPTA: The panel statement in support of rejecting my proposal refers to 300-14. Section 300-14 defines the requirement of a free conductor to be "at least 6 in. (152 mm)" and it does not address a normal wiring practice of keeping extra length of wire in loop or coil form in a box.
The panel statement "while the additional wire may be good for future work, it is undefined and, therefore, an allowance cannot be determined" allows any extra length of wire left in a box without considering the code's requirement.

(Log #4280)

9- 17 - (370-16(b)(1)): Reject
SUBMITTER: Sukanta Sengupta, FMC Corp.
RECOMMENDATION: Delete the last line of first paragraph.
"A conductor, no part of which leaves the box, shall not be counted."
SUBSTANTIATION: A conductor in a box always occupies space whether it leaves the box or not. For example the number of external jumpers behind a control device in a box may be more than the number of conductors leaving the box. The box based on the present conductor fill calculation may become an undersized box.
PANEL ACTION: Reject.
PANEL STATEMENT: The external jumpers attached to control devices were taken into account when the code was revised to require a double deduction for devices.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
SENGUPTA: Control devices are designed and manufactured with a number of external terminals and the wiring is done based on a control system's design. External terminals are there for addition of external jumpers to meet the control schematic's requirement.
With the present code, we can add any number of external jumpers which do not leave the box without considering any volume requirement.

(Log #3316)

9- 18 - (370-16(b)(4)): Reject
SUBMITTER: Paul E. Phelan, Rep. New Hampshire Electrical Contractors Assn.
RECOMMENDATION: Revise as follows:
370-16(b)(4) Device or Equipment Fill. For each yoke or strap containing one or more devices or equipment a ~~double~~ single volume allowance in accordance with Table 370-16(b)....
SUBSTANTIATION: Over the years the revised NECs have justifiably required more and more room in device and other boxes to facilitate uncrowded wiring and prevent damage during installation to conductors and devices. Meanwhile however, the wiring devices have been reduced in size, the splicing devices are better designed and smaller sizes will accommodate more conductors, and, the insulation on the conductors themselves has been substantially reduced in thickness while becoming more resistant to abrasion and accidental cutting.
This latest restriction requiring a double volume allowance approaches overkill, e.g. a 3 x 2 x 2 3/4 device box with cable clamps and a wiring device cannot, by code, accommodate 2 entries of 14-2 NM cable.
Clamps 1
Grounding conductors 1
Device 2
Number of conductors to be counted in 2 14-2 entries = 4
Total number of "conductors" = 8
Permissible number of conductors for a 3 x 2 x 2 3/4 device box = 7
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 9-13.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #868)

9- 19 - (370-17(b), (c)): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
(b) ~~Metal~~ Boxes and Conduit Bodies. Where metal boxes or metal or nonmetallic conduit bodies are installed with open wiring or concealed knob-and-tube wiring, conductors shall enter through insulating bushings, or in dry locations, through flexible tubing extending from the last insulating support to no less than 1/4 in. (6.35 mm) inside the box and beyond any cable clamps, and firmly secured to the box or conduit body. Where raceway or cable is installed with ~~metal~~ boxes or conduit bodies, the raceway or cable shall be secured to such boxes and conduit bodies, except that securing of nonmetallic-sheathed cable to a box shall not be required where all of the following conditions are met: (1) the cable(s) enter a surface-mounted box through one or more surface-mounted nonflexible raceways not less than 18 in. (457 mm) or more than 10 ft (3.05 m) in length; (2) the cable(s) is fastened within 12 in. (305 mm), measured along the sheath, of the outer end of the raceway; (3) a fitting is provided on each end of the

raceway(s) to protect the cable from abrasion; (4) the raceway(s) is sealed or plugged at the outer end using approved means; (5) the cable sheath is continuous through the raceway and extends beyond the raceway fitting into the box no less than 1/4 in. (6.35 mm); (6) the raceway(s) is fastened at the outer end and at other points in accordance with the respective raceway article.

(c) Nonmetallic Boxes. Nonmetallic boxes shall be suitable for the lowest temperature rated conductor entering the box. Where nonmetallic boxes are used with open wiring or concealed knob-and-tube wiring, the conductor shall enter the box through individual holes. Where flexible tubing is used to ~~encase~~ enclose the conductors, the tubing shall extend from the last insulating support to no less than 1/4 in. (6.35 mm) inside the box and beyond any cable clamp. Where nonmetallic-sheathed cable or multiconductor Type UF cable is used, ~~the cable assembly, including~~ the sheath shall extend ~~into the box~~ no less than 1/4 in. (6.35 mm) inside the box and beyond any cable clamp. ~~through a nonmetallic sheathed cable knockout opening.~~ In all instances, all permitted wiring methods shall be secured to the boxes.

Exception: Where nonmetallic-sheathed cable or multiconductor Type UF cable is used with boxes no larger than a nominal size 2-1/4 in. by 4 in. flush-mounted in walls or ceilings and where the cable is fastened within 8 in. (2.03 mm) of the box, measured along the sheath, and where the sheath extends through a cable knockout no less than 1/4 in. (6.35 mm), securing the cable to the box shall not be required. Multiple cable entries shall be permitted in a single cable knockout opening.

SUBSTANTIATION: The requirements of the first sentence in (b) should be clearly indicated to apply to metal and nonmetallic conduit bodies. Tubing should extend beyond clamps, where used, to prevent conductor insulation damage.

The proposed additional text would legitimize a common long-standing practice and is similar to Section 373-5(c) which covers cabinets and cut-out boxes. It basically provides for support and protection for what would otherwise be exposed NMSC, and which is already permitted by the Code provided the raceway ends a few inches from the box to permit cable connectors or clamps to be used. This type installation is a viable surface-mounted method for installing NMSC to receptacle outlets, switches, etc., on walls of basements, garages, and other locations. Cable support, protection, and a neat, workmanlike, and aesthetic installation is achieved.

Though Type UF cable may be installed under provisions of Article 336 it does not become NMSC specified in the exception for (c) which is a specific cable.

All nonmetallic boxes do not have cable knockouts, some may have hubs.

PANEL ACTION: Accept in Principle in Part.

Revise the proposal to read as follows:

" (b) Metal Boxes and Conduit Bodies. Where metal boxes or conduit bodies are installed with open wiring or concealed knob-and-tube wiring, conductors shall enter through insulating bushings or, in dry locations, through flexible tubing extending from the last insulating support to not less than 6 mm (1/4 in.) inside the box and beyond any cable clamps. The wiring shall be firmly secured to the box or conduit body. Where raceway or cable is installed with metal boxes or conduit bodies, the raceway or cable shall be secured to such boxes and conduit bodies except as provided in Section 300-15(c).

(c) Nonmetallic Boxes and Conduit Bodies. Nonmetallic boxes and conduit bodies shall be suitable for the lowest temperature-rated conductor entering the box. Where nonmetallic boxes and conduit bodies are used with open wiring or concealed knob-and-tube wiring, the conductors shall enter the box through individual holes. Where flexible tubing is used to enclose the conductors, the tubing shall extend from the last insulating support to not less than 6 mm (fl in.) inside the box and beyond any cable clamp. Where nonmetallic-sheathed cable or multiconductor Type UF cable is used, the sheath shall extend not less than 6 mm (fl in.) inside the box and beyond any cable clamp. In all instances, all permitted wiring methods shall be secured to the boxes.

Exception: Where nonmetallic-sheathed cable or multiconductor Type UF cable is used with single gang boxes not larger than a nominal size 57 mm x 100 mm (2 1/4 in. x 4 in.) mounted in walls or ceilings, and where the cable is fastened within 200 mm (8 in.) of the box measured along the sheath and where the sheath extends through a cable knockout not less than 6 mm (1/4 in.), securing the cable to the box shall not be required. Multiple cable entries shall be permitted in a single cable knockout opening."

PANEL STATEMENT: The panel accepts the principle of including nonmetallic conduit bodes, but prefers using (c). The panel rejects the extension of the panoply of Section 373-5(c) Exception provisions into a section that would seldom apply to those applications. The provisions of Section 300-15(c) adequately address the submitter's objectives. The panel rejects the inclusion of the word "flush" because it does not add anything to the present requirement. The remainder of the proposal has been accepted with editorial improvements.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #4375)

9- 20 - (370-20 Note (New)): Accept in Principle

SUBMITTER: Joseph A. Hertel, Safety and Buildings Div., State of Wisconsin

RECOMMENDATION: Add a note to indicate:

A wall with wood or metal studs covered by plaster or gypsum board is considered to be a wall of noncombustible material for the purposes of NEC 370-20.

SUBSTANTIATION: By defining these walls as noncombustible for the purpose of this section many disagreements will be eliminated. Most electricians and inspectors will treat a wall of this construction as noncombustible, but we always seem to find the exception, who will not agree since 370-20 only lists concrete, tile and other noncombustible materials. The second sentence refers to walls or ceilings, constructed of wood and does not elaborate on the possible use of a noncombustible surface treatment.

PANEL ACTION: Accept in Principle.

Revise the existing code text to read as follows:

"In walls or ceilings with a surface of concrete, tile, gypsum, plaster or other noncombustible material, boxes shall be installed so that the front edge of the box will not be set back of the finished surface more than 6 mm (1/4 in.) .

In walls and ceilings constructed of wood or other combustible surface material, boxes shall be flush with the finished surface or project therefrom."

PANEL STATEMENT: The panel agrees with the submitter and has modified the rule to address the submitter's concern.

(Log #869)

9- 21 - (370-22): Accept

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise:

Exposed Surface Extensions. Surface extensions from a flush-mounted box ~~of a concealed wiring system~~ shall be made by mounting and mechanically securing ~~a box or~~ an extension ring over the ~~concealed~~ flush box. ~~Where required~~ Equipment grounding and bonding shall be in accordance with Article 250.

"Exception: A surface extension shall be permitted to be made from the cover of a ~~concealed~~ flush-mounted box where the cover is designed so it is unlikely to fall off, or be removed if its securing means becomes loose. The wiring method shall be flexible for a length sufficient to permit removal of the cover and provide access to the box interior, and arranged so that any bonding or grounding continuity is independent of the connection between the box and cover...".

SUBSTANTIATION: Edit. Boxes are not permitted to be concealed per Section 370-29. Wiring systems may supply flush boxes yet not be concealed, such as exposed wiring in an attic connected to boxes in the ceiling below. Present wording does not specify any opening in the back of a box installed over a flush box; is it intended that conductors may be extended through knockouts in the surface box? Bonding is added since it is technically different from grounding. Removal of "where required" removes inference that bonding/grounding rules only apply where specified by the Code.

The length reference for the flexible extension is proposed as the present wording can be interpreted as requiring the entire portion of the extended wiring method to be flexible.

PANEL ACTION: Accept.

(Log #2427)

9- 22 - (370-22): Reject
SUBMITTER: Dennis Kaunzner, City of Sierra-Vista, AZ
RECOMMENDATION: Make the text that is there Part A and add a Part B stating:
"Metal boxes may have one extension ring to increase the volume of the box. The extension ring shall not have any conduit or cable entries in it."
SUBSTANTIATION: There are many instances where a 4 in. square, 1 1/2 in. deep box is used and then extension rings added as many as 2 and 3. The extension ring works good for one, but the more there are the box becomes very unstable and the rings come off easy. The 6 in. free conducted is usually violated and when they run conduit into the extension they cannot be removed to get to the connections, etc. If this continues to be allowed why make several other box sizes?
PANEL ACTION: Reject.
PANEL STATEMENT: The 1999 code revisions to section 300-14 address access to the conductors. The mechanical suitability of mutliple extension rings is adequately addressed in the product standards.

9- 23 - (370-22): Reject
SUBMITTER: Ed Stubbs, City of Atlanta, GA
RECOMMENDATION: Add new text to read as follows:
370-22 Extension Boxes.
(a) Exposed Surface Extensions (no change)
(b) Extensions on Existing Surface Mounted Boxes. When a surface-mounted box exists where additional circuits are added, an additional extension box, no larger than the existing box, shall be allowed if all of the following conditions are met:
(1) The additional conductors do not exceed the total cubic in. of the two boxes together,
(2) Only the unused knockouts of the existing box can be used to connect raceways or cables,
(3) The extension box shall not be used to support any raceways, cables, fixtures or equipment,
(4) The boxes shall be accessible and,
(5) The existing boxes shall be on building structure, not on supporting wires not rigidly supported.
SUBSTANTIATION: For years, contractors have dealt with existing surface-mounted boxes in an existing ceiling. What about a situation where a change order calls for additional circuit or fixture, etc.; is required? My understanding for an extension on an exposed surface extension box was to pick up existing circuits flush in the wall. The only difference here is trying to remove an existing box to accommodate more conductors to a larger box, just to meet the cubic inches required on Table 370-16. What about all the damage you can cause by pulling all the cables back out, cutting the raceways and trying to reanchor the new box in on a concrete ceiling that may have been shot in. You may not be able to resupport it. Is it not the intent the same? Think how long the tenant would be without service in the area with this structure change. I feel this code section will accommodate those impossible situations.
PANEL ACTION: Reject.
PANEL STATEMENT: In Section 370-16(a), the code already permits what the submitter requests. There is no code limit to the use of extension boxes on surface wiring applications, either new or existing. Section 370-22 addresses a transition from flush to surface wiring.

RECOMMENDATION: Add new text to read as follows:
(a) Junction Boxes with extension shall be tapped to accept a 10/32 machine screw to maintain ground continuity and provide rigidity of the extension that is attached to the junction box.
(b) No more than two extensions shall be used, and only the primary extension knockouts shall be used, so that the conductors in the junction box are not concealed and unsafe to work on being too short for safe access per Section 300-14.
SUBSTANTIATION: I often find loose extensions, junction box overfill, concealed conductors and more than two extensions used.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 9-22.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2483)

9- 27 - (370-23(d)(2)): Accept in Part
SUBMITTER: James M. Imlah, City of Hillsboro, OR
RECOMMENDATION: Revise as follows:
(2) Support Wires. The installation shall comply with the provisions of Section 300-11(a). The enclosure shall be secured, using methods identified for the purpose, to ceiling support ~~wires~~ wire(s) including any additional support ~~wires~~ wire(s) installed for that purpose. Support ~~wires~~ wire(s) used for enclosure support shall be fastened at each end so as to be taut within the ceiling cavity.
Boxes having less than 100 In^3 may be supported by a single support wire where an approved box wire support is used.
SUBSTANTIATION: A better clarification is needed of when multiple or a single wire should be used for support of enclosures in the ceiling cavity. There are devices that do provide adequate support for boxes as listed in Table 370-16(a). All of the boxes smaller than 100 In^3 will allow for a box extension if additional area is required and still are under 100 In^3. Wiring in this area is generally for lighting fixtures and the weight on the boxes supported by a wire is adequate for the weight being applied to a box(es) by conductors and raceways when support requirements are followed. This makes it clear that boxes larger than 100 In^3 will then have multiple support wires going to building structure to provide adequate enclosure support.
PANEL ACTION: Accept in Part.
The panel rejects the last sentence of the submitter's recommended text, and accepts the remainder of the proposal.
PANEL STATEMENT: The last sentence of the proposal is redundant.

COMMENT ON AFFIRMATIVE:
HARTWELL: By "redundant" the panel is referring to the parent language in Section 370-23(d).

(Log #3322)

9- 28 - (370-23(d)(3) (New)): Reject
SUBMITTER: Paul E. Phelan, Rep. New Hampshire Electrical Contractors Assn.
RECOMMENDATION: Add a (3) to 370-23(d):
(3) Raceway Supported Boxes Over Suspended Ceilings. Standard steel boxes not exceeding 4 11/16 x 2 1/8 trade size and containing only splices or conductors run through without splices shall be considered adequately supported by two or more conduit entries of electrical metallic tubing, intermediate metal conduit and/or rigid metal conduit employing locknuts where said box is isolated by elevation.
SUBSTANTIATION: This change/addition will make legitimate a long time and widespread practice in the trade.
PANEL ACTION: Reject.
PANEL STATEMENT: The box could be supported by the locknuts if this proposal were accepted. Locknuts on rigid or intermediate metal conduits are not acceptable for this purpose. Where required, the box can be fitted with hubs for this purpose within the present code. The use of EMT for box support violates Section 348-5(5).

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #870)

9- 29 - (370-23(e), (f)): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
(e) Raceway Supported Enclosures, Without Devices or Fixtures. ~~An enclosure~~ A box that ~~does not~~ contains only conductors and no ~~a~~ device(s) other than splicing devices, and does not ~~or~~ support a fixture(s) or other equipment, and is supported by entering raceways shall not exceed 100 $in.^3$ (1640 cm^3) inches in size. It shall have threaded entries or hubs identified for the purpose. It shall be supported by two or more conduits threaded wrenchtight into the box ~~enclosure~~ or hubs. Each conduit shall be secured within 3 ft (914 mm) of the box ~~enclosure~~ or within 18 in. (457 mm) of the box ~~enclosure~~ or within 18 in. (457 mm) of the box ~~enclosure~~ if all entering ~~entries~~ conduits are on the same side. ~~Exception:~~ Rigid metal, intermediate metal, or rigid nonmetallic conduit or electrical metallic tubing shall be permitted to support a conduit body of any size that contains only conductors and no devices other than splicing devices, and does not support a fixture(s) or other equipment, including a conduit body with only one ~~conduit~~ raceway entry, provided the conduit body is not larger than the largest trade size of the conduit or electrical metallic tubing and the conduit or tubing is secured within 3 ft (914 mm) of the conduit body.
(f) Raceway Supported Enclosures, with Devices or Fixtures. ~~An enclosure~~ A box that contains a device(s) other than splicing devices, or supports a fixture(s) or other equipment and is supported by entering raceways shall not exceed 100 $in.^3$ (1640 cm^3) in size. It shall have threaded entries or have hubs identified for the purpose. It shall be supported by two or more conduits threaded wrenchtight into the enclosure or hubs. Each conduit shall be secured within 18 in. (457 mm) of the box. ~~enclosure. Exception No. 1:~~ Rigid metal conduits or intermediate metal conduit(s) shall be permitted to support a A conduit body of any size including a conduit body constructed with only one conduit entry shall be permitted to be supported in accordance with the foregoing, except that one conduit shall be permitted, provided the conduit body ~~bodies are~~ is not larger than the largest trade size of the conduit(s).
Exception No. 1 ~~2~~: An unbroken length ~~(s)~~ of rigid or intermediate metal conduit(s) shall be permitted to support a box or conduit body used for fixture support, or to support a wiring enclosure that is an integral part of a fixture and used in lieu of a box in accordance with Section 300-15(b), where all of the following conditions are met:
(a) through (e): No change.
(f) At the fixture end, the conduit(s) is threaded wrenchtight into the box, conduit body, or integral wiring enclosure, or into hubs identified for the purpose.
(g) A conduit supported box or conduit body not an integral part of a fixture shall be connected to the fixture by wrenchtight threaded conduit connections or by means such as bolts or rivets. Hubs not an integral part of a fixture shall be connected to the fixture by threaded connections or by means such as bolts or rivets. A locknut and bushing type connection shall not be considered a threaded connection.
SUBSTANTIATION: Edit. A "device" can include wire connectors, supplementary fuses, etc. in addition to receptacles, switches, push buttons, etc. which appear to be the type intended. A box may have entries on more than one side which literally voids the 18 in. requirement; the proposal clarifies the intent is that it applies to all entering conduits.
In effect the "enclosures" of (e) only applies to boxes, since if it is a conduit body the size limit, threaded connection, two raceways, and 18 in. support are relieved by the exception, which becomes the de facto rule for conduit bodies. The proposal incorporates it into the rule. An exception which negates the rule should be part of the rule.
The present exception for (e) refers to EMT; some conduit bodies constructed for use only with EMT have nonthreaded openings not suitable for conduit, which the proposed word "raceway" would cover.
Since the present exception for (e) implies threaded connections are not required (RNMC, EMT) and Exception No. 1 for (f) is similarly worded some may infer threaded connections are also not required. The proposal simply references the basic requirements, and exempts only the two conduit requirement.
In present Exception No. 2 for (f) inclusion of conduit bodies is appropriate as they are commonly used for such applications. The wiring enclosure should not be limited to within a fixture, but an integral part as indicated in Section 300-15(b), which in all cases is

not within the fixture.

Present Exception No. 2 is quite detailed but doesn't address connection of the supported box, conduit body, or hub, to the fixture. Section 410-16(f) is not specific.
PANEL ACTION: Accept in Principle in Part.
Revise existing code Sections 370-23(e) and (f) to read as follows:
"(e) Raceway Supported Enclosure, Without Devices or Fixtures. An enclosure that does not contain a device(s) other than splicing devices or support a fixture(s) or other equipment, and is supported by entering raceways, shall not exceed 1650 cm^3 (100 in^3.) in size. It shall have threaded entries or have hubs identified for the purpose. It shall be supported by two or more conduits threaded wrenchtight into the enclosure or hubs. Each conduit shall be secured within 900 mm (3 ft) of the enclosure, or within 450 mm (18 in.) of the enclosure if all conduit entries are on the same side.
Exception: Rigid metal, intermediate metal, or rigid nonmetallic conduit or electrical metallic tubing shall be permitted to support a conduit body of any size, including a conduit body constructed with only one conduit entry, provided the trade size of the conduit body is not larger than the largest trade size of the conduit or electrical metallic tubing.
(f) Raceway Supported Enclosures, with Devices or Fixtures. An enclosure that contains a device(s) or supports a fixture(s) or other equipment, and is supported by entering raceways, shall not exceed 1650 cm^3 (100 $in.^3$) in size. It shall have threaded entries or have hubs identified for the purpose. It shall be supported by two or more conduits threaded wrenchtight into the enclosure or hubs. Each conduit shall be secured within 450 mm (18 in.) of the enclosure.
Exception No. 1: Rigid metal or intermediate metal conduit shall be permitted to support a conduit body of any size, including a conduit body constructed with only one conduit entry, provided the trade size of the conduit body is not larger than the largest trade size of the conduit.
Exception No. 2: An unbroken length(s) of rigid or intermediate metal conduit shall be permitted to support a box used for fixture support, or to support a wiring enclosure that is an integral part of a fixture and used in lieu of a box in accordance with Section 300-15(b), where all of the following conditions are met.
(a) through (e), no change.
f. At the fixture end, the conduit(s) is threaded wrenchtight into the box, conduit body, or integral wiring enclosure, or into hubs identified for the purpose. Where a box or conduit body is used for support, the fixture shall be secured directly to the box or conduit body, or through a threaded conduit nipple not over 75 mm (3 in.) long."
PANEL STATEMENT: The panel accepts the concept of including splicing devices into the rules, however, no additional reference need be added to Section 370-23(f) since its provisions necessarily include devices.
The panel rejects the inclusion of the exceptions on conduit bodies into the rules because the material is clearer in the exception form. In this case, the exceptions focus on size and add certain wiring methods only to Section 370-23(e) Exception.
The existing language allows the use of threaded reducing bushings when the conduit bodies are smaller than 100 cu. in.; the proposal muddies that concept. The panel action adds the words "trade size of the" ahead of the term "conduit body" to reflect the action on Proposal 9-30. The panel notes that the proposal misquotes the Code in omitting the word "constructed" in the case of conduit bodies with a single entry.
The panel accepts the concept of the change in Section 370-23(f) Exception No. 2 covering boxes on or within a fixture. However, if a conduit nipple is used, the panel wishes to assure that there isn't a significant change in the mechanical advantage gained by the fixture at the end of the run. A 3 in. nipple allowance meets the submitter's intent; as written, the proposal would literally allow another 10 ft conduit run. The panel rejects the final sentence of the proposal because the phrase "threaded into" in the existing Code does not include locknut connections.

(Log #2300)

9- 34 - (370-23(g)): Reject
SUBMITTER: Paul E. Guidry, Fluor Daniel, Inc.
RECOMMENDATION: Add new text to read:
Raceway Supported Conduit Bodies. Rigid metal conduit or intermediate metal conduit shall be permitted to support an oversized conduit body provided the conduit body doesn't exceed the trade size of the largest conduit by two trade sizes.
SUBSTANTIATION: Many times conduit bodies are oversized in order to splice within them in accordance with Section 370-16(c)(2). With the present wording of Section 370-23(e) Exception and 370-23(f) Exception No. 1, oversized conduit bodies are not permitted to be used without supporting the conduit body. There isn't any good way to support an LB or a T fitting independently. The only option is to drill a hole in the fitting to anchor it to some type of support. It is a common practice to oversize fittings and not support them independently. Limiting the amount that one may oversize the fitting to two trade sizes would ensure that the fitting would be adequately supported and would meet the intent of Section 370-23.
PANEL ACTION: Reject.
PANEL STATEMENT: The code already allows what is proposed. See panel action and statement on Proposal 9-31.

SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
"In completed installations, each box shall have a cover, faceplate, lampholder, or fixture canopy, except where the installation complies with Section 410-14(b)."
SUBSTANTIATION: Edit. To correlate with Section 410-14(b) and to include lampholders such as porcelain or plastic types. Lampholders per definition of lighting outlet is not the same as a lighting fixture.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3884)

9- 36 - (370-27): Accept in Part
SUBMITTER: J. Philip Simmons, Simmons Electrical Services
RECOMMENDATION: Revise text as follows:
(a) Boxes at Lighting Fixture Outlets. Boxes used at lighting fixture outlets shall be designed for the purpose. At every outlet used exclusively for lighting, the box shall be designed or installed so that a lighting fixture may be attached.
Exception: A wall-mounted fixture weighing not more than 6 lb (2.72 kg) and not exceeding 16 in. (406 mm) in any dimension shall be permitted to be supported on other boxes, provided the fixture or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws.
(b) Maximum Fixture Weight. Outlet boxes or fittings installed as required by Section 370-23 shall be permitted to support lighting fixtures weighing 50 lb (22.7 kg) or less. A lighting fixture that weighs more than 50 lb (22.7 kg) shall be supported independent of the outlet box unless the outlet box is listed for the weight to be supported.
Renumber the following subsections.
SUBSTANTIATION: The rules on using outlet boxes for supporting lighting fixtures need to be located here in Article 370 rather than in Article 410. The expertise for the use and installation of outlet boxes is with CMP-9 while the expertise for lighting fixtures is with CMP-18.
Locating all the support rules here will improve the organization of the Code and make it more user friendly by consolidating similar requirements in one location.
PANEL ACTION: Accept in Part.
1. The panel accepts new subsection (b) with the change of the word "independent" to "independently". Change the weight to read: "23 kg (50 lb.)".
2. The panel does not accept (a) or the Exception of the proposal.
PANEL STATEMENT: 1. Editorial.
2. The panel revised the wording of the exception in Proposal 9-39.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1399)

9- 37 - (370-27(a), Exception): Accept in Principle
SUBMITTER: Larry T. Smith, Nat'l Electrical Seminars
RECOMMENDATION: Revise to read as follows:
Boxes at Lighting Fixture Outlets. Boxes used at lighting fixture outlets shall be designed for the purpose. At every outlet used exclusively for lighting, the box shall be designed or installed so that a lighting fixture may be attached.
Exception: A ceiling or wall-mounted fixture weighing not more than ~~6 lb (2.72kg) and not exceeding 16 in. (406mm) in any dimension~~ 15 lbs (6.80 kg) shall be permitted to be supported on other boxes, provided the fixture or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws.
SUBSTANTIATION: This exception was enacted in the 1999 cycle, and was originally intended to permit device boxes to support small fixtures, an age-old practice in the industry. While the intent was laudable, the weight limitation of six pounds for wall-mounted boxes was misguided.
The submitter's proposal cited Section 410-15, wherein the maximum fixture weight permitted to be supported by the screw shell of a lampholder is six pounds and the fixture cannot exceed sixteen in. in any dimension. Note that Section 410-15 does not specify whether the fixture is ceiling or wall-mounted.
Underwriters Laboratories had previously investigated and listed device boxes, metallic outlet boxes (QCIT), for use in existing structures for the support of fixtures, smoke detectors, and carbon monoxide detectors weighing not more than 15 pounds without regard to wall or ceiling mounting.
Underwriter's investigation had proved that an old work device box cut into an existing ceiling is capable of supporting a fixture up to fifteen pounds. Surely, a device box roughed into a brick wall, a device box mailed to a ceiling joist, or a 4 in. sq. box with a single gang 1 1/2 in. tile ring installed in a poured concrete wall is capable of supporting a fixture weighing 15 lbs.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 9-39 which meets the submitter's intent.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1711)

9- 38 - (370-27(a), Exception): Accept in Principle
SUBMITTER: Ray C. Mullin, Ray C. Mullin Books
RECOMMENDATION: Revise text as follows:
Exception: A wall-mounted lighting fixture weighing not more than 6 lb (2.72 kg) ~~and not exceeding 16 in. (406 mm) in any dimension~~ shall be permitted to be supported on other boxes, or plaster rings that are secured to the other boxes, provided the fixture or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws.
SUBSTANTIATION: Many of the decorative strip type lighting fixtures installed along side and above mirrors in bathrooms exceed

16 inches in length, yet they weight less than 6 pounds. Electricians install device boxes for this type of installation because of the narrow width of the lighting fixture. Removing the 16 in. limitation would permit these light weight decorative lighting fixtures to be supported by the "other boxes."

Adding the words or plaster rings that are secured to the other boxes would clarify the intent that when a plaster ring is attached to a box, for all practical purposes it becomes part of the box, and should be treated as such.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See panel action and statement on Proposal 9-39 which meets the submitter's intent.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #4217)

9- 39 - (370-27(a), Exception): Accept in Principle

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Revise as follows:

Exception: A ~~wall mounted~~ fixture weighing not more than ~~6 lb (2.72 kg)~~ 15 lb (6.80 kg) and not exceeding 16 in. (406 mm) in any dimension shall be permitted to be supported on other boxes, provided the fixture or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws.

SUBSTANTIATION: Before the ink was dry on the 1999 NEC, UL released the 1998 edition of the Green Book recognizing device boxes as generically adequate to support up to 15 lb fixtures (and carbon monoxide detectors), with no orientation restriction. After expressing consternation at this turn of events, that effectively circumvented the intended limits in the 1999 NEC, UL backed off in the next edition of the Green Book. However, their technical evaluation should now be considered on its merits, which I think are quite good. This proposal is intended as a vehicle to allow just that.

PANEL ACTION: Accept in Principle.

Revise the proposed wording of the Exception to read as follows:

"Exception: A fixture weighing not more than 7 kg (15 lb) shall be permitted to be supported on other boxes or plaster rings that are secured to other boxes, provided the fixture or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws."

PANEL STATEMENT: The change recognizes the substantiation of the submitter and further removes the 16 in. limitation after receiving the technical information about the product testing. The plaster ring was added based on the substantiation in Proposal 9-38.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #3372)

9- 40 - (370-27(c) and (d)): Reject

SUBMITTER: Jack Wells, Pass & Seymour/Legrand

RECOMMENDATION: Revise 370-27(c) as follows:

Boxes at Ceiling Suspended (Paddle) Fan Outlets. ~~Outlet boxes shall not be used as the sole support for ceiling suspended (paddle) fans.~~

~~Exception: Boxes listed for the application shall be permitted as the sole means of support.~~

Boxes used at ceiling-suspended (paddle) fan outlets shall be listed outlet boxes that are identified for the purpose. Other boxes shall be permitted to be used if the ceiling-suspended (paddle) fan is supported in accordance with Section 422-18.

Add new subsection 370-27(d):

(d) Ceiling Boxes. Boxes installed in ceilings not less than 7 1/2 feet (2.3 meters) above the floor shall be boxes designed or installed so that a lighting fixture or a ceiling-suspended (paddle) fan may be attached.

SUBSTANTIATION: Revising 370-27(c) restates the requirement in positive language and correlates this requirement with Section 422-18. The revision also makes it clear that ceiling suspended fan boxes must be listed for the purpose unless independent support is provided in accordance with 422-18.

New subsection 370-27(d) is proposed because most of the boxes installed in a ceiling higher than 7-1/2 feet will be used for either lighting or ceiling fan installations. This new subsection will ensure that the appropriate box is installed for the support of fixtures and fans.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed positive language does correlate with Section 422-18. However, this is not an improvement in the code. The negative language tends to draw one's attention, therefore, stressing the importance of the correct installation. As for the new subsection, there is not substantiated technical data provided to indicate that a safety hazard exists with the present system.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

HARTWELL: This rule should be recast in affirmative language, as one part of the submittal suggested, I will submit the following as a public comment:

"Boxes used at suspended ceiling (paddle) fan outlets shall be listed for the purpose where used as the sole support of the fan. The installation shall comply with Section 422-18."

(Log #3964)

9- 41 - (370-27(c) and (d)): Reject

SUBMITTER: Jack Wells, Pass & Seymour/Legrand

RECOMMENDATION: Revise 370-27(c) as follows:

Boxes at Ceiling-Suspended (Paddle) Fan Outlets. ~~Outlet boxes shall not be used as the sole support for ceiling suspended (paddle) fans.~~

~~Exception: Boxes listed for the application shall be permitted as the sole means of support.~~

Boxes used at ceiling-suspended (paddle) fan outlets shall be listed outlet boxes that are identified for the purpose. Other boxes shall be permitted to be used if the ceiling-suspended (paddle) fan is supported in accordance with Section 422-18.

Add new Subsection 370-27(d):

(d) Ceiling Boxes. Boxes installed in ceilings not less than 7-1/2 ft (2.3 m) above the floor shall be boxes designed or installed so that a lighting fixture or a ceiling-suspended (paddle) fan may be attached.

SUBSTANTIATION: Revising 370-27(c) restates the requirement in positive language and correlates this requirement with Section 422-18. The revision also makes it clear that ceiling-suspended fan boxes must be listed for the purpose unless independent support is provided in accordance with 422-18.

New Subsection 370-27(d) is proposed because most of the boxes installed in a ceiling higher than 7-1/2 feet will be used for either lighting or ceiling fan installations. This new subsection will insure that the appropriate box is installed for the support of fixtures and fans.

PANEL ACTION: Reject.

HARTWELL: See my Explanation of Negative Vote on Proposal 9-40.

(Log #394)

9- 42 - (370-27(c), Exception): Reject

SUBMITTER: Richard Schuh, Edwardsville Electric

RECOMMENDATION: Revise 370-27(c) to read as follows:

Outlet boxes shall not be used as the sole means of support for ceiling (paddle) fans unless listed for application. In bedrooms, dining rooms, family rooms, living rooms, boxes more than five ft from wall shall be listed for ceiling fans.

SUBSTANTIATION: Most ceiling fans are installed in boxes not listed for such use by homeowners following an inspection. Retrofitting existing box locations for fans is difficult, so not done. I have replaced fans that have fallen to the floor.

PANEL ACTION: Reject.

PANEL STATEMENT: The intent of the submitter's proposal is to require a listed outlet box suitable for fan support in bedrooms, dining rooms, family rooms, and living rooms. Code-Making Panel 9 does not support this concept.

The panel notes that there is nothing in the NEC that prohibits an electrician from installing listed outlet boxes suitable for fan support in ceiling locations described by the submitter. The installer may choose to provide this extra equipment for the homeowner's convenience. Installing these boxes at the location mentioned by the submitter will comply with the existing NEC.

The panel notes there are alternate methods to provide suitable support for a paddle fan. Many retrofit devices are available for the support of paddle fans. Listed boxes are not the only suitable means for support.

The technical information available to the panel indicated that paddle fans fell due to improper installation and not a failure of the box. Product packaging and labeling has been changed to address the problem of improper installation.

Changes in the NEC rule will not increase safety if the homeowner chooses to improperly install the equipment. The requirement of providing listed boxes for future fan support in every ceiling lighting fixture location as described by the submitter is prohibitive since alternate retrofit support means are available.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2958)

9- 43 - (370-28): Accept

NOTE: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Dick Murray, Randolph, MA
RECOMMENDATION: Revise the title as follows:
370-28 Conduit Bodies Pull and Junction Boxes.
SUBSTANTIATION: This proposal is not intended to change the code requirement but to make it more user friendly.

This change will make it easier for the user to locate dimension requirements that apply to conduit bodies used for pull and junction boxes containing conductors No. 4 or larger. The requirements for conduit bodies containing conductors No. 6 and smaller are easily located in Section 370-16(c) because they are included in the title.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
HARTWELL: The title should be reorganized to reflect the relative importance of terms, as follows: "Pull and Junction Boxes, and Conduit Bodies."

(Log #CP904)

9- 43a - (370-28(a)(3), 370-71(b)(1), 370-71(b)(2)): Accept
SUBMITTER: CMP 9
RECOMMENDATION: Add a title to 370-28(a)(3) to read:
"Smaller Dimensions."
Add a title to 370-71(b)(1) to read:
"Distance to Opposite Wall."
Add a title to 370-71(b)(2) to read:
"Distance Between Entry and Exit."
SUBSTANTIATION: To comply with the NEC Style Manual.
PANEL ACTION: Accept.

(Log #2503)

9- 44 - (370-28(a)(3)): Accept
SUBMITTER: Andre R. Cartal, Bldg Dept., Princeton Borough, NJ
RECOMMENDATION: Revise as follows:
Boxes or conduit bodies of dimensions less than those required in (a)(1) and (a)(2) shall be permitted for installations of combination of conductors that are less than the maximum conduit or tubing fill (of conduits or tubing being used) permitted by Table 1 of Chapter 9, provided the box or conduit body has been ~~approved~~ listed for and is permanently marked with the maximum number and maximum size of conductors permitted.
SUBSTANTIATION: These code requirements are a testing lab function and the change reflects that.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #872)

9- 45 - (370-29): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
"Conduit Bodies, ~~Junction, Pull,~~ and ~~Outlet~~ Boxes to be Accessible. Conduit bodies, ~~junction, pull, and outlet~~ boxes shall be so installed that the wiring contained in them can be..." (remainder unchanged)
SUBSTANTIATION: Edit. By designating boxes used for certain purposes boxes used for other purposes such as a device (switch) box are inferred as not covered. The word "box" is sufficient and covers any specific use designation.
PANEL ACTION: Accept in Principle.
Revise the proposed wording to read as follows:
"Boxes and Conduit Bodies to be Accessible. Boxes and conduit bodies shall be installed so that the wiring contained in them can be...".
PANEL STATEMENT: The panel agrees with the submitter's substantiation, but have reordered the title and text to reflect the relative importance of the terms. The word "so" is relocated to comply with the NEC Style Manual.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1459)

9- 46 - (370-29): Reject
SUBMITTER: Joseph E. McCann, City of Coral Springs, FL
RECOMMENDATION: Revise to read as follows:
Outlet boxes installed above suspended ceiling shall be not more than four ft above the suspended ceiling.
SUBSTANTIATION: When outlet boxes are installed in high bay bar joist construction with suspended ceiling below many times the outlet box will be at the bar joist height say 20 ft or more and not reachable from a ladder at an 8 ft ceiling height.
PANEL ACTION: Reject.
PANEL STATEMENT: Access to these boxes can be provided through other means such as removing the grid. The substantiation does not identify a problem that is within the scope of the NEC. See Section 90-1(b).

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3760)

9- 47 - (370-29 Exception No. 2 (New)): Reject

NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 3 for information.

SUBMITTER: Timothy M. Croushore, Allegheny Power Service Corp.
RECOMMENDATION: Number the existing exception as Exception No. 1 and add a new Exception No. 2 to read as follows:
Exception No. 2: Listed pull boxes containing no taps or splices shall be permitted to be installed underground and under sidewalks, paving, earth, or other substances that is to be used to establish the finished grade.
SUBSTANTIATION: This new exception is necessary to permit pull boxes that are used during the initial installation of conductors in an underground circuit to be covered over by a finished grade or surface. Often large areas of land are paved for parking lots or pedestrian use. The paving covers over the installation of circuit raceways used for lighting and other electric circuit conductors. Pull boxes are often used in long runs of conduit to make the installation of conductors manageable. These pull boxes currently have to be rendered accessible after the installation of the paving materials. These pull boxes at the surface are often damaged by snow removal equipment, vehicles, grass cutting equipment, frost heaves, and earth movement. The damaged pull boxes can expose conductors to pedestrians, form tripping hazards, or become hazards to vehicles. Pull boxes that do not contain splices or taps are rarely accessed for maintenance or adding taps. These pull boxes should be permitted to be buried in the earth and covered over after the initial installation. This new exception will permit

pull boxes having no taps or splices to be installed underground and under finished surfaces.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal does not comply with the intent of Section 300-18(a). If the pull box is inaccessible and a failure occurs, a repairing contractor will be tempted to try and pull between available access points, rather than digging up the parking lot. This could include pulling through the buried box, even if the conduits did not line up, resulting in hidden conductor damage. Handholes with appropriate covers are readily available for this purpose, and if installed correctly will not be damaged by snow removal. Alternatively, the box could be placed under loose soil at a landscaped island, with its location identified in accordance with existing rules.

(Log #2771)

9- 48 - (370 Part D): Reject
SUBMITTER: Joseph A. Tedesco, Nat'l Technology Transfer, Inc.
RECOMMENDATION: Delete and relocate Part D in Article 370 to Article 110 in a new Part E.
SUBSTANTIATION: While it is true, that this part covers enclosures it also covers the subject of manholes which can be "subsurface enclosures" now covered by Section 110-12(b).
PANEL ACTION: Reject.
PANEL STATEMENT: A manhole, in concept, is an enclosure that is large enough for personnel entry as now covered in the scope of Article 370. The technical correlating committee agreed with the placement of the material in the previous code cycle.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4343)

9- 49 - (370-52): Reject
SUBMITTER: Sukanta Sengupta, FMC Corp.
RECOMMENDATION: CMP 9 should investigate the discrepancies between
370-52
110-26
110-34
SUBSTANTIATION: None.
PANEL ACTION: Reject.
PANEL STATEMENT: There are no discrepancies between the cited sections. Section 370-52 is cabling work space; only Section 370-53 requires correlation, and it does correlate with Sections 110-26 and 110-34.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3891)

9- 50 - (370-52(a) and (b) (New)): Accept in Principle
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Add text as follows:
370-52(a) Access to Enclosures. Conductors shall be racked to provide ready and safe access in underground and subsurface enclosures, into which persons enter for installation and maintenance.
370-52(b) Cabling Work Space. (Include existing text of Section 370-52.)
SUBSTANTIATION: The text of this subsection is identical to Section 110-12(b) and should be moved to this location to aid the user of the Code.
PANEL ACTION: Accept in Principle.
Revise the final sentence of existing Section 370-54 to read as follows:
"All conductors shall be cabled, racked up, or arranged in an approved manner that provides ready and safe access for persons to enter for installation and maintenance."
PANEL STATEMENT: This revision meets the intent of the submitter. However, the panel believes the material belongs in Section 370-54.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

COMMENT ON AFFIRMATIVE:
HARTWELL: Adding the word "arranged" allows for something short of racking in smaller enclosures where safe access can be achieved through raceway placement, conductor cabling, or other methods.

(Log #4106)

9- 51 - (370-60 (New)): Accept in Principle
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 1 for action on Article 110, Part C. This action will be considered by Panel 1 as a Public Comment. The Technical Correlating Committee further directs that this Proposal be forwarded to Code-Making Panel 13 for information.
SUBMITTER: Robert E. Molde, Northern States Power Co./Rep. Wisconsin Utilities Assn.
RECOMMENDATION: Change title to: 370 Part D. Manholes, Vaults and Other Electric Enclosures Intended for Personnel Entry.
Add new paragraph as follows:
370-60. Fire Resistivity of Electrical Vaults. The walls, roof, floors, and doorways of vaults containing conductors and equipment over 600 volts nominal shall be constructed of materials that have adequate structural strength for the conditions with a minimum fire rating of 3 hours. The floors of vaults in contact with the earth shall be of concrete that is not less than 4 in. (102 mm) thick, but where the vault is constructed with a vacant space or other stories below it, the floor shall have adequate structural strength for the load imposed thereon and a minimum fire resistance of 3 hours. For the purpose of this section, studs and wallboards shall not be considered acceptable.
SUBSTANTIATION: "Vaults" are referred to in numerous paragraphs of Part D and should be included in the title. Vaults are a type of construction that implies fire resistance as outlined in Article 450. Making these changes will promote consistency in the Code. All vault design requirements should be contained in 370 Part D.
PANEL ACTION: Accept in Principle.
Relocate this new section to Article 110, Part C in a new section 110-xx. Make no change in the title of Article 370, Part D.
PANEL STATEMENT: Although the proposal has merit, it is the opinion of the panel that this material belongs in Article 110. The panel requests that the Technical Correlating Committee refer this proposal to Code-Making Panel 1 for action in Part C of Article 110. Code-Making Panel 9 understands that the focus of the proposal is medium voltage systems.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
CROUSHORE: This proposal should have been accepted as originally submitted. This proposal contains good information for constructing manholes and electrical vaults.

(Log #4218)

9- 52 - (370-70(2)): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
2. In Part B, Sections 370-15; 370-17; 370-18; 370-20; 370-23(a), (b), or (g); 370-28(b); and 370-29.
SUBSTANTIATION: When we changed from "applicable provisions" to specifying exactly which provisions, I knew, I just knew we were going to leave something out. We did. This material is especially critical now that we have the manhole rules in this article. This proposal fixes that oversight.
PANEL ACTION: Accept.

ARTICLE 373 — CABINETS, CUTOUT BOXES, AND METER SOCKET ENCLOSURES

(Log #540)

9- 53 - (373): Accept in Principle
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: a) Section 373-2(a): Replace "1/4-in. (6.35-mm)" with "6 mm (1/4 in.)".
b) Section 373-3: Replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".
c) Section 373-4: Replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".
d) Section 373-5(c) Exception: Replace "18 in. (457 mm)" with "450 mm (18 in.)"; Replace "10 ft (3.05 m)" with "3.0 m (10 ft)"; Replace "12 in. (305 mm)" with "300 mm (12 in.)"; Replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".
e) Section 373-10(b): Replace "0.053 in. (1.35 mm)" with "1.35 mm (0.053 in.)".
f) Section 373-11(a)(1): Replace "1/16 in. (1.59 mm)" with "1.6 mm (1/16 in.)".
g) Section 373-11(a)(2): Replace "1 in. (25.4 mm)" with "25 mm (1 in.)".
h) Section 373-11(a)(2) Exception: Replace "0.093 in. (2.36 mm)" with "2.36 mm (0.093 in.)"; Replace "1/2 in. (12.7 mm)" with "13 mm (1/2 in.)".
i) Section 373-11(a)(3): Replace "1/2 in. (12.7 mm)" with "13 mm (1/2 in.)"; Replace "1 in. (25.4 mm)" with "25 mm (1 in.)".
j) Section 373-11(a)(3) Exception: Replace "1/2 in. (12.7 mm)" with "13 mm (1/2 in.)".
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement.
PANEL ACTION: Accept in Principle.
Make the following changes:
(a) through (e) No changes
(f) Use the soft conversion, "1.59 mm (0.0625 in.)".
(g) Use the soft conversion, "25.4 mm (1.00 in.)
(h) Use the soft conversion for the final dimension, "12.7 mm (0.500 in.)
(i) Use soft conversions, as follows: "12.7 mm (0.500 in.)" and "25.4 mm (1.00 in.)".
(j) Use the soft conversion, "12.7 mm (0.500 in.)
PANEL STATEMENT: The panel has modified the proposal to use soft conversions in instances where hard conversions could inadvertently jeopardize the continuing viability of present equipment designs.

(Log #4455)

9- 54 - (373-3): Reject
SUBMITTER: David E. Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
RECOMMENDATION: Revise as follows:
"... other combustible material... 1/4 in." ... <u>that in the course of intended use, including installation and maintenance and repair, will not release potential contaminants.</u>
SUBSTANTIATION: There is a strong argument for adding explicit wording right here. It takes a broad interpretation of 110-12(c), which does not directly address installation, to override the permission in 373-3.
The purpose of enclosures is to form a barrier between their contents and that which has not been investigated for this purpose. This purpose is especially important when the enclosures guard protective equipment, as opposed to, for example, ceiling lights or receptacles. For example, I have found the inside of cabinet, including the circuit breakers, coated with plaster dust despite the fact that there were no open knockouts, and that the mounting openings in the back were snug against the wood support. The source of such dust was in this case, and often in my experience appears to be, the drywall that was installed over the cabinet, recessing the enclosure proper about a quarter inch behind its cover. In the not-unusual case of my example, the main breaker appeared to be defective. I can't be certain that the coating of dust had infiltrated the internal mechanisms, but manufacturers warn that circuit breakers' need for arc chutes exposes the workings of these essential protective devices to injury by dust or other particles. I also have found circuit breakers incapacitated where paint has coated the inside of enclosures, and exposed to interior spider webs and other evidence of vermin. I can provide a photograph of a small pile of sawdust or bug nest sitting on top of MAIN circuit breakers. Clearly some of these problems can be laid to causes other than the gaps caused by recessing the cabinets, but what we can try to control by explicit wording should be addressed in some way such as the wording I suggest.
PANEL ACTION: Reject.
PANEL STATEMENT: No "broad interpretation" of Section 110-12(c) is required. The substantiation points to one of the very reasons that this subsection is in the code. There are now products specifically designed to correct those problems.

AFFIRMATIVE: 11

(Log #1981)

9- 57 - (373-4(a) and (b) (New)): Reject
SUBMITTER: John M. O'Connor, North American Technologies, Inc.
RECOMMENDATION: Revise as follows:
373-4. Unused Openings. Unused openings in enclosures within the scope of this article shall be effectively closed to afford protection substantially equivalent to that of the enclosures within the scope of this article.

(a) Nonmetallic. Where metal plugs or plates are used with nonmetallic cabinets or cutout boxes, they shall be recessed at least 1/4 in. (6.35 mm) from the outer surface.

(b) Meter Socket Enclosures. Meter sockets shall be effectively closed by a closure which is integral to the meter socket enclosure when a meter is not installed in the socket.

SUBSTANTIATION: The enclosure of a meter socket is UL listed only when a meter is installed in a socket. The service which is energized without a meter being installed does not meet Section 111-27. Guarding of Live Parts. In many instances meters are bypassed, often by noncode approved means, in order to provide temporary power on construction jobsites. The protection of these live parts may or may not exist, depending on the installer and when or if a meter is installed.

These hazardous situations are occurring at new homes, offices, construction sites and at temporary classrooms (which are usually located on school playgrounds) while they are waiting to have meters installed. Utility deregulation may also cause increased incidence of these situations.

The addition of an integral closure to a meter socket would protect workers, children and others from a potentially dangerous situation, one that is preventable. Listed metering assemblies with integral socket closures are already commercially available.

Note: This is a companion proposal to my proposal on Section 230-62.

PANEL ACTION: Reject.

PANEL STATEMENT: The basic rule in Section 373-4(a) requires that unused openings shall be effectively closed.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

HARTWELL: In all my years in the trade, and in all the seminars I have given across the country, I have never found an electrician who would think to apply this section to a vacant meter socket. the universal trade practice is to cover the jaws with part of the carton and hope it holds up in the rain until the utility gets there to set a meter. Many utilities, including my own, allow for hot-work cut and reconnects. If an old A-base meter is being replaced, that means the socket will be energized in this condition for some period of time.

This section has to do with omitted knock-out sections, and the coordinate responsibility to provide knock-out seals of equivalent heft to that of the enclosure. If this material is relocated to Article 110, we will have an open section number, and we should use this opportunity to write a clear requirement. I suggest the following:

"373-4. Meter Socket Enclosures. Meter socket enclosures shall be completed by the installation of a meter, or by a closure assembly identified for use with the meter socket enclosure employed."

This language avoids the problem in the proposal as written, which would prohibit meter socket closure assemblies added to ring-type meter sockets.

(Log #2099)

9- 58 - (373-4(b)): Reject

SUBMITTER: John M. O'Connor, North American Technologies, Inc.

RECOMMENDATION: Revise text to read as follows:

373-4. Unused Openings. Unused openings in enclosures within the scope of this article shall be effectively closed to afford protection substantially equivalent to that of the enclosures within the scope of this article.

(a) Nonmetallic. Where metal plugs or plates are used with nonmetallic cabinets or cutout boxes, they shall be recessed at least 1/4 in. (6.35 mm) from the outer surface.

(b) Meter Socket Enclosures. Meter sockets shall be effectively closed by a closure which is integral to the meter socket enclosure when a meter is not installed in the socket.

SUBSTANTIATION: The enclosure of a meter socket is UL listed only when a meter is installed in a socket. The service which is energized without a meter being installed does not meet Section 111-27 Guarding of Live Parts. In many instances meters are bypassed, often by non-code approved means, in order to provide temporary power on construction jobsites. The protection of these live parts may or may not exist, depending on the installer and when or if a meter is installed.

These hazardous situations are occurring at new homes, offices, construction sites and at temporary classrooms (which are usually located on school playgrounds) while they are waiting to have meters installed. Utility deregulation may also cause increased incidence of these situations.

The addition of an integral closure to a meter socket would protect workers, children and others from a potentially dangerous situation, one that is preventable. Listed metering assemblies with integral socket closures are already commercially available.

Note: This is a companion proposal to my proposal on Section 230-62.

HARTWELL: See my Explanation of Negative Vote on Proposal 9-57.

(Log #3612)

9- 59 - (373-5): Reject

SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors

RECOMMENDATION: Revise text to read as follows:

373-5. Cabinets, Cutout Boxes, and Meter Socket Enclosures. Conductors entering enclosures within the scope of this article shall be protected from abrasion and shall comply with (a) through (c).

... (no change)

(c) Cables. Where cable is used, each cable shall be secured to the cabinet, cutout box, or meter socket enclosure.

Exception: Cables with entirely nonmetallic sheaths shall be permitted to enter ~~the top of a surface mounted~~ an enclosure through one or more nonflexible raceways not less than 18 in. (457 mm) or more than 10 ft (3.05 m) in length, provided all the following conditions are met.

a. Each cable is fastened within 12 in. (305 mm), measured along the sheath of the outer end of the raceway.

b. The raceway does not penetrate a structural ceiling ~~The raceway extends directly above the enclosure and does not penetrate a structural ceiling.~~

c. A fitting is provided on each end of the raceway to protect the cable(s) from abrasion and the fittings remain accessible after installation.

d. The raceway is sealed or plugged at the outer end using approved means so as to prevent access to the enclosure through the raceway.

e. The cable sheath is continuous through the raceway and extends into the enclosure beyond the fitting not less than 1/4 in. (6.35 mm).

f. The raceway is fastened at its outer end and at other points in accordance with the applicable article.

g. Where installed as conduit or tubing, the allowable cable fill does not exceed that permitted for complete conduit or tubing systems by Table 1 of Chapter 9 of this Code, and all applicable notes thereto.

FPN: See Table 1 in Chapter 9, including Note 9, for allowable cable fill in circular raceways. See Section 310-15(b)(2)(a) for required ampacity reductions for multiple cables installed in a common raceway.

SUBSTANTIATION: The use of nonflexible raceway to provide physical protection for cable or to provide a passage through finished structure should not be limited to extending up only or entering through the top of the enclosure, as it is a common practice to go down or horizontally from these enclosures.

When the cable sheathing is stripped away for termination, the stress is the same as individual conductors used in typical raceway installations.

PANEL ACTION: Reject.

PANEL STATEMENT: The exception permits only top entry through a raceway not less than 18 in. long to assure that the outer raceway termination will not provide access into the enclosure through the raceway, while preserving the principle use of the Exception. The requirement that the raceway not penetrate a structural ceiling is to prevent the spread of fire or products of combustion.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
HARTWELL: I agree that entry to these enclosures from other directions is harmless; I opposed the original restriction during the course of panel discussions. I only assented to assure that the concept would enter the code in some way, which at the time was in doubt. Now that the allowance is in place, proposals such as this are pertinent to sort out, one by one, the merits of the various restrictions.

(Log #1511)

9- 60 - (373-5(c)): Reject
SUBMITTER: Junior L. Owings, Rep. Oregon Chapter Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text as follows:
373.5 Cabinets, Cutout Boxes, and Meter Socket Enclosures. Conductors entering enclosures within the scope of this article shall be protected from abrasion and shall comply with (a) through (c).
...
(c) Cables. Where cable is used, each cable shall be secured to the cabinet, cutout box, or meter socket enclosure.
Exception: Cables with entirely nonmetallic sheaths shall be permitted to enter ~~the top of a surface mounted~~ an enclosure through one or more nonflexible raceways not less than 18 in. (457 mm) or more than 10 ft (3.05 m) in length, provided all the following conditions are met.
a. Each cable is fastened within 12 in. (305 mm), measured along the sheath, of the outer end of the raceway.
~~b. The raceway extends directly above the enclosure and does not penetrate a structural ceiling.~~
b.~~c.~~ A fitting is provided on each end of the raceway to protect the cable(s) from abrasion and the fittings remain accessible after installation.
c.~~d.~~ The raceway is sealed or plugged at the outer end using approved means so as to prevent access to the enclosure through the raceway.
d.~~e.~~ The cable sheath is continuous through the raceway and extends into the enclosure beyond the fitting not less than 1/4 in. (6.35 mm).
e.~~f.~~ The raceway is fastened at its outer end and at other points in accordance with the applicable article.
f.~~g.~~ Where installed as conduit or tubing, the allowable cable fill does not exceed that permitted for complete conduit or tubing systems by Table 1 of Chapter 9 of this Code, and all applicable notes thereto.
FPN: See Table 1 in Chapter 9, including Note 9, for allowable cable fill in circular raceways. See Section 310-15(b)(2)(a) for required ampacity reductions for multiple cables installed in a common raceway.
SUBSTANTIATION: The use of nonflexible raceway to provide physical protection for cable or to provide a passage through finished structure should not be limited to extending up only or entering through the top of the enclosure, as it is a common practice to go down or horizontally from these enclosures.
When the cable sheathing is stripped away for termination, the stress is the same as individual conductors used in typical raceway installations.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel action and statement on Proposal 9-59.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
HARTWELL: In this case the panel action is appropriate. Structural penetrations were never contemplated in this context.

(Log #608)

9- 61 - (373-5(c), Exception): Reject
SUBMITTER: Glenn W. Zieseniss, Crown Point, IN
RECOMMENDATION: Add the following to the beginning of the first sentence of the exception:
Exception: Feeder and Branch Circuit cables with entirely nonmetallic sheaths shall...
SUBSTANTIATION: This would clarify that service entrance (SE) conductors are not to be installed with the conductors permitted by this section, unless they are for feeder or branch circuits.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 230-7 prohibits conductors, other than service conductors, in the same service raceway or service cable.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4376)

9- 62 - (373-5(c), Exception): Reject
SUBMITTER: Joseph A. Hertel, Safety and Buildings Div., State of Wisconsin
RECOMMENDATION: Revise as follows:
Exception: Cables with entirely nonmetallic sheaths shall be permitted to enter the top of a surface-mounted enclosure through one or more nonflexible raceways not less than ~~18~~ 12 in. (~~457~~ 305 mm) or more than 10 ft (3.05 m) in length, provided all the following conditions are met.
SUBSTANTIATION: The State of Wisconsin has had a similar provision in the state supplement to the NEC for many years and it is only the minimum raceway length that differs. A 12 inch raceway length allows this provision to be used almost universally in one and two family dwellings for branch circuits to the service panel in the basement area. A 12-inch length from the top of the service panel places the raceway opening between the joists where the cables may be fastened. The use of an 18-inch length, in many installations, places the raceway opening in close proximity to the underside of the floor and restricts the cable installation and proper fastening of the cables.
PANEL ACTION: Reject.
PANEL STATEMENT: The exception permits top entry through a raceway not less than 18 in. long to assure that the upper raceway termination will not provide access into the enclosure through the raceway. While preserving the principle use of the exception, it provides safe and consistent installation requirements for the common practice of using raceway sleeves for nonmetallic sheathed cables entering panelboards and the like.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8
NEGATIVE: 3
EXPLANATION OF NEGATIVE:
HARTWELL: I agree with the substantiation. Twelve inches is long enough to assure that the nipple isn't being used as a giant cable connector, and the cable securement rules at its outer end remain applicable.
LeMAY: There is no reason not to consider using a nonflexible raceway length of 12 in. The submitter of this proposal provides reasonable substantiation and a solution to a real installation problem. The mandate of a sleeve to be 18 in. long to eliminate the entry of foreign material into the enclosure being served, as the panel statement suggests, can be equally accomplished using a 12 in. sleeve, while allowing for acceptable clearances from the underside of the floor and other structural framing. I believe lengths shorter than 12 in. will threaten the "secured to the..." and the "Openings to be closed" rules(s).
WELNAK: This proposal should be accepted. I agree with the submitter. A 12 in. raceway length allows this provision to be used almost universally in one and two family dwellings for branch circuits to the service panel in the basement area. A 12 in. length from the top of the service panel places the raceway opening between the joists where the cables may be fastened. The use of an 18 in. length, in many installations, places the raceway opening in close proximity to the underside of the floor and restricts the cable installation and proper fastening of the cables.

(Log #317)

9- 63 - (373-5(c), Exception (h)-(New); 373-5(c) FPN): Reject
SUBMITTER: Roy D. Broderson, Washington State Labor and Industries
RECOMMENDATION: Add to 373-5(c) exception, a new subsection (h) to read as follows:
(h) Where multiple cables are installed in a raceway longer than 24 in. see Section 310-15(b)(2)(a) for required ampacity reductions.
Delete FPN following 373-5(c).

SUBSTANTIATION: Section 373-5(c) Exception (g), makes first sentence of FPN redundant.
New Section 373-5(c) Exception (h) will put in positive text, the second sentence of FPN.
PANEL ACTION: Reject.
PANEL STATEMENT: Clause (g) of the exception to Section 373-5(c) is written in the style of the preceding clauses, and correctly references Table 1 of Chapter 9. The Fine Print Note provides additional reference material to the user.

PANEL STATEMENT: The panel has modified the proposal to use soft conversions throughout because hard conversions could inadvertently jeopardize the continuing viability of present equipment designs.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
DEMING: I agree with the panel action, but question which Table 373-6(b) will appear in the new edition of the code. Hopefuly, it will be the table appearing in the present (1999) edition of the code with the English measurements converted to Metric. I do not believe it is the panel's intent to use the table appearing with the proposal which begins with the words: "use soft conversions throughout as follows."

(Log #2241)

9- 66 - (Table 373-6(b)): Accept

NOTE: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 9-65. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Ravindra H. Ganatra, Alcan Cable

1750				24		—		—	—
2000				24		—		—	—

RECOMMENDATION: Revise Table 373-6(b) as follows:

Notes:

1. For SI units, 1 in. = 25.4 mm.
2. Bending space at terminals shall be measured in a straight line from the end of the lug or wire connector in a direction perpendicular to the enclosure wall.
3. *For removable and lay-in wire terminals intended for only one wire, bending space shall be permitted to be reduced by the number of inches shown in parentheses.*
4. *This column shall be permitted to determine the required wire bending space for compact stranded aluminum conductors in sizes up to 1000 kcmil and manufactured using AA-8000 series electrical grade aluminum alloy conductor material in accordance with 310-14.*

SUBSTANTIATION: New Information for this Proposal:

Key Points:

1. The proposal does not change the bending space requirements for all conductors.
2. The proposal does not affect negatively any existing products designed and manufactured in accordance with the current bending space requirements.
3. The proposal may actually increase the potential for applications of the existing products designed and manufactured in accordance with the current bending space requirements.
4. The proposal proposes adjustments to accommodate electrically equivalent sizes of compact stranded aa-8000 series aluminum alloy conductors.

(a) These conductor materials were recognized in the Code in 1981 for sizes up to No. 8 and then in 1984 for sizes up to 1000 kcmil.

(b) The work for the current bending space requirements was done in 1978.

(c) The data presented in the Fact Finding Report of 1978 for the Bending Space Report suggests that the compact stranded AA-8000 series aluminum alloy conductors manufactured commercially since early 1980's and today were not used in the study at that time. Unidirectional (or unilay) stranded compact conductors of aluminum alloys used today are smaller in diameter and more flexible than the reverse-lay stranded concentric conductors of aluminum used in the 1978 study.

Attached Fact Finding Study provides the necessary substantiation to the Panel so the proposed change can be accepted. It was initiated to provide a comparative data, in a manner consistent with the NEMA/UL Fact Finding Study (wire bending study) done for the 1981 NEC, Proposal No. 38 for Code-Making Panel 9, in the 1980 Technical Committee Report. Recommendation in this proposal has been edited for clarity purpose compared to the recommendation shown in the Fact Finding Report.

Results presented in this fact finding study support this proposal.

Background: See Proposal 9-77 and Comment 9-49 for 1999 NEC. See Appendix A of the attached Fact Finding Report.

Note: Supporting material available for review at NFPA Headquarters.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

COMMENT ON AFFIRMATIVE:

HARTWELL: The panel action on this proposal needs to be correlated with the action on Proposal 9-65. At the time the CMP 9 Metrication Task Group reported, the panel had not acted on this proposal, and we failed to anticipate the effect on the notes, notes that this proposal modifies. It may be sufficient to renumber the proposed Note 4 as Note 3 (also in the body of the table), but that is an editorial judgment for the panel to make.

(Log #CP905)

9- 66a - (373-6(b)(1) and 373-6(b)(2)): Accept
SUBMITTER: CMP 9
RECOMMENDATION: Add a title to Section 373-6(b)(1) to read as follows:
"Conductors Not Entering or Leaving Opposite Wall."
Add a title to Section 373-6(b)(2) to read as follows:
"Conductors Entering or Leaving Opposite Wall."
SUBSTANTIATION: To comply with the NEC Style Manual.
PANEL ACTION: Accept.

(Log #1755)

9- 67 - (373-10(d) (New)): Reject
SUBMITTER: Jamie McNamara, Hastings, MN
RECOMMENDATION: Add new text to read as follows:
373-10. Material. Cabinets and cutout boxes shall comply with (a) through (c) below.
(a) Metal Cabinets and Cutout Boxes. Metal cabinets and cutout boxes shall be protected both inside and outside against corrosion.
(FPN): For protection against corrosion, see Section 300-6.
(b) Strength. The design and construction of cabinets and cutout boxes shall be such as to secure ample strength and rigidity. If constructed of sheet steel, the metal thickness shall not be less than 0.053 in. (1.35 mm) uncoated.
(c) Nonmetallic Cabinets. Nonmetallic cabinets shall be listed or they shall be submitted for approval prior to installation.
(d) Razor Sharp Edges. Metal cabinets and cutout boxes shall be designed installed and maintained that users, installers and maintenance personnel will not be likely to come into contact with razor sharp edges.
SUBSTANTIATION: Some equipment is manufactured or modified in the field that the installer or users of the equipment come into contact with razor sharp edges. Often cutting there fingers or hands. Some examples are punched or cut enclosures and knockouts that leave a razor sharp edge near the front of the enclosure that one has to reach over or by to work on or in the equipment. Please see similar proposal 110-15.
PANEL ACTION: Reject.
PANEL STATEMENT: Product standards provide requirements and tests for sharp edges. Problems should be directed to manufacturers or follow-up service departments of the various testing laboratories.

ARTICLE 374 — AUXILIARY GUTTERS

(Log #1296)

8- 439 - (374): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise as follows:
374-2. Extension Beyond Equipment
An auxiliary gutter shall not extend a greater distance than 9 m (30 ft) ~~(9.14 m)~~ beyond the equipment that it supplements.
Exception: As permitted in Section 620-35 for elevators, an auxiliary gutter shall be permitted to extend a distance greater than 9 m (30 ft) ~~(9.14 m)~~ beyond the equipment that it supplements.
374-3 (a)
Sheet Metal Auxiliary Gutters. Sheet metal auxiliary gutters shall be supported throughout their entire length at intervals not exceeding 1.5 m (5 ft) ~~(1.52 m)~~.
374-3 (b)
Nonmetallic Auxiliary Gutters. Nonmetallic auxiliary gutters shall be supported at intervals not to exceed 900 mm (3 ft) ~~(914 mm)~~ and at each end or joint, unless listed for other support intervals. In no case shall the distance between supports exceed 3 m (10 ft) ~~(3.05 m)~~.
374-6. Ampacity of Conductors
(a) Sheet Metal Auxiliary Gutters. Where the number of current-carrying conductors contained in the sheet metal auxiliary gutter is 30 or less, the correction factors specified in Section 310-15(b)(2)(a) shall not apply. The current carried continuously in bare copper bars in sheet metal auxiliary gutters shall not exceed 1.55 amperes/mm2 (1000 amperes/in.2) ~~(645 mm2)~~ of cross section of the conductor. For aluminum bars, the current carried continuously shall not exceed 1.09 amperes/mm2 (700 amperes/in.2) ~~(645 mm2)~~ of cross section of the conductor.
374-7. Clearance of Bare Live Parts
Bare conductors shall be securely and rigidly supported so that the minimum clearance between bare current-carrying metal parts of different potential mounted on the same surface will not be less than 50 mm (2 in.) ~~(50.8 mm)~~, nor less than 25 mm (1 in.) ~~(25.4 mm)~~ for parts that are held free in the air. A clearance not less than 25 mm (1 in.) ~~(25.4 mm)~~ shall be secured between bare current-carrying metal parts and any metal surface. Adequate provisions shall be made for the expansion and contraction of busbars.
374-9 (b) Substantial Construction. Gutters shall be of substantial construction and shall provide a complete enclosure for the contained conductors. All surfaces, both interior and exterior, shall be suitably protected from corrosion. Corner joints shall be made tight, and where the assembly is held together by rivets, bolts, or screws, such fasteners shall be spaced not more than 300 mm (12 in.) ~~(305 mm)~~ apart.
374-9 (2) (a) (4) Have expansion fittings installed where the expected length change due to expansion and contraction due to temperature change is more than 6 mm (0.25 in.) (6.35 mm).
374-9 (2) (b) (2) Have expansion fittings installed where expected length change, due to expansion and contraction due to temperature change, is more than 1/2 in. (6.35 mm).
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the (inch-pound units) immediately following in parenthesis.
In accordance with NFPA 1M Manual of Style Section 4.1, a hard conversion is proposed wherever safety would not be compromised.
In accordance with NFPA 1M Manual of Style Section 4.1, a soft conversion is proposed wherever safety could be compromised by using a hard conversion.
PANEL ACTION: Accept.

RECOMMENDATION: Revise:
(4) ~~Where the 20 percent fill specified in (3) is not exceeded and the derating~~ Derating factors specified in Section 310-15(b)(2)(a) shall not be required, but where they are ~~is~~ applied, the number of current-carrying conductors shall not be limited.
SUBSTANTIATION: Edit. The phrase "where the 20 percent fill specified in (3) is not exceeded" infers it may be exceeded though there is nothing to suggest (3) is not a hard and fast rule, therefore the phrase is extraneous. The wording also suggests the derating factors are not required but there is no specific wording to modify Section 310-15(b)(2)(a). Inference interpretation is not good Code.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The submitter's concerns are adequately covered by the panel's action on Proposal 8-442.

(Log #4219)

8- 442 - (374-5(a)): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
(a) Sheet Metal Auxiliary Gutters. The sum of the cross-sectional areas of all contained conductors at any cross-section of a sheet metal auxiliary gutter shall not exceed 20 percent of the interior cross-sectional area of the sheet metal auxiliary gutter. The derating factors in Section 310-15(b)(2)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of Section 310-15(b)(4), exceeds 30. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.

~~The number of conductors permitted in a sheet metal auxiliary gutter shall be in accordance with (1) through (4).~~

~~1. Sheet metal auxiliary gutters shall not contain more than 30 current-carrying conductors at any cross section. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.~~

~~2. As provided in Section 620-35 for elevators, the 30-conductor limitation shall not apply.~~

~~3. The sum of the cross-sectional areas of all contained conductors at any cross section of a sheet metal auxiliary gutter shall not exceed 20 percent of the interior cross-sectional area of the sheet metal auxiliary gutter.~~

~~4. Where the 20 percent fill specified in (3) is not exceeded and the derating factors specified in Section 310-15(b)(2)(a) is applied, the number of current-carrying conductors shall not be limited.~~

SUBSTANTIATION: This is an editorial simplification of a rule that has become more complex than it needs to be. The only real limit on fill is the 20 percent limitation. The opening statement about 30 conductors doesn't address fill, it addresses mutual conductor heating. The result is one paragraph to get us into trouble and another to get us back out by saying the putative opening limit ("not contain more than 30") isn't a real limit if you want to pay the derating penalty. It's much better to use one sentence to set out the physical limitation (20 percent), and then one sentence to say when you pay the derating penalty. I threw in the appropriate reference on when neutrals are current-carrying for clarity. Then I included the control circuit sentence, and that's it. A simple paragraph with three declarative sentences, written positively. The reference to elevator gutters now violates the Style Manual because Section 90-3 adequately addresses it, so I threw that out as well.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NOT RETURNED: 1 Corry

(Log #2316)

8- 443 - (374-5(a)(1)): Reject
SUBMITTER: Michael L. True, Abbott True Electric, Inc.
RECOMMENDATION: Revise text to read as follows:
(1) ~~Sheet metal auxiliary gutters shall not contain more than 30 current-carrying conductors at any cross section.~~ Conductors for signaling circuits or controller conductors between a motor and starter and used only for starting duty shall not be considered as current-carrying conductors. Fill shall be based on percentage of cross section with the most current-carrying conductors.
SUBSTANTIATION: Gutter fill has become an issue in serving meter centers. A 1000 amp three phase service made up of 3 sets of 400 kcmil wire will put 12 current-carrying conductors in the gutter. Six three phase services tapped in the gutter will add 24 current-carrying conductors for a total of 36 current-carrying conductors, a code infraction. Auxiliary gutter fill should be based on percentage of fill only.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel reaffirms that the number of current carrying conductors is permitted to exceed 30 provided that ampacity adjustment factors are applied. See panel action on Proposal 8-442.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

NOT RETURNED: 1 Corry

(Log #2319)

8- 444 - (374-5(a)(4)): Reject
SUBMITTER: Michael L. True, Abbott True Electric, Inc.
RECOMMENDATION: Revise text to read as follows:
(4) Where the 20 percent fill specified in (3) is not exceeded and the current-carrying conductors are not bundled ~~and the derating factors in Section 310-15(b)(2)(a) is applied~~ the number of current-carrying conductors shall not be limited.
SUBSTANTIATION: Table 310-15(b)(2)(a) is based on 40 percent conduit fill where the current-carrying conductors are "bundled". This should not apply to a sheet metal auxiliary gutter. The gutter allows the current-carrying conductors to be spread out over a larger area than a conduit, thus allowing heat to dissipate. Table 310-15(b)(2)(a) should not apply to a gutter that is 20 percent filled. The derating chart should apply to gutters and wireways that are over 20 percent filled.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided adequate technical substantiation to remove the limitation on the number of conductors without applying the ampacity adjustment factors.

(Log #3057)

9- 70 - (380-2(a)):
NOTE: The Technical Committee notes that the action on this Proposal received less than the two-thirds affirmative vote. It was the action of the Technical Correlating Committee that this action be reconsidered based on the comments expressed in the voting. This action will be considered by the Panel as a Public Comment..
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Revise text as follows:
Three-Way and Four-Way Switches. Three-way and four-way switches shall be wired so that all switching is done only in the ungrounded circuit conductor. Where in metal raceways or metal-armored cables, wiring between switches and outlets shall be in accordance with Section 300-20(a).
~~Exception: Switch loops shall not require a grounded conductor.~~
An insulated grounded circuit conductor shall be provided on all single pole and 3-way switch loops in residential and commercial installations when wired with cable systems.
SUBSTANTIATION: Many products are available today such as programmable controllers, timers, home automation switches, occupancy sensors, etc., and some of these devices may require a connection to a grounded circuit conductor. In some cases, grounded circuit conductors may be present in the device box; in other cases, where a switch loop is installed, a grounded circuit conductor may not be present.
During replacement or retrofit of a standard wall switch, some installers have made an improper connection to a grounding conductor. This proposal addresses that impropriety.
Section 90-3 of the NEC identifies the Introduction as part of the Code and within the Introduction in 90-8 future expansion and convenience is identified as a necessary provision.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 90-1(b) does not provide for future adequacy of the wiring system.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 7
NEGATIVE: 4
EXPLANATION OF NEGATIVE:
DEMING: The panel should have accepted this proposal. During the 1999 code cycle, the panel recognized the inherent danger of using the grounding conductor as a grounded circuit conductor. During the public comment period, some of the panel members changed their position because of the far-reaching ramifications this requirement would have created.
This proposal now limits the requirement to single pole and three-way switch loops in residential and commercial installations when wired with cable systems. To my knowledge there are no accessories or retrofit kits available to get a grounded circuit conductor into an enclosure at a later date when the wiring method originally used was a cable system.
HIDAKA: This proposal should be accepted. As the use of electronic switching devices has increased, the need for a grounded circuit conductor at each switch outlet is becoming a necessity. The addition of a grounded circuit conductor will allow electronic switching devices to be installed at any time during the life of the building without encouraging the practice of using the equipment grounding conductor as an inappropriate grounded circuit conductor path.
LeMAY: I believe that if a "switch loop" wiring method is employed, the grounded circuit conductor should be brought from the lighting outlet to the first control device outlet box.
While complications are introduced by requiring the grounded circuit conductor at 3-way and 4-way devices, it should not preclude the grounded circuit conductor from at least being installed to the first control point.
Section 90-1(b) FPN specifically states that hazards can occur by not providing for increases in the use of electricity. An end user installing a device requiring a grounded circuit conductor or installing a utilization equipment requiring additional control is an increase in the use of electricity.
REED: Use of electronic switching devices has increased, and many of these devices use the grounded circuit conductor for thier circuitry power. The addition of a grounded circuit conductor in the switching circuits will eliminate having the occupant use the equipment grounding conductor when the grounded conductor is not present. This will improve safety in today's applications.

(Log #4003)

9- 71 - (380-2(c) (New)): Accept in Principle
SUBMITTER: James T. Dollard, Jr., IBEW Local Union 98/Rep. IBEW Eastern Code Advisory Group
RECOMMENDATION: Add the following text:
380-2(c) Occupancy Sensors. Occupancy sensors used as switches shall disconnect all ungrounded conductors when in the "OFF" position.
SUBSTANTIATION: This proposal attempts to remove a serious shock hazard which is presently permitted by the NEC. This proposal is directed to the members of Panel 9 and Article 380 due to the fact that in the 1999 cycle, Panel 2 voted to hold comments on Proposal 2-250 and the TCC directed that this issue go to Panel 9 in the 2002 cycle. This proposal addresses the use of occupancy sensors as permitted in 210-70(a)(1), Exception No. 2.
Section 210-70(a)(1), Exception No. 2: Lighting outlets shall be permitted to be controlled by occupancy sensors that are (1) in addition to wall switches or (2) located at a customary wall switch location and equipped with a manual override that will allow the sensor to function as a wall switch.
This exception permits an occupancy sensor in addition to a wall switch or in place of a switch provided the sensor is equipped with a manual override that will allow the sensor to function as a wall switch. In order to function as a wall switch, the OFF position should disconnect all ungrounded conductors. When in the OFF position occupancy sensors DO NOT DISCONNECT THE UNGROUNDED CONDUCTORS. This is presently permitted by the NEC. These devices are listed and in the OFF position do not mean a no voltage situation. The manufacturers of these devices acknowledge that OFF no longer means OFF. The manufacturers state that the maximum amount of current that could flow is well below the let go level and therefore does not present a serious danger. Tell that to the homeowner or even an electrician working a fixture with the switch in the OFF position that receives a shock resulting in a fall that causes serious injury or even death.
Upon the removal of a single fixture or the last fixture where multiple fixtures are installed full voltage is present with the device in the OFF position. A switch in any type of installation that has an OFF position should disconnect all ungrounded conductors! OFF must mean a no voltage situation!
If occupancy sensors installed as a SWITCH in accordance with the NEC are permitted to have an OFF position that does not mean that all ungrounded conductors have been disconnected,

then perhaps we should include in Article 100 a definition for the word OFF that simply says "check with the manufacturer."
I have submitted with this proposal copies of Proposal 2-250 and Comments 2-139, 2-140, 2-141, and 2-142.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action on Proposal 9-88a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4470)

9- 72 - (380-2(c) (New)): Reject
SUBMITTER: Gordon E. Berg, W. St. Paul, MN
RECOMMENDATION: Add new paragraph (c) to read as follows:
(c) The ungrounded screws on 15 and 20 amp switches shall be covered or protected before the switch is installed in a metal electrical box.
SUBSTANTIATION: The screws on 15 and 20 amp switches should be covered before securing them in a metal electrical box. This additional protection would prohibit strands of wire or an uncentered switch from coming in contact with the grounded edge of an electrical box and also avoid the danger of exposed screws should the plates ever come off or break.
PANEL ACTION: Reject.
PANEL STATEMENT: The designs of the switches and boxes are such that the screw will not contact the box after assembly. Proper faceplates should be provided in accordance with Sections 380-9 and 370-25. Use of stranded wire on terminal screws is a workmanship issue.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11COMMENT ON AFFIRMATIVE:
DEMING: I agree with the panel action, but want to add the following to the panel statement: "Unused terminal screws should be tightened into the device and not left in their most outward position."
HARTWELL: The stranded wire issue is valid, but not addressable here. It should be addressed in Section 110-14, through additional wording substantially as follows: "Where stranded conductors are terminated on and not looped through such terminals, the terminals shall be identified for such use, or the strands at the terminals shall be made solid."
Surprisingly, it isn't a violation of any listing requirement to use side-wired devices with stranded wire. Normally such devices are used without problems for residential applications with solid wire, but nothing restricts them to such applications. Present product standards don't adequately address the near impossibility of back-wrapping 19-stranded conductors under a screw head, especially on lower quality devices. Take receptacles, for example. At present UL 498 appears to have no testing protocol to adequately assure the containment of stranded wires on binding screw lugs. Paragraph 12.5 simply parrots the present NEC rule under discussion here.
Conductors looping through devices are okay because insulation on both sides of the skinned section of wire contains the strands. If necessary, a little work with a soldering tool quickly makes a solid conductor out of a stranded one. A number of highly qualified individuals have discussed the problem with the standard privately, pointing to the issue of stranding characteristics. They were referring to the fact that the standed was drawn at a time when the stranded conductors typically used with these devices, if stranded wire were ever actually used, would be 7-strand instead of today's 19-strand conductors, which makes the problem even worse today. NEMA and UL should stop stonewalling this type of proposal in CMP 1.

(Log #874)

9- 73 - (380-3 Exception No. 1): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
Exception No. 1: ~~Pendant and surface type snap switches and~~ Knife switches mounted on an open-face switchboard or panelboard shall be permitted without enclosures.
SUBSTANTIATION: Pendant type and surface type snap switches generally have enclosures as part of the listed device though the enclosures may be different than those for switches and circuit breakers of the rule.
PANEL ACTION: Reject.
PANEL STATEMENT: Installation of pendant and suface type snap switches with enclosures are not precluded by this article.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #331)

9- 74 - (380-4): Reject
SUBMITTER: Richard L. Miell, Otero County, CO
RECOMMENDATION: 380-4. Wet Locations
A switch or circuit breaker in a wet location or outside of a building shall be enclosed in a weatherproof enclosure or cabinet that shall comply with Section 373-2(a). Switches shall not be installed within the Bathtub and Shower Zone, unless installed as a part of a listed tub or shower assembly.
SUBSTANTIATION: Over the years we have seen additional rules for this area around and above tubs and shower stalls. The current rule uses vague language to identify the space where switches are not allowed. This change will properly identify the zone, as defined in Article 100, and make the use of switches in this zone a violation, just like a receptacle or a light fixture.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing code is clear. A bathtub and shower zone is not defined in Article 100 of the NEC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4220)

9- 75 - (380-6(c)): Accept in Principle in Part
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
Connection of Switches. Single-throw knife switches and bolted pressure contact switches ~~with butt contacts~~ shall be connected so that the blades are de-energized when the switch is in the open position. Single-throw knife switches, molded-case switches, switches with butt contacts, and circuit breakers used as switches shall be connected so that the terminals supplying the load are de-energized when the switch is in the open position.
SUBSTANTIATION: This corrects an error in this submitter's original proposal which went undetected throughout the process, only coming to light when I was working on my 1999 NEC analysis. Butt contact switches don't have knives; what was intended for the first sentence was bolted pressure contact switches that do. The butt-contact design properly appears in the second sentence.
PANEL ACTION: Accept in Principle in Part.
Revise the wording of the proposal to read as follows:
"Single-throw knife switches, bolted pressure contact switches, and switches with butt contacts shall be connected so that the blades are de-energized when the switch is in the open position. Single-throw knife switches, bolted pressure contact switches, molded case switches, switches with butt contacts, and circuit breakers used as switches shall be connected so that the terminals supplying the load are de-energized when the switch is in the open position."
PANEL STATEMENT: It is equally important that the blades of bolted pressure contact switches be de-energized when the switch is in the open position, and that the terminals supplying the load are de-energized when the switch is in the open position.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3267)

9- 76 - (380-6(c), Exception): Accept
SUBMITTER: Alan Manche, Square D Co.
RECOMMENDATION: Revise the 380-6(c) Exception with the additions (underlined) and deletions (strike through) as shown. The entire text is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.

Exception: The blades and terminals supplying the load of a switch shall be permitted to be energized when the switch is in the open position where the switch is connected to circuits or equipment inherently capable of providing a backfeed source of power. For such installations, a permanent sign shall be installed on the switch enclosure or immediately adjacent to open switches ~~that reads:~~ with the following words or equivalent:

WARNING - LOAD SIDE TERMINALS MAY BE ENERGIZED BY BACKFEED.

SUBSTANTIATION: The explicit nature of the present wording is causing field problems in the acceptance of appropriate warning signs or markings. The ANSI Z535 series of standards provides the proper procedure in establishing a hazard sign or marking. ANSI Z535.4 provides the information about what should be contained in a hazard sign or label. This includes a message panel that identifies the hazard, indicates how to avoid the hazard and advises the probable consequence of not avoiding the hazard.

The objective of the NEC wording is to generally convey the basic message requirement to user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would allow a hazard sign to comply with the NEC, but be formated in accordance with Z535.4.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #875)

9- 77 - (380-7): Accept in Principle

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise first paragraph:

"General-use and motor circuit switches and circuit breakers, where mounted in an enclosure as described in Section 380-3, and molded-case switches, shall clearly indicate whether they are in the open "off" or closed "on" position.

SUBSTANTIATION: Edit. Molded-case switches should also warrant the requirement.

PANEL ACTION: Accept in Principle.

Revise the existing code text to read as follows:

"General-use and motor-circuit switches, circuit breakers, and molded case switches, where mounted...".

PANEL STATEMENT: The revised wording meets the intent of the submitter, and editorially rearranges the order of the terms.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #368)

9- 78 - (380-8 Exception No. 2): Reject

NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 11 for information.

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Add:

where there is compliance with Section 430-107.

SUBSTANTIATION: Proposal would clarify that Section 430-107 is not abrogated by this section, if that is the intent.

PANEL ACTION: Reject.

PANEL STATEMENT: These provisions extend to many other applications outside of Article 430. The relationship between Section 430-107 and this section must be addressed by Code-Making Panel 11 within Article 430.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #876)

9- 79 - (380-8 Exception No. 2 and (b)): Accept in Principle

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

Exception No. 2: Switches and circuit breakers installed adjacent to motors, appliances, or other equipment that they supply shall be permitted to be located higher than specified in the foregoing and to be accessible by portable means.

(b) Voltage Between Adjacent Switch(es) or Other Devices. A snap switch~~es~~ shall not be grouped or ganged in enclosures with other snap switches, receptacles, or other devices unless they ~~can be~~ are arranged so that the voltage between adjacent ~~switches~~ devices does not exceed 300, or unless they are installed in enclosures equipped with permanently installed barriers between adjacent ~~switches~~ devices.

SUBSTANTIATION: Circuit breakers should be included in Exception No. 2 since switches with fuses are permitted by Section 240-24(a)(4), and that section implies circuit breakers are permitted.

Switches on 277 volt circuits may also be installed in enclosures adjacent to receptacles on 120 volt circuits where the voltage difference can exceed 300. The hazard of such exposed terminals is just as great regardless of the type of device.

The phrase "can be arranged" does not invoke a rule, only a possibility.

PANEL ACTION: Accept in Principle.

Revise (b) of the proposal to read as follows:

"(b) Voltage Between Adjacent Switch(es). A snap switch shall not be grouped or ganged in enclosures with other snap switches, receptacles, or similiar devices unless they are arranged so that the voltage between adjacent devices does not exceed 300 volts, or unless they are installed in enclosures equipped with permanently installed barriers between adjacent devices."

PANEL STATEMENT: The panel wishes to assure that the restriction is not applied to motor starter control circuits and the like.

(Log #28)

9- 80 - (380-8(a) Exception No. 2): Accept

NOTE: The following proposal consists of Comment 9-58 on Proposal 9-90 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 9-90 was:

Add text at the end to read:

Switches installed adjacent to motors, appliances, or other equipment that they supply shall be permitted to located higher than specified in the foregoing if readily accessible from the platform installed for service of equipment and accessible by portable means.

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Accept in Principle revised as follows:

Switches and circuit breakers installed adjacent to motors, appliances, or other equipment that they supply shall be permitted to be located higher than specified in the foregoing ~~if readily accessible from the platform installed for the service of equipment~~ and to be accessible by portable means.

SUBSTANTIATION: Clarification. Section 240-24 Exception No. 4 permits overcurrent devices (circuit breakers) to be accessible by portable means. The text and Exception No. 1 indicate circuit breakers are technically not the same as switches. If circuit breakers are specifically noted, it would eliminate confusion and enhance the user friendly concept.

PANEL ACTION: Accept.

(Log #369)

9- 81 - (380-9): Accept in Part

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise 380-9 to read as follows:

380-9. Provisions for General use Snap Switches ~~Faceplates.~~

(a) ~~Position~~ Faceplates. Faceplates provided for snap ~~Snap~~ switches mounted in boxes and other enclosures shall ~~have faceplates~~ be installed so as to completely cover the opening, and where the switch is flush-mounted, seat against the finish surface:

(b) Grounding. Snap switches with metal yokes, including dimmer switches shall be effectively grounded and provide a means to ground metal faceplates, whether or not a metal faceplate is installed. Snap switches shall be considered effectively grounded if either of the following conditions ~~are~~ is met.

(1) The switch is mounted with metal screws to a grounded metal box or other enclosure or to a nonmetallic box or other enclosure with integral means for grounding ~~devices~~ the switch.

(2) No change.

Snap switches with nonmetallic yokes shall be permitted where provided with a faceplate of insulating material.

Exception to (b): Where no grounding means exists within the snap switch enclosure, ~~or where the wiring method does not include or provide an equipment ground,~~ a snap switch ~~without a grounding connection~~ with a metal yoke shall be permitted for replacement purposes only, ~~A snap switch wired under the provisions of this exception~~ and where located within reach of earth grade, conducting floors or other conducting surfaces shall be provided with a faceplate of ~~nonconducting, noncombustible~~ insulating material. The faceplate mounting screws shall be nonmetallic.

SUBSTANTIATION: Snap switches have many forms; it appears this section is intended to apply to general-use type defined in Article 100 and as covered in Section 380-14. The requirements should apply to enclosures other than boxes only, such as cabinets, surface wireways, and enclosures covered in Section 336-21 for exposed Type NM cable. Since a switch plate for a surface-mounted box may be considered by some to be a faceplate, the requirement to seat against the surface is modified to apply to flush switches.

The grounding provisions of (b) in effect disallow the use of switches with nonmetallic yokes for which grounding is not needed and not practically feasible. Some forms of these switches have nonconducting faceplates which snap on without the use of screws. Where limited to use with insulating plates there is nothing to be energized. Various sections of the code permit insulation as an alternative to grounding.

The metal box of (b)(1) should be specified as grounded since that is the intent, but not literally required.

The literal wording of the exception indicates a switch that does have a grounding termination is not suitable as a replacement. The reference to wiring method is superfluous as it is covered by "where no grounding means exists". Earth grade, which may not be equated as a conducting surface, and metal faceplate mounting screws can also contribute to potential shock hazard.

"Nonconducting" and "noncombustible" are somewhat superfluous since those requirements are generally part of listing standards for nonmetallic faceplates and covered in (c) and Section 410-56(d).

PANEL ACTION: Accept in Part.

1. The panel accepts the proposed change to the title of Section 380-9.
2. The panel accepts all of the changes in 380-9(a) as submitted.
3. The panel accepts the words "earth, grade," in the proposed Exception which would modify the existing code text to add "earth, grade," after "within reach of" and before "conducting floors".
4. The panel rejects the remainder of the proposal.

PANEL STATEMENT: The remainder of the proposal is rejected because it would allow snap switches to be installed in a manner that would not assure the grounding of a metal faceplate. The proposed action would directly counteract the intent of Code-Making Panel 9 in making the changes to this section in the 1999 code cycle.

(Log #1920)

9- 88 - (380-14(e) (New)): Accept in Principle
SUBMITTER: Michael J. Johnston, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Add text to read as follows:
(e) Dimmer switches. General use dimmer switch shall only be used to control permanently installed incandescent lighting fixtures unless otherwise listed for control of other loads and stated in the individual listing.
SUBSTANTIATION: Although the listing and installation instructions for general use dimmer switches is specific and information in the UL green book carries this information, this continues to be an issue for many because it does not appear as a mandatory requirement in the NEC. This wording for this proposal was extracted from the UL white book 1998 edition, page 20. The product category is Dimmers, General Use Switch (EOYX). Discussions with both engineers and contractors at construction sites have raised the question when wanting to apply these dimmers in this manner. The comment was something to the effect that it does not appear anywhere in the Code. That is a true statement, however 110-3(b) does cover this indirectly. Inserting this new section in Article 380 should help eliminate these gray areas and improve safety.
PANEL ACTION: Accept in Principle.
Revised the proposed wording to read as follows:
" (e) Dimmer Switches. General use dimmer switches shall only be used to control permanently installed incandescent lighting fixtures unless listed for the control of other loads, and installed accordingly."
PANEL STATEMENT: Editorially revised for clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
CROUSHORE: The action on this proposal should be to reject. The submitter has not provided any technical substantiation of a problem existing in the field and this restriction is unnecessary. This new restriction will eliminate the receptacle-controlled table lamp on a dimmer switch.

(Log #CP901)

9- 88a - (380-15): Accept
SUBMITTER: CMP 9
RECOMMENDATION: Add an additional subsection to 380-15 to read as follows:
"380-15 Marking.
(a) Ratings. Switches shall be marked with the current and voltage and, if horsepower rated, the maximum rating for which they are designed.
(b) Off Indication. Where in the off postion, a switching device with a marked OFF position shall completely disconnect all ungrounded conductors to the load it controls."
SUBSTANTIATION: The panel believes this is a safety consideration, and addresses the issue of the "off" position disconnecting ungrounded conductors. This provides continuity with sections 422-33, 424-19(c), and 424-20(a).
PANEL ACTION: Accept.

9- 91 - (384-3(a)(3), Exception): Reject
NOTE: The following proposal consists of Comment 9-64 on Proposal 9-103 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 9-103 was:
Revise Section 384-3(a) as shown:
(a) Conductors and Busbars on a Switchboard or Panelboard. Conductors and busbars on a switchboard or panelboard shall comply with (1), (2) and (3) as applicable.
(1) Location. Conductors and busbars shall be located as to be free from physical damage and shall be held firmly in place.
(2) Service Switchboards. In all service switchboards, the arrangement of components and any necessary barriers shall be such that no uninsulated ungrounded service busbar or service terminal will be exposed to inadvertent contact by persons servicing any load terminal. Barriers shall be placed in all service switchboards that will isolate the service busbars and terminals from the remainder of the switchboard.
(3) Same Vertical Section. Other than the required interconnections and control wiring, only those conductors that are intended for termination in a vertical section of a switchboard shall be located in that section.
Exception: Conductors shall be permitted to travel horizontally through vertical sections of switchboards where such conductors are isolated from busbars by a barrier.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Accept in principle revised as following:
(a)(3) Exception: Conductors shall be permitted to ~~travel~~ be run horizontally through vertical sections of switchboards where such conductors are isolated from busbars by a barrier or by factory-installed insulation on the busbars.
SUBSTANTIATION: Insulated bus appears to provide suitable separation.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes the present code text is clear. The concept of factory-installed insulation on busbars has not been substantiated in this application.

9- 99 - (384-11 (New)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add a new section for overcurrent protection of switchboards as follows.
384-11 Overcurrent Protection. Switchboards shall be protected in accordance with Section 230-90.

SUBSTANTIATION: Presently there seem to be no clear rules for the protection of switchboards. Currently panelboards and motor control centers have clearly outlined manners in which they are to be protected, switchboards however, do not. This proposal would give clear guidance for the protection of this type of equipment.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided any documented instances of problems. Overcurrent protection requirements for switchboards within the Scope of Article 384 would be additional specific requirements to those in Article 240.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
HARTWELL: The proposal should have been accepted in principle, revised to use comparable wording as presently exists in Section 384-13 for panelboards. The submitter correctly points to a gap in code coverage. The rule would be simple, to the effect of "Switchboards shall have a rating not less than the minimum feeder capacity required for the load computed in accordance with Part B or C of Article 220."
The panel would do well to remember that motor control centers are essentially a form of switchboard and Section 430-94 requires not just a board rating but actual overcurrent protection based on the common power bus.

(Log #4456)

9- 100 - (384-13): Reject
SUBMITTER: David E. Shapiro, Safety First Electrical Contracting Consulting, and Safety Education
RECOMMENDATION: Revise as follows:
"... shall be durably marked with voltage and current ratings and number of poles and manufacturer's name or trademark and any installation instructions and restrictions, including both text and schematics used for this purpose, in such a manner as to be visible after installation."
SUBSTANTIATION: I frequently open panels and need to see what circuit breakers can be installed where, so as to comply with manufacturers' instructions and to avoid overloading busbars. Frequently I have had to insert a prying tool between conductors and cabinet wall and push with all my muscle against the wires that are in place in order to gain a glimpse of the schematic. I have nudged bare grounding conductors right up to circuit

breaker terminals, and the least bit of overstripping could have caused a short circuit. It does not matter whether this risk of shorting existed right then, in instances where I was worked live, or subsequently when I restored power in the event that the panel; was dead. Furthermore, when I have to pry I am stressing the terminations.

When panelboard cabinets contain any printed material that may require future legibility, including text, diagrams, and schematics, it needs to be readable. When that material already is not in a normal reading orientation and when it is not in direct line of sight subsequent to installation of the circuiting, if installers block it as they route the wiring, electricians subsequently are placed in far more danger than when they can't see the voltage rating. It does not ask too much of installers that they route wires away from such instructions as much as possible, and that they use wire ties on conductors that need to pass near the instructions -- at least when they are preparing for inspection.

PANEL ACTION: Reject.

PANEL STATEMENT: Required markings, instructions and requirements for visibility are covered in existing product listing standards.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #877)

9- 101 - (384-14): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Delete this section.

SUBSTANTIATION: A panelboard is a panelboard and the definition appears to cover various construction from small 2-circuit "load center" types to large floor-standing types with compartments for switch and fuse or circuit breaker assemblies. It seems the primary effect of this section is to provide for application of Sections 384-15 and 384-16. The designation of type of panelboard is determined by the number of overcurrent devices protecting specific type circuits. Apparently the same panelboard could be either lighting and appliance or power, dependent on the installed overcurrent devices and circuits. A removal or addition of one circuit can change the classification and application of Section 384-16(a) or (b). If a classification is made based on installed devices and circuits, but spare spaces are available which when used could change the classification, which overcurrent provision of Section 384-16 should be applied? If a panelboard is installed without branch circuit devices or circuits, such as in future tenant spaces in speculation building where occupancy is future and undetermined, how is the panelboard to be classified? How does a mere change in classification effect heating, current capacity, and other factors?

If a panelboard supplies only 30-ampere rated feeders with neutrals it is a power panelboard; if the same circuits are lighting and appliance circuits it is a lighting and appliance panelboard. The same applies dependent on neutral connections. What safety considerations justify this? In many industrial and commercial occupancies frequent circuit changes are made whereby classification based or prior conditions are changed and meaningless.

If a panelboard supplied by a 2-wire feeder, ac or dc, with or without a grounded conductor, supplying circuits rated 30-amperes or less, a lighting and appliance or power panelboard? Since there is technically no neutral it is a power panelboard, though perceived intent, if one conductor is grounded, may result in classification as lighting and appliance panelboard.

This section and Section 384-16 appear to be influenced by considerations of possible future additions or alterations by unqualified persons. Code rule should be governed and based on application by qualified persons. The premise of rules to prevent misuse or safety hazards caused by unqualified persons, if logically extended, would result in more restrictive and stringent requirements for 120-volt systems than for 5kV systems, since the probability of unqualified persons working on 120-volt systems is much greater.

The requirements of Section 384-13 and testing standards for heat rise, circuit limiting, short-circuit rating, etc., for panelboards should be sufficient for safety. This section encourages capricious and subjective interpretation, if applied, but likely has little effect in the real world due to factors noted above.

PANEL ACTION: Reject.

PANEL STATEMENT: The language in the present Code is the result of a code-making panel task group study of Proposal 9-142 for the 1996 NEC. The task group study resulted in Proposal 9-120 for the 1999 code and included revised material for Sections 384-14 and 384-16. The panel reaffirms its action on Proposal 9-120 as recorded in NFPA 70 - A98 ROP concerning definitions of lighting and appliance branch circuit panelboards and power panelboards in Section 384-14, and the addition of requirements for power panelboard protection in Section 384-16.

9- 102 - (384-14-Lighting and Appliance Branch Circuit (New)): Accept in Principle

SUBMITTER: Andrew T. Crescuillo, Rep. Genesee Chapter IAEI

RECOMMENDATION: Revise as follows:

Definition of a Lighting and Appliance Branch Circuit. A branch circuit that has a connection to the neutral of the panelboard and that has overcurrent protection of 30 amperes or less in one or more conductors.

(a) Lighting and Appliance Branch-Circuit Panelboard. A lighting and appliance branch-circuit panelboard is one having more than 10 percent of its overcurrent devices protecting lighting and appliance branch circuits. ~~A lighting and appliance branch circuit is a branch circuit that has a connection to the neutral of the panelboard and that his overcurrent protection of 30 amperes or less in one or more conductors.~~

SUBSTANTIATION: This makes it more user friendly and easier to read and understand.

Example: As in definition of Motor Control Circuits 430-71.

PANEL ACTION: Accept in Principle.

Revise existing Section 384-14 to read as follows:

"384-14. Classification of Panelboards. Panelboards shall be classified for the purposes of this Article as either lighting and appliance branch-circuit panelboards or power panelboards, based on their content. A lighting and appliance branch circuit is a branch circuit that has a connection to the neutral of the panelboard and that has overcurrent protection of 30 amperes or less in one or more conductors.

(a) Lighting and Appliance Branch-Circuit Panelboard. A lighting and appliance branch-circuit panelboard is one having more than 10 percent of its overcurrent devices protecting lighting and appliance branch circuits.

(b) Power Panelboard. A power panelboard is one having 10 percent or fewer of its overcurrent devices protecting lighting and appliance branch circuits."

PANEL STATEMENT: This change is for editorial clarity and meets the intent of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #878)

9- 103 - (384-15): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

Number of Overcurrent Devices on One Panelboard. Not more than 42 overcurrent devices (other than those provided for in the mains) of a ~~lighting and appliance branch-circuit~~ panelboard shall be installed in any one cabinet or cutout box.

A ~~lighting and appliance branch circuit~~ panelboard shall be provided with physical means to prevent installation of more overcurrent devices than that number for which the panelboard was designed, rated, and listed. ~~approved.~~

For the purposes of this section ~~article, a 2-pole circuit breaker shall be considered two overcurrent devices; a 3-pole circuit breaker shall be considered three overcurrent devices~~ each fuse and each pole of a circuit breaker shall be considered an overcurrent device.

SUBSTANTIATION: If the limit of 42 overcurrent devices has been established due to heat considerations, it should apply regardless of panelboard classification. One circuit or overcurrent device can determine such classification. The limit of 42 is generally standard practice, since final determination of classification may not be known.

The UL "white book" indicates the circuit-limiting provision also applies to fusible panelboards; each fuse should be noted also as is each pole of circuit breakers.

"Listed" is proposed in lieu of "approved" as the number of overcurrent devices is best determined by a NRTL, not the authority having jurisdiction. "Section" is more appropriate than "article".

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and statement on Proposal 9-101.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #879)

9- 104 - (384-16(a), (b)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

(a) ~~Lighting and Appliance Branch Circuit~~ Panelboard Individually Protected. Each ~~lighting and appliance branch circuit~~ panelboard shall be individually protected on the supply side by not more than two main circuit breakers or two sets of fuses. ~~having a combined rating~~ Each main circuit breaker or set of fuses shall have an ampere rating not greater than ~~that of~~ the panelboard bus it protects.

Exception No. 1: Individual protection for a ~~lighting and appliance branch circuit~~ panelboard shall not be required if the panelboard feeder has overcurrent protection not greater than the ampere rating of the panelboard.

Exception No. 2: ~~For existing installations, individual protection for lighting and appliance branch circuit panelboards shall not be required where such panelboards are used as service equipment in supplying an individual residential occupancy.~~ Individual protection shall not be required for a panelboard used as service equipment, with multiple sets of overcurrent devices as permitted in Section 230-90(a) Exception No. 3.

Exception No. 3: The rating of the panelboard protective device(s) shall be permitted in accordance with the provisions of Sections 430-62 and 430-63 for motor loads and motor and lighting or appliance loads, and Sections 630-12(b) and 630-32(b) for electric welder supply conductors.

(b) Delete.

SUBSTANTIATION: The rationale for classification of panelboards as lighting and appliance or power is not clear. What are the safety reasons for permitting two sets of overcurrent devices for one but not the other?

Present Exception No. 1 for (a) is unnecessary as the code is not purported to be retroactive to change a previous code compliant installation. Such exceptions are not provided for all previous compliant installations which may not conform to present code. Moreover, it is limited to residential occupancies; is this intended to infer that existing split-bus panels in commercial or industrial occupancies are to be replaced?

In (b) the described power panelboard becomes the lighting and appliance branch-circuit panelboard of (a) if the circuits are connected to the neutral. It doesn't address the condition where the panel supplies branches which are feeders.

The exception for (b) relates to deletion of overcurrent protection based on multiple service disconnects which per se, are not overcurrent protection.

Proposed Exception No. 3 is for correlation with other code sections which permit overcurrent protection with ratings higher than conductor ampacities. Since the maximum overcurrent protection for conductors in Articles 430 and 630 are permissive values it may be concluded they don't apply if a panelboard bus constitutes part of the supply conductors.

If a feeder with an ampacity of 400 is enclosed in a gutter from which fused switches or circuit breakers are tapped to supply motor or welder load, the feeder overcurrent device may exceed the feeder ampacity. The same feeder supplying a 400 ampere panelboard with the same load is required to have overcurrent protection not to exceed 400 amperes if the panelboard includes a neutral and 10 percent of the circuits are rated 30-amperes or less. Electrically, what is the difference.

PANEL ACTION: Reject.

PANEL STATEMENT: See panel action and statement on Proposal 9-101.

With regard to Exception No. 2, the phrase "for existing installations" means the existing panelboard. It is not intended that a split-bus panelboard used in an individual dwelling occupancy be replaced if a circuit is added to the existing panelboard. It does mean, however, that for installations of new panelboards in new or existing residential occupancies, a split-bus, six-disconnect panelboard (with more than two circuit breakers or sets of fuses protecting the panelboard) is not permitted for the service equipment.

The panel reaffirms its decision during the 1999 Code cycle not to allow increased sizing of protective devices per Sections 430-62(a) and 430-63. The clarifications in Sections 384-14 and 384-16 were added because of the likelihood of abuse under the previous rules. It would be inconsistent to now allow the same panels to have overcurrent protection calculated according to a section of the NEC that requires a sophisticated analysis and inspection to be sure that it is properly applied.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #640)

9- 105 - (384-16(b)): Reject

SUBMITTER: Vohn N. Peeler, Faith, NC

RECOMMENDATION: Delete entire Section 384-16(b) and exception.

SUBSTANTIATION: The panelboard described in this section meets the definition of a lighting and appliance branch circuit panelboard as defined in 384-14(a). A panelboard that meets this definition cannot also be a power panel. The rules for providing overcurrent protection for a lighting and appliance branch circuit panelboard are covered in 384-16(a).

PANEL ACTION: Reject.

PANEL STATEMENT: The panelboard descriped in Section 384-16(b) is a power panelboard when the branch circuits rated 30 amperes or less are not connected to the neutral. These circuits could be fed by 30 ampere or less multi-pole breakers with no neutral connection.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #4221)

9- 106 - (384-16(b)): Accept in Principle

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Revise as follows:

Power Panelboard Protection. In addition to the requirements of Section 384-13, a power panelboard with supply conductors that include a neutral and having more than 10 percent of its overcurrent devices protecting branch circuits rated 30 amperes or less shall be protected ~~on the supply side~~ by an overcurrent protective device having a rating not greater than that of the panelboard. The overcurrent protective device shall be located at any point on the supply side of the panelboard.

SUBSTANTIATION: As I travel nationally presenting 1999 NEC changes seminars, one question that comes up repeatedly is "Why can't we use the feeder protection to protect the panelboard, assuming it has the appropriate rating?" I point out that since the feeder protection is "on the supply side" there isn't any problem, and a close reading of the Code clearly supports that conclusion. Nevertheless, people look for a comparable exception to Section 384-16(a), Exception No. 1, and not finding it, assume they have to use a panelboard with a main.

The reason for the exception in 384-16(a) is that there the principle rule allows for a double main, and the exception has to be independently stated since it inherently covers a single device. That isn't true in 384-16(b), however, I think some editorial clarification is in order, and this proposal does just that.

PANEL ACTION: Accept in Principle.

Revise the last sentence of the proposed wording to read as follows:

"The overcurrent protective device shall be located within, or at any point on the supply side of the panelboard."

PANEL STATEMENT: The revised wording meets the intent of the submitter and provides clarity.

(Log #880)

9- 107 - (384-16(c)): Accept
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete this section.
SUBSTANTIATION: This section is superfluous as it is already covered in Sections 210-19(a), 210-20(a), and 215-3 in a clearer fashion and not limited to panelboards. It may also be somewhat misleading since the requirement is not in Part B Switchboards, nor Article 380 for circuit breakers and fused switches. The requirements of the above noted sections apply without distinction as to enclosure types and correlate with UL maximum load restrictions which generally apply to circuit breakers, fused switches, and switchboards. The present wording may be confusing if a total load consists of both continuous load and noncontinuous load. For example, a 20-amepre circuit supplying ten general use receptacles (computed 15-ampere noncontinuous load) and 3-amperes continuous lighting load; total load exceeds 80 percent of the overcurrent device rating and violates this section as written. However, per Sections 210-19(a) and 210-20(a) the overcurrent device is not less than the 15-ampere noncontinuous load plus 125 percent of the continuous load (3.75 amperes), or 18.75-amperes, and complies with those sections.
PANEL ACTION: Accept.
Delete Section 384-16(d) and the Exception.
PANEL STATEMENT: The panel assumes that the submitter is referring to Section 384-16(d).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
REED: Section 384-16(d) correctly limits the load on any overcurrent devices in the panelboard, including the main, which is not covered by the referenced Articles 210 and 215. In addition, Section 210-19 covers the conductor sizing, not the size of the overcurrent devices. Having the present "(d)" adds clarity to the requirements for panelboards.
COMMENT ON AFFIRMATIVE:
DEMING: I agree with the panel action. However, if 384-16(d) and the Exception are to be deleted then the present paragraphs need to be renumbered as follows:
(e) should become (d)
(f) should become (e)
(g) should become (f).

(Log #2201)

9- 108 - (384-16(d)): Accept in Principle
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
The total load on any overcurrent device located in a panelboard shall not exceed 80 percent of its rating where, in normal operation, the load is a continuous load ~~will continue for three hours or more.~~
SUBSTANTIATION: "Standard terms have been established through accepted use or by definition and are to be used...". [NEC Style Manual 3.2.4 Standard Terms].
Continuous Load is defined in Article 100; therefore, the definition should not be repeated here. This is the only instance in the code where three hours or more is used instead of continuous load.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 9-107.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1452)

9- 109 - (384-16(h) (New)): Reject
SUBMITTER: Barry F. Tower, Patten, ME
RECOMMENDATION: Please add the following new text:
(h) Overcurrent protection of branch circuit grounded conductors and equipment grounding conductors. Overcurrent protection of branch circuit grounded conductors and equipment grounding conductors of the panelboard shall be provided where the following conditions exist: The panelboard is supplied by one or more ungrounded conductors, a grounded conductor, and an equipment grounding conductor, and no interconnection is permitted between the grounded circuit conductors and the equipment grounding conductors. The overcurrent protection shall interrupt ungrounded conductors, but never interrupt the continuity of any grounding conductor. Overcurrent shall be detected and interrupted by use of one of the following means:
1. Ground-fault type circuit breakers located on each branch circuit of the panelboard.
2. A single ground-fault device installed as the main circuit breaker in the panelboard.
3. A single ground-fault device installed within the branch circuit of another panelboard that supplies this panelboard.
Where a single ground-fault type device is used as permitted in 2 and 3 above, it shall be designed so that the ground-fault trip setting does not exceed 1 ampere.
SUBSTANTIATION: The purpose of this change is to prevent fires caused by "open neutrals" in mobile homes and buildings with subpanels. We all know about the dangers of short circuits, but we have been ignoring a much more serious problem. An open neutral feeding a four-wire 240/120V subpanel can start a fire if there is an interconnection between any branch circuit grounded neutral conductor and a grounding conductor. Open neutrals are a very common problem on mobile homes and buildings with subpanels, and accidental interconnections between a grounded conductor and a grounding conductor are even more common. Any such interconnection causes the grounded conductor and the grounding conductor to be in parallel with each other. A typical overload occurs as follows: The neutral conductor (may be rated at 100 amperes) becomes open, but instead of disconnecting the power, there is an alternate path for the circuit because the grounding conductor is accidentally connected in parallel with it. The neutral bus for the entire panelboard will be back fed through that alternate path (perhaps through no. 14 conductors in device box). There is no overcurrent protection on the grounded conductor or the grounding conductor, so there is no warning until the fire starts. There are several ways in which a grounded neutral conductor can be made parallel with an equipment grounding conductor. The equipment grounding conductor may be in contact with the grounded conductor inside a device box. Any defective appliance in which the neutral conductor is grounded to the case can burn down a building (if the neutral becomes open). Someone could have an appliance with a grounded neutral plugged in for many years and not know that they have any problem. Then one day their neutral becomes open and a fire starts. They had no warning and they had no way of knowing that the appliance was defective. Of course, this is only a problem on a 4-wire subpanels and mobile homes. Now we have changed the requirements for ranges and dryers to require a 4-wire plug on all new homes. I agree that this is the proper wiring method. Unfortunately we have increased the fire hazard while decreasing the electrocution hazard. I think that more people die from house fires than from electrocution - thousands more each year. With a 3-wire range, there was a shock hazard if the neutral became open. A person could complete the 120V path to ground by touching the case of the range. With a 4-wire range fed from a subpanel or mobile home, there is a fire hazard if the neutral becomes open and the bonding jumper on the back of the range is still attached. Most pigtails on ranges and dryers are installed by appliance delivery persons - not electricians. This proposal is the only way to protect the grounded circuit conductors and the equipment grounding conductors from overload where they are supplied from subpanels. Manufacturers could develop 2-pole GFCIs with a 1 ampere ground fault trip setting for this.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel disagrees with the submitter's technical substantiation. The panel does not understand how providing overcurrent protection in the branch-circuit grounded conductors and equipment grounding conductors would solve the problems discussed by the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #384)

9- 110 - (384-20): Reject
SUBMITTER: Larry T. Smith, Nat'l Electrical Seminars
RECOMMENDATION: Revise as follows:
Panelboard cabinets and panelboard frames, if of metal, shall be in physical contact with each other and shall be grounded.

Where the panelboard is used with nonmetallic raceway or cable or where separate grounding conductors are provided, a terminal bar for the grounding conductors shall be secured inside the cabinet. The terminal bar shall be bonded to the cabinet and panelboard frame, if of metal, otherwise it shall be connected to the grounding conductor that is run with the conductors feeding the panelboard.

Grounding conductors shall not be connected to a terminal bar provided for grounded conductors.

Exception No. 1: Grounding conductors shall be permitted to be connected to a terminal bar provided for grounded conductors (may be a neutral) when the bar is identified for the purpose and is located where interconnection between equipment grounding conductors and grounded circuit conductors is permitted or required by Article 250.

Exception No. 2: Where an isolated equipment grounding conductor is provided as permitted by Section 250-146(d), the insulated equipment grounding conductor that is run with the circuit conductors shall be permitted to pass through the panelboard without being connected to the panelboard's equipment grounding terminal bar.

~~Grounding conductors shall not be connected to a terminal bar provided for grounded conductors (may be a neutral) unless the bar is identified for the purpose and is located where interconnection between equipment grounding conductors and grounded circuit conductors is permitted or required by Article 250.~~

SUBSTANTIATION: The first paragraph demands the installation of a terminal bar for the connection of grounding conductors whenever a panelboard is used with nonmetallic raceway or cable, or where separate grounding conductors are installed. I recently inspected a new panelboard that was labeled when used as service equipment all unused neutral terminals may be used for terminating equipment ground wires. The panelboard did not contain a terminal bar for grounding conductors. This is according to paragraph two and in direct conflict with the first paragraph.

I am getting reports that many inspectors are reading the first paragraph and requiring the installation of a terminal bar for grounding conductors in all panelboards used with nonmetallic raceway or cable, or where separate grounding conductors are installed, virtually all panelboards. They are simply doing their job; that is exactly what the first paragraph of this section requires.

The best solution is to (1) restate the first sentence of paragraph two immediately following paragraph one, (2) create Exception No. 1 from the remainder of the second paragraph, and (3) renumber the existing exception as Exception No. 2.

PANEL ACTION: Reject.

PANEL STATEMENT: The exception in the present code is to the requirements in paragraph one of Section 384-20, and is correctly located. Paragraph one sets requirements for terminal bars in panelboards for connection of grounding conductors. The exception allows an isolated equipment grounding conductor used for the reduction of electrical noise to pass through the panelboard without connection to the terminal bar.

Paragraph two of Section 384-20 sets requirements for interconnection between grounded and grounding conductors, as permitted or required by Article 250. The proposed change would restate the requirement as an exception.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11COMMENT ON AFFIRMATIVE:

HARTWELL: In addition to the panel statement, the proposal submitter and other readers should understand that a terminal bar nonimally for grounded condutors, but bonded to the cabinet where so permitted, such as at a service entrance, thereby becomes a terminal bar for grounding conductors as well. As such, it then complies with the express terms of the first paragraph. The inspectors requiring otherwise are incorrect.

(Log #2904)

9- 111 - (384-20): Reject

SUBMITTER: Joseph E. Csenteri, Robbinsville, NJ

RECOMMENDATION: Added to 384-20:

All panelboards not classified as service equipment should have factory installed ground bus. (bars) Bars must be bonded to cabinet.

SUBSTANTIATION: This proposal will eliminate improvised grounding terminal bars.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter's concern is covered by Section 110-3(b).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #3883)

9- 112 - (384-20, Exception): Reject

SUBMITTER: J. Philip Simmons, Simmons Electrical Services

RECOMMENDATION: Revise text as follows:

384-20. Grounding of Panelboards. Panelboard cabinets and panelboard frames, if of metal, shall be in physical contact with each other and shall be grounded. Where the panelboard is used with nonmetallic raceway or cable or where separate grounding conductors are provided, a terminal bar for the grounding conductors shall be secured inside the cabinet. The terminal bar shall be bonded to the cabinet and panelboard frame, if of metal, otherwise it shall be connected to the grounding conductor that is run with the conductors feeding the panelboard.

Exception: Where an isolated equipment grounding conductor is provided as permitted by Section 250-146(d), the insulated equipment grounding conductor that is run with the circuit conductors shall be permitted to pass through the panelboard without being connected to the panelboard's equipment grounding terminal bar unless the panelboard is part of a separately derived system, is used as the building or structure disconnecting means, or is the service equipment.

Equipment grounding conductors shall not be connected to a terminal bar provided for grounded conductors (may be a neutral) unless the bar is identified for the purpose and is located where interconnection between equipment grounding conductors and grounded circuit conductors is permitted or required by Article 250.

SUBSTANTIATION: These changes will bring this section into compliance with Section 250-146(d). As presently worded, this section does not require that the isolated ground equipment grounding conductor terminate at the nearest of the separately derived system, building disconnecting means or the service.

PANEL ACTION: Reject.

PANEL STATEMENT: The first part of the Exception already says the installation needs to comply with Section 250-146(d) and the building disconnect rules need not be repeated here.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #3287)

9- 113 - (384-21 (New)): Accept

SUBMITTER: James T. Pauley, Square D Co.

RECOMMENDATION: Add a new 384-21 to read as follows:

384-21. Grounded Conductor Terminations. Each grounded conductor shall terminate within the panelboard in an individual terminal that is not also used for another conductor.

Exception: Grounded conductors of circuits with parallel parallel shall be permitted to terminate in a single terminal if the terminal is identified for connection of more than one conductor.

SUBSTANTIATION: This revision is needed to coordinate the installation requirements with a long standing product standard requirement. Clause 12.3.10 of UL 67 (Panelboards) states “An individual terminal shall be provided for the connection of each branch-circuit neutral conductor.” The requirement has been enforced in the past by a close review of the manufacturers markings and by NEC 110-3(b). However, since it is a rule that specifically effects how the installer can make connections, it is important that it be in the NEC.

Even with the manufacturers markings, inspectors still indicate that they see a number of panelboards installed with two (or more) branch circuit neutrals under one terminal or they see an equipment grounding conductor and neutral under the same terminal.

There is very good rationale for the requirement in the product standards. Doubling up on the neutrals creates a significant problem when the circuit needs to be isolated. In order to isolate the circuit, the branch breaker is turned off and the neutral is disconnected by removing it from the terminal. If the terminal is shared with another circuit, the connection on the other (still energized) circuit will be loosened as well. This can

wreak havoc, particularly if the neutral is part of a 120/240V multi-wire branch circuit. Also, the neutral assemblies are not evaluated with doubled-up neutrals in the terminals.

The connection of a neutral and equipment grounding conductor creates a similar issue. One of the objectives of the particular arrangement of bonding jumpers, neutrals and equipment grounds is to allow circuit isolation while keeping the equipment grounding conductor still connected to the grounding electrode (see UL 896A - Reference standard for Service Equipment). When the neutral is disconnected, the objective is to still have the equipment ground solidly connected to the grounding electrode. If both the neutral and grounded conductor are under the same terminal, this cannot be accomplished.

This addition to the NEC does not change any product or permitted wiring arrangement from what it is today. It will however, it will help installers to avoid wiring the panel in violation of 110-3(b) and then have to contend with a red-tag from the inspector.

The code language is proposed in a fashion to allow consistent enforcement of the provision the the AHJ. Although the UL wording is adequate for the product standard, it is important that the NEC language is as clear an unambiguous as possible. This is the reason for specifically noting that the terminal cannot be used for another conductor. Furthermore, the code requirement has been worded to make sure that both branch circuit and feeder neutrals are covered since it is not uncommon to have feeder breakers as well as branch breakers in the panelboard (the issue for the neutral is the same regardless of branch or feeder). Also, the term "grounded conductor" is used to be consistent with the code terminology and to recognize that not all grounded conductors are neutrals.

An exception has been proposed to avoid any confusion relative to parallel circuit arrangements. In these instances, multiple neutrals could be in a single terminal if the terminal has been identified as acceptable for multiple conductors.

PANEL ACTION: Accept.

In the proposed exception, change the second instance of the word "parallel" to "conductors".

PANEL STATEMENT: The correction of the typographical error meets the intent of the submitter.

ARTICLE 400 — FLEXIBLE CORDS AND CABLES

(Log #1077)

6- 146 - (400): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise Article 400 as follows:
Table 400-4, Note 5 - change "No. 20" to "20 AWG" in two places
Table 400-4, Note 8 - change "Nos. 10" to "10 AWG"
Table 400-4, Note 10 - change "No. 20 through 14" to "20 through 14 AWG" and "No. 12" to "12 AWG"
400-9 - change "No. 14" to "14 AWG"
400-12, Exception - change "No. 10" to "10 AWG"
400-13 - change "No. 18" to "18 AWG"
400-21, Exception - change "No. 8" to "8 AWG" and "No. 10" to "10 AWG"
400-31, Exception - change "No. 10" to "10 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3 or Article 400.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
PANEL STATEMENT: See panel statement on Proposal 6-7.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2933b)

6- 147 - (400, 402): Accept in Principle in Part
NOTE: The Technical Correlating Committee understands that the panel has accepted those portions of the Proposal which fall under its Scope. The Technical Correlating Committee directs that the term "luminaire" be accepted as shown by the panel, but be followed by the existing term in parenthesis. This action is intended to provide consistency throughout the code.
The Technical Correlating Committee refers this Proposal to Code-Making Panels 1 and 18 for action on Items (b) and (c) of the Recommendation. This action will be considered by Panels 1 and 18 as a Public Comment.
SUBMITTER: Bernard J. Mezger, American Lighting Association
RECOMMENDATION: Incorporate "luminaire" into the 2002 NEC:
(a) To incorporate the use of the inclusive wording "luminaire" throughout the Code wherever the ambiguous wording "fixture" or "lighting fixture" is used and the intent and meaning is a complete lighting unit consisting of a fixture and the lamp(s), called a "luminaire".
(b) Add the definition of "luminaire" to Article 100-1 as follows:
Luminaire. A complete lighting unit consisting of a lamp, or lamps, and a ballast (when applicable), together with the parts designed to distribute the light, to position the lamp(s), and connect the lamp(s) to the power supply.
(c) Delete the FPN from Section 410-1 (an identical definition).
SUBSTANTIATION: Clarify the true meaning and intent of the item described as a "fixture", or a "lighting fixture", by providing the proper wording for a complete lighting unit. A luminaire consists of a fixture plus lamp(s). The definition and use proposed is consistent with that published and used by IESNA and NEMA.
PANEL ACTION: Accept in Principle in Part.
Part A of the recommendation is accepted. Parts B and C are not being acted on.
PANEL STATEMENT: Parts B and C are outside of the scope Panel 6. See panel statement on Proposal 6-1.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #340)

6- 148 - (Table 400-4): Accept
SUBMITTER: Siegfried A. Schauffele, Essex Group Inc.
RECOMMENDATION: Increase the number of permitted circuit conductors for Type G-GC from 3 to 6, the same as Type G, and change "plus 2 grounding conductors" to "grounding conductors", the same as Type G, there is no need to specify number of grounds.
SUBSTANTIATION: User requests for Type G-GC cable with more than 3 circuit conductors. Since Type G-GC is nothing more than a Type G plus an insulated ground-check conductor, there is no technical or safety reason to limit G-GC to 3 circuit conductors.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #341)

6- 149 - (Table 400-4): Reject
SUBMITTER: Siegfried A. Schauffele, Essex Group Inc.
RECOMMENDATION: Increase the maximum conductor size for single conductor Type W to 1000 kcmil.
SUBSTANTIATION: Users require larger cables. Present maximum size is 500 kcmil. ICEA S-75-381, the Canadian Electrical Code and CSA Standard C22.2 No. 96 have sizes to 1000 kcmil. A supplementary proposal to add ampacities to Table 400-5(b) will be made.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The recommendation is not complete in regard to the required changes in Table 400-4.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
POST: I vote to accept. See my Explanation of Negative on Proposal 6-61 - future problems with harmonization of ampacity tables could be avoided.

(Log #1247)

6- 150 - (Table 400-4): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Add SI units for insulation thicknesses using the following conversion table.
Under "Nominal Insulation Thickness" add a new column entitled "mm" between "AWG" and "Mils" and insert the SI equivalents for the nominal insulation thickness based on the following table.
Change the footnotes to Table 400-4 as follows:
Note 2: Change "8 ft (2.44 m)" to read "2.5 m (8 ft)".
Note 8: Change "45 mils" to read "1.14 mm (45 mil)".
Note 10: Change "30 mil-insulation thickness" to read "0.76 mm (30 mil insulation thickness".
Note 10: Change "45-mil insulation thickness" to read "1.14 mm (45 mil) insulation thickness".
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
A "soft" conversion is necessary to conform to U.S. industry practice and applicable product standards.
PANEL ACTION: Accept.
A bracket must be added after 30 mil on note 10.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2126)

6- 151 - (Table 400-4): Reject
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 14 for comment.
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Replace "nonhazardous" with "unclassified".
SUBSTANTIATION: This is a companion proposal to other proposals which provide a definition of unclassified in Articles 100, 500, and 505, and provides correlation. The term "Classified" refers to the type of material/hazard potential involved, i.e., Class I, Division 1, Class II, Division 2, etc. Terms such as nonhazardous and unclassified are used in both the NEC, the Uniform Building Code (UBC) and other NFPA documents. The term nonhazardous infers that the area has "no" hazards while the term "unclassified" more clearly correlates with the condition of being reviewed but found not to need classification. This action provides needed correlation with other NFPA documents, such as NFPA 497. Additionally the term "nonhazardous" is used 7 times within various parts of the NEC and in at least one place in the NEC the meaning of nonhazardous applies to voltages and not classification. A companion proposal has been made to change the term "nonhazardous" to "unclassified" as appropriate elsewhere in the NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: Code terminology is a Code-wide issue. Panel 6 requests guidance from the TCC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
MCCLUNG: The term "unclassified" is more specific to indicate that such areas are just the opposite of classified areas. The NEC electrical hazardous (classified) areas are further designated with Class, Division, and Group Classifications rather than Class, Division, and Group Hazards.
PETTIGREW: I disagree with the Panel Action. The issue is just being avoided. The term "unclassified" provides a much clearer description of an area that has been examined and found to be suitable for general purpose equipment, than the term "nonhazardous", which could imply a false sense of security that other nonelectrical related hazards also do not exist. The Code is intended to make electrical installations safe, and the clear interpretation of the wording and definitions in the Code are necessary to meet that intent. "Unclassified" is the logical converse to the definition of "classified" areas as used throughout the Code.

(Log #2242)

6- 152 - (Table 400-4): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: In Table 400-4: change the phrase "flame-retardant" (or "flame retardant") to "flame tested" in three (3) places in column titled "Outer Covering" and in two (2) places in notes: "Note 5" and "Note 9."
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.
[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
PANEL ACTION: Reject.
PANEL STATEMENT: Cables are listed for their flame retardant properties and some of their applications are referenced in the Code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

[1]**See Note 8.**

[2]**The required outer covering on some single conductor cables may be integral with the insulation.**

Notes:

1. Except for Types HPN, SP-1, SP-2, SP-3, SPE-1, SPE-2, SPE-3, SPT-1, SPT-2, SPT-3, TPT, and three-conductor parallel versions of SRD, SRDE, SRDT, individual conductors are twisted together.

2. Types TPT, TS, and TST shall be permitted in lengths not exceeding 8 ft (2.44 m) where attached directly, or by means of a special type of plug, to a portable appliance rated at 50 watts or less and of such nature that extreme flexibility of the cord is essential.

3. Rubber-filled or varnished cambric tapes shall be permitted as a substitute for the inner braids.

4. Types G, G-GC, S, SC, SCE, SCT, SE, SEO, SEOO, SO, SOO, ST, STO, STOO, PPE, and W shall be permitted for use on theater stages, in garages, and elsewhere where flexible cords are permitted by this Code.

5. Elevator traveling cables for operating control and signal circuits shall contain nonmetallic fillers as necessary to maintain concentricity. Cables shall have steel supporting members as required for suspension by Section 620-41. In locations subject to excessive moisture or corrosive vapors or gases, supporting members of other materials shall be permitted. Where steel supporting members are used, they shall run straight through the center of the cable assembly and shall not be cabled with the copper strands of any conductor.

In addition to conductors used for control and signaling circuits, Types E, EO, ET, ETLB, ETP, and ETT elevator cables shall be permitted to incorporate in the construction, one or more No. 20 telephone conductor pairs, one or more coaxial cables, or one or more optical fibers. The No. 20 conductor pairs shall be permitted to be covered with suitable shielding for telephone, audio, or higher frequency communications circuits; the coaxial cables consist of a center conductor, insulation, and shield for use in video or other radio frequency communications circuits. The optical fiber shall be suitably covered with flame-retardant thermoplastic. The insulation of the conductors shall be rubber or thermoplastic of thickness not less than specified for the other conductors of the particular type of cable. Metallic shields shall have their own protective covering. Where used, these components shall be permitted to be incorporated in any layer of the cable assembly but shall not run straight through the center.

6. The third conductor in these cables shall be used for equipment grounding purposes only. The insulation of the grounding conductor for Types SPE-1, SPE-2, SPE-3, SPT-1, SPT-2, AND SPT-3 shall be permitted to be thermoset polymer.

7. The individual conductors of all cords, except those of heat-resistant cords, shall have a thermoset or thermoplastic insulation, except that the equipment grounding conductor where used shall be in accordance with Section 400-23(b).

8. Where the voltage between any two conductors exceeds 300, but does not exceed 600, flexible cord of Nos. 10 and smaller shall have thermoset or thermoplastic insulation on the individual conductors at least 45 mils in thickness, unless Type S, SE, SEO, SEOO, SO, SOO, ST, STO, or STOO cord is used.

9. Insulations and outer coverings that meet the requirements as flame retardant, limited smoke, and are so listed, shall be permitted to be designated limited smoke with the suffix *LS* after the code type designation.

10. Elevator cables in sizes No. 20 through 14 are rated 300-volts, and sizes 10 through 2 are rated 600 volts. No. 12 is rated 300 volts with a 30 mil-insulation thickness and 600 volts with a 45 mil-insulation thickness.

11. Conductor size for Types EV, EVJ, EVE, EVJE, EVT, and EVJT cables apply to nonpower-limited circuits only. Conductors of power-limited (data, signal, or communications) circuits may extend beyond the stated AWG size range. All conductors shall be insulated for the same cable voltage rating.

12. Insulation thickness for Types EV, EVJ, EVE, EVJE, EVT, and EVJT cables of nylon construction is indicated in parentheses.

SUBSTANTIATION: There is no indication as to the voltage ratings of flexible cords and cables in Table 400-4 per se. It is only an optional marking on the surface print of the cord. The CEC Part I lists voltage ratings in Table 11. The NEC should also.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3064)

6- 154 - (Table 400-4): Reject
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Extend the range of sizes of SPT-2 to 14 AWG. Nominal insulation thickness to be 45 mils.
SUBSTANTIATION: There is a need in the industry for a #14 AWG SPT-2 cord for higher ampacity applications and reduced voltage drops in cord sets. The only available parallel cord in this conductor size is an SPT-3, which is intended for refrigerators and air conditioners.
PANEL ACTION: Reject.
PANEL STATEMENT: For the required application SPT-3 can be used. Also, no data has been submitted to support the proposed insulation thickness.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1EXPLANATION OF NEGATIVE:
POST: I vote to accept, if this cord is manufactured and is available why not add it to table.
COMMENT ON AFFIRMATIVE:
FRIEDMAN: Affirm the Panel Action to reject with the following comment:
"Understand rejection due to the insufficient technical support, however, this proposal should be accepted once the information is provided."

(Log #3065)

6- 155 - (Table 400-4): Reject
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Extend the range of sizes on multi-conductor Types W and G to include 12 AWG and 10 AWG and adopt the CEC Part I Table 12A ampacities for those sizes.
SUBSTANTIATION: The CEC Part I lists multi-conductor Types W and G down to 12 AWG in Table 11, along with their respective ampacities in Table 12A. These cables are needed for stage cable and other applications where the larger sizes are not practical.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal does not include all of the table data.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3341)

6- 159 - (Table 400-4): Accept in Principle
SUBMITTER: Samuel B. Friedman, BICCGeneral/Rep. CANENA Flexible Cord Harmonization Committee
RECOMMENDATION: Add NISP-1, NISP-2, NISPT-1, NISPT-2, NISPE-1, and NISPE-2 to Table 400-4. The -1 products will have an insulation thickness of 0.015 in. and a size range of #20 AWG to #18 AWG. The -2 products will have an insulation thickness of 0.030 in. and a size range of #18 AWG to #16 AWG. See suggested revision to Table 400-4. This revision should be inserted before twisted portable cord in Table 400-4. In addition, change outer covering column in Table 400-4 for SP-1, SP-2, SP-3, SPE-1, SPE-2, SPE-3, SPT-1, SPT-2 and SPT-3 to read "None" since these can no longer be nonintegral cords.
SUBSTANTIATION: Several appliances, such as televisions are now required by UL to employ the nonintegral, jacketed version of parallel cord. Since the fittings used with these cords can be different than those used with the integral versions a new type designation was necessary. These new types need to be incorporated in Table 400-4.
Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept in Principle.
In addition to the recommendation, modify Notes 1 and 6 to Table 400-4 as follows:
1. All Types listed in Table 400-4 shall have individual conductors twisted together except for Types HPN, SP-1, SP-2, SP-3, SPE-1, SPE-2, SPE-3, SPT-1, SPT-2, SPT-3, TPT, NISP-1, NISP-2, NISPT-1, NISPT-2, NISPE-1, NISPE-2, and three-conductor parallel versions of SRD, SRDE, and SRDT.
6. The third conductor in these cables shall be used for equipment grounding purposes only. The insulation of the grounding conductor for Types SPE-1, SPE-2, SPE-3, SPT-1, SPT-2, SPT-3, NISPT-1, NISPT-2, NISPE-1, and NISPE-2 shall be permitted to be thermoset polymer.
PANEL STATEMENT: These products previously existed under different nomenclature, i.e. SPT-1, non-integral.

6- 164 - (Table 400-4 Note 9): Accept
SUBMITTER: Ravindra H. Ganatra, Alcan Cable /Rep. CANENA Tech Harmonization Subcomm. For Bldg Wire and Cable Products
RECOMMENDATION: Revise the Footnote 9 to the Table 400-4 as follows:
9. Insulations and outer coverings that meet the requirements as flame retardant, limited smoke, and are so listed, shall be permitted to be marked for ~~designated~~ limited smoke ~~with the suffix LS~~ after the code type designation.
SUBSTANTIATION: This proposal is submitted on behalf of the THSC - Building Wire and Cable Product Standards, of Council of Harmonization of Electrotechnical Standardization of North America (CANENA).
Abbreviation LS has been found to represent different requirements in different national product standards in North America. In Mexico, "LS" is used to indicate compliance with requirements associated with marking for low smoke. In the US, "LS" marking has been used to indicate compliance with requirements associated with marking for limited smoke. However, the requirements in Mexico and the US are different. Further, requirements for "ST1" marking used in Canada are similar to limited smoke marking used in the US.
Thus, removal of the abbreviation in the Code will facilitate harmonization of marking requirements in the product standards.
The proposal does not recommend any change in the test method or performance requirements for a product being evaluated for limited smoke marking.
PANEL ACTION: Accept.

(Log #4222)

6- 165 - (400-5): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise the table to read as follows:

Number of Current-Carrying Conductors	Percent of Values in Tables 400-5A and 400-5B
4 through 6	80
7 through 24	70
25 through 42	60
43 and above	50

FPN: Overheating may occur where continuous, fully loaded conductor diversity is less than 50 percent and the number of current-carrying conductors exceeds nine. See Section 310-10.
SUBSTANTIATION: This is a companion proposal to a similar one on Section 310-15(b)(2)(a). Electricians are not installing conductors so as not to energize them, or load them to only half of their normal ampacity. From the 1993 NEC forward the NEC has effectively disallowed any cord make-up with 10 or more conductors. The data on which the panel relied does not translate well into real world experience. A circuit is never 100 percent loaded for continuous periods due to listing restrictions on overcurrent protective devices. Because conductor heating is proportional to the current squared, a very small reduction from maximum current values produces a great reduction in heating. This is why no loss experience has ever been produced stemming from the 50 or more years the 1984 language was in the Code.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 6-61.

6- 174 - (400-7(a)): Reject
NOTE: The following proposal consists of Comment 6-74 on Proposal 6-122 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 6-122 was:
Modify to read:
Flexible cords and cables shall be used only for (1) pendants; (2) wiring of fixtures and signs; (3) connection of portable lamps, portable and mobile signs or appliances; (4) elevator cables; (5) wiring of cranes and hoists; (6) connection of stationary equipment to facilitate their frequent interchange; (7) prevention of the transmission of noise or vibration; (8) appliances where the fastening means and mechanical connections are specifically designed to permit ready removal for maintenance and repair, and the appliance is intended or identified for flexible cord connection; (9) data processing cables as permitted by Section 645-5; (10) connection of moving parts; or (11) temporary wiring as permitted in Sections 305-4(b) and 305-4(c).
SUBMITTER: Tom Dunn, Butler Amusements/Rep. Outdoor Amusement Bus. Assn.
RECOMMENDATION: Add to end of last sentence:
(12) Portable wiring as permitted in Section 525-13.
SUBSTANTIATION: Section 525-13 permits the use of flexible cords and cables and provides direction for their use.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is a redundant reference.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2855)

6- 175 - (400-7(a)(5)): Reject
SUBMITTER: Bill F. Neitzel, Madison, WI
RECOMMENDATION: Add new text after cranes and hoists:
"as permitted in Sections 610-11(c), 610-11(d), and 610-13(c)."
SUBSTANTIATION: Without the added wording, it appears to permit cord connection of cranes and hoists even if the crane/hoist does not require flexibility. This text addition would clarify when cords can be used for cranes/hoists.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is a redundant reference.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2145)

6- 176 - (400-7(a)(6)): Reject
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Revise text to read as follows:
"Connection of stationary, portable or mobile utilization equipment to facilitate their frequent interchange."
SUBSTANTIATION: Within most companies there are manufacturing machines that produce more than one product. To produce so many products on one machine, it must be reconfigured each time during the "process changeover" to produce a different product. This usually entails electrically disconnecting and connecting flexible cords of the mobile or portable utilization equipment. Once the new configuration is done, the machine may run hours to days until it's time to reconfigure and run another product.
PANEL ACTION: Reject.
PANEL STATEMENT: Uses already permitted address the application described in the substantiation, 400-7(a)(6). Proposed text alone would imply an alternate for hard wiring.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
PETTIGREW: Although the Panel believes that use outlined in the substantiation is already permitted, there is much confusion in the field over this issue. Stationary equipment is not clearly defined in the NEC and there is not a general understanding of what it means. Equipment described in the substantiation is not considered as stationary equipment in the field. The equipment described in the substantiation can be skid mounted and moved by a forklift or it can be equipment mounted on wheels and can be rolled into place. This equipment is often defined as mobile equipment or sometimes defined as portable equipment, although you cannot pick it up without mechanical assistance. Adding the proposed wording would clarify what the Panel says is already permitted.

(Log #882)

6- 177 - (400-7(a)(12) (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add a new paragraph (12) to read as follows:
(12) feeders as permitted in Sections 550-5, 553-7, and 555-6.
SUBSTANTIATION: Since chapters other than 1 through 4 are referenced, the proposed sections should be included, for user friendliness.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is a redundant reference.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3690)

6- 178 - (400-7(e)(12) (New)): Reject
SUBMITTER: Tom Dunn, Rep. Outdoor Amusement Business Assn.
RECOMMENDATION: Add text to read:
(12) Portable wiring as permitted in Section 525.13.
SUBSTANTIATION: Section 400-8 prohibits the use of flexible cords or cables as the permanent wiring of a structure. This forces the use of THHN wires run through same wireway for the permanent wiring on portable amusement rides. As these rides move, either during their operation or during their transportation from one location to another, this (THHN) type of wiring is subjected to wear which it wouldn't be subjected to as the wiring of an immovable building or structure. There are situations where, within one circuit, the wiring switches from flexible cable to wires within wireway and back to flexible cable again. By allowing the use of flexible cable, in one continuous run, these splices can be eliminated.
There have been no problems encountered with the use of flexible cords or cables as the permanent wiring on portable rides. Flexible cords or cables have been installed along the steel structural members, as well as within structural members and wireways successfully.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is a redundant reference.

(Log #4384)

6- 179 - (400-8): Reject
SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Add text to read:
"For the purpose of this section ventilated, non-acoustical type ceiling panels such as eggcrate type shall be considered as dropped or suspended ceilings."
SUBSTANTIATION: Ceiling panels are sometimes used in dropped or suspended ceilings that are not completely solid, such as used for aesthetic or ventilation purposes or where light fixtures are located directly above them. In these applications if flexible cord is installed above the ceiling tile, it is not visible unless standing directly beneath it. Where other equipment is located below the cord and above the ceiling panel, the cord is not visible at all. There are many other readily available wiring methods that can be used in these situations. Flexible cord should not be permitted above ceilings of any type.
PANEL ACTION: Reject.
PANEL STATEMENT: The recommendation is covered by 400-8(5). See the definition of "concealed" for additional clarification.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #23)

6- 180 - (400-8 Exceptions No. 1 and No. 2 (New)): Reject
NOTE: The following proposal consists of Comment 6-76 on Proposal 6-127 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 6-127 was:
Revise and designate the existing exception as Exception No. 1 and add a second exception as follows:
Exception No. 1: Flexible cord and cable shall be permitted to have one connection to the building surface for a suitable tension take-up device. Length of the cord or cable from the supply termination to the take-up device shall be limited to 8 ft (2.44 m).
Exception No. 2: Flexible cord shall be permitted to be installed in raceways where its calculated ampacity has been further derated by a factor of 0.8, or where its ampacity has been calculated under Section 310-15(b).
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Accept in Principle revise proposed Exception No. 2:
Listed flexible cord lighting strings with integral (molded) lampholders and means for attachment of support shall be permitted to be attached to building or structure surfaces, where installed in conformance with Article 305.
SUBSTANTIATION: These assemblies are commonly supported overhead during building construction. Many have molded tabs for support attachment. This comment would correlate with Proposal 3-167.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is a redundant reference.

(Log #884)

6- 182 - (400-8(2) and (5)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(2) Where run through holes in walls, structural ceilings or floors, suspended ceilings, or dropped ceilings.
(5) Where concealed behind building walls, structural ceilings or floors, or installed above suspended or dropped ceilings. ~~or floors.~~
SUBSTANTIATION: Editorial. The definition of concealed indicates a flexible cord above a suspended or dropped ceiling with lift-out titles or access panel is not concealed, especially if the ceiling is not a structural component. Designating the floor as structural would correlate with Section 645-5(d).
PANEL ACTION: Reject.
PANEL STATEMENT: The recommendation does not further clarify the existing text.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4223)

6- 183 - (400-8(4), Exception): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:
"Flexible cord and cable shall be permitted to be attached to building surfaces in accordance with the provisions of Section 364-8. For other applications, where the length of the cord from the supply termination to a suitable tension take-up device is limited to 8 feet (2.44 m), flexible cord shall be permitted to have one connection to the building surface."

SUBSTANTIATION: This proposal allows for traditional cord extensions from other, non-busway sources such as overhead wireways. The present NEC isn't clear whether or not that entire family of cord use dropped out of the 1999 Code. The 1999 rule only mentions Section 364-8, and the scope of that section only covers extensions from busways (naturally, since that's what Article 364 covers.) One theory holds that "the provisions" involved here are the installation rules for similar applications, such as that the vertical drop be vertical and so on. The other, more literal theory, holds that no cords can extend to a take-up device unless they originate at a busway.

The latter view represents an enormous change in standard installation practice, and there wasn't a shred of technical substantiation in the last Code cycle to support such a preposterous restriction. This proposal, by covering other non-busway applications in a separate sentence, clearly allows those other applications to continue.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided any technical substantiation to support the recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3638)

6- 184 - (400-8(4) Exception No. 1 (New)): Reject
SUBMITTER: Will Dockham, Gilmanton Iron Works, NH
RECOMMENDATION: Change the existing Exception to Exception No. 2, and add the following new Exception No. 1:

Exception No. 1: Flexible cord and cable shall be permitted to have one connection to the building surface for a suitable tension take-up device. Length of the cord or cable from the supply termination to the tension take-up device shall be limited to 6 ft (1.83 m).

Exception No. 2: Flexible cord and cable run from busways shall be permitted to be attached to building surfaces in accordance with the provisions of Section 364-8.
SUBSTANTIATION: Changes to Section 400-8(4) Exception, in the 1999 NEC, have caused considerable confusion because of the reference to Section 364-8. Many inspectors have interpreted the exception to allow connection to building surface only when cord or cable is run from busway. That certainly was not the intent of Proposal 6-127 (Proposals to the 1999 NEC, Log #3205). Also, the panel gave no substantiation for limiting the connection of cord or cable to building surfaces via a tension take-up device, to busway installations only.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 6-183.

(Log #2501)

6- 185 - (400-8(5)): Reject
SUBMITTER: Andre R. Cartal, Bldg Dept., Princeton Borough, NJ
RECOMMENDATION: Revise as follows:

(5) Where ~~concealed~~ located behind building walls, structural ceilings, suspended ceilings, dropped ceilings, or floors.
SUBSTANTIATION: As now written there is a conflict with the panel intent since the word "concealed" as used in this section would permit cords in these locations based on the definition of "concealed" in Article 100.
PANEL ACTION: Reject.
PANEL STATEMENT: Existing code text and the definition of "concealed" adequately address this issue.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3364)

6- 186 - (400-8(5)): Reject
SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Revise 400-8(5) to read as follows:

5. Where ~~concealed~~ located behind building walls, structural ceilings, suspended ceilings, dropped ceilings, or floors.
SUBSTANTIATION: As presently worded the argument can be made that the wiring behind a suspended (accessible) ceiling may not be considered concealed especially when reviewing the definitions for concealed and exposed. Other sections such as 410-30(c)(1)(b) require that cords are continuously visible for their entire length. Flexible cord located out of site such as behind suspended ceiling panels is subject to damage or fatigue which would not be readily detected. Various flexible wiring methods are readily available for connecting equipment in these locations.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel statement on Proposal 6-185.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3067)

6- 187 - (400-8(6), Exception (New)): Reject
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Add an exception to 400-8(b) as follows:

"Exception: Flexible cord and cable shall be permitted to be installed in raceways where its calculated ampacity has been further derated by a factor of 0.8, or where its ampacity has been calculated under Section 310-15(b)."
SUBSTANTIATION: Flexible cords and cables are typically used in exposed locations where ambient air circulates. In applications where these cords and cables are installed in raceways, an additional factor must be incorporated into the formula to make an allowance for the heat generated.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed recommendation would permit the use of flexible cord for permanent wiring which is presently limited in the Code.

6- 192 - (400-22): Accept
NOTE: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 5 and 15 for information.
SUBMITTER: Charles F. Mello, Milwaukie, OR
RECOMMENDATION: Revise text to read as follows:
400.22. Grounded-Conductor Identification. One conductor of flexible cords that is intended to be used as a grounded circuit conductor shall have a continuous marker that readily distinguishes it from the other conductor or conductors. The identification shall consist of one of the methods indicated in (a) through (f).
(a) Colored Braid. A braid finished to show a white or ~~natural~~ gray color and the braid on the other conductor or conductors finished to show a readily distinguishable solid color or colors.
(b) Tracer in Braid. A tracer in a braid of any color contrasting with that of the braid and no tracer in the braid of the other conductor or conductors. No tracer shall be used in the braid of any conductor of a flexible cord that contains a conductor having a braid finished to show white or ~~natural~~ gray.
Exception: In the case of Types C and PD and cords having the braids on the individual conductors finished to show white or ~~natural~~ gray. In such cords, the identifying marker shall be permitted to consist of the solid white or ~~natural~~ gray finish on one conductor provided there is a colored tracer in the braid of each other conductor.
(c) Colored Insulation. A white or ~~natural~~ gray insulation on one conductor and insulation of a readily distinguishable color or colors on the other conductor or conductors for cords having no braids on the individual conductors.
For jacketed cords furnished with appliances, one conductor having its insulation colored light blue, with the other conductors having their insulation of a readily distinguishable color other than white or ~~natural~~ gray.
Exception: Cords that have insulation on the individual conductors integral with the jacket. The insulation shall be permitted to be covered with an outer finish to provide the desired color.
(d) Colored Separator. A white or ~~natural~~ gray separator on one conductor and a separator of a readily distinguishable solid color on the other conductor or conductors of cords having insulation on the individual conductors integral with the jacket.
SUBSTANTIATION: Delete the word natural since the color natural gray is not defined and in fact does not exist as a specified color for wire insulation. This proposal goes with the definition of gray within a specified range of color per the Munsell color system as used by industry for wire color coding. The definition of the gray is provided in another proposal.
PANEL ACTION: Accept.
PANEL STATEMENT: This change may effect other parts of the Code.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2518)

6- 193 - (400-22(a) through (f)): Accept in Principle
SUBMITTER: Richard E. Loyd, Perryville, AR
RECOMMENDATION: Revise as follows:
(a) Colored Braid. A braid finished to show a white ~~or natural gray color~~ and the braid on the other conductor or conductors finished to show a readily distinguishable solid color or colors.
(b) Tracer in Braid. A tracer in a braid of any color contrasting with that of the braid and no tracer in the braid of the other conductor or conductors. No tracer shall be used in the braid of any conductor of a flexible cord that contains a conductor having a braid finished to show white ~~or natural gray.~~
Exception: In the case of Types C and PD and cords having the braids on the individual conductors finished to show white or natural gray. In such cords, the identifying marker shall be permitted to consist of the solid white ~~or natural gray finish~~ on one conductor provided there is a colored tracer in a braid of each other conductor.
(c) Colored Insulation. A white ~~or natural gray~~ insulation on one conductor and insulation of a readily distinguishable color or colors on the other conductor or conductors for cords having no braids on the individual conductors.
For jacketed cords furnished with appliances, one conductor having its insulation colored light blue with the other conductors having their insulation of a readily distinguishable color other than white ~~or natural gray.~~
Exception: Cords that have insulation on the individual conductors integral with the jacket. The insulation shall be permitted to be covered with an outer finish to provide the desired color.
(d) Colored Separator. A white ~~or natural gray~~ separator on one conductor and a separator of a readily distinguishable solid color on the other conductor or conductors of cords having insulation on the individual conductors integral with the jacket.
(e) Tinned Conductors. One conductor having the individual strands untined for cords having insulation on the individual conductors integral with the jacket.
(f) Surface Marking. One or more stripes, ridges, or grooves located on the exterior of the cord so as to identify one conductor for cords having insulation on the individual conductors integral with the jacket.
SUBSTANTIATION: This term is undefined. The past Chairman of CMP 5 and others with historical data as to where this term originally came from all relate to products or product manufacturing process that has not been used for the past 35 to 50 years. Since it is a term that was used to define a product no longer made it should be deleted to eliminate the confusion that continues to exist in the industry.
There are many shades of white and many shades of black. How does one determine if gray is a shade of black or white? Different manufactures use various shades of each color and often two or three different manufactures wire will be installed on the same job site. The continued use of the term causes confusion and is or could be a safety issue that might result in life threatening shock hazard.

PANEL ACTION: Accept in Principle.
Do not delete the word "gray".

6- 197 - (400-25 (New)): Accept
SUBMITTER: Siegfried A. Schauffele, Essex Group Inc.
RECOMMENDATION: Add the following new section:
400-25. The outer covering of flexible cords and cables shall be flame retardant.
SUBSTANTIATION: Flexible cords and cables are used without the protection of raceways, and are directly exposed to many external fire hazards. Current (UL) requirements for some portable power cables such as type W, G, G-GC do not require a flame test.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
PETTIGREW: I disagree with the Panel Action because there is insufficient data in the substantiation to warrant this change in the Code. If there is a need for flame retardant flexible cords or cables in specific applications, there are existing types (elevator cable, for example) which can be used. The submitter presented no backup documentation to support the general nature of the proposal, such as statistical data on the frequency of fires where flexible cords or cables were involved. The Panel Action could result in the requirement that these cables now be listed, which may not be the result intended by the submitter. In the field, flexible cords and cables are often used over and over. If not marked or identified in accordance with this proposal, would all the existing cables in use have to be replaced at significant costs to the owners?
COMMENT ON AFFIRMATIVE:
GALAN: The submitter's intent is that all portable cables comply with a flame test. The proposed new paragraph states that the outer covering is flame retardant. We believe the proper wording should be:
"400-25. Flexible cords and cables shall be flame retardant."

(Log #885)

ARTICLE 402 — FIXTURE WIRES

(Log #536)

6- 200 - (402): Reject
SUBMITTER: Paul Petit, American Insulated Wire Corp.
RECOMMENDATION: Create four new 60°C wet-rated fixture wires Types TFW, TFFW, TFWN and TFFWN

Additions to Table 402-3

Thermoplastic Covered Fixture Wire-Solid or 7-Strand	TFW	Thermoplastic	18-16 30	None	60°C 140°F Wet or Dry	Fixture Wiring
Thermoplastic Covered Fixture Wire-Flexible Stranding	TFFW	Thermoplastic	18-16 30	None	60°C 140°F Wet or Dry	Fixture Wiring
Heat-resistant Thermoplastic Covered Fixture Wire-Solid or 7-Strand	TFWN	Thermoplastic	18-16 15	Nylon-jacketed or Equivalent	90°C 194°F Dry 60°C 140°F Wet	Fixture Wiring
Heat-resistant Thermoplastic Covered Fixture Wire-Flexible Stranded	TFFWN	Thermoplastic	18-16 15	Nylon-jacketed or Equivalent	90°C 194°F Dry 60°C 140°F Wet	Fixture Wiring

SUBSTANTIATION: There is a need for wet rated 18 AWG and 16 AWG Fixture Wires. Authorities having jurisdiction want assurances that the fixture wires being used have some kind of wet rating, as in similarly constructed Appliance Wires, such as Style 1408 which has a 60°C wet rating. Water can enter in the raceways where these products are used, (in fire alarm or gasoline pump applications.) which is cause for removal when the wire doesn't have a wet rating.
PANEL ACTION: Reject.
PANEL STATEMENT: No fact finding report has been submitted for a new product type.

6- 203 - (Table 402-3): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" (or "flame retardant") to "flame tested" in "*" note at the end of the Table 402-3.
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.

[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
PANEL ACTION: Reject.

SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Extend the range of sizes on Types SF-2 and SFF-2 to include 12 AWG and 10 AWG. Nominal insulation thickness to be 30 mils on 12 AWG and 45 mils on 10 AWG.
SUBSTANTIATION: Customers are presently purchasing larger sizes of "SF-2" and "SFF-2" under AWM Styles 3074, 3075, 3070, and 3101. Larger sizes of fixture wire are currently allowed on Type XFF, including 12 and 10 AWG.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept.

6- 205 - (Table 402-3 Note): Accept
SUBMITTER: Ravindra H. Ganatra, Alcan Cable /Rep. CANENA Tech Harmonization Subcomm. For Bldg Wire and Cable Products
RECOMMENDATION: Revise the Footnote to Table 402-3 as follows:
*Insulations and outer coverings that meet the requirements of flame retardant, limited smoke and are so listed shall be permitted to be marked for ~~designated~~ limited smoke ~~with the suffix LS~~ after the code type designation.
SUBSTANTIATION: This proposal is submitted on behalf of the THSC - Building Wire and Cable Product Standards, of Council of Harmonization of Electrotechnical Standardization of North America (CANENA).
Abbreviation LS has been found to represent different requirements in different national product standards in North America. In Mexico, "LS" is used to indicate compliance with requirements associated with marking for low smoke. In the US, "LS" marking has been used to indicate compliance with requirements associated with marking for limited smoke. However, the requirements in Mexico and the US are different. Further, requirements for "ST1" marking used in Canada are similar to limited smoke marking used in the US.
Thus, removal of the abbreviation in the Code will facilitate harmonization of marking requirements in the product standards.
The proposal does not recommend any change in the test method or performance requirements for a product being evaluated for limited smoke marking.
PANEL ACTION: Accept.

(Log #1078)

6- 206 - (402-6): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Change "No. 18" to "18 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3 or in Table 402-3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
PANEL STATEMENT: See panel statement Proposal on 6-7.

(Log #886)

6- 207 - (402-8): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
~~One conductor of~~ Fixture A fixture wire~~s~~ that is intended to be used as a grounded conductor shall be identified by means of continuous white stripes or by the means described in Sections 400-22(a) through (e).
SUBSTANTIATION: Editorial. More than one conductor of fixture wires may be a grounded conductor (multiple sets in a raceway, fixtures with multiple pairs of conductors).
The proposal specifies the stripe(s) to be continuous and white.
PANEL ACTION: Reject.
PANEL STATEMENT: Requirements for conductor marking are already covered.

6- 209 - (402-9(b)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Change "24 in. (610 mm)" to "610 mm (24 in.)".
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
A "soft" conversion is necessary to conform to U.S. industry practice for 610 mm (24 in.) requirement. The SI units for "610 mm (24 in.)" are not rounded since the measurement is product specific and 610 mm may be required to complete the legend, 600 mm may be too short.
PANEL ACTION: Accept.

6- 210 - (402-9(c), FPN): Accept in Principle
SUBMITTER: Ravindra H. Ganatra, Alcan Cable /Rep. CANENA T Harmonization Subcomm. For Bldg Wire and Cable Products
RECOMMENDATION: Revise the FPN to 402-9(c) as follows:
FPN: Examples of these markings include~~,~~ but are not limited to~~,~~ markings suitable for limited smoke, sunlight resistant, etc. ~~"LS" for limited smoke and markings such as "sunlight resistant."~~
SUBSTANTIATION: This proposal is submitted on behalf of the THSC - Building Wire and Cable Product Standards, of Council of Harmonization of Electrotechnical Standardization of North America (CANENA).

Abbreviation LS has been found to represent different requirements in different national product standards in North America. In Mexico, "LS" is used to indicate compliance with requirements associated with marking for low smoke. In the US, "LS" marking has been used to indicate compliance with requirements associated with marking for limited smoke. However, the requirements in Mexico and the US are different. Further, requirements for "ST1" marking used in Canada are similar to limited smoke marking used in the US.

Thus, removal of the abbreviation in the Code will facilitate harmonization of marking requirements in the product standards.

The proposal does not recommend any change in the test method or performance requirements for a product being evaluated for limited smoke marking.

PANEL ACTION: Accept in Principle.

Add the following text to 402-9(c).

"These markings include, but are not limited to, markings for limited smoke, sunlight resistance, etc."

Delete FPN.

PANEL STATEMENT: The panel is implementing a requirement of the NEC Style Manual to delete FPNs and make them Code text.

6- 211 - (402-11, Exception): Accept in Principle

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

Exception: ~~As~~ Fixture wires shall be permitted in accordance with Section 620-11 for elevators and dumbwaiters, Section 725-27 for Class 1 circuits, Section 725-52 for Class 2 and Class 3 circuits, and Section 760-27 for fire alarm circuits.

SUBSTANTIATION: Revised to sentence form with additional sections where use is permitted. Section 620-11 does not limit use to Class 1 circuits. Section 725-52 only requires an insulation rating which fixture wires comply with, and if suitable for Class 1 use should be suitable for Class 2 and 3.

PANEL ACTION: Accept in Principle.

Delete the existing exception.

PANEL STATEMENT: See first sentence of the substantion for Proposal 6-208.

ARTICLE 410 — LIGHTING FIXTURES, LAMPHOLDERS, LAMPS, AND RECEPTACLES

(Log #547)

18- 3 - (410): Accept

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: a) Section 410-3 Exception: Replace "8 ft (2.44 m)" with "2.5 m (8 ft)".

b) Section 410-4(d): Replace "3 ft (914 mm)" with "900 mm (3 ft)"; Replace "8 ft (2.44 m)" with "2.5 m (8 ft)".

c) Section 410-6: Replace "8 ft (2.44 m)" with "2.5 m (8 ft)".

d) Section 410-8(a): Replace "6 ft (1.83 m)" with "1.8 m (6 ft)"; Replace "24 in. (610 mm)" with "600 mm (24 in.)"; Replace "12 in. (305 mm)" with "300 mm (12 in.)" in 2 locations.

e) Section 410-8(d): Replace "12 in. (305 mm)" with "300 mm (12 in.)"; Replace "6 in. (152 mm)" with "150 mm (6 in.)" in 3 locations.

f) Section 410-15(a): Replace "6 lb (2.72 kg)" with "3 kg (6 lb)"; Replace "16 in. (406 mm)" with "400 mm (16 in.)".

g) Section 410-15(b)(1): Replace "2 in. x 4 in. (50.8 mm x 102 mm)" with "50 mm x 100 mm (2 in. x 4 in.)".

h) Section 410-15(b)(1) Exception No. 1: Replace "8 ft (2.44 m)" with "2.5 m (8 ft)".

i) Section 410-15(b)(1) Exception No. 2: Replace "20 ft (6.10 m)" with "6.0 m (20 ft)".

j) Section 410-15(b)(3) Exception: Replace "8 ft (2.44 m)" with "2.5 m (8 ft)".

k) Section 410-16(a): Replace "50 lb (22.7 kg)" with "23 kg (50 lb)" in 2 locations.

l) Section 410-18(a): Replace "1 1/2 in. (38 mm)" with "38 mm (1 1/2 in.)".

m) Section 410-27(c): Replace "3 ft (914 mm)" with "900 mm (3 ft)".

n) Section 410-29(c): Replace "2 in. (50.8 mm)" with "50 mm (2 in.)"; Replace "12 in. (305 mm)" with "300 mm (12 in.)".

o) Section 410-30(a): Replace "3/8-in." with "12 (3/8)"; Replace "9/32 in. (7.14 mm)" with "7 mm (9/32 in.)"; Replace "13/32 in. (10.3 mm)" with "11 mm (13/32 in.)".

p) Section 410-31: Replace "3 in. (76 mm)" with "75 mm (3 in.)".

q) Section 410-35(a): Replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".

r) Section 410-38(a): Replace "0.040 in. (1.016 mm)" with "1.02 mm (0.040 in.)"; Replace "0.025 in. (0.635 mm)" with "0.64 mm (0.025 in.)".

s) Section 410-38(b): Replace "8 lb (3.63 kg)" with "4 kg (8 lb)"; Replace "0.020 in. (0.508 mm)" with "0.51 mm (0.020 in.)" in 2 locations; Replace "0.016 in. (0.4064 mm)" with "0.41 mm (0.016 in.)".

t) Section 410-38(c): Replace "0.025 in. (0.635 mm)" with "0.64 mm (0.025 in.)"; Replace "3 1/2 in. (89 mm)" with "90 mm (3 1/2 in.)".

u) Section 410-46: Replace "1/2 in. (12.7 mm)" with "13 mm (1/2 in.)".

v) Section 410-50: Replace "1/8 in. (3.18 mm)" with "3 mm (1/8 in.)".

w) Section 410-56(d): Replace "0.030 in. (0.762 mm)" with "0.76 mm (0.030 in.)"; Replace "0.040 in. (1.016 mm)" with "1.02 mm (0.040 in.)"; Replace "0.010 in. (2.54 mm)" with "2.54 mm (0.010 in.)" in 2 locations.

x) Section 410-56(e): Replace "0.015 in. (0.381 mm)" with "0.4 mm (0.015 in.)".

y) Section 410-66(a)(1): Replace "1/2 in. (12.7 mm)" with "13 mm (1/2 in.)".

z) Section 410-66(b): Replace "3 in. (76 mm)" with "75 mm (3 in.)".

aa) Section 410-67(c): Replace "1 ft (305 mm)" with "300 mm (1 ft)"; Replace "18 in. (450 mm)" with "450 mm (18 in.)"; Replace "6 ft (1.83 m)" with "1.8 m (6 ft)".

bb) Section 410-70: Replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".

cc) Section 410-76(b): Replace "1 1/2 in. (38 mm)" with "38 mm (1 1/2 in.)".

dd) Section 410-76(b) FPN: Replace "20 lb/ft^3 (320.36 kg/m^3)" with "320 kg/m^3 (20 lb/ft^3)" in 2 locations.

ee) Section 410-77(c): Replace "3/8-in." with "12 (3/8) trade size"; Replace "25 ft (7.62 m)" with "7.5 m (25 ft)".

ff) Section 410-91: Replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".

gg) Section 410-101(c): Replace "5 ft (1.52 m)" with "1.5 m (5 ft)"; Replace "3 ft (914 mm)" with "900 mm (3 ft)"; Replace "8 ft (2.44 m)" with "2.5 m (8 ft)".

hh) Section 410-104: Replace "4 ft (1.22 m)" with "1.2 m (4 ft)" in 2 locations.

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #633)

18- 4 - (410): Accept

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts as modified by Proposal 18-5.

SUBMITTER: Jack Wells, Pass & Seymour/Legrand

RECOMMENDATION: Revise Article 410 for receptacles, cord connectors and attachment plugs (cord caps) as proposed below:

ARTICLE 410 -- Lighting Fixtures, Lampholders, and Lamps~~, and Receptacles~~

A. General

410-1. Scope

This article covers lighting fixtures, lampholders, pendants, ~~receptacles,~~ incandescent filament lamps, arc lamps, electric-discharge lamps, the wiring and equipment forming part of such lamps, fixtures, and lighting installations.

FPN: The international term for a lighting fixture is luminaire and is defined as a complete lighting unit consisting of a lamp or lamps together with the parts designed to distribute the light, to position and protect the lamps, and to connect the lamps to the power supply.

410-2. Application of Other Articles

Equipment for use in hazardous (classified) locations shall conform to Articles 500 through 517. Lighting systems operating at 30 volts or less shall conform to Article 411. Arc lamps used in theaters shall comply with Section 520-61, and arc lamps used in projection machines shall comply with Section 540-20. Arc lamps used on constant-current systems shall comply with the general requirements of Article 490.

410-3. Live Parts

Fixtures, lampholders, and lamps~~, and receptacles~~ shall have no live parts normally exposed to contact. Exposed accessible terminals in lampholders, ~~receptacles,~~ and switches shall not be installed in metal fixture canopies or in open bases of portable table or floor lamps.

Exception: Cleat-type lampholders ~~and receptacles~~ located at least 8 ft (2.44 m) above the floor shall be permitted to have exposed terminals.

B. Fixture Locations

410-4. Fixtures in Specific Locations

(a) Wet and Damp Locations. Fixtures installed in wet or damp locations shall be installed so that water cannot enter or accumulate in wiring compartments, lampholders, or other electrical parts. All fixtures installed in wet locations shall be marked, "Suitable for Wet Locations." All fixtures installed in damp locations shall be marked, "Suitable for Wet Locations" or "Suitable for Damp Locations."

(b) Corrosive Locations. Fixtures installed in corrosive locations shall be of a type suitable for such locations.

(c) In Ducts or Hoods. Fixtures shall be permitted to be installed in commercial cooking hoods where all of the following conditions are met.

1. The fixture shall be identified for use within commercial cooking hoods and installed so that the temperature limits of the materials used are not exceeded.

2. The fixture shall be constructed so that all exhaust vapors, grease, oil, or cooking vapors are excluded from the lamp and wiring compartment. Diffusers shall be resistant to thermal shock.

3. Parts of the fixture exposed within the hood shall be corrosion resistant or protected against corrosion, and the surface shall be smooth so as not to collect deposits and facilitate cleaning.

4. Wiring methods and materials supplying the fixture(s) shall not be exposed within the cooking hood.

FPN: See Section 110-11 for conductors and equipment exposed to deteriorating agents.

(d) Bathtub and Shower Areas. No parts of cord-connected fixtures, hanging fixtures, lighting track, pendants, or ceiling-suspended (paddle) fans shall be located within a zone measured 3 ft (914 mm) horizontally and 8 ft (2.44 m) vertically from the top of the bathtub rim or shower stall threshold. This zone is all encompassing and includes the zone directly over the tub or shower stall.

410-5. Fixtures Near Combustible Material

Fixtures shall be constructed, or installed, or equipped with shades or guards so that combustible material will not be subjected to temperatures in excess of 90°C (194°F).

410-6. Fixtures Over Combustible Material

Lampholders installed over highly combustible material shall be of the unswitched type. Unless an individual switch is provided for each fixture, lampholders shall be located at least 8 ft (2.44 m) above the floor, or shall be located or guarded so that the lamps cannot be readily removed or damaged.

410-7. Fixtures in Show Windows

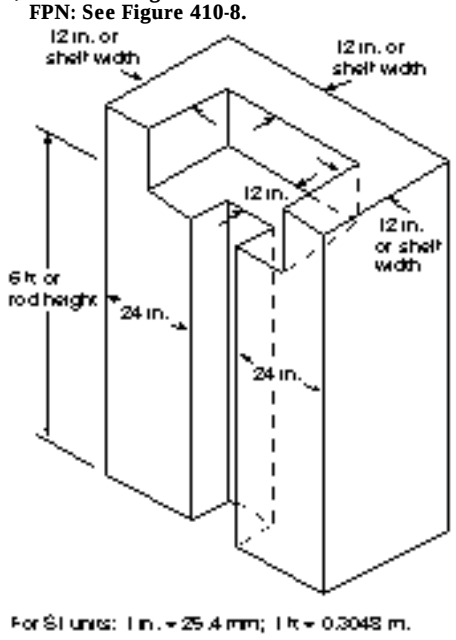
Chain-supported fixtures used in a show window shall be permitted to be externally wired. No other externally wired fixtures shall be used.

410-8. Fixtures in Clothes Closets

(a) Definition.

Storage Space. Storage space shall be defined as a volume bounded by the sides and back closet walls and planes extending from the closet floor vertically to a height of 6 ft (1.83 m) or the highest clothes-hanging rod and parallel to the walls at a horizontal distance of 24 in. (610 mm) from the sides and back of the closet walls respectively, and continuing vertically to the closet ceiling parallel to the walls at a horizontal distance of 12 in. (305 mm) or the width of the shelf, whichever is greater.

FPN: See Figure 410-8.



For SI units: 1 in. = 25.4 mm; 1 ft = 0.3048 m.

Figure 410-8 Closet storage space.

For a closet that permits access to both sides of a hanging rod, the storage space shall include the volume below the highest rod extending 12 in. (305 mm) on either side of the rod on a plane horizontal to the floor extending the entire length of the rod.

(b) Fixture Types Permitted. Listed fixtures of the following types shall be permitted to be installed in a closet:

1. A surface-mounted or recessed incandescent fixture with a completely enclosed lamp

2. A surface-mounted or recessed fluorescent fixture

(c) Fixture Types Not Permitted. Incandescent fixtures with open or partially enclosed lamps and pendant fixtures or lampholders shall not be permitted.

(d) Location. Fixtures in clothes closets shall be permitted to be installed as follows.

1. Surface-mounted incandescent fixtures installed on the wall above the door or on the ceiling, provided there is a minimum clearance of 12 in. (305 mm) between the fixture and the nearest point of a storage space.

2. Surface-mounted fluorescent fixtures installed on the wall above the door or on the ceiling, provided there is a minimum clearance of 6 in. (152 mm) between the fixture and the nearest point of a storage space.

3. Recessed incandescent fixtures with a completely enclosed lamp installed in the wall or the ceiling, provided there is a minimum clearance of 6 in. (152 mm) between the fixture and the nearest point of a storage space.

4. Recessed fluorescent fixtures installed in the wall or on the ceiling, provided there is a minimum clearance of 6 in. (152 mm) between the fixture and the nearest point of a storage space.

410-9. Space for Cove Lighting

Coves shall have adequate space and shall be located so that lamps and equipment can be properly installed and maintained.

C. Provisions at Fixture Outlet Boxes, Canopies, and Pans

410-10. Space for Conductors
Canopies and outlet boxes taken together shall provide adequate space so that fixture conductors and their connecting devices can be properly installed.
410-11. Temperature Limit of Conductors in Outlet Boxes
Fixtures shall be of such construction or installed so that the conductors in outlet boxes shall not be subjected to temperatures greater than that for which the conductors are rated.
Branch-circuit wiring, other than 2-wire or multiwire branch-circuits supplying power to fixtures connected together, shall not be passed through an outlet box that is an integral part of a fixture unless the fixture is identified for through-wiring.
FPN: See Section 410-31, Exceptions No. 2 and 3 for circuits supplying power to fixtures connected together.
410-12. Outlet Boxes to Be Covered
In a completed installation, each outlet box shall be provided with a cover unless covered by means of a fixture canopy, lampholder, receptacle, or similar device.
410-13. Covering of Combustible Material at Outlet Boxes
Any combustible wall or ceiling finish exposed between the edge of a fixture canopy or pan and an outlet box shall be covered with noncombustible material.
410-14. Connection of Electric-Discharge Lighting Fixtures
(a) Independent of the Outlet Box. Electric-discharge lighting fixtures supported independent of the outlet box shall be connected to the branch circuit through metal raceway, nonmetallic raceway, Type MC cable, Type AC cable, Type MI cable, nonmetallic sheathed cable, or by flexible cord as permitted in Section 410-30(b) or (c).
(b) Access to Boxes. Electric-discharge lighting fixtures surface mounted over concealed outlet, pull, or junction boxes shall be installed with suitable openings in back of the fixture to provide access to the boxes.
D. Fixture Supports
410-15. Supports
(a) General. Fixtures~~,~~ and lampholders~~, and receptacles~~ shall be securely supported. A fixture that weighs more than 6 lb (2.72 kg) or exceeds 16 in. (406 mm) in any dimension shall not be supported by the screw shell of a lampholder.
(b) Metal Poles Supporting Lighting Fixtures. Metal poles shall be permitted to be used to support lighting fixtures and as a raceway to enclose supply conductors, provided the following conditions are met.
1. A metal pole shall have a handhole not less than 2 in. x 4 in. (50.8 mm x 102 mm) with a raintight cover to provide access to the supply terminations within the pole or pole base.
Exception No. 1: No handhole shall be required in a pole 8 ft (2.44 m) or less in height above grade where the supply wiring method continues without splice or pull point, and where the interior of the pole and any splices are accessible by removing the fixture.
Exception No. 2: No handhole shall be required in a metal pole 20 ft (6.10 m) or less in height above grade that is provided with a hinged base.
2. Where raceway risers or cable is not installed within the pole, a threaded fitting or nipple shall be brazed or welded to the pole opposite the handhole for the supply connection.
3. A metal pole shall be provided with a grounding terminal.
a. A pole with a handhole shall have the grounding terminal accessible from the handhole.
b. A pole with a hinged base shall have the grounding terminal accessible within the base.
Exception: No grounding terminal shall be required in a pole 8 ft (2.44 m) or less in height above grade where the supply wiring method continues without splice or pull, and where the interior of the pole and any splices are accessible by removing the fixture.
4. A pole with a hinged base shall have the hinged base and pole bonded together.
5. Metal raceways or other equipment grounding conductors shall be bonded to the pole with an equipment grounding conductor recognized by Section 250-118 and sized in accordance with Section 250-122.
6. Conductors in vertical metal poles used as raceway shall be supported as provided in Section 300-19.
410-16. Means of Support
(a) Outlet Boxes. Outlet boxes or fittings installed as required by Section 370-23 shall be permitted to support fixtures weighing 50 lb (22.7 kg) or less. A fixture that weighs more than 50 lb (22.7 kg) shall be supported independent of the outlet box unless the outlet box is listed for the weight to be supported.
(b) Inspection. Fixtures shall be installed so that the connections between the fixture conductors and the circuit conductors can be inspected without requiring the disconnection of any part of the wiring unless the fixtures are connected by attachment plugs and receptacles.
(c) Suspended Ceilings. Framing members of suspended ceiling systems used to support fixtures shall be securely fastened to each other and shall be securely attached to the building structure at appropriate intervals. Fixtures shall be securely fastened to the ceiling framing member by mechanical means such as bolts, screws, or rivets. Listed clips identified for use with the type of ceiling framing member(s) and fixture(s) shall also be permitted.
(d) Fixture Studs. Fixture studs that are not a part of outlet boxes, hickeys, tripods, and crowfeet shall be made of steel, malleable iron, or other material suitable for the application.
(e) Insulating Joints. Insulating joints that are not designed to be mounted with screws or bolts shall have an exterior metal casing, insulated from both screw connections.
(f) Raceway Fittings. Raceway fittings used to support a lighting fixture(s) shall be capable of supporting the weight of the complete fixture assembly and lamp(s).
(g) Busways. Fixtures shall be permitted to be connected to busways in accordance with Section 364-12.
(h) Trees. Outdoor lighting fixtures and associated equipment shall be permitted to be supported by trees.
FPN No. 1: See Section 225-26 for restrictions for support of overhead conductors.
FPN No. 2: See Section 300-5(d) for protection of conductors.
E. Grounding
410-17. General
Fixtures and lighting equipment shall be grounded as required in Article 250 and Part E of this article.
410-18. Exposed Fixture Parts
(a) Exposed Conductive Parts. Exposed metal parts shall be grounded or insulated from ground and other conducting surfaces or inaccessible to unqualified personnel. Lamp tie wires, mounting screws, clips, and decorative bands on glass spaced at least 1 1/2 in. (38 mm) from lamp terminals shall not be required to be grounded.
(b) Made of Insulating Material. Fixtures directly wired or attached to outlets supplied by a wiring method that does not provide a ready means for grounding shall be made of insulating material and shall have no exposed conductive parts.
410-20. Equipment Grounding Conductor Attachment
Fixtures with exposed metal parts shall be provided with a means for connecting an equipment grounding conductor for such fixtures.
410-21. Methods of Grounding
Fixtures and equipment shall be considered grounded where mechanically connected to an equipment grounding conductor as specified in Section 250-118 and sized in accordance with Section 250-122.
F. Wiring of Fixtures
410-22. Fixture Wiring — General
Wiring on or within fixtures shall be neatly arranged and shall not be exposed to physical damage. Excess wiring shall be avoided. Conductors shall be arranged so that they shall not be subjected to temperatures above those for which they are rated.
410-23. Polarization of Fixtures
Fixtures shall be wired so that the screw shells of lampholders will be connected to the same fixture or circuit conductor or terminal. The grounded conductor, where connected to a screw-shell lampholder, shall be connected to the screw shell.
410-24. Conductor Insulation
Fixtures shall be wired with conductors having insulation suitable for the environmental conditions, current, voltage, and temperature to which the conductors will be subjected.
FPN: For ampacity of fixture wire, maximum operating temperature, voltage limitations, minimum wire size, etc., see Article 402.
410-27. Pendant Conductors for Incandescent Filament Lamps
(a) Support. Pendant lampholders with permanently attached leads, where used for other than festoon wiring, shall be hung from separate stranded rubber-covered conductors that are soldered directly to the circuit conductors but supported independently thereof.
(b) Size. Unless part of listed decorative lighting assemblies, pendant conductors shall not be smaller than No. 14 for mogul-base or medium-base screw-shell lampholders, nor smaller than No. 18 for intermediate or candelabra-base lampholders.

(c) Twisted or Cabled. Pendant conductors longer than 3 ft (914 mm) shall be twisted together where not cabled in a listed assembly.

410-28. Protection of Conductors and Insulation

(a) Properly Secured. Conductors shall be secured in a manner that will not tend to cut or abrade the insulation.

(b) Protection Through Metal. Conductor insulation shall be protected from abrasion where it passes through metal.

(c) Fixture Stems. Splices and taps shall not be located within fixture arms or stems.

(d) Splices and Taps. No unnecessary splices or taps shall be made within or on a fixture.

FPN: For approved means of making connections, see Section 110-14.

(e) Stranding. Stranded conductors shall be used for wiring on fixture chains and on other movable or flexible parts.

(f) Tension. Conductors shall be arranged so that the weight of the fixture or movable parts will not put a tension on the conductors.

410-29. Cord-Connected Showcases

Individual showcases, other than fixed, shall be permitted to be connected by flexible cord to permanently installed receptacles, and groups of not more than six such showcases shall be permitted to be coupled together by flexible cord and separable locking-type connectors with one of the group connected by flexible cord to a permanently installed receptacle.

The installation shall comply with (a) through (e) of this section.

(a) Cord Requirements. Flexible cord shall be of the hard-service type, having conductors not smaller than the branch-circuit conductors, having ampacity at least equal to the branch-circuit overcurrent device, and having an equipment grounding conductor.

FPN: See Table 250-122 for size of equipment grounding conductor.

(b) Receptacles, Connectors, and Attachment Plugs. Receptacles, connectors, and attachment plugs shall be of a listed grounding type rated 15 or 20 amperes.

(c) Support. Flexible cords shall be secured to the undersides of showcases so that (1) wiring will not be exposed to mechanical damage; (2) a separation between cases not in excess of 2 in. (50.8 mm), nor more than 12 in. (305 mm) between the first case and the supply receptacle, will be ensured; and (3) the free lead at the end of a group of showcases will have a female fitting not extending beyond the case.

(d) No Other Equipment. Equipment other than showcases shall not be electrically connected to showcases.

(e) Secondary Circuit(s). Where showcases are cord-connected, the secondary circuit(s) of each electric-discharge lighting ballast shall be limited to one showcase.

410-30. Cord-Connected Lampholders and Fixtures

(a) Lampholders. Where a metal lampholder is attached to a flexible cord, the inlet shall be equipped with an insulating bushing that, if threaded, shall not be smaller than nominal 3/8-in. pipe size. The cord hole shall be of a size appropriate for the cord, and all burrs and fins shall be removed in order to provide a smooth bearing surface for the cord.

Bushing having holes 9/32 in. (7.14 mm) in diameter shall be permitted for use with plain pendant cord and holes 13/32 in. (10.3 mm) in diameter with reinforced cord.

(b) Adjustable Fixtures. Fixtures that require adjusting or aiming after installation shall not be required to be equipped with an attachment plug or cord connector provided the exposed cord is of the hard usage or extra-hard usage type and is not longer than that required for maximum adjustment. The cord shall not be subject to strain or physical damage.

(c) Electric-Discharge Fixtures.

1. A listed fixture or a listed assembly shall be permitted to be cord connected if

a. The fixture is located directly below the outlet box or busway, and

b. The flexible cord is

1. Visible for its entire length outside the fixture,

2. Not subject to strain or physical damage, and

3. Terminated in a grounding-type attachment plug cap, busway plug or have a fixture assembly with a strain relief and canopy.

2. Electric-discharge lighting fixtures provided with mogul-base, screw-shell lampholders shall be permitted to be connected to branch circuits of 50 amperes or less by cords complying with Section 240-4. Receptacles and attachment plugs shall be permitted to be of lower ampere rating than the branch circuit but not less than 125 percent of the fixture full-load current.

3. Electric-discharge lighting fixtures equipped with a flanged surface inlet shall be permitted to be supplied by cord pendants equipped with cord connectors. Inlets and connectors shall be permitted to be of lower ampere rating than the branch circuit but not less than 125 percent of the fixture load current.

410-31. Fixtures as Raceways

Fixtures shall not be used as a raceway for circuit conductors.

Exception No. 1: Fixtures listed for use as a raceway.

Exception No. 2: Fixtures designed for end-to-end assembly to form a continuous raceway or fixtures connected together by recognized wiring methods shall be permitted to carry through conductors of a 2-wire or multiwire branch circuit supplying the fixtures.

Exception No. 3: One additional 2-wire branch circuit separately supplying one or more of the connected fixtures described in Exception No. 2 shall be permitted to be carried through the fixtures.

FPN: See Article 100 for definition of "Multiwire Branch Circuits."

Branch-circuit conductors within 3 in. (76 mm) of a ballast within the ballast compartment shall have an insulation temperature rating not lower than 90°C (194°F), such as Types RHH, THW, THHN, THHW, FEP, FEPB, SA, and XHHW.

G. Construction of Fixtures

410-34. Combustible Shades and Enclosures

Adequate airspace shall be provided between lamps and shades or other enclosures of combustible material.

410-35. Fixture Rating

(a) Marking. All fixtures shall be marked with the maximum lamp wattage or electrical rating, manufacturer's name, trademark, or other suitable means of identification. A fixture requiring supply wire rated higher than 60°C (140°F) shall be marked in letters not smaller than 1/4 in. (6.35 mm) high, prominently displayed on the fixture and shipping carton or equivalent.

(b) Electrical Rating. The electrical rating shall include the voltage and frequency and shall indicate the current rating of the unit, including the ballast, transformer, or autotransformer.

410-36. Design and Material

Fixtures shall be constructed of metal, wood, or other material suitable for the application and shall be designed and assembled so as to secure requisite mechanical strength and rigidity. Wiring compartments, including their entrances, shall be such that conductors may be drawn in and withdrawn without physical damage.

410-37. Nonmetallic Fixtures

When fixture wiring compartments are constructed from combustible material, armored or lead-covered conductors with suitable fittings shall be used or the wiring compartment shall be lined with metal.

410-38. Mechanical Strength

(a) Tubing for Arms. Tubing used for arms and stems where provided with cut threads shall not be less than 0.040 in. (1.016 mm) in thickness and where provided with rolled (pressed) threads shall not be less than 0.025 in. (0.635 mm) in thickness. Arms and other parts shall be fastened to prevent turning.

(b) Metal Canopies. Metal canopies supporting lampholders, shades, etc., exceeding 8 lb (3.63 kg), or incorporating attachment-plug receptacles, shall not be less than 0.020 in. (0.508 mm) in thickness. Other canopies shall not be less than 0.016 in. (0.4064 mm) if made of steel and not less than 0.020 in. (0.508 mm) if of other metals.

(c) Canopy Switches. Pull-type canopy switches shall not be inserted in the rims of metal canopies that are less than 0.025 in. (0.635 mm) in thickness unless the rims are reinforced by the turning of a bead or the equivalent. Pull-type canopy switches, whether mounted in the rims or elsewhere in sheet metal canopies, shall not be located more than 3 1/2 in. (89 mm) from the center of the canopy.

Double set-screws, double canopy rings, a screw ring, or equal method shall be used where the canopy supports a pull-type switch or pendant receptacle.

The above thickness requirements shall apply to measurements made on finished (formed) canopies.

410-39. Wiring Space

Bodies of fixtures, including portable lamps, shall provide ample space for splices and taps and for the installation of devices, if any. Splice compartments shall be of nonabsorbent, noncombustible material.

410-42. Portable Lamps

(a) General. Portable lamps shall be wired with flexible cord recognized by Section 400-4 and an attachment plug of the polarized

or grounding type. Where used with Edison-base lampholders, the grounded conductor shall be identified and attached to the screw shell and the identified blade of the attachment plug.
(b) Portable Handlamps. In addition to the provisions of Section 410-42(a), portable handlamps shall comply with the following.
1. Metal shell, paper-lined lampholders shall not be used.
2. Handlamps shall be equipped with a handle of molded composition or other insulating material.
3. Handlamps shall be equipped with a substantial guard attached to the lampholder or handle.
4. Metallic guards shall be grounded by the means of an equipment grounding conductor run with circuit conductors within the power-supply cord.
5. Portable handlamps shall not be required to be grounded where supplied through an isolating transformer with an ungrounded secondary of not over 50 volts.

410-44. Cord Bushings
A bushing or the equivalent shall be provided where flexible cord enters the base or stem of a portable lamp. The bushing shall be of insulating material unless a jacketed type of cord is used.

410-45. Tests
All wiring shall be free from short circuits and grounds and shall be tested for these defects prior to being connected to the circuit.

410-46. Live Parts
Exposed live parts within porcelain fixtures shall be suitably recessed and located so as to make it improbable that wires will come in contact with them. There shall be a spacing of at least 1/2 in. (12.7 mm) between live parts and the mounting plane of the fixture.

H. Installation of Lampholders

410-47. Screw-Shell Type
Lampholders of the screw-shell type shall be installed for use as lampholders only. Where supplied by a circuit having a grounded conductor, the grounded conductor shall be connected to the screw shell.

410-48. Double-Pole Switched Lampholders
Where supplied by the ungrounded conductors of a circuit, the switching device of lampholders of the switched type shall simultaneously disconnect both conductors of the circuit.

410-49. Lampholders in Wet or Damp Locations
Lampholders installed in wet or damp locations shall be of the weatherproof type.

J. Construction of Lampholders

410-50. Insulation
The outer metal shell and the cap shall be lined with insulating material that shall prevent the shell and cap from becoming a part of the circuit. The lining shall not extend beyond the metal shell more than 1/8 in. (3.17 mm) but shall prevent any current-carrying part of the lamp base from being exposed when a lamp is in the lampholding device.

410-52. Switched Lampholders
Switched lampholders shall be of such construction that the switching mechanism interrupts the electrical connection to the center contact. The switching mechanism shall also be permitted to interrupt the electrical connection to the screw shell if the connection to the center contact is simultaneously interrupted.

K. Lamps and Auxiliary Equipment

410-53. Bases, Incandescent Lamps
An incandescent lamp for general use on lighting branch circuits shall not be equipped with a medium base if rated over 300 watts, nor with a mogul base if rated over 1500 watts. Special bases or other devices shall be used for over 1500 watts.

410-54. Electric-Discharge Lamp Auxiliary Equipment
(a) Enclosures. Auxiliary equipment for electric-discharge lamps shall be enclosed in noncombustible cases and treated as sources of heat.
(b) Switching. Where supplied by the ungrounded conductors of a circuit, the switching device of auxiliary equipment shall simultaneously disconnect all conductors.

~~L. Receptacles, Cord Connectors, and Attachment Plugs (Caps)~~

~~410-56. Rating and Type~~

~~(a) Receptacles. Receptacles installed for the attachment of portable cords shall be rated at not less than 15 amperes, 125 volts, or 15 amperes, 250 volts, and shall be of a type not suitable for use as lampholders.~~

~~(b) CO/ALR Receptacles. Receptacles rated 20 amperes or less and directly connected to aluminum conductors shall be marked CO/ALR.~~

~~(c) Isolated Ground Receptacles. Receptacles intended for the reduction of electrical noise (electromagnetic interference) as permitted in Section 250-146(d) shall be identified by an orange triangle located on the face of the receptacle. Receptacles so identified shall be used only with grounding conductors that are isolated in accordance with Section 250-146(d). Isolated ground receptacles installed in nonmetallic boxes shall be covered with a nonmetallic faceplate.~~

~~Exception: Where an isolated ground receptacle is installed in a nonmetallic box, a metal faceplate shall be permitted if the box contains a feature or accessory that permits the effective grounding of the faceplate.~~

~~(d) Faceplates. Metal faceplates shall be of ferrous metal not less than 0.030 in. (0.762 mm) in thickness or of nonferrous metal not less than 0.040 in. (1.016 mm) in thickness. Metal faceplates shall be grounded. Faceplates of insulating material shall be noncombustible and not less than 0.10 in. (2.54 mm) in thickness but shall be permitted to be less than 0.10 in. (2.54 mm) in thickness if formed or reinforced to provide adequate mechanical strength.~~

~~(e) Position of Receptacle Faces. After installation, receptacle faces shall be flush with or project from faceplates of insulating material and shall project a minimum of 0.015 in. (0.381 mm) from metal faceplates. Faceplates shall be installed so as to completely cover the opening and seat against the mounting surface.~~

~~(f) Receptacle Mounting.~~

~~1. Receptacles mounted in boxes that are set back of the wall surface, as permitted in Section 370-20, shall be installed so that the mounting yoke or strap of the receptacle is held rigidly at the surface of the wall.~~

~~2. Receptacles mounted in boxes that are flush with the wall surface or project therefrom shall be installed so that the mounting yoke or strap of the receptacle is seated against the box or raised box cover.~~

~~3. Receptacles Mounted on Covers. Receptacles mounted to and supported by a cover shall be secured by more than one screw or shall be a device assembly or box cover listed and identified for securing by a single screw.~~

~~(g) Attachment Plugs. All 15- and 20-ampere attachment plugs and connectors shall be constructed so that there are no exposed current-carrying parts except the prongs, blades, or pins. The cover for wire terminations shall be a part, which is essential for the operation of an attachment plug or connector (dead-front construction). Attachment plugs shall be installed so that their prongs, blades, or pins are not energized unless inserted into an energized receptacle. No receptacle shall be installed so as to require an energized attachment plug as its source of supply.~~

~~(h) Attachment Plug Ejector Mechanisms. Attachment plug ejector mechanisms shall not adversely affect engagement of the blades of the attachment plug with the contacts of the receptacle.~~

~~(i) Noninterchangeability. Receptacles, cord connectors, and attachment plugs shall be constructed so that receptacle or cord connectors will not accept an attachment plug with a different voltage or current rating than that for which the device is intended; however, a 20-ampere T-slot receptacle or cord connector shall be permitted to accept a 15-ampere attachment plug of the same voltage rating. Nongrounding type receptacles and connectors shall not accept grounding type attachment plugs.~~

~~410-57. Receptacles in Damp or Wet Locations~~

~~(a) Damp Locations. A receptacle installed outdoors in a location protected from the weather or in other damp locations shall have an enclosure for the receptacle that is weatherproof when the receptacle is covered (attachment plug cap not inserted and receptacle covers closed).~~

~~An installation suitable for wet locations shall also be considered suitable for damp locations.~~

~~A receptacle shall be considered to be in a location protected from the weather where located under roofed open porches, canopies, marquees, and the like, and will not be subjected to a beating rain or water runoff.~~

~~(b) Wet Locations.~~

~~1. A receptacle installed in a wet location where the product intended to be plugged into it is not attended while in use (e.g., sprinkler system controllers, landscape lighting, holiday lights, etc.) shall have an enclosure that is weatherproof with the attachment plug cap inserted or removed.~~

~~2. A receptacle installed in a wet location where the product intended to be plugged into it will be attended while in use (e.g., portable tools, etc.) shall have an enclosure that is weatherproof when the attachment plug cap is removed.~~

~~(c) Bathtub and Shower Space. A receptacle shall not be installed within a bathtub or shower space.~~

~~(d) Protection for Floor Receptacles. Standpipes of floor receptacles shall allow floor cleaning equipment to be operated without damage to receptacles.~~
~~(e) Flush Mounting with Faceplate. The enclosure for a receptacle installed in an outlet box flush-mounted on a wall surface shall be made weatherproof by means of a weatherproof faceplate assembly that provides a watertight connection between the plate and the wall surface.~~
~~(f) Installation. A receptacle outlet installed outdoors shall be located so that water accumulation is not likely to touch the outlet cover or plate.~~
~~410-58. Grounding-Type Receptacles, Adapters, Cord Connectors, and Attachment Plugs~~
~~(a) Grounding Poles. Grounding-type receptacles, cord connectors, and attachment plugs shall be provided with one fixed grounding pole in addition to the circuit poles. The grounding contacting pole of grounding-type plug-in ground-fault circuit interrupters shall be permitted to be of the movable, self-restoring type on circuits operating at not over 150 volts between and to conductors nor over 150 volts between any conductor and ground.~~
~~(b) Grounding Pole Identification. Grounding-type receptacles, adapters, cord connections, and attachment plugs shall have a means for connection of a grounding conductor to the grounding pole.~~
~~A terminal for connection to the grounding pole shall be designated by one of the following.~~
~~1. A green-colored hexagonal-headed or shaped terminal screw or nut, not readily removable.~~
~~2. A green-colored pressure wire connector body (a wire barrel).~~
~~3. A similar green-colored connection device, in the case of adapters. The grounding terminal of a grounding adapter shall be a green-colored rigid ear, lug, or similar device. The grounding connection shall be designed so that it cannot make contact with current-carrying parts of the receptacle, adapter, or attachment plug. The adapter shall be polarized.~~
~~4. If the terminal for the equipment grounding conductor is not visible, the conductor entrance hole shall be marked with the word "green" or "ground," the letters "G" or "GR" or the grounding symbol, as shown in Figure 410-58(b)(4), or otherwise identified by a distinctive green color. If the terminal for the equipment grounding conductor is readily removable, the area adjacent to the terminal shall be similarly marked. Figure 410-58(b)(4) Grounding symbol.~~
~~(c) Grounding Terminal Use. A grounding terminal or grounding-type device shall not be used for purposes other than grounding.~~
~~(d) Grounding Pole Requirements. Grounding-type attachment plugs and mating cord connectors and receptacles shall be designed so that the grounding connection is made before the current-carrying connections. Grounding-type devices shall be designed so grounding poles of attachment plugs cannot be brought into contact with current-carrying parts of receptacles or cord connectors.~~
~~(e) Use. Grounding-type attachment plugs shall be used only with a cord having an equipment grounding conductor.~~

M. Special Provisions for Flush and Recessed Fixtures

410-64. General

Fixtures installed in recessed cavities in walls or ceilings shall comply with Sections 410-65 through 410-72.

410-65. Temperature

(a) Combustible Material. Fixtures shall be installed so that adjacent combustible material will not be subjected to temperatures in excess of 90°C (194°F).

(b) Fire-Resistant Construction. Where a fixture is recessed in fire-resistant material in a building of fire-resistant construction, a temperature higher than 90°C (194°F) but not higher than 150°C (302°F), shall be considered acceptable if the fixture is plainly marked that it is listed for that service.

(c) Recessed Incandescent Fixtures. Incandescent fixtures shall have thermal protection and shall be identified as thermally protected.

Exception No. 1: Thermal protection shall not be required in a recessed fixture identified for use and installed in poured concrete.

Exception No. 2: Thermal protection shall not be required in a recessed fixture whose design, construction, and thermal performance characteristics are equivalent to a thermally protected fixture, and are identified as inherently protected.

410-66. Clearance and Installation

(a) Clearance.

1. A recessed fixture that is not identified for contact with insulation shall have all recessed parts spaced at least 1/2 in. (12.7 mm) from combustible materials. The points of support and the trim finishing off the opening in the ceiling or wall surface shall be permitted to be in contact with combustible materials.

2. A recessed fixture that is identified for contact with insulation, Type IC, shall be permitted to be in contact with combustible materials at recessed parts, points of support, and portions passing through or finishing off the opening in the building structure.

(b) Installation. Thermal insulation shall not be installed above a recessed fixture or within 3 in. (76 mm) of the recessed fixture"s enclosure, wiring compartment, or ballast unless it is identified for contact with insulation, Type IC.

410-67. Wiring

(a) General. Conductors that have insulation suitable for the temperature encountered shall be used.

(b) Circuit Conductors. Branch-circuit conductors that have an insulation suitable for the temperature encountered shall be permitted to terminate in the fixture.

(c) Tap Conductors. Tap conductors of a type suitable for the temperature encountered shall be permitted to run from the fixture terminal connection to an outlet box placed at least 1 ft (305 mm) from the fixture. Such tap conductors shall be in suitable raceway or Type AC or MC cable of at least 18 in. (450 mm) but not more than 6 ft (1.83 m) in length.

N. Construction of Flush and Recessed Fixtures

410-68. Temperature

Fixtures shall be constructed so that adjacent combustible material will not be subject to temperatures in excess of 90°C (194°F).

410-70. Lamp Wattage Marking

Incandescent lamp fixtures shall be marked to indicate the maximum allowable wattage of lamps. The markings shall be permanently installed, in letters at least 1/4 in. (6.35 mm) high, and shall be located where visible during relamping.

410-71. Solder Prohibited

No solder shall be used in the construction of a fixture box.

410-72. Lampholders

Lampholders of the screw-shell type shall be of porcelain or other suitable insulating materials. Where used, cements shall be of the high-heat type.

P. Special Provisions for Electric-Discharge Lighting Systems of 1000 Volts or Less

410-73. General

(a) Open-Circuit Voltage of 1000 Volts or Less. Equipment for use with electric-discharge lighting systems and designed for an open-circuit voltage of 1000 volts or less shall be of a type intended for such service.

(b) Considered as Energized. The terminals of an electric-discharge lamp shall be considered as energized where any lamp terminal is connected to a circuit of over 300 volts.

(c) Transformers of the Oil-Filled Type. Transformers of the oil-filled type shall not be used.

(d) Additional Requirements. In addition to complying with the general requirements for lighting fixtures, such equipment shall comply with Part P of this article.

(e) Thermal Protection.

1. The ballast of a fluorescent fixture installed indoors shall have integral thermal protection. Replacement ballasts shall also have thermal protection integral with the ballast.

2. A simple reactance ballast in a fluorescent fixture with straight tubular lamps shall not be required to be thermally protected.

3. A ballast in a fluorescent exit fixture shall not have thermal protection.

4. A ballast in a fluorescent fixture that is used for egress lighting and energized only during an emergency shall not have thermal protection.

(f) High-Intensity Discharge Fixtures.

1. Recessed high-intensity fixtures designed to be installed in wall or ceiling cavities shall have thermal protection and be identified as thermally protected.

2. Thermal protection shall not be required in a recessed high-intensity fixture whose design, construction, and thermal performance characteristics are equivalent to a thermally protected fixture and are identified as inherently protected.

3. Thermal protection shall not be required in a recessed high-intensity discharge fixture identified for use and installed in poured concrete.

4. A recessed remote ballast for a high-intensity discharge fixture shall have thermal protection that is integral with the ballast and be identified as thermally protected.

410-74. Direct-Current Equipment

Fixtures installed on dc circuits shall be equipped with auxiliary equipment and resistors especially designed and for dc operation, and the fixtures shall be so marked.

410-75. Open-Circuit Voltage Exceeding 300 Volts

Equipment having an open-circuit voltage exceeding 300 volts shall not be installed in dwelling occupancies unless such equipment is designed so that there will be no exposed live parts when lamps are being inserted, are in place, or are being removed.

410-76. Fixture Mounting

(a) Exposed Ballasts. Fixtures that have exposed ballasts or transformers shall be installed so that such ballasts or transformers will not be in contact with combustible material.

(b) Combustible Low-Density Cellulose Fiberboard. Where a surface-mounted fixture containing a ballast is to be installed on combustible low-density cellulose fiberboard, it shall be listed for this condition or shall be spaced not less than 1 1/2 in. (38 mm) from the surface of the fiberboard. Where such fixtures are partially or wholly recessed, the provisions of Sections 410-64 through 410-72 shall apply.

FPN: Combustible low-density cellulose fiberboard includes sheets, panels, and tiles that have a density of 20 lb/ft^3 (320.36 kg/m^3) or less, and that are formed of bonded plant fiber material but does not include solid or laminated wood, nor fiberboard that has a density in excess of 20 lb/ft^3 (320.36 kg/m^3) or is a material that has been integrally treated with fire-retarding chemicals to the degree that the flame spread in any plane of the material will not exceed 25, determined in accordance with tests for surface burning characteristics of building materials. See Test Method for Surface Burning Characteristics of Building Materials, ANSI/ASTM E84-1997.

410-77. Equipment Not Integral with Fixture

(a) Metal Cabinets. Auxiliary equipment, including reactors, capacitors, resistors, and similar equipment, where not installed as part of a lighting fixture assembly, shall be enclosed in accessible, permanently installed metal cabinets.

(b) Separate Mounting. Separately mounted ballasts that are intended for direct connection to a wiring system shall not be required to be separately enclosed.

(c) Wired Fixture Sections. Wired fixture sections are paired, with a ballast(s) supplying a lamp or lamps in both. For interconnection between paired units, it shall be permissible to use 3/8-in. flexible metal conduit in lengths not exceeding 25 ft (7.62 m) in conformance with Article 350. Fixture wire operating at line voltage, supplying only the ballast(s) of one of the paired fixtures, shall be permitted in the same raceway as the lamp supply wires of the paired fixtures.

410-78. Autotransformers

An autotransformer that is used to raise the voltage to more than 300 volts, as part of a ballast for supplying lighting units, shall be supplied only by a grounded system.

410-79. Switches

Snap switches shall comply with Section 380-14.

Q. Special Provisions for Electric-Discharge Lighting Systems of More than 1000 Volts

410-80. General

(a) Open-Circuit Voltage Exceeding 1000 Volts. Equipment for use with electric-discharge lighting systems and designed for an open-circuit voltage exceeding 1000 volts shall be of a type intended for such service.

(b) Dwelling Occupancies. Equipment that has an open-circuit voltage exceeding 1000 volts shall not be installed in or on dwelling occupancies.

(c) Live Parts. The terminal of an electric-discharge lamp shall be considered as a live part where any lamp terminal is connected to a circuit of over 300 volts.

(d) Additional Requirements. In addition to complying with the general requirements for lighting fixtures, such equipment shall comply with Part Q of this article.

FPN: For signs and outline lighting, see Article 600.

410-81. Control

(a) Disconnection. Fixtures or lamp installations shall be controlled either singly or in groups by an externally operable switch or circuit breaker that opens all ungrounded primary conductors.

(b) Within Sight or Locked Type. The switch or circuit breaker shall be located within sight from the fixtures or lamps, or it shall be permitted elsewhere if it is provided with a means for locking in the open position.

410-82. Lamp Terminals and Lampholders

Parts that must be removed for lamp replacement shall be hinged or held captive. Lamps or lampholders will be designed so that there shall be no exposed live parts when lamps are being inserted or are being removed.

410-83. Transformer Ratings

Transformers and ballasts shall have a secondary open-circuit voltage of not over 15,000 volts with an allowance on test of 1000 volts additional. The secondary-current rating shall not be more than 120 milliamperes if the open-circuit voltage is over 7500 volts, and not more than 240 milliamperes if the open-circuit voltage is 7500 volts or less.

410-84. Transformer Type

Transformers shall be enclosed and listed.

410-85. Transformers and Secondary Connections

The high-voltage windings of transformers shall not be connected in series or parallel.

410-86. Transformer Locations

(a) Accessible. Transformers shall be accessible after installation.

(b) Secondary Conductors. Transformers shall be installed as near to the lamps as practicable to keep the secondary conductors as short as possible.

(c) Adjacent to Combustible Materials. Transformers shall be located so that adjacent combustible materials will not be subjected to temperatures in excess of 90°C (194°F).

410-87. Transformer Loading

The lamps connected to any transformer shall be of such length and characteristics so as not to cause a condition of continuous overvoltage on the transformer.

410-88. Wiring Method — Secondary Conductors

Conductors shall be installed in accordance with Section 600-32.

410-89. Lamp Supports

Lamps shall be adequately supported as required in Section 600-41.

410-90. Exposure to Damage

Lamps shall not be located where normally exposed to physical damage.

410-91. Marking

Each fixture or each secondary circuit of tubing having an open-circuit voltage of over 1000 volts shall have a clearly legible marking in letters not less than 1/4 in. (6.35 mm) high reading: "Caution . . . volts." The voltage indicated shall be the rated open-circuit voltage.

410-92. Switches

Snap switches shall comply with Section 380-14.

R. Lighting Track

410-100. Definition

Lighting track is a manufactured assembly designed to support and energize lighting fixtures that are capable of being readily repositioned on the track. Its length may be altered by the addition or subtraction of sections of track.

410-101. Installation

(a) Lighting Track. Lighting track shall be permanently installed and permanently connected to a branch circuit. Only lighting track fittings shall be installed on lighting track. Lighting track fittings shall not be equipped with general-purpose receptacles.

(b) Connected Load. The connected load on lighting track shall not exceed the rating of the track. Lighting track shall be supplied by a branch circuit having a rating not more than that of the track.

(c) Locations Not Permitted. Lighting track shall not be installed in the following locations:

1. Where likely to be subjected to physical damage
2. In wet or damp locations
3. Where subject to corrosive vapors
4. In storage battery rooms
5. In hazardous (classified) locations
6. Where concealed
7. Where extended through walls or partitions
8. Less than 5 ft (1.52 m) above the finished floor except where protected from physical damage or track operating at less than 30 volts rms open-circuit voltage
9. Within the zone measured 3 ft (914 mm) horizontally and 8 ft (2.44 m) vertically from the top of the bathtub rim

(d) Support. Fittings identified for use on lighting track shall be designed specifically for the track on which they are to be installed. They shall be securely fastened to the track, maintain polarization and grounding, and shall be designed to be suspended directly from the track.

410-103. Heavy-Duty Lighting Track

Heavy-duty lighting track is lighting track identified for use exceeding 20 amperes. Each fitting attached to a heavy-duty lighting track shall have individual overcurrent protection.

410-104. Fastening

Lighting track shall be securely mounted so that each fastening will be suitable for supporting the maximum weight of fixtures that can be installed. Unless identified for supports at greater intervals, a single section 4 ft (1.22 m) or shorter in length shall have two

supports, and, where installed in a continuous row, each individual section of not more than 4 ft (1.22 m) in length shall have one additional support.
410-105. Construction Requirements
(a) Construction. The housing for the lighting track system shall be of substantial construction to maintain rigidity. The conductors shall be installed within the track housing permitting insertion of a fixture, and designed to prevent tampering and accidental contact with live parts. Components of lighting track systems of different voltages shall not be interchangeable. The track conductors shall be a minimum No. 12 or equal, and shall be copper. The track system ends shall be insulated and capped.
(b) Grounding. Lighting track shall be grounded in accordance with Article 250, and the track sections shall be securely coupled to maintain continuity of the circuitry, polarization, and grounding throughout.
SUBSTANTIATION: This proposal was developed by a Task Group of CMP-18 appointed by the chairman to consider separating 1999 NEC Article 410 into two articles, one covering lighting fixtures and the other covering receptacles, attachment plugs and cord connectors. This Task Group was appointed in response to Proposal 18-55 for the revision of the 1996 NEC.
This is a companion proposal to revise Article 410 to reflect the relocation of the requirements for receptacles, cord connectors and attachment plugs to proposed Article 420.
The Task Group believes this is consistent with the objective of the Usability Task Group and will make these requirements easier to find and use.
The Task Group realizes that the NEC Correlating Committee has jurisdiction over number, title and scope of articles and submits the proposed wording for their consideration. PANEL ACTION: Accept.

(Log #2933c)

18- 5 - (410): Accept in Principle in Part
SUBMITTER: Bernard J. Mezger, American Lighting Association
RECOMMENDATION: Incorporate "luminaire" into the 2002 NEC:
(a) To incorporate the use of the inclusive wording "luminaire" throughout the Code wherever the ambiguous wording "fixture" or "lighting fixture" is used and the intent and meaning is a complete lighting unit consisting of a fixture and the lamp(s), called a "luminaire".
(b) Add the definition of "luminaire" to Article 100-1 as follows:
Luminaire. A complete lighting unit consisting of a lamp, or lamps, and a ballast (when applicable), together with the parts designed to distribute the light, to position the lamp(s), and connect the lamp(s) to the power supply.
(c) Delete the FPN from Section 410-1 (an identical definition).
SUBSTANTIATION: Clarify the true meaning and intent of the item described as a "fixture", or a "lighting fixture", by providing the proper wording for a complete lighting unit. A luminaire consists of a fixture plus lamp(s). The definition and use proposed is consistent with that published and used by IESNA and NEMA.
PANEL ACTION: Accept in Principle in Part.
The panel accepts the proposal under (a) but limits acceptance to Articles 410, 411, and 600, and refers the proposal to all other appropriate code panels. Refer item(b) to CMP 1. Accept item (c).
PANEL STATEMENT: CMP 18 acted on only those articles under their jurisdiction.

(Log #330)

18- 7 - (410-4): Reject
SUBMITTER: Richard L. Miell, Otero County, CO
RECOMMENDATION: 410-4. Fixtures in Specific Locations
(d) Bathtub and Shower Zone. There shall be no light fixtures, other than those listed for the area, in the Bathtub and Shower Zone.
SUBSTANTIATION: Over the years we have seen additional rules for this area around and above tubs and shower stalls. The current rule listed a few of the types not allowed, and by listing them, it seemed to allow wall mount fixtures in this area. This section also had the definition for the zone, which should be Article 100. This change will prohibit any light fixture from this area, unless listed for the area.
PANEL ACTION: Reject.
PANEL STATEMENT: The current wording is intended to specifically exclude certain types of luminaires. It is not intended to exclude all luminaires. For example recessed or wall mounted luminaires suitable for the environment are acceptable. There is no listing category for "bathtub or shower zone", however, there are luminaires listed for the environmental conditions likely to be found in these areas.
The Scope of Article 100 specifically indicates that it contains definitions generally used in two or more Articles and that definitions used in a single article are contained in that article. Therefore the definition is properly located.
Paragraph 3-3.3 (d) of the NFPA Regulations Governing Committee Projects requires the submitter to provide "a statement of the problem and substantiation". This proposal contains neither. The submitter should provide specific examples of the hazards associated with properly installed wall luminaires suitable for this environment and cite accident data of such installations.

(Log #2786)

18- 9 - (410-4(d)): Reject
SUBMITTER: Peter R. Hawes, Hawes Electric
RECOMMENDATION: Add to the first sentence "wall mounted lighting fixtures".
SUBSTANTIATION: It is totally absurd that a wall mounted lighting fixture is permitted to be located in a shower or bathtub area. To think that this safety code would prohibit a hanging fixture from being located 7 ft 11 in. about a tub would would permit a wall mounted light fixture to be installed so someone could actually touch the fixture while sitting in the tub is beyond belief. What makes a wall mounted light fixture safer than a hanging fixture. This allowance is a design consideration and it does not belong in a safety code.
PANEL ACTION: Reject.
PANEL STATEMENT: Paragraph 3-3.3 (d) of the NFPA Regulations Governing Committee Projects requires the submitter to provide "a statement of the problem and substantiation". This proposal contains neither. Rather it is justified by an unsubstantiated relational argument. The submitter should provide specific examples of the hazards associated with properly installed wall luminaires suitable for this environment and cite accident data of such installations. Ceiling or wall (surface or recessed) luminaires of the type suitable for the environment are typically well grounded and do not represent a shock hazard
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
KEMPEL: The phrase "typically well grounded" in the second paragraph of the panel statement infers that there are luminaires that my not be well grounded that are suitable to be mounted in this area. To avoid this potential misunderstanding it is suggested that the second paragraph read:
"All accessible conductive parts of ceiling or wall (surface or recessed) luminaires that are likely to become energized are required by 410-18 to be grounded. The product safety standards for luminaires also require metal parts that may become energized to be grounded."

(Log #2787)

18- 10 - (410-4(d)): Reject
SUBMITTER: Peter R. Hawes, Hawes Electric
RECOMMENDATION: Add a new second sentence to read as follows:
The conductors supplying wall mounted lighting fixtures located within this zone shall have Ground Fault Circuit Protection.
SUBSTANTIATION: It may not be practical or even possible to prohibit wall mounted lighting fixtures from this zone, so at the very least GFCI protection for personnel should be required.
PANEL ACTION: Reject.
PANEL STATEMENT: Paragraph 3-3.3 (d) of the NFPA Regulations Governing Committee Projects requires the submitter to provide "a statement of the problem and substantiation". This proposal contains neither. The submitter should provide specific examples of the hazards associated with properly installed wall luminaires suitable for this environment and cite accident data of such installations.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
KEMPEL: Part of the panel's rationale was omitted in the panel statement. Adding the following paragraph would convey the complete rationale for the panel action:
"All accessible conductive parts of ceiling or wall (surface or recessed) luminaires that are likely to become energized are required by 410-18 to be grounded. The product safety standards for luminaires also require metal parts that may become energized to be grounded."

(Log #298)

18- 11 - (410-8): Reject
SUBMITTER: Vincent Metallo, Sr., Baltimore County, MD
RECOMMENDATION: Revise 410-8 to read as follows:
410-8. Fixtures in ~~clothes~~ closets.
SUBSTANTIATION: Easily ignitable material such as linens are stored in closets that are not considered clothes closets because the lack of a hanging rod. These materials can be stored on shelves and are subject to the same hazards as clothing. This change will coincide with 410-8(b) in which the word clothes is not used. This will make all closet storage subject to required clearances as most material stored on shelves are easily ignitable.
PANEL ACTION: Reject.
PANEL STATEMENT: The absence of the word "clothes" in 410-8(b) should not be construed to mean that this Section applies to all closets. It applies only to clothes closets because it is a part of 410-8 that deals only with clothes closets.
Paragraph 3-3.3 (d) of the NFPA Regulations Governing Committee Projects requires the submitter to provide "a statement of the problem and substantiation". This proposal contains neither. Rather it is justified by an unsubstantiated relational argument.
The current requirements were adopted as a result of incident reports of fires in clothes closets. The proposal should be substantiated with fire or accident data for other types of storage closets. NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

(Log #888)

18- 19 - (410-14(a), (b)): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Connection of ~~Electric Discharge~~ Lighting Fixtures.
(a) Independent of the Outlet Box. ~~Electric discharge lighting~~ Lighting fixtures supported independently of the outlet box or fitting, or installed separate from the outlet shall be connected to the branch circuit through ~~metal raceway, nonmetallic~~ raceway, Type MC cable, Type AC cable, Type MI cables, Type NM cable, or for an individual fixture, by flexible cord as ~~permitted~~ covered in Section 410-30(a) or (b).
(b) Access to Boxes. Electric-discharge lighting fixtures mounted over ~~concealed~~ outlet, pull, or junction boxes shall be installed with suitable openings in the back of the fixture to provide access to the boxes.
SUBSTANTIATION: Editorial. There does not seem to be a reason not to apply this section (a) to incandescent fixtures such as independently supported floodlights. Conduit bodies (fittings) are also used at the outlet to supply independently supported fixtures. This section does not appear to cover suspended fixtures which are supported by the outlet box by the use of box covers with provisions (hooks) for field-installed chain supports which are not part of a

fixture canopy assembly with stem or chain support.

Flexible cord use is specifically limited to an individual fixture; apparently some installers and inspectors are not aware a cord/plug should not be used as branch circuit conductors. I have seen a number of supermarkets and other establishments where end-to-end suspended fluorescent fixtures are supplied by a cord and plug connection. There is no literal permission in Section 410-30 (b) for cord use, only as inferred permission.

In (b) concealed boxes are not permitted by Section 370-29. Fixtures may be mounted over flush or surface-mounted boxes and the rules should apply in either case.

PANEL ACTION: Accept in Part.

Delete "electric discharge" from the title and in Section (a).

PANEL STATEMENT: The panel accepts the proposal to delete electric discharge as shown and rejects the balance of the proposal for lack of substantiation that clearly defines the problem.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

KEMPEL: Accepting the panel action will revise 410-14 to include incandescent luminaires mounted independent of the outlet box. While most listed incandescent luminaires may not be impacted by such a change, an incandescent chain suspended luminaire (chandelier) or cable suspended luminaire (pendant) mounted independent of the outlet box that is connected to the branch circuit via flexible cord would be.

In the 1999 NEC, 410-14(a) specifies the wiring methods permitted to connect an electric discharge luminaire mounted independent of the outlet box to the branch circuit. Revising 410-14(a) as specified in the panel action would delete the qualifier "electric discharge" and include all luminaires. This would, for example, result in requiring an incandescent chandelier mounted independent of the outlet box to be connected to the branch circuit through one of the wiring methods specified in 410-14(a). The flexible cord that is intertwined in the chain supporting an incandescent chandelier would not be permitted by 410-14(a) to connect it to the branch circuit.

There may be other incandescent luminaires mounted independent of the outlet box that are similarly affected. The submitter has not defined the problem or justified the need for this change as required by paragraph 3-3.3(d) of the NFPA Regulations Governing Committee Projects.

MEZGER: The reason for my negative vote is that the original limits placed on the clause of only applying to "electric discharge" luminaires was accurate and appropriate. Adding incandescent luminaires as proposed is an expansion of the intent that would create a hardship to many incandescent luminaires installations and not make any contribution to safety. The proposer makes no specific justification for generalizing the application of the clause to all luminaires.

(Log #1460)

18- 20 - (410-14(b)): Reject

SUBMITTER: Joseph E. McCann, City of Coral Springs, FL

RECOMMENDATION: Delete access to boxes in its entirety.

SUBSTANTIATION: Whether the fixture is electric discharge or incandescent should not make a difference, incandescent per Section 410-12 the outlet box can be covered. Testing laboratory should require an opening of sufficient size because many HID fixtures are made of cast aluminum with 3/4 in. or 1/2 in. openings, and are not easily modified in the field. Also, small fluorescent fixtures used in closets do not have an area within the fixture large enough to knock out so that sufficient access would be provided.

PANEL ACTION: Reject.

PANEL STATEMENT: Deleting Section 410-14 (b) would allow electric-discharge luminaires to be manufactured without access holes resulting in uncontrolled field modification of the luminare or no access to concealed boxes. The substantiation provides no information why this should be permitted.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #890)

18- 21 - (410-15(b)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

(b) ~~Metal~~ Poles Supporting Lighting Fixtures. ~~Metal poles~~ Poles shall be permitted to be used to support lighting fixtures and as a raceway to enclose supply conductors, provided the following conditions are met.

(1) A metal pole shall have a handhole not less than 2 in. by 4 in. (50.8 mm x 102 mm) with a raintight cover to provide access to the supply terminations within the pole or pole base.

Exception No. 1: No change.

Exception No. 2: No change.

Exception No. 3: No handhole shall be required in a pole where the supply conductors are completely external of the pole or enter a weatherhead near the top of the pole and supply terminations are accessible by means of a removable pole cap or cover.

(2) Except as provided in Exception No. 3, where supply conductors are installed in underground raceway or cable and ~~Where~~ a raceway riser or cable is not installed within the pole, a threaded fitting or nipple ~~shall be~~ brazed or welded to the pole or a suitable threaded opening, opposite to the handhole for the supply connection shall be provided.

(remainder unchanged)

SUBSTANTIATION: Editorial. The requirements should apply to poles made of material other than metal, such as concrete. A handhole is not necessary where supply conductors are completely external of the pole such as a solid wood pole or one not used to enclose conductors, or where tap conductors enter through a weatherhead near the pole top and access is provided through a removable cap or cover. The present (2) literally imposes a requirement where the supply is by open overhead conductors.

PANEL ACTION: Reject.

PANEL STATEMENT: Paragraph 3-3.3 (d) of the NFPA Regulations Governing Committee Projects requires the submitter to provide "a statement of the problem and substantiation". This proposal contains neither. The substantiation should include a definition of the problems creating hazardous conditions with wood, concrete or other types of poles.

The submitter is referred to the heading for Section 410-15 (b) which clearly states that the requirements apply only to metal poles. To suggest that hand holes are not necessary in wood or concrete poles is inappropriate since this Section does not require them. Further, 410-15 (b) (2) in no way imposes a supply by open overhead conductors.

If conductors are external of the pole, then the pole is not being used as a raceway and Exception No. 3 is unnecessary.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #1738)

18- 22 - (410-15(b)): Reject

SUBMITTER: Jamie McNamara, Hastings, MN

RECOMMENDATION: 410-15 (b) add new # (7) after # (6):

7. "Conductors not in a chapter 3 wiring method of different systems (communication circuits and power circuits) inside poles shall be considered in a raceway and meet the separation requirement for conductor in the same raceway as indicated elsewhere in this code."

SUBSTANTIATION: Light poles are not raceways and the current wording in ((b) Metal Poles Supporting Lighting Fixtures. Metal poles shall be permitted to be used to support lighting fixtures and as a raceway to enclose supply conductors, provided the following conditions are met) are not very clear the separation requirement need to be met. The separation from electric light, power, class 1 nonpower limited circuits, nonincendive circuits and intrinsically safe circuits etc.. should be clear. Light poles often have communication circuits (cameras speaker etc..) mounted on them and the power wiring and communication circuits wiring and do not have the same separation requirements as required in article 300-3, 504-30, 725-52, 760-52, 800-52, 820-52 etc.. . The current text is limited to metal poles only. Some light poles are maid of other things than metal.

PANEL ACTION: Reject.

PANEL STATEMENT: Section 90-3 Code Arrangement makes it clear that "Chapters 1, 2, 3 and 4 apply generally". Therefore, the requirements of 300-3 are applicable. 90-3 further states that "Chapters 5, 6, and 7…. Supplement or modify the general rules."

And that Chapter 8 is "independent" of other Chapters. Therefore, the requirements of these later Chapters are applicable when other types of circuits are installed.

(Log #3253)

18- 24 - (410-15(b) Exception No. 3 (New)): Reject
SUBMITTER: John O'Bryan, Lockwood Greene
RECOMMENDATION: Add an exception to read as follows:
Exception No. 3: If a pole's size is 1 1/4 in. thru 2 in. and is 10 ft or less in height above grade where the wiring assembly from fixture through pipe is continuous, a handhole or hinged base is not required.
SUBSTANTIATION: Stanchion lighting in the petro-chemical plants, power plants and other industry plants have utilized 1 1/4 in. thru 2 in. conduit @ 10 ft 0 in. or less for mounting a 25° stanchion light on platforms, stairwells, etc., requiring the hand-rail for means of support. Article 410-15(b) does not address this concept or installation.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The code does not prohibit this installation. Conduit is an acceptable raceway as per Chapter 3.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1739)

18- 25 - (410-15(c)): Reject
SUBMITTER: Jamie McNamara, Hastings, MN
RECOMMENDATION: New (c) Poles Supporting Lighting Fixtures. Poles not made of metal shall not be used to support lighting fixtures.
SUBSTANTIATION: To clarify that poles made of, plastic, fiberglass, concrete, composite materials and the like cannot be used to support lighting fixtures.
PANEL ACTION: Reject.
PANEL STATEMENT: Paragraph 3-3.3 (d) of the NFPA Regulations Governing Committee Projects requires the submitter to provide "a statement of the problem and substantiation". This proposal contains neither. Poles of other material are commonly used and are not prohibited by 410-15. This section is intentionally limited to the use of metal poles as a support for luminaires and as a "raceway" for circuits supplying the luminaire. Metal poles pose specific shock hazards which are addressed by this section. The substantiation does not contain any documentation or data defining hazards that would cause the panel to extend these requirements to poles constructed of other materials.

(Log #3882)

18- 26 - (410-16(a)): Reject
NOTE: The Technical Correlating Committee directs the Panel to "Accept" this Proposal to correlate with the Panel Action on Proposal 9-36. The responsibility for outlet boxes is with Code-Making Panel 9. This action will be considered by the Panel as a Public Comment.
SUBMITTER: J. Philip Simmons, Simmons Electrical Services
RECOMMENDATION: Revise as follows:
(a) Outlet Boxes. Outlet boxes or fittings installed as required by Section 370-23 shall be permitted to support fixtures ~~weighing 50 lb (22.7 kg) or less. A fixture that weighs more than 50 lb (22.7 kg) shall be supported independent of the outlet box unless the outlet box is listed for the weight to be supported.~~
SUBSTANTIATION: The requirements for using outboxes for the support of lighting fixtures should be included with similar requirements in Section 370-27. This will improve the organization of the code and make it more user friendly by consolidating similar requirements in one location.
PANEL ACTION: Reject.
PANEL STATEMENT: The Scope of Article 370 indicates that it covers the installation of outlet boxes, not luminaires. It would appear more appropriate to delete or move the requirements in Article 370 that deal with the installation of luminaires to Article 410. The submitter may want to address this during the comment period.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #417)

18- 27 - (410-16(h)): Reject
SUBMITTER: Ronald E. Soltis, Centre Region Code Admin.
RECOMMENDATION: Revise to read as follows:
(h) Trees. Outdoor lighting fixtures and associated equipment shall (not) be permitted to be supported by trees.
~~(FPN No. 1): See Section 225-6 for restriction for support of overhead conductors.)~~
~~(FPN No. 2): See Section 300-5(d) for protection of conductors.~~
SUBSTANTIATION: Using trees or any live vegetation as supports for permanent lighting fixtures and associated equipment can only cause problems in the future. I have seen instances where the trees have grown around the lighting fixtures and equipment to a point where it is impossible to remove the covers for ordinary repairs. Injuries may occur when the tree is harvested and metal fasteners remain in the lumber. This change would also coincide with Section 225-6 entitled "Vegetation."
PANEL ACTION: Reject.
PANEL STATEMENT: Given the prohibition for installing luminaries with overhead conductors and the protection of conductors specified in Section 300-5, the current requirements are appropriate.
Additional documentation demonstrating a hazard to people or property is necessary to support deletion of an installation method that has been satisfactory and safe for a number of years.

(Log #3881)

18- 28 - (410-18(b), Exception (New)): Accept in Principle
NOTE: The Techncial Correlating Committee directs the Code-Making Panel to review the Proposal relative to the word "when". The Techncial Correlating Committee directs this proposal be sent to Code-Making Panel 5 for information. This action will be considered by the Panel as a Public Comment.
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Revise as follows:
(b) Made of Insulating Material. Fixtures directly wired or attached to outlets supplied by a wiring method that does not provide a ready means for grounding shall be made of insulating material and shall have no exposed conductive parts.
Exception: Where the wiring method does not provide a ready means for grounding the lighting fixture at the lighting outlet, it shall be permitted to connect an equipment grounding conductor from the outlet in compliance with Section 250-130(c). The lighting fixture shall then be grounded in accordance with (a).
SUBSTANTIATION: A serious problem exists with this section at the present time. No satisfactory method is provided for grounding of lighting fixtures where a grounding means does not exist in the box. As a result, some installations may inadvertently violate the provisions of Section 410-18(b) as very few lighting fixtures are made with all insulating materials. Typically, lighting fixtures are selected based on appearance and functionality and not on whether they can be grounded or not. If this proposal is accepted, manufacturer installation instructions can be provided to describe and illustrate proper installation methods. This proposed change will provide a workable solution to a known problem. Section 250-130(c) provides for the grounding of ungrounded receptacles as well as for the extension of br circuits where there is not a grounding means in the outlet. Additional flexibility for connection of this remote equipment grounding conductor was provided during the processing of the 1999 NEC. This same provision should be permitted for grounding of lighting fixtures.
PANEL ACTION: Accept in Principle.
Modify the text to read as follows:
"Exception: When replacing a luminaire, it shall be permitted to connect an equipment grounding conductor from the outlet in compliance with 250-130(c). The lighting fixture shall then be grounded in accordance with 410-18(a) ."
PANEL STATEMENT: The first portion of the sentence is not necessary. The requirement limiting the exception to replacement is necessary to clarify that the exception does not apply to new installations. The implication in the substantiation concerning manufacturer installation instructions is not a code issue.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3741)

18- 30 - (410-31): Accept
SUBMITTER: Michael S. O'Boyle, Lightolier, Inc./Rep. American Lighting Assn.
RECOMMENDATION: Delete the exceptions and divide the three requirements contained in 410-31 into 410-31, 410-32 and 410-33:
410-31. Fixtures as Raceways. Fixtures shall not be used as a raceway for circuit conductors unless listed and identified for use as a raceway.
410-32. Wiring Supplying Fixtures Connected Together. Fixtures designed for end-to-end connection to form a continuous assembly, or fixtures connected together by recognized wiring methods, shall be permitted to contain the conductors of two 2-wire circuits, or one multiwire branch circuit, supplying the connected fixtures. One additional 2-wire branch circuit separately supplying one or more of the connected fixtures shall also be permitted.
FPN: See Article 100 for definition of "Multiwire Branch Circuit."
410-33 Branch Circuit Conductors and Ballasts. Branch-circuit conductors within 3 in. (76 mm) of a ballast shall have an insulation temperature rating not lower than 90°C (194°F) unless supplying a fixture listed and identified as suitable for a different insulation temperature.
SUBSTANTIATION: The text of 410-31 presently addresses three distinct issues that should be addressed in separate sections. Fixture listings and markings apply to items contained in these requirements and therefore references to them were added as needed. This proposal eliminates an excessive number of exceptions; rearrangement of the section better conveys the objectives. This proposal eliminates redundant statement of maximum operating temperature for specific wire types, which is already clearly stated in Table 310-13. This is a companion proposal to Section 410-11 to revise the fine print note referencing 410-31.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4332)

18- 31 - (410-33 (New)): Reject
SUBMITTER: Curtis Chapel, Resistance Electric
RECOMMENDATION: Add new Section 410-33 to read:
410-33. Surface Mounted Fixtures with Screwshell Type Lampholders. In lighting fixtures with screw-shell type lampholders, the lampholder shall be designed so that it cannot accept a lamp of higher wattage than the fixture is listed and marked to use.
SUBSTANTIATION: I was dramatically convinced of the absolute necessity of this proposal, in this form, when I was called to the home of an elderly woman to find and fix the problem in a surface mounted ceiling light fixture that intermittently worked.

Upon removal of that fixture (which was at that time over-lamped) I found the building wires in the box to which it was attached completely disintegrating, with its remaining cracked insulation falling into my eyes.

I climbed into the ceiling and crawled over and above the box and looked down on the box. There, to my horror, shock, and amazement lay the conductor cabling, with its outer sheath and conductor insulation completely disintegrated (only bare parallel blackened copper wires, up to one foot away). It was only the grace of god, and an occasionally tripping circuit breaker, that prevented a fire up to that point.

And I am not the only person with similar observations.

Consumer Product Safety Commission estimates 14,800 residential structure fires a year 1992-1996 in "installed wiring" (see the copy of 1996 Residential Fire Loss Estimates which I have provided). In addition, 5,200 were probably caused by "light fixtures". Up to 23,200 Fires, 180 civilian deaths (not fire fighters and others), 660 civilian injuries, $359.9 million property loss in 1996 alone.

Obviously citizens/consumers are not seeing (elderly or sight-impaired), understanding (nonenglish speaking and/or nonreading), or heeding the current markings on surface mounted ceiling light fixtures.

Current code protects us from ourselves by the use of rejecting fuse-holders in Section 240-54 (from which the wording in this proposal is patterned). Fluorescent and compact-fluorescent fixtures reject, buy design of fixtures matching bulbs, inappropriate wattages.

The last code cycle had numerous requests for change in this area. Please do not allow three more years of fires and deaths by delaying any further.

Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The data provided is not specific enough to identify overlamping as the cause of fires in the report. The proposal is a product requirement that is difficult if not impossible for an AHJ to enforce. Also, as written, it is a prescriptive requirement that provides only one way to accomplish its purpose. Section 90-2 clearly states that the NEC covers the installation of electric conductors and equipment. Since lamps of varying wattages have a common base and envelope, there is no physical means for the lampholder to reject the lamp based on wattage.

(Log #307)

18- 32 - (410-56): Reject
SUBMITTER: Steven Holewinski, Long Electric/Rep. IBEW
RECOMMENDATION: Either receptacles should be mounted with the ground up or down.
SUBSTANTIATION: The ground should be down. Cords with grounds on them are wired with the ground closest to the cord, so when it is plugged in with the ground up, the weight of the cord and/or tripping hazard will make the prongs more accessible to energized prongs.
PANEL ACTION: Reject.
PANEL STATEMENT: Paragraph 3-3.3 (d) of the NFPA Regulations Governing Committee Projects requires the submitter to provide "a statement of the problem and substantiation". This proposal contains neither. Further, there is no standard as to the direction of the cord in relation to the ground prong as implied in the substantiation. In fact, molded plugs are produced in several forms.

Since the introduction of grounding-type receptacles, they have been installed in both positions (in roughly equal proportions) as well as mounted horizontally, with no significant history of shock or fire hazard supporting a required mounting position.

(Log #4370)

18- 33 - (410 Part L): Reject
SUBMITTER: Ed Stubbs, City of Atlanta, GA
RECOMMENDATION: Revise as follows:
410-L. Receptacles, Cord Connections, and Attachment Plugs. (Revised text)

Relocate 410-56, 410-57, 410-58 to Chapter 2 Wiring and Protection. Which will fall under Article 210 Branch Circuits(a) General Provisions.
SUBSTANTIATION: Under Article 210-1 Scope, it states "This article covers branch circuits except for branch circuits that supply only motor loads, which are covered in Article 430, etc." 210-2 said "Other articles for specific purpose branch circuits." When you look down the article and section listed, it doesn't refer you to article 410-L under any circumstances.

If you are at Chapter 4 "Equipment for General Use" with the exception of Article 400 fixture wiring and 410-L for receptacles, everything in Chapter 4 is equipment that utilize (burn) electricity. I've been teaching the NEC since 1990. An electrical inspector since 1988, and an electrician since 1966 and I see no logic in the location of the receptacles in Chapter 4. I try to teach all contractors and inspectors how to find articles. We all agree that this one is out of place, and the fixture wiring, which is a wiring method, is also out of place. Since Article 250 was rearranged to meet the proper applications, so can the receptacles be relocated. I can't tell you how many contractors and inspectors could not find the section on required dome covers (410-57) unless you memorized it. It said this book is not for untrained persons, but even the trained couldn't find it at its location.
PANEL ACTION: Reject.
PANEL STATEMENT: Article 210 contains the rules for branch circuits which, by definition in Article 100, relates only to the "circuit conductors". Article 210 does not cover the installation of other equipment. The list in Section 210-2 covers "..specific purpose branch circuits…" , again, not the installation of other equipment.

See panel action on Proposal 18-70 which establishes a separate article for wiring devices.

(Log #889)

18- 34 - (410-56(a)): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Receptacles and Cord Connectors. Receptacles installed for the attachment of portable cords, and cord connectors, shall be rated not less than 15 amperes, 125 volts, or 15 amperes, 250 volts, and shall be of a type not suitable for lampholders.
SUBSTANTIATION: No rating is specified for cord connectors which are used for attachment of plugs. Subsection (g) appears to assume ratings of 15- or 20 amperes for connectors since there is no comma after "plugs" in the first sentence.
PANEL ACTION: Accept in Principle.
Revise 420-2(b) to read as follows:
"(b) Rating. Receptacles and cord connectors shall be rated not less than 15 amperes, 125 volts, or 15 amperes, 250 volts, and shall be of a type not suitable for use as lampholders."

PANEL STATEMENT: The panel accepts the intent of the proposal and is incorporating the change into proposed Article 420.
The words "installed for the attachment of portable cords" were deleted because equipment such as night lights may also be plugged into such receptacles.

(Log #3223)

18- 35 - (410-56(a)): Reject
SUBMITTER: Mike Weitzel, City of Wenatchee, WA
RECOMMENDATION: Add new text to read as follows:
Receptacle devices with push-in connections that do not depend upon the use of pressure terminal screws shall not be used.
SUBSTANTIATION: Many fires have been caused by the failure of these types of receptacle devices due to loose and overheated connections. We have experienced these problems in our city.
PANEL ACTION: Reject.
PANEL STATEMENT: Improperly made terminations of any type (binding terminal screw, twist on wire connector, split bolt, etc.) can produce overheating. Nothing in the substantiation supports "push-in connections" as any more or less susceptible too improper termination than other methods.
The ANSI standard covering receptacles (UL 498) was significantly revised several years ago limiting the conductor size to 14 AWG solid conductors and adding more severe terminal temperature test requirements for push-in type terminals.
The substantiation does not identify whether the receptacles with which he has experience were produced before or after this standard revision.

(Log #2081)

18- 36 - (410-56(b)): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Revise text to read as follows:
(b) CO/ALR Receptacles. Receptacles ~~rated 20 amperes or less and directly~~ connected to aluminum conductors shall be marked CO/ALR.
SUBSTANTIATION: There are other sizes of receptacles connected to aluminum conductors other than 15-20 ampere sizes.
All these receptacles should be required to comply with this requirement.
This part "L" of the NEC does not limit the size of receptacles just to 15-20 amperes.
Section 410-56(a) just states that receptacles shall be rated not smaller than 15 amperes where attachment of portable cords are utilized.
There is no general statement included in 410-56.
Thereby implying that this section applies to ALL receptacles.
PANEL ACTION: Reject.
PANEL STATEMENT: The "CO/ALR" marking is restricted to 15- and 20- ampere switches and receptacles. The product standards covering other ratings and products generally require "AL/CU" marking. Therefore, the requirement in Section 410-56(b) is correct.

(Log #2082)

18- 38 - (410-56(e), Exception): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Add an Exception to read as Follows:
Exception: Faceplates of insulating materials that are listed for the purpose shall be allowed to cover the receptacle faces.
SUBSTANTIATION: Third Party Listing Agency's have listed special insulating faceplates that cover the receptacle faces.
One such faceplate is the KIDDY PROOF cover.
The present wording would not allow this installation.
There have been no reports that this installation presents a fire hazard.
UL has tested these covers and would not have listed such if the covers did not meet the pull out requirements.
This product should not be removed from the marked place.
Also please note that their is in the market place other covers that are listed by UL that also cover the receptacle faces.
No reports of fires or electrical shock have been reported on these other devices.
Please also consider that receptacle covers of the weather proof type do not comply with this requirement and a change may be required to exempt this requirement for weatherproof covers and hazardous location covers.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation contains several statements that are assumptions that this panel believes are incorrect or at least undocumented.
It is correct that several certification organizations have listed such products. None-the-less, significant questions remain as to the criteria for listing and the degree to which the investigation of these products inhibit full (and thus safe) engagement of the attachment plug blades in the receptacle contacts. Since there is not a specified dimension in the standard that defines the depth of the point of contact engagement below the surface of the receptacle cover, this depth varies from one product to another. Further, there is not any

standard defining the thickness of such covers.
It is also clear that these products were not listed for installation in accordance with the National Electrical Code. Recognizing that any obstruction between the plug and receptacle face can result in unsafe blade engagement, Section 410-56 (e) clearly requires receptacle faces to be "flush or project from faceplates of insulating material. None of the plates examined by the Panel meet this requirement. Therefore, their installation, regardless of whether or not they are listed, is a violation of this Section unless over ruled by the AHJ's special permission clause in Section 90-2 (c).
Analysis of a limited number of such covers indicate that some of the covers in question (including one which is listed) do inhibit attachment plug blade insertion to a potentially hazardous degree in some receptacles. While these investigations have not examined all combinations of covers and receptacles, the limited investigation indicates a potential problem exists.
Therefore, the assumption that a fire hazard does not exist is simply not correct.
The substantiation further indicates that there are no reports of fires. No data is provided as an example and no indication is given as to the data sources analyzed to support this statement. It is not likely that fire reports would be definitive enough to identify the cover as the cause, rather, the reports would likely refer to a "receptacle fire".

(Log #1921)

18- 41 - (410-56(j)): Reject
SUBMITTER: Michael J. Johnston, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read as follows:
L. Receptacles, Cord Connectors, and Attachment Plugs (Caps)
410-56. Rating and Type and Control
(a) Receptacles. Receptacles installed for the attachment of portable cords shall be rated at not less than 15 amperes, 125 volts, or 15 amperes, 250 volts, and shall be of a type not suitable for use as lampholders.
(b) CO/ALR Receptacles. Receptacles rated 20 amperes or less and directly connected to aluminum conductors shall be marked CO/ALR.
(c) Isolated Ground Receptacles. Receptacles intended for the reduction of electrical noise (electromagnetic interference) as permitted in Section 250-146(d) shall be identified by an orange triangle located on the face of the receptacle. Receptacles so identified shall be used only with grounding conductors that are isolated in accordance with Section 250-146(d). Isolated ground receptacles installed in nonmetallic boxes shall be covered with a nonmetallic faceplate.
Exception: Where an isolated ground receptacle is installed in a nonmetallic box, a metal faceplate shall be permitted if the box contains a feature or accessory that permits the effective grounding of the faceplate.
(d) Faceplates. Metal faceplates shall be of ferrous metal not less than 0.030 in. (0.762 mm) in thickness or of nonferrous metal not less than 0.040 in. (1.016 mm) in thickness. Metal faceplates shall be grounded. Faceplates of insulating material shall be noncombustible and not less than 0.10 in. (2.54 mm) in thickness but shall be permitted to be less than 0.10 in. (2.54 mm) in thickness if formed or reinforced to provide adequate mechanical strength.
(e) Position of Receptacle Faces. After installation, receptacle faces shall be flush with or project from faceplates of insulating material and shall project a minimum of 0.015 in. (0.381 mm) from metal faceplates. Faceplates shall be installed so as to completely cover the opening and seat against the mounting surface.
(f) Receptacle Mounting.
1. Receptacles mounted in boxes that are set back of the wall surface, as permitted in Section 370-20, shall be installed so that the mounting yoke or strap of the receptacle is held rigidly at the surface of the wall.
2. Receptacles mounted in boxes that are flush with the wall surface or project there from shall be installed so that the mounting yoke or strap of the receptacle is seated against the box or raised box cover.
3. Receptacles Mounted on Covers. Receptacles mounted to and supported by a cover shall be secured by more than one screw or shall be a device assembly or box cover listed and identified for securing by a single screw.
(g) Attachment Plugs. All 15- and 20-ampere attachment plugs and connectors shall be constructed so that there are no exposed current-carrying parts except the prongs, blades, or pins. The cover for wire terminations shall be a part, which is essential for the operation of an attachment plug or connector (dead-front construction). Attachment plugs shall be installed so that their prongs, blades, or pins are not energized unless inserted into an energized receptacle. No receptacle shall be installed so as to require an energized attachment plug as its source of supply.
(h) Attachment plug ejector mechanisms shall not adversely affect engagement of the blades of the attachment plug with the contacts of the receptacle.
(i) Noninterchangeability. Receptacles, cord connectors, and attachment plugs shall be constructed so that receptacle or cord connectors will not accept an attachment plug with a different voltage or current rating than that for which the device is intended; however, a 20-ampere T-slot receptacle or cord connector shall be permitted to accept a 15-ampere attachment plug of the same voltage rating. Nongrounding-type receptacles and connectors shall not accept grounding-type attachment plugs.
(j) Controlled Receptacles. 125 volt 15- and 20-ampere receptacles shall be permitted to be controlled by switches installed in accordance with Article 380. General use dimmer switches shall not be used to control 125-volt 15- and 20-ampere receptacles. See Section 380-14(e).
SUBSTANTIATION: Although the listing and installation instructions for general use dimmer switches is specific and information in th UL green book carries this information, this continues to be an issue for many because it does not appear as a

mandatory requirement in the NEC. This wording for this proposal was extracted from the UL white book 1998 edition page 20. The product category is Dimmers, General Use Switch (EOYX). Discussions with both engineers and contractors at construction sites have raised the question when wanting to apply these dimmers in this manner. The comment was something to the effect that it does not appear anywhere in the Code. That is a true statement, however 110-3(b) does cover this indirectly. Inserting this new section in Article 380 should help eliminate these gray areas and improve safety. Safety hazards and fire hazards are created if items such as vacuum cleaners and other utilization equipment is connected to a receptacle that is controlled by a dimmer switch.
PANEL ACTION: Reject.
PANEL STATEMENT: The guide information in the UL General Information Guide and the required installation instructions clearly indicate that these products are for the "control of permanently installed incandescent fixtures." The hazards mentioned in the proposer's substantiation are due to improper installation and therefore in violation of 110-3(b).

18- 42 - (410-57): Reject
SUBMITTER: Richard L. Miell, Otero County, CO
RECOMMENDATION: 410-57. Receptacles in Damp or Wet Locations
(c) Bathtub and shower Zone. A receptacle shall not be installed within a Bathtub and Shower Zone.
SUBSTANTIATION: This change will make this section consistant with changes in Article 100, Section 380-4, and Section 410-4, allowing a rule to reference a defined area, as defined in Article 100.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel is not aware of any requirements in 380-4 that would be in conflict with 410-57. This proposal has no substantiation sufficient to define the problem with the present wording.

(Log #2498)

18- 43 - (410-57(b)(1)): Accept in Principle in Part
SUBMITTER: Andre R. Cartal, Bldg Dept., Princeton Borough, NJ
RECOMMENDATION: Revise as follows:
(1) A receptacle installed in a wet location ~~where the product is intended to be plugged into it is not attended while in use (e.g., sprinkler system controllers, landscape lighting, holiday lights, etc.)~~ shall have an enclosure that is weatherproof with the attachment plug cap inserted or removed.
SUBSTANTIATION: Uniform enforcement of this is a nightmare, for instance, the receptacle on the patio bubble cover or no bubble cover? How does the inspector or contractor know how if someone is going to be in attendance?
THIS IS NOT USER FRIENDLY CODE LANGUAGE so eliminate the problem which is attendance and come back to uniformity.
PANEL ACTION: Accept in Principle in Part.
Modify the text of proposed 420-8(b) to read as follows:
"420-8 (b) Wet Locations.
(1) 15- and 20-ampere outdoor receptacles. 15- and 20-ampere, 125- and 250-volt receptacles installed outdoors in a wet location shall have an enclosure that is weatherproof whether or not the attachment plug cap is inserted.
(2) Other receptacles. All other receptacles installed in a wet location shall comply with (a) or (b) below:
(a) A receptacle installed in a wet location where the product intended to be plugged into it is not attended while in use (e.g., sprinkler system controller, landscape lighting, holiday lights, etc.) shall have an enclosure that is weatherproof with the attachment plug cap inserted or removed.
(b) A receptacle installed in a wet location where the product intended to be plugged into it will be attended while in use (e.g., portable tools, etc.) shall have and enclosure that is weatherproof when the attachment plug is removed."
PANEL STATEMENT: The panel accepts the intent of the proposal and is incorporating the change into proposed Article 420.
The proposal covered all types and sizes of receptacles and locations. The Panel has limited the wording to specific current / voltage ratings and to those installed outdoors.
The reason for limiting this requirement to outdoor receptacles is that a number of receptacles are installed in wet locations indoors in facilities such as food processing plants or breweries where washdown of walls is commonly done with high pressure sprayers. Enclosures intended to be weatherproof when the plug cap is inserted or removed may well not provide the degree of protection afforded by enclosures which are weatherproof only when the plug is removed. Such facilities typically do not leave attachment plug caps inserted and unattended.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
WALL: The submitter of the proposal did not provide technical substantiation nor did he mention any safety issues. The submitter indicated only that enforcement of the present code language was a "nightmare"; therefore, the proposal should be rejected.

(Log #2497)

18- 44 - (410-57(b)(2)): Reject
SUBMITTER: Andre R. Cartal, Bldg Dept., Princeton Borough, NJ
RECOMMENDATION: Delete. See proposal for Section 410-57(b)(1).
SUBSTANTIATION: Uniform enforcement of this is a nightmare, for instance, the receptacle on the patio bubble cover or no bubble cover? How does the inspector or contractor know how if someone is going to be in attendance?
THIS IS NOT USER FRIENDLY CODE LANGUAGE so eliminate the problem which is attendance and come back to uniformity.
PANEL ACTION: Reject.
PANEL STATEMENT: The reason for limiting this requirement to outdoor receptacles is that a number of receptacles are installed in wet locations indoors in facilities such as food processing plants or breweries where washdown of walls is commonly done with high pressure sprayers. Enclosures intended to be weatherproof when the plug cap is inserted or removed may well not provide the degree of protection afforded by enclosures which are weatherproof only when the plug is removed. Such facilities typically do not leave attachment plug caps inserted and unattended.
Therefore the requirements in 410-57 (b) (2) have been maintained. See panel action on Proposal 18-43.

18- 45 - (410-57(b)(3) (New)): Accept in Principle
SUBMITTER: Jack Wells, Pass & Seymour/Legrand
RECOMMENDATION: Add a new subsection to read as follows:
410-57(b)(3) - A 125-volt, single phase, 15- and 20-ampere receptacle type ground-fault circuit-interrupter, installed in an outdoor wet location in a dwelling unit shall have an enclosure that is weatherproof with the attachment plug cap inserted or removed.
SUBSTANTIATION: Section 210-8(a)(3) requires all 125-volt, single-phase, 15- and 20-ampere outdoor receptacles in dwelling units to be ground-fault circuit-interrupter protected. A common means of achieving this protection is to install a receptacle type GFCI on the outside of the dwelling unit in a location that is unprotected from exposure to weather conditions such as rain and snow. A receptacle type GFCI installed in such a location must be adequately protected to prevent corrosion of internal components due to excessive exposure to moisture. The result of prolonged direct exposure to moisture may compromise the capability of the GFCI to provide personnel protection.
It is difficult to predict that an outdoor receptacle installed in a dwelling unit will be used only with equipment that is attended while in use. These outdoor dwelling unit receptacles are commonly used for unattended applications, such as landscape and seasonal lighting, that probably were not foreseen at the time of installation. In order to provide maximum protection for the receptacle GFCI it is essential to install an enclosure/cover that

protects the GFCI under all conditions, regardless of whether or not a plug is inserted or removed.

A receptacle GFCI requires a higher level of protection from water than a standard receptacle because of the potential moisture damage to the circuitry that provides ground fault protection. Underwriters Laboratories recognizes this by requiring GFCI instruction sheets to specify that in wet locations a weatherproof cover must be provided to keep dry both the receptacle and plugs inserted into the receptacle.

It is important to adopt this proposed requirement to ensure the highest level of safety when a GFCI type receptacle is installed in dwelling unit locations.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on proposal 18-43.

(Log #1980)

18- 46 - (410-57(c)): Reject
SUBMITTER: Victor V. Timpanaro, Rep. Municipal Electrical Inspections Assn. of NJ Inc.
RECOMMENDATION: Revise as follows:

Bathtub and Shower Space. A receptacle shall not be installed within 5 feet of a bathtub or shower space.

SUBSTANTIATION: Commentary following the above section in NFPA 70 Handbook, page 424, states reason for above rule was to prohibit installation of receptacles inside bathtub and shower spaces to prevent use of shavers, radios, hair dryers, etc.

Several illustrations shown in code change books have shown that a receptacle outlet may be installed immediately outside the tub area, though GFCI protected.

Since the intent seems to be to prevent the use of the aforementioned electrical products which prove to be a potential hazard, as explained in the commentary, the permitted use of a receptacle outlet installed as illustrated, still presents the same hazard, since the product can be plugged into the outlet.

Your panel may choose 5 or 6 feet whichever you believe would accomplish the purpose. However, to be consistent with the requirement for hot tubs located at Section 680-41(a)(1), you may wish to use the 5 ft dimension.

Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: Section 210-52 (d) requires a wall receptacle outlet within 36 in. of the outside edge of the basin in bathrooms. This requirement is to ensure that a wall receptacle is present in the bathroom to eliminate the need for serving the bathroom with an extension cord.
Many bathrooms are not large enough to require this receptacle to be located 5 ft. from the bath or shower zone.

The receptacle must be grounded and protected with a GFCI in accordance with Section 210-8 (a)(1) which provides protection from shock hazard.

(Log #2083)

18- 48 - (410-57(f)): Accept in Principle
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Revise text to read as follows:

(f) Installation. A receptacle outlet installed outdoors shall be located so that water accumulation is not likely to touch the ~~outlet cover or~~ receptacle face plate.

SUBSTANTIATION: As worded the section is not clear as to the water accumulation on the outlet which holds the receptacle.

This rewrite will clarify this over site.

Also water must accumulate on the cover when it rains.

Only the face plate under the cover must be kept dry.
PANEL ACTION: Accept in Principle.
Delete the wording in the proposed new 420-8(f).
PANEL STATEMENT: The panel accepts the intent of the proposal and is incorporating the change into proposed Article 420.

The revision to 410-57 (b) accepted in Proposal 18-43 eliminates the need for this requirement. Deleting the requirement eliminates the wording described by the submitter as unclear.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 2
EXPLANATION OF NEGATIVE:

KEMPEL: The submitter's substantiation infers that the phrase "water accumulation" as used in 410-57(f) refers to rain drops or sprinkler spray that strikes the outlet cover. The panel action and panel statement were based on this inference. The phrase "located so that water accumulation is not likely to touch the outlet cover" in 410-57(f) could also refer to water that might collect below the receptacle and rise high enough to contact it. Further research of earlier Code cycle documents reveals that this was the intent of the original requirement, which was added as Section 410-54(d) to the 1971 NEC. Thus, this Code section is instructing the installer to mount the receptacle high enough above grade to prevent this.

This being the case, 410-57(f) [420-8(f)] should not be deleted as this is the only section in Article 410 that addresses this installation issue. Also, the fact that the submitter and Panel 18 interpreted the existing wording differently than intended validates the submitter's contention that 410-57(f) needs clarification.

MEZGER: The reason for my negative vote is that the panel's interpretation of the proposer's intent was apparently in error as adequately explained and reviewed in the negative vote submitted by Mr. Kempel. Therefore, 410-57(f) should not be deleted as proposed. Clarification of the clause should be considered.

(Log #2084)

18- 49 - (410-57(f)): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Add a second paragraph to read as follows:

"A weatherproof faceplate assembly shall not be dependent on a single mounting screw or support to secure the weatherproof faceplate assembly to the outlet box or any surface mounted assembly."

SUBSTANTIATION: Weatherproof faceplate assembly's are now becoming to large to accept only the single screw to support the cover to the receptacle center screw.

With the cord now dependent on the cover being closed or water tight when the cover is closed this additional requirement puts additional forces on a single screw.

Where force is put on the cord additional forces allow water to enter the sealing area around the outlet box and cover plate.

Box covers are now manufactured with additional mounting means and the code should change to make this requirement mandatory for a safer installation.

There are reported concerns where the covers are missing due to this support being inadequate.
PANEL ACTION: Reject.
PANEL STATEMENT: This is a product safety requirement that more appropriately belongs in the product standard.
The substantiation anecdotally indicates there are "reported concerns where covers are missing due to this support being

inadequate", but provides no documentation of the specific problem.

18- 50 - (410-57(f)): Reject
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Revise section to read as follows and add a new subsection to read:
(f) Installation.
(1) A receptacle outlet installed outdoors shall be located so that water accumulation is not likely to touch the outlet cover or plate.
(2) A receptacle outlet installed outdoors on a dwelling unit shall comply with Section 410-57(b)(1).
SUBSTANTIATION: Dwelling units are more susceptible to having attachment plugs remain attached to the receptacle then other type occupancies which lead to a hazardous condition when the occupant attempts to disengage the plug.
By requiring the cover to comply with 410-57(b)(1) will eliminate the haste to unplug the flexible cord when it starts to rain.
Also many Christmas decorations are left unattended during this season.
Requiring this while not attended cover will eliminate this concern.
PANEL ACTION: Reject.
PANEL STATEMENT: See panel actions and panel statements in Proposals 18-43 and 18-48.

(Log #2817)

18- 52 - (410-58): Reject
SUBMITTER: Frank Martucci, Fort Lee, NJ
RECOMMENDATION: After existing material, add:
(c) Warning tags. Replacement cord connectors and attachment plugs, shall be permanently tagged with warnings that improper use of this product can cause fiery death, shock, or electrocution.
SUBSTANTIATION: There is a dire need to install permanent warning tags on all replacement cord connectors and attachment plugs. This because, as presently designed, 4 of 6 ways to wire replacement components to cords, or cordsets, can cause electrocutions and fiery deaths.
For the past 13 years, I have been trying to convince the National Fire Protection Association that electrocutions and fatal, destructive fires of electrical origin alluded to by the U.S. Consumer Product Protection Agency, are caused by serious defects in the design of our cord and plug connected grounding system.
Yet, despite my admonitions regarding these life threatening hazards, cord components continue to be sold at hardware stores without any warning tags or instructions; warnings that 4 of 6 ways to wire this product to the white, black, and green cord conductors can cause an electrocution or fiery death.
And, to further compound the chances of fatal wiring errors are the molded extension cords now flooding the market without any color coding whatsoever.
The most insidious nature of the present cord and plug connected grounding system is that a reversal of the white and green wires will operate an appliance properly. They are both grounded conductors.
However, the wiring error will cause current to flow through a hundred feet, or so, of the flexible metal raceways that lace the space inside the walls and ceilings of practically every dwelling, and tenement, in our nation; literally converting rooms into electric ovens.
Massive current from a heater, for example, will cause the lengthy raceway and up to sixteen outlet box connections to overheat enough to cause "unseen", and undetectable, fire inside walls of dwellings. Tests I've made with heater current disclosed flexible raceway temperatures of 150 degrees in open air. The temperatures could be considerably higher inside insulated sealed walls. And, any poorly made, or rusted out, grounding connector may cause arcing sufficient enough to cause immediate ignition.
Tenements, and older dwellings, converted to electricity prior to the adoption of the equipment grounding system are extremely vulnerable to fires inside walls because they lack the approved grounding connectors now in use. There was no need to fasten armored cable securely in those days because the only purpose for armored cable was to protect conductors from damage and to contain, and dissipate heat. It never occurred to electricians that at some future date the armor would be permitted to carry current.
Since practically every dwelling in our nation uses metal raceways as the equipment grounding conductor it is imperative to prevent massive current, such as from heaters, dryers, and air conditioners, to flow through them for extended periods of time.
Two wire redundancy together with a slight, no cost, change in existing components will prevent a reversal of the white and green conductors from causing deadly fires inside walls, and also correct the many design defects, and cord violations, that cause electrocutions.
If the system I propose is adopted by our nation, a homeowner no longer will be playing 4 bullet "Russian Roulette" with their family because it is impossible to wire the cord and plug grounding system so as to cause an electrocution or fiery death.
However, despite my many proposals during the past 13 years, the National Fire Protection and NEMA still refuses to correct the product design defects that cause electrocutions and fiery deaths.
Therefore, permanent warning tags should be attached to all cord replacement components to, at least, warn a homeowner that 4 of the 6 ways they wire the component can cause an electrocution or a fiery death.
PANEL ACTION: Reject.
PANEL STATEMENT: Most electrical equipment when improperly connected or used represents a potential shock or fire hazard. Code requirements are written to clearly define how to properly install electrical equipment. Product safety standards, including their marking requirements, are developed to assure that equipment installed in accordance with this Code function safely.
The current combination of requirements contained in this Code and related product safety standards is adequate.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2822)

18- 53 - (410-58(a)): Reject
SUBMITTER: Frank Martucci, Fort Lee, NJ
RECOMMENDATION: Add after first sentence: "Each grounding pole for cord connectors, and attachment plugs shall have two wiring sites. The cord connectors, and attachment plugs, shall be designed so that only the grounding pole can be wired with two conductors."
SUBSTANTIATION: Note: This proposal is related to a proposal for Section 250-45 seeking the adoption of electrocution-proof and fire-proof cord components for all cord and plug connected equipment. The adoption of both proposals will make the cord and plug connected grounding system electrocution-proof, and fire-proof.

The proposal will correct the design defects in existing line and extension cords that cause thousands of electrocutions and fiery deaths each and every year. Ralph Nader accused the medical profession of accidentally electrocuting 5000 patients a year with electrical equipment and covering up the deaths. The U.S. National Institute for Occupational Safety and Health estimates 700 Americans are electrocuted on the job each year. The Consumer Product Safety Commission estimates 600 persons lose their lives each year by electrocution in and around the home. And each year, hundreds of thousands of fires of electrical origin result in many more deaths, as well as billions of dollars of property damage.

Yet, despite these horrific statistics, not a single attempt has ever been made by government agencies, or the National Fire Protection Association, to investigate and correct the design defects in the electrical grounding system responsible for them.

For the past 13 years, I have been trying to convince the National Fire Protection Association that electrocutions, and fatal, destructive, fires, of electrical origin, alluded to by the U.S. consumer Product Protection Agency, are caused by serious defects in the design of our cord and plug connected grounding system.

Yet, despite my admonitions regarding these life threatening hazards, cord components continue to be sold at hardware stores, without warning tags or instructions; warnings that 4 of 6 ways to wire this product to the white, black, and green cord conductors can cause an electrocution of fiery death.

And, to further compound the chances of fatal wiring errors are the molded extension cords now flooding the market without any color coding whatsoever.

The most insidious nature of the present cord and plug connected grounding system is that a reversal of the white and green wires will operate an appliance properly. They are both grounded conductors.

However, the wiring error will cause current to flow through a hundred feet, or so, of the flexible metal raceways that lace the space inside the walls and ceilings of practically every dwelling, and tenement, in our nation; literally converting rooms into electric ovens.

Massive current from a heater, for example, will cause the lengthy raceway and up to sixteen outlet box connections to overheat enough to cause "unseen", and undetectable, fire inside walls of dwellings. Tests I've made with heater current disclosed flexible raceway temperatures of 150 degrees in open air. The temperatures could be considerably higher inside insulated sealed walls. And, any poorly made, or rusted out, grounding connector may cause arcing sufficient enough to cause immediate ignition.

Tenements, and older dwellings, converted to electricity prior to the adoption of the equipment grounding system are extremely vulnerable to fires inside walls because they lack the approved grounding connectors now in use. There was no need to fasten armored cable securely in those days because the only purpose for armored cable was to protect conductors from damage and to contain, and dissipate, heat. It never occurred to electricians that at some future date the armor would be permitted to carry current.

Since practically every dwelling in our nation uses metal raceways as the equipment grounding conductor it is imperative to prevent massive current, such as from heaters, dryers, and air conditioners, to flow through them for extended periods of time.

Two wire redundance together with a slight, no cost, change in existing components will prevent a reversal of the white and green conductors from causing deadly fires inside walls, and also correct the many design defects, and cord violations, that cause electrocutions.

If the system I propose is adopted by our nation, a homeowner no longer will be playing 4 bullet "Russian Roulette" with his family because it is impossible to wire the cord and plug grounding system so as to cause an electrocution or fiery death.

However, despite my many proposals during the past 13 years, the National Fire Protection Association still remains unconvinced the deadly fires that incinerate entire families within seconds, and cause billions of dollars of property damage each year, are "unseen" fires that originate, and rage inside walls.

Therefore, the carnage will continue until, hopefully, new members of the NFPA wall see the danger as I do.

We're talking about fires within walls that rage, undetected by occupants, sprinkler systems, or smoke alarms until too late. "Unseen" fires that superheat the interior of walls until they flashover and consume occupants and their procession within seconds.

Case in point is an article in the January 5, 1994 issue of the Bergen Record that reported a firefighter, (name deleted), was incinerated by a sudden inferno while searching for survivors. His buddy said a "flashover" from superheated walls caused temperatures to rise from 100 degrees to 2000 degrees within seconds. Everything in the room became incinerated within seconds.

Rutherford Fire Chief (name deleted), explained that the interiors of walls create a large area where "unseen" fires can develop and build up heat due to lack of ventilation. It makes for the ideal conditions for a flashover.

The January 15, 1995 issue of the Bergen Record reported that a house fire in Burbank, IL killed 6 children and one adult despite working smoke alarms. The report stated a smoke alarm was still blaring when firefighters arrived.

The October 9, 1995 issue of the New York Post reported that 31 year old hero firefighter (name deleted) was incinerated when the room he was standing in suddenly flashed over.

The March 22, 1998 mysterious fire that killed 11 students in Pennsylvania could also have been caused by "unseen", and undetectable, raging fires inside the cabin walls that flashed over and incinerated them within seconds.

And during a two week period of the 1998-9 Christmas season, fast moving fires in the New York Metropolitan area caused 8 deaths, several injuries, and millions of dollars of property damage. Fire officials blamed heaters that ignited combustible material. I say heater "current" and not heater "heat" is responsible for all fast moving, inferno, type fires.

A fire that demonstrates how wrong the NFPA is concerning the cause of fires is an inferno that killed nine members of a man's family while he talking to his wife on the phone. He heard his wife scream in agony at the same time the smoke alarm went off.

Orange fire officials blamed the tragedy on a heater placed too close to a blanket. And a spokesperson for the National Fire Protection Agency also informed an investigative reporter that "most heater related deaths are caused by heaters placed too close to combustible material."

Nothing could be further from the truth. In the first place, I found it impossible to get tissue paper to burn while draped around two types of electric heaters turned on for three hours. Try the experiment and see for yourself.

We are also led to believe that cigarettes, halogen lamps, or candles are also reasons for fast moving fires that caused fatalities and total destruction of property. This is simply not true. If working smoke alarms are sensitive enough to blare when toasters are used, they most certainly will warn occupants in ample time to escape if a blanket, drape, paper, or chair is on fire inside a room.

Fires that start inside rooms can be easily detected and extinguished by occupants. While serving on the fire brigade in Francis Dealfield Hospital, every fire responded to was extinguished and occupants were able to walk away unharmed.

It's the fires that start inside walls that kill and destroy property. But how can a fire start inside a wall? Walls are sealed from floor to ceiling. A fire, originating in a room, would have to rage for a half hour or more before it burnt itself into a wall, during which time smoke alarms and occupants would have detected the fire in ample time to extinguish it or escape.

And people can't smoke, use heaters, play with matches, or toss lit cigarettes inside the walls of dwellings. So its obvious that the electrical system, prone to overheating, and arcing, is to blame for flashover, fireball, and inferno type fires that kill and destroy property.

The cause of fires inside the walls are the design defects in line and extension cords together with an ill-conceived grounding system adopted and installed in practically every building in our nation

According to the original National Electric Code document, devised under the influence of insurance companies, the grounding conductor should only be copper, copper clad, or aluminum (Article 250-95 in the original code.).

Instead, electrical safety has been severely compromised with exceptions to the original code whereby inappropriate corrosive metal raceways are permitted to be used as the equipment grounding conductor.

The exception also violates the intent of the code that mandates all conductors must terminate in splice boxes to contain any heat or sparking from poorly made connections.

Because practically all buildings in our nation use the metal raceways as the grounding conductor, it behooves NEMA and the NFPA to prevent wiring errors from causing massive current to cause them to overheat and cause raging fires inside the walls.

No family should become incinerated because a plug is inadvertently wired with reversed green and white conductors. Or die because a replacement plug was not properly installed on one of the violation extension cords now flooding the market with similarly colored conductors. The white, green, and black conductors are now all black, all yellow, all gray or all brown.

My proposal provides a standard that will make all line and extension cords fire-proof, and also electrocution-proof, by eliminating or ameliorating the potentially hazardous defects in their design. And even though all conductors are similarly colored.

The standard requires no physical changes except to provide a no cost second wiring site only at the ground pole of cord components.

The extra conductor in all cords is the only cost, a small price to pay to eliminate the following design defects:

1ST DESIGN DEFECT: This defect defies conventional wisdom and practice. Instead of the redundancy resorted to by every other federal agency whenever lives are at stake, the protective equipment grounding conductor used on practically all electrical devices has been reduced up to 66%.

This increases the chances of shock or electrocution from loss of grounding or injury due to line drop shock. My proposal, will prevent loss of grounding and voltage drop.

2ND DESIGN DEFECT: This defect results from sizing cord, and cordset, equipment grounding conductors the same as the circuit conductors (3#18, 3#16, 3#14, etc). The equipment grounding conductor must, at all times, assure that it will withstand fault currents for the length of time it takes fuses, or circuit breakers, to clear a fault. A 20 ampere circuit breaker, for example, can cause spike currents that could burn open the equipment grounding conductor, instead of the circuit conductor, leaving the metal exposed parts of an appliance energized.

Two equipment grounding conductors in all cords, regardless of wire size, will assure that the circuit conductors will always burn open first during massive ground faults.

3RD DESIGN DEFECT: This cord design defect permits miswired devices to operate safely until they are plugged into an outlet, or extension cord, with reversed polarity. The drill in figure 1 operates safely when used with a properly wired outlet, or extension cord, even though improperly wired with reversed green and white conductors.

However, the moment the drill is plugged into an outlet, or extension cord, wired with reversed polarity, the case of the drill becomes energized with a full 120 volt potential, figure 2.

Figure 3 illustrates how my electrocution-proof grounding system will correct this “Russian Roulette” type hazard. The two grounding conductors needed to correct the two previous design defects will make possible a wiring scheme that absolutely prevents miswired cords from causing shock or electrocution regardless of whether, or not, a wall outlet, or extension cord remains wired with reversed polarity.

If all cord components, and device terminals, are designed according to the specification in my proposal, there is no possible way to miswire a cord without at least one of the three grounded conductors (two green and one white) attached to the grounding pole of components and exposed metal parts of electrical devices or extension cords.

Acceptance of my proposal will eliminate the cord design defect that permits wiring errors to shock or electrocute.

4TH DESIGN DEFECT: No provision is provided in existing cords to activate branch circuit ground fault current interrupters when miswiring energizes the exposed metal parts of electrical devices. A ground fault causing current to flow through people cannot trip circuit breakers or blow fuses.

Accepting my proposal will assure that an equipment grounding conductor is ALWAYS attached to the metal exposed parts of electrical devices, despite wiring errors, thereby providing the necessary impedance required to activate branch circuit ground fault current interrupters.

In fact, adoption of my proposal will convert branch circuit ground fault current interrupters into people GFCIs. See how the second grounded conductor in figure 3 prevents shock, or electrocution, by providing the low resistance path required to activate branch circuit ground fault devices.

5TH DESIGN DEFECT: No provision is provided in existing cords to prevent miswiring from causing current to flow through metal raceways. A heater, or extension cord, miswired with reversed green and white conductors, can cause raceway heating, or arcing, at metal raceway connections sufficient enough to cause “unseen” raging fires inside walls.

If my proposal is accepted, the second grounding conductor will shunt any metal raceway current back to the proper circuit conductor.

Figure A illustrates how heater current flows through metal raceways when a line cord, or extension cord, is miswired with reversed green and white conductors.

Figure B illustrates how my proposal will prevent current flow through raceways.

At the New Orleans annual meeting a member ridiculed my A and B figures so I am also submitting figures C and D. They depict, in diagram form, how current flowing through metal raceways can be automatically shunted back to the white circuit conductor.

The second grounding conductor, in conjunction with electrocution-proof and fire-proof cord components, will shunt raceway current to the proper circuit conductor.

Current flowing through raceways, instead of the white conductor, cause the ground poles of all downstream outlets to become energized, a hazard also eliminated by the second ground conductor and the properly designed cord components I propose.

6TH DESIGN DEFECT: Molded cords have similarly colored branch circuit conductors instead of the usual black and white ones, a violation of the National Electrical Code. Without color coding, there is no way to prevent replacement components from being wired with reversed polarity. Even manufacturers are shipping extension cords with reversed polarity. I can corroborate this by producing such an extension cord purchased at a local hardware store.

Figure 2 illustrates how extension cords, or wall outlets, wired with reversed polarity, will cause shock, or electrocution, if used with devices, or another extension cord, inadvertently wired with reversed green and white conductors.

Figure 3 illustrates how a second grounding conductor, together with electrocution-proof components will prevent electrocution from this type of wiring hazard.

Accepting my proposal will permit the SAFE repair of molded cords even if all conductors are colored the same.

7TH DESIGN DEFECT: Providing only one equipment grounding conductor for up to 6 extension outlets. Accepting my proposal will ameliorate this defect.

8th DESIGN DEFECT: Molded cord components cannot be examined or repaired at the strain relief. Accepting my proposal will provide true assurance that the protective equipment grounding conductors will never open prior to the circuit conductors.

9th DESIGN DEFECT: The lack of wiring safeguards. Experienced electricians, including myself, have admitted catching themselves wiring outlets and cords improperly. It is unconscionable to permit a grounding system whereby an electrical worker could be responsible for an electrocution or fiery death.

If four of six ways to wire an attachment plug can cause an electrocution, or fiery death, it becomes imperative that they be designed to at least assure the proper attachment of the equipment grounding conductor.

My proposal will absolutely assure that the grounding pole of cord components will be attached to a grounded conductor regardless of any amount of wiring errors.

It will also assure that the ground poles of cord components are always wired with two green conductors. A green and white, green and black, or black and white conductor attached to the ground pole clamp will be immediately noticed and corrected.

Conclusion: Thousands of our citizens suffer fiery deaths, electrocutions, and serious, shock induced, injuries, because of the above mentioned design defects in all cords

Design defects that caused an 8 fold increase in electrocutions on construction sites, despite the use of extensive written assured grounding programs by well supervised, and qualified, personnel. Without the assured grounding program, the loss of life and serious injuries would have been considerably higher.

Millions of homeowners, other workers, and patients, exposed to the same defectively designed cords, do not have this mandated assured grounding program and remain unprotected. Therefore, it behooves NEMA and NFPA to adopt my self monitoring electrocution-proof and fire-proof grounding system.

My proposal, if adopted by our nation, will provide true assured grounding for every man, woman, and child, in every area of our nation, without the need for, costly, ineffective, testing programs.

No one should needlessly suffer fiery deaths, shock, or electrocution in order to save the cost of less than two cups of coffee.

Note: Supporting material is available upon request at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The Panel has seriously considered and responded in detail to the submitter's concerns for at least three

previous Code cycles. The Panel has meticulously pointed out the errors and misrepresentations in the data such as:

No credible source has verified Mr. Nader's claim of 5000 hospital electrocutions.
CPSC actually reports fewer than 200 electrocutions per year associated with low voltage utilization equipment.
The submitter cites seven fires in support of this proposal.
None of the cited fires indicated an electrical cause.
The October 9, 1995 fire that killed a firefighter in New York was a kitchen fire resulting from an unattended stove.
Heaters placed too close to combustible material were cited as the cause of two of the fires used to justify this proposal. It wasn't even indicated whether the heaters were electric or not. Using such data is patently misleading. Numerous types of fires other than electrical migrate into the walls. Indeed, in all probability none of these fires had anything to do with electrical equipment of any kind, much less attachment plugs or cord connectors. To imply that these fires would have been prevented by the proposal is disingenuous to say the least.
The litany of 9 "Design Defects" cited are technically without foundation. In fact, nearly all are wiring defects contrary to the provisions of this Code.
Panel 18 does not doubt the sincerity of the submitter. However, the substantiation demonstrates a fundamental lack of understanding of proven electrical safety precepts and, at times, defies the laws of physics. NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

(Log #CP1808)

18- 53a - (410-66(a)): Accept
SUBMITTER: CMP 18
RECOMMENDATION: Modify the text to read as follows:
"(a) Clearance.
(1) Non Type IC. A recessed fixture that is not identified for contact with insulation shall have all recessed parts spaced not less than 12.7 mm (1/2 in.) from combustible materials. The points of support and the trim finishing off the opening in the ceiling or wall surface shall be permitted to be in contact with combustible materials.
(2) Type IC. A recessed fixture that is identified for contact with insulation, Type IC, shall be permitted to be in contact with combustible materials at recessed parts, points of support, and portions passing through or finishing off the opening in the building structure."
SUBSTANTIATION: The text was modified to conform to Style Manual Section 2.1.5 and 2.1.5.1.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3857)

18- 54 - (410-67(c)): Reject
SUBMITTER: J. Philip Simmons, Olympia, WA
RECOMMENDATION: Revise this section as follows:
410-67(a) General. Conductors that have insulation suitable for the temperature encountered shall be used.
(b) Circuit Conductors. Branch-circuit conductors that have an insulation suitable for the temperature encountered shall be permitted to terminate in the fixture.
(c) ~~Tap~~ Fixtures Requiring Conductors with Higher Rated Insulation. Fixtures requiring conductors having an insulation with a temperature rating higher than the branch circuit conductors shall have conductors installed with insulation ~~Tap conductors~~ of a type suitable for the temperature encountered. Such conductors shall be ~~permitted to~~ run from the fixture terminal connection to an outlet box placed at least 1 ft (305 mm) from the fixture. Such ~~tap~~ conductors shall be in suitable raceway or Type AC or MC cable of at least 18 in. (450 mm) but not more than 6 ft (1.83 m) in length.
SUBSTANTIATION: These changes are primarily editorial to recognize that in most cases, conductors the same size as the branch circuit conductors but with a higher temperature rating need to be installed from the junction box to the fixture housing. This is not really a tap as conductors of the same size are being installed but having a higher temperature rating. This occurs where the branch circuit conductors are adequate in ampacity but have an insulation that is lower than required by the lighting fixture.
This proposal also clarifies that all wiring methods must have a temperature rating sufficient for the lighting fixtures as indicated in (a) and (b) of this section.
PANEL ACTION: Reject.
PANEL STATEMENT: Tap conductors are not always temperature rated higher than the branch circuit conductors. As an example many recessed fluorescent luminaries employ tap conductors rated 90 degrees C and are attached to branch circuit conductors rated 90 degrees C. The proposed changes would reorient this section to apply only to higher temperature tap conductors.

(Log #4224)

18- 55 - (410-67(c)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc
RECOMMENDATION: Delete this subsection.
SUBSTANTIATION: The substantiation for the present wording pointed to current recessed fixture designs that have tap con-ductors in the 18-in. range running from the fixture compartment to the prewired branch-circuit wiring com-partment. Why should such taps have to observe a 4-ft minimum length, as required in the previous Code (and every preceding Code going back to 1940)? Meanwhile, the proposal didn't change the minimum box separation part of the requirement, namely 1 ft, although very few prewired fixtures have anywhere near that degree of separation, and if they did, the minimum tap length would need to be at least 2 ft or longer.
The current wording of this rule is completely senseless. This section doesn't have anything to do with pre-wired fixtures suitable for normal branch-circuit wiring connections. The branch-circuit wiring compartment of a prewired fixture isn't an "outlet box" that has been "placed" (a field wiring requirement) as described in this rule. Due to evolving requirements for thermal protection, together with market forces, no fixtures to which this section applies are still in production.
This change proved absolutely that we are so far from the original concept for this rule, even the panel no longer has any idea why it's in the Code. The rule dates from the 1940 NEC, and it has to do with establish-ing a cold lead so the fixture heat wouldn't reach the branch circuit conductors. Before the advent of thermal protection, and prewired recessed fixtures, you ran a 4 to 6 ft lead in greenfield with Type AF or other high-temperature fixture wire from the lamp compartment to a box at least one foot away. The resulting loop of raceway made transmission of heat to the box impossible.
The beginning of the end came in the 1990 NEC, when Type AC or MC cable got added in, in spite of the fact that neither cable assembly had high-temperature conductors, and could not possibly be used for this purpose. Now we describe a tap that isn't a tap covered by the Code to a box that isn't the box described in the Code. The panel should either find a use that corresponds to today's market for this section and then write a proper rule (there might conceivably be a use with non-thermally-protected recessed fixtures in poured concrete), or, more likely, as in this proposal, delete it.
PANEL ACTION: Reject.
PANEL STATEMENT: There are luminaries in production and use today designed for installation in accordance with these requirements. While the substantiation argued the history of the wording, it did nothing to address the lack of need to ensure that luminaries are properly connected to conductors appropriate for the installation. The product standard (not 410-67(c)) addresses the flexible conduit between the luminare housing and the integral wiring compartment on a recessed luminare.

AFFIRMATIVE: 11

(Log #370)

18- 56 - (410-72, Exception (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add an exception to read as follows:
Exception: Metal lampholders shall be permitted for portable table or floor lamps and as covered in Sections 305-4(f) and 410-30(a).

SUBSTANTIATION: This section is suitable for fixtures, porcelain and plastic lampholders which mount directly to outlet boxes, lampholders on extension cords, but is broad enough to disallow metal lampholders in portable lamps and those recognized in Sections 305-4(f) and 410-30(a).
PANEL ACTION: Reject.
PANEL STATEMENT: Section 410-72 is in Part N titled "Construction of Flush and Recessed Fixtures". It has nothing to do with portable lamps or those recognized in Section 305-4(f) or 410-30. To imply that it does is incorrect.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1922)

18- 64 - (410-84(a), and (b)(1) and (2) and Exception): Reject
SUBMITTER: Michael J. Johnston, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read as follows:
410-85. Transformers ~~Type~~
(a) Type. Transformers shall be listed and shall be identified for the use. Transformers shall be the enclosed type.
(b) Secondary-Circuit Ground-Fault Protection. Transformers other than the following shall have secondary-circuit ground-fault protection:
1. Transformers with isolated secondaries and with a maximum open circuit voltage of 7500 volts or less.
2. Transformers with integral porcelain or glass secondary housing for the tubing and requiring no field wiring of the secondary circuit.
Exception: Listed assemblies that require no field installed high voltage secondary circuits.
SUBSTANTIATION: The electrical characteristics of these field installed high voltage secondary circuits (i.e. capacitance effects, corona, and the resultant ozone effects) are similar to those of the secondary circuits for neon installations. These types of lighting circuits and custom systems resemble field installed neon tubing installations and the same protection should be provided for these secondaries. Clearly, in Section 410-88 the requirements for installation of secondary conductors are the same as for neon transformer secondary circuits. In fact it refers to the requirements of 600-32. No mention of length limitation here though, as in Section 600-32(j).
PANEL ACTION: Reject.
PANEL STATEMENT: The panel assumes the proposal intends to modify 410-84, not 410-85. The substantiation does not clearly state what the hazard with electric discharge lighting systems is that would require adoption of the proposed changes.

420-8 (a) - (f)	410-57(a) - (f)
420-9 (a) - (b)	410--58(a) - (f)
420-10(a) - (d)	250-146 (a) - (d)

ARTICLE 420 — Receptacles, Cord Connectors, and Attachment Plugs (Caps)

420-1. Scope. This Article covers the rating, type and installation of receptacles, cord connectors, and attachment plugs (cord caps).
420-2. Receptacle Rating and Type
(a) Receptacles. Receptacles shall be listed for the purpose and marked with the manufacturer's name or identification, and voltage and ampere ratings.
(b) Receptacles. Receptacles installed for the attachment of portable cords shall be rated at not less than 15 amperes, 125 volts, or 15 amperes, 250 volts, and shall be of a type not suitable for use as lampholders.
FPN: See Section 210-21(b) for receptacle ratings where installed on branch circuits.
(c) Receptacles for Aluminum Conductors. Receptacles rated 20 amperes or less and designed for the direct connection of aluminum conductors shall be marked CO/ALR.
(d) Isolated Ground Receptacles. Receptacles incorporating an isolated grounding connection intended for the reduction of electrical noise (electromagnetic interference) as permitted in Section 250-146(d) shall be identified by an orange triangle located on the face of the receptacle.
(1) Receptacles so identified shall be used only with grounding conductors that are isolated in accordance with Section 250-146(d).
(2) Isolated ground receptacles installed in nonmetallic boxes shall be covered with a nonmetallic faceplate.
Exception: Where an isolated ground receptacle is installed in a nonmetallic box, a metal faceplate shall be permitted if the box contains a feature or accessory that permits the effective grounding of the faceplate.
420-3. General Installation Requirements. Receptacle outlets shall be located in branch circuits in accordance with Part C of Article 210. General installation requirements shall be in accordance with (a) through (f) below:
(a) Grounding Type. Receptacles installed on 15- and 20-ampere branch circuits shall be of the grounding type. Grounding-type receptacles shall be installed only on circuits of the voltage class and current for which they are rated, except as provided in Tables 210-21(b)(2) and (b)(3).
Exception: Non-grounding-type receptacles installed in accordance with Section 420-3(d).
(b) To Be Grounded. Receptacles and cord connectors that have grounding contacts shall have those contacts effectively grounded.
Exception No. 1: Receptacles mounted on portable and vehicle-mounted generators in accordance with Section 250-34.
Exception No. 2: Replacement receptacles as permitted by Section 420-3(d).
(c) Methods of Grounding. The grounding contacts of receptacles and cord connectors shall be grounded by connection to the equipment grounding conductor of the circuit supplying the receptacle or cord connector.
FPN: For installation requirements for the reduction of electrical noise, see Section 250-146(d).

The branch-circuit wiring method shall include or provide an equipment-grounding conductor to which the grounding contacts of the receptacle or cord connector shall be connected.

FPN No. 1: Section 250-118 describes acceptable grounding means.

FPN No. 2: For extensions of existing branch circuits, see Section 250-130.

(d) Replacements. Replacement of receptacles shall comply with (1), (2), and (3) as applicable.

(1) Where a grounding means exists in the receptacle enclosure or a grounding conductor is installed in accordance with Section 250-130(c), grounding-type receptacles shall be used and shall be connected to the grounding conductor in accordance with Sections 420-3(c) or 250-130(c).

(2) Ground-fault circuit-interrupter protected receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in this Code.

(3) Where a grounding means does not exist in the receptacle enclosure, the installation shall comply with (a), (b), or (c).

(a) A non-grounding-type receptacle(s) shall be permitted to be replaced with another non-grounding-type receptacle(s).

(b) A non-grounding-type receptacle(s) shall be permitted to be replaced with a ground-fault circuit interrupter-type of receptacle(s). These receptacles shall be marked "No Equipment Ground." An equipment grounding conductor shall not be connected from the ground-fault circuit interrupter-type receptacle to any outlet supplied from the ground-fault circuit interrupter receptacle.

(c) A non-grounding-type receptacle(s) shall be permitted to be replaced with a grounding-type receptacle(s) where supplied through a ground-fault circuit interrupter. Grounding-type receptacles supplied through the ground-fault circuit interrupter shall be marked "GFCI Protected" and "No Equipment Ground." An equipment grounding conductor shall not be connected between the grounding-type receptacles.

(e) Cord- and Plug-Connected Equipment. The installation of grounding-type receptacles shall not be used as a requirement that all cord- and plug-connected equipment be of the grounded type.

FPN: See Section 250-114 for types of cord- and plug-connected equipment to be grounded.

(f) Non-interchangeable Types. Receptacles connected to circuits that have different voltages, frequencies, or types of current (ac or dc) on the same premises shall be of such design that the attachment plugs used on these circuits are not interchangeable.

420-4. Receptacle Mounting. Receptacles shall be mounted in boxes, or assemblies designed for the purpose, and such boxes or assemblies shall be securely fastened in place.

(a) Receptacles mounted in boxes that are set back of the wall surface, as permitted in Section 370-20, shall be installed so that the mounting yoke or strap of the receptacle is held rigidly at the surface of the wall.

(b) Receptacles mounted in boxes that are flush with the wall surface or project therefrom shall be installed so that the mounting yoke or strap of the receptacle is held rigidly against the box or raised box cover.

(c) Receptacles Mounted on Covers. Receptacles mounted to and supported by a cover shall be held rigidly against the cover by more than one screw or shall be a device assembly or box cover listed and identified for securing by a single screw.

(d) Position of Receptacle Faces. After installation, receptacle faces shall be flush with or project from faceplates of insulating material and shall project a minimum of 0.015 in. (0.381 mm) from metal faceplates.

(e) Receptacles in Work Surfaces and Countertops. Receptacles shall not be installed in a face-up position in work surfaces or countertops.

(f) Exposed Terminals. Receptacles shall be enclosed so that live wiring terminals are not exposed to contact.

420-5. Receptacle Faceplates (Cover Plates). Receptacle faceplates shall be installed so as to completely cover the opening and seat against the mounting surface.

(a) Metal faceplates shall be of ferrous metal not less than 0.030 in. (0.762 mm) in thickness or of nonferrous metal not less than 0.040 in. (1.016 mm) in thickness.

(b) Metal faceplates shall be grounded.

(c) Faceplates of insulating material shall be non-combustible and not less than 0.10 in. (2.54 mm) in thickness but shall be permitted to be less than 0.10 in. (2.54 mm) in thickness if formed or reinforced to provide adequate mechanical strength.

420-6. Attachment Plugs. All attachment plugs and cord connectors shall be listed for the purpose and marked with the manufacturer's name or identification, and voltage and ampere ratings.

(a) Attachment plugs and cord connectors shall be constructed so that there are no exposed current-carrying parts except the prongs, blades, or pins. The cover for wire terminations shall be a part, which is essential for the operation of an attachment plug or connector (dead-front construction).

(b) Attachment plugs shall be installed so that their prongs, blades, or pins are not energized unless inserted into an energized receptacle. No receptacle shall be installed so as to require an energized attachment plug as its source of supply.

(c) Attachment Plug Ejector Mechanisms. Attachment plug ejector mechanisms shall not adversely affect engagement of the blades of the attachment plug with the contacts of the receptacle.

420-7. Non-interchangeability. Receptacles, cord connectors, and attachment plugs shall be constructed so that receptacle or cord connectors will not accept an attachment plug with a different voltage or current rating than that for which the device is intended; however, a 20-ampere T-slot receptacle or cord connector shall be permitted to accept a 15-ampere attachment plug of the same voltage rating. Non-grounding-type receptacles and connectors shall not accept grounding-type attachment plugs.

420-8. Receptacles in Damp or Wet Locations

(a) Damp Locations. A receptacle installed outdoors in a location protected from the weather or in other damp locations shall have an enclosure for the receptacle that is weatherproof when the receptacle is covered (attachment plug cap not inserted and receptacle covers closed).

An installation suitable for wet locations shall also be considered suitable for damp locations.

A receptacle shall be considered to be in a location protected from the weather where located under roofed open porches, canopies, marquees, and the like, and will not be subjected to a beating rain or water runoff.

(b) Wet Locations.

(1) A receptacle installed in a wet location where the product intended to be plugged into it is not attended while in use (e.g., sprinkler system controllers, landscape lighting, holiday lights, etc.) shall have an enclosure that is weatherproof with the attachment plug cap inserted or removed.

(2) A receptacle installed in a wet location where the product intended to be plugged into it will be attended while in use (e.g., portable tools, etc.) shall have an enclosure that is weatherproof when the attachment plug cap is removed.

(c) Bathtub and Shower Space. A receptacle shall not be installed within a bathtub or shower space.

(d) Protection for Floor Receptacles. Standpipes of floor receptacles shall allow floor-cleaning equipment to be operated without damage to receptacles.

(e) Flush Mounting with Faceplate. The enclosure for a receptacle installed in an outlet box flush-mounted on a wall surface shall be made weatherproof by means of a weatherproof faceplate assembly that provides a watertight connection between the plate and the wall surface.

(f) Installation. A receptacle outlet installed outdoors shall be located so that water accumulation is not likely to touch the outlet cover or plate.

420-9. Grounding-Type Receptacles, Adapters, Cord Connectors, and Attachment Plugs.

(a) Grounding Poles. Grounding-type receptacles, cord connectors, and attachment plugs shall be provided with one fixed grounding pole in addition to the circuit poles. The grounding contacting pole of grounding-type plug-in ground-fault circuit interrupters shall be permitted to be of the movable, self-restoring type on circuits operating at not over 150 volts between and to conductors nor over 150 volts between any conductor and ground.

(b) Grounding-Pole Identification. Grounding-type receptacles, adapters, cord connections, and attachment plugs shall have a means for connection of a grounding conductor to the grounding pole.

A terminal for connection to the grounding pole shall be designated by one of the following.
(1) A green-colored hexagonal-headed or shaped terminal screw or nut, not readily removable.
(2) A green-colored pressure wire connector body (a wire barrel).
(3) A similar green-colored connection device, in the case of adapters. The grounding terminal of a grounding adapter shall be a green-colored rigid ear, lug, or similar device. The grounding connection shall be designed so that it cannot make contact with current-carrying parts of the receptacle, adapter, or attachment plug. The adapter shall be polarized.
(4) If the terminal for the equipment grounding conductor is not visible, the conductor entrance hole shall be marked with the word "green" or "ground," the letters "G" or "GR" or the grounding symbol, as shown in Figure 4~~20-910-58~~(b)(4), or otherwise identified by a distinctive green color. If the terminal for the equipment grounding conductor is readily removable, the area adjacent to the terminal shall be similarly marked.

Figure 4~~20-910-58~~(b)(4) Grounding symbol.

(c) Grounding Terminal Use. A grounding terminal or grounding-type device shall not be used for purposes other than grounding.
(d) Grounding-Pole Requirements. Grounding-type attachment plugs and mating cord connectors and receptacles shall be designed so that the grounding connection is made before the current-carrying connections. Grounding-type devices shall be designed so grounding poles of attachment plugs cannot be brought into contact with current-carrying parts of receptacles or cord connectors.
(e) Use. Grounding-type attachment plugs shall be used only with a cord having an equipment grounding conductor.

FPN: See section 200-10(b) for identification of grounded conductor terminals.

420-10. Connecting Receptacle Grounding Terminal to Box. An equipment bonding jumper shall be used to connect the grounding terminal of a grounding-type receptacle to a grounded box unless grounded as in (a) through (d).
(a) Surface Mounted Box. Where the box is mounted on or at the surface, direct metal-to-metal contact between the device yoke and the box shall be permitted to ground the receptacle to the box. This provision shall not apply to cover-mounted receptacles unless the box and cover combination are listed as providing satisfactory ground continuity between the box and the receptacle.
(b) Contact Devices or Yokes. Contact devices or yokes designed and listed for the purpose shall be permitted in conjunction with the supporting screws to establish the grounding circuit between the device yoke and flush-type boxes.
(c) Floor Boxes. Floor boxes designed for and listed as providing satisfactory ground continuity between the box and the device shall be permitted.
(d) Isolated Receptacles. Where required for the reduction of electrical noise (electromagnetic interference) on the grounding circuit, a receptacle in which the grounding terminal is purposely insulated from the receptacle mounting means shall be permitted. An insulated equipment grounding conductor run with the circuit conductors shall ground the receptacle grounding terminal. This grounding conductor shall be permitted to pass through one or more panelboards without connection to the panelboard grounding terminal as permitted in Section 384-20, Exception, so as to terminate within the same building or structure directly at an equipment grounding conductor terminal of the applicable derived system or service.

FPN: Use of an isolated equipment grounding conductor does not relieve the requirement for grounding the raceway system and outlet box.

SUBSTANTIATION: This proposal was developed by a Task Group of CMP-18 appointed by the chairman to consider separating 1999 NEC Article 410 into two articles, one covering lighting fixtures and the other covering receptacles, attachment plugs and cord connectors. This Task Group was appointed in response to Proposal 18-55 for the revision of the 1996 NEC.

The intent of this proposal is to relocate the general requirements covering the rating, type, construction and installation of these devices into a new article separate from lighting fixtures.

Over many Code cycles the general installation and construction requirements for receptacles, attachment plugs and cord connectors have been adopted in various Sections of the Code. Additional and related proposals are also being submitted by the Task Group to relocate these installation and construction requirements from other Articles of the Code to this new Article.

The Task Group believes this is consistent with the objective of the Usability Task Group and will make these requirements easier to find and use.

The Task Group realizes that the NEC Correlating Committee has jurisdiction over number, title and scope of articles and submits the proposed wording for their consideration.

PANEL ACTION: Accept.

ARTICLE 422 — APPLIANCES

(Log #526)

20- 4 - (422): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Section 422-13, replace "120 gal (454.2 L)" with "450 L (120 gal)".
2. In Section 422-16(b)(1)(b), replace "18 in. (457 mm)" with "450 mm (18 in.)" and replace "36 in. (914 mm)" with "900 mm (36 in.)".
3. In Section 422-16(b)(2)(b), replace "3 ft to 4 ft (0.914 m to 1.22 m)" with "0.9 m to 1.2 m (3 ft to 4 ft)".
4. In Sections 422-18(a) and (b), replace "35 lb (15.88 kg)" with "16 kg (35 lb)" throughout and replace "70 lb (31.76 kg)" with "32 kg (70 lb)" in part (b)'s Exception.
5. In Section 422-47(b), replace "1 gal (3.785 L)" with "3.8 L (1 gal)".
6. In Section 422-49, replace "12 in. (305 mm)" with "300 mm (12 in.)".
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following.
PANEL ACTION: Accept.

20- 5 - (422-2-Appliance, Fixed (New); Appliance, Portable (New); and Appliance, Stationary (New)): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and the Panel clarify their Panel Statement since the terms "fixed" and "portable" are used in Article 422. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Angelo S. Sperlongo, City of Coral Springs, FL
RECOMMENDATION: Add definitions:
Appliance, Fixed. An appliance that is fastened or otherwise secured at a specific location.
Appliance, Portable. An appliance that is actually moved or can easily be moved from one place to another in normal use.
Appliance, Stationary. An appliance that is not easily moved from one place to another in normal use.
SUBSTANTIATION: to add the definitions of Fixed, Portable and Stationary Appliances to Article 422 — Appliances.
The only space in the code where these definitions are located is Article 550 - Mobile Homes. According to the scope of Article 550-1, the provisions of this article covers the electrical conductors and equipment installed within or on mobile homes only. By adding these definitions to Article 422, it will cover electric appliances used in any occupancies.
PANEL ACTION: Reject.
PANEL STATEMENT: These terms are not used in this article and do not need to be defined.

20- 5a - (422-11): Accept

Note: It is the understanding of the Technical Correlating Committee that the Panel Action is to accept the titles for 422-11(f)(1), (2), and (3), respectively.

SUBMITTER: CMP 20

RECOMMENDATION: Add titles to the subsections as follows:

(1) Electric Heating Appliances
(2) Commercial Kitchen and Cooking Appliances
(3) Water Heaters and Steam Boilers

SUBSTANTIATION: Compliance with NEC Correlating Committee directive on style.

PANEL ACTION: Accept.

(Log #2268)

20- 6 - (422-11(f)): Accept in Principle in Part

Note: The Technical Correlating Committee directs that the Panel clarify the Panel Action and Statement on this Proposal. The Panel Action has not been incorporated into Proposal 20-5a as indicated in the Panel Statement. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Thomas L. Harman, Univ. of Houston Cleark Lake/Rep. Univ. of Houston Clear Lake

RECOMMENDATION: Add the following text:

The circuits supplying listed instantaneous water heaters employing resistance-type immersion electric heating elements shall be permitted to be subdivided into circuits not to exceed 80 amperes and protected at not more than 100 amperes.

SUBSTANTIATION: Due to the technological advances in tankless (instantaneous) water heater design, I believe that Section 422-11(f) should not apply as presently written to water heaters that are protected within their rating. If an instantaneous water heater is a listed (UL) product that has been field tested with a variety of supply circuits, there is no technical or safety reason to limit the branch circuit protection to 60 amperes or cause the loads to be subdivided to 48 amperes.

This requirement for water heaters was introduced in the 1975 code with the justification that heaters with "small internal conductors" might be protected by unspecified sizes of overcurrent devices.

The restrictions on overcurrent protection of water heaters in the present Code are unnecessarily restrictive for the new types of instantaneous water heaters. No technical justification has been given to limit the loads to 48 amperes. Field experience and testing has indicated that the design and control of today's instantaneous water heaters allows for their safe installation as described in the proposal.

For example, an instantaneous water heater with four elements drawing a maximum of 25 amperes each would require four 30-ampere branch circuits by the present wording of the NEC. A safer alternative would be to subdivide the loads using two elements each on a 60-ampere circuit as allowed by the proposal. Then, only two circuit breakers need be turned off to disconnect the unit. Since the heater must be a listed appliance, the internal wiring would be sufficient for the 60-ampere circuits.

PANEL ACTION: Accept in Principle in Part.

In 422-11(f)(3), insert the words "or listed instantaneous water heaters" after "stamped vessel".

PANEL STATEMENT: This more simply accomplishes the submitter's objective. This has been incorporated into Proposal 20-5a.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12

AFFIRMATIVE: 11

NOT RETURNED: 1 Ryan

(Log #50)

20- 7 - (422-15(b)(3)a): Accept in Principle in Part

NOTE: The following proposal consists of Comment 20-22 on Proposal 20-5 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 20-5 was: Revise Article 422 as follows:

ARTICLE 422 — APPLIANCES

A. General

422-1. Scope. This article covers electric appliances used in any occupancy.

422-3. Other Articles. ~~All requirements of this *Code* shall apply where applicable~~. Appliances for use in hazardous (classified) locations shall comply with Articles 500 through 517.

The requirements of Article 430 shall apply to the installation of motor-operated appliances and the requirements of Article 440 shall apply to the installation of appliances containing a hermetic refrigerant motor-compressor(s), except as specifically amended in this article.

422-4. ~~422-2.~~ Live Parts. Appliances shall have no live parts normally exposed to contact.

Exception: Toasters, grills, or other appliances in which the current-carrying parts at high temperatures are necessarily exposed.

~~B. Branch Circuit Requirements~~

B. ~~C.~~ Installation ~~of Appliances~~

~~422-6. General. All appliances shall be installed in an approved manner.~~

422-10. ~~422-4.~~ Branch-Circuit Rating. This section specifies ~~sizes~~ the ratings of branch circuit ratings capable of carrying appliance current without overheating under the conditions specified. ~~This section shall not apply to conductors that form an integral part of an appliance.~~

(a) Individual Circuits. The rating of an individual branch circuit shall not be less than the marked rating of the appliance or the marked rating of an appliance having combined loads as provided in Section ~~422-32~~ 422-62.

Exception No. 1: For motor-operated appliances not having a marked rating, the branch-circuit size shall be in accordance with Part B of Article 430.

Exception No. 2: For an appliance, other than a motor-operated appliance, that ~~is continuously loaded~~, operates as a continuous load, the branch-circuit rating shall not be less than 125 percent of the marked rating; or not less than 100 percent if the branch-circuit device and its assembly are listed for continuous loading at 100 percent of its rating.

Exception No. 3: Branch circuits for household cooking appliances shall be permitted to be in accordance with Table 220-19.

(b) Circuits Supplying Two or More Loads. For branch circuits supplying appliance and other loads, the rating shall be determined in accordance with Section 210-23.

422-11. ~~422-28~~. Overcurrent Protection.

(a) Appliances. Appliances shall be protected against overcurrent in accordance with (b) through (f)(g) below and Section~~s 422-4 and 422-5.~~ 422-10.

Exception: Motors of motor-operated appliances shall be provided with overload protection in accordance with Part C of Article 430. Hermetic refrigerant motor-compressors in air-conditioning or refrigerating equipment shall be provided with overload protection in accordance with Part F of Article 440. Where appliance overcurrent protective devices that are separate from the appliance are required, data for selection of these devices shall be marked on the appliance. The minimum marking shall be that specified in Sections 430-7 and 440-4.

(b) ~~422-5.~~ Branch-Circuit Overcurrent Protection. Branch circuits shall be protected in accordance with Section 240-3.

If a protective device rating is marked on an appliance, the branch-circuit overcurrent device rating shall not exceed the protective device rating marked on the appliance.

(c) ~~(b)~~ Household-type Appliance with Surface Heating Elements. A household-type appliance with surface heating elements having a maximum demand of more than 60 amperes computed in accordance with Table 220-19 shall have its power supply subdivided into two or more circuits, each of which is provided with overcurrent protection rated at not over 50 amperes.

(d) (c) Infrared Lamp Commercial and Industrial Heating Appliances. Infrared lamp commercial and industrial heating appliances shall have overcurrent protection not exceeding 50 amperes.

(e) (d) Open-Coil or Exposed Sheathed-Coil Types of Surface Heating Elements in Commercial-type Heating Appliances. Open-coil or exposed sheathed-coil types of surface heating elements in commercial-type heating appliances shall be protected by overcurrent protective devices rated at not over 50 amperes.

(f) (e) Single Nonmotor-Operated Appliance. If the branch circuit supplies a single nonmotor-operated appliance, the rating of overcurrent protection shall (1) not exceed that marked on the appliance; (2) if the overcurrent protection rating is not marked and the appliance is rated over 13.3 amperes, not exceed 150 percent of the appliance rated current; or (3) if the overcurrent protection rating is not marked and the appliance is rated 13.3 amperes or less, not exceed 20 amperes.

Exception: Where 150 percent of appliance rating does not correspond to a standard overcurrent device ampere rating, the next higher standard rating shall be permitted.

(g) (f) Electric Heating Appliances Employing Resistance-type Heating Elements Rated More than 48 Amperes. Electric heating appliances employing resistance-type heating elements rated more than 48 amperes shall have the heating elements subdivided. Each subdivided load shall not exceed 48 amperes and shall be protected at not more than 60 amperes.

These supplementary overcurrent protective devices shall be (1) factory-installed within or on the heater enclosure or provided as a separate assembly by the heater manufacturer; (2) accessible, but need not be readily accessible; and (3) suitable for branch-circuit protection.

The main conductors supplying these overcurrent protective devices shall be considered branch-circuit conductors.

Exception No. 1: Household-type appliances with surface heating elements as covered in Section 422-11(c) ~~422-28(b)~~ and commercial-type heating appliances as covered in Section 422-11(e) ~~422-28(d)~~.

Exception No. 2: Commercial kitchen and cooking appliances using sheathed-type heating elements not covered in Section 422-28(d) shall be permitted to be subdivided into circuits not exceeding 120 amperes and protected at not more than 150 amperes where one of the following is met:

a. Elements are integral with and enclosed within a cooking surface;

b. Elements are completely contained within an enclosure identified as suitable for this use; or

c. Elements are contained within an ASME rated and stamped vessel.

Exception No. 3: Water heaters and steam boilers employing resistance-type immersion electric heating elements contained in an ASME rated and stamped vessel shall be permitted to be subdivided into circuits not exceeding 120 amperes and protected at not more than 150 amperes.

422-12. ~~422-7.~~ Central Heating Equipment. Central heating equipment other than fixed electric space-heating equipment shall be supplied by an individual branch circuit.

Exception: Auxiliary equipment such as a pump, valve, humidifier, or electrostatic air cleaner directly associated with the heating equipment shall be permitted to be connected to the same branch circuit.

422-13. (b) Storage-type Water Heaters. A branch circuit supplying a fixed storage-type water heater having a capacity of 120 gal (454.2 L) or less shall have a rating not less than 125 percent of the nameplate rating of the water heater.

(FPN): For branch-circuit sizing, see Section 422-10(a) ~~422-4(a),~~ Exception No. 2.

422-14. Infrared Lamp Industrial Heating Appliances. Infrared industrial heating appliance lampholders ~~(c) Lampholders. Lampholder~~s shall be permitted to be connected to any of the branch circuits in Article 210 and, in industrial occupancies, shall be permitted to be operated in series on circuits of over 150 volts to ground provided the voltage rating of the lampholders is not less than the circuit voltage.

Each section, panel, or strip carrying a number of infrared lampholders (including the internal wiring of such section, panel, or strip) shall be considered an appliance. The terminal connection block of each such assembly shall be considered an individual outlet.

422-15. Flexible Cords.

(a) (General). ~~(c) Other Appliances~~. Flexible cord shall be permitted (1) for connection of appliances to facilitate their frequent interchange or to prevent the transmission of noise or vibration or (2) to facilitate the removal or disconnection of appliances that are fastened in place, where the fastening means and mechanical connections are specifically designed to permit ready removal for maintenance or repair, and the appliance is intended or identified for flexible cord connection.

(b) ~~(d)~~ Specific Appliances.

(1) Electrically operated kitchen waste disposers shall be permitted to be cord- and plug-connected with a flexible cord identified for the purpose, terminated with a grounding-type attachment plug where all of the following conditions are met:

a. The length of the cord shall not be less than 18 in. (457 mm) and not over 36 in. (914 mm).

b. Receptacles shall be located to avoid physical damage to the flexible cord.

c. The receptacle shall be accessible.

(2) Built-in dishwashers and trash compactors shall be permitted to be cord- and plug-connected with a flexible cord identified for the purpose, terminated with a grounding-type attachment plug where all of the following conditions are met:

a. The length of the cord shall be 3 ft to 4 ft (0.914 m to 1.22 m).

b. Receptacles shall be located to avoid physical damage to the flexible cord.

c. The receptacle shall be located in the space occupied by the appliance or adjacent thereto.

d. The receptacle shall be accessible.

Exception: Listed kitchen waste disposers, dishwashers, and trash compactors protected by a system of double insulation, or its equivalent, shall not be required to be grounded. Where such a system is employed, the equipment shall be distinctively marked.

~~422-17. Wall-Mounted Ovens and Counter-Mounted Cooking Units. (3) (a) Permitted to Be Cord- and Plug-Connected or Permanently Connected~~. Wall-mounted ovens and counter-mounted cooking units complete with provisions for mounting and for making electrical connections shall be permitted to be permanently connected or, only for ease in servicing or for installation, cord- and plug-connected.

~~(b) Separable Connector or a Plug and Receptacle Combination~~. A separable connector or a plug and receptacle combination in the supply line to an oven or cooking unit shall:

a. ~~(1)~~ Not be installed as the disconnecting means required by Section 422-30 ~~422-20~~.

b. ~~(2)~~ Be approved for the temperature of the space in which it is located.

422-16. ~~422-10~~. Protection of Combustible Material. Each electrically heated appliance that is intended by size, weight, and service to be located in a fixed position shall be so placed as to provide ample protection between the appliance and adjacent combustible material.

422-17. ~~422-18~~. Support of Ceiling Fans.

(a) Ceiling Fans 35 Lb (15.88 kg) or Less. Listed ceiling fans that do not exceed 35 lb (15.88 kg) in weight, with or without accessories, shall be permitted to be supported by outlet boxes identified for such use and supported in accordance with Sections 370-23 and 370-27.

(b) Ceiling Fans Exceeding 35 Lb (15.88 kg). Listed ceiling fans exceeding 35 lb (15.88 kg) in weight, with or without accessories, shall be supported independently of the outlet box. See Section 370-23.

422-18. ~~422-16~~. Grounding. Appliances required by Article 250 to be grounded shall have exposed noncurrent-carrying metal parts grounded in the manner specified in Article 250.

(FPN): See Sections 250-42, 250-43, and 250-45 for equipment grounding of refrigerators and freezers and Sections 250-57 and 250-60 for equipment grounding of electric ranges, wall-mounted ovens, counter-mounted cooking units, and clothes dryers.

422-19. Other Installation Methods. Appliances employing methods of installation other than covered by this article shall be permitted to be used only by special permission.

C. Disconnecting Means

~~D. Control and Protection of Appliances~~

422-30. General. ~~422-20. Disconnecting Means~~. A means shall be provided to disconnect each appliance from all ungrounded conductors in accordance with the following sections of Part C ~~D~~.

If an appliance is supplied by more than one source, the disconnecting means shall be grouped and identified.

422-31. ~~422-21.~~ Disconnection of Permanently Connected Appliances.

(a) Rated at Not Over 300 Volt-Amperes or 1/8 Horsepower. For permanently connected appliances rated at not over 300 volt-amperes or 1/8 horsepower, the branch-circuit overcurrent device shall be permitted to serve as the disconnecting means.

(b) Appliances Rated Over 300 Volt-Amperes or 1/8 Horsepower. For permanently connected appliances rated over 300 volt-amperes or 1/8 horsepower, the branch-circuit switch or circuit breaker shall be permitted to serve as the disconnecting means where the switch or circuit breaker is within sight from the appliance or is capable of being locked in the open position.

(FPN No. 1): For motor-driven appliances of more than 1/8 horsepower, see Section 422-35 ~~422-27~~.

(FPN No. 2): For appliances employing unit switches, see Section 422-33 ~~422-25~~.

422-32. ~~422-22~~. Disconnection of Cord- and Plug-Connected Appliances.

(a) Separable Connector or an Attachment Plug and Receptacle. For cord- and plug-connected appliances, an accessible separable connector or an accessible plug and receptacle shall be permitted to serve as the disconnecting means. Where the separable connector or plug and receptacle are not accessible, cord- and plug-connected appliances shall be provided with disconnecting means in accordance with Section 422-31 ~~422-21~~.

(b) Connection at the Rear Base of a Range. For cord- and plug-connected household electric ranges, an attachment plug and receptacle connection at the rear base of a range, if it is accessible from the front by removal of a drawer, shall be considered as meeting the intent of Section 422-32(a) ~~422-22(a)~~.

(c) Rating. The rating of a receptacle or of a separable connector shall not be less than the rating of any appliance connected thereto.

Exception: Demand factors authorized elsewhere in this Code shall be permitted to be applied.

~~**(d) Requirements for Attachment Plugs and Connectors. Attachment plugs and connectors shall conform to the following:**~~

~~**(1) Live Parts. They shall be so constructed and installed as to guard against inadvertent contact with live parts.**~~

~~**(2) Interrupting Capacity. They shall be capable of interrupting their rated current without hazard to the operator.**~~

~~**(3) Interchangeability. They shall be so designed that they will not fit into receptacles of lesser rating.**~~

422-33. ~~422-25.~~ Unit Switch(es) as Disconnecting Means. A unit switch(es) with a marked "off" position that is a part of an appliance and disconnects all ungrounded conductors shall be permitted as the disconnecting means required by this article where other means for disconnection are provided in the following types of occupancies:

(a) Multifamily Dwellings. In multifamily dwellings, the other disconnecting means shall be within the dwelling unit, or on the same floor as the dwelling unit in which the appliance is installed, and shall be permitted to control lamps and other appliances.

(b) Two-Family Dwellings. In two-family dwellings, the other disconnecting means shall be permitted either inside or outside of the dwelling unit in which the appliance is installed. In this case, an individual switch or circuit breaker for the dwelling unit shall be permitted and shall also be permitted to control lamps and other appliances.

(c) One-Family Dwellings. In one-family dwellings, the service disconnecting means shall be permitted to be the other disconnecting means.

(d) Other Occupancies. In other occupancies, the branch-circuit switch or circuit breaker, where readily accessible for servicing of the appliance, shall be permitted as the other disconnecting means.

422-34. ~~422-26~~. Switch and Circuit Breaker to Be Indicating. Switches and circuit breakers used as disconnecting means shall be of the indicating type.

422-35. ~~422-27.~~ Disconnecting Means for Motor-Driven Appliances. If a switch or circuit breaker serves as the disconnecting means for a permanently connected motor-driven appliance of more than 1/8 horsepower, it shall be located within sight from the motor controller and shall comply with Part I of Article 430.

Exception: A switch or circuit breaker that serves as the other disconnecting means as required in Section 422-33 ~~422-25~~(a), (b), (c), or (d) shall be permitted to be out of sight from the motor controller of an appliance provided with a unit switch(es) with a marked "off" position and that disconnects all ungrounded conductors.

D. Construction

422-40. ~~422-23.~~ Polarity in Cord- and Plug-Connected Appliances. If the appliance is provided with a manually operated, line-connected, single-pole switch for appliance on-off operation, an Edison-base lampholder, or a 15- or 20-ampere receptacle, the attachment plug shall be of the polarized or grounding type.

Exception: A listed double insulated shaver using a 2-wire, nonpolarized attachment plug, if not provided with an Edison-base lampholder or a 15- or 20-ampere receptacle.

(FPN): For polarity of Edison-base lampholders, see Section 410-42(a).

422-41. ~~422-24.~~ Cord- and Plug-Connected Appliances Subject to Immersion. Cord- and plug-connected portable freestanding hydromassage units and hand-held hair dryers shall be constructed to provide protection for personnel against electrocution when immersed while in the "on" or "off" position.

422-42. ~~422-12.~~ Signals for Heated Appliances. In other than dwelling-type occupancies, each electrically heated appliance or group of appliances intended to be applied to combustible material shall be provided with a signal.

Exception: If an appliance is provided with an integral temperature-limiting device.

422-43. ~~422-8.~~ Flexible Cords.

(a) Heater Cords. All cord- and plug-connected smoothing irons and electrically heated appliances that are rated at more than 50 watts and produce temperatures in excess of 121°C (250°F) on surfaces with which the cord is likely to be in contact shall be provided with one of the types of approved heater cords listed in Table 400-4.

(b) Other Heating Appliances. All other cord- and plug-connected electrically heated appliances shall be connected with one of the approved types of cord listed in Table 400-4, selected in accordance with the usage specified in that table.

422-44. ~~422-9~~. Cord- and Plug-Connected Immersion Heaters. Electric heaters of the cord- and plug-connected immersion type shall be so constructed and installed that current-carrying parts are effectively insulated from electrical contact with the substance in which they are immersed.

422-45. ~~422-11~~. Stands for Cord- and Plug-Connected Appliances. Each smoothing iron and other cord- and plug-connected electrically heated appliance intended to be applied to combustible material shall be equipped with an approved stand, which shall be permitted to be a separate piece of equipment or a part of the appliance.

422-46. ~~422-13.~~ Flatirons. Electrically heated smoothing irons shall be equipped with an identified temperature-limiting means.

422-47. ~~422-14.~~ Water Heaters.

(a) Storage- and Instantaneous-type Water Heaters. Each storage- or instantaneous-type water heater shall be equipped with a temperature-limiting means in addition to its control thermostat to disconnect all ungrounded conductors, and such means shall be (1) installed to sense maximum water temperature and (2) either a trip-free, manually reset type or a type having a replacement element. Such water heaters shall be marked to require the installation of a temperature and pressure relief valve.

(FPN): See *Relief Valves and Automatic Gas Shutoff Devices for Hot Water Supply Systems,* **ANSI Z21.22-1990.**

Exception: Water heaters with supply water temperature of 82°C (180°F) or above and a capacity of 60 kW or above and identified as being suitable for this use; and water heaters with a capacity of 1 gal (3.785 L) or less and identified as being suitable for such use.

422-48. ~~422-15~~. Infrared Lamp Industrial Heating Appliances.

(a) 300 Watts or Less. Infrared heating lamps rated at 300 watts or less shall be permitted with lampholders of the medium-base, unswitched porcelain type or other types identified as suitable for use with infrared heating lamps rated 300 watts or less.

(b) Over 300 Watts. Screw-shell lampholders shall not be used with infrared lamps over 300 watts rating.

Exception: Lampholders identified as suitable for use with infrared heating lamps rated more than 300 watts.

422-49. High Pressure Spray Washers.

~~(3)~~ Cord- and plug-connected high-pressure spray washing machines shall be provided with factory-installed ground-fault circuit-interrupter protection for personnel. The ground-fault circuit-interrupter shall be an integral part of the attachment plug or shall be located in the supply cord within 12 in. (305 mm) of the attachment plug.

Exception No. 1: A high-pressure spray washer rated for a 3-phase supply system.

Exception No. 2: A high-pressure spray washer rated over 250 volts.

422-50. ~~422-29~~. Cord- and Plug-Connected Pipe Heating Assemblies. Cord- and plug-connected pipe heating assemblies intended to prevent freezing of piping shall be listed.

E. Marking ~~of Appliances~~

422-60. ~~422-30.~~ Nameplate.

(a) Nameplate Marking. Each electric appliance shall be provided with a nameplate giving the identifying name and the rating in volts and amperes, or in volts and watts. If the appliance is to be used on a specific frequency or frequencies, it shall be so marked.

Where motor overload protection external to the appliance is required, the appliance shall be so marked.

(FPN): See Section 422-11(a) ~~422-28(a),~~ Exception, for overcurrent protection requirements.

(b) To Be Visible. Marking shall be located so as to be visible or easily accessible after installation.

422-61. ~~422-31.~~ Marking of Heating Elements. All heating elements that are rated over one ampere, replaceable in the field, and a part of an appliance shall be legibly marked with the ratings in volts and amperes, or in volts and watts, or with the manufacturer's part number.

422-62. ~~422-32.~~ Appliances Consisting of Motors and Other Loads. Appliances shall be marked in accordance with (a) or (b) below.

(a) Marking. In addition to the marking required in Section 422-60 ~~422-30~~, the marking on an appliance consisting of a motor with other load(s) or motors with or without other load(s) shall specify the minimum supply circuit conductor ampacity and the maximum rating of the circuit overcurrent protective device.

Exception No. 1: Appliances factory-equipped with cords and attachment plugs, complying with Section 422-60 ~~422-60~~.

Exception No. 2: An appliance where both the minimum supply circuit conductor ampacity and maximum rating of the circuit overcurrent protective device are not more than 15 amperes and complies with Section 422-60 ~~422-30~~.

(b) Alternate Marking Method. An alternate marking method shall be permitted to specify the rating of the largest motor in volts and amperes, and the additional load(s) in volts and amperes, or volts and watts in addition to the marking required in Section 422-30.

Exception No. 1: Appliances factory-equipped with cords and attachment plugs, complying with Section 422-30.

Exception No. 2: The ampere rating of a motor 1/8 horsepower or less or a nonmotor load 1 ampere or less shall be permitted to be omitted unless such loads constitute the principal load.

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Accept in principle, revise panel action as follows:

422-15(b)(3)a Delete ~~not to be installed as the disconnecting means required by Section 422-30.~~ 422-32(a) revise first sentence:

For cord- and plug-connected appliances an accessible separable connector or accessible plug and receptacle shall be permitted to serve as the disconnecting means. Where the separable connector or plug and receptacle are not readily accessible ~~cord-and-plug-connected appliances shall be provided with~~ a disconnecting means in accordance with Section 422-31 shall be provided.

SUBSTANTIATION: Section 422-15a is under the heading Flexible Cords; Part C covers disconnecting means. The requirement that a separable connector or plug and receptacle not be the disconnecting means required by Section 422-30 is confusing as that section specifies disconnecting means specifically permitting such means for cord- and plug-connected appliances which includes ovens or cooking units. A receptacle installed in the cavity of a built-in oven appears to meet both Article 100 definitions of accessible, i.e., not closed in by building structure and not guarded by effective means (the oven can be pulled from the cavity). The last sentence should apply to receptacles not readily accessible, as in the case of having to remove an obstacle (oven) to gain access. A counter top cooking unit supplied by cord and plug will almost always have an accessible plug/receptacle cord which complies with Section 433-32(a) as a disconnect, but disallowed by Section 422-15(b)(3)a.

PANEL ACTION: Accept in Principle in Part.

See the actions on Proposals 20-8 and 20-11.

PANEL STATEMENT: The action on Proposal 20-8 addresses the first part of this proposal. The panel statement for Proposal 20-11 provides the reason for not accepting the second part of this proposal.

(Log #2772)

20- 10 - (422-31(b)): Reject

SUBMITTER: Joseph A. Tedesco, Nat'l Technology Transfer, Inc.

RECOMMENDATION: Add the word "individually" in between the words "being" and "locked."

SUBSTANTIATION: This word will help to avoid the questions as to whether or not a panel cover hasp, and lock or other locking device constitutes a disconnecting means.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not provided sufficient substantiation for the need for this proposal.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 1 Ryan

(Log #892)

20- 11 - (422-32(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise second sentence:
Where the separable connector or plug and receptacle are rendered not readily accessible by stationary appliances, cord- and plug-connected appliances shall be provided with disconnecting means in accordance with Sections 422-31 or 422-33.
SUBSTANTIATION: The two definitions of accessible in Article 100 do not appear applicable to plug/receptacles of this section. Cords are not permitted by Section 400-8 to be behind building walls or finish nor are outlet boxes for receptacles or cord connection, by Section 370-29, and the appliances of this section don't fit the description of building in Article 100.
Section 550-8(d) Exception No. 2 indicates appliances (obstacles) may render receptacles not "readily" accessible. Section 422-33 seems to be an appropriate alternative.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient substantiation for this proposal.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
NOT RETURNED: 1 Ryan
EXPLANATION OF NEGATIVE:
EGAN: An appliance disconnecting means is normally plug and cord as per manufacturer's specifications. The question is accessibility. The disconnecting means is arrived at only after the removal of panels, panel hardware, or stationary appliance while still energized.

(Log #CP2007)

20- 11a - (422-47): Accept
Note: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual to read as follows:
"422-47. Water Heater Controls. All Storage or instantaneous-type water heaters shall be equipped with a temperature-limiting means in addition to its control thermostat to disconnect all ungrounded conductors. Such means shall be:
(1) Installed to sense maximum water temperature; and
(2) Either a trip-free, manually reset type or type having a replacement element. Such water heaters shall be marked to require the installation of a temperature and pressure relief valve.
Exception No. 1: Storage water heaters that are identified as being suitable for use with supply water temperature of 82 degrees C (180 degrees F) or above and a capacity of 60 kW or above.
Exception No. 2: Instantaneous-type water heaters that are identified as being suitable for such use, with a capacity of 4L (1 gal) or less.
FPN: See ANSI Z21.22-1999/CSA 4.4-M99, Relief Valves for Hot Water Supply Systems."
SUBMITTER: CMP 20
RECOMMENDATION: Revise to read as follows:
"422.47. Water Heater Controls.
(A) Storage or Instantaneous-Type Water Heaters. All storage or instantaneous-type water heaters other than (1) and (2) below shall be equipped with a temperature-limiting means in addition to its control thermostat to disconnect all ungrounded conductors. Such means shall be:
(a) Installed to sense maximum water temperature; and
(b) Be either a trip-free, manually reset type or a type having a replacement element. Such water heaters shall be marked to require the installation of a temperature and pressure relief valve.
(1) Storage Water Heaters. Storage water heaters that are identified as being suitable for use with supply water temperature of 82°C (180°F) or above and a capacity of 60 kW or above; or
(2) Instantaneous-Type Water Heaters. Instantaneous-type water heaters that are identified as being suitable for such use, with a capacity of 4L (1 gal) or less.
FPN: See ANSI Z21.22-1999/CSA 4.4-M99, Relief Valves for Hot Water Supply Systems."
SUBSTANTIATION: This revision incorporates the recommendations of Proposals 20-12 and 20-13, as well as modifying the text to comply with the style manual. It also corrects an error that existed in the 1999 edition of the code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 1 Ryan

(Log #4225)

20- 12 - (422-47): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows
422.47. Water Heater Controls.
(a) Temperature Limitation, General. Each storage- or instantaneous-type water heater not covered in (B) shall be equipped with a temperature-limiting means in addition to its control thermostat to disconnect all ungrounded conductors, and such means shall be (1) installed to sense maximum water temperature and (2) either a trip-free, manually reset type or a type having a replacement element. Such water heaters shall be marked to require the installation of a temperature and pressure relief valve.
(b) Temperature Limitation, Exempt. Instantaneous-type water heaters with supply water temperature of 82°C (180°F) or above and a capacity of 60 kW or above, and water heaters with a capacity of 1 gal (3.785 L) or less, shall be permitted without the temperature limitation controls in (A). Such units shall be identified as being suitable for such use.
SUBSTANTIATION: This essentially returns to the 1996 language, but without the former exception form. The 1999 version is so horribly worded as to be unintelligible without a copy of the 1996 NEC as a guide, along with a Code analysis to explain that no substantive change was intended. The 1999 wording does not comply with current style manual requirements, being written in the negative ("other than …") and with the reader expected to filter that exclusionary thought over the entire first subsection but only over the first half of the second subsection. This proposal achieves the intent of the panel with far more straightforward wording.
PANEL ACTION: Accept in Principle.
See Proposal 20-11a.
PANEL STATEMENT: Proposal 20-11a addresses this issue.

NOT RETURNED: 1 Ryan

(Log #2574)

20- 14 - (422-47(b)): Reject
SUBMITTER: David Berning, A.O. Smith Watr Products Co.
RECOMMENDATION: Separate the following from beginning of (b) by a line and revise as indicated:
Shall be equipped with a temperature-limiting ~~means~~ control(s) in addition to its control thermostat(s).
SUBSTANTIATION: The most popular control arrangement utilizes two thermostats with either one or two limit controls.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: "Temperature Limiting Means" does not restrict the methods used to control.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 1 Ryan

(Log #2931)

20- 15 - (422-49): Reject
SUBMITTER: Timothy D. Curry, Curry Electric, Inc.
RECOMMENDATION: Revise text to read as follows:
"All ~~single phase~~ cord ~~and plug~~ connected high pressure spray washing machines rated at ~~250~~ 480 volts or less shall be provided with factory installed ground fault circuit-interrupter protection for personnel. The ground fault circuit interrupter shall be an integral part of the attachment plug or shall be located in the supply cord within 12 in. (305 mm) of the ~~attachment plug~~ supply end."
SUBSTANTIATION: These types of units are typically used in commercial truck and heavy equipment washing. The cords are subject to all types of abuse, misuse, and just plain wear and tear. Any sharp or heavy object could cut or damage the cord, in such a way as to allow current leakage, shock, or electrocution. Listed GFCI units are now available to protect the users of this equipment.
In the 1990-1993 code cycle, verbiage was added to Section 422-8(d)(3) to increase the required GFCI protection, from only 125 volt units, to 125 and 240 volt, single phase units. This was done simply because the GFCI units had not been available, and now were. Please see 1992 ROP (Log #3740), page 362. Also see 1992 ROC (Log #764), page 440. The code panel unanimously accepted the proposal and comment, without asking for further documented injury statistics.
In the 1993-1996 code cycle, Proposal #20-8 (Log #2590), 1995 ROP, page 479, was rejected because the panel was not aware of any listed GFCIs to meet the proposal.
However, in the same 1993-1996 code cycle, Proposal #20-7 (Log #2088), page 478 of the ROP, was accepted. See also comments #20-5, 20-6, 20-7, and 20-8, pages 285 and 286 of the 1995 ROC. This change deleted the exception that had previously allowed double insulated spray washers without GFCI protection. This was done simply because new two wire GFCI devices were available.
When a proposal was made in the 1996-1999 code cycle, see Log #3121, page 661 of the 1998 ROP, it was rejected only for lack of a "body count". See also 1998 ROC page 500, (Logs #1368 and #1362).
The real problem seems to be that we cannot satisfy the committee. Once a hurdle is cleared, that is, units are now available, the committee requests "field data/body count" I would submit that the same "field data" that caused the GFCI requirement to be added, prior to the 1993, for 125 volt units, is still relative today. Also, as evidenced in the 1992 change and the 1995 deletion, the committee was able to move forward with increased protection, without any further "field data". Other areas have also had GFCI protection expanded, for example, wet bar outlets, and kitchen counter outlets, beyond the 6 ft rule, were all added without "field data". Please except this proposal and increase the protection of the people using this equipment.
PANEL ACTION: Reject.
PANEL STATEMENT: The present code requirement has reduced the hazards referenced in the original proposal, as indicated by CPSC data.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 1 Ryan

(Log #3309)

20- 16 - (422-51 (New)): Reject
SUBMITTER: Jack Wells, Pass & Seymour/Legrand
RECOMMENDATION: Add a new section to read as follows:
422-51. Kitchen Waste Disposers. A momentary contact switch shall operate electrically operated kitchen waste disposers.
SUBSTANTIATION: I have provided a copy of a US Consumer Product Safety Commission report describing injuries sustained as a result of individuals using garbage disposals. Many of these injuries could have been avoided if a momentary contact switch was used to control the operation of the garbage disposal. A momentary contact switch requires the operator to continuously depress the switch lever to run the garbage disposal. As a result, the operator is in a position to immediately turn off the garbage disposal by simply releasing the switch lever when it is recognized that material entering the disposal unit presents a hazardous situation. The momentary contact switch also assures that the operator is in attendance while the garbage disposal is running. The CPSC Report indicates that there are many incidents of people placing fingers into the garbage disposal and foreign material such as knives and forks entering the disposal. Both the attendance of the operator and the quick response afforded by the use of a momentary contact switch insures that the operator is in a position to recognize when a hazard occurs and is able to quickly turn off the garbage disposal.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The incident data does not indicate that the use of a momentary contact switch would have prevented the injuries noted by the submitter.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 2
NOT RETURNED: 1 Ryan
EXPLANATION OF NEGATIVE:
EGAN: A momentary contact switch provides an immediate means of disconnect if the opposing hand is subject to physical injury from the appliance.
KOESSEL: I support the substantiation and feel it is in the realm of safe operation.
COMMENT ON AFFIRMATIVE:
CLINE: I agree with the panel's action to reject, but wish to further emphasize the reasons. 1) There should be a very strong desire to NOT have one wet hand on the switch and one hand in the water pushing food into the disposal. 2) The stance and stretch required, and the possible task vision impairment of operating the momentary switch while pushing food into the disposal could add great hazards. 3) Not a single incident confirmed an injury which would have been avoided by a finger coming off the momentary switch after the incident started. I tallied the first 124 incidents as: 73 incidents completely unrelated to a running disposal; 39 as possibly but not probably related to a running disposal; and 12 which appeared to be related to a running disposal, but only two of these appear that they might have been alleviated by the proposed switch. Almost all hand-in-the-disposal injuries appear to be due to cuts received while cleaning out broken or jammed materials in a motionless disposal.

(Log #293)

20- 17 - (422-55 (New)): Reject
SUBMITTER: George Dumsar, Connecticut Light & Power Co.
RECOMMENDATION: Propose that water cooler/drinking fountains be GFCI protected.
SUBSTANTIATION: Water coolers/drinking fountains contain 3 elements that potentially could be hazardous, metal, water and electricity.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient technical justification, nor has he provided suggested text. There is no history of shock problems. The code does not prevent these from being GFCI-protected.

(Log #4226)

20- 18 - (422-62): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:

422-62. Appliances Consisting of Motors and Other Loads.

(a) Nameplate Horsepower Markings. Where a motor-operated appliance nameplate includes a horsepower rating, that rating shall not be less than the horsepower rating on the motor nameplate. Where an appliance consists of multiple motors, or one or more motors and other loads, the nameplate value shall not be less than the equivalent horsepower of the combined loads, calculated in accordance with Section 430-110(c)(1).

(b) Additional Nameplate Markings. Appliances, other than those factory-equipped with cords and attachment plugs and with nameplates in compliance with Section 422-60, shall be marked in accordance with (1) or (2).

(1) Marking. In addition to the marking required in Section 422-60, the marking on an appliance consisting of a motor with other load(s) or motors with or without other load(s) shall specify the minimum supply circuit conductor ampacity and the maximum rating of the circuit overcurrent protective device. This requirement shall not apply to an appliance with a nameplate in compliance with Section 422-60 where both the minimum supply circuit conductor ampacity and maximum rating of the circuit overcurrent protective device are not more than 15 amperes.

(2) Alternate Marking Method. An alternate marking method shall be permitted to specify the rating of the largest motor in volts and amperes, and the additional load(s) in volts and amperes, or volts and watts in addition to the marking required in Section 422-60. The ampere rating of a motor 1/8 horsepower or less or a nonmotor load 1 ampere or less shall be permitted to be omitted unless such loads constitute the principal load.

SUBSTANTIATION: Item (a) of this proposal provides CMP 20 with a vehicle to correct an oversight in the 1999 NEC adoption process. While acting on the submitter's Proposal 11-10, the TCC directed that the final sentence of the panel action be given to CMP 20 for action during the comment period within Article 422. The issue was mislaid and never made it on to CMP 20's comment agenda. There was no reason for CMP 20 to have known about the referral, and it fell through the cracks. The first half of this proposal is a more robust and complete version of that original CMP 11 recommendation, appropriately located and in a convenient form for CMP 20 to be able to complete the anticipated action.

Item (b) of this proposal is editorial, aimed at correcting the manner in which four exceptions were converted to positive text by dumping them into the middle of the affected sections in the 1999 rewrite. This wording if far more clear without returning to the use of exceptions. The key is to realize that one of the exceptions to each of the 1996 subsections was identical, and therefore amenable to being inserted into the parent language. The remaining exceptions, one to each subsection, then fold into the end of the subsections much more cleanly and in a way that avoids the run-on sentence construction of the 1999 version.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
NOT RETURNED: 1 Ryan
EXPLANATION OF NEGATIVE:
TALKA: Proposed revision to 422-62 makes reference to Section 430-110(c)(1) for the calculation of equivalent horsepower rating of an appliance having multiple motors and/or combination loads. Section 430-110(c)(1) has nothing to do with calculating equivalent horsepower ratings, but rather it deals with determination of the size of a disconnect switch, in FLA and LRA, for multiple motor loads and/or combination loads. Section 430-110(c)(1) to determine the FLA and LRA values of motor loads based upon Tables 430-147, 430-148, 430-149, or 430-150 and to add these values to the rating in amperes of the other non-motor loads. It does not indicate to revert back to the tables to determine the equivalent horsepower rating of the combined load. If Section 422-62 pertained to the determination of the sizing of the appliance disconnect, then 430-110(c)(1) would be a proper reference. However 422-62 deals with the rating of the appliance and as such the reference to 430-110(c)(1) is improper.

ARTICLE 424 — FIXED ELECTRIC SPACE-HEATING EQUIPMENT

(Log #527)

20- 19 - (424): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Section 424-34, replace "7 ft (2.13 m)" with "2.1 m (7 ft)".
2. In Section 424-35, replace "3 in. (76 mm)" with "75 mm (3 in.)".
3. In Section 424-36, replace "2 in. (50.8 mm)" with "50 mm (2 in.)" throughout.
4. In Section 424-39, replace "8 in. (203 mm)" with "200 mm (8 in.)" and replace "2 in. (50.8 mm)" with "50 mm (2 in.)".
5. In Section 424-41(b), replace "2 13/42 watts/ft (2 3/4 watts/305 mm)" with "9 watts/m (2 3/4 watts/ft)" and replace "1 1/2 in. (38 mm)" with "38 mm (1 1/2 in.)".
6. In Section 424-41(d), replace "3-in. (76-mm)" with "75 mm (3 in.)".
7. In Section 424-41(e), replace "1/2 in. (12.7 mm)" with "13 mm (1/2 in.)".
8. In Section 424-41(f), replace "16 in. (406 mm)" with "400 mm (16 in.)" and replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
9. In Section 424-41(g), replace "1/2 in. (12.7 mm)" with "13 mm (1/2 in.)".
10. In Section 424-41(i), replace "2 1/2 in. (64 mm)" with "65 mm (2 1/2 in.)".
11. In Sections 424-43(b) and (c), replace "6 in. (152 mm)" with "150 mm (6 in.)" throughout.
12. In Section 424-44(a), replace "16 1/2 watts/linear foot (305 mm)" with "54 watts/linear meter (16 1/2 watts/linear foot)".
13. In Section 424-44(b), replace "1 in. (25.4 mm)" with "25 mm (1 in.)".
14. In Section 424-59 FPN, replace "4 ft (1.22 m)" with "1.2 m (4 ft)".
15. In Section 424-61, replace "4 ft (1.22 m)" with "1.2 m (4 ft)".
16. In Section 424-93(a)(3), replace "8 in. (203 mm)" with "200 mm (8 in.)" and replace "2 in. (50.8 mm)" with "50 in.)".
17. In Section 424-93(b)(3), replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".
18. In Section 424-94, replace "2 in. (50.8 mm)" with "50 mm (2 in.)" throughout.
19. In Section 424-98(a), replace "33 watts/ft^2 (33 watts/0.093 m^2)" with "355 watts/m^2 (33 watts/ft^2)".
20. In Section 424-99(b), replace "15 watts/ft^2 (15 watts/0.093 m^2)" with "160 watts/m^2 (15 watts/ft^2)".

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 1 Ryan

(Log #3880)

20- 20 - (424-3(a)): Accept
SUBMITTER: J. Philip Simmons, Simmons Electrical Services
RECOMMENDATION: Revise as follows:

424-3(a) Branch-Circuit Requirements. Individual branch circuits shall be permitted to supply any size fixed electric space-heating equipment.

Branch circuits supplying two or more outlets for fixed electric space-heating equipment shall be rated 15, 20, 25, or 30 amperes. In other than residential occupancies, fixed infrared heating equipment shall be permitted to be supplied from branch circuits rated not over 50 amperes.

SUBSTANTIATION: Twenty-five ampere overcurrent devices are standard overcurrent devices in Section 240-6. They should be

permitted for use as the overcurrent protection for fixed electric space-heating branch circuits.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 1 Ryan

(Log #2383)

20- 21 - (424-19(a)(2)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Revise 424-19(a)(2) as shown below:
(2) Heater Containing a Motor(s) Rated Over 1/8 Horsepower. The above disconnecting means shall be permitted to serve as the required disconnecting means for both the motor controller(s) and heater ~~by one of the means specified in~~ where the installation complies with a through ~~d~~ c below.
~~a. Where the above disconnecting means is also in sight from the motor controller(s) and heater.~~
~~b~~ a. Where the disconnecting means is not within sight from the heater, a separate disconnecting means shall be installed, or the disconnecting means shall be capable of being locked in the open position, or unit switches complying with Section 424-19(c) shall be permitted.
~~c~~ b. Where the disconnecting means is not within sight from the motor controller location, a disconnecting means complying with Section 430-102 shall be provided.
~~d~~ c. Where the motor is not in sight from the motor controller location, Section 430-102(b) shall apply.
SUBSTANTIATION: Substantiation for Proposal 10-48 for the 1990 Code indicates that it was intended to effect an editorial change, but in fact it changed (or at least obscured) the literal meaning of Section 424-19(a)(2). The term "one of the means" used in the sentence that was added literally requires the installation to comply with only one of the items "a" through "d". Item "a" can be deleted because the remaining items cover the cases where the disconnecting means is not in sight from the motor controller or heater, or the motor controller is not within sight of the motor.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing text is more clearly understood.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 1 Ryan

(Log #421)

20- 22 - (424-35): Reject
SUBMITTER: Louis Chiappone, Delta-Therm Corp.
RECOMMENDATION: Delete text:
~~The lead wire shall have the following color identification to indicate the circuit voltage on which it is to be used:~~
~~120 volts, nominal — yellow~~
~~208 volts, nominal — blue~~
~~240 volts, nominal — red~~
~~277 volts, nominal — brown~~
~~480 volts, nominal — orange~~
SUBSTANTIATION: The use of color coding cold leads is redundant to the marking requirement for volts and watts or volts and amperes. This requirement forces manufactures to inventory up to five colors times the number of gauge sizes. Where a cable is dual rated, such as 208/240 volts, the proper color coding is indeterminable. Deleting the color coding requirement does not compromise safety since the voltage information is available on the cold leads.
PANEL ACTION: Reject.
PANEL STATEMENT: This seriously compromises safety.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:

NOT RETURNED: 1 Ryan

(Log #1141)

20- 23 - (424-35): Reject
SUBMITTER: Edward Witte, Delta-Therm Corp.
RECOMMENDATION: Revise text to read:
"Each unit length of heating cable shall have a permanent legible marking on each non-heating lead located within 3 in. (76 mm) of the terminal end. When the marking is the identifying name, identification symbol, or catalog number, the lead wire shall have the following color identification to indicate the circuit voltage on which it is to be used:
120 volt, nominal - yellow 208 volt, nominal - blue 240 volt, nominal - red 277 volt, nominal - brown 480 volt, nominal - orange."
SUBSTANTIATION: It is redundant to mark the volts and amps, or the volts and watts, and then also color code the leads. This now forces a manufacturer to stock five wire colors times the number of gauge sizes used.
PANEL ACTION: Reject.
PANEL STATEMENT: Color-coding is simpler and more reliable.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2799)

20- 24 - (424-40): Reject
SUBMITTER: Edward Witte, Delta-Therm Corp.
RECOMMENDATION: Revise as follows:
Splices. Embedded cables shall be spliced only where necessary and only by approved means,. ~~and in no case shall the length of the heating cable be altered.~~ Altering the heating cable length will require a voltage transformer to maintain the original cable electrical parameters.
SUBSTANTIATION: All cable splices or repairs involve altering cable length to some extent. This code change will resolve any conflicts due to code interpretation.
PANEL ACTION: Reject.
PANEL STATEMENT: The language being suggested is not precise and could lead to a safety problem in the choice of a transformer.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 1 Ryan

(Log #893)

20- 25 - (424-43(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Free nonheating leads of cables shall be installed in accordance with approved wiring methods from the junction box to a location within the ceiling. Such installations shall be permitted to be single conductors in approved raceways, ~~single or~~ multiconductor Type UF, Type NMC, Type MI cables, or other approved conductors. Bushings or other approved fittings shall be used where the leads emerge within the ceiling.
SUBSTANTIATION: Single conductors are generally required to be part of a recognized wiring method, why not single conductor Type UF? Such conductors do not appear to be open exposed wiring covered by Article 320; Sections 424-44(f); 424-98(f); and 426-22(c) require bushings or approved fittings, as does Section 300-16 which may not apply; a similar requirement for this section seems warranted.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient technical justification for this change.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 1 Ryan

(Log #1140)

20- 26 - (424-44(g)): Reject
SUBMITTER: Edward Witte, Delta-Therm Corp.
RECOMMENDATION: Revise text to read:
(g) Ground-Fault Circuit-Interrupter Protection for Conductive Heated Floors of Bathrooms, Hydromassage Bathtub, Spa, and Hot Tub Locations. Ground-fault circuit-interrupter protection for personnel shall be provided for electrically heated floors in bathrooms, hydromassage bathtub, spa, and hot tub locations. This shall apply to ~~all~~ systems used with conductive floor coverings,

whether cable, panel, or other approved types.
Exception: Embedded mineral insulated cable used as floor heating in public, commercial, or industrial buildings shall not require ground-fault circuit-interrupter protection.
SUBSTANTIATION: A potential situation exists when a facility utilizing mineral insulated cable for floor heating adds a shower or bathroom which will be located in one or more circuit zones. This will require the owner to purchase one or more ground-fault circuit-interrupter devices. These devices are not available in all the voltages and current ratings that the heating cables can be operating on. On long cable lengths nuisance tripping will be likely with a ground fault trip level of 4 to 6 mA. Due to the hygroscopic nature of magnesium oxide, the dielectric in mineral insulated cable, the unlikely occurrence of a breach in the outer sheath will short the cable internally thusly tripping the over-current protection device.
PANEL ACTION: Reject.
PANEL STATEMENT: The scenario described by the submitter in his substantiation is exactly why the GFCI requirement was added.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 1 Ryan

(Log #3391)

20- 27 - (424-44(g)): Accept in Principle
SUBMITTER: John E. Turner, Swansea Consulting
RECOMMENDATION: Delete "Conductive," and delete "used with conductive floor coverings", to read:
(g) Ground-Fault Circuit-Interruption Protection for Heated Floors of Bathrooms, Hydromassage Bathtub, Spa, and Hot Tub Locations. Ground-fault circuit-interrupter protection for personnel shall be provided for electrically heated floors in bathrooms, hydromassage bathtub, spa, and hot tub locations. This shall apply to all systems, whether cable, or other approved types.
SUBSTANTIATION: The word "conductive" can be confusing as it might be understood to mean either thermally conductive or electrically conductive. In either case the word "conductive" is unnecessary. The thermal conductivity of the floor is a design consideration and not a safety issue. When one considers the electrical conductivity of the floor, the present wording implies that electrically heated floors, under floor coverings that are not electrically conductive, do not need GFCI protection. While the floor covering may initially provide electrical insulation, this could be compromised over a period of time and in a wet environment. The initial submission (Log #2783) which initiated this new Section 424-44(g) in the 1999 National Electrical Code specifically referred to degradation due to the flexibility of the substrate.
PANEL ACTION: Accept in Principle.
See Proposal 20-28.
PANEL STATEMENT: Proposal 20-28 accomplishes this.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 12
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NOT RETURNED: 1 Ryan

(Log #4227)

20- 28 - (424-44(g)): Accept in Principle in Part
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
"Ground-fault circuit-interrupter protection for personnel shall be provided for electrically heated floors in bathrooms, and in hydromassage bathtub, spa, and hot tub locations. This shall apply to all systems, whether cable, panel, or other types, used with conductive flooring or floor coverings ~~whether cable, panel, or other approved types~~. Conductive flooring shall include, but not be limited to, exposed concrete, masonry, and tile subject to foot traffic."
SUBSTANTIATION: This proposal corrects some editorial deficiencies in the existing rule. First, it deletes the term "approved." Although it was undoubtedly included in an attempt to force approvals, it actually worsens the situation by leaving a gap in Code coverage; no rule literally now applies to an unapproved system. In addition, it clarifies that the rule applies to flooring in general and not just coverings. Finally, the rewritten requirement clarifies that flooring systems that would be considered grounded by Condition 2 of the workspace tables would be considered conductive here. Most inspectors are applying the rule this way, seeing relatively few sheet-metal bathroom floors, for example, but the issue needs to be put to rest.
PANEL ACTION: Accept in Principle in Part.
Revise 424-44(g) to read as follows:
"424-44(g) Ground Fault Circuit-Interruption Protection for Heated Floors of Bathrooms, and in Hydromassage Bathtub, Spa, and Hot Tub Locations. Ground-fault circuit-interrupter protection for personnel shall be provided for electrically heated floors in bathrooms, and in hydromassage bathtub, spa, and hot tub locations."
PANEL STATEMENT: The panel's version clearly meets the intent of the submitter.

(Log #3716)

12- 8 - (427-23): Accept
Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Wayne A. Williams, Raychem HTS
RECOMMENDATION: Revise text as follows:
427-23. ~~Metal Covering.~~ Grounded Conductive Covering. Electric heating equipment shall have a grounded ~~metal~~ conductive covering in accordance with (a) or (b). The conductive ~~metal~~ covering shall provide an effective ground path for equipment protection.
(a) Heating Wires or Cables. Heating wires or cables shall have a grounded conductive ~~metal~~ covering that surrounds the heating element and bus wires, if any, and their electrical installation.
(b) Heating Panels. Heating panels shall have a grounded conductive ~~metal~~ covering over the heating element and its electrical insulation on the side opposite the side attached to the surface to be heated.
SUBSTANTIATION: Materials other than "metal" can provide an effective ground path to operate the required equipment protection. New conductive materials or combinations of conductive materials and metallic grounding conductors can be used in place of metal braid or sheaths to provide a low impedance ground path sufficient to operate the equipment protection device. This can be accomplished while maintaining 100 percent coverage of the heating device.
The code should not restrict technological innovation, provided the intended safety of the system is maintained.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8
NEGATIVE: 3
NOT RETURNED: 2 Kelly, Laney
EXPLANATION OF NEGATIVE:
HANTHORN: I am voting negative on this proposal for the following reason: Right now the various approval bodies - UL and FM, the heating cable standard IEEE 515, and Recommended Practice IEEE 515.1 require a metal braid or sheath on heating cables. If a homeowner or other person installing the heater or working on equipment which utilizes a heating cable should penetrate the heating cable with a sharp object and contact the heating conductor or bus bar, they will cause a short between that and the braid causing the protective device to trip. My understanding of the proposed construction which would be permitted by this code change is that the braid could be replaced by a conductive polymer plus a grounding wire. If the person happens to penetrate the heater away from the grounding wire, will the voltage to which they are subjected be low enough to not cause them injury?
I feel acceptance of this proposed change should be delayed until the various approval bodies, standards and practices include tests to ensure the safety of the person.
QUAVE: The submitter did not provide any substantiation to the claim that "grounding conductive covering" can provide a low impedance path. Article 250 requires that equipment grounding shall be such that there is a path of sufficient low impedance to clear any fault current that may be on it.
TROUT: This proposal should have been rejected. The metal covering required is for physical protection of heating cables and the heating panel element. The grounding requirement is necessary because of the presence of the metal covering in close proximity to the heating elements and circuits. The metal covering is not intended as the equipment grounding conductor required by Article 250.
No documentation was provided to show that any new conductive materials would furnish the physical protection intended, nor was any documentation provided to show that these new conductive

materials anticipated have successfully passed any testing which would indicate their ability to carry ground fault current levels which might be expected.

(Log #3717)

12- 9 - (427-23): Reject
SUBMITTER: Wayne A. Williams, Raychem HTS
RECOMMENDATION: Replace current text with text from 426-27.
Current text:
427-23. ~~Metal Covering. Electric heating equipment shall have a grounded metal covering in accordance with (a) or (b). The metal covering shall provide an effective ground path for equipment protection.~~
~~(a) Heating Wires or Cables. Heating wires or cables shall have a grounded metal covering that surrounds the heating element and bus wires, if any, and their electrical insulation.~~
~~(b) Heating Panels. Heating panels shall have a grounded metal covering over the heating element and its electrical insulation on the side opposite the side attached to the surface to be heated.~~
Proposed text:
427-23. Grounded Conductive Covering, ~~Grounding Braid or Sheath~~
Grounding means, such as copper braid, metal sheath, or other approved means, shall be provided as part of the heated section of the cable, panel, or unit.
SUBSTANTIATION: Adoption of this language will bring correlation with Section 426-27. This language meets the intent of requiring an "approved means" for grounding the heated section of the equipment covered by this article. Leaves the specific requirement to the certified approval agency and relevant national standard(s) for the equipment. Materials other than "metal" can provide an effective ground path to operate the required equipment protection. New conductive materials or combinations of conductive materials and metallic grounding conductors can be used in place of metal braid or sheaths to provide a low impedance ground path sufficient to operate the equipment protection device. This can be accomplished while maintaining 100 percent coverage of the heating device.
The code should not restrict technological innovation, provided the intended safety of the system is maintained.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter provides no substantiation for deletion of requirements in parts (a) and (b) of 427-23. The existing language in 427-23 meets the panel's intent for providing an effective ground path for equipment protection.

NOT RETURNED: 2 Kelly, Laney

(Log #324)

12- 13 - (427-59 (New)): Reject
SUBMITTER: Julius M. Marsh, Specialty Supply Co.
RECOMMENDATION: It shall be permitted to provide ground fault alarm indication on entire panelboards rather than individual branch circuits in industrial establishments where conditions of maintenance and supervision ensure only qualified persons will service the system.
SUBSTANTIATION: Ground fault branch circuit breakers for 250V or less circuits are readily available and reasonably economical. GF branch breakers for circuits over 250V are not economical nor are they readily available. The cost of providing GF breakers on circuits over 250V is very unreasonable and impractical.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no requirement for ground fault alarm indication on individual branch circuits in the current Code. The submitter's concerns are addressed in 427-22.

ARTICLE 430 — MOTORS, MOTOR CIRCUITS, AND CONTROLLERS

(Log #552)

11- 3 - (430): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Section 430-7(a)(12), replace "7 in. (178 mm)" with "175 mm (7 in.)".
2. In Section 430-9(c), replace "7 lb-in. (0.79 N•m)" with "0.8 N•m (7 lb-in.)".
3. In Section 430-28(1), replace "10 ft (3.05 m)" with "3.0 m (10 ft)".
4. In Section 430-28(2), replace "25 ft. (7.62 m)" with "7.5 m (25 ft.)".
5. In Section 430-28 Exception, replace "25 ft. (7.62 m)" with "7.5 m (25 ft)" in two locations.
6. In Section 430-28 Exception, replace "35 ft. (10.67 m)" with "11

m (35 ft.)".
7. In Section 430-28 Exception, replace "100 ft. (30.5 m)" with "30 m (100 ft.)".
8. In Section 430-28 Exception (g), replace "30 ft. (9.14 m)" with "9.0 m (30 ft.)".
9. In Section 430-53(d)(2), replace "25 ft. (7.62 m)" with "7.5 m (25 ft.)".
10. In Section 430-123, replace "6 ft. (1.83 m)" with "1.8 m (6 ft.)".
11. In Section 430-132 (3), replace "8 ft. (2.44 m)" with "2.5 m (8 ft.)".
12. In Section 430-145 (b), replace "6 ft. (1.83 m)" with "1.8 m (6 ft.)".
13. In Section 430-145 (b), In the first Paragraph, replace "3/8 in." with "Metric Designator 12 (Trade size 3/8)".
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #1081)

11- 4 - (430): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise Article 430 as follows:
430-9(c) - change "No. 14" to "14 AWG"
430-22(c) - change "No. 14" to "14 AWG" and "No. 18" to "18 AWG"
430-28(e) - change "No. 6 copper or No. 4 aluminum" to "6 AWG copper or 4 AWG aluminum"
430-145(b), 3rd paragraph - change "No. 10" to "10 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.

11- 4a - (430 and 440): Accept
SUBMITTER: CMP 11
RECOMMENDATION: 1. In 430-7(b), add headings to (1) - (5), as follows:
(1) Multispeed Motors.
(2) Single-Speed Motors.
(3) Dual Voltage Motors.
(4) 50/60 Hz Motors.
(5) Part-Winding Motors.
2. In 430-7(d), add headings to (1) and (2), as follows:
(1) Factory-Wired.
(2) Not Factory-Wired.
3. In Section 430-32(a), add headings to (1) - (4), as follows:
(1) Separate Overload Device.
(2) Thermal Protector.
(3) Integral With Motor.
(4) Larger Than 1500 Horsepower.
4. In 430-32(b), add headings to (1) and (2), as follows:
(1) Within Sight From Controller.
(2) Not Within Sight From Controller.
5. In 430-32(c), add headings to (1) - (4), as follows:
(1) Separate Overload Device.
(2) Thermal Protector.
(3) Integral With Motor.
(4) Impedance-Protected.
6. In 430-52(c), add headings to (1) - (7), as follows:
(1) In Accordance With Table 430-152.
(2) Overload Relay Table.
(3) Instantaneous Trip Circuit Breaker.
(4) Multispeed Motor.
(5) Power Electronic Devices.
(6) Self-Protected Combination Controller.
(7) Motor Short-Circuit Protector.
7. In 430-72(b), add headings to (1) and (2), as follows:
(1) Separate Overcurrent Protection.
(2) Branch Circuit Overcurrent Protective Device.
8. In 430-72(c), add headings to (1) - (5), as follows:
(1) Compliance With Article 725.
(2) Compliance With Article 450.
(3) Less Than 50 Volt-Amperes.
(4) Primary Less Than 2 Amperes.
(5) Other Means.
9. In 430-83(a), add headings to (1) and (2), as follows:
(1) Horsepower Ratings.
(2) Circuit Breaker.
10. In 430-109(a), add headings (1) - (6), as follows:
(1) Motor Circuit Switch.
(2) Molded Case Circuit Breaker.
(3) Molded Case Switch.
(4) Instantaneous Trip Circuit Breaker.
(5) Self-Protected Combination Controller.
(6) Manual Motor Controller.
11. In 430-125(b), add headings to (1) - (4), as follows:
(1) Type of Overload Device.
(2) Wound-Rotor ac Motors.
(3) Operation.
(4) Automatic Reset.
12. In 430-125(c), add headings to (1), (2) and (3) as follows:
(1) Type of Protection.
(2) Reclosing.
(3) Combination Protection.
Also, 430-125(c)(1), make the first statements in (a) and (b) headings (titles).
13. In 440-12(a), add headings to (1) and (2) as follows:
(1) Ampere Rating.
(2) Equivalent Horsepower.
14. In 440-12(b), add headings to (1) and (2), as follows:
(1) Horsepower Rating.
(2) Full-Load Current Equivalent.
15. In 440-22(b), add headings to (1) and (2), as follows:
(1) Motor-Compressor Largest Load.
(2) Motor-Compressor Not Largest Load.
SUBSTANTIATION: The proposed revisions are intended to comply with the NEC Style Manual, 2.1.5, with respect to headings.
PANEL ACTION: Accept.

(Log #2602)

11- 5 - (430): Reject
Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Donald R. Cook, Southern Section, IAEI
RECOMMENDATION: Revise 430 to read as follows:
430-52. Rating or Setting for Individual Motor Circuit.
(a) General. The motor branch-circuit short-circuit and ground-fault protective device shall comply with (b) and either (c) or (d), as applicable.
(b) All Motors. The motor branch-circuit short-circuit and ground-fault protective device shall be capable of carrying the starting current of the motor.
(c) Rating or Setting.
1. A protective device that has a rating or setting not exceeding the value calculated according to the values given in Table 430-52 shall be used.

**Table 430-52. Maximum Rating or Setting of Motor Branch-Circuit Short-Circuit and Ground-Fault Protective Devices

Type of Motor	Percentage of Full-Load Current			
	Nontime Delay Fuse	Duel Element (Time-Delay Fuse)1	Instantaneous Trip Breaker	Inverse Time Breaker2
Single-phase motors	300	175	800	250
AC polyphase motors other than wound-rotor				
Squirrel cage—				
Other than Design E	300	175	800	250
Design E	300	175	1100	250
Synchronous3	300	175	800	250
Wound rotor	150	150	800	150
Direct current (constant voltage	150	150	250	150

Note: For certain exceptions to the values specified, see Sections 430-52 through 430-54.
1 The values in the Nontime Delay Fuse column apply to Time-Delay Class CC fuses.
2 The values given in the last column also cover the ratings of nonadjustable inverse time types of circuit breakers that may be modified as in Section 430-52.
3 Synchronous motors of the low-torque, low-speed type (usually 450 rpm or lower), such as are used to drive reciprocating compressors, pumps, etc., that start unloaded, do not require a fuse rating or circuit-breaker setting in excess of 200 percent of full-load current.**

Exception No. 1: Where the values for branch-circuit short-circuit and ground-fault protective devices determined by Table 430-52 do not correspond to the standard sizes or ratings of fuses, nonadjustable circuit breakers, thermal protective devices, or possible settings of adjustable circuit breakers, the next higher standard size, rating, or possible setting shall be permitted.

Exception No. 2: Where the rating specified in Table 430-52, as modified by Exception No. 1, is not sufficient for the starting current of the motor:

(a) The rating of a nontime-delay fuse not exceeding 600 amperes or a time-delay Class CC fuse shall be permitted to be increased but shall in no case exceed 400 percent of the full-load current.

(b) The rating of a time-delay (dual-element) fuse shall be permitted to be increased but shall in no case exceed 225 percent of the full-load current.

(c) The rating of an inverse time circuit breaker shall be permitted to be increased but shall in no case exceed 400 percent for full-load currents of 100 amperes or less or 300 percent for full-load currents greater than 100 amperes.

(d) The rating of a fuse of 601-6000 ampere classification shall be permitted to be increased but shall in no case exceed 300 percent of the full-load current.

FPN: See Appendix D, Example No. D8, and Figure 430-1.

2. Where maximum branch-circuit short-circuit and ground-fault protective device ratings are shown in the manufacturer's overload relay table for use with a motor controller or are otherwise marked on the equipment, they shall not be exceeded even if higher values are allowed as shown above.

3. An instantaneous trip circuit breaker shall be used only if adjustable and if part of a listed combination motor controller having coordinated motor overload and short-circuit and ground-fault protection in each conductor, and the setting is adjusted to no more than the value specified in Table 430-52.

FPN: For the purpose of this article, instantaneous-trip circuit breakers may include a damping means to accommodate a transient motor inrush current without nuisance tripping of the circuit breaker.

Exception No. 1: Where the setting specified in Table 430-52 is not sufficient for the starting current of the motor, the setting of an instantaneous trip circuit breaker shall be permitted to be increased but shall in no case exceed 1300 percent of the motor full-load current for other than Design E motors or Design B energy efficient motors and no more than 1700 percent of full-load motor current for Design E motors or Design B energy efficient motors. Trip settings above 800 percent for other than Design E motors or Design B energy efficient motors and above 1100 percent for Design E motors or Design B energy efficient motors shall be permitted where the need has been demonstrated by engineering evaluation. In such cases, it shall not be necessary to first apply an instantaneous-trip circuit breaker at 800 percent or 1100 percent.

FPN: For additional information on the requirements for a motor to be classified "energy efficient," see Motors and Generators, NEMA Standards Publication No. MG1-1993, Revision 1, Part 12.59.

Exception No. 2: Where the motor full-load current is 8 amperes or less, the setting of the instantaneous-trip circuit breaker with a continuous current rating of 15 amperes or less in a listed combination motor controller that provides coordinated motor branch-circuit overload and short-circuit and ground-fault protection shall be permitted to be increased to the value marked on the controller.

4. For a multispeed motor, a single short-circuit and ground-fault protective device shall be permitted for two or more windings of the motor, provided the rating of the protective device does not exceed the above applicable percentage of the nameplate rating of the smallest winding protected.

Exception: For a multispeed motor, a single short-circuit and ground-fault protective device shall be permitted to be used and sized according to the full-load current of the highest current winding, where all of the following conditions are met.

(a) Each winding is equipped with individual overload protection sized according to its full-load current.

(b) The branch-circuit conductors supplying each winding are sized according to the full-load current of the highest full-load current winding.

(c) The controller for each winding has a horsepower rating not less than that required for the winding having the highest horsepower rating.

5. Suitable fuses shall be permitted in lieu of devices listed in Table 430-52 for power electronic devices in a solid state motor controller system provided that the marking for replacement fuses is provided adjacent to the fuses.

6. A listed self-protected combination controller shall be permitted in lieu of the devices specified in Table 430-52. Adjustable instantaneous-trip settings shall not exceed 1300 percent of full-load motor current for other than Design E motors or Design B energy efficient motors and not more than 1700 percent of full-load motor current for Design E motors or Design B energy efficient motors.

7. A motor short-circuit protector shall be permitted in lieu of devices listed in Table 430-52 if the motor short-circuit protector is part of a listed combination motor controller having coordinated motor overload protection and short-circuit and ground-fault protection in each conductor and it will open the circuit at currents exceeding 1300 percent of motor full-load current for other than Design E motors or Design B energy efficient motors and 1700 percent of motor full-load motor current for Design E motors or Design B energy efficient motors.

(d) Torque Motors. Torque motor branch circuits shall be protected at the motor nameplate current rating in accordance with Section 240-3(b).

430-53. Several Motors or Loads on One Branch Circuit. Two or more motors or one or more motors and other loads shall be permitted to be connected to the same branch circuit under conditions specified in (d) and in (a), (b), or (c).

(a) Not Over 1 Horsepower. Several motors, each not exceeding 1 hp in rating, shall be permitted on a nominal 120-volt branch circuit protected at not over 20 amperes or a branch circuit of 600 volts, nominal, or less, protected at not over 15 amperes, if all of the following conditions are met.

1. The full-load rating of each motor does not exceed 6 amperes.
2. The rating of the branch-circuit short-circuit and ground-fault protective device marked on any of the controllers is not exceeded.
3. Individual overload protection conforms to Section 430-32.

(b) If Smallest Rated Motor Protected. If the branch-circuit short-circuit and ground-fault protective device is selected not to exceed that allowed by Section 430-52 for the smallest rated motor, two or more motors or one or more motors and other load(s), with each motor having individual overload protection, shall be permitted to be connected to a branch circuit where it can be determined that the branch-circuit short-circuit and ground-fault protective device will not open under the most severe normal conditions of service that might be encountered.

(c) Other Group Installations. Two or more motors of any rating or one or more motors and other load(s), with each motor having individual overload protection, shall be permitted to be connected to one branch circuit where the motor controller(s) and overload device(s) are (1) installed as a listed factory assembly and the motor branch-circuit short-circuit and ground-fault protective device is either provided as part of the assembly or is specified by a marking on the assembly, or (2) the motor branch-circuit short-circuit and ground-fault protective device, the motor controller(s), and overload device(s) are field-installed as separate assemblies listed for such use and provided with manufacturers' instructions for use with each other, and (3) all of the following conditions are complied with.

1. Each motor overload device is listed for group installation with a specified maximum rating of fuse or inverse time circuit breaker, or both.
2. Each motor controller is listed for group installation with a specified maximum rating of fuse or circuit breaker, or both.
3. Each circuit breaker is one of the inverse time type and listed for group installation.
4. The branch circuit shall be protected by fuses or inverse time circuit breakers having a rating not exceeding that specified in Section 430-52 for the highest rated motor connected to the branch circuit plus an amount equal to the sum of the full-load current ratings of all other motors and the ratings of other loads connected to the circuit. Where this calculation results in a rating less than the ampacity of the supply conductors, it shall be permitted to increase the maximum rating of the fuses or circuit breaker to a value not exceeding that permitted by Section 240-3(b).
5. The branch-circuit fuses or inverse time circuit breakers are not larger than allowed by Section 430-40 for the overload relay protecting the smallest rated motor of the group.

FPN: See Section 110-10 for circuit impedance and other characteristics.

(d) Single Motor Taps. For group installations described above, the conductors of any tap supplying a single motor shall not be required to have individual branch-circuit short-circuit and ground-fault protective device, provided they comply with either of the following.

1. No conductor to the motor shall have an ampacity less than that of the branch-circuit conductors.
2. No. conductor to the motor shall have an ampacity less than one-third that of the branch-circuit conductors, with a minimum in accordance with Section 430-22; the conductors to the motor overload device being not more than 25 ft (7.62 m) long and being protected from physical damage.

430-54. Multimotor and Combination-Load Equipment. The rating of the branch-circuit short-circuit and ground-fault protective device for multimotor and combination-load equipment shall not exceed the rating marked on the equipment in accordance with Section 430-7(d).

430-55. Combined Overcurrent Protection. Motor branch-circuit short-circuit and ground-fault protection and motor overload protection shall be permitted to be combined in a single protective device where the rating or setting of the device provides the overload protection specified in Section 430-32.

430-56. Branch-Circuit Protective Devices—In Which Conductor Branch-circuit protective devices shall comply with the provisions of Section 240-20.

430-57. Size of Fuseholder. Where fuses are used for motor branch-circuit short-circuit and ground-fault protection, the fuseholders shall not be of a smaller size than required to accommodate the fuses specified by Table 430-52.

Exception: Where fuses having time delay appropriate for the starting characteristics of the motor are used, it shall be permitted to use fuseholders sized to fit the fuses that are used.

430-58. Rating of Circuit Breaker. A circuit breaker for motor branch-circuit short-circuit and ground-fault protection shall have a current rating in accordance with Sections 430-52 and 430-110.

E. Motor Feeder Short-Circuit and Ground-Fault Protections

430-61. General. Part E specifies protective devices intended to protect feeder conductors supplying motors against overcurrents due to short circuits or grounds.

FPN: See Appendix D, Example No. D8.

430-62. Rating or Setting—Motor Load.

(a) Specific Load. A feeder supplying a specific fixed motor load(s) and consisting of conductor sizes based on Section 430-24 shall be provided with a protective device having a rating or setting not greater than the largest rating or setting of the branch-circuit short-circuit and ground-fault protective device for any motor supplied by the feeder [based on the maximum permitted value for the specific type of a protective device shown in Table 430-52, or Section 440-22(a) for hermetic refrigerant motor-compressors], plus the sum of the full-load currents of the other motors of the group. Where the same rating or setting of the branch-circuit short-circuit and ground-fault protective device is used on two or more of the branch circuits supplied by the feeder, one of the protective devices shall be considered the largest for the above calculations.

Exception: Where one or more instantaneous trip circuit breakers or motor short-circuit protectors are used for motor branch-circuit short-circuit and ground-fault protection as permitted in Section 430-52(c), the procedure provided above for determining the maximum rating of the feeder protective device shall apply with the following provision. For the purpose of the calculation, each instantaneous trip circuit breaker or motor short-circuit protector shall be assumed to have a rating not exceeding the maximum percentage of motor full-load current permitted by Table 430-52 for the type of feeder protective device employed.

FPN: See Appendix D, Example No. D8.

(b) Other Installations. Where feeder conductors have an ampacity greater than required by Section 430-24, the rating or setting of the feeder overcurrent protective device shall be permitted to be based on the ampacity of the feeder conductors.

**Relocating and changing Table 430-152 to Code Section 430-52 and changing table to 430-52.

SUBSTANTIATION: 1. To put all percentages together, and under the same section.

2. Will make looking up percentage chart easier.

PANEL ACTION: Reject.

PANEL STATEMENT: Table 430-152 is now referenced in 11 places in Article 430, from page 267 through page 270 (430-52, 430-57, and 430-62) and the proposed revision includes the same number and locations of references to the table. Relocating the table to 430-52 does not make it easier to look up. The proposal does not make the necessary changes in the table to correlate with the proposed change to become Table 430-52.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 14

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

GARVEY: Of the 11 places Table 430-152 is referenced, all but three are within 430-52. The Panel's Action to accept Proposal 11-48 effectively makes two of the three redundant. This leaves one minor reference to sizing fuseholders in 430-57. Since the majority of the references to the Table are found in 430-52, Section 430-52 is where the Table belongs.

(Log #CP1102)

11- 5a - (FPN Figure 430-1): Accept

SUBMITTER: CMP 11

RECOMMENDATION: Add caption to Fine Print Note Figure 430-1, as follows:

"Article 430 Contents"

SUBSTANTIATION: The addition of a caption is intended to comply with NEC Style Manual 2.3.1.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

(Log #2866)

11- 6 - (430-2): Reject
SUBMITTER: David R. Petrozza, Steel City Inspection Agency
RECOMMENDATION: Revise text to read as follows:

430-2 Adjustable-Speed Drive Systems. The incoming branch circuit or feeder to power conversion equipment included as part of an adjustable-speed drive system shall be based on the rated input to the power conversion equipment. ~~Where the power conversion equipment is marked to indicate that overload protection is included, additional overload protection shall not be required.~~ Appropriate devices shall be provided to detect and automatically de-energize the supplied motor or provide an adequate alarm if there is any increase in temperature of the motor beyond design limits.

The disconnecting means shall be permitted to be in the incoming line to the conversion equipment and shall have a rating not less than 115 percent of the rated input current of the conversion equipment.

SUBSTANTIATION: Adjustable speed drives provide overload protection by a factory installed programmed thermal model of the motor. While this may be satisfactory for mechanical overloads it will not detect excessive heating that will occur when the motor is operated at 50 percent base speed or less. A motor operated by a constant torque pulse width modulated drive will draw full load amperes at as low as 20 percent base speed. Due to the fact that the armature mounted fan is running slower at reduced speeds this will result in dangerous over heating of the motor that will not be detected by the drive programmed overload.

Compliance with the above proposed code change could be as easy as wiring a thermal protector integral with the motor into the start permissive of the drive.

PANEL ACTION: Reject.
PANEL STATEMENT: No evidence of a field problem has been supplied. Drive systems are manufactured and listed to specific industry standards that address motor overheating conditions.

(Log #4385)

11- 7 - (430-6(a)(1)): Reject

Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting relative to the Style Manual. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Add the following text:

The nameplate rating shall be used when it is greater than the table value.

SUBSTANTIATION: Where a motor such as one used for a special purpose is installed, the circuit components should be sized sufficient for the connected motor when it exceeds the table value.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's concern is already covered by Tables 430-148 through 430-150.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
GARVEY: There are references to special purpose motors in the Tables 148, 149, and 150. All three references say essentially the same thing. "Motors built for low speeds or high torques may require more running current, and multispeed motors will have full-load current varying with speed. In these cases, the nameplate current rating shall be used." Placing this mandatory language once in the general rule, 430-6(a)(1) enhances usability. The NEC style manual Section 2.3 suggest that tables consist of a brief title followed by the data with any accompanying Notes. Mandatory requirements are easier to find if found within the text of the general rules.

(Log #3827)

11- 8 - (430-7(a)(1) through (4)): Reject
SUBMITTER: Nico Santana, Riviera Electric
RECOMMENDATION: Delete Section 430-7(a) 1 through 4.
SUBSTANTIATION: This section has much to do with NEMA/ANSI/IEEE, and little to do with what a field electrician has control over. In the interest of brevity and clarity, and controlling the content of an increasingly complex tool, please consider placing this information where it belongs - with the manufacturer's publications.
PANEL ACTION: Reject.
PANEL STATEMENT: Many motors are not designed or manufactured to NEMA standards. The marking under (a)(1) is needed on the motor so the installer/user of the motor can determine where to go for the manufacturer's publication. The markings under (a)(2), (3), and (4) are needed to determine compliance with other requirements in Article 430.

(Log #1834)

11- 9 - (430-10(a), FPN): Reject
SUBMITTER: Timothy L. Shank, City of Orlando, FL
RECOMMENDATION: Add "and 380-9(b)" after 373-8, and change "Section" to "Sections."
SUBSTANTIATION: Calls attention to another rule that covers the same situation. Will make the NEC more user friendly.
PANEL ACTION: Reject.
PANEL STATEMENT: The material contained in 380-3(b) is duplicative to 373-8, and, as such, does not add any new requirements. It is assumed the proposal should have referred to 380-3(b), rather than 380-9(b), which has no relevance.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #553)

11- 10 - (Table 430-10(b)): Accept
SUBMITTER: Technical Correlating Committee National Electrical
RECOMMENDATION: Revise Table 430-10(b) Minimum Wire-Bending Space at the Terminals of Enclosed Motor Controllers as follows, to add the metric values.

Table 430-10(b) Minimum Wire-Bending Space at the Enclosed Motor Controllers

Size of Wire (AWG or kcmil)	Wires per Terminal*		
	1		
	mm	in.	mm
14–10	Not specified		
8–6	38	1 1/2	
4–3	50	2	
2	65	2 1/2	
1	75	3	
1/0	125	5	12
2/0	150	6	15
3/0–4/0	175	7	17
250	200	8	20
300	250	10	25
350–500	300	12	30
600–700	350	14	40
750–900	450	18	47

*Where provision for three or more wires per terminal exists, the mi shall be in accordance with the requirements of Article 373.

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement.
PANEL ACTION: Accept.

AFFIRMATIVE: 15

(Log #4461)

11- 11 - (430-12): Reject
SUBMITTER: David E. Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
RECOMMENDATION: Delete entire section and tables.
SUBSTANTIATION: This material addresses a factory standard, not field selection, construction, or installation. With the Code as lengthy as it is, such material should be left to ANSI and NRTLs, and addressed by Sections 110-2 and 110-3.
PANEL ACTION: Reject.
PANEL STATEMENT: Most general use motors are not listed by testing laboratories. The provisions of this section are necessary to require constructions that can be safely installed.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #3959)

11- 12 - (430-12(a)): Reject
SUBMITTER: Neil F. LaBrake, Jr., Niagara Mohawk Power Corp.
RECOMMENDATION: (A companion proposal was submitted for Section 430-31).
Add a new sentence to the end of existing paragraph 1 (after the word "apparatus") as follows:
Protection against 3-phase motor overheating caused by phase loss, phase reversal and system voltage unbalance shall be provided for circuits supplying stationary 3-phase motors for driving processes or other machinery types as opposed to portable motor-driven equipment. This protection shall be permitted with the installation of voltage sensing devices that open all three poles simultaneously of the motor supply circuit disconnect.
SUBSTANTIATION:
Regardless of the cause, whether it be mechanical overloads or one of the three abnormal operating conditions referred to in the Proposal, the resulting overcurrents produce excessive heating in the motor windings, creating the potential for equipment damage, fire, and other safety concerns. Voltage sensing devices (relays) are commonly installed for the purpose of tripping a circuit breaker or an electrically ganged operated switch upon detection of voltage decrease below a set threshold or loss of voltage indicating a loss of phase or unbalance between phases supplying stationary motor-driven processes.
Throughout the United States, users of 3-phase motors, especially the new high-efficiency "E" motors, are experiencing motor damage caused by phase loss, phase reversal, and system voltage unbalance. For instance, a July 4, 1995 lightning storm caused a New York State utility's customer's three-phase motor to single phase, which resulted in a fire. Upon loss of three-phase power, the 10 horsepower, three-phase 120/208-volt motor, which drove the exhaust fan on an unmanned furnace, stopped exhausting the furnace gases. As a result, the furnace overheated, spreading fire to the remainder of the plant. If the exhaust motor had single phase protection with alarm annunciation, the customer could have avoided this fire. This incident is presently under litigation for damages in New York State.
The existing requirements for overload (operating overcurrent) protection are not adequate to protect 3-phase motors against overheating under these operating conditions. The electrical industry has recognized and acknowleged this problem in the publication of technical papers. The electric utilities are very familiar with the problem due to numerous customer complaints and damage claims. These are abnormal operating conditions caused by things such as auto accidents, storms, customer load switching, and human error. In the majority of cases, the electric utilities have no control over the causes, and cannot provide adequate protection against damage to customer equipment. Utility Tariffs and Filed Rules require customers to protect their equipment for these conditions. However, there is presently no clear and specific Code requirement to support this need.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal would require a redundant level of protection that is not necessary, but allowed as a design consideration. It is assumed the proposal should have referred to 430-125(a), rather than 430-12(a).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1EXPLANATION OF NEGATIVE:
THOMAS: While the Panel feels that the current requirements in Article 430 provide adequate motor protection, there continues to be motor failures, which result in claims and litigation. Additional technical documentation with specific proposals could possibly identify steps to mitigate these motor failures.
COMMENT ON AFFIRMATIVE:
HAMER: API supports the Panel Action to reject this proposal.

(Log #554)

11- 13 - (Table 430-12(b)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise Table 430-12(b) as follows to add the metric values, and delete the note regarding unit conversions.
(Table shown on following page)
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement. A "soft" conversion is necessary to conform to industry practice.
PANEL ACTION: Accept.

~~Note: For SI units, 1 in. = 25.44 mm~~

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #896)

11- 16 - (430-14(a)): Accept
Note: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Ventilation and Maintenance. Except for submersible types, ~~Motors~~ motors shall be located so that adequate ventilation is provided, and so that maintenance, such as lubrication of bearings and replacing of brushes, can be readily accomplished.
SUBSTANTIATION: Editorial. Article 100 definition of ventilated indicates a circulation of air is required. While it is self-evident that submersible motors are not ventilated, a rule that literally applies but is not reasonable invites ridicule of the code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
GARVEY: The Panel should accept only the principle of the submitter's suggestion. The proposed text conflicts with the NEC style manual, Section 2.6.1. Exceptions should follow the general rule. There are two issues addressed in 430-14(a), dissipation of heat to maintain the motor within the rated temperature rise and location of the motor to provide for maintenance. The Panel should consider separating these issues into two subsections, one section on "Cooling" or "Heat Dissipation" and the second section on "Location".

(Log #2467)

11- 17 - (430-17): Reject
SUBMITTER: Dann M. Strube, Lanesville, IN
RECOMMENDATION: Add new sentence:
Where two or more motors have the same rated full load current only one of them shall be considered as the highest rated (largest) motor.
SUBSTANTIATION: This was taken from Section 440-7 and will make 430-17 clear.
PANEL ACTION: Reject.
PANEL STATEMENT: The section is clear as written. The submitter has provided no documentation of problems in the field.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #897)

11- 18 - (430-21): Accept
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise first sentence:
Part B specifies ~~sizes~~ ampacities of conductors capable of carrying the motor current without overheating under the conditions specified.
SUBSTANTIATION: Editorial. Part B specifies ampacities, not sizes.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #4331)

11- 19 - (430-21): Accept in Principle
SUBMITTER: Leo F. Martin, Martin Electrical & Technical Training Services
RECOMMENDATION: Add a second sentence to read as follows:
For motors with design letters B, C, D, or E, conductors having an insulation rating of 75°C (167°F) or higher shall be permitted to be used provided the ampacity of such conductors does not exceed the 75°C (167°F) ampacity.
SUBSTANTIATION: To correlate with the requirements of Section 110-14(c)(1)(d). This section addresses motor circuit conductors and should be mentioned in Article 430 to eliminate misapplication of code requirements, and make the Code more user friendly.
PANEL ACTION: Accept in Principle.
In FPN No. 2 change "Section 430-9(b)" to "110-14(c) and 430-9(b)".
PANEL STATEMENT: Section 110-14(c) is generally applicable to motor circuit conductor terminations and Section 110-14(c)(1)(d) specifically covers motor circuit conductor terminations. The panel action should meet the submitter's intent.

(Log #3096)

11- 20 - (430-22): Accept in Principle

Note: The Technical Correlating Committee notes that the Panel Statement indicates that the FPN was deleted, however, the Panel Action still includes the FPN following Exception No. 2.

The Technical Correlating Committee directs the panel clarify the Panel Action and Panel Statement on this Proposal. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)

RECOMMENDATION: Revise as follows:

Single Motor

Relocate and renumber existing second paragraph as paragraph (b). Relocate and renumber existing third paragraph as paragraph (c). Add a new paragraph (d) as shown by underlined text. Renumber existing paragraphs (b) and (c) as (e) and (f), respectively. Relocated/renumbered and new text are as follows:

(a) General. Branch-circuit conductors that supply a single motor used in a continuous duty application shall have an ampacity of not less than 125 percent of the motor's full-load current rating as determined by Section 430-6(a)(1).

Exception No. 1: For dc motors operating from a rectified single-phase power supply, the conductors between the field wiring terminals of the rectifer and the motor shall have an ampacity of not less than the following percent of the motor full-load current rating:

a. Where a rectifier bridge of the single-phase half-wave type is used, 190 percent

b. Where a rectifier bridge of the single-phase full-wave type is used, 150 percent

Exception No. 2: Circuit conductors supplying power conversion equipment included as part of an adjustable-speed drive system shall have an ampacity not less than 125 percent of the rated input to the power conversion equipment.

b) For a multispeed motor, the selection of branch-circuit conductors on the line side of the controller shall be based on the highest of the full-load current ratings shown on the motor nameplate. The selection of branch-circuit conductors between the controller and the motor shall be based on the current rating of the winding(s) that the conductors energize.

(c) For a wye-start motor, the selection of branch-circuit conductors on the line side of the controller shall be based on the motor full-load current. The selection of conductors between the controller and the motor shall be based on 58 percent of the motor full-load current.

(d) For a part-winding connected motor, the selection of branch-circuit conductors on the line side of the controller shall be based on the motor full-load current. The selection of conductors between the controller and the motor shall be based on 50 percent of the motor full-load current.

FPN: See Appendix D, Example No. D8, and Figure 430-1.

SUBSTANTIATION: Information cannot be easily located and part-winding is not included. Users frequently consult with manufacturers for this information.

PANEL ACTION: Accept in Principle.

Revise as follows:

"Single Motor."

Relocate and renumber existing second paragraph as paragraph (b). Relocate and renumber existing third paragraph as paragraph (c). Add a new paragraph (d) as shown by underlined text. Renumber existing paragraphs (b) and (c) as (e) and (f), respectively. Delete the FPN. Relocated/renumbered and new text are as follows:

"(a) General. Branch-circuit conductors that supply a single motor used in a continuous duty application shall have an ampacity of not less than 125 percent of the motor's full-load current rating as determined by Section 430-6(a)(1).

Exception No. 1: For dc motors operating from a rectified single-phase power supply, the conductors between the field wiring terminals of the rectifer and the motor shall have an ampacity of not less than the following percent of the motor full-load current rating:

a. Where a rectifier bridge of the single-phase half-wave type is used, 190 percent

b. Where a rectifier bridge of the single-phase full-wave type is used, 150 percent

Exception No. 2: Circuit conductors supplying power conversion equipment included as part of an adjustable-speed drive system shall have an ampacity not less than 125 percent of the rated input to the power conversion equipment.

FPN: See Appendix D, Example No. D8, and Figure 430-1.

(b) Multi-speed Motor. For a multispeed motor, the selection of branch-circuit conductors on the line side of the controller shall be based on the highest of the full-load current ratings shown on the motor nameplate. The selection of branch-circuit conductors between the controller and the motor shall be based on the current rating of the winding(s) that the conductors energize.

(c) Wye-Start Delta-Run Motor. For a wye-start, delta-run connected motor, the selection of branch-circuit conductors on the line side of the controller shall be based on the motor full-load current. The selection of conductors between the controller and the motor shall be based on 58 percent of the motor full-load current.

(d) Part-Winding Motor. For a part-winding connected motor, the selection of branch-circuit conductors on the line side of the controller shall be based on the motor full-load current. The selection of conductors between the controller and the motor shall be based on 50 percent of the motor full-load current."

PANEL STATEMENT: The Panel action editorially corrects the proposal, and adds headings in accordance with the NEC Style Manual.

The FPN was deleted as it provides no substantive guidance.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

(Log #2283)

11- 21 - (430-22 Exception No. 3 (New)): Reject

SUBMITTER: Terry L. Schneider, Regional Bldg Dept.

RECOMMENDATION: Add new text to read as follows:

"The full load current rating shall not exceed 15 amperes for No. 14, 20 amperes for No. 12, and 30 amperes for No. 10 copper, or 15 amperes for No. 12 and 25 amperes for No. 10 aluminum and copper-clad aluminum after any correction factors for ambient temperature and number of conductors have been applied."

SUBSTANTIATION: All other sections of the code limit actual load possible to the above values for small conductors, motor full load rating is not addressed, and starting current in many circumstances can cause conductor slap in the conduits, and presently allow 20 amp, motor on #14 THHN and 24 amp on 12 THHN. Conflicts with the rest of the standards in the code.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter apparently believes 240-3(d) is applicable to motor circuits. That is not correct. See 240-3(g).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

(Log #371)

11- 22 - (430-22(a)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Add to second paragraph:

Where a continuous-duty motor is connected to a branch circuit by means of a field-installed flexible cord, attachment plug and receptacle, the flexible cord conductors shall have an ampacity of not less than 125 percent of the motor full-load current rating as determined by Section 430-6(a)(1).

SUBSTANTIATION: Since a cord with attachment plug is not generally considered as branch circuit conductors, the requirements of the first paragraph do not apply. Section 430-6 indicates required sizes and ampacities to be considered for cords, but this section applies the multiplier to such ampacities (ratings) and does not include cords which are technically not branch circuit conductors.

Permanently connected cords as permitted elsewhere in the code and used as branch circuit conductors are included. Factory-installed cords for listed equipment would be included in the proposal. The wording of (b) which is not limited to branch circuit conductors, covers a cord/plug connection for other than continuous-duty motors.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has provided no evidence that a problem exists in the field.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #1154)

11- 23 - (430-22(b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise text to read:
(b) Other than Continuous Duty. Branch-circuit conductors ~~Conductors~~ for a motor used in a short-time, intermittent, periodic, or varying duty application shall have an ampacity of not less than the percentage of the motor nameplate current rating shown in Table 430-22(b), unless the authority having jurisdiction grants special permission for conductors of lower ampacity. Service and feeder conductors that supply only a motor for duty-cycle service shall comply with this section.
SUBSTANTIATION: It appears reasonable to apply this section to service and feeder conductors that supply only such a motor as they see the same heating effect as the branch-circuit conductors. "Branch-circuit" is added as it appears the intent is not to apply this section to service or feeder conductors that supply other additional load. (See Sections 230-23(a), 230-31(a), 230-42(a), and 430-24.)
This proposal does not address how much additional load the service and feeder conductors should supply in order not to invoke additional ampacity for the table percentages above 125 percent. If the proposal is accepted perhaps the panel could address that.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's concerns are addressed by the current language.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #898)

11- 24 - (430-24): Accept in Principle in Part
Note: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual relative to references to entire articles. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Conductors supplying several motors, or a motor(s) and other load(s) shall have an ampacity not less than ~~at least equal to~~ the sum of the full-load current rating as determined by Section 430-6(a)(1) of all the motors, plus 25 percent of the highest rated motor of the group, plus 125 percent of the continuous load, plus the ampere rating of other loads determined in accordance with Article 220 and other applicable articles. (remainder unchanged).
SUBSTANTIATION: "Not less than" is proposed as a preferable phrase. The reference to Article 220 does not provide sufficient clarification since the loads, per se, are not increased, only conductor ampacities for continuous loads.
PANEL ACTION: Accept in Principle in Part.
Revise the first paragraph of 430-24 to read:
"Conductors supplying several motors, or a motor(s) and other load(s) shall have an ampacity not less than 125 percent of the full-load current rating of the highest rated motor plus the sum of the full-load current ratings of all the other motors in the group, as determined by 430-6(a), plus the ampacity required for the other loads determined in accordance with Article 220 and other applicable articles."
PANEL STATEMENT: The panel accepts the first proposed change. The second proposed change is inadequate to meet the submitter's intent. The increased minimum ampacity of conductors for some other loads is not limited to continuous loads, as defined in Article 100.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #2471)

11- 25 - (430-24): Accept in Principle
SUBMITTER: Andrew Schmid, Goldhorn Electrical Construction
RECOMMENDATION: Revise as follows:
430-24 . Several Motors or a Motor(s) and other load(s). Conductors supplying several motors, or a motor(s) and other load(s), shall have an ampacity at least equal to ~~the sum of the full load current rating as determined by Section 430-6(a)(1) of all the motors plus 25 percent of the highest rated motor in the group~~ 125 percent of the largest motors current, in addition to any other motor(s) current(s) in the group as determined by Section 430-6(a)(1) plus the ampere rating of the other loads determined in accordance with Article 220 and other applicable articles.
SUBSTANTIATION: While teaching the code to my students, it has come to my attention that they typically have a much easier time working with and applying 430-22 because of the way it is presented. However, they get confused and struggle when applying 430-24. The majority of these students feel the wording is a little hard to comprehend and apply. However, with the proposed change in wording, I feel the article will be more user friendly and will make this section easier for anyone using this code to apply.
PANEL ACTION: Accept in Principle.
See the panel action on Proposal 11-24.
PANEL STATEMENT: The panel action on Proposal 11-24 should meet the submitter's intent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #899)

11- 26 - (430-28): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise first sentence:
Feeder tap conductors shall have an ampacity not less than that required by Part B and Part E, shall terminate in ~~a branch-circuit~~ an overcurrent protective device and, in addition, shall meet one of the following requirements:.
SUBSTANTIATION: Editorial. In the exception condition b. indicates the tap conductors may be a feeder. Reference to Part E and deletion of "branch-circuit" will correlate with the condition of tap conductors which are a feeder. By definition of feeder, tap conductors are included up to the final overcurrrent device.
PANEL ACTION: Reject.
PANEL STATEMENT: A branch circuit overcurrent device is not limited to branch circuits. It may also be used on feeders.

(Log #908)

11- 27 - (430-28(3) and Exception No. 2 (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete ~~(3) Have the same ampacity as the feeder conductors.~~
Add an exception to read as follows:
Exception No. 2: Feeder taps shall be permitted in accordance with Sections 240-21(b)(5) and 240-21(c)(4).
SUBSTANTIATION: Section 240-3(e) indicates conductors of the same ampacity of properly protected conductors to which they are tapped are not "tap conductors" and therefore are not feeder tap conductors covered in this section. The provisions of Sections 240-21(b)(5) and (c)(4) should also be suitable for motor tap conductors where the conductors have an ampacity not less than the motor overcurrent device they supply.
PANEL ACTION: Reject.
PANEL STATEMENT: The second paragraph of 240-3(e) applies only to Article 240. The changes proposed introduce confusion in lieu of the simple and accurate statement in the Code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #CP1104)

11- 27a - (430-31and FPN No. 1 (New)): Accept
SUBMITTER: CMP 11
RECOMMENDATION: 1. In fourth paragraph, delete "See Part K".
2. Add new FPN No. 1 after fourth paragraph to read as follows:
FPN No. 1: For over 600 volts, nominal, see Part K.
3. Existing FPN to become FPN No. 2.
SUBSTANTIATION: The revision is intended to comply with the NEC Style Manual, 3.1, with respect to explanatory information.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #3958)

11- 28 - (430-31): Reject
SUBMITTER: Neil F. LaBrake, Jr., Niagara Mohawk Power Corp.
RECOMMENDATION: Note: A companion proposal was submitted for Section 430-125(a).
Add a new sentence to the end of existing paragraph 2 (after the word "faults") as follows:
It does include protection against 3-phase motor overheating caused by phase loss, phase reversal and system voltage unbalance where voltage sensing devices are installed to open all three poles simultaneously of the motor supply circuit disconnect. This applies to stationary 3-phase motors for driving processes or other machinery types as opposed to portable motor-driven equipment."

SUBSTANTIATION: Regardless of the cause, whether it be mechanical overloads or one of the three abnormal operating conditions referred to in the Proposal, the resulting overcurrents produce excessive heating in the motor windings, creating the potential for equipment damage, fire, and other safety concerns. Voltage sensing devices (relays) are commonly installed for the purpose of tripping a circuit breaker or an electrically ganged operated switch upon detection of voltage decrease below a set threshold or loss of voltage indicating a loss of phase or unbalance between phases supplying stationary motor-driven processes.
Throughout the United States, users of 3-phase motors, especially the new high-efficiency "E" motors, are experiencing motor damage caused by phase loss, phase reversal, and system voltage unbalance. For instance, a July 4, 1995 lightning storm caused a New York State utility's customer's three-phase motor to single phase, which resulted in a fire. Upon loss of three-phase power, the 10 horsepower, three-phase 120/208-volt motor, which drove the exhaust fan on an unmanned furnace, stopped exhausting the furnace gases. As a result, the furnace overheated, spreading fire to the remainder of the plant. If the exhaust motor had single phase protection with alarm annunciation, the customer could have avoided this fire. This incident is presently under litigation for damages in New York State.
The existing requirements for overload (operating overcurrent) protection are not adequate to protect 3-phase motors against overheating under these operating conditions. The electrical industry has recognized and acknowleged this problem in the publication of technical papers. The electric utilities are very familiar with the problem due to numerous customer complaints and damage claims. These are abnormal operating conditions caused by things such as auto accidents, storms, customer load switching, and human error. In the majority of cases, the electric utilities have no control over the causes, and cannot provide adequate protection against damage to customer equipment. Utility Tariffs and Filed Rules require customers to protect their equipment for these conditions. However, there is presently no clear and specific Code requirement to support this need.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's recommendation would, if accepted, protect motors and motor circuits against phase loss, phase reversal, and system voltage imbalance simply by saying the motors and circuits are protected. If, in fact, there is a need for additional motor and motor circuit protection against the phenomena described, the submitter has not proposed a Code requirement that would meet the need. Further, no substantiation for exempting "portable motor-driven equipment" has been provided.
Meeting the requirements of Article 430 provides the intended level of protection against voltage imbalance, phase loss and phase reversal conditions.

NEGATIVE: 1
EXPLANATION OF NEGATIVE:
THOMAS: See my Explanation of Negative Vote on Proposal 11-12.

(Log #3820)

11- 29 - (430-32, 430-34, and 430-52): Reject
SUBMITTER: Loren Feldman, Riviera Electric
RECOMMENDATION: Move Sections 430-32, 430-34, and 430-52 to the end of Section 430-152.

SUBSTANTIATION: Sections 430-32, 430-34, and 430-52 are not located in the appropriate location.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel assumes the submitter is referring to Table 430-152 since there is no Section 430-152. Sections 430-32 and 430-34 are under Part C (overload protection). Section 430-52 and referenced Table 430-152 are under Part D (short-circuit and ground-fault protection). For motor circuits, the requirements for these forms of protection are not the same.

11- 31 - (430-32(a)(1)): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panels 14 and 19 for action. This action will be considered by the Panels as a Public Comment.
SUBMITTER: Donald R. Cook, Southern Section, IAEI
RECOMMENDATION: Revise text to read as follows:
430-32. Continuous-Duty Motors.
(a) More than 1 Horsepower. Each continuous-duty motor rated more than 1 hp shall be protected against overload by one of the following means.
1. A separate overload device that is responsive to motor current. This devise shall be selected to trip or shall be rated at no more than the following percent of the motor nameplate full-load current rating:

Motors with a marked service factor not less than 1.15	125 percent
Motors with a marked temperature rise not over 40°C	125 percent
All other motors	115 percent

Modification of this value shall be permitted as provided in Section 430-32 Exception No. 1. For a multispeed motor, each winding connection shall be considered separately. Where a separate motor overload device is connected so that it does not carry the total current designated on the motor nameplate, such as for wye-delta starting, the proper percentage of nameplate current applying to the selection or setting of the overload device shall be clearly designated on the equipment, or the manufacturer's selection table shall take this into account.

FPN: Where power factor correction capacitors are installed on the load side of the motor overload device, see Section 460-9.

Exception No. 1: Selection of Overload Relay. Where the overload relay selected in accordance with Sections 430-32(a)(1) and (c)(1) is not sufficient to start the motor or to carry the load, the next higher size overload relay shall be permitted to be used, provided the trip current of the overload relay does not exceed the following percentage of motor nameplate full-load current rating:

Motors with marked service factor not less than 1.15	140 percent
Motors with a marked temperature rise not over 40°C	140 percent
All other motors	130 percent

If not shunted during the starting period of the motor as provided in Section 430-35, the overload device shall have sufficient time delay to permit the motor to start and accelerate its load.

FPN: A Class 20 or 30 overload relay will provide a longer motor acceleration time than a Class 10 or 20, respectively. Use of a higher class overload relay may preclude the need for selection of a higher trip current.

SUBSTANTIATION: Change 430-34 to an Exception to the general rule of 430-32(a)(1). Because this is really an Exception to 430-32(a)(1).
PANEL ACTION: Accept in Principle.
1. Renumber 430-32(b) as 430-32(d).
2. Renumber 430-32(c) as 430-32(b).
3. Renumber 430-32(d) as new 430-32(e).
4. Renumber 430-34, including FPN, as 430-32(c).
5. Change reference in first sentence, second paragraph of 430-32(a)(1) to read 430-32(c).
6. Change both references in 430-32(b)(2) to read 430-32(b).
7. Change the reference in 430-32(c)(1) paragraph 2 to read 430-32(c).
8. Change the reference in 430-32(c)(4) to read 430-32(d)(1).
9. Change the reference in the first sentence of 430-32(c)(1) to read 430-32(b)(1).
10. Change the reference to 430-32(b) and (c) in 430-42(a) to read 430-32(b) and (d).
11. Change the reference in 430-7(a)(13) from 430-32(c)(2) to 430-32(b)(2).
12. Change the reference in 430-7(a)(14) from 430-32(c)(4) to 430-32(b)(4).
13. In Annex D, delete the reference to 430-34 following the title.
14. In Annex D, Example D8, under the heading Motor Overload Protection, revise 430-34 to read 430-32(c).

PANEL STATEMENT: The panel revisions are editorial and consistent with the NEC Style Manual, 2.6.1. The Panel action should meet the submitter's intent.
The panel requests the TCC direct panel 14 to modify the reference in 505-21, bullet item 7, from 430-34 to 430-32(c), consistent with this action. Also direct Panel 19 to modify the reference in 551-10(e)(3), bullet item 3, from 430-32(c) to 430-32(b).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

(Log #1792)

11- 36 - (430-34): Accept in Principle

SUBMITTER: Noel Williams, Noel Williams Consulting

RECOMMENDATION: Revise Section 430-34 to read as follows:

"Selection of Overload Device. Where the overload device selected in accordance with Sections 430-32(a)(1) and (c)(1) is not sufficient to start the motor or to carry the load, the next higher setting or device size shall be permitted to be used, provided the trip current of the overload device does not exceed the following percentage of motor nameplate full-load current rating: " (Rest of section to remain as is.)

SUBSTANTIATION: Both Sections 430-32(a)(1) and (c)(1) refer to overload devices. The language is general enough to allow heaters to be replaced in the case of conventional overload relays or settings to be adjusted where solid-state or other adjustable overload relays are used. In any case, the relays themselves are seldom replaced, the sensing devices or heaters are the replaceable devices. In fact, many starters are not suitable for the next larger sized relay, only for replacement of heaters up to some maximum for the relay provided with the starter. This proposal is intended to clarify the intent of the section and make it consistent with actual practice and the other referenced sections. This assumes that the intent is as stated, that only one increase in size is permitted, even if two or more increases could be made without exceeding the 140/130% levels.

The panel should also consider clarifying whether the permitted increase is to happen only once or if further increases up to the 140%/130% levels are permitted. The present language implies that only one increase in size is permitted even if the one increase does not approach 140%. Similarly, if the overload device is adjustable, the language is not clear whether only the next incremental setting is permitted or if the setting may be increased to 140%.

PANEL ACTION: Accept in Principle.

Revise the first paragraph of 430-32(c) to read as follows:

Selection of Overload Relay. Where the sensing element or setting of the overload relay selected in accordance with 430-32(a)(1) and 430-32(b)(1) is not sufficient to start the motor or carry the load, higher size sensing elements or incremental settings shall be permitted to be used, provided the trip current of the overload relay does not exceed the following percentage of the motor nameplate full-load current rating."

PANEL STATEMENT: The use of "overload device" could be interpreted to mean fuses or a circuit breaker, which is not intended. The panel has clarified the wording to permit more than one increase in the sensing element or incremental setting, provided the percent limit is not exceeded.

The renumbering is consistent with the panel action on Proposal 11-31.

AFFIRMATIVE: 15

(Log #4015)

11- 42 - (430-43): Reject
SUBMITTER: Christopher Pharo, Rep. IBEW
RECOMMENDATION: Delete the entire last sentence of 430-43 and replace with:
Article 430-43 Automatic Restarting. A motor overload device that can restart a motor automatically after overload tripping shall not be installed unless approved for use with the motor it protects. ~~A motor overload device that can restart a motor automatically after overload tripping shall not be installed if automatic restarting can result in injury to persons.~~ A motor overload device that can automatically reset after an overload trip shall not be able to restart the motor automatically upon reset. Manual means must be imposed in order to restart the motor.
SUBSTANTIATION: Motor starters with overloads capable of automatic reset are useful in some sectors of industry. One such example would be when the starter must be located in an area that is not easily accessible. If the motor were to trip the overloads, then personnel would not have to physically reset the overload section. My concern is that when the overload is reset automatically, the motor should not automatically restart. The motor should have to be restarted via the human factor.
What happens if the motor continuously resents automatically and resets automatically? The motor will surely burn out due to the accumulated heat from successive inrush currents. Herein lies the danger of a fire. Worse yet would be a situation when the electrician or operator is trying to figure out why the motor trips the overloads in the first place. The electrician or operator may begin adjusting the conveyor belt tensions or maybe the fanbelt tensions only to be startled when the motor overload section cools down enough to reset the overloads and in turn restart the motor automatically.
For all personnel involved, please take the time to discuss the ramifications with this dangerous practice.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed change is too restrictive. If accepted, it would prohibit automatic reset thermal protection in many applications, such as for submersable pump motors and hermetic refrigerant motor-compressors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
NAUGHTON: I disagree with the panel action. In many cases motors that automatically restart after automatically resetting go unnoticed for indefinite periods of time creating more of a hazard to equipment and for personnel.
Manual restarting after automatic resetting, as the submitter suggests will bring attention to the personnel in charge that a problem exists and repair may be needed, this would prevent any additional or increased hazard.

(Log #CP1105)

11- 42a - (430-51 and FPN No. 1 (New)): Accept
SUBMITTER: CMP 11
RECOMMENDATION: Make the following changes in the second paragraph:
1. Change "do not" to "shall not".
2. Delete "See Part K".
3. Add new FPN No. 1, to read as follows:
"FPN No. 1: For over 600 volts, nominal, see Part K."
4. Existing FPN to become FPN No. 2.

SUBSTANTIATION: The revision are intended to comply with the NEC Style Manual, 3.1, with respect to mandatory language and explanatory information.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #3454)

11- 43 - (430-52): Reject
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise Section 430-52 to read as follows:
430-52. Rating or Setting for Individual Motor Circuit.
(a) General. The motor branch-circuit short-circuit and ground-fault protective device shall comply with (b) and either (c) or (d), as applicable.
(b) All Motors. The motor branch-circuit short-circuit and ground-fault protective device shall be capable of carrying the starting current of the motor.
(c) Rating or Setting.
1. A protective device that has a rating or setting not exceeding the value calculated according to the values given in Table 430-52 shall be used.
Exception No. 1: Where the values for branch-circuit short-circuit and ground-fault protective devices determined by Table 430-52 do not correspond to the standard sizes or ratings of fuses, nonadjustable circuit breakers, thermal protective devices, or possible settings of adjustable circuit breakers, the next higher standard size, rating, or possible setting shall be permitted.
Exception No. 2: Where the rating specified in Table 430-52, as modified by Exception No. 1, is not sufficient for the starting current of the motor:
a. The rating of a nontime-delay fuse not exceeding 600 amperes or a time-delay Class CC fuse shall be permitted to be increased but shall in no case exceed 400 percent of the full-load current.
b. The rating of a time-delay (dual-element) fuse shall be permitted to be increased but shall in no case exceed 225 percent of the full-load current.
c. The rating of an inverse time circuit breaker shall be permitted to be increased but shall in no case exceed 400 percent for full-load currents of 100 amperes or less or 300 percent for full-load currents greater than 100 amperes.
d. The rating of a fuse of 601–6000 ampere classification shall be permitted to be increased but shall in no case exceed 300 percent of the full-load current.
FPN: See Appendix D, Example No. D8, and Figure 430-1.
2. Where maximum branch-circuit short-circuit and ground-fault protective device ratings are shown in the manufacturer's overload relay table for use with a motor controller or are otherwise marked on the equipment, they shall not be exceeded even if higher values are allowed as shown above.
3. An instantaneous trip circuit breaker shall be used only if adjustable and if part of a listed combination motor controller having coordinated motor overload and short-circuit and ground-fault protection in each conductor, and the setting is adjusted to no more than the value specified in Table 430-52.
FPN: For the purpose of this article, instantaneous-trip circuit breakers may include a damping means to accommodate a transient motor inrush current without nuisance tripping of the circuit breaker.
Exception No. 1: Where the setting specified in Table 430-52 is not sufficient for the starting current of the motor, the setting of an instantaneous trip circuit breaker shall be permitted to be increased but shall in no case exceed 1300 percent of the motor full-load current for other than Design E motors or Design B energy efficient motors and no more than 1700 percent of full-load motor current for Design E motors or Design B energy efficient motors. Trip settings above 800 percent for other than Design E motors or Design B energy efficient motors and above 1100 percent for Design E motors or Design B energy efficient motors shall be permitted where the need has been demonstrated by engineering evaluation. In such cases, it shall not be necessary to first apply an instantaneous-trip circuit breaker at 800 percent or 1100 percent.
FPN: For additional information on the requirements for a motor to be classified "energy efficient," see Motors and Generators, NEMA Standards Publication No. MG1-1993, Revision 1, Part 12.59.
Exception No. 2: Where the motor full-load current is 8 amperes or less, the setting of the instantaneous-trip circuit breaker with a continuous current rating of 15 amperes or less in a listed combination motor controller that provides coordinated motor branch-circuit overload and short-circuit and ground-fault protection shall be permitted to be increased to the value marked on the controller.
4. For a multispeed motor, a single short-circuit and ground-fault protective device shall be permitted for two or more windings of the motor, provided the rating of the protective device does not exceed the above applicable percentage of the nameplate rating of the smallest winding protected.
Exception: For a multispeed motor, a single short-circuit and ground-fault protective device shall be permitted to be used and sized according to the full-load current of the highest current winding, where all of the following conditions are met.
a. Each winding is equipped with individual overload protection sized according to its full-load current.
b. The branch-circuit conductors supplying each winding are sized according to the full-load current of the highest full-load current winding.
c. The controller for each winding has a horsepower rating not less than that required for the winding having the highest horsepower rating.
5. Suitable fuses shall be permitted in lieu of devices listed in Table 430-52 for power electronic devices in a solid state motor controller system provided that the marking for replacement fuses is provided adjacent to the fuses.

****Table 430-52. Maximum Rating or Setting of Motor Branch-Circuit Short-Circuit and Ground-Fault Protective Devices**

Type of Motor	Percentage of Full-Load Current			
	Nontime Delay Fuse	Duel Element (Time-Delay Fuse)[1]	Instantaneous Trip Breaker	Inverse Time Breaker[2]
Single-phase motors	300	175	800	250
AC polyphase motors other than wound-rotor				
Squirrel cage—				
Other than Design E	300	175	800	250
Design E	300	175	1100	250
Synchronous3	300	175	800	250
Wound rotor	150	150	800	150
Direct current (constant voltage)	150	150	250	150

Note: For certain exceptions to the values specified, see Sections 430-52 through 430-54.
[1]The values in the Nontime Delay Fuse column apply to Time-Delay Class CC fuses.
[2]The values given in the last column also cover the ratings of nonadjustable inverse time types of circuit breakers that may be modified as in Section 430-52.
[3]Synchronous motors of the low-torque, low-speed type (usually 450 rpm or lower), such as are used to drive reciprocating compressors, pumps, etc., that start unloaded, do not require a fuse rating or circuit-breaker setting in excess of 200 percent of full-load current.**

6. A listed self-protected combination controller shall be permitted in lieu of the devices specified in Table 430-52. Adjustable instantaneous-trip settings shall not exceed 1300 percent of full-load motor current for other than Design E motors or Design B energy efficient motors and not more than 1700 percent of full-load motor current for Design E motors or Design B energy efficient motors.

7. A motor short-circuit protector shall be permitted in lieu of devices listed in Table 430-52 if the motor short-circuit protector is part of a listed combination motor controller having coordinated motor overload protection and short-circuit and ground-fault protection in each conductor and it will open the circuit at currents exceeding 1300 percent of motor full-load current for other than Design E motors or Design B energy efficient motors and 1700 percent of motor full-load motor current for Design E motors or Design B energy efficient motors.

(d) Torque Motors. Torque motor branch circuits shall be protected at the motor nameplate current rating in accordance with Section 240-3(b).

430-53. Several Motors or Loads on One Branch Circuit. Two or more motors or one or more motors and other loads shall be permitted to be connected to the same branch circuit under conditions specified in (d) and in (a), (b), or (c).

(a) Not Over 1 Horsepower. Several motors, each not exceeding 1 hp in rating, shall be permitted on a nominal 120-volt branch circuit protected at not over 20 amperes or a branch circuit of 600 volts, nominal, or less, protected at not over 15 amperes, if all of the following conditions are met.

1. The full-load rating of each motor does not exceed 6 amperes.

2. The rating of the branch-circuit short-circuit and ground-fault protective device marked on any of the controllers is not exceeded.

3. Individual overload protection conforms to Section 430-32.

(b) If Smallest Rated Motor Protected. If the branch-circuit short-circuit and ground-fault protective device is selected not to exceed that allowed by Section 430-52 for the smallest rated motor, two or more motors or one or more motors and other load(s), with each motor having individual overload protection, shall be permitted to be connected to a branch circuit where it can be determined that the branch-circuit short-circuit and ground-fault protective device will not open under the most severe normal conditions of service that might be encountered.

(c) Other Group Installations. Two or more motors of any rating or one or more motors and other load(s), with each motor having individual overload protection, shall be permitted to be connected to one branch circuit where the motor controller(s) and overload device(s) are (1) installed as a listed factory assembly and the motor branch-circuit short-circuit and ground-fault protective device is either provided as part of the assembly or is specified by a marking on the assembly, or (2) the motor branch-circuit short-circuit and ground-fault protective device, the motor controller(s), and overload device(s) are field-installed as separate assemblies listed for such use and provided with manufacturers' instructions for use with each other, and (3) all of the following conditions are complied with.

1. Each motor overload device is listed for group installation with a specified maximum rating of fuse or inverse time circuit breaker, or both.

2. Each motor controller is listed for group installation with a specified maximum rating of fuse or circuit breaker, or both.

3. Each circuit breaker is one of the inverse time type and listed for group installation.

4. The branch circuit shall be protected by fuses or inverse time circuit breakers having a rating not exceeding that specified in Section 430-52 for the highest rated motor connected to the branch circuit plus an amount equal to the sum of the full-load current ratings of all other motors and the ratings of other loads connected to the circuit. Where this calculation results in a rating less than the ampacity of the supply conductors, it shall be permitted to increase the maximum rating of the fuses or circuit breaker to a value not exceeding that permitted by Section 240-3(b).

5. The branch-circuit fuses or inverse time circuit breakers are not larger than allowed by Section 430-40 for the overload relay protecting the smallest rated motor of the group.

FPN: See Section 110-10 for circuit impedance and other characteristics.

(d) Single Motor Taps. For group installations described above, the conductors of any tap supplying a single motor shall not be required to have an individual branch-circuit short-circuit and ground-fault protective device, provided they comply with either of the following.

1. No conductor to the motor shall have an ampacity less than that of the branch-circuit conductors.

2. No conductor to the motor shall have an ampacity less than one-third that of the branch-circuit conductors, with a minimum in accordance with Section 430-22; the conductors to the motor overload device being not more than 25 ft (7.62 m) long and being protected from physical damage.

430-54. Multimotor and Combination-Load Equipment. The rating of the branch-circuit short-circuit and ground-fault protective device for multimotor and combination-load equipment shall not exceed the rating marked on the equipment in accordance with Section 430-7(d).

430-55. Combined Overcurrent Protection. Motor branch-circuit short-circuit and ground-fault protection and motor overload protection shall be permitted to be combined in a single protective device where the rating or setting of the device provides the overload protection specified in Section 430-32.

430-56. Branch-Circuit Protective Devices — In Which Conductor. Branch-circuit protective devices shall comply with the provisions of Section 240-20.

430-57. Size of Fuseholder. Where fuses are used for motor branch-circuit short-circuit and ground-fault protection, the fuseholders shall not be of a smaller size than required to accommodate the fuses specified by Table 430-52.

Exception: Where fuses having time delay appropriate for the starting characteristics of the motor are used, it shall be permitted to use fuseholders sized to fit the fuses that are used.

430-58. Rating of Circuit Breaker. A circuit breaker for motor branch-circuit short-circuit and ground-fault protection shall have a current rating in accordance with Sections 430-52 and 430-110.

E. Motor Feeder Short-Circuit and Ground-Fault Protection

430-61. General. Part E specifies protective devices intended to protect feeder conductors supplying motors against overcurrents due to short circuits or grounds.

FPN: See Appendix D, Example No. D8.

430-62. Rating or Setting — Motor Load.

(a) Specific Load. A feeder supplying a specific fixed motor load(s) and consisting of conductor sizes based on Section 430-24 shall be provided with a protective device having a rating or setting not greater than the largest rating or setting of the branch-circuit short-circuit and ground-fault protective device for any motor supplied by the feeder [based on the maximum permitted value for the specific type of a protective device shown in Table 430-52, or Section 440-22(a) for hermetic refrigerant motor-compressors], plus the sum of the full-load currents of the other motors of the group.

Where the same rating or setting of the branch-circuit short-circuit and ground-fault protective device is used on two or more of the branch circuits supplied by the feeder, one of the protective devices shall be considered the largest for the above calculations.

Exception: Where one or more instantaneous trip circuit breakers or motor short-circuit protectors are used for motor branch-circuit short-circuit and ground-fault protection as permitted in Section 430-52(c), the procedure provided above for determining the maximum rating of the feeder protective device shall apply with the following provision. For the purpose of the calculation, each instantaneous trip circuit breaker or motor short-circuit protector shall be assumed to have a rating not exceeding the maximum percentage of motor full-load current permitted by Table 430-52 for the type of feeder protective device employed.

FPN: See Appendix D, Example No. D8.

(b) Other Installations. Where feeder conductors have an ampacity greater than required by Section 430-24, the rating or setting of the feeder overcurrent protective device shall be permitted to be based on the ampacity of the feeder conductors.

**Relocating and changing Table 430-152 to Code Section 430-52 and changing table to 430-52.

SUBSTANTIATION: 1. To put all percentages together, and under the same section.

2. Will make looking up percentage chart easier.

PANEL ACTION: Reject.

(Log #3288)

11- 45 - (430-53(c)(3)): Accept
Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
SUBMITTER: James T. Pauley, Square D Co.
RECOMMENDATION: Revise Section 430-53(c)(3) as follows:
3. Each circuit breaker shall be listed and be ~~is one~~ of the inverse time type. ~~and listed for group installation.~~
SUBSTANTIATION: This is a repeat proposal from the 1999 cycle requesting the same action. CMP 11 accepted the proposal but it failed to achieve the 2/3 necessary to change the Code. The proposal is brought back once again to provide CMP 11 with information relative to the negative comments.
The negative comments reflect a number of items that are inaccurate relative to HACR circuit breakers. The requirement in the NEC should state that the CB should be a listed device and be of inverse time type. The statement "listed for the purpose" is superfluous. UL 489, Section 6.7.1 states "Heating, air conditioning, and refrigeration (HACR) circuit breakers shall comply with the construction requirements in All Types, Section 6.1." Section 6.1 contains requirements of All Types of CB's. UL and industry recognized that there is no need to have a separate set of requirements for HACR circuit breakers, when every circuit breaker is evaluated to a performance and safety level and allows it to perform acceptably in group motor installations. The revision to note specifically that the CB must be listed will ensure that the breaker meets the safety and performance expectations for these installations.
By virtue of the code having the "listed for the purpose" statement, it requires an HACR marking on the breaker. Every circuit breaker designed and evaluated to UL 489 can have an HACR marking by the requirement in 6.7.1. The code requirement simply adds costs to the product (for the label) with no benefit for safety or the user.
The fact is that in group applications, both fuses and circuit breakers that meet their respective standards are acceptable in group installations without further evaluation.
The panel should not be distracted by the "red herring" of needing short circuit current ratings on utilization equipment (e.g. air-conditioners) and attempting to relate that non-issue to HACR (as indicated in some of the negative comments). Attempting to place a short-circuit rating on a piece of utilization equipment will have severe negative effects on the industry, the consumer and will negatively impact safety. Faults that occur in utilization equipment are not like faults on the distribution system. For instance, in an air-conditioner the fault may be a winding fault in the compressor. This type of internal fault is impedance limited. There is absolutely NO evidence to support any need to short circuit ratings on utilization equipment. Another argument is that a fault is created by a maintenance technician in a piece of utilization equipment while doing service work. This is a dangerous argument will result in an assumption that some "rating" on the equipment will protect a worker who is exposed to energized parts and potential arcing faults. Working on any piece of energized electrical equipment has a hazard associated with it. If a fault is created by a technician in a utilization equipment such as an air-conditioner, it will be an arcing fault and the OCP will provide little to no "protection" for the worker under those conditions. Proper work procedures must be followed.
Also, references in the negative voting to other UL standards that mention HACR are only serving to confuse the issue. These standards have not been updated to reflect the changes in UL 489 and given and any listed breaker could also carry a HACR label, makes referencing these standards as objections to this proposal somewhat meaningless.
I urge CMP 11 to finally accept this proposal .
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 5
EXPLANATION OF NEGATIVE:
BUNCH: Changing the requirement for the circuit breaker to be listed for group installation to just a listed breaker could lead to inconsistent applications since not all breakers are HACR. Further standardization of these requirements by recognized testing labs might address this, but is not acceptable at this time.
GARVEY: The submitter should expand on the statement: "The fact is that in group application, both fuses and circuit breakers that meet their respective standards are acceptable in group applications without further evaluation". This statement seems to conflict with the UL White Book, Motor Controllers (NJOT) and testimony presented to the panel.
NAUGHTON: Substantiation has not been provided that shows UL or industry stating that there is not a need for the requirements for HACR circuit breakers as described in the submitter's substantiation. Removal of "and listed for group installations" could result in a potential hazard if used in other than group installations. Further study is needed.
SAPORITA: I must vote negative on the panel action. This is a safety issue. The proposal and substantiation incorrectly assume that all group motor installations are for heating/air conditioning/refrigeration (HACR) applications. 430-53(c) also applies to (1) other listed factory assemblies and to (2) field assembled equipment. As written, this proposal would remove the requirements for the circuit breaker's "group motor listing" for these two other applications described above. No substantiation has been provided to show that these other "systems" will be safe and free from hazards without the currently required testing and listing.
While the code permits circuit breakers to be used interchangeabily if LISTED for group installation, manufacturers have chosen not to submit their products for listing under this special application. Most likely because circuit breakers of the same rating from different manufacturers have significantly different energy let-through characteristics. This can result in damage to the controller and associated overload relays. Note the FPN reference to 110-10 at the end of 430-53(c).
SAUNDERS: The submitter's substantiation incorrectly assumes that all group motor installations are HACR (Heating Air Conditioning/Refrigeration) applications. An inverse time circuit breaker that is marked "HACR" is acceptable for group motor installations in HACR applications, but not automatically acceptable for other applications such as field assembled panels.
COMMENT ON AFFIRMATIVE:
WRIGHT: The UL listing requirements for circuit breakers listed for group installations are identical to those for circuit breakers not listed for group installations. The only reason the markings are still included in UL 489 is that the requirement for marking is still included in the NEC. Removing the marking from the NEC would permit UL to remove the marking requirements from UL 489.

(Log #3093)

11- 46 - (430-53(d)): Accept in Principle
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Revise section 430-53(d) and add a new item 3 to read as follows:
(d) Single Motor Taps: For group installations...provided they comply with ~~either~~ one of the following:
(3) Conductors from the branch circuit short-circuit and ground-fault protective device to a listed manual motor controller additionally marked "Suitable for Tap Conductor Protection in Group Installations" shall be permitted to have an ampacity rating of not less than 1/10 of the rating or setting of the branch circuit

protective device. The conductors from the controller to the motor shall have an ampacity in accordance with 430-22. The conductors from the branch circuit protective device to the controller shall be suitably protected from physical damage or enclosed by either an enclosed controller or by a raceway, and be not more than 10 ft. (3.05m) in length.

SUBSTANTIATION: The listed manual motor controller additionally marked "Suitable for Tap Conductor Protection in Group Installations" is a listed motor controller provided with an instantaneous trip mechanism, with motor overload protection and motor disconnect functions. It would be listed for group applications under the proposed Section 430-53(d)(3). Underwriters Laboratories Inc. is developing a special category of UL 508 to recognize this unit's functionality. It has the line-side electrical spacing in accordance with UL 508 and is limited to applications on the load-side of the motor branch-circuit protective device. The listed manual motor controller additionally "Suitable for Tap Conductor Protection in Group Installations" provides supplemental protection for the wires in this group application.

During the lase code cycle the panel was reluctant to permit any exception to the wire sizing allowed under 430-53(d) for manual motor controllers with an instantaneous trip function. The reason was that these controllers had not been subjected to testing to determine that they provide proper protection of the motor wires. Devices tested and listed as listed manual motor controllers additionally marked "Suitable for Tap Conductor Protection in Group Installations" will provide this protection.

The proposed test program is a follows:

1. Standard Fault Short-Circuit Test 10kA - no welding allowed
   a) Single-phase, "O-CO" each pole
   b) Three-phase, "O"
      1.1 Followed by trip-out, 120 percent of specified trip current
      1.2 Dieelectric Test
   c) 2x test voltage, not less than 900V
2. High Capacity Short Circuit Tests on the Controller Without Contactors
   a) "O" and "CO" tests using the same controller followed by trip-out and dieelectric tests
3. UL 508 - Motor Disconnecting Means Evaluation. These requirements qualify the device under Section 430-109A(6)
   a) Temperature
   b) Overload/endurance
   c) Three-phase short-circuit (covered by 1.b)
   d) Dielectric withstant test
4. UL 508 - Overload Relay Tests
5. Short-Circuit Tests on Magnetic Controllers used with listed manual motor controllers additionally marked "Suitable for Tap Conductor Protection in Group Installations."
   a) Standard fault short-circuit current tests.
   b) High capacity short-circuit current tests.

A UL Bulletin covering this test procedure is forthcoming. It should be noted. PANEL ACTION: Accept in Principle. Accept the recommended change in the first line of (d). Revise (3) in the proposal to read as follows:

"(3) Conductors from the branch-circuit short-circuit and ground-fault protective device to a listed manual motor controller additionally marked 'Suitable for Tap Conductor Protection in Group Installations' shall be permitted to have an ampacity not less than 1/10 the rating or setting of the branch-circuit short-circuit and ground-fault protective device. The conductors from the controller to the motor shall have an ampacity in accordance with 430-22. The conductors from the branch-circuit short-circuit and ground-fault protective device shall (1) be suitably protected from physical damage and enclosed by either an enclosed controller or by a raceway, and shall be not more than 3 m (10 ft) long, or (2) shall have an ampacity in accordance with 430-22."

PANEL STATEMENT: Revisions are editorial and to clarify that full size conductors are still permitted in the tap to the controller without a length limit.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NEGATIVE: 3

EXPLANATION OF NEGATIVE:

NAUGHTON: The submitter does not show reasoning for this change and there are concerns with UL 508 in respect to size, spacing and availability.

SAPORITA: I vote negative on the panel action because this proposal removes a degree of safety.

The proposal attempts to copy the requirements of 430-28, but with one big difference. 430-28 requires that the feeder tap terminate in a branch-circuit protective device. This proposal would substitute a manual motor protector for the branch-circuit protective device.

Manual motor protectors are not branch-circuit protective devices. They do not have the larger spacings required of branch-circuit protective devices. The larger spacings are necessary for different degrees of workmanship and for the effects of aging. These larger spacings provide the extra margin of safety for personnel installing, maintaining, and troubleshooting the motor circuit.

Finally, this proposal should be rejected because the standard does not exist to list these Manual Motor Protectors as "Suitable for Tap Conductor Protection in Group Installations", and as a result, the devices with this marking are not available.

SAUNDERS: The submitter appears to be modifying the intent of Section 430-28 (1) Feeder Taps to include devices other than branch circuit protective devices. The device referred to in the proposal to modify Section 430-53(d) is a "manual motor controller additionally marked "Suitable for Tap Conductor Protection in Group Installations"". We understand that this device consists of an instantaneous only circuit breaker (MCP) and an overload element, and that it does not meet Branch Circuit, Short Circuit and Ground Fault Protective Device Ratings or Standards. This appears to be a new product that may not be commercially available in this country and there does not appear to be any current US consensus standards that address this equipment. A "manual motor controller additionally marked "Suitable for Tap Conductor Protection in Group Installations"" to be used in this application should meet the Branch Circuit Protective device ratings as referenced in 430-28(1). Short Circuit and Ground Fault device protective ratings and standards should be required for this application and as such would not require a modification to the code. Allowing devices that do not meet the Branch Circuit Protective Device Short Circuit and Ground Fault protection standards or ratings as required in 430-28 reduces safety.

COMMENT ON AFFIRMATIVE:

RASMUSSEN: The proposal should be accepted. However, item (2) in the last sentence of the panel action is not consistent with the panel statement since 430-22 does not address the conductor ampacity relative to the rating of the branch-circuit short-circuit and ground-fault protective device. Item (2) in the last sentence of the panel action should be revised to read "(2) shall have an ampacity in accordance with 430-22 and shall have an ampacity not less than that of the branch circuit conductors." Item (2) as written in the panel action does not require "full size" conductors relative to the size of the branch-circuit short-circuit and ground-fault protective device. The intent of the proposal is to permit use of a new class of manual motor controller for motor tap conductor protection in the same manner that 430-28 permits branch-circuit protective devices to protect feeder taps. The requirements for manual motor controllers Listed and marked "Suitable for Tap Conductor Protection in Group Installations" will provide the same level of protection for motor taps as is currently required for feeder taps.

WRIGHT: The test program for these devices is the same as the test program for molded case circuit breakers. The provision for use as tap protection is the same concept as in 430-28. UL has indicated that a bulletin to industry giving the listing requirements will be published by the third quarter of 2000.

(Log #900)

11- 47 - (430-57, Exception): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Delete exception.

SUBSTANTIATION: Since the rule doesn't require fuseholders to accommodate the largest fuse ratings of Table 430-152, which are maximums but don't prohibit smaller ratings, this is not an exception to anything in the rule. The table already indicates time-delay fuse ratings may be smaller than other types.

PANEL ACTION: Reject.

PANEL STATEMENT: The exception is needed to facilitate the use of time delay (dual-element) fuses at less than the maximum sizes permitted in 430-52.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

(Log #3365)

11- 48 - (430-62): Accept
SUBMITTER: Paul Dobrowsky, Holley, NY
RECOMMENDATION: Revise to read as follows:
A feeder supplying a specific fixed motor load(s) and consisting of conductor sizes based on Section 430-24 shall be provided with a protective device having a rating or setting not greater than the largest rating or setting of the branch-circuit short-circuit and ground-fault protective device for any motor supplied by the feeder [based on the maximum permitted value for the specific type of a protective device in accordance with Section 430-52 and ~~shown in~~ Table 430-152, or Section 440-22(a) for hermetic refrigerant motor-compressors],.plus the sum of the full-load currents of the other motors of the group.
SUBSTANTIATION: The rating determined for the branch circuit is already determined by rounding up of the overcurrent device, in accordance with Section 430-52. The existing text within the brackets directly conflicts with text in the first sentence that requires you to use the sizing of the branch-circuit short-circuit and ground-fault protective device, that has already been sized in accordance with Section 430-52(c), Exception No. 1 or 2. This clears up a conflict in calculating the feeder overcurrent protective device size.
PANEL ACTION: Accept.

(Log #32)

11- 49 - (430-62(a) Exception No. 2 (New)): Accept
NOTE: The following proposal consists of Comment 11-46 on Proposal 11-63 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 11-63 was:
Revise Section 430-62(a) Specific Load as follows:
"A feeder supplying a specific fixed motor load(s) and consisting of conductor sizes based on Section 430-24 shall be provided with a protective device having a rating or setting not greater than the largest rating or setting of the branch-circuit short-circuit and ground-fault protective device for any motor supplied by the feeder ~~of the group~~ [based on the maximum permitted value for the specific type of a protective device shown in Table 430-152, or Section 440-22(a) for hermetic refrigerant motor-compressors], plus the sum of the full-load currents of the other motors of the group.
Where the same rating or setting of the branch-circuit short-circuit and ground-fault protective device is used on two or more of the branch circuits supplied by the feeder ~~of the group~~, one of the protective devices shall be considered the largest for the above calculations."
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Accept in Principle revised as follows:
Add: Exception No. 2: Where the feeder overcurrent protective device also provides overcurrent protection for a motor control center the provisions of Section 430-94 shall apply.
SUBSTANTIATION: Where the feeder protective device also provides overcurrent protection for a motor control center, the provisions of this section and Section 430-94 may conflict.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #902)

11- 51 - (430-63): Accept
Note: The Technical Correlating Committee directs the Panel to revise the sentence structure for clarity. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Rating or Setting-Power and Light Loads. Where a feeder or service supplies a motor load and, in addition a lighting or a lighting and appliance load, the feeder and service protective device shall ~~be permitted to~~ have a rating or setting sufficient to carry the lighting or lighting and appliance load as determined in accordance with Articles 210 and 220, plus for a single motor, the rating permitted by Section 430-52, or a single motor comprised of a hermetic refrigerant motor-compressor, the rating permitted by Section 440-22, and for two or more motors, the rating permitted by Section 430-62.
Exception: Where the feeder or service overcurrent protective device provides the overcurrent protection for a motor control center the provisions of Section 430-94 shall apply.
SUBSTANTIATION: Section 230-90(a), Exception No. 1 indicates this section applies to service overcurrent protective devices also and that should be noted in this section. Sections 210-20(a); 210-11(c); 384-16(d) have mandatory requirements for overcurrent device ratings and this section should correlate with a similar mandatory rating sufficient to carry the load.
Section 440-22 covers overcurrent protective ratings for hermetic refrigerant motor-compressors and is properly referenced in Section 430-62(a).
The proposed exception would correlate with Section 430-94 and avoid an apparent conflict.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #903)

11- 53 - (430-74(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) General. Motor control circuits shall be so arranged that they will be disconnected from all ungrounded ~~sources of~~ supply source conductors when the disconnecting means is in the open position.
(remainder unchanged).
SUBSTANTIATION: Editorial. Where a 120-volt motor is controlled by a 120-volt coil-operated magnetic starter, or a 480-volt motor is controlled by a 120-volt coil-operated magnetic starter supplied from an external 120-volt source, present wording infers the grounded 120-volt circuit conductor must be disconnected, since it is connected to the source of supply. Disconnecting means per Article 100 is indicated as disconnecting conductors of a circuit which includes grounded conductors. This is permitted by Section

430-105. While no one is doing this, based on the understanding of intent, such understanding should not replace concise wording.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal would permit a 3-phase delta corner grounded leg to remain energized with disconnecting means open.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #1929)

11- 54 - (430-81(d) (New)): Reject
SUBMITTER: W. Creighton Schwan, Hayward, CA
RECOMMENDATION: Add new text to read as follows:
(d) Automatic Restarting. A motor that can restart automatically after shutdown shall not be installed if its automatic restarting can result in injury to persons.
SUBSTANTIATION: The Panel rejected a comment which would have returned to the 1996 wording. (See Comments 11-22 and 11-23 on Proposal 11-45, on page 525 of the 1998 ROC) on the basis of it being in the wrong place in the code, even though it has been in that place from the 1956 to 1996 codes, and as Section 4333 in the 1947 through 1953 codes. Is this a better location? If not, you move it.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is too general in its application to be practical.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
COMMENT ON AFFIRMATIVE:
SAUNDERS: Many electrical systems and equipment "require" an "automatic restart" after a power outage condition (i.e. sump pump, exhaust fan, projection heater). The proposal as submitted could be interpreted as not permitting installations of the type.

(Log #4453)

11- 55 - (430-81(d) (New)): Reject
SUBMITTER: David E. Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
RECOMMENDATION: Add new: "(d) Automatic Restarting. A motor that can restart automatically after shutdown shall not be installed if its automatic restarting can result in injury."
SUBSTANTIATION: A comment submitted in the last Code cycle would have returned this section to its 1996 wording. The Panel rejected this, asserting that rightfully it belonged elsewhere in the Code, notwithstanding the fact that it has been located here in the versions of the Code from 1956 through 1996, following its presence in the Code from 1947 through 1953 as Section 4333. See Comments 11-22 and 11-23 on Proposal 11-45, located on page 525 of the '98 ROC. If this proposal does not sit quite right, perhaps you can accept it in principle, or refer it to the Correlating Committee.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is too general in its application to be practical.

COMMENT ON AFFIRMATIVE:
SAUNDERS: See my Comment on Affirmative on Proposal 11-54.

(Log #4228)

11- 56 - (430-83(a)(1)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
Controllers, other than inverse time circuit breakers and molded case switches, shall have horsepower ratings at the application voltage not lower than the horsepower rating of the motor. A controller for a Design E motor or a Design B energy efficient motor rated more than 2 hp shall (1) be marked as rated for use with a Design E motor or a Design B energy efficient motor, or (2) have a horsepower rating not less than 1.4 times the rating of a motor rated 3 through 100 hp, or not less than 1.3 times the rating of a motor rated over 100 hp.
SUBSTANTIATION: The added language correlates with the CMP 11 decision to treat Design B energy efficient motors the same as Design E motors for the purposes of setting instantaneous trip circuit breaker parameters in the last code cycle. That decision was substantiated on the basis of locked-rotor inrush currents equivalent to Design E motors. The provisions in this section for Design E motors (see A95 Proposal 11-69) used identical substantiation, having to do with motor currents under locked-rotor conditions. Since identical substantiation was used in the 1996 code cycle to change both this section and Section 430-52(c)(3) Exception No. 1, it doesn't seem technically consistent to now again change the rules for one section and not the other.
PANEL ACTION: Reject.
PANEL STATEMENT:
The exception in 430-52 allows the higher setting of instantaneous trip for Design B energy efficient motors only if needed to start the motor. A requirement for all motor controllers for Design B energy efficient motors to be marked, or, perhaps, have a larger horsepower rating is not justified. The submitter has presented no evidence of problems.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
COMMENT ON AFFIRMATIVE:
HAMER: See my Comment on Affirmative on 11-12.
WRIGHT: See the table of Locked-rotor currents for Design B motors. There is no separate table for energy efficient Design B motor.

MAXIMUM LOCKED-ROTOR CURRENT FOR 60-Hz DESIGN B, C, AND D MOTORS AT 230 VOLTS

Hp	Locked-Rotor Current, Amperes*	Design Letters
1/2	20	B, D
3/4	25	B,D
1	30	B, C, D
1 –1/2	40	B, C, D
2	50	B, C, D
3	64	B, C, D
5	92	B, C, D
7 – 1/2	127	B, C, D
10	152	B, C, D
15	232	B, C, D
20	290	B, C, D
25	365	B, C, D
30	435	B, C, D
40	580	B, C, D
50	725	B, C, D
60	870	B, C, D
75	1085	B, C, D,
100	1450	B, C, D
125	1815	B, C, D
150	2170	B, C, D
200	2900	B, C

*The locked-rotor current of motors designed for voltages other than 230 volts shall be inversely proportional to the voltages.

(Log #3879)

11- 57 - (430-83(a)(2)): Reject
SUBMITTER: J. Philip Simmons, Simmons Electrical Services
RECOMMENDATION: Revise text as follows:
2. A branch-circuit inverse time circuit breaker rated in amperes not less than the full-load current of the motor shall be permitted as a controller for all motors, including Design E. Where this circuit breaker is also used for overload protection, it shall conform to the appropriate provisions of this article governing overload protection.
SUBSTANTIATION: It seems this subsection is incomplete without the added wording. Obviously, a circuit breaker needs to be rated for the full-load current of the motor to be suitable for use as a controller for the motor.
PANEL ACTION: Reject.

PANEL STATEMENT: The ampere rating of the circuit breaker is required to be at least 115 percent of the full-load current rating of the motor, in accordance with 430-110(a).

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #CP1113)

11- 57a - (430-83(a)(3) (New)): Accept
SUBMITTER: CMP 11
RECOMMENDATION: Add new 430-83(a)(3), to read as follows:
"(3) Molded Case Switch. A molded case switch rated in amperes shall be permitted as a controller for all motors, including Design E."
SUBSTANTIATION: Molded case switches are essentially molded case circuit breakers without overload trip mechanisms, and are rated in amperes but not in horsepower. 430-83(a)(1) requires that, for use with Design E motors, they be so identified or be effectively derated. This proposal is to provide for use of molded case switches as controllers in a manner similar to 430-83(a)(2) for circuit breakers.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #910)

11- 58 - (430-90, Exception): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete exception.
SUBSTANTIATION: Editorial. Part C specifies maximum ratings of fuses for overload protection, i.e., 115 or 125 percent, but does not preclude lower values. Where fuses are used for this application they will normally be time-delay types to allow for motor starting. If a lower than maximum rating is used which allows a smaller fuseholder, this is already covered in the rule.
PANEL ACTION: Reject.
PANEL STATEMENT: The exception is needed to facilitate the use of time delay (dual-element) fuses at less than the maximum sizes permitted in 430-52.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #3768)

11- 58a - (430-91): Reject
SUBMITTER: James L. Boyer, Firetrol, Inc.
RECOMMENDATION: Reword 430.91. Delete the existing first sentence and replace with new first sentence to read:
430.91. Motor Controller Enclosure Types. An enclosure type number shall be marked on the motor controller enclosure. ~~Table 430-91 provides a basis for selecting enclosures for use in specific locations, other than hazardous (classified) locations.~~ The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings. These internal conditions shall require special consideration by the installer and user.
FPN: See Chapter 9, Table ?, Enclosure Type Number Designations.
~~Table 430-91. Motor Controller Enclosure Selection.~~
Note: Delete Table 430-91 from Section 430, restructure and relocate to Chapter 9 as follows:
SUBSTANTIATION: Type designations are used on enclosures for other than motor controllers, such as switch and circuit breaker enclosures and could be used on transformer, panelboard, switchgear, and other enclosures. They are also used on devices, such as pilot lights, pushbuttons and could be used on fittings, operators, junction boxes, lighting enclosures, etc. By relocating Table 430-91 to Chapter 9, other Sections of the Code refer to it without referencing a section dedicated to motors and controllers.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel is not aware of any other sections in the Code that refer to the NEMA enclosure type designations. The panel does not have the authority to relocate the Table to Chapter 9.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #2974)

11- 59 - (Table 430-91): Accept
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Delete the word "Occasional" (two places) from Table 430-91 before prolong submersion under both the outdoor use and indoor use.
SUBSTANTIATION: Even though Table 2-1 of NEMA Standard 250 includes the word "Occasional" before prolong submersion, the definition in NEMA 250 for an Enclosure Type 6P does not. Does occasional prolonged submersion indicate an application where an enclosure is submerged once a year for 364 days? Removing the word "Occasional" will clarify the table.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #2975)

11- 60 - (Table 430-91): Accept in Principle
SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions
RECOMMENDATION: Add Enclosure Types 3X, 3RX, and 3SX to Table 430-91. Motor Controller Enclosure Selection for Outdoor Use. The new Enclosures Types shall be indicated as follows:

	3X	3RX	3SX
Incidental contact with the enclosed equipment	X	X	X
Rain, snow, and sleet	X	X	X
Sleet 2	—	—	X
Windblown dust	X	—	X
Hosedown	—	—	—
Corrosive agents	X	X	X
Occasional temporary submersion	—	—	—
Occasional prolonged submersion	—	—	—

SUBSTANTIATION: These enclosures are the same as the 3, 3R, and 3S with the exception that they have been evaluated for protection against corrosive agents. Enclosures without this degree of protection will corrode due to condensation and weathering. Enclosure without protection are corroding and leaving conductors exposed. This is a safety issue and is more prevalent in the south where higher humidity exists.
NEMA Standard 250 has adopted these designators and will publish them in the next publication of this standard.
PANEL ACTION: Accept in Principle.
Accept the proposal as modified by deleting "occasional" before "prolonged submersion" in accordance with the action on Proposal 11-59.
PANEL STATEMENT: The Panel action should meet the submitter's intent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:

(Log #3094)

11- 61 - (430-94): Accept in Principle
Note: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual relative to referencing an entire article. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Revise 430-94 as follows:
Motor control centers shall be provided with overcurrent protection in accordance with Article 240 ~~based on~~ with a maximum rating not to exceed the rating of the common power bus. This...
SUBSTANTIATION: This section has been improperly interpreted to mean that the overcurrent device must match exactly with the rating of the power bus. The added wording will clarify that it is permissible and sometimes desirable to protect the MCC with a reduced rating for the main overcurrent protection.
PANEL ACTION: Accept in Principle.
End the first sentence after "Article 240" and add a new second sentence as follows:
"The ampere rating or setting of the overcurrent protective device shall not exceed the rating of the common power bus."
(Remainder of paragraph unchanged.)
PANEL STATEMENT: The revised wording meets the submitter's intent and is less subject to misunderstanding than the proposed wording.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #904)

11- 62 - (430-95, Exception (New)): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add after second paragraph exception to read as follows:
Exception: Where used as service equipment on high-impedence grounded neutral systems in accordance with Section 250-27, a main bonding jumper shall not be required.

SUBSTANTIATION: The proposal is essentially the same as the exception for Section 384-3(c). Since this article covers motor control centers, one may conclude Section 384-3(c) does not apply. Though most impedance grounded systems may not be directly supplied by service conductors, they should be covered where used as service equipment.
PANEL ACTION: Accept in Principle.
After the second paragraph, add an exception to read as follows:
" Exception: High-impedance grounded neutral systems shall be permitted to be connected as provided in 250-36."
PANEL STATEMENT: The panel action corrects the reference to that in the 1999 NEC, and is consistent with the language in 250-28, Exception No. 2. The panel action should meet the submitter's intent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:

11- 64 - (430-97(a), Exception and (f) (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise exception for (a) to read as follows:

Exception: Conductors shall be permitted to ~~travel~~ be run horizontally through vertical sections where such conductors are isolated from the busbars by a barrier or factory-installed busbar insulation.

Add:

(f) High-Leg Marking. Where a motor-control center is supplied by a 4-wire 3-phase delta-connected system, where the midpoint of one phase is grounded, that phase busbar or conductor having the highest voltage to ground shall be durably and permanently marked by an outer finish that is orange in color.

SUBSTANTIATION: Factory-installed busbar insulation can provide satisfactory separation and negate the need for field-installed barriers and raceways where conductors enter the "wrong" section.

Though switchboads and motor-control centers may be similar in construction, it appears from this article and Article 384 they are construed as different equipment. If the marking for switchboards and panelboards is necessary for safety, such marking is also warranted for motor-control centers.
PANEL ACTION: Reject.
PANEL STATEMENT: A factory-installed insulated busbar does not provide the same level of safety as a barrier. The submitter has not provided documentation of problems in the field with respect to the recommended marking of motor-control centers.

(Log #4229)

11- 67 - (430-102(a) Exception No. 2): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc
RECOMMENDATION: Revise as follows:

Exception No. 2: A single disconnecting means shall be permitted for a group of coordinated controllers that drive several parts of a single machine or piece of apparatus. The disconnecting means shall be located in sight from the controllers and the controllers shall be located in sight from the machine or apparatus.

SUBSTANTIATION: The present wording requires the disconnect and the controllers to be in sight of the machine. There are many layouts on large machines where that condition could be met with the disconnect completely out of sight of the controllers. The 1996 NEC precluded this possibility by requiring adjacent locations; the exception only gave relief to the individual disconnect requirement. Although the increased flexibility inherent in dropping the word "adjacent" is generally justified, the idea that the disconnect could be entirely out of sight of the controllers it disconnects is a safety hazard and not substantiated. This proposal preserves the intended flexibility in the 1999 change, while correcting the problem.
PANEL ACTION: Accept in Principle.
Revise as follows:

"Exception No. 2: A single disconnecting means shall be permitted for a group of coordinated controllers that drive several parts of a single machine or piece of apparatus. The disconnecting means shall be located in sight from the controllers and both the disconnecting means and the controllers shall be located in sight from the machine or apparatus."

PANEL STATEMENT: As proposed the disconnecting means would not be required to be in sight of the machine or apparatus. The panel action should meet the submitters intent.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COX: The submitter provides no substantiation of any problems caused by the present wording.

(Log #4074)

11- 68 - (430-102(b)): Accept in Principle
SUBMITTER: Michael I. Callanan, IBEW
RECOMMENDATION: Add a second sentence to read:

"The disconnecting means required in accordance with 430-102(a) may also serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location."

Remove the exception in 430-102(b).
SUBSTANTIATION: Current wording allows for the motor disconnecting means to be an unlimited distance from the motor as long as the disconnecting means for the controller can be locked in the open position. There are two serious safety issues. When the distance is excessive, workers attempt to work the equipment "hot," rather than walk the distance four times. The other issue concerns the worker who gets "hung up" and the disconnecting means is not within sight. This proposal will reduce accidental injuries and death, at very minor incremental cost to the owner.
PANEL ACTION: Accept in Principle.
Revise Section 430-102(b) to read as follows:

"(b) Motor. A disconnecting means shall be located in sight from the motor location and the driven machinery location. The disconnecting means required in accordance with 430-102(a) shall be permitted to serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location.

Exception: The disconnecting means shall not be required to be in sight of the motor if such a location of the disconnecting means is impracticable or introduces additional or increased hazards to persons or property and the disconnecting means is individually capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be

permanently installed on or at the switch or circuit breaker used as the disconnecting means.

FPN: Some examples of increased or additional hazards include, but are not limited to; motors rated in excess of 100 hp, multi-motor equipment, submersible motors, motors associated with variable frequency drives and motors located in hazardous (classified) locations."

PANEL STATEMENT: The panel recognizes that where practicable the motor disconnecting means shall be located within sight from the motor or driven machinery location. In some installations however, the placement of the disconnecting means at a location in sight of the motor could result in an installation which introduces a greater or increased hazard. The panel has revised the exception to limit the application of the exception so that the motor disconnect is permitted to be located remotely only if it would result in an additional or increased hazard or it is impracticable to locate it within sight of the motor. A FPN was added to clarify examples of some of the types of increased or additional hazards.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 4

EXPLANATION OF NEGATIVE:

COX: "Practicable" is synonymous with "practical". The style manual (3.2.1) lists "practical" as a term that is possibly unenforceable and vague and states that the NEC shall not contain requirements that are unenforceable and vague. Every local disconnect installation could be argued as practicable or impracticable depending on the point of view.

It could also be argued that the addition of a local disconnect increases the hazards to persons or property for every installation. The local disconnect adds one more electrical device into the motor circuit. That device can fail through abuse, can be wired incorrectly, can fault to ground, can short circuit and can be operated by unqualified persons. This is the only location in the electrical system that unqualified persons can be easily exposed to live circuits, even with the disconnecting means in the off position.

The panel recognizes, in the exception, that local disconnects may introduce additional or increased hazards for certain installations and shall not be required for those installations. If those installations are considered "safe" without local disconnects, then the only logic remaining for requiring local disconnects for other installations would have to be for convenience. NEC 90-1(b) points out that compliance with the code will result in installations that are free from hazards, but are not necessarily efficient, convenient, etc. The convenience required, by adoption of this proposal, is not necessary for safety and would be costly to implement. Additional wiring and conduit would be needed for each motor.

The original substantiation discussed working the equipment "hot" when the distance to the disconnecting device is excessive. When working on motors, the easiest place to get at the wiring is the controller for checking for motor problems, not at the motor itself. Substantiation also mentions those getting "hung up". The local start-stop or E-stop is the proper safety shutdown for a motor; not the disconnect. Disconnects are not designed to be used as controllers.

Enforced OSHA lockout/tagout and NFPA 70E regulations referenced in the existing Fine Print Note are the means for safely installing and maintaining all electrical equipment, including motors. The chemical Industry has hundreds of thousands of motor installations around the world and has achieved an excellent safety record through utilization of lockout/tagout procedures as required by OSHA.

HAMER: When the Lockout/Tagout requirements within the NFPA 70E and OSHA are followed, additional disconnect safeguards are not required for personnel safety. This information is highlighted by the existing FPN. Additional disconnects add complexity without safety improvement benefits. The petroleum industry has a record of safe operation using the current National Electrical Code requirements in combination with the Lockout/Tagout requirements of NFPA 70E.

SAUNDERS:

- Insufficient substantiation of a problem relative to the lack of use of a disconnect in sight of the motor for all applications was not provided;
- The use of the term "impracticable" in the exception is not enforceable. The present text is enforceable and well understood as it exists;
- The present regulations for lockout (i.e. OSHA 1910.147 and NFPA 70E) provide safeguards for the motor installation and applications covered by this article where the regulations and practices are followed and enforced.

The Panel Action could consider a proposed dealing with this issue where "conditions of maintenance and supervision" address the concern where requiring an additional lockable disconnect in sight from the motor or motor driven machinery is not required. This would address the concerns of the companies where OSHA 1910.147 and NFPA 70E lockout tagout regulations and procedures are followed and strictly enforced. In locations where these conditions are not met, the added disconnecting device would be required and help ensure lockout of equipment as required by OSHA 1910.147 and NFPA 70E.

THOMAS: The existing text is adequate to provide a safe installation.

COMMENT ON AFFIRMATIVE:

NAUGHTON: This proposal allows personnel the satisfaction of visually seeing the locked out disconnecting means while the repair or maintenance is being performed, which permits for a safe job as well as reducing the chance of a potential hazardous situation.

SAPORITA: I vote affirmative with three comments: (1) We did not discuss the existing FPN at the end of 430-102(b) and as such it needs to be made clear that it should remain, probably as "FPN No. 2" while labeling the new FPN as "FPN No. 1." (2) In the first sentence of the new exception, the phrase ", required in accordance with 430-102(a)," should be added after the third "disconnecting means" and before "is individually capable...". This added phrase clarifies which disconnecting means "is individually capable of being locked in the open position." (3) While it is difficult to list all of the situations that may introduce "additional or increased hazards" the examples in the FPN would better serve the design engineering community if they were part of the specific text of the exception.

(Log #2926)

11- 69 - (430-102(b), Exception): Accept in Principle

SUBMITTER: Frank Pologruto, Rep. IBEW L.U. 98

RECOMMENDATION: Delete the Exception in Section 430-102(b).

SUBSTANTIATION: On many jobs that I have worked on, disconnect switches are not within sight of the motors to be serviced, leaves many electricians as well as myself with an uncomfortable feeling. Some buildings have motor control centers that are capable of being locked out. However, how do you lock out a circuit breaker that is not capable of being locked out? This was true on one particular job that we serviced.

As electricians we look at this exception as being questionable as to who has the authority to lock as well as unlock the disconnect switch. There is a very good possibility that a disconnect switch can be unlocked and energized when a maintenance personnel is asked to turn on a specific exhaust fan because of odors they want to exhaust out of a room. This has happened to one of our electricians and fortunately he was warned just prior to the lock being cut off and the fan being energized. While this may be a rare incident, it could have been a deadly one!

The only sure way that personnel is in control of the switch, is to have the disconnect located within sight of the motor!

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The panel action on Proposal 11-68 should meet the submitter's intent.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 4

EXPLANATION OF NEGATIVE:

COX: "Practicable" is synonymous with "practical". The style manual (3.2.1) lists "practical" as a term that is possibly unenforceable and vague and states that the NEC shall not contain requirements that are unenforceable and vague. Every local disconnect installation could be argued as practicable or impracticable depending on the point of view.

It could also be argued that the addition of a local disconnect increases the hazards to persons or property for every installation. The local disconnect adds one more electrical device into the motor circuit. That device can fail through abuse, can be wired incorrectly, can fault to ground, can short circuit and can be operated by unqualified persons. This is the only location in the electrical system that unqualified persons can be easily exposed to live circuits, even with the disconnecting means in the off position.

The panel recognizes, in the exception, that local disconnects may introduce additional or increased hazards for certain installations and shall not be required for those installations. If those installations are considered "safe" without local disconnects, then the only logic remaining for requiring local disconnects for other installations would have to be for convenience. NEC 90-1(b) points out that compliance with the code will result in installations that are free from hazards, but are not necessarily efficient, convenient, etc. The convenience required, by adoption of this proposal, is not necessary for safety and would be costly to implement. Additional wiring and conduit would be needed for each motor.

The original substantiation discussed using a circuit breaker that was not capable of being locked. In this installation, the existing exception does not apply and a local disconnect is already required. Further statements indicate lack of proper procedures and training, required by OSHA, when anyone can cut off locks from equipment that has been locked-out. Adding another disconnecting means will not remedy this unsafe situation.

Enforced OSHA lockout/tagout and NFPA 70E regulations referenced in the existing Fine Print Note are the means for safely installing and maintaining all electrical equipment, including motors. The chemical Industry has hundreds of thousands of motor installations around the world and has achieved an excellent safety record through utilization of lockout/tagout procedures as required by OSHA.

HAMER: See my Explanation of Negative Vote on 11-68 (Log #4074).

SAUNDERS:

NAUGHTON: See my Comment on Affirmative on Proposal 11-68.

(Log #4004)

11- 70 - (430-102(b), Exception): Accept in Principle

SUBMITTER: James T. Dollard, Jr., IBEW Local Union 98/Rep. IBEW Eastern Code Advisory Group

RECOMMENDATION: Revise text as follows:

430-102(b) Exception: A disconnecting means, in addition to the controller disconnecting means as required in accordance with Section 430-102(a), shall not be required for the motor where the disconnecting means for the controller is individually capable of being locked in the open position. Circuit breakers without permanent provisions for applying a lock shall not be considered as capable of being locked in the open position.

SUBSTANTIATION: The problem with the present wording of this exception is that the disconnect in many motor applications is a circuit breaker in a panelboard that is not made with permanent provisions for locking the circuit breaker in the open position. This clearly does not meet the requirements of 430-102(b), Exception. The exception states capable of being locked. With lock in hand an installer/maintainer can apply it and work safely. This language does not include "through the use of a device which will permit a lock to be utilized."

However, the onset of circuit breaker locking devices have given the impression that any circuit breaker is capable of being locked in the open position.

Circuit breaker lockout devices are not permitted by OSHA. OSHA requires that they be approved (listed by National Recognized Testing Laboratory). None are listed. If these devices were recognized by OSHA then the NEC would expect that installer/maintainers would each carry dozens of different accessory devices to safely lockout motor power sources. This is not practical.

Permanent provisions for making circuit breaker capable of being locked in the open position are readily available from manufacturers today.

This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.

Where motors are involved we know that regular maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.

The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have a device that happens to fit the circuit breaker in an installation.

Where motors are involved we know that regular maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.

PANEL ACTION: Accept in Principle.

Add the following to 430-102(b), Exception:

"The provision for locking or adding a lock to the disconnecting means shall be permanently installed on or at the switch or circuit breaker used as the disconnecting means."

PANEL STATEMENT: The requirement should also apply to switches. Positive wording is more user-friendly.

COMMENT ON AFFIRMATIVE:

NAUGHTON: See my Comment on Affirmative on Proposal 11-68.

(Log #353)

11- 71 - (430-107): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Add:

Switches and circuit breakers in accordance with Exception No. 1 for Section 380-8 shall be considered as meeting this requirement.

SUBSTANTIATION: This section requires, in effect an additional disconnecting means where a disconnect is busway-mounted. If a motor circuit is not supplied, Exception No. 1 for Section 380-8 doesn't require the disconnect to be readily accessible. The requirement for floor operated means appears to be in lieu of readily accessible.

PANEL ACTION: Reject.

PANEL STATEMENT: It is imperative that at least one disconnecting means be readily accessible for safety reasons. The example of 380-8, Exception No. 1 is not intended to apply to motor circuits.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

(Log #906)

11- 72 - (430-107): Accept

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

At least one ~~One~~ of the disconnecting means shall be readily accessible.

SUBSTANTIATION: Editorial. Literal wording suggests that readily accessible is limited to one disconnecting means and not permitted for additional disconnecting means, where used.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

(Log #1984)

11- 73 - (430-109, FPN (New)): Reject
SUBMITTER: Gordon T. Davis, Moeller Electric Corp.
RECOMMENDATION: Add a fine print note after Section 430-109 to read as follows:
FPN: A listed combination controller consists of a magnetic or solid state controller with disconnecting means. It may also have short circuit and overload protection. The components of a listed combination controller are associated by tests and markings and are rated as a unit.
SUBSTANTIATION: Statement of Problem: There is no definition of a combination controller found in NFPA 70. Because of this lack of definition it has been and remains a concern of industry that the disconnecting means of some listed combination controllers might be unrecognizable to the authorities having jurisdiction (AHJ).
Substantiation: The proposal was accepted by CMP 11 in the 1999 Code Cycle Report on Proposal (11-104), but rejected in the Report on Comments (11-64). The comment found in the Report on Comments would indicate a more serious problem than that found in the Statement of Problem and a greater need for a definition of a combination controller.
The comment indicated that putting together devices found in Article 430 "in some type of combination fashion was not unique". We believe this to be in error and could possibly lead to a misinterpretation of the listing product standards by an authority having jurisdiction.
Many components of combination controllers are unique only to that listing. For example magnetic-only circuit breakers can only be used in a combination controller when the Type D combination tests are performed by the listing agency and suitably marked; the components of a listed Type D combination controller are unique to that listing. All combination controllers with high capacity short circuit ratings are tested, marked and listed by the listing agency; the components in the high capacity short-circuit combination controllers are unique to that listing. The listing product standards do not allow the assembly of components in just any fashion.
Although it is possible to assemble components together in a manner that simulates a combination controller, that assembly would not be listed and would have to be further evaluated by the authority having jurisdiction for suitableness. In such cases the definition of a listed combination starter would prove to be helpful to the authority having jurisdiction which is reflected in the statement of problem.
A listed combination controller is not just an assembly of components. A listed combination contoller consists by definitions found in the respective UL 508 and IEC 60947 of the following:
a. disconnecting means
b. a magnetic or solid state controller
c. optional short circuit and overload protection
d. tested ratings and markings by listing (certifying) agency.
The definition of a combination controller will help the authority having jurisdiction, installer, and user recognize the components of combinations controller its ratings, and markings.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The FPN is not necessary because listed combination motor controllers are so marked.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #4230)

11- 74 - (430-109(a)(1)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
A listed motor-circuit switch rated in horsepower. For Design E motors or Design B energy efficient motors rated greater than 2 hp, the motor circuit switch shall be either (a) marked as rated for use with Design E motors or Design B energy efficient motors or (b) have a horsepower rating not less than 1.4 times the rating of a motor rated 3—100 hp, or not less than 1.3 times the rating of a motor rated over 100 hp.
SUBSTANTIATION: The added language correlates with the CMP 11 decision to treat Design B energy efficient motors the same as Design E motors for the purposes of setting instantaneous trip circuit breaker parameters in the last code cycle. That decision was substantiated on the basis of locked-rotor inrush currents equivalent to Design E motors. The provisions in this section for Design E motors (see A95 Proposal 11-91a) used identical substantiation, having to do with motor currents under locked-rotor conditions. Since identical substantiation was used in the 1996 code cycle to change both this section and Section 430-52(c)(3) Exception No. 1, it doesn't seem technically consistent to now again change the rules for one section and not the other.
PANEL ACTION: Reject.
PANEL STATEMENT: The exception in 430-52 allows the higher setting of instantaneous trip circuit breakers for Design B energy efficient motors only if needed to start the motor. Requiring all motor-circuit switches used with Design B energy efficient motors to be marked or, perhaps, have a larger horsepower rating is not justified. The locked-rotor currents of energy efficient Design B motors are within standard switch ratings. The submitter presents no evidence of problems.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
COMMENT ON AFFIRMATIVE:
WRIGHT: See my Comment on Affirmative on Proposal 11-56.

(Log #596)

11- 75 - (430-109(a)(6)): Reject
SUBMITTER: Gordon T. Davis, Klockner-Moeller Corp.
RECOMMENDATION: Revise as follows:
Listed manual motor controllers additionally marked "Suitable as Motor Disconnect" shall be permitted as a disconnecting means where installed between the final motor branch circuit short-circuit and ground-fault protective device and the motor.
A listed manual motor controller additionally marked as "Suitable for Motor Disconnect" shall be permitted as a disconnecting means on the line side of motor branch short circuit and ground fault protective devices rated 100 amps or less.
SUBSTANTIATION: Listed manual motor controllers additionally marked as "Suitable for Motor Disconnect" have been tested by a Nationally Recognized Testing Laboratory (NRTL) and comply with the performance requirements of UL 98. Constructionally, a major difference between the distribution equipment found in UL 98 and a listed manual motor controller additionally marked as "Suitable for Motor Disconnect' is that the field wiring terminals for the manual controllers are finger safe per the intent of IEC/EN 60536. The manual controllers' terminals also comply to UL 508 spacings for industrial control equipment.
The need for finger safe disconnects is evidenced by Underwriters Laboratories proposals regarding the safety of maintenance personnel. Maintenance personnel are more vulnerable to shock hazards and energy when working in the vicinity of terminals of distribution equipment that have larger spacings and that were not designed to be finger safe.
Listed manual motor controllers additionally marked as "Suitable for Motor Disconnect" use insulation coordination (UL 840 and IEC 664) to attain a dielectric at the terminals and internal spacings equivalent to the terminals with larger spacings required by UL 98. This insulation coordination allows listed manual motor controllers to be used throughout the world on circuits rated greater than 600 VAC. The insulation coordination is determined by impulse tests that are described in IEC, UL, and NEMA standards.
Listed manual motor controllers have been tested by NRTL to be functionally equivalent to UL 98 distribution equipment (including dielectric of terminals) without the likelihood of shock hazard and energy hazards to maintenance personnel that exists for distribution equipment with the larger spacings terminals that were not designed to be finger safe.
The restriction to 100 amps reflects the actual application limitation of these devices. Because of larger conductors and fuses above 100 amps, devices with larger spacing terminals are usually required.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation does not support use of these devices on the line side of the motor branch-circuit short-circuit and ground-fault protective device at any level.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

11- 76 - (430-109(f)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
For a cord- and plug-connected motor, a horsepower-rated attachment plug and receptacle having ratings no less than the motor ratings shall be permitted to serve as the disconnecting means for other than a Design B energy efficient or Design E motor, and for a Design B energy efficient or Design E motor rated 2 hp or less. For a Design B energy efficient or Design E motor rated more than 2 hp, an attachment plug and receptacle used as the disconnecting means shall have a horsepower rating not less than 1.4 times the motor rating. A horsepower-rated attachment plug and receptacle shall not be required for a cord- and plug-connected appliance in accordance with Section 422-32, a room air conditioner in accordance with Section 440-63, or a portable motor rated 1/3 hp or less.
SUBSTANTIATION: The added language correlates with the CMP 11 decision to treat Design B energy efficient motors the same as Design E motors for the purposes of setting instantaneous trip circuit breaker parameters in the last code cycle. That decision was substantiated on the basis of locked-rotor inrush currents equivalent to Design E motors. The provisions in this section for Design E motors (see A95 Proposal 11-92a) used identical substantiation, having to do with motor currents under locked-rotor conditions. Since identical substantiation was used in the 1996 code cycle to change both this section and Section 430-52(c)(3) Exception No. 1, it doesn't seem technically consistent to now again change the rules for one section and not the other.
PANEL ACTION: Reject.
PANEL STATEMENT: The exception in 430-52 allows the higher setting of instantaneous trip circuit breakers for Design B energy efficient motors only if needed to start the motor. Requiring all plugs and receptacles used as disconnects for Design B energy efficient motors to perhaps, have a larger horsepower rating is not justified. The submitter provides no evidence of problems.

11- 78 - (430-113): Accept in Principle
SUBMITTER: Jack H. Zewe, Electrical Consultants, Inc.
RECOMMENDATION: Incorporate wording in section 430-113 similar to that used in section 620-52(b)regarding warning sign requirements for "foreign" voltage sources.

Warning - Foreign Voltage Present
Parts of this controller may remain energized and are not deenergized by this switch.
SUBSTANTIATION: This warning sign is required by section 620, but should also be incorporated in section 430. There is a lot of automation equipment today that is powered by more than one source of power and often, although the main disconnect is turned off, hazardous voltage is still present in the controller.
PANEL ACTION: Accept in Principle.
Add to the end of the paragraph:
"Where multiple disconnecting means are provided, a permanent warning sign shall be provided on or adjacent to each disconnecting means."
PANEL STATEMENT: The proposed wording is too vague with respect to location of the sign. The proposed sign wording too restrictive. The panel action should meet the submitter's intent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
COMMENT ON AFFIRMATIVE:
BUNCH: I vote affirmative with comment. I do not agree with trying to place warnings in the code. ANSI has standards which detail warnings and the requirements in wording. Panel members cannot cover properly these requirements to be consistent with ANSI. If a warning is needed in this section of the code, it should be worded to say that a warning in compliance with ANSI is required at stop at that point.
SCHRAM: I understand the intent is to require a warning sign or label, worded as appropriate for the particular circumstances in the installation involved. This could include "foreign" voltage sources in motors, controllers and/or in the disconnecting means, in any combination. In view of all these variables, it was not considered feasible to specify a particular wording. ANSI Z535.4-1998, Standard for Product Safety Signs and Labels, includes details as to what constitutes an adequate sign or label.
I believe further consideration should be given to the location of the marking. It would seem more appropriate to place the sign on the apparatus where the "foreign" voltage is present.

(Log #3092)

11- 79 - (430-113 Exception No. .3 (New)): Accept
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 15 for action in Article 695. This exemption to a Chapter 4 requirement should be located in the Chapter 6 article. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Add a new Exception No. 3 to section 430-113 to read as follows:
430-113. Energy from More than One Source
Exception No. 3: The provisions of this section shall not apply to fire pumps where the alternate source is provided only by an on-site standby generator.
SUBSTANTIATION: Section 695-3(b) is under the purview of NFPA 20, which specifically does not require a disconnecting means under the conditions described.
This is a companion proposal to the proposal on Section 695-3(b)(1).
PANEL ACTION: Accept.
PANEL STATEMENT: The panel requests the TCC refer this action to Panel 15.

(Log #CP1106)

11- 81a - (430-125(a)): Accept
NOTE: The Technical Correlating Committee understands that this proposed change is to 430-125(a) Exception.
SUBMITTER: CMP 11
RECOMMENDATION: Change "is permitted" to "shall be permitted".
SUBSTANTIATION: The revision is intended to comply with the NEC Style Manual, 3.1, with respect to mandatory language.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #907)

11- 82 - (430-145): Reject
NOTE: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual relative to referencing entire articles. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Where ~~required~~ employed, grounding shall be done in the manner specified in Article 250.
SUBSTANTIATION: Grounding should be done in a code approved manner, whether required by code, or done by choice. The lack of requirements for optional grounding could result in potential hazard.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter should explain the potential hazard in the substantiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #1835)

11- 83 - (430-145(a), FPN): Accept
SUBMITTER: Efren Asinas, City of Orlando, FL
RECOMMENDATION: Add "equipment" before the word "grounding".
SUBSTANTIATION: Adds the correct identification covered by Section 430-12(e). This corrects the NEC and makes the code user friendly.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #2040)

11- 84 - (430-145(b)): Accept in Principle
SUBMITTER: Mark O. Wise, Merritt Island, FL
RECOMMENDATION: Revise the last paragraph to read:
"Where stranded leads are used, protected as specified above, they shall not be larger than No. 10 for each strand and shall comply with other requirements of this Code for conductors to be used in raceways."
SUBSTANTIATION: To clarify that each strand should not be larger than No. 10 in order to provide for a vibration tolerant installation.
PANEL ACTION: Accept in Principle.
Revise the last paragraph to read:
"Where stranded leads are used, protected as specified above, each strand shall be not larger than 10 AWG and shall comply with other requirements of this Code for conductors to be used in raceways."
PANEL STATEMENT: Changes are for improved syntax. The panel action should meet the submitter's intent. See also the panel action on Proposal 11-4. The panel solicits public comment on the panel action.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
NEGATIVE: 2
EXPLANATION OF NEGATIVE:
CLOSSON: I vote negatively for the following reasons:
1. Lack of substantiation by the submitter.
2. This requirement is for limitng the size of the leads or conductors used in the separation of the junction box from the motor. It is not defining or limiting the stranding of the lead wire to be used. The third paragraph of Section 430-145(b) is difficult to interpret and, therefore, should be improved, but not as proposed by the submitter or the panel.
WRIGHT: Lack of substantiation. The submitter is changing the requirements of the present code without clear and understandable technical substantiation.

(Log #2474)

11- 85 - (430-152): Reject
SUBMITTER: Jeffrey H. Armstrong, Electrical Training and Consulting Services
RECOMMENDATION: Table 430-152 is used only with 430-52.
Place Table 430-152 with 430-52.
SUBSTANTIATION: For clarification.
PANEL ACTION: Reject.
PANEL STATEMENT: The table is also used with 430-57 and 430-62. See the panel statement on Proposal 11-5.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
GARVEY: While the submitter is not technically correct, the intent of the proposal is clear. Place Table 430-152 within the section where the majority of references are located, 430-52. Of the 11 places Table 430-152 is referenced all but three are within 430-52.

The Panel's Action to accept Proposal 11-48 effectively makes two of the three redundant. This leaves one minor reference to sizing fuseholders in 430-57. Since the majority of the references to the Table are found in 430-52, Section 430-52 is where the Table belongs.

(Log #3163)

11- 86 - (430-152): Reject
SUBMITTER: Jeffrey H. Armstrong, Electrical Training and Consulting Services
RECOMMENDATION: Table 430-152 if used ONLY with Section 430-52.
SUBSTANTIATION: Place Table 430-152 with 430-52 for clarification.
PANEL ACTION: Reject.
PANEL STATEMENT: The table is also used with 430-57 and 430-62. See the panel statement on Proposal 11-5.

11- 89 - (Table 430-152): Accept
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Revise the table headings as follows:
Change the Type of Motor for Squirrel cage motors designated "Other than Design E" to "Other than Design E or Design B energy efficient." Also change the Type of Motor for Squirrel cage motors designated "Design E" to "Design E or Design B energy efficient."
SUBSTANTIATION: This change correlates with similar changes made to 430-52(c)(3) Exception No. 1 in the 1999 Edition.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

Table 430-152 Maximum Rating or Setting of Motor Branch-Circuit Short-Circuit and Ground-Fault Protective Devices

Type of Motor	Percentage of Full-Load Current			
	Nontime Delay Fuse[1]	Dual Element (Time-Delay) Fuse	Instantaneous Trip Breaker	Inverse Time Breaker[2]
Single-phase motors	300	175	800	250
AC polyphase motors other than wound-rotor				
Squirrel cage— ~~Other than Design E~~	300	175	800	250
Other than Design E or Design B energy efficient ~~Design E~~ Design E or Design B energy efficient	300	175	1100	250
Synchronous[3]	300	175	800	250
Wound rotor	150	150	800	150
Direct Current (constant voltage)	150	150	250	150

Note: For certain exceptions to the values specified, see Sections 430-52 through 430-54.
[1] The values in the Nontime Delay Fuse column apply to Time-Delay Class CC fuses.
[2] The values given in the last column also cover the ratings of nonadjustable inverse time types of circuit breakers that may be modified as in Section 430-52.
[3] Synchronous motors of the low-torque, low-speed type (usually 450 rpm or lower), such as are used to drive reciprocating compressors, pumps, etc., that start unloaded, do not require a fuse rating or circuit breaker setting in excess of 200 percent of full-load current.

(Log #4232)

11- 90 - (Table 430-152): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: In the left column, change "Other than Design E" to "Other than Design E or Design B Energy Efficient" and change "Design E" to "Design E or Design B Energy Efficient."
SUBSTANTIATION: This proposal relieves a direct conflict between the table provisions and the 1999 NEC change in Section 430-52(c)(3) Exception No. 1 that puts high-efficiency Design B motors on the same playing field, in terms of short-circuit and ground-fault protection, as Design E motors. The table should have been changed to correlate with the changes in the exception, but didn't. The result is an anomaly, where if you have a high-efficiency Design B motor you literally can't protect it between 800 percent and 1100 percent, but you can from 1100 percent to 1700 percent.
PANEL ACTION: Accept.

11- 98 - (440 Part D Heading): Reject
SUBMITTER: Vohn N. Peeler, Faith, NC
RECOMMENDATION: The new heading for part D of Article 440 would be: Conductors
~~Branch Circuit~~ Conductors.
SUBSTANTIATION: I believe that Sections 440-33 and 440-34 are intended to apply to feeders as well as branch circuits. If this is true, then the part D heading should not indicate that it covers branch circuits only.
PANEL ACTION: Reject.
PANEL STATEMENT: Part D of Article 440 applies only to branch circuit conductors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #4233)

11- 99 - (440-32, Exception): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc
RECOMMENDATION: Add the following exception:
Exception: For a wye-start, delta-run connected motor-compressor, the selection of branch-circuit conductors on the line side of the controller shall be based on the motor-compressor full-load current. The selection of conductors between the controller and the motor-compressor shall be permitted to be based on 58 percent of the motor full-load current.
SUBSTANTIATION: This is essentially the last paragraph of Section 430-22(a) adapted for Article 440 purposes. I received a question regarding a compressor with a rated load current of 751A, which was to be started wye-delta. The question submitter was hoping I could give him some alternative to running twelve sets of conductors figured under the normal 125 percent rule in this section. Since Article 440 amends Article 430 but not vice-versa [see Section 440-3(a)], my only choice was to send him off to the inspector under Section 90-4. I promised I would submit the appropriate proposal to clear up what seems to be a simple oversight, but one which clearly has major implications on large installations.
Editorially, I formatted this as an exception, because that's what it is, an alternate method to the general rule. It shouldn't be an unnumbered, stand-alone paragraph conflicting with what would become the first of two paragraphs otherwise. I also used expressly permissive language. If someone wants to base the conductor calculations on the full-load current all the way through, I saw no reason to forbid it.
PANEL ACTION: Accept in Principle.
Add a new paragraph:
"For a wye-start, delta-run connected motor-compressor, the selection of branch-circuit conductors between the controller and the motor-compressor shall be permitted to be based on 58 percent of either the motor-compressor rated-load current or the branch-circuit selection current, whichever is greater."
PANEL STATEMENT: No exception is needed for the conductors to the controller because the first paragraph still applies to these conductors. The proposal is revised to make the provision applicable to hermetic refrigerant motor-compressors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #2956)

11- 100 - (440 Part E): Reject
SUBMITTER: Donald W. Christy, Coraopolis, PA
RECOMMENDATION: Change in code could read and be enforced as follows:
Three Phase Motors shall have all 3 phases interrupted.
Single Phase 220 volt motors shall have both legs interrupted.
Single Phase 120 volt motors shall have interruption in the hot side of line only.
If only one person's life could be saved, this would be worth while.
SUBSTANTIATION: It seems most of the Air Conditioning Companies ignore the National Electrical Code when designing the electrics of air conditioning units. They used to abide by the code, installing two pole contactors on 220 volt compressor and condenser fan circuits. But, as of late, they install single pole contactors to interrupt their circuits. This is wrong because if an installer is not knowledgeable about grounding, and the compressor or fan motor becomes grounded, you have a hot unit which could electrocute a child or person touching the unit outside, maybe even while standing on wet ground. Why they do this disturbs me. Maybe it is to save a few dollars, but at the expense of injury or death to someone at home or their business.
Please refer to the schematics I have provided for example 1 and 2, which show that both compressor and condenser fan motors are in violation of the NEC.
Also shown refers to 120 volt RV unit air conditioners on Airstream trailers. During the 1970's, they installed a relay for condenser and blower fans in the neutral side of the line, allowing the motors to be energized with power while in the off position. When a motor becomes grounded, it tries to run and heats up. This could obviously cause a fire as trailers have rubber tires and usually a block of wood under the tongue. Anyone touching the

trailer could get shocked or electrocuted. Refer to example 3 where compressor is wired correctly but fan and blower motors are interrupted in the neutral side of the line, which is again in violation of the NEC (Revision 1 shows corrections.)
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: Use of 2 pole controllers on 3 phase and 1 pole controllers on 240 volt single-phase is not a Code violation. The controller is only required to open a sufficient number of conductors to stop the motor-compressor, unless the controller is also the disconnecting means. See 430-84 and 430-85, which are applicable under Article 440, per 440-3(a).

(Log #914)

11- 101 - (440-62(c)): Accept in Principle in Part
NOTE: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal relative to the words "are supplied." This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(c) Where Lighting Units or Other Appliances are also Supplied. The total rating of a cord-and attachment plug-connected room air conditioner shall not exceed 50 percent of the rating of a branch circuit where lighting ~~units~~ outlets, other type appliances, or general-use receptacles are also supplied. Where the circuitry is interlocked to prevent simultaneous operation of the room air conditioner and other outlets supplied a cord- and attachment plug-connected room air conditioner shall not exceed 80 percent of the branch-circuit rating. Where more than one cord- and plug-connected room air conditioner is supplied by the same branch circuit, the provisions of Section 430-53(a) shall apply.
SUBSTANTIATION: General-use receptacles should be included as they are not considered as outlets for general lighting in all occupancies and where no load is plugged in there is no supplied load, only a computed load. Other "type" appliances is proposed to eliminate any inference that other appliances could be another room air conditioner. Where a room air conditioner and baseboard heater, for example, are supplied by the same circuit and interlocked, the 50 percent requirement seems severe since in effect, it is electrically the same as (b). Where there is no product marking specifying an individual circuit, the provisions of Section 430-53(a) appear to be reasonable and economical.
PANEL ACTION: Accept in Principle in Part.
Revise to read as follows:
"(c) Where Lighting Units or Other Appliances are also Supplied. The total rating of a cord-and attachment plug-connected room air conditioner shall not exceed 50 percent of the rating of a branch circuit where lighting ~~units~~ outlets, other appliances, or general-use receptacles are also supplied. Where the circuitry is interlocked to prevent simultaneous operation of the room air conditioner and other outlets are supplied, a cord- and attachment plug-connected room air conditioner shall not exceed 80 percent of the branch-circuit rating."
PANEL STATEMENT: The 50 percent rule should also apply where the other appliance is another cord- and plug-connected room air conditioner.
The proposal is also editorially revised for grammatical correctness.

Note: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
SUBMITTER: Edward A. Schiff, Technology Research Corp.
RECOMMENDATION: 440-65. Cord Sets with Leakage Current Detection and Interruption Protection
(a) Definition: Cord Sets with Leakage Current Detection and Interruption (LCDI) - a cord set intended to sense leakage currents flowing between or from the conductors of the cord set and interrupt the circuit. If leakage current is allowed to continue flowing from the conductors, risk of ignition of the surrounding combustible materials and risk of serious injury from electrical shock may result.
(b) All single phase cord and plug connected room air conditioners shall be provided with factory installed cord leakage current detection and interruption protection. The LCDI shall utilize air break contacts and be an integral part of the the attachment plug or located in the supply cord within 12 in. (305 mm) of the attachment plug.

SUBSTANTIATION: Electrical cords and plugs are responsible for 7400 fires (attended by the fire service) per year which result in 108 deaths, 539 civilian injuries and $121 million in direct property damage per year in US homes according to The US Home Product Report, 1991-1995 (Appliances and Equipment) published by the NFPA in 1998. The majority of the cord and plug fires were caused by short circuits or ground faults (54.3%). Other electrical failure (23%) and overloads (9.4%) accounted for most of the balance. Following the leadership of the Consumer Products Safety Commission, the electronics Industry Association, AHAM, NEMA, and Underwriters Laboratory, industry has made a significant effort on the development of technologies for improving the safety of electrical products.

The flexible cords on room air conditioners are subjected to excessive abuse during its product life. The power supply cord can be damaged in a number of ways. The cord can be pinched or crimped during installation or storage. The shear mass of the product can permanently damage the cord. Once installed the cord is often within harms way by being pinched by furniture, chewed by a pet or infant or kicked.

This abuse will result in series (broken conductors), parallel (degraded insulation), and/or ground faults in the cord. These conditions will lead to combustion of the cord and/or surrounding material. Examples of recent serious room air conditioner cord fires are contained in table 1 that I have provided. Room and portable air conditioners account for 1,400 fires (attended by the fire service) per year and result in 10 deaths per year, on average according to the NFPA. Considering that these products are primarily used seasonally in the North East, this would equate to approximately 10 fires per day attended by the fire service (not to mention, all the fires which are controlled without calling 911).

In addition, cord damage presents a significant risk of serious injury from shock or death by electrocution. There have also been many incidents of electric shock and even electrocution involving air conditioners. In 1997, an 18-year-old girl was electrocuted in Maryland because a damaged cord was touching the metal frame of her hotel room door. In July of 1999, a seven year old boy in Sabetha, Kansas died from electrocution when he came in contact with a dehumidifier cord on a wet kitchen counter top. Devices which meet this standard sense ground faults, thus providing protection from serious injury from shock or electrocution.

Many precedents exist for incorporating cord LCDI protection for room air conditioners into the code. The safety of service cords has long been viewed as part of the branch circuit wiring by the code for years. Examples include Section 422-49 GFCIs on high pressure spray washers, Section 422-41, Cord and Plug connected appliances subject to immersion (hair dryers), Table 400-4 defining lamp, heater, iron, range, dryer and vacuum cleaner cords, and Article 422 defines a multitude of flexible cord and plug-connected appliance requirements.

A serious safety problem continues to exist. Proven UL recognized / CSA certified cord sets are available from multiple manufacturers which provide this protection at an economical cost. The elimination of these needless deaths is immeasurable and the savings in property losses, injuries, insurance claims, and law suits will be dramatic.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept in Principle in Part.

Add a new definition to 440-2 as follows:

"Leakage Current Detection and Interruption (LCDI) Protection. A device provided in a power supply cord or cord set that senses leakage current flowing between or from the cord conductors and interrupts the circuit at a predetermined level of leakage current."

Add a new 440-65 as follows:

"Leakage Current Detection and Interruption (LCDI). Single-phase cord- and plug-connected room air conditioners shall be provided with factory-installed LCDI protection. The LCDI protection shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm (12 in) of the attachment plug."

PANEL STATEMENT: The changes are to (1) comply with the NEC Style Manual; (2) include power supply cords; (3) delete the proposed requirement that air break contacts be provided, as being too restrictive and not substantiated.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 7

NEGATIVE: 8

EXPLANATION OF NEGATIVE:

BUNCH: There is conflicting data as to actual cause of cited incidents of cord related failures. Although this CDI might lead to a product improvement, it should be regulated through the recognized testing labs and standards, not in the NEC.

COX: Devices, such as proposed, would offer protection of all available portable cord connected devices if they were installed on the branch circuits rather than on individual pieces of equipment. Article 210-12 already provides for similar devices on branch circuits for bedrooms.

HAMER: This should be handled in the product standards, not the National Electrical Code.

RASMUSSEN: The proposal should be rejected. The concept of utilizing advancements in technology to enhance the safety of appliances should be encouraged. However, the submitter's substantiation does not provide clear evidence that the incidents of cord fires cited relate to damage to the room air conditioner supply cord. The involvement of inappropriate extension cords appear to be a factor. For instance, in the Oct. 1998 El Dorado, AR incident, one of the few examples where some detail is given, it states, "The spliced cord was run under a rug across the room, when it overheated and arced." Before requiring such major change to existing room air conditioner requirements, the submitter is encouraged to provide well documented and verifiable examples of specific incidents where the product improvement being recommended would have prevented the unwanted incident from occurring.

SCHRAM: The information on fires alleged to have been caused by overheating or faults in room air conditioner power supply cords, which was presented to the panel, is vague as to the details of the actual causes of the fires. It is not clear from this material a that a LCDI in the air conditioner power supply cord or plug would have prevented any of the reported fires. The substantiation for the proposal refers to the "excessive abuse" potential for room air conditioner cords, but the material presented to the panel contains no details to support this contention. Further, no data was presented to the panel to support the statements in the substantiation concerning electric shock incidents that could have been prevented by use of a LCDI in the cord or plug.

It is my opinion that the NEC is not the proper place for a product safety requirement, such as mandating the factory installation of a LCDI in room air conditioner power supply cords or plugs. I recognize that 422-41 and 422-49 do include similar requirements, but the circumstances that resulted in these code requirements were quite different than the circumstances in this case, and the need was well supported. I would urge the manufacturers of room air conditioners to thoroughly investigate the need for and efficacy of LCDIs on room air conditioners, and if appropriate, revise UL484 to require their use.

SAPORITA: I must vote negative on the panel action. While I believe that this proposal may reduce the likelihood of cord fires, this is a product standards issue.

THOMAS: The cord set with leakage current detection and interruption seems to be a reasonable safety item but I question placing the requirement in the NEC. This is not part of the premises wiring and is not enforceable by the Authority Having Jurisdiction.

WRIGHT: The proposal should be rejected. NEMA agrees with the submitter's concept. However the proposal is too restrictive. There are other methods of providing this protection.

ARTICLE 445 — GENERATORS

(Log #CP1506)

15- 3a - (445): Accept
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: CMP 15
RECOMMENDATION: Revise Article 445 as follows:
Add new 445-1 to read as follows:
445-1 Scope. This article covers the installation of generators.
Renumber and retitle existing "445-1 General" as "445-3 Other Articles." (no change in text)
Renumber existing 445-2 through 445-10 to 445.10 through 445.18, respectively.
SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual. PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 19

(Log #1183)

15- 4 - (445-5): Accept in Principle
SUBMITTER: Lawrence A. Bey, Onan Corp.
RECOMMENDATION: Add "or distribution switchboard or panelboard" to the first sentence as follows:
"The ampacity of the conductors from the generator terminals to the first overcurrent device or distribution switchboard or panelboard shall not be less than 115 percent of the nameplate current rating of the generator."
SUBSTANTIATION: The present wording is singular, overcurrent device, and often the generator conductors terminate at a distribution switchboard or panelboard, with or without a main overcurrent device.
PANEL ACTION: Accept in Principle.
Revise the submitter's recommendation to read as follows"
Revise the first sentence as follows:
"The ampacity of the conductors from the generator terminals to the first distribution device(s) containing overcurrent protection shall not be less than 115 percent of the nameplate current rating of the generator."
PANEL STATEMENT: The revised text meets the intent of the submitter and more clearly expresses the requirement.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
NEGATIVE: 1
ABSTENTION: 1
EXPLANATION OF NEGATIVE:
VANNICE: I still have concerns that the feeder bussing in the first distribution device(s) should also be not less than 115 percent. The distribution device is the panelboard and not the feeder bus inside before the overcurrent protection device(s). I do not believe the Panel Action covers that situation.
COMMENT ON AFFIRMATIVE:
EXPLANATION OF ABSTENTION:
KOVACIK: The comments expressed in the negative ballot submitted by Mr. Vannice clearly indicate confusion exists regarding the intent of Section 445-5. The requirement for sizing not less than 115 percent of the nameplate current rating of the generator applies only to conductors. There is no technical substantiation to apply this requirement to panelboads or switchboards in the distribution circuit. This includes all components that are an integral part of panelboards or switchboards such as incoming and feeder bus. The rating on such equipment indicates it suitable without the need for overszing or derating when the rating of the circuit (in this case the generator) does not exceed that of the equipment. Further revisions to Section 445-5 are needed to clarify this.

(Log #4234)

15- 5 - (445-9): Accept
Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Add the following sentence at the end:
"Where a horsepower rating is required to determine the required size, the full-load current of the generator shall be compared with comparable motors in Tables 430-147 through 430-150."
SUBSTANTIATION: Generators don't normally have horsepower ratings. The new rule doesn't tell the user how to apply its provisions when the generator doesn't exceed 11 in. in diameter, and thereby falls within Table 430-12(b), first table. This proposal clarifies the procedure.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 19
COMMENT ON AFFIRMATIVE:
KOVACIK: The recommended procedure should be further clarified by adding text to inform the user how to choose the correct horsepower rating when the generator amp rating is between two horsepower ratings. The text should specify that the higher hp rating shall be used as the choice of the lower hp rating may lead to inadequate generator terminal housing size.

ARTICLE 450 — TRANSFORMERS AND TRANSFORMER VAULTS (INCLUDING SECONDARY TIES)

(Log #573)

13- 2 - (450): Accept in Part
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Section 450-21(a), replace "12 in. (305 mm)" with "300 mm (12 in.)".
2. In Section 450-21(b) Exception No. 1, replace "6 ft. (1.83 m)" with "1.8 m (6 ft.)".
3. In Section 450-21(b) Exception No. 1, replace "12 ft. (3.66 m)" with "3.7 m (12 ft.)".
4. In Section 450-22, replace "12 in. (305 mm)" with "300 mm (12 in.)".
5. In Section 450-26 Exception No. 1, replace "4 in. (102 mm)" with "100 mm (4 in.)".
6. In Section 450-26 Exception No. 6(c), replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".
7. In Section 450-42, replace "4 in. (102 mm)" with "100 mm (4 in.)".
8. In Section 450-42 Exception FPN No. 2, replace "6 in. (152 mm)" with "150 mm (6 in.)".
9. In Section 450-43(b), replace "4 in. (102 mm)" with "100 mm (4 in.)".
10. In Section 450-45(c), replace "3 in.^{2} (1936 mm^2)" with "1900 mm^2 (3 in.^{2})".
11. In Section 450-45(c), replace "1 ft.^{2} (0.093 m^2)" with "0.1 m^2 (1 ft.2)".
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement.
PANEL ACTION: Accept in Part.
The panel modifies the following parts of the proposal to read as follows:
1. In Section 450-21(a), replace "12 in. (305 mm)" with "305 mm (12 in.)".
2. In Section 450-21(b) Exception No. 1, replace "6 ft. (1.83 m)" with "1.83 m (6 ft.)".
3. In Section 450-21(b) Exception No. 1, replace "12 ft. (3.66 m)" with "3.7 m (12 ft.)".
4. In Section 450-22, replace "12 in. (305 mm)" with "305 mm (12 in.)".
5. In Section 450-26 Exception No. 1, replace "4 in. (102 mm)" with "100 mm (4 in.)".
6. In Section 450-26 Exception No. 6(c), replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".

7. In Section 450-42, replace "4 in. (102 mm)" with "100 mm (4 in.)".
8. In Section 450-42 Exception FPN No. 2, replace "6 in. (152 mm)" with "150 mm (6 in.)".
9. In Section 450-43(b), replace "4 in. (102 mm)" with "100 mm (4 in.)".
10. In Section 450-45(c), replace "3 in.^{2} (1936 mm^2)" with "1900 mm^2 (3 in.^{2})".
11. In Section 450-45(c), replace "1 ft.^{2} (0.093 m^2)" with "0.1 m^2 (1 ft.2)".

PANEL STATEMENT: The panel recognizes that the present NEC has minimum dimension requirements that are in the code for safety reasons. The modified parts reflect the need to maintain the minimum dimensions.

(Log #1837)

13- 4 - (Table 450-3(a) Note 3): Accept in Principle
SUBMITTER: James D. Gray, City of Orlando, FL
RECOMMENDATION: Add word "circuit" before "breakers" in the last sentence of the table in Note 3.
SUBSTANTIATION: Adds a missing word. When used will clear up questions and make the NEC user friendly.
PANEL ACTION: Accept in Principle.
The panel modifies the proposal as follows: Add word "circuit" before "breakers" in the last sentence of the table in Note 2.
PANEL STATEMENT: There is no reference to "breakers" in Note 3.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Davis

(Log #4107)

13- 5 - (Table 450-3(a) Note 3): Reject
SUBMITTER: Robert E. Molde, Northern States Power Co./Rep. Wisconsin Utilities Assn.
RECOMMENDATION: Add a second sentence to Note 3 as follows:

3. A supervised location where conditions of maintenance and supervision ensure that only qualified persons will monitor and service the transformer installation. The qualified person can be either an employee at that location or an employee contracted for this purpose who is readily available.

SUBSTANTIATION: Depending upon the jurisdiction in an area, an interpretation could be made with the intent that the qualified individual must be an employee of that location. This restricts the use of highly qualified contract personnel, who are versed and trained in the installation, use, operation and maintenance of this equipment. This is already being done where qualified contractors are available.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "qualified persons" is defined in Article 100 and makes no reference to employment status.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Davis

(Log #916)

13- 6 - (450-6): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:

Secondary Ties. A secondary tie is a circuit operating at 600-volts, nominal, or less between phases that connects in parallel ~~two power sources or power supply points, such as~~ the secondaries of two transformers in different locations. The tie shall be permitted to consist one of ~~or more~~ conductor~~s~~ per phase or neutral or paralleled conductors in accordance with Section 310-4. The conductors interconnecting the secondaries of adjacent transformers operating in parallel as a unit as permitted in Section 450-7 shall not be considered a secondary tie.

As used in this section, the word transformer means a transformer or a bank of transformers operating as a unit.

(a) Tie Circuits. Ungrounded conductors of ~~Tie~~ tie circuits shall be provided with overcurrent protection at each ~~end~~ supply point ~~as required~~ in ~~Article 240~~ accordance with their ampacity as specified in Section 310-15.

Under the conditions described in (a)(1) and (a)(2), the overcurrent protection shall be permitted to be in accordance with (a)(3).

(1) Loads at Transformer Supply Points Only. Where all loads are connected at the transformer supply points at each end of the tie and covercurrent protection is not provided in accordance with ~~Article 240~~ (a), the rated ampacity of the tie shall not be less than 67 percent of the rated secondary current of the largest transformer ~~connected to~~ supplying the secondary tie system.

(2) Loads Connected Between Transformer Supply Points. Where load is connected to the tie at any point between transformer supply points and overcurrent protection is not provided in accordance with ~~Article 240~~ (a), the rated ampacity of the tie shall not be less than 100 percent of the rated secondary current of the largest transformer ~~connected to~~ supplying the secondary tie system.

Exception No. 1: ~~As otherwise provided in~~ Where the tie consists of paralleled conductors the provisions of Section 450-6(a)(4) shall apply.

Exception No. 2: Neutral conductors and the conductor connected to the midpoint of one phase winding shall be permitted to have an ampacity not less than the computed load.

(3) Tie Circuit Protection. Under the conditions described in (a)(1) and (a)(2), both supply ends of each individual ungrounded or grounded phase tie conductor shall be equipped with a protective device that will open at a predetermined temperature of the tie conductor under short-circuit conditions. This protective device shall consist of one of the following: (1) a fusible link cable connector, terminal, or lug, commonly known as a limiter, each being of a size corresponding with that of the conductor and of construction and characteristics according to the operating voltage and the type of insulation on the conductor~~s~~ or (2) an automatic circuit breaker actuated by devices having comparable current-time sensing characteristics as limiters.

(4) Interconnection of ~~Phase~~ Conductors Between Transformer Supply Points. Where the tie consists of more than one conductor per phase, neutral, or midpoint of one phase winding, the conductors of each phase, neutral, or midpoint of one phase winding shall comply with one of the following provisions.

(a) Interconnected. The conductors shall be interconnected ~~in order to establish a~~ at each load supply point, and where overcurrent protection in accordance with (a) is not provided the protection specified in (a)(3) shall be provided in each

individual tie conductor at this point on both sides of the interconnection. The means of interconnection shall have an ampacity not less than the load served.

(b) The loads shall be connected to ~~one or more~~ a set of individual conductors of a paralleled conductor tie without interconnecting the conductors of each phase, neutral, or midpoint of one phase winding and without the protection specified in (a)(3) at load connection points. Where this is done, the tie conductors of each phase shall have a combined ~~capacity~~ ampacity of not less than 133 percent of the largest transformer ~~connected to~~ supplying the secondary tie system, the total load ~~of~~ supplied by such taps shall not exceed the rated secondary current of the largest transformer, and the load shall be equally divided on each phase and on the individual conductors of each phase, insofar as practicable.

(5) Tie Circuit Control. Where the operating voltage exceeds 150 volts to ground, secondary ties provided with limiters shall have a switch at each supply end, that when open will de-energize the tie conductors and limiters. The current rating of each switch shall not be less than the rated current of the tie conductors connected to the switch. It shall be capable of safely interrupting ~~opening~~ its rated current, and it shall be constructed so that it will not open under the magnetic forces resulting from short-circuit current.

(b) Overcurrent Protection for Secondary Connections. Where secondary ties are used, an overcurrent device rated or set at not more than 250 percent of the rated secondary current of the transformer~~s~~ shall be provided in the secondary connections of each transformer supplying the system. In addition, an automatic circuit breaker actuated by a reverse-~~current~~ power relay set to open the circuit at not more than the secondary rated current of the transformer shall be provided in the secondary of each transformer.

(c) Grounding. Where the secondary tie system is grounded, each transformer secondary supplying the tie system shall be grounded in accordance with the requirements of Section 250-30 for separately derived systems.

SUBSTANTIATION: This proposal is largely editorial. The title of this article relates to transformers, as does the text, however the phrase "two power sources or power supply points" is not limited to transformers and could include batteries, generators, solar photovoltaic systems, services, etc. for which this section does not appear applicable or intended.

The proposed "in parallel" and "different locations" would clarify that conductors interconnecting the secondaries of two single-phase transformers in open-delta three-phase configuration, for example are excluded. Also conductors interconnecting secondaries of transformers covered by Section 450-7 are clearly excluded. This section doesn't appear applicable to those conductors, although not specifically excluded.

In (a) overcurrent protection is referenced to Section 310-15 to avoid any inference that location of overcurrent devices such as for tap rules, and protection by primary overcurrent devices may be applied.

Transformers are indicated as "supplying" rather than "connected to", which literally applies to transformers that may be supplied from the secondary tie.

Exception No. 2 provides for conductors not explicitly addressed. While use of secondary ties once may have been primarily involved with 3-wire three-phase ungrounded systems the text does not disallow grounded systems, grounded phase systems are noted in (3).

In (a)(4) provision is made for neutrals.

In (a)(4)(a) the reference to overcurrent protection in accordance with (a) is proposed, as where this basic rule is applied the requirements of (a)(3) for limiters does not seem necessary since the paralleled conductors between the source and load supply points are essentially one conductor, where the overcurrent protection of (a) should suffice since load is not limited to one conductor, as in (4)(b).

Section (a)(1) and (2) base their requirements on noncompliance with (a).

There is no specific reference to the ampacity of the interconnection in (a)(4)(a).

In (4)(b) the present wording appears to permit a load supplied by parallel conductors to have each individual phase conductor to be tapped to each individual phase conductor of the tie, whereby the paralleled load conductors do provide an interconnection between the tie conductors at the load end where they are connected together.

Proposed (c) provides specific grounding requirements for a somewhat unique installation. Do two transformers with interconnected conductors meet the definition of separately derived systems? Section 250-20 may require the system to be grounded, but if it is not defined as separately derived, or a service, what specific rules re: bonding, grounding conductor, grounding electrode, etc. apply? It appears preferable to treat each supply transformer as a separately derived system rather than have grounding/bonding at only one which would provide the grounding/bonding for another transformer which may be at a considerable distance with perhaps a different kVA rating.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has misinterpreted the intent of Section 450-6. The requirements of Section 450-6 apply to the secondary ties of transformers as defined by the scope of Article 450. Present requirements already cover transformers in parallel and networking systems.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Davis

(Log #2896)

13- 7 - (450-11): Reject

SUBMITTER: James Maldonado, City of Tempe, AZ/Rep. Central Arizona Chapter IAEI

RECOMMENDATION: Revise Section 450-11 to read as follows:

450-11. Marking. Each transformer shall be provided with a nameplate giving the name of the manufacturer, rated kilovolt-amperes, frequency, primary and secondary or high and low voltage, impedance of transformers 25 KVA and larger, required clearances for transformers with ventilating openings, and the amount and kind of insulating liquid where used. In addition, the nameplate of each dry-type transformer shall include the temperature class for the insulation system.

SUBSTANTIATION: Transformers may be listed and labeled as primary and secondary - which must be connected in that manner. They may also be Listed and Labeled as High Votlage and Low Votlage - In which case the transformer may be reverse connected. This change will provide wording acknowledging this reverse connection capability.

PANEL ACTION: Reject.

PANEL STATEMENT: The primary winding is defined as the winding on the energy input side by ANSI/IEEE C57. The submitter has misinterpreted the marking requirements of national recognized standards.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Davis

(Log #416)

13- 8 - (450-21(a), Exception): Reject

SUBMITTER: Shree G. Khaitan, Pennell & Wiltberger, Inc.

RECOMMENDATION: Revise to read as follows:

This rule shall not apply to transformers ~~rated for 600 volts, nominal, or less,~~ completely enclosed, with or without ventilating openings, provided:

(i) The transformers are rated for 600 volts nominal or less; or

(ii) The transformers are with Class 155 or higher insulation systems.

SUBSTANTIATION: There does not appear to be any logical justification to exclude transformers like fire pump transformers, which are over 600 volts and rated 112 1/2 kva or less, from the benefit of rule 450-21(b), Exception No. 2.

The proposed change will correct this anomaly.

PANEL ACTION: Reject.

PANEL STATEMENT: The higher fault energy available in supply systems rated above 600 volts warrants transformers with windings rated above 600 volts to have greater separation from combustible materials.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

(Log #2434)

13- 9 - (450-21(d) (New)): Reject
SUBMITTER: Dennis Kaunzner, City of Sierra-Vista, AZ
RECOMMENDATION: Add new text to read:
450-21(d) All transformers shall be required to maintain the same clearances as light fixtures in clothes closets (410-8). This would include all signaling, doorbell, security, alarm signaling, transformers.
SUBSTANTIATION: These small transformers create enough heat that if they are against something such as tissue paper they will start fires. A doorbell transformer where the button sticks has caused two known fires in our area.
PANEL ACTION: Reject.
PANEL STATEMENT: The installation defined by the submitter is covered in Section 450-21(a).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Davis

(Log #3744)

13- 10 - (450-23(a)(1)(c)): Reject
SUBMITTER: C. Patrick McShane, Cooper Power Systems
RECOMMENDATION: Delete requirement c:
"A liquid containment area is provided."
SUBSTANTIATION: Statement of Problem:
1) The requirement has proven to be unnecessary for fire protection and safety for indoor installations of less-flammable liquid-filled transformers.
2) The inclusion of requirement of a liquid confinement area, item "c" of Section 450-23 (a)(1) goes beyond the stated purpose of the NEC per Section 90-1.
Substantiation:
1) FMRC dropped transformer clearance requirements based on expectations of pool fires and related heat release from their Loss Prevention Data Sheet 5-4/14-8, October 1994 and subsequent revisions. This change was based on the fire safety history of less-flammable dielectric liquids, and on no ignition of pools of these liquids in worse case scenario testing.
2) FMRC dropped testing and publishing listed approved dielectric fluids heat release ratings, effective in the May 1999 - FMRC Approval Guide for Electrical Equipment.
3) The pool fire scenario for less-flammable liquid-filled transformers was never incorporated by Underwriters Laboratories in their listing (Classification) requirements.
4) There has never been a pool fire reported involving less-flammable dielectric fluids since their introduction in 1975, with over two hundred-thousand transformers in service.
5) Prior to the 1981 NEC, containment was not a requirement in 450-23. There have been no reports of problems with such indoor installations. (The push for the 1981 NEC Article 450 to add the requirement for a containment area was based on the concept of having a pool fire.)
6) High temperature, high fault current, high voltage "worse case scenario" tests performed under Underwriters Laboratories witnessing resulted in no ignition of a pool of any listed less-flammable dielectric liquid tested.
7) High temperature, sustained high current, low voltage tests "worse case scenario" designed and performed under Factory Mutual Laboratories witnessing resulted in no ignition of a pool of any listed less-flammable dielectric liquid.
8) Field case histories of less-flammable liquid-filled transformers that have experienced severe internal arcing faults also provide interesting insight. Even when the arcing has been so severe as to burn through the tank walls, no ignition of the liquid has occurred.
9) Arguments for the need for the containment for indoor installations based on either environmental issues or for elimination of physical nuisance in the unlikely case of significant leakage are beyond the scope of NEC 70. No listed less-flammable liquid is listed as a hazardous material by the EPA. (See Article 90-1).

Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The scope of Section 90-1, states: " The purpose of this code is the practical safeguarding of persons and property from hazards arising from the use of electricity." If the installation of liquid filled electrical equipment can result in damage to property or hazards to individuals by the release of liquid, then the requirement for containing liquid electrical insulating materials should stand.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:

NOT RETURNED: 1 Davis

(Log #CP1302)

13- 10a - (450-27): Accept
SUBMITTER: CMP 13
RECOMMENDATION: Modify the second paragraph of Section 450-27 to read as follows:
"450-27. Oil-Insulated Transformers Installed Outdoors. In cases where the transformer installation presents a fire hazard, one or more of the following safeguards shall be applied according to the degree of hazard involved:
(1) Space separations
(2) Fire-resistant barriers
(3) Automatic fire suppression systems
(4) Enclosures that confine the oil of a ruptured transformer tank "
SUBSTANTIATION: The text was modified to change the wording from explanatory to mandatory language. The phrase "water spray" was changed to "fire suppression" to recognize other acceptable types of automatic fire suppression systems.
PANEL ACTION: Accept.

ARTICLE 480 — STORAGE BATTERIES

(Log #40)

15- 6 - (480-3): Reject
NOTE: The following proposal consists of Comment 15-6 on Proposal 15-13 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 15-13 was:
Revise Article 480 as follows:
Article 480 - Storage Batteries
The provisions of this article shall apply to all stationary installations of storage batteries.
480-2. Definitions.
Storage Battery: A battery comprised of one or more rechargeable cells of the lead-acid, nickel-cadmium, or other rechargeable electrochemical types.
Sealed Cell or Battery: A sealed cell or battery is one that has no provision for the addition of water or electrolyte or for external measurement of electrolyte specific gravity. The individual cells shall be permitted to contain a venting arrangement as described in Section 480-9(b).
Nominal Battery Voltage: The voltage computed on the basis of 2.0 volts per cell for the lead-acid type and 1.2 volts per cell for the alkali type.
480-3. Wiring and Equipment Supplied from Batteries.
Wiring and equipment supplied from storage batteries shall be subject to the requirements of this Code applying to wiring and equipment operating at the same voltage.
480-4 Disconnecting Means. A means shall be provided and shall be capable of disconnecting all batteries from the circuit. A disconnecting means shall not be required between individual groups of cells.
480-45. Grounding.
The requirements of Article 250 shall apply.
480-56. Insulation of Batteries of Not Over ~~250~~300 Volts. This section shall apply to storage batteries having cells so connected as to operate at a nominal battery voltage of not over ~~250~~ 300 volts.
(a) Vented Lead-Acid Batteries. Cells and multicompartment batteries with covers sealed to containers of nonconductive, heat-resistant material shall not require additional insulating support.
(b) Vented Alkaline-type Batteries. Cells with covers sealed to jars of nonconductiveheat-resistant material shall require no additional insulation support. Cells in jars of conductive material shall be installed in trays of nonconductive material with not more than 20 cells (24 volts, nominal) in the series circuit in any one tray.
(c) Rubber Jars. Cells in rubber or composition containers shall require no additional insulating support where the total nominal voltage of all cells in series does not exceed 150 volts. Where the total voltage exceeds 150 volts, batteries shall be sectionalized into groups of 150 volts or less, and each group shall have the individual cells installed in trays or on racks.
(d) Sealed Cells or Batteries. Sealed cells and multicompartment sealed batteries constructed of nonconductive, heat-resistant material shall not require additional insulating support. Batteries constructed of a conducting container shall have insulating support if a voltage is present between the container and ground.
480-67. Insulation of Batteries over ~~250~~300 Volts. The provisions of Section 480-5 shall apply to storage batteries having the cells so connected as to operate at a nominal voltage not exceeding ~~250~~300 volts and, in addition, the provisions of this section shall also apply to such batteries.
(1) Cells in each group shall be series connected.
(2) Cells shall be installed in groups having a total nominal voltage of not over 250300 volts.
(3) Groups shall be separated by a minimum of 12 in. of air or by barrier of suitable insulating material. ~~Insulation which can be air, shall be provided between groups and shall have a minimums~~
(4) Groups shall be of equal potential.
(5) Separation shall be maintained between live battery parts of opposite polarity of 2 in. (50.8 mm) for battery voltages not exceeding 300 volts.
(6) Batteries or cells in a group shall be series connected.
480-8. Working Space. Racks and Trays shall be readily accessible with a minimum of 36 in. of clear working space on one side.
(1) Where racks or trays are readily accessible from the front only, the depth shall not exceed 36 in. with a minimum of 36 in. of clear working space on one side.
(2) Where racks or trays are readily accessible from both sides the depth shall not exceed 60 in. with a minimum of 36 in. of clear working space on both sides.
480-79 Racks and Trays. Racks and trays shall comply with (a) and (b) below.
(a) Racks. Racks, as required in this article, are rigid frames designed to support cells or trays. They shall be substantial and made of:
(1) Metal, so treated as to be resistant to deteriorating action by the electrolyte and provided with nonconducting members directly supporting the cells or with continuous insulating material other than paint or conducting members; or
(2) Other construction such as fiberglass or other suitable nonconductive materials.
(b) Trays. Trays are frames, such as crates or shallow boxes usually of wood or other nonconductive material, so constructed or treated as to be resistant to deteriorating action by the electrolyte.
480-810. Battery Locations. Battery locations shall conform to (a) and (b) below.
(a) Ventilation. Provisions shall be made for sufficient diffusion and ventilation of the gases from the battery to prevent the accumulation of an explosive mixture.
(b) Live Parts. Guarding of live parts shall comply with Section 110-17.
480-911. Vents.
(a) Vented Cells. Each vented cell shall be equipped with a flame arrester designed to prevent destruction of the cell due to ignition of gases within the cell by an external spark or flame under normal operating conditions.
(b) Sealed Cells. Sealed battery/cells shall be equipped with a pressure-release vent to prevent excessive accumulation of gas pressure, or the battery/cell shall be designed to prevent scatter of cell parts in event of a cell explosion.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Accept in principle in part, revised as follows:

480-3 Wiring and equipment supplied from batteries. Wiring and equipment supplied from storage batteries shall be subject to the requirements of this Code applying to wiring and equipment at the same voltage.

Exception. Overcurrent protection shall not be required for circuit conductors supplied by a battery rated 50 volts or less where used for starting, ignition, or control of prime movers and the conductors are short as practicable. Such conductors shall not be required to comply with Section 300-3(a).

SUBSTANTIATION: Section 240-1 indicates Section 240-3 Part A through G provides requirements for conductor overcurrent protection, 600 volts or less. While I don't believe Article 720 is intended to apply nevertheless Section 720-1 indicates battery circuits of less than 50 volts are not exempted from Article 720. Section 720-8 indicates overcurrent protection shall comply with Article 240. There does not appear to be any specifics in Articles 445, 517, 700, 701, or 702 which modify Sections 240-3 or 300-3(a). Section 300-1(b) does not apply since these conductor installations are generally made in the field. Since Chapters 1 through 4 apply generally an Exception is warranted to legitimize an accepted practice which does not comply with Code rules.

If this comment is accepted a correlating exception may be desirable for Sections 240-1 and 300-3(a).

PANEL ACTION: Reject.

PANEL STATEMENT: Normally the batteries addressed by the submitter's proposal are part of a unit and therefore not subject to individual requirements of the code as suggested by the proposer.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 19

COMMENT ON AFFIRMATIVE:

JOHNSON: It should be understood that the panel agrees with the proposer that engine cranking battery cables should not be required to have overcurrent protecton. While the battery cables are usually furnished with the unit, they may not be.

(Log #918)

15- 7 - (480-3 Exception No. 1 and No. 2 (New)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Add exceptions to read as follows:

Exception No. 1: Overcurrent protection shall not be required for conductors supplied by a battery rated less than 50 volts where the battery provides power for starting, ignition, or control of prime movers and the conductors are as short as practicable. Such conductors shall not be required to comply with Section 300-3.

Exception No. 2: Overcurrent protection shall not be required for conductors that interconnect terminals of batteries or battery cells provided the conductors are as short as practicable and the conductors supplied by the battery are protected in accordance with Section 240-3. Conductors that interconnect batteries or battery cells shall not be required to comply with Section 300-3.

SUBSTANTIATION: Section 240-1 indicates Article 240 Parts A through G provides requirements for conductor overcurrent protection, 600 volts or less. While I don't believe Article 720 is intended to apply to the installation proposed in Exception No. 1, nevertheless Section 720-1 does not indicate such installations are exempt.

Section 720-8 indicates overcurrent protection shall comply with Article 240.

This section also indicates wiring is subject to other code requirements (e.g., Sections 240-3 and 300-3). There does not appear to be any specifics in this article or Articles 517, 695, 700, 701, or 702 re: battery systems wiring for engine generators which modify Sections 240-3 or 300-3. Section 300-1(b) does not apply to wiring done in the field, which is the case for most installations covered in the proposal.

PANEL ACTION: Reject.

PANEL STATEMENT: Normally the batteries addressed by the submitter's proposal are part of a unit and therefore not subject to individual requirements of the code as suggested by the proposer.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 19

(Log #316)

15- 8 - (480-3(a) (New)): Reject

SUBMITTER: Christopher M. Johnston, R. L. Daniell & Assoc., P.C.

RECOMMENDATION: Add a new paragraph (a) to 480-3 to read as follows:

(a) Short-Time Ampacity. Where the application ensures that the period of maximum battery discharge does not exceed 60 minutes, the allowable ampacities of conductors shall be as shown in Table 610-14(a).

SUBSTANTIATION: Uninterruptible power supply systems typically include storage batteries with discharge times of 60 minutes or less. Using Table 610-14(a) ampacities for these situations results in smaller conductor sizing. This smaller conductor sizing reduces mechanical stress on battery terminal plates and battery posts to which the conductors attach. The reduced stress enhances battery service life.

PANEL ACTION: Reject.

PANEL STATEMENT: The conductors in the proposal are typically part of a unit which is tested by a Nationally Recognized Testing Laboratory with different guidelines.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

PASTERNACK: The Panel Statement indicates that units are tested by a NRTL with battery conductors included.

This is true for small UPS systems. It is normally not true for systems over 100 kVA. In these large systems the battery backup is normally supplied as an input service to the UPS.

The passage of the original request or at least reconsideration seems justified.

(Log #477)

15- 9 - (480-6): Accept

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Change “2 in. (50.8 mm)” to “50 mm (2 in.)”

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 19

(Log #2478)

15- 10 - (480-8(d) (New)):

Note: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual relative to the word “such” in the last sentence of the Panel Action. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Gordon S. Johnson, Dundee, FL

RECOMMENDATION: Add new paragraph (d) to read as follows:

Where the total free electrolyte in a single battery installation exceeds 50 gallons, each rack of batteries, or group of racks, shall be provided with a liquid-tight, 100 mm spill containment barrier which extends at least 25 mm beyond the battery rack in all directions.

SUBSTANTIATION: Battery electrolyte is an extremely hazardous material that if spilled due to a leaky cell can cause damage to surrounding equipment and serious injury to personnel. Where not contained the cleanup of such spills can be difficult.

Battery Electrolyte Spill Containment. This proposal is the result of a proposal for change to NFPA 111, Stored Energy Emergency and Standby Power Systems, that was accepted by the committee and then sent back to the committee by the NFPA Fall Meeting. Subsequently the proposal was rejected by the committee without any action for further development. That proposal was not well thought out and should not have been accepted in the first place, however, it stirred up much interest in the industry. The present proposal is essentially what was recommended by the Battery Council International. It is based upon a requirement in the Universal Fire Code (UFC) Section 64

with one essential difference. Section 64 of the UFC does not differentiate on the type of electrolyte. Therefore, some inspectors apply it to VLRA batteries, which do not have free electrolyte and containment serves no function. The current proposal applies only to batteries with free electrolyte. I have been informed that the UFC is considering making that change.

I am proposing adding this requirement to NEC Article 480 because the NEC, not NFPA 111, is responsible for installation. Further, the NEC is required in virtually all jurisdictions in the USA, while the Universal Fire Code is not widely known in many parts of the country.

The Institute of Electrical and Electronics Engineers under their Standards Coordinating Committee 29 has set up a working group to study battery electrolyte spill containment. The report of that working group, of which I am a member, will not be available until after the deadline for proposals but according to schedule should be available by the January code panel meeting.

PANEL ACTION: Accept in Principle.

Revise the submitter's recommendation to read as follows:

Add new paragraph (d) to read as follows:

(d) Electrolyte Containment. Where the total free electrolyte in a single battery installation exceeds 190 liters (50 gallons), each rack of batteries, or group of racks, shall be provided with a liquid-tight, 100 mm (4 in.) spill containment barrier which extends at least 25 mm (1 in.) beyond the battery rack in all directions.

Steel encased NiCad batteries shall have a containment system such that there is no contact between the spilled electrolyte and the steel casing of adjacent cells.

PANEL STATEMENT: The added second paragraph addresses the concerns of steel contained NiCad batteries to prevent shorting cells through the spilled electrolyte.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

TRIFFO: "The CMA agrees in principle that a spill containment barrier be required under the conditions specified (50 gallons free electrolyte in a single battery installation), however, the proposed wording defining requirements for such a barrier does not adequately convey their intent. Is it intended to contain the volume of electrolyte from one cell in the rack, or for all cells? Either way, can it be demonstrated that the proposed dimensions are adequate for every installation? It would be more appropriate simply to require the containment barrier dimensions to be adequate to contain a specific electrolyte volume."

COMMENT ON AFFIRMATIVE:

JOHNSON: Battery spill containment takes care of only a part of the problem. Disposal and neutralization of the spilled liquid need to be considered.

ARTICLE 490 — EQUIPMENT, OVER 600 VOLTS, NOMINAL

(Log #578)

13- 18 - (490): Accept

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: 1. In Section 490-3, replace "10 gal. (37.85 L)" with "38 L (10 gal.)".

2. In Section 490-21(d)(7), replace "5 ft. (1.52 m)" with "1.5 m (5 ft.)".

3. In Section 490-38, replace "12 ft.^{2} (1.11 m^2)" with "1.1 m^2 (12 ft.^{2})".

4. In Section 490-38, replace "60 lb. (27.22 kg)" with "27 kg (60 lb.)".

5. In Section 490-41(a), replace "78 in. (1.98 m)" with "2.0 m (78 in.)".

6. In Section 490-41(a) Exception, replace "50 lb.(22.68 kg)" with "23 kg (50 lb.)".

7. In Section 490-41(a) Exception, replace "66 in. (1.68 m)" with "1.7 m (66 in.)

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement.

PANEL ACTION: Accept.

(Log #2193)

13- 19 - (490-2): Accept

NOTE: The Technical Correlating Committee advises that "high voltage" is acceptable as presently used in the NEC.

SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.

RECOMMENDATION: Revise as follows:

For the purposes of this article, high voltage is ~~shall be defined as~~ more than 600 volts, nominal.

SUBSTANTIATION: This is a definition. It should be stated in a declarative sentence and should not use mandatory rule language, such as "shall be." Definitions shall not contain requirements. See the NEC Style Manual 2.2.2 and 3.1.

PANEL ACTION: Accept.

PANEL STATEMENT: The panel recommends that TCC review the term "high voltage". The term is not consistent with other ANSI standards as used in the NEC.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Davis

(Log #4444)

13- 20 - (490-4): Reject

SUBMITTER: Frants Marvin Jensen, Consolidated Engr Labs

RECOMMENDATION: Add new paragraph 490-4:

Workspace required by 110-34 shall be flat.

SUBSTANTIATION: Should be self evident.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal should have addressed changes to Section 110-34, not Article 490.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NOT RETURNED: 1 Davis

(Log #3271)

13- 21 - (490-4(b)): Accept in Principle

SUBMITTER: Alan Manche, Square D Co.

RECOMMENDATION: Revise 490-44(b) with the additions (underlined) and deletions (strike through) as shown. The entire text is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.

(b) Backfeed. Where fuses can be energized by backfeed, a sign shall be placed on the enclosure door ~~reading~~ with the following words or equivalent:

WARNING - FUSES MAY BE ENERGIZED BY BACKFEED.

SUBSTANTIATION: The explicit nature of the present wording is causing field problems in the acceptance of appropriate warning signs or markings. The ANSI Z535 series of standards provides the proper procedure in establishing a hazard sign or marking. ANSI Z535.4 provides the information about what

should be contained in a hazard sign or label. This includes a message panel that identifies the hazard, indicates how to avoid the hazard and advises the probable consequence of not avoiding the hazard.

The objective of the NEC wording is to generally convey the basic message requirement to user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would allow a hazard sign to comply with the NEC, but be formated in accordance with Z535.4.or equivalent" would allow a warning sign to comply with the NEC, but be formated in accordance with Z535.4.

PANEL ACTION: Accept in Principle.

Modify Section 490-44(b) to read as follows:

"(b) Backfeed. Where fuses can be energized by backfeed, a sign shall be placed on the enclosure door identifying this hazard." Delete the words "WARNING-FUSES MAY BE ENERGIZED BY BACKFEED."

PANEL STATEMENT: The specific wording is removed to permit appropriate hazard sign development. A FPN is proposed in Section 490-1 for reference to ANSI Z535 for sign development.

(Log #CP1307)

13- 21a - (490-21(a)(1), through 9): Accept

SUBMITTER: CMP 13

RECOMMENDATION: Modify Section 490-21(a) 1 through 9 to read as follows:

"490-21 Circuit-Interrupting Devices

(A) Circuit Breakers.

(1) Location.

(a) Circuit breakers installed indoors shall be mounted either in metal-enclosed units or fire-resistant cell-mounted units, or they shall be permitted to be open mounted in locations accessible to qualified persons only.

(b) Circuit breakers used to control oil-filled transformers shall be located either outside the transformer vault or be capable of operation from outside the vault.

(c) Oil circuit breakers shall be arranged or located so that adjacent readily combustible structures or materials are safeguarded in an approved manner.

(2) Operating Characteristics. Circuit breakers shall have the following equipment or operating characteristics.

(a) An accessible mechanical or other approved means for manual tripping, independent of control power.

(b) Be release free (trip free).

(c) If capable of being opened or closed manually while energized, the main contacts shall operate independently of the speed of the manual operation.

(d) A mechanical position indicator at the circuit breaker to show the open or closed position of the main contacts.

(e) A means of indicating the open and closed position of the breaker at the point(s) from which they may be operated.

(3) Nameplate. A circuit breaker shall have a permanent and legible nameplate showing manufacturer's name or trademark, manufacturer's type or identification number, continuous current rating, interrupting rating in megavolt-amperes (MVA) or amperes, and maximum voltage rating. Modification of a circuit breaker affecting its rating(s) shall be accompanied by an appropriate change of nameplate information.

(4) Rating. Circuit breakers shall have the following ratings:

(a) The continuous current rating of a circuit breaker shall not be less than the maximum continuous current through the circuit breaker.

(b) The interrupting rating of a circuit breaker shall not be less than the maximum fault current the circuit breaker will be required to interrupt, including contributions from all connected sources of energy.

(c) The closing rating of a circuit breaker shall not be less than the maximum asymmetrical fault current into which the circuit breaker can be closed.

(d) The momentary rating of a circuit breaker shall not be less than the maximum asymmetrical fault current at the point of installation.

(e) The rated maximum voltage of a circuit breaker shall not be less than the maximum circuit voltage."

SUBSTANTIATION: The existing text was reformatted and edited to meet the requirements of the NEC Style Manual.

PANEL ACTION: Accept.

13- 23 - (490-21(b)(7), Exception): Accept in Principle

SUBMITTER: Alan Manche, Square D Co.

RECOMMENDATION: Revise 490-21(b)(7) Exception with the additions (underlined) and deletions (strike through) as shown. The entire text is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.

Exception: More than one switch shall be permitted as the disconnecting means for one set of fuses where the switches are installed to provide connection to more than one set of supply conductors. The switches shall be mechanically or electrically interlocked to permit access to the fuses only when all switches are open. A conspicuous sign shall be placed at the fuses ~~reading~~ with the following words or equivalent:

WARNING - FUSES MAY BE ENERGIZED FROM MORE THAN ONE SOURCE.

SUBSTANTIATION: The explicit nature of the present wording is causing field problems in the acceptance of appropriate warning signs or markings. The ANSI Z535 series of standards provides the proper procedure in establishing a hazard sign or marking. ANSI Z535.4 provides the information about what should be contained in a hazard sign or label. This includes a message panel that identifies the hazard, indicates how to avoid the hazard and advises the probable consequence of not avoiding the hazard.

The objective of the NEC wording is to generally convey the basic message requirement to user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would allow a hazard sign to comply with the NEC, but be formatted in accordance with Z535.4.

PANEL ACTION: Accept in Principle.

Modify Section 490-21(b)(7) Exception to read as follows:

"Exception: More than one switch shall be permitted as the disconnecting means for one set of fuses where the switches are installed to provide connection to more than one set of supply conductors. The switches shall be mechanically or electrically interlocked to permit access to the fuses only when all switches are open. A conspicuous sign shall be placed at the fuses identifying the presence of more than one source."

Revise wording to delete : "WARNING - FUSES MAY BE ENERGIZED FROM MORE THAN ONE SOURCE."

PANEL STATEMENT: The specific wording is removed to permit appropriate hazard sign development. A FPN is proposed in Section 490-1 for reference to ANSI Z535 for sign development.

(Log #3960)

13- 28 - (490-46 (New)): Reject
SUBMITTER: Neil F. LaBrake, Jr., Niagara Mohawk Power Corp.
RECOMMENDATION: Add a new Section 490-46 to Part C of Article 490 as follows:

490-46. Metal Enclosed and Metalclad Service Equipment.

(a) General. Metal enclosed and metalclad switchgear installed as high-voltage service equipment shall have separation between service and feeder or branch circuit equipment

FPN: Local serving utilities may have additional requirements for high-voltage service equipment. See ANSI/IEEE C2-1997 Sections 18 and 38 for further information.

(b) Service Conductor Termination Compartment. The high-voltage service conductors shall terminate in a separate compartment with the following:

(1) A solid hinged door, which is latched or bolted, shut and has provisions for padlocking with a sign marked: "DANGER - High Voltage Within - Keep Out - Access Restricted to Qualified Persons Only".

FPN: Most local serving utilities require to be contacted to enter this line connection compartment.

(2) Provisions to mount and connect surge arresters.

(3) Live front construction shall have an inner barrier marked "DANGER ____ Volts" allowing inspection without opening. Each phase bus shall have a bare bus bar extension for potential checks and application of safety grounds. Clearances of these bus extension shall comply with Table 490-24. The cable termination shall permit the service cable to be supported to minimize forces applied to conductor terminals.

(4) Dead front construction shall be equipped with elbow ports, and provisions for parking station.

(5) Provisions for a ground bus extension to connect service cable termination shields and a safety ground attachment meeting local supplying utility requirements.

(6) Only the following high-voltage equipment may be installed in this compartment; service conductors and terminations, surge arresters, utility metering transformers, insulators, bus, and associated line side primary parts of the main disconnecting device, including current transformers for protective relaying.

(c) Service Overcurrent Protective Device. Access for maintenance of the service fuses, circuit breaker or circuit interrupter shall not expose personnel to live parts connected to the service conductors. Barriers rack-out mechanisms and interlocks with disconnect or isolating switches are recognized safeguards to provide this isolation.

(d) Access. Access to exposed live parts in excess of 600 V shall require (1) the opening of a door or barrier that is locked or otherwise secured against unauthorized entry and (2) by either the opening of a door or the removal of a barrier.

FPN: A prominent and appropriate safety sign should be visible when the first door or barrier is opened or removed. Note: ANSI Z535.1-1991, ANSI Z535.2-1991; ANSI Z535.3-1991; ANSI Z535.4-1991, and ANSI Z535.5-1991 contain information regarding safety signs.

SUBSTANTIATION: This proposal will establish a minimum requirement for high-voltage service equipment, identifying and isolating the service conductors and associated equipment which must be de-energized by the serving utility from the load related equipment which is under the control of the premise management. Provisions are also made for applications of safety grounds or electrical isolation during maintenance procedures for both the utility and the customer.
PANEL ACTION: Reject.
PANEL STATEMENT: Most of the issues presented by the submitter are product requirements which should be addressed by proposals to the product standards. Serving utilities have differing requirements which may not be addressed by the proposal.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 1
NOT RETURNED: 1 Davis

EXPLANATION OF NEGATIVE:
FOGARTY: Current high-voltage product standards do not address minimum requirements for metal enclosed and metalclad equipment to be installed as high-voltage service entrance equipment. This proposal is an attempt to establish minimum performance based requirements that would satisfy user, utility and manufacturer concerns. These areas include but are not limited to the following:

- Utility access to service terminations for isolation, grounding and or testing
- Separation between service and feeder or branch circuit equipment
- A minimum standard to facilitate listing and labeling of this equipment for use as high-voltage service entrance equipment.

This negative comment is offered to foster public comment and encourage utilities, users, and manufacturers to submit recommendations to assist in the development and acceptance of this new section.

(Log #2169)

13- 29 - (490-51(a)): Reject
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise to read as follows:
490-51(a) ~~Covered~~ Scope. The provisions of this part...
SUBSTANTIATION: It is common practice to use scope as the title of a subsection rather than covered. The NEC Style Manual foreword states, "It is vitally important ... that maximum consistency be achieved in the language of the text.
PANEL ACTION: Reject.
PANEL STATEMENT: The NEC Style Manual Section 2.2.1 states: "Each article shall have a scope, which shall be the first section of the article."
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NOT RETURNED: 1 Davis

(Log #2173)

13- 30 - (490-51(b)): Reject
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
Other Articles ~~Requirements.~~

... those prescribed in Articles 100 through 725 of this code especially ~~special attention shall be paid to~~ Article 250.

SUBSTANTIATION: As written, this section is possibly unenforceable because of the vague expression "special attention shall". The authority having jurisdiction can not judge "special attention". This section should be rewritten to be consistent with many other similar articles in the code, for example, 320-2 and 324-2.
PANEL ACTION: Reject.
PANEL STATEMENT: The use of the term "especially" does not improve the enforceability of the code.

(Log #CP1401)

14- 2a - (500): Accept

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. Further, it was the action of the Technical Correlating Committe this this Proposal be reconsidered by the Panel, with further consideration given to the comments expressed in the voting, specifically with respect to comments that the accepted Proposal does not accurately reflect what was agreed upon by the Panel. It is the understanding of the Technical Correlating Committee that this proposal is modified by Proposals 14-4a, 14-6, 14-20, 14-21, 14-33, 14-34, 14-38, 14-39, 14-42, 14-43, 14-44, 14-45, 14-46, 14-47, 14-48, and 14-57a. This action will be considered by the Panel as a Public Comment.

SUBMITTER: CMP 14

RECOMMENDATION: Revise Article 500 as shown:

Entire 500 with recommended changes would appear as follows:

ARTICLE 500 –
Hazardous (Classified) Locations, Classes I, II, and III, Divisions 1 and 2

500-1. Scope — Articles 500 through 504
Articles 500 through 504 cover the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Divisions 1 and 2; Class II, Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, combustible dust, or ignitible fibers or flyings.

FPN: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors, or flammable liquids, refer to Article 505.

500-2 Definitions. For purposes of Articles 500 through 504 and Articles 506 through 516, the following definitions apply.

Identified (as applied to equipment). Recognizable as suitable for the specific purpose, function, use, environment, application, etc., where prescribed in a particular Code requirement.

FPN: Suitability of equipment for a specific purpose, environment, or application may be determined by:

1. equipment listing or labeling;
2. evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation; or
3. other evidence acceptable to the authority having jurisdiction such as a manufacturer's self evaluation or an owner's engineering judgement.

(See definitions of *Labeled* and *Listed*)

Unclassified Locations. Locations that have been evaluated by the classification process defined in Section 500-~~3~~5(a) or Section 505-~~3~~-5 (a) and determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof.

Nonhazardous Locations. Locations which are not required to have been evaluated by the process defined in 500-~~3~~-5 (a) or 505-~~3~~5(a).

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with an electrical installation, as well as any portable or transportable device having a battery or other electrical power source. (14-6)

Dust-ignitionproof. Equipment enclosed in a manner that will exclude dusts and will not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.

FPN: For further information on dust-ignitionproof enclosures, see Type 9 enclosure in Enclosures for Electrical Equipment, ANSI/NEMA 250-1991, and Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations, ANSI/UL 1203-1994.

Dusttight. Enclosures constructed so that dust will not enter under specified test conditions.

FPN: See Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA S12.12-1994, and Electrical Equipment for Use in Class I and II, Division 2 and Class III Hazardous (Classified) Locations, UL 1604-1994.

Explosionproof Apparatus. Apparatus enclosed in a case that is capable of withstanding an explosion of a specified gas or vapor that may occur within it and of preventing the ignition of a specified gas or vapor surrounding the enclosure by sparks, flashes, or explosion of the gas or vapor within, and that operates at such an external temperature that a surrounding flammable atmosphere will not be ignited thereby.

FPN: For further information, see Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations, ANSI/UL 1203-1994.

Purged and Pressurized. The process of supplying an enclosure with a protective gas, at a sufficient flow and positive pressure to reduce the concentration of any flammable gas or vapor initially present to an acceptable level.

FPN: For further information, see Purged and Pressurized Enclosures for Electrical Equipment, ANSI/NFPA 496-1998.

Nonincendive Circuit. A circuit, other than field wiring, in which any arc or thermal effect produced under intended operating conditions of the equipment, is not capable, under specified test conditions, of igniting the flammable gas–, vapor–, or dust–air mixture.

FPN: For further information see Nonincendive Electrical Equipment for Use in Class I and II, Division 2 and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA-S12.12-1994.

Nonincendive Field Wiring. Wiring that enters or leaves an equipment enclosure and, under normal operating conditions of the equipment, is not capable, due to arcing or thermal effects, of igniting the flammable gas–, vapor–, or dust–air mixture. Normal operation includes opening, shorting, or grounding the field wiring.

Nonincendive Equipment. Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing ignition of a specified flammable gas–, vapor–, or dust–air mixture due to arcing or thermal means.

FPN: For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA-S12.12-1994.

Nonincendive Component. A component having contacts for making or breaking an incendive circuit and the contacting mechanism shall be constructed so that the component is incapable of igniting the specified flammable gas– or vapor–air mixture. The housing of a nonincendive component is not intended to exclude the flammable atmosphere or contain an explosion.

FPN: For further information, see Electrical Equipment for Use in Class I and II, Division 2, and Class III Hazardous (Classified) Locations, UL 1604-1994.

Oil Immersion. Electrical equipment immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

FPN: For further information, see Industrial Control Equipment for Use in Hazardous (Classified) Locations, ANSI/UL 698-1995.

Hermetically Sealed. Equipment sealed against the entrance of an external atmosphere where the seal is made by

fusion, e.g., soldering, brazing, welding, or the fusion of glass to metal.

FPN: For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations, ANSI/ISA S12.12-1994.

500-~~2~~3. Other Articles
Except as modified in Articles 500 through 504, all other applicable rules contained in this Code shall apply to electrical equipment and wiring installed in hazardous (classified) locations.

500-~~3~~4 General
(a) Documentation All areas designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

(b) Reference Standards.

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with the standards of the National Fire Protection Association, the American Petroleum Institute, and the Instrument Society of America that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

FPN No. 2: For further information on the classification of locations, see Flammable and Combustible Liquids Code, NFPA 30-1996; Standard for Drycleaning Plants, NFPA 32-1996; Standard for Spray Application Using Flammable or Combustible Materials, NFPA 33-1995; Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids, NFPA 34-1995; Standard for the Manufacture of Organic Coatings, NFPA 35-1995; Standard for Solvent Extraction Plants, NFPA 36-1997; Standard on Fire Protection for Laboratories Using Chemicals, NFPA 45-1996; Standard for Gaseous Hydrogen Systems at Consumer Sites, NFPA 50A-1994; Standard for Liquefied Hydrogen Systems at Consumer Sites, NFPA 50B-1994; Liquefied Petroleum Gas Code, NFPA 58-1998; Standard for the Storage and Handling of Liquefied Petroleum Gases at Utility Gas Plants, NFPA 59-1998; Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997; Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997; Standard for Fire Protection in Wastewater Treatment and Collection Facilities, NFPA 820-1995; Recommended Practice for Classification of Locations of Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2, ANSI/API RP500-1997; Area Classification In Hazardous (Classified) Dust Locations, ANSI/ISA-S12.10-1988.

FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see Recommended Practice on Static Electricity, NFPA 77-1993; Standard for the Installation of Lightning Protection Systems, NFPA 780-1997; and Protection Against Ignitions Arising Out of Static Lightning and Stray Currents, API RP 2003-1991.

FPN No. 4: For further information on ventilation, see Flammable and Combustible Liquids Code, NFPA 30-1996; and Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2, API RP 500-1997, Section 4.6.

FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class I, Division 1 and Division 2 Locations, ANSI/API RP 14F-1999.

500-~~4~~5. Classifications of Locations
(a) Classifications of Locations. Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases, or combustible dusts or fibers that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified. Each room, section, or area shall be considered individually in determining its classification.

FPN: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in reduced level of classification or in an unclassified location ~~less hazardous or in nonhazardous locations~~ and, thus, to reduce the amount of special equipment required.

Rooms and areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation, may be classified as "unclassified" locations.

FPN: For further information regrading classification and ventilaton of areas involving ammonia, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989 (14-37)

(b) Class I Locations
Class I locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures. Class I locations shall include those specified in (1) and (2).

(1) Class I, Division 1. A Class I, Division 1 location is a location
(a) In which ignitible concentrations of flammable gases or vapors can exist under normal operating conditions, or
(b) In which ignitible concentrations of such gases or vapors may exist frequently because of repair or maintenance operations or because of leakage, or
(c) In which breakdown or faulty operation of equipment or processes might release ignitible concentrations of flammable gases or vapors, and might also cause simultaneous failure of electrical equipment in such a way as to directly cause the electrical equipment to become a source of ignition.

FPN No. 1: This classification usually includes the following locations:

a. Where volatile flammable liquids or liquefied flammable gases are transferred from one container to another
b. Interiors of spray booths and areas in the vicinity of spraying and painting operations where volatile flammable solvents are used
c. Locations containing open tanks or vats of volatile flammable liquids
d. Drying rooms or compartments for the evaporation of flammable solvents
e. Locations containing fat and oil extraction equipment using volatile flammable solvents
f. Portions of cleaning and dyeing plants where flammable liquids are used
g. Gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape
h. Inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids
i. The interiors of refrigerators and freezers in which volatile flammable materials are stored in open, lightly stoppered, or easily ruptured containers
j. All other locations where ignitible concentrations of flammable vapors or gases are likely to occur in the course of normal operations.

FPN No. 2: In some Division 1 locations, ignitible concentrations of flammable gases or vapors may be present continuously or for long periods of time. Examples include the following:

a. The inside of inadequately vented enclosures containing instruments normally venting

flammable gases or vapors to the interior of the enclosure
b. The inside of vented tanks containing volatile flammable liquids
c. The area between the inner and outer roof sections of a floating roof tank containing volatile flammable fluids
d. Inadequately ventilated areas within spraying or coating operations using volatile flammable fluids
e. The interior of an exhaust duct that is used to vent ignitible concentrations of gases or vapors.

Experience has demonstrated the prudence of avoiding the installation of instrumentation or other electric equipment in these particular areas altogether or where it cannot be avoided because it is essential to the process and other locations are not feasible [see Section 500-~~4~~5(a), FPN], using electric equipment or instrumentation approved for the specific application or consisting of intrinsically safe systems as described in Article 504.

(2) Class I, Division 2. A Class I, Division 2 location is a location
(a) In which volatile flammable liquids or flammable gases are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems, or in case of abnormal operation of equipment, or
(b) In which ignitible concentrations of gases or vapors are normally prevented by positive mechanical ventilation, and which might become hazardous through failure or abnormal operation of the ventilating equipment, or
(c) That is adjacent to a Class I, Division 1 location, and to which ignitible concentrations of gases or vapors might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.

FPN No. 1: This classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used but that, in the judgment of the authority having jurisdiction, would become hazardous only in case of an accident or of some unusual operating condition. The quantity of flammable material that might escape in case of accident, the adequacy of ventilating equipment, the total area involved, and the record of the industry or business with respect to explosions or fires are all factors that merit consideration in determining the classification and extent of each location.

FPN No. 2: Piping without valves, checks, meters, and similar devices would not ordinarily introduce a hazardous condition even though used for flammable liquids or gases. Depending on factors such as the quantity and size of the containers and ventilation, locations used for the storage of flammable liquids or liquefied or compressed gases in sealed containers may either be considered hazardous (classified) or nonhazardous locations. See Flammable and Combustible Liquids Code, NFPA 30-1996, and Liquefied Petroleum Gas Code, NFPA 58-1998.

(c) Class II Locations
Class II locations are those that are hazardous because of the presence of combustible dust. Class II locations shall include those specified in (a) and (b).
(1) Class II, Division 1. A Class II, Division 1 location is a location
(a) In which combustible dust is in the air under normal operating conditions in quantities sufficient to produce explosive or ignitible mixtures, or
(b) Where mechanical failure or abnormal operation of machinery or equipment might cause such explosive or ignitible mixtures to be produced, and might also provide a source of ignition through simultaneous failure of electric equipment, operation of protection devices, or from other causes, or
(c) In which combustible dusts of an electrically conductive nature may be present in hazardous quantities.

FPN: Combustible dusts that are electrically nonconductive include dusts produced in the handling and processing of grain and grain products, pulverized sugar and cocoa, dried egg and milk powders, pulverized spices, starch and pastes, potato and wood-flour, oil meal from beans and seed, dried hay, and other organic materials that may produce combustible dusts when processed or handled. Only Group E dusts are considered to be electrically conductive for classification purposes. Dusts containing magnesium or aluminum are particularly hazardous, and the use of extreme precaution will be necessary to avoid ignition and explosion.

(2) Class II, Division 2. A Class II, Division 2 location is a location (a) Where combustible dust is not normally in the air in quantities sufficient to produce explosive or ignitible mixtures, and dust accumulations are normally insufficient to interfere with the normal operation of electrical equipment or other apparatus, but combustible dust may be in suspension in the air as a result of infrequent malfunctioning of handling or processing equipment and

(b) Where combustible dust accumulations on, in, or in the vicinity of the electrical equipment may be sufficient to interfere with the safe dissipation of heat from electrical equipment or may be ignitible by abnormal operation or failure of electrical equipment.

FPN No. 1: The quantity of combustible dust that may be present and the adequacy of dust removal systems are factors that merit consideration in determining the classification and may result in an nonhazardous area.

FPN No. 2: Where products such as seed are handled in a manner that produces low quantities of dust, the amount of dust deposited may not warrant classification.

(d) Class III Locations
Class III locations are those that are hazardous because of the presence of easily ignitible fibers or flyings, but in which such fibers or flyings are not likely to be in suspension in the air in quantities sufficient to produce ignitible mixtures. Class III locations shall include those specified in (a) and (b).
(1) Class III, Division 1. A Class III, Division 1 location is a location in which easily ignitible fibers or materials producing combustible flyings are handled, manufactured, or used.

FPN No. 1: Such locations usually include some parts of rayon, cotton, and other textile mills; combustible fiber manufacturing and processing plants; cotton gins and cotton-seed mills; flax-processing plants; clothing manufacturing plants; woodworking plants; and establishments and industries involving similar hazardous processes or conditions.

FPN No. 2: Easily ignitible fibers and flyings include rayon, cotton (including cotton linters and cotton waste), sisal or henequen, istle, jute, hemp, tow, cocoa fiber, oakum, baled waste kapok, Spanish moss, excelsior, and other materials of similar nature.

(2) Class III, Division 2. A Class III, Division 2 location is a location in which easily ignitible fibers are stored or handled other than in the process of manufacture.

500-~~5~~6 Material Groups
For purposes of testing, approval, and area classification, various air mixtures (not oxygen-enriched) shall be grouped in accordance with Sections 500-~~5~~6(a) and 500-~~5~~6(b).

Exception: Equipment approved for a specific gas, vapor, or dust.

FPN: This grouping is based on the characteristics of the materials. Facilities are available for testing and identifying equipment for use in the various atmospheric groups.

(a) Class I Group Classifications . Class I groups shall be as follows.
(1) Group A. Acetylene.
(2) Group B. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.45 mm or a minimum igniting current ratio (MIC ratio) less than or equal to 0.40.

FPN: A typical Class I, Group B material is hydrogen.

Exception No. 1: Group D equipment shall be permitted to be used for atmospheres containing butadiene provided all conduit runs into explosionproof equipment are provided with explosionproof seals installed within 18 in. (457 mm) of the enclosure.
Exception No. 2: Group C equipment shall be permitted to be used for atmospheres containing allyl glycidyl ether, n-butyl glycidyl ether, ethylene oxide, propylene oxide, and acrolein provided all conduit runs into explosionproof equipment are provided with explosionproof seals installed within 18 in. (457 mm) of the enclosure.

(3) Group C. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.45 mm and less than or equal to 0.75 mm, or a minimum igniting current ratio (MIC ratio) greater than 0.40 and less than or equal to 0.80.

FPN: A typical Class I, Group C material is ethylene.

(4) Group D. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.75 mm or a minimum igniting current ratio (MIC ratio) greater than 0.80.

FPN No. 1: A typical Class I, Group D material is propane.
FPN No. 2: For classification of areas involving ammonia atmosphere, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989.

~~*Exception: For atmospheres containing ammonia, the authority having jurisdiction for enforcement of this Code shall be permitted to reclassify the location to a reduced level of classification or to an unclassified hazardous location or a nonhazardous location.(14.37)*~~

~~FPN No. 1: For additional information on the properties and group classification of Class I materials, see Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997, and Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, NFPA 325-1994.~~

The following FPN's apply to section (a):
FPN No. 1: The explosion characteristics of air mixtures of gases or vapors vary with the specific material involved. For Class I locations, Groups A, B, C, and D, the classification involves determinations of maximum explosion pressure and maximum safe clearance between parts of a clamped joint in an enclosure. It is necessary, therefore, that equipment be approved not only for class but also for the specific group of the gas or vapor that will be present.
FPN No. 2: Certain chemical atmospheres may have characteristics that require safeguards beyond those required for any of the above groups. Carbon disulfide is one of these chemicals because of its low ignition temperature [100ºC (212ºF)] and the small joint clearance permitted to arrest its flame.
~~FPN No. 3: For classification of areas involving ammonia atmosphere, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989.~~

(b) Class II Group Classifications. Class II groups shall be as follows.

(1) Group E. Atmospheres containing combustible metal dusts, including aluminum, magnesium, and their commercial alloys, or other combustible dusts whose particle size, abrasiveness, and conductivity present similar hazards in the use of electrical equipment.

FPN: Certain metal dusts may have characteristics that require safeguards beyond those required for atmospheres containing the dusts of aluminum, magnesium, and their commercial alloys. For example, zirconium, thorium, and uranium dusts have extremely low ignition temperatures [as low as 20ºC (68ºF)] and minimum ignition energies lower than any material classified in any of the Class I or Class II Groups.

(2) Group F. Atmospheres containing combustible carbonaceous dusts that have more than 8 percent total entrapped volatiles (see Standard Test Method for Volatile Material in the Analysis Sample for Coal and Coke, ASTM D3175-89, for coal and coke dusts) or that have been sensitized by other materials so that they present an explosion hazard. Coal, carbon black, charcoal, and coke dusts are examples of carbonaceous dusts.

(3) Group G. Atmospheres containing combustible dusts not included in Group E or F, including flour, grain, wood, plastic, and chemicals.

FPN No. 1: For additional information on group classification of Class II materials, see Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997.

FPN No. 2: The explosion characteristics of air mixtures of dust vary with the materials involved. For Class II locations, Groups E, F, and G, the classification involves the tightness of the joints of assembly and shaft openings to prevent the entrance of dust in the dust-ignitionproof enclosure, the blanketing effect of layers of dust on the equipment that may cause overheating, and the ignition temperature of the dust. It is necessary, therefore, that equipment be approved not only for the class, but also for the specific group of dust that will be present.

FPN No. 3: Certain dusts may require additional precautions due to chemical phenomena that can result in the generation of ignitible gases. See National Electrical Safety Code, ANSI C2-1997, Section 127A, Coal Handling Areas.

500 ~~6~~-7 Protection Techniques
The following shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.

(a) Explosionproof Apparatus. This protection technique shall be permitted for equipment in Class I, Division 1 or 2 locations.

(b) Dust Ignitionproof. This protection technique shall be permitted for equipment in Class II, Division 1 or 2 locations.

(c) Dusttight. This protection technique shall be permitted for equipment in Class II, Division 2 or Class III locations.

(d) Purged and Pressurized. This protection technique shall be permitted for equipment in any hazardous (classified) location for which it is approved.

(e) Intrinsic Safety. This protection technique shall be permitted for equipment in Class I, Division 1 or 2, or Class II, Division 1 or 2, or Class III, Division 1 or 2 locations. The provisions of Articles 501 through 503 and 510 through 516 shall not be considered applicable to such installations, except as required by Article 504, and installation of intrinsically safe apparatus and wiring shall be in accordance with the requirements of Article 504.

(f) Nonincendive Circuit. This protection technique shall be permitted for equipment in Class I, Division 2, Class II, Division 2, Class III, Division 2 locations.

(g) Nonincendive Equipment. This protection technique shall be permitted for equipment in Class I, Division 2, Class II, Division 2, Class III, and Division 2 locations.

(h) Nonincendive Component This protection technique shall be permitted for equipment in Class I, Division 2, Class II, Division 2, Class III, Division 2 locations.

(i) Nonincendive Component. This protection technique shall be permitted for current-interrupting contacts in those Class I, Division 2 locations for which the component is approved.

(j) Oil Immersion. This protection technique shall be permitted for current-interrupting contacts in Class I, Division 2 locations as described in Section 501-~~6~~7(b)(1)(b).

(k) Hermetically Sealed. This protection technique shall be permitted for equipment in Class I and II, Division 2, and Class III, Division 1 and 2 locations.

(l) Other Protection Techniques. Other protection techniques used in equipment listed for use in hazardous (classified) locations.

500 ~~-7~~ 8 Equipment

Articles 500 through 504 require equipment construction and installation that will ensure safe performance under conditions of proper use and maintenance.

FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to installation and maintenance.

FPN No. 2: Low ambient conditions require special consideration. Explosionproof or dust-ignitionproof equipment may not be suitable for use at temperatures lower than -25ºC (-13ºF) unless they are identified for low-temperature service. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified Class I, Division 1 at normal ambient temperature.

(a) Approval for Class and Properties.

(1) Equipment shall be approved not only for the class of location but also for the explosive, combustible, or ignitible properties of the specific gas, vapor, dust, fiber, or flyings that will be present. In addition, Class I equipment shall not have any exposed surface that operates at a temperature in excess of the ignition temperature of the specific gas or vapor. Class II equipment shall not have an external temperature higher than that specified in Section 500-~~7~~8(2). Class III equipment shall not exceed the maximum surface temperatures specified in Section 503-1.

(2) Equipment that has been approved for a Division 1 location shall be permitted in a Division 2 location of the same class and group.

(3) Where specifically permitted in Articles 501 through 503, general-purpose equipment or equipment in general-purpose enclosures shall be permitted to be installed in Division 2 locations if the equipment does not constitute a source of ignition under normal operating conditions.

(4) Equipment, regardless of the classification of the location in which it is installed, that depends on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the equipment, shall be approved for a Class I, Division 2 location.

Exception: Equipment installed in a Class I, Division 1 location shall be suitable for the Division 1 location.

FPN: See Section 501-5(f)(3) for additional requirements.

(5) Unless otherwise specified, normal operating conditions for motors shall be assumed to be rated full-load steady conditions.

(6) Where flammable gases or combustible dusts are or may be present at the same time, the simultaneous presence of both shall be considered when determining the safe operating temperature of the electrical equipment.

FPN: The characteristics of various atmospheric mixtures of gases, vapors, and dusts depend on the specific material involved.

(b) Marking. Equipment shall be marked to show the class, group, and operating temperature or temperature class ~~range~~ referenced to a 40ºC ambient.

Exception No. 1: Equipment of the non-heat-producing type, such as junction boxes, conduit, and fittings, and equipment of the heat-producing type having a maximum temperature not more than 100ºC (212ºF) shall not be required to have a marked operating temperature or temperature class ~~range~~

Exception No. 2: Fixed lighting fixtures marked for use in Class I, Division 2 or Class II, Division 2 locations only shall not be required to be marked to indicate the group.

Exception No. 3: Fixed general-purpose equipment in Class I locations, other than fixed lighting fixtures, that is acceptable for use in Class I, Division 2 locations shall not be required to be marked with the class, group, division, or operating temperature.

Exception No. 4: Fixed dusttight equipment other than fixed lighting fixtures that are acceptable for use in Class II, Division 2 and Class III locations shall not be required to be marked with the class, group, division, or operating temperature.

Exception No. 5: Electric equipment suitable for ambient temperatures exceeding 40ºC (104ºF) shall be marked with both the maximum ambient temperature and the operating temperature or temperature class ~~range~~ at that ambient temperature.

FPN: Equipment not marked to indicate a division, or marked "Division 1" or "Div. 1," is suitable for both Division 1 and 2 locations. Equipment marked "Division 2" or "Div. 2" is suitable for Division 2 locations only.

The temperature ~~-~~ class ~~range~~, if provided, shall be indicated using the temperature class (T Codes) ~~in identification numbers, as~~ shown in Table 500-~~7~~8(b).

The temperature class (T Code) ~~Identification numbers~~ marked on equipment nameplates shall be in accordance with Table 500-8~~7~~(b).

Equipment ~~that is approved~~ for Class I and Class II shall be marked with the maximum safe operating temperature, as determined by simultaneous exposure to the combinations of Class I and Class II conditions.

FPN: Since there is no consistent relationship between explosion properties and ignition temperature, the two are independent requirements.

Table 500-8(b). Classification of Maximum Surface Temperature ~~Identification Numbers~~

Maximum Temperature		~~Identification Number~~ Temperature Class (T Code)
ºC	ºF	
450	842	T1
300	572	T2
280	536	T2A
260	500	T2B
230	446	T2C
215	419	T2D
200	392	T3
180	356	T3A
165	329	T3B
160	320	T3C
135	275	T4
120	248	T4A
100	212	T5
85	185	T6

(c) Temperature

(1) Class I Temperature. The temperature marking specified in (b) shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

FPN: For information regarding ignition temperatures of gases and vapors, see Recommended Practice for the Classification of flammable gases, etc. and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997.

(2) Class II Temperature. The temperature marking specified in (b) shall be less than the ignition temperature of the specific dust to be encountered. For organic dusts that may dehydrate or carbonize, the temperature marking shall not exceed the lower of either the ignition temperature or 165ºC (329ºF).

FPN: See Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997, for minimum ignition temperatures of specific dusts.

The ignition temperature for which equipment was approved prior to this requirement shall be assumed to be as shown in Table 500-5(c) (2).

Table 500-5(c) (2).

	Equipment (Such as Motors or Power Transformers) that May Be Overloaded				
	Equipment that Is Not Subject to Overloading		Normal Operation	Abnormal Operation	
Class II Group	ºC	ºF	ºC	ºF	ºC ºF
E	200	392	200	392	200 392
F	200	392	150	302	200 392
G	165	329	120	248	165 329

(d) Threading

All threaded conduit referred to herein shall be threaded with an National (American) Standard Pipe Taper (NPT) standard conduit cutting die that provides _-in. taper per foot. Such conduit shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof or flameproof integrity of the conduit system where applicable.

Equipment provided with threaded entries for field wiring connections shall be installed in accordance with (1) or (2).

(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.

FPN: Threading specifications for NPT threads are located in Pipe Threads, General Purpose (Inch), ANSI/ASME B1.20.1-1983.

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in Metric Screw Threads, ISO 965/1:1980, and Metric Screw Threads, ISO 965/3:1980.

(e) Fiber Optic Cable Assembly.

Where a fiber optic cable assembly contains conductors that are capable of carrying current, the fiber optic cable assembly shall be installed in accordance with the requirements of Articles 500, 501, 502, or 503, as applicable.

500-9. Specific Occupancies

Articles 510 through 517 cover garages, aircraft hangars, gasoline dispensing and service stations, bulk storage plants, spray application, dipping and coating processes, and health care facilities.

SUBSTANTIATION: This complete revision of Article 500 editorially revises the text to make it more easily understood and also incorporates numerous technical and editorial improvements made via other proposals.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

COMMENT ON AFFIRMATIVE:

BRIESCH: While the Panel Action to accept the rewrite of Article 500 is supported, the NFPA-Circulated Panel Proposal does not include all of the changes agreed to at the meeting. The e-mail sent by Dave Wechsler subsequent to the meeting is more complete in reflecting the Panel Actions from the meeting.

COOK: I agree with Proposal 14-2a and the substantiation, however, it does not incorporate all of the changes made via other proposals. An updated version that was emailed from Dave Wechsler on 1-26-2000 seems to be more complete with respect to including Panel Actions from the meeting in Hilton Head. I agree with the proposals submitted to change the term "nonhazardous" to "unclassified". During the panel discussion, the term "nonhazardous" was defined and also used in certain applications. After considering discussion and reviewing written ballots, I believe that some evaluation is done on every installation and a determination is made to use ordinary electrical equipment, or continue more extensive evaluation and possibly use some special equipment. I believe that defining and using two terms would complicate the issue. I believe we should define and use the term "unclassified" and drop "nonhazardous."

ENGLER: Not all of the changes made it into the draft circulated with this ballot, vote is to affirm the text with all of the necessary changes made to it.

GOODMAN: Part 1, Rewritten Article is inconsistent with other Panel Actions and has missing or incorrect information. Rewritten Article requires additional backchecking.

Examples: Panel Action to Proposal 14-20 to "Purged and Pressurized" (new Section 500-7(d)) was to use "Identified" but is shown in draft as "Approved"; redundant paragraphs numbered 500-7(h) and 500-7(i); added text of Proposal 14-30 and 14-31 is missing from draft, and new text or modified text is not identified accurately in the margin.

Part 2, this comment recommends change to a specific part of the rewritten Article. In the new Section 500-2 Definitions, the term "Nonhazardous" has been included. This comment recommends the removal of this term, definition, and use for the following reasons:

1. This term was added as part of the Panel Chairman assigned Task Group responsible for reorganizing the information in Article 500. This term and definition are new material and beyond the scope of the Panel Chair's direction.
2. The added term and definition was not part of any Proposal made to the Panel and has no substantiation for its inclusion.
3. Several Proposals (14-8, 14-40, 14-315, and 14-316) specifically requested that the term "nonhazardous" currently used in the Article be deleted and substituted with the term "unclassified".
4. This term adds an additional area classification location that does not currently exist in related standards and practices (API 500 and 505 for example) or in most company documentation systems.
5. The term is misleading. The implication of "nonhazardous" is that there are no hazards. There are hazards other than electrical area classification such as caustics, acids, radiation, etc. Using the term "unclassified" is becoming widely accepted and recognized as specific to electrical area classification. "Nonhazardous" is much too broad.
6. The term is not needed. An area is either "Classified", requiring specifically identified or approved equipment suitable for the location or "Unclassified", not requiring equipment so identified or approved. The term will only add confusion and potential misapplication.
7. By its definition, "Nonhazardous Locations. Locations which are not required to have been evaluated". Whoever makes the determination that the location is not required to be evaluated has just evaluated the location. It is also not at all clear how or who would make that determination.

For the above reasons, the term "Nonhazardous", its definition and use should be removed from Article 500 and (505).

JAGUNICH: The definitions of "nonincendive field wiring apparatus" and "associated nonincendive field wiring apparatus" were established by CMP14 and do not appear in panel proposal 14-2a as sent in the ballot. These definition should included.

LAWRENCE: Due to the large number of public proposals received and acted upon, and also due to time constraints, the panel was not able to compile and correlate all aspects of the rewrites of the affected article. Please see David Wechsler's ballot

OMEARA: Please see the comments on the ballot for David Wechsler.

WECHSLER: While attempts were made to provide NFPA staff with corrected revisions of this text before the end of the CMP 14 panel meeting, a detailed review of this balloted draft version has indicated that this does not reflect the correct committee actions and is not correct.

We attribute the problems with this draft to the following:

a) the use of several earlier drafts that were consistently being revised to keep pace with changes made due to committee actions on public proposals,

b) the limited time available to proof and develop this work,

c) the extremely large number of public proposals,

d) the complex nature of the interaction of affected texts within Articles 500, 501, 502, and 505, and the desire of the panel to maintain consistency, and

e) human errors in transcribing this information.

The following text provides a correct revision of this complete work effort for Article 500. This text should be the panel document of record and not that provided with the panel ballot.

Entire 500 with recommended changes would appear as follows:

ARTICLE 500 –

Hazardous (Classified) Locations, Classes I, II, and III, Divisions 1 and 2

500-1. Scope — Articles 500 through 504

Articles 500 through 504 cover the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Divisions 1 and 2; Class II, Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, combustible dust, or ignitible fibers or flyings.

FPN: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors, or flammable liquids, refer to Article 505.

500-2 Definitions. For purposes of Articles 500 through 504 and Articles 506 through 516, the following definitions apply.

Identified (as applied to equipment). Recognizable as suitable for the specific purpose, function, use, environment, application, etc., where prescribed in a particular Code requirement.

FPN: Suitability of equipment for a specific purpose, environment, or application may be determined by:

~~1.~~2. equipment listing or labeling;

2. evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation; or

3. other evidence acceptable to the authority having jurisdiction such as a manufacturer's self evaluation or an owner's engineering judgement.

(See definitions of *Labeled* and *Listed*)

Unclassified Locations. Locations that have been evaluated by the classification process defined in Section 500-~~3~~5(a) or Section 505-~~3~~5(a) and determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof.

Nonhazardous Locations. Locations which are not required to have been evaluated by the process defined in 500-~~3~~5 (a) or 505-~~3~~5(a).

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with an electrical installation, as well as any portable or transportable device having a battery or other electrical power source. (14-6)

Dust-ignitionproof. Equipment enclosed in a manner that will exclude dusts and will not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.

FPN: For further information on dust-ignitionproof enclosures, see Type 9 enclosure in Enclosures for Electrical Equipment, ANSI/NEMA 250-1991, and Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations, ANSI/UL 1203-1994.

Dusttight. Enclosures constructed so that dust will not enter under specified test conditions.

FPN: See Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA S12.12-1994, and Electrical Equipment for Use in Class I and II, Division 2 and Class III Hazardous (Classified) Locations, UL 1604-1994.

Explosionproof Apparatus. Apparatus enclosed in a case that is capable of withstanding an explosion of a specified gas or vapor that may occur within it and of preventing the ignition of a specified gas or vapor surrounding the enclosure by sparks, flashes, or explosion of the gas or vapor within, and that operates at such an external temperature that a surrounding flammable atmosphere will not be ignited thereby.

FPN: For further information, see Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations, ANSI/UL 1203-1994.

Purged and Pressurized. The process of supplying an enclosure with a protective gas, at a sufficient flow and positive pressure to reduce the concentration of any flammable gas or vapor initially present to an acceptable level.

FPN: For further information, see Purged and Pressurized Enclosures for Electrical Equipment, ANSI/NFPA 496-1998.

Nonincendive Circuit. A circuit, other than field wiring, in which any arc or thermal effect produced under intended operating conditions of the equipment, is not capable, under specified test conditions, of igniting the flammable gas–, vapor–, or dust–air mixture.

FPN: For further information see Nonincendive Electrical Equipment for Use in Class I and II, Division 2 and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA-S12.12-1994.

Nonincendive Field Wiring. Wiring that enters or leaves an equipment enclosure and, under normal operating conditions of the equipment, is not capable, due to arcing or thermal effects, of igniting the flammable gas–, vapor–, or dust–air mixture. Normal operation includes opening, shorting, or grounding the field wiring.

Nonincendive Equipment. Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing ignition of a specified flammable gas–, vapor–, or dust–air mixture due to arcing or thermal means.

FPN: For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA-S12.12-1994.

Nonincendive Component. A component having contacts for making or breaking an incendive circuit and the contacting mechanism shall be constructed so that the component is incapable of igniting the specified flammable gas– or vapor–air mixture. The housing of a nonincendive component is not intended to exclude the flammable atmosphere or contain an explosion.

FPN: For further information, see Electrical Equipment for Use in Class I and II, Division 2, and Class III Hazardous (Classified) Locations, UL 1604-1994.

Oil Immersion. Electrical equipment immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

FPN: For further information, see Industrial Control Equipment for Use in Hazardous (Classified) Locations, ANSI/UL 698-1995.

Hermetically Sealed. Equipment sealed against the entrance of an external atmosphere where the seal is made by fusion, e.g., soldering, brazing, welding, or the fusion of glass to metal.

FPN: For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations, ANSI/ISA S12.12-1994.

500-~~2~~3. Other Articles

Except as modified in Articles 500 through 504, all other applicable rules contained in this Code shall apply to electrical equipment and wiring installed in hazardous (classified) locations.

500-~~3~~4 General

(a) Documentation All areas designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

(b) Reference Standards.

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with the standards of the National Fire Protection Association, the American Petroleum Institute, and the Instrument Society of America that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

FPN No. 2: For further information on the classification of locations, see Flammable and Combustible Liquids Code, NFPA 30-1996; Standard for Drycleaning Plants, NFPA 32-1996; Standard for Spray Application Using Flammable or Combustible Materials, NFPA 33-1995; Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids, NFPA 34-1995; Standard for the Manufacture of Organic Coatings, NFPA 35-1995; Standard for Solvent Extraction Plants, NFPA 36-1997; Standard on Fire Protection for Laboratories Using Chemicals, NFPA 45-1996; Standard for Gaseous Hydrogen Systems at Consumer Sites, NFPA 50A-1994; Standard for Liquefied Hydrogen Systems at Consumer Sites, NFPA 50B-1994; Liquefied Petroleum Gas Code,

NFPA 58-1998; Standard for the Storage and Handling of Liquefied Petroleum Gases at Utility Gas Plants, NFPA 59-1998; Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997; Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997; Standard for Fire Protection in Wastewater Treatment and Collection Facilities, NFPA 820-1995; Recommended Practice for Classification of Locations of Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2, ANSI/API RP500-1997; Area Classification In Hazardous (Classified) Dust Locations, ANSI/ISA-S12.10-1988.

FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see Recommended Practice on Static Electricity, NFPA 77-1993; Standard for the Installation of Lightning Protection Systems, NFPA 780-1997; and Protection Against Ignitions Arising Out of Static Lightning and Stray Currents, API RP 2003-1991.

FPN No. 4: For further information on ventilation, see Flammable and Combustible Liquids Code, NFPA 30-1996; and Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2, API RP 500-1997, Section 4.6.

FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class I, Division 1 and Division 2 Locations, ANSI/API RP 14F-1999.

500-45. Classifications of Locations

(a) Classifications of Locations. Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases, or combustible dusts or fibers that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified. Each room, section, or area shall be considered individually in determining its classification.

FPN: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in reduced level of classification or in an unclassified location ~~less hazardous or in nonhazardous locations~~ and, thus, to reduce the amount of special equipment required.

Rooms and areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation, may be classified as "unclassified" locations.

FPN: For further information regrading classification and ventilaton of areas involving ammonia, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989 (14-37)

(b) Class I Locations

Class I locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures. Class I locations shall include those specified in (1) and (2).

(1) Class I, Division 1. A Class I, Division 1 location is a location
(a) In which ignitible concentrations of flammable gases or vapors can exist under normal operating conditions, or
(b) In which ignitible concentrations of such gases or vapors may exist frequently because of repair or maintenance operations or because of leakage, or
(c) In which breakdown or faulty operation of equipment or processes might release ignitible concentrations of flammable gases or vapors, and might also cause simultaneous failure of electrical equipment in such a way as to directly cause the electrical equipment to become a source of ignition.

FPN No. 1: This classification usually includes the following locations:

a. Where volatile flammable liquids or liquefied flammable gases are transferred from one container to another
b. Interiors of spray booths and areas in the vicinity of spraying and painting operations where volatile flammable solvents are used
c. Locations containing open tanks or vats of volatile flammable liquids
d. Drying rooms or compartments for the evaporation of flammable solvents
e. Locations containing fat and oil extraction equipment using volatile flammable solvents
f. Portions of cleaning and dyeing plants where flammable liquids are used
g. Gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape
h. Inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids
i. The interiors of refrigerators and freezers in which volatile flammable materials are stored in open, lightly stoppered, or easily ruptured containers
j. All other locations where ignitible concentrations of flammable vapors or gases are likely to occur in the course of normal operations.

FPN No. 2: In some Division 1 locations, ignitible concentrations of flammable gases or vapors may be present continuously or for long periods of time. Examples include the following:

a. The inside of inadequately vented enclosures containing instruments normally venting flammable gases or vapors to the interior of the enclosure
b. The inside of vented tanks containing volatile flammable liquids
c. The area between the inner and outer roof sections of a floating roof tank containing volatile flammable fluids
d. Inadequately ventilated areas within spraying or coating operations using volatile flammable fluids
e. The interior of an exhaust duct that is used to vent ignitible concentrations of gases or vapors.

Experience has demonstrated the prudence of avoiding the installation of instrumentation or other electric equipment in these particular areas altogether or where it cannot be avoided because it is essential to the process and other locations are not feasible [see Section 500-45(a), FPN], using electric equipment or instrumentation approved for the specific application or consisting of intrinsically safe systems as described in Article 504.

(2) Class I, Division 2. A Class I, Division 2 location is a location
(a) In which volatile flammable liquids or flammable gases are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems, or in case of abnormal operation of equipment, or
(b) In which ignitible concentrations of gases or vapors are normally prevented by positive mechanical ventilation, and which might become hazardous through failure or abnormal operation of the ventilating equipment, or
(c) That is adjacent to a Class I, Division 1 location, and to which ignitible concentrations of gases or vapors might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.

FPN No. 1: This classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used but that, in the judgment of the authority having jurisdiction, would become hazardous only in case of an accident or of some unusual operating

condition. The quantity of flammable material that might escape in case of accident, the adequacy of ventilating equipment, the total area involved, and the record of the industry or business with respect to explosions or fires are all factors that merit consideration in determining the classification and extent of each location.

FPN No. 2: Piping without valves, checks, meters, and similar devices would not ordinarily introduce a hazardous condition even though used for flammable liquids or gases. Depending on factors such as the quantity and size of the containers and ventilation, locations used for the storage of flammable liquids or liquefied or compressed gases in sealed containers may either be considered hazardous (classified) or nonhazardous locations. See Flammable and Combustible Liquids Code, NFPA 30-1996, and Liquefied Petroleum Gas Code, NFPA 58-1998.

(c) Class II Locations
Class II locations are those that are hazardous because of the presence of combustible dust. Class II locations shall include those specified in (a) and (b).
(1) Class II, Division 1. A Class II, Division 1 location is a location
(a) In which combustible dust is in the air under normal operating conditions in quantities sufficient to produce explosive or ignitible mixtures, or
(b) Where mechanical failure or abnormal operation of machinery or equipment might cause such explosive or ignitible mixtures to be produced, and might also provide a source of ignition through simultaneous failure of electric equipment, operation of protection devices, or from other causes, or
(c) In which combustible dusts of an electrically conductive nature may be present in hazardous quantities.

FPN: Combustible dusts that are electrically nonconductive include dusts produced in the handling and processing of grain and grain products, pulverized sugar and cocoa, dried egg and milk powders, pulverized spices, starch and pastes, potato and wood-flour, oil meal from beans and seed, dried hay, and other organic materials that may produce combustible dusts when processed or handled. Only Group E dusts are considered to be electrically conductive for classification purposes. Dusts containing magnesium or aluminum are particularly hazardous, and the use of extreme precaution will be necessary to avoid ignition and explosion.

(2) Class II, Division 2. A Class II, Division 2 location is a location
(a) Where combustible dust is not normally in the air in quantities sufficient to produce explosive or ignitible mixtures, and dust accumulations are normally insufficient to interfere with the normal operation of electrical equipment or other apparatus, but combustible dust may be in suspension in the air as a result of infrequent malfunctioning of handling or processing equipment and

(b) Where combustible dust accumulations on, in, or in the vicinity of the electrical equipment may be sufficient to interfere with the safe dissipation of heat from electrical equipment or may be ignitible by abnormal operation or failure of electrical equipment.

FPN No. 1: The quantity of combustible dust that may be present and the adequacy of dust removal systems are factors that merit consideration in determining the classification and may result in an nonhazardous area.

FPN No. 2: Where products such as seed are handled in a manner that produces low quantities of dust, the amount of dust deposited may not warrant classification.

(d) Class III Locations
Class III locations are those that are hazardous because of the presence of easily ignitible fibers or flyings, but in which such fibers or flyings are not likely to be in suspension in the air in quantities sufficient to produce ignitible mixtures. Class III locations shall include those specified in (a) and (b).
(1) Class III, Division 1. A Class III, Division 1 location is a location in which easily ignitible fibers or materials producing combustible flyings are handled, manufactured, or used.

FPN No. 1: Such locations usually include some parts of rayon, cotton, and other textile mills; combustible fiber manufacturing and processing plants; cotton gins and cotton-seed mills; flax-processing plants; clothing manufacturing plants; woodworking plants; and establishments and industries involving similar hazardous processes or conditions.

FPN No. 2: Easily ignitible fibers and flyings include rayon, cotton (including cotton linters and cotton waste), sisal or henequen, istle, jute, hemp, tow, cocoa fiber, oakum, baled waste kapok, Spanish moss, excelsior, and other materials of similar nature.

(2) Class III, Division 2. A Class III, Division 2 location is a location in which easily ignitible fibers are stored or handled other than in the process of manufacture.

500-~~5~~6 Material Groups
For purposes of testing, approval, and area classification, various air mixtures (not oxygen-enriched) shall be grouped in accordance with Sections 500-~~5~~6(a) and 500-~~5~~6(b).

Exception: Equipment approved for a specific gas, vapor, or dust.

FPN: This grouping is based on the characteristics of the materials. Facilities are available for testing and identifying equipment for use in the various atmospheric groups.

(a) Class I Group Classifications . Class I groups shall be as follows.
(1) Group A. Acetylene.
(2) Group B. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.45 mm or a minimum igniting current ratio (MIC ratio) less than or equal to 0.40.

FPN: A typical Class I, Group B material is hydrogen.

Exception No. 1: Group D equipment shall be permitted to be used for atmospheres containing butadiene provided all conduit runs into explosionproof equipment are provided with explosionproof seals installed within 18 in. (457 mm) of the enclosure.
Exception No. 2: Group C equipment shall be permitted to be used for atmospheres containing allyl glycidyl ether, n-butyl glycidyl ether, ethylene oxide, propylene oxide, and acrolein provided all conduit runs into explosionproof equipment are provided with explosionproof seals installed within 18 in. (457 mm) of the enclosure.

(3) Group C. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.45 mm and less than or equal to 0.75 mm, or a minimum igniting current ratio (MIC ratio) greater than 0.40 and less than or equal to 0.80.
FPN: A typical Class I, Group C material is ethylene.

(4) Group D. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.75 mm or a minimum igniting current ratio (MIC ratio) greater than 0.80.
FPN No. 1: A typical Class I, Group D material is propane.
FPN No. 2: For classification of areas involving ammonia atmosphere, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989.

~~*Exception: For atmospheres containing ammonia, the authority having jurisdiction for enforcement of this Code shall be permitted to reclassify the location to a reduced level of classification or to an unclassified or nonhazardous location or a nonhazardous location.(14.37)*~~

~~FPN No. 1: For additional information on the properties and group classification of Class I materials, see Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997, and Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, NFPA 325-1994.~~

The following FPN's apply to section (a):
FPN No. 1: The explosion characteristics of air mixtures of gases or vapors vary with the specific material involved. For Class I locations, Groups A, B, C, and D, the classification involves determinations of maximum explosion pressure and maximum safe clearance between parts of a clamped joint in an enclosure. It is necessary, therefore, that equipment be approved not only for class but also for the specific group of the gas or vapor that will be present.
FPN No. 2: Certain chemical atmospheres may have characteristics that require safeguards beyond those required for any of the above groups. Carbon disulfide is one of these chemicals because of its low ignition temperature [100ºC (212ºF)] and the small joint clearance permitted to arrest its flame.
~~FPN No. 3: For classification of areas involving ammonia atmosphere, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989.~~

(b) Class II Group Classifications. Class II groups shall be as follows.

(1) Group E. Atmospheres containing combustible metal dusts, including aluminum, magnesium, and their commercial alloys, or other combustible dusts whose particle size, abrasiveness, and conductivity present similar hazards in the use of electrical equipment.

FPN: Certain metal dusts may have characteristics that require safeguards beyond those required for atmospheres containing the dusts of aluminum, magnesium, and their commercial alloys. For example, zirconium, thorium, and uranium dusts have extremely low ignition temperatures [as low as 20ºC (68ºF)] and minimum ignition energies lower than any material classified in any of the Class I or Class II Groups.

(2) Group F. Atmospheres containing combustible carbonaceous dusts that have more than 8 percent total entrapped volatiles (see Standard Test Method for Volatile Material in the Analysis Sample for Coal and Coke, ASTM D3175-89, for coal and coke dusts) or that have been sensitized by other materials so that they present an explosion hazard. Coal, carbon black, charcoal, and coke dusts are examples of carbonaceous dusts.

(3) Group G. Atmospheres containing combustible dusts not included in Group E or F, including flour, grain, wood, plastic, and chemicals.

FPN No. 1: For additional information on group classification of Class II materials, see Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997.

FPN No. 2: The explosion characteristics of air mixtures of dust vary with the materials involved. For Class II locations, Groups E, F, and G, the classification involves the tightness of the joints of assembly and shaft openings to prevent the entrance of dust in the dust-ignitionproof enclosure, the blanketing effect of layers of dust on the equipment that may cause overheating, and the ignition temperature of the dust. It is necessary, therefore, that equipment be approved not only for the class, but also for the specific group of dust that will be present.

FPN No. 3: Certain dusts may require additional precautions due to chemical phenomena that can result in the generation of ignitible gases. See National Electrical Safety Code, ANSI C2-1997, Section 127A, Coal Handling Areas.

500 ~~-6~~-7 Protection Techniques
The following shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.

(a) Explosionproof Apparatus. This protection technique shall be permitted for equipment in Class I, Division 1 or 2 locations.

(b) Dust Ignitionproof. This protection technique shall be permitted for equipment in Class II, Division 1 or 2 locations.

(c) Dusttight. This protection technique shall be permitted for equipment in Class II, Division 2 or Class III locations.

(d) Purged and Pressurized. This protection technique shall be permitted for equipment in any hazardous (classified) location for which it is approved.

(e) Intrinsic Safety. This protection technique shall be permitted for equipment in Class I, Division 1 or 2, or Class II, Division 1 or 2, or Class III, Division 1 or 2 locations. The provisions of Articles 501 through 503 and 510 through 516 shall not be considered applicable to such installations, except as required by Article 504, and installation of intrinsically safe apparatus and wiring shall be in accordance with the requirements of Article 504.

(f) Nonincendive Circuit. This protection technique shall be permitted for equipment in Class I, Division 2, Class II, Division 2, Class III, Division 2 locations.

(g) Nonincendive Equipment. This protection technique shall be permitted for equipment in Class I, Division 2, Class II, Division 2, Class III, and Division 2 locations.

(h) Nonincendive Component This protection technique shall be permitted for equipment in Class I, Division 2, Class II, Division 2, Class III, Division 2 locations.

(i) Nonincendive Component. This protection technique shall be permitted for current-interrupting contacts in those Class I, Division 2 locations for which the component is approved.

(j) Oil Immersion. This protection technique shall be permitted for current-interrupting contacts in Class I, Division 2 locations as described in Section 501-~~6~~7(b)(1)(b).

(k) Hermetically Sealed. This protection technique shall be permitted for equipment in Class I and II, Division 2, and Class III, Division 1 and 2 locations.

(l) Other Protection Techniques. Other protection techniques used in equipment listed for use in hazardous (classified) locations.

500 ~~-7~~-8 Equipment
Articles 500 through 504 require equipment construction and installation that will ensure safe performance under conditions of proper use and maintenance.

FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to installation and maintenance.
FPN No. 2: Low ambient conditions require special consideration. Explosionproof or dust-ignitionproof equipment may not be suitable for use at temperatures lower than -25ºC (-13ºF) unless they are identified for low-temperature service. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified Class I, Division 1 at normal ambient temperature.

(a) Approval for Class and Properties.
(1) Equipment shall be approved not only for the class of location but also for the explosive, combustible, or ignitible properties of the specific gas, vapor, dust, fiber, or flyings that will be present. In addition, Class I equipment shall not have any exposed surface that operates at a temperature in excess of the ignition temperature of the specific gas or vapor. Class II equipment shall not have an external temperature higher than that specified in Section 500-~~7~~8(2). Class III equipment shall not exceed the maximum surface temperatures specified in Section 503-1.
(2) Equipment that has been approved for a Division 1 location shall be permitted in a Division 2 location of the same class and group.
(3) Where specifically permitted in Articles 501 through 503, general-purpose equipment or equipment in general-purpose enclosures shall be permitted to be installed in Division 2 locations if the equipment does not constitute a source of ignition under normal operating conditions.
(4) Equipment, regardless of the classification of the location in which it is installed, that depends on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the equipment, shall be approved for a Class I, Division 2 location.

Exception: Equipment installed in a Class I, Division 1 location shall be suitable for the Division 1 location.

FPN: See Section 501-5(f)(3) for additional requirements.

(5) Unless otherwise specified, normal operating conditions for motors shall be assumed to be rated full-load steady conditions.
(6) Where flammable gases or combustible dusts are or may be present at the same time, the simultaneous presence of both shall be considered when determining the safe operating temperature of the electrical equipment.

FPN: The characteristics of various atmospheric mixtures of gases, vapors, and dusts depend on the specific material involved.

(b) Marking. Equipment shall be marked to show the class, group, and operating temperature or temperature class ~~range~~ referenced to a 40ºC ambient.

Exception No. 1: Equipment of the non-heat-producing type, such as junction boxes, conduit, and fittings, and equipment of the heat-producing type having a maximum temperature not more than 100ºC (212ºF) shall not be required to have a marked operating temperature or temperature class ~~range~~

Exception No. 2: Fixed lighting fixtures marked for use in Class I, Division 2 or Class II, Division 2 locations only shall not be required to be marked to indicate the group.

Exception No. 3: Fixed general-purpose equipment in Class I locations, other than fixed lighting fixtures, that is acceptable for use in Class I, Division 2 locations shall not be required to be marked with the class, group, division, or operating temperature.

Exception No. 4: Fixed dusttight equipment other than fixed lighting fixtures that are acceptable for use in Class II, Division 2 and Class III locations shall not be required to be marked with the class, group, division, or operating temperature.

Exception No. 5: Electric equipment suitable for ambient temperatures exceeding 40ºC (104ºF) shall be marked with both the maximum ambient temperature and the operating temperature or temperature class ~~range~~ at that ambient temperature.

FPN: Equipment not marked to indicate a division, or marked "Division 1" or "Div. 1," is suitable for both Division 1 and 2 locations. Equipment marked "Division 2" or "Div. 2" is suitable for Division 2 locations only.

The temperature ~~-~~ class ~~range~~, if provided, shall be indicated using the temperature class (T Codes) ~~in identification numbers, as~~ shown in Table 500-~~7~~8(b).

The temperature class (T Code) ~~Identification numbers~~ marked on equipment nameplates shall be in accordance with Table 500-~~8~~7(b).

Equipment ~~that is approved~~ for Class I and Class II shall be marked with the maximum safe operating temperature, as determined by simultaneous exposure to the combinations of Class I and Class II conditions.

FPN: Since there is no consistent relationship between explosion properties and ignition temperature, the two are independent requirements.

Table 500-8(b). Classification of Maximum Surface Temperature ~~Identification Numbers~~

Maximum Temperature		~~Identification~~ Temperature ~~Number~~ Class (T Code)
ºC	ºF	
450	842	T1
300	572	T2
280	536	T2A
260	500	T2B
230	446	T2C
215	419	T2D
200	392	T3
180	356	T3A
165	329	T3B
160	320	T3C
135	275	T4
120	248	T4A
100	212	T5
85	185	T6

(c) Temperature

(1) Class I Temperature. The temperature marking specified in (b) shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

FPN: For information regarding ignition temperatures of gases and vapors, see Recommended Practice for the Classification of flammable gases, etc. and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997.

(2) Class II Temperature. The temperature marking specified in (b) shall be less than the ignition temperature of the specific dust to be encountered. For organic dusts that may dehydrate or carbonize, the temperature marking shall not exceed the lower of either the ignition temperature or 165ºC (329ºF).

FPN: See Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997, for minimum ignition temperatures of specific dusts.

The ignition temperature for which equipment was approved prior to this requirement shall be assumed to be as shown in Table 500-5(c) (2).

Table 500-5(c) (2).

Equipment (Such as Motors or Power Transformers) that May Be Overloaded					
	Equipment that Is Not Subject to Overloading		Normal Operation		Abnormal Operation
Class II Group	ºC	ºF	ºC	ºF	ºC ºF
E	200	392	200	392	200 392
F	200	392	150	302	200 392
G	165	329	120	248	165 329

(d) Threading

All threaded conduit referred to herein shall be threaded with an National (American) Standard Pipe Taper (NPT) standard conduit cutting die that provides _-in. taper per foot. Such conduit shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof or flameproof integrity of the conduit system where applicable.

Equipment provided with threaded entries for field wiring connections shall be installed in accordance with (1) or (2).

~~(1)~~ (2) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.

FPN: Threading specifications for NPT threads are located in Pipe Threads, General Purpose (Inch), ANSI/ASME B1.20.1-1983.

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in Metric Screw Threads, ISO 965/1:1980, and Metric Screw Threads, ISO 965/3:1980.

(e) Fiber Optic Cable Assembly.

Where a fiber optic cable assembly contains conductors that are capable of carrying current, the fiber optic cable assembly shall be installed in accordance with the requirements of Articles 500, 501, 502, or 503, as applicable.

500-9. Specific Occupancies

Articles 510 through 517 cover garages, aircraft hangars, gasoline dispensing and service stations, bulk storage plants, spray application, dipping and coating processes, and health care facilities.

(Log #2128)

14- 3 - (500): Accept in Principle
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Reorganize Article 500 as indicated below per NEC CMA Proposal 14-1. With the exception of minor titling changes and a rearrangement of sentences as indicated within one section, this proposal contains no new words, concepts or requirements.
Revise Article 500 as follows:
1) Relocate 500-3 (a) as 500- 4 (a) and renumber 500-3 with existing 500 -3 (b) (c) section. Relocate 500-3 (d) and 500 -3 (e) to new sections under 500-7.

With change:
500-3 General.
(a) Documentation All areas designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

(b) Reference Standards.

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with the standards of the National Fire Protection Association, the American Petroleum Institute, and the Instrument Society of America that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

FPN No. 2: For further information on the classification of locations, see Flammable and Combustible Liquids Code, NFPA 30-1996; Standard for Drycleaning Plants, NFPA 32-1996; Standard for Spray Application Using Flammable or Combustible Materials, NFPA 33-1995; Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids, NFPA 34-1995; Standard for the Manufacture of Organic Coatings, NFPA 35-1995; Standard for Solvent Extraction Plants, NFPA 36-1997; Standard on Fire Protection for Laboratories Using Chemicals, NFPA 45-1996; Standard for Gaseous Hydrogen Systems at Consumer Sites, NFPA 50A-1994; Standard for Liquefied Hydrogen Systems at Consumer Sites, NFPA 50B-1994; Liquefied Petroleum Gas Code, NFPA 58-1998; Standard for the Storage and Handling of Liquefied Petroleum Gases at Utility Gas Plants, NFPA 59-1998; Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997; Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997; Standard for Fire Protection in Wastewater Treatment and Collection Facilities, NFPA 820-1995; Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2, ANSI/API RP500-1997; Area Classification In Hazardous (Classified) Dust Locations, ANSI/ISA-S12.10-1988.

FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see Recommended Practice on Static Electricity, NFPA 77-1993; Standard for the Installation of Lightning Protection Systems, NFPA 780-1997; and Protection Against Ignitions Arising Out of Static Lightning and Stray Currents, API RP 2003-1991.

FPN No. 4: For further information on ventilation, see Flammable and Combustible Liquids Code, NFPA 30-1996; and Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2, API RP 500-1997, Section 4.6.

FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see Recommended Practice for Design and Installation of Electrical Systems for Offshore Production Platforms, ANSI/API RP 14F-1991.

2) Move the entire sections 500-7, 500-8 and 500- 9 under new 500 - 4: this will result in a discussion of the classification of locations all under a single new titled section as follows:

With change:

500-4. Classifications of Locations.
(a) Classifications of Locations. Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases, or combustible dusts or fibers that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified. Each room, section, or area shall be considered individually in determining its classification.

FPN: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in less hazardous or in nonhazardous locations and, thus, to reduce the amount of special equipment required.

(b) Class I Locations(500-7.) Class I locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures. Class I locations shall include those specified in (1) and (2).

(1) Class I, Division 1. A Class I, Division 1 location is a location
(a) In which ignitible concentrations of flammable gases or vapors can exist under normal operating conditions, or
(b) In which ignitible concentrations of such gases or vapors may exist frequently because of repair or maintenance operations or because of leakage, or
(c) In which breakdown or faulty operation of equipment or processes might release ignitible concentrations of flammable gases or vapors, and might also cause simultaneous failure of electrical equipment in such a way as to directly cause the electrical equipment to become a source of ignition.

FPN No. 1: This classification usually includes the following locations:

a. Where volatile flammable liquids or liquefied flammable gases are transferred from one container to another
b. Interiors of spray booths and areas in the vicinity of spraying and painting operations where volatile flammable solvents are used
c. Locations containing open tanks or vats of volatile flammable liquids
d. Drying rooms or compartments for the evaporation of flammable solvents
e. Locations containing fat and oil extraction equipment using volatile flammable solvents
f. Portions of cleaning and dyeing plants where flammable liquids are used
g. Gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape
h. Inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids
i. The interiors of refrigerators and freezers in which volatile flammable materials are stored in open, lightly stoppered, or easily ruptured containers
j. All other locations where ignitible concentrations of flammable vapors or gases are likely to occur in the course of normal operations.

FPN No. 2: In some Division 1 locations, ignitible concentrations of flammable gases or vapors may be present continuously or for long periods of time. Examples include the following:

a. The inside of inadequately vented enclosures containing instruments normally venting flammable gases or vapors to the interior of the enclosure
b. The inside of vented tanks containing volatile flammable liquids
c. The area between the inner and outer roof sections of a floating roof tank containing volatile flammable fluids

d. Inadequately ventilated areas within spraying or coating operations using volatile flammable fluids
e. The interior of an exhaust duct that is used to vent ignitible concentrations of gases or vapors.

Experience has demonstrated the prudence of avoiding the installation of instrumentation or other electric equipment in these particular areas altogether or where it cannot be avoided because it is essential to the process and other locations are not feasible [see Section 500-4(a), FPN], using electric equipment or instrumentation approved for the specific application or consisting of intrinsically safe systems as described in Article 504.

(2) Class I, Division 2. A Class I, Division 2 location is a location
(a) In which volatile flammable liquids or flammable gases are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems, or in case of abnormal operation of equipment, or
(b) In which ignitible concentrations of gases or vapors are normally prevented by positive mechanical ventilation, and which might become hazardous through failure or abnormal operation of the ventilating equipment, or
(c) That is adjacent to a Class I, Division 1 location, and to which ignitible concentrations of gases or vapors might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.

FPN No. 1: This classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used but that, in the judgment of the authority having jurisdiction, would become hazardous only in case of an accident or of some unusual operating condition. The quantity of flammable material that might escape in case of accident, the adequacy of ventilating equipment, the total area involved, and the record of the industry or business with respect to explosions or fires are all factors that merit consideration in determining the classification and extent of each location.

FPN No. 2: Piping without valves, checks, meters, and similar devices would not ordinarily introduce a hazardous condition even though used for flammable liquids or gases. Depending on factors such as the quantity and size of the containers and ventilation, locations used for the storage of flammable liquids or liquefied or compressed gases in sealed containers may either be considered hazardous (classified) or nonhazardous locations. See Flammable and Combustible Liquids Code, NFPA 30-1996, and Liquefied Petroleum Gas Code, NFPA 58-1998.

(c) Class II Locations. Class II locations are those that are hazardous because of the presence of combustible dust. Class II locations shall include those specified in (a) and (b).
(1) Class II, Division 1. A Class II, Division 1 location is a location
(a) In which combustible dust is in the air under normal operating conditions in quantities sufficient to produce explosive or ignitible mixtures, or
(b) Where mechanical failure or abnormal operation of machinery or equipment might cause such explosive or ignitible mixtures to be produced, and might also provide a source of ignition through simultaneous failure of electric equipment, operation of protection devices, or from other causes, or
(c) In which combustible dusts of an electrically conductive nature may be present in hazardous quantities.

FPN: Combustible dusts that are electrically nonconductive include dusts produced in the handling and processing of grain and grain products, pulverized sugar and cocoa, dried egg and milk powders, pulverized spices, starch and pastes, potato and wood-flour, oil meal from beans and seed, dried hay, and other organic materials that may produce combustible dusts when processed or handled. Only Group E dusts are considered to be electrically conductive for classification purposes. Dusts containing magnesium or aluminum are particularly hazardous, and the use of extreme precaution will be necessary to avoid ignition and explosion.

(2) Class II, Division 2. A Class II, Division 2 location is a location
(a) Where combustible dust is not normally in the air in quantities sufficient to produce explosive or ignitible mixtures, and dust accumulations are normally insufficient to interfere with the normal operation of electrical equipment or other apparatus, but combustible dust may be in suspension in the air as a result of infrequent malfunctioning of handling or processing equipment and

(b) Where combustible dust accumulations on, in, or in the vicinity of the electrical equipment may be sufficient to interfere with the safe dissipation of heat from electrical equipment or may be ignitible by abnormal operation or failure of electrical equipment.

FPN No. 1: The quantity of combustible dust that may be present and the adequacy of dust removal systems are factors that merit consideration in determining the classification and may result in an nonhazardous area.

FPN No. 2: Where products such as seed are handled in a manner that produces low quantities of dust, the amount of dust deposited may not warrant classification.

(d) Class III Locations. Class III locations are those that are hazardous because of the presence of easily ignitible fibers or flyings, but in which such fibers or flyings are not likely to be in suspension in the air in quantities sufficient to produce ignitible mixtures. Class III locations shall include those specified in (a) and (b).
(1) Class III, Division 1. A Class III, Division 1 location is a location in which easily ignitible fibers or materials producing combustible flyings are handled, manufactured, or used.

FPN No. 1: Such locations usually include some parts of rayon, cotton, and other textile mills; combustible fiber manufacturing and processing plants; cotton gins and cotton-seed mills; flax-processing plants; clothing manufacturing plants; woodworking plants; and establishments and industries involving similar hazardous processes or conditions.

FPN No. 2: Easily ignitible fibers and flyings include rayon, cotton (including cotton linters and cotton waste), sisal or henequen, istle, jute, hemp, tow, cocoa fiber, oakum, baled waste kapok, Spanish moss, excelsior, and other materials of similar nature.

(2) Class III, Division 2. A Class III, Division 2 location is a location in which easily ignitible fibers are stored or handled other than in the process of manufacture.

3) Provide new 500 -5 consisting of existing sections 500-5 (a) (b) and (c)

500-5 Material Groups. For purposes of testing, approval, and area classification, various air mixtures (not oxygen-enriched) shall be grouped in accordance with Sections 500-5(a) and 500-5(b).

Exception: Equipment approved for a specific gas, vapor, or dust.

FPN: This grouping is based on the characteristics of the materials. Facilities are available for testing and identifying equipment for use in the various atmospheric groups.

(a) Class I Group Classifications. Class I groups shall be as follows.
(1) Group A. Acetylene.
(2) Group B. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.45 mm or a minimum igniting current ratio (MIC ratio) less than or equal to 0.40.

FPN: A typical Class I, Group B material is hydrogen.

Exception No. 1: Group D equipment shall be permitted to be used for atmospheres containing butadiene provided all conduit runs into explosionproof equipment are provided with explosionproof seals installed within 18 in. (457 mm) of the enclosure.

Exception No. 2: Group C equipment shall be permitted to be used for atmospheres containing allyl glycidyl ether, n-butyl glycidyl ether, ethylene oxide, propylene oxide, and acrolein provided all conduit runs into explosionproof equipment are provided with explosionproof seals installed within 18 in. (457 mm) of the enclosure.

(3) Group C. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.45 mm and less than or equal to 0.75 mm, or a minimum igniting current ratio (MIC ratio) greater than 0.40 and less than or equal to 0.80.

FPN: A typical Class I, Group C material is ethylene.

(4) Group D. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.75 mm or a minimum igniting current ratio (MIC ratio) greater than 0.80.

FPN: A typical Class I, Group D material is propane.

Exception: For atmospheres containing ammonia, the authority having jurisdiction for enforcement of this Code shall be permitted to reclassify the location to a less hazardous location or a nonhazardous location.

FPN No. 1: For additional information on the properties and group classification of Class I materials, see Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997, and Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, NFPA 325-1994.

FPN No. 2: The explosion characteristics of air mixtures of gases or vapors vary with the specific material involved. For Class I locations, Groups A, B, C, and D, the classification involves determinations of maximum explosion pressure and maximum safe clearance between parts of a clamped joint in an enclosure. It is necessary, therefore, that equipment be approved not only for class but also for the specific group of the gas or vapor that will be present.

FPN No. 3: Certain chemical atmospheres may have characteristics that require safeguards beyond those required for any of the above groups. Carbon disulfide is one of these chemicals because of its low ignition temperature [100ºC (212ºF)] and the small joint clearance permitted to arrest its flame.

FPN No. 4: For classification of areas involving ammonia atmosphere, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989.

(b) Class II Group Classifications. Class II groups shall be as follows.

(1) Group E. Atmospheres containing combustible metal dusts, including aluminum, magnesium, and their commercial alloys, or other combustible dusts whose particle size, abrasiveness, and conductivity present similar hazards in the use of electrical equipment.

FPN: Certain metal dusts may have characteristics that require safeguards beyond those required for atmospheres containing the dusts of aluminum, magnesium, and their commercial alloys. For example, zirconium, thorium, and uranium dusts have extremely low ignition temperatures [as low as 20ºC (68ºF)] and minimum ignition energies lower than any material classified in any of the Class I or Class II Groups.

(2) Group F. Atmospheres containing combustible carbonaceous dusts that have more than 8 percent total entrapped volatiles (see Standard Test Method for Volatile Material in the Analysis Sample for Coal and Coke, ASTM D3175-89, for coal and coke dusts) or that have been sensitized by other materials so that they present an explosion hazard. Coal, carbon black, charcoal, and coke dusts are examples of carbonaceous dusts.

(3) Group G. Atmospheres containing combustible dusts not included in Group E or F, including flour, grain, wood, plastic, and chemicals.

FPN No. 1: For additional information on group classification of Class II materials, see Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997.

FPN No. 2: The explosion characteristics of air mixtures of dust vary with the materials involved. For Class II locations, Groups E, F, and G, the classification involves the tightness of the joints of assembly and shaft openings to prevent the entrance of dust in the dust-ignitionproof enclosure, the blanketing effect of layers of dust on the equipment that may cause overheating, and the ignition temperature of the dust. It is necessary, therefore, that equipment be approved not only for the class, but also for the specific group of dust that will be present.

FPN No. 3: Certain dusts may require additional precautions due to chemical phenomena that can result in the generation of ignitible gases. See National Electrical Safety Code, ANSI C2-1997, Section 127A, Coal Handling Areas.

5) Renumber 500-4 as 500-6.

With change:

500 -6 Protection Techniques. The following shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.

(a) Explosionproof Apparatus. This protection technique shall be permitted for equipment in those Class I, Division 1 and 2 locations for which it is approved.

FPN: Explosionproof apparatus is defined in Article 100. For further information, see Explosionproof and Dust-Ignitionproof Electrical Equipment for Use in Hazardous (Classified) Locations, ANSI/UL 1203-1994.

(b) Dust Ignitionproof. This protection technique shall be permitted for equipment in those Class II, Division 1 and 2 locations for which it is approved.

FPN: Dust-ignitionproof equipment is defined in Article 100. For further information, see Explosionproof and Dust-Ignitionproof Electrical Equipment for Use in Hazardous (Classified) Locations, ANSI/UL 1203-1994.

(c) Dusttight. This protection technique shall be permitted for equipment in those Class II, Division 2 and Class III locations for which it is approved.

FPN No. 1: Dusttight enclosures are constructed so that dust will not enter the enclosing cases under specified test conditions.

FPN No. 2: For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA S12.12-1994, and Electrical Equipment for Use in Class I and II, Division 2 and Class III Hazardous (Classified) Locations, UL 1604-1994.

FPN No. 3: For further information on test conditions for equipment other than rotating equipment, see Enclosures for Electrical Equipment (1000 volts Maximum), ANSI/NEMA 250-1991.

(d) Purged and Pressurized. This protection technique shall be permitted for equipment in any hazardous (classified) location for which it is approved.

FPN No. 1: In some cases, hazards may be reduced or hazardous (classified) locations limited or eliminated by adequate positive-pressure ventilation from a source of clean air in conjunction with effective safeguards against ventilation failure.

FPN No. 2: For further information, see Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

(e) Intrinsically Safe Systems. Intrinsically safe apparatus and wiring shall be permitted in any hazardous (classified) location for which it is approved, and the provisions of Articles 501 through 503 and 510 through 516 shall not be considered applicable to such installations, except as required by Article 504.

Installation of intrinsically safe apparatus and wiring shall be in accordance with the requirements of Article 504.

FPN: For further information, see Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Division 1, Hazardous Locations, ANSI/UL 913-1997.

(f) Nonincendive. A protective technique where, under normal operating conditions, any arcing or thermal effects are not capable of igniting the flammable gas, vapor, or dust-in-air mixture. This protection technique shall be permitted for equipment in those Class I, Division 2; Class II, Division 2; and Class III locations for which it is approved.

(1) Nonincendive Circuit. A circuit in which any arc or thermal effect produced, under intended operating conditions of the equipment or due to opening, shorting, or grounding of field wiring, is not capable, under specified test conditions, of igniting the flammable gas–, vapor–, or dust–air mixture.

FPN No. 1: For test conditions, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations, ANSI/ISA S12.12-1994.

FPN No. 2: Nonincendive circuit is defined in Article 100. For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations, ANSI/ISA S12.12-1994.

(2) Nonincendive Equipment. Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing ignition of a specified flammable gas–, vapor–, or dust–air mixture due to arcing or thermal means.

FPN: For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA-S12.12-1994.

(3) Nonincendive Component. A component having contacts for making or breaking an incendive circuit and the contacting mechanism shall be constructed so that the component is incapable of igniting the specified flammable gas– or vapor–air mixture. The housing of a nonincendive component is not intended to exclude the flammable atmosphere or contain an explosion.

This protection technique shall be permitted for current-interrupting contacts in those Class I, Division 2 locations for which the component is approved.

FPN: For further information, see Electrical Equipment for Use in Class I and II, Division 2, and Class III Hazardous (Classified) Locations, UL 1604-1994.

(g) Oil Immersion. This protection technique shall be permitted for current-interrupting contacts in Class I, Division 2 locations as described in Section 501-6(b)(1)(b).

FPN: See Sections 501-3(b)(1), Exception (a); 501-5(a)(1), Exception (b), 501-6(b)(1); 501-14(b)(1), Exception (a); 502-14(a)(2), Exception; and 502-14(a)(3), Exception. For further information, see Industrial Control Equipment for Use in Hazardous (Classified) Locations, ANSI/UL 698-1995.

(h) Hermetically Sealed. A hermetically sealed device shall be sealed against the entrance of an external atmosphere and the seal shall be made by fusion, e.g., soldering, brazing, welding, or the fusion of glass to metal.

This protection technique shall be permitted for current-interrupting contacts in Class I, Division 2 locations.

FPN: See Sections 501-3(b)(1), Exception (b); 501-5(a)(1), Exception (a); 501-6(b)(1)(a); and 501-14(b)(1), Exception (b). For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations, ANSI/ISA S12.12-1994.

(i) Other Protection Techniques. Other protection techniques used in equipment listed for use in hazardous (classified) locations.

4) Renumber 500-5 and 500-7, change the order of paragraphs in 500-5(c) and insert it as new 500-7 (a).

With change:

500 -7 Equipment. Articles 500 through 504 require equipment construction and installation that will ensure safe performance under conditions of proper use and maintenance.

FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to installation and maintenance.

FPN No. 2: Low ambient conditions require special consideration. Explosionproof or dust-ignitionproof equipment may not be suitable for use at temperatures lower than -25ºC (-13ºF) unless they are identified for low-temperature service. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified Class I, Division 1 at normal ambient temperature.

(a) Approval for Class and Properties.

(1) Equipment shall be approved not only for the class of location but also for the explosive, combustible, or ignitible properties of the specific gas, vapor, dust, fiber, or flyings that will be present. In addition, Class I equipment shall not have any exposed surface that operates at a temperature in excess of the ignition temperature of the specific gas or vapor. Class II equipment shall not have an external temperature higher than that specified in Section 500-7(2). Class III equipment shall not exceed the maximum surface temperatures specified in Section 503-1.

(2) Equipment that has been approved for a Division 1 location shall be permitted in a Division 2 location of the same class and group.

(3) Where specifically permitted in Articles 501 through 503, general-purpose equipment or equipment in general-purpose enclosures shall be permitted to be installed in Division 2 locations if the equipment does not constitute a source of ignition under normal operating conditions.

(4) Equipment, regardless of the classification of the location in which it is installed, that depends on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the equipment, shall be approved for a Class I, Division 2 location.

Exception: Equipment installed in a Class I, Division 1 location shall be suitable for the Division 1 location.

FPN: See Section 501-5(f)(3) for additional requirements.

(5) Unless otherwise specified, normal operating conditions for motors shall be assumed to be rated full-load steady conditions.

(6) Where flammable gases or combustible dusts are or may be present at the same time, the simultaneous presence of both shall be considered when determining the safe operating temperature of the electrical equipment.

FPN: The characteristics of various atmospheric mixtures of gases, vapors, and dusts depend on the specific material involved.

(b) Marking. Approved equipment shall be marked to show the class, group, and operating temperature or temperature range referenced to a 40ºC ambient.

Exception No. 1: Equipment of the non-heat-producing type, such as junction boxes, conduit, and fittings, and equipment of the heat-producing type having a maximum temperature not more than 100ºC (212ºF) shall not be required to have a marked operating temperature or temperature range.

Exception No. 2: Fixed lighting fixtures marked for use in Class I, Division 2 or Class II, Division 2 locations only shall not be required to be marked to indicate the group.

Exception No. 3: Fixed general-purpose equipment in Class I locations, other than fixed lighting fixtures, that is acceptable for use in Class I, Division 2 locations shall not be required to be marked with the class, group, division, or operating temperature.

Exception No. 4: Fixed dusttight equipment other than fixed lighting fixtures that are acceptable for use in Class II, Division 2 and Class III locations shall not be required to be marked with the class, group, division, or operating temperature.

Exception No. 5: Electric equipment suitable for ambient temperatures exceeding 40ºC (104ºF) shall be marked with both the maximum ambient temperature and the operating temperature or temperature range at that ambient temperature.

FPN: Equipment not marked to indicate a division, or marked "Division 1" or "Div. 1," is suitable for both Division 1 and 2 locations. Equipment marked "Division 2" or "Div. 2" is suitable for Division 2 locations only.

The temperature range, if provided, shall be indicated in identification numbers, as shown in Table 500-7(b).

Identification numbers marked on equipment nameplates shall be in accordance with Table 500-7(b).

Equipment that is approved for Class I and Class II shall be marked with the maximum safe operating temperature, as determined by simultaneous exposure to the combinations of Class I and Class II conditions.

FPN: Since there is no consistent relationship between explosion properties and ignition temperature, the two are independent requirements.

Table 500-5(d). Identification Numbers

Maximum Temperature °C	Maximum Temperature °F	Identification Number
450	842	T1
300	572	T2
280	536	T2A
260	500	T2B
230	446	T2C
215	419	T2D
200	392	T3
180	356	T3A
165	329	T3B
160	320	T3C
135	275	T4
120	248	T4A
100	212	T5
85	185	T6

(c) Temperature.
(1) Class I Temperature. The temperature marking specified in (b) shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

FPN: For information regarding ignition temperatures of gases and vapors, see Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997, and Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, NFPA 325-1994.

(2) Class II Temperature. The temperature marking specified in (b) shall be less than the ignition temperature of the specific dust to be encountered. For organic dusts that may dehydrate or carbonize, the temperature marking shall not exceed the lower of either the ignition temperature or 165ºC (329ºF).

FPN: See Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997, for minimum ignition temperatures of specific dusts.

The ignition temperature for which equipment was approved prior to this requirement shall be assumed to be as shown in Table 500-5(f).

Table 500-5(f).

Class II Group	Equipment that Is Not Subject to Overloading °C	Equipment that Is Not Subject to Overloading °F	Equipment (Such as Motors or Power Transformers) that May Be Overloaded Normal Operation °C	Normal Operation °F	Abnormal Operation °C	Abnormal Operation °F
E	200	392	200	392	200	392
F	200	392	150	302	200	392
G	165	329	120	248	165	329

d) Threaded Conduit. All threaded conduit referred to herein shall be threaded with an NPT standard conduit cutting die that provides _-in. taper per foot. Such conduit shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and ensure the explosionproof or dust-ignitionproof integrity of the conduit system where applicable. For equipment provided with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in Metric Screw Threads, ISO 965/1:1980 and Metric Screw Threads, ISO 965/3:1980.

(e) Fiber Optic Cable Assembly. Where a fiber optic cable assembly contains conductors that are capable of carrying current, the fiber optic cable assembly shall be installed in accordance with the requirements of Articles 500, 501, 502, or 503, as applicable.
6) Renumber 500-6 to 500 -8

With change:

500-8. Specific Occupancies. Articles 510 through 517 cover garages, aircraft hangars, gasoline dispensing and service stations, bulk storage plants, spray application, dipping and coating processes, and health care facilities.

Entire 500 with recommended changes would appear as follows:

ARTICLE 500 –Hazardous (Classified) Locations, Classes I, II, and III, Divisions 1 and 2

500-1. Scope — Articles 500 through 504. Articles 500 through 504 cover the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Divisions 1 and 2; Class II, Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, combustible dust, or ignitible fibers or flyings.

FPN: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors, or flammable liquids, refer to Article 505.

500-2. Other Articles. Except as modified in Articles 500 through 504, all other applicable rules contained in this Code shall apply to electrical equipment and wiring installed in hazardous (classified) locations.

500-3 General
(a) Documentation All areas designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

(b) Reference Standards.

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with the standards of the National Fire Protection Association, the American Petroleum Institute, and the Instrument Society of America that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.
FPN No. 2: For further information on the classification of locations, see Flammable and Combustible Liquids Code, NFPA 30-1996; Standard for Drycleaning Plants, NFPA 32-1996; Standard for Spray Application Using Flammable or Combustible Materials, NFPA 33-1995; Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids, NFPA 34-1995; Standard for the Manufacture of Organic Coatings, NFPA 35-1995; Standard for Solvent Extraction Plants, NFPA 36-1997; Standard on Fire Protection for Laboratories Using Chemicals, NFPA 45-1996; Standard for Gaseous Hydrogen Systems at Consumer Sites, NFPA 50A-1994; Standard for Liquefied Hydrogen Systems at Consumer Sites, NFPA 50B-1994; Liquefied Petroleum Gas Code, NFPA 58-1998; Standard for the Storage and Handling of Liquefied Petroleum Gases at Utility Gas Plants, NFPA 59-1998; Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997; Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997; Standard for Fire Protection in Wastewater Treatment and Collection Facilities, NFPA 820-1995; Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2, ANSI/API RP500-1997; Area Classification In Hazardous (Classified) Dust Locations, ANSI/ISA-S12.10-1988.
FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see Recommended Practice on Static Electricity, NFPA 77-1993; Standard for the Installation of Lightning Protection Systems, NFPA 780-1997; and Protection Against Ignitions Arising Out of Static Lightning and Stray Currents, API RP 2003-1991.
FPN No. 4: For further information on ventilation, see Flammable and Combustible Liquids Code, NFPA 30-1996; and Recommended Practice for Classification of

Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2, API RP 500-1997, Section 4.6.
FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see Recommended Practice for Design and Installation of Electrical Systems for Offshore Production Platforms, ANSI/API RP 14F-1991.

500-4. Classifications of Locations.
(a) Classifications of Locations. Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases, or combustible dusts or fibers that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified. Each room, section, or area shall be considered individually in determining its classification.

FPN: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in less hazardous or in nonhazardous locations and, thus, to reduce the amount of special equipment required.

(b) Class I Locations. Class I locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures. Class I locations shall include those specified in (1) and (2).

(1) Class I, Division 1. A Class I, Division 1 location is a location
(a) In which ignitible concentrations of flammable gases or vapors can exist under normal operating conditions, or
(b) In which ignitible concentrations of such gases or vapors may exist frequently because of repair or maintenance operations or because of leakage, or
(c) In which breakdown or faulty operation of equipment or processes might release ignitible concentrations of flammable gases or vapors, and might also cause simultaneous failure of electrical equipment in such a way as to directly cause the electrical equipment to become a source of ignition.

FPN No. 1: This classification usually includes the following locations:

a. Where volatile flammable liquids or liquefied flammable gases are transferred from one container to another
b. Interiors of spray booths and areas in the vicinity of spraying and painting operations where volatile flammable solvents are used
c. Locations containing open tanks or vats of volatile flammable liquids
d. Drying rooms or compartments for the evaporation of flammable solvents
e. Locations containing fat and oil extraction equipment using volatile flammable solvents
f. Portions of cleaning and dyeing plants where flammable liquids are used
g. Gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape
h. Inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids
i. The interiors of refrigerators and freezers in which volatile flammable materials are stored in open, lightly stoppered, or easily ruptured containers
j. All other locations where ignitible concentrations of flammable vapors or gases are likely to occur in the course of normal operations.

FPN No. 2: In some Division 1 locations, ignitible concentrations of flammable gases or vapors may be present continuously or for long periods of time. Examples include the following:

a. The inside of inadequately vented enclosures containing instruments normally venting flammable gases or vapors to the interior of the enclosure
b. The inside of vented tanks containing volatile flammable liquids
c. The area between the inner and outer roof sections of a floating roof tank containing volatile flammable fluids
d. Inadequately ventilated areas within spraying or coating operations using volatile flammable fluids
e. The interior of an exhaust duct that is used to vent ignitible concentrations of gases or vapors.

Experience has demonstrated the prudence of avoiding the installation of instrumentation or other electric equipment in these particular areas altogether or where it cannot be avoided because it is essential to the process and other locations are not feasible [see Section 500-4(a), FPN], using electric equipment or instrumentation approved for the specific application or consisting of intrinsically safe systems as described in Article 504.

(2) Class I, Division 2. A Class I, Division 2 location is a location
(a) In which volatile flammable liquids or flammable gases are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems, or in case of abnormal operation of equipment, or
(b) In which ignitible concentrations of gases or vapors are normally prevented by positive mechanical ventilation, and which might become hazardous through failure or abnormal operation of the ventilating equipment, or
(c) That is adjacent to a Class I, Division 1 location, and to which ignitible concentrations of gases or vapors might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.

FPN No. 1: This classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used but that, in the judgment of the authority having jurisdiction, would become hazardous only in case of an accident or of some unusual operating condition. The quantity of flammable material that might escape in case of accident, the adequacy of ventilating equipment, the total area involved, and the record of the industry or business with respect to explosions or fires are all factors that merit consideration in determining the classification and extent of each location.
FPN No. 2: Piping without valves, checks, meters, and similar devices would not ordinarily introduce a hazardous condition even though used for flammable liquids or gases. Depending on factors such as the quantity and size of the containers and ventilation, locations used for the storage of flammable liquids or liquefied or compressed gases in sealed containers may either be considered hazardous (classified) or nonhazardous locations. See Flammable and Combustible Liquids Code, NFPA 30-1996, and Liquefied Petroleum Gas Code, NFPA 58-1998.

(c) Class II Locations. Class II locations are those that are hazardous because of the presence of combustible dust. Class II locations shall include those specified in (a) and (b).
(1) Class II, Division 1. A Class II, Division 1 location is a location
(a) In which combustible dust is in the air under normal operating conditions in quantities sufficient to produce explosive or ignitible mixtures, or
(b) Where mechanical failure or abnormal operation of machinery or equipment might cause such explosive or ignitible mixtures to be produced, and might also provide a source of ignition through simultaneous failure of electric equipment, operation of protection devices, or from other causes, or
(c) In which combustible dusts of an electrically conductive nature may be present in hazardous quantities.

FPN: Combustible dusts that are electrically nonconductive include dusts produced in the handling and processing of grain and grain products, pulverized sugar and cocoa, dried egg and milk powders, pulverized spices, starch and pastes, potato and wood-flour, oil meal from beans and seed, dried hay, and other organic materials that may produce combustible dusts when processed or handled. Only Group E dusts are considered to be electrically conductive for classification purposes. Dusts containing magnesium or aluminum are particularly hazardous, and the use of extreme precaution will be necessary to avoid ignition and explosion.

(2) Class II, Division 2. A Class II, Division 2 location is a location (a) Where combustible dust is not normally in the air in quantities sufficient to produce explosive or ignitible mixtures, and dust accumulations are normally insufficient to interfere with the normal operation of electrical equipment or other apparatus, but combustible dust may be in suspension in the air as a result of infrequent malfunctioning of handling or processing equipment and

(b) Where combustible dust accumulations on, in, or in the vicinity of the electrical equipment may be sufficient to interfere with the safe dissipation of heat from electrical equipment or may be ignitible by abnormal operation or failure of electrical equipment.

FPN No. 1: The quantity of combustible dust that may be present and the adequacy of dust removal systems are factors that merit consideration in determining the classification and may result in an nonhazardous area.
FPN No. 2: Where products such as seed are handled in a manner that produces low quantities of dust, the amount of dust deposited may not warrant classification.

(d) Class III Locations. Class III locations are those that are hazardous because of the presence of easily ignitible fibers or flyings, but in which such fibers or flyings are not likely to be in suspension in the air in quantities sufficient to produce ignitible mixtures. Class III locations shall include those specified in (a) and (b).

(1) Class III, Division 1. A Class III, Division 1 location is a location in which easily ignitible fibers or materials producing combustible flyings are handled, manufactured, or used.

FPN No. 1: Such locations usually include some parts of rayon, cotton, and other textile mills; combustible fiber manufacturing and processing plants; cotton gins and cotton-seed mills; flax-processing plants; clothing manufacturing plants; woodworking plants; and establishments and industries involving similar hazardous processes or conditions.
FPN No. 2: Easily ignitible fibers and flyings include rayon, cotton (including cotton linters and cotton waste), sisal or henequen, istle, jute, hemp, tow, cocoa fiber, oakum, baled waste kapok, Spanish moss, excelsior, and other materials of similar nature.

(2) Class III, Division 2. A Class III, Division 2 location is a location in which easily ignitible fibers are stored or handled other than in the process of manufacture.

500-5 Material Groups. For purposes of testing, approval, and area classification, various air mixtures (not oxygen-enriched) shall be grouped in accordance with Sections 500-5(a) and 500-5(b).

Exception: Equipment approved for a specific gas, vapor, or dust.

FPN: This grouping is based on the characteristics of the materials. Facilities are available for testing and identifying equipment for use in the various atmospheric groups.

(a) Class I Group Classifications . Class I groups shall be as follows.
(1) Group A. Acetylene.
(2) Group B. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.45 mm or a minimum igniting current ratio (MIC ratio) less than or equal to 0.40.

FPN: A typical Class I, Group B material is hydrogen.

Exception No. 1: Group D equipment shall be permitted to be used for atmospheres containing butadiene provided all conduit runs into explosionproof equipment are provided with explosionproof seals installed within 18 in. (457 mm) of the enclosure.
Exception No. 2: Group C equipment shall be permitted to be used for atmospheres containing allyl glycidyl ether, n-butyl glycidyl ether, ethylene oxide, propylene oxide, and acrolein provided all conduit runs into explosionproof equipment are provided with explosionproof seals installed within 18 in. (457 mm) of the enclosure.

(3) Group C. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.45 mm and less than or equal to 0.75 mm, or a minimum igniting current ratio (MIC ratio) greater than 0.40 and less than or equal to 0.80.

FPN: A typical Class I, Group C material is ethylene.

(4) Group D. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.75 mm or a minimum igniting current ratio (MIC ratio) greater than 0.80.

FPN: A typical Class I, Group D material is propane.

Exception: For atmospheres containing ammonia, the authority having jurisdiction for enforcement of this Code shall be permitted to reclassify th location to a less hazardous location or a nonhazardous location.

FPN No. 1: For additional information on the properties and group classification of Class I materials, see Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997, and Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, NFPA 325-1994.
FPN No. 2: The explosion characteristics of air mixtures of gases or vapors vary with the specific material involved. For Class I locations, Groups A, B, C, and D, the classification involves determinations of maximum explosion pressure and maximum safe clearance between parts of a clamped joint in an enclosure. It is necessary, therefore, that equipment be approved not only for class but also for the specific group of the gas or vapor that will be present.
FPN No. 3: Certain chemical atmospheres may have characteristics that require safeguards beyond those required for any of the above groups. Carbon disulfide is one of these chemicals because of its low ignition temperature [100ºC (212ºF)] and the small joint clearance permitted to arrest its flame.
FPN No. 4: For classification of areas involving ammonia atmosphere, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989.

(b) Class II Group Classifications. Class II groups shall be as follows.

(1) Group E. Atmospheres containing combustible metal dusts, including aluminum, magnesium, and their commercial alloys, or other combustible dusts whose particle size, abrasiveness, and conductivity present similar hazards in the use of electrical equipment.

FPN: Certain metal dusts may have characteristics that require safeguards beyond those required for atmospheres containing the dusts of aluminum, magnesium, and their commercial alloys. For example, zirconium, thorium, and uranium dusts have extremely low ignition temperatures [as low as 20ºC (68ºF)] and minimum ignition energies lower than any material classified in any of the Class I or Class II Groups.

(2) Group F. Atmospheres containing combustible carbonaceous dusts that have more than 8 percent total entrapped volatiles (see Standard Test Method for Volatile Material in the Analysis Sample for Coal and Coke, ASTM D3175-89, for coal and coke dusts) or that have been sensitized by other materials so that they present an explosion hazard. Coal, carbon black, charcoal, and coke dusts are examples of carbonaceous dusts.

(3) Group G. Atmospheres containing combustible dusts not included in Group E or F, including flour, grain, wood, plastic, and chemicals.

FPN No. 1: For additional information on group classification of Class II materials, see Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997.
FPN No. 2: The explosion characteristics of air mixtures of dust vary with the materials involved. For Class II locations, Groups E, F, and G, the classification involves the tightness of the joints of assembly and shaft openings

to prevent the entrance of dust in the dust-ignitionproof enclosure, the blanketing effect of layers of dust on the equipment that may cause overheating, and the ignition temperature of the dust. It is necessary, therefore, that equipment be approved not only for the class, but also for the specific group of dust that will be present.
FPN No. 3: Certain dusts may require additional precautions due to chemical phenomena that can result in the generation of ignitible gases. See National Electrical Safety Code, ANSI C2-1997, Section 127A, Coal Handling Areas.

500 -6 Protection Techniques. The following shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.
(a) Explosionproof Apparatus. This protection technique shall be permitted for equipment in those Class I, Division 1 and 2 locations for which it is approved.
FPN: Explosionproof apparatus is defined in Article 100. For further information, see Explosionproof and Dust-Ignitionproof Electrical Equipment for Use in Hazardous (Classified) Locations, ANSI/UL 1203-1994.

(b) Dust Ignitionproof. This protection technique shall be permitted for equipment in those Class II, Division 1 and 2 locations for which it is approved.
FPN: Dust-ignitionproof equipment is defined in Article 100. For further information, see Explosionproof and Dust-Ignitionproof Electrical Equipment for Use in Hazardous (Classified) Locations, ANSI/UL 1203-1994.

(c) Dusttight. This protection technique shall be permitted for equipment in those Class II, Division 2 and Class III locations for which it is approved.
FPN No. 1: Dusttight enclosures are constructed so that dust will not enter the enclosing cases under specified test conditions.
FPN No. 2: For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA S12.12-1994, and Electrical Equipment for Use in Class I and II, Division 2 and Class III Hazardous (Classified) Locations, UL 1604-1994.
FPN No. 3: For further information on test conditions for equipment other than rotating equipment, see Enclosures for Electrical Equipment (1000 volts Maximum), ANSI/NEMA 250-1991.
(d) Purged and Pressurized. This protection technique shall be permitted for equipment in any hazardous (classified) location for which it is approved.
FPN No. 1: In some cases, hazards may be reduced or hazardous (classified) locations limited or eliminated by adequate positive-pressure ventilation from a source of clean air in conjunction with effective safeguards against ventilation failure.
FPN No. 2: For further information, see Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.
(e) Intrinsically Safe Systems. Intrinsically safe apparatus and wiring shall be permitted in any hazardous (classified) location for which it is approved, and the provisions of Articles 501 through 503 and 510 through 516 shall not be considered applicable to such installations, except as required by Article 504.
Installation of intrinsically safe apparatus and wiring shall be in accordance with the requirements of Article 504.
FPN: For further information, see Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Division 1, Hazardous Locations, ANSI/UL 913-1997.
(f) Nonincendive. A protective technique where, under normal operating conditions, any arcing or thermal effects are not capable of igniting the flammable gas, vapor, or dust-in-air mixture. This protection technique shall be permitted for equipment in those Class I, Division 2; Class II, Division 2; and Class III locations for which it is approved.
(1) Nonincendive Circuit. A circuit in which any arc or thermal effect produced, under intended operating conditions of the equipment or due to opening, shorting, or grounding of field wiring, is not capable, under specified test conditions, of igniting the flammable gas–, vapor–, or dust–air mixture.
FPN No. 1: For test conditions, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations, ANSI/ISA S12.12-1994.
FPN No. 2: Nonincendive circuit is defined in Article 100. For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations, ANSI/ISA S12.12-1994.
(2) Nonincendive Equipment. Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing ignition of a specified flammable gas–, vapor–, or dust–air mixture due to arcing or thermal means.
FPN: For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, ANSI/ISA-S12.12-1994.
(3) Nonincendive Component A component having contacts for making or breaking an incendive circuit and the contacting mechanism shall be constructed so that the component is incapable of igniting the specified flammable gas– or vapor–air mixture. The housing of a nonincendive component is not intended to exclude the flammable atmosphere or contain an explosion.
This protection technique shall be permitted for current-interrupting contacts in those Class I, Division 2 locations for which the component is approved.
FPN: For further information, see Electrical Equipment for Use in Class I and II, Division 2, and Class III Hazardous (Classified) Locations, UL 1604-1994.
(g) Oil Immersion. This protection technique shall be permitted for current-interrupting contacts in Class I, Division 2 locations as described in Section 501-6(b)(1)(b).
FPN: See Sections 501-3(b)(1), Exception (a); 501-5(a)(1), Exception (b), 501-6(b)(1); 501-14(b)(1), Exception (a); 502-14(a)(2), Exception; and 502-14(a)(3), Exception. For further information, see Industrial Control Equipment for Use in Hazardous (Classified) Locations, ANSI/UL 698-1995.
(h) Hermetically Sealed. A hermetically sealed device shall be sealed against the entrance of an external atmosphere and the seal shall be made by fusion, e.g., soldering, brazing, welding, or the fusion of glass to metal.
This protection technique shall be permitted for current-interrupting contacts in Class I, Division 2 locations.
FPN: See Sections 501-3(b)(1), Exception (b); 501-5(a)(1), Exception (a); 501-6(b)(1)(a); and 501-14(b)(1), Exception (b). For further information, see Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations, ANSI/ISA S12.12-1994.
(i) Other Protection Techniques. Other protection techniques used in equipment listed for use in hazardous (classified) locations.

500 -7 Equipment. Articles 500 through 504 require equipment construction and installation that will ensure safe performance under conditions of proper use and maintenance.
FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to installation and maintenance.
FPN No. 2: Low ambient conditions require special consideration. Explosionproof or dust-ignitionproof equipment may not be suitable for use at temperatures lower than -25°C (-13°F) unless they are identified for low-temperature service. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified Class I, Division 1 at normal ambient temperature.

(a) Approval for Class and Properties.
(1) Equipment shall be approved not only for the class of location but also for the explosive, combustible, or ignitible properties of the specific gas, vapor, dust, fiber, or flyings that will be present. In addition, Class I equipment shall not have any exposed surface that operates at a temperature in excess of the ignition temperature of the specific gas or vapor. Class II equipment shall not have an external temperature higher than that specified in Section 500-7(2). Class III equipment shall not exceed the maximum surface temperatures specified in Section 503-1.
(2) Equipment that has been approved for a Division 1 location shall be permitted in a Division 2 location of the same class and group.

(3) Where specifically permitted in Articles 501 through 503, general-purpose equipment or equipment in general-purpose enclosures shall be permitted to be installed in Division 2 locations if the equipment does not constitute a source of ignition under normal operating conditions.
(4) Equipment, regardless of the classification of the location in which it is installed, that depends on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the equipment, shall be approved for a Class I, Division 2 location.
Exception: Equipment installed in a Class I, Division 1 location shall be suitable for the Division 1 location.

FPN: See Section 501-5(f)(3) for additional requirements.

(5) Unless otherwise specified, normal operating conditions for motors shall be assumed to be rated full-load steady conditions.
(6) Where flammable gases or combustible dusts are or may be present at the same time, the simultaneous presence of both shall be considered when determining the safe operating temperature of the electrical equipment.

FPN: The characteristics of various atmospheric mixtures of gases, vapors, and dusts depend on the specific material involved.

(b) Marking. Approved equipment shall be marked to show the class, group, and operating temperature or temperature range referenced to a 40ºC ambient.
Exception No. 1: Equipment of the non-heat-producing type, such as junction boxes, conduit, and fittings, and equipment of the heat-producing type having a maximum temperature not more than 100ºC (212ºF) shall not be required to have a marked operating temperature or temperature range.
Exception No. 2: Fixed lighting fixtures marked for use in Class I, Division 2 or Class II, Division 2 locations only shall not be required to be marked to indicate the group.
Exception No. 3: Fixed general-purpose equipment in Class I locations, other than fixed lighting fixtures, that is acceptable for use in Class I, Division 2 locations shall not be required to be marked with the class, group, division, or operating temperature.
Exception No. 4: Fixed dusttight equipment other than fixed lighting fixtures that are acceptable for use in Class II, Division 2 and Class III locations shall not be required to be marked with the class, group, division, or operating temperature.
Exception No. 5: Electric equipment suitable for ambient temperatures exceeding 40ºC (104ºF) shall be marked with both the maximum ambient temperature and the operating temperature or temperature range at that ambient temperature.

FPN: Equipment not marked to indicate a division, or marked "Division 1" or "Div. 1," is suitable for both Division 1 and 2 locations. Equipment marked "Division 2" or "Div. 2" is suitable for Division 2 locations only.

The temperature range, if provided, shall be indicated in identification numbers, as shown in Table 500-7(b).
Identification numbers marked on equipment nameplates shall be in accordance with Table 500-7(b).
Equipment that is approved for Class I and Class II shall be marked with the maximum safe operating temperature, as determined by simultaneous exposure to the combinations of Class I and Class II conditions.

FPN: Since there is no consistent relationship between explosion properties and ignition temperature, the two are independent requirements.

Table 500-7(b). Identification Numbers

Maximum Temperature ºC	Maximum Temperature ºF	Identification Number
450	842	T1
300	572	T2
280	536	T2A
260	500	T2B
230	446	T2C
215	419	T2D
200	392	T3
180	356	T3A
165	329	T3B
135	275	T4
120	248	T4A
100	212	T5
85	185	T6

(c) Temperature.
(1) Class I Temperature. The temperature marking specified in (b) shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

FPN: For information regarding ignition temperatures of gases and vapors, see Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997, and Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, NFPA 325-1994.

(2) Class II Temperature. The temperature marking specified in (b) shall be less than the ignition temperature of the specific dust to be encountered. For organic dusts that may dehydrate or carbonize, the temperature marking shall not exceed the lower of either the ignition temperature or 165ºC (329ºF).

FPN: See Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 499-1997, for minimum ignition temperatures of specific dusts.

The ignition temperature for which equipment was approved prior to this requirement shall be assumed to be as shown in Table 500-7(2) below.

Table 500-7(2)

Class II Group	Equipment that Is Not Subject to Overloading °C	Equipment that Is Not Subject to Overloading °F	Equipment (Such as Motors or Power Transformers) that May Be Overloaded Normal Operation °C	Equipment (Such as Motors or Power Transformers) that May Be Overloaded Normal Operation °F	Equipment (Such as Motors or Power Transformers) that May Be Overloaded Abnormal Operation °C	Equipment (Such as Motors or Power Transformers) that May Be Overloaded Abnormal Operation °F
E	200	392	200	392	200	392
F	200	392	150	302	200	392
G	165	329	120	248	165	329

(**d) Threaded Conduit.** All threaded conduit referred to herein shall be threaded with an NPT standard conduit cutting die that provides 3/4-in. taper per foot. Such conduit shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and ensure the explosionproof or dust-ignitionproof integrity of the conduit system where applicable. For equipment provided with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in Metric Screw Threads, ISO 965/1:1980 and Metric Screw Threads, ISO 965/3:1980.

(e) Fiber Optic Cable Assembly. Where a fiber optic cable assembly contains conductors that are capable of carrying current, the fiber optic cable assembly shall be installed in accordance with the requirements of Articles 500, 501, 502, or 503, as applicable.

500-8. Specific Occupancies. Articles 510 through 517 cover garages, aircraft hangars, gasoline dispensing and service stations, bulk storage plants, spray application, dipping and coating processes, and health care facilities.
SUBSTANTIATION: Currently, the introduction to Hazardous (Classified) Locations is presented with little regard to clarity and understanding. The text jumps from "classifications" to documentation to threaded conduit, to protection techniques, without ever providing groundwork as to the need for the protection techniques. Under the proposed revision, the reader is moved in a logical sequence, that defines general needs, addresses the classifications of locations, discusses material groups, before ever mentioning equipment. Then with protection techniques, equipment, equipment approvals, equipment markings and equipment designs are addressed. This provides a flow into the more specific sections beyond Article 500.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Proposal 14-2a addresses this issue.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

Log #1545)

14- 4 - (500-1-Hazardous Classified Locations): Reject
SUBMITTER: Thomas J. Conlan, Conlan's "The Electrician Inc."
RECOMMENDATION: For simplicity add definitions to the nomenclature for Hazardous Classified Locations as H = Hazardous Classified, the next number if the Class and next number is the Division.
H11 = Class 1 Division 1
H12 = Class 1 Division 2
H21 = Class 2 Division 1
H22 = Class 2 Division 2
H31 = Class 3 Division 1
H32 = Class 3 Division 2
Addresses using short version of the "H" system provides clarity as to exactly where the discussion is and where the location is.
SUBSTANTIATION: This will simplify the practical applications to all H locations specifically among many others. For example 502-7(3) resistors and resistance devices shall have dust-ignitionproof enclosures approved for Class II locations. (Class II locations is specifically addressed to Section (a) Division I which requires one to look back to see where they were and this can cause confusion)
So now the section would read:
For example 502-7(3) Resistors and resistance devices shall have dust-ignitionproof enclosures approved for H21 locations.
[Where H21 means Hazardous/Class 2/ Division 1 real simple and easy to understand immediately]
PANEL ACTION: Reject.
PANEL STATEMENT: The technical substantiation does not support the use of arabic numerals for the Class designation. Thus, the use of arabic numerals would be contrary to the NEC style manual. Additionally, there is no substantiation that a problem exists.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #CP1405)

14- 4a - (500-2 and 505-2): Accept
Note: The Technical Correlating Committee directs that this Proposal be reconsidered and directs the Code-Making Panel to use the definition currently in Article 100.
The Technical Correlating Committee further directs that this Proposal be referred to Code-Making Panel 1 for action relative to the elimination of the existing Fine Print Note in the definition of "Identified" because the Fine Print Note contains permissive language and is not permitted by the NEC Style Manual. This action will be considered by Code-Making Panels 1 and 14 as a Public Comment.
SUBMITTER: CMP 14
RECOMMENDATION: Add the following definition to 500-2 and 505-2:
"Identified (as applied to equipment). Recognizable as suitable for the specific purpose, function, use, environment, application, etc., where prescribed in a particular Code requirement.
FPN: Suitability of equipment for a specific purpose, environment, or application may be determined by:
1. equipment listing or labeling;
2. evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation; or
3.other evidence acceptable to the authority having jurisdiction such as a manufacturer's self evaluation or an owner's engineering judgement.
(See definitions of Labeled and Listed)"
SUBSTANTIATION: This definition clarifies the intent for approval of equipment.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban
COMMENT ON AFFIRMATIVE:
BRIESCH: The Panel Action to include this definition in the special situations presented by hazardous locations is supported. However, it should be noted that it would be inappropriate to apply it generally to all chapters of the Code.
JAGUNICH: See ballot for David Wechsler.
WECHSLER: This was just one of the many Cook/Cox "identified, approved, listed, other" proposals in which the committee acted to develop a new definition for "identified" with a new fine print note (FPN) in Articles 500 and 505. This action was incorporated into the panel action rewrites for Articles 500 and 505, as noted in CP1401 and CP1402.

(Log #2264)

14- 5 - (500-2 (New)): Reject
SUBMITTER: David Wechsler, Union Carbide Corp.
RECOMMENDATION: Add the following new second paragraph:
Portable electrical or electronic devices or equipment shall not be required to comply with Chapter 5.
SUBSTANTIATION: "500-1 Scope" indicates that "Articles 500 through 504 cover the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Divisions 1 and 2..." The term "equipment" is defined in Article 100 as "A general term including material, fittings, devices, appliances, fixtures, apparatus, and the like used as a part of, or in connection with, an electrical installation." "Installation" is not an NEC defined term, but has as its meaning the concept of setting in place and being connected. As such, portable devices or equipment which are not part of an electrical installation are not addressed within Chapter 5 of the NEC and thus there are no requirements that such devices must comply with Chapter 5 of the NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: This proposal conflicts with the action on Proposal 14-2a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #2263)

14- 6 - (500-2-Electrical and Electronic Equipment): Accept in Principle

SUBMITTER: David Wechsler, Union Carbide Corp.

RECOMMENDATION: Add the following new section "Definitions" and renumber all existing paragraphs/sections accordingly:

Definitions. The following definition applies for Chapter 5:

Electrical and Electronic Equipment – Includes material, fittings, devices, appliances, fixtures, apparatus, and the like that is part of, or in connection with, an electrical installation, as well as any portable or transportable device having a battery or other electrical power source.

SUBSTANTIATION: It may be inferred that because "500-1 Scope" indicates that "Articles 500 through 504 cover the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Divisions 1 and 2..." and the term "equipment" as defined in Article 100 applies only to installed electrical/electronic devices, appliances, fixtures, apparatus, etc. that portable electrical devices are excluded from the requirements of Chapter 5. With this new definition, this ambiguity is removed and portable electrical devices are required to comply with Chapter 5.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Proposal 14-2a addresses this issue.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9

NEGATIVE: 3

NOT RETURNED: 2 Earley, Saban

EXPLANATION OF NEGATIVE:

GOODMAN: Although I agree with the intent that all equipment including "portable or transportable devices having a battery or other electrical power source" should be properly rated for the location in which it will be used, there is a practical element that makes this unenforceable and unrealistic.

First, without an actual "installation", there is some question as to whether this is within the scope of the NEC at all.

Secondly, there are classified areas in public places, such as at gasoline dispensers, where this code provision as written would apply, but is totally unenforceable. For example, I would be in violation of the NEC whenever I pump gas because my battery powered watch is not approved (or identified) for the classified areas. Within operating plants and other company facilities that do not have public access, safety rules banning the use of nonapproved equipment in classifed areas or specifying the necessary permitting and safety requirements to ensure their safe operation are typical throughout the affected industries.

Adding all these battery powered equipment items, without exception, is unrealistic and does not add anything substantial to the NEC which is an installation-based document.

OMEARA: The proposal needs to be rejected because the definition is too broad.

ZIPSE: I agree with Mr. Goodman's Explanation of Negative Vote.

(Log #2309)

14- 7 - (500-3(a)): Reject

SUBMITTER: Sukanta Sengupta, FMC Corp.

RECOMMENDATION: Revise the last line of the first paragraph as follows.

"Locations with Oxygen enriched atmospheres or locations where pyrophoric materials are the only materials used or handled shall not be classified."

SUBSTANTIATION: This statement will be compatible to NFPA 497 paragraph 1-1.5 which includes "Oxygen enriched atmosphere" in defining areas not to be classified.

PANEL ACTION: Reject.

PANEL STATEMENT: Locations where oxygen is the only material present are already excluded by 500-1.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

(Log #2146)

14- 8 - (500-3(a), FPN (New)): Accept in Principle

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: Replace "nonhazardous" with "unclassified".

SUBSTANTIATION: This is a companion to other proposals which provide a definition of unclassified in Articles 100, 500, and 505, and provides correlation. The term "Classified" refers to the type of material/hazard potential involved, i.e., Class I, Division 1, Class II, Division 2, etc. Terms such as nonhazardous and unclassified are used in both the NEC, the Uniform Building Code (UBC) and other NFPA documents. The term nonhazardous infers that the area has "no" hazards while the term "unclassified" more clearly correlates with the condition of being reviewed but found not to need classification. This action provides needed correlation with other NFPA documents, such as NFPA 497. Additionally the term "nonhazardous" is used 7 times within various parts of the NEC and in at least one place in the NEC the meaning of nonhazardous applies to voltages and not classification. A companion proposal has been made to change the term "nonhazardous" to "unclassified" as appropriate elsewhere in the NEC.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Proposal 14-2a addresses this issue.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

(Log #2384)

14- 9 - (500-3(b)): Reject

SUBMITTER: William E. Bickner, Stillwater, MN

RECOMMENDATION: Revise Section 500-3(b) as shown below:

500-3(b). Documentation. ~~All areas designated as hazardous (classified) locations shall be properly documented.~~ Where, in the judgement of the authority having jurisdiction, flammable gases or vapors, volatile flammable liquids, combustible dust, or ignitable fibers or flyings are or may be present in potentially hazardous quantity or concentration in any indoor or outdoor location, upon written request of the authority having jurisdiction, a person responsible for the installation of wiring or equipment in such location shall provide documentation, prepared by or under the supervision of a qualified person acceptable to the authority having jurisdiction, which delineates the extent, class, division or zone, and group, of any classified locations, or certifies the absence thereof. Where a classification depends on factors such as mechanical ventilation, atmospheric pressure differentials, or determination of lower flammable limit percentages, the relevant data shall be included in the documentation. This documentation shall be available to those authorized to design, install, inspect, maintain or operate electrical equipment at the location.

SUBSTANTIATION: This section fails to state what must be documented. The present requirement is too vague to be enforceable and becomes onerous if broadly interpreted and applied to all potentially hazardous locations. However, it would be generally useful with the changes proposed, which empower the authority having jurisdiction to require documentation where appropriate, but forgo it where not needed. For example, Articles 511 to 517 generally define classified areas in the covered occupancies, but such documentation would be useful for other types of occupancies, or where the extent of a classified area is undefined or uncertain or it is proposed to reduce or eliminate a classification by suitable means.

PANEL ACTION: Reject.

PANEL STATEMENT: Area classification criteria is covered in other sections of the code. The existing text is adequate. Format and requirements for documentation may vary from authority having jurisdiction to authority having jurisdiction and other compliance requirements, such as process safety management, may apply.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

(Log #1258)

14- 10 - (500-3(d) and 500-5(a)(2)): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: In 500-3(d), change the first sentence to read:

"All threaded conduit referred to herein shall be threaded with an NPT standard cutting die that provides ~~3/4 in.~~ a taper of 1 in 16 ~~per foot.~~"

In 500-5(a)(2) Exception No. 1 and Exception No. 2, in both exceptions, change "18 in. (457 mm)" to "450 mm (18 in.)"

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.

PANEL ACTION: Reject.

PANEL STATEMENT: CMP 14 believes the following issues need further evaluation before changes are made to the code: trade sizes of conduit; extract policies; consistency from article to article within the code. For example, trade size of conduit is not a true dimension and cannot be converted to a true metric number.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9
NEGATIVE: 3
NOT RETURNED: 2 Earley, Saban

EXPLANATION OF NEGATIVE:

KUCZKA: Panel Action should have been Accept in Principle. Metric conversion should be exact rather than rounded.

OMERA: The proposal should be accepted to be in conformance with Chapter 4 of the NFPA MOS-1 Manual of Style.

ZIPSE: The Institute of Electrical and Electronics Engineers, Inc. policy is SI units are to be used.

(Log #2842)

14- 11 - (500-3(d)): Accept in Principle

Note: It was the action of the Technical Correlating Committee that the Panel Statement be modified to also refer to 500-8(d) of the rewrite of Article 500 in Proposal 14-2a.

SUBMITTER: Melvin K. Sanders, Ankeny, IA

RECOMMENDATION: Provide the name for the "NPT" acronym so it would read when first encountered, remaining text as in the 1999 Edition:

(d) Threaded Conduit. All threaded conduit referred to herein shall be threaded with a National Pipe Thread (NPT) standard conduit cutting die that provides 3/4-in. taper per foot. Such conduit shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and ensure the explosionproof or dust-ignitionproof integrity of the conduit system where applicable.

For equipment provided with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in Metric Screw Threads, ISO 965/1:1980 and Metric Screw Threads, ISO 965/3:1980.

SUBSTANTIATION: Standard practice is to not use an acronym unless accompanied the first time by the full name to avoid confusion that the pipe thread in question is for a conduit thread taper per foot and not a plumbing thread taper per foot to ensure the five full threads required by Section 501-4(a) are fully engaged.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The panel agrees with the submitter, but has used the correct term, as taken from ANSI/ASME B1.20.1.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #3234)

14- 12 - (500-3(d) and (e)): Reject

SUBMITTER: Sukanta Sengupta, FMC Corp.

RECOMMENDATION: Move these two sections to Article 501, Article 502 and Article 503.

SUBSTANTIATION: Editorial change. Application related topics like these should not be mixed up with general topics.

PANEL ACTION: Reject.

PANEL STATEMENT: These are general requirements that belong in the "General" section of the chapter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #1546)

14- 13 - (500-4(a)): Accept in Principle

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI

RECOMMENDATION: Revise to read as follows:

(a) Explosionproof Apparatus. This protection technique shall be permitted for equipment in those Class I, Division 1 and 2 locations for which it is ~~approved.~~ (identified.).

SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.

PANEL ACTION: Accept in Principle.

G**PANEL STATEMENT:** Proposal 14-2a addresses this issue.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban

EXPLANATION OF NEGATIVE:

ZIPSE: I am voting negative at this time on all the proposals to change "approved". I will change my vote at the comment stage if the acceptance of the definition found in Proposal 14-4a, Sections 500-2 and 505-2 is accepted by the Panel and the Technical Correlating Committee.

If the definition is rejected by the Panel or the Technical Correlating Committee, then all proposals to change "approve" by Mr. Cook and Mr. Cox will remain rejected.

COMMENT ON AFFIRMATIVE:

LAWRENCE: The panel needs to review the use of "Approved," "Listed," and "Identified" throughout Articles 500 through 516 to confirm that the use of these terms correlates through all of the text and cross-references. As one example of a correlation problem, 505-8(b) uses "Approved" for the protection technique of purged and pressurized. 505-9(a) refers to equipment being "identified". The term in 505-8(b) should have been revised to "Identified" as part of the action to revise 505-9(a).

WECHSLER: Clarification for Cook/Cox proposals - addressing "identified, approved, listed, other" — all these proposals were acted upon based upon committee action to provide a new definition for "identified" with a new fine print note (FPN) in Articles 500 and 505. It was my understanding that all these proposals and not just those with the change to "identified" were to be contingent upon this definition of "identified" with its fine print note, as reflected in CP1405. Only those with the word identified appear to have the statement "Acceptance of this proposal is contingent upon acceptance of the fine print note to the definition of "Identified" in Proposal 14-4a (Log #CP1405).

(Log #4482)

14- 14 - (500-4(a)): Accept in Principle
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read as follows:
(a) Explosionproof Apparatus. This protection technique shall be permitted for equipment in those Class I, Division 1 and 2 locations for which it is ~~approved~~ (identified).
SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Proposal 14-2a addresses this issue.

(Log #4235)

14- 27 - (500-4(f)): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Delete paragraph (1) and (1) (FPN No. 1). Redesignate (FPN No. 2) as (FPN), applying only to the initial paragraph of Section 500-4(f), and ahead of the subsequent paragraphs. Change "(2)" to "(1)" and "(2)a." to "(2)".
SUBSTANTIATION: The 1999 NEC contains a direct conflict between the definition of "Nonincendive Circuit" as it appears in Article 100 and the version that appears in Section 500-4(f)(1). The version in Article 100 is correct, and technically threatened with noneffectiveness because the wrong definition appears in Chapter 5. This was the result of a panel error that this proposal corrects.
The other changes are editorial and properly format a subsection that just lost one of its two subsections by promoting the two paragraphs in "a." to a number item "(2)". This can be done safely because although nonincendive components are part of equipment, both they and the equipment will stand as part of the general concept of nonincendive. In addition, the second paragraph of NEC "(2)a." adequately restrains its application to current-interrupting contacts, and the network of fine print notes that will remain refer to both the definition of "Nonincendive Circuit" in Article 100 and also to all the relevant product standards.
PANEL ACTION: Accept in Principle.

14- 30 - (500-4(f)(3)-Associated Nonincendive Field Wiring Apparatus): Accept in Principle
SUBMITTER: Nicholas Ludlam, Factory Mutual Research
RECOMMENDATION: Associated Nonincendive Field Wiring Apparatus. Apparatus in which the circuits are not necessarily nonincendive themselves, but that affect the energy in the nonincendive field wiring circuits and are relied on to maintain nonincendive safety. Associated nonincendive field wiring apparatus may be either of the following:
1. Electrical apparatus that has an alternative-type protection for use in the appropriate hazardous (classified) location, or
2. Electrical apparatus not so protected that shall not be used within a hazardous (classified) location
FPN No. 1: Associated nonincendive field wiring apparatus has identified associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and also may have connections for other electrical apparatus.
SUBSTANTIATION: The above definition would be required if the other proposed text on nonincendive field wiring is accepted.
PANEL ACTION: Accept in Principle.
Add the following definition to 500-2:
"Associated Nonincendive Field Wiring Apparatus. Apparatus in which the circuits are not necessarily nonincendive themselves, but that affect the energy in the nonincendive field wiring circuits and are relied on to maintain nonincendive energy levels. Associated nonincendive field wiring apparatus may be either of the following:
1. Electrical apparatus that has an alternative-type protection for use in the appropriate hazardous (classified) location, or
2. Electrical apparatus not so protected that shall not be used within a hazardous (classified) location
FPN: Associated nonincendive field wiring apparatus has designated associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and also may have connections for other electrical apparatus."

PANEL STATEMENT: The editorial changes shown as underlined text are for clarity.

14- 32 - (500-4(j)-Ex Component): Reject
SUBMITTER: Nicholas Ludlam, Factory Mutual Research
RECOMMENDATION: Ex Component. Part of electrical apparatus for use in hazardous (classified) locations, which is not to be used alone in such locations and which requires additional evaluation of any electrical apparatus with which it is used.
SUBSTANTIATION: This definition is based on the definition in ANSI/ISA S12.0.01-1998 (IEC 79-0 Mod) for an Ex component. Although this is not a type of protection in its own right, manufacturers could get components listed which would be marked with the appropriate information in 505-10. The definition is required to reinforce the proposed FPN to 505-10(b), and the proposed change to 505-10(3). The above definition is based on that of the ISA standard with 'IEC' wording revised to align with that of the NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: This is a product certification issue, not an installation issue.

(Log #4418)

14- 37 - (500-5(a)(4)): Accept in Principle

SUBMITTER: Jeffrey M. Shapiro, Int'l Code Consultants/Rep. Int'l Inst. of Ammonia Refrigeration

RECOMMENDATION: Revise text to read as follows:

500.5(a)(4) Group D. Flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.75 mm or a minimum igniting current ratio (MIC ratio) greater than 0.80.

FPN: A typical Class I, Group D material is propane.

Exception: Areas containing ammonia refrigeration equipment shall be permitted to be classified as nonhazardous locations when (1) continuous mechanical ventilation is provided and failure of the ventilation system actuates and alarm, or (2) vapor detection is provided to automatically activate a mechanical ventilation system and sound an alarm at a detection threshold of 1,000 parts-per-million or less. ~~For atmospheres containing ammonia, the authority having jurisdiction for enforcement of this Code shall be permitted to reclassify the location to a less hazardous location or a nonhazardous location.~~

FPN No. 1: For additional information on the properties and group classification of Class I materials, see NFPA 497, Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, 1997 edition and NFPA 325, Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, 1994 edition.

FPN No. 2: The explosion characteristics of air mixtures of gases or vapors vary with the specific material involved. For Class I locations, Groups A, B, C, and D, the classification involves determinations of maximum explosion pressure and maximum safe clearance between parts of a clamped joint in an enclosure. It is necessary, therefore, that equipment be approved not only for class but also for the specific group of the gas or vapor that will be present.

FPN No. 3: Certain chemical atmospheres may have characteristics that require safeguards beyond those required for any of the above groups. Carbon disulfide is one of these chemicals because of its low ignition temperature [100°C (212°F)] and the small joint clearance permitted to arrest its flame.

FPN No. 4: For classification of areas involving ammonia atmosphere, see ANSI/ASHRAE 15-1994, Safety Code for Mechanical Refrigeration, and ANSI/CGA G2.1-1989, Safety Requirements for the Storage and Handling of Anhydrous Ammonia.

SUBSTANTIATION: The purpose of this proposal is to clarify application of the code. The text of the existing exception unnecessarily complicates enforcement and introduces the opportunity for inconsistent application of the code for cases involving ammonia refrigeration systems. The intent of the exception, which is established through FPN No. 4, is to permit a reduction in the hazard classification for ammonia based on prescriptive allowance in ASHRAE 15.

The referenced provisions in ASHRAE 15 are set forth in Sections 8.14(g) and (h) of that document, which provide the following:

"(g) When refrigerants of Groups A2, A3, B2, and B3 are used, the machinery room shall conform to Class I, Division 2 of the National Electrical Code. When refrigerant Groups A1 and B1 are used, the machinery room is not required to meet Class I, Division 2 of the National Electrical Code.

Exception: When ammonia is used, the requirements of Class I, Division 2 of the National Electrical Code shall not apply providing the requirements of 8.14(h) are met.

(h) When ammonia is used, the machinery room is not required to meet Class I, Division 2 of the National Electrical Code providing (1) the mechanical ventilation system in the machinery room is run continuously and failure of the mechanical ventilation system actuates an alarm or (2) the machinery room is equipped with a vapor detector that will automatically start the mechanical ventilation system and actuate an alarm at a detection level not to exceed 1,000 ppm."

Unlike many gases that support combustion [Lower Explosive Limit (LEL)] at concentrations of 10,000 to 20,000 parts per million (ppm), ammonia is not ignitable until the concentration reaches approximately 150,000 ppm. Because ammonia has a low propensity toward ignition, having such a high LEL, a narrow flammable range and a high required ignition energy, the U.S. Department of Transportation and other code writing organizations do not regulate ammonia as a "flammable gas" even though it can support combustion in limited circumstances.

The existing exception for ammonia in Section 500.5(a)(4) has been regarded as necessary to clarify that areas containing ammonia refrigeration equipment should be classified as nonhazardous locations when controls specified in ASHRAE 15 are followed because of ammonia's unique properties. Since the technical aspects of ASHRAE 15's provisions related to classified locations are fairly short, it seems more appropriate to provide these regulations with NFPA 70 as opposed to forcing the code user to reference another standard (the proponent has contacted ASHRAE to acquire permission to include the conceptual information from ASHRAE 15 in the NEC based on this proposal). This will make the NEC easier to apply and more definitive in its application.

PANEL ACTION: Accept in Principle.

Add the following text to 500-3(a) after the Fine Print Note:

"Rooms and areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation, may be classified as "unclassified" locations.

FPN: For further information regrading classification and ventilaton of areas involving ammonia, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989 (14-37)"

PANEL STATEMENT: The panel believes its proposed text more clearly meets the intent of the submitter.

(Log #1971)

14- 38 - (500-5(a)(4), FPN No. 2): Accept

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI

RECOMMENDATION: Revise the second sentence as follows:

It is necessary, therefore, that equipment be ~~approved~~ (identified) not only for the class but also for the specific group of gas or vapor that will be present.

SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.

PANEL ACTION: Accept.

PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.

(Log #2132)

14- 40 - (500-5(a)(4), Exception): Accept in Principle
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Replace "nonhazardous" with "unclassified".
SUBSTANTIATION: This is a companion to other proposals which provide a definition of unclassified in Articles 100, 500, and 505, and provides correlation. The term "Classified" refers to the type of material/hazard potential involved, i.e., Class I, Division 1, Class II, Division 2, etc. Terms such as nonhazardous and unclassified are used in both the NEC, the Uniform Building Code (UBC) and other NFPA documents. The term nonhazardous infers that the area has "no" hazards while the term "unclassified" more clearly correlates with the condition of being reviewed but found not to need classification. This action provides needed correlation with other NFPA documents, such as NFPA 497. Additionally the term "nonhazardous" is used 7 times within various parts of the NEC and in at least one place in the NEC the meaning of nonhazardous applies to voltages and not classification. A companion proposal has been made to change the term "nonhazardous" to "unclassified" as appropriate elsewhere in the NEC.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Proposal 14-2a addresses this issue.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #1195)

14- 41 - (500-5(b)(3) and FPN No. 4 (New)): Reject
Note: The Technical Correlating Committee directs that this Proposal be referred to the NFPA Committee on Electrical Equipment in Chemical Atmospheres for action.
SUBMITTER: Terry L. Carlson, Nebraska State Electrical Board
RECOMMENDATION: Revise 500-5(b)(3)text as follows:
(3) Group G. Atmospheres containing combustible dusts not included in Group E or F, including flour, grain, plastic, chemicals, and fireworks explosives.
Add new FPN as follows:
FPN No. 4: Fireworks explosives includes but is not limited to dynamite, black powder, salute powder, pellet powder, initiating explosives, detonators, safety fuses, squibs, detonating cord, igniter cord, and igniters. The presence of fireworks explosives may require additional precautions due to the easy ignitability of the manufactured or stored product. See NFPA 1124, Code for the Manufacture, Transportation, and Storage of Fireworks.
SUBSTANTIATION: Fireworks explosives are not presently covered by the NEC. Fireworks manufacturing, processing and storage facilities are very hazardous. A documented case that began in 1995 at Hastings, Nebraska is on record. A complete new wiring system was installed at a huge storage and processing facility. NEMA 1 type wiring was installed. A heat shrink wrap machine was installed for use in making small retail packages of fireworks. Because of the presence of the explosives, a Nebraska State Electrical Inspector red tagged the installation and wrote a Correction Order referencing NEC Article 502 to require the building to be rewired as a hazardous location along with removal of the heat shrink wrap machine. Attorneys for the building owner appealed the correction order, challenging the State Electrical Board. The attorneys reasoned that although NFPA 1124 does reference NEC Article 502 as a requirement, there is no specific wording in NEC Article 500 to 502 regarding fireworks explosives.
After many months, NFPA responded to the board by stating a Formal Interpretation could not be given because the Code panel members could not come to agreement on whether or not the fireworks explosives are covered under the NEC articles. However, the Code panel did agree that NFPA 1124 is the Code that applies to fireworks explosives, that NFPA 1124 2-9 does reference NEC Article 502 as a wiring method for fireworks storage and processing buildings, and that Article 502 for some unknown reason does not reference fireworks explosives.
Like thousands of governmental agencies, the Nebraska Legislature only adopts NFPA 70, the National Electrical Code, as State law to be used as the minimum standard for electrical wiring. Because there are no Code sections in the NEC to regulate fireworks explosives, the Nebraska State Electrical Board had no choice but to countermand the correction order and let the NEMA 1 type wiring remain in the building, along with the heat shrink wrap machine used for packaging the fireworks.
Forty-two months later, on June 3, 1999, there was an explosion and fire in the facility while employees were making retail packages of fireworks. The explosion injured two employees, sending them to the hospital in critical condition with burns. Investigation showed that the open heating element on the heat shrink wrap machine ignited the fireworks explosives dust.
Over the last few years there have been several explosions and fires in fireworks storage and processing facilities all over the United States. The stories have been reported on television and in newspapers. With this proposal, the National Electrical Code will address the problem by providing a standard for fireworks explosives wiring methods. This will help alleviate the chance of more people being killed or injured.
PANEL ACTION: Reject.
PANEL STATEMENT: Responsibility for group classification of dust is the responsibility of the T/C on Electrical Equipment in Chemical Atmospheres. 500-5(b)(3) is actually extracted text and should have been identified as such. This oversight will be editorially corrected.

(Log #2338)

14- 56 - (500-7): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Revise Section 500-7 to read as follows:
Class I Locations. Class I locations are those in which Class I (flammable) liquids or Class II (combustible) liquids whose temperatures are above their flash points are housed, stored or used that are or may be present in the air in quantities sufficient to produce explosive or ignitable mixtures. Class I locations shall include those specified in (a) and (b).
SUBSTANTIATION: This section presently does not address Class II liquids that are used, stored or handled in ambient temperatures above their flash point, this could be outside or even inside a structure. An example would be a liquid with a flash point of 105°F. used in and area that has a 110 degree ambient temperature. At this temperature the combustible liquid will take on the properties of a flammable liquid at a lower temperature. This is a concern in the southwestern United States, and other areas or buildings that have an ambient temperature above the flash point of combustible liquids that may be present. For instance, some jet fuels have a flash point right at 100 degrees F. In many locations throughout the southwest it is common to be well above 100 degrees for more than 8 hours.
There is justification for this proposal in NEC 513-1, NEC 514-1 FPN N0. 1, NEC 515-1. FPN, NEC 516-1, and NFPA 30, 1996 Flammable and combustible liquids code 5-9.5.1 and which states "This section shall apply to areas where Class I liquids are stored or handled and to areas where Class II or Class III liquids are stored or handled at temperatures above their flash points (see 1-1.3)." 5-9.5.2 "Electrical wiring and utilization equipment shall be designed and installed in accordance with NFPA 70, National Electrical Code, and this section. Electrical wiring and utilization equipment in classified locations shall be designed and installed in accordance with Chapter 5 of NFPA 70."
The NEC does not currently help the electrical community by clearly addressing combustible liquids. We should not have to rifle through multiple standards to solve a simple problem. This would enable the NEC to address this issue.
All of the above make some reference that a combustible liquid that is above its flash point is a hazard.
PANEL ACTION: Reject.
PANEL STATEMENT: Areas other than those containing Class I or II liquids may need to be classified. NFPA 497 addresses this issue.

(Log #3416)

14- 57 - (500-7(b)): Reject
SUBMITTER: Nicholas T. Abbatiello, Spencerport, NY
RECOMMENDATION: Add a subparagraph (4) to read:
"Locations, within enclosed equipment and machines in industrial establishments where the conditions of design, maintenance and supervision ensure that only qualified persons will build and service the installation, not complying with (1) through (3) which otherwise would be designated as Division 1 shall be permitted to be classified to Division 2:
(i) when maintained at or below 25 percent of the Lower Flammable Limit, or
(ii) where the electrical equipment, not rated for Division 1 but only rated for Division 2, is reliably interlocked by Listed and Labeled flammable gas detectors which will deenergize the equipment if 60 percent of the Lower Flammable Limit is exceeded. Consideration shall be given to rate at which the concentration can reach 100 percent versus the time for the deenergized equipment to come to a safe state.
FPN: For additional information, refer to NFPA 69-1997, Explosion Prevention Systems, and ISA S84.01-1996, Application of Safety Instrumented Systems for Process Industries.
SUBSTANTIATION: The current requirements do not address machinery interiors where protection against hazards, such as deflagration, by concentration reduction of the flammable gas or vapor. NFPA 34, Flammable or Combustible Liquids, Dipping and Coating Process, 1995, and Article 516, Spray Application, Dipping, and Coating Processes require interiors to be Division 1. NFPA 69 recognizes the 25 percent or below control and above 60 percent deenergization for protection against deflagration. Why can't there then be allowance for Division 2 equipment since the concentration is not normally flammable? This would provide equivalent safety as the likelihood, rather than the consequence, of an ignition in explosionproof equipment is reduced.
PANEL ACTION: Reject.
PANEL STATEMENT: The text proposed is too vague. The submitter has not addressed all of the issues pertinent to area classification when using gas detection equipment, as detailed in the referenced standards.

NOT RETURNED: 2 Earley, Saban

(Log #CP1410)

14- 57a - (500-8(a), FPN (New)): Accept
SUBMITTER: CMP 14
RECOMMENDATION: Add a new FPN under 500-8(a) in Proposal 14-2a (CP1401) to read: "FPN: Switches, circuit breakers, plugs and receptacles, lighting fixtures, and other heat-producing apparatus are considered to be sources of ignition and are investigated for suitability in classified locations. Such types of equipment, as well as cable terminations for entry into explosionproof enclosures, are available as listed for Division 2. Fixed wiring, however, may utilize nonhazardous location wiring

methods that are not evaluated with respect to classified locations. Wiring products such as cable, raceways, boxes, and fittings, therefore, are not marked as being suitable for Division 2. Also see Exception No. 3 to 500-8(b)."
SUBSTANTIATION: Assists in clarifying the use of general purpose equipment in Division 2 locations, without the need for it being identified specifically for Division 2.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
GOODMAN: The use of the term "nonhazardous location" is confusing and not required. As indicated in the Substantiation, the term "general purpose" is acknowledged as the proper term and would provide a clearer description if wording were deemed necessary. Preferably, simply delete the term "nonhazardous location" to have the sentence read:
"Fixed wiring, however, may utilize wiring methods that are not evaluated with respect to classified locations."
LAWRENCE: My records of the meeting do not support the panel action. The text as shown does not correlate with the text at the indicated location of insertion.
WECHSLER: My notes do not support the panel action shown for panel action on this specific proposal. The reference to adding the proposed fine print note to Section 500-8(a) does not appear to fit the existing text, nor does it appear to agree with the revised Article 500 rewrite.
COMMENT ON AFFIRMATIVE:
JAGUNICH: See ballot for David Wechsler.
ZIPSE: I am in agreement with Mr. Goodman. However, it would be more advisable to save the panel proposal and change it during the comment stage than to remove the proposal from ever existing.

(Log #2130)

14- 58 - (500-10 (New)): Accept in Principle
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Add new text to read as follows:
500-10. Unclassified Locations. Locations which are neither Class I, Division 1; Class I, Division 2, Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2, or any combination thereof.
SUBSTANTIATION: The term "unclassified" is currently used at least 12 times in the NEC, but is not defined. While the terms "nonhazardous" and "unclassified" are used in both the NEC and other NFPA documents, the preferred term for area/location electrical classification is "unclassified" as it more clearly correlates with the condition of being reviewed but found not to need special electrical equipment for a specific electrically classified location. The term "nonhazardous" infers that the area has "no" hazards. This action provides needed correlation with other NFPA documents, such as NFPA 497 and NFPA 30. Additionally the term "nonhazardous" is used in at least in one other place in the NEC (i.e., Section 640-2) in which the meaning applies to voltages and not classification. A companion proposal has been made to change the term "nonhazardous" to "unclassified" elsewhere in the NEC and to define this term in Article 100 and 505.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Proposal 14-2a addresses this issue.

ARTICLE 501 — CLASS I LOCATIONS

(Log #1259)

14- 59 - (501): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: In 501-3(b)(6)(3), change "3 ft (914 mm)" to "900 mm (3 ft)".
In 501-4(a)(1) Exception No. 1, change "2 in. (50.8 mm)" to "50 mm (2 in.)" in paragraph 1 of this exception; and change "24 in. (610 mm)" to "600 mm (24 in.)" in this exception in two places, one in each paragraph.
In 501-5(a)(1), change "2 in." to "50 mm (2 in.)" and "18 in. (457 mm)" to "450 mm (18 in.)".
In 501-5(a)(2), change "18 in. (457 mm)" to "450 mm (18 in.)".
In 501-5(a)(3), change "36 in. (914 mm) to "900 mm (36 in.)" and "18 in. (457 mm)" to "450 mm (18 in.)"
In 501-5(a)(4), change "10 ft (3.05 m)" to "3.0 m (10 ft)".
In 501-5(a)(4) Exception change "12 ft (305 mm)" to "300 mm (12 in.)".
In 501-5(b)(2), change "10 ft (3.05 m)" to "3.0 m (10 ft)".
In 501-5(b)(2), Exception No. 1, change "12 in. (305 mm)" to "300 mm (12 in.)".
In 501-5(b)(2), Exception No. 4(a), change "12 in. (305 mm)" to "300 mm (12 in.)".
In 501-5(c)(3), change "5/8 in. (16 mm)" to "16 mm (5/8 in.)".
In 501-5(d)(2), Exception, change "18 in. (457 mm)" to "450 mm (18 in.)".
In 501-5(e)(2), change "[0.007 ft^3/hour (198 cm^3/hour) of air at a pressure of 6 in. of water (1493 pascals)]" to "[200 cm^3/hour (0.007 ft^3/hour) of air at a pressure of 1500 pascals (6 in. of water)]".
In 501-5(e)(3), change "6 in. of water (1493 pascals)" to "1500 pascals (6 in. of water)."
In 501-6(b)(1)(b), change "2-in. (50.8 mm)" to "50 mm (2 in.)" and "1 in. (25.4-mm)" to "25 mm (1 in.)".
In 501-9(a)(3), change "12 in. (305 mm)" to "300 mm (12 in.)" in three places.
In 501-9(b)(3), change "12 in. (305 mm)" to "300 mm (12 in.)" in three places.
In 501-16(b), Exception (a), change "6 ft (1.83 m)" to "1.8 m (6 ft)".
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Reject.
PANEL STATEMENT: Panel 14 believes the following issues need further evaluation before changes are made to the code. Trade sizes of conduit, extract policies, consistency from article to article within the code are all issues that need further evaluation. For example, trade size of conduit is not a true dimension and cannot be converted to a true metric number.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
KUCZKA: See my Explanation of Negative Vote on Proposal 14-10.
OMEARA: The proposal should be accepted, to be in conformance with Chapter 4 of the NFPA MOS-1 Manual of Style.
ZIPSE: See my Explanation of Negative Vote on Proposal 14-10.

(Log #CP1411)

14- 59a - (Article 501): Accept
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. Further, it was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel, with further consideration given to the comments expressed in the voting, specifically with respect to comments that the accepted Proposal does not accurately reflect what was agreed upon by the Panel. It is the understanding of the Technical Correlating Committee that this proposal is modified by Proposals 14-61, 14-62, 14-64, 14-66, 14-67, 14-68, 14-69, 14-70, 14-71, 14-72, 14-75, 14-77, 14-92, 14-93, 14-94, 14-95, 14-96, 14-98, 14-100, 14-101, 14-102, 14-103, 14-106, 14-107, 14-108, 14-109, 14-110, 14-111,

14-116, 14-117, 14-118, 14-119, 14-130, 14-131, 14-132, 14-133, 14-134, 14-135, 14-140, 14-141, 14-142, 14-143, 14-144, 14-145, 14-146, 14-147, 14-149, 14-150, 14-151, 14-152, 14-153, 14-154, 14-155, 14-156, 14-157, 14-158, 14-162, 14-164, 14-165, 14-166, 14-168, 14-169, 14-170, 14-171, 14-172, 14-174, 14-175, 14-178, 14-179, 14-184, 14-185, 14-186, 14-187, 14-194, 14-195, 14-196, and 14-197. This action will be considered by the Panel as a Public Comment
SUBMITTER: CMP 14
RECOMMENDATION: Revise Article 501 to read as follows:

501

ARTICLE 501 -- Class I Locations
501-1. General. The general rules of this Code shall apply to the electric wiring and equipment in locations classified as Class I in Section 500-~~7~~5.

Equipment listed and marked in accordance with Section 505-10 for use in Class I, Zone 0, 1, or 2 locations shall be permitted in Class I, Division 2 locations for the same gas and with a suitable temperature ~~rating~~classification.
Exception: As modified by this article.

501-2. Transformers and Capacitors
(a) Class I, Division 1. In Class I, Division 1 locations, transformers and capacitors shall comply with the following.

(1) Containing Liquid that Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed only in approved vaults that comply with Sections 450-41 through 450-48, and, in addition,

a. There shall be no door or other communicating opening between the vault and the Division 1 location, and
b. Ample ventilation shall be provided for the continuous removal of flammable gases or vapors, and
c. Vent openings or ducts shall lead to a safe location outside of buildings, and
d. Vent ducts and openings shall be of sufficient area to relieve explosion pressures within the vault, and all portions of vent ducts within the buildings shall be of reinforced concrete construction.

(2) Not Containing Liquid that Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with (a)(1) or be approved for Class I locations.

(b) Class I, Division 2. In Class I, Division 2 locations, transformers and capacitors shall comply with Sections 450-21 through 450-27.

501-3. Meters, Instruments, and Relays
(a) Class I, Division 1. In Class I, Division 1 locations, meters, instruments, and relays, including kilowatt-hour meters, instrument transformers, resistors, rectifiers, and thermionic tubes, shall be provided with enclosures approved for Class I, Division 1 locations. Enclosures approved for Class I, Division 1 locations include explosionproof enclosures and purged and pressurized enclosures.

FPN: See Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

(b) Class I, Division 2. In Class I, Division 2 locations, meters, instruments, and relays shall comply with the following.

(1) Contacts. Switches, circuit breakers, and make-and-break contacts of pushbuttons, relays, alarm bells, and horns shall have enclosures approved for Class I, Division 1 locations in accordance with Section 501-3(a).

Exception: General-purpose enclosures shall be permitted, if current-interrupting contacts are
a. Immersed in oil, or
b. Enclosed within a chamber that is hermetically sealed against the entrance of gases or vapors, or
c. In nonincendive circuits, or
d. Part of a listed nonincendive component.

(2) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment that are used in or in connection with meters, instruments, and relays shall comply with Section 501-3(a).
Exception: General-purpose–type enclosures shall be permitted if such equipment is without make-and-break or sliding contacts [other than as provided in (b)(1)] and if the maximum operating temperature of any exposed surface will not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved or has been tested and found incapable of igniting the gas or vapor. This exception shall not apply to thermionic tubes.

(3) Without Make-or-Break Contacts. Transformer windings, impedance coils, solenoids, and other windings that do not incorporate sliding or make-or-break contacts shall be provided with enclosures. General-purpose–type enclosures shall be permitted.

(4) General-Purpose Assemblies. Where an assembly is made up of components for which general-purpose enclosures are acceptable as provided in (b)(1), (b)(2), and (b)(3), a single general-purpose enclosure shall be acceptable for the assembly. Where such an assembly includes any of the equipment described in (b)(2), the maximum obtainable surface temperature of any component of the assembly shall be clearly and permanently indicated on the outside of the enclosure. Alternatively, approved equipment shall be permitted to be marked to indicate the temperature ~~range~~class ~~-~~ for which it is suitable, using the temperature class (T Code) ~~identification numbers~~ of Table 500-8 (b) ~~5(d)~~.

(5) Fuses. Where general-purpose enclosures are permitted in (b)(1), (b)(2), (b)(3), and (b)(4), fuses for overcurrent protection of instrument circuits not subject to overloading in normal use shall be permitted to be mounted in general-purpose enclosures if each such fuse is preceded by a switch complying with (b)(1).

(6) Connections To facilitate replacements, process control instruments shall be permitted to be connected through flexible cord, attachment plug, and receptacle, provided the following:

1. A switch complying with (b)(1) is provided so that the attachment plug is not depended on to interrupt current; and
2. The current does not exceed 3 amperes at 120 volts, nominal; and
3. The power-supply cord does not exceed 3 ft (914 mm), is of a type approved for extra-hard usage or for hard usage if protected by location, and is supplied through an attachment plug and receptacle of the locking and grounding type; and
4. Only necessary receptacles are provided; and
5. The receptacle carries a label warning against unplugging under load.

501-4. Wiring Methods. Wiring methods shall comply with (a) or (b).

(a) Class I, Division 1.
(1) In Class I, Division 1 locations, the following wiring methods shall be permitted:

a) Threaded rigid metal conduit or threaded steel intermediate metal conduit. Threaded joints shall be made up with at least five threads fully engaged.

Exception No. 1: Rigid nonmetallic conduit complying with Article 347 shall be permitted where encased in a concrete envelope a minimum of 2 in. (50.8 mm) thick and provided with not less than 24 in. (610 mm) of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of Section 511-4, Exception; 514-8, Exception No. 2; and Section 515-5(a). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 24 in. (610 mm) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.

b) Type MI cable with termination fittings approved for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision

ensure that only qualified persons will service the installation Type MC-HL cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated metallic (14-78) sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application.
FPN: See Sections 334-3 and 334-4 for restrictions on use of Type MC cable.

d) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type ITC-HL cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application.

(2) Where necessary to employ flexible connections, as at motor terminals, flexible fittings listed for Class I, Division 1 locations or flexible cord in accordance with the provisions of Section 501-11 shall be permitted.

(3) All boxes, fittings, and joints shall be approved for Class I, Division 1.

(b) Class I, Division 2.
(1) In Class I, Division 2 locations, the following wiring methods shall be permitted:

a) Threaded rigid metal conduit, threaded steel intermediate metal conduit,
b) Enclosed gasketed busways, enclosed gasketed wireways,
c) Type PLTC cable in accordance with the provisions of Article 725, or in cable tray systems. PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.
d) Type ITC cable in cable trays, in raceways, supported by messenger wire, afforded mechanical protection and run as open wiring, or directly buried where the cable is listed for this use;
e) Type MI, MC, MV, or TC cable with (14-79/14-80) termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings.

(2) Where provision must be made for limited flexibility, flexible metal fittings, flexible metal conduit with listed fittings, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord listed for extra-hard usage and provided with listed bushed fittings shall be used. An additional conductor for grounding shall be included in the flexible cord. (14-87)
FPN: See Section 501-16(b) for grounding requirements where flexible conduit is used.
FPN ~~?~~2
(3) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for nonhazardous (14-88/1401) locations, including Chapter 7 and 8 wiring methods. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). (14-83)

(4) Boxes, fittings, and joints shall not be required to be explosionproof except as required by Sections 501-3(b)(1), 501-6(b)(1), and 501-14(b)(1).

501-5. Sealing and Drainage
Seals in conduit and cable systems shall comply with (a) through (f). ~~Sealing compound shall be of a type approved for the conditions and use~~ (14-89). Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.

FPN No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal, and through conductors passing through the seal. See Section 501-5(e)(2). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See Section 501-5(c)(2).
FPN No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than No. 2. Special conductor constructions, e.g., compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.

(a) Conduit Seals, Class I, Division 1. In Class I, Division 1 locations, conduit seals shall be located as follows.
1. In each conduit entry into an explosionproof enclosure where either (a) the enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors, that may produce arcs, sparks, or high temperatures that are considered to be an ignition source in normal operation, or (b) the entry is 2-in. size or larger and the enclosure contains terminals, splices, or taps. For the purposes of this section high temperatures shall be considered to be any temperatures exceeding 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved.

Exception to (a)(1)(a): Conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors are
a. Enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or
b. Immersed in oil in accordance with Section 501-6(b)(1)(b), or
c. Enclosed within a factory-sealed explosionproof chamber located within the enclosure, approved for the location, and marked "factory sealed" or equivalent. Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal.
Conduit seals shall be installed within 18 in. (457 mm) from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and Cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.

2. In each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 18 in. (457 mm) from the pressurized enclosure.

FPN No. 1: Installing the seal as close as possible to the enclosure will reduce problems with purging the dead airspace in the pressurized conduit.
FPN No. 2: For further information, see Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

3. Where two or more explosionproof enclosures for which conduit seals are required under (a)(1) are connected by nipples or by runs of conduit not more than 36 in. (914 mm) long, a single conduit seal in each such nipple connection or run of conduit shall be considered sufficient if located not more than 18 in. (457 mm) from either enclosure.

4. In each conduit run leaving a Class I, Division 1 location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Division 1 portion of the conduit from being communicated to the conduit beyond the seal. Except for approved explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 1 location.
Exception: Metal conduit containing no unions, couplings, boxes, or fittings that passes completely through a Class I, Division 1 location with no fittings less than 12 in. (305 mm) beyond each

boundary shall not require a conduit seal if the termination points of the unbroken conduit are in unclassified locations.

(b) Conduit Seals, Class I, Division 2. In Class I, Division 2 locations, conduit seals shall be located as follows.
1. For connections to enclosures that are required to be explosionproof, a conduit seal shall be provided in accordance with (a)(1)(a) and (a)(3). All portions of the conduit run or nipple between the seal and such enclosure shall comply with Section 501-4(a).
2. In each conduit run passing from a Class I, Division 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Division 2 portion of the conduit from being communicated to the conduit beyond the seal. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Division 2 location, and a threaded connection shall be used at the sealing fitting. Except for approved explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 2 location.

Exception No. 1: Metal conduit containing no unions, couplings, boxes or fittings that passes completely through a Class I, Division 2 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.
Exception No. 2: Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or open wiring shall not be required to be sealed where passing from the Class I, Division 2 location into the unclassified location. The unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The conduits shall not terminate at an enclosure containing an ignition source in normal operation.
Exception No. 3: Conduit systems passing from an enclosure or room that is unclassified as a result of pressurization into a Class I, Division 2 location shall not require a seal at the boundary.

FPN: For further information, refer to Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Class I, Division 2 location into an unclassified location if the following conditions are met:

a. No part of the conduit system segment passes through a Class I, Division I location where the conduit contains unions, couplings, boxes, or fittings within 12 in. (305 mm) of the Class I, Division 1 location; and
b. The conduit system segment is located entirely in outdoor locations; and
c. The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system; and
d. The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location; and
e. The conduit system segment is sealed at its entry to each enclosure or fitting housing terminals, splices, or taps in Class I, Division 2 locations.

(c) Class I, Divisions 1 and 2. Where required, seals in Class I, Division 1 and 2 locations shall comply with the following.
(1) Fittings. Enclosures for connections or equipment shall be provided with an approved integral means for sealing, or sealing fittings approved for Class I locations shall be used. ~~Sealing fittings shall be accessible.~~Sealing fittings shall be listed for use with one or more specific compounds and shall be accessible. (14-104, 14-105)
(2) Compound. The compound shall provide a ~~Sealing compound shall be approved and shall provide a~~ seal against passage of gas or vapors through the seal fitting, shall not be affected by the surrounding atmosphere or liquids, and shall not have a melting point of less than 93ºC (200ºF). (14-104)
(3) Thickness of Compounds. In a completed seal, the minimum thickness of the sealing compound shall not be less than the trade size of the sealing fitting and, in no case, less than 5/8 in. (16 mm).
Exception: Listed cable sealing fittings shall not be required to have a minimum thickness equal to the trade size of the fitting.
(4) Splices and Taps. Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.
(5) Assemblies. In an assembly where equipment that may produce arcs, sparks, or high temperatures is located in a compartment separate from the compartment containing splices or taps, and an integral seal is provided where conductors pass from one compartment to the other, the entire assembly shall be approved for Class I locations. Seals in conduit connections to the compartment containing splices or taps shall be provided in Class I, Division 1 locations where required by (a)(1)(b).(14-
(6) Conductor Fill. The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless it is specifically approved for a higher percentage of fill.

(d) Cable Seals, Class I, Division 1. In Class I, Division 1 locations, cable seals shall be located as follows.
1. Cable shall be sealed at all terminations. The sealing fitting shall comply with (c). Multiconductor Type MC cables with a gas/vaportight continuous corrugated aluminum sheath and an overall jacket of suitable polymeric material shall be sealed with an approved fitting after removing the jacket and any other covering so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors.
Exception: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

2. Cables in conduit with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Division 1 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor and the outer jacket.
Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered as a single conductor by sealing the cable in the conduit within 18 in. (457 mm) of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods. For shielded cables and twisted pair cables, it shall not be required to remove the shielding material or separate the twisted pair.

3. Each multiconductor cable in conduit shall be considered as a single conductor if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with (a).

(e) Cable Seals, Class I, Division 2. In Class I, Division 2 locations, cable seals shall be located as follows.
1. Cables entering enclosures that are required to be approved for Class I locations shall be sealed at the point of entrance. The sealing fitting shall comply with (b)(1). Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in an approved fitting in the Division 2 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors. Multiconductor cables in conduit shall be sealed as described in (d).
Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Class I, Division 2 location shall not require a seal at the boundary.
Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

2. Cables with a gas/vaportight continuous sheath and that will not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in (e)(1). The minimum length of such cable run shall not be less than that length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings [0.007 ft^3/hour (198 cm^3/hour) of air at a pressure of 6 in. of water (1493 pascals)].
FPN No. 1: See Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations, ANSI/UL 886-1994.
FPN No. 2: The cable core does not include the interstices of the conductor strands.

3. Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall not be required to be sealed except as required in (e)(1), unless the cable is attached to process equipment or devices that may cause a pressure in excess of 6 in. of water (1493 pascals) to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified area.
Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, Division 2 location without seals.

4. Cables that do not have gas/vaportight continuous sheath shall be sealed at the boundary of the Division 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.
FPN: The sheath mentioned in (d) and (e) may be either metal or a nonmetallic material.

(f) Drainage.
(1) Control Equipment. Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.

(2) Motors and Generators. Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize entrance of liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.

(3) Canned Pumps, Process or Service Connections, etc. For canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the electrical raceway or cable system capable of transmitting fluids, an additional approved seal, barrier, or other means shall be provided to prevent the flammable or combustible fluid from entering the raceway or cable system capable of transmitting fluids beyond the additional devices or means, if the primary seal fails.
The additional approved seal or barrier and the interconnecting enclosure shall meet the temperature and pressure conditions to which they will be subjected upon failure of the primary seal, unless other approved means are provided to accomplish the purpose above.
Drains, vents, or other devices shall be provided so that primary seal leakage will be obvious.
FPN: See also the fine print notes to Section 501-5.

501-6. Switches, Circuit Breakers, Motor Controllers, and Fuses
(a) Class I, Division 1. In Class I, Division 1 locations, switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices, shall be provided with enclosures, and the enclosure in each case, together with the enclosed apparatus, shall be approved as a complete assembly for use in Class I locations.

(b) Class I, Division 2. Switches, circuit breakers, motor controllers, and fuses in Class I, Division 2 locations shall comply with the following:

(1) Type Required. Circuit breakers, motor controllers, and switches intended to interrupt current in the normal performance of the function for which they are installed shall be provided with enclosures approved for Class I, Division 1 locations in accordance with Section 501-3(a), unless general-purpose enclosures are provided and
a. The interruption of current occurs within a chamber hermetically sealed against the entrance of gases and vapors, or
b. The current make-and-break contacts are oil-immersed and of the general-purpose type having a 2-in. (50.8-mm) minimum immersion for power contacts and a 1-in. (25.4-mm) minimum immersion for control contacts, or
c. The interruption of current occurs within a factory-sealed explosionproof chamber approved for the location, or
d. The device is a solid state, switching control without contacts, where the surface temperature does not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved.

(2) Isolating Switches. Fused or unfused disconnect and isolating switches for transformers or capacitor banks that are not intended to interrupt current in the normal performance of the function for which they are installed shall be permitted to be installed in general-purpose enclosures.

(3) Fuses. For the protection of motors, appliances, and lamps, other than as provided in (b)(4), standard plug or cartridge fuses shall be permitted, provided they are placed within enclosures identified ~~approved~~ (14-136) for the location; or fuses shall be permitted if they are within general-purpose enclosures, and if they are of a type in which the operating element is immersed in oil or other approved liquid, or the operating element is enclosed within a chamber hermetically sealed against the entrance of gases and vapors, or the fuse is a nonindicating, filled, current-limiting type.

(4) Fuses Internal to Lighting Fixtures. Approved cartridge fuses shall be permitted as supplementary protection within lighting fixtures.

501-7. Control Transformers and Resistors
Transformers, impedance coils, and resistors used as, or in conjunction with, control equipment for motors, generators, and appliances shall comply with (a) and (b).
(a) Class I, Division 1. In Class I, Division 1 locations, transformers, impedance coils, and resistors, together with any switching mechanism associated with them, shall be provided with enclosures approved for Class I, Division 1 locations in accordance with Section 501-3(a).

(b) Class I, Division 2. In Class I, Division 2 locations, control transformers and resistors shall comply with the following.
(1) Switching Mechanisms. Switching mechanisms used in conjunction with transformers, impedance coils, and resistors shall comply with Section 501-6(b).
(2) Coils and Windings. Enclosures for windings of transformers, solenoids, or impedance coils shall be permitted to be of the general-purpose type.
(3) Resistors. Resistors shall be provided with enclosures; and the assembly shall be approved for Class I locations, unless resistance is nonvariable and maximum operating temperature, in degrees Celsius, will not exceed 80 percent of the ignition temperature of the gas or vapor involved, or has been tested and found incapable of igniting the gas or vapor.

501-8. Motors and Generators
(a) Class I, Division 1. In Class I, Division 1 locations, motors, generators, and other rotating electric machinery shall be as follows:
1. **Approved** for Class I, Division 1 locations; or
2. Of the totally enclosed type supplied with positive-pressure ventilation from a source of clean air with discharge to a safe area, so arranged to prevent energizing of the machine until ventilation has been established and the enclosure has been purged with at least 10 volumes of air, and also arranged to automatically de-energize the equipment when the air supply fails; or
3. Of the totally enclosed inert gas-filled type supplied with a suitable reliable source of inert gas for pressuring the enclosure, with devices provided to ensure a positive pressure in the enclosure and arranged to automatically de-energize the equipment when the gas supply fails; or
4. Of a type designed to be submerged in a liquid that is flammable only when vaporized and mixed with air, or in a gas or vapor at a pressure greater than atmospheric and that is flammable only when mixed with air; and the machine is arranged so to prevent energizing it until it has been purged with the liquid or gas to exclude air, and also arranged to automatically de-energize the

equipment when the supply of liquid or gas or vapor fails or the pressure is reduced to atmospheric.
Totally enclosed motors of Types (2) or (3) shall have no external surface with an operating temperature in degrees Celsius in excess of 80 percent of the ignition temperature of the gas or vapor involved. Appropriate devices shall be provided to detect and automatically de-energize the motor or provide an adequate alarm if there is any increase in temperature of the motor beyond designed limits. Auxiliary equipment shall be of a type approved for the location in which it is installed.
FPN: See ASTM Test Procedure, D 2155-69.

(b) Class I, Division 2. In Class I, Division 2 locations, motors, generators, and other rotating electric machinery in which are employed sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices, either while starting or while running, shall be approved for Class I, Division 1 locations, unless such sliding contacts, switching mechanisms, and resistance devices are provided with enclosures approved for Class I, Division 2 locations in accordance with Section 501-3(b). The exposed surface of space heaters used to prevent condensation of moisture during shutdown periods shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved when operated at rated voltage, and the maximum surface temperature [based on a 40ºC (104ºF) ambient] shall be permanently marked on a visible nameplate mounted on the motor. Otherwise, space heaters shall be approved for Class I, Division 2 locations.
In Class I, Division 2 locations, the installation of open or nonexplosionproof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Division 2 location, shall be permitted.
FPN No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.
FPN No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitible gases or vapors is suspected, clean-air purging may be needed immediately prior to and during start-up periods.

501-9. Lighting Fixtures
Lighting fixtures shall comply with (a) or (b).
(a) Class I, Division 1. In Class I, Division 1 locations, lighting fixtures shall comply with the following.
(1) Approved Fixtures. Each fixture shall be approved as a complete assembly for the Class I, Division 1 location and shall be clearly marked to indicate the maximum wattage of lamps for which it is approved. Fixtures intended for portable use shall be specifically approved as a complete assembly for that use.
(2) Physical Damage. Each fixture shall be protected against physical damage by a suitable guard or by location.
(3) Pendant Fixtures. Pendant fixtures shall be suspended by and supplied through threaded rigid metal conduit stems or threaded steel intermediate conduit stems, and threaded joints shall be provided with set-screws or other effective means to prevent loosening. For stems longer than 12 in. (305 mm), permanent and effective bracing against lateral displacement shall be provided at a level not more than 12 in. (305 mm) above the lower end of the stem, or flexibility in the form of a fitting or flexible connector approved for the Class I, Division 1 location shall be provided not more than 12 in. (305 mm) from the point of attachment to the supporting box or fitting.
(4) Supports. Boxes, box assemblies, or fittings used for the support of lighting fixtures shall be approved for Class I locations.

(b) Class I, Division 2. In Class I, Division 2 locations, lighting fixtures shall comply with the following.
(1) Portable Lighting Equipment. Portable lighting equipment shall comply with (a)(1).
Exception: Where portable lighting equipment are mounted on movable stands and are connected by flexible cords, as covered in Section 501-11, they shall be permitted, where mounted in any position, if they conform to Section 501-9(b)(2).
(2) Fixed Lighting. Lighting fixtures for fixed lighting shall be protected from physical damage by suitable guards or by location. Where there is danger that falling sparks or hot metal from lamps or fixtures might ignite localized concentrations of flammable vapors or gases, suitable enclosures or other effective protective means shall be provided. Where lamps are of a size or type that may, under normal operating conditions, reach surface temperatures exceeding 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved, fixtures shall comply with (a)(1) or shall be of a type that has been tested in order to determine the marked operating temperature or temperature class~~range~~ (T Code).
(3) Pendant Fixtures. Pendant fixtures shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, or by other approved means. For rigid stems longer than 12 in. (305 mm), permanent and effective bracing against lateral displacement shall be provided at a level not more than 12 in. (305 mm) above the lower end of the stem, or flexibility in the form of an approved fitting or flexible connector shall be provided not more than 12 in. (305 mm) from the point of attachment to the supporting box or fitting.
(4) Switches. Switches that are a part of an assembled fixture or of an individual lampholder shall comply with Section 501-6(b)(1).
(5) Starting Equipment. Starting and control equipment for electric-discharge lamps shall comply with Section 501-7(b).
Exception: A thermal protector potted into a thermally protected fluorescent lamp ballast if the lighting fixture is approved for locations of this class and division.

501-10. Utilization Equipment
(a) Class I, Division 1. In Class I, Division 1 locations, all utilization equipment shall be approved for Class I, Division 1 locations.

(b) Class I, Division 2. In Class I, Division 2 locations, all utilization equipment shall comply with the following.
(1) Heaters. Electrically heated utilization equipment shall conform with either item (a) or (b).

a. The heater shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved on any surface that is exposed to the gas or vapor when continuously energized at the maximum rated ambient temperature. If a temperature controller is not provided, these conditions shall apply when the heater is operated at 120 percent of rated voltage.

Exception No. 1: For motor-mounted anticondensation space heaters, see Section 501-8(b).
Exception No. 2: A current-limiting device is applied to the circuit serving the heater that will limit the current in the heater to a value less than that required to raise the heater surface temperature to 80 percent of the ignition temperature.

b. The heater shall be approved for Class I, Division 1 locations.
Exception: Electrical resistance heat tracing approved for Class I, Division 2 locations.

(2) Motors. Motors of motor-driven utilization equipment shall comply with Section 501-8(b).

(3) Switches, Circuit Breakers, and Fuses. Switches, circuit breakers, and fuses shall comply with Section 501-6(b).

501-11. Flexible Cords, Class I, Divisions 1 and 2
A flexible cord shall be permitted for connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit. Flexible cord shall also be permitted for that portion of the circuit where the fixed wiring methods of Section 501-4(a) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment, in an industrial establishment where conditions of maintenance and engineering supervision ensure that only qualified persons will install and service the installation, and the flexible cord is protected by location or by a suitable guard from damage. The length of the flexible cord shall be continuous. Where flexible cords are used, the cords shall be as follows:
1. Of a type approved for extra-hard usage;
2. Contain, in addition to the conductors of the circuit, a grounding conductor complying with Section 400-23;
3. Connected to terminals or to supply conductors in an approved manner;
4. Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections; and

5. Be provided with suitable seals where the flexible cord enters boxes, fittings, or enclosures of the explosionproof type.
Exception: As provided in Sections 501-3(b)(6) and 501-4(b).
Electric submersible pumps with means for removal without entering the wet-pit shall be considered portable utilization equipment. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be permitted.
Electric mixers intended for travel into and out of open-type mixing tanks or vats shall be considered portable utilization equipment.
FPN: See Section 501-13 for flexible cords exposed to liquids having a deleterious effect on the conductor insulation.

501-12. Receptacles and Attachment Plugs, Class I, Divisions 1 and 2
Receptacles and attachment plugs shall be of the type providing for connection to the grounding conductor of a flexible cord and shall be approved for the location.
Exception: As provided in Section 501-3(b)(6).

501-13. Conductor Insulation, Class I, Divisions 1 and 2
Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type approved for use under such conditions; or the insulation shall be protected by a sheath of lead or by other approved means.

501-14. Signaling, Alarm, Remote-Control, and Communications Systems
(a) Class I, Division 1. In Class I, Division 1 locations, all apparatus and equipment of signaling, alarm, remote-control, and communications systems, regardless of voltage, shall be approved for Class I, Division 1 locations, and all wiring shall comply with Sections 501-4(a) and 501-5(a) and (c).

(b) Class I, Division 2. In Class I, Division 2 locations, signaling, alarm, remote-control, and communications systems shall comply with the following.
(1) Contacts. Switches, circuit breakers, and make-and-break contacts of pushbuttons, relays, alarm bells, and horns shall have enclosures approved for Class I, Division 1 locations in accordance with Section 501-3(a).
Exception: General-purpose enclosures shall be permitted if current-interrupting contacts are one of the following:
a. Immersed in oil, or
b. Enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or
c. In nonincendive circuits, or
d. Part of a listed nonincendive component
(2) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with Section 501-3(b)(2).
(3) Protectors. Enclosures shall be provided for lightning protective devices and for fuses. Such enclosures shall be permitted to be of the general-purpose type.
(4) Wiring and Sealing. All wiring shall comply with Sections 501-4(b) and 501-5(b) and (c).

501-15. Live Parts, Class I, Divisions 1 and 2
There shall be no exposed live parts.

501-16. Grounding, Class I, Divisions 1 and 2
Wiring and equipment in Class I, Division 1 and 2 locations shall be grounded as specified in Article 250 and with the following additional requirements.
(a) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.
Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in Sections 250-32(a), (b), and (c), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.
FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.

(b) Types of Equipment Grounding Conductors. Where flexible metal conduit or liquidtight flexible metal conduit is used as permitted in Section 501-4(b) and is to be relied on to complete a sole equipment grounding path, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with Section 250-102.
Exception: In Class I, Division 2 locations, the bonding jumper shall be permitted to be deleted where all the following conditions are met.
a. Listed liquidtight flexible metal conduit 6 ft (1.83 m) or less in length, with fittings listed for grounding, is used.
b. Overcurrent protection in the circuit is limited to 10 amperes or less.
c. The load is not a power utilization load.

501-17. Surge Protection
(a) Class I, Division 1. Surge arresters, including their installation and connection, shall comply with Article 280. The surge arresters and capacitors shall be installed in enclosures approved for Class I, Division 1 locations. Surge-protective capacitors shall be of a type designed for specific duty.

(b) Class I, Division 2. Surge arresters shall be nonarcing, such as metal-oxide varistor (MOV), sealed type, and surge-protective capacitors shall be of a type designed for specific duty. Installation and connection shall comply with Article 280.
Enclosures shall be permitted to be of the general-purpose type.
Surge protection of types other than described above shall be installed in enclosures approved for Class I, Division 1 locations.

501-18. Multiwire Branch Circuits
In a Class I, Division 1 location, a multiwire branch circuit shall not be permitted.
Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.

SUBSTANTIATION: This complete revision of Article 501 editorially revises the text to make it more easily understood and also incorporates numerous technical and editorial improvements made via other proposals.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban
COMMENT ON AFFIRMATIVE:
BRIESCH: While the Panel Action to accept the rewrite of Article 501 is supported, the NFPA-circulated Panel Proposal does not include all of the changes agreed to at the meeting. The e-mail sent by Dave Wechsler subsequent to the meeting is more complete in reflecting the Panel Actions from the meeting.
COOK: I agree with Proposal 14-59a and the substantiation, however, it does not incorporate all of the changes made via other proposals. An updated version that was emailed from Dave Wechsler on 1-26-2000 seems to be more complete with respect to including Panel Actions form the meeting in Hilton Head.
ENGLER: Not all of the changes made it into the draft circulated with this ballot, vote is to affirm the text with all of the necessary changes made to it.
JAGUNICH: See ballot for David Wechsler.
LAWRENCE: Due to the large number of public proposals received and acted upon, and also due to time constraints, the panel was not able to compile and correlate all aspects of the rewrites of the affected article. Please see David Wechsler's ballot.
OMEARA: Please see the comments on the ballot for David Wechsler.
WECHSLER: While attempts were made to provide NFPA Staff with corrected revisions of this text before the end of the CMP 14 panel meeting, a detailed review of this balloted draft version has indicated that this does not reflect the accurate committee actions and is not correct.
We attribute the problems with this draft to the following:
a) the use of several earlier drafts that were consistently being revised to keep pace with changes made due to committee actions on public proposals,
b) the limited time available to proof and develop this work,
c) the extremely large number of public proposals,
d) the complex nature of the interaction of affected texts within Articles 500, 501, 502 and 505, and the desire of the panel to maintain consistency, and
e) human errors in transcribing this information.
The following text provides a correct revision of this complete work effort for Article 501. This text should be the panel document of record and not that provided with the committee ballot.

ARTICLE 501 -- Class I Locations

501-1. General. The general rules of this Code shall apply to the electric wiring and equipment in locations classified as Class I in Section 500-~~7~~5.

Equipment listed and marked in accordance with Section 505-10 for use in Class I, Zone 0, 1, or 2 locations shall be permitted in Class I, Division 2 locations for the same gas and with a suitable temperature ~~rating~~classification.
Exception: As modified by this article.

501-2. Transformers and Capacitors

(a) Class I, Division 1. In Class I, Division 1 locations, transformers and capacitors shall comply with the following.

(1) Containing Liquid that Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed only in ~~approved~~ [14-61,14-62]vaults that comply with Sections 450-41 through 450-48, and, in addition,

a. There shall be no door or other communicating opening between the vault and the Division 1 location, and
b. Ample ventilation shall be provided for the continuous removal of flammable gases or vapors, and
c. Vent openings or ducts shall lead to a safe location outside of buildings, and
d. Vent ducts and openings shall be of sufficient area to relieve explosion pressures within the vault, and all portions of vent ducts within the buildings shall be of reinforced concrete construction.

(2) Not Containing Liquid that Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with (a)(1) or be approved for Class I locations.

(b) Class I, Division 2. In Class I, Division 2 locations, transformers and capacitors shall comply with Sections 450-21 through 450-27.

501-3. Meters, Instruments, and Relays

(a) Class I, Division 1. In Class I, Division 1 locations, meters, instruments, and relays, including kilowatt-hour meters, instrument transformers, resistors, rectifiers, and thermionic tubes, shall be provided with enclosures approved for Class I, Division 1 locations. Enclosures ~~approved~~ [14-66] for Class I, Division 1 locations include explosionproof enclosures and purged and pressurized enclosures.

FPN: See Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

(b) Class I, Division 2. In Class I, Division 2 locations, meters, instruments, and relays shall comply with the following.

(1) Contacts. Switches, circuit breakers, and make-and-break contacts of pushbuttons, relays, alarm bells, and horns shall have enclosures approved [14-67,14-68] for Class I, Division 1 locations in accordance with Section 501-3(a).

Exception: General-purpose enclosures shall be permitted, if current-interrupting contacts are
a. Immersed in oil, or
b. Enclosed within a chamber that is hermetically sealed against the entrance of gases or vapors, or
c. In nonincendive circuits, or
d. Part of a listed nonincendive component.

(2) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment that are used in or in connection with meters, instruments, and relays shall comply with Section 501-3(a).

Exception: General-purpose–type enclosures shall be permitted if such equipment is without make-and-break or sliding contacts [other than as provided in (b)(1)] and if the maximum operating temperature of any exposed surface will not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved or has been tested and found incapable of igniting the gas or vapor. This exception shall not apply to thermionic tubes.

(3) Without Make-or-Break Contacts. Transformer windings, impedance coils, solenoids, and other windings that do not incorporate sliding or make-or-break contacts shall be provided with enclosures. General-purpose–type enclosures shall be permitted.

(4) General-Purpose Assemblies. Where an assembly is made up of components for which general-purpose enclosures are acceptable as provided in (b)(1), (b)(2), and (b)(3), a single general-purpose enclosure shall be acceptable for the assembly. Where such an assembly includes any of the equipment described in (b)(2), the maximum obtainable surface temperature of any component of the assembly shall be clearly and permanently indicated on the outside of the enclosure. Alternatively, ~~approved~~ [14-69,14-70] equipment shall be permitted to be marked to indicate the temperature ~~range~~class for which it is suitable, using the temperature class (T Code)~~identification numbers~~ of Table 500-8 (b)~~5(d)~~.

(5) Fuses. Where general-purpose enclosures are permitted in (b)(1), (b)(2), (b)(3), and (b)(4), fuses for overcurrent protection of instrument circuits not subject to overloading in normal use shall be permitted to be mounted in general-purpose enclosures if each such fuse is preceded by a switch complying with (b)(1).

(6) Connections To facilitate replacements, process control instruments shall be permitted to be connected through flexible cord, attachment plug, and receptacle, provided the following:

1. A switch complying with (b)(1) is provided so that the attachment plug is not depended on to interrupt current; and
2. The current does not exceed 3 amperes at 120 volts, nominal; and
3. The power-supply cord does not exceed 3 ft (914 mm), is of a type listed ~~approved~~ [14-71,14-72]-for extra-hard usage or for hard usage if protected by location, and is supplied through an attachment plug and receptacle of the locking and grounding type; and
4. Only necessary receptacles are provided; and
5. The receptacle carries a label warning against unplugging under load.

501-4. Wiring Methods. Wiring methods shall comply with (a) or (b). [14-73, 14-75,14-76,14-79]

(b) Class I, Division 1.

(1) In Class I, Division 1 locations, the following wiring methods shall be permitted:

a) Threaded rigid metal conduit or threaded steel intermediate metal conduit. Threaded joints shall be made up with at least five threads fully engaged.

Exception No. 1: Rigid nonmetallic conduit complying with Article 347 shall be permitted where encased in a concrete envelope a minimum of 2 in. (50.8 mm) thick and provided with not less than 24 in. (610 mm) of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of Section 511-4, Exception; 514-8, Exception No. 2; and Section 515-5(a). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 24 in. (610 mm) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.

b) Type MI cable with termination fittings approved for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings. [14-77]

c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation Type MC-HL cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated metallic (14-78) sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application.
FPN: See Sections 334-3 and 334-4 for restrictions on use of Type MC cable.

d) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type ITC-HL cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application.

(2) Where necessary to employ flexible connections, as at motor terminals, flexible fittings listed for Class I, Division 1 locations or flexible cord in accordance with the provisions of Section 501-11 shall be permitted.

(3) All boxes, fittings, and joints shall be approved for Class I, Division 1.

(b) Class I, Division 2.

(1) In Class I, Division 2 locations, the following wiring methods shall be permitted: [14-83,14-86,14-87]

a) Threaded rigid metal conduit, threaded steel intermediate metal conduit,

b) Enclosed gasketed busways, enclosed gasketed wireways,

c) Type PLTC cable in accordance with the provisions of Article 725, or in cable tray systems. PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.

d) Type ITC cable in cable trays, in raceways, supported by messenger wire, afforded mechanical protection and run as open wiring, or directly buried where the cable is listed for this use;

e) Type MI, MC, MV, or TC cable with [14-79/14-80] termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings.

(2) Where provision must be made for limited flexibility, flexible metal fittings, flexible metal conduit with listed fittings, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord listed for extra-hard usage and provided with listed bushed fittings shall be used. An additional conductor for grounding shall be included in the flexible cord. [14-87, 14-80]

FPN: See Section 501-16(b) for grounding requirements where flexible conduit is used.

(3) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for nonhazardous [14-81,14-88,1401] locations, including Chapter 7 and 8 wiring methods. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). (14-83)

(4) Boxes, fittings, and joints shall not be required to be explosionproof except as required by Sections 501-3(b)(1), 501-6(b)(1), and 501-14(b)(1).

501-5. Sealing and Drainage

Seals in conduit and cable systems shall comply with (a) through (f). ~~Sealing compound shall be of a type approved for the conditions and use~~ (14-89,14-91). Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.

FPN No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal, and through conductors passing through the seal. See Section 501-5(e)(2). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See Section 501-5(c)(2).

FPN No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than No. 2. Special conductor constructions, e.g., compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.

(a) Conduit Seals, Class I, Division 1. In Class I, Division 1 locations, conduit seals shall be located as follows.

1. In each conduit entry into an explosionproof enclosure where either (a) the enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors, that may produce arcs, sparks, or high temperatures that are considered to be an ignition source in normal operation, or (b) the entry is 2-in. size or larger and the enclosure contains terminals, splices, or taps. For the purposes of this section high temperatures shall be considered to be any temperatures exceeding 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved.

Exception to (a)(1)(a): Conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors are

a. Enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or

b. Immersed in oil in accordance with Section 501-6(b)(1)(b), or

c. Enclosed within a factory-sealed explosionproof chamber located within the enclosure, identified ~~approved~~ [14-92, 14-93] for the location, and marked "factory sealed" or equivalent.

Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal. Conduit seals shall be installed within 18 in. (457 mm) from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and Cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.

d. In nonincendive circuits. [14-94]

2. In each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 18 in. (457 mm) from the pressurized enclosure.

FPN No. 1: Installing the seal as close as possible to the enclosure will reduce problems with purging the dead airspace in the pressurized conduit.

FPN No. 2: For further information, see Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

3. Where two or more explosionproof enclosures for which conduit seals are required under (a)(1) are connected by nipples or by runs of conduit not more than 36 in. (914 mm) long, a single conduit seal in each such nipple connection or run of conduit shall be considered sufficient if located not more than 18 in. (457 mm) from either enclosure.

4. In each conduit run leaving a Class I, Division 1 location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Division 1 portion of the conduit from being communicated to the conduit beyond the seal. Except for listed ~~approved~~ [14-95,14-96] explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 1 location.

Exception: Metal conduit containing no unions, couplings, boxes, or fittings that passes completely through a Class I, Division 1 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not require a conduit seal if the termination points of the unbroken conduit are in unclassified locations.

(b) Conduit Seals, Class I, Division 2. In Class I, Division 2 locations, conduit seals shall be located as follows.

1. For connections to enclosures that are required to be explosionproof, a conduit seal shall be provided in accordance with (a)(1)(a) and (a)(3). All portions of the conduit run or

nipple between the seal and such enclosure shall comply with Section 501-4(a).
2. In each conduit run passing from a Class I, Division 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Division 2 portion of the conduit from being communicated to the conduit beyond the seal. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Division 2 location, and a threaded connection shall be used at the sealing fitting. Except for listed ~~approved~~ [14-100,14-101]**-**explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 2 location.

Exception No. 1: Metal conduit containing no unions, couplings, boxes or fittings that passes completely through a Class I, Division 2 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.

Exception No. 2: Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or open wiring shall not be required to be sealed where passing from the Class I, Division 2 location into the unclassified location. The unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The conduits shall not terminate at an enclosure containing an ignition source in normal operation.

Exception No. 3: Conduit systems passing from an enclosure or room that is unclassified as a result of pressurization into a Class I, Division 2 location shall not require a seal at the boundary.

FPN: For further information, refer to Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Class I, Division 2 location into an unclassified location if the following conditions are met:

a. No part of the conduit system segment passes through a Class I, Division I location where the conduit contains unions, couplings, boxes, or fittings within 12 in. (305 mm) of the Class I, Division 1 location; and

b. The conduit system segment is located entirely in outdoor locations; and

c. The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system; and

d. The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location; and

e. The conduit system segment is sealed at its entry to each enclosure or fitting housing terminals, splices, or taps in Class I, Division 2 locations.

(c) Class I, Divisions 1 and 2. Where required, seals in Class I, Division 1 and 2 locations shall comply with the following.
(1) Fittings. Enclosures for connections or equipment shall be provided with an approved integral means for sealing, or sealing fittings approved for Class I locations shall be used. ~~Sealing fittings shall be accessible.~~Sealing fittings shall be listed for use with one or more specific compounds and shall be accessible. (14-102,14-103,14-104, 14-105)
(2) Compound. The compound shall provide a ~~Sealing compound shall be approved and shall provide a~~ seal against passage of gas or vapors through the seal fitting, shall not be affected by the surrounding atmosphere or liquids, and shall not have a melting point of less than 93ºC (200ºF). (14-104, 14-105)
(3) Thickness of Compounds. In a completed seal, the minimum thickness of the sealing compound shall not be less than the trade size of the sealing fitting and, in no case, less than 5/8 in. (16 mm).
Exception: Listed cable sealing fittings shall not be required to have a minimum thickness equal to the trade size of the fitting.
(4) Splices and Taps. Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.
(5) Assemblies. In an assembly where equipment that may produce arcs, sparks, or high temperatures is located in a compartment separate from the compartment containing splices or taps, and an integral seal is provided where conductors pass from one compartment to the other, the entire assembly shall be identified ~~approved~~ for Class I locations. Seals in conduit connections to the compartment containing splices or taps shall be provided in Class I, Division 1 locations where required by (a)(1)(b).[14-106, 14-107]
(6) Conductor Fill. The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless it is specifically identified ~~approved~~ [14-108,14-109]**-**for a higher percentage of fill.

(d) Cable Seals, Class I, Division 1. In Class I, Division 1 locations, cable seals shall be located as follows.
1. Cable shall be sealed at all terminations. The sealing fitting shall comply with (c). Multiconductor Type MC cables with a gas/vaportight continuous corrugated aluminum sheath and an overall jacket of suitable polymeric material shall be sealed with an listed ~~approved~~ [14-110,14-111]**-**fitting after removing the jacket and any other covering so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors.
Exception: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

2. Cables in conduit with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Division 1 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor and the outer jacket.
Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered as a single conductor by sealing the cable in the conduit within 18 in. (457 mm) of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods. For shielded cables and twisted pair cables, it shall not be required to remove the shielding material or separate the twisted pair.

3. Each multiconductor cable in conduit shall be considered as a single conductor if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with (a).

(e) Cable Seals, Class I, Division 2. In Class I, Division 2 locations, cable seals shall be located as follows.
1. Cables entering enclosures that are required to be explosionproof ~~approved for Class I locations~~ [14-116,14-118]shall be sealed at the point of entrance. The sealing fitting shall comply with (b)(1). Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in an listed ~~approved~~ [14-117,14-119] fitting in the Division 2 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors. Multiconductor cables in conduit shall be sealed as described in (d).
Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Class I, Division 2 location shall not require a seal at the boundary.
Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

2. Cables with a gas/vaportight continuous sheath and that will not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in (e)(1). The minimum length of such cable run shall not be less than that length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings [0.007 ft3/hour (198 cm3/hour) of air at a pressure of 6 in. of water (1493 pascals)].
FPN No. 1: See Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations, ANSI/UL 886-1994.
FPN No. 2: The cable core does not include the interstices of the conductor strands.

3. Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall not be required to be sealed except as required in (e)(1), unless the cable is attached to process equipment or devices that may cause a pressure in excess of 6 in. of water (1493 pascals) to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified area.
Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, Division 2 location without seals.

4. Cables that do not have gas/vaportight continuous sheath shall be sealed at the boundary of the Division 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.
FPN: The sheath mentioned in (d) and (e) may be either metal or a nonmetallic material.

(f) Drainage.
(1) Control Equipment. Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.

(2) Motors and Generators. Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize entrance of liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.

(3) Canned Pumps, Process or Service Connections, etc. For canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the electrical raceway or cable system capable of transmitting fluids, an additional approved seal, barrier, or other means shall be provided to prevent the flammable or combustible fluid from entering the raceway or cable system capable of transmitting fluids beyond the additional devices or means, if the primary seal fails.
The additional approved seal or barrier and the interconnecting enclosure shall meet the temperature and pressure conditions to which they will be subjected upon failure of the primary seal, unless other approved means are provided to accomplish the purpose above.
Drains, vents, or other devices shall be provided so that primary seal leakage will be obvious.
FPN: See also the fine print notes to Section 501-5.

501-6. Switches, Circuit Breakers, Motor Controllers, and Fuses
(a) Class I, Division 1. In Class I, Division 1 locations, switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices, shall be provided with enclosures, and the enclosure in each case, together with the enclosed apparatus, shall be identified ~~approved~~ [14-130, 14-131] as a complete assembly for use in Class I locations.

(b) Class I, Division 2. Switches, circuit breakers, motor controllers, and fuses in Class I, Division 2 locations shall comply with the following:

(1) Type Required. Circuit breakers, motor controllers, and switches intended to interrupt current in the normal performance of the function for which they are installed shall be provided with enclosures identified ~~approved~~ [14-132,14-133]- for Class I, Division 1 locations in accordance with Section 501-3(a), unless general-purpose enclosures are provided and
a. The interruption of current occurs within a chamber hermetically sealed against the entrance of gases and vapors, or
b. The current make-and-break contacts are oil-immersed and of the general-purpose type having a 2-in. (50.8-mm) minimum immersion for power contacts and a 1-in. (25.4-mm) minimum immersion for control contacts, or
c. The interruption of current occurs within a factory-sealed explosionproof chamber ~~approved for the location~~ [14-134, 14-135], or
d. The device is a solid state, switching control without contacts, where the surface temperature does not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved.

(2) Isolating Switches. Fused or unfused disconnect and isolating switches for transformers or capacitor banks that are not intended to interrupt current in the normal performance of the function for which they are installed shall be permitted to be installed in general-purpose enclosures.

(3) Fuses. For the protection of motors, appliances, and lamps, other than as provided in (b)(4), standard plug or cartridge fuses shall be permitted, provided they are placed within enclosures identified ~~approved~~ (14-136,14-137) for the location; or fuses shall be permitted if they are within general-purpose enclosures, and if they are of a type in which the operating element is immersed in oil or other approved liquid, or the operating element is enclosed within a chamber hermetically sealed against the entrance of gases and vapors, or the fuse is a nonindicating, filled, current-limiting type.

(4) Fuses Internal to Lighting Fixtures. Approved cartridge fuses shall be permitted as supplementary protection within lighting fixtures.

501-7. Control Transformers and Resistors
Transformers, impedance coils, and resistors used as, or in conjunction with, control equipment for motors, generators, and appliances shall comply with (a) and (b).
(a) Class I, Division 1. In Class I, Division 1 locations, transformers, impedance coils, and resistors, together with any switching mechanism associated with them, shall be provided with enclosures identified ~~approved~~ [14-140,14-141]- for Class I, Division 1 locations in accordance with Section 501-3(a).

(b) Class I, Division 2. In Class I, Division 2 locations, control transformers and resistors shall comply with the following.
(1) Switching Mechanisms. Switching mechanisms used in conjunction with transformers, impedance coils, and resistors shall comply with Section 501-6(b).
(2) Coils and Windings. Enclosures for windings of transformers, solenoids, or impedance coils shall be permitted to be of the general-purpose type.
(3) Resistors. Resistors shall be provided with enclosures; and the assembly shall be identified ~~approved~~ [14-142, 14-143]- for Class I locations, unless resistance is nonvariable and maximum operating temperature, in degrees Celsius, will not exceed 80 percent of the ignition temperature of the gas or vapor involved, or has been tested and found incapable of igniting the gas or vapor.

501-8. Motors and Generators
(a) Class I, Division 1. In Class I, Division 1 locations, motors, generators, and other rotating electric machinery shall be as follows:
1. Identified ~~Approved~~ [14-146,14-147]- for Class I, Division 1 locations; or
2. Of the totally enclosed type supplied with positive-pressure ventilation from a source of clean air with discharge to a safe area, so arranged to prevent energizing of the machine until ventilation has been established and the enclosure has been purged with at least 10 volumes of air, and also arranged to automatically de-energize the equipment when the air supply fails; or
3. Of the totally enclosed inert gas-filled type supplied with a suitable reliable source of inert gas for pressuring the enclosure, with devices provided to ensure a positive pressure in the enclosure and arranged to automatically de-energize the equipment when the gas supply fails; or
4. Of a type designed to be submerged in a liquid that is flammable only when vaporized and mixed with air, or in a gas or vapor at a pressure greater than atmospheric and that is flammable only when mixed with air; and the machine is arranged so to prevent

energizing it until it has been purged with the liquid or gas to exclude air, and also arranged to automatically de-energize the equipment when the supply of liquid or gas or vapor fails or the pressure is reduced to atmospheric.
Totally enclosed motors of Types (2) or (3) shall have no external surface with an operating temperature in degrees Celsius in excess of 80 percent of the ignition temperature of the gas or vapor involved. Appropriate devices shall be provided to detect and automatically de-energize the motor or provide an adequate alarm if there is any increase in temperature of the motor beyond designed limits. Auxiliary equipment shall be of a type identified ~~approved~~ [14-144,14-145]**-**for the location in which it is installed.
FPN: See ASTM Test Procedure, D 2155-69.

(b) Class I, Division 2. In Class I, Division 2 locations, motors, generators, and other rotating electric machinery in which are employed sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices, either while starting or while running, shall be identified ~~approved~~ [14-149, 14-151]**-**for Class I, Division 1 locations, unless such sliding contacts, switching mechanisms, and resistance devices are provided with enclosures approved for Class I, Division 2 locations in accordance with Section 501-3(b). The exposed surface of space heaters used to prevent condensation of moisture during shutdown periods shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved when operated at rated voltage, and the maximum surface temperature [based on a 40ºC (104ºF) ambient] shall be permanently marked on a visible nameplate mounted on the motor. Otherwise, space heaters shall be identified ~~approved~~ [14-152] for Class I, Division 2 locations.
In Class I, Division 2 locations, the installation of open or nonexplosionproof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Division 2 location, shall be permitted.
FPN No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.
FPN No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitible gases or vapors is suspected, clean-air purging may be needed immediately prior to and during start-up periods.

501-9. Lighting Fixtures
Lighting fixtures shall comply with (a) or (b).
(a) Class I, Division 1. In Class I, Division 1 locations, lighting fixtures shall comply with the following.
(1) Approved Fixtures. Each fixture shall be identified ~~approved~~ as a complete assembly for the Class I, Division 1 location and shall be clearly marked to indicate the maximum wattage of lamps for which it is identified ~~approved~~. Fixtures intended for portable use shall be specifically identified ~~approved~~ as a complete assembly for that use. [14-153,14-154]
(2) Physical Damage. Each fixture shall be protected against physical damage by a suitable guard or by location.
(3) Pendant Fixtures. Pendant fixtures shall be suspended by and supplied through threaded rigid metal conduit stems or threaded steel intermediate conduit stems, and threaded joints shall be provided with set-screws or other effective means to prevent loosening. For stems longer than 12 in. (305 mm), permanent and effective bracing against lateral displacement shall be provided at a level not more than 12 in. (305 mm) above the lower end of the stem, or flexibility in the form of a fitting or flexible connector identified ~~approved~~ [14-155,14-156]**-**for the Class I, Division 1 location shall be provided not more than 12 in. (305 mm) from the point of attachment to the supporting box or fitting.
(4) Supports. Boxes, box assemblies, or fittings used for the support of lighting fixtures shall be identified ~~approved~~ [14-157, 14-158]**-**for Class I locations.

(b) Class I, Division 2. In Class I, Division 2 locations, lighting fixtures shall comply with the following.
(1) Portable Lighting Equipment. Portable lighting equipment shall comply with (a)(1).
Exception: Where portable lighting equipment are mounted on movable stands and are connected by flexible cords, as covered in Section 501-11, they shall be permitted, where mounted in any position, if they conform to Section 501-9(b)(2).
(2) Fixed Lighting. Lighting fixtures for fixed lighting shall be protected from physical damage by suitable guards or by location. Where there is danger that falling sparks or hot metal from lamps or fixtures might ignite localized concentrations of flammable vapors or gases, suitable enclosures or other effective protective means shall be provided. Where lamps are of a size or type that may, under normal operating conditions, reach surface temperatures exceeding 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved, fixtures shall comply with (a)(1) or shall be of a type that has been tested in order to determine the marked operating temperature or temperature class~~range~~ (T Code).
(3) Pendant Fixtures. Pendant fixtures shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, or by other approved means. For rigid stems longer than 12 in. (305 mm), permanent and effective bracing against lateral displacement shall be provided at a level not more than 12 in. (305 mm) above the lower end of the stem, or flexibility in the form of an identified ~~approved~~ [14-162, 14-164]**-**fitting or flexible connector shall be provided not more than 12 in. (305 mm) from the point of attachment to the supporting box or fitting.
(4) Switches. Switches that are a part of an assembled fixture or of an individual lampholder shall comply with Section 501-6(b)(1).
(5) Starting Equipment. Starting and control equipment for electric-discharge lamps shall comply with Section 501-7(b).
Exception: A thermal protector potted into a thermally protected fluorescent lamp ballast if the lighting fixture is identified ~~approved~~ [14-165, 14-166]**-**for locations of this class and division.

501-10. Utilization Equipment
(a) Class I, Division 1. In Class I, Division 1 locations, all utilization equipment shall be approved for Class I, Division 1 locations.

(b) Class I, Division 2. In Class I, Division 2 locations, all utilization equipment shall comply with the following.
(1) Heaters. Electrically heated utilization equipment shall conform with either item (a) or (b).

a. The heater shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved on any surface that is exposed to the gas or vapor when continuously energized at the maximum rated ambient temperature. If a temperature controller is not provided, these conditions shall apply when the heater is operated at 120 percent of rated voltage.

Exception No. 1: For motor-mounted anticondensation space heaters, see Section 501-8(b).

Exception No. 2: A current-limiting device is applied to the circuit serving the heater that will limit the current in the heater to a value less than that required to raise the heater surface temperature to 80 percent of the ignition temperature.

b. The heater shall be identified ~~approved~~ {14-169, 14-170]**-**for Class I, Division 1 locations.
Exception: Electrical resistance heat tracing identified ~~approved~~ [14-171, 14-172]**-**for Class I, Division 2 locations.

(2) Motors. Motors of motor-driven utilization equipment shall comply with Section 501-8(b).

(3) Switches, Circuit Breakers, and Fuses. Switches, circuit breakers, and fuses shall comply with Section 501-6(b).

501-11. Flexible Cords, Class I, Divisions 1 and 2
A flexible cord shall be permitted for connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit. Flexible cord shall also be permitted for that portion of the circuit where the fixed wiring methods of Section 501-4(a) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment, in an industrial establishment where conditions of maintenance and engineering supervision ensure that only qualified persons will install and service the installation, and the flexible cord is protected by location or by a suitable guard from damage. The length of the flexible cord shall be continuous. Where flexible cords are used, the cords shall be as follows:

1. Of a type listed ~~approved~~ [14-174,14-175]**-**for extra-hard usage;
2. Contain, in addition to the conductors of the circuit, a grounding conductor complying with Section 400-23;
3. Connected to terminals or to supply conductors in an approved manner;
4. Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections; and
5. Be provided with suitable seals where the flexible cord enters boxes, fittings, or enclosures of the explosionproof type.

Exception: As provided in Sections 501-3(b)(6) and 501-4(b).
Electric submersible pumps with means for removal without entering the wet-pit shall be considered portable utilization equipment. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be permitted.
Electric mixers intended for travel into and out of open-type mixing tanks or vats shall be considered portable utilization equipment.
FPN: See Section 501-13 for flexible cords exposed to liquids having a deleterious effect on the conductor insulation.

501-12. Receptacles and Attachment Plugs, Class I, Divisions 1 and 2
Receptacles and attachment plugs shall be of the type providing for connection to the grounding conductor of a flexible cord and shall be identified ~~approved~~ [14-178,14-179]**-**for the location.
Exception: As provided in Section 501-3(b)(6).

501-13. Conductor Insulation, Class I, Divisions 1 and 2
Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type approved for use under such conditions; or the insulation shall be protected by a sheath of lead or by other approved means.

501-14. Signaling, Alarm, Remote-Control, and Communications Systems
(a) Class I, Division 1. In Class I, Division 1 locations, all apparatus and equipment of signaling, alarm, remote-control, and communications systems, regardless of voltage, shall be identified ~~approved~~ [14-184,14-185]**-**for Class I, Division 1 locations, and all wiring shall comply with Sections 501-4(a) and 501-5(a) and (c).

(b) Class I, Division 2. In Class I, Division 2 locations, signaling, alarm, remote-control, and communications systems shall comply with the following.
(1) Contacts. Switches, circuit breakers, and make-and-break contacts of pushbuttons, relays, alarm bells, and horns shall have enclosures identified ~~approved~~ [14-186,14-187]**-**for Class I, Division 1 locations in accordance with Section 501-3(a).
Exception: General-purpose enclosures shall be permitted if current-interrupting contacts are one of the following:
a. Immersed in oil, or
b. Enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or
c. In nonincendive circuits, or
d. Part of a listed nonincendive component
(2) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with Section 501-3(b)(2).
(3) Protectors. Enclosures shall be provided for lightning protective devices and for fuses. Such enclosures shall be permitted to be of the general-purpose type.
(4) Wiring and Sealing. All wiring shall comply with Sections 501-4(b) and 501-5(b) and (c).

501-15. Live Parts, Class I, Divisions 1 and 2
There shall be no exposed live parts.

501-16. Grounding, Class I, Divisions 1 and 2
Wiring and equipment in Class I, Division 1 and 2 locations shall be grounded as specified in Article 250 and with the following additional requirements.
(a) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.
Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in Sections 250-32(a), (b), and (c), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.
FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.

(b) Types of Equipment Grounding Conductors. Where flexible metal conduit or liquidtight flexible metal conduit is used as permitted in Section 501-4(b) and is to be relied on to complete a sole equipment grounding path, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with Section 250-102.
Exception: In Class I, Division 2 locations, the bonding jumper shall be permitted to be deleted where all the following conditions are met.
a. Listed liquidtight flexible metal conduit 6 ft (1.83 m) or less in length, with fittings listed for grounding, is used.
b. Overcurrent protection in the circuit is limited to 10 amperes or less.
c. The load is not a power utilization load.

501-17. Surge Protection
(a) Class I, Division 1. Surge arresters, including their installation and connection, shall comply with Article 280. The surge arresters and capacitors shall be installed in enclosures identified ~~approved~~ [14-194, 14-195] for Class I, Division 1 locations. Surge-protective capacitors shall be of a type designed for specific duty.

(b) Class I, Division 2. Surge arresters shall be nonarcing, such as metal-oxide varistor (MOV), sealed type, and surge-protective capacitors shall be of a type designed for specific duty. Installation and connection shall comply with Article 280.
Enclosures shall be permitted to be of the general-purpose type.
Surge protection of types other than described above shall be installed in enclosures identified ~~approved~~ [14-196,14-197]**-**for Class I, Division 1 locations.

501-18. Multiwire Branch Circuits
In a Class I, Division 1 location, a multiwire branch circuit shall not be permitted.
Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.

(Log #1398)

14- 60 - (501-1): Reject
SUBMITTER: Jon Miller, Richard Poling, Detector Electronics Corp./Rep. Detector Electronics Corp./ E I du Pont
RECOMMENDATION: Revise 501-1 to read as follows:

501-1. General

The general rules of this Code shall apply to the electric wiring and equipment in locations classified as Class I in Section 500-7.

Equipment listed and marked in accordance with Section 505-10 for use in Class I, Zone 0, 1, or 2 locations shall be permitted in Class I, Division 2 locations for the same gas and with a suitable temperature rating.

Exception: As modified by this article.

Permanently mounted combustible gas detection equipment may be used as a means for reducing the need for special electrical equipment when:

- combustible gas detection equipment is listed and marked both as performance tested and as suitable for use in hazardous (classified) locations,
- combustible gas detection equipment is installed in accordance with industrial practices,
- used in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and
- appropriate alarms with ventilation or interlocks are provided.

FPN 1: For suggested minimum performance specifications and guidance in the selection of gas detection equipment, see ISA S12.13.01, Performance Requirements, Combustible Gas Detectors.

FPN 2: For suggested installation, operation and maintenance guidance, see ISA RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments.

FPN 3: For guidance in the installation of gas detection equipment, see ANSI/API RP 500, Recommended Practice for

Classification of Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2.

SUBSTANTIATION: Equipment necessary to be placed in hazardous (classified) locations which cannot meet specific hazardous location protection techniques currently requires purged/pressurized protection techniques. This is not always possible or desirable under all installation considerations. For many years gas detection equipment has been used as a method of protection in petroleum facilities in accordance with ANSI/API RP 500, Recommended practice for Classification of Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2 and within hazardous location facilities in Canada in accordance with the Canadian Electrical Code (CEC) with no reported incidents. Gas detection equipment is capable of providing indication of the presence of combustible gases prior to reaching lower explosive limits and is capable of providing alarms with ventilation or interlocks. To ensure proper gas detection equipment functionality under such critical conditions, an existing ISA standard S12.13.01, Performance Requirements, Combustible Gas Detectors, will provide guidance on gas detection equipment performance requirements and an existing ISA recommended practice RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments, will provide user guidance on the proper use of gas detection equipment. In conclusion, this additional method of protection should be considered for equipment which cannot meet the proper hazardous (classified) location requirements, but is necessary to be installed in such locations.

PANEL ACTION: Reject.

PANEL STATEMENT: While the Panel agrees with the principle of selectively applying gas detection in Class I areas, the evaluation process that is required to support this complex operating condition extends beyond merely a simple installation requirement. The NEC is primarily an electrical installation document.

(Log #2125)

14- 73 - (501-4): Accept in Principle in Part
Note: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. The Panel's stated action is to revise 501-4 as shown in Proposal 14-318a which is a complete rewrite of Article 505, not Article 501. This action will be considered by the Panel as a Public Comment. It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 16 for information, with respect to Code-Making Panel 16's Panel Action on Proposal 16-319. Code-Making Panel 14 shall retain jurisdiction regarding types of wiring methods permitted in hazardous locations.
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Revise and add the underlined text into existing paragraph as follows:
See NEC Proposal 501-4 Wiring Methods, "Proposal" for the revised rewrite of this entire section.
501-4. Wiring Methods. Wiring methods shall comply with (a) and (b).
(a) Class I, Division 1. In Class I, Division 1 locations, apply the following:
(1) Threaded rigid metal conduit, or threaded steel intermediate metal conduit may be used.
Exception No. 1: Rigid nonmetallic conduit complying with Article 347 shall be permitted where encased in a concrete envelope a minimum of 2 in. (50.8 mm) thick and provided with not less than 24 in. (610 mm) of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of Section 511-4, Exception 514-8, Exception No. 2; and Section 515-5(a).
Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 24 in. (610 mm) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.
(2) Type MI cable with termination fittings approved for the location may be used. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.
Exception No. 1~~2~~: In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type MC cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated aluminum sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application shall be permitted.
FPN: See Sections 334-3 and 334-4 for restrictions on use of Type

MC cable.

Exception No. 2~~3~~: In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type ITC cable, ~~listed for use in Class I, Division 1 locations,~~ with a gas/vaportight continuous corrugated aluminum sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application shall be permitted.

(3) All boxes, fittings, and joints shall be threaded for connection to conduit or cable terminations and shall be explosionproof. Threaded joints shall be made up with at least five threads fully engaged.

(4) Flexible Connections. Where necessary to employ flexible connections, as at motor terminals, flexible fittings listed for Class I locations shall be used.

Exception: Flexible cord installed in accordance with the provisions of Section 501-11 shall be permitted.

(b) Class I, Division 2. In Class I, Division 2 locations, apply the following:

(1) Threaded rigid metal conduit, threaded steel intermediate metal conduit,

(2) Enclosed gasketed busways, enclosed gasketed wireways,

(3) Type PLTC cable in accordance with the provisions of Article 725, or in cable tray systems. PLTC shall be installed in a manner to avoid tensile stress at the termination fittings,

(4) Type ITC cable in cable trays, in raceways, supported by messenger wire, afforded mechanical protection and run as open wiring, or directly buried where the cable is listed for this use,

(5) Types MI, MC, MV, or TC cable with approved termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings,

(6) Types CATVP, CATVR, CATV, or CATVX in cable tray, and in opening wiring,

(7) Where provision must be made for limited flexibility, as at motor terminals, flexible metal fittings, flexible metal conduit with approved fittings, liquidtight flexible metal conduit with approved fittings, liquidtight flexible nonmetallic conduit with approved fittings, or flexible cord approved for extra-hard usage and provided with approved bushed fittings shall be used. An additional conductor for grounding shall be included in the flexible cord,

FPN: See Section 501-16(b) for grounding requirements where flexible conduit is used.

(8) Boxes, fittings, and joints shall not be required to be explosionproof except as required by Sections 501-3(b)(1), 501-6(b)(1), and 501-14(b)(1).

SUBSTANTIATION: See NEC Proposal 501-4 Wiring Methods "Problem".

• This proposal first reorganizes the existing text within to clarify the requirements, and to correct years of additions that simply aggravated the problem further. For example, the phrase, "Type MI, MC, MV, or TC cable with approved termination fittings shall be the wiring method employed" hardly fits into a paragraph that permits may different installation techniques to be used.

• This proposal also eliminates the unnecessary and undefined term "Fixed Wiring" that appeared in 501-4(a)(1) and "Flexible Connections" that appeared in 501-4(a)(2), with a simply listing of permitted methods.

• The order of the exceptions under 501-4(a)(1) has been changed to reflect the reordered listing and to agree with the paragraph that the exception applies.

• Type CATVP, CATVR, CATV, or CATVX coaxial cables, as described in Article 820-51, have been added as these cables are needed in modern industrial facilities for digital and video signal transmission. Further these cables have the additional having fire-resistant characteristics similar to the requirements for other types of cables such as TC and ITC, which are currently permitted for Class I, Division 2 locations. In addition they are suitable for installation in cable trays as permitted by Article 318.

PANEL ACTION: Accept in Principle in Part.

Revise 501-4 as shown in Proposal 14-318a, but do not accept the addition of Types CATVP, CATVR, CATV, or CATVX in cable tray.

PANEL STATEMENT: The submitter has not provided adequate technical justification to support the proposal to accept CATV cable.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

NOT RETURNED: 2 Earley, Saban

EXPLANATION OF NEGATIVE:

LAWRENCE: Panel action should have been "Accept in Part in Principle" with the removal of Type CATVX and the addition of support/protection requirements to correlate with the actions of Panel 16 on Proposal 16-318 to accept Types CATVP, CATVR, and CATV in Section 820-53(e).

COMMENT ON AFFIRMATIVE:

WECHSLER: Panel 16 took action to permit the use of all but CATVX in hazardous locations. [See CMP 16, Proposal 16-319] Based upon this action, CMP 14 should have accepted in part, too, the use of coaxial cable to complement the action of CMP 16: "Revise the submitter's proposal by adding a new 820-53(e) as follows:

"(e) Hazardous (Classified) Locations. Where the use of Type CATVP, CATVR, and CATV cable is permitted in Section 501-4(b), 502-4(b), and 504-20, the cable shall be installed in cable trays; in raceways; supported by messenger wire, or otherwise adequately supported and mechanically protected by angles, struts, channels, or by other mechanical means."

(Log #2282)

14- 74 - (501-4 Exception No. 4): Reject

SUBMITTER: Jack Bartlett, Gilbarco Inc.

RECOMMENDATION: Text change for 501-4 as follows:

Exception No. 4: In Gas Pumps and Dispensers with restricted public access to the enclosures (i.e., locked cabinets), where the conditions of maintenance and supervision ensure that only qualified persons will install and service the installation, flexible cord of a type suitable to comply with 501-11 and 501-13 will be permitted.

SUBSTANTIATION: Flexible cord has been permitted for use in this application outside the USA for many years with no detrimental effect to safety.

The continuance of NFPA 70 to demand conduit has a negative effect on USA based design and manufacturing companies to compete in the world market and restricts imaginative design solutions in this market area.

PANEL ACTION: Reject.

PANEL STATEMENT: Flexible cord is not an acceptable wiring method for permanently installed equipment where there is no demonstarted need.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

(Log #1558)

14- 75 - (501-4(a)(1)): Accept in Principle

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI

RECOMMENDATION: Revise to read as follows:

(1) Fixed Wiring. In Class I, Division 1 locations, threaded rigid metal conduit, threaded steel intermediate metal conduit, or Type MI cable with termination fittings ~~approved~~ (identified) for the location shall be the wiring method employed.

SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.

PANEL ACTION: Accept in Principle.

Change "approved" to "listed".

PANEL STATEMENT: Listed fittings are readily available.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

NEGATIVE: 1

NOT RETURNED: 2 Earley, Saban

EXPLANATION OF NEGATIVE:

ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.

COMMENT ON AFFIRMATIVE:

WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #1811)

14- 76 - (501-4(a)(1)): Reject
SUBMITTER: William G. Lawrence, Jr., S. Yarmouth, MA
RECOMMENDATION: (Existing Text) ....Threaded joints shall be made up with at least five threads fully engaged.....
(Revised Text) ...Threaded joints shall be made up with at least three and one half threads fully engaged....
SUBSTANTIATION: Although the nominal thread engagement of male conduit / female equipment NPT parts threaded per ANSI/ASME B1.20.1 (Pipe Threads, General Purpose Inch) is 5.5 threads, with both the male and female parts at a minimum tolerance (L1-1), the resulting thread engagement is only 3.5 threads. To allow for the five thread engagement currently specified, the female parts have historically been tapped deeper with a minimum limit of L1+0.5. This creates a nominal engagement of 7 threads with a minimum of 5.
The International Standard for Type of Protection "d" (IEC 60079-1) is changing the minimum thread engagement for taper threaded joints from 5 to 3.5 to allow the use of standard NPT gauging practice. Based on flame propagation tests conducted by the British on this construction and the current allowance of a straight-thread conduit coupling with a taper-thread conduit, the relaxation from 5 to 3.5 does not represent a compromise in safety.
In addition, the introduction of various types of cable glands and other fittings with a hex "shoulder" for tightening aggravates the problem. With the male NPT thread on the fitting conforming to the standard ASME gauging and the female equipment entry tapped deeper to ensure five threads of engagement, it is highly likely that the shoulder will contact the surface of the equipment before the NPT threads are "tight" resulting in a "loose" joint likely to propagate an explosion. The Europeans recognized this potential problem several years ago and the "European ATEX Notified Bodies Group ExNB" issue Clarification Sheet ExNB/98/06/010/CS requiring that, for Eurpean Certification, female threaded entries conform to ANSI/ASME B1.20.1 and also meet the five thread engagement. This results in female entries tapped to L1+0.5 / L1+1 instead of the deeper L1+0.5 / L1+3.5. This tight tolerance with a half thread "window" in lieu of a 3 thread "window" makes manufacturing difficult with much scrap produce
The change in NPT thread engagement does not compromise safety and would allow US manufacturers to produce one product for use both here in the US and in the rest of the world.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not demonstrated that relaxation of this requirement will not detract from the integrity of the installation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
LAWRENCE: The panel statement ignores the statement by the submitter that "straight thread" couplings have been permitted to be used with "tapered thread" conduit since the 1930's. This already permitted joint results in a thread engagement relaxation far greater than that proposed for "taper-thread" to "taper-thread" joints.

(Log #3477)

14- 77 - (501-4(a)(1)): Accept in Principle
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read as follows:
(1) Fixed Wiring. In Class I, Division 1 locations, threaded rigid metal conduit, threaded steel intermediate metal conduit, or Type MI cable with termination fittings ~~approved~~ (identified) for the location shall be the wiring method employed.
SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept in Principle.
Change "approved" to "listed".
PANEL STATEMENT: Listed fittings are readily available.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.

(Log #2998)

14- 78 - (501-4(a)(1) Exception No. 2): Accept
Note: The Technical Correlating Committee understands that the Proposal reference in the Panel Statement is to Proposal 14-59a.
SUBMITTER: Michael P. Mennone, Rockbestos-Surprenant Cable Corp.
RECOMMENDATION: Revise Section 501-4(a)(1) Exception No. 2 to read as follows:
Exception No. 2: In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type MC cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated ~~aluminum~~ metallic sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application shall be permitted.
SUBSTANTIATION: Type MC with a gas/vaportight continuous corrugated sheath is manufactured and listed with various (aluminum, stainless steel, copper) sheath materials. In response to the acceptance of this exception (which was to be added to the 1996 NEC), UL Standard No. 2225 entitled "Metal-Clad Cables and Cable-Sealing Fittings for Use in Hazardous (Classified) Locations" was developed to qualify Type MC cables for this specific use. Cables meeting these additional requirements would then be listed as Type MC-HL. Copper and stainless steel sheathed Type MC cables have the same ability as aluminum to meet the intent of this section and also possess the ability to meet all of the additional requirements stated in UL Standard No. 2225. It is our contention that these additional types of sheathed cables were overlooked in the original proposal. This capability does exist and should be recognized by the code.
PANEL ACTION: Accept.
PANEL STATEMENT: The accepted change is reflected in Proposal 14-318a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #1559)

14- 79 - (501-4(b)): Accept in Part
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise to read as follows:
(b) Class I, Division 2. In Class I, Division 2 locations, threaded rigid metal conduit, threaded steel intermediate metal conduit, enclosed gasketed busways, enclosed gasketed wireways, or Type PLTC cable in accordance with the provisions of Article 725, or Type ITC cable in cable trays, in raceways, supported by messenger wire, or directly buried where the cable is listed for this use; Type MI, MC, MV, or TC cable with ~~approved~~ (identified) termination fittings shall be the wiring method employed.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept in Part.
Delete the word "approved".
PANEL STATEMENT: Requirements for ordinary location electrical equipment need not be repeated in Chapter 5.

WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #2127)

14- 81 - (501-4(b)): Accept in Principle in Part
Note: The Technical Correlating Committee understands that the Proposal reference in the Panel Statement is to Proposal 14-59a.
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Delete the current exception "~~Exception: Nonincendive field wiring shall be permitted using any of the methods suitable for wiring in ordinary locations~~" and replace it with the following positive text:
"Nonincendive field wiring shall be permitted using any of the wiring methods suitable for unclassified locations, including Chapter 7 and Chapter 8 methods, and special instrument cables. At termination boxes and instruments, coaxial and multi-conductor cables may be run as open wiring for up to 6 ft to allow flexibility for limited movement, vibrations, or replacement."
SUBSTANTIATION: In accordance with the NEC Style Manual, since nonincendive field wiring is a defined term, it is not appropriate to consider this an exception. It is a recognized practice and the revised text, provides this fact with revised wording that permits any wiring method to be used for this special type of field wiring.
PANEL ACTION: Accept in Principle in Part.
Add the following to 501-4(b):
"(4) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for nonhazardous locations, including Chapter 7 and 8 wiring methods."
PANEL STATEMENT: This change is reflected in Proposal 14-318a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

(Log #2295)

14- 82 - (501-4(b)): Reject
SUBMITTER: Gregory J. Steinman, Thomas & Betts Corp.
RECOMMENDATION: Revise the fourth sentence to read as follows:
"Where provision must be made for limited flexibility, or where flexibility is needed for installation, as at motor terminals, flexible metal fittings, flexible metal conduit with approved fittings, liquidtight flexible nonmetallic conduit with approved fittings, or flexible cord approved for extra hard usage and provided with approved bushed fittings shall be used."
SUBSTANTIATION: Mast arm type pole mounted luminaires need a flexible wiring method to pull through the mast arm. If these wiring methods are suitable to be flexible in Class I Division 2 locations, they should be suitable enclosed within a pole. This is an application where flexibility is not needed for the use of the product, only in the installation.
PANEL ACTION: Reject.
PANEL STATEMENT: "Needed" is a reduction in the requirements based on "must" in the referenced sentence. If required for installation, this method is allowed already.

14- 83 - (501-4(b)): Accept in Principle in Part
Note: The Technical Correlating Committee understands that the Proposal reference in the Panel Statement is to Proposal 14-59a.
SUBMITTER: Nicholas Ludlam, Factory Mutual Research
RECOMMENDATION: (b) Class I, Division 2. In Class I, Division 2 locations, threaded rigid metal conduit, threaded steel intermediate metal conduit, enclosed gasketed busways, enclosed gasketed wireways, or Type PLTC cable in accordance with the provisions of Article 725, or Type ITC cable in cable trays, in raceways, supported by messenger wire, or directly buried where the cable is listed for this use; Type MI, MC, MV, or TC cable with approved termination fittings shall be the wiring method employed. Type ITC, PLTC, MI, MC, MV, or TC cable shall be permitted to be installed in cable tray systems and shall be installed in a manner to avoid tensile stress at the termination fittings. Boxes, fittings, and joints shall not be required to be explosionproof except as required by Sections 501-3(b)(1), 501-6(b)(1), and 501-14(b)(1). Where provision must be made for limited flexibility, as at motor terminals, flexible metal fittings, flexible metal conduit with approved fittings, liquidtight flexible metal
FPN: See Section 501-16(b) for grounding requirements where flexible conduit is used.
Exception: Nonincendive field wiring shall be permitted using any of the methods suitable for wiring in unclassified locations.
Nonincendive field wiring apparatus, associated nonincendive field wiring apparatus, and other equipment shall be installed in accordance with the control drawing(s).
FPN: The control drawing identification is marked on the apparatus.
Exception: A simple apparatus that does not interconnect nonincendive field wiring circuits.
SUBSTANTIATION: 501-4 is modified to require a Control Drawing which details the permitted connections.
PANEL ACTION: Accept in Principle in Part.
Add the following new sentence to 501-4(b): "Nonincendive field wiring systems shall be installed in accordance with the control drawing(s)."
This change is reflected in Proposal 14-318a.
PANEL STATEMENT: The concept of the control drawings has been accepted and editorially revised. The Fine Print Note is not accepted because it includes a requirement and an exception.

(Log #2850)

14- 84 - (501-4(b)): Reject
SUBMITTER: Nicholas Ludlam, Factory Mutual Research
RECOMMENDATION: Separation of Nonincendive Field Wiring Conductors
(a) From Nonincendive Field Wiring Conductors.
(1) Open Wiring. Conductors and cables of nonincendive field wiring circuits not in raceways or cable trays shall be separated at least 1.97 in. (50 mm) and secured from conductors and cables of any other circuits.
(2) In Raceways, Cable Trays, and Cables. Conductors of nonincendive field wiring circuits shall not be placed in any raceway, cable tray, or cable with conductors of any other circuit.
Exception No. 1: Where conductors of nonincendive field wiring circuits are separated from conductors of incendive field wiring circuits by a distance of at least 1.97 in. (50 mm) and secured, or by a grounded metal partition or an approved insulating partition.
FPN: No. 20 gauge sheet metal partitions 0.0359 in. (912 µm) or thicker are generally considered acceptable.
Exception No. 2: Where either (1) all of the nonincendive field wiring circuit conductors or (2) all of the incendive field wiring circuit conductors are in grounded metal-sheathed or metal-clad cables where the sheathing or cladding is capable of carrying fault current to ground.
FPN: Cables meeting the requirements of Articles 330 and 334 are typical of those considered acceptable.
(3) Within Enclosures.
a. Conductors of nonincendive field wiring circuits shall be separated at least 1.97 in. (50 mm) from conductors of any incendive field wiring circuits, or as specified in Section 501-4(b)(a)(2).
b. All conductors shall be secured so that any conductor that might come loose from a terminal cannot come in contact with another terminal.
FPN No. 1: The use of separate wiring compartments for the nonincendive field wiring and incendive field wiring terminals is the preferred method of complying with this requirement.
FPN No. 2: Physical barriers such as grounded metal partitions or approved insulating partitions or approved restricted access wiring ducts separated from other such ducts by at least ≤ in. (19 mm) can be used to help ensure the required separation of the wiring.
(b) From Different Nonincendive Field Wiring Circuit Conductors. Different nonincendive field wiring circuits shall be in separate cables or shall be separated from each other by one of the following means.
1. The conductors of each circuit are within a grounded metal shield.
2. The conductors of each circuit have insulation with a minimum thickness of 0.01 in. (254 µm).
Exception: Unless otherwise approved.
SUBSTANTIATION: Apart from the exception in 501-4(b) the current version of the Code does not give any guidance on wiring for nonincendive field wiring circuits. An examination of nonincendive field wiring takes into consideration the faults of opening, shorting, and grounding of the field wiring. When applied to multiple conductor applications such as programmable logic controllers [PLCs] this type of approach can lead to output parameters for the devices which render them unusable. The current version of the Code requires the examination to include situations which, cannot be determined by the manufacturer of the equipment or an NRTL. The installer could determine these parameters but how many would actually consider these in the case where multiple nonincendive circuits are run in a single cable. The situation is similar to that for intrinsically safe wiring, and the proposed text is based on that in Article 504-30.
PANEL ACTION: Reject.
PANEL STATEMENT: The Panel believes that there is no technical justification given for separatiion of conductors above what is required in nonhazardous locations.

14- 85 - (501-4(b)): Reject
SUBMITTER: Richard J. Buschart, PC & E Inc.
RECOMMENDATION: In the first paragraph, after the words "steel intermediate conduit", add "rigid nonmetallic conduit with an equipment grounding conduction".
SUBSTANTIATION: Addition of rigid nonmetallic conduit to Class I, Division 2 wiring methods.
This proposal provides the option of using a conduit system that is corrosion resistant and safe for Class I, Division 2 locations. Chemical plants, refineries, off shore drilling facilities, and other similar processes are highly corrosive and also have classified areas. Nonmetallic conduit provides a critical option in these locations. The NEC requirements for rigid nonmetallic conduit are found in Article 347. Rigid nonmetallic conduit is also listed in the UL Information Directory, which describes the types of rigid nonmetallic conduit, and also in UL Standard 1684.
Rigid nonmetallic conduit is permitted in Class III, Division I locations as a buried raceway in Class I locations in Commercial Garages, Article 511; in Bulk Storage Plants, Articles 515; and in Class I, Division I locations when enclosed in concrete.
This proposal also requires an equipment grounding conduction in these locations. Rigid nonmetallic conduit is not permitted where subject to physical damage unless identified for such use.
PANEL ACTION: Reject.
PANEL STATEMENT: There is insufficient technical information presented to accept this proposal. There are concerns about mechanical strength and the proposal is not specific enough about the product that is desired to be used.

EXPLANATION OF NEGATIVE:
ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.

(Log #4236)

14- 88 - (501-4(b), Exception): Accept in Principle
Note: The Technical Correlating Committee understands that the Proposal reference in the Panel Statement is to Proposal 14-59a.
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise by deleting the word "ordinary" and replacing it with the word "unclassified."
SUBSTANTIATION: This is the technically correct term. This was proposal 14-113 in the prior cycle, one of four proposals that the panel accepted in the ROP, forgot about, and inadvertently wiped out through unrelated editorial activity in the comment period.
PANEL ACTION: Accept in Principle.
See Proposal 14-318a.
PANEL STATEMENT: Proposal 14-318a addresses this issue. The word "nonhazardous" has been established by definition in Proposal 14-2a and meets the submitter's intent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: The panel action should be "Accept". See my comments on Proposal 14-2a.
GOODMAN: This proposal should be "Accept" and not "Accept in Principle". The Panel Action is contrary to the submitter's intent and justification. The correct term is "unclassified". Also see detailed comment under Proposal 14-2a. Note that the reference used in the Panel Action and Panel Statement of Proposal 14-318a applies to the Article 505 rewrite and does not apply to this proposal or action.

(Log #1561)

14- 89 - (501-5): Accept in Principle
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise second sentence to read as follows:
Sealing compound shall be of a type ~~approved~~ (identified) for the conditions and use.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept in Principle.
Delete the second sentence in 501-5.
PANEL STATEMENT: The Panel believes its action on Proposal 14-104 meets the intent of the submitter.

COMMENT ON AFFIRMATIVE:
WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #3032)

14- 90 - (501-5): Accept in Principle
SUBMITTER: Sukanta Sengupta, FMC Corp.
RECOMMENDATION: Revise the second line to read as follows:
Sealing compound shall be of a type tested and approved for the conditions and use on specific brand of fittings as integral installation.
SUBSTANTIATION: Sealing compound is tested on specific brand fittings and is approved only for that brand of fittings. A mix match of seal fittings and sealing compound of various brands is a common problem of installation practice. This revision is required for avoiding faulty installations.
PANEL ACTION: Accept in Principle.
See Proposal 14-89.
PANEL STATEMENT: Proposal 14-89 addresses this issue.

(Log #4237)

14- 94 - (501-5(a)(1), Exception (d)): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Add a part (d) as a fourth option under the Exception, as follows:
d. In nonincendive circuits.
SUBSTANTIATION: The operational language of the parent language under exception specifically mentions ignition sources in "normal" operation. A nonincendive circuit is presumed to not be ignition capable under normal operating conditions. Therefore, this proposal doesn't increase the risk of ignition, and it increases the flexibility of the wiring system design. Although this substantiation is my own, the proposal was Proposal 14-121 in the prior cycle. It is one of four proposals that the panel accepted in the ROP, forgot about, and inadvertently wiped out through unrelated editorial activity in the comment period.
PANEL ACTION: Accept.

(Log #3307)

14- 97 - (501-5(a)(4) Exception No. 2): Reject
SUBMITTER: Shawn K. Williams, B.H.M.G. Consulting Engineers
RECOMMENDATION: Add a new exception to read as follows:
Exception No. 2: Where a submerged pump is installed in a sewage wet well that has been classified as a Class I Division 1 location and has flexible cords for connection to a supply or control circuit as allowed in 501-11, a junction box with terminals listed for Class I locations may be installed between the boundary of the classified location and the seal fitting required by 501-5(a)(4) to facilitate easy removal of the pump cable.
SUBSTANTIATION: The code as it is written now requires that the pump cable be installed in a seal fitting. If the pump needs to be removed for maintenance the seal fitting must be destroyed, possibly damaging the cable, in order to remove the pump cable. An explosionproof junction box will allow for easy removal of the cable and provide a safe installation in case gases build up and arcing occurs in the junction box.
PANEL ACTION: Reject.
PANEL STATEMENT: It is not permitted to have a box between the boundary and a seal fitting. This situation may be already covered by 501-11. The submitter's intent is not clear.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #4238)

14- 98 - (501-5(a)(4) Exception No. 2): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Identify the existing exception as Exception No. 1 and add a second exception as follows:
Exception No. 2: For underground conduit installed in accordance with Section 300-5 where the boundary is beneath the ground, the sealing fitting shall be permitted to be installed after the conduit leaves the ground, but there shall be no union, coupling, box, or fitting, other than approved explosionproof reducers at the sealing fitting, in the conduit between the sealing fitting and the point at which the conduit leaves the ground.

SUBSTANTIATION: Section 501-5(c)(1) requires seals to be accessible. Since hazardous locations frequently involve flammable gases and vapors heavier than air, generally area classifications require graded locations below a classified location to retain the same area classification. Some Code rule expressly impose this requirement, such as Section 515-6, which mandates a Division 1 classification for below grade conduits. The only way to literally combine these two rules is to go through the burden of installing a handhole within a conduit length of the transition point. This proposal is a reasonable compromise to address this problem. Its principle is reflected in Sec. 514-8, which has allowed this procedure since the 1987 NEC through the verbal sleight of hand of artificially extending the boundary of the classified location. I am submitting a companion proposal to remove that language from Section 514-8, since it won't be necessary if this general procedure is agreed to. Although this is my own substantiation, the proposal is the final panel action in the ROP on Proposal 14-126 in the previous cycle. It is one of four proposals that the panel accepted in the ROP, forgot about, and in-advertently wiped out through unrelated editorial activity in the comment period.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #2133)

14- 99 - (501-5(b) Exception No. 1): Reject
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Revise text to read as follows:
"Metal conduit containing no unions, ~~couplings,~~ boxes or fittings that passes completely through a Class I, Division 2 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not be required to be sealed if the termination points of the ~~unbroken~~ conduit are in unclassified locations. Couplings shall be permitted in the conduit run in the Division 2 location."
SUBSTANTIATION: A metal conduit, containing only couplings, completely passing through a Division 2 location and terminating with both ends in an unclassified location should not require sealing. The risk of vapors in ignitable quantities in the atmosphere, migrating into the conduit, which is at the same atmospheric pressure both inside and outside the conduit, through a threaded metal coupling in a Division 2 location is extremely low if not nonexistent.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided sufficient technical justification for reducing the requirements.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
GOODMAN: The current Exception allows a conduit completely passing through a Division 2 location with both ends in an unclassified location to not require seals. The submitter's request to add only couplings into that conduit should be permitted. As indicated in the substantiation, there is, in essence, no risk of the entrance or migration of vapors from the Division 2 location to the unclassified location since there is no differential pressure to "push" into the conduit system any vapors which may be present.

(Log #1563)

14- 100 - (501-5(b)(2)): Accept in Principle
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise fourth sentence to read as follows:
Except for ~~approved~~ (identified) explosionproof reducers at the conduit seal; there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 2 location.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.

NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.
COMMENT ON AFFIRMATIVE:
WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #3489)

14- 111 - (501-5(d)(1)): Accept in Principle
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise the third sentence to read as follows:
"Multiconductor Type MC cables with a gas/vaportight continuous corrugated aluminum sheath and an overall jacket of suitable polymeric material shall be sealed with an ~~approved~~ (identified) fitting after removing the jacket and any other covering so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors."
SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept in Principle.
Change "approved" to "listed".
PANEL STATEMENT: Listed fittings are readily available.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.

(Log #1985)

14- 123 - (501-5(f)(1), (2), and (3)): Reject
SUBMITTER: John H. Rannells, JHR Consulting
RECOMMENDATION: Revise text to read as follows:
501-5. Sealing and Drainage.
(f) Drainage.
(1) Control Equipment. Where there is a probability that liquid or other condensed vapor may enter and be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.
FPN No. 1: Electrical Submersible Pump (ESP) produced oil well operate at high pressures and may also experience seal leakage and the attendant problems.
FPN No. 2: Other codes or standards may require special handling of the above "trapped liquid or condensed vapor".
FPN No. 3: In addition to "liquid or other condensed vapor" poisonous gases such as hydrogen sulfide (H2S) may also be present and "may enter, and be trapped within, enclosures" and parts of the raceway systems.
(2) Motors and Generators. Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize entrance of the liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.
(3) Canned Pumps, Process or Service Connections, etc. For canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the electrical conduit, raceway or cable system capable of transmitting fluids, an additional listed seal system, seal, barrier, or other means shall be provided to prevent the flammable or combustible fluid from entering the conduit, raceway or cable system capable of transmitting fluids beyond the additional systems, devices or means, if the primary seal fails.
The additional approved seal system, seal or barrier and the interconnecting enclosure shall meet the temperature and pressure conditions to which they will be subjected upon failure of the primary seal, unless other approved means are provided to accomplish the purpose above. Drains, vents, or other devices shall be provided so that primary seal leakage will be obvious.
FPN: See also the fine print notes to Section 501-5.
SUBSTANTIATION: Problem: The problem is that materials not listed for high pressure are installed in systems where they may encounter high-pressure fluids. NEC Article 501-5(f), (1), (2), and (3) works perfectly when the process system is not under high pressure. But, because it requires material not listed for pressure [Rigid Metal Conduit (RMC), Electrical Metallic Tubing (EMT), Drains or Vents, and Poured Conduit Seals], it is possible that "flammable or combustible fluids" may enter "arcing electrical devices" in processes operating at high pressure such as Electrical Submersible Pump (ESP) "produced" oil wells ("5000 psi).
- RMC may be derived from ASTM A-53, but is not listed for pressure, and is therefore not suitable for pressure service.
- EMT, with a wall thickness less than RMC of the same external diameter, is not listed for pressure and is therefore not suitable for pressure service.
- Poured Conduit Seals are not listed for pressures beyond those in 501-5, (e), (2) and are therefore not suitable for use in situations where they are required to prevent the passage of gases at pressures greatly in excess of 6 in. of water (1493 pascals).
- Conduit Drains, Vents, and Fittings are not listed for pressure and are therefore not suitable for pressure service.
Solution: The use of a listed system (Primary Seal, Drain/Vent, and Secondary Seal) for high process pressure ("5000 psi) applications will eliminate release of flammable or combustible fluids that may occur when conduit, fittings, drains or vents, and seals, not listed for high pressures, are used...and fail. High pressure capable, NRTL listed systems, are available and in use in the United States today.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation addresses a pressure rating problem which does not exist in the code. Section 501-5(f)(3) requires that seals and barriers meet the pressure requirements to which they might be subjected. There is no substantiation given for the fine print notes.

(Log #1576)

14- 136 - (501-6(b)(3)): Accept in Part
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise to read as follows:
(3) Fuses. For the protection of motors, appliances, and lamps, other than as provided in (b)(4), standard plug or cartridge fuses shall be permitted, provided they are placed within enclosures ~~approved~~ (identified) for the location, or fuses shall be permitted

if they are within general-purpose enclosures, and if they are of a type in which the operating element is immersed in oil or other ~~approved~~ (identified)liquid, or the operating element is enclosed within a chamber hermetically sealed against the entrance of gases, vapors, or the fuse is a nonindicating, filled, current-limiting type.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept in Part.
Change only first "approved" with "identified".
PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a. Also, a "liquid" cannot be listed or identified.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.
COMMENT ON AFFIRMATIVE:
COOK: I will agree that the liquid used to immerse the element of a fuse will not be listed, however I would assume that the fuse manufacturer would identify some specific liquid to be used for that purpose. I would also assume that all liquids would not be acceptable and that an authority having jurisdiction should not be the person determining which liquid is acceptable. I would like to have input from the fuse manufacturers on this issue before determining if "approved" is the correct term.
WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #3500)

14- 137 - (501-6(b)(3)): Accept in Part
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read:
(3) Fuses. For the protection of motors, appliances, and lamps, other than as provided in (b)(4), standard plug or cartridge fuses shall be permitted, provided they are placed within enclosures ~~approved~~ (identified) for the location; or
fuses shall be permitted if they are within general-purpose enclosures, and if they are of a type in which the operating element is immersed in oil or other ~~approved~~ (identified) liquid, or the operating element is enclosed within a chamber hermitically sealed against the entrance of gases and vapors, or the fuse is a nonindicating, filled, current-limiting type.
SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. (Log #1577)

14- 138 - (501-6(b)(4)): Reject
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise to read as follows:
(4) Fuses Internal to Lighting Fixtures. ~~Approved~~ (identified) cartridge fuses shall be permitted as supplementary protection within lighting fixtures.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Reject.
PANEL STATEMENT: "Approved" is the appropriate word to use here.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: I disagree with the Panel Action and Statement. Fuses that are used for supplementary protection are not an item that an authority having jurisdiction could "approve" (acceptable to the authority having jurisdiction) without some listing or identification. I realize that the listing or identification would not be for hazardous locations, the proposal does not propose fuses identified for hazardous locations, however test lab directories include many listings for ordinary location fuses that are acceptable. I can not imagine any authority having jurisdiction or owner at a hazardous location facility that would want a fuse that did not meet the ordinary location requirements. Listed fuses are readily available.
JAGUNICH: The deletion of the word "approved" should be accepted but no word should be substituted for it. CMP14 has repeatedly stated that means or methods must be approved, but has removed the word "approved" for all other purposes within the articles for which the panel is responsible. Code enforcement officials rarely have at their disposal the tools for approving supplementary protection within lighting fixtures.
ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.

(Log #3508)

14- 154 - (501-9(a)(1)): Accept
Note: It was the action of the Technical Correlating Committee that the Panel give consideration to also revising the title of 501-9(a)(1) to correlate with the Panel's actions on Proposals 14-237 and 14-238. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read as follows:
(1) Approved Fixtures. Each fixture shall be ~~approved~~ (identified) as a complete assembly for the Class I, Division 1 location and shall be clearly marked to indicate the maximum wattage of lamps for which it is ~~approved~~ (identified). Fixtures intended for portable use shall be specifically ~~approved~~ (identified) as a complete assembly for that use.
SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.
PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.

(Log #3804)

14- 159 - (501-9(b)(2)): Reject
SUBMITTER: Hector R. de Vega, Fluor Daniel, Inc.
RECOMMENDATION: Revise text to read as follows:
(2) Fixed Lighting. Lighting fixtures for fixed lighting shall be protected from physical damage by suitable guards or by location. Where there is danger that falling sparks or hot metal from lamps or fixtures might ignite localized concentrations of flammable vapors or gases, suitable enclosures or other effective means shall be provided. Where lamps are of a size or type that may, under normal operating conditions, reach surface temperatures exceeding 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved, fixtures shall comply with (a)(1) above or shall be of a type that has been tested in order to determine the marked operating temperature or temperature range not to exceed 100 percent of the ignition temperature in degrees Celsius of the gas or vapor involved.
SUBSTANTIATION: The original text allowed a fixture to be used in a Class I, Division 2 area without regard to the maximum surface temperature of the fixture, provided it was "tested and marked". This proposal would limit the use of "tested and marked" fixtures to those that do not exceed 100 percent of the ignition temperature of the surrounding atmosphere.
PANEL ACTION: Reject.
PANEL STATEMENT: The concern of the submitter is already covered by 500-5(e) of the existing code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #4414)

14- 160 - (501-9(b)(2)): Reject
SUBMITTER: Stephen V. Norako, Cooper Crouse-Hinds Div.
RECOMMENDATION: Revise text to read as follows:
"~~Where lamps are of a size or type that may, under normal operating conditions, reach surface temperatures exceeding 80 percent of the ignition temperatures in degrees Celsius of the gas or vapor involved,~~ fixtures shall with (a)(1) or shall be of a type that has been tested in order to determine the marked operating temperature or temperature range."
SUBSTANTIATION: Lamp temperatures today are seldom if ever published by the lamp manufacturers. When temperatures are available, they are established in open air at favorable ambient (25°C). These temperature values in no way compare to the temperatures reached inside enclosed thick walled glass light fixtures at the high ambiance, 40°C or higher, typical of industrial establishments. Therefore this 80 percent rule has no basis and should be deleted.
PANEL ACTION: Reject.

PANEL STATEMENT: The substantiation does not demonstrate the possibility that lamp temperatures will reach or exceed autoignition temperatures.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: I disagree with the Panel Action and agree with the submitter's proposal and substantiation. It is also an unenforceable requirement.

(Log #1586)

14- 161 - (501-9(b)(3)): Reject
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise to read as follows:
(3) Pendant Fixtures. Pendant fixtures shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, or by other ~~approved~~ (identified) means.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.

Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 14-318a. The Technical Correlating Committee understands that there is no change to 501-11. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL
RECOMMENDATION: Revise text to read as follows:
~~501-11.~~ 505-17. Flexible Cords, Class I, ~~Divisions~~ Zones 1 and 2. A flexible cord shall be permitted for connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit. Flexible cord shall also be permitted for that portion of the circuit where the fixed wiring methods of Section ~~501-4(a)~~ 505-15(b) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment, in an industrial establishment where conditions of maintenance and engineering supervision ensure that only qualified persons will install and service the installation, and the flexible cord is protected by location or by a suitable guard from damage. The length of the flexible cord shall be continuous. Where flexible cords are used, the cords shall be as follows:
1. Of a type approved for extra-hard usage;
2. Contain, in addition to the conductors of the circuit, a grounding conductor complying with Section 400-23;
3. Connected to terminals or to supply conductors in an approved manner;
4. Be supported by clamps or by other suitable means in such a manner that there will be no tension no the terminal connections; and
5. Be provided with suitable seals where the flexible cord enters boxes, fittings, or enclosures that are required to be explosionproof or flameproof.
Exception: As provided in ~~Sections 501-3(b)(6) and 501-4(b),~~ 505-15(c).
Electric submersible pumps with means for removal without entering the wet-pit shall be considered portable utilization equipment. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be permitted.
Electric mixers intended for travel into and out of open-type mixing tanks or vats shall be considered portable utilization equipment.
FPN: See Section ~~501-13~~ 505-18 for flexible cords exposed to liquids having a deleterious effect on the conductor insulation.
SUBSTANTIATION: This proposal is the work of a Task Group including Ed Briesch, Bill Lawrence, Dave Wechsler, Lon Ballard, Larry Fuhrman, and Will McBride. This Task Group was not balloted. The purpose of the proposal is to provide clear guidelines for wiring, sealing, and installation in Article 505, without having to refer to Article 501.
PANEL ACTION: Accept in Principle.
Add the following as new 505-17:
"505-17. Flexible Cords, Class I, Zones 1 and 2. A flexible cord shall be permitted for connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit. Flexible cord shall also be permitted for that portion of the circuit where the fixed wiring methods of Section 505-15(b) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment, in an industrial establishment where conditions of maintenance and engineering supervision ensure that only qualified persons will install and service the installation, and the flexible cord is protected by location or by a suitable guard from damage. The length of the flexible cord shall be continuous. Where flexible cords are used, the cords shall be as follows:
1. Of a type listed for extra-hard usage;
2. Contain, in addition to the conductors of the circuit, a grounding conductor complying with Section 400-23;
3. Connected to terminals or to supply conductors in an approved manner;
4. Be supported by clamps or by other suitable means in such a manner that there will be no tension no the terminal connections; and
5. Be provided with listed seals where the flexible cord enters boxes, fittings, or enclosures that are required to be explosionproof or flameproof .
Exception: As provided in Sections 505-15(c)(2).
Electric submersible pumps with means for removal without entering the wet-pit shall be considered portable utilization equipment. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be permitted.
Electric mixers intended for travel into and out of open-type mixing tanks or vats shall be considered portable utilization equipment.
FPN: See Section 505-18 for flexible cords exposed to liquids having a deleterious effect on the conductor insulation."
PANEL STATEMENT: The panel has changed the words "approved" and "suitable" to "listed" in accordance with present requirements in Article 505. Cross-references have also been corrected where necessary.

(Log #1593)

14- 180 - (501-13): Reject
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise to read as follows:
501-13. Conductor Insulation, Class I, Divisions 1 and 2. Where condensed vapors or liquids may collect on, or come in contact

with, the insulation on conductors, such insulation shall be of a type ~~approved~~ (identified) for use under such conditions; or the insulation shall be protected by a sheath of lead or by other ~~approved~~ (identified) means.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Reject.
PANEL STATEMENT: To accept this proposal would cause a conflict with the action taken on Proposal 14-181.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: I disagree with the Panel Action. I have no idea how an authority having jurisdiction could "approve" conductor insulation for use in chemical atmospheres. We do not expect the authority having jurisdiction to determine suitability of insulation, for use in wet locations without the insulation being identified with a "W", but expect the same authority having jurisdiction to determine if the insulation is suitable to be used in chemical atmospheres. After reviewing the test criteria for gasoline and oil resistance ratings, I am certain that I am not qualified to make those approvals in the field without some way to identify that the insulation is suitable.

(Log #3989)

14- 181 - (501-13): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 14-318a. The Technical Correlating Committee understands that there is no change to 501-13. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL
RECOMMENDATION: Revise text to read as follows:
~~501-13.~~ 505-18. Conductor Insulation, Class I, ~~Divisions~~ Zones 1 and 2. Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type approved for use under such conditions; or the insulation shall be protected by a sheath of lead or by other approved means.
SUBSTANTIATION: This proposal is the work of a Task Group including Ed Briesch, Bill Lawrence, Dave Wechsler, Lon Ballard, Larry Fuhrman, and Will McBride. This Task Group was not balloted. The purpose of the proposal is to provide clear guidelines for wiring, sealing, and installation in Article 505, without having to refer to Article 501.
PANEL ACTION: Accept in Principle.
Add a new 505-18 to read: "Conductors and Conductor Insulation.
(1) For Type of Protection 'e', field wiring conductors shall be copper.
(2) Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type approved for use under such conditions; or the insulation shall be protected by a sheath of lead or by other approved means."
PANEL STATEMENT: This text is placed in the correct location as originally intended and redundant references have been deleted. The similar requirement in 501-13 will remain.
The requirement in (1) is taken from Section 4.1 of ISA S12.16.01-1998 (IEC 79-7 Mod) titled Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection – Increased Safety "e". See Proposal 14-365 for additional information.

(Log #589)

14- 189 - (501-16, 502-16): Reject
SUBMITTER: Ted Abner, Pinckney, MI
RECOMMENDATION: I propose the below listed sections make reference back to other like sections where possible due to the fact the only difference between them is their classifications.
Section 501-16
Grounding, Class I, Division 1 and 2. Wiring and equipment in Class I and II Division 1 and 2 locations shall be grounded as specified in Article 250 and with the following additional requirements:
(a) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended upon for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class I or II locations and the point of grounding for service equipment or point of grounding of a separately derived system.
Section 502-16.
Grounding, Class II, Division 1 and 2. Shall comply with Section 501-16. ~~Wiring and equipment in Class II Division 1 and 2 locations shall be grounded as specified in Article 250 and with the following additional requirements:~~
~~(a) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended upon for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such mans of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class II locations and the point of grounding for service equipment or point of grounding of a separately derived system.~~
The above listed article is only one of many changes that could be made throughout the code.

SUBSTANTIATION: This proposal would eliminate duplication of paragraphs.
PANEL ACTION: Reject.
PANEL STATEMENT: The Panel's intent is to keep Class I and Class II requirements separate.

(Log #2385)

14- 191 - (501-16(a)): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for information.
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Revise as shown below:
(a) Bonding. Standard locknuts or bushings ~~The locknut-bushing, and double-locknut types of contacts~~ shall not be depended on for bonding purposes~~, but bonding jumpers with proper fittings or other approved means of bonding shall be used~~; bonding shall comply with Sections 250-100 and 250-94. (Balance of paragraph and exception unchanged)
~~FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.~~
SUBSTANTIATION: Present wording conflicts with Section 250-94, which is referenced by Section 250-100. Taken literally, it does not require bonding for standard locknuts that are employed to secure threadless connectors to enclosures, nor around concentric or eccentric knockouts that may not be suitable for bonding, as required under Section 250-94. May also be interpreted to prohibit the use of bonding locknuts and bushings, which are acceptable under Section 250-94. (The balance of this paragraph and the exception are also unnecessary if submitter's proposal for Section 250-100 is accepted).
PANEL ACTION: Reject.
PANEL STATEMENT: These requirements are more stringent than those in Article 250.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: I disagree with the Panel Action and Statement. I agree with the submitter's proposal and most of the substantiation. I am not certain about the last sentence, in parentheses, since I have not seen the submitter's proposal for Section 250-100.

(Log #2386)

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise second paragraph to read as follows:
Enclosures shall be permitted to be of the general-purpose type. Surge protection of types other than described above shall be installed in enclosures ~~approved~~ (identified) for Class I, Division 1 locations.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.
PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.
COMMENT ON AFFIRMATIVE:
WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #3521)

14- 197 - (501-17(b)): Accept
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise the second paragraph to read as follows:
"Enclosures shall be permitted to be of the general-purpose type. Surge protection of types other than described above shall be installed in enclosures ~~approved~~ (identified) for Class I, Division 1 locations."
SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.

EXPLANATION OF NEGATIVE:
ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.

(Log #3988)

14- 198 - (501-18): Accept in Principle
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 14-318a. The Technical Correlating Committee understands that there is no change to 501-18. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL
RECOMMENDATION: Revise text to read as follows:
~~501-18.~~ 505-21. Multiwire Branch Circuits. In a Class I, ~~Division~~ Zone 1 location, a multiwire branch circuit shall not be permitted.
Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.
SUBSTANTIATION: This proposal is the work of a Task Group including Ed Briesch, Bill Lawrence, Dave Wechsler, Lon Ballard, Larry Fuhrman, and Will McBride. This Task Group was not balloted. The purpose of the proposal is to provide clear guidelines for wiring, sealing, and installation in Article 505, without having to refer to Article 501.
PANEL ACTION: Accept in Principle.
Add the proposed text to 505-22.
PANEL STATEMENT: The Panel agrees with the text, but the correct location is 505-22.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

NOT RETURNED: 2 Earley, Saban
COMMENT ON AFFIRMATIVE:
WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #1541)

14- 199 - (501-18, Exception): Reject
SUBMITTER: Thomas J. Conlan, Conlan's "The Electrician Inc."
RECOMMENDATION: Revise to read as follows:
501-18. Multiwire Branch Circuits. In H11 location a multiwire branch circuit shall not be permitted.
~~Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.~~
SUBSTANTIATION: Remove the exception.
The disconnect does not address automatic or manual operation. Fusible disconnects can blow one fuse and not the other also a bad neutral can cause a higher voltage than 120 nominal on 120/240 volt multiwire branch circuit which can lead to a fire.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation does not support the proposal.
